New Electrical System Inspector(ESI) Training 1. Introduction 2. Safety 3. Tools 4. Equipment Recognition 5. Clearances 6. Detailed Inspection 7. Inspect App 8. Notifications 9. Repairs 10. Private Property 11. Quality Assurance (QA)	1. Describe GOs 95 & 165, explain purpose of inspection programs 2. Requirements of Inspection safety for ESIs, guidelines for PPE, safe driving & parking 3. Identify tools, proper maintenance of tools, how to use tools safety 4. Identify common Distribution equipment and purpose of equipment. How to identify damage 5. Measure & report clearances that legally define basic minimum allowable vertical clearance values 6. Purpose & duties regarding inspections, steps of the inspection method, describe P1 conditions, purpose of Annual Grid Patrol 7. Layout of survey questions by category, practice answering surveyquestions on iPad 8. Categorize different types of Priority conditions, how & when todocument notifications, how to make changes in the field tool 9. Precautions to take prior to making repairs, proper actions to takefor repairs they cannot make 10. Outline responsibilities of ESI, describe access issues an ESI faces and how to approach and remedy 11. At the end of this module ESI's will be able to explain elements &purpose of QA Program and how it applies to ESI 12. Explain their part in the inspection, repair and reporting of overhead structures 13. Training refresher annually
Existing ESI Inspection Training	1. ODI Survey App Reference Guide (Responding to Survey Questions) 2. Inspection App User Guide 3. ESI Help Guide 4. Laser Rangefinder – TruePulse 360 Quick Start Manual

	5. Overhead Detail Inspections (ODI) Covered Conductor Training 6. New ESI Training (Details above)
Aerial Inspection Training	1. Identify common Distribution equipment and purpose of equipment. How to identify damage 2. Purpose & duties regarding inspections, steps of the inspection method, describe P1 conditions 3. Layout of survey questions by category, practice answering survey questions on Inspection Application 4. Categorize different types of Priority conditions, how & when to document notifications 5. Outline responsibilities of Aerial Inspectors, including photos capturing misalignment, for example, blurriness, oblique, and improper contrast photos. 6. At the end of this training, Aerial Inspectors will be able to identify appropriate level of priority risk-based Notifications. 7. Explain their part in the inspection and reporting of overhead structures
Transmission Inspection Training	1. Overview of program, including schedule, deadlines and targets 2. Layout of survey questions, with emphasis on new questions or question changes 3. Outline responsibilities of Transmission Ground Inspectors

8.1.9.2 Target Role: Grid Hardening

SCE's Grid Hardening activities focus on implementing grid infrastructure that mitigates the risks of ignitions associated with utility equipment. This includes several activities, such as deploying covered conductor, undergrounding of overhead lines, installing system automation equipment, remediating issues with long conductor spans, replacing old and potentially faulty equipment, and more. For more information on SCE's Grid Hardening programs, please see Section 8.1.2.

Table SCE 8-10 details the field worker titles and associated qualifications pertaining to Grid Hardening.

Table 8-10 - Workforce Planning, Grid Hardening[184]

Worker Title	Minimum Qualifications for Target Role	Special Certification Requirements	Electrical Corporation % FTE Min Quals[182]	Electrical Corporation % Special Certifications[183]	Contractor % FTE Min Quals[182]	Contractor % Special Certifications[183]	Reference to Electrical Corporation Training/Qualification Programs
TRANSMISSION /DISTRIBUTION APPRENTICE LINEMAN	See below	N/A	15.1%	N/A	17.3%	N/A	See Distribution Apprentice Lineman program in Table 8-02 and Transmission Apprentice Lineman training in Table 8-03
JOURNEYMAN TRANSMISSION /DISTRIBUTION LINEMAN	See below	QEW	32.8%	100%	41.5%	100%	See below

[184] The SCE worker population identified in this Table overlaps with the SCE worker population identified in Section 8.1.9.2 (Risk Event Inspections), as these FTE can perform both target roles.

General Minimum Qualifications: Workers are required to have knowledge of applicable Accident Prevention Manual rules, SCE standards, policies and procedures, GO 95/128; electrical theory and mechanical principals.

Additional Minimum Qualifications:

TRANSMISSION/DISTRIBUTION APPRENTICE LINEMAN: Knowledge of and proficiency in the principles of electricity and mechanics; characteristics of electrical AC and DC circuits; the connections of electrical apparatus; equipment, circuits and their functions; principles of physics and advanced mathematics. In addition, must possess knowledge of SCE's Accident Prevention Manual and proficiency in safe work practices, County and State Electrical Code; rigging practices; and proper and safe use of cleaning agents. The knowledge, skills, and abilities required for this job are of a level comparable with those normally acquired through courses taken in obtaining a high school education and considerable working experience in electrical repair work. Table SCE 8-02 and Table SCE 8-03 below details the associated training pertaining to the Distribution and Transmission Apprentice Lineman.

JOURNEYMAN TRANSMISSION/DISTRIBUTION LINEMAN: See qualifications of Lineman in Section 8.1.9.1.

FOREMAN: Oversee work performed by their crews and helps to ensure the work is performed safely. Requires knowledge of and proper use of approved tools, material, equipment, as applied to the construction, maintenance and repair of overhead and underground electrical systems. Skills and abilities required for this job are of a level comparable with those normally acquired through a high school education and extensive training and experience as a Journeyman Lineman.

GROUNDMAN: Assist with overhead and underground work as assigned. General knowledge of principles of electricity and mechanics; characteristics of electrical AC and DC circuits; and the connections of electrical apparatus; equipment, circuits and their functions. In addition, must possess knowledge of SCE's Accident Prevention Manual and safe work practices; rigging practices; and proper and safe use of tools and cleaning agents. The knowledge, skills, and abilities required for this job are of a level comparable with those normally acquired through courses taken in obtaining a high school education.

SPLICER: Responsible for all types of power cable and major electrical equipment and related facilities. Must have knowledge of and proficiency in electrical theory and shop mathematics; methods, practices, and procedures; tools, instruments, equipment and materials; SCE's Accident Prevention Manual and safety rules; established codes and standards; and the nomenclature and functions of parts necessary for installation, replacement, inspection, servicing, overhauling and repairing overhead and underground lines, electrical equipment and related facilities. The knowledge, skills, and abilities required for this job are of a level comparable with those normally acquired through experience as an Electrical Helper or Apprentice Electrician.

SUBSTATION MAINTENANCE ELECTRICIAN: Responsible for the installation, maintenance, and repair of high voltage electrical substation apparatus. Utilizes various meters, testing and diagnostic devices, performs routine testing, troubleshoots equipment problems, performs wiring of substation equipment, dismantles and overhauls CBs, transformers, regulators, and associated substation equipment. Qualification includes completion of the Substation Apprentice Electrician Program and Substation Operators School. The knowledge, skills, and abilities required by the job are of a level comparable with those normally acquired through courses taken in obtaining a high school diploma and the training and experience required to successfully complete the apprentice electrician program.

TEST TECHNICIAN: Responsible for programs and tests, inspections, repairs, relay adjustments, instrumentation equipment, local controllers, pilot wire equipment, battery chargers, and associated devices for the protection, control, and indication of system equipment. Must be a qualified substation operator. The knowledge, skills, and abilities required for this job are normally acquired through completion of high school and/or formal training in electrical engineering, or experience with extensive comprehension of electrical theory and use of principles of electrical theory in actual performance.

GENERATION: HYDRO ELECTRICIAN & INSTRUMENT CONTROL TECHNICIAN/ICE TECHNICIAN: See qualifications of Hydro Electrician & Instrument Control Technician in Section 8.1.9.1.

GENERATION: HYDRO FOREMAN ELECTRICIAN & INSTRUMENT CONTROL TECHNICIAN FOREMAN/FOREMAN, ICE TECHNICIAN: See qualifications of Hydro Electrician & Instrument Control Technician Foreman in Section 8.1.9.1.

GENERATION: CHIEF HYDRO STATION OPERATOR: See qualifications of Chief Hydro Station Operator in Section 8.1.9.1.

Training and plans to improve SCE worker qualifications:

To facilitate grid hardening work, SCE implements training for SCE workers, such as those identified above. This technical training includes core technical training for working on the electric system, as well as specialized training on PSPS, HFRA, grid hardening, etc., and prepares workers to perform their jobs safely, comply with regulatory requirements and laws, maintain system reliability, and meet the demands of new technology. SCE will continue to deploy new work methods and technologies in support of wildfire activities. Wildfire activities may also require the use of new technology, such as situational awareness tools or information technology (IT). The use of new technology is usually accompanied by end-user training to help ensure the appropriate click-through of the application and accurate capture of data. New work methods also require the creation of new training material and deployment of the training to SCE employees. In addition to technical competency, this training will provide education and clarification on new procedures and standards, building upon lessons learned obtained from field activities. For example, these trainings can include Hot Sticks Training, Aerial

Construction Training, etc. SCE provides these trainings through ongoing efforts with existing employees and through its Apprenticeship programs for new employees, which is shown Table SCE 8-02 and Table SCE 8-03. In addition, SCE also provides training program to Substation Maintenance Technician and Test Technician, which is shown in Table SCE 8-04, Table SCE 8-05, and Table SCE 8-06. SCE also conducts training for workers in the Risk Event Inspection role related to its wildfire mitigation and PSPS work, which is described in Section 8.1.9.3 below.

Table SCE 8-02 - SCE Training Courses Specific to a Distribution Apprentice Lineman

Course Name	Course Description
1st Step Distribution Apprentice Lineman Training is comprised of 13 modules 1. Orientation 2. Climbing Basics 3. Grounding 4. Guying 5. Meter Panels 6. OH Services 7. Pole Framing 8. Pole Top Rescue 9. PPE and Safety 10. Primary Conductors 11. Rigging Basics 12. Secondary Conductors 13. Streetlights	Basic Climbing Climbing and Pole Top Rescue, and safety & equipment basics.
2nd Step Distribution Apprentice Lineman Training is comprised of 14 modules 1. Wire Banks 2. AC vs DC 3. Delta vs Wye 4. Ferroresonance 5. Interconnected Systems 6. Orientation 7. Ohms Law 8. Temp Grounding Devices 9. Transformer Design & Theory 10. Transformer Load Calcs 11. Transformer Nameplates 12. Polarity 13. Vectoring 14. Voltage Problems	Basic Theory Introduction to Electrical Theory, vectoring and Ferroresonance.

Course Name	Course Description
3rd Step Distribution Apprentice Lineman Training is comprised of 9 modules 1. Orientation 2. UG Components 3. UG Conductors 4. UG Fuses 5. UG Grounding 6. UG Rules & Regulations 7. UG Structures 8. UG Switches 9. UG Transformer	Underground Underground equipment, rules, and procedures.
4th Step Distribution Apprentice Lineman Training is comprised of 13 modules 1. Orientation 2. Ohms Law 3. Vectoring 4. Ferroresonance 5. Reclosers 6. Fuses 7. HV Testing & Phasing 8. Capacitor Banks & PF 9. Metering Theory 10. Voltage Regulators 11. RCS Theory 12. Ground Banks 13. PE Gear	Advanced Theory Application and deep dive of Electrical Theory. Equipment theory.
5th Step Distribution Apprentice Lineman Training is comprised of 9 modules 1. Orientation 2. Fuses 3. 4kV Rubber Gloving 4. Hot Stick Basics 5. Armor Rods & Gins 6. Corner Pole Taps & Phasing 7. Double Dead-Ending 8. Hot Splicing 9. Hot Stick Skills	Step Hot Stick & Live line Tools Rubber gloving and hot sticking.
6th Step Distribution Apprentice Lineman Training is comprised of 25 modules 1. Orientation 2. Safety Protocol 3. 6.6 Streetlights	Operations and troubleshooting.

Course Name	Course Description
4. Capacitors 5. SOB 322 6. Remote Automatic Reclosers (RAR) 7. Remote Sectionalizing Recloser (RSR) 8. N-1 SOB 311 9. Event Response 10. Circuit Balancing 11. Circuit Maps 12. Clearances & No Test Orders 13. Co-Generation 14. Dist. Ops Responsibilities 15. Emergency Primary Trouble shooting 16. Fault Indicators 17. Fault Interrupters 18. Patrol Collector App 19. Metering ESR 20. PE Gear 21. RCS Switches – Operating 22. Secondary Trouble Shooting 23. Substation Entry & Logbook 24. Switching Procedures 25. Switching Techniques	

Table SCE 8-03 - SCE Training Courses Specific to Transmission Apprentice Lineman

Course Name	Course Description
1st Step: Transmission Apprentice Lineman Training is comprised of 11 modules 1. Orientation 2. Grounding – Induction Mitigation 3. Induction – Guy Wires 4. Pole Climbing Basics 5. Grounding 6. Knife Safety 7. Rigging Basics 8. Guying 9. Pole Framing 10. Pole Top Rescue 11. Rigging	Basic Climbing • Climbing and Pole Top Rescue, and safety & equipment basics. • Rigging Techniques. • Review of more in depth grounding, installing grounds and learning foreign grounds on various configurations. Hanging varying martials in various configurations.
2nd Step: Transmission Apprentice Lineman Training is comprised of 15 modules 1. Orientation 2. Grounding Review 3. Interconnected Systems	Basic Electrical Theory Introduction to Electrical Theory, Transformers, vectoring.

Course Name	Course Description
4. Ohm's Law 5. AC vs. DC 6. Transformer Design and Theory 7. Transformer Polarity 8. Transformer Nameplates 9. Vectoring 10. Delta Vs Wye 11. Transformer Load Calculations 12. Guying 13. Splicing 1. Guying 14. Basic Aerial Construction	
3rd step: Transmission Apprentice Lineman Is comprised of 10 modules 1. Orientation 2. Daggett Orientation 3. Wood Poles and LWSPs 4. Tubular Steels Poles (TSPs) 5. Shotgun Splicing 6. Wire Stringing (Conductors) 7. Towers 8. Insulators 9. Hot Washing from a Truck 10. Working from Space Carts	• Introduction to standard pole configuration and construction • Assemble tower sections. Learn about insulators.
4th step: Transmission Apprentice Lineman Is comprised of 7 modules 1. Cable Pulling 2. Cable Splicing 3. Risers 4. Terminations 5. UG Cable 6. UG Grounding 7. UG Systems Overview	Underground Learn underground equipment, rules, and procedures. Cable Learn to pull cable from vault to Riser, and installing and setting cable support grips
5th step: Transmission Apprentice Lineman Is comprised of 16 modules 1. 4 kV Rubber Gloving 2. Avian Protection 3. Capacitor Banks 4. Change Out Insulators on Energized Lines 5. Distribution Risers 6. Double Dead Ending 7. Energize/De-energized Transformers 8. Fuses and Test Equipment 9. Hot Stick Basics	Rubber Gloving Use HV rubber gloves on energized 4kV lines. Change out insulators with energized lines. TS-5 and OH wiring, including inspection, testing, temporary grounding device, connecting primary taps.

Course Name	Course Description
10. Overhead Transformers 11. Primary Distribution Circuit Transfer 12. Protective Covers 13. Transformer Theory 14. Conductor Ties and Shunts 15. Incorporating the MGPN 16. Grounding Additions	
6th step: Transmission Apprentice Lineman Is comprised of 19 modules 1. Orientation 2. Grid Operations 3. Substation Basics 4. Distribution Circuit Maps 5. Line Programming and Clearances 6. Circuit Field Phasing 7. Wood Pole Inspections 8. Steel Pole Inspections 9. Steel Pole and Tower Inspections 10. Pole and Tower Signs 11. Switch Installation Lead a Work Crew 12. Switch Repair and Maintenance 13. Underground Inspections 14. Underground Service Alerts (USAs) 15. On Job Training (OJT) 16. Pilot Wire 17. Helicopter Operations 18. OJT 19. Lead a Work Crew	• Circuit Phasing • Switching • Submit Grid Ops and Distribution circuit maps changes Learn how to lead crew

Table SCE 8-04 - SCE Training Courses Specific to Substation Electrician Apprentice Program (SEAP)[185]

Course Name	Course Description
Step 1 of this program consists of 3 modules, OJT, and TPEs during a six-month time period: 1. Safety 2. Clearances 3. Personal Grounding	At the end of this step, the apprentice will be able to: • Perform switching in a substation under supervision • Take clearances under supervision • Apply personal grounds under supervision
Step 2 of this program consists of 11 modules, OJT, and TPEs during a six-month time period: 1. Pneumatics Hydraulics 2. Mechanical Concepts 3. Hot Washing 4. Rigging 5. Operating Heavy Equipment 6. Electrical Equipment Grounding 7. High Voltage Connectivity 8. Basic Test Instruments 9. Oil Handling 10. Gas Handling 11. Circuit Breaker Fundamentals	At the end of this step, the apprentice will be able to: • Perform job setup and observe safety precautions during hot wash under supervision • Identify and use tools and fasteners • Tie knots • Inspect slings and shackles • Plan requirements for a given rigging job and operate heavy equipment under Supervision • Clean, bolt, and torque connections • Operate Microhmeter (Ductor), Megohmmeter (Megger), and Multimeters • Perform Dielectric Oil test • Draw DGA sample • Switch and Operate as a "Qualified Operator"

[185] SEAP is a 6-step (3-year) apprenticeship program for New-to-Role employees. The curriculum uses a blended learning approach, including instructor-led, web-based, and On-the-Job Training to provide the Substation Electrician apprentice with the skills and knowledge to install, repair, and maintain high voltage substation electrical equipment.

Course Name	Course Description
Step 3 of this program consists of 5 modules, OJT, and TPEs during a six-month time period: 1. CB Print Reading 2. CBA 3. Timing 4. Advanced CB's 5. Trouble Shooting	At the end of this step, the apprentice will be able to: • Perform Ductor and Megger tests on CBs • Perform timing tests • Perform vacuum bottle tests • Install, setup, run and interpret basic CBA records • Perform gas and oil tests: test purity and moisture of SF6 gas; run gas reclaimer for SF6 breaker; run filter cart for CB oil • Perform CB Mechanical Maintenance using MM sheet and Internal Inspection using overhaul sheet under supervision Troubleshoot CB problems under supervision
Step 4 of this program consists of 16 modules, OJT, and TPEs during a six-month time period: 1. Substation Battery Systems 2. Electrical Checking 3. Electrical Equipment Grounding 4. Substation Print Reading 5. Disconnects and Switchers 6. Intro to Instrument Transformers 7. Pressure Relief Devices and Sudden Pressure Relays 8. Transformer Principles 9. Power Transformers Components, Core, Windings, and Insulation 10. Station Light and Power 11. Water in Paper (Transformers) 12. PTC Construction and Auxiliary Components (Enclose Tank, Cooling, Temp Rise Cooling Cases 13. Dissolve Gas Analysis 14. On-Line Monitoring 15. Transformer Connections 16. Auxiliary Control Circuit	At the end of this step, the apprentice will be able to: Work on hydraulic and pneumatic systems Ground station equipment to the ground grid Perform work on CT's, PTs, and SL&P Install, maintain, and test transformers and the auxiliary equipment under supervision Replace fuses Batteries (check voltage; check bad cells; make necessary connections; check battery charger) Perform Checking duties under Supervision

Course Name	Course Description
Step 5 of this program consists of 19 modules, OJT, and TPEs during a six-month time period: 1. Capacitors 2. LTC Testing and Quality Pointers 3. LTC Maintenance 4. LTC Intro and Theory 5. DTA Record Transfer 6. Intro to Doble Bushings Testing 7. Dry Wall Calibrator 8. Ground Bank and Delta Zig Zag Testing 9. Doble Leakage Reactance Test 10. LTC Testing 11. Transformer Megger Testing 12. Brushing Name Plate 13. Oil Power Factor Test 14. Circuit Breaker Testing 15. Recommended Testing Voltage 16. Surge Arrestor 17. Transformer Testing Safety Protocol 18. TTR Set Up 19. WRM Vanguard Bridge Testing	At the end of this step, the apprentice will be able to: Perform primary conductoring Perform secondary wiring Overhaul LTCs under supervision Installation, maintenance, and adjustment of switches and disconnects Overhaul regulators Balance, check and test shunt and series capacitors Apply covers and barriers Test A Bank Transformers and below Employee will become a qualified electrical worker at the 2-year mark if all conditions are met
Step 6 of this program consists of 7 modules, OJT, and TPEs during a six-month time period: 1. Coaching 2. Decision Making 3. Effective Communication 4. Evaluating 5. Listening 6. Memorable People Exercise 7. Mentoring	At the end of this step, the apprentice will be able to: Perform duties of lead person on major job (e.g., order materials, assign positions on job, tailboard, direct personnel, and complete overhaul sheets).

Table SCE 8-05 - SCE Training Courses Specific to Substation Test Technician Program[186]

Course Name	Course Description
Session 1 of this program consists of 5 modules, OJT, and TPEs during a six-month time period: 1. Print Reading 2. Phasor Analysis 3. Instrument Transformers 4. Protection Suite 5. Initial and Routine Testing	After completing this session, the Test Technician should be able to: • Understand and describe basic circuits on electrical print diagrams and descriptive information • Calculate both voltage and current quantities for wye and delta three-phase transformer connections • Perform basic phasoring using a phasor wheel, and devise connections • Devise auxiliary current transformer connections • Perform the following tests on current and potential transformers • Create data bases • Develop a test plan for a CO relay • Use the Maintenance & Inspection Manual (MIM) to identify the necessary tests for each specific piece of equipment. • Use the necessary prints, including the one line for operation, wiring, and elementary diagrams. • Verify the equipment is labeled correctly • Verify a “bill of materials” form • Compare Station Elementary Diagrams against Wiring Diagrams to verify circuits or correct wire connections • Use Elementary Diagrams to prove or troubleshoot the operation of station equipment

[186] The Test Tech program is a 6-session (3-year) program for New-to-Role employees. The curriculum uses a blended learning approach, including instructor-led, web-based, and On-the-Job Training.

Course Name	Course Description
Session 2 of this program consists of 4 modules, OJT, and TPEs during a six-month time period: 1. Non-Directional Over Current Protection 2. Directional Overcurrent Protection 3. Power Transformer Theory and Calculations 4. Power Transformer Test and Connect	After completing this session, the Test Technician should be able to: • Set and test a directional overload relay. IBC type suggested • Set and test CO and IAC type overload relays • Set and test a directional overload relay • Perform calculations for power transformers and transformer banks by using the appropriate formulas to determine results for: o Full load o Single-phase o Three-phase o Parallel operation o Impedance o Parallel operation o Short circuit current • Perform the following tests on a power transformer: o Transformer turns ratio o Winding resistance (bridge) o Insulation resistance (megger) o Impedance o High voltage Doble power factor tests using DTA software o In service • Calibrate, set, and test gauges, alarms, and controls • Calculate capacitor bank KVAR or MVAR ratings. Balance single capacitor units connected in series and parallel bank configurations. Connect, set, and test shunt capacitor controls.

Course Name	Course Description
Session 3 of this program consists of 3 modules, OJT, and TPEs during a six-month time period: 1. Bank Differential Relays 2. Bus Differential Relays 3. Metering	After completing this session, the Test Technician should be able to: • Set and test a PVD electromechanical bus differential relay. • Set and test station metering. • Perform in-service readings and show the expected results on a test sheet for the following two and three-element watt/var metering: o Substation equipment o Distribution lines o Transmission lines • Set and test a bank differential relay • Perform in-service tests on a bank differential relay. • Properly connect, set, and test the general integrity of the alarms and annunciator equipment. o Plan initial testing of new installations; perform routine testing of in-service schemes; and trip test, adjust, and calibrate alarm relays.
Session 4 of this program consists of 5 modules, OJT, and TPEs during a six-month time period: 1. Distance Relays 2. Ground Relays 3. HCB Relays	After completing this session, the Test Technician should be able to: • Set and test a directional ground relay. IBCG relay suggested. • Perform in-service tests on an IBCG relay • Set and test an HCB relay including the pilot wires and terminal equipment. • Perform in-service testing on an HCB pilot relay scheme. • Set and test a distance relay • Perform in-service tests on a distance relay • Set and test reclosing relays • Set and test automatic substation schemes for Stage I-V substations and automatic-service schemes. • Read and interpret the applicable AC and DC diagrams, flow charts, function

Course Name	Course Description
	numbers, and symbols.

Session 5 of this program consists of 5 modules, OJT, and TPEs during a six-month time period:
1. Prog. Logic Continued
2. LBFB and LBBU Relay Schemes
3. HCB Relays
	After completing this session, the Test Technician should be able to:
	• Properly connect LBFB and LBBU relays
	• Safely set up and operate test instruments/equipment specific to LBFB and LBBU schemes.
	• Apply settings to the relays and test the general integrity of each LBFB/LBBU backup scheme.
	• Plan, initial test, routine test, trip-test, adjust, and calibrate LBFB and LBBU relays.
	• Properly test and set the following power line equipment:
	  • Line traps
	  • Line tuners
	• Properly test and set SWR reference readings.
	• Perform utility functions, including loading and storing a PLC program.
	• Change capacitor control, clock, & PT settings.
	• Test a PLC program and associated equipment after changing a setting.
	• Properly connect, set, and test the general integrity of the relays.

Session 6 of this program consists of 4 modules, OJT, and TPEs during a six-month time period: 1. Substation Automation System (SAS) 2. Regulators	After completing this session, the Test Technician should be able to: • Perform duties of lead person on major job (e.g., order materials, assign

Course Name	Course Description
3. Pilot Relays 4. Leadership and Communication	positions on job, tailboard, direct personnel, and complete overhaul sheets). • Plan initial testing of new installations (whenever necessary); perform routine testing of in-service schemes; trip-test, adjust, and calibrate relays. • Troubleshoot and perform minor repairs to these relays using applicable diagrams and prints.

Table SCE 8-06 - SCE Training Courses Specific to Acting Operator Training[187]

Course Name	Course Description
Kickoff 1. Acting Operator Class Documentation 2. Acting Operator Station Tour 3. Acting Operator Substation Safety Kick-Off	At the end of this session, the participant will be able to: • Identify program documentation • Identify, at a high-level, components of a Substation. • Discuss the expectations of their participation in this program. • Identify safety risks and mitigations in Substations.

[187] New-to-role Electrician Apprentices and Test Technicians are required to take the Acting Operator program as a pre-requisite to their specific New-to-Role programs (SEAP and Test Technician training in Table 8-04 and Table 8-05). The Acting Operator program provides the skills and knowledge to perform routine and emergency switching tasks.

Course Name	Course Description
Session 1 • Session 1 Study Guide (Student Version) o NERC o SCE Electrical System o SOB 12 o Intro to Substations o Personnel o One Lines & Exercises o APM rules o Rack Structures o Power System Safety o Nomenclature & Exercises o Sub Station Logs & Exercises o Power Flow Exercises o SAS o Basic Protection o Live Line Tools o 900 MHz Radio OJT Guidelines 1. One Lines & Symbols OJT 2. Rack Structures OJT 3. Nomenclature OJT 4. Powerflow OJT 5. Logging OJT 6. APX 400 900 MHz Hand-Held Radio OJT 7. Basic Protection OJT o 401-01 Electron Theory o 401-03 Ohm's and Kirchoff's Laws Relating to DC Circuits o 401-04 Evaluating Series and Parallel DC Circuit Performance	At the end of this session, the participant will be able to: • Discuss key resources (e.g., Accident Prevention Manual, System Operating Bulletins, Safety concepts, etc.) that will be used in their role. • Learn and perform key tasks (e.g., using one lines, nomenclature, logging, tracing powerflow, using 900 MHz Radio, etc.). • Discuss basic protection theory (e.g., Electron theory, Ohm's Law and Kirchoff's Law). • Evaluate Series and Parallel DC Circuit Performance .

Course Name	Course Description
Session 2 1. Session 1 Review 2. Basic Protection o Zone of Protection o Overload and Directional o Differential Relays o Bank Protection Relays 3. Ground Systems (Solid & Med) 4. Reclosers 5. Live Line Tools 6. Switching Technique (Tailboard, PDOE) 7. SAS 8. Alarm Processing 9. Red Logbook 10. Pinch Points 11. Disconnects 12. Switching with a Checker 13. MMI and Relay Panel Switching 14. Basic Protection Additional Material 15. Line, Bank & Bus Protection 16. Clearances 17. Routine Switching Practice	At the end of this session, the participant will be able to: • Discuss high level basic protection concepts • Identify safety risks and mitigations (e.g., pinch points, clearances, etc.). • Perform switching tasks based on foundational concepts and knowledge (e.g., ground systems, reclosers, Switching Technique, PDOE, etc.).
Session 3 1. Program Writing OJT 2. Real Time Switch OJT 3. Clearances OJT 4. Field Assignment OJT	At the end of this session, the participant will be able to: • Experience performing program writing tasks • Experience performing real time switching tasks. • Experience requesting clearances • Perform other field assignments

Course Name	Course Description
Session 4 1. Transformers 2. Instrument Transformers 3. Automatic Subs 4. DC Systems 5. Station Light & Power 6. Fuse Replacement 7. Circuit Breakers / Switchers 8. Ino-LECT Racking Device 9. VAR Principles 10. Capacitors 11. Reactors 12. Load Tap Changers and Voltage Regulators 13. Basic Protection (Review, Local Breaker Back up Unit (LBBU), Local Break Failure Back up (LBFB), Differential/Distance Line Protection, Permissive Trip Bus (PTB)/ Fast Bus Blocking (FBB), Fast Curve Relay Settings). 14. Program Writing 15. Grounding Systems/SOB 322	At the end of this session, the participant will be able to: • Identify and describe the purpose and safety risks of common substation equipment. • Discuss basic protection concepts in further detail. • Continue program writing practice • Explain grounding systems/ SOB 322
Session 5 1. Program Writing OJT 2. Real Time Switch OJT 3. Clearances OJT	At the end of this session, the participant will be able to: • Write programs • Switch in real time • Request clearances

Course Name	Course Description
Session 6 1. Review various System Operator Bulletins, Operating Bulletins and APM rules that apply to Emergency Switching. 2. Hands on practices of various Emergency Switching Scenarios. 3. Practice Emergency Logging 4. Technology Integration Introduction	At the end of this session, the participant will be able to: • Identify how and where to find critical resources (e.g., SOBs, APM rules, etc.) pertaining to emergency switching. • Perform various Emergency Switching scenarios. • Perform emergency logging • Identify where to find resources pertinent to the installation, operations, and maintenance of new equipment in the field (Technology Introduction).

8.1.9.3 Target Role: Risk Event Inspection

SCE inspects various risk events – ignitions, outages, wire-down, faults, etc. – to determine cause and to remediate issues. This work is performed by many of the same qualified field personnel who also perform other work on the system, such as Grid Hardening work.

Table 8-11 below details the worker titles and associated qualifications pertaining to these Risk Event Inspections.

Table 8-11 - Workforce Planning, Risk Event Inspection[188]

Worker Title	Minimum Qualifications for Target Role	Special Certification Requirements	Electrical Corporation % FTE Min Quals[182]	Electrical Corporation % Special Certifications[183]	Contractor % FTE Min Quals[182]	Contractor % Special Certifications[183]	Reference to Electrical Corporation Training/Qualification Programs
TRANSMISSION/ DISTRIBUTION APPRENTICE LINEMAN	See below	N/A	14.5%	N/A	17.3%	N/A	See Distribution Apprentice Lineman training in Table 8-10-1 and Transmission Apprentice Lineman training in Table 8-10-2
JOURNEYMAN TRANSMISSION/ DISTRIBUTION LINEMAN	See below	QEW	31.5%	100%	41.6%	100%	See below
FOREMAN	See below	QEW	15.8%	100%	18.7%	100%	See below
GROUNDMAN	See below	N/A	19.4%	N/A	21.7%	N/A	See below
PATROLMAN	See below	QEW	1.9%	100%	0.0%	N/A	See below
SPLICER	See below	QEW	2.8%	100%	0.7%	100%	See below
APPARATUS TECHNICIAN	See below	N/A	2.8%	N/A	0.0%	N/A	See below
TROUBLEMAN	See below	QEW	11.0%	100%	0.0%	N/A	See below
FIPA ENGINEER	See below	N/A	0.3%	N/A	0.0%	N/A	See below
			100.0%		100.0%		

[188] The SCE worker population identified in this Table overlaps with the SCE worker population identified in Section 8.1.9.2 (Grid Hardening), as these FTE can perform both target roles.

Minimum qualifications:

TRANSMISSION/DISTRIBUTION APPRENTICE LINEMAN: See qualifications of Apprentice Lineman in Section 8.1.9.2.

JOUYNEYMAN TRANSMISSION/DISTRIBUTION LINEMAN: See qualifications of Lineman in Section 8.1.9.1

FOREMAN: See qualifications of Foreman in Section 8.1.9.2.

GROUNDMAN: See qualifications of Groundman in Section 8.1.9.2.

PATROLMAN: See qualifications of Groundman in Section 8.1.9.1.

SPLICER: See qualifications of Lineman in Section 8.1.9.2.

APPARATUS TECHNICIAN: Responsible for performing inspections and maintenance on equipment unique to electric distribution overhead and underground systems. Must have knowledge of: Advanced principles of three phase electrical theory, mathematics, phasor analysis, use of scientific engineering calculator, publications and standards, including system operating bulletins, grounding and G.O. 95/128 manuals, equipment design, and programming manuals. Must possess computer skills, including but not limited to Company desktop applications as well as software and programming applications used to configure, program, and test specific equipment installations. The knowledge, skills, and abilities required for this job are of a level comparable to those normally acquired through Journeyman Lineman experience and demonstrated ability to apply the principles of electrical theory.

TROUBLEMAN: Responsible for troubleshooting and performing routine inspections and minor repairs of the electric distribution system. Must have knowledge of: Equipment, tools, techniques, and methods employed in the construction, installation, maintenance, and repair of distribution overhead and underground line facilities; overhead and underground circuitry and switching; and SCE's Accident Prevention Manual. The knowledge, skills, and abilities required for this job are of a level comparable with those normally acquired through a high school education, supplemented by technical study and extensive training and experience as a Journeyman, Patrolman, or Lineman.

Fire Investigation Preliminary Analysis (FIPA) Engineer: Responsible for investigating, collecting information, performing root cause and failure analysis, and supporting the development of mitigations to ignitions within SCE service territory. The knowledge, skills, and abilities required by the job are of a level comparable with those normally acquired through courses taken in an engineering degree from an accredited university regarding electrical theory, material science, and any experience in root cause analysis.

Training and plans to improve worker qualifications:

SCE will continue to refine its training program and worker qualifications based on lessons learned and feedback from field employees. SCE will continue to provide training to existing field personnel and those that are onboarded prior to every wildfire season. As it relates to wildfire and PSPS, SCE has implemented several training courses to educate and train field workers on proper practices and procedures. These training efforts are described in Table SCE 8-07.

Table SCE 8-07 - List of Instructor Led and Web-Based Transmission and Distribution Wildfire and PSPS-Related Training Courses in 2022

Course Name	Course Description
PSPS Training	The purpose of this workshop is to provide an overview of the overall PSPS protocol including: 1) Roles and responsibilities 2) Communications process 3) Internal and external types of notifications 4) A detailed timeline of events and 5) How to access the pertinent information during a PSPS activation
PSPS 2022 Patrolling & Live Field Observation (LFO) Training	Training on PSPS patrolling and live field observations protocols, and any updates since prior year.
PSPS Patrolling & Live Field Observation (LFO) Refresher: Contractor Orientation (Train the Trainer)	Orientation with contractor supervisors on PSPS patrolling and live field observations protocols, and any updates since prior year; contractor supervisors train their own field crews and submit rosters to SCE.
Protection from Wildfire Smoke	This course is to teach how to protect workers when working in areas where there may be exposure to wildfire smoke. Teaches where to acquire the Air Quality Index, the health effects from wildfire smoke and how to obtain medical treatment if needed. Also teaches how to select, use and maintain proper respirator protection.
Wildfire Smoke Respirator (PAPR)	This course provides usage and maintenance procedures and requirements for Powered Air Purifying Respirator (PAPR) respirators.
Technology Integration – Grid Resiliency	Provides initial training on pilots or new equipment technologies being deployed across HFRA.
SOB 322 Refresher Training	SOB 322 that outlines the operational protocols for overhead distribution, sub-transmission, and transmission equipment within HFRA.

8.1.10 Maturity Advancement

SCE continually seeks alignment with government and industry organizations and practices and continues to look for opportunities to improve maturity over time.

The activities discussed in this section could lead to Grid Design, Inspections and Maintenance and Grid Operations and Protocols maturity advancements. Below is a summary of broader anticipated maturity improvements over the WMP period that supplement the objectives outlined at the beginning of the Section.

Table SCE 8-08 - Inspections and Maintenance and Grid Operations Maturity Improvements

Capability Name	Projected Maturity Improvements
Asset Maintenance and Repair	Improvements include evaluating new considerations in establishing maintenance frequency (e.g., local PSPS risk, equipment utilization).
Asset and Grid Personnel Training and Quality Assurance	Improvements include benchmarking with other utilities in areas such as training (e.g., sharing best practices, consistent venue/forum, etc.)
Protective equipment and device settings	Improvements include an increased portion of the service territory that has protective equipment and device settings installed.
Incorporation of ignition risk factors in Grid Control	Improvements include clearly defined processes to include wildfire risk to determine control limits beyond its current carrying capacity and the increase in subject matter review of these processes.

8.2 Vegetation Management and Inspections

8.2.1 Overview

In accordance with Public Utilities Code section 8386(c)(9), each electrical corporation's WMP must include plans for vegetation management.

In this section, the electrical corporation must identify objectives for the next 3- and 10-year periods, targets, and performance metrics related to the following vegetation management programmatic areas:

- *Vegetation inspections*
- *Vegetation and fuels management*
- *Vegetation management enterprise system*
- *Environmental compliance and permitting*
- *Quality assurance / quality control*
- *Open work orders*
- *Workforce planning*

8.2.1.1 Objectives

Each electrical corporation must summarize the objectives for its 3-year and 10-year plans for implementing and improving its vegetation management and inspections.[189] These summaries must include the following:

- *Identification of which initiative(s) in the WMP the electrical corporation is implementing to achieve the stated objective, including Utility Initiative Tracking IDs*
- *Reference(s) to applicable codes, standards, and best practices/guidelines and an indication of whether the electrical corporation exceeds an applicable code, standard, or regulation*
- *Method of verifying achievement of each objective*
- *A completion date for when the electrical corporation will achieve the objectiveReference(s) to the WMP section(s) or appendix, including page numbers, where the details of the objective(s) are documented and substantiated*

This information must be provided in Table 8-12 for the 3-year plan and Table 8-13 for the 10- year plan.

[189] Annual information included in this section must align with the QDR data.

Table 8-12 - Vegetation Management Implementation Objectives (10-year plan)

Objectives for Three Years (2023–2025)	Applicable Initiative(s), Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
Complete Joint-IOU Effectiveness of Expanded Clearances Study	Routine Line Clearing (VM-7, VM-8), Expanded Clearances (VM-7, VM-8)	GO 95, Rule 35, Clearance Requirements in UVM 02 and 03 Distribution and Transmission Vegetation Management Plan	Report from 3rd party project manager	2025	Section 8.2.3.3.1 Expanded Clearing, pp. 412-418
Deploy consolidated inspection strategy and transition to circuits from grids	Distribution and Transmission inspections (VM-7, VM-8); Hazard Tree Management Program (HTMP) (VM-1); Dead & Dying Tree Removal (VM-4)	Feedback from Independent Third Party Evaluation[190]	Documentation of percentage completion as compared to the master schedule.	2025	Section 8.2.2 Vegetation Management Inspections, pp. 384-408 Section 8.2.3.3.1 Expanded Clearing, pp. 412-418 Section 8.2.3.4 Fall-In Mitigation, pp. 418-422
Develop and implement a risk-informed process to minimize backlog	Distribution and Transmission inspections (VM-7, VM-8); HTMP (VM-1); Dead & Dying Tree Removal (VM-4)	GO 95, Rule 35, Tree Trimming Guidance	For Routine Line Clearing, target the completion of prescribed mitigation work within 60 days from planned month, subject to constraints. For HTMP and Dead and Dying Tree Removal, target the completion of prescribed work within 180 days of assignment.	2025	Section 8.2.6 Open Work Orders, pp. 432-438
Make substantial progress on evaluating remote sensing technology for vegetation inspections	LiDAR (VM-9, VM-10), Satellite Technology	N/A	Develop report on progress	2025	Section 8.2.2.4 Remote Sensing Inspections, pp. 398-408

[190] In 2022, on behalf of the Governor's Office, Filsinger Energy Partners (FEP) was brought in to provide oversight and potential enhancement opportunities for SCE's wildfire mitigation strategies.

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

Table 8-13 - Vegetation Management Implementation Objectives (10-year plan)

Objectives for Ten Years (2026–2032)	**Applicable Initiative(s), Tracking ID(s)**	**Applicable Regulations, Codes, Standards, and Best Practices (See Note)**	**Method of Verification (i.e., program)**	**Completion Date**	**Reference (section & page #)**
Replace a majority of ground inspection for vegetation line clearing in HFRA with remote sensing technology (e.g., LiDAR, satellite), subject to the evolution and effectiveness of the technology	LiDAR (VM-9, VM-10), Satellite Technology	GO 95, Rule 35, Tree Trimming Guidance	Total Number of HFRA miles of vegetation inspections performed with remote sensing and total reduction in ground inspections.	2033	Section 8.2.2.4 Remote Sensing Inspections, pp. 398-408
Create and implement predictive growth model to facilitate "auto prescription" to reduce the frequency of manual or remote inspection in HFRA.	LiDAR (VM-9, VM-10), Satellite Technology	GO 95, Rule 35, Tree Trimming Guidance	Total Number of HFRA miles auto-prescribed trims, reduction in ground inspections.	2033	Section 8.2.2.4 Remote Sensing Inspections, pp. 398-408
Optimize vegetation inspection cycles/prescriptions based on risk factors (e.g., species, wind) for more granular locations	Routine Line Clearing (VM-7, VM-8), HTMP (VM-1), Dead & Dying Tree Removal (VM-4)	GO 95, Rule 35, Tree Trimming Guidance	Updated vegetation protocols with revised inspection schedule and/or trim instructions to account for risk analysis	2028	Section 8.2.3.3.1 Expanded Clearing, pp. 412-418 Section 8.2.3.4 Fall-In Mitigation, pp. 418-422
Obtain and implement programmatic permits to facilitate timely vegetation management work execution	Routine Line Clearing (VM-7, VM-8), HTMP (VM-1), Dead & Dying Tree Removal (VM-4)	Relevant environmental regulations	Programmatic permit documents that were executed	2026-2028	Section 5.4.5 - Environmental Compliance and Permitting, pp. 83-88

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

8.2.1.2 Targets

Initiative targets are forward-looking quantifiable measurements of activities identified by each electrical corporation in its WMP. Electrical corporations will show progress toward completing targets in subsequent reports, including QDRs and WMP Updates.

The electrical corporation must list all targets it will use to track progress on its vegetation management and inspections for the three years of the Base WMP. Energy Safety's Compliance Assurance Division and third parties must be able to track and audit each target.[191] *For each initiative target, the electrical corporation must provide the following:*

- *Utility Initiative Tracking IDs.*
- *Projected targets for each of the three years of the Base WMP and relevant units.*
- *Quarterly, rolling targets for 2023 and 2024 (inspections only).*
- *The expected "x% risk impact" For each of the three years of the Base WMP. The expected x% risk impact is the expected percentage risk reduction per year, as described in Section 7.2.2.2.*
- *Method of verifying target completion.*

The electrical corporation's targets must provide enough detail to effectively inform efforts to improve the performance (i.e., reduction in ignition probability or wildfire consequence) of the electrical corporation's vegetation management and inspections initiatives.

Table 8-14 and Table 8-15 provide examples of the minimum acceptable level of information.

The risk impact percentages shown in Table 8-14 and Table 8-15 below are based on the cumulative MARS scores of the structures in the area SCE expects to inspect for each vegetation management initiative annually, divided by the cumulative MARS scores for all structures in the applicable area covered by that initiative in HFRA. SCE also provides the percentage of a vegetation management initiative's inspection scope that is in Severe Risk and High Consequence areas.

[191] Annual information included in this section must align with Table 1 of the QDR.

Table 8-14 - Vegetation Management Initiative Targets by Year

Initiative Activity	Tracking ID	2023 Target & Unit	x% Risk Impact 2023	% in SRA/HCA 2023	2024 Target & Unit	x% Risk Impact 2024	% in SRA/HCA 2024	2025 Target & Unit	x% Risk Impact 2025	% in SRA/HCA 2025	Method of Verification
Expanded Clearances for Generation Legacy Facilities	VM-3	Perform vegetation treatment and maintenance to **50** sites SCE will strive to perform vegetation treatment and maintenance to **60** sites	23%	N/A	Perform vegetation treatment and maintenance to **50** sites SCE will strive to perform vegetation treatment and maintenance to **60** sites	23%	N/A	Perform vegetation treatment and maintenance to **48** sites SCE will strive to perform vegetation treatment and maintenance to **56** sites	25%	N/A	Listing of all completed work orders
Vegetation Management Work Management Tool (Arbora)	VM-6	Enable supplemental Vegetation Management (emergent work) tree maintenance program capabilities in Arbora by end of year	N/A	N/A	Monitor stabilization of Arbora and develop plan and begin execution of plan to enable additional VM maintenance programs	N/A	N/A	Monitor stabilization of Arbora and continue execution of plan to enable additional VM maintenance programs	N/A	N/A	System evidence of the capability to assign non-routine work activity in work management tool

*To inform trimming prescriptions in the January to December calendar year, with inspections occurring as early as November 1 in the prior year.

Table 8-15 - Vegetation Inspections Targets

Initiative Activity	Tracking ID	Target End of Q2 2023 & Unit	Target End of Q3 2023 & Unit	End of Year Target 2023 & Unit	x% Risk Impact 2023	% in SRA/HCA 2023	Target End of Q2 2024 & Unit	Target End of Q3 2024 & Unit	End of Year Target 2024 & Unit	x% Risk Impact 2024	% in SRA/HCA 2024	Target 2025 & Unit	x% Risk Impact 2025	% in SRA/HCA 2025	Method of Verification
Hazard Tree Management Program (HTMP)	VM-1	260	350	Inspect **412** grids/circuits and prescribe mitigation for hazardous trees with strike potential within those grids in SCE's HFRA	83%	88%	250	358	Inspect **408** grids/ circuits and prescribe mitigation for hazardous trees with strike potential within those grids in SCE's HFRA * (see insertion text above)	70%	88%	Inspect **440** grids/circuits and prescribe mitigation for hazardous trees with strike potential within those grids in SCE's HFRA* (see insertion text above) Q2 Target: 233 Q3 Target: 356 Note: 2025 schedule will be developed at the circuit /span level, subject to change	63%	70%	Tracking of year-to-date completed grids/circuits for inspection and mitigation
Structure Brushing	VM-2	29,870	63,700	Inspect and clear (where clearance is needed) **63,700** structures,* with the exception of structures for which there are customer access or environmental constraints SCE will strive to inspect and clear (where clearance is needed) **135,200** structures,* with the exception of structures for which there are customer access or environmental constraints * These structures are in addition to poles subject to PRC 4292	62%	84%	29,870	63,700	Inspect and clear (where clearance is needed) **63,700** structures,* with the exception of structures for which there are customer access or environmental constraints SCE will strive to inspect and clear (where clearance is needed) **135,200** structures,* with the exception of structures for which there are customer access or environmental constraints * These structures are in addition to poles subject to PRC 4292	62%	84%	Inspect and clear (where clearance is needed) **63,700** structures,* with the exception of structures for which there are customer access or environmental constraints Q2 Target: 26,180 Q3 Target: 33,830 SCE will strive to inspect and clear (where clearance is needed) **135,200** structures,* with the exception of structures for which there are customer access or environmental constraints * These structures are in addition to poles subject to PRC 4292	62%	84%	Listing of work orders attempted, inspected and/or completed in calendar year
Dead & Dying Tree Removal	VM-4	298	433	Inspect **509** grids/circuits and prescribe mitigation for	100%	85%	281	424	Inspect **485** grids/ circuits and prescribe mitigation for dead and dying trees	100%	85%	Inspect **536** grids/circuits and prescribe mitigation for dead and dying trees with strike potential	100%	77%	Tracking of year-to-date completed grids/circuits

8.2.1.3 Performance Metrics Identified by the Electrical Corporation

Performance metrics indicate the extent to which an electrical corporation's Wildfire Mitigation Plan is driving performance outcomes. The electrical corporation must:

- *List the performance metrics the electrical corporation uses to evaluate the effectiveness of its vegetation management and inspections in reducing wildfire and PSPS risk*[192]

For each of these performance metrics listed, the electrical corporation must:

- *Report the electrical corporation's performance since 2020 (if previously collected)*
- *Project performance for 2023-2025*
- *List method of verification*

The electrical corporation must ensure that each metric's name and values are the same in its WMP reporting as its QDR reporting (specifically, QDR Table 2 and QDR Table 3). Metrics listed in this section that are the same as performance metrics required by Energy Safety and reported in QDR Table 2 (Performance Metrics)[193] *must match those reported in QDR Table 2. Metrics listed in this section that are not the same as any of the performance metrics identified by Energy Safety and reported in QDR Table 2 must match those reported in QDR Table 3.*

The electrical corporation must:

- *Summarize its self-identified performance metric(s) in tabular form*
- *Provide a brief narrative that explains trends in the metrics*

SCE identifies performance metrics that its vegetation management activities support in Table 8-16. SCE then provides a brief narrative describing trends for each metric.

[192] *There may be overlap between the performance metrics the electrical corporation uses and performance metrics required by Energy Safety. The electrical corporation must list these overlapping metrics in this section in addition to any unique performance metrics it uses.*

[193] T*he performance metrics identified by Energy Safety are included in Energy Safety's Data Guidelines.*

Table 8-16 - Vegetation Management and Inspection Performance Metrics Results by Year

Performance Metrics	2020	2021	2022	2023 Projected	2024 Projected	2025 Projected	Method of Verification (e.g., third-party evaluation, QDR)
Number of trees inspected in HFRA where at least some vegetation was found in a non-compliant condition	22,600	16,555	16,613	15,782	14,993	14,244	QDR, Tables 2 and 3
Number of Tree-Caused Circuit Interruptions (TCCIs) in HFRA	90	73	60	57	54	51	QDR, Table 3
Number of CPUC reportable ignitions in HFRA	50	48	40	39	38	37	QDR, Tables 2 and 3
Number of wire downs in HFRA	379	468	316	361	360	361	QDR, Tables 2 and 3
Number of outages in HFRA	2,824	2,356	2,404	2,018	1,946	1,892	QDR, Tables 2 and 3

- **Number of trees inspected in HFRA where at least some vegetation was found in a non-compliant condition:** This metric applies to SCE's routine transmission and distribution vegetation clearing programs and counts the number of trees that were found to have some vegetation within the respective required clearance distances.
  This metric has been trending downward in the 2020 through 2022 period. SCE anticipates its vegetation management initiatives will contribute to the continuation of a downward trend for this metric over the 2023-2025 WMP period. This projection is an estimate, and actual performance is dependent on weather and other factors.
- **Number of Tree-Caused Circuit Interruptions (TCCIs) in HFRA:** This metric applies to the number of tree-caused circuit interruptions occurring in SCE's HFRA.
  This metric has experienced a downward trend from 2020 – 2022. SCE anticipates its vegetation management initiatives to make further progress and influence a continued downward trend for this metric over the 2023-2025 WMP period. This projection is an estimate only and actual performance is dependent on weather and other factors. This metric is impacted by multiple factors beyond SCE's control, such as weather-related factors. For instance, due to weather factors, there may be a significant unanticipated increase in growth rate for certain vegetation creating a potential for fall-in events.
- **Number of CPUC reportable ignitions, wire downs, and outages in HFRA:** Please see Section 8.1.1.3 for a narrative describing these metrics and associated trends. These metrics represent total counts across SCE's HFRA and are not solely attributable to risk events driven by vegetation.

8.2.2 Vegetation Management Inspections

In this section, the electrical corporation must provide an overview of its procedures for vegetation management inspections.

The electrical corporation must first summarize details regarding its vegetation management inspections in Table 8-17. The table must include the following:

- ***Type of inspection**: distribution, transmission, substation, etc.*
- ***Inspection program name:** Identify various inspection programs within the electrical corporation (e.g., routine, enhanced vegetation, high-risk species, and off-cycle)*
- ***Frequency or trigger**: Identify the frequency or triggers, such as inputs from the risk model. Indicate differences in frequency or trigger by HTFD Tier, if applicable*
- ***Method of inspection**: Identify the methods used to perform the inspection (e.g., patrol, detailed, sounding or root examination, aerial, and LiDAR)*
- ***Governing standards and operating procedures**: Identify the regulatory requirements and the electrical corporation's procedures for addressing them*

Table 8-17 - Vegetation Management Inspection Frequency, Method, and Criteria

Type	Inspection Program	Frequency or Trigger (Note 1)	Method of Inspection (Note 2)	Governing Standards & Operating Procedures
Distribution	Distribution Vegetation Management Plan (DVMP) (Routine Line Clearing)	Frequency: Vegetation inspections and maintenance should be completed annually or more often as deemed necessary. Trigger: The work is based on an annual schedule with risk-informed prioritization based on the Tree Risk Index (TRI)	(1) Ground and (2) LiDAR;	SCE's standard operating procedures for the DVMP are documented in SCE's Utility Vegetation Management (UVM) Program titled, UVM-03 (DVMP). Manage vegetation to prevent vegetation encroachment into Clearance Zones stated in the following regulations, as applicable: GO 95 Rule 35 (Case 13 and Case 14)

Type	Inspection Program	Frequency or Trigger (Note 1)	Method of Inspection (Note 2)	Governing Standards & Operating Procedures
		model.[194] However, emergent work is driven by off-cycle notifications, including customer notification and priority conditions.		GO 95 Rule 37 PRC 4293 PRC 4292 Title 14 CCR Sections 1250-1258
Transmission	Transmission Vegetation Management Plan (TVMP) (Routine Line Clearing)	Frequency: Vegetation inspections and maintenance should be completed annually or more often as deemed necessary. Trigger: The work is based on an annual schedule. However, emergent work is driven by off-cycle notifications, including customer notification and priority conditions.	(1) Ground and (2) LiDAR	SCE's standard operating procedures for the TVMP are documented in SCE's UVM Program titled, UVM-02 (TVMP). Note 1: The electrical corporation must provide electrical corporation-specific risk-informed triggers used for vegetation management.

Note 2: The electrical corporation must provide electrical corporation-specific definitions of the different methods of inspection.

The electrical corporation must then provide a narrative overview of each vegetation inspection program identified in the above table; Sections 8.2.2.1. provides instructions for the overviews. The sections should be numbered 8.2.2.1 to Section 8.2.2.n (i.e., each vegetation inspection program is detailed in its

[197] For Transmission, SCE utilizes the class ranking system to assign risk by circuits as described in Section 8.2.2.4.1. For Distribution, SCE deploys LiDAR for AOC and use IWMS as described in Section 8.1.3.1.

own section). The electrical corporation must include inspection programs it is discontinuing or has discontinued since the last WMP submission; in these cases, the electrical corporation must explain why the program is being discontinued or has been discontinued.

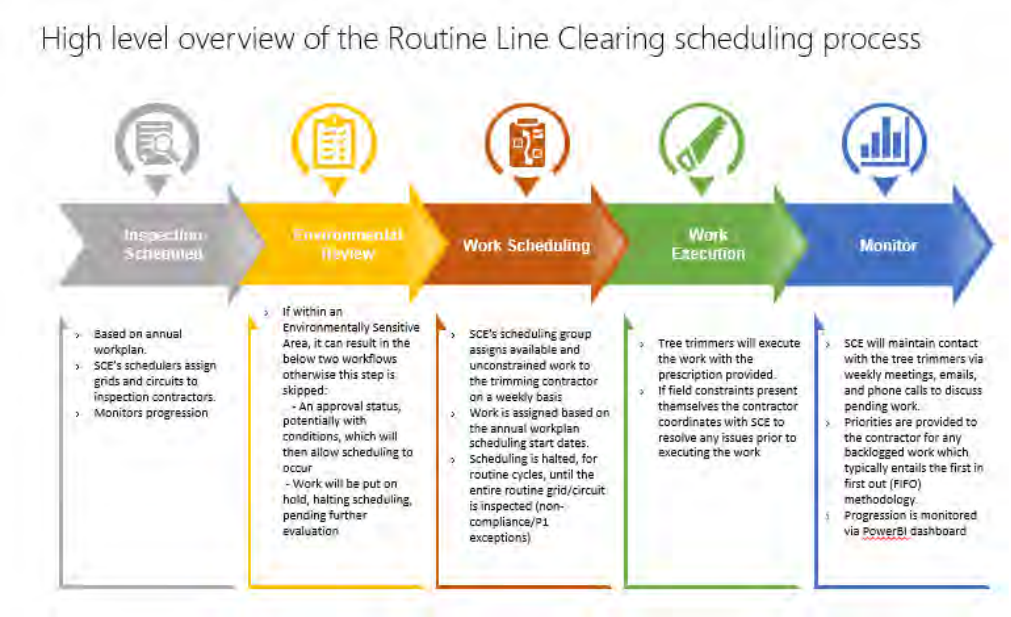
8.2.2.1 Routine Line Clearing

In this section, the electrical corporation must provide an overview of the individual vegetation inspection program, including inspection criteria and the various inspection methods used for each inspection program.

Include relevant visuals and graphics depicting the workflow and decision-making process the electrical corporation uses for the inspection program (see the example in Figure SCE 8-38).

Inspection Process

SCE performs annual inspections and trimming for clearance around conductors in accordance with applicable regulations and internal processes such as GO 95, PRC 4293 and SCE's Transmission Vegetation Management Plan (UVM-02) and Distribution Vegetation Management Plan (UVM-03).



Inspections of vegetation clearance distances from transmission and distribution lines and equipment are generally performed by vegetation ground personnel.[198] During these inspections, the inspector identifies vegetation that requires trimming or removal to meet program requirements designed to maintain required clearances from the lines, taking into consideration a tree's anticipated growth over the ensuing twelve months.[199] Additionally, SCE performs level 1 assessments to address fall-in risk. In level 1 assessments, the inspectors conduct an assessment from the side of the tree nearest to the electrical facilities, focusing on identifying obvious tree defects (e.g., dead branches or leaning) that are observable. Finally, inspectors investigate vegetation concerns raised by customers, assess vegetation adjacent to electrical line work, and address inspection findings requiring immediate planning or schedule coordination.

SCE also uses remote sensing (LiDAR and Satellite) in the inspection cycle and continues to explore the possibility of transitioning from ground inspections to more remote options.

[198] SCE also uses aerial inspections and LiDAR in specific conditions. Where line clearance cannot be readily assessed from the ground but the horizontal and vertical clearance between the vegetation and conductors can be determined from an aerial inspection, then aerial inspections may be performed. SCE uses LiDAR as an inspection and measurement tool to identify clearances between high-voltage lines and vegetation. SCE also uses LiDAR data, which are acquired via air patrol.

[199] Fast-growing species, or trees in HFRA, may need additional inspections, trimming, or removal to maintain regulatory compliance.

Figure SCE 8-38 - Routine Line Clearing Scheduling Process Flow

Frequency or Trigger

In this section, the electrical corporation must identify the frequency or triggers used in the inspection program, such as inputs from the risk model. It must also identify how the frequency or trigger might differ by HFTD Tier or other risk designation.

If the inspection program is based on a schedule, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

SCE's Routine Line Clearing inspections are scheduled such that each grid in SCE's service area is inspected annually. Grids are SCE-defined geographic boundaries that define a work area. SCE has approximately 3,000 grids systemwide, including roughly 1,100 in HFRA. SCE plans to transition to a circuit basis by 2025 to align with other wildfire mitigation efforts and PSPS decision making.

For non-HFRA grids, the inspection schedules consider factors such as resource availability, appropriate allocation of work throughout the year, permitting lead times and availability, and challenges with access to worksites based on seasonal weather conditions. The schedule incorporates risk prioritization by ranking grids according to historical vegetation related outages and tree density.

For HFRA grids, SCE applies the outcome from the Tree Risk Index (TRI), which ranks grids according to the "probability of ignition" (POI) from contact with vegetation based on species, locations, and other factors, and the Technosylva "consequence scores." The TRI model is described in more detail in Section 8.2.2.2 under "Frequency or Trigger." To the extent feasible, SCE strives to schedule annual inspections for higher-risk locations in HFRA grids in the months leading up to peak-fire season.

SCE also conducts supplemental patrols to help ensure that vegetation encroachments do not occur during peak fire season and high wind conditions. The risks are higher in certain locations, such as canyons, which experience higher winds. SCE also uses the TRI model to optimize and help reduce the

need for supplemental patrols, which incorporates a number of risk factors into the POI value. SCE analyzes all methods of alternative patrols, selecting the most appropriate patrol based on the location-specific need for inspection.

For more information on risk prioritization related to the TRI, refer to Section 8.2.2.2.

Accomplishments, Roadblocks, and Updates

In this section, the electrical corporation must discuss:

Noteworthy accomplishments for the inspection program since the last WMP submission

Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks

Changes/updates to the inspection program since the last WMP submission including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)

Noteworthy accomplishments for the inspection program since the last WMP submission

Senior Specialist (SSP) Oversight Project

In 2022, SCE began implementing a new initiative to increase SCE oversight after a pre-inspection is performed called the Senior Specialist (SSP) Oversight Project. SCE uses internal SSPs, who are International Society of Arboriculture (ISA) -certified arborists, to provide oversight and general guidance to contractors for SCE routine line clearing activities. The purpose of this increased post-work verification (PWV) is to improve the quality of work, create more accurate prescriptions released to tree trimmers, and reduce missed trees. SCE made these improvements to its pre-inspection program, in part to address recommendations identified by an independent third-party review of its program.

The additional oversight provided by this initiative will help improve the performance and quality of pre-inspections. SCE analyzes the data from PWV to help inform future training and continuous learning opportunities provided to inspectors and/or other key Vegetation Management personnel. Based on the effectiveness of the PWV in 2022, it will be formalized across the service area by first quarter 2023.

Satellite Technology Pilot Program

In 2022, SCE also launched a pilot program to test the use of satellite technology for confirming the accuracy of vegetation clearances and identifying trees near overhead lines. Section 8.2.2.4.2 describes this effort in more detail.

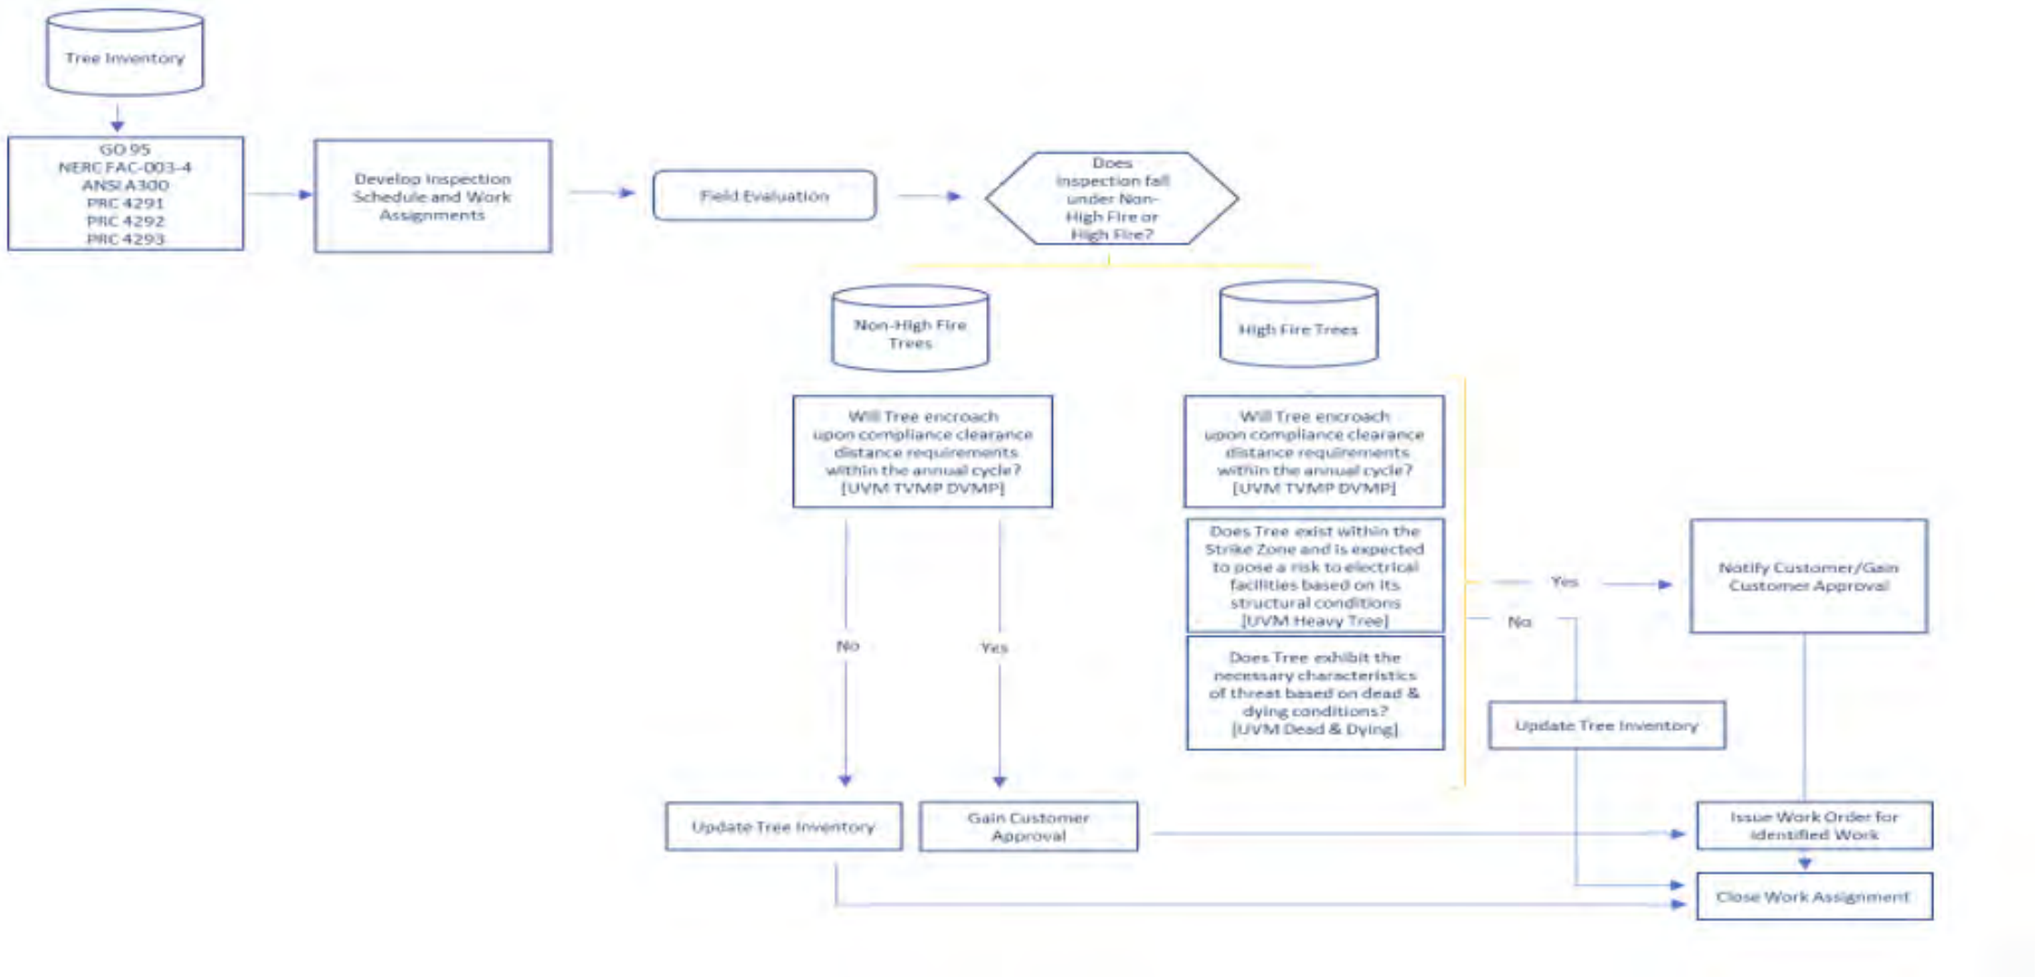
Workforce Retention and Upskilling

SCE is developing new contractor requirements to improve its ability to attract and retain skilled inspectors, in order to help facilitate overall improvement of the quality of prescriptions. In 2022, SCE revised the Statement of Work (SOW) for Vegetation Management inspectors to include an experience and education-based classification structure. This structure aligns wages to specific experience and education levels for individuals performing various inspection activities, thus promoting the advancement of inspection-related skills and experiences.

Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblocks

Customer Refusals

Inspections can be impeded by customer refusals, but these constraints, among others, are more prevalent when SCE executes remediation. Please see the discussion in Section 8.2.3.3.1 describing customer refusals and other constraints, which can impact the Routine Line Clearing Program.



Changes/updates to inspection program since the last WMP Including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)

Consolidated Inspection Strategy

In 2023, SCE will introduce a new centralized tree inspection schedule for its three largest inspections programs: Routine Line Clearing, HTMP,[200] and Dead & Dying Tree Removal. Historically, SCE has hired different inspection personnel for each program. Therefore, in practice, when a contracted inspection company conducted routine inspections in a particular district, the company would not inspect trees that fell within another program's scope, such as hazard or dead and dying trees, even if those trees were in the same district.201 SCE explored consolidating the vegetation inspection programs to improve effectiveness and efficiency, which was validated by recommendations from an independent third-party review. With the new centralized tree inspection schedule, SCE will assign one inspection contractor company to inspect the entire designated district and apply the criteria for all three inspection programs, as needed. The figure below shows the flowchart for consolidated inspections.

[200] For Hazard Tree Management Program, inspectors will continue to be required to be Certified Arborists.
[201] Although the inspector would not formally assess all trees, if a concerning issue was observed, the inspector would escalate their finding to SCE personnel.

Figure 8-2 - Vegetation Management Consolidated Inspection Overview

Circuit Basis

In 2022, inspections of SCE's Distribution Routine Line Clearing were conducted on a grid-by-grid basis while inspections for other Vegetation Management programs such as Transmission Routine Line Clearing, HTMP, and Dead and Dying Tree Removal inspections were conducted on a circuit basis. In 2023, inspections related to distribution assets for HTMP, Dead and Dying Tree Removal, and Routine Line Clearing program will be conducted on a grid basis in order to deploy the centralized tree inspection schedule. Consistent with recommendations from an independent third-party observation, by 2025, SCE plans to transition inspections for all Vegetation Management programs to a circuit basis, thus completing the consolidated inspection strategy.

LiDAR

As described in Section 8.2.2.4.1, SCE will continue to evaluate the use of LiDAR to supplement and/or replace ground inspections.

8.2.2.2 Hazard Tree Management Program

Inspection Process

The Hazard Tree Management Program (HTMP) assesses live trees in HFRA that pose a fall-in risk due to the condition of the tree and other site-specific factors when they are located far enough from SCE lines and equipment to meet statutory clearance requirements.

Once a circuit[202] is scheduled for inspection, certified arborists complete a detailed level 2 assessment to identify subject trees that could potentially fall into or otherwise impact electrical facilities in HFRA. This assessment is distinct from the inspection process related to Routine Line Clearing, where visual level 1 assessments are performed on trees immediately adjacent to electrical facilities. The arborists inspect trees in the Utility Strike Zone (USZ), the area on either side of SCE's electrical facilities from which a tree or a portion of a tree could strike or impact electrical facilities. The USZ can vary significantly based on the height of the trees, slope conditions, and the potential for impacts from wind-driven vegetation.

HTMP inspectors use the Tree Risk Calculator (TRC) to document tree defects and likelihood of failure and target impact. The certified arborist assigns a risk score based on six criteria: (1) Voltage Impact; (2) Fire Impact; (3) Likelihood of Impact; (4) Tree Lean; (5) Tree Height Factor; and (6) Site Condition Attributes. The final scoring results can range from 1-100 (100 being the highest risk score).

Depending on the inspector's assessment results, a tree is classified into one of two categories: (1) a subject tree which does not need mitigation but is added to SCE's tree inventory for continued monitoring or (2) a hazard tree needing mitigation (trim) or removal. A subject tree is a tree within SCE's tree inventory that is identified as low-risk and with a typical risk score between 0 to 49. A hazard tree needing mitigation, while alive, is considered hazardous with a typical risk score between 50 to 100. The classification of the tree and arborist opinion informs the remediation required.

SCE performs inspections using a risk-based approach encompassed in the TRI model, as described in the below section Frequency or Trigger. Based on the results of the inspection, SCE generates

[202] In 2023, SCE's HTMP program for distribution assets, and not for transmission assets, will be inspected on a grid basis to align with the current Distribution Routine Line Clearing program. However, SCE plans to transition back to a circuit basis in 2025.

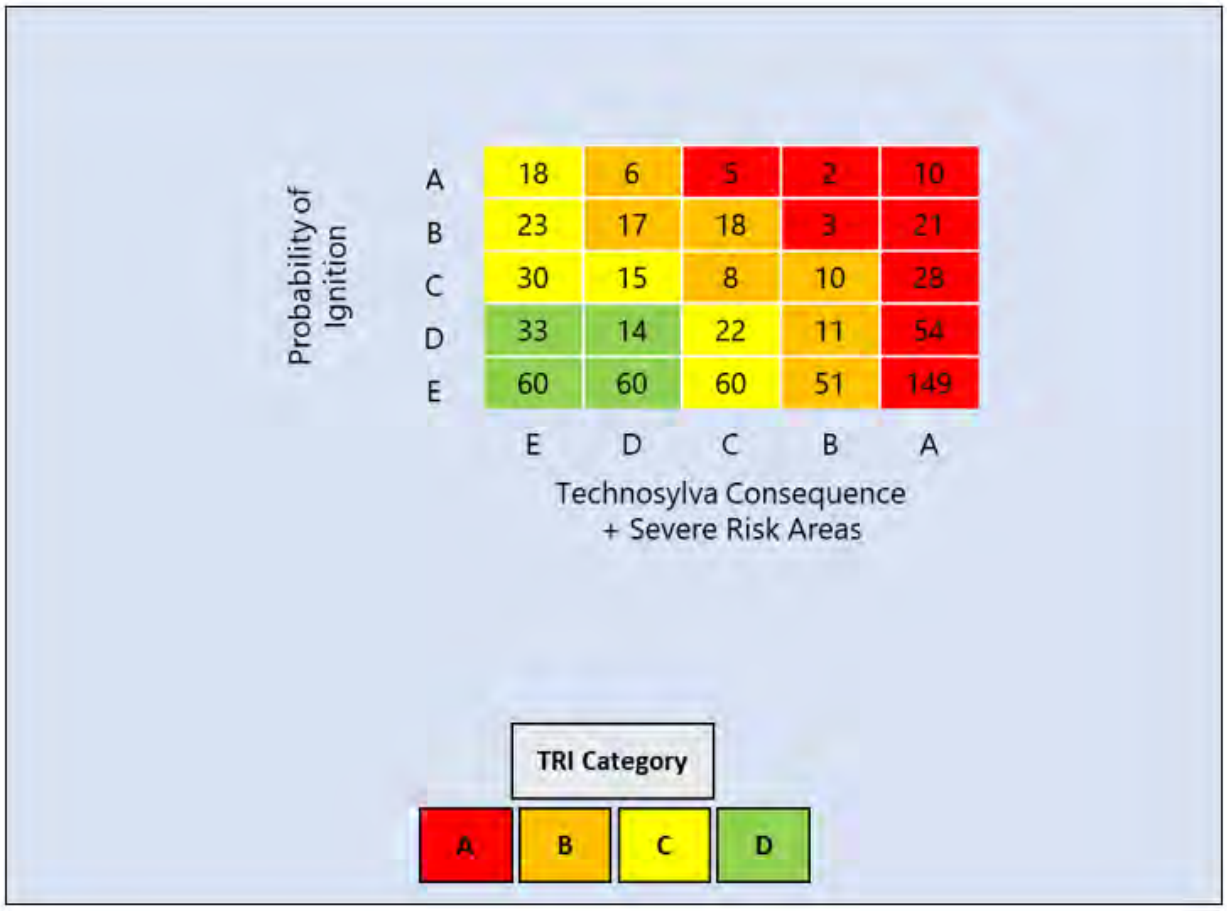
prescriptions and performs the required remediations.

The HTMP will also be impacted by the implementation of the consolidated inspection strategy. Please refer to Figure 8-2 in Section 8.2.2.1 for the workflow of the consolidated inspection process.

Frequency or Trigger

In this section, the electrical corporation must define and identify the frequency (including how frequency may differ by HFTD or other risk designation[s]) or triggers of the inspection program, such as inputs from the risk model.

If the inspection program is schedule based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.



The HTMP is focused on SCE's HFRA service area. HTMP inspection scope and frequency are driven by the TRI model. Within the TRI model, each structure in HFRA is evaluated for the risk of vegetation contact and is assigned a probability of ignition (POI) as well as a Technosylva consequence score (which estimates the potential number of acres burned should an ignition occur at the location of the structure). These structures with assigned POI and consequence scores are then aggregated to the Vegetation Management grid level. Grids are then assigned to risk categories A, B, C, and D (with A being the highest risk category) according to their TRI score.

To align the TRI with SCE's Integrated Wildfire Mitigation Strategy (IWMS),[203] the consequence category for those grids with higher proportions of Severe Risk Area miles were classified as "A". In *Figure SCE 8-39* below, the numbers in the boxes identify grids that have been categorized based on their TRI score. The red boxes in the top right of the figure show the grids with the highest risk level, resulting from having the highest scores in both categories, while the green boxes in the bottom left show the grids with the lowest risk level.

Based on their TRI score, grids in the highest risk category of A follow an annual cycle for HTMP inspections, while grids in categories B, C, and D follow a three-year inspection cycle for HTMP. The three-year inspection cycle for categories B, C, and D will start in 2023 with the highest risk category B grids, then C grids in 2024 and D grids in 2025. Any hazardous tree that was trimmed as a mitigation prescription in HTMP pass one (2019-2022) will continue to be inspected based on TRI ranking. This methodology yields various assessment quantities for HTMP per year and will be refreshed annually for new subject trees recorded in each category.

[203] This strategy determines how SCE assigns risk categories in HFRA (severe risk areas, high consequence areas, and other HFRA)

Figure SCE 8-39 - Tree Risk Index (TRI) – Distribution Grids (HFRA)

Accomplishments, Roadblocks, and Updates

- *Noteworthy accomplishments for the inspection program since the last WMP.*

Assessment of HFRA Circuits

In 2022, SCE substantially completed the first pass of inspections of circuits in HFRA for Hazard Trees, which enabled the unified inspection scope beginning in 2023 under the consolidated inspection strategy for SCE's Routine Line Clearing, HTMP, and Dead & Dying Tree Removal Program. This resulted in performing over 350,000 HTMP assessments. The subject trees not removed as a result of the HTMP assessment will be re-inspected on a defined cadence, based on risk category as determined by the TRI model. See sub-section "Frequency or Trigger" above for a description of SCE's risk prioritization method.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblock.*

Inspections can be impeded by customer refusals, but these constraints, among others, are more prevalent when SCE executes remediation. Please see the discussion in Section 8.2.3.3.1 describing

customer refusals and other constraints, which can impact the Hazard Tree Management Program.

- *Changes/updates to inspection program since the last WMP Including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

Consolidated Inspection Strategy

As discussed in Section 8.2.2.1 Routine Line Clearing (Distribution & Transmission) above, in 2023, SCE will deploy a new centralized inspection schedule to consolidate the inspection processes for Routine Line Clearing, HTMP, and Dead and Dying Tree Removal Program to allow for better contract and planning optimization.

8.2.2.3 Dead and Dying Tree Removal Program

Inspection Process

SCE uses its ground crews to patrol its HFRA to identify dead and dying trees for removal in its Dead and Dying Tree Removal Program. A tree is classified as dead when the canopy has declined 75% or greater and/or is significantly infected with bark beetles or other invasive insects.

After an inspection is performed and the prescription is generated, SCE will remove the tree consistent with industry practice. This is discussed further below in Section 8.2.3.4 Fall-In Mitigation.

The Dead and Dying Tree Removal Program will also be impacted by the implementation of the consolidated inspection strategy. Please refer to Figure SCE 8-49 in Section 8.2.2.1 for the workflow of the consolidated inspection process.

Frequency or Trigger

For the Dead and Dying Tree Removal program, inspections are performed in applicable areas within Tier 2 and Tier 3 of SCE's HFRA. Applicable areas are determined based on California's Tree Mortality Task Force,[204] which updates maps annually to show High Hazard Zones and Hazard Severity Zones. SCE utilizes these Tree Mortality Task Force categories to incorporate risk prioritization into the Dead and Dying Tree inspection scope.

Starting in 2023, inspections for the Dead and Dying Tree Removal program will be scheduled based on the consolidated inspection strategy. All Hazard Severity Zones and HFRA tiers 2 and 3 have been mapped to a grid/circuit or grids/circuits[205] and will be inputted in SCE's work management tool based on planning month. Building off the Routine Line Clearing schedule (which covers all SCE service area, and not just the applicable areas within Tier 2 and Tier 3 of HFRA targeted by the Dead and Dying Tree Removal program), inspectors who are sent during "cycle buster"[206] visits looking for uncharacteristic growth will

[204] For more information, see the link for the California Tree Mortality Task Force.
[205] In 2025, SCE intends to return to circuit based mapping for all VM inspections to align with T&D processes.
[206] Cycle buster visits typically occur on a six-month cadence and are intended to address vegetation that will not make it through the annual routine trim cycle without encroaching on the required minimum clearances and which therefore require pruning midterm before the routine cycle is completed.

now have the opportunity to identify hazard trees in addition to routine maintenance.

Accomplishments, Roadblocks, and Updates

- *Noteworthy accomplishments for the inspection program since the last WMP.*

In 2022, SCE continued to conduct the Dead and Dying Tree Removal Program as planned and consistent with past practices.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblock.*

Inspections can be impeded by customer refusals, but these constraints, among others, are more prevalent when SCE executes remediation. Please see the discussion in Section 8.2.3.3.1 describing customer refusals and other constraints, which can impact the Dead and Dying Tree Removal Program.

- *Changes/updates to inspection program since the last WMP Including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)*

Consolidated Inspection Strategy

As discussed in Section 8.2.2.1 Routine Line Clearing (Distribution & Transmission) above, in 2023, SCE will deploy a new centralized inspection schedule to consolidate the inspection process for Routine Line Clearing, HTMP, and Dead and Dying Tree Removal Program to allow for better contract and planning optimization.

8.2.2.4 Remote Sensing Inspections

8.2.2.4.1 LiDAR Inspections

Inspection Process

In this section, the electrical corporation must provide an overview of the individual vegetation inspection and inspection criteria. Include the various methods of inspection conducted for each inspection program. Include relevant visuals and graphics that depicts the workflow and decision process the electrical corporation uses for the inspection program (see example Figure 8-3).

LiDAR is a surveying inspection method that measures distance to a target by illuminating the target with pulsed laser light and measuring the reflected pulses with a sensor. Differences in laser return times are then used to make digital three-dimensional representations of field conditions at the time of survey.

LiDAR for Transmission Assets

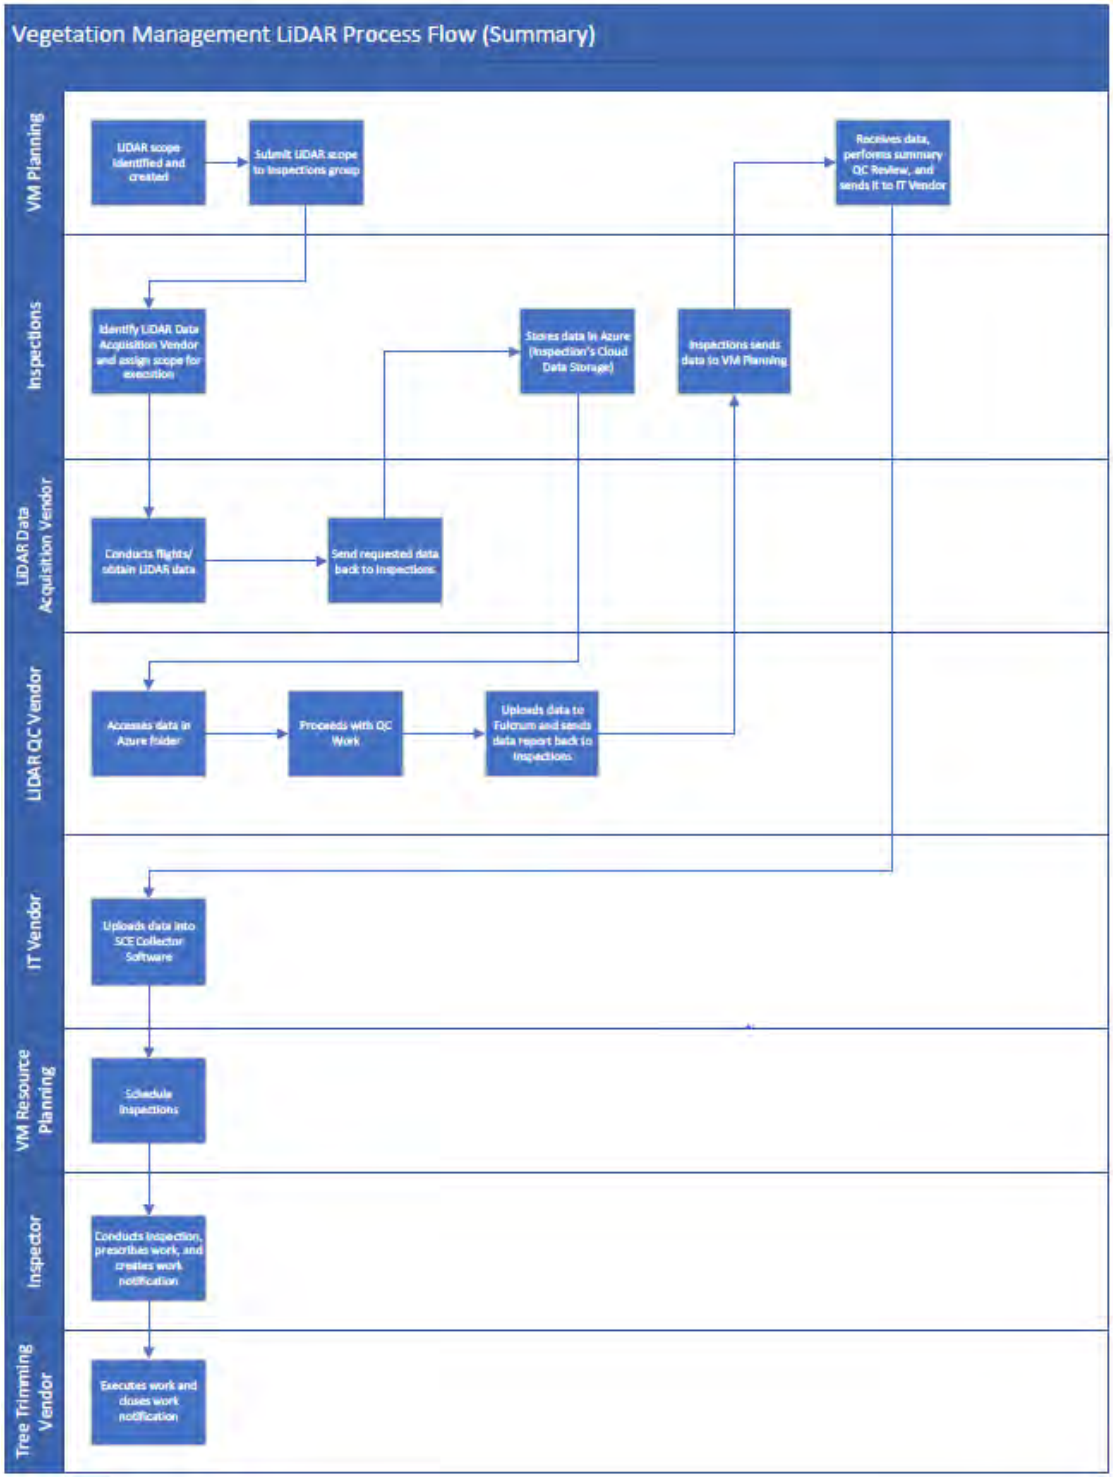
For Transmission lines, SCE calculates the maximum sag and sway of conductors (modeled conditions under maximum current load and maximum wind load) and compares the resulting conductor positions

under those “worst case scenarios” to existing vegetation as determined by LiDAR for the purposes of determining where mitigation is required. This form of inspection supplements and has the potential to help reduce/replace the typical ground-based, visual vegetation management inspections used as part of the maintenance of minimum clearance distances under maximum heat, wind, and load conditions.

SCE provides LiDAR data to inspectors conducting foot patrols on circuits, when available, to assist them in identifying potential encroachments and to help them validate that right-of-way clearances fully account for conductor dynamics. SCE uses LiDAR technology to inspect select Transmission and Sub-Transmission lines in accordance with FAC 003-4, General Order 95, Rule 35, and Public Resources Code 4293 to maintain appropriate clearances between SCE’s lines and vegetation.

Implementation of LiDAR for Bulk Transmission Lines was a 2019 WMP initiative and the use of LiDAR was operationalized using the class ranking system.[207] The success of the initiative demonstrated the effectiveness of using LiDAR for Transmission

inspections. LiDAR delivers consistently accurate results and allows for inspection of difficult terrain that may be inaccessible to ground inspectors.



LiDAR for Distribution Assets

Currently, utilizing LiDAR on a large scale to supplement routine Distribution-related inspections is not feasible primarily because inspections for SCE’s distribution network is grid-based, while deploying LiDAR occurs on a circuit basis. As discussed in sub-section Circuit Basis in Section 8.2.2.1, SCE plans to transition to deploying work on a circuit basis by 2025. Once the circuit-based approach is implemented, SCE plans to use LiDAR to supplement or replace routine Distribution inspections

The workflow for LiDAR is illustrated below in Figure SCE 8-40.

[207] The class ranking system is a schedule based on criteria for LiDAR surveys to be performed and the frequency that LiDAR is used on impacted rights-of-way within the SCE System, as described in SCE’s UVM-06 LiDAR Schedule Reference Guide, Section 3.1.

Figure SCE 8-40 - LiDAR Process Flow

Frequency or Trigger

In this section, the electrical corporation must define and identify the frequency (including how frequency may differ by HFTD or other risk designation[s]) or triggers of the inspection program, such as inputs from the risk model.

If the inspection program is schedule based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

LiDAR for Transmission Assets

As documented in SCE's UVM-06, SCE uses a class ranking system to establish a schedule for LiDAR surveys to be performed on Transmission lines based on certain criteria. SCE provides the LiDAR Right-of-Way (ROW) Schedule via the Class designation for each ROW in UVM-06.

For 2023 and 2024, SCE plans to utilize LiDAR in Transmission as a supplemental tool to support inspections on circuits according to their class designation. Additionally, SCE will continue to evaluate the use of LiDAR to replace ground inspections for low-risk areas[208] and advance internal processes on how to auto-prescribe work to trim crews. Also, to realize additional remote sensing benefits, SCE plans on conducting targeted inspections based only on LiDAR-identified points rather than inspecting entire circuits via ground inspections. Lastly, this two-year window will also be critical to calibrate fall-in and grow-in modeled clearances in SCE's licensed Visualization & Analytics software. This calibration will enable SCE to begin building a vegetation inventory model that connects the LiDAR clearance data to the vegetation inventory's corresponding species and predicted growth rates.

Beginning in 2025, SCE will create a baseline set of fall-in/grow-in data points for the vegetation inventory across SCE's electrical assets, which will determine future LiDAR data capture optimization needs. SCE can build on this baseline LiDAR data to add to the inventory and process and visualize clearances systematically. Achieving this capability may allow SCE to revise or eliminate the Transmission class ranking system.

LiDAR for Distribution Assets

The use of LiDAR on SCE's distribution assets for inspections occurred for the first time in 2022 to support AOC. No trigger or frequency can be established from this occurrence. SCE provides more details on the use of LiDAR for AOC in the below section Accomplishments.

Accomplishments, Roadblocks, and Updates

- *Noteworthy accomplishments for the inspection program since the last WMP.*

Area of Concern (AOC)

In 2022, LiDAR was successfully deployed to support AOC (Area of Concern) for the first time. This method was used as a quicker way to identify abnormal growth and unexpected risks. Inspectors were

[208] A low-risk area is one defined by low inventory circuits with fewer than 50 inventory points and more than five miles long or long circuits over 50 miles in desert areas.

deployed to verify LiDAR points on the ground, and as a result of the accuracy of LiDAR measurements, did not have to inspect the entire circuit. Section 8.2.3.1.1 and Section 8.1.3.1 provide more details on AOCs.

- *Roadblocks the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblock.*

Weather Delays and Vendor Procurement

Some challenges that SCE has encountered with LiDAR include delays caused by weather and vendor procurement. While flights are scheduled as far in advance as possible for cost and schedule reasons, if inclement weather prohibits a flight due to safety concerns, the flight is rescheduled to the next earliest possible date.

SCE is currently working to engage multiple vendors to facilitate fewer interruptions in the execution of work. For instance, if one vendor has issues accomplishing the scope, SCE may request another vendor to assist in completing the scope. In addition to revising the acquisition and processing procurement strategy, SCE is expanding acquisition and processing capabilities, as detailed in Section 8.1.3.1.

- *Changes/updates to inspection program since the last WMP Including known future plans (beyond the curren*t year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)

Expanded Capabilities for LiDAR Inspections

SCE plans to improve the internal capability to collect, process, visualize and analyze vegetation clearances from LiDAR data, and vegetation health data from multispectral and hyperspectral imaging, respectively. As mentioned above, SCE also plans to capture a baseline LiDAR data set of fall-in/grow-in points. This data would eventually be systematically associated with the vegetation inventory. With a newly formed digital database, SCE expects to use AI/ML to develop schedules and determine work prescriptions.

SCE Inspection Team Software Dependency

In 2023, SCE plans to utilize licenses of a SaaS LiDAR Visualization & Analytics software platform to automate the vegetation encroachment clearance calculations and identify instances where Priority 1 (P1) clearance is not met at a network scale. Between Q3 2023 and Q2 2024, SCE plans to train the model and simultaneously test the algorithm to transition from vendor performed processing and analytics and move toward utilizing the SaaS licensed platform. After establishing the vegetation inventory, SCE anticipates being able to associate the inventory with vegetation encroachment clearance calculations and instances when P1 clearances are not met. Once the clearance data is mapped to the associated vegetation inventory, additional data such as vegetation health, species, and other attributes can be incorporated into the vegetation inventory to enable future AI/ML capabilities such as predictive growth, predictive trims, designation of high-risk areas, and network level vegetation health and density information. Advanced details around the integration of Vegetation Management's work management tool among the various analytics software are forthcoming. As mentioned in Section 8.1.3.1, SCE will execute the 2023 LiDAR Operations RFP to maintain current state procured third-party capabilities while concurrently building out in-house capabilities.

Work Prescriptions

The increase in utilization of remote sensing technology and related software is intended to reduce the amount of ground inspections over time. However, processes related to generating tree prescriptions through remote sensing technology and collecting environmental data attributes need to be developed further to complete the transition. Currently, prescriptions require a ground crew inspector to record a comprehensive amount of information including species, environmental considerations, and specifics regarding tree structure and health. To obtain this information through remote sensing technology, the use of multispectral and hyperspectral imagery along with AI/ML may become necessary. Even with those technologies in place, other information currently required for prescriptions may not be obtainable with remote sensing. In a multi-faceted effort to address these challenges and ultimately achieve the ability to issue prescriptions via remote sensing, SCE will be exploring the following:

- Employing the use of multispectral and hyperspectral imaging data processing through various mediums such as satellite
- Augmenting various data types (multispectral and LiDAR) with AI/ML technologies to perform optimized remote vegetation inspections
- Employing the use of AI/ML technologies on SCE Inspections' in-house software platform
- Potentially reducing the amount of information required for prescriptions
- Creating "hybrid" trim crews comprised of one or more individuals capable of completing prescriptions at the same time trim work takes place without a separate inspection visit
    - Initial prescription created via remote sensing and final prescription completed by trim crew
- Leveraging personnel in environmentally sensitive areas who pre-field, or examine site conditions, prior to trim work taking place
    - Initial prescription created via remote sensing and final prescription completed by pre-fielding personnel

8.2.2.4.2 Satellite Inspections

***Inspect*ion Process**

*I*n this section, the electrical corporation must provide an overview of the individual vegetation inspection and inspection criteria. Include the various methods of inspection conducted for each inspection program. Include relevant visuals and graphics that depicts the workflow and decision process the electrical corporation uses for the inspection program (see example Figure 8-3).

In 2022, SCE launched a pilot program to test the use of satellite technology for confirming the accuracy of vegetation clearances and identifying trees near overhead lines. This program evaluated a satellite's ability to identify the need for remediation on circuits with lower tree density

using hyperspectral imaging to identify vegetation health, density, and species. A variety of Transmission circuits were selected for this effort and results were validated against ground inspection data.

Similar to LiDAR, satellite-based inspection may be used to supplement or replace ground-based, visual vegetation management inspections to help maintain minimum clearance distances under maximum heat, wind, and load conditions. Satellite technology may be a viable alternative for inspecting circuits and could prove less expensive than LiDAR because it would not require helicopters or ground inspectors in the field. Satellite technology could also be a companion to LiDAR in higher risk areas by providing hyperspectral imagery and allowing SCE to reallocate resources, such as ground inspectors, to other areas. An additional use case for satellite is to evaluate tower locations that are only accessible by helicopter to determine if there is a need for brushing work prior to dispatching a helicopter-based brushing crew to the location. This provides the potential to reduce time, risk, and cost for the structure brushing activities. The benefits for all use cases are still under evaluation.

The projected implementation for satellite is generally the same as that of LiDAR. Below are three potential use cases that SCE is evaluating for satellite technology. SCE will continue to evaluate the viability, cost-effectiveness, operational feasibility, and other factors of satellite technology before adopting satellite technology into its Vegetation Management portfolio and deploying it for these use cases.

1. **Satellite to Drive Inspections**
    a. Use satellite data as the primary reference for ground inspectors to locate work points.
    b. Dispatch ground inspectors to work points identified by satellite only.
    c. Consider the remainder of the circuit clear.
    d. As with LiDAR, there may be a potential to save time and expenses related to ground inspector work with this method.
2. **Satellite to Replace Inspections**
    a. Use satellite as the complete inspection, obviating the need for ground inspections.
    b. Auto-prescribe all identified work points and assign to trim crews
        1. Requires the use of hyperspectral imagery to identify species (if required for prescriptions)
    c. Use historical imagery, ongoing scans, and AI/ML to create a working predictive analysis model of a circuit that predicts growth rate of inventory to facilitate planning on when and where trims will be required

d. Prescribe work based on predictions and validate new or eliminated inventory via ongoing scans

2. Requires a one-time effort to create the existing tree inventory in SCE's LiDAR and Visualization and Analytics and/or other data platform(s)

3. Satellite to Assist LiDAR

a. Use the hyperspectral imagery and AI/ML to identify species and tree health

b. Assist with LiDAR to facilitate auto-prescriptions

***Fr*equency or Trigger**

In this section, the electrical corporation must define and identify the frequency (including how frequency may differ by HFTD or other risk designation[s]) or triggers of the inspection program, such as inputs from the risk model.

If the inspection program is schedule based, the electrical corporation must explain how it uses risk prioritization in the scheduling of the inspection program to target high-risk areas. If the electrical corporation does not use risk prioritization in the scheduling of the inspection program, it must explain why.

Satellite technology is a pilot program and therefore, does not have a schedule. The scope will be strategically developed to test the functionality of satellite within each of the Vegetation Management programs listed in Table SCE 8-06. For more information on future frequency see the "Changes/Updates" section below.

***Accomplishments,* Roadblocks, and Updates**

- *N*oteworthy accomplishments for the inspection program since the last WMP.

In 2022, SCE launched a pilot program to test the use of satellite technology for confirming the accuracy of vegetation clearances and identifying trees near overhead lines. This program evaluated a satellite's ability to identify the need for remediation on circuits with less dense vegetation while using hyperspectral imaging to identify vegetation health, density, and species. Lower vegetation density circuits have vegetation points that are more easily identifiable, thus allowing SCE to become more familiar with satellite's capabilities. While SCE is still evaluating results, the results appear favorable in the areas of clearances, species identification, health identification, and inventory counting.

- *Roadblocks* the electrical corporation has encountered while implementing the inspection program and how the electrical corporation has addressed the roadblock.

Limited Resolution

While satellite possesses an advantage over ground inspections in terms of hyperspectral imagery and subsequent species/health identification, the current centimeter resolution is not accurate enough to use the tool independent of ground verification. As satellite technology matures, the capability and accuracy of satellite distance measurements should also improve. Public satellites with better resolution are forecasted to be launched and in orbit in the three-year WMP window, and SCE plans to continue

piloting with the goal of transitioning to more remote sensing as the technology continues to improve.

- *C*hanges/updates to inspection program since the last WMP Including known future plans (beyond the current year) and new/novel strategies the electrical corporation may implement in the next 5 years (e.g., references to and strategies from pilot projects and research)

Table SCE 8-09 below displays ways in which SCE is considering using satellite for its Vegetation Management programs.

Table SCE 8-09 - Satellite's Future Potential

Vegetation Management Programs	**Potential Implementation of Satellite**
• Routine Line Clearing	- Drive inspections (clearance analysis) - Replace inspections (auto prescription) - "Cycle Buster" activities (predictive analysis)
• HTMP and Dead and Dying Tree Removal Program	- Assess tree health/need for mitigation (hyperspectral/species analysis)
• Structure Brushing	- Identify the existence of vegetation and need for mitigation work (hyperspectral analysis)
• Weed Abatement	- Identify the existence of vegetation and need for mitigation work (hyperspectral analysis)
• Supplemental Patrols	- Drive or perform inspections (clearance analysis) - Determine the need for patrols (predictive analysis)
• QA/QC	- Post-work verification (clearance analysis)

For 2023 and beyond, SCE plans to expand the satellite technology pilot program by adding approximately 1,000 circuit miles per year, depending on the technology's evolution. Additionally, SCE intends to increase the evaluation of inaccessible tower locations in the structure brushing program by approximately 50 sites per year. The full implementation of satellite technology throughout Vegetation Management's programs depends on: 1) improvements in accuracy, 2) SCE inspections processing software, and 3) integration with Arbora. These efforts are all in development.

8.2.3 Vegetation and Fuels Management

In this section, the electrical corporation must discuss the following mitigation initiatives associated with vegetation and fuels management:

1. *Fuels management*
2. *Clearance*
3. *Fall-in mitigation*
4. *Substation defensible space*
5. *High-risk species*
6. *Fire-resilient right-of-way*
7. *Emergency response vegetation management*

In the following subsections, the electrical corporation must provide an overview of its vegetation and fuels management initiatives. These overviews should include figure(s) that depict the workflow and decision process used for vegetation and fuels management. Figure 8-3 provides an example of the appropriate level of detail for tree trimming and removal.

In addition to figure(s), the electrical corporation must provide a narrative overview of each vegetation and fuels management initiative. The discussion must include the following:

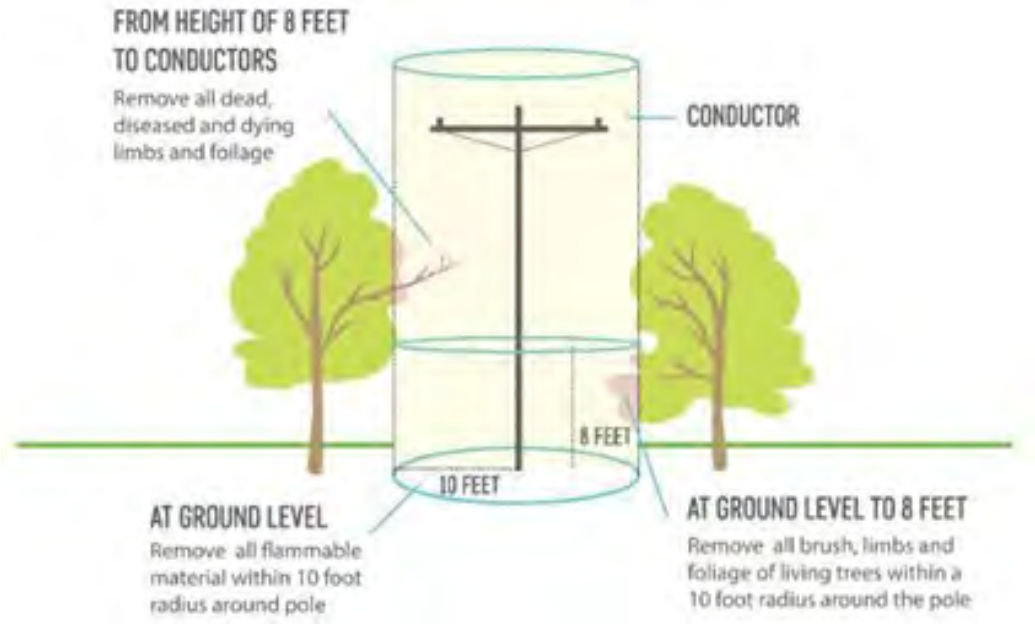
- *Utility Initiative Tracking ID.*
- ***Overview of the initiative:** A brief description of the initiative including reference to related objectives and targets.*
- ***Governing standards and electrical corporation standard operating procedures:** Reference to the appropriate code and electrical corporation procedure. If any standard exceeds regulatory requirements, the electrical corporation must reference the document that the electrical corporation uses as a basis for exceeding the regulatory requirements.*
- ***Updates to the initiative:** Changes to the initiative since the last WMP submission and a brief explanation as to why those change were made. Discuss any planned improvements or updates to the initiative and the timeline for implementation.*

8.2.3.1 Pole Clearing

In this subsection, the electrical corporation must provide an overview of pole clearing activities, including:

- Pole clearing per Public Resources Code section 4292
- Pole clearing outside the requirements of Public Resources Code section 4292 (e.g., pole clearing performed outside of the State Responsibility Area)

8.2.3.1.1 Structure Brushing



Utility Initiative Tracking ID: VM-2 (formerly Expanded Pole Brushing)

***Overview* of initiative** – Brief description of the initiative including the objective and the risk targeted by the initiative.

Vegetation at the base of poles and structures can provide the fuel needed to convert a spark from equipment failure into a fire. This vegetation can also support fire propagation, especially during dry and windy conditions. Additionally, even where the equipment is not the source of the ignition, brush surrounding a pole may catch fire and damage electric assets, impeding power restoration and reconstruction efforts. Thus, SCE removes vegetation around all poles and structures subject to PRC 4292 in State Responsibility Areas, while targeting additional Distribution poles outside of these areas in HFRA for risk mitigation.

The figure below illustrates the clearances around structures as required by PRC 4292. The structure brushing program maintains clearance from the ground up to 8 feet. Clearances above 8 feet are maintained in Routine Line Clearing.

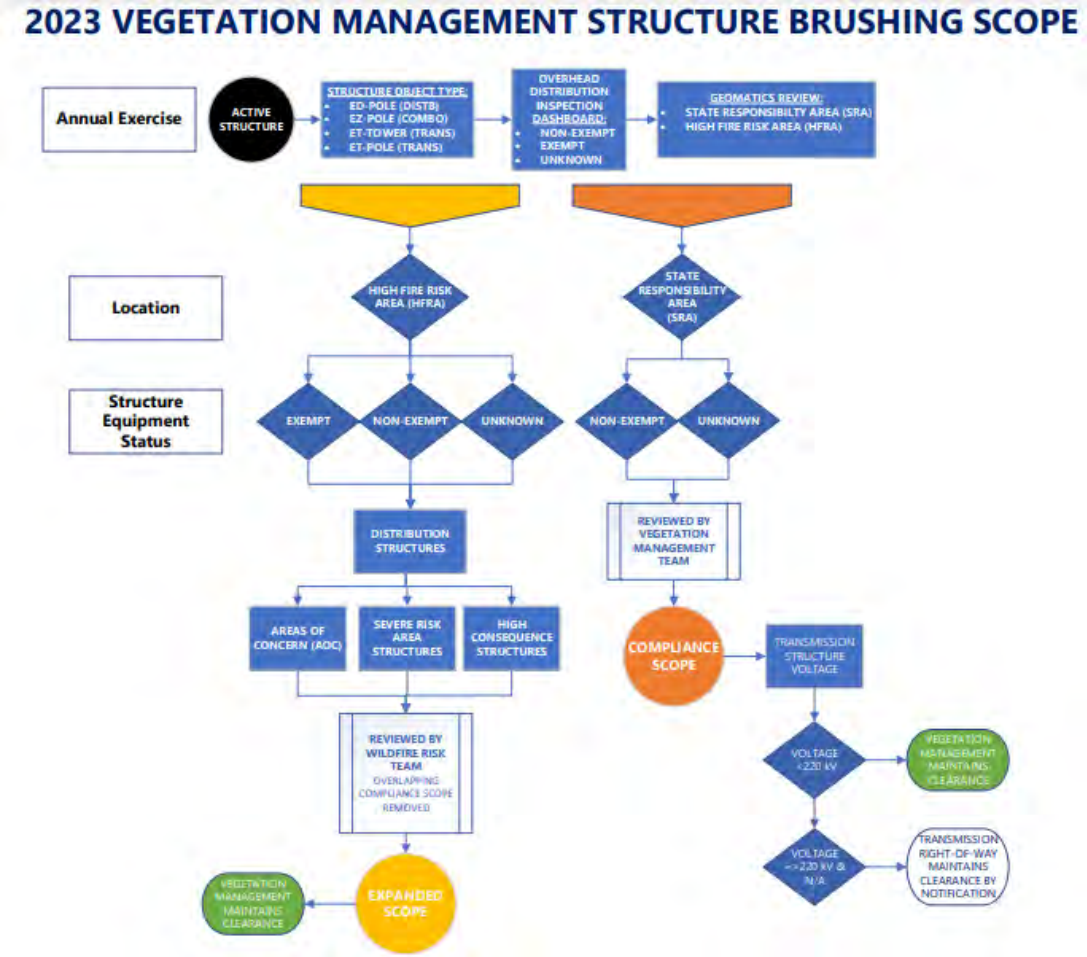


Figure SCE 8-41 - Structure Brushing Program

One of SCE's priorities is to maintain clearance on those poles subject to PRC 4292 in State Responsibility Areas. SCE also prioritizes poles in AOC in HFRA. The AOC population aims to mitigate risk in areas identified by SCE's Fire Science team that pose intra-year increased fuel-driven and wind-driven fire risk. SCE also addresses other poles identified in HFRA with non-exempt equipment and highest potential wildfire consequence. SCE considers both regulatory compliance and ignition risk in prioritizing its brushing schedule, as well as access issues (e.g., landowner consents, environmental approvals) and operational efficiency.

The figure below illustrates the workflow and decision process for all structure brushing scope.

Figure SCE 8-42 - Structure Brushing Decision Process

***Governing standards and electrical corporation standard* operating procedures** – Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.

PRC 4292

California Public Resource Code (PRC) 4292 and related regulations require utilities in certain areas and at certain times to "maintain around and adjacent to any pole or tower which supports a switch, fuse, transformer, lightning arrester, line junction, or dead end or corner pole, a firebreak which consists of a clearing of not less than 10 feet in each direction from the outer circumference of such pole or tower." The structure brushing program removes vegetation at the base of distribution poles to reduce the risk of ignition and/or fire spread due to a spark or contact with failed equipment. This activity removes vegetation around applicable structures subject to PRC 4292 in State Responsibility Areas, while

targeting additional distribution poles in HFRA for further risk mitigation.

The scope incremental to that required by PRC 4292 aligns with SCE's IWMS which targets distribution structures in AOCs, Severe Risk Areas, and High Consequence Segments. These areas have been identified to present heightened wildfire risk and are being targeted for grid hardening with additional mitigations, which includes additional Vegetation Management activities like structure brushing.

Climate Adaptation Vulnerability Assessment

SCE filed its first Climate Adaptation Vulnerability Assessment (CAVA) on May 13, 2022 as required by CPUC D.20-08-046. This Decision required utilities to study climate risks to their assets, operations, and services and to file the assessment results one year before their GRC to enable the results of the assessment to inform GRC requests. In the CAVA, wildfire was studied as a climate variable of concern alongside temperature, sea level rise, precipitation, and cascading events. Importantly, CAVA studied the risks wildfires pose to utility infrastructure and operations, and not the risks from ignitions associated with utility equipment. The CAVA included a detailed analysis of the exposure of assets, operations, and services to wildfire, the adaptive capacity of the system to continue to provide service to customers in the event of climate-related disruption, and the potential impacts on vulnerable communities and community adaptive capacity, as developed through an in-depth community engagement process. The CAVA identified structure brushing as one potential adaptation strategy to limit the probability of fires damaging high-risk sub-transmission poles.

Climate projections show that fire exposure is projected to increase in and around HFRAs, which already have an elevated risk of wildfires.[209] Summer wildfires are projected to become more intense, particularly in mountainous regions. Most non-HFRA portions of SCE's service area are projected to experience fire exposure similar to their historical exposure. Based on this analysis and subject to approved cost recovery, SCE proposes to add a limited scope of approximately 200 structures to its sub-transmission pole brushing activity in HFRA, incremental to the pole brushing activity already discussed in this WMP. The current pole brushing scope is intended to mitigate the risk of utility-caused ignitions, while the additional scope proposed in this section is intended to adapt to higher burn activity resulting from climate change. The sub-transmission poles proposed as incremental scope were selected based on the highest projected burn areas in 2030 and are located in geographic proximity to other pole brushing scope. This activity is projected to begin in 2025.

***Updates* to initiative** - Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation.

In 2023, SCE plans to explore leveraging AI/ML to improve structure brushing prioritization and furthering the integration of pole brushing into SCE's IWMS by targeting structures in severe and high consequence areas.

Also, as mentioned above, in 2025 SCE plans to increase the scope of its sub-transmission pole brushing activity in response to the CAVA analysis, if approved in the 2025 GRC.

[209] Climate Change Vulnerability Assessment Pursuant to Decision 20-08-046, Section IV.D.1, pp.104-108.

8.2.3.1.2 Reduction or adjustment of live fuel (based on species or otherwise)

See Section 8.2.3.6 for details regarding the fuel management of "high-risk species", Section 8.2.3.7for details regarding the management of live fuel in rights-of-way and Section 8.2.3.1.1 above for details on the management of live fuel at the base of structures.

8.2.3.2 Wood and Slash Management

In this subsection, the electrical corporation must provide an overview of how it manages all downed wood and "slash" generated from vegetation management activities, including references to applicable regulations, codes, and standards.

8.2.3.2.1 Reduction or adjustment of dead fuel, including all downed wood and "slash" generated from vegetation management activities

Utility Initiative Tracking ID: Reduction of downed wood and slash from Vegetation Management activities is incorporated into each Vegetation Management initiative and therefore relates to VM-1 through VM-4, VM-7, and VM-8. SCE describes these efforts in this section.

***Overview* of initiative** – Brief description of the initiative including the objective and the risk targeted by the initiative.

Vegetation Management activities produce woody debris that, if not properly handled, can act as fuel around or near electrical equipment and other critical infrastructure and increase the probability of ignition and spread of wildfire. SCE reduces slash (e.g., cut limbs and other woody debris) from Vegetation Management activities by chipping and hauling the material away to be disposed or recycled by pruning/removal contractors.

SCE's contract crews strive to remove all wood and material resulting from mitigation for Routine Line Clearing, Structure Brushing, HTMP, and the Dead and Dying Tree Program typically within 100 feet of a dirt or paved road, subject to site conditions. On private property, crews will typically strive to remove all wood, providing that crews are able to maneuver and operate their equipment close enough to the area (e.g., skid steers). On federal lands, crews will typically remove logs, branches, and debris within 100 feet of a road or structure. Beyond 100 feet, SCE lops and scatters the limbs and brush with a height no greater than 18 inches above the ground and leaves logs greater than four inches in manageable sections, subject to site conditions.

SCE's pruning and removal contractors abide by the standard cleanup and disposal expectations for work sites. Removal and disposal of debris generated during SCE vegetation management activity, except as requested by the customer (e.g., for firewood or mulch) or where logistical constraints exist (e.g., steep slope with no vehicular access), is typically performed the same day. For example, where possible, all debris after pruning or removal is chipped with trailer chippers and hauled away from the work site. In some cases, debris is moved the following day due to the volume or is not removed at all due to logistical constraints. Where logistical constraints exist, SCE will work to mitigate the potential fuel risk by scattering the debris according to best practices or any existing fuel management plan applicable to the work site. Concerted efforts are made to rake up and dispose of green or freshly removed leaves, and work sites are left in a condition consistent with the condition prior to Vegetation Management activity.

Governing standards and electrical corporation standard operating procedures – Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.

Reducing slash from Vegetation Management initiatives is a standard prudent practice conducted during Vegetation Management activities, as documented in UVM-02 and UVM-03. SCE requires its Vegetation Management contractors to include debris removal as part of their Statement of Work, with a few exceptions such as in remote forested areas where lopping and scattering debris approximately 100 feet from the road, subject to site conditions, is generally permitted.

***Updates* to initiative** - Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation.

There have been no updates since the last WMP submission.

8.2.3.3 Clearance

In this subsection, the electrical corporation must provide an overview of clearance activities, including:

- *Clearances established in excess of the minimum clearances in Table 1 of GO 95*
- *The bases for the clearances established*

8.2.3.3.1 Expanded Clearing (Clearances established in excess of the GO 95 minimum required clearances in Table 1 of GO 95 - for purposes of clarification SCE utilizes the GRCD as verification that an expanded clearance has been obtained)

Utility Initiative Tracking ID: SCE seeks to achieve expanded clearances where feasible in HFRA as part of its Routine Line Clearing activities (Distribution Vegetation Management Plan (VM-7) and Transmission Vegetation Management Plan (VM-8)), and thus this activity does not have a separate tracking ID.

***Overview* of initiative** – Brief description of the initiative including the objective and the risk targeted by the initiative.

SCE performs expanded line clearances to mitigate the risk of vegetation contact with energized conductors. For line voltages between 2.4 kV to 69 kV, vegetation can create a risk to SCE facilities when the vegetation is located in “grow-in zones” (i.e., beneath or adjacent to the conductors), “blow-in zones” (i.e., within general proximity to conductors where there exists the risk of vegetation being blown into conductors), and “fall-in zones” (i.e., outside of the grow-in zone but within striking distance of conductors). For line voltages greater than 115 kV, SCE has a “wire-zone” which is defined as the area directly beneath the conductors and includes the distance of the conductors at maximum sway condition. Vegetation within this zone has grow-in and fall-in potential, which creates risk to SCE equipment and facilities.

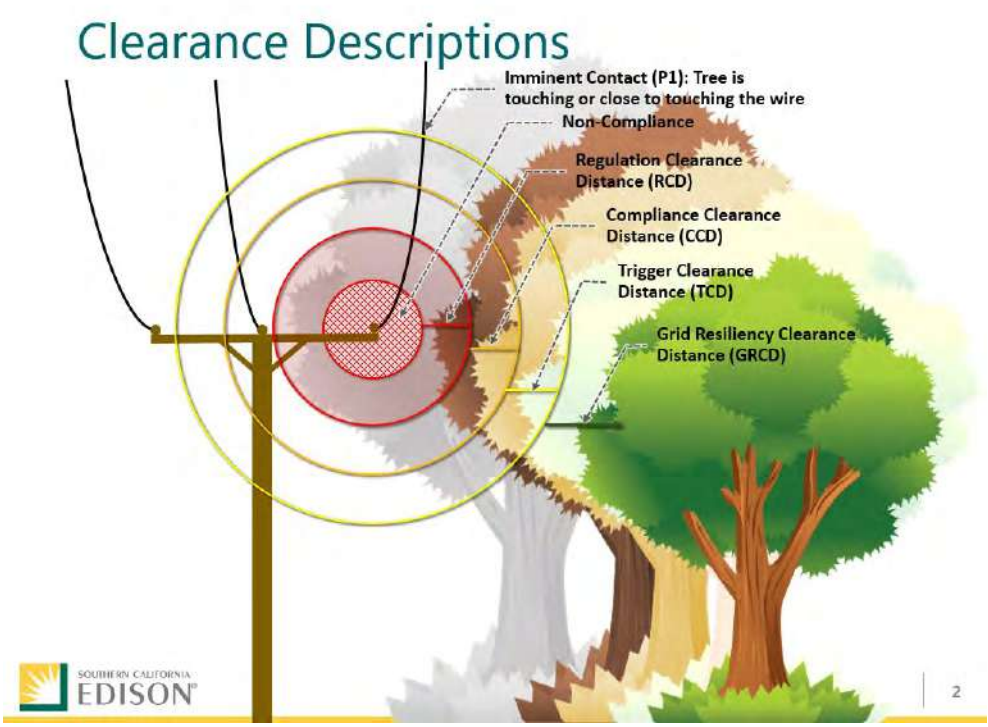
SCE utilizes the Grid Resiliency Clearance Distance (GRCD) to verify whether an expanded clearance has been obtained. In HFRA, SCE strives to obtain expanded clearances of 12 feet for Distribution lines, and 30 feet for Transmission lines. At a minimum, SCE’s Routine Line Clearing work within HFRA maintains at

least the required four feet clearance for Distribution lines and the required 10 feet clearance for Transmission lines for a full annual inspection cycle. Where GRCD has been achieved historically, SCE strives to maintain the expanded clearance thereafter. Additionally, within the wire-zone, fast-growing species are targeted for removal if the species has the capability to encroach into the wire zone.

Over the last two years, SCE has worked to categorize the GRCD exemption status of trees in HFRA to support analysis and understanding of the total inventory available to achieve expanded clearances. Over the next three years, SCE seeks to improve the support and execution of expanded clearing by applying the TRI calculations to SCE's high fire inventory and overlaying that data set with the GRCD exemption status from the 2022 annual cycle. SCE's initial efforts will focus on highly challenged districts in high TRI ranking quadrants.

The figure below depicts the various types of clearance to be achieved, with Regulation Clearance Distance (RCD) representing required distance per GO 95 and GRCD representing expanded clearing.

Figure SCE 8-43 - Clearance Descriptions[210]



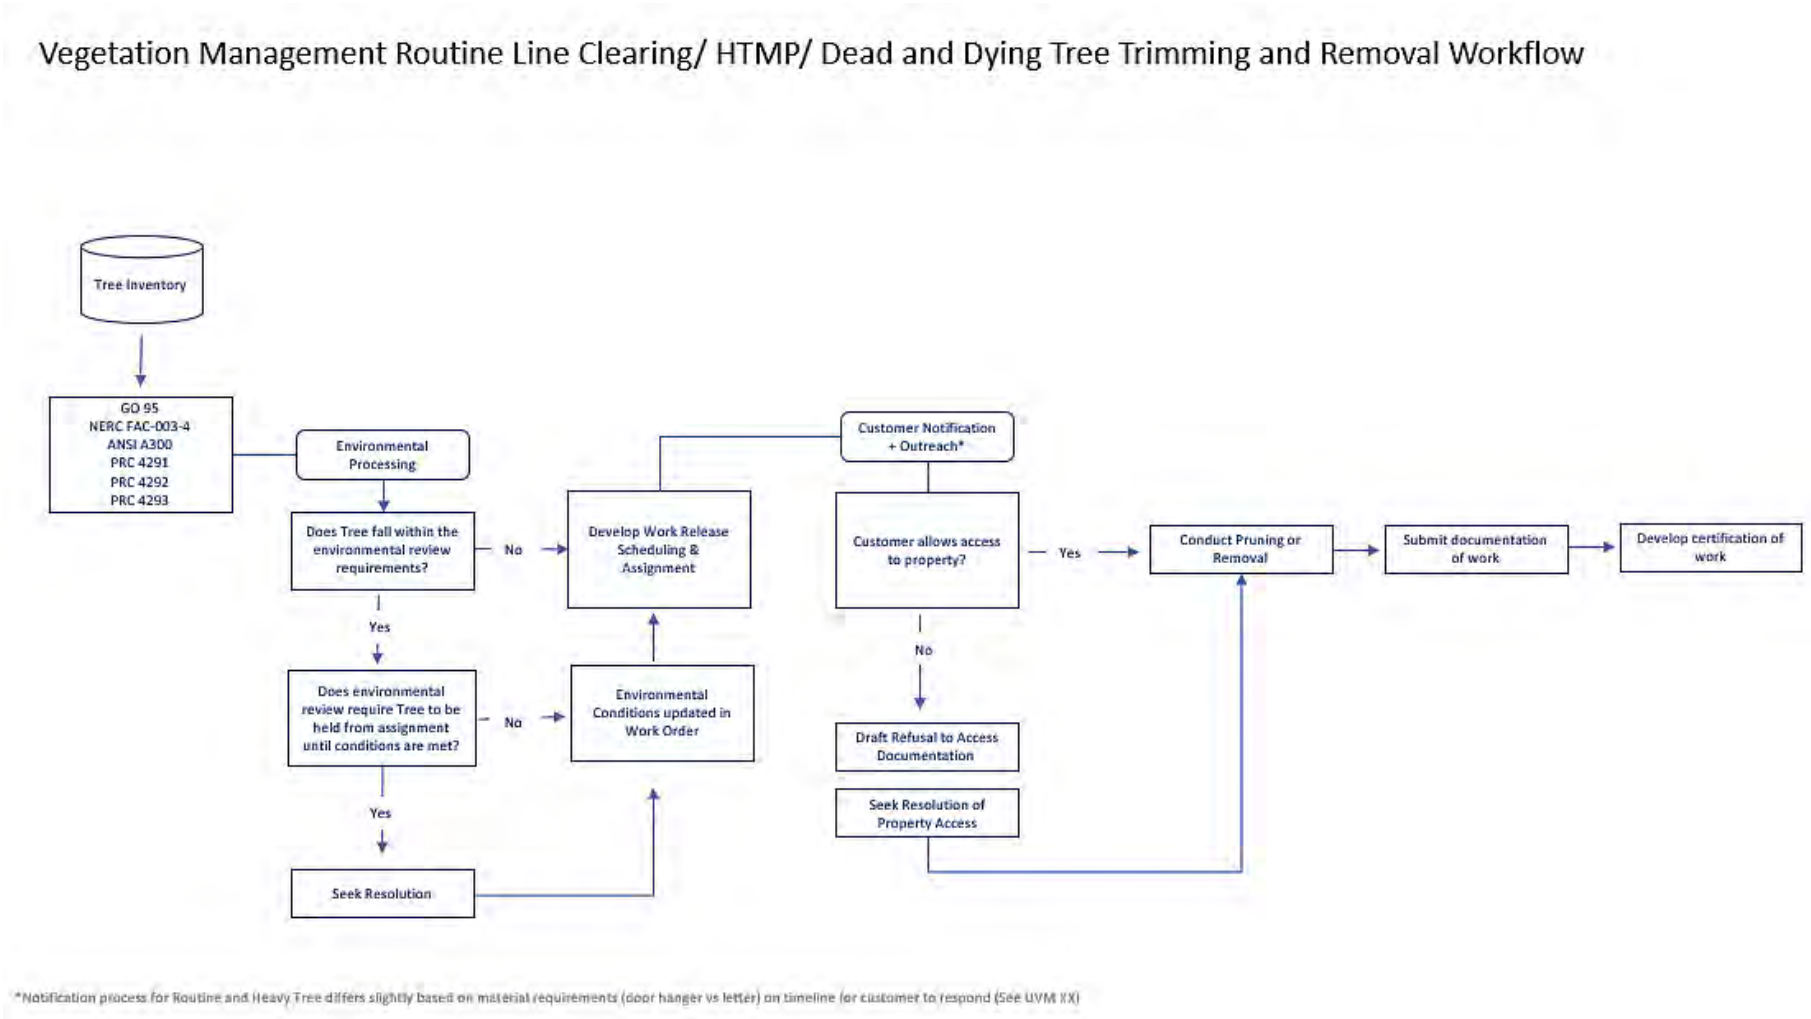


Figure 8-3 below shows the workflow for the remediation work, including trimming and removal, performed under Routine Line Clearing, HTMP and Dead and Dying Removal Program.

[210] RCD means Regulatory Clearance Distance, and is the minimum clearance required by regulation. CCD means Compliance Clearance Distance and is SCE's minimum clearance standard which is 1.5 times the RCD. TCD means Trigger Clearance Distance. TCD is derived from CCD plus 3 feet and is the distance that triggers the maintenance activity. GRCD is the Grid Resiliency Clearance Distance, which aligns with the GO95 Rule 35, Appendix E recommended clearance.

Figure 8-3 - Trim and Removal Workflow

In some instances, SCE may not achieve expanded clearances due to the factors noted in the table below.

Table SCE 8-10 - Operational Factors

Operational Factors	Description
Agency and environmental regulatory requirements	Work in environmentally sensitive areas may be restricted in both scope and timing, or may require a lengthy permitting process, making timely expanded clearances infeasible. For more information, see the Environmental Compliance and Permitting in Section 5.4.5
Crew equipment	Trees that may require the use of specialized equipment/needs (such as a crane or outage) to safely and adequately achieve the GRCD
Customer denies GRCD	Customer requests to not trim back "more" than in previous trim cycles. No authorization from property owners to clear beyond Regulation Clearance Distance (RCD) + 1-year's growth. SCE takes appropriate and at times, extensive, steps to engage customers in these matters.
PRC Exemption (Major Woody Stem)	Trees that qualify for Cal. Code Regs. Tit. 14, § 1257 - exempt minimum clearance provisions
Site condition/environmental factors	Crew-identified conditions at time of work being performed which necessitate less than desired clearance (e.g., active wildlife nests or site construction). For more information, see the Environmental Compliance and Permitting in Section 5.4.5
Tree condition	Indication that the tree could not be cleared back to the GRCD without a significant impact to the tree health and could ultimately worsen tree health and increased potential for future hazardous tree conditions
UVM Exception (e.g., Oaks, Conifers, Historic, etc.)	Trees known to have slower growth rates/risk profiles and have regional, local, or arboricultural requirements that prevent the GRCD from being achieved

Governing standards and electrical corporation standard operating procedures *– Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

For expanded clearing, SCE strives to meet, when possible, the recommended clearances of GO 95 Rule 35, Appendix E.

These standards have been incorporated into SCE's Transmission Vegetation Management Plan (TVMP) found in UVM-02 and Distribution Vegetation Management Plan (DVMP) found in UVM-03.

Updates to initiative *- Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation.*

Helisaw Pilot

SCE has been exploring an alternative method of bulk tree trimming by utilizing helicopters to trim trees. This method would primarily be used on long spans of transmission ROW, where a high density of trees exists. The work is performed by suspending a large saw on a helicopter to trim trees as the helicopter directs it along the ROW, with the ground crew typically removing all debris. SCE is exploring costs and other benefits that might result from using this method of work. The new work method will only be utilized when the project is cost neutral or less than traditional ground maintenance.

Improvements in GRCD Achievement Rate

In 2019, SCE implemented expanded clearances, then known as Grid Resiliency Clearance Distance (GRCD), per the recommendation of GO 95 Rule 35 Appendix E. At present, SCE has an approximate 67% success rate in achieving GRCD. As part of SCE's collaboration with an independent third-party, SCE is conducting an analysis related to GRCD achievement and will prioritize locations and specific steps to be taken based on the analysis results in an effort to increase the GRCD achievement rate, subject to the operational factors noted in Table SCE 8-10 above.

As a first step, SCE overlaid its GRCD achievement rates to the TRI analysis rankings to prioritize the highest risk districts. SCE has been collecting GRCD deviation data for the past two years and will use that data to develop plans to address each district. SCE plans to deploy an engagement strategy for targeted geographic locations over the next two to three annual cycles to improve GRCD achievement rates, excluding the UVM excepted tree species (e.g., Oaks, Conifers, Historic) and the PRC exempted heavy woody stem species.

8.2.3.3.2 Expanded Clearances for Legacy Facilities

Utility Initiative Tracking ID: Expanded Clearances for Legacy Facilities, VM-3

Overview of initiative *– Brief description of the initiative including the objective and the risk targeted by the initiative*

Legacy facilities comprise SCE's generation assets located in Tier 2 or 3 in HFRA that have a risk of ignition and include high voltage facilities such as powerhouses, switchyards, and substations. These energized facilities may also be low voltage facilities or assets such as weather stations, valves, pull boxes or other electrified equipment.

Many of SCE's energized legacy facilities, including powerhouses and switchyards, are located in or near heavily forested areas. Electrical facilities in close proximity to vegetation face an increased risk of faults due to vegetation contact, and potential for those faults leading to an ignition. Therefore, this initiative seeks to reduce the risk of vegetation contact associated with these facilities.

The compliance defensible space in accordance with PRC 4291 is 100 feet for occupied facilities and 30 feet for unoccupied structures, respectively. In this initiative, SCE seeks to remove or clear additional vegetation using the standard remediation methods of trims, removals, and/or weed abatement to render the defensible space[211] around a facility even more vegetation-free.

In 2020, SCE completed an analysis of all sites to prioritize treatment based on HFRA tier and assessment findings. SCE's analysis identified 156 legacy facilities in HFRA to be targeted for expanded clearances in the 2020-2022 WMP cycle. In 2020, all 156 sites were assessed, with SCE completing treatment of 62 of the highest risk locations. In 2021, SCE completed treatment of an additional 62 sites, with the remaining 32 sites treated in 2022.

For the current WMP cycle, the scope of the expanded clearance program for legacy facilities is being increased to include an additional 95 legacy facilities. Due to resource constraints, these additional 95 facilities, which represent lower risk than the original 156 sites, were not included in the 2020-2022 cycle.

However, the inclusion of these sites helps to further reduce wildfire risk. In the 2023-2025 cycle, the program will continue maintaining expanded clearance of 95 previously treated legacy facilities that have experienced vegetation re-growth.

Governing standards and electrical corporation standard operating procedures *– Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

PRC 4291 requires a landowner that owns a building in or adjoining a mountainous area, forest-covered lands, shrub covered lands, grass-covered lands, or land covered with flammable material to maintain a defensible space of 100 feet around an occupied building with more intense fuel reductions within 30 feet around the structure. For unoccupied structures (e.g., gatehouse, gauging station, or intake structure),[212] the defensible space required is 30 feet from the structure.

[211]Defensible space comprises the area around a legacy facility which fire personnel can safely enter to defend a legacy facility from fires.

[212] SCE personnel and contractors may visit these structures (outbuildings) from time to time, but they would not occupy them for an extensive period of time.

SCE incorporates these standards in its procedures found in "SCE VM-3 Program Guide."

***Updates** to **initiative** - Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation*

SCE identified an additional 95 energized sites located in Tier 2 and Tier 3 of SCE's HFRA for treatment in 2023 through 2025, as well as re-treatment of 95 previously treated sites. See the above sub-section "Overview of Initiative" for more details.

8.2.3.4 Fall-In Mitigation

In this subsection, the electrical corporation must provide an overview of its actions taken to identify and remove or otherwise remediate trees that pose a high risk of failure or fracture that could potentially strike electrical equipment (e.g., danger trees or hazard trees).

8.2.3.4.1 Hazard Tree Management Program (HTMP)

Utility Initiative Tracking ID: VM-1

***Overview of initiative** - Brief description of the initiative including the objective and the risk targeted by the initiative*

SCE's HTMP is a wildfire mitigation program performed in SCE's HFRA designed to reduce fall-in or blow-in risk to SCE's electrical assets posed by green or live trees with specific conditions. Analysis of Tree Caused Circuit Ignition (TCCI) data revealed that a significant number of faults were caused by green trees "falling in" or branches, fronds, or other tree parts from green trees "blowing in" to SCE lines and equipment. These trees were typically outside of the compliance clearance zone.

The purpose of an HTMP assessment is to identify trees that pose a risk to electric facilities based on the tree's observed structural integrity and site conditions. Some visually healthy trees located beyond the required clearance distances can still pose a fall-in risk, depending on the condition of the tree and other site-specific factors. Branches or fronds can become dislodged from trees near electrical facilities, blow into the lines and equipment, and cause faults that can potentially initiate an ignition. As discussed in Section 8.2.2.2, SCE prioritizes locations within HFRA based on HFRA tier and density of vegetation surrounding SCE's facilities.

Please refer to Figure 8-3 in Section 8.2.3.3.1 for the workflow to the remediation process.

***Governing standards and electrical corporation standard operating procedures** – Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

SCE's standard operating procedures (SOP) for HTMP are documented in SCE's Utility Vegetation Management (UVM) Program titled, UVM-04 "Hazard Tree Management Plan."

Updates to initiative *- Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation*

As discussed in Section 8.2.2.1 above, SCE will deploy a new centralized inspection schedule to consolidate the inspection process for Routine Line Clearing, HTMP and Dead and Dying Tree Removal Program. SCE anticipates more efficiency in the deployment of contractor resources to execute work because cross-program scope will generally be identified at the same time in one geographical area under the new consolidated inspection strategy.

SCE has also made changes to the Tree Risk Calculator (TRC) and plans to utilize the new formula for Hazard Tree re-inspections beginning June 2023. A review of the TRC identified opportunity to align rated tree lean severity with direction of lean to better capture risk of vegetation strike to SCE assets. Previously, separation of lean from likelihood of impact could cause a severe lean to elevate the priority of a tree leaning away from SCE assets.

8.2.3.4.2 Dead and Dying Tree Removal Program

Utility Initiative Tracking ID: VM-4

Overview of initiative *- Brief description of the initiative including the objective and the risk targeted by the initiative*

The Dead & Dying Tree Removal program (formerly called the Drought Relief Initiative or DRI) was established as a result of the epidemic of dead and dying trees brought on by climate change and years of drought. Moreover, Resolution ESRB-4, GO 95 and PRC 4923 require that SCE mitigate the hazards posed by dead trees or those that are identified as significantly compromised.

Dead and dying trees have a higher probability of failing, and if within striking distance of SCE lines and equipment, can cause fault conditions, sparks, and ignition. Under this program, SCE conducts patrols in HFRA to identify and remove dead, dying, or diseased trees affected by drought conditions and/or insect infestation. All trees that are identified within strike distance of SCE overhead facilities that are dead or expected to die within one year are prescribed for removal.

Please refer to Figure 8-3 in Section 8.2.3.3.1 for the workflow to the remediation process.

Governing standards and electrical corporation standard operating procedures *– Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

SCE's Dead and Dying Removal Tree Program is documented in SCE's UVM procedure UVM-18, "Assessment and Removal of Dead and Dying Trees" which meets and/or exceeds the requirements established by GO 95, PRC 4923 and the CPUC Drought Resolution ESRB-4, dated June 12, 2014.

Updates to initiative *- Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation*

As discussed in Section 8.2.2.1 above, SCE will deploy a new centralized inspection schedule to consolidate the inspection process for Routine Line Clearing, HTMP and Dead and Dying Tree Removal Program. SCE anticipates more efficiency in the deployment of contractor resources to execute work because cross-program scope will generally be identified at the same time in one geographical area under the new consolidated inspection strategy.

8.2.3.5 Substation Defensible Space

In this subsection, the electrical corporation must provide an overview of its actions taken to reduce ignition probability and wildfire consequence due to contact with substation equipment.

8.2.3.5.1 Substation Inspection and Management

Utility Initiative Tracking ID: 8.2.3.5.1 Substation Inspection and Management

Overview of initiative *– Brief description of the initiative including the objective and the risk targeted by the initiative*

SCE inspects vegetation around its substations for potential risks from encroachment or blow-in or fall-in hazards and manages vegetation around its substations by performing pruning, removal, and weed abatement. The primary risk to be mitigated is vegetation contact with energized conductors and equipment, as well as preventing fire damage to substations.

Governing standards and electrical corporation standard operating procedures *– Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

The governing standards for substation inspection and management is documented in CPUC GO 174. SCE's SOP for substation inspection and management is documented in SCE's Substation Operations and Maintenance Policy and Procedures (SOM), SCE's Electrical Design Standards Layout 06-90-01.

Updates to initiative *- Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation*

There are no changes to this initiative since the last WMP submission.

8.2.3.6 High-Risk Species

In this subsection, the electrical corporation must provide an overview of its actions, such as trimming, removal, and replacement, taken to reduce the ignition probability and wildfire consequence attributable to high-risk species of vegetation.

Utility Initiative Tracking ID: SCE targets high-risk (which SCE refers to as "at-risk") species through its HTMP (VM-1) initiative and/or Routine Line Clearing (VM-7 and VM-8) activities.

Overview of initiative *- Brief description of the initiative including the objective and the risk targeted by the initiative.*

SCE manages at-risk species and implements clearances to reduce the probability of vegetation contacting electric facilities. Certain tree species, due to their characteristics, have the potential to cause "grow-in", "blow-in", or "fall-in" incidents that could lead to an outage or an ignition. Accordingly, SCE takes steps to mitigate the risk of at-risk species coming into contact with energized conductors.

SCE considers other factors, but primarily focuses on tree growth rates, to identify at-risk tree species. SCE has identified tree inventory species within three growth rate categories (fast, medium, slow). In addition, SCE has documented the list of species contained in SCE's service area that have historically caused problems such as Tree Caused Circuit Interruptions (TCCI). Some of the risk attributes associated with these species include, but are not limited to: being prone to trunk failure, branch failure, limb sway during windy conditions, frond drop, root failure, and tree flammability.

SCE's tree species inventory list with growth rates and risk characteristics has been integrated into SCE's probability of ignition (POI) model that informs the TRI. The TRI is used to develop the inspection scope and frequency for HTMP, as discussed further in Section 8.2.2.2 .

SCE's vegetation crews are knowledgeable about both tree growth rates and tree risk attributes. Line clearing crews are instructed to factor risk attributes into the decision-making process when determining the right tree prescriptions, to ensure compliance clearances are maintained, or when determining if a tree removal is warranted. Additionally, all fast-growing species in grow-in zones are targeted for removal, if possible, when the species has the capacity to encroach into the clearance distance. When practical, SCE removes immature vegetation in the drop-in zone (e.g., overhangs) within HFRA and removes or makes safe palms that have the potential to dislodge fronds.

Due to a palm's fast growth rate, palms drive a significant amount of off-cycle trims and emergency work required to prevent circuit interruptions and other safety risks. Palms make up approximately 6 percent of SCE's overall inventory but are responsible for almost 45 percent of TCCIs. Trimming a palm also poses worker safety risks. Approximately 45% of palm inventory requires climbing the tree to trim it. To further mitigate public and worker safety risks associated with trimming palm trees, palms near lines are typically targeted for removal.

In 2021, SCE implemented its palm removal program to help mitigate the risk of vegetation- related ignitions and faults caused by palms. This program deployed resources to seek removal of palms based on specific risk criteria. Depending on their proximity to electrical facilities, these palms may pose significant operational challenges, which include: (1) the palm is a major driver of emergent work and outages (e.g., palm fronds drop onto primary wire); (2) the palm represents a wildfire threat, as dead

palm fronds are highly flammable and are easily blown long distances by winds; and (3) the palm is fast-growing (upwards) and may require multiple trims per year to maintain compliance.

Since 2021, SCE has removed over 20,000 palm trees posing potential blow-in or grow-in hazards, and currently has an inventory of approximately 95,000 palms remaining. SCE will continue applying criteria to determine when a palm should be targeted for removal. SCE will also continue to monitor both removal rates and ignition/fault data to determine if additional efforts are warranted.

Governing standards and electrical corporation standard operating procedures *– Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

SCE's standard operating procedures for at-risk species are documented in SCE's UMV-09, which provides information on at-risk species and subsequent remediation.

Updates to initiative *- Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation.*

There are no changes to this initiative since the last WMP submission.

8.2.3.7 Fire-Resilient Right-of-Ways

In this subsection, the electrical corporation must provide an overview of its actions taken to promote vegetation communities that are sustainable, fire-resilient, and compatible with the use of the land as an electrical corporation right-of-way. It must also provide an overview of its actions to control vegetation that is incompatible with electrical equipment and with the use of the land as an electrical corporation right-of-way. This may include, but is not limited to, the following activities: the strategic use of herbicides, growth regulators, or other chemical controls; tree-replacement programs; promotion of native shrubs; prescribed fire; or fuel treatment activities not covered by another initiative.

Utility Initiative Tracking ID: 8.2.3.7

Overview of initiative *– Brief description of the initiative including the objective and the risk targeted by the initiative.*

SCE's Fuel Management Program demonstrates SCE's commitment to wildfire safety through active management of Rights-of-Way (ROW) and reduction of hazardous fuel loading on the landscape that is not captured by routine VM operations. The goal of SCE's Fuel Management Program is to proactively remove vegetation, typically with mechanized equipment, under transmission and distribution conductors, in areas beyond the scope of Routine Line Clearance. An added benefit of this initiative is the creation of wildfire fuel breaks and increased buffer protection for conductor infrastructure.

Additionally, SCE currently manages several pilot programs, that if successful and subject to an assessment of constraints and feasibility, may be incorporated into this initiative in future years. Several of these pilot programs have been implemented in conjunction with environmentally approved Integrated Vegetation Management (IVM) practices. SCE focuses its IVM programs in mountainous

service area due to the high inventory counts, frequency of maintenance, and the potential impact from wildfires and hazardous trees.

SCE's pilot programs related to this initiative include the use of herbicides, hydroseeding, goat grazing, the use of tree growth regulators (TGRs), and the ROW Low Growth program.

- For the herbicide program, SCE is piloting the use of herbicides for pre- and post-emergent applications. The former works well for sites where re-growth of fast and/or invasive woody stem species is undesirable while the latter is useful for combatting invasive species.
- Hydroseeding involves the application of seeds, mulch, water, and additional components and is designed to develop a desired plant community of beneficial, slow-growing vegetation.
- Goat grazing allows SCE to target specific plant species while minimizing ground disturbance and provides a more cost-effective approach to brush mitigation. Also, SCE is looking to partner with the USFS to develop a plan for fuel management by goat grazing across several forests, where steep terrain and limited access make it challenging for traditional tree crews to navigate.
- The TGR pilot is testing the viability of TGR technology in which trees are treated with a growth slowing compound that inhibits cell elongation. The compound is injected into the soil at the base of a tree, and is gradually absorbed by the tree, resulting in slower outward growth rates for several years. Slower growth rates have the potential to extend trim cycles and/or reduce the frequency of visits.
- Finally, the ROW Low Growth program seeks to employ the use of pre-emergent and post-emergent herbicide on certain parcels where feasible to eliminate all vegetation within Transmission ROWs and fee owned parcels. If successful, these treatments would reduce the need for brushing crews to manually clear the vegetation, thereby saving time, cost, and reducing safety risks.

Governing standards and electrical corporation standard operating procedures *– Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

SCE's standard operating procedures for IVM are documented in UVM-05, "Utility Vegetation Management Integrated Vegetation Management Plan (IVMP)" & UVM-08 "Utility Vegetation Management Managing Vegetation Threats."

Updates to initiative *- Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation.*

In 2023, SCE will continue the development and implementation of IVM practices described above with the goal of evaluating environmentally sound and cost-effective means to promote desirable, stable, low-growing vegetation that is resistant to undesirable tree species. The use of these methods may

provide long-term cost efficiencies and reduce the risk of outages and fires while improving wildlife habitat. SCE intends to consult with agencies before expanding or rolling out the various pilot programs as a broader strategy.

Emergency Response Vegetation Management

In this subsection, the electrical corporation must provide an overview of the following emergency response vegetation management activities:

- *Activities based on weather conditions:*
    - *Planning and execution of vegetation management activities, such as trimming or removal, executed based on and in advance of a Red Flag Warning or other weather condition forecast that indicates an elevated fire threat in terms of ignition probability and wildfire potential.*
- *Post-fire service restoration:*
    - *Vegetation management activities during post-fire service restoration, including, but not limited to, activities or protocols that differentiate post-fire vegetation management from programs described in other WMP initiatives; supporting documentation for the tool and/or standard the electrical corporation uses to assess the risk presented by vegetation after a fire; and how the electrical corporation includes fire-specific damage attributes in its assessment tool/standard. The description of such activities must differentiate between those emergency actions initiated to restore power while active fire suppression is ongoing and actions that occur following active fire suppression during the post-fire suppression repair and rehabilitation phases of fire protection operations.*

8.2.3.8 Emergency Response Vegetation Management

Utility Initiative Tracking ID: 8.2.3.8.1

SCE conducts this activity within its inspection and line clearing programs and therefore, relates to VM-7 and VM-8.

Overview of initiative *– Brief description of the initiative including the objective and the risk targeted by the initiative*

As part of mitigating increased wildfire risk, SCE performs incremental vegetation inspections and remediations in certain locations within its HFRA during the fire season based on weather conditions and other factors. This initiative is distinct from emergent work that may arise leading to P1 and/or P2 work orders, as described in more detail in Section 8.2.6.

For this activity, SCE targets locations that experience increased wildfire risk conditions, such as elevated dry fuel levels, known as Areas of Concern (AOC). These AOCs are identified by a combination of factors

such as age of the fuels, current and forecasted state of fuel moisture, and the area's subjectivity to fire during periods of high wind, high temperatures and low humidity. The AOCs are prioritized by risk ranking.

Weather conditions such as high wind or extended heat during periods of low fuel moisture have greater potential to generate significant fire events if an ignition occurs. In 2020, SCE's Fire Science team identified 17 AOCs in its HFRA, which are areas that pose increased fuel-driven and wind-driven fire risk primarily due to elevated dry fuel levels. This threat can be magnified during periods of high wind, high temperatures and low humidity, as forecasts predicted for Fall 2020 in Southern California. The methodology used to identify the AOCs was based on several factors, including fire history, weather conditions, fuel type, exposure to wind, and egress, among others. In 2021, SCE improved its AOC inspections by implementing both a Summer and a Fall AOC program. The Summer AOC effort identified 12 areas where there was risk of a fuel-driven fire, five of which were identified as significant risk and were the focus of additional inspections. The 2021 Fall AOC effort was very similar to the 2020 AOC exercise, and indeed many of the same areas were identified (11 areas). The identified AOCs will continue to be a part of SCE's wildfire strategy with similar areas consistently targeted for inspection unless a significant event or weather condition adjusts the makeup of the AOCs.

Additionally, SCE modifies its Vegetation Management activities during red flag warning (RFW) periods to help mitigate potential risks. For example, SCE will pause non-emergency work in HFRA (e.g., use of chainsaws) that has the potential to cause sparks, and instead work in non-HFRA areas. For any PSPS events during high fire risk days, Vegetation Management crews are on standby to mitigate any vegetation-related ignition risks identified during PSPS pre- or post-patrols.

Governing standards and electrical corporation standard operating procedures *– Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

SCE's standard operating procedures related to this initiative are documented in "Vegetation Management Operations Incident Management Team (IMT) Storm Manual."

Updates to initiative *- Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation*

Currently, there are no changes to this initiative since the last WMP submission.

8.2.3.8.1 Emergency Response Vegetation Management Post-Fire

Utility Initiative Tracking ID: 8.2.3.8.1.1

SCE performs post-fire Vegetation Management activities as a response to fires that occur unexpectedly and not as a planned fire mitigation initiative with forecasted scope.

Overview of initiative *– Brief description of the initiative including the objective and the risk targeted by the initiative*

SCE conducts post-fire remediation efforts to remove trees that have become hazards due to fire damage and address resulting debris. Trees can become hazards as a result of recent fire damage and be at risk of falling into SCE facilities and infrastructure.

For example, in response to 2020's Creek Fire events, SCE identified trees that had become hazards and conducted requisite removals. Similarly, in 2021, SCE responded to the French fire, and performed mitigation work to identify hazard trees and remove them.

Governing standards and electrical corporation standard operating procedures *– Reference to the appropriate code and electrical corporation program/process. If any standard exceeds regulatory requirements, this must include reference to the basis document for the electrical corporation-specific values.*

In 2021, SCE began developing internal standard practices for post-fire remediation work. This involved integrating SCE's Vegetation Management documentation processes with those of SCE's Incident Management Team (IMT) related to restoration work. This allows for an integrated approach to post-fire Vegetation Management work as part of SCE's overall restoration efforts. Because this Vegetation Management work is critical to helping ensure the safety and reliability of the electric system, and the health and safety of our workers and our customers, and because it is often necessary to clear vegetation from roads, ROWs, and properties prior to other restoration work beginning, SCE works expeditiously to remediate identified Vegetation Management issues post-fire. Delaying restoration efforts until routine work is scheduled is not practical and could result in increased risks of tree failure.

SCE relies on the professional judgment of its ISA certified arborist employees and qualified contractor inspectors to determine whether a tree has the potential to live and/or presents a high enough risk to utility infrastructure to warrant trimming or removal. This is especially important in environmentally sensitive areas, such as waterways and areas where protected wildlife live.

Updates to initiative *- Changes to the initiative since the last WMP submission and a brief explanation as the why those change were made. Discuss any planned improvements or updates to the initiative and timeline for implementation.*

There have been no updates to this initiative since the last WMP filing.

8.2.4 Vegetation Management Enterprise System (Arbora)

In this section, the electrical corporation must provide an overview of inputs to, operation of, and support for a centralized vegetation management enterprise system updated based upon inspection results and management activities such as trimming and removal of vegetation. This overview must include discussion of:

- *The electrical corporation's vegetation inventory and condition database(s).*

Throughout 2023, SCE will transition from legacy work management systems to the Arbora system. Multiple databases will be utilized for work execution during this transition period. As a mitigation effort, SCE plans to leverage a data warehouse to house these databases for consolidated work tracking and reporting. In 2024 and beyond, all VM programs are eventually planned for integration with Arbora.

Transitioning all VM programs to Arbora will help optimize day-to-day operations and improve data accuracy.

The legacy database used for Routine Vegetation Management was based on Esri native/off-the-shelf tools, mostly referred to as Survey123, which is a cloud-based application that houses SCE's tree related inventory and related inspections. These tools were deployed to field users in 2019 to replace the paper-based inspection form previously used to collect tree-related information.

Since 2018, HTMP and the Dead and Dying Tree Program have maintained inspection and mitigation inventory in Fulcrum, another cloud-based application. Field personnel use the Fulcrum application to enter tree risk assessment data captured from ISA Arborists' Level 2 assessments and execute the resulting mitigations. This data includes tree characteristics and location information.

Arbora, a Salesforce-based platform, is being developed to integrate programs from Survey123 and Fulcrum into a single work management system. SCE began integrating HTMP and the Dead and Dying Tree Program inventory data into Arbora in 2022 and will incorporate Routine VM inspection data in 2023. Field personnel will leverage mobile applications for mapping and data collection.

These tools are all adapted to either iOS (Apple-based iPad) or Android (Google-based tablets) platforms for easy field use. SCE provides iPads to inspection personnel as the preferred data collection tool. Use of electronic devices eliminates time-consuming and manual data entry and scanning of the paper-based forms.

- *Describe the electrical corporation's internal documentation of its database(s) - IT*

All current solutions are cloud-based platforms (Esri, Amazon Web Services, Salesforce). SCE maintains an in-house database as the system of record, and system support comprises both in-house and contract services. Our future planned work management system, Arbora, a Salesforce software-as-a-service, includes Salesforce's standards for backup and recovery processes.

The Arbora application solution design, including the data model, data schema, and all other database design aspects, are documented in the Solution Architecture Document for the application.

Functionally, SCE provides user job aids and training materials for users on how to enter data into field forms.

- *Integration with systems in other lines of business.*

The primary systems that Arbora integrates with are SAP and cGIS (consolidated geographic information system). All integrations are documented in the Solution Architecture Document for the Arbora application.

SCE is currently integrating Arbora with other systems, primarily for purposes related to Vegetation Management reporting. SCE is integrating Arbora with Snowflake, which SCE plans to use for operational reporting. Snowflake allows for a greater degree of reporting for Arbora along with legacy data from previous work management systems. Daily database archiving of Arbora data will be stored in Snowflake. With vastly different databases and system architectures, migrating historic data from

system to system is not practical. This streamlined reporting via a single source of data provides an overarching business advantage in reporting current and historic data.

- *Integration with the auditing system(s) (see Section 8.2.5, "Quality Assurance and Quality Control").*

QA/QC is currently performed within Survey123 and Fulcrum applications and will be performed in Arbora once programs are fully transitioned. SCE will continue to work within these work management systems to perform all necessary QC functions.
Describe internal procedures for updating the enterprise system including database(s) and any planned updates.

SCE is utilizing Salesforce as well as two Salesforce partner products, Youreka (for mobile forms) and Lemur (for mobile maps), as the core technology components of Arbora. The vendors for these products are responsible for updating their respective systems, including internal databases, on a regular basis (typically 3-4 times a year). When these updates are available, SCE loads this new code into the test environment and validate the functionality end-to-end with regression and user acceptance testing to help ensure everything works as expected in the production environment. Any bugs found are communicated back to the vendor to be fixed and retested. Once the testing is completed and passed, SCE migrates the new functionality to the production environment. For any custom developed functionality for the solution, SCE uses an agile development process with a standard monthly release schedule. This process also includes quality assurance testing, regression testing, and user acceptance testing before new functionality is moved into the production environment.

Any changes to the initiative since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation.

SCE implemented Arbora for HTMP and the Dead and Dying Tree program in June 2022 and for Routine Line Clearing in December 2022. As with other large system implementations, SCE will continue to monitor performance, and as applicable, run legacy systems in parallel. A data cutover comprising remaining open work from legacy systems is expected to occur in 2023. Existing work created in those systems will be "worked down" while Arbora ramps up with new work generation. Emergent li ne clearing work that is not part of routine maintenance cycles will be enabled by year-end 2023. SCE plans to enable Arbora for additional VM maintenance programs in 2024.

8.2.5 Quality Assurance and Quality Control

In this section, the electrical corporation must provide an outline of its quality assurance and quality control (QA/QC) activities for vegetation management. This overview must include:

- Reference to procedures documenting QA/QC activities.

VM QA/QC activities are addressed in procedure UVM-07, "Post Work Verification and UVM Program Oversight."[213]

[213] This procedure is included as a supporting document at https://www.sce.com/safety/wild-fire-mitigation.

- *How the sample sizes are determined and how the electrical corporation ensures the samples are representative.*

For Distribution line clearing, VM QC sampling is performed on a circuit mile basis. SCE uses a combination of risk-based (through its TRI risk model) and judgmental sampling[214] for this activity and applies varying Confidence Levels (CL) and Confidence Intervals (CI). First, sampling is performed using

SCE's TRI risk model which identifies four specific risk categories: A, B, C and D, with A being the highest risk tranche. The table below identifies the four risk categories and planned circuit miles to be inspected. 100% of Category A High Fire Risk miles will inspected, when practical, and miles within Category B, C & D will be inspected using a Confidence Level / Confidence Interval of 99/3%.

Table SCE 8-11 – Distribution Circuit Mile Inspections

Distribution HFRA & State Responsibility Area (SRA)				
TRI Category	HFRA & SRA	Total Miles	CL/CI %	Miles Inspected
A	4718	4718	100%	4718
B	2332	5788	99/3	1402
C	1887			
D	1569			
Total	10506		N/A	6120

With these risk-informed sampling volumes established, SCE then performs judgmental sampling to determine which miles to inspect. Judgmental sampling is performed in lieu of random sampling because VM QC is required to verify that work performed by all VM inspection and trimming contractors meets SCE and regulatory compliance requirements. This allows for an appropriate balance of QC inspections across the contractors that perform work.

For Transmission line clearing activities, sampling is performed on a circuit mile basis. Sampling for Transmission miles is performed using judgmental sampling and a CL/CI of 99/5%. Section 4.4 in UVM-07 provides the sampling strategy in more detail.

For VM's Hazard Tree and Dead and Dying Tree programs, 100% QC is performed to verify the remediation was performed. Additionally, for SCE's Hazard Tree program, independent QC tree assessments are performed to provide assurance the assessments performed by the Hazard Tree assessments are accurate. QC typically samples assessments that had a risk score of between 35 to 49 (the typical threshold where mitigation was not required) providing added assurance the trees requiring mitigation were not missed. QC sampling for the independent risk assessments is performed using a CL/CI of 99/2%.

Additionally, for Structure Brushing, in 2023 QC inspectors will focus structure brushing QC on Distribution structures subject to Public Resource Code 4292. The intent of the QC will be to confirm: (1)

[214] Judgmental sampling is a type of non-random sample that is selected based on the opinion of an expert. Results obtained from a judgment sample are subject to some degree of bias, due to the frame and population not being identical.

Structures brushed have met the requirements of PRC 4292, and: (2) reasonable assurance that structures are maintaining clearance requirements during the declared fire season. QC will target to inspect PRC 4292 Distribution Structures using a CL/CI of 99/2%, approximately 330 structures monthly.

- *Who performs QA/QC (internal or external, is there a dedicated team, etc.).*

QC is performed by a dedicated external contractor for all of SCE's VM programs, including Routine Line Clearing, Hazard Tree, Dead and Dying Trees, and Structure Brushing. However, selection and assignment of the QC work is performed by SCE internal compliance personnel. QC work is typically assigned 60 days after work completion.

- *Qualifications of the auditors.*

SCE interprets "auditors" to be the resources that perform QC, the function described in this section. QC personnel for HTMP, Dead and Dying Tree Removal, Routine Line Clearing for both Transmission and Distribution, and Structure Brushing are ISA Certified Arborists with utility vegetation management experience. QC inspectors that are not ISA certified but have utility vegetation experience may also be used but are required to obtain ISA certification within twelve-months of being hired.

- *Documentation of findings and how the lessons learned from those findings are incorporated into trainings and/or procedures.*

QC findings are tabulated using a dashboard system that identifies conformance rate and specific locations where work is performed and by the specific contractor. Monthly reports are generated documenting the results of the QC inspections in addition to monthly performance review meetings where performance in general is discussed. Contractors not meeting internal quality requirements (Acceptable Quality Level) may be placed on a corrective action plan if repeat performance issues are identified. The QC inspection, review and reporting process provides a continuous learning environment.

- *Any changes to the procedures since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation.*

SCE is reviewing the current oversight strategy for post-work verification performed by SCE senior specialists and will be increasing the volume and type of inspections performed for Routine Line Clearing. The changes will include additional oversight of Pre-inspection and Trimming activities and will be implemented in Q2 2023.

- *Tabular information:*
    - *Sample sizes*
    - *Type of QA/QC performed (e.g., desktop or field)*
    - *Resulting pass rates, starting in 2022*
    - *Yearly target pass rate for the 2023-2025 Base WMP cycle Table 8-18 provides an example of the appropriate level of detail.*

Table 8-18 - Vegetation Management QA/QC Program

Activity Being Audited	Sample Size	Type of Audit	Audit Results 2022	Yearly Target Pass Rate for 2023-2025
Distribution Vegetation Management Plan	SCE's Tree Risk Index (TRI) risk model is applied to sampling for Distribution circuits and was developed using outputs from SCE's Wildfire Risk Reduction Model (WRRM), historic Tree Caused Circuit Interruption (TCCI) data and other VM inventory data. The TRI risk model identifies four risk categories A, B, C & D, with category A being the highest risk. Sampling is performed using the following Confidence Level (CL)/Confidence Interval (CI) levels. UVM-07, Section 4.4 provides the sampling strategy in more detail.	Field	RCD:[210] 99.56% CCD:[210] 97.80%	RCD Target Pass Rate is 100% CCD Target Pass Rate is 95%
Transmission Vegetation Management Plan	Sampling for Transmission miles is performed using a CL/CI of 99/5%. UVM-07, Section 4.4 provides the sampling strategy in more detail.	Field	RCD: 99.74% CCD: 99.28%	RCD Target Pass Rate is 100% CCD Target Pass Rate is 95%

Activity Being Audited	Sample Size	Type of Audit	Audit Results 2022	Yearly Target Pass Rate for 2023-2025
Dead & Dying Tree Removal	100% verification of remediation	Field	>99.5%	100% remediation
HTMP	100% verification of remediation	Field	>99.5%	100% remediation

8.2.6 Open Work Orders

In this section, the electrical corporation must provide an overview of the procedures it uses to manage its open work orders resulting from vegetation management inspections that prescribe vegetation management activities. This overview must include a brief narrative that provides:

- *Reference to procedures documenting the work order process.*

Work order-related procedures are included in the standard operating procedures for each program and the overall vegetation management program.

- UVM Program Governance, reflected in UVM-01, "Utility Vegetation Management Program Manual."
- Transmission Vegetation Management Plan (TVMP), reflected in UVM-02, "Utility Vegetation Management Transmission Vegetation Management Plan (TVMP)" and UVM-08 "Utility Vegetation Management Managing Vegetation Threats".
- Distribution Vegetation Management Plan (DVMP), reflected in UVM-03, "Utility Vegetation Management Distribution Vegetation Management Plan (DVMP)" and UVM-08 "Utility Vegetation Management Managing Vegetation Threats".
- Integrated Vegetation Management Plan (IVMP), reflected in UVM-05, "Utility Vegetation Management Integrated Vegetation Management Plan (IVMP)" & UVM-08 "Utility Vegetation Management Managing Vegetation Threats".
- Hazard Tree Management Plan (HTMP), reflected in UVM-04, "Utility Vegetation Management Hazard Tree Management Plan (HTMP)". & UVM-08 "Utility Vegetation Management Managing Vegetation Threats".
- *A description of how work orders are prioritized based on risk.*

SCE prioritizes and endeavors to complete work orders within certain time frames based on the risk

posed by observed conditions. First, SCE categorizes vegetation work orders between Priority 1 (P1) and Priority 2 (P2).

The conditions below are situations that most likely would trigger a P1 work order:

- Any observed tree, or parts thereof, that is expected to imminently fail and contact electric facilities
- Any observed vegetation condition where it appears that contact has occurred with primary electric facilities
- Any observed vegetation condition where it appears that strain or abrasion has occurred with secondary bare open wire
- Specific to HTMP and Dead and Dying Tree Removal, any observed tree, where failure of the tree and contact with the conductors is highly probable to occur in a high-wind events
- Any observed tree, or parts thereof, where vegetation contact or arcing with bare-wire conductors is highly probable to occur in a high-wind or modeled maximum load event due to vegetation proximity to power lines

The conditions below are situations that most likely would trigger a P2 work order:

- Any observed tree, or parts thereof, that is not a P1 condition and is currently stable but the likelihood of failure and/or contact with primary electric facilities is plausible but not imminent
- Any observed vegetation condition, that is not a P1 condition and is currently stable but where it appears that vegetation may cause a failure of electric facilities (i.e., a condition that changes pole loading conditions such as excessive strain on a down guy or communication wires)
- Any observed tree, or parts thereof, that is not a P1 condition but is within the Trigger Clearance Distance (TCD), Compliance Clearance Distance (CCD), or Regulatory Clearance Distance (RCD)215 (including strain or abrasion at the secondary level that is not a P1 condition)
- Any Vegetation with an HTMP Risk score resulting in a P2 mitigation (typically a risk score 50–100 using the Tree Risk Calculator)

SCE then endeavors to remediate according to the following time frames:

For P1 Work Orders

- SCE endeavors to remediate P1s where there is vegetation contact or evidence of contact (e.g., scarring or burn marks) within 24 hours.
- SCE endeavors to remediate P1s in HFRA only, where vegetation is within approximately 18

[215] See UVM-03 Distribution Vegetation Management Plan (DVMP) in Supporting Docs. RCD means Regulatory Clearance Distance, and is the minimum clearance required by regulation. CCD means Compliance Clearance Distance and is SCE's minimum clearance standard which is 1.5 times the RCD. TCD means Trigger Clearance Distance. TCD is derived from CCD plus 3 feet and is the distance that triggers the maintenance activity. GRCD is the Grid Resiliency Clearance Distance, which aligns with the GO95 Rule 35, Appendix E recommended clearance.

inches of energized equipment and thus an imminent threat, but there is no evidence of actual contact (e.g., scarring or scorch marks) within 72 hours.

For P2 Work Orders

- SCE endeavors to remediate P2s when vegetation is closer than the regulatory required distance (e.g., four feet) but beyond 18 inches within 30 days.
- For all other P2s related to Routine Line Clearing, SCE endeavors to remediate them within 90 days, unless there is a limited timeframe triggered by permitting requirements or customer requests. Currently SCE addresses these based on a first-in/first-out methodology, but starting in 2023 SCE anticipates utilizing a new risk calculation accounting for factors such as species growth rate, days elapsed since identification of work, TRI identification, and the clearance distance at time of inspection. These combined factors will provide a better depiction of overdue work risk based on the data collected in the field.
- For P2s related to HTMP and the Dead and Dying Tree Removal Program, SCE endeavors to address them within 180 days. Currently SCE addresses these based on a first-in/first-out methodology, but starting in 2023 SCE anticipates utilizing Tree Risk Calculator scores to help prioritize P2 work orders based on the various conditions that the score incorporates, such as root defects, cracks, rot, pest infestations, lean, height, and fire impact.

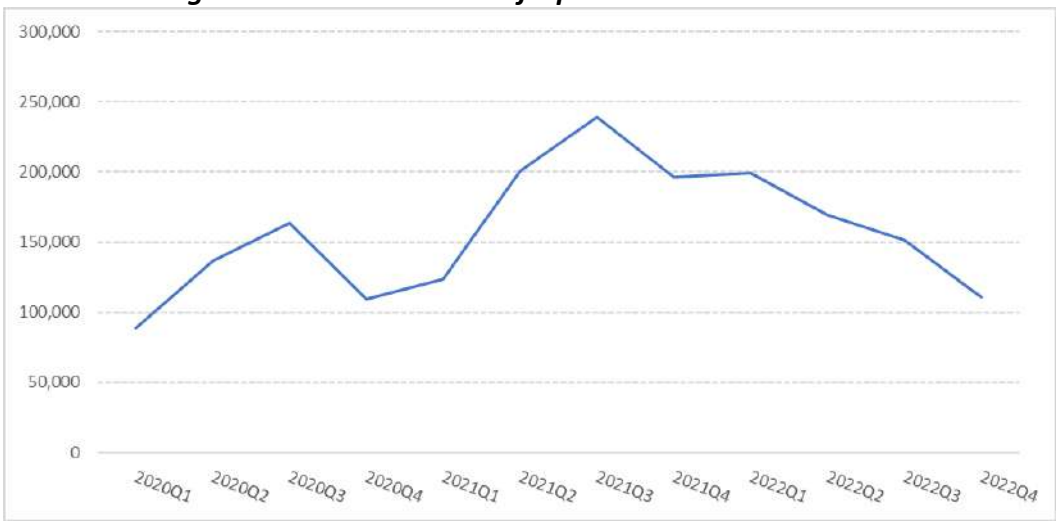
- A description of the plan for eliminating work order backlogs (i.e., open work orders that have passed remediation deadlines), if applicable.

SCE is working diligently to address work order backlogs. These backlogs can form for several reasons, including environmental regulatory requirements and permitting, contractor performance, and other factors. In Section 5.4.5, SCE outlines the steps it is taking to address environmental related backlogs. Further, SCE has implemented process improvements for monitoring contractor progress against plan, and grouping and prioritizing work. Additionally, SCE's continued progress on developing a single work order system will improve efficiency for contractor assignment and data input. Finally, SCE has implemented more robust reporting to improve the monitoring of work order completion progress.

To mitigate the risk of an overdue vegetation work order becoming a fire risk, SCE monitors overdue work orders related to Routine Line Clearing that involve vegetation breaching the required compliance distance from SCE's lines by revisiting them every 30 days to help ensure they do not become imminent threats.

- *A discussion of trends with respect to open work orders.*

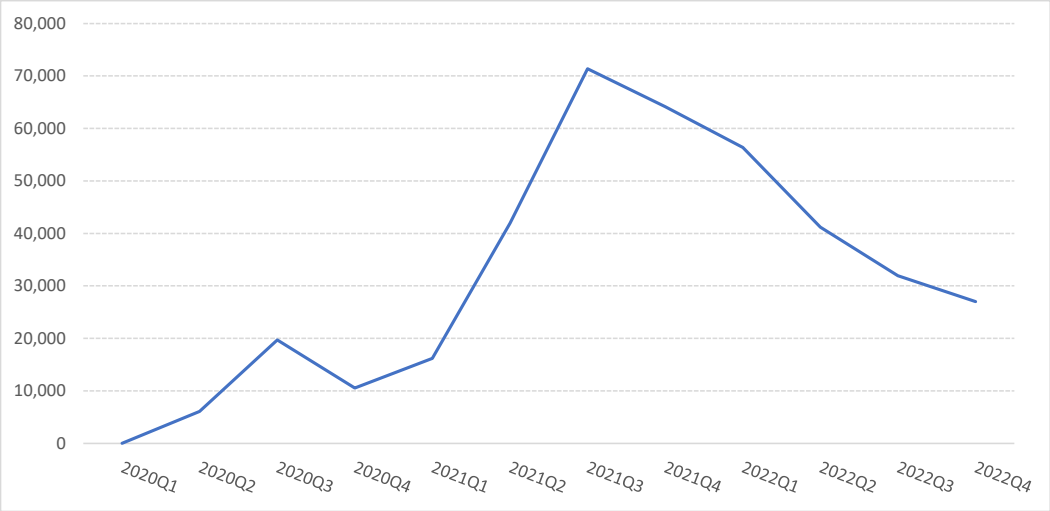
SCE's open work order history shows a reduction of 22% when comparing the average of total open work orders at year-end for 2019 through 2021 to the year-end count of open work orders in 2022. Additionally, in the last four years, SCE has maintained a 55-day average turnaround time for all



generated work not impacted by environmental constraints. For environmentally constrained work, SCE's work orders have been completed in an average turnaround time of 110 days. The longer duration is generally a result of the high level of coordination required with various entities and stakeholders. Additionally, it should be noted that the environmentally impacted tree inventory has increased from 13% in 2019 to 36% in 2022, a significant factor underlying SCE's open work order counts.

In addition, each electrical corporation must:

- *Graph open work orders over time as reported in the QDRs (Table 2, metrics 7.a and 7.b).*



The figure below shows the count of open work orders for Vegetation Management for 2020 through 2022, as of each quarter-end, and as reflected in SCE's QDR Table 2 for metric 6a.

Figure SCE 8-44 - Volume of Open Work Orders

The figure below shows the count of past due work orders for Vegetation Management for 2020 through 2022, as of each quarter-end, and as reflected in SCE's QDR Table 2 for metric 6b. SCE defines "past due work orders" as those work orders that have exceeded internal targets of 30 days for work where the existing clearance is less than the Regulatory Clearance Distance (RCD) and for 90 days where the existing clearance is between the RCD and the Trigger Clearance Distance (TCD).

Figure SCE 8-45 - Volume of Past Due Work Orders

Note: In 2019, SCE began building its capabilities to capture data related to past due work orders. Due to the time lag required to render a work order "past due," first quarter of 2020 shows a low volume, with a steady increase throughout the year.

In 2021, SCE experienced a higher level of both open and past due work orders as a result of an increase in mitigation work requiring environmental review and the shifting of work resulting from safety stand-downs for two contractors.

- *Provide an aging report for work orders past due (Table 8-19 provides an example).*

Table 8-19: Number of Past Due Vegetation Management Work Orders Categorized by Age

Table 8-19 - Routine Line Clearing as of 12/31/2022 (1)

HTFD Area	0-30 Days	31-90 Days	91-180 Days	181+ Days	Total
Non-HFTD	4,592	2,582	1,962	2,113	**11,249**
HFTD Tier 2	2,049	1,512	1,661	6,522	**11,744**
HFTD Tier 3	2,107	7,545	1,988	6,284	**17,924**

Note: The majority of the past due open work orders comprise P2 work orders.

Hazard Tree (HTMP/DRI) as of 12/31/2022

HTFD Area	0-30 Days	31-90 Days	91-180 Days	181+ Days	Total
Non-HFTD	7	30	18	192	**247**
HFTD Tier 2	57	423	291	2,328	**3,099**
HFTD Tier 3	0	14	5	82	**101**

Note: The majority of the past due open work orders comprise P2 work orders.

8.2.7 Workforce Planning

In this section, the electrical corporation must provide a brief overview of its recruiting practices for vegetation management personnel. It must also provide its worker qualifications and training practices for workers in the following target roles:

- *Vegetation inspections*
- *Vegetation management projects*

For each of the target roles listed above, the electrical corporation must:

- *List all worker titles relevant to the target role.*
- *List and explain minimum qualifications for each worker title with an emphasis on qualifications relevant to vegetation management. Note if the job requirements include the following:*
    - *Special certification requirements, such as being an International Society of Arboriculture Certified Arborist with specialty certification as a Utility Specialist or a California-licensed Registered Professional Forester*
    - *Additional training on biological resources identification and protection (e.g., plant and animal species and habitats); and cultural prehistoric and historic resources identification and protection*
- *Report the percentage of electrical corporation and contractor full-time equivalents (FTEs) in target roles with specific job titles*
- *Report plans to improve qualifications of workers relevant to vegetation management. The electrical corporation must explain how it is developing more robust outreach an onboarding training programs for new electric workers to identify hazards that could ignite wildfires*

Table 8-20 provides an example of the required information.

SCE's vegetation management personnel are integral to the success of its operations. To that end, in addition to a pay structure emphasizing work experience and education, SCE utilizes employment-focused social media platforms and community outreach programs to recruit resources. See Section 8.2.2.1 Routine Line Clearing under "Accomplishments" in sub-section "Workforce Retention and Upskilling" for more details on SCE's alignment between compensation and qualifications.

In the table below, SCE summarizes the applicable information for each of the target roles identified. Full time employee (FTE) figures represent counts and percentages as of month-end November 2022 and include SCE and contractor field workers relevant to each target role. It is important to note that worker counts can fluctuate throughout the year depending on work required, resource availability, and other factors, particularly for contract workers. Below each table, SCE provides a more detailed description of the qualifications for each role, as well as discussion on training and plans to improve worker qualifications.

8.2.7.1 Target Role: Vegetation Inspections

SCE's Vegetation Management program performs several types of inspections to identify the risk of vegetation contact with energized conductors and electrical assets. Recruiting and training vegetation personnel is an ongoing activity. Staffing levels are continuously evaluated and adjusted based on identified needs and implementation of future programs. See Section 8.2.2 for detailed information on vegetation management inspections.

Vegetation Management Inspections include the following target role positions:

- Specialist
- Senior Specialist
- Inspector
- Lead Inspector
- Customer Coordinator
- General Foreman
- Quality Control Inspector

Table 8-20 details the worker titles and associated qualifications pertaining to Vegetation Inspections. For purposes of this table and target role, "Special Certification Requirements" includes International Society of Arboriculture (ISA) Arborist.[216]

[216] To earn a credential as an ISA Certified Arborist, an individual must be trained and knowledgeable in all aspects of arboriculture and adhere to the ISA's Code of Ethics. To be eligible, individuals must have one or both of the following: three or more years of full time, eligible, practical work experience in arboriculture; a degree in the field of arboriculture, horticulture, landscape architecture, or forestry from a regionally accredited educational institute

Table 8-20 - Vegetation Inspections Qualifications and Training

Worker Title	Minimum Qualifications for Target Role	Special Certification Requirements	Electrical Corporation % FTE Min Quals[217]	Electrical Corporation % Special Certifications[218]	Contractor % FTE Min Quals	Contractor % Special Certifications	Reference to Electrical Corporation Training/Qualification Programs
SPECIALIST	See below	N/A	26.3%	N/A	0.0%	N/A	See below
SENIOR SPECIALIST	See below	ISA Arborist[219]	73.7%	100%	4.0%	47%	See below
LEAD INSPECTOR	See below	ISA Arborist	0.0%	N/A	13.4%	62%	See below
PRE-INSPECTOR[220]	See below	N/A	0.0%	N/A	39.7%	20%	See below
CUSTOMER COORDINATOR[220]	See below	N/A	0.0%	N/A	20.4%	9%	See below
GENERAL FOREMAN	See below	ISA Arborist	0.0%	N/A	13.7%	12%	See below
QUALITY CONTROL INSPECTOR	See below	ISA Arborist	0.0%	N/A	8.8%	67%	See below
TOTAL			100.0%	N/A	100.0%	N/A	N/A

[217] "% of FTE Min Quals" column = # of SCE Workers in each Worker Title / Total # of SCE Workers in the Table. The same logic applies for Contractor.
[218] "% Special Certification" column = # of SCE workers in that Worker Title that have the special certification / total number of SCE workers in that Worker Title. The same logic applies for Contractor.
[219] ISA Certified Arborist is required for SCE-employed Senior Specialists. For contractor Senior Specialists who may perform some work duties on a temporary basis, ISA certification is encouraged, but not required.
[220] ISA Certified Arborist is not a requirement for Inspectors and Customer Coordinators, but they are encouraged to obtain certification when eligible.

All Vegetation Management field workers must meet certain minimum qualifications. In some cases, certain worker types are required to be ISA-certified. Specific qualifications for each position are detailed below.

Additional Minimum Qualifications:

SPECIALIST: Provides oversight and guidance to field contractors performing vegetation work. All of SCE's Specialists must have three or more years' experience in Utility Vegetation Management.

SENIOR SPECIALIST: Provides oversight and guidance to field contractors performing vegetation work. Senior Specialists have additional responsibilities such as being able to perform post-work verification (to help ensure that work is done to regulatory requirements and program standards), responding to trouble orders, and performing review of work performed on SCE's Bulk Transmission System. SCE employed Senior Specialists must be ISA Certified Arborists.[221]

PRE-INSPECTOR: Personnel performing pre-inspections without supervision responsibilities. Pre-Inspectors are qualified if they meet one of the following conditions at date of hire: Possess a 4-year degree in related field with ability to obtain ISA certification in 12 months; possess a 2-year degree in related field with one year experience and ability to obtain certification in 12 months; possess two years of industry experience with the ability to obtain ISA certification in 12 months.

LEAD PRE-INSPECTOR: Personnel responsible for supervising pre-inspections. Lead pre- Inspectors are qualified if they meet of the following conditions at date of hire: classified as a level 3 or higher on the T&E Labor Classifications described in the Pricing Workbook[222] and be an International Society of Arboriculture (ISA) Certified Arborist,[223] it is recommended that they also obtain the Tree Risk Assessment Qualification (TRAQ).

CUSTOMER COORDINATOR: Issues notifications regarding upcoming vegetation management work, fields customer constraints (e.g., refusals, issues with site access, etc.) related to vegetation management work, and works to obtain customer permissions, e.g., for recommended expanded clearances. To qualify, the individual must possess a minimum of two years of related utility vegetation management pruning, inspection, or planning experience.

GENERAL FOREMAN: Oversees crew operations by helping to ensure crew safety, scheduling work based on crew qualifications, resolving escalated customer constraints, and coordinating with the Senior Specialists in their district. At a minimum, SCE's contracts require one designated General Foreman per every eight crews. The General Foremen must be ISA Certified Arborists and/or must possess a minimum of three years of related utility vegetation management pruning, inspection, or planning experience.

QUALITY CONTROL (QC) INSPECTOR: QC Inspectors are independent of vegetation management

[221] To earn a credential as an ISA Certified Arborist, an individual must be trained and knowledgeable in all aspects of arboriculture and adhere to the ISA's Code of Ethics. To be eligible, individuals must have one or both of the following: Three or more years of full time, eligible, practical work experience in arboriculture; a degree in the field of arboriculture, horticulture, landscape architecture, or forestry from a regionally accredited educational institute
[222] For more information, please see Pricing Workbook in Supplemental Materials.
[223] In certain situations, pending Edison Representative approval, a contractor may recommend a non-ISA certified arborist to perform pre-inspection supervisory functions.

operations and perform inspections to verify that regulatory and program standards have been achieved. They must have either an ISA Arborist Certification or have a minimum of two years of experience performing utility vegetation inspections and have experience measuring vegetation to conductor clearance using precision measuring tools. Once the inspector is eligible for ISA certification, it is expected that the inspector will become certified within six months of eligibility.

Training and plans to improve worker qualifications:

SCE provides onboard and annual training– Utility Vegetation Management Core Plans Training – to all vegetation management employees and vegetation contractor lead personnel. This training provides detailed reviews of program requirements, practices, and procedures, and any updates or enhancements pertaining to SCE's vegetation management program. Typical training included in Core Plans Training reviews the following vegetation management process documents that guide work in this space: Transmission Vegetation Management Plan (TVMP); Distribution Vegetation Management Plan (DVMP); Hazard Tree Management Plan; Vegetation Threat Management; Customer Refusals; and QC and SCE's Oversight Strategy. As it pertains to wildfire mitigation practices, this training identifies and conveys differences in inspecting, and pruning practices (e.g., clearance distances) within SCE's HFRA vs. non-HFRA and identifies vegetation that pose a risk and/or hazard to electrical facilities.

Additionally, SCE provides Environmental Awareness Orientation annually or at time of personnel onboarding to all vegetation management employees and vegetation contractor personnel listed in Table 8-20 and Table 8-21. This Orientation includes review of biological, wetlands/waters, and cultural/historical resources avoidance and protection; environmental compliance and requirements; and environmentally sensitive areas.

In addition to Core Plans Training, all vegetation management personnel receive training to identify and understand the actions required when work is being performed in environmentally sensitive locations. For SCE's Bulk Transmission vegetation management inspections, SCE also provides technical training on how to use LiDAR-acquired data to determine vegetation encroachments into the minimum vegetation clearance distance.

To grow the pool of ISA-certified arborists, SCE plans to continue to hire Specialists who do not yet have an ISA-certification but who will, under the guidance of Senior Specialists, acquire the vegetation management-related experience necessary to meet the experience requirement for an ISA-certification.

8.2.7.2 Target Role: Vegetation Management Projects

SCE's vegetation management projects are programs focused on removing hazards, such as dead and dying trees and those that are in proximity and may pose a risk to electric facilities.

Recruiting and training vegetation personnel is an ongoing activity. Staffing levels are continuously evaluated and adjusted based on identified needs and implementation of future programs. Please see Sections 8.2.3.1.1 and 8.2.3.4 for detailed information on vegetation management projects.

The three vegetation management projects are: (1) Structure Brushing; (2) HTMP; (3) Dead and Dying Tree Removal Program, as described in Sections 8.2.3.1.1, 8.2.3.4.1 and 8.2.3.4.2, respectively.

Table SCE 8-12 below detail the worker titles and associated qualifications pertaining to Vegetation Projects.

Table SCE 8-12 - Vegetation Management Qualifications and Training

Worker Title	Minimum Qualifications for Target Role	Special Certification Requirements	Electrical Corporation % FTE Min Quals[35]	Electrical Corporation % Special Certifications[36]	Contractor % FTE Min Quals	Contractor % Special Certifications	Reference to Electrical Corporation Training/Qualification Programs
SPECIALIST	See below	N/A	26.3%	N/A	0.0%	N/A	See below
SENIOR SPECIALIST	See below	ISA Arborist[224]	73.7%	100%	8.6%	47%	See below
HTMP ASSESSOR	See below	ISA Arborist	0.0%	N/A	17.1%	100%	See below
DEAD AND DYING TREE ASSESSOR[225]	See below	N/A	0.0%	N/A	20.0%	9%	See below
QUALITY CONTROL HTMP ASSESSOR	See below	ISA Arborist	0.0%	N/A	4.0%	100%	See below
FOREMAN	See below	N/A	0.0%	N/A	5.7%	N/A	See below
HAZARDOUS TREE SPECIALIST	See below	N/A	0.0%	N/A	2.9%	N/A	See below
STRUCTURE BRUSHER	See below	N/A	0.0%	N/A	41.7%	N/A	See below
TOTAL			100.0%	N/A	100.0%	N/A	N/A

[224] ISA Certified Arborist is required for SCE-employed Senior Specialists. For contractor Senior Specialists who may perform some work duties on a temporary basis, ISA certification is encouraged, but not required.
[225] ISA Certified Arborist is not a requirement for Dead and Dying Tree Assessor, but they are encouraged to obtain certification when eligible.

Additional Minimum Qualifications:

SPECIALIST: Support Senior Specialists in their Routine Line Clearing, HTMP and Dead and Dying Tree Program work. Specialists are also not assigned to specific geographic Districts and are available to support where needed. See qualifications of Specialist in Section 8.2.8.1.

SENIOR SPECIALIST: Resolve customer constraints and help ensure that the Routine Line Clearing, HTMP and Dead and Dying Tree Program work is done. See qualifications of Senior Specialist in Section 8.2.8.1

HTMP ASSESSOR: Responsible for conducting risk assessments on trees located in the Utility Strike Zone (USZ). Assessors are qualified if, at date of hire, they possess an ISA Arborist Certification and a minimum of three years of related utility vegetation management inspection/planning experience.

DEAD AND DYING TREE ASSESSOR: Responsible for performing visual inspections to detect dead, dying and diseased trees in the field. Assessors are qualified if, at date of hire, they have the requisite experience as a vegetation management professional and have two years of previous utility vegetation management experience.

QUALITY CONTROL HTMP ASSESSOR: Independent of HTMP operations and perform two specific roles related to QC of HTMP: Perform an independent risk assessment to verify the accuracy of the risk assessment score achieved by the HTMP assessors; and verify all HTMP remediations have been performed. ISA Certification is only required for HTMP QC personnel who perform risk assessment using the TRC. All other QC work requires a minimum of two years of experience performing utility vegetation inspections.

FOREMAN: Oversees work performed by crews to help ensure proper tools and equipment are available and the work is performed safely; help ensures process adherence and conducts QC reviews. Must have knowledge of: Brush clearance requirements; herbicide restrictions; and environmental requirements. Skills and abilities required for this job are of a level comparable with those normally acquired through a high school education and extensive training and experience as a Structure Brusher.

HAZARDOUS TREE SPECIALIST: Conducts the felling of trees and identifies the hazards and obstacles before and after felling each tree. Provides direction to crews and helps allocate resources and equipment such that work is performed safely and efficiently, and without compromising surrounding trees and environment. The knowledge, skills, and abilities required for this job are of a level comparable with those normally acquired through a high school education, Supplemental by one year of experience as a timber faller with thorough knowledge of tree soundness and cutting techniques to directionally fall trees.

STRUCTURE BRUSHER: Responsible for conducting pole and sub-transmission tower brushing by eliminating weeds, grass, and other flammable materials to bare soil by mechanical methods from 10-foot radius at ground level to a height of 8 feet. Skills and abilities required for this job are of a level comparable with those normally acquired through a high school education and annual environmental training.

Training summary and plans to improve worker qualifications:

Training for HTMP, the Dead and Dying Tree Removal Program, and Structure Brushing includes: Training of specific work processes; refusal management; vegetation threat management; QC requirements; Tree Risk Calculator training for those involved in HTMP; and environmental-specific training.

Through the substantive minimum qualifications established for the various roles within Vegetation Projects, SCE has established the foundation of a strong skilled workforce. SCE will continue requiring the qualifications discussed above and encourage continued advancement of SCE and Contract workers. For example, once an assessor is eligible for ISA certification, it is expected that he or she will become certified within twelve months of eligibility.

As part of continuing education and improvement of the vegetation management program, SCE updates its training programs based on lessons learned. SCE also provides refresher training and relevant communications to workers on updated guidelines, as there are typically changes in protocols that occur each year.

8.2.8 Maturity Advancement

SCE continually seeks alignment with government and industry organizations and continues to look for opportunities to improve vegetation management maturity over time.

The activities discussed in this section could lead to Vegetation Management and Inspections maturity advancements. Below is a summary of broader anticipated maturity improvements over the WMP period that supplement the objectives outlined at the beginning of the Section.

Table SCE 8-13 – Vegetation Management Maturity Improvements

Capability Name	Projected Maturity Improvements
Vegetation Inventory and Condition Database	Improvements include utilization of remote sensing information that will help validate database information.
Vegetation Inspections	Improvements include new considerations taken for inspection frequency (i.e., tree health) and using remote sensing information to support increased inspection frequency and QA/QC assessment of inspection program conducted on a quarterly basis.

8.3 Situational Awareness and Forecasting

8.3.1 Overview

In this section, the electrical corporation must identify objectives for the next 3- and 10-year periods, targets, and performance metrics related to the following situational awareness and forecasting programmatic areas:

- *Environmental monitoring systems*
- *Grid monitoring systems*
- *Ignition detection systems*
- *Weather forecasting*
- *Ignition likelihood calculation*
- *Ignition consequence calculation*[226]

8.3.1.1 Objectives

Each electrical corporation must summarize the objectives for its 3-year and 10-year plans for implementing and improving its situational awareness and forecasting.[227] *These summaries must include the following:*

- *Identification of which initiative(s) in the WMP the electrical corporation is implementing to achieve the stated objective, including Utility Initiative Tracking IDs*
- *Reference(s) to applicable codes, standards, and best practices/guidelines and an indication of whether the electrical corporation exceeds an applicable code, standard, or regulation*
- *Method of verifying achievement of each objective*
- *A completion date for when the electrical corporation will achieve the objective*
- *Reference(s) to the WMP section(s) or appendix, including page numbers, where the details of the objective(s) are documented and substantiated*

This information must be provided in Table 8-21 for the 3-year plan and Table 8-22 for the 10- year plan. Examples of the minimum acceptable level of information are provided in Tables below.

[226] The final 2023-2025 Wildfire Mitigation Plan Technical Guidelines, issued on December 6, 2022, removes Ignition likelihood calculation and Ignition consequence calculation and replaced it with Fire Potential Index.
[227] *Annual information included in this section must align with the QDR data.*

Table 8-21 - Situational Awareness Initiative Objectives (3-year plan)

Objectives for Three Years (2023–2025)	Applicable Initiative(s), Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
Increased data collection (through additional weather station deployment, explore increased collection intervals, and additional SCE HD camera deployment) to expand situational awareness of real-time conditions and refine weather models	Weather Stations, SA-1, HD Cameras, SA-10 Satellite & Other Imaging Technology, SA-10	SA-1 Requested by OEIS to increase weather station data collection periods (more than 6 reads per hour)[228] SA-10: N/A	SA-1: GIS data, increase frequency of reads SA-10: Additional GIS data, data camera feed on vendor network.	SA-1: End of 2025 SA-10: End of 2024	Section 8.3.2.1.1 Weather Stations (SA-1), pp. 454-459 Section 8.3.4.1.1 (HD Cameras SA-10), pp. 492-497 Section 8.3.4.1.2 (Satellite& Other Imaging Technology SA-10), pp. 494-498
Expand data analysis supporting wildfire mitigation efforts, advance fire potential forecasting further, and improve modeling efforts as it relates to fire science	Fire Science, SA-8	N/A	Additional data sets, analysis results, operational products	Ongoing	Section 8.3.2.1 Existing Systems, Technologies and Procedures pp. 453-464; Section 8.3.4 Ignition Det. Sys. pp. 490-501
Increase ability to detect issues (e.g., damage and degradation) on the electric grid prior to risk events occurring	Early Fault Detection (D&T), SA-11	• GO 95 • GO 165	Number of EFD devices deployed	Ongoing	Section 8.3.3.1.1, Radio Frequency Monitors: Early Fault Detection (EFD) (SA-11), p. 469
Review emerging technologies to improve weather situational awareness and forecasting capabilities for potential evaluation or adoption	Weather & Fuels Modeling, SA-3	N/A	Technical report from academic or vendor work, and/or new product outputs.	Ongoing	Section 8.3.5, Weather Forecasting, pp. 499-515
Continue to increase situational awareness and improve the accuracy of weather forecasting to help optimize the scope of PSPS events	Weather Stations, SA-1, Weather & Fuels Modeling, SA-3, Fire Science, SA-8, HD Cameras, SA-10	Best practices	SA-1: Continue installing new weather stations, commitment of 85. Upgrade more stations for dual comms for real-time reads capabilities. SA-3 and SA-8: Weather and fuel forecast output from operational systems and associated verification and/or technical reports. SA-10: Continued installs of HD Cameras, goal of 10, max of 20.	Ongoing; annual scope	Section 8.3.2.1.1 Weather Stations (SA-1), pp. 454-458 Section 8.3.5, Weather Forecasting, pp. 499-514 Section 8.3.2.1 Existing Systems, Technologies and Procedures pp. 453-462; Section 8.3.4 Ignition Det. Sys. pp. 490-497 Section 8.3.4.1.1 (HD Cameras SA-10), p. 492-497

[228] Decision on SCE's 2022 Wildfire Mitigation Plan Update, p. 45.

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

Table 8-22 - Situational Awareness Initiative Objectives (10-year plan)

Objectives for Ten Years (2026–2032)	Applicable Initiative(s), Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
Incorporate climate modeling (e.g., impacts of climate change) into medium- and long-term weather and fire potential forecasts	SA-3 SA-8	N/A	Provide commentary on trends in weather, fuels, and fire potential. Develop new products.	2028	Section 8.3.5, Weather Forecasting, pp. 499-514 Section 8.3.2.1.2 Existing Systems, Technologies and Procedures pp. 457-462; Section 8.3.4 Ignition Det. Sys. pp. 490-501
Continue to incorporate technologies and pilots into grid monitoring	Early Fault Detection (D&T), SA-11	• GO 95 • GO 165	Grid monitoring procedure updates.	End of 2032	Section 8.3.3.1.1, Radio Frequency Monitors: Early Fault Detection (EFD) (SA-11), p. 469

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

8.3.1.2 Targets

Initiative targets are forward-looking quantifiable measurements of activities identified by each electrical corporation in its WMP. Electrical corporations will show progress toward completing targets in subsequent reports, including QDRs and WMP Updates.

The electrical corporation must list all targets it will use to track progress on its situational awareness and forecasting for the three years of the Base WMP. Energy Safety's Compliance Assurance Division and third parties must be able to track and audit each target.[229] *For each initiative target, the electrical corporation must provide the following:*

- *Utility Initiative Tracking IDs.*
- *Projected targets for each of the three years of the Base WMP and relevant units.*
- *The expected "x% risk impact" For each of the three years of the Base WMP. The expected x% risk impact is the expected percentage risk reduction per year, as described in Section 7.2.2.2*
- *Method of verifying target completion.*

The electrical corporation's targets must provide enough detail to effectively inform efforts to improve the performance (i.e., reduction in ignition probability or wildfire consequence) of the electrical corporation's situational awareness and forecasting initiatives.

Table 8-23 provides an example of the minimum acceptable level of information.

In Table 8-23 below, SCE provides the expected risk impact for each initiative at the scoping unit level and at the HFRA-level. The risk impact percentages are in MARS. SCE includes additional columns in the table below showing the percentage of an initiative's scope that is in Severe Risk Area (SRA) and High Consequence Areas (HCA).

[229] Annual information included in this section must align with Table 1 of the QDR.

Table 8-23 - Situational Awareness Initiative Targets by Year

Initiative Activity	Tracking ID	2023 Target & Unit	x% Risk Impact 2023 (Scoped / HFRA)	2024 Target & Unit	x% Risk Impact 2024 (Scoped / HFRA)	2025 Target & Unit	x% Risk Impact 2025 (Scoped / HFRA)	Method of Verification
Weather Stations	SA-1	Install **85** weather stations in SCE's HFRA SCE will strive to install up to **95** weather stations in SCE's HFRA, subject to resource and execution constraints	32%/.01% *(PSPS risk only)*	Install **50** weather stations in SCE's HFRA SCE will strive to install up to **55** weather stations in SCE's HFRA, subject to resource and execution constraints	32%/.001% *(PSPS risk only)*	Install **15** weather stations in SCE's HFRA SCE will strive to install up to **20** weather stations in SCE's HFRA, subject to resource and execution constraints	32%/.0001% *(PSPS risk only)*	List and location of installed weather stations

8.3.1.3 Performance Metrics Identified by the Electrical Corporation

Performance metrics indicate the extent to which an electrical corporation's Wildfire Mitigation Plan is driving performance outcomes. Each electrical corporation must:

- *List the performance metrics the electrical corporation uses to evaluate the effectiveness of its situational awareness and forecasting in reducing wildfire and PSPS risk*[230]

For each of these performance metrics listed, the electrical corporation must:

- *Report the electrical corporation's performance since 2020 (if previously collected)*
- *Projected performance for 2023-2025*
- *List method of verification*

The electrical corporation must ensure that each metric's name and values are the same in its WMP reporting as its QDR reporting (specifically, QDR Table 2 and QDR Table 3). Metrics listed in this section that are the same as performance metrics required by Energy Safety and reported in QDR Table 2 (Performance Metrics)[231] *must match those reported in QDR Table 2. Metrics listed in this section that are not the same as any of the performance metrics identified by Energy Safety and reported in QDR Table 2 must match those reported in QDR Table 3.*

The electrical corporation must:

- *Summarize its self-identified performance metric(s) in tabular form*
- *Provide a brief narrative that explains trends in the metrics*

SCE identifies performance metrics that its situational awareness activities support in Table 8-24. Because SCE's situational awareness and forecasting activities are instrumental in reducing PSPS impacts, these metrics overlap with those identified in Section 9 – PSPS. Please refer to Section 9 for a narrative that explains trends in these metrics.

[230] There may be overlap between the performance metrics the electrical corporation uses and performance metrics required by Energy Safety. The electrical corporation must list these overlapping metrics in this section in addition to any unique performance metrics it uses.

[231] The performance metrics identified by Energy Safety are included in Energy Safety's Data Guidelines.

Table 8-24 - Situational Awareness and Forecasting Performance Metrics Results by Year

Performance Metrics	2020	2021	2022	2023 Projected	2024 Projected	2025 Projected	Method of Verification (e.g., third-party evaluation, QDR)
Frequency of PSPS Events (total)[232]	10	8	3	7	7	7	QDR, Tables 3 and 10
Scope of PSPS Events (total)[233]	424	232	13	210	197	185	QDR, Tables 3 and 10
Duration of PSPS events (total)[234]	4,455,936	3,700,254	112,274	2,508,101	2,282,372	2,076,958	QDR, Tables 3 and 10
Number of customers impacted by PSPS[235]	229,800	179,502	15,784	120,441	102,375	87,019	QDR, Tables 3 and 10

[232] Frequency of PSPS Events definition: Number of instances where utility operating protocol requires de-energization of a circuit or portion thereof to reduce ignition probability, per year. Only include events in which de-energization ultimately occurred
[233] Scope of PSPS Events definition: Circuit-events, measured in number of events multiplied by number of circuits de-energized per year
[234] Duration of PSPS events definition: Customer hours per year
[235] Number of customers impacted by PSPS definition: Number of customers impacted by PSPS (if multiple PSPS events impact the same customer, count each event as a separate customer)

8.3.2 Environmental Monitoring Systems

The electrical corporation must describe its systems and procedures for monitoring environmental conditions within its service territory. These observations should inform the electrical corporation's near-real-time risk assessment and weather forecast validation. The electrical corporation must document the following:

- *Existing systems, technologies, and procedures*
- *How the need for additional systems is evaluated*
- *Implementation schedule for any planned additional systems*
- *How the efficacy of systems for reducing risk are monitored*

Reference the Utility Initiative Tracking ID where appropriate.

8.3.2.1 Existing Systems, Technologies, and Procedures

The electrical corporation must report on the environmental monitoring systems and related technologies and procedures currently in use, highlighting any improvements made since the last WMP submission. At a minimum, the electrical corporation must discuss systems, technologies, and procedures related to the reporting of the following:

- *Current weather conditions:*
    - *Air temperature*
    - *Relative humidity*
    - *Wind velocity (speed and direction)*
- *Fuel characteristics:*
    - *Seasonal trends in fuel moisture*

Each system must be summarized in Table 8-25. The electrical corporation must provide the following additional information for each system in the accompanying narrative:

- *Generalized location of the system / locations measured by the system (e.g., HTFD, entire service territory).*
- *Integration with the broader electrical corporation's system.*
- *How measurements from the system are verified.*
- *Frequency of maintenance.*
- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate.*

For calculated quantities, how raw measurements are converted into calculated quantities. This should include flow charts and equations as appropriate.

SCE summarizes each of its environmental monitoring system in the table below. SCE details its efforts

to understand trends in seasonal fuel moisture and other fuel characteristics in Section 8.3.2.1.2 - Fuel Sampling (Fire Science SA-8).

Table 8-25 - SCE's Environmental Monitoring Systems

System	***Measurement/ Observation***	***Frequency***	***Purpose and Integration***
Weather Stations (SA-1)	Wind speed, wind direction, 3-second max wind gust, temperature, dew point, relative humidity, solar radiation (where applicable)	10-minutes, hourly, 24-hour (daily), 30-second reads on stations with cellular communications	Provide weather data for PSPS decision making Provide weather data for forecasts.
Fuel Sampling (SA-8)	Vegetation Moisture	Bi-weekly	Assess how receptive the fuels are to fire and help align FPI values when forecasts of live fuel moisture are misaligned with observations.
Fire Science (SA-8)	Santa Ana Wind Outlook	Monthly	Determine above or below normal Santa Ana wind days for the one-month and three-month periods.
Live Field Observations	Supplement information from weather stations and also identify flying debris, wire slap and other hazardous conditions that may be present at impacted area	As needed during PSPS	Qualified personnel can be deployed to high-risk portions of the grid to take live wind readings to supplement information from fixed weather stations and to watch for other inclement hazards.

8.3.2.1.1 Weather Stations (SA-1)

Weather stations are used to provide critical situational awareness for PSPS decision-making and help improve weather models. SCE's weather stations provide data points such as temperature measurements, wind speeds, wind direction, dew point, and relative humidity. Weather conditions can differ significantly at any given time within the HFRA in SCE's service area, due to the large size and diverse topography involved. For example, Southern California's mountains have rapid elevation changes and differing canyon orientations, which create localized weather zones. Installing weather stations on specific segments of circuits, SCE can sectionalize circuits and reduce the scope of PSPS events, where possible, thereby reducing the impact on our customers.

SCE monitors and analyzes weather data at the circuits and circuit segments, where available, across HFRA to inform critical operational decisions such as deploying PSPS protocols during elevated weather

conditions. Granular, circuit-level or circuit-segment level weather data is used by incident management team (IMT) personnel to inform initiation of PSPS events, customer notifications, de-energization decisions for SCE circuits, re-energizations, as well as limiting the impact of PSPS to the extent possible to particular segments of a circuit instead of a full circuit, where applicable, dependent on circuit configurations.

To improve existing weather models and access more granular real-time information during wildfire risk conditions, SCE increased the number of weather stations across distribution, sub-transmission and bulk-transmission circuits in its HFRA. A higher density of weather stations allows SCE to validate real-time conditions in the field during elevated fire conditions. Adding weather stations to transmission circuits will also help improve the visibility of the service area for enhanced weather models and accuracy, where data was not previously captured. Weather stations on transmission circuits provide a broader, more holistic weather forecast model as data from these stations are in locations not previously captured. Transmission weather stations allow for more complete weather modeling for situational awareness. Having more stations also expands and increases the granularity of data to enable improved weather forecasting capabilities at the circuit and circuit-section level.

As of December 2022, SCE has over 1,600 weather stations deployed across its HFRA, primarily on the distribution system, including over 115 stations on the sub-transmission and bulk-transmission system. SCE used industry equipment standards and placement techniques to capture the wind profiles of its circuits, while at times siting more than one station per circuit to account for variations in terrain, as well as circuit segmentation to minimize customer impacts.

Highlights since last WMP submission

SCE continued to expand its weather station network by installing 160 new weather stations in 2022, of which 53 were dual communications (cellular and satellite) stations. SCE further enhanced the existing network of weather stations by converting 127 existing stations to dual communication stations, to allow for real-time weather read capabilities as well as redundancy. Dual communication stations have both cellular and satellite communication capabilities. The satellite network is not reliable enough to facilitate increased weather reads more frequently than the current 10-minute reads. Cellular communications are capable and reliable for increased data collection intervals. Post 2019, weather station installations only consisted of satellite communications, therefore the addition of cellular modems will help us to achieve more frequent data reads per Energy Safety's Final Decision on SCE's WMP 2022 Update.

In 2023, SCE plans to convert approximately 500 existing stations into dual communication stations by adding cellular modems, where cellular coverage is available. In addition, SCE will attempt to pilot 30-second reads during 2023 PSPS events in order to learn how to best operationalize real time data reads on selected stations, based on PSPS needs and station functionality. Please see Appendix D: Areas for Continued Improvement for additional detail provided in response to a related ACI from SCE's 2022 WMP.

Generalized location of the system / locations measured by the system (e.g., HTFD, entire service territory)

SCE prioritizes weather station installations on HFRA circuits that are most likely to exceed PSPS wind thresholds. All distribution circuits that have met or exceeded PSPS wind thresholds in the past five

years now have at least one weather station installed. Not every distribution circuit in the HFRA has a weather station installed, but is in close enough proximity to have a nearby weather station assigned to provide coverage. Some circuits also need additional stations to obtain the desired level of situational awareness due to repeated PSPS impacts.

At this time, SCE considers the following in sequential order when prioritizing the locations of weather station installations:

1. HFRA distribution circuits with historical instances of forecasts reaching PSPS criteria[236] and does not have an assigned weather station to provide coverage.

2. HFRA distribution circuits that have previously experienced PSPS conditions and could benefit from extra weather stations for additional sectionalizing.

3. Sub-transmission and transmission monitoring zones with historical instances of forecasts reaching PSPS criteria and have no representative weather stations.

4. PSPS Operations subject matter experts' identification of circuits that would benefit from a weather station or an additional weather station by potentially limiting the number of customers impacted by a PSPS event by having more granular weather data available at a circuit/segment

Once the circuit is identified, placement along the circuits depends on several factors, including, but not limited to the following:

• Location is in a wind prone area (SCE prioritizes those circuits in wind-prone locations where the potential consequences of a catastrophic fire are high);

• Location is easily accessible to maintenance crews;

• Location has a clear view of the southern horizon for solar power recharge purposes as the stations are battery-powered;

• Location is free from major obstructions such as trees and buildings.

Integration with the broader utility system

While the primary intended purposes of the weather stations installed under this initiative are intended to support wildfire and PSPS risk mitigation, they can and do support other secondary functions within the utility. The following are some of the other applications of weather stations:

- SCE uses the weather data from the weather stations to forecast demand for load conditions to aide energy procurement.
- SCE's Transmission and Distribution organization uses weather data forecasts from SCE's weather services organization for outage forecasting to complete field work related to outages (e.g. pole replacements).

[236] See https://energized.edison.com/psps-decision-making for a description of SCE's PSPS decision-making criteria.

- SCE inputs the weather data for its-flown field conditions, the weather at the time of an aerial inspection, into its computer aided design and drafting program to help determine max-sag and max-sway for lidar imaging.

- SCE uses the current and historical weather data to provide seasonal outlooks for long term weather forecasting.
- Various IMTs unrelated to PSPS are sometimes activated during storm events, where high winds, rains, thunderstorms, etc. may be present but PSPS conditions are lacking, and rely on data from weather stations for situational awareness.

Process to verify measurements from the system

The weather stations in the field are calibrated on a nearly annual basis, based on field access, scheduling and coordination with other work. These calibrations are conducted with a set of specific tools as a part of the routine maintenance. The calibrations are a form of quality control to ensure accurate data reads as the tools compare station data to kit tools monitoring the same field conditions.

The data collected from the weather stations is also verified by checking for outlier reads compared to nearby stations. Outlier data is identified as possibly erroneous and not recorded for historical recall.

Frequency of maintenance

The weather stations are currently maintained approximately once per year, based on field access, scheduling and coordination with other work. SCE plans to adopt an annual calibration maintenance cycle by the end of 2023, based on weather station industry standards. Calibrations are completed on each station. The calibration validates data observed in the field and compares the values to those being collected by the weather station. The various weather station instruments are cleaned, tightened, re-aligned, replaced, etc., as needed during the calibration.

For intermittent systems (e.g., aerial imagery, line patrols), the processes used to trigger collection. This should include flow charts and equations as appropriate to describe the process.

Weather Stations are not considered an intermittent system; as such, this question does not apply.

For calculated quantities, the processes used to convert raw measurements to calculated quantities. This should include flow charts and equations as appropriate to describe the process

Weather stations are not a calculated quantity; as such, this question does not apply.

8.3.2.1.2 Fuel Sampling (Fire Science SA-8)

Frequently throughout the year it is important to view and collect vegetation moisture observations for the purposes of increasing our intra-year wildfire situational awareness. While local fire agencies conduct fuel sampling, SCE determined it would be beneficial to sample in areas where gaps exist both spatially and temporally in areas not covered by fire agencies and within its service territory. Fuel sampling consists of physically collecting small portions of the native vegetation, which is then brought to a lab to be weighed, dried, and then weighed again to determine the vegetation's moisture content. To assure the fuels sampling program is properly managed and there is little interruption of data, SCE

checks that all samples are collected and analyzed properly and resolves issues that may arise at any of the sites with the vendor as quickly as possible. This helps to ensure that the fuel sampling data is high-quality and will result in better model solutions and outputs.

Highlights since last WMP submission

In 2022, SCE continued sampling moisture levels within the live vegetation at the same 15 locations through its Fuels Sampling Program. SCE is continuing to evaluate the feasibility of expanding the program to collect samples from additional sites in SCE's HFRA where observation gaps may still exist (for instance in the Tehachapis or Southern Sierra). Also, SCE successfully used some of its sampled data from the past two years to approximate live fuel moisture content in other vegetation species such as sagebrush and ceanothus/manzanita.

Generalized location of the system / locations measured by the system (e.g., HTFD, entire service territory)

There are 15 fuel sampling sites within SCE's HFRA. These sites were initially selected by determining where areas could use more sampling to improve its locational fuel data, and then further refined based on SCE's right-of-way access, proximity to major roads, and the amount, type, and health of the vegetation at each location.

Integration with the broader utility system

This data is used extensively to help assess daily fire potential and to adjust FPI calculations when needed during PSPS events.

Process to verify measurements from the system

Measurements are verified by comparing the results with fuel sampling measurements performed by fire agencies.

Frequency of maintenance

Sampling is performed every two weeks throughout the year except when conditions are too wet from rain or vegetation is covered in snow.

For intermittent systems (e.g., aerial imagery, line patrols), the processes used to trigger collection. This should include flow charts and equations as appropriate to describe the process

Fuel Sampling is not considered an intermittent system, and as such, this question does not apply.

For calculated quantities, the processes used to convert raw measurements to calculated quantities. This should include flow charts and equations as appropriate to describe the process

Live Fuel Moisture Content (LFMC) is calculated by the following:

$$\text{LFMC} = \frac{\text{Weight of water in the vegetation}}{\text{Dry weight of the vegetation}} \times 100$$

This formula is applied individually to each vegetation species sampled at each of the 15 fuel sampling locations.

8.3.2.1.3 Fire Science Enhancements (Fire Science, SA-8)

SCE continues to build upon its foundational fire science program established several years ago. These enhancements include improving dead fuel moisture modeling, investigating historical weather patterns associated with critical fire weather events, and improving long-range fire potential forecasting. These enhancements are specifically designed to support the higher prioritized objectives associated with SCE's wildfire mitigation efforts for more risk-informed decision-making.

Improvements to dead fuel moisture modeling are necessary for better assessments of fire potential, especially how it relates to PSPS and associated customer notifications. Dead fuel moisture is one of the major inputs into the Fire Potential Index (FPI), which is a critical metric used in helping identify which customers may be affected by PSPS and when.

In 2025, SCE plans to utilize Self-Organizing Maps (SOMS) which are a form of pattern recognition and can be used to identify meteorological patterns that lead to extreme weather events. For example, SOMS can be used to not only identify Santa Ana winds, but they can also identify the characteristic of the Santa Ana wind events (i.e., magnitude, duration, and location). SOMS can also relate weather patterns to fire activity to show what fires may exhibit extreme fire behavior based on weather scenarios. This type of pattern recognition can be used as a predictive tool in helping identify potential PSPS events and situations where multiple large fires can occur simultaneously. SOMS can be incorporated into climate change modeling to show what trends exist in critical weather patterns that may pose a threat to SCE's infrastructure.

SCE's Santa Ana Wind Outlook subscription allows SCE to continue receiving 1-month and 3-month ahead forecasts of Santa Ana winds over the service territory. The model consists of several components, including a machine learning approach to help determine the approximate number of days over the forecast period in which Santa Ana wind conditions will occur. These forecasts are used in combination with SCE's seasonal outlooks to help inform the frequency of these events when planning for inspections and remediations across SCE's service area.

Finally, SCE has partnered with the California Polytechnic State University, San Luis Obispo (Cal Poly-SLO) and SJSU on academic research initiatives through the Wildland Urban Interface Fire Institute and the Wildfire Interdisciplinary Research Center (WIRC), respectively to support projects that address California's IOUs efforts to reduce utility caused ignitions.

Highlights since last WMP submission

In 2022, SCE retrained the machine learning models used to generate its Santa Ana Wind 1-month and 3-month-ahead outlooks. These retrained models incorporate more history and allow for improved forecasting of these types of events. In addition, SCE was able to generate products that compare forecasts of wind, temperature, FPI, etc., to historical weekly climatologies. These products allow the

user to understand the current forecast as it relates to past weather events.

Generalized location of the system / locations measured by the system (e.g., HTFD, entire service territory)

These efforts cover the SCE service area.

Integration with the broader utility system

The Santa Ana wind outlook is utilized for seasonal forecasting, while the dead fuel moisture model is used as a direct input into our daily assessment of fire potential.

Process to verify measurements from the system

SCE's vendor, ADS, provides verification for the Santa Ana Wind Outlook and the dead fuel moisture forecast.

Frequency of maintenance

Models are retrained every two-to-four years in order to better account for any large-scale atmospheric changes. In meteorology, large-scale is defined as a horizontal length scale of the order of 1000 kilometers (about 620 miles) or more.

For intermittent systems (e.g., aerial imagery, line patrols), the processes used to trigger collection. This should include flow charts and equations as appropriate to describe the process

Fire Science Enhancements is not an intermittent system and as such this question is not applicable.

For calculated quantities, the processes used to convert raw measurements to calculated quantities. This should include flow charts and equations as appropriate to describe the process

Fire Science Enhancements is not a calculated quantity and as such this question is not applicable.

8.3.2.1.4 Live Field Observations

SCE trains and deploys personnel to perform line patrols and live field observations (LFOs), providing critical situational awareness during PSPS to inform decision-making.

During PSPS, real-time information regarding the impacted areas can help determine the need for various just-in-time wildfire mitigations efforts, such as vegetation remediation and infrastructure repairs. In-person observations may help to supplement information from weather stations and identify flying debris, wire slap and other hazardous conditions that may be present at the impacted area. Prior to re-energization, in-person observations may also help to identify whether lines are clear of potential hazards. Without these observations, SCE would miss some valuable inputs, compromising its ability to make informed decisions about potential PSPS de-energizations and re-energizations.

Line patrols and LFOs (monitoring) provide critical sources of situational awareness that allow for the execution of SCE's PSPS protocols before and during a PSPS event, and after weather conditions have abated. Before an event, line patrols are carried out by qualified personnel (e.g., troublemen, senior patrolmen, etc.) using iPads to examine SCE assets for any potential concerns that may be exacerbated by the upcoming wind event. During an event, qualified personnel can be deployed to high-risk portions of the grid to take live wind readings using handheld weather stations to provide field conditions readings to supplement information from fixed weather stations and to watch for other inclement hazards (e.g., airborne debris). These LFOs are performed to provide real-time data to SCE's Emergency

Operations Center. After concerning weather conditions have abated, SCE must dispatch qualified personnel again to perform restoration patrols on all circuits that experienced a PSPS de-energization to ensure that they are safe for service restoration.

These protocols are imperative to SCE's decision making and will continue to be a part of SCE's WMP for the foreseeable future. Even with expanding automation and new technology, providing SMEs with visibility to grid and weather conditions provides invaluable situational awareness on local hazards like swaying lines with potential for wire-to-wire contact and airborne debris or vegetation. Field observers can also provide real-time weather reads using portable devices, supplementing weather station coverage of SCE's HFRA circuits.

Highlights since last WMP submission

In the latter half of 2022, SCE augmented PSPS pre-patrols with inspectors from the Vegetation Management team as part of an exploratory effort to better understand vegetation-related risks leading up to and associated with PSPS events, and to prescribe appropriate mitigations if any concerning issues were identified. In 2023, SCE plans to review the findings to better understand the risks involved and how they specifically relate to asset and field conditions associated with PSPS events and develop the appropriate mitigation, if any, through the established vegetation management inspection and remediation programs.

Using lessons-learned, SCE focused on resource management in order to execute on live field observations and quickly mobilize patrol resources, particularly during holidays when resources can be constrained. SCE modified internal policies that limited SCE 's ability to pre-stage patrol aircraft to ensure they were available as soon as PSPS conditions abated, in addition resource planning meetings were held several days prior to the event to ensure the right level of support through the entire duration of events.

Generalized location of the system / locations measured by the system (e.g., HTFD, entire service territory)

Line patrols and field observations are performed throughout the HFRA on any circuit that is in scope for PSPS consideration.

Integration with the broader utility system

The deployment and use of Live Field Observers (LFOs) is limited to PSPS events and, as a result, is not integrated with daily operations on the SCE grid.

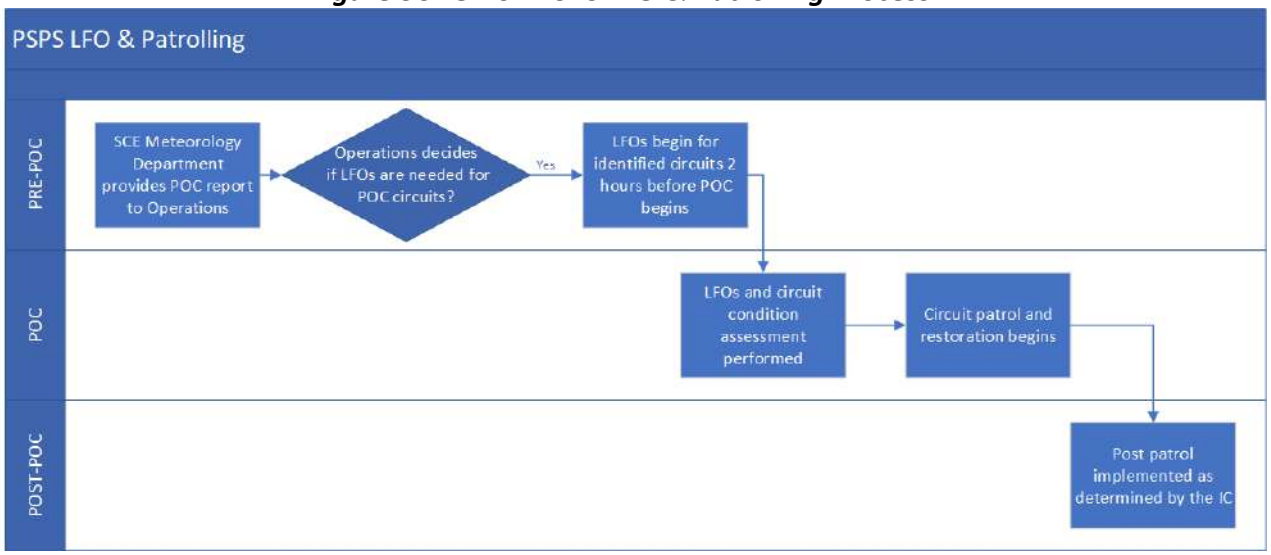
Process to verify measurements from the system

Not applicable, as this activity involves observations of weather and environmental conditions.

Frequency of maintenance

Annually, SCE delivers training to PSPS field personnel and briefs its contractors engaged in wildfire mitigation activities on requirements, potential impacts, and any updates to PSPS protocols since the prior year.

For intermittent systems (e.g., aerial imagery, line patrols), the processes used to trigger collection. This should include flow charts and equations as appropriate to describe the process



SCE utilizes proactive de-energization as a measure of last resort when all alternatives to de-energization are insufficient to address wildfire risk. The period of concern (POC) is when fire weather is forecasted that could potentially impact SCE's service territory. SCE performs pre-patrols of circuits in scope and deploys field personnel to circuits at risk to monitor real-time weather conditions.

LFOs provide critical sources of situational awareness that allow for the execution of SCE's PSPS protocols before and during a PSPS event, and after weather conditions have abated. These LFOs are performed to provide real-time data back to SCE's Emergency Operations Center. If field conditions are unsafe, field personnel performing the LFOs are required to notify the PSPS IMT.
After weather conditions have subsided, SCE dispatches qualified personnel to perform restoration patrols on all circuits that experienced a PSPS de-energization to ensure that re-energization is safe for service restoration.

The type of patrols performed by field personnel on circuits that appear on the POC Report include:

1. Pre-patrol: May be initiated up to five days in advance of the forecasted event.
2. LFO: Patrols performed during the POC Report.
3. Restoration Patrols: Performed during restoration to ensure no hazards exist before energizing circuit sections
4. Post-Patrol: Performed on circuits that were not de-energized at the request of the IMT Incident Commander.

Figure SCE 8-46 - PSPS LFO & Patrolling Process

For calculated quantities, the processes used to convert raw measurements to calculated quantities. This should include flow charts and equations as appropriate to describe the process

Live Field Observations is not a calculated quantity, and as such this question does not apply.

8.3.2.2 Evaluation and Selection of New Systems

The electrical corporation must describe how it evaluates the need for additional environmental monitoring systems. This description must include:

- *How the electrical corporation evaluates the impact of new systems on reducing risk (e.g., expected quantitative improvement in weather forecasting)*
- *How the electrical corporation evaluates the efficacy of new technologies These descriptions should include flow charts as appropriate.*

SCE continuously evaluates its current environmental monitoring systems for opportunities for improvement. As noted in Section 8.3.2.3, SCE is developing several changes and improvements to its environmental monitoring activities, which are intended to address areas and needs where SCE determined that its activities could be improved as existing technology advances.

8.3.2.2.1 How the electrical corporation evaluates the impact of new systems on reducing risk (e.g., expected quantitative improvement in weather forecasting)

SCE evaluates the impact of new systems by first proving the use case for the new system or technology with small case studies or limited deployment of the system or technology. SCE will observe the new technology or system to see if there are quantifiable impacts to SCE operations (e.g., fewer customers on a circuit de-energized during a PSPS event) or if the system or technology can aide in SCE's operational decision marking (e.g., improvement in weather forecasting).

8.3.2.2.2 How the electrical corporation evaluates the efficacy of new technologies

Once a system or technology has been operationalized, SCE evaluates the efficacy of the new systems or technologies by validating that the systems or technologies are being used and providing essential information to aide in SCE's decision-making process. This process occurs in a few cross-functional groups across SCE who routinely meet and discuss identified improvements to aide in efforts to continuously improve its situational awareness.

8.3.2.3 Planned Improvements

The electrical corporation must describe its planned improvements for its environmental monitoring systems.[237] This must include any plans for the following:

- *Expansion of existing systems*
- *Establishment of new systems*

For each planned improvement, the electrical corporation must provide the following in Table 8-26:

- ***Description:** A description of the planned initiative activity*
- ***Impact:** Reference to and description of the impact of the initiative activity on each risk and risk component*
- ***Prioritization:** A description of the x% risk impact (see Section 8.1.1.2 for explanation)*

[237] *Annual information included in this section must align with Tables 7 and 8 of the QDR.*

- ***Schedule:*** *A description of the planned schedule for implementation*

SCE provides its planned improvements to its Environmental Monitoring Systems in Table 8-26 below.

Table 8- 26 - SCE's Planned Improvements to Environmental Monitoring Systems

System	Description	Impact	x% Risk Impact	Implementation Schedule
Weather Stations (SA-1)	SCE plans to install an additional 85, with a strive goal of 95, weather stations in 2023. SCE will continue to install on sub-transmission and bulk-transmission locations for more complete weather forecast models. Installs will also still occur at the distribution circuit level.	The additional weather stations will improve existing weather models and provide more granular real-time information during wildfire risk conditions. Additional weather stations will also enable SCE to sectionalize circuits and reduce the scope of PSPS events, where possible, thereby reducing the impact on our customers	Please see Table 8-23 for risk impact information	End of 2025
Remote Sensing (SA-8)	SCE plans to develop the Vegetation Build-up Index with the University of Colorado.	The Vegetation Build-up index will provide better assessment of long-term fire potential	Please see Table 8-23 for risk impact information for all of SA-8	End of 2024

System	Description	Impact	x% Risk Impact	Implementation Schedule
Fire Science Enhancements (SA-8)	SCE will work to continuously improve the accuracy of its weather modeling capabilities and begin work in SOMS in 2025.	SOMS can be used to identify meteorological patterns that lead to extreme weather events.	Please see Table 8-23 for risk impact information for all of SA-8	End of 2025
Climate Change Modeling (SA-8)	Starting in 2025, SCE will downscale multiple Global Climate Models (GCM's) to 1-kilometer resolution with hourly temporal resolution of various weather and fuel parameters such as temperature, relative humidity, wind, fuel moisture, and FPI.	This allow for detailed analysis to be conducted to show trends in weather, fuels, and fire potential.	Please see Table 8-23 for risk impact information for all of SA-8	End of 2028

SCE also provides additional information on its Remote Sensing and Climate Change Modeling planned improvements that was not discussed in Section 8.3.2.1.

8.3.2.3.1. Remote Sensing (Fire Science-SA-8)

SCE is implementing remote sensing technology to collect additional information on weather, fuels, and fire activity to enhance SCE's wildfire modeling capabilities. Collecting weather, fuels, and fire activity information in remote areas is challenging, which makes it necessary for SCE to continually evaluate ways to improve its situational awareness in these areas.

SCE's Fire Sciences organization is actively engaged in two remote sensing projects:

1. SCE is working with the University of Colorado, Boulder to develop a Vegetation Build-Up Index which will utilize remote sensing information pertaining to vegetation amount, type, and age to determine where the greatest threat for significant fire may be possible within SCE's service area within the next 6 months. The Vegetation Buildup Index will result in a heat map showing

the approximate areas where the dynamic combustibility of fuels is greatest. This product will allow for an objective, quantifiable process to help identify AOCs which are areas where inspections and potential remediations of any known issues are accelerated.

2. SCE will continue to explore its LiDAR pilot project with San Jose State University (SJSU) to measure wind speeds. While SCE uses LiDAR for vegetation management purposes, LiDAR technology in this case is used to observe wind speeds above the ground every 5 minutes. When circuit level wind speeds are difficult to predict due to complex terrain, monitoring wind speeds above these circuits could provide insight into the behavior of the wind and the potential for PSPS threshold winds to extend down to the circuit level. This data may potentially be useful in the decision-making process regarding PSPS de-energization.

SCE began implementing a lower atmospheric wind profiler pilot project in 2021 in connection with SJSU. The pilot includes profiling winds in the lower atmosphere using LiDAR technology to collect wind observations above ground level. In 2022, SCE continued to use SJSU's LiDAR system to sample wind speeds at specific locations on an ad hoc basis dependent on the occurrence of Santa Ana winds.

8.3.2.3.2 Climate Change Modeling (Fire Science-SA-8)

With the rapid change in climate and its impact on wildfire activity, it is imperative that SCE have detailed projections of weather and fuel conditions to determine changes in fire potential and fire activity in the future. This information will drive decision-making regarding any remaining grid hardening activities and will help SCE be better prepared for future changes in wildfire.

Starting in 2025, SCE will downscale multiple Global Climate Models (GCM's) to 1-kilometer resolution with hourly temporal resolution of various weather and fuel parameters such as temperature, relative humidity, wind, fuel moisture, and FPI. These datasets will allow for detailed analysis to be conducted to show trends in weather, fuels, and fire potential. It is also possible that this data can help determine trends in the number of PSPS events in the future. The result of these analyses will not only help to improve SCE's weather and fuels modeling, but it will also help inform how SCE designs its equipment and grid structure moving forward.

8.3.2.4 Evaluating Mitigation Initiatives

The electrical corporation must describe its procedures for the ongoing evaluation of the efficacy of its environmental monitoring program.

SCE's procedures for the ongoing evaluation of the efficacy of its environmental monitoring program include a review of how these systems are used and verifying system measurements are accurate.

SCE continuously evaluates the efficacy of its environmental monitoring program by validating that it consistently provides essential information to aide in SCE's decision-making process. SCE's environmental monitoring systems and processes have evolved from operational decision making during PSPS events only, to being used on a daily basis to inform assessments of the service territory, fire risk, and provide situational awareness. The continued use and refinement of SCE's environmental monitoring systems assures SCE is producing the desired result it intended to. In evaluating new technologies and industry standards of the same or similar systems, SCE is able to assess and confirm efficacy due to the growth of use, and even expansion, in its various systems.

And as discussed in each environmental monitoring system, SCE has developed a process to verify the

measurement from the system so that SCE can rely on the information the system or process provides. SCE is continuously evaluating its environmental monitoring systems to determine areas for improvements. As noted above in Section 8.3.2.3, SCE is developing several changes and improvements to its environmental monitoring activities, which are intended to address areas and needs where SCE determined that its activities could be improved.

8.3.3 Grid Monitoring Systems

The electrical corporation must describe its systems and procedures used to monitor the operational conditions of its equipment. These observations should inform the electrical corporation's near-real-time risk assessment. The electrical corporation must document:

- *Existing systems, technologies, and procedures*
- *Procedure used to evaluate the need for additional systems*
- *Implementation schedule for any planned additional systems*
- *How the efficacy of systems for reducing risk are monitored Reference the Utility Initiative Tracking ID where appropriate.*

8.3.3.1 Existing Systems, Technologies, and Procedures

The electrical corporation must report on the grid system monitoring systems and related technologies and procedures currently in use, highlighting any improvements made since the last WMP submission. At a minimum, the electrical corporation must discuss systems, technologies, and procedures related to the detection of:

- *Faults (e.g., fault anticipators, rapid earth fault current limiters, etc.)*
- *Failures*
- *Recloser operations*

Each system must be summarized in Table 8-27 below. The electrical corporation must provide the following information for each system in the accompanying narrative:

- *Location of the system / locations measured by the system*
- *Integration with the broader electrical corporation's system*
- *How measurements from the system are verified*
- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate*
- *For calculated quantities, how raw measurements are converted to calculated quantities. This should include flow charts and equations as appropriate.*

Below, SCE summarizes each of its grid operation monitoring systems in Table 8-27. SCE employs a variety of systems/technologies to track and monitor issues on its grid related to faults, failures and recloser operations. SCE's Grid Operations team will monitor faults and power flow, and work to respond and/or dispatch qualified resources to remediate issues in the field.

For systems such as Early Fault Detection (EFD) and Distribution Fault Anticipation (DFA), reviews of data collected from EFD and DFA are not performed immediately and therefore the information does not inform near-term risk assessment. SCE also analyzes outages, faults and wire-down data collected from these systems to make recommendations for any changes needed to the suite of existing grid monitoring systems/technologies.

Table 8-27 - Grid Operation Monitoring Systems

System	Measurement/ Observation	Frequency	Purpose and Integration
Radio Frequency Monitors	• High frequency discharges	Approximately 4.16 million samples per cycle	Identifies incipient faults before they are realized, e.g., Early Fault Detection (EFD) (SA-11)
Protective Relays	• Electrical current • Electrical voltage • Wave form harmonics	Minimum 4 samples per cycle.	Detects abnormal grid conditions such as faults, wire-downs, open phase conditions, and high impedance faults and deenergizes those circuits or circuit segments, e.g., TOPD (SH-8), Hi-Z, DOPD, and Fast Curves
Smart Meters	• Electrical voltage • Electrical usage (kWh) • Meter exceptions and events (voltage thresholds that are exceeded, power off and on)	Voltage readings are in hourly intervals. Usage readings are either 15 minute or 1 hour intervals. Meter events are logged in the meter as they exceed thresholds. Meter exceptions are generated near real-time when thresholds are exceeded.	Detects energized wire-downs and other high impedance faults/hazards or identifies a failure mode of distribution transformers, e.g., MADEC, Transformer Early Damage Detection
Fault Recorders	• Electrical current • Electrical voltage • Wave form harmonics	For transient records, minimum 20 samples per cycle. For long term records, minimum 4 samples per cycle.	Verifies faulted phases, fault locations and relay operation after a faulted event, e.g., Digital Fault Recorder (DFR)

System	Measurement/ Observation	Frequency	Purpose and Integration
Fault Current Limiters	• Electrical current • Electrical voltage	Approximately 83 samples per cycle	Detects ground fault and reduces voltage on faulted lines, e.g., REFCL

8.3.3.1.1 Radio Frequency Monitors: Early Fault Detection (EFD) (SA-11)

EFD technology detects high frequency radio emissions that can occur from arcing or partial discharge conditions on the electric system. These types of conditions can be indicative of an incipient failure, such as severed strands on a conductor, vegetation contact, or deterioration of insulating material (known as tracking). EFD could potentially be used to monitor the overall health of the electric system which may inform operational decisions during high-risk conditions. Each pair of sensors is able to "bi-angulate" the detection down to a specific location.

- *Location of the system / locations measured by the system:* EFD sensors are installed every 3 circuit miles on distribution circuits and every 5 circuit miles on sub-transmission and transmission circuits. All circuitry between sensor pairs is monitored by the system.
- *Integration with the broader electrical corporation's system:* EFD presently leverages the use of conventional cellular carriers (AT&T, T-Mobile, Verizon) and cloud service providers (Amazon Web Services) to operate and is not directly integrated with SCE systems.
- *How measurements from the system are verified:* SCE uses patrols and inspections to verify the conditions of assets identified by EFD as being potentially degraded or defective.
- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate:* Not applicable. These are not intermittent systems despite having sampling intervals as the systems are continuously operating to detect conditions. EFD sensors continually monitor the lines in locations where the sensors are deployed. If a potential fault condition is detected, the EFD system will begin recording and reporting the data. A "detection" is either a high voltage excursion or a sample that is detected at multiple EFD's ("matching detection"). The analysis of EFD data is then performed manually by SCE's engineers. If engineering finds that the EFD technology detected a potential issue on the grid, they will notify the district, who creates a notification and repair work order for patrols and inspections to verify the condition of the asset(s) in the field.
- *For calculated quantities, how raw measurements are converted to calculated quantities. This should include flow charts and equations as appropriate*: Not applicable. EFD does not use calculated quantities.

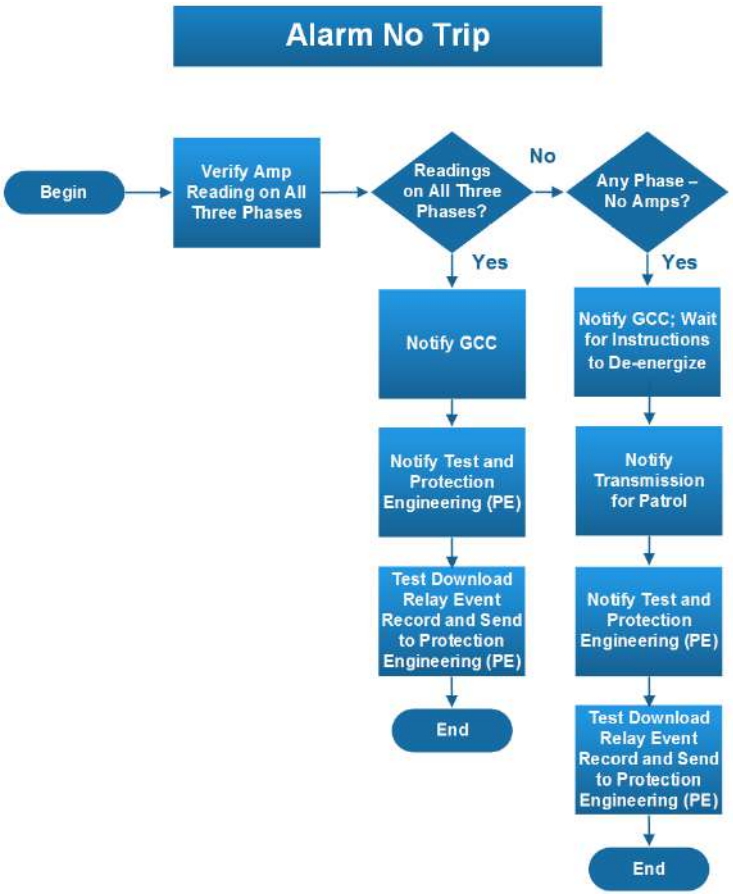
8.3.3.1.2. Protective Relay—e.g., Transmission Open Phase Detection (TOPD), Distribution Open Phase Detection (DOPD), High-Impedance faults Relays (Hi-Z), Rapid Earth Fault Current Limiters (REFCL), RARs, Fast Curve, Circuit Breaker Relays

8.3.3.1.2.1 Protective Relay - Transmission Open Phase Detection (TOPD) (SH-8)

TOPD technology allows de-energization of an open phase (broken conductor) on the transmission system before it contacts a grounded object resulting in a fault event. This technology reduces ignition risks associated with the high voltage transmission system. Please see Section 8.1.8.1.3.2 for a detailed discussion of TOPD.

- *Location of the system / locations measured by the system:* SCE equips existing Transmission relays that protect the Transmission lines residing in HFRA with the TOPD scheme. The TOPD scheme provides open phase detection from both the local and remote terminal to the whole Transmission line on which the TOPD-equipped Transmission relay sits.
- *Integration with the broader electrical corporation's system:* The TOPD scheme provides an additional layer of protection for Transmission lines and is integrated with the Energy Management System (EMS).
- *How measurements from the system are verified:* TOPD is in the pilot stage and most of the installation will remain in "Alarm mode" only, including new installations of TOPD. During "Alarm Mode" the TOPD scheme will not de-energize Transmission lines (please see Section 8.1.8.1.3.2 for a detailed discussion of TOPD). Upon receiving an Open Phase alarm, analysis of the any available relay oscillographs will be performed to determine operational effectiveness.
- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate:* Not applicable. These are not intermittent systems despite having sampling intervals as the systems are continuously operating to detect conditions. TOPD provides continuous monitoring of the Transmission line for an Open phase event related to a hardware failure.
- *For calculated quantities, how raw measurements are converted to calculated quantities. This should include flow charts and equations as appropriate*: The TOPD scheme is continuously monitoring the Transmission line for a loss of current on any single phase (wire). The minimum arming requirements must be met to successfully declare an open phase event. Upon an identification of a loss of phase, the TOPD scheme will validate that remaining phases are continuing to operate normally (un-faulted, normal load, etc.). If the above requirements are met, the TOPD will successfully declare an Open Phase event providing a local and remote alarm.
- TOPD is armed when loading is above 13% of the primary current transformer ratio (CTR) and identifies an open phase event on the transmission line for a single conductor break. The scheme measures the primary current of a Current Transformer (CT) by measuring the secondary of the CT and then multiplying by the CTR.

$$TOPD_{Arming} \geq 13\% * CTR_{Pri}$$



8.3.3.1.2.2 Protective Relay—Distribution Open Phase Detection (DOPD)

Similar to TOPD, DOPD is a technology on the distribution system that allows de-energization of an open phase (broken conductor) before it contacts a grounded object resulting in a fault event.

- *Location of the system / locations measured by the system:* The DOPD scheme leverages existing assets (Distribution Recloser Controllers) that protect the Distribution lines residing in high fire risk areas.

- *Integration with the broader electrical corporation's system:* The DOPD scheme is integrated with the Distribution Management System (DMS) and provides an additional layer of protection that is continuously monitoring the Distribution line for an Open phase event related to a hardware failure.
- *How measurements from the system are verified*: The DOPD scheme is being deployed initially in "alarm mode" only during the pilot stage. Upon receiving an open phase alarm, analysis is performed on the available relay oscillographs to determine operational effectiveness. Figure SCE 8-47 below demonstrates how DOPD alarms are currently verified.

Figure SCE 8-47 - DOPD Alarm Verification Process

- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection*. This should include flow charts and equations as appropriate: Not applicable. These are not intermittent systems despite having sampling intervals as the systems are continuously operating to detect conditions. DOPD provides continuous monitoring.
- *For calculated quantities, how raw measurements are converted to calculated quantities*. This should include flow charts and equations as appropriate: The DOPD scheme is continuously monitoring the Distribution line for changes in the magnitude and angle of the voltage to detect for an Open Phase condition.

DOPD utilizes the voltage (V) and current (I) transformation signals to identify an open phase(s) event on the primary portion of the distribution circuit. The scheme measures the primary voltage of a Potential Transformer (PT) by measuring the secondary of the PT and then multiplying by the PT ratio (PTR). The scheme measures the primary current of a CT by measuring the secondary of the CT and then multiplying by the CTR.

$$I_{Pri} = I_{Sec} * CTR$$

$$V_{Pri} = V_{Sec} * PTR$$

8.3.3.1.2.3 Protective Relay—High Impedance (Hi-Z) Relays

SCE's traditional feeder protection elements are based on overcurrent, meaning the protection elements rely on fault magnitude to trigger the relay to operate. In a Hi-Z event, however, the fault magnitude is relatively small to non-existent. A Hi-Z scheme may detect incipient faults that are undetectable by the conventional overcurrent-based schemes. SCE is evaluating and validating Hi-Z efficiency in the field in detecting actual Hi-Z events.

- *Location of the system / locations measured by the system:* The Hi-Z scheme leverages existing assets (Distribution Recloser Controllers) that protect the Distribution lines residing in HFRA. The Hi-Z controllers are installed at recloser controller locations in HFRA to assess the effectiveness of detecting Hi-Z conditions. The locations were selected based on having voltage-sensors with minimum required current levels (i.e., ≥ 25amps).
- *Integration with the broader electrical corporation's system*: The Hi-Z scheme is integrated with the DMS system and is an additional layer of protection for incipient faults that is continuously monitoring the Distribution line for high impedance conditions.
- *How measurements from the system are verified:* The Hi-Z scheme is being deployed initially in "alarm mode" only during the pilot stage. Upon receiving a Hi-Z alarm, analysis of the any available relay oscillographs will be performed to determine operational effectiveness.
- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate*: Not applicable. These are not intermittent systems despite having sampling intervals as the systems are continuously operating to detect conditions. The Hi-Z scheme is continuously monitoring the Distribution line for changes in circuit harmonics to detect Hi-Z conditions.
- *For calculated quantities, how raw measurements are converted to calculated quantities. This should include flow charts and equations as appropriate:* Once a Hi-Z condition is detected, records from the controller are collected to be analyzed to evaluate the schemes' performance.

Hi-Z algorithm utilizes voltage (V) and currents (I) from the primary to arm the scheme when the loading is above 5% of the primary CTR to detect for Hi-Z conditions. The scheme measures the primary voltage of a PT by measuring the secondary of the PT and then multiplying by the PTR. The scheme measures the primary current of a CT by measuring the secondary of the CT and then multiplying by the CTR.

$$HiZ_{Arming} \geq 5\% * CTR_{Pri}$$

$$I_{Pri} = I_{Sec} * CTR$$

$$V_{Pri} = V_{Sec} * PTR$$

8.3.3.1.2.4 Protective Relays—Fast Curves

Fast Curves provide an additional layer of protection that detects faults and operates faster than traditional relay protection to deenergize the fault circuit or circuit section to reduce the fault energy and reduce ignition risk. For detailed information about Fast Curve Settings, please refer to Section 8.1.8.1.1. Information about the Remote Automatic Reclosures (RARs) (SH-5) and substation circuit breakers (CBs) (SH-6) on which Fast Curve settings are installed can be found in Section 8.1.2.8.2.

- *Location of the system / locations measured by the system:* Fast Curves leverage new or existing microprocessor relays on distribution lines at the station CB or RARs residing in HFRA.
- *Integration with the broader electrical corporation's system:* Fast Curve settings are integrated with RARs and substation CBs on the system (please refer to Sections 8.1.2.10 and 8.1.2.11 for more information). Fast Curve integrates with and utilizes both EMS and DMS for remote enablement and disablement of Fast Curve settings.
- *How measurements from the system are verified:* Fast Curve operation initiates an event record in the protective relay for analysis. Analyzing records after an event can identify which phases were faulted, the amount of fault current detected, and the possible location of the fault. The analysis is useful in identifying improper relay operations that can be remedied, by helping field crews verify the fault source and confirm correct protection equipment operation after a fault event.
- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate*: Not applicable. These are not intermittent systems despite having sampling intervals as the systems are continuously operating to detect conditions.
- *For calculated quantities, how raw measurements are converted to calculated quantities. This should include flow charts and equations as appropriate*: When enabled during fire weather threats, Fast Curves continuously monitor the circuit or circuit section for sudden increases in line current indicating an electrical fault and take action to deenergize the station CB or RAR to reduce the fault energy.

Fast Curve equations: CB station and RAR relays

Phase Fast Curve Pickup: >2.3x existing phase min trip

Phase Delay: 4 cycles

Ground Fast Curve Pickup: >5x existing ground min trip

Ground Delay: 4 cycles

8.3.3.1.3 Fault Current Limiters—Rapid Earth Fault Current Limiters (REFCL)

REFCL devices can detect ground faults as small as a half ampere on one phase in a three-phase powerline and almost instantly reduce the voltage on the faulted line while boosting the voltage on the two remaining phases, to maintain service for customers while extinguishing arcs. SCE utilizes two different forms of REFCL technology: Ground Fault Neutralizer (GFN) and Grounding Conversions for small systems. Significant details on SCE's REFCL program can be found in the workpaper titled, "Rapid

Earth Fault Current Limiter (REFCL) Projects at Southern California Edison."[238]

- *Location of the system / locations measured by the system*: The REFCL project covering the most circuit miles at SCE, Ground Fault Neutralizer (GFN), is installed in substations feeding circuits that go into HFRA. SCE is also performing other grounding conversion projects in 2023 through 2025 which monitor a smaller system, often a single circuit or even part of a distribution circuit.

- *Integration with the broader electrical corporation's system:* REFCL is integrated with the distribution system. GFN is integrated with EMS and DFRs. The GFN is connected to the source transformer for the distribution circuits. Isolation Transformers can also be installed so only part of a distribution circuit is monitored by these devices.

- *How measurements from the system are verified*: A digital fault recorder measures line currents and voltages for a post-fault analysis.

- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate*: Not applicable. These are not intermittent systems despite having sampling intervals as the systems are continuously operating to detect conditions. While operating modes continue to be developed, the expectation is the system will run constantly except when equipment reliability or activities such as single-phase switching require taking it temporarily out of service.

- *For calculated quantities, how raw measurements are converted to calculated quantities. This should include flow charts and equations as appropriate*: The controller for the GFN calculates many quantities. For a detailed description of the quantities calculated by REFCL systems see the workpaper titled, "Rapid Earth Fault Current Limiter (REFCL) Projects at Southern California Edison."[239]

8.3.3.1.4 Smart Meters—e.g., Meter Alarm Down Energized Conductor (MADEC), Transformer Early Damage Detection

MADEC is a machine-learning (ML) algorithm utilizing smart meter data to detect a subset of energized wire-downs and other high impedance faults/hazards. MADEC generates an alarm that allows an operator to act quickly and de-energize the circuit.

Transformer Early Damage Detection (EDD) utilizes meter data and a custom algorithm to proactively identify one failure mode of distribution transformers. Identified transformers are replaced before possible failure to mitigate safety hazards for the public, prevent grid disruptions, and outages.

- *Location of the system / locations measured by the system*: MADEC and Transformer EDD are currently being used to actively monitor SCE's service area, in locations where smart meters exist and adequate data can be collected. Each system resides on internal SCE hardware/software.

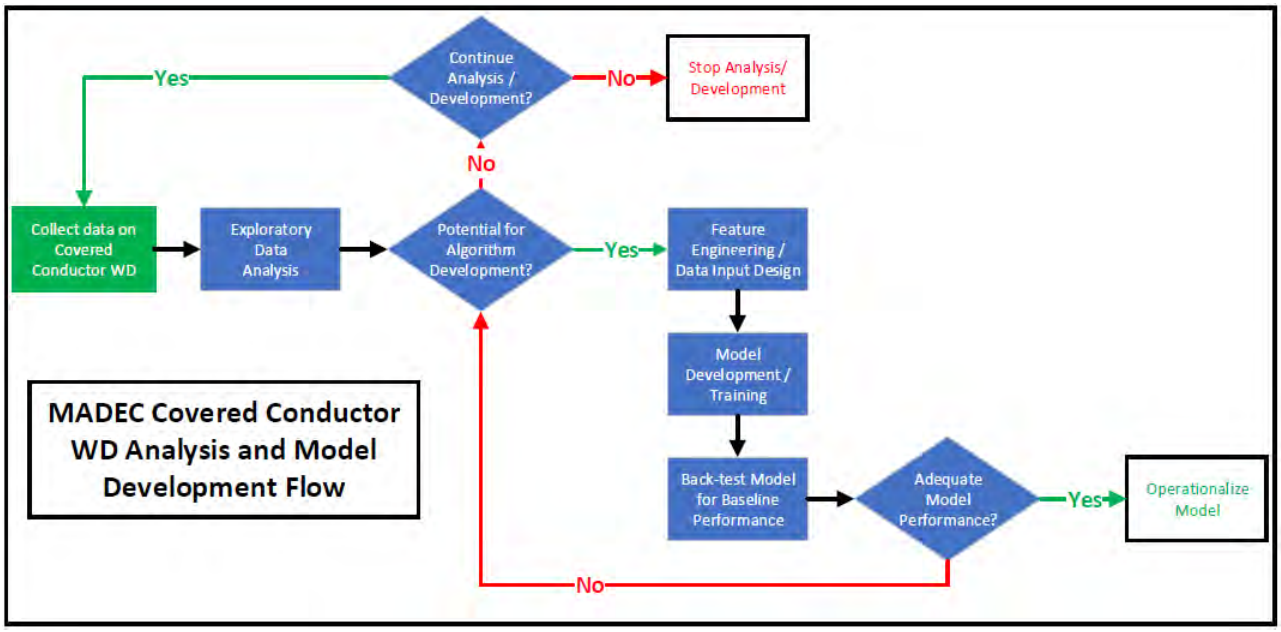
- *Integration with the broader electrical corporation's system:* Each system uses existing collected smart data from our meter data management system and meter data warehouse. Smart meters

[238] See "Rapid Earth Fault Current Limiter (REFCL) Projects at Southern California Edison" workpaper, available at https://www.sce.com/safety/wild-fire-mitigation.
[239] *Ibid*.

are already integrated into the grid.

- *How measurements from the system are verified:* During algorithm design, historical meter data is analyzed and validated to be suitable for use cases. Additionally, various meter data are captured for further analysis as warranted.
- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate:* MADEC (described in Figure SCE 8-48 below) runs automatically every minute on the available near real-time meter data, given all supporting infrastructure is available. Personnel at the Reliability Operations Center trigger the algorithm for Transformer EDD (described in Figure SCE 8-49 below) to review the preliminary results since manual post-processing of results is required before any trouble orders for field investigation or remediation can be created.

Figure SCE 8-48 - MADEC Flowchart



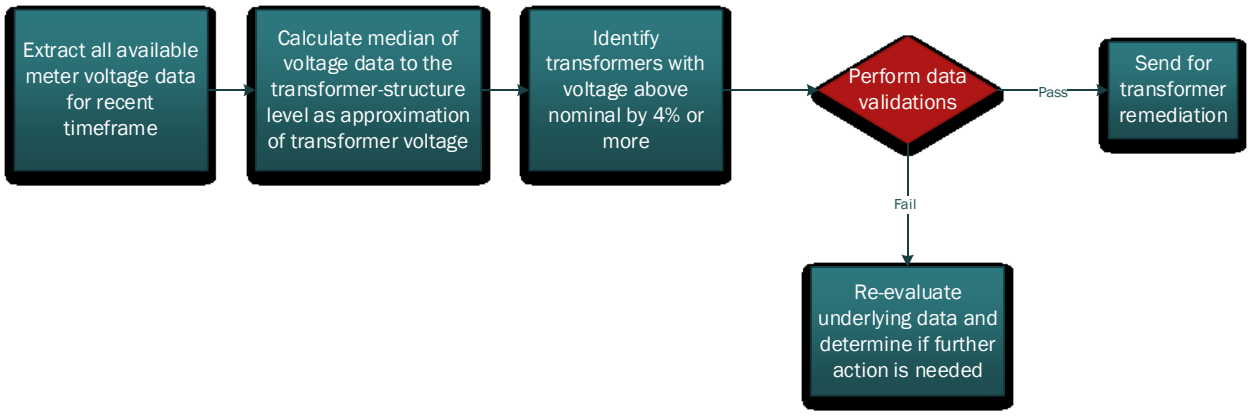


Figure SCE 8-49 - Transformer EDD Flowchart

- *For calculated quantities, how raw measurements are converted to calculated quantities. This should include flow charts and equations as appropriate:*

For MADEC, simple calculations and transformations are used to convert incoming raw data into binned values and ratios. While the calculations are not easily captured here as the ML model is constantly refining the algorithm used for detections, SCE provides the following information:

- MADEC uses internal grid connectivity data and voltage type exception information to create various downstream features for the model. Most of these features are used to create/calculate bins, ratios, and the timing/sequence of events and are typically aggregated to the structure or meter level.
- The model itself utilizes a standard Gradient Boosted Trees model. Model hyperparameters are based on a historic dataset.
- If a potential wire down situation is determined, the model output will identify a line with the circuit and nearby device or structures to help with locating the wire down. No output is generated if nothing is detected.

For Transformer EDD, raw meter voltage data—e.g., historic smart meter hourly voltage interval data and internal grid connectivity information—is used to calculate the list of transformer failures for remediation. The output is produced by identifying transformers with voltage (V) ≥4% above nominal, which is calculated by taking the median voltage of smart meters per transformer-structure and then comparing the calculations between neighboring transformers to understand if the transformer could have damage.

$$V_{Tranformer\ meter\ median} \geq 1.04\% * V_{Nominal}$$

8.3.3.1.5 Fault Recorders –e.g., Digital Fault Recorder

Digital Fault Recorders (DFRs) can be used to verify faulted phases, potential fault locations and correctness of relay operation after a faulted event, which helps with remediation of failed equipment (line or relay) to prevent reoccurrence of these events.

- *Location of the system / locations measured by the system:* DFRs are located on Transmission Substations in SCE's territory across the Bulk Electric System (BES) to record faults on Transmission lines. DFRs are also being deployed at Distribution Substations, including those substations located in HFRA.
- *Integration with the broader electrical corporation's system:* At the moment, DFRs are not integrated with the broader system. The data from the Distribution DFRs are automatically stored on the devices but needs to be retrieved from the devices manually since there are no commercial products currently available or a production grade system that has been implemented for automatically retrieving and aggregating the data in a central repository.
- *How measurements from the system are verified:* Data collected by the DFRs can be independently verified by other Intelligent Electronic Devices such as relays and meters.
- *For intermittent systems (e.g., aerial imagery, line patrols), what triggers collection. This should include flow charts and equations as appropriate:* DFRs are triggered whenever the voltage is 110% over or 10% under. Additionally, one ampere secondary residual current and external digital inputs are used to trigger fault recordings on the DFR at the BES.
- *For calculated quantities, how raw measurements are converted to calculated quantities. This should include flow charts and equations as appropriate:* The DFR provides the primary voltage of a Potential Transformer (PT) by measuring the secondary of the PT and then multiplying by the PT ratio.

$$V_{Pri} = V_{Sec} * P$$

The DFR provides the primary Current of a Current Transformer (CT) by measuring the secondary of the CT and then multiplying by the CT ratio.

$$I_{Pri} = I_{Sec} * CTR$$

8.3.3.2 Evaluation and Selection of New Systems

The electrical corporation must describe how it evaluates the need for additional grid operation monitoring systems. This description must include:

- *How the electrical corporation evaluates the impact of new systems on reducing risk (e.g., expected reduction in ignitions from failures, expected reduction in failures)*
- *How the electrical corporation evaluates the efficacy of new technologies*

These descriptions should include flow charts as appropriate.

How the electrical corporation evaluates the impact of new systems on reducing risk (e.g., expected reduction in ignitions from failures, expected reduction in failures)

Please refer to Section 8.3.2.2 for a general description of the process that SCE takes to evaluate new technologies for wildfire mitigation/prevention.

SCE's Fire Incident Preliminary Analysis (FIPA) processes investigate all ignitions and identify the drivers that may have caused the ignitions. An engineering evaluation is performed to understand whether there were mitigations in place to address the underlying cause of the risk event, and whether that mitigation performed as intended. SCE also identifies improvements to reduce the likelihood of recurrence, improve mitigation actions, and improve operational procedures and practices. This includes selecting and evaluating new grid monitoring technologies or systems based on an identified need and/or the mitigation's overall effectiveness at risk reduction. For instance, SCE may determine that a new system or mitigation is required when, upon review and analysis of ignition and fault data on the grid, it becomes apparent that one or more drivers of ignitions/faults cannot be adequately addressed using existing mitigations or a better mitigation may be available if proved to be effective.

SCE will also consider each new grid monitoring technology or a system's efficiency in reducing system risk. New systems (such as DOPD) are deployed in detection-only modes until the pilot program is determined to be successful at detecting the target issues on the grid. However, SCE evaluates the impact of new systems on reducing risk by first developing an estimate of the mitigation's effectiveness against various drivers of ignition risk, such as contact-from-object or equipment failure. Once the mitigation effectiveness percentage is identified, SCE will compare the overall risk for a specific area to the mitigation's effectiveness against that risk in locations where the mitigation is deployed. As discussed in Section 7.1.4.1, SCE also considers a host of other factors such as cost, resource availability, and overall feasibility when evaluating new grid monitoring systems. This step helps SCE to calculate how much risk could be reasonably reduced by the mitigation at that specific location when the mitigation is fully operational and can act to prevent a fault or ignition while successfully detecting issues on the grid.

How the electrical corporation evaluates the efficacy of new technologies.

SCE evaluates the efficacy of new technologies based on the historical ignition and fault data in conjunction with subject matter expert judgement. The specific process for evaluating the technology's efficacy at grid monitoring may vary depending on the technology. For example, the mitigation effectiveness percentages for REFCL are based on a combination of SCE testing and analysis conducted from 2019 to 2021, testing conducted in Australia, and SCE subject matter expert judgement. Other evaluations may involve using historical data, comparing geographies, or lab testing. Please refer to Section 8.3.2.2 for additional detail on the evaluation process.

8.3.3.3 Planned Improvements

The electrical corporation must describe its planned improvements in its grid operation monitoring systems. This must include any plans for the following:

- *Expansion of existing systems*
- *Establishment of new systems*

For each planned improvement, the electrical corporation must provide the following in Table 8-28:

- *Description: A description of the planned initiative activity*
- *Impact: Reference to and description of the impact of the initiative activity on each risk and risk component*
- *Prioritization: A description of the x% risk impact (see Section 8.1.1.2 for explanation)*
- *Schedule: A description of the planned schedule for implementation*

SCE describes in Table 8-28, below, its planned improvements to expand its grid operation monitoring capabilities through installations of: EFD sensors, relays capable of applying fast curve and Hi-Z settings, open phase detection schemes for Transmission and Distribution systems, and new DFRs.

Table 8-28 - Planning Improvements to Grid Operation Monitoring Systems

System	Description	Impact	x% Risk Impact	Implementation Schedule
Radio Frequency Monitors	Installation of EFD sensors in HFRA prioritized by risk analysis (SA-11).	EFD sensors are capable of detecting and locating degraded or defective assets that produce radio frequency emissions prior to failure, such as damaged conductor strands or insulator tracking. Early identification of these facilities and their replacement reduces ignition risk as the conditions further degrade.	Please see Table 8-23 for risk impact	Please see Table 8-23 in Section 8.3.1.2 for EFD's implementation schedule.

System	Description	Impact	x% Risk Impact	Implementation Schedule
Protective Relays - Fast Curves	Installation of microprocessor relays capable of applying fast trip settings to reduce fault energy.	Fast acting overcurrent protection used to detect faults on the grid and quickly deenergize circuits or circuit sections may reduce ignitions by reducing the amount of fault energy.	Please see Table 8-23 for risk impact	Please see Table 8-3 in Section 8.1.1.2 for the implementation schedule for circuit breaker relay units.
Protective Relays - Hi Z	Installation of recloser controllers capable of applying Hi-Z settings that detect high impedance conditions in HFRA.	Hi-Z settings detect high impedance conditions. Ignition risk can be reduced by detecting and isolating the high impedance conditions within HFRA.	N/A, evaluation still underway	Monitor the installations that are in-service in 2023 and 2024. Install Hi-Z at 20 new locations in 2025 and beyond, pending results of pilot analysis.
Protective Relays - TOPD (SH-8)	Installation and retrofit of open phase detection schemes on the Transmission system in HFRA.	TOPD scheme will detect an open phase (Broken Conductor) condition on its Transmission line, allowing for de-energization of the line before it contacts a grounded object and results in a fault.	Please see Table 8-23 for risk impact	Please see Table 8-3 in Section 8.1.1.2 for TOPD's implementation schedule.
Protective Relays - DOPD	Installation of open phase detection schemes on the Distribution	DOPD scheme will detect an open phase (Broken Conductor) condition on the distribution line, allowing for de-energization of the line before it contacts a	N/A, evaluation still underway	Monitor the installations that are in-service. Install DOPD at 12 locations in 2025 and beyond, pending

System	Description	Impact	x% Risk Impact	Implementation Schedule
	system in HFRA.	grounded object and results in a fault.		results of pilot analysis.
Fault Recorder	Installation of DFRs in SCE's territory across the Bulk Electric System (BES) and at Distribution Substations.	DFRs do not directly reduce wildfire risk. As a post-event analysis tool, DFRs are useful for performing root cause analysis on faulted events to help inform corrective action.	N/A	Install 20 DFRs per year in 2024 and 2025.
Fault Current Limiter	Installation of Ground Fault Neutralizers (GFN) (SH-17) in substations supplying HFRA circuitry and grounding conversions (SH-18) of small distribution systems.	Both GFN and grounding conversion designs target increases in ground fault sensitivity to 0.5 amperes and a 99.9% reduction in energy release from ground faults. This impacts wildfire drivers caused by ground faults, such as down wires, or phase-to-ground foreign object contact.	Please see Table 8-23 for risk impact	Please see Table 8-3in Section 8.1.1.2 for REFCL's implementation schedule.

8.3.3.4 Evaluating Mitigation Initiatives

The electrical corporation must describe its procedures for the ongoing evaluation of the efficacy of its grid operation monitoring program.

SCE monitors the efficacy of its mitigations by performing engineering reviews of ignitions involving SCE facilities through the Fire Investigation Preliminary Analysis (FIPA) process. The FIPA process examines ignitions to determine:

- Cause
- Contributing Factors
- Involved Equipment
- Deployed Mitigation in the area

SCE routinely monitors the data derived from its FIPA process and other pieces of information, such as outages and wire downs, to ensure SCE's programs are performing as desired. If an engineer in the FIPA process notices an event where mitigations did not perform as expected, the engineer will escalate the issue and the team will discuss whether changes to SCE's standards or policies are needed to correct any issues. Additionally, SCE will periodically supplement its FIPA analysis by reviewing fault data, repair notification and wire downs to evaluate whether the grid monitoring mitigations are operating as intended. In addition, SCE will periodically review other fault data not captured in the FIPA process to evaluate whether the grid monitoring mitigations are operating as intended.

8.3.3.5 Enterprise System for Grid Monitoring

In this section, the electrical corporation must provide an overview of its enterprise system for grid monitoring. This overview must include discussion of:

- *Any database(s) used for storage*
- *Describe the electrical corporation's internal documentation of its database(s)*
- *Integration with systems in other lines of business*
- *Describe any QA/QC or auditing of its system*
- *Describe internal processes for updating the enterprise system including database(s)*
- *Any changes to the initiative since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation*

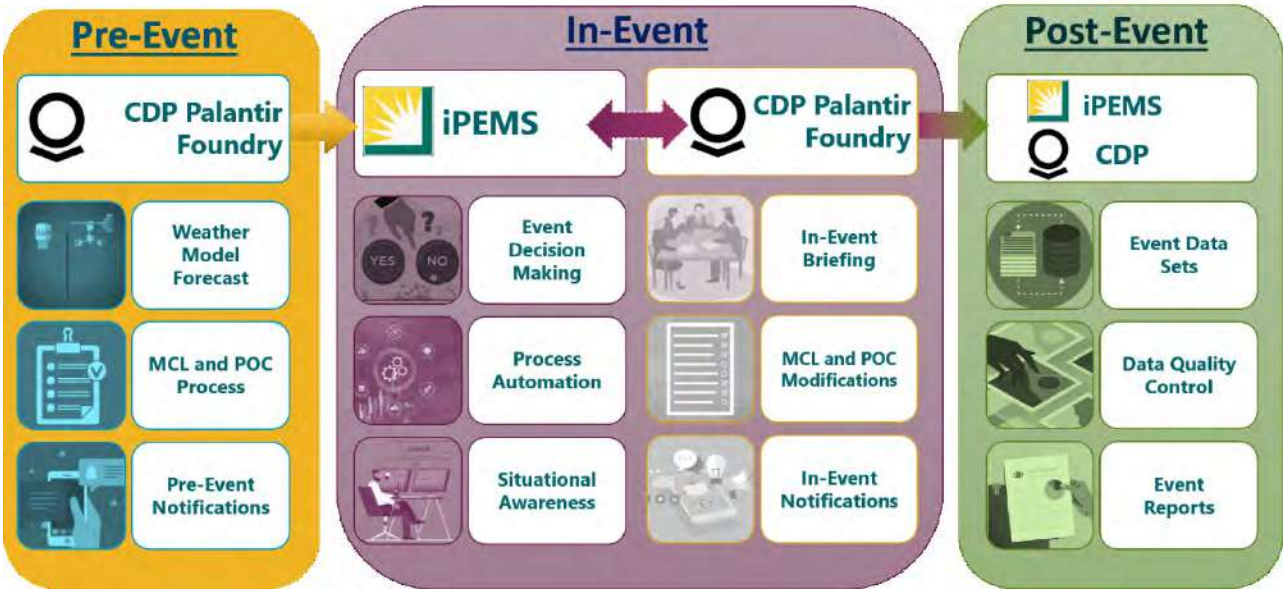
Several systems support the technologies described above. The supporting systems are listed below, and support the following technologies:

- PSPS-related situational awareness and decision-making: Supported by the Integrated PSPS Event Management System (iPEMS) and Centralized Data Platform (CDP).
- TOPD, DOPD, Hi-Z, REFCL, and Fast Curve Settings: Supported by the Protective Relay Database (Aspen) and the SCADA Historian.
- MADEC and Transformer EDD: Hosted on Splunk.

8.3.3.5.1 The Integrated PSPS Event Management System (iPEMS)

The iPEMS software application was created to efficiently manage Public Safety Power Shutoff (PSPS)

events by integrating electric grid and weather station information on a single platform for effective decision-making. iPEMS consolidates several legacy tools into a simplified cloud-based application by taking inputs from Weather Stations, other Grid Monitoring Systems, and Fire Risk Calculation sources to provide situational awareness for potential PSPS de-energizations and track decision-making for de-energizing and restoring circuits during PSPS events.



- *Any database(s) utilized for storage*: iPEMS uses NoSQL data (blobs and tables) spread out over seven storage accounts.
- *Describe the utilities internal documentation of its database(s)*: iPEMS is hosted by an Azure cloud-based application. The documentation is contained within SCE Azure documentation and iPEMS Solution Architecture Document.
- *Integration with systems in other lines of business*: iPEMS integrates with CDP, Outage Management System (OMS), eDNA historian, Survey 123, SCE's Geographic Information Systems (GIS), Weather Services, and Fire Science Analytical Service.
- *Describe any QA/QC or auditing of its system*: iPEMS ingests data from other systems, which are subject to their own QC. For example, internal operational datasets in these other systems are validated and QC'd using built-in reasonability logic and user interface indications of potential data discrepancies. While there is no ongoing QA/QC of iPEMS after deployment, SCE conducts extensive user acceptance testing when new versions of iPEMs are deployed and makes developer support available during PSPS events to address any bugs that are identified.
- *Describe internal processes for updating enterprise system including database(s)*: iPEMS utilizes Azure for its platform. Updates to the platform are performed by the vendor, and SCE validates functionality through user acceptance testing.
- *Any changes to the initiative since the last WMP submission and a brief explanation as the why those changes were made. Include any planned improvements or updates to the initiative and timeline for implementation*: Since the last WMP submission in 2022, SCE matured its iPEMS system capability to increase focus on supporting in-event PSPS decision-making. This means that PSPS pre-event considerations—such as the Risk Comparison Tool described in 2022 WMP under iPEMS[240]—are now managed under the CDP instead of iPEMS.[241] While the CDP supports all three phases of a PSPS event, the CDP system is primarily used now to provide support for PSPS pre-event and post-event data processing and analyses.

The types of iPEMS and CDP system support for each of three phases of a PSPS event are described in Figure SCE 8-50, below. During the Pre-Event phase, the CDP system stores and processes information that will help identify the specific circuits (Monitored Circuit List, or MCL) and potential timeframe (Period of Concern, or POC) in scope for potential de-energization and prepare pre-event PSPS notifications, as applicable. During the In-Event phase, iPEMS utilizes real-time grid and weather station monitoring and other situational awareness tools to inform PSPS decision-making about whether or not

[240] See Section 8.1.1 of SCE's 2022 Wildfire Mitigation Plan Update, p. 521.
[241] See the section following (8.3.3.5.2) for a detailed description of the CDP.

to de-energize or re-energize circuits on the MCL during the POC timeframes. iPEMS also provides the threshold information necessary to trigger any in-event notifications. Meanwhile, the CDP system documents any changes to the MCL or the POC due to weather model forecasts and builds notification campaigns to execute in-event notifications, as needed. In the Post-Event phase, CDP is used to perform data quality control and generate post-event reports. Information about PSPS decision-making, that are stored in iPEMS, is shared with CDP and is used to contribute to event reports and analyses.

Figure SCE 8-50 - Systems Support for PSPS Events

To improve the efficiency and performance of PSPS data systems, SCE plans to improve the collection frequency of weather station reads, integrate Smart Meter data sets, and enhance the ability to integrate with future grid operational systems. SCE also plans to reduce system processing time through automation, including time for processing PSPS notification campaigns, and to work towards integration of its CDP and iPEMS systems, where feasible. The specific timeline and details around these improvements are noted below:

- In 2023, SCE will work to improve the sampling frequency of SCE weather stations in the iPEMS application for enhanced situational awareness by piloting technology that can help reduce the data retrieval times from once every ten minutes to once every thirty seconds as observed winds speeds near PSPS thresholds for de-energization.
- In 2023, SCE will work to automate several PSPS operational processes within CDP and iPEMS, including processes that initiate customer notifications and restoration activities.
- In 2024 and 2025, SCE plans to enhance iPEMS' ability to integrate Smart Meter data (e.g., Advanced Metering Infrastructure [AMI]) for enhanced situational awareness. Whereas SCE currently relies on its list of de-energized and re-energized circuits to understand customer impacts from a PSPS event, the smart meter information collected improves SCE's understanding of the exact times that customers experienced a PSPS de-energization and validate when restoration has occurred.
- In 2024 and 2025, SCE will work to enhance iPEMS' ability to integrate with new grid operational systems (e.g., Advanced Distribution Management System [ADMS], GMS, PI Historian, etc.) that are being introduced.
- SCE will continue to investigate potential integration opportunities between iPEMS and CDP to increase efficiencies between the systems, where feasible.

8.3.3.5.2 Consolidated Data Platform (CDP)

The CDP organizes data about PSPS functionality such as pre- and in-event notifications, data centralization, data management (e.g., modeling, semantics, clean-up, and validation), event analytics and reporting and process automation (e.g., elimination of manual hand-offs between different software programs by replacing those programs with one data platform).

- *Any database(s) utilized for storage*: The CDP's PSPS Data is stored on the Palantir Foundry Product on the Amazon Web Services (AWS) Platform.
- *Describe the utilities internal documentation of its database(s)*: The data ontology and data objects are built into the Foundry Platform. The application solution design and all other database design aspects are documented in the Solution Architecture Document.
- *Integration with systems in other lines of business*: PSPS CDP integrates with iPEMS, OMS, Weather Forecasting, Message Broadcast, Everbridge, Operational GIS Data Store (ODS), and SAP High Performance Analytic Appliance (HANA).
- *Describe any QA/QC or auditing of its system*: QA is performed during product updates, as described in the next response below.
- *Describe internal processes for updating enterprise system including database(s)*: SCE is utilizing the Palantir Foundry platform as the core technology components for PSPS CDP. The vendor is responsible for updating the product (including databases) on a regular basis. When these updates are available, SCE validates the functionality end to end with regression and user acceptance testing to ensure everything works as expected. Any bugs found are communicated back to the vendor to be fixed and retested. Once the testing is completed and passed, the new functionality is migrated to our production environment.
- *Any changes to the initiative since the last WMP submission and a brief explanation as the why those changes were made. Include any planned improvements or updates to the initiative and timeline for implementation*: Please see response to this prompt in the section above, 8.3.3.5.1, for a description of updates to the CDP since the last WMP.

8.3.3.5.3 SCADA Historian

SCE uses eDNA and OSI PI as historians for its Grid Monitoring Systems. These historians capture analog values for grid parameters including voltage, current, and power flow, as well as device status changes (e.g., Circuit Breaker Open/Close, relay actuation).

- *Any database(s) utilized for storage:* SCE uses both the eDNA and PI System for historization of power system data, which is maintained at full fidelity in real time. Since the eDNA product has an upcoming end of life of 2026, SCE is moving to the PI System for all SCADA data.
- *Describe the utilities internal documentation of its database(s):* The systems are documented in accordance with standard IT governance for support, approval of change, and end user access.
- *Integration with systems in other lines of business:* The eDNA and PI historians capture data from SCE's SCADA systems (i.e., EMS and DMS and non-SCADA transformer data for Dissolved Gas Analysis. The current system is integrated with an enterprise analytics platform. The PI System has an integrated analytics platform.

- *Describe any QA/QC or auditing of its system:* The PI and eDNA Systems were tested in accordance with SCE's IT governance prior to being placed into production and is monitored on a daily basis with a variety of monitoring tools, including applications monitoring data flow from various collection points to the historian servers, Windows Performance counters for data center machines, and dedicated dashboards to monitor system health. This is in addition to standard SCE tools monitoring basic server health.
- *Describe internal processes for updating enterprise system including database(s):* Historian applications are updated and/or enhanced in response to SCE's technical and business needs. OSI PI replaced eDNA as the historian for the SCE Distribution System outside the Substations in 2022 and will become the historian system for all Distribution voltages inside and outside the substations upon deployment of the Grid Management System (GMS) in 2024.
- *Any changes to the initiative since the last WMP submission and a brief explanation as the why those changes were made. Include any planned improvements or updates to the initiative and timeline for implementation:* Not applicable, as this is a new section for the WMP.

8.3.3.5.4 Protective Relay Database (Aspen)

Aspen is an application used to store relay information.

- *Any database(s) utilized for storage:* Aspen uses an Oracle database to store information about a relay's name, ID, type, setting, link and activity.
- *Describe the utilities internal documentation of its database(s)*: The systems are documented in accordance with standard IT governance for support, approval of change and end user access.
- *Integration with systems in other lines of business*: Aspen has interfaces with Doble, Master Data Governance (MDG), and SAP.
- *Describe any QA/QC or auditing of its system:* As Aspen is classified as a NERC CIP application; changes are tested by end users prior to being placed in production.
- *Describe internal processes for updating enterprise system including database(s)*: Aspen is not updated unless required by a business need.
- *Any changes to the initiative since the last WMP submission and a brief explanation as the why those changes were made. Include any planned improvements or updates to the initiative and timeline for implementation*: Not applicable, as this is a new section for the WMP.

8.3.3.5.5 Splunk

The MADEC and Transformer EDD applications run in Splunk.

- *Any database(s) utilized for storage:* Splunk stores data in a proprietary storage system called "index," based upon flat files.
- *Describe the utilities internal documentation of its database(s):* SCE does not have internal documentation. Splunk documentation is available online from the vendor.
- *Integration with systems in other lines of business:* Splunk uses feeds from the smart meter exception data to send email/text alerts or uses scripts to route meter data to other systems, e.g., sending a MADEC to EMS alert.
- *Describe any QA/QC or auditing of its system:* Data is not generated in Splunk. Data is ingested from various sources with source QCs.
- *Describe internal processes for updating enterprise system including database(s)*: Splunk is upgraded regularly by the Splunk team based upon new vendor releases offering functionality improvements or based upon security fixes.
- *Any changes to the initiative since the last WMP submission and a brief explanation as the why those changes were made. Include any planned improvements or updates to the initiative and timeline for implementation*. Not applicable, as this is a new WMP section in 2022.

8.3.3.5.6 Early Fault Detection (EFD) Data Storage

Data from EFD (SA-11) are stored and managed in a data storage system.

- *Any database(s) utilized for storage:* SCE uses a cloud-based data storage system used for EFD data collection, analysis, and storage. Each EFD installation reports discharge activity that is detected and incorporated by the vendor into proprietary algorithms. SCE then accesses the data via an online user interface which turns the detection data into the information that can be assessed for potential system degradation or defects. When defects or degradation is detected by EFD, SCE follows present processes for creating repair notifications in existing repair databases that are tracked in SAP.
- *Describe the utilities internal documentation of its database(s)*: Documentation is maintained by the vendor for the database. SCE user documentation of the system has not been formalized although with broader EFD deployment additional documentation will be needed around use of the new web portal system anticipated in 2024.
- *Integration with systems in other lines of business:* This is a standalone system with no integration to other SCE systems. Future capabilities may include integration with SCE's GIS. EFD equipment itself must also be inspected and includes maintenance of the equipment such as battery replacement. The EFD hardware is being incorporated into SCE's maintenance plans in SAP.
- *Describe any QA/QC or auditing of its system:* SCE regularly reviews the EFD database to confirm its accuracy and may identify system improvements. One recent improvement in the QC process is related to phasing of the conductors for the sensor installations. The initial EFD hardware did

not have the data capabilities to check the accuracy of phasing. Although SCE has not observed any phasing issues to date (as of December 2022), to remedy this concern and others, the present hardware now includes the capability to check the accuracy of phasing connection for each EFD sensor. Should a problem be identified, it is then reported to SCE, and can either be remedied in software changes or physically in the field with sensor placement.

- *Describe internal processes for updating enterprise system including database(s)*: EFD data storage is presently a standalone application that will only be updated in response to EFD needs. When new EFD devices are installed, SCE's vendor, who hosts the EFD database, will identify an EFD unit as online when the device connects to a cellular network and transmits the device's activation and location information. SCE will then perform an end point test on the device in order to log the device as complete in the system. This process ensures that the device is included in the data system and algorithm for monitoring.
- *Any changes to the initiative since the last WMP submission and a brief explanation as the why those changes were made. Include any planned improvements or updates to the initiative and timeline for implementation:* Not applicable, as this is a new section for the WMP.

8.3.4 Ignition Detection Systems

The electrical corporation must describe its systems, technologies, and procedures used to detect ignitions within its service territory and gauge their size and growth rates.

- *The electrical corporation must document the following:*
- *Existing ignition detection sensors and systems*
- *Evaluation and selection of new ignition detection systems*
- *Planned integration of new ignition detection technologies*
- *Monitoring of mitigation improvements*

Reference the Utility Initiative Tracking ID where appropriate.

8.3.4.1 Existing Ignition Detection Sensors and Systems

The electrical corporation must report on the sensors and systems, technologies, and procedures for ignition detection that are currently in use, highlighting any improvements made since the last WMP submission. At a minimum, the electrical corporation must document the deployment of each of the following:

- *Early fire detection including, for example:*
    - *Satellite infrared imagery*
    - *High-definition video*
    - *Infrared cameras*
- *Fire growth potential software*

The electrical corporation must summarize each system in Table 8-29 below. It must provide the following additional information for each system in an accompanying narrative:

- *General location of detection sensors (e.g., HFTD or entire service territory)*
- *Resiliency of sensor communication pathways*
- *Integration of sensor data into machine learning or AI software*
- *Role of sensor data in risk response*
- *False positives filtering*
- *Time between detection and confirmation*
- *Security measures for network-based sensors*

While SCE is not a fire suppression agency, it does maintain various technologies and systems that can help confirm ignition and gauge their size and/or growth rates. These tools help to monitor and evaluate weather and climate conditions for the purpose of understanding ignition potential and consequence, which informs a range of short-and long-term mitigations such as PSPS, inspections, and grid hardening. As such, SCE summarizes each of its applicable systems in the table below.

Table 8-29 - Fire Detection Systems Currently Deployed

Detection System	***Capabilities***	***Companion Technologies***	***Contribution to Fire Detection and Confirmation***
HD Cameras (SA-10)	Real-time viewing of remote areas to confirm smoke and wildfires	Used with Artificial Intelligence satellite imagery for fire confirmation	SCE partners with University of California, San Diego (UCSD) to install HD cameras on non-SCE infrastructure, such as a communications towers, in locations where its Fire Science Team, Fire Management Team, IMT and fire agencies have previously identified gaps in the spatial data related to fire detection.
Satellite & Other Imaging Technology (SA-10)	Resolve gaps in SCE's spatial data and provide improved fire confirmation capabilities.	Used with HD Cameras for fire confirmation	Satellite & Other Imaging fire confirmation will be used with the current fire confirmation capabilities provided by UCSD. The Satellite detection will provide full coverage of the SCE territory and work as tool to

Detection System	*Capabilities*	*Companion Technologies*	*Contribution to Fire Detection and Confirmation*
			help confirm fires on the HD camera system.
Fire Spread Modeling (SA-8)	SCE plans to use advanced fire spread modeling tools—Technosylva's FireCast and FireSim applications—to predict fire spread and consequence outputs such as fire perimeter size, structures impacted, populations affected, and injury and death	N/A	Ability to estimate the impacts that fire activity will have on a particular area (i.e., wildfire consequences).

Additional information for each of its system is detailed below.

8.3.4.1.1 HD Cameras (SA-10)

HD camera installations address areas for improvement in SCE's spatial data and provides improved fire confirmation capabilities. To support situational awareness with respect to fuel conditions, help inform PSPS decision-making, and have the ability to confirm smoke and/or fire in a location via an Artificial Intelligence pilot, SCE maintains a network of 182 HD cameras installed through University of California, San Diego's (UCSD's) AlertCalifornia (formerly AlertWIdlfire) system. The live data feeds aide in faster information gathering for fire location and possible direction of growth. This information is imperative for SCE asset protection as well as for fire departments to assess resource deployment.

SCE has observed areas for improvement in its ability to view certain parts of its service area, including locations where SCE infrastructure cannot currently be seen, and in communities that intersect mountainous terrain. Left unaddressed, these blind spots could compromise SCE's ability to provide adequate and timely response for asset protection from fires and to help supplement fire response efforts and coordinate with fire response agencies. SCE's 2023-2024 HD camera installations will help improve SCE's spatial data and provide improved fire confirmation capabilities.

Highlight any improvements made since the last WMP submission

SCE has installed 16 additional cameras in 2022, to address areas for improvement described above. In partnership with UCSD, SCE continues to pilot artificial intelligence (AI) that utilizes the cameras data feeds to alert a specific camera location so personnel can better assess real-time conditions of a fire (i.e., location, growth potential, nearby SCE assets, possible communities in danger, fire department

resource deployment). The primary goal of the AI is for fire fighting agencies to subscribe to alerts in their respective areas for greater situational awareness in fighting fires. An ancillary benefit for utilities as the camera sponsors, are to be informed of confirmed fires in or around SCE infrastructure to assist with asset protection.

General location of detection sensors (e.g., HFTD or entire service territory)

SCE partners with UCSD to install HD cameras in locations where its Fire Science Team, Fire Management Team, IMT and/or fire agencies provide insight for rural areas needing viewshed to assist in confirming the start of a fire. UCSD installs on towers of opportunity in these remote locations, such as shared communication towers or county owned communication towers. Cameras are not installed on SCE-owned infrastructure. The number and location of future installations will be based on requests by SCE's fire science, fire management, IMT teams or by fire agencies. To fulfill these requests, SCE is forecasting to install at least 10 and up to 20 HD cameras per year through 2024, based on need.

Resiliency of sensor communication pathways

The HD Camera communication pathways are provided through UCSD. UCSD secures network connections through wireless internet service providers which are available at the location of installation. Not every camera is on the same communication path network. UCSD monitors the connectivity and is responsible for connectivity maintenance and any necessary break fix. UCSD allows SCE access to the HD camera status page in order to view the connectivity status.

Integration of sensor data into machine learning or AI software

SCE has partnered with UCSD to allow access to SCE cameras for AI software development. SCE is currently receiving alerts from a pilot UCSD is conducting with an AI software company. SCE provides feedback on alerts to better train and grow the AI software.

Role of sensor data in risk response

HD Cameras are not sensors, per se, however the live feeds that are provided from the cameras provide direct indication for wildfire conditions and ignition propagation. These confirmation capabilities can be enhanced through the use of AI to send alerts to fire agencies to inform of early-stage ignitions. The confirmation capabilities and AI alerts provide situational awareness to better inform decision making post ignition.

False positives filtering

Upon receiving notifications, SCE personnel view for situational awareness and decide if an alert needs to be investigated or any further actions taken. Amongst the alerts, false positives are seen where further action is not needed and the alert is dismissed.

Time between detection and confirmation

Artificial Intelligence (AI) is used primarily to confirm the existence of a fire. SCE does not use the AI to detect fire starts therefore SCE does not track time stamping of the alert notifications. The AI will alert of a potential fire or a confirmed fire.

Security measures for network-based sensors

SCE relies on the vendor UCSD to keep the data feeds secure. SCE accesses the cameras through the

vendor provided website, https://AlertCA.live which is available to the public.

8.3.4.1.2 Satellite & Other Imaging Technology (SA-10)

Satellite and other imaging technology can be used to help determine the point of ignition origin and perform threat assessments, among other information that can be derived from having an overhead or aerial view of the fires. SCE uses this technology to confirm and follow changes in fire locations and the spread of a fire. SCE will communicate that information with stakeholders and SCE resources impacted by the area of threat. This technology will allow SCE to reduce the impact of wildfire, though quantifying the reduction will be difficult to ascertain.

Highlight any improvements made since the last WMP submission

SCE created a map on its website for customer to view fire detection from public satellites along with fire perimeters from local fire agencies, which includes weather station observation from the National Weather Service.[242] This SCE website provides customers and other stakeholders with increased situational awareness.

General location of detection sensors (e.g., HFTD or entire service territory). The technology produces an output that covers the entire SCE service area.

Resiliency of sensor communication pathways

Communication pathways are control by NOAA and NASA since this is a government owned satellite system.

Integration of sensor data into machine learning or AI software

Satellite fire confirmation capabilities will be integrated in the current fire conformation technology being used by SCE that UCSD is providing. This service will add additional notification and confirmation abilities.

Role of sensor data in risk response

Sensor provides increased coverage for wildfire detection within the SCE service territory. This increases the ability to reduce risk by increasing fire conformation coverage capabilities across the SCE territory.

False positives filtering

False positives are filtered out by the algorithm that will provide the alert of a possible wildfire. False positives will still occur as this is a new technology being used within SCE. The AI software for the HD cameras will be used for fire conformation.

Time between detection and confirmation

Satellite & Other Imaging will be used primarily to confirm or track the existence of a fire by SCE or local fire agencies. SCE will not use the Satellite & Other Imaging to detect fires therefore SCE will not track detection and confirmation. Fire Confirmation will depend on the geographic location of the detection and view shed of any existing alert wildfire camera to confirm this detection. Some detections will not

[242] See https://www.sce.com/wildfire/situational-awareness

be within the view of the cameras and will need to be confirmed by local fire agencies.

Security measures for network-based sensors

Sensors from the satellite detection is operated and managed by the United States' National Oceanic and Atmospheric Administration (NOAA)'s National Environmental Satellite, Data, and Information Service division. No sensor will be placed within the SCE network, system or assets.

8.3.4.1.3 Fire Spread Modeling (SA-8)

SCE plans to use advanced fire spread modeling tools—Technosylva's FireCast and FireSim applications—to simulate fire ignitions and subsequent consequences such as fire perimeter size, structures impacted, populations affected, and potential fatalities. SCE's Fire Science team will continue to evaluate the output to help ensure that FireCast and FireSim are suitable tools for accurately estimating fire consequences.

In 2022, Technosylva began estimating the number of buildings destroyed as one of its metrics. In addition, they created a metric that evaluates response complexity as a proxy to address wildfire suppression. In 2023, SCE will work with Technosylva to build upon these newly created metrics to more accurately reflect the number of buildings destroyed by wildfire and the ability to predict resource response. This will include an analytical study detailing circuits having met consequence criteria which will enable the Fire Science team to more adequately address any potential inaccuracies in the output.

Highlights since last WMP submission

In 2022 and under the direction of SCE, Technosylva developed the Buildings Destroyed metric and the Response Complexity Metric to address known deficiencies in the fire spread modeling consequence processes. In addition, Fire Sciences evaluated the performance of the deliverables from Technosylva which included the Building Loss Factor Metric, the Response Complexity Metric (previously referred to as Suppression Effectiveness), the Extended Attack Index, the Custom Fuels Atlas, and the WRRM Historical Percent Daily Forecast Integration. Specifically, the Building Loss Factor and the Response Complexity metrics were reviewed in the Fall of 2022 to determine their ability to properly inform PSPS decision-making. Although the addition of the two metrics in 2022 further improves fire spread modeling, more analysis and refinement to the metrics from 2023 through 2024 will be needed before anticipated integration into PSPS decision-making by the end of 2025.

General location of detection sensors (e.g., HFTD or entire service territory)

The Technosylva output covers SCE's HFRA plus a 20-mile buffer.

Resiliency of sensor communication pathways

N/A – This technology does not use sensors.

Integration of sensor data into machine learning or AI software

Security measures for network-based sensors

N/A – This technology does not use sensors.

8.3.4.2 Evaluation and Selection of New Detection Systems

The electrical corporation must describe how it evaluates the need for additional ignition detection technologies. This description must include:

- *How the electrical corporation evaluates the impact on new detection technologies on reducing and improving detection and response times*
- *How the electrical corporation evaluates the efficacy of new technologies*
- *The electrical corporation's budgeting process for new detection system purchases*

SCE consults with external agencies, such as fire agencies, to determine additional fire confirmation technology needs. As discussed in Section 8.3.4.1, SCE partners with other entities for its fire confirmation systems and capabilities, such as UCSD's Alert California system and NOAA and NASA's satellite system. Any needs identified by SCE or fire agencies are reviewed and approved collaboratively.

How the electrical corporation evaluates the impact on new detection technologies on reducing and improving detection and response times.

SCE evaluates the impact of new ignition confirmation technologies by first proving out the use case for the technology with small case studies or limited deployment of the system or technology. SCE then assesses the new technology or system to see if there are quantifiable impacts on its or fire agencies' abilities to confirm ignitions. SCE notes that it is not a fire suppression agency and therefore focuses efforts on methods to support customer safety, grid resiliency, and the ability for fire suppression agencies to respond to wildfires.

How the electrical corporation evaluates the efficacy of new technologies

SCE evaluates the efficacy of new ignition confirmation technology by, as described above, assessing if it is useful for fire mitigation efforts and to inform analyses of the service territory, fire risk, and provide situational awareness, in addition to operational decision making, including but not limited to PSPS. In addition to the assessment described above, SCE also consults with fire agencies for their own assessments of the efficacy of new technologies.

The electrical corporation's budgeting process for new detection system purchases

As indicated above, SCE partners with external agencies to determine additional ignition confirmation needs. Once a need is identified and confirmed, SCE's share of the cost is reviewed and approved by SCE's internal approval process, which includes review by a variety of stakeholders, such as SCE's wildfire strategy and enterprise risk management groups, in addition to senior management.

8.3.4.3 Planned Integration of New Ignition Detection Technologies

The electrical corporation must provide an implementation schedule for new ignition detection and alarm system technologies. This must include any plans for the following:

- *Integration of new systems into existing physical infrastructure*
- *Integration of new systems into existing data analysis*
- *Increases in budgets and staffing to support new systems*

For each new technology system, the electrical corporation must provide the following in Table 8-30:

- ***Description:** A description of the technology's capabilities*
- ***Impact:** A description of the impact the technology will have on each risk and risk component*
- ***Prioritization:** A description of the x% risk impact (see Section 8.1.1.2 for explanation)*
- ***Schedule:** A description of the planned schedule for implementation*

Please see the table below for SCE's implementation schedule for new ignition confirmation system technologies.

Table 8-30 - SCE's Planning Improvements to Fire Detection and Alarm Systems

System	*Description*	*Impact*	*x% Risk Impact*	*Implementation Schedule*
HD Cameras and Satellite & Other Imaging (SA-10)	SCE plans to support UCSD's planned integration of satellite & other imaging technology into the Alert CA HD camera network	An integrated system of HD Cameras and Satellite & Other Imaging technology will enhance SCE's situational awareness by providing additional fire confirmation abilities	Please See Table 8-23 for risk impact information	End of 2025

8.3.4.4 Evaluating Mitigation Initiatives

The electrical corporation must describe its procedures for the ongoing evaluation of the efficacy of its fire detection systems.

SCE's procedures for the ongoing evaluation of the efficacy of its ignition confirmation technologies include reviewing how HD cameras and Satellite & Other Imaging technology are used and that its fire spread modeling provides essential information to aide in SCE's decision-making process. SCE evaluates the efficacy of HD cameras and Satellite & Other Imaging based on the amount of usage of the SCE networks, feedback from the SCE Fire Management Team, and feedback from firefighting agencies. SCE's ignition confirmation systems and processes are useful for fire mitigation efforts and to inform assessments of the service territory, fire risk, and provide situational awareness, in addition to operational decision making, including but not limited to PSPS.

The HD Cameras and Satellite & Other Imaging technology are viewed on a near daily basis by SCE Fire Science and SCE Fire Management Officers. Fire Agencies also routinely use the cameras and have provided positive feedback to SCE's Fire Management Officers and UCSD. Efficacy can also be determined by the expansion of the Alert California system. The camera network has undergone user interface improvements and other agencies, including the US Forest Service and CalFire, continue to install cameras across California, in addition to SCE. The growth of the camera network platform and Satellite & Other Imaging technology helps to validate the efficacy of these technologies and confirm they are fulfilling their intended purpose.

SCE's ignition confirmation systems provide essential information to aide in fire mitigation efforts, but do not directly influence wildfire risk drivers. For example, HD Cameras have proven useful in fire mitigation efforts by providing live views of fires for fire management officers to use for situational awareness. SCE fire management officers heavily rely on the HD cameras and are one of the most frequent users of the network. SCE fire management officers are able to view the proximity of a fire to SCE infrastructure and help direct asset protection efforts. Fire departments also utilize the HD Cameras to be able to help identify smoke, fire location, size of fire, direction of fire, direct response efforts, possible growth potential etc.

SCE measures the efficacy of its fire spread model by its application and use for decision marking. First, fire spread modeling is used extensively alongside historical data to help identify areas that have the greatest wildfire risk. This information is used to help prioritize various mitigation activities such as installing covered conductor, undergrounding, etc. Second, fire-spread modeling is used in real-time ahead of a PSPS event to populate SCE's In-Event Risk Calculator. This allows SCE to determine the risk associated with a wildfire occurring versus the risk associated with de-energization. Third, projections of fire size potential in real-time are used to help brief external partners during PSPS events. This information becomes very useful for explaining why certain areas are being considered for potential de-energization. Lastly, fire spread modeling is used in real-time to model new and on-going wildfire incidents. This helps SCE understand how the fire will spread and how its assets may be impacted and when.

8.3.4.5 Enterprise System for Ignition Detection

In this section, the electrical corporation must provide an overview of its enterprise system for ignition detection. This overview must include discussion of:

- *Any database(s) used for storage.*
- *Describe the electrical corporation's internal documentation of its database(s).*
- *Integration with systems in other lines of business.*
- *Describe any QA/QC or auditing of its system.*
- *Describe internal processes for updating the enterprise system including database(s).*
- *Any changes to the initiative since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation.*

SCE does not use any enterprise systems for ignition detection or confirmation. As discussed in Section 8.3.4.1, SCE partners with UCSD for its camera database systems. SCE uses Technosylva servers and databases for its fire spread modeling. SCE does not store its fire spread models.

There are no changes to SCE's approach of using third party vendor for its databases for its ignition confirmation systems since SCE's last WMP submission. SCE does not have plans for changes to this approach in the future.

8.3.5 Weather Forecasting

The electrical corporation must describe its systems and procedures used to forecast weather within its service territory. These forecasts should inform the electrical corporation's near-real- time-risk assessment and PSPS decision-making processes. The electrical corporation must document the following:

- *Its existing modeling approach*
- *The known limitations of its existing approach*
- *Implementation schedule for any planned changes to the system*
- *How the efficacy of systems for reducing risk are monitored Reference the Utility Initiative Tracking ID where appropriate.*

8.3.5.1 Existing Modeling Approach

At a minimum, the electrical corporation must discuss the following components of weather forecasting:

- ***Data assimilation** from environmental monitoring systems within the electrical corporation service territory*
- ***Ensemble forecasting** with control forecast and perturbations*
- ***Model inputs** including, for example:*
    - *Land cover / land use type*

- *Local topography*

- ***Model outputs*** *including, for example:*
  - *Air temperature*
  - *Barometric pressure*
  - *Relative humidity*
  - *Wind velocity (speed and direction)*
  - *Solar radiation*
  - *Rainfall duration and amount*
- ***Separate modules*** *(e.g., local weather analysis and local vegetation analysis)*
  - *Subject matter expert (SME) assessment of forecasts*
  - *Spatial granularity of forecasts including:*
  - *Horizontal resolution*
  - *Vertical resolution*
- ***Time horizon*** *of the weather forecast throughout the service territory*

The electrical corporation must highlight improvements made to the electrical corporation's weather forecasting since the last WMP submission.

The electrical corporation must also provide documentation of its modeling approach pertaining to its weather forecasting system in accordance with the requirements in Appendix B.

Data assimilation

SCE uses new weather forecast information from either in-house model systems or public weather data from vendors at a frequency of up to every hour. SCE's in-house models are generated by downscaling initial conditions provided by various government agencies described in 8.3.5.2 twice per day. Additionally, during high-impact events, meteorologists consult rapidly-updating forecasts from the High Resolution Rapid Refresh (HRRR) model that is generated every hour by the National Centers for Environmental Prediction (NCEP). SCE weather station observations are also shared into the Meteorological Assimilation Data Ingest (MADIS) system used by the National Weather Service to integrate observations into their models that are received by SCE.

Ensemble Forecasting

SCE creates an ensemble forecast consisting of 18 individual Weather Research and Forecasting (WRF) model solutions. The ensemble members are developed by using multiple model initial and boundary conditions sources, multiple physics parameterization choices, and multiple grid lengths. Physics parameterization selections within the control and ensemble models are listed in the table below. Initial and boundary conditions for the ensemble models are provided by the NCEP Global Forecast System (GFS), NCEP North American Mesoscale Model (NAM), and the European Centre for Medium-range Weather Forecasts (ECMWF) Integrated Forecast System (IFS; i.e., European Global Weather Model).

The control model is initialized using the GFS. Model grid length is described later in this section. More detail on the physics choices can be found in the WRF users guide published by the National Center for Atmospheric Research https://www2.mmm.ucar.edu/wrf/users/docs/user_guide_v4/.

Table SCE 8-14 - Summary of WRF Model Physics Configurations

Physics Parameterization Selections	Control Model (Deterministic WRF)	Ensemble Perturbations
Cloud Physics	Morrison	Morrison, New Thompson, Eta
Boundary Layer Physics	MYNN3	MYNN, MYNN3, YSU, Shin-hong, MYNN2.5
Surface Layer Physics	MYNN	MYNN, Revised MM5
Shortwave Radiation	New Goddard	New Goddard, RTTMG, CAM
Longwave Radiation	New Goddard	New Goddard, RTTMG, CAM
Land Surface Model	NoahMP	NoahMP

Model Inputs

The following are input of SCE's weather and fuels modeling

- **Operational and historical Weather Research and Forecasting Model Inputs**
  - Operational forecast models are driven by upper-level weather conditions, surface weather conditions from the GFS, NAM, and ECMWF initial and boundary conditions with soil moisture estimates from the NASA SPoRT dataset.
  - Historical reanalysis data stored within SCE's Data Manager tool is initialized from the NCEP Climate Forecast System Reanalysis (CFSR)
- **Machine Learning**
  - Multiple fields from the control WRF model including:
    - Surface wind speed
    - Surface wind direction
    - Surface dew point temperature
    - Friction velocity (a measure of the degree of turbulence and mixing)
    - Terrain roughness

        - Surface temperature gradient
        - Surface wind speed gradient
        - Wind speed (at 500 m, 1000 m, and 1500 m above ground level (AGL))
        - Wind direction (at 500 m, 1000 m, and 1500 m AGL)
        - Temperature (at 500 m, 1000 m, and 1500 m AGL)
    - Historical weather station observations
- **Fuels Model**
    - Machine Learning model utilizing WRF weather model output to approximate live fuel moisture.

Model outputs

The following are outputs of SCE's weather and fuels modeling:

- Air temperature
- Mean Sea Level Pressure
- Relative humidity
- Wind velocity (speed and direction)
- Incoming shortwave radiation
- Geopotential Heights
- Omega (vertical velocity)
- Absolute Vorticity
- Dead Fuel Moisture
- Live Fuel Moisture
- Normalized Difference Vegetation Index
- Energy Release Component
- Burning Index
- Spread Component
- Ignition Component
- Keetch-Byram Index
- Growing Season Index
- Large Fire Potential Weather Component
- Large Fire Potential Fuel Moisture Component

- Greenness
- Convective Available Potential Energy
- Lifted Index
- Total Totals
- Rainfall
- Snow water equivalent
- Precipitable Water
- Peak 15 min rainfall accumulation
- Low, Mid, and High Cloud Cover
- Soil moisture
- Soil temperature
- Probability of exceeding sustained wind speed thresholds
- Probability of exceeding gust wind speed thresholds
- Weather Score component of the Fire Potential Index
- Fire Potential Index

Separate modules (e.g., local weather analysis and local vegetation analysis)

The Weather Research and Forecast (WRF) model deployed by SCE for its in-house weather modeling system is comprised of several separate modules that can be customized around forecast accuracy. These include the choice of initial and lateral boundary conditions, the underlying terrain resolution, and each of the physics parameterizations specified in Section 8.3.5.1.2. While each of these represent individual modules, they are linked within the WRF framework such that regardless of the module settings used to create a final forecast, a set of standard WRF output is created thereby providing flexibility in the form of allowing SCE to tailor "module" choice for improved forecast accuracy. This framework also allows SCE and its vendors to quickly test new module options as they become available from the research community. The initial and lateral boundary conditions provide information on both the synoptic and mesoscale weather features that will be impacting the SCE territory, which are then downscaled within the WRF model to finer detail. Inclusive in the WRF model solution is a module known as the planetary boundary layer scheme, which is responsible for including the impacts of large eddy scale weather on the overall weather solution as well as the land surface module responsible for including the impacts of local topography and land cover on the weather forecast.

Separate from SCE's numerical weather prediction system described above is SCE's machine learning forecast module. The machine learning module leverages the output from the numerical weather prediction system as input and then removes forecast biases from these inputs based on historical weather observations co-located at the forecast points. The machine learning module and the ensemble forecast output provide additional information on forecast uncertainty to SMEs. As of the end of 2022,

machine learning has been deployed at 564 weather station locations throughout the SCE territory.

Finally, SCE's fuel moisture modeling is a separate module that leverages SCE's weather forecast output in conjunction with mathematical algorithms to estimate dead fuel moisture across the service area. In addition, SCE, through its vendor, Atmospheric Data Solutions, has developed a machine learning model which has been trained on SCE's gridded historic weather and fuels data to predict live fuel moisture through the forecast period.

Collectively, SCE's weather and fuels model output are linked to shapefiles of SCE's infrastructure to produce forecasts directly on assets.

Subject matter expert (SME) assessment of forecasts

SCE Weather Services assesses weather model forecast outputs distilled to electrical circuit and weather station locations from models produced in house (i.e., the ensemble and machine learning guidance described above) as well as publicly available from government weather agencies. Automation is used to quickly identify areas of concern meeting key weather and fuels thresholds for meteorologist and fire scientist assessment. Use of multiple weather models and probabilistic forecast output allows SMEs to evaluate multiple possible forecast outcomes and their likelihood of occurrence. The machine learning models provide point forecasts that have been bias-corrected and probabilistically calibrated by historic observed weather that has occurred at that location. The team validates weather model forecasts for accuracy after each PSPS event and at the end of each year. SCE Weather Services additionally consults expert forecasts from the National Weather Service through publicly available weather discussions. Finally, SCE Weather Services utilizes historical climatological data compiled from each of our 1600+ weather stations installed on our distribution, sub-transmission and transmission systems. This climatological data helps the forecaster to calibrate forecast expectations with true, observable outcomes that have been recorded.

SCE's Fire Sciences assesses fuel conditions by reviewing its in-house fuel moisture modeling output and comparing that to live fuel moisture sampling observations. This information combined with meteorological forecasts helps SCE provide a daily assessment of fire potential across the landscape.

SCE's meteorologists review weather forecasts at a minimum of once per day.

Spatial Granularity

All WRF models' spatial granularity of either 2-km or 1-km. All WRF models are configured with 52 vertical levels.

Time Horizon

The maximum time horizon of SCE's in-house weather forecast and machine learning capabilities is 7 days. SCE meteorologists consult publicly available weather model guidance from vendors and the National Weather Service at longer forecast horizons up to two weeks in advance to gain knowledge on the broad-scale weather pattern and changes that may be coming in the future.

Highlights Since Last WMP Submission

Since the last WMP filing, SCE has improved its weather modeling system by focusing on expanding the use of machine learning to more locations. At the time of the last WMP filing, a total of 64 machine learning forecast locations were operational. As of this filing, 564 machine learning forecast locations are operational, a net gain of 500 new locations. Additionally, SCE has retrained older machine learning

model locations (e.g., the original 64) on additional available observations, improving their accuracy at capturing extreme wind scenarios. Finally, SCE has also developed new probabilistic forecast capabilities derived from machine learning at all 564 operational forecast locations to further aid in accurately estimated forecast uncertainty around sustained and gust winds.

SCE has additionally continued to update its gridded historical reanalysis dataset by twice-annual data refreshes. Data is uploaded into the Data Manager tool once generated.

8.3.5.2 Known Limitations of Existing Approach

The electrical corporation must describe any known limitations of its existing modeling approach resulting from assumptions, data availability, and computational resources. It must discuss the impact of these limitations on the modeling outputs.

SCE relies on numerical weather prediction models based on current state-of-the-art scientific methods developed and supported primarily by academia and government institutions. Several known limitations exist not only within SCE's weather models but generally all operational weather models in existence today. These limitations include:

1. It is not possible to achieve a perfect weather forecast because no perfect initial and boundary conditions exist to drive weather models. No perfect initial and boundary conditions exist because current observations sources used to determine the current state of the atmosphere do not provide complete planetary coverage (this includes areas well beyond the borders of the SCE territory). Additionally, such observations sources are subject to sampling errors that can result in inaccurate forecasts. SCE relies on the federal government to assimilate all surface and upper air observations into the initial and boundary conditions used as input into our WRF models. Therefore, the accuracy of the initial conditions is limited to the accuracy of the methods used in national meteorology centers like the US National Centers for Environmental Prediction and the European Centre for Medium-range Weather Forecasts. SCE uses multiple initial and boundary conditions to account for these uncertainties in its ensemble modeling approach.
2. There are no known analytical solutions to the equations of motion describing the state of the atmosphere. In other words, the equations used to predict the future state of the weather contain unknown terms that are parameterized using empirical experimental data from field campaigns. Such parameterizations do not provide perfect fits and can result in forecast errors. SCE has tested available physics parameterizations to choose those which provide the best forecast accuracy over our territory. SCE uses multiple parameterization choices to sample these unknowns in its ensemble approach.
3. Current state-of-the-art weather models such as the Weather Research and Forecasting (WRF) model are designed for grid lengths of roughly 1km by 1km and larger. This is due to computational restraints and the limitations of the physical parameterizations mentioned in (2). This limits the granularity of weather models until higher computational power becomes available as well as new physics parameterizations can be developed for smaller scales. The result is that fine-scale, unresolvable meteorology features impacting observations may be missed by weather models.

4. Computational constraints limit the number of high-resolution weather models SCE can run in-house, as well as the feasible forecast horizon for weather models. Currently this limits SCE to a forecast horizon of seven days, which is adequate for short to medium range planning. Additionally, it limits the number of ensemble members SCE can run in house, as well as the forecast update frequency as spare cycles are not currently available to run many rapid updates per day.

5. Weather model outputs can contain systematic (repeatable) bias resulting in inaccurate forecasts. SCE is removing these biases by using machine learning to create bias-corrected forecasts. Such forecasts require observations to train the machine learning to detect patterns in forecast error based on prior forecast-observation pairs. Given the dependence on observations for training, statistically correct forecasts are only available at locations where observations exist and with a long enough record for machine learning training. Still such forecasts will be subject to errors described in (1) and no perfect machine learning forecast exists. To overcome this, SCE has developed, and will continue to expand, probabilistic machine learning forecasts for wind speed and gust that estimate the possible forecast in each updated forecast.

6. Short periods of record for forecast evaluation and machine learning. SCE has installed 1600+ weather stations as of this WMP and continues to plan for more station installs. Such weather stations are used to evaluate forecast performance and train SCE's machine learning models. However, development of machine learning models requires at least six months of historical observations data to train new models. Thus, the coverage of SCE's machine learning network is limited to only those locations with sufficient historical data to train new models. Additionally, as the period of record for observations increases, existing machine learning model accuracy will be improved through retraining over more weather events.

7. Modeling fuel moisture is affected by the same limitations that are common in the numerical modeling stated above. In addition to the biases and other forecast errors associated with parameters such as temperature, atmospheric moisture, soil moisture, evaporation rates, etc., needed to calculate fuel moisture, uncertainties within the physical processes of vegetation phenology compound the errors associated with vegetation moisture outputs.

8.3.5.3 Planned Improvements

The electrical corporation must describe its planned improvements in its weather forecasting systems. This must include any plans for the following:

- *Increase in model validation*
- *Increase in spatial granularity*
- *Decrease in limitations by removal of assumptions*
- *Increase in input data quality*
- *Increase in related frequency*

For each planned improvement, the electrical corporation must provide the following in Table 8-31:

- ***Description:*** *A description of the planned initiative activity*
- ***Impact:*** *Reference to and description of the impact of the initiative activity on each risk and risk component*
- ***Prioritization:*** *A description of the x% risk impact (see Section 8.1.1.2 for explanation)*
- ***Schedule:*** *A description of the planned schedule for implementation*

SCE's planned improvements are documented in the Table 8-31.

Table 8-31 - SCE's Planned Improvements to Weather Forecasting Systems

System	***Description***	***Impact***	***x% Risk Impact***	***Implementation Schedule***
Weather Visualization Tool	Build an internal visualization tool to view weather models available overlaid on top of SCE infrastructure.	Improve ability to analyze system impacts associated with weather events.	N/A, enhances foundational / enabling capabilities	System implementation in 2023 and will continue to operational in the following years.
Enhance ADS Date Manager	Extend historical datasets and enhance the functionality.	Allows for easy retrieval of model and historical weather data to perform analytics.	N/A, enhances foundational / enabling capabilities	Continued extensions of datasets and enhancements through foreseeable future
Update Gridded Wind Speed Percentiles	Use improved methods to model wind to produce an extreme wind map for winds at 10m above the ground.	Improves accuracy of wind models, which can help to inform PSPS wind thresholds.	N/A, enhances foundational / enabling capabilities	Updated in 2023 and every two years after.

System	*Description*	*Impact*	*x% Risk Impact*	*Implementation Schedule*
Monthly Circuit Geometry Updates	Continue to update information about circuits since work is always being done on them.	Ensuring proper data and shape of circuits is up to date to accurately forecast weather conditions on the circuit.	N/A, enhances foundational / enabling capabilities	Continued through foreseeable future.
Machine Learning Model Expansion	Continue to expand machine learning model capabilities to all weather station locations.	Improves forecast accuracy and ensures consistent situational awareness throughout	N/A, enhances foundational / enabling capabilities	Continue to implement as long as new weather stations come online.
Machine Learning Model Improvement	Evaluate forecasts and investigate future forecasts improvements.	Ensures that new techniques and knowledge is used to continuously improve forecast models.	N/A, enhances foundational / enabling capabilities	Continued through foreseeable future.
Self-Organizing Maps (SOMs)	Use analog /pattern recognition approach in analysis for forecasts	Adding another model and forecasting technique adds resiliency and provides better insight to forecast uncertainty.	N/A, enhances foundational / enabling capabilities	Pilot system in 2023 and implement in 2024.
1-month and 3-month forecast of Santa Ana Wind days	Continue to create and improve seasonal Santa Ana Wind Forecasts.	Allows for advanced planning of potential critical weather conditions that can result in significant fire activity.	N/A, enhances foundational / enabling capabilities	Continued through foreseeable future.

System	*Description*	*Impact*	*x% Risk Impact*	*Implementation Schedule*
European Model Data Procurement	Continue European Model data feed.	Additional data feed increases forecast redundancy and improves planning around weather forecast uncertainties.	N/A, enhances foundational / enabling capabilities	Continued through foreseeable future.
Dead Fuel Moisture Model Improvement	Evaluate forecasts and investigate future forecasts improvements	Ensures that new techniques and knowledge are used to continuously improve forecast models.	N/A, enhances foundational / enabling capabilities	Continue through 2023.

In 2022, SCE expanded its ML model capabilities to a total of 564 weather station locations and additionally built-out new probabilistic forecasts using machine learning at these same locations. SCE continued to expand its gridded historical data record through twice-yearly updates and improved the functionality of the Data Manager tool. SCE also kicked-off research efforts with UCSB on a gridded observations model and nowcasting tool and additionally began development of the Weather Visualization Portal.

In 2023, SCE plans to improve in-house weather modeling capabilities, by 1) expanding the number of ML model locations, 2) by evaluating a new ML modeling approach for improved forecast accuracy to inform future ML model development efforts, and 3) by implementing analog forecasts derived using Self-organizing Maps. In addition, SCE will continue to expand its gridded historical dataset through twice-yearly updates and add functionality improvements to the Data Manager used to access the historical data. SCE will also leverage this historical data and the ML methodology to refresh historical wind profiles (e.g., wind percentiles) on HFRA circuits. Finally, SCE will continue to explore new innovative technologies to mature situational awareness capabilities with research performed by UCSB and UCSD as well as through continued development of a Weather Visualization Portal with a vendor to enhance its ability to analyze data from several sources. A brief description of each improvement is noted below.

- ML models will be developed for select SCE weather station locations to improve wind forecast accuracy and provide calibrated estimates of forecast uncertainty. SCE plans to equip 500 to 600 weather station locations with Machine Learning (ML) capabilities in 2023.

- SCE will evaluate a new ML model approach that leverages new predictors from the SCE ensemble forecast systems for forecast accuracy improvements over the existing approach. The results will inform the ML model approach in 2024 and beyond.
- The Data Manager improves SCE's ability to analyze historical weather and fuels conditions by providing users a platform to efficiently interact with SCE's historical data. SCE will add further functionalities to the Data Manager around how data can be queried as well as extending the historical dataset to maintain currency.
- SCE is partnering with UCSB to create a gridded observation model that supplements the information provided by SCE's existing network of weather stations. Additionally, UCSB is evaluating a nowcasting tool (very short-term forecast capability covering a horizon of the next six hours with rapid forecast updates) that will allow meteorologists to quickly analyze changing wind trends during PSPS events over granular areas.
- SCE is also planning to partner with the UCSD possibly along with other California utilities to evaluate a new, large 200-member ensemble weather forecast. This new forecast, if proven accurate across the period of research, would add to SCE's forecast redundancy, provide another forecast solution for meteorologists to consider, and increase forecast capability maturity.
- SCE is developing a Weather Visualization Portal that, along with a more robust graphic user interface, will allow users to view and analyze large amounts of data from these models quickly and efficiently. This represents a marked improvement over the current process in which users are retrieving information from different data sources and comparing them, in order to produce an analysis.

In 2024 and 2025, SCE will continue to expand the development and implementation of its machine learning models to improve weather forecast accuracy and representation of confidence. SCE eventually plans to cover all weather station locations with a machine learning model as sufficient data becomes available and new weather station locations are added. SCE will also continually evaluate its machine learning approach and retrain models as updated data becomes available, which will make forecasts more accurate. SCE will also keep its gridded historical data current going forward and will pursue new innovative technologies through strategic academic partnerships. Finally, SCE intends to refresh its high-performance computing cluster (HPCC) infrastructure beginning in 2025 and periodically thereafter as current hardware reaches its end of life.

8.3.5.4 Evaluating Mitigation Initiatives

The electrical corporation must describe its procedures for the ongoing evaluation of the efficacy of its weather forecasting program.

To measure the efficacy of SCE's weather forecast mitigations, SCE creates annual weather forecast verification summaries created by comparing forecast weather conditions to available observations. that the verifications provide robust indications of overall forecast performance which are used to further understand the limitations of current forecast capabilities. Additionally, SCE monitors its weather forecasting program through post event analyses for PSPS events. Finally, SCE asks vendors to include verification of developmental forecast systems within statements of work prior to implementation.

These summaries inform future continuous improvement efforts around weather forecasting as well as help to gain understanding of known modeling limitations.

8.3.5.5 Enterprise System for Weather Forecasting

In this section, the electrical corporation must provide an overview of its enterprise system for weather forecasting. This overview must include discussion of:

- *Any database(s) used for storage.*
- *Describe the electrical corporation's internal documentation of its database(s).*
- *Integration with systems in other lines of business.*
- *Describe any QA/QC or auditing of its system.*
- *Describe internal processes for updating the enterprise system including database(s).*
- *Any changes to the initiative since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation.*

Any database(s) used for storage

Full gridded weather forecast data from the deterministic weather forecast model (ensemble control model) is stored internally on SCE's Enterprise Analytics Platform – Hadoop in the Weather Data Mart (WDM) application. Distilled weather information at the circuit level is also maintained from all internal weather model sources (e.g., the ensemble and machine learning forecasts) in a file repository.

Describe the electrical corporation's internal documentation of its database(s)

The WDM application solution design and all other database design aspects are documented in the Solution Architecture Document.

Integration with systems in other lines of business

The WDM integrates weather/environmental dimensional data from multiple sources for data consolidation and processing. In addition to maintain the forecasts from the control model mentioned early, the WDM also stores specialized forecasts used by SCE Weather Services for the Energy Procurement and Management functions including those created by the National Weather Service.

Describe any QA/QC or auditing of its system

QA/QC of weather data being loaded into the WDM is handled via system checks and alerts which are in place for any exceptions or failures of automated data loads and integrations. These alerts and failures are addressed to ensure timely remediation. For any enhancements or fixes done to WDM, remediation is done by corresponding IT Support teams through an SCE established IT Service Management Process

ensuring requisite compliance and data quality.

Describe internal processes for updating the enterprise system including database(s)

SCE contracts with its Managed Services Provider, who is responsible for enhancements (including databases) on a regular basis. When these updates are completed, SCE validates the functionality end to end with regression and user acceptance testing to ensure everything works as expected. Any bugs found are communicated back to the vendor to be fixed and retested. Once the testing is completed and passed, the new functionality is migrated to our production environment. These changes are managed and tracked using BMC Remedy IT's change management control tool.

Any changes to the initiative since the last WMP submission and a brief explanation as to why those changes were made. Include any planned improvements or updates to the initiative and the timeline for implementation

SCE did not make any changes to its enterprise system for weather forecasting since the last WMP submission. In 2023, SCE will work to archive inputs used to drive in-house weather models within electric corporation maintained databases to improve weather forecast capability maturity.

8.3.6 Fire Potential Index

The electrical corporation must describe its process for calculating its fire potential index (FPI) or a similar a landscape scale index used as a proxy for assessing real-time risk of a wildfire under current and forecasted weather conditions. The electrical corporation must document the following:

- *Its existing calculation approach and how its FPI is used in its operations*
- *The known limitations of its existing approach*
- *Implementation schedule for any planned changes to the system Reference the Utility Initiative Tracking ID where appropriate.*

8.3.6.1 Existing Calculation Approach and Use

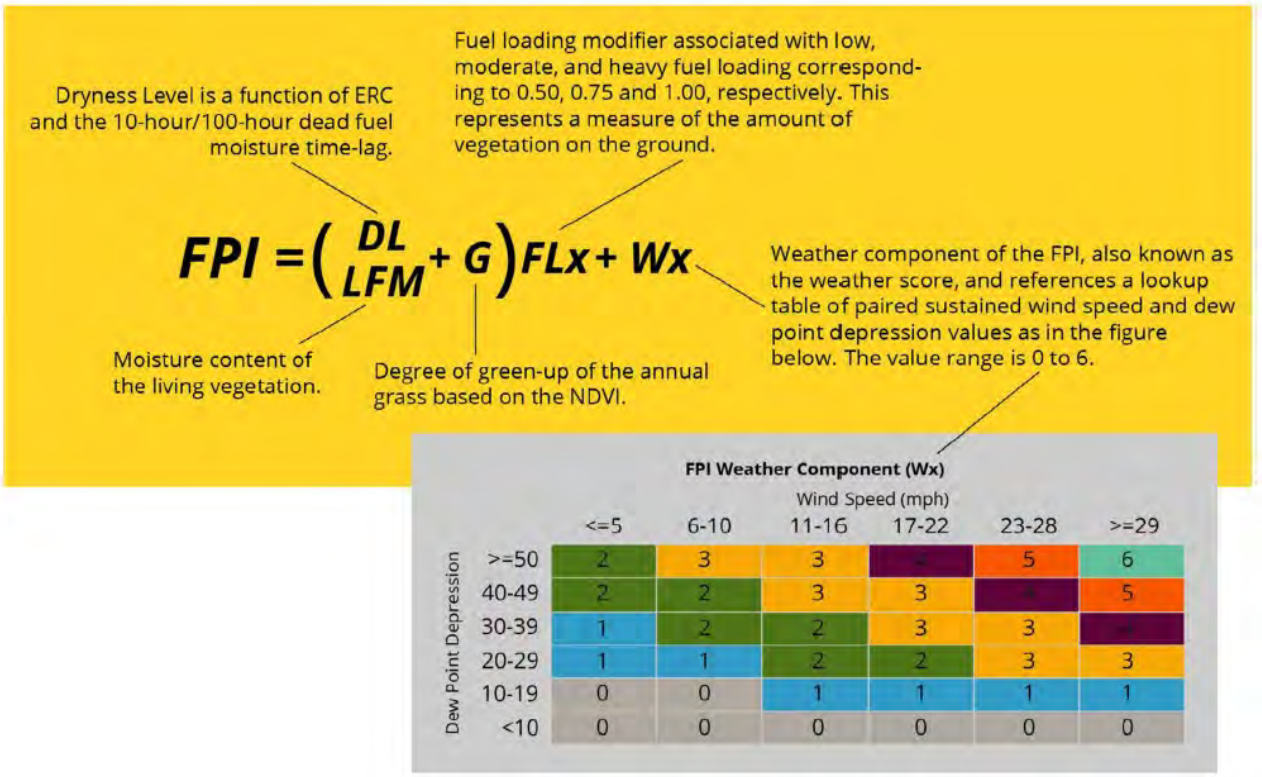
The electrical corporation must describe:

- *How it calculates its own FPI or if uses an external source, such as the United States Geological Survey*[35]
- *How it uses its or an FPI in its operations*

Additionally, if the electrical corporation calculates its own FPI, it must provide tabular information regarding the features of its FPI. Table 8-32 provides a template for the required information.

How it calculates its own FPI or if uses an external source, such as the United States Geological Survey.

SCE assesses daily wildfire potential through use of its Fire Potential Index (FPI) which is based on weather and fuel (vegetation) conditions. FPI is calculated at the circuit level twice daily with output



every three hours, out to seven days and includes the following inputs.

- Wind speed—Sustained wind velocity at six meters above ground level.
- Dew point depression—The dryness of the air as represented by the difference between air temperature and dew point temperature at two meters above ground level.
- Energy release component (ERC)—As defined by the U.S. Department of Agriculture: "The available energy in British Thermal Unit (BTU) per unit area (square foot) within the flaming front at the head of a fire … reflects the contribution of all live and dead fuels to potential fire intensity."[243]
- 10-hour dead fuel moisture—A measure of the amount of moisture in ¼-inch diameter dead fuels, such as small twigs and sticks.
- 100-hour dead fuel moisture—A measure of the amount of moisture in 1- to 3-inch diameter dead fuels, i.e., dead, woody material such as small branches.
- Live fuel moisture—A measure of the amount of moisture in living vegetation.
- Normalized Difference Vegetation Index (NDVI)— As defined by the U.S. Department of the Interior: "… used to quantify vegetation greenness and is useful in understanding vegetation density and assessing changes in plant health."[244]

[243] U.S. Department of Agriculture. n.d. "Energy Release Component (ERC) Fact Sheet." Forest Service. Accessed April 14, 2021. https://www.fs.usda.gov/Internet/FSE_Documents/stelprdb5339121.pdf.

[244] Department of the Interior. n.d. Landsat Normalized Difference Vegetation Index. Access April 14, 2021. https://www.usgs.gov/core-science-systems/nli/landsat/landsat-normalized-difference-vegetation-index?qt-science_support_page_related_con=0#qt-science_support_page_related_com.

Figure SCE 8-51 - Fire Potential Index Equation

Based on a risk analysis of the historical fire data, the FPI is set at 13 for most areas. However, exceptions exist for certain areas and situations in which the FPI threshold is set at 12. These include:

- FCZ1 (Coastal region) — The threshold for FCZ1 remains at 12 because calculated historical probabilities indicated a significantly higher ignition risk factor at an FPI threshold of 13 for this FCZ than for the other FCZs (2, 3, 4, 9, and 10).
- Geographic Area Coordination Center (GACC) preparedness level of 4 or 5 — The GACC coordinates multiple federal and state agencies to track and manage regional fire resources. It provides a daily fire preparedness level on a score of 1-5. A high score signals that there could be resource issues in responding to a fire.
- Circuits located in an active Fire Science Area of Concern (AOC) — AOCs are areas within FCZs that are at high risk for fire with significant community impact. This designation is based on factors that are common to FPI as well as egress, fire history, and fire consequence.

How it uses its or an FPI in its operations

The Fire Potential Index (FPI) is a tool that is used to estimate fire potential across the landscape based on weather and fuel (vegetation) conditions and is one data point used in the PSPS decision-making process.

Table 8-32 - Fire Potential Features

Feature Group	*Feature*	*Altitude*	*Description*	*Source*	*Update Cadence*	*Spatial Granularity*	*Temporal Granularity*
Weather Component	Wind Speed	Surface	Wind speed in miles per hour at 6 meters above ground	Deterministic Weather model	2x per day	2 km	3 Hour Forecasts for 7 days
Weather Component	Dewpoint Depression	Surface	The difference between the temperature and dew point temperature in degrees Fahrenheit at 2 meters above ground	Deterministic Weather model	2x per day	2 km	3 Hour Forecasts for 7 days
Fuels Component	Dryness Level	Surface	Comprised of the Energy Release Component[245] and the 10-hour/100-hour dead fuel moisture time-lag[246]	Deterministic Weather model	2x per day	2 km	3 Hour Forecasts for 7 days
Fuels Component	Live Fuel Moisture	Surface	Moisture content of the living vegetation in percent.	Deterministic Weather model	2x per day	2 km	3 Hour Forecasts for 7 days

[245] Energy Release Component (ERC) is a measure of potential energy (BTU) at the flaming front of a fire and is a composite of fuel moisture from various dead and live fuels.
[246] The time required for dead vegetation (1/2" diameter) to respond to changes in ambient temperature and humidity.

Fuels Component	Grass Green-Up	Surface	The degree of green-up of the annual grass based on the Normalized Difference Vegetation Index (NDVI)[247]	Deterministic Weather model	2x per day	2 km	3 Hour Forecasts for 7 days

8.3.6.2 Known Limitations of Existing Approach

The electrical corporation must describe any known limitations of current FPI calculation.

The current FPI is based on SDG&E's index, which was adopted in 2018 and used for PSPS in 2019. During the 2019 PSPS events, SCE observed limitations in its current FPI. SCE added a fuel-loading modifier in 2019 to account for areas where fuels are sparse and unlikely to support a significant fire. In 2021, SCE calibrated the index and was able to raise FPI thresholds across much of its HFRA as a result. While FPI is a good metric for identifying critical weather events that can result in high fire potential and PSPS, SCE is looking to improve upon its current FPI in subsequent iterations. As a result, SCE is developing a new fire potential index (FPI 2.0) which employs a more sophisticated methodology for assessing fuel conditions. It also puts more emphasis on wind speed as wind can dominate the fire environment. This improved index will do a better job in capturing the sensitivity of critical fire weather conditions as well as being able to highlight extreme events.

8.3.6.3 Planned Improvements

The electrical corporation must describe its planned improvements for its FPI including a description of the improvement and the planned schedule for implementation.

In 2021, SCE developed a new FPI (2.0) to address the limitations stated previously, by placing more emphasis on wind speeds and constructing a new fuels component to account for the diversity of fuel conditions across SCE's service area. The output of FPI 2.0 will provide supplemental data perspectives and continue to be compared with the current FPI in 2023. SCE plans to determine if FPI 2.0 captures more detail in the environmental conditions and provides a more accurate representation of fire potential across the SCE service area. This will allow for an extensive evaluation of FPI 2.0 to occur, with the goal of slowly integrating FPI 2.0 into the PSPS data driven decision making process.

8.3.7 Maturity Advancement

SCE continually seeks alignment with government and industry organizations and practices and continues to look for opportunities to improve situational awareness maturity over time.

[247] The Normalized Difference Vegetation Index (NDVI) is an index of plant "greenness" or photosynthetic activity and is one of the most commonly used remotely sensed vegetation indices.

The activities discussed in this section could lead to Situational Awareness and Forecasting maturity advancements. Below is a summary of broader anticipated maturity improvements over the WMP period that supplement the objectives outlined at the beginning of the Section.

Table SCE 8-15 - Situational Awareness Maturity Improvements

Capability Name	Projected Maturity Improvements
Weather Forecasting	Improvements include improved documentation (i.e., version control) of model inputs and sharing of model performance and validation metrics with the public. Additional improvements include evaluating the expansion of ensemble size on forecast accuracy and development of forecasts that quantify uncertainty information for additional variables from those in use today.
Ignition Likelihood Estimation	Improvements include documentation of discrepancies between ignition likelihood estimates and observations, and a process to validate these SCE conducted analysis by a third-party. Additional improvements will be come from model enrichment with new data, the creation of sub-modules, and documentation on model sensitivity.
Wildfire spread forecasting	Improvements include new wildfire spread model inputs (i.e.; ensemble weather forecasts).
Data collection for near-real-time conditions	Clearly defined processes to track discrepancies between current and historical data; and providing information to the public (i.e.; statistical summary).

8.4 Emergency Preparedness

8.4.1 Overview

Each electrical corporation must develop and adopt an emergency preparedness[248] plan in compliance with the standards established by the CPUC pursuant to Public Utilities Code section 768.6(a). Wildfires and PSPS events introduce unique risk management challenges requiring the electrical corporation to evaluate, develop, and implement wildfire- and PSPS- specific emergency preparedness activities as part of a holistic emergency preparedness strategy.

In this section, the electrical corporation must identify objectives for the next 3- and 10-year periods, targets, and performance metrics related to the following emergency preparedness programmatic areas:

- *Wildfire and PSPS emergency preparedness plan*
- *Collaboration and coordination with public safety partners*
- *Public notification and communication strategy*
- *Preparedness and planning for service restoration*
- *Customer support in wildfire and PSPS emergencies*
- *Learning after wildfire and PSPS events*

SCE maintains a comprehensive business continuity and emergency management program. This program includes emergency and continuity planning, a robust training and exercise program, a hazard

[248] "Emergency and Disaster Preparedness" from Public Utilities Code section 768.6 has been shortened here to Emergency Preparedness.

analysis and mitigation program, and an after-action/corrective action process. This inclusive approach to emergency preparedness helps SCE in building and maturing emergency response capabilities year over year. SCE prioritizes emergency preparedness at all levels of the organization, including senior leadership.

SCE addresses emergency preparedness and response planning through an all-hazards approach, which focuses on capabilities that are critical to address a full spectrum of disruptive events, including natural and/or human-caused emergencies. SCE maintains a Business Resiliency (BR) All-Hazards Emergency Operations Plan (AHP) that incorporates disaster and emergency preparedness, emergency incident response and recovery activities that facilitate restoration and continuity of critical operations. The AHP outlines the roles and responsibilities for the company leadership and incident response personnel across the enterprise for response operations during any type of event.

The AHP serves as the foundation for emergency preparedness, response, and recovery operations and connects to more detailed and specific plans that are specialized to certain hazards and/or situations, including the Earthquake Response Plan, Electric Emergency Action Plan, Cyber Annex, Business Continuity Plans, and the PSPS Protocols. These response plans are available for responders to guide operations during emergency events.

8.4.1.1 Objectives

Each electrical corporation must summarize the objectives for its 3-year and 10-year plans for implementing and improving its emergency preparedness.[249] These summaries must include the following:

- *Identification of which initiative(s) in the WMP the electrical corporation is implementing to achieve the stated objective, including Utility Initiative Tracking IDs*
- *Reference(s) to applicable codes, standards, and best practices/guidelines and an indication of whether the electrical corporation exceeds an applicable code, standard, or regulation*
- *Method of verifying achievement of each objective*
- *A completion date for when the electrical corporation will achieve the objective*
- *Reference(s) to the WMP section(s) or appendix, including page numbers, where the details of the objective(s) are documented and substantiated*

This information must be provided in Table 8-33 for the 3-year plan and Table 8-34 for the 10- year plan. Examples of the minimum acceptable level of information are provided below.

[249] Annual information included in this section must align with the QDR data.

Below is a summary of SCE's 3-year Emergency Preparedness objectives.

Table 8-33 - Emergency Preparedness Initiative Objectives (3-year plan)

Objectives for Three Years (2023–2025)	***Applicable Initiative(s), Tracking ID(s)***	***Applicable Regulations, Codes, Standards, and Best Practices (See Note)***	***Method of Verification (i.e., program)***	***Completion Date***	***Reference (section & page #)***
Maintain a comprehensive all-hazards planning and preparedness program to provide effective emergency response and to safely and expeditiously restore service during and after a major event.	Emergency Preparedness Plan (8.4.2)	• GO 95 • GO128 • GO 166 • ESRB-8 • PSPS OIR Phase 1 D.19-05-042, Phase 2 D.20-05-051, Phase 3 D.21-06-034 • PSPS OII D.21-06-014 • SEMS • NIMS	Annual Filing**	Yearly	Section 8.4.2 Emergency Preparedness Plan, pp. 529-551
Provide effective and accurate communications to the public before, during and immediately following major outages and emergencies.	Public Emergency Communication Strategy (8.4.4)	• GO 95 • GO128 • GO 166 • ESRB-8 • PSPS OIR Phase 1 D.19-05-042, Phase 2 D.20-05-051, Phase 3 D.21-06-034 • PSPS OII D.21-06-014 • SEMS • NIMS	Activity Reporting***	On-going	Section 8.4.4 Public Emergency Communication Strategy, pp. 558-566

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

** SCE maintains an annual schedule for completion of updates to both the All-Hazards Emergency Plan and associated hazard specific plans to provide for response and meet regulatory requirements. SCE also files these emergency plans annually to meet regulatory requirements (GO166, EEAP, etc.) with the Safety Enforcement Division of the CPUC. A publicly available version of the All Hazards Emergency Plan was also posted on the Energy Safety website in 2023 and can be found at https://efiling.energysafety.ca.gov/eFiling/Getfile.aspx?fileid=53525&shareable=true

*** Communication to customers occurs on our website, including banners and macro messaging on our home page, and updated information on our outage page and map; through Energized, our news channel; and on social media. During emergencies, all these channels are publicly available for review. News stories on Energized are posted in advance of flex alerts, and when there is a potential for significant customer impacts, with follow-up reporting as required. These articles are archived and publicly available indefinitely (going back to 2013) at energized.com. For PSPS, notifications are sent pursuant to PSPS guidelines and results are available in SCE post-event reports, 10 days after the conclusion of each event, which can be found on SCE's website at: https://www.sce.com/wildfire/wildfire-safety.

Below is a summary of SCE's 10-year Emergency Preparedness objectives.

Table 8-34 - Emergency Preparedness Initiative Objectives (10-year plan)

Objectives for Ten Years (2026–2032)	***Applicable Initiative(s), Tracking ID(s)***	***Applicable Regulations, Codes, Standards, and Best Practices (See Note)***	***Method of Verification (i.e., program)***	***Completion Date***	***Reference (section & page #)***
Refined emergency planning and preparedness practices and programs to support customers before, during, and following emergency events.	Customer Support in Wildfire and PSPS Emergencies (8.4.6)	• GO 95 • GO128 • GO 166 • ESRB-8 • PSPS OIR Phase 1 D.19-05-042, Phase 2 D.20-05-051, Phase 3 D.21-06-034 • PSPS OII D.21-06-014 • SEMS • NIMS	Activity Reporting **	On-going	Section 8.4.6 Customer Support in Wildfire and PSPS Emergencies, pp. 570-576
Ongoing implementation of lessons learned and findings from After Action Reports (AARs) and other external sources to continuously improve emergency response capabilities.	Emergency Preparedness Plan (8.4.2) External Collaboration and Coordination (8.4.3) Public Emergency Communication Strategy (8.4.4)	• ESRB-8 • PSPS OIR Phase 1 D.19-05-042, Phase 2 D.20-05-051, Phase 3 D.21-06-034 • PSPS OII D.21-06-014	Activity Reporting AARs – completed after each exercise and real-world event. AARs include corrective action items for resolution that are managed to completion.	On-going	Section 8.4.2 (Emergency Preparedness Plan), pp. 529-551; Section 8.4.3 (External Collaboration and Coordination) pp. 550-560; Section 8.4.4 (Public Emergency Communication Strategy), pp. 558-566

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

** All planning and preparedness programs to support customers before, during and following emergency events are described on SCE's website at: https://www.sce.com/outage-center/customer-resources-and-support Information is updated to be current with any program updates or changes.

8.4.1.2 Targets

Initiative targets are forward-looking quantifiable measurements of activities identified by each electrical corporation in its WMP. Electrical corporations will show progress toward completing targets in subsequent reports, including QDRs and WMP Updates.

The electrical corporation must list all targets it will use to track progress on its emergency preparedness for the three years of the Base WMP. Energy Safety's Compliance Assurance Division and third parties must be able to track and audit each target.[250] *For each initiative target, the electrical corporation must provide the following:*

- *Utility Initiative Tracking IDs.*
- *Projected targets for the three years of the Base WMP and relevant units.*
- *The expected "x% risk impact" for each of the three years of the Base WMP. The expected x% risk impact is the expected percentage risk reduction per year, as described in Section 7.2.2.2.*
- *Method of verifying target completion.*

The electrical corporation's targets must provide enough detail to effectively inform efforts to improve the performance (i.e., reduction in wildfire consequence) of the electrical corporation's emergency preparedness initiatives.

Table 8 - 3 5 provides an example of the minimum acceptable level of information.

In Table 8-35 below, SCE provides the expected risk impact for each initiative at the scoping unit level and at the HFRA-level. The risk impact percentages for PSPS-2 and PSPS-3 are based on the expected reduction to PSPS risk in MARS, while the risk impact percentages for DEP-2 is based on the expected reduction to wildfire risk in MARS.. SCE includes additional columns in the table below showing the percentage of an initiative's scope that is in Severe Risk Area (SRA) and High Consequence Areas (HCA).

[250] Annual information included in this section must align with Tables 1 and 12 of the QDR.

Below is a summary of SCE's Emergency Preparedness targets by year.

Table 8-35 - Emergency Preparedness Initiative Targets by Year

Initiative Activity	***Tracking ID***	***2023 Target & Unit***	***x% Risk Impact 2023 (Scoped / HFRA)***	***2024 Target & Unit***	***x% Risk Impact 2024 (Scoped / HFRA)***	***2025 Target & Unit***	***x% Risk Impact 2025 (Scoped / HFRA)***	***Method of Verification***
SCE Emergency Response Training	DEP-2	PSPS response teams are fully qualified/re-qualified by 7/1 annually to maintain readiness	N/A	PSPS response teams are fully qualified/re-qualified by 7/1 annually to maintain readiness	N/A	PSPS response teams are fully qualified/re-qualified by 7/1 annually to maintain readiness	N/A	IMT training roster
Aerial Suppression	DEP-5	Provide fire agencies with funding to support quick reaction force (QRF) program for 2023	1.6%	SCE will continue to reassess availability and funding for aerial suppression resources in SCE's service area annually to determine ongoing QRF strategy	1.9%	SCE will continue to reassess availability and funding for aerial suppression resources in SCE's service area annually to determine ongoing QRF strategy	2%	Copy of funding agreement

		* Number of calendar/business days subject to change based on customer survey feedback to inform appropriate calendar/business day measurement		based on customer survey feedback to inform appropriate calendar/business day measurement		on customer survey feedback to inform appropriate calendar/business day measurement		

The projections provided in Table 8-35 are estimates and subject to change.

8.4.1.3 Performance Metrics Identified by the Electrical Corporation

Performance metrics indicate the extent to which an electrical corporation's Wildfire Mitigation Plan is driving performance outcomes. Each electrical corporation must:

- *List the performance metrics the electrical corporation uses to evaluate the effectiveness of its emergency preparedness in reducing wildfire and PSPS risk*[251]

For each of these performance metrics listed, the electrical corporation must:

- *Report the electrical corporation's performance since 2020 (if previously collected)*
- *Project performance for 2023-2025*
- *List method of verification*

The electrical corporation must ensure that each metric's name and values are the same in its WMP reporting as its QDR reporting (specifically, QDR Table 2 and QDR Table 3). Metrics listed in this section that are the same as performance metrics required by Energy Safety and reported in QDR Table 2 (Performance Metrics)[252] *must match those reported in QDR Table 2. Metrics listed in this section that are not the same as any of the performance metrics identified by Energy Safety and reported in QDR Table 2 must match those reported in QDR Table 3.*

The electrical corporation must:

- *Summarize its self-identified performance metric(s) in tabular form*
- *Provide a brief narrative that explains trends in the metrics*

SCE has identified performance metrics relating to SCE's Emergency Preparedness activities. These metrics align with SCE's efforts to minimize the scope, duration, and customer impacts from PSPS events. SCE's IMT structure and overall emergency preparedness function is critical in being able to reduce these impacts and communicate effectively with all our stakeholders. Please see Section 9 for further discussion on these metrics, including a brief narrative that explains trends in the metrics.

[251] There may be overlap between the performance metrics the electrical corporation uses and performance metrics required by Energy Safety. The electrical corporation must list these overlapping metrics in this section in addition to any unique performance metrics it uses.

[252] The performance metrics identified by Energy Safety are included in Energy Safety's Data Guidelines.

Below is a summary of SCE's Emergency Preparedness performance metrics by year.

Table 8-36 - Emergency Preparedness Performance Metrics Results by Year

Performance Metrics	***2020***	***2021***	***2022***	***2023 Projected***	***2024 Projected***	***2025 Projected***	***Method of Verification (e.g., third-party evaluation, QDR)***
Scope of PSPS Events (total)[253]	424	232	13	210	197	185	QDR, Tables 3 and 10
Duration of PSPS events (total)[254]	4,455,936	3,700,254	112,274	2,508,101	2,282,372	2,076,958	QDR, Tables 3 and 10
Number of customers impacted by PSPS[255]	229,800	179,502	15,784	120,441	102,375	87,019	QDR, Tables 3 and 10

[253] Scope of PSPS Events definition: Circuit-events, measured in number of events multiplied by number of circuits de-energized per year
[254] Duration of PSPS events definition: Customer hours per year
[255] Number of customers impacted by PSPS definition: Number of customers impacted by PSPS (if multiple PSPS events impact the same customer, count each event as a separate customer)

8.4.2 Emergency Preparedness Plan

In this section, the electrical corporation must provide an overview of how it has evaluated, developed, and integrated wildfire- and PSPS-specific emergency preparedness strategies, practices, policies, and procedures into its overall emergency plan based on the minimum standards described in GO 166. The electrical corporation must provide the title of its latest emergency preparedness report, the date of the report, and an indication of whether the plan complies with CPUC R. 15-06-009, D. 21-05-019, and GO 166. The overview must be no more than two paragraphs.

SCE's AHP (Version December 2022) outlines the company's emergency management response strategy and tactics, including wildfire responses. The plan integrates the strategies set by the National Response Framework,[256] mirroring the mission areas and the applicable core capabilities as defined by the Federal Emergency Management Agency (FEMA). It aligns with concepts identified in both the California Standardized Emergency Management System (SEMS)[257] and National Incident Management System (NIMS). In 2021, SCE performed a comprehensive update to the AHP that included additional elements recently required by D.21-05-019.[258] PSPS-06-SCE-01 Public Safety Power Shutoff Protocol, Version 3, dated August 1, 2022, outlines PSPS strategy and tactics.

In both the AHP and the PSPS Protocol, SCE adheres to the regulations imposed by CPUC, FERC, CAISO, CalOES, and NERC. Please see Section 8.4.2.1 for additional information.

In addition, the electrical corporation must provide a list of any other relevant electrical corporation documents that govern its wildfire and PSPS emergency preparedness planning for response and recovery efforts. This must be a bullet point list with document title, version (if applicable), and date. For example: Electrical Corporation's Emergency Response Plan (ECERP), Third Edition, dated January 1,2021

- SOB 21: System Emergency Response Plan, dated October 3, 2022.

Reference the Utility Initiative Tracking ID where appropriate.

[256] *See* National Response Framework, available at https://www.fema.gov/emergency-managers/national-preparedness/frameworks/response

[257] The California Standardized Emergency Management System is a structure for coordination between the government and local emergency response organizations. It provides and facilitates the flow of emergency information and resources within and between the organizational levels of field response, local government, operational areas, regions, and state emergency management. SCE has integrated SEMS into its emergency plans and response structure.

[258] *See* Decision (D.) 21-05-19 from (Rulemaking 15-06-009) Addressing Phase II Issues Relating to Emergency and Disaster and Preparedness Plans, available at https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M385/K377/385377826.PDF

8.4.2.1 Overview of Wildfire and PSPS Emergency Preparedness

In this section of the WMP, the electrical corporation must provide an overview of its wildfire- and PSPS-specific emergency preparedness plan. At a minimum, the overview must describe the following:

- *Purpose and scope of the plan.*

The AHP is the base document for strategic, operational, and tactical planning for all SCE emergency response, and documents our company-wide approach to continue operations and meet the diverse needs of the community in coordination and participation with our emergency response partners. It is designed to guide us in the safe and efficient restoration after any type of outage through identification of applicable prioritization and restoration strategies, and the development of a common operating picture for communicating situational awareness to internal and external stakeholders. The AHP integrates the strategies set by the National Response Framework, including the mission areas and the applicable core capabilities defined by FEMA. It is in alignment with concepts identified in both the SEMS and NIMS.

The AHP does not supersede or replace existing procedures for safety, hazardous materials response, or other similar procedures adopted and in place, including but not limited to specific response plans prepared to address individual circumstances or to comply with regulatory requirements.

The PSPS Protocol coordinates critical preparedness, response, and recovery operations for PSPS, including public safety partner and customer notifications. It outlines specific PSPS IMT roles and responsibilities and describes the communication and coordination protocols between internal and external stakeholders when implementing a PSPS.

Overview of protocols, policies, and procedures for responding to and recovering from a wildfire or PSPS event (e.g., means and methods for assessing conditions, decision-making framework, prioritizations). This must include:

SCE maintains compliance with the protocols, policies, and procedures that govern PSPS. Multiple authorities guide the structure, development, and implementation of PSPS, including numerous regulatory agencies such as FERC, NERC, and the CPUC. SCE has built an internal program and structure to adhere to and implement these requirements, including establishing operational protocols pertaining to wildfire and PSPS-related outages and emergency response.

The following requirements inform emergency plans and procedures:

CPUC Requirements:

- General Order Number 166: Standards for Operation, Reliability, and Safety during Emergencies and Disasters, current revision
- General Order Number 95: Rules for Overhead Electric Line Construction
- General Order Number 128: Rules for Construction of Underground Electric Supply and Communication Systems

- Resolution ESRB-8: Resolution Extending De-Energization Reasonableness, Notification, Mitigation, and Reporting Requirements in Decision 12-04-024 to All Electric Investor Owned Utilities
- PSPS Order Instituting Rulemaking (OIR) Phase 1 (Decision (D.) 19-05-042), Phase 2 (D.20-05-051), Phase 3 (D.21-06-034) and PSPS Order Instituting Investigation (OII) (D.21-06-014)

CAISO

- California Independent System Operator (CAISO) Standards for Reliability and Safety during Emergencies and Disasters (May 2021)

Energy Safety

- Senate Bill 901 (2018) provided for the treatment of wildfire

SCE Policies/Procedures

- System Operating Bulletin No. 21: System Emergency Response Plan

Internally, SCE identifies general standards and authorities for IMT through the Incident Management Team guidelines, and unique standards and authorities specific to incident types through the development of Incident/Hazard Specific Annexes to the All-Hazards Plan. In some cases, SCE will stand up an Incident Support Team (IST). ISTs are more advanced teams, whose members go through more training and are typically in a management role in the company. ISTs are also subject to IMT guidelines. In addition, the Crisis Management Council (CMC) or Officer-In-Charge may issue a delegation of authority to IST/IMT Incident Commanders to outline incident-specific authorities.

An operational flow diagram illustrating key components of its wildfire- and PSPS-specific emergency response procedures from the moment of activation to response, recovery, and restoration of service.

Separate overviews and operational flow diagrams for wildfires and PSPS events.

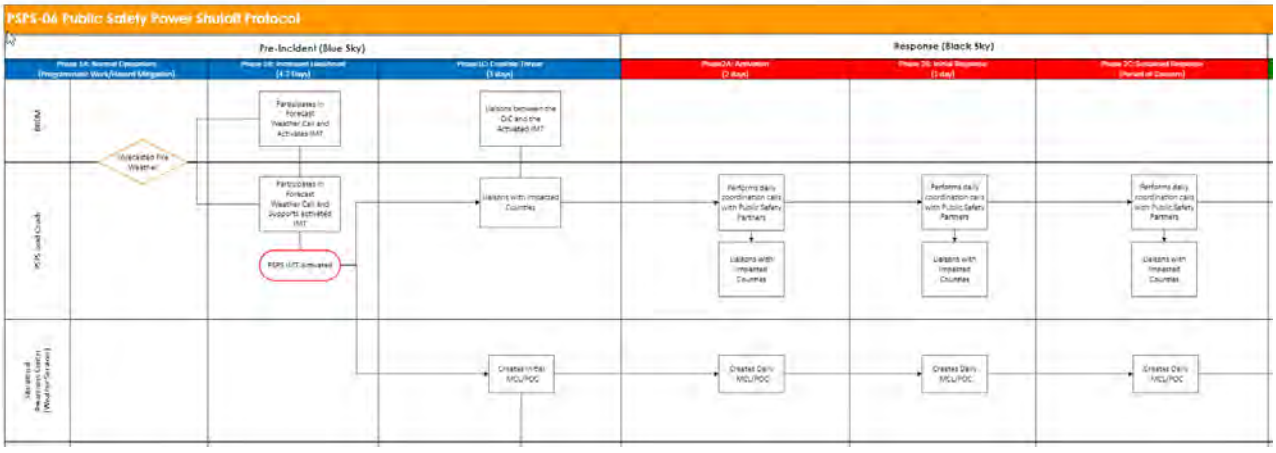

Table SCE 8-16 illustrates the phases of emergency management. These phases generally apply to wildfire and all-hazards.

Table SCE 8-16 - Emergency Management Phases

Pre-Incident			Response			Recovery
1A	1B	1C	2A	2B	2C	3A
Normal Operations	Increased Likelihood	Credible Threat	Activation	Initial Response	Sustained Response	Long-Term Recovery

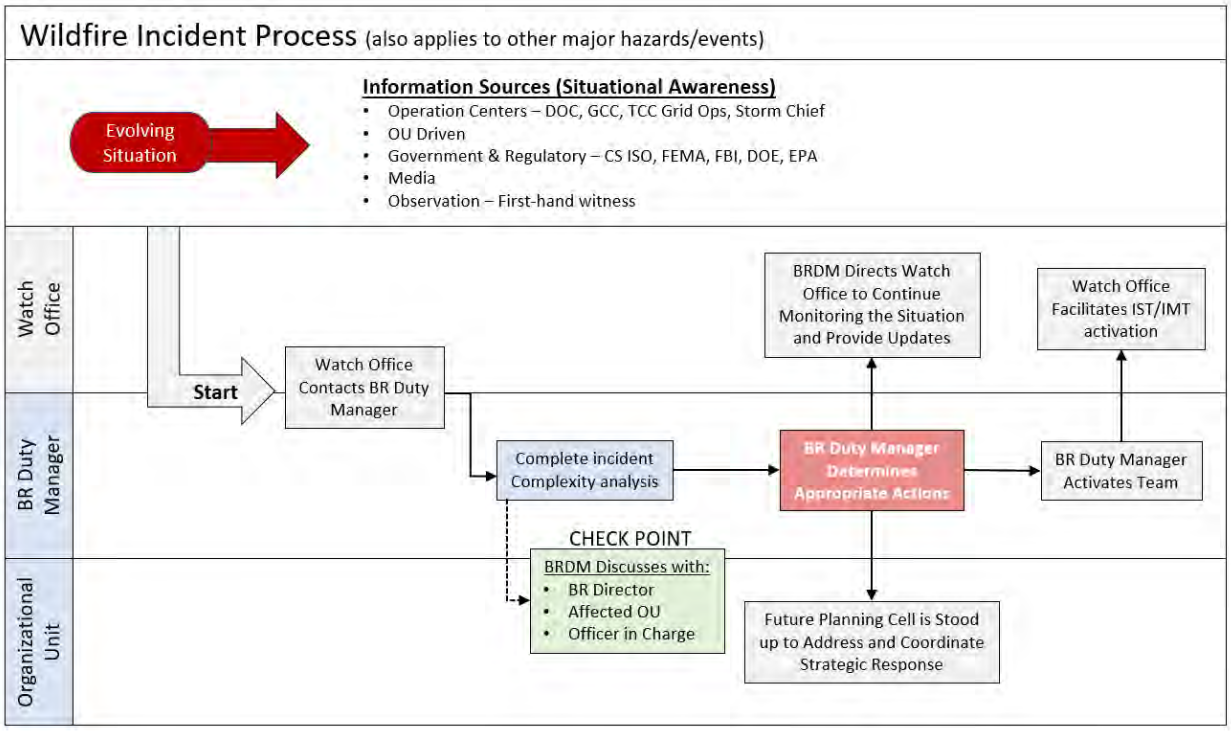
Figure SCE 8-52a illustrates the phases of emergency management through a PSPS event.

Figure SCE 8-52a - PSPS Flowchart

Full chart can be found in Appendix F: Supplemental Information.

Figure SCE 8-52b illustrates the initial phases of emergency management through a wildfire event up to IMT activation.

Figure SCE 8-52b – Wildfire Incident Process Through IMT Activation



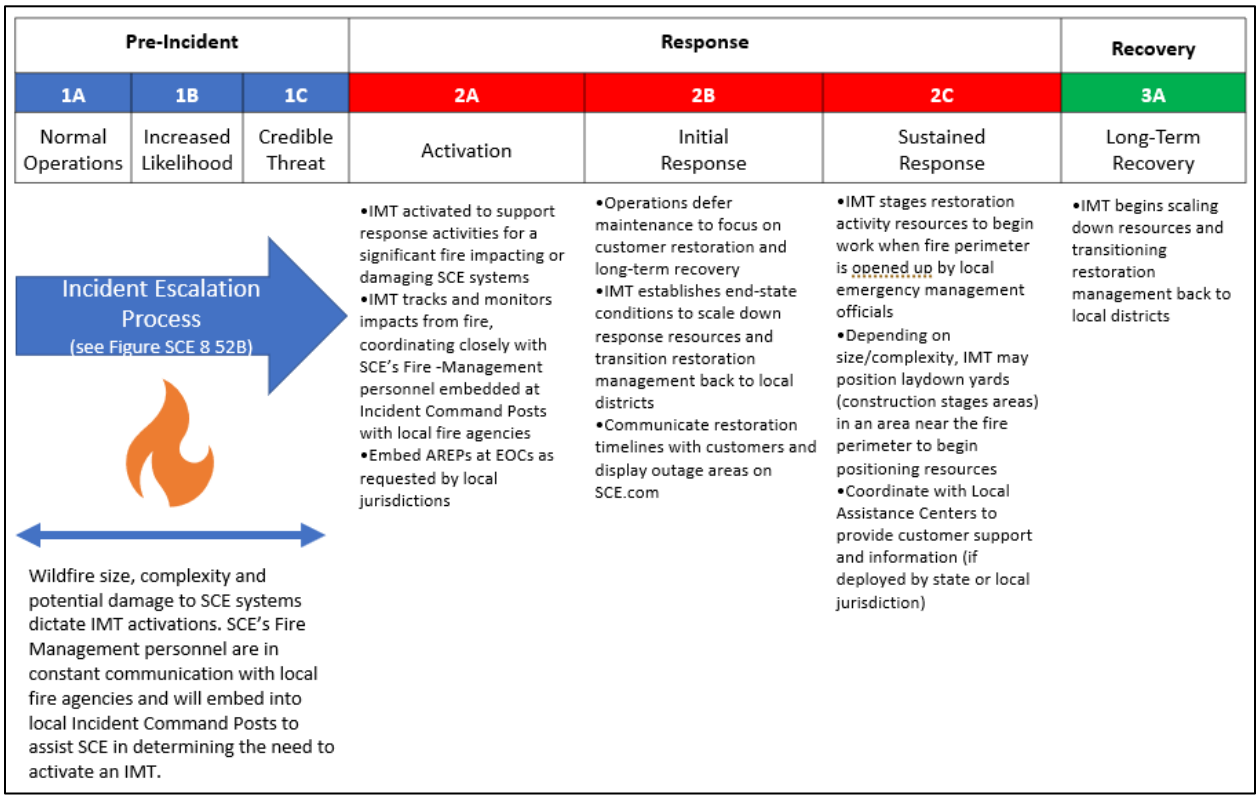


Figure SCE 8-52c illustrates the phases of emergency management through a wildfire event. SCE notes that these steps also apply to hazards generally, and that SCE continually evalutes its response practices and may adjust as needed.

Figure SCE 8-52c – Wildfire Incident Response Phases

Key personnel, qualifications, and training.

All-Hazards IMT and IST teams include qualified personnel from across the company whose emergency management roles use complimentary skills and capabilities to those used in their "blue sky" roles. For example, the Finance Section chief could be filled by someone in SCE's Financial organization. These team members acquire and master proficiency at emergency response through independent and instructor-led classes, exercises, and feedback. Their participation in the IMT program is evaluated as part of their annual year-end performance review. Small teams of trained individuals are qualified for leadership roles. Support roles have deeper rosters, and these "pooled" team members are on call one week out of every four or six weeks.

PSPS IMT teams include dedicated team membe

rs whose blue-sky functions are to develop, train, and manage the PSPS program year-round. These dedicated leads are responsible for training and managing the pooled PSPS teams.

Team members are required to take on-line training through FEMA's Emergency Management Institute (EMI) & California Specialized Training Institute (CSTI). These independent study courses provide a fundamental understanding of emergency management principles and concepts. SCE requires the following as prerequisites to classroom training:

- IS 100.c – Introduction to ICS

- IS 200.c – ICS for Single Resources & Initial Action
- IS 700.b – National Incident Management
- IS 800.d – National Response Framework, an Introduction

CSTI- certified instructors conduct the classroom training required for IST and IMT qualification. Course materials include materials pertinent to the electric utility industry as well as training for situations unique to SCE and meet national Incident Management standards. Some courses include information on SCE-specific plans or relevant technology, such as Web EOC.

Team members are required to take ICS 300 - Intermediate ICS for Expanding Incidents. IST members must complete ICS 400 after completing ICS 300.

Once training is complete, team members demonstrate proficiency in their position under the direct supervision of a fully qualified team member in their role during a functional exercise or real-world activation. Collectively, IS online and ICS classroom training and exercise/activation components are the minimum qualification requirements needed to build a baseline capability for responding to incidents. Additional familiarity and skill development take place through formal and informal learning opportunities provided throughout the year.

SCE also requires SEMS G606 (Standardized Emergency Management System Introduction Online Course) as an online course for IMT, IST, Pool Positions, and PSPS IMTs personnel. Selected IMT/IST positions also require G197 (G197 Integrating Access & Functional Needs into Emergency Management).

Each year SCE requires that all IMT, IST and pooled positions go through requalification to maintain a basic level of familiarity with their position and build on their knowledge, skills, and abilities. SCE reviews qualification requirements annually and communicates any changes out to all IMT/IST members through a cross-OU committee with representatives from all teams that are matrixed to the IMT. To maintain qualification, a member must complete the following:

- Position Specific User Group Training
- IMT/IST Requalification Training

Dedicated PSPS team members are required to attend an annual PSPS-position specific training and an exercise.

Resource planning and allocation (e.g., staffing).

Within one hour of the identification of a major outage or other emergency situation, SCE will coordinate internal resources.

When the Business Resiliency Duty Manager (BRDM) receives information that could potentially lead to an activation, analysis is applied to determine the severity of the incident and how the company should respond. The Complexity Analysis Tool is utilized to provide a standardized and rapid quantitative assessment regarding incident severity level. Severity level determines the course of action when leveraging company resources required to respond commensurate to the incident complexity.

The criteria in the Complexity Analysis tool determines the severity level of an incident and drives

activation decisions for an IMT/IST. The criteria in the Complexity Analysis is evaluated by the IC and BRDM regularly throughout an activation to assess appropriate staffing levels. This will drive a more gradual and methodical approach to both escalation and de-escalation of resources and ultimately demobilization of an IMT.

Drills, simulations, and tabletop exercises.

SCE Exercise and Evaluation Program

To foster exercise-related interoperability and collaboration, SCE has adapted the Department of Homeland Security Exercise and Evaluation Program (HSEEP), which was developed to provide an overview of exercise, development, conduct, evaluation, and improvement planning process. In alignment with HSEEP, SCE identifies gaps and lessons learned from exercises to improve the process over time. As part of this improvement process, an Integrated Preparedness Plan is developed to establish a strategy and structure for the exercise program to verify preparedness efforts are met, while setting the foundation for the planning, conduct, and evaluation of individual exercises.

Exercise Planning

HSEEP provides a set of guiding principles for exercise and evaluation programs, as well as a common approach to exercise program management, design and development, conduct, and improvement planning.

By incorporating the HSEEP process, SCE develops, executes, and evaluates exercises that address company preparedness priorities. These priorities are informed by hazards, capability assessment findings, corrective actions from previous events, and external requirements. These priorities guide the overall direction of the exercise program and the design and development of individual exercises. These priorities also guide planners as they identify exercise objectives and align them to capabilities for evaluation during the exercise.

SCE invites Public Safety Partners to observe and participate in emergency exercises to foster a high level of coordination and collaboration. Please see Table 8-41.

Coordination and collaboration with public safety partners (e.g., emergency planning, interoperable communications).

Annually, SCE coordinates emergency preparations with state, county, and local agencies, as well as Essential Customers who are defined in General Order 166 as “Customers representing critical infrastructure and Public Safety Partners.” As part of this activity, SCE has a process for confirming and maintaining contacts and communication channels.

SCE’s plan development process includes considerations and lessons learned from recent incidents and events, coordination, and consultation with key internal and external stakeholders, and follows a regular annual update and maintenance cycle, in accordance with CPUC GO-166 standards. Following emergency activations, SCE reviews that the activation and escalation standards are clear and appropriate in the plan. In addition, every two years, SCE invites local government representatives to provide consultation as the plan is updated as well as the opportunity to comment on draft plans.

SCE maintains multiple contacts for each local government potentially impacted by service interruptions

and requests that local governments provide a list of officials to be notified (i.e., Public Safety Partners, agency management, and elected officials) about service interruptions. SCE performs annual communications tests in advance of the peak wildfire season as requested by the Commission and defined by the California Department of Forestry and Fire Protection.

Notification of and communication to customers during and after a wildfire or PSPS event.

The objective of SCE's notification strategy is to provide State Agencies, Public Safety Partners, critical infrastructure and facilities providers, customers (including those with access and functional needs), and all interested stakeholders with accessible, actionable, and easy to understand information. For PSPS, this includes information provided before, during, and after events that may impact them.

SCE has established a messaging protocol that complies with all standard emergency alerting and warning protocols.

The Emergency Outage Notifications System (EONS) is the primary tool used to keep customers informed before, during, and after PSPS events. EONS allows SCE to communicate to all customer classes (receiving under 66kv power) impacted by PSPS via email, voice calls, and/or SMS. PSPS notification translations are available in 23 languages.

Please refer to Section 8.5.2 Public Outreach and Education Awareness Program for information on additional communications with customers.

Improvements/updates made since the last WMP submission.

SCE's All Hazards Plan development process includes considerations and lessons learned from recent incidents and events, coordination, and consultation with key internal and external stakeholders, and follows a regular annual update and maintenance cycle, in accordance with CPUC GO-166 standards. The current All Hazards Plan is dated December 2022 and includes additions and modifications. Please see Section 8.4.2.4 for additional information on updates and modifications made to the plan in recent years.

The overview must be no more than six pages.

In addition, the electrical corporation must provide a table with a list of current gaps and limitations in evaluating, developing, and integrating wildfire- and PSPS-specific preparedness and planning features into its overall emergency preparedness plan(s). Where gaps or limitations exist, the electrical corporation must provide a remedial action plan and the timeline for resolving the gaps or limitations. Table 8-37 provides an example of the minimum level of content and detail required.

Below is a summary of SCE's gaps and limitations in integrating wildfire and PSPS planning into emergency planning.

Table 8-37 - Key Gaps and Limitations in Integrating Wildfire- and PSPS-Specific Strategies into Emergency Plan

Gap or Limitation Subject	Remedial Brief Description	Remedial Action Plan
Training	SCE continues to mature training and exercises based on lessons learned within after action reports from exercises and real-world incidents. SCE's annual readiness activities for IMT resources who respond to PSPS events through training and exercises is based on HSEEP's improvement cycle approach.	The training and exercise program continually updates and improves training and exercises to incorporate changes to procedures and tools used for activations. Target timeline: SCE will conduct a PSPS Full-Scale Exercise in 2023, increasing complexity from the 2022 Functional Exercise.
After-action report reviews	After action reports are conducted after all PSPS exercises and real-world events to evaluate lessons learned and areas of improvement.	These reports are then translated into formal corrective actions that are tracked and monitored through completion. Target timeline: Exercise After Action reports are published as part of the annual July 1 readiness deadline and real-world incident After Action reports are produced within 2 weeks of an incident.

8.4.2.2 Key Personnel, Qualifications, and Training

In this section, the electrical corporation must provide an overview of the key personnel constituting its emergency planning, preparedness, response, and recovery team(s) for wildfire and PSPS events. This includes identifying key roles and responsibilities, personnel resource planning (internal and external staffing needs), personnel qualifications, and required training programs.

Personnel Qualifications

The electrical corporation must report on the various roles, responsibilities, and qualifications of electrical corporation and contract personnel tasked with wildfire emergency preparedness planning, preparedness, response, and recovery, and those tasked for PSPS-related events. This may include representatives from administration, information technology (IT), human resources, communications, electrical operations, facilities, and any other mission-critical units in the electrical corporation. As part of this section, the electrical corporation must provide a brief narrative describing its process for planning to meet its internal and external staffing needs for emergency preparedness planning, preparedness, response, and recovery related to wildfire and PSPS. The narrative must be no more than two to four pages.

SCE utilizes the Incident Command System (ICS) structure to guide its activations, exercises, and its planning process. The flexibility of ICS means it can be adapted for incidents and events of any type, scope, and complexity. It allows its users to adopt an integrated organizational structure that matches the complexities and demands of single or multiple incidents or events.

ICS allows for a scalable response. If a disruption is a localized, single incident in one functional area, only one IMT activates. If multiple incidents occur multiple IMTs may activate as well as an IST to coordinate the overall response and recovery activities and manage resource requirements between the IMTs.

A single IMT is typical for situations of limited scope. Additional IMTs and an IST activate for complex incidents with multiple impacts. In the event of a complex incident requiring a response by more than one IMT and coordination of those teams, the individual incident commanders adopt a Unified Command structure with all involved IMTs organized into a single team. The IST Incident Commander (IC) leads the unified command effort, and the teams work under a single set of objectives and one incident action plan.

SCE utilizes Area Command as an organizational approach for management of multiple incidents or during large incidents that cross jurisdictional boundaries. Area Command is typical for when an incident calls for a coordinated response, with large-scale coordination necessary at a higher jurisdictional level. SCE will typically organize under Area Command when a single functional business line is affected by multiple incidents across the SCE Service Territory.

SCE established a SEMS, NIMS and ICS compliant incident management structure built around Incident Management Teams (IMTs). An IMT is a group of trained personnel from different SCE organizational units called on to lead a response to an emergency or incident. IMTs typically activate for incidents expected to last longer than a day and requiring coordinated planning and resource allocation within a specific functional area. One primary IMT is:

- **Public Safety Power Shutoff (PSPS) IMT** activates when conditions are projected to meet established thresholds (combination of fuel conditions and weather). The PSPS IMT is led by a dedicated team of subject matter experts who manage each of the key positions on the team. Other supplemental team members are activated to fill out teams and to spell dedicated team members for additional shifts. In cases such as the PSPS IMT, having a dedicated team supports consistent decision making, deeper PSPS-specific experience, and greater ability to support continuous improvements and planning during non-event periods.

Among many responsibilities, these teams make de-energization recommendations, communicate potential outages with public safety partners and customers, manage company

notification activities, re-energization activities and notifications. All de-energization decisions are authorized by the incident commander. In addition, these teams are responsible for maintaining communications with state/county representatives as required by California State Public Utilities Commission. Subject Matter Experts from across the company can be activated as Technical Specialists to support IMTs.

Initial Qualification

Team members are required to take on-line training through FEMA's Emergency Management Institute (EMI) & California Specialized Training Institute (CSTI). These independent study courses provide a fundamental understanding of emergency management principles and concepts. While there are several hundred different independent study courses available, SCE only requires the following as prerequisites to classroom training:

- IS 100.c – Introduction to ICS
- IS 200.c – ICS for Single Resources & Initial Action
- IS 700.b – National Incident– Management
- IS 800.d – National Response Framework, an Introduction

CSTI certified instructors conduct the classroom training required for IST and IMT qualification. Course materials include activities unique to SCE and the electric utility industry and meet national ICS standards. Some courses include information on SCE-specific plans or technology such as Web EOC.

Team members are required to take ICS 300 - Intermediate ICS for Expanding Incidents. IST Members must complete ICS 400 after completing ICS 300.

Once training is complete, team members must demonstrate proficiency in their position under the direct supervision of a fully qualified team member during a functional exercise or real-world activation. Collectively, ICS online and classroom training, and exercise/activation components are the minimum qualification requirements needed to build a baseline capability for responding to incidents. Additional familiarity and skill development will continue to take place through formal and informal learning opportunities provided throughout the year.

SCE also requires SEMS G606 online for IMT, IST, Pool Positions and PSPS IMTs personnel

- SEMS G606 - Standardized Emergency Management System Introduction Online Course
- For selected IMT/IST positions SCE will also require G197 Integrating Access & Functional Needs into Emergency Management Training

Requalification

Each year SCE requires that all IMT, IST and pooled positions go through requalification to maintain a

basic level of familiarity with their position and build on their knowledge, skills, and abilities. SCE will annually review qualification requirements and communicate any changes to all IMT/IST members through the matrix. To maintain qualification a member must complete the following:

- Positions Specific User Group Training
- IMT/IST Requalification Training

Public Safety Power Shutoff Incident Management Teams, PSPS Task Force and PSPS Dedicated Team are required to attend an annual PSPS position specific training and an exercise.

8.4.2.2.1 Emergency Response Training (DEP-2)

SCE maintains a robust and highly skilled workforce (both employees and contractors) to provide effective emergency response and restore service during and after a major event. SCE develops technical training programs that prepare employees to perform their jobs safely, comply with regulatory requirements and laws, maintain system reliability, and leverage new technology. SCE conducts specific training on an annual basis to adequately train employees and field workers responsible for restoration of power after emergencies.

SCE also provides specialized training on an annual basis for PSPS IMT members, who oversee and execute de-energization and restoration protocols. For the purposes of DEP-2, SCE is tracking training compliance against core PSPS positions as indicated in Table 8-38.

Below is a summary of SCE's emergency preparedness staffing and qualifications.

Table 8-38 - Emergency Preparedness Staffing and Qualifications

Role	*Incident Type*	*Responsibilities*	*Qualifications*	*No. of Dedicated Staff Required*	*No. of Dedicated Staff Provided*	*No. of Contract Workers Required*	*No. of Contract Workers Provided*
PSPS Incident Commander	PSPS	• Approves monitored circuit list • Approves circuits for de-energization and re-energization • Directs mitigation strategies for potential public safety concerns and at-risk customers • Works with IMT to determine resource requirements for staffing and equipment	ICS 100, 200, 700, 800, 300, Position Specific Training, Qualifying Exercise or Shadow Activation	9	9	N/A	N/A
PSPS Operations Section Chief	PSPS	• Responsible for providing situational awareness to the IMT Incident Commander, and supervising all operational actions, air operations and customer care functions	ICS 100, 200, 700, 800, 300, Position Specific Training, Qualifying Exercise or Shadow Activation	7	7	N/A	N/A
PSPS Task Force (Substation Tech Spec, GCC Liaison, PSPS Analyst, Transmission Tech Spec, Distribution Tech Spec, Operations Compliance Tech Spec)	PSPS	• Recommends de-energization and re-energization decisions and manages field resources and circuit situational awareness	ICS 100, 200, 700, 800, 300, Position Specific Training, Qualifying Exercise or Shadow Activation	60	60	N/A	N/A
Customer Care Branch (Customer Care Branch Director, Customer Notifications Group, Access and Functional Needs Group, Customer Outreach	PSPS	• Responsible for customer programs including notifications, customer care resources and the needs of the AFN community	ICS 100, 200, 700, 800, 300, Position Specific Training, Qualifying Exercise or Shadow Activation	217	217	N/A	N/A
Planning Section Chief	PSPS	• Coordinates across IMT to establish incident response tempo and situational awareness consistency	ICS 100, 200, 700, 800, 300, Position Specific Training, Qualifying Exercise or Shadow Activation	16	16	N/A	N/A

Personnel Training

The electrical corporation must report on its internal personnel training program(s) for wildfire and PSPS emergency events. This training must include, at a minimum, training on relevant policies, practices, and procedures before, during, and after a wildfire or PSPS event. The reporting must include, at a minimum:

- *The name of each training program*
- *A brief narrative on the purpose and scope of each program*
- *The type of training method*
- *The schedule and frequency of training programs*
- *The percentage of staff who have completed the most current training program*
- *How the electrical corporation tracks who has completed the training programs Table 8-39 provides an example of the minimum acceptable level of information.*

*E*xternal Contractor Training

The electrical corporation must report on its external contractor training program(s) for wildfire and PSPS emergency events. This training must include, at a minimum, training on relevant policies, practices, and procedures before, during, and after a wildfire or PSPS event. The reporting must include, at a minimum:

- *The name of each training program*
- *A brief narrative on the purpose and scope of each program*
- *The type of training method*
- *The schedule and frequency of training programs*
- *The percentage of contractors who have completed the most current training program*
- *How the electrical corporation tracks who has completed the training programs*

SCE does not provide training to its Contract Field Workforce and instead, provides Orientation via Train the Trainer sessions with contractor Supervisors on PSPS patrolling and Live Field Observations protocols, and any updates since prior year; contractor Supervisors train their own field crews and submits attendance rosters to SCE.

Table 8-40 provides an example of the minimum acceptable level of information.

Below is a summary of SCE's Emergency Preparedness training programs.

Table 8-39 - Electrical Corporation Personnel Training Program

Training Topic	***Purpose and Scope***	***Training Method***	***Training Frequency***	***Position or Title of Personnel Required to Take Training***	***# Personnel Requiring Training***	***# Personnel Provided with Training***	***Form of Verification or Reference***
IS 100, 200, 700, 800	Incident command system fundamentals and basics. Standard training introducing personnel to the concepts of organized emergency response	Web Based Training via FEMA	Initial qualification – persons take once	All IMT / IST personnel	N/A - All IMT members	N/A - All active duty personnel rostered for an IMT	IMT Training materials and Attendance Rosters
ICS 300	ICS-300 provides an in-depth focus on the NIMS Incident Command System (ICS) that includes the tools, practices, and procedures that are available in ICS to effectively manage emergency incidents or planned local events at a local Type 3 level. Expanding upon ICS-100 and -200, this course ensures that responders understand the basic ICS concepts that allow an incident management organization to expand and contract as needed to fit the incident and maintain its operational effectiveness	Instructor Led Training	Initial qualification – persons take once	All IMT / IST personnel	N/A - All IMT members	N/A - All active duty personnel rostered for an IMT	IMT Training materials and Attendance Rosters
PSPS Position Specific Training	These courses provide IMT and IST members with an understanding of the position-specific duties, responsibilities, and capabilities of their positions. The courses provide information on their role and information on how to successfully execute on their role during all types of incidents. PSPS Position/Function Specific:	Instructor Led Training	Initial qualification – persons take once	All personnel assigned to a PSPS IMT	N/A - All PSPS IMT members	N/A - All active duty personnel rostered for a PSPS IMT	IMT Training materials and Attendance Rosters
PSPS General Training	Provide hazard-specific information to personnel based on the PSPS response plan, specifically review the interdependencies of the different positions on the team and how the key functions are executed in PSPS incidents and activations.	Virtual	Annually	All personnel assigned to a PSPS IMT	N/A - All PSPS IMT members	N/A - All active duty personnel rostered for a PSPS IMT	IMT Training materials and Attendance Rosters

Below is a summary of SCE's Emergency Preparedness contractor training programs.

Table 8-40 - Contractor Training Program

Training Topic	*Purpose and Scope*	*Training Method*	*Training Frequency*	*Position or Title of Personnel Required to Take Training*	*# Contractors Requiring Training*	*# Contractors Completed Training*	*Form of Verification or Reference*
PSPS Patrolling & Live Field Observation (LFO) Orientation for Contractors	Provide awareness of: • The Wildfire Mitigation Plan (WMP) • PSPS Incident Management • Circuit Switch Plans (to minimize customer impact) • Updates to "Operation of Circuits Traversing High Fire Risk Areas" procedure • Patrolling scenarios under various operating conditions • Timing of LFO deployment • PSPS Field Tools (PSPS Patrol Form) • Communication protocols when hazardous conditions exist • Various Patrolling Scenarios	Train the Trainer	Annually	Line Contract Worker	576	576	Training materials and Attendance Rosters

8.4.2.3 Drills, Simulations, and Tabletop Exercises

Discussion-based and operational-based exercises enhance knowledge of plans, allow personnel to improve their own performance, and identify opportunities to improve capabilities to respond to real wildfire emergency events and PSPS events. Exercises also provide a method to evaluate an electrical corporation's emergency preparedness plan and identify planning and/or procedural deficiencies.

Internal Exercises

The electrical corporation must report on its program(s) for conducting internal discussion- based and operations-based exercises for both wildfire and PSPS emergency events. This must include, at a minimum:

- *The types of discussion-based exercises (e.g., seminars, workshops, tabletop exercises, games) and operations-based exercises (e.g., drills, functional exercises, full-scale exercises)*
- *The purpose of the exercises*
- *The schedule and frequency of exercise programs*
- *The percentage of staff who have completed/participated in exercises*
- *How the electrical corporation tracks who has completed the exercises.*

*T*able 8-41 provides an example of the minimum acceptable level of information.

External Exercises

The electrical corporation must report on its program(s) for conducting external discussion- based and operations-based exercises for both wildfire and PSPS emergency events. This must include, at a minimum:

- *The types of discussion-based exercises (e.g., seminars, workshops, tabletop exercises, games) and operations-based exercises (e.g., drills, functional exercises, full-scale exercises)*
- *The schedule and frequency of exercise programs*
- *The percentage of public safety partners who have participated in these exercises*
- *How the electrical corporation tracks who has completed the exercises*

*T*able 8-42 provides an example of the minimum acceptable level of information.

External agencies and jurisdictions maintain responsibility for developing and delivering their own exercise programs. Therefore, SCE does not run an external exercise program. Where appropriate, SCE coordinates exercises with external agencies or invites external participation in SCE exercises when the scenario and objectives overlap with external partner agencies. SCE also sends personnel to external exercises when invited to participate.

Below is a summary of SCE's Emergency Preparedness internal exercise programs.

Table 8-41 - Internal Drill, Simulation, and Tabletop Exercise Program

*External agencies and jurisdictions invited to participate in this exercise.

Category	***Exercise Title and Type***	***Purpose***	***Exercise Frequency***	***Position or Title of Personnel Required to Participate***	***# Personnel Participation Required***	***# Personnel Participation Completed***	***Form of Verification or Reference***
Discussion Based	Tabletop Exercise	Provide awareness and understanding of roles and responsibilities, existing documentation, policies, and procedures.	Annually	PSPS IMT Positions	Varies	Varies	Situation Manual, Registration Sheets
Operations Based	Drill	Provide awareness and understanding of roles and responsibilities, and how to execute on discrete tasks and actions.	As Needed	Targeted IMT positions as identified via the exercise planning process	Varies	Varies	Situation Manual, Registration Sheets
Operations Based	Functional Exercise	Demonstrate an ability to successfully execute roles and responsibilities of an IMT through a set period of time and incident response. Confirm positions are able to successfully work across incident response functions and work as a team in support of objectives.	Annually	PSPS IMT positions	Varies	Varies	Exercise Plan, Registration Sheets
Operations Based	Full Scale Exercise*	Successfully work across multiple levels of response to execute on roles and responsibilities in an incident. Demonstrate ability to work across complex systems and in response to a significant, high-impact scenario.	As Needed	PSPS IMT positions	Varies	Varies	Exercise Plan, Registration Sheets

Below is a summary of SCE's Emergency Preparedness external exercise programs.

Table 8-42 - External Drill, Simulation, and Tabletop Exercise Program

Category	***Exercise Title and Type***	***Purpose***	***Exercise Frequency***	***Position or Title of Personnel Required to Participate***	***# Personnel Participation Required***	***# Personnel Participation Completed***	***Form of Verification or Reference***
Please see Section 8.4.2.3 External Exercises for additional information							

8.4.2.4 Schedule for Updating and Revising Plan

The electrical corporation must provide a log of the updates to its emergency preparedness plan since 2019 and the date of its next planned update.

Updates should occur every two years, per R. 15-06-009 and D. 21-05-019. For each update, the electrical corporation must provide the following:

- *Year of updated plan*
- *Revision type (e.g., addition, modification, elimination)*
- *Component modified (e.g., communications, training, drills/exercises, protocols/procedures, MOAs)*
- *A brief description of the lesson learned that informed the revision*
- *A brief description of the specific addition, modification, or elimination Table 8-43 provides an example of the minimum acceptable level of information.*

Below is a summary of updates to SCE's Emergency Preparedness plans.

Table 8-43 - Wildfire-Specific Updates to the Emergency Preparedness Plan

ID #	*Year of Updated Plan*	*Revision Type*	*Lesson Learned*	*Revision Description*	*Reference Section*
1	2021 AHP	Creation	Consolidated and expanded various annexes/response plans into an All-Hazards Plan	Creation of AHP	Entire document
2	2021 AHP	Creation	GO 166 standards and criteria	Inclusion of GO 166 standards and criteria	Reference Table; Chapters 2, 5 and Annual Filing
3	2021 AHP	Creation	Organization response information, including national and state guidelines (NIMS, SEMS)	Inclusion of NIMS and SEMS guidelines	Section 1: Purpose and Scope; Chapter 3: Organization; Chapter 4: Preparedness
4	2022 AHP	Addition	Proactive development of the AHP	Expansion of damage assessment, situational awareness, and restoration prioritization concepts of operation	Chapter 5: Concept of Operations
5	2022 AHP	Addition	Proactive development of the AHP	Incorporation of FERC Standards of Conduct	Appendix C
6	2022 AHP	Addition	Proactive development of the AHP	Inclusion of Macro Messaging	Appendix B
7	2022 AHP	Addition	Further clarification for GO 166 requirements stemming from internal self-assessment	Added detail for GO166 compliance areas such as post event data requirements for Call Center and Customer Average Interruption Duration Index (CAIDI)	Chapter 5: Major Outage and Restoration Estimate Communication
8	2022 AHP	Addition	Proactive development of the AHP	Inclusion of Major Outage criteria and Storm definitions	Chapter 2: Storm Conditions, Major Outages, and Measured Events
9	2022 PSPS Protocol	Modification	Proactive development of PSPS Protocol	• Plan language updated to reflect relevant changes to PSPS protocols and IMT positions • Organizational chart updated • Hyperlinks to processes and procedures in the body of the document removed • Formatting changes for plan cohesion and flow	Overall document
10a	2022 PSPS Protocol	Modification	Proactive development of PSPS Protocol	Added introduction section to address alignment with SEMS/NIMS	Introduction
10b	2022 PSPS Protocol	Modification	Proactive development of PSPS Protocol	• Minor revisions for cohesion and flow; added Concurrent Emergencies • Minor revisions for formatting and updated IMT roles • Substantive revisions to include the Centralized Data Platform and iPEMS systems	• Section 6 • Section 8 • Section 9

ID #	*Year of Updated Plan*	*Revision Type*	*Lesson Learned*	*Revision Description*	*Reference Section*
10c	2022 PSPS Protocol	Modification	Proactive development of PSPS Protocol	• Added link to PSPS Process Flow • Renamed Attachments • Updated Attachment C: IMT Organizational Structures • Updated Attachment D: High Fire Risk Area (HFRA) Map	Attachments

8.4.3 External Collaboration and Coordination

8.4.3.1 Emergency Planning

In this section, the electrical corporation must provide a high-level description of its wildfire and PSPS emergency preparedness coordination with relevant public safety partners at state, county, city, and tribal levels within its service territory. The electrical corporation must indicate if its coordination efforts follow California's SEMS or, where relevant for multi-jurisdictional electrical corporations (e.g., PacifiCorp), the Federal Emergency Management Agency (FEMA) National Incident Management Systems (NIMS), as permitted by GO 166. The description must be no more than a page.

SCE uses the California Standardized Emergency Management System (SEMS) and the Federal National Incident Management System. Emergency events are managed using the Incident Command System through an Emergency Operations Center (or virtual EOC as required).

Depending on the circumstances, one or multiple Incident Management Teams may be activated. For more complex incidents, including concurrent emergencies, an Incident Support Team may be activated to manage the totality of the incident including prioritization and resource allocation. The IST will direct all aspects of communications and outreach including coordination with external agencies and first responders.

SCE maintains multiple contacts for each local government potentially impacted by service interruptions. SCE requests that local governments provide a list of officials to be notified (i.e., Public Safety Partners, agency management, and elected officials) about service interruptions. SCE performs an annual communications test in advance of the peak wildfire season as requested by the Commission and defined by the California Department of Forestry and Fire Protection.

During an EOC activation, SCE shares incident related information and timely notifications with public safety partners through the incident Liaison Officer and other SCE designees (Customer Support Branch Director, Regulatory Affairs Technical Specialist) tasked with coordination/notification of public safety partners.

The Command and General Staff provide interface between SCE and public sector emergency management and elected officials. Interface with public sector emergency management and elected officials is primarily conducted through the IST/IMT Liaison Officers and SCE Agency Representatives. As part of external coordination, SCE establishes two-way communication during an incident to share incident status, restoration strategies, and priorities.

In addition, the electrical corporation must provide the following information in tabular form, with no more than one page of information in the main body of the WMP and a full table, if needed, in an appendix:

List of relevant state, city, county, and tribal agencies within the electrical corporation's service territory and key point(s) of contact, with associated contact information. Where necessary, contact information can be redacted for the public version of the WMP.

For each agency, whether the agency has provided consultation and/or verbal or written comments in preparation of the most current wildfire- and PSPS-specific emergency preparedness plan. If so, the electrical corporation should provide the date, time, and location of the meeting at which the agency's feedback was received.

For each agency, whether it has an MOA with the electrical corporation on wildfire and/or PSPS emergency preparedness, response, and recovery activities. The electrical corporation must provide a brief summary of the MOA, including the agreed role(s) and responsibilities of the external agency before, during, and after a wildfire or PSPS emergency.

In a separate table, a list of current gaps and limitations in the electrical corporation's existing collaboration efforts with relevant state, county, city, and tribal agencies within its territory. Where gaps or limitations exist, the electrical corporation must indicate the remedial action plan and the timeline for resolving the gaps or limitations.

For all requested information, a form of verification that can be provided upon request for compliance assurance.

The electrical corporation must reference the Utility Initiative Tracking ID where appropriate.

Table 8-44 and Table 8-45 provide examples of the minimum level of content and detail required.

Below is a summary of contacts and collaboration SCE maintains with State and local agencies. This table is provided in full within the supporting documents folder at https://www.sce.com/safety/wild-fire-mitigation.

Table 8-44 - State and Local Agency Collaboration(s)

Name of State or Local Agency	***Point of Contact and Information*** **Confidential Information in Accordance with California Law and Regulations**			***Emergency Preparedness Plan Collaboration – Last Version of Plan Agency Collaborated***	***Emergency Preparedness Plan Collaboration – Collaborative Role***		***Memorandum of Agreement (MOA)?***	***Brief Description of MOA***
Acton Town Council				General WMP Plan and PSPS Protocols	Acton Town Council Concerned About Uptick in Emergency Outages	6/17/2022	N/A	N/A
Adelanto				General WMP Plan and PSPS Protocols	City of Adelanto WMP/Reliability Meeting Schedule	6/9/2022	N/A	N/A
Agoura Hills				General WMP Plan and PSPS Protocols	Wildfire Update	6/21/2022	N/A	N/A

Alhambra				General WMP Plan and PSPS Protocols	Alhambra: June 2022 Vice Mayor Andrade-Stadler To Attend 6/29 EOC Tour	6/29/2022	N/A	N/A
Full table is included within the supporting documents folder at https://www.sce.com/safety/wild-fire-mitigation.								

Below is a summary of SCE's gaps and limitations on collaborations with state and local agencies.

Table 8-45 - Key Gaps and Limitations in Collaboration Activities with State and Local Agencies

Gap or Limitation Subject	Remedial Brief Description	Remedial Action Plan
Resiliency Zones	Back-up generator at Resiliency Zone was not efficiently deployed due to incomplete equipment specifications.	**Strategy:** SCE will clarify the complete specifications for each of the eight Resiliency Zones so that the specifications are prepared and ready for future deployments • Target completion: 2023
External Coordination Calls and Debrief	SCE engages with its emergency management partners at the county and state level by hosting daily coordination calls with impacted agencies. SCE also conducts daily personalized PSPS outreach and engagement calls for both critical infrastructure providers and the AFN community.	**Strategy:** SCE will evaluate its current strategy for conducting multiple daily operational briefings to identify opportunities to amplify and optimize engagement with public safety partners while reducing possible redundancy. SCE will hold debriefs to capture feedback with CBOs after major incidents. • Target timeline: 2023 season

8.4.3.2 Communication Strategy with Public Safety Partners

The electrical corporation must describe at a high level its communication strategy to inform external public safety partners and other interconnected electrical corporation partners of wildfire, PSPS, and re-energization events as required by GO 166 and Public Utilities Code section 768.6. This must include a brief description of the policies, practices, and procedures the electrical corporation adopts to establish appropriate communication protocols with public safety partners for both wildfire- and PSPS-specific incidents to ensure timely, accurate, and complete communications. The electrical corporation must refer to its emergency preparedness plan as needed to provide more detail. The narrative must be no more than two pages.

Please see Section 8.4.2.1 Overview of Wildfire and PSPS Emergency Preparedness and Section 8.5.2.2 Public Outreach and Education Awareness Program for the communication strategy with public safety partners.

As each public safety partner will have its own unique communication protocols, procedures, and systems, the electrical corporation must coordinate with each entity individually. The electrical corporation must summarize the following information in tabulated format:

- *All relevant public safety partner groups (e.g., fire, law enforcement, OES, municipal governments, Energy Safety, CPUC, other electrical corporations) at every level of administration (state, county, city, or tribe) as needed.*
- *The names of individual public safety entities.*
- *For each entity, the point of contact for emergency communications coordination, and the contact information. Information may be redacted as needed.*
- *Key protocols for ensuring the necessary level of voice and data communications (e.g., interoperability channels, methods for information exchange, format for each data typology, communication capabilities, data management systems, backup systems, common alerting protocols, messaging), and associated references in the emergency plan for more details.*
- *Frequency of prearranged communication review and updates.*
- *Date of last discussion-based or operations-based exercise(s) on public safety partner communication.*

In a separate table, the electrical corporation must list the current gaps and limitations in its public safety partner communication strategy coordination. Where gaps or limitations exist, the electrical corporation must indicate the remedial action plan and the timeline for resolving the gaps or limitations. For all requested information, the electrical corporation must indicate a form of verification that can be provided upon request for compliance assurance.

Table 8-46 and Table 8-47 provide examples of the minimum level of content and detail required.

Below is a summary of SCE's Emergency Preparedness communication procedures with Public Safety Partners.

Table 8-46 - Example of High-Level Communication Protocols, Procedures, and Systems with Public Safety Partners

This table is provided in full within the supporting documents folder at https://www.sce.com/safety/wild-fire-mitigation.

* See individual line items for contact information

** Information applies to all rows within entire column

Public Safety Partner Group*	Name of Entity*	Point of Contact and Information*	Key Protocols**	Frequency of Prearranged Communication Review and Update**	Communication Exercise(s): Date of Last Completed**	Communication Exercise(s): Date of Planned Next**

See individual line items in full table	See individual line items in full table	See individual line items in full table	• Update contact lists of public safety partners on an ongoing basis
			• Take actions to address any problems or deficiencies identified during an exercise
			• Business contact to be sent a message according to enrolled channel preference(es) (SMS, email, call)
			• Messages sent to inform of potential PSPS events and actual de-energizations and re-energizations:
			  • Initial
			  • Update
			  • Expected Shutoff
			  • Shutoff
			  • Imminent Restoration
			  • Restoration
			  • Event Concluded
			• Undeliverable contacts will be reviewed and updated
				Conduct a minimum of two exercises prior to the WF season		

Full table is included within the supporting documents folder at https://www.sce.com/safety/wild-fire-mitigation.						

Table 8-47 - Key Gaps and Limitations in Communication Coordination with Public Safety Partners

Gap or Limitation Subject	Remedial Brief Description	Remedial Action Plan
Public Safety Portal	Delay between e-mail notifications and data updates being posted on Public Safety Partner Portal.	SCE is in the process of updating portal alert notifications to coincide with data being posted on external platforms. Target timeline: 2023

8.4.3.3 Mutual Aid Agreements

In this section, the electrical corporation must provide a brief overview of the Mutual Aid Agreements (MAA) it has entered into regarding wildfire emergencies and/or disasters, as well as PSPS events. The overview narrative must be no more than one page.

SCE participates in mutual assistance agreements at the State, Regional and National levels.

State-level mutual assistance is requested when SCE identifies that resource requirements will exceed existing capabilities. SCE will coordinate with in-state utilities through the California Utilities Emergency Association (CUEA) to request resource needs. CUEA is responsible for facilitating mutual assistance requirements between requesting and responding utilities.

In the event of statewide resource shortfalls, mutual assistance requests are then escalated to the Western Regional Mutual Assistance Group (WRMAG). WRMAG facilitates mutual assistance coordination at the regional-level between member utilities.

A National Response Event (NRE) is when a natural or man-made event is forecasted to cause or that causes widespread power outages impacting a significant population or several regions across the United States and requires resources from multiple Regional Mutual Assistance Groups (RMAGs). An NRE declaration is made by the Edison Electric Institute and is reserved only for events that may result in a widespread power outage, such as a major hurricane, earthquake, or an act of war, impacting industry's mutual assistance efforts.

8.4.3.3.1 Aerial Suppression (DEP-5)

Due to the limited availability of fire suppression resources available statewide, in 2021 SCE partnered with Los Angeles, Ventura, and Orange Counties to support their proposal to fund the stand-by time of aerial suppression resources to reduce wildfire risk to SCE's system and help protect SCE's infrastructure and communities. SCE established a funding agreement with each fire agency, pursuant to which SCE funded the cost of stand-by time for the helicopters, and each fire agency paid for flight time when the helicopters were used to fight fires.

Operational decisions regarding where and when the assets are used are at the discretion of the individual fire agencies and are prioritized and deployed by a regional fire coordination center, primarily within the SCE service territory. A regional fire agency coordination center maintains responsibility for directing the aerial suppression resources, using their existing prioritization and deployment process.

Starting in December 2022, SCE entered a new funding agreement with Los Angeles, Orange, and Ventura County fire agencies and expand QRF coverage from 165-days to year-round. SCE will continue to monitor funding and access to aerial suppression resources in SCE's service area to determine the need for continued investment in this area. Although the fire suppression assets are intended primarily for use in fighting wildfires in SCE's service territory, SCE relies on the professional judgment of the agencies to inform day to day operations, including determining how and when to deploy the assets.

In addition, the electrical corporation must provide the following wildfire emergency information in tabulated format:

- *List of entities with which the electrical corporation has entered into an MAA*
- *Scope of the MAA*
- *Resources available from the MAA partner*

Table 8-48 provides an example of the minimum level of content and detail required.

Below is a summary of SCE's mutual aid agreements during wildfire and de- energization events.

Table 8-48 - High-Level Mutual Aid Agreement for Resources During a Wildfire or De-Energization Incident

Mutual Aid Partner	***Scope of Mutual Aid Agreement***	***Available Resources from Mutual Aid Partner***
California Utilities Emergency Association Mutual Assistance Agreement (CUEA) - 44 Member Companies	Both: Any storm, disaster, and/or catastrophic incident requiring supplemental resources and/or equipment provided to a private, municipal, and cooperative utility(s) that is a party to the CUEA mutual assistance agreement in support of electrical and gas restoration.	D-Line, T-Line, Substation, Veg Mgmt, DA, Gas, and ICS position-specific resources, and/or associated equipment and materials.
Edison Electric Institute Mutual Assistance Agreement (EEI) - Investor Owned Utilites across the U.S.	Both: Any storm, disaster, and/or catastrophic incident requiring supplemental resources and/or equipment provided to investor owned utility(s) that is a party to the EEI mutual assistance agreement in support of electrical restoration.	D-Line, T-Line, Substation, Veg Mgmt, DA, and ICS position-specific resources, and/or associated equipment and materials.
Western Energy Institute (WEI) - 62 Member Companies	Both: Any storm, disaster, and/or	D-Line, T-Line, Substation, Veg Mgmt, DA, Gas, and ICS

Mutual Aid Partner	*Scope of Mutual Aid Agreement*	*Available Resources from Mutual Aid Partner*
	catastrophic incident requiring supplemental resources and/or equipment provided to a private, municipal, and cooperative utility(s) that is a party to the Western Region Mutual Assistance Agreement (WRMAA) in support of electrical and gas restoration.	position-specific resources, and/or associated equipment and materials.
Los Angeles, Ventura, and Orange County Fire Agencies	Wildfire: Funding of stand-by time of aerial suppression resources.	Aerial suppression resources.

8.4.4 Public Emergency Communication Strategy

The electrical corporation must describe at a high level its comprehensive communication strategy to inform essential customers and other stakeholder groups of wildfires, outages due to wildfires, and PSPS and service restoration, as required by Public Utilities Code section 768.6. This should include a discussion of the policies, practices, and procedures the electrical corporation adopts to establish appropriate communication protocols to ensure timely, accurate, and complete communications. The electrical corporation may refer to its Public Utilities Code section 768.6 emergency preparedness plan to provide more detail. The narrative must be no more than one page.

SCE communicates with the public during and immediately following major outages and emergencies. SCE coordinates with various entities and key stakeholders on education, outreach, and feedback in preparation for emergency events which result in any type of outage. This preparedness extends to overall customer resiliency and while it has initially been directed to address PSPS, many of the efforts are also broadly applicable to other extended outages or emergencies.

Additionally, website improvements are being implement for customers to increase awareness of wildfire mitigation activities, receive up to date information regarding events and learn when an event is impacting their area. Website improvements will include digital user testing and research, content audit, end-to-end journey mapping, and user experience design improvements to deliver a simplified user experience for customers.

Please see Section 8.4.2.1 Overview of Wildfire and PSPS Emergency Preparedness and Section 8.5.2.2 Public Outreach and Education Awareness Program for additional information responsive to this prompt.

In the following sections, the electrical corporation must provide an overview of the following components of an effective and comprehensive communication strategy:

- *Protocols for emergency communications*
- *Messaging*
- *Current limitations*

Reference the Utility Initiative Tracking ID where appropriate.

8.4.4.1 Protocols for Emergency Communications

The electrical corporation must identify the relevant stakeholder groups in its service territory and describe the protocols, practices, and procedures used to provide notification of wildfires, outages due to wildfires and PSPS, and service restoration before, during, and after each incident type. Stakeholder groups include, but are not limited to, the general public, priority essential services, AFN populations, populations with limited English proficiency, tribes, and people in remote areas. The narrative must include a brief discussion of the decision-making process and use of best practices to ensure timely, accurate, and complete communications. The narrative must be no more than one page.

Please see Section 8.4.2.1 Overview of Wildfire and PSPS Emergency Management and Section 8.5.2.2 Public Outreach and Education Awareness Program for additional information responsive to this prompt.

The electrical corporation must also provide, in tabular form, details of the following:

- *Communication methods*
- *Message receipt verification mechanisms*

Table 8-49 provides an example of the minimum level of content and detail required.

Below is a summary of SCE's Emergency Preparedness communications.

Table 8-49 - Protocols for Emergency Communication to Stakeholder Groups

Stakeholder Group	***Event Type***	***Method(s) for Communicating***	***Means to Verify Message Receipt***
State agencies	PSPS	Delivers notices in recipient's preferred channel: email, SMS	N/A
Public safety partners	PSPS	Delivers notices in recipient's preferred channel: voice, email, SMS	Information is available as long as customer is signed up to receive notifications and there is an emergency preference alert (Water/wastewater and Communication Sector)
Critical facilities and infrastructure Customers	PSPS	Delivers notices in recipient's preferred channel: voice, email, SMS	Information is available as long as customer is signed up to receive notifications and there is an emergency preference alert
All customers including AFN	PSPS	Delivers notices in recipient's preferred channel: voice, email, SMS	Information is available as long as customer is signed up to receive notifications and there is an emergency preference alert. Verification of notification is only conducted for MBL, Critical Care and Self Certify
Local governments	PSPS	Delivers notices in recipient's preferred channel: email, SMS	N/A
Tribal governments	PSPS	Delivers notices in recipient's preferred channel: email, SMS	Recipient can acknowledge receipt of email
First responders	PSPS	Delivers notices in recipient's preferred channel: email, SMS	Recipient can acknowledge receipt of email
Non-customers who signed up for alerts and all other parties	PSPS	Address level alerts: email, SMS and voice Public Safety Portal, SCE.com, social media	Information is available as long as non-account holder is signed up in the address level alert portal hosted by vendor Message Broadcast.
State agencies	Maintenance or Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	N/A
Public safety partners	Maintenance or Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	N/A
Local governments	Maintenance or Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	N/A
Tribal governments	Maintenance or Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	N/A
First responders	Maintenance or Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	N/A
Essential Use Customers	Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	Verification of receipt of voice communication
Major Customers	Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	Verification of receipt of Voice communication
All customers including Medical Baseline and Critical Care	Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	Verification of receipt of Voice communication
Unassigned/Residential	Repair Outage related to Wildfire	Delivers notices in recipient's preferred channel: voice, email, SMS	Only able to verify receipt of Voice communication
Essential Use Customers	Wildfire – As needed communication	Delivers notices in recipient's preferred channel: voice, email, SMS	Information is available as long as customer is signed up to receive notifications and there is an emergency preference alert

Stakeholder Group	***Event Type***	***Method(s) for Communicating***	***Means to Verify Message Receipt***
Major Customers	Wildfire – As needed communication	Delivers notices in recipient's preferred channel: voice, email, SMS	Information is available as long as customer is signed up to receive notifications and there is an emergency preference alert
All customers including Medical Baseline and Critical Care	Wildfire – As needed communication	Delivers notices in recipient's preferred channel: voice, email, SMS	Information is available as long as customer is signed up to receive notifications and there is an emergency preference alert
Unassigned/Residential	Wildfire – As needed communication	Delivers notices in recipient's preferred channel: voice, email, SMS	Information is available as long as customer is signed up to receive notifications and there is an emergency preference alert

8.4.4.2 Messaging

In this section, the electrical corporation must describe its procedures for developing effective messaging to reach the largest percentage of stakeholders in its service territory before, during, and after a wildfire, an outage due to wildfire, or a PSPS event.

In addition, the electrical corporation must provide an overview of the development of the following aspects of its communication messaging strategy:

- *Features to maximize accessibility of the messaging (e.g., font size, color contrast analyzer)*
- *Alert and notification schedules*
- *Translation of notifications*
- *Messaging tone and language*
- *Key components and order of messaging content (e.g., hazard, location, time)*

The narrative must be no more than one page.

All emergency management communications follow SCE's "One-Voice" communications strategy. This strategy adopted following the 2011 SCE response to windstorms in our service area requiring all communications across SCE through all channels to follow initial messaging laid out in a One Voice internal messaging document issued periodically via e-mail by the public information officer (PIO) and approved by the IC.

Channels using One Voice messaging include written communications, media outreach, SCE.com, and direct communication with customers (through the call center) and local officials (through the liaison officers). One Voice messaging is updated daily or more frequently when there is significant updated information available such as a substantial change in number of customers de-energized.

All messaging is written by PIOs, who are fully IMT-trained and have received additional specialized PIO and SCE-specific communications training. PIOs all serve in communications roles in their blue-sky roles or have communications backgrounds. PSPS PIOs can be in other marketing or communications roles across SCE or have moved from these roles into other roles across the company. There is a dedicated PIO resource on the PSPS IMT, whose blue-sky role is to develop and manage PSPS communications year-round and to prepare the team for activations.

One Voice messaging can be adapted by internal users to meet channel requirements. For example, the specific language and format used by social media will not be the same as language and format used in the call center. However, the messaging remains constant. The breadth of channels maximizes accessibility. Stakeholders can access messages verbally, through the call center, in a Web Content Accessibility Guidelines (WCAG)-compliant format through SCE.com, or via media reports. Outage communications and PSPS notifications are sent to customers in the format and channel of their choice. PSPS notifications are also available in multiple languages and formats; please see Section 8.5.2 Public Outreach and Education Awareness Program for additional information on these communications and notifications.

PSPS Notifications are written in simplified direct language with the goal of providing message clarity and actionable information. They are translated into 19 languages that are prevalent in SCE's service territory as well as three indigenous (spoken) languages. Static versions of PSPS notifications translated into the prevalent languages can be accessed via SCE's Wildfire Communications Center (*https://www.sce.com/wildfire/wildfire-communications-center)*

PSPS notifications follow the alerts and warnings systems in the California Public Alert and Warning System (CalPAWS) Plan.

Initial notifications are classified as alerts, in keeping with the definition that alerts "draw the attention of recipients to some previously unexpected or unknown condition or event."

Update notifications 24 hours before the onset of the period of concern are classified as warnings, in keeping with the definition that warnings encourage "recipients to take immediate protective actions appropriate to some emergent hazard or threat."

Other notifications, including PSPS Expected, Shutoff, Prepare to Retore and restoration are classified as notifications as they are "intended to inform recipients of a condition or event for which contingency plans are in place."

PSPS alert and notification schedules can be found in Appendix F: Supplemental Information.

Please see Section 8.5.2 Public Outreach and Education Awareness Program for additional information.

8.4.4.3 Current Gaps and Limitations

In tabulated format, the electrical corporation must provide a list of current gaps and limitations in its public communication strategy. Where gaps or limitations exist, the electrical corporation must indicate the remedial action plan and the timeline for resolving the gaps or limitations. For all requested information, the electrical corporation should indicate a form of verification that can be provided upon request for compliance assurance. Table 8-50 provides an example of the minimum level of content and detail required.

Below is a summary of SCE's gaps and limitations in public emergency communication strategy.

Table 8-50 - Key Gaps and Limitations in Public Emergency Communication Strategy

Gap or Limitation Subject	Remedial Brief Description	Remedial Action Plan
Notifications	SCE was not able to send advance notifications for an event due to the sudden onset of unexpected weather.	SCE will examine current protocols for activating the PSPS IMT for marginal weather conditions to determine if changes to activation criteria should be made. Target timeline: 2023
Notifications	Cancellation notices for portions of some circuits were not sent within two hours of the decision to cancel or remove those segments from scope.	SCE will evaluate the process for sending cancellation notices to customers on circuit segments removed from scope to reduce end-to-end processing time in situations where segment-level (and sub-segment level) decision making is necessary to minimize customer impacts. Target timeline: 2023

8.4.5 Preparedness and Planning for Service Restoration

8.4.5.1 Overview of Service Restoration Plan

In this section of the WMP, the electrical corporation must provide an overview of its plan to restore service after an outage due to a wildfire or PSPS event. At a minimum, the overview must include a brief description of the following:

- *Purpose and scope of the restoration plan.*

SCE begins assessment of restoration priorities and development of a restoration plan once damage assessment are available and the extent of impacts are analyzed. The protection of life safety, the environment, infrastructure, and property are base planning factors for restoration planning. Across SCE, considerations taken as part of restoration planning include technical factors related to impacts, availability of resources and replacement equipment, as well as internal and external dependencies.

- *Overview of protocols, policies, and procedures for service restoration (e.g., means and methods for assessing conditions, decision-making framework, prioritizations, degree of customization).*

SCE may employ different restoration strategies based on the size, scope, complexity, and intensity of each non PSPS incident. In smaller, more isolated incidents, SCE typically employs the standard order-based strategy that it uses under routine outage circumstances. This strategy is not effective in larger incidents where there is an overwhelming volume of orders. When incidents are larger, SCE moves to an area-based strategy where repair priorities are assigned by areas and circuits. This is a tactical decision

made during the planning process for a given operational period and documented in the IAP. The two strategy types, order- and area-based can be used together within an event as needed.

For PSPS, PSPS IMT personnel monitor all circuits that are de-energized and will watch for winds to decrease below thresholds, which triggers circuit patrols for re-energization. Upon receiving the All-Clear declaration and approval from the PSPS IMT Incident Commander to begin restoration of a circuit circuits or circuit segments under PSPS protocols are patrolled and re-energized. The patrols are intended to ensure there is no damage to SCE facilities before power can be safely restored. In most cases, field crews are standing by for patrol, so that patrols can typically take place within eight hours. However, visual inspections of the power lines usually take place during daylight hours for safety and accuracy. Consequently, patrol and restoration operations may be limited or prolonged during overnight hours. SCE strives to restore all power within 24 hours of de- energization when possible. For multiday events, with gaps of even a few hours, field crews will attempt to restore customers before a second POC begins, even if this requires a repeat de-energization. Some circuits will require a helicopter patrol. When possible, customers on difficult-to-patrol circuits are switched to more accessible circuits for restoration, so that circuits with no customers on them will be the last in line for restoration. PSPS IMT personnel perform ongoing assessments of restoration plans to monitor progress and address any delays to re-energization that may occur.

This must include:

An operational flow diagram illustrating key components of the service restoration procedures from the moment of the incident to response, recovery, and restoration of service.

See figures in Section 8.4.2.1 Overview of Wildfire and PSPS Emergency Preparedness for such diagram.

Resource planning and allocation (e.g., staffing, equipment).

Please see Section 8.4.2.2Key Personnel, Qualifications, and Training and Section 8.4.6.2 Planning and Allocation of Resources for information on resource planning and allocation.

Drills, simulations, and tabletop exercises.

Please see Section 8.4.2.2 for additional information.

Coordination and collaboration with public safety partners (e.g., interoperable communications).

Within four hours of the identification of a major (non PSPS) outage, SCE will notify state and local public agencies, and the media of the major outage, its location, expected duration and cause (if available). SCE will provide estimates of restoration times as soon as possible following an initial assessment of damage and the establishment of priorities for service restoration.

Within four hours of the initial (non PSPS) damage assessment and the establishment of priorities for restoring service, SCE will make estimated restoration times, by geographic area, available to state and local public agencies, and to media. If restoration time estimate is not available, SCE will provide that update.

For PSPS, Prepare to Restore notifications are sent to all impacted customers and public safety partners as soon as restoration has been authorized. These notifications specify that restoration typically takes up to 8 hours.

Notification of and communication to customers during and after a wildfire- or PSPS- related outage.

Within four hours of the identification of a major (non PSPS) outage, SCE will make information available to customers through our call center and notify Essential Customers, state and local public agencies, and the media of the major outage, its location, expected duration and cause (if available). SCE will provide estimates of restoration times as soon as possible following an initial assessment of damage and the establishment of priorities for service restoration.

Within four hours of the initial (non PSPS) damage assessment and the establishment of priorities for restoring service, SCE will make estimated restoration times, by geographic area, available through its call center to Essential Customers, state and local public agencies, and to media. If restoration time estimate is not available, SCE will provide that update.

For PSPS, upon receiving the All-Clear declaration and approval from the PSPS IMT Incident Commander to begin restoration of a circuit, restoration notifications are sent to impacted customers.

The electrical corporation may refer to its Public Utilities Code section 768.6 emergency preparedness plan to provide more detail. Where the electrical corporation has already reported the requested information in another section of the WMP, it must provide a cross- reference with a hyperlink to that section. The overview must be no more than one page.

Reference the Utility Initiative Tracking ID where appropriate.

8.4.5.2 Planning and Allocation of Resources

The electrical corporation must briefly describe its methods for planning appropriate resources (e.g., equipment, specialized workers), and allocating those resources to assure the safety of the public during service restoration.

In addition, the electrical corporation must provide an overview of its plans for contingency measures regarding the resources required to respond to an increased number of reports concerning unsafe conditions and expedite a response to a wildfire- or PSPS-related power outage.

This must include a brief narrative on how the electrical corporation:

- *Uses weather reports to pre-position manpower and equipment before anticipated severe weather that could result in an outage*
- *Sets priorities*
- *Facilitates internal and external communications*
- *Restores service*

The narrative for this section must be no more than two pages.

Emergency management during an incident within the SCE service territory is a comprehensive effort that requires SCE to work and coordinate with a diverse set of internal and external stakeholders. SCE is prepared to respond to natural and human-caused emergencies promptly and effectively and to take all appropriate actions including steps to preserve life, property and infrastructure, and maintain the ability to deliver safe and reliable electricity. On incidents when SCE internal capabilities are overwhelmed, mutual assistance resources are requested and incorporated into the incident organizational structure following the same ICS and NIMS principles for internal SCE resources.

The All-Hazards Plan discusses a Concept of Operations (ConOps)[259] which provides further guidance to SCE leadership and emergency responders regarding the sequence and scope of actions to be taken during an incident. It describes all levels of SCE's emergency management capability and corresponding roles and responsibilities operational procedures during an emergency and describes SCE's alignment with SEMS and NIMS. The Plan also describes SCE's phased approach at emergency response, details functions of the SCE EOC, and demonstrates how information flows internally within SCE and externally to and from various public safety and emergency response partners.

During an incident response, the Incident Commander, Planning Section Chief, and BRDM continue to evaluate any dynamic changes to resource needs which may change throughout the incident.

Objectives: Resource scaling decisions are driven by incident objectives that are developed at the start of an event/incident. They are re-evaluated daily through the course of the IMT activation to help determine resource needs. This re-evaluation is dependent upon situational awareness such as weather reports, current outages, and cascading effects.

Operational Periods and Shifts: Incident Commanders establish operational periods, the time frames for executing a set of operation actions as specified in the Incident Action Plan. Operational Periods can be of various lengths, although usually not over 24 hours. There may be multiple shifts within an operational period (e.g., 3X 8 hr. shifts or 2X 12 hr.) and shift ranges may vary by position demand and associated deliverables.

SCE employs a PSPS-compatible Communications Strategy during an All Hazards incident to provide effective communications with both internal and external stakeholders. SCE's Watch Office, Incident Commander, Public Information Officer, Liaison Officer, Operations Section Chief, and Customer Care Branch Director all work together to coordinate internal and external facing communication and messaging.

8.4.5.3 Drills, Simulations, and Tabletop Exercises

Discussion-based and operational-based exercises enhance knowledge of plans, allow personnel to improve their own performance, and identify opportunities to improve capabilities to respond to wildfire- and PSPS-related service outages. Exercises also provide a method to evaluate an electrical corporation's emergency preparedness plan and identify planning and/or procedural deficiencies.

[259] Concept of Operations is discussed within the All-Hazards Plan, Section 6.1, p 43.

Internal Exercises

The electrical corporation must report on its program(s) for conducting internal discussion- based and operations-based exercises for service restoration. This must include, at a minimum:

- *The types of discussion-based exercises (e.g., seminars, workshops, tabletop exercises, games) and operations-based exercises (e.g., drills, functional exercises, full-scale exercises)*
- *The purpose of the exercises*
- *The schedule and frequency of exercise programs*
- *The percentage of staff who have completed/participated in exercises*
- *How the electrical corporation tracks who has completed the exercises Table 8-51 provides an example of the minimum acceptable level of information.*

External Exercises

The electrical corporation must report on its program(s) for conducting external discussion- based and operations-based exercises for service restoration due to wildfire. This must include, at a minimum:

- *The types of discussion-based exercises (e.g., seminars, workshops, tabletop exercises, games) and operations-based exercises (e.g., drills, functional exercises, full-scale exercises)*
- *The schedule and frequency of exercise programs*
- *The percentage of public safety partners who have participated in these exercises*
- *How the electrical corporation tracks who has completed the exercises Table 8-52 provides an example of the minimum acceptable level of information.*

Below is a summary of SCE's Emergency Preparedness internal exercise programs.

Table 8-51 - Internal Drill, Simulation, and Tabletop Exercise Program for Service Restoration

Category	*Exercise Title and Type*	*Purpose*	*Exercise Frequency*	*Position of Title of Personnel Required to Participate*	*Personnel Required*	*Personnel Completed*	*Form of Verification or Reference*
Discussion Based	Tabletop Exercise	Provide awareness and understanding of roles and responsibilities, existing documentation, policies, and procedures.	Annually	PSPS IMT positions	Varies	Varies	Situation Manual, Registration Sheets
Operations Based	Drill	Provide awareness and understanding of roles and responsibilities, and how to execute discrete tasks and actions.	As needed	Targeted IMT positions as identified via the exercise planning process	Varies	Varies	Situation Manual, Registration Sheets
Operations Based	Functional Exercise	Demonstrate an ability to successfully execute roles and responsibilities of an IMT through a set period and incident response. Confirm positions can successfully work across incident response functions and work as a team in support of objectives.	Annually	PSPS IMT positions	Varies	Varies	Exercise Plan, Registration Sheets
Operations Based	Full Scale Exercise	Successfully work across multiple levels of response to execute roles and responsibilities in an incident. Demonstrate ability to work across complex systems and in response to a significant, high-impact scenario.	As needed	PSPS IMT positions	Varies	Varies	Exercise Plan, Registration Sheets

Below is a summary of SCE's Emergency Preparedness external exercise programs.

Table 8-52 - External Drill, Simulation, and Tabletop Exercise Program for Service Restoration

Category	*Exercise Title and Type*	*Purpose*	*Exercise Frequency*	*Position or Title of Personnel Required to Participate*	*Personnel Required*	*Personnel Completed*	*Form of Verification or Reference*

8.4.6 Customer Support in Wildfire and PSPS Emergencies

In this section of the WMP, the electrical corporation must provide an overview of its programs, systems, and protocols to support residential and non-residential customers in wildfire emergencies and PSPS events. The overview for each emergency service must be no more than one page. At a minimum, the overview must cover the following customer emergency services, per Public Utilities Code section 8386(c)(21):

In the event of a major emergency, SCE has a dedicated customer support team to help impacted customers by providing information on available resources. All customer inquiries during major emergencies, such as wildfire, are prioritized. SCE's efforts to reach, engage and support AFN communities, including by developing partnerships with CBOs and providing for AFN needs at CRCs, can be found in SCE's AFN Plan Quarterly Update reports and the AFN Plan filed on January 31, 2023. Please see Section 8.5.3 Engagement with Access and Functional Needs Populations.

SCE has programs available to customers to help them through emergencies. SCE continues to improve communications to promote awareness and provide access to information and resources needed to mitigate the safety and economic impacts customers may face.

SCE utilizes the following programs to provide customer support during wildfire and PSPS emergencies: outage reporting, support for low-income customers, billing adjustments, deposit waivers, extended payment plans, suspension of disconnection and nonpayment fees, repair processing and timing, list and description of community assistance locations and services, medical baseline support services, and access to electrical corporation representatives. These programs are further described below.

8.4.6.1 Customer Protections and Practices During Emergencies

To mitigate customer risks that could arise during and after an emergency, SCE utilizes the following practices and/or enacts customer protections in line with CPUC directives, as appropriate:

Outage reporting

SCE uses best practices to provide customers with the most up-to-date information regarding outages and emergency communications, and to provide resources for reporting outages. SCE.com provides an interactive Outage Map for customers to determine if a customer's service area is affected by an outage, including an outage caused by a wildfire or PSPS event. The website also provides an opportunity for customers to sign up to receive alerts, get tips to help stay safe during an outage, and connect to important resources and support programs available during an outage emergency. Please see Section 8.5.2 and Figure SCE 8-53 for an example of SCE.com displaying outage and community support information.

Support for low-income customers

SCE offers qualifying customers discounted rates on their electricity bill through California Alternate Rate for Energy(CARE)/Family Electric Rate Assistance (FERA) programs. These customer accounts are flagged to bypass program qualification checks of annual verifications and high usage verifications. Customers can enroll in CARE or FERA regardless of whether they are experiencing an emergency related to a wildfire. Customers may also reach out to SCE partner organizations like 211 to receive referral services and in certain circumstances, they may also receive direct assistance such as

transportation, food support or housing accommodations. 211 services to educate, outreach and support customers with Access and Functional Needs before, during, and after a PSPS event. SCE leverages 211's established network to provide customers with personalized safety/emergency plans prior to a PSPS as well as provide direct support during PSPS such as food, transportation, and lodging.

Billing adjustments

Affected customers will not receive estimated bills, and daily minimum charges are halted/adjusted.

Deposit waivers

Waive deposit requirements for small business customers seeking to reestablish service to a new location. SCE does not collect reestablishment deposits from residential customers.

Extended payment plans

Providing affected customers with extended payment plans as needed.

Suspension of disconnection and nonpayment fees

Affected customers are not sent for disconnection due to non-payment, and assessment of non-payment fees are eliminated.

Repair processing and timing

Provide access to local planning resources to assist with expediting SCE support for rebuilding and providing up to date information about restoration timing both through the customer contact center and the web for affected customers.

List and description of community assistance locations and services

During PSPS events, SCE uses Community Resource Centers and Community Crew Vehicles to provide support to customers in areas most likely to experience shutoffs. These locations provide customers with water, light snacks and, access to restrooms and Wi-Fi. Customers can also obtain updated outage information, sign up for alerts, update their contact information and charge their personal mobile and certain portable medical devices. A list of pre-approved locations can be found here: https://www.sce.com/sites/default/files/custom-files/Web%20files/G22-046%20Update%20of%20CRC%20List%20for%20Web_WCAG%205-1-22.pdf

Medical Baseline support services

This program is for customers who are reliant on electrically operated medical or mobility equipment. This program provides customers additional electricity per day at a discounted rate, helping to reduce monthly utility costs. MBL customers receive additional program eligibility for SCE's Critical Care Backup Battery Program outlined in Section 8.4.1.2 below if they reside in SCE's HFRA. This program supports customers' ability to utilize their medical equipment in the event of an outage, including an outage propounded by a PSPS event or a wildfire. SCE also works with regional agencies and partners such as 211 to support customer needs before and during PSPS events. Additionally, enrollment in MBL adds protections during PSPS activations and prior to disconnections through an escalated notification process.

Access to electrical corporation representatives

SCE has been utilizing its virtual resource center (SCE.com/disaster-support) and makes information on SCE's disaster support programs available to local assistance centers. In alignment with SCE's COVID-19 protocols, SCE will continue its practice of providing in-person staff to county and local government assistance centers during disasters and other events. During PSPS events, and in alignment with SCE's COVID-19 protocols, SCE staff are deployed to CRCs and CCVs to support customers. Furthermore, as needed, SCE may direct staff and resources to county and local government assistance centers during disasters and other events to provide in-person support to assist with information and consumer protections.

8.4.6.2 Critical Care Backup Battery Program (PSPS-2)

The Critical Care Battery Backup (CCBB) program supports all customers enrolled in Medical baseline (MBL) that reside in a HFRA to provide a battery-powered portable backup solution to operate critical medical equipment during power outages due to PSPS events or other emergencies. Between January 2022 and December 2022, SCE deployed over 3,400 free portable backup batteries to eligible customers. SCE will continue to offer the CCBB program to newly identified eligible customers, deploy backup batteries to all eligible customers who choose to participate in the program, and adjust the program outreach and strategy as needed to serve eligible customers who choose to participate.

8.4.6.3 Portable Power Station Rebate Program and Portable Generator Rebate Program (PSPS-3)

The Portable Power Station Rebate Program, previously called Residential Battery Station Rebates, provided up to five $75 rebates to customers for purchasing a portable power station for their general home or small business resiliency needs. As of September 1, 2022, the rebate amount increased up to $150 per portable power station. The Portable Power Station Rebate Program is available to all SCE customers residing in a HFRA or served by circuits passing through HFRA that are impacted by PSPS. As of December 31, 2022, SCE issued 2,152 Portable Power Station rebates. SCE will continue to review and update the program offerings that offer the most impact to SCE customers.

The Portable Generator Rebate program, previously called the Well Water Generator Incentive program, was developed to assist customers by offsetting the cost of purchasing a portable generator. SCE targets customers living in HFRA communities or surrounding communities that receive their power from a circuit fed from a HFRA circuit, whose electrical needs may extend beyond the limited power supply offered by a portable power station. SCE launched the program in June 2020 by offering a $300 rebate on the purchase of a qualified portable generator, and further enhanced the rebate amount to $500 for income-qualified customers (e.g., those enrolled in California Alternate Rates for Energy (CARE) or Family Electric Rate Assistance (FERA)). In July 2021, SCE revised the program eligibility requirements and rebate amounts, based on customer survey feedback. The water-pumping dependency eligibility requirement was removed, and the eligibility requirement of MBL program enrollment was added to increase accessibility to the higher rebate amounts. The rebate was reduced from $300 to $200 to support the set budget while allowing the added MBL program customers participation that now qualified for the higher rebate. As of September 1, 2022, the rebate amount increased up to $600 for

income-qualified and MBL-enrolled customers that reside in a HFRA. As of December 31, 2022, SCE issued 993 Portable Generator rebates.

8.4.6.4 Disability Disaster and Access Resources (DDAR) Program

The Disability Disaster and Access Resource program provides support to customers with AFN prior to and during PSPS events, to mitigate customer impacts associated with PSPS. Prior to PSPS events, DDAR will help customers with AFN prepare for PSPS by helping them develop emergency resiliency plans, including procuring backup power, and support them in enrolling in applicable customer care and bill support programs (e.g., SCE's medical baseline allowance program). During PSPS events, DDAR will assist customers with in-event battery backup needs, obtaining food vouchers, and finding accessible transportation and accessible hotel accommodations. SCE will evaluate the expansion of DDAR to support customers prior to and during significant non-PSPS outage events.

8.4.6.5 In-Event Battery Loan Pilot

The In-Event Battery Loan Pilot supports customers with AFN who live in a HFRA and utilize a medical device or assistive technology for independence, health, or safety; customers who participate in the pilot are those who would not otherwise be eligible or have yet to apply for CCBB. The pilot provides in-event support to customers that escalate a need for SCE to accommodate the provision of temporary power for a medical device or assistive technology during a PSPS activation.

8.4.6.6 Customer-Side Generator

SCE retains portable generator units during the PSPS season to provide to customers. SCE will continue to deploy temporary portable generators for critical facilities to assist maintaining electric service for essential safety and public services emergencies.

8.4.6.7 eMobility Phase 2

The PSPS OIR Phase 2 Decision (D.20-05-051) required the IOUs to implement pilot projects to investigate the feasibility of mobile and deployable electric vehicle Level 3 fast charging for areas impacted by PSPS events. SCE investigated the commercial availability of mobile electric vehicle chargers (MEVC) and found that no off-the-shelf MEVC existed that met SCE needs. A request for information (RFI) and subsequent request for qualifications (RFQ) were released and awarded in 2021 for the development of a custom solution to pilot and test safe and reliable mobile electric vehicle charging in areas impacted by PSPS events.

SCE issued a purchase order in October 2021 for the design and development of a MEVC capable of charging electric vehicles at a rate up to 50kW that is legally transportable on all public roads by a standard shipping container trailer. The MEVC is expected to be fully delivered by Q1 2023, following which SCE will begin pre-deployment testing. Pending successful testing, the MEVC will be deployed as a

pilot at select PSPS events from 2023-2026 to determine its feasibility to provide safe and reliable transportation electrification resilience.

8.5 Community Outreach and Engagement

8.5.1 Overview

In accordance with California Public Utilities Code section 8386(c)(19)(B) each electrical corporation must provide its plans for community outreach and engagement before, during, and after a wildfire. The electrical corporation must also provide its plans for outreach and engagement related to PSPS, outages from protective equipment and device settings, and vegetation management.

In this section, the electrical corporation must identify objectives for the next 3- and 10-year periods, targets, and performance metrics related to the following community outreach and engagement mitigation initiatives:

- *Public outreach and education awareness for wildfires, PSPS, outages from protective equipment and device settings, and vegetation management*
- *Public engagement in the WMP decision-making process*
- *Engagement with AFN populations, local governments, and tribal communities*
- *Collaboration on local wildfire mitigation and planning*
- *Best practice sharing with other electrical corporations from within and outside of California*

8.5.1.1 Objectives

Each electrical corporation must summarize the objectives for its 3-year and 10-year plans for implementing and improving its community outreach and engagement.[260] *These summaries must include the following:*

- *Identification of which initiative(s) in the WMP the electrical corporation is implementing to achieve the stated objective, including Utility Initiative Tracking IDs*
- *Reference(s) to applicable codes, standards, and best practices/guidelines and an indication of whether the electrical corporation exceeds an applicable code, standard, or regulation*
- *Method of verifying achievement of each objective*
- *A completion date for when the electrical corporation will achieve the objective*

[260] Annual information included in this section must align with Tables 1 and 12 of the QDR.

- *Reference(s) to the WMP section(s) or appendix, including page numbers, where the details of the objective(s) are documented and substantiated*

This information must be provided in Table 8-53 for the 3-year plan and Table 8-54 for the 10- year plan. Examples of the minimum acceptable level of information are provided below.

Below is a summary of SCE's 3-year Community Outreach and Engagement objectives.

Table 8-53 - Community Outreach and Engagement Initiative Objectives (3-year plan)

Objectives for Three Years (2023–2025)	***Applicable Initiative(s), Tracking ID(s)***	***Applicable Regulations, Codes, Standards, and Best Practices (See Note)***	***Method of Verification (i.e., program)***	***Completion Date***	***Reference (section & page #)***
Actively collaborating with stakeholder networks and partnerships to better understand customer, community and stakeholder specific needs and develop tailored solutions, including AFN.	Public Outreach and Education Awareness Program and Section (8.5.2) Engagement with Access and Functional Needs Populations (8.5.3)	N/A	See Table 8-44 and Table 8-59	on-going	Section 8.5.2 Public Outreach and Education Awareness Program, pp. 583-602; and Section 8.5.3 Engagement with Access and Functional Needs Populations, pp. 601-605
Meet at least quarterly to provide updates on PSPS enhancement efforts and solicit input for improvement areas in how SCE approaches PSPS overall and provides a forum for stakeholders to propose ways to improve all aspects of PSPS	PSPS Advisory Board Meetings (Public Outreach and Education Awareness Program (8.5.2))	PSPS OIR Phase 2 D.20-05-051[261]	CPUC Quarterly Update Report Post-meeting surveys	on-going	Section 8.5.2 Public Outreach and Education Awareness Program, pp. 583-602

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

Refine stakeholder engagement capabilities through tailored approaches for outreach, engagement and information exchange with customers, communities, and stakeholders	DEP-1 and DEP-4	N/A	Activity Reporting	on-going	Section 8.5.2 Public Outreach and Education Awareness Program, pp. 583-602
Continue to look for ways to expand engagement with agencies outside of CA, including supporting IWRMC's efforts to expand utility membership base and appoint leaders to its Executive Steering Group	Best Practice Sharing with Other Electrical Corporations (8.5.5)	N/A	Engagements with outside agencies	on-going	Section 8.5.5 Best Practice Sharing with Other Electrical Corporations, pp. 606-610

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

8.5.1.2 Targets

Initiative targets are forward-looking quantifiable measurements of activities identified by each electrical corporation in its WMP. Electrical corporations will show progress toward completing targets in subsequent reports, including QDRs and WMP Updates.

The electrical corporation must list all targets it will use to track progress on its community outreach and engagement for the three years of its Base WMP. Energy Safety's Compliance Assurance Division and third parties must be able to track and audit each target.[262] *For each initiative target, the electrical corporation must provide the following:*

- *Utility Initiative Tracking IDs.*
- *Projected targets for each of the three years of the Base WMP and relevant units.*
- *Quarterly, rolling targets for 2023 and 2024 (PSPS outreach only).*
- *The expected "x% risk impact" for each of the three years of the Base WMP. The expected x% risk impact is the expected percentage risk reduction per year, as described in Section 7.2.2.2.*
- *Method of verifying target completion.*

The electrical corporation's targets must provide enough detail to effectively inform efforts to improve the performance (i.e., reduction in ignition probability or wildfire consequence) of the electrical corporation's community outreach and engagement initiatives.

Table 8-55 and Table 8-56 provide examples of the minimum acceptable level of information.

[262] Annual information included in this section must align with Tables 1 and 12 of the QDR.

Below is a summary of SCE's Community Outreach and Engagement targets by year.

Table 8-55 - Community Outreach and Engagement Initiative Targets by Year

Initiative Activity	***Tracking ID***	***2023 Target & Unit***	***x% Risk Impact 2023***	***2024 Target & Unit***	***x% Risk Impact 2024***	***2025 Target & Unit***	***x% Risk Impact 2025***	***Method of Verification***

8.5.1.3 Performance Metrics Identified by the Electrical Corporation

Performance metrics indicate the extent to which an electrical corporation's Wildfire

Mitigation Plan is driving performance outcomes. Each electrical corporation must:

- *List the performance metrics the electrical corporation uses to evaluate the effectiveness of its community outreach and engagement in reducing wildfire and PSPS risk*[263]

For each of those performance metrics listed, the electrical corporation must:

- *Report the electrical corporation's performance since 2020 (if previously collected)*
- *Project performance for 2023-2025*
- *List method of verification*

The electrical corporation must ensure that each metric's name and values are the same in its WMP reporting as its QDR reporting (specifically, QDR Table 2 and QDR Table 3). Metrics listed in this section that are the same as performance metrics required by Energy Safety and reported in QDR Table 2 (Performance Metrics)[264] *must match those reported in QDR Table 2. Metrics listed in this section that are not the same as any of the performance metrics identified by Energy Safety and reported in QDR Table 2 must match those reported in QDR Table 3.*

The electrical corporation must:

- *Summarize its self-identified performance metric(s) in tabular form*
- *Provide a brief narrative that explains trends in the metrics*

Table 8-57 provides an example of the minimum acceptable level of information.

[263] There may be overlap between the performance metrics the electrical corporation uses and performance metrics required by Energy Safety. The electrical corporation must list these overlapping metrics in this section in addition to any unique performance metrics it uses.

[264] The performance metrics identified by Energy Safety are included in Energy Safety's Data Guidelines.

Below is a summary of SCE's Community Outreach and Engagement metrics by year.

Table 8-57 - Community Outreach and Engagement Performance Metrics Results by Year

Performance Metrics	***2020***	***2021***	***2022***	***2023 Projected***	***2024 Projected***	***2025 Projected***	***Method of Verification (e.g., third-party evaluation, QDR)***
Customer recall of SCE wildfire and preparedness communications (Service Area / HFRA-Only) *Units reflect % of customers recalling*	56 / 65	51/ 56	48 / 56	48 / 56	48 / 56	48 / 56	In-Language Wildfire Mitigation / PSPS Communications Effectiveness Survey, QDR Table 3

One way SCE evaluates the effectiveness of its community outreach and engagement activities is by measuring customer awareness of SCE's wildfire messaging and customer wildfire and PSPS programs and services. Since 2020, SCE has surveyed customers through its In-Language Wildfire Mitigation / PSPS Communications Effectiveness Survey. This mandated survey is performed twice annually, once toward the start of Q3 and once toward the end of Q4 – and it is offered in English and 19 other languages. The metrics that SCE provides in Table reflect the Q4 survey results from each year, for customers systemwide and within HFRA. The figures in this table represent the percentage of surveyed customers who responded that they recalled communications from SCE about the threat of wildfire and how they can prepare for them. SCE performs this survey across its service area, and therefore provides figures for both its entire service area and HFRA-only.

SCE's In-Language Survey generally sees higher awareness in the Q4 update than earlier in the year before the fire season begins. This trend is likely due to increased outreach and heightened awareness of PSPS-related activities later in the year. Generally, the overall awareness has declined slightly year over year in the limited data set which is likely due to several reasons (e.g., intensity of summer, reduction in frequency of PSPS events, scale of PSPS communications and outreach activities). SCE will continue to monitor and track awareness of wildfire and preparedness communications through the In-language Survey previously described.

The projections provided in Table 8-57 are estimates and subject to change. For purposes of this table, SCE's customer recall projections align with the Q4 2022 awareness data to match similar communications efforts and activities levels from previous years. Communication and outreach will include efforts such as a PSPS newsletter, PSPS notifications, community outreach such as safety fairs, and customer surveys. SCE expects these metrics to remain generally consistent over time to align with consistent levels of marketing anticipated from year to year. Some fluctuation is expected to occur due to varying levels of PSPS related notifications and activity based on weather events.

8.5.2 Public Outreach and Education Awareness Program

The electrical corporation must provide a high-level overview of its public outreach and education awareness program(s) for wildfires; outages due to wildfires, PSPS events, and protective equipment and device settings; service restoration before, during, and after the incidents (as required by Public Utilities Code section 8386[c][19][B]); and vegetation management. This includes outreach efforts in English, Spanish, Chinese (including Cantonese, Mandarin, and other Chinese languages), Tagalog, and Vietnamese, as well as Korean and Russian where those languages are prevalent within the service territory.

At a minimum, the overview must include the following:

- *A description of the purpose and scope of the program(s).*
- *References to the Utility Initiative Tracking ID where appropriate.*

SCE holds a variety of meetings and workshops to inform and educate stakeholders and customers about SCE's Grid Hardening activities, wildfire, PSPS, customer programs, and resources available to assist customers with emergency preparedness.

Customers and communities require information to become better prepared for SCE's wildfire mitigation work and PSPS events, and to build resilience. To service this need, SCE performs the following public outreach and educational awareness efforts:

- Every year, in advance of fire season, we send informational materials to every local and tribal government in HFRA to update them on WMP activities and PSPS protocols. In this outreach, we request emergency contact updates and feedback on Community Resource Center locations and services. Additionally, we offer to meet with every local and tribal government in HFRA to review the information in person.
- Every year, in advance of fire season, we meet with County Operational Areas to review PSPS protocols and decision-making factors, AFN outreach, and other types of emergencies including fires and storms. SCE also solicits feedback on how we can build on our partnerships with the Operational Areas.
- We conduct regional quarterly regional Working Group meetings with local governments, critical infrastructure providers, and organizations serving the AFN community to review best practices and lessons learned related to wildfire, PSPS, and outage management.
- We conduct workshops with critical infrastructure customers as identified by the CPUC (including hospitals, telecommunications providers, etc.) to provide an overview of PSPS and wildfire mitigation and how they can enhance their resiliency in a PSPS event.
- We have proactively participated in safety fairs in HFRA communities to help customers prepare for potential PSPS. At these fairs, we update customer contact information, enroll customers in SCE's outage alert notifications, and share information on SCE's resiliency programs, as well as other community resources.

- We mail a PSPS Newsletter annually to all customers in both HFRA and non-HFRA with tailored content. The HFRA version of the newsletter highlights SCE's wildfire mitigation efforts and what we are doing to reduce the impacts of PSPS events. Customer care programs and resources are prominently featured. The Non-HFRA version of the newsletter focuses on outage safety tips and how customers can prepare for emergencies. It also includes an update on SCE's wildfire mitigation efforts. Call Center phone numbers and website links are included and electronic copies of both newsletter versions in the 19 languages (Arabic, Armenian, Chinese Mandarin, Chinese Cantonese, Farsi, French, German, Japanese, Khmer, Korean, Punjabi, Russian, Spanish, Tagalog, Vietnamese, Portuguese, Hindi, Hmong, and Thai) plus English, prevalent in SCE's service territory can be accessed via SCE's Wildfire Communications Center on SCE.com.

SCE continues to partner with an extensive network of Community Based Organizations (CBOs) enlisted to conduct in-language wildfire safety/PSPS preparedness customer education and outreach throughout its service territory, with particular emphasis on high fire risk areas.

- SCE launched incentivized partnerships with CBOs that have a strong reach in communities and demonstrate the ability to partner with SCE to help educate and increase awareness around Wildfire and Safety Preparedness. Together, the CBOs and SCE share information about SCE's wildfire mitigation plan and the importance of building resiliency plans for when emergencies occur. Other important topics regularly shared are helpful programs like MBL, CARE/FERA, rate options and important rebates and incentives available to our customers. CBOs also regularly exchange and share healthcare communications on programs and services through social media, newsletters, e-blasts, blog posts, and direct stakeholder engagement efforts like digital webinars.

- All the Tier 1 CBOs (SCE contracted CBOs for ongoing incentivized partnerships) are required to track their outreach and engagement efforts and submit this information via monthly reports. These metrics are used to evaluate CBO performance, program effectiveness, and identify areas of improvement.

- Together, the CBOs and SCE share information about customer care programs for PSPS, such as portable power station and generation rebates, battery storage, Critical Care Backup Battery and Medical Baseline program, along with other wildfire and safety preparedness resources. CBOs regularly exchange and share information on these programs through their social media channels, newsletters, emails, blog posts, and direct stakeholder engagement efforts, either through CBO-facilitated webinars or in-person events (when permitted). Some of these resources are also provided in multiple languages at the CBOs' request.

Each year, SCE sends a bi-lingual letter and flyer requesting master-metered customers (i.e., landlord/property owner) to educate their sub-metered tenants about wildfire/PSPS information including steps they can take to prepare in advance and stay safe during a PSPS outage. Electronic copies of the flyer in English, Spanish, Chinese, Vietnamese, Korean and Tagalog are also accessible via SCE's Wildfire Communications Center on sce.com.

SCE sends periodic letters to customers most frequently impacted by PSPS to provide important updates regarding SCE's efforts to strengthen the grid and reduce the number of PSPS outages.

SCE conducts annual pre- and post-season surveys to evaluate the effectiveness of its wildfire safety and preparedness communications and outreach to customers in general. These pre- and post-season surveys are offered to customers in 19 languages as well as English.

SCE's ongoing marketing campaign, which includes radio, digital, social media, newspaper and search ads, and direct customer mailings, seeks to educate customers and the public on PSPS, including the conditions that trigger a PSPS, how to prepare for a PSPS, what SCE has done and continues to do to mitigate the risk of wildfires, how to prepare for emergencies, and customer programs and resources for impacted customers. In 2023, SCE will create new digital ads on these themes to ensure continued customer engagement. The digital banner ads will continue to be available in 19 languages plus English. SCE will also continue to track total impressions of these ads.

In 2023, SCE will implement a customer-centric, integrated communications strategy to deliver consistent and cohesive messaging across traditional and digital channels to drive Wildfire/PSPS customer education and preparedness behavior. SCE will place customers into specific segments and design journeys that are relevant to each segment before, during and after a PSPS outage. PSPS preparedness messaging will also be amplified through inclusions and cross promotions in other integrated communications as appropriate.

SCE is exploring ways to prevent customers from receiving conflicting messaging, by improving coordination between our PSPS notification system and standard customer communications system to exclude customers from marketing campaigns who are experiencing PSPS de-energizations.

8.5.2.1 Community Meetings (DEP-1)

SCE holds wildfire safety community meetings throughout SCE's service area, prioritizing HFRA, to share information about SCE's wildfire mitigation plan, grid hardening updates, PSPS, and emergency preparedness, and an additional focus on SCE's programs, services, and resources. These meetings offer participants a chance to ask questions of SCE staff and share feedback and concerns.

For 2023, SCE will host a minimum of four virtual wildfire community safety meetings prioritizing HFRA counties, grouping all counties by region (North, South, East and West), and in-person targeted communities based on the impact of 2022 PSPS events and ongoing wildfire mitigation activities.

8.5.2.2 Marketing Campaign

SCE's multilingual marketing campaign, which includes radio, digital, print, social media, search ads, and direct customer mailings, seeks to educate customers and the public on PSPS, including the conditions that trigger a PSPS, how to prepare for a PSPS and emergencies in general, what SCE has done and continues to do to mitigate the risk of wildfires, and programs and resources SCE offers to impacted customers.

The marketing campaign seeks to educate customers about PSPS and emergency preparedness and reduce the impact of a PSPS or a wildfire primarily through three methods: (1) advertising campaign, (2) social media, and (3) direct customer mailings.

- Advertising Campaign: The advertising campaign aims to convey key messages that collectively help educate customers about PSPS and emergency preparedness. These advertisements run on a variety of channels including print/newspaper, digital banners, digital video, connected TV, social media, search, digital audio, and broadcast radio. The 2022 advertising campaign centered the following themes: Emergency Preparedness, PSPS Definition/Condition, Wildfire Mitigation, Alert Sign-Up, MBL Program, and Customer Resources and Support. The 2022 ad campaign generated about 832 million total impressions. In 2023, SCE will run its in-language and English advertisements concurrently service area-wide.
- Social Media: SCE uses social media as part of its marketing campaign with paid and organic posts informing customers about PSPS, emergency preparedness tips, how to sign up for PSPS alerts, and information on SCE's wildfire mitigation efforts. Also, information about SCE's CCVs and CRCs is shared on Facebook, Twitter, Instagram, and Nextdoor.
- Direct Customer Mailings: As part of the direct customer mailing strategy, SCE mails a PSPS Newsletter. Please refer to Section 8.5.2.

For 2023, SCE will launch new ads that will focus on SCE's wildfire mitigation efforts and emergency preparedness tips for customers.

8.5.2.3 Customer Research and Education (DEP-4)

SCE seeks to improve its understanding of how to reduce impacts of wildfires, PSPS, and wildfire mitigation work for its customers. SCE develops surveys to capture customer feedback on SCE's wildfire mitigation initiatives with a special emphasis on PSPS activities. Specific activities as part of this customer research and education initiative are detailed below:

- The PSPS Tracker is an annual survey conducted at the end of wildfire season to assess and understand customer awareness, experience, and opinions of SCE's PSPS and wildfire mitigation activities, focusing on customers affected by PSPS events. Five customer segments are targeted:
    - Customers not notified but de-energized
    - Customers notified and de-energized
    - Customers notified but not de-energized
    - Customers not notified and not de-energized
    - Customers who do not live in a HFRA
- Wildfire safety community meeting surveys conducted among attendees of the meetings to receive feedback on their experience and the information provided.
- CRC/CCV visitor surveys conducted among customers who visited a CRC/CCV during a PSPS event to receive feedback on their experience, and the resources and support provided.

- In-Language Wildfire Mitigation Communications Effectiveness Surveys that measured the communications and outreach effectiveness prior to and coincident with the wildfire seasons by prevalent language.

For 2023, SCE will continue to conduct surveys to bolster the assessment of customer attitudes, perceptions, and behaviors towards wildfire mitigation programs and PSPS events.

A brief narrative followed by a tabulated list of all the different target communities it is trying to reach across the electrical corporation's service territory. The target communities list must include AFN and other vulnerable or marginalized populations, but they may also include other target populations, such as communities in different geographic locations (e.g., urban areas, rural areas), age groups, language and ethnic groups, transient populations, or Medical Baseline customers. In addition, the electrical corporation must summarize the interests or concerns each community may have before, during, or after a wildfire or PSPS event to help inform outreach and education awareness needs. Table 8-58 provides an example of the minimum acceptable level of information.

A tabulated list of community partners the electrical corporation is working with or intends to work with to support its community outreach and education programs. Table 8-59 provides an example of the minimum acceptable level of information.

A table of the various outreach and education awareness programs (i.e., campaigns, informal education, grant programs, participatory learning) that the electrical corporation implements before, during, and after wildfire, vegetation management, and PSPS events, including efforts to engage with partners in developing and exercising these programs. In addition, the electrical corporation must describe how it implements its overall program, including staff and volunteer needs, other resource needs, method for implementation (e.g., industry best practice, latest research in methods for risk communication, social marketing), long-term monitoring and evaluation of each program's success, need for improvement, etc. The narrative for this section is limited to two to three pages. The electrical corporation must also provide the information on its outreach and education awareness programs a in tabulated format. Table 8-58 provides an example of the minimum acceptable level of information.

SCE implements an integrated communications strategy to provide effective communications with the public before, during, and immediately following major outages and emergencies, including PSPS. SCE coordinates with various entities and key stakeholders on education, outreach, and feedback in preparation for emergency events. This preparedness extends to overall customer resiliency; and while it has initially been directed to address PSPS, many of the efforts are also broadly applicable to other extended outages or emergencies.

Whole Community Communications

In advance of potential outages that may affect them, SCE informs state agencies, public safety partners, critical infrastructure and facilities providers, and all customers (including populations from the Disabilities and Access and Functional Needs community) through multiple programs and procedures.

SCE uses the following definition of disabilities and access and functional needs (AFN):

- Populations whose members may have additional needs before, during, and after an incident in

functional areas, including but not limited to maintaining independence and the ability to perform the activities of daily living, communication, transportation, supervision, and medical care.

- Individuals in need of additional response assistance may include those who have disabilities, who live in institutionalized settings, who are elderly, who are children, who are from diverse cultures, who have limited English proficiency or are non-English speaking, or who are transportation disadvantaged.
- The population of people experiencing homelessness.

Emergency Communications

SCE delivers notifications in numerous ways and intervals, including via voice and/or email according to the recipient's preference. Before, during, and immediately following a major outage SCE disseminates information to customers using the call center, as well as radio, television, and electronic communications, and in-person contact.

SCE's layered approach to communication avoids exclusive reliance on online strategies. SCE employs the following methods for communication:

- Interactive Voice Response (IVR) and direct access to SCE Energy Advisors through the Customer Contact Center
- Automated notifications including via voice, and/or email, and TTY formats according to the recipient's preference
- SCE.com website with outage map showing all types of outages
- Community Resource Centers
- Social media
- Coordination through Public Safety Partners and their notification systems

SCE maintains Community Crew Vehicles (CCVs) to assist with communication, engage with the community, and provide support to the public. SCE has designed and outfitted these vehicles with the required equipment and technology to enable SCE staff to transport and distribute water, snacks, and resiliency kits to communities potentially impacted by a PSPS event.

During incident response, SCE's Emergency Operations Center (EOC) is responsible for ensuring information sharing across all internal and external stakeholders. The EOC typically serves as the interface between SCE, public sector emergency management, regulatory agencies, and elected officials.

Incident Communications Team/One Voice Messaging

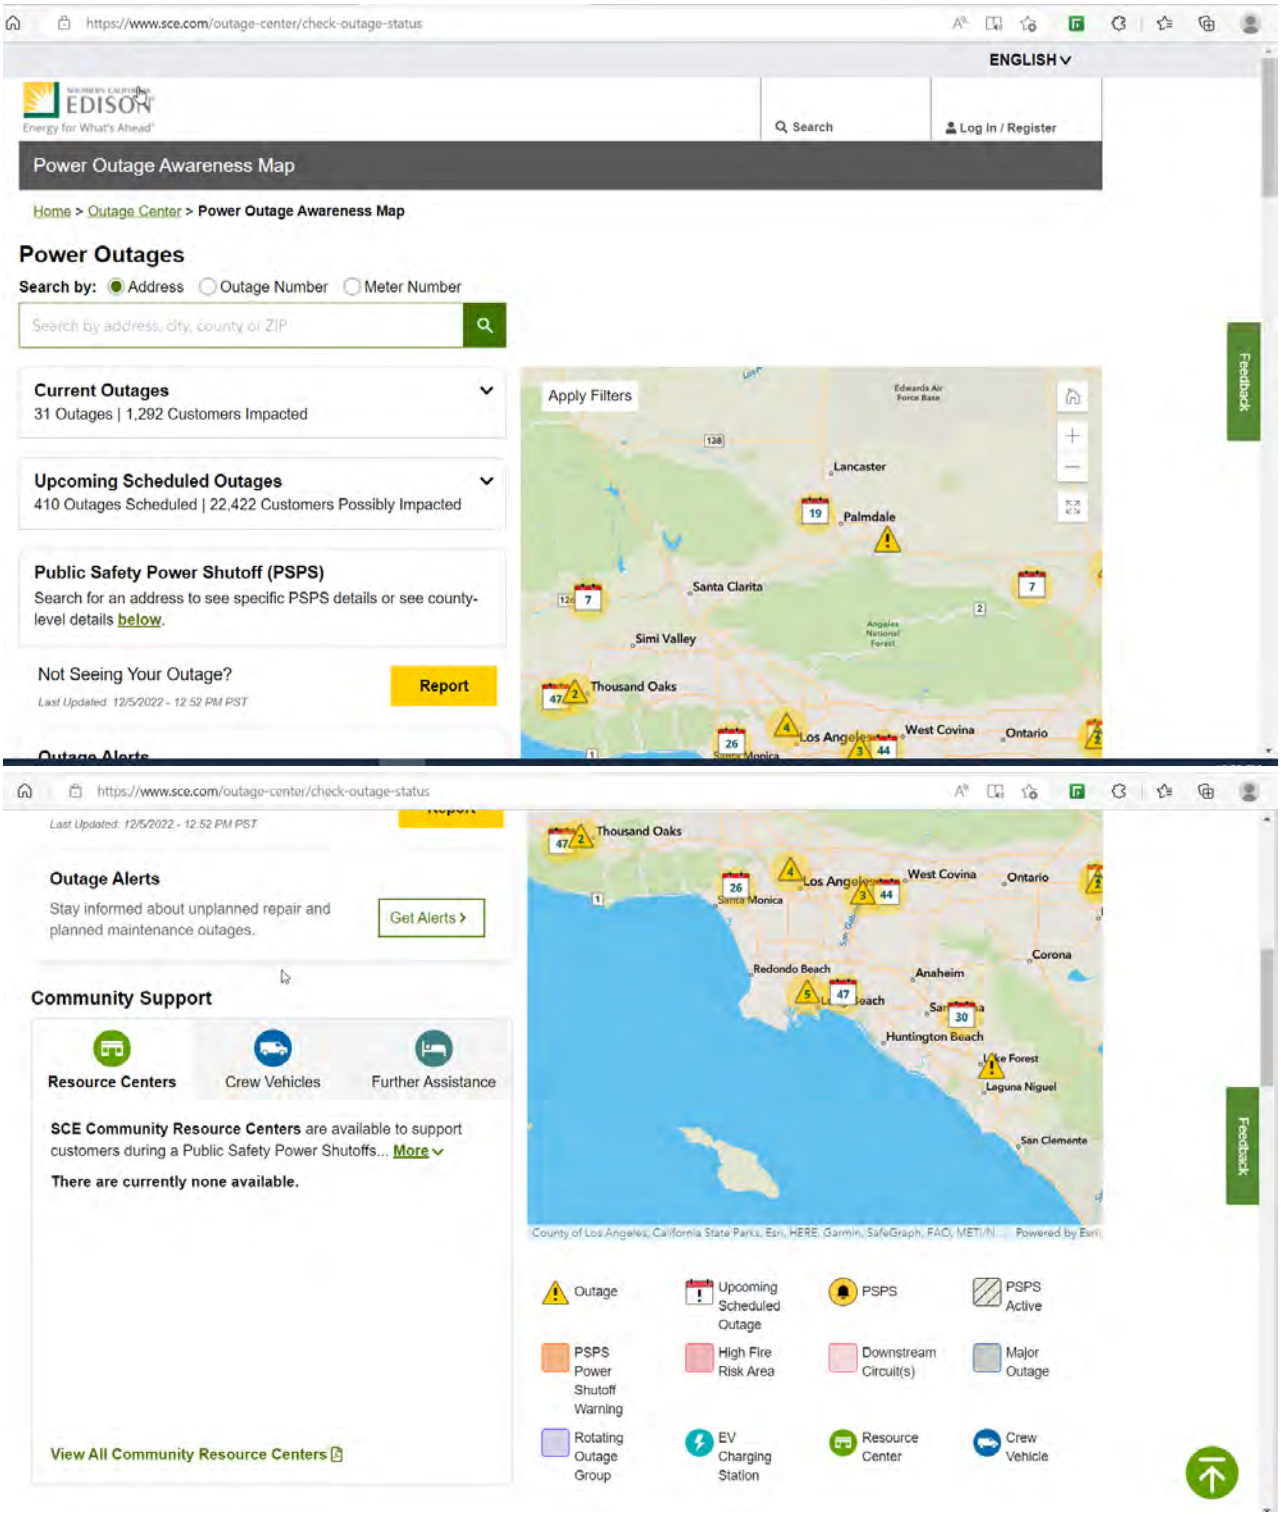
One-voice messaging is developed by the Public Information Officer (PIO), in coordination with key members of the Incident Management Team and/or Incident Support team and approved by the Incident Commander prior to release. This is inclusive messaging that is led, developed, and managed by the PIO and distributed during a crisis to stakeholders throughout the company to utilize.

Talking Points and Media Statements

Talking points and media statements are developed by the PIO to be used by company spokespeople to communicate with their respective stakeholders/audiences using established channels of communications (e.g., social media, phone call briefings, employee intranet, press release, press conference, teleconference, one-on-one media interviews, e-mail or written notification, and website content with videos).

The talking points and media statements enable scalable timely media coordination before, during and after a major outage, including estimated restoration times and potential safety hazards.

SCE.com



Online communication on SCE.com updates customers with the current status of outages. In the event of an incident, the website contains an outage map where customers can access outage details, including the projected restoration time. During Public Safety Power Shutoffs, there are two types of information on this page:

Dynamic information relating to current notifications, de-energizations, re-energizations, and locations of Community Crew Vehicles (CCVs) and Community Resource Centers (CRCs).

Static information explaining the PSPS process and necessity, including links for more information, notification sign-ups, additional languages, and FAQs.

Figure SCE 8-53 below provides an example of SCE.com displaying outage and Community Support information.

Figure SCE 8-53 - Example of SCE.com

Customer Communications

Customer communications refers to any communications, such as letters, email, text or phone calls, developed and delivered to SCE customers. It consists of: (1) any communications during an unplanned incident, which is derived from one-voice messaging developed by the PIO, in coordination with the IMT/IST and approved by the Incident Commander and tailored towards SCE customers; and (2) customized information pre-developed and automated for specific customers, homes, and businesses based on location and utilized for automated messaging for planned events (i.e., PSPS, construction or maintenance).

Critical Care Customers

SCE annually sends all its medical baseline customers a letter to raise awareness of outages and requests their most current contact information preferences. Messaging includes a call-to-action for customers to update their contact information either by phone or on SCE.com. Knowing that outages can impact customers at any time, this campaign encourages plans for resiliency during all types of power outages.

Critical Facilities and Infrastructure

SCE engages with public safety partners to identify critical facilities and infrastructure that may be impacted by potential outages, as outlined in the CPUC guidance, and other facilities that our public safety partners identify as important. SCE continually assesses the customer contact information for all critical infrastructure and facilities by periodically reaching out to these customers by phone and email, and actively working to update any missing or inaccurate contact information. An annual communication is sent to request updated contact information and back up generation status. SCE has created a page in SCE.com Critical Infrastructure customers may also go into and update contact information.

All Other Customers

- SCE attempts to verify customer contact information is up to date through various sources and channels.
- SCE's Customer Contact Center procedures include confirmation and updating customer contact information when speaking with our customers.
- SCE.com has enabled with a persistent prompt to remind customers to upgrade their contract information with a link that quickly navigates them to the update page.
- SCE continues community meetings where representatives are available to update customer contact information.
- Requests for customers to update contact information are included on printed material and bill inserts.

- Business customer account managers complete an annual contact certification for all critical infrastructure and government and industrial customers. While this is a normal course of business throughout the year, if update or verification has not occurred, specific outreach is made to update contact information.
- The request to update information is included in radio spots and media interviews.
- SCE is addressing messages that fail to deliver to a device by removing the incorrect information and verifying the correct information.

Below is a summary of Target Communities and their interests/concerns before, during, or after a wildfire or PSPS event

Table 8-58 - List of Target Communities

Target Community	***Interests or Concerns Before, During, and After Wildfire and PSPS events***
Individuals who have developmental or intellectual disabilities	• Access to electrically powered durable medical equipment or assistive technology used for health, safety, and independence (e.g., Augmentative and Alternative Communication devices) • Access to information that can be understood • Access to transportation on demand (e.g., paratransit or accessible transportation) Examples of offerings to mitigate impact: • SCE offers battery and generator rebates for assistive technology or other devices. Additionally, SCE offers batteries free of charge to customers enrolled in the MBL who reside in HFRA. • SCE offers notification/alerts in English (translated into prevalent languages) and address level alerts that can be used by anyone, including caregivers. • SCE is partnering with a third-party vendor to translate notifications/alerts in American Sign Language with English voice over and text that is accessible via screen readers and Braille readers. • SCE has partnered with 211 CA Network to connect customers to transportation. Additionally, SCE is exploring expanding

Target Community	*Interests or Concerns Before, During, and After Wildfire and PSPS events*
	partnerships with paratransit providers. • SCE partners with Community Based Organizations that serve individuals with AFN to help with wildfire safety education and outreach.
Individuals who have physical disabilities	• Access to electrically powered durable medical equipment or assistive technology used for health, safety, and independence (e.g., motorized scooter) • Access to information that can be understood (e.g., American Sign Language) • Access to transportation on demand (e.g., paratransit or accessible transportation) Examples of offerings to mitigate impact: • SCE offers battery and generator rebates for assistive technology or other devices. Additionally, SCE offers batteries free of charge to customers enrolled in the MBL who reside in HFRA. • SCE offers notification/alerts in English (translated into prevalent languages) and address level alerts that can be used by anyone, including caregivers. • SCE is partnering with a third-party vendor to translate notifications/alerts in American Sign Language with English voice over and text that is accessible via screen readers and braille readers. • SCE has partnered with 211 CA Network to connect customers to transportation. Additionally, SCE is exploring expanding partnerships with paratransit providers. • SCE partners with Community Based Organizations that serve individuals with AFN to help with wildfire safety education and outreach.
Individuals who have chronic	• Access to electrically powered durable medical equipment or assistive technology used for health, safety, and independence

Target Community	***Interests or Concerns Before, During, and After Wildfire and PSPS events***
conditions, injuries, or enrolled in the medical baseline program	(e.g., durable medical equipment used for breathing purposes) Examples of offerings to mitigate impact • SCE offers battery and generator rebates for assistive technology or other devices. Additionally, SCE offers batteries free of charge to customers enrolled in the MBL who reside in HFRA. • SCE partners with Community Based Organizations that serve individuals with AFN to help with wildfire safety education and outreach. • SCE takes additional steps to ensure that MBL and Life Support customers are receiving notifications advising them about a potential PSPS. When SCE does not receive confirmation that these customers received proactive alerts and notifications, SCE will conduct follow-up calls and messages, and finally, send a representative to attempt in-person contact (doorbell ring).
Limited English proficiencies	• Limited access to understand electrical corporation wildfire hazards and risks, specific actions that can be taken to reduce risk, and awareness of emergency services, resources, etc. Examples of offerings to mitigate impact • SCE offers notification/alerts in plain English (translated into prevalent languages) • SCE partners with Community Based Organizations that serve individuals with AFN to help with wildfire safety education and outreach.
Children	• Access to information that can be understood Examples of offerings to mitigate impact • SCE partners with Community Based Organizations that serve individuals with AFN, including youth-based groups, to help with wildfire safety education and outreach.

Target Community	***Interests or Concerns Before, During, and After Wildfire and PSPS events***
People living in institutionalized settings	• Access of information pertaining to wildfire hazards and risks, specific actions that can be taken to reduce risk, and awareness of emergency services, resources, etc. Examples of offerings to mitigate impact • SCE provides advance notifications to Public Safety Partners and critical infrastructure and keeps them informed of the PSPS • SCE offers individuals with access to address level alerts for PSPS. Any individual can enroll to receive these alerts even if they are not the customer of record.
People who are low income or enrolled in income qualified programs	• Access to resources and food support during a PSPS Examples of offerings to mitigate impact • SCE partnered with 211 California Network to assist customers with food needs during and immediately after a PSPS. • SCE is expanding partnerships with local food banks to provide customers affected by PSPS with a food box during or immediately after a PSPS.
People experiencing homelessness	• Access of information pertaining to wildfire hazards and risks, specific actions that can be taken to reduce risk, and awareness of emergency services, resources, etc. • Access to power and cell signal for their mobile devices Examples of offerings to mitigate impact • SCE provides advance notifications to Public Safety Partners and critical infrastructure and keeps them informed of the PSPS. • SCE offers individuals with access to address level alerts for PSPS. Any individual can enroll to receive these alerts even if they are not the customer of record.

Target Community	***Interests or Concerns Before, During, and After Wildfire and PSPS events***
People who are transportation disadvantaged, including but not limited to, those who are dependent on public transit	• Access of on-demand transportation for evacuation, or relocation purposes • Access of on-demand transportation to visit community resource centers or community crew vehicles Examples of offerings to mitigate impact • SCE partnered with 211 California Network to assist customers with transportation needs. • SCE provides advance notifications to Public Safety Partners and critical infrastructure (transportation sector is identified as a critical infrastructure) and keeps them informed of the PSPS.
People who are pregnant or nursing babies	• Access to electrically powered durable medical equipment or assistive technology used for health, safety, independence and nursing (e.g., breast pump, air conditioner, or refrigeration for medication, formulas, or breast milk) Examples of offerings to mitigate impact • SCE offers battery and generator rebates for assistive technology or other devices. Additionally, SCE offers batteries free of charge to customers enrolled in the MBL who reside in HFRA. • Customers who have refrigeration needs for medication, formulas, or breastmilk can get a small thermal bag and ice voucher at any CRC/CCV that are operating during PSPS.

Below is a list of community partners the electrical corporation is working with or intends to work with to support its community outreach and education programs.

Table 8-59 - List of Community Partners

This table is provided in full within the supporting documents folder at:

https://www.sce.com/safety/wild-fire-mitigation

Community Partners	***County***	***City***
AMERI CARE ENTERPRISES INCORP	LOS ANGELES	INGLEWOOD
ASA CHARTER SCHOOL	SAN BERNARDINO	SAN BERNARDINO
ASSISTANCE LEAGUE OF SANTA ANA	ORANGE	SANTA ANA
Full table is included within the supporting documents folder at https://www.sce.com/safety/wild-fire-mitigation.		

Below lists information on SCE's community outreach and education programs.

Table 8-60 - Community Outreach and Education Programs

Core Activity	***Event Type***	***Period of Application (Before, During, After Incident)***	***Name of Outreach or Education Program***	***Description of Program***	***Target Audience***	***Reference/ Link***
Advertising Campaign	PSPS and Emergency Events	Before	Emergency Preparedness, PSPS Definition /Condition, Wildfire Mitigation, Alert Sign-Up, MBL Program, and Customer Resources and Support	The advertising campaign aims to convey key messages that collectively help educate customers about PSPS, wildfire mitigation and emergency preparedness. These advertisements run on a variety of channels including print/newspaper, digital banners, digital video, connected TV, social media, search, digital audio and broadcast radio.	General public, AFN population, limited English proficiency (LEP) population	N/A
Traditional Media	PSPS, Wildfire, and Emergency Events	Before, During and After	PSPS, emergency preparedness tips, PSPS alerts, wildfire mitigation, in event information	The dedicated media team conducts outreach to outlets ahead of the height of PSPS and wildfire season to educate reporters and share resources. During events they conduct active outreach to outlets covering affected areas and after events they continue responding to inquiries and providing information.	TV, radio, print, news websites	N/A
Social Media	PSPS, Wildfire, and Emergency Events	Before, During and After	PSPS, emergency preparedness tips, PSPS alerts, wildfire mitigation, CCV and CRC information	SCE uses social media with paid and organic posts informing customers about a variety of emergency preparedness information shared through Facebook, Twitter, Instagram and Nextdoor	General public	N/A
Direct Customer Mailings	PSPS, Wildfire, and Emergency Events	Before	PSPS Newsletter	As part of the direct customer mailing strategy, SCE sent the 2022 PSPS Newsletter to all SCE customers in both HFRAs and non-HFRAs The HFRA PSPS newsletter highlighted SCE's wildfire mitigation efforts and what we are doing to reduce the impacts of PSPS events. Customer Care resources were also prominently featured. A QR code was included to facilitate quick access to SCE's PSPS decision-making video and information related to the performance of SCE-funded fire-suppression helitankers. The Non-HFRA PSPS newsletter focused on outage safety	General public	https://edisonintl.sharepoint.com/:b:/t/Public/MCRR/english/Efaq2EDHvMtAqHrYJbVuULUBiJrF3pVMBXuNmibYiHrLDg?e=ESGerI https://edisonintl.sharepoint.com/:b:/t/Public/MCRR/english/EUAI71A2pN5MjJX2UqoSwY8BqpNmp6-jTTf3oNdEjP_vlg?e=cjA0jL

Core Activity	*Event Type*	*Period of Application (Before, During, After Incident)*	*Name of Outreach or Education Program*	*Description of Program*	*Target Audience*	*Reference/ Link*
				tips and how customers can prepare for emergencies. It also included an update on SCE's wildfire mitigation efforts. Translated versions of the HFRA and non-HFRA PSPS Newsletters in all 19 prevalent languages were made accessible to customers via SCE's Wildfire Communications Center on SCE.com.		https://download.newsroom.edison.com/create_memory_file/?f_id=620fe9b4b3aed34b1cc770f3&content_verified=True
Direct Customer Mailings	Wildfire and PSPS	Before	Letters and flyers to SCE mastered-metered property owners/landlords	These letters and flyers were mailed on June 9, 2022 and requested landlord/property owners' assistance with educating their sub-metered tenants about wildfire and PSPS, including steps they can take to plan, prepare and stay safe in advance and during a PSPS outage, in addition to requesting that landlords post the provided flyers for tenant awareness. The flyer included a QR code to help drive signups for PSPS Address Level Alerts. The letter and the flyer are bilingual (English/Spanish). Translated versions of the flyer in Chinese, Vietnamese, Korean and Tagalog (in addition to Spanish) were made accessible for download via SCE's Wildfire Communications Center webpage.	General public	https://www.sce.com/sites/default/files/custom-files/Web%20files/Master%20Meter%20PSPS%202022%20Flyer_English_WCAG.pdf
News and Public Storytelling	Wildfire and PSPS	Before	Energized by Edison	News stories and videos about SCE wildfire mitigation and PSPS efforts	General public	https://energized.edison.com/wildfire-safety
Direct Customer Mailing	Vegetation Management – Routine	Prior to inspections	Vegetation Management Routine Inspections	Intended to make property owners aware that their trees will be inspected by SCE and trimmed/mitigated as needed.	Property owners whose property contains one or more trees in our inventory.	N/A
Email Messaging	Vegetation Management – Routine	Prior to inspections	Vegetation Management Routine Inspections	Intended to make property owners aware that their trees will be inspected by SCE and trimmed/mitigated as needed.	Property owners whose property contains one or more trees in our inventory.	N/A

Core Activity	*Event Type*	*Period of Application (Before, During, After Incident)*	*Name of Outreach or Education Program*	*Description of Program*	*Target Audience*	*Reference/ Link*
Direct Customer Mailing	Vegetation Management Palm Inspections	Prior to inspections of palms	Vegetation Management Palm Strategy	Intended to make property owners aware that their palms will be inspected by SCE and trimmed/mitigated as needed.	Property owners whose property contains one or more palms in our inventory.	N/A
Direct Customer Mailing & Email Messaging	Fast Curve Pilot Circuits	Prior and during changes made to the 15 circuits with the faster-acting pilot settings	Fast curve settings	Informed local government city managers and staff in HFRA about the changes SCE is making to its fast curve settings strategy, which has been implemented since 2018. Informed Medical Baseline and critical infrastructure customers on the 15 circuits with faster-acting pilot settings to prepare for potential outages by providing links to resources as well as a link to the fast curve fact sheet.	HFRA city managers and staff; Medical Baseline and critical infrastructure customers on the 15 faster-acting pilot settings	N/A

8.5.3 Engagement with Access and Functional Needs Populations

In this section, the electrical corporation must provide an overview of its process for understanding, evaluating, designing, and implementing wildfire and PSPS risk mitigation strategies, policies, and procedures specific to AFN customers across its territory. The electrical corporation must also report, at a minimum, on the following:

- *Summary of key AFN demographics, distribution, and percentage of total customer base.*

Based on 2022 data, SCE estimates that it has over 1.5 million unique customer accounts with AFN, which equates to approximately 32% of total customer accounts. SCE uses an approach consistent with other IOUs to identify and track customers with AFN. See Section 5.4.3.1 Individuals at Risk from Wildfire for a map showing the Distribution of AFN across SCE service territory.

SCE aggregates unique customer accounts enrolled in the following programs to determine the annual number of customers and percentage of accounts:

- California Alternate Rates for Energy (CARE) or Family Electric Rate Assistance (FERA): The annual number of income-qualified customers is calculated as the total number of service accounts enrolled in SCE's income qualified programs such as CARE/FERA.
- Medical Baseline Allowance Program: The annual number of MBL customers is calculated as the total number of customers enrolled in SCE's MBL program.
- Life-Support (Critical Care): Critical Care customers are a subset of the MBL population. The annual number of Critical Care customers is calculated as the total number of customers who have been identified to use medical equipment for life support purposes, meaning that the customer cannot be without life support equipment for at least two hours.
- Customers who receive their utility bill in an alternate format (e.g., Braille; large font).
- Customers who have identified their preferred language as a language other than English: Limited English proficiency is calculated based on the total number of customers who have self-certified with SCE as their primary language is other than English.
- Older adults/seniors: Customers who have certified as being 65 years or older
- Customers who self-certify SCE appends information on customer accounts for households that self-certify as having someone in their household with a condition that can be significantly affected by the interruption of power during a PSPS event or a disconnection for non-payment of a bill. The benefit of self-certification, which is good for 90 days, is that in the event of a disconnection, SCE will attempt to reach the customer through their preferred method of contact (email, text, or voice call) to notify them of the outage. If SCE cannot reach the customer through their preferred method, a field service representative will attempt to make in-person contact at the customer's home address to deliver the message regarding the disconnection.

SCE launched an AFN Self-Identification pilot in 2022 to further identify customers and household members with access and functional needs, above and beyond customers enrolled in the Medical Baseline Allowance Program. The pilot was conducted among all residents on SCE circuit frequently impacted by PSPS. In 2023, it will be expanded to a full campaign to reach all account holders residing in HFRAs.

New customer information gathered through the survey will enable SCE to provide further tailored support to customers who:

- Rely on electrically powered medical equipment
- Need heating and cooling for body temperature regulation
- Rely on assistive technology
- Need refrigeration for a medical purpose
- Need accessible transportation
- Cannot leave home without difficulty
- Are 65 and older
- Have a household member with a disability
- Have language preferences

For other AFN categories not currently tracked in our data system, SCE uses data from Acxiom, a third-party vendor providing census-based data. Acxiom supplies data to SCE for each residential service account on an annual basis. However, it is important to note that the data available on AFN individuals does not cover all categories (e.g., individuals experiencing homelessness or transient populations, or transportation disadvantaged).

SCE's efforts to reach, engage and support AFN communities, including developing partnerships with CBOs and providing for AFN needs at CRCs, can be found in the 2023 AFN Plan filed on January 30, 2023.

Evaluation of the specific challenges and needs during a wildfire or PSPS event of the electrical corporation's AFN customer base.

Every year, SCE conducts an annual PSPS Tracker Survey, which asks customers who had been in scope of a PSPS in the prior year about their experience and knowledge surrounding PSPS. In 2022, SCE included AFN demographics questions to the survey to better understand the experience of PSPS specific to customers who have disabilities and other access and functional needs. Challenges and needs as highlighted in the Survey include:

- Concerns on alternate sources of power and the challenges of financial barriers to building resiliency.
- Concerns on the negative impacts to households, including the challenges associated with the inability to use or charge adjustable hospital beds, electric scooters, nebulizers, air conditioners, and Continuous Positive Airway Pressure (CPAP) machines.

Further details on the results and insights gained from this survey are provided in SCE's 2023 Annual AFN Plan filed to the CPUC on January 30, 2023.[265]

In Q4 2022, SCE launched a study to gain a deeper understanding of the accessibility of engaging with SCE.com, including the Outage Center and dedicated AFN PSPS landing page, for customers with sensory disabilities. This valuable customer experience feedback will be used to evaluate improvements to SCE.com.

Additionally, during PSPS events, SCE opens Community Resource Centers (CRCs) and deploys Community Crew Vehicles (CCVs) in areas near the impacted area to provide customers a safe place to

[265] AFN Plan available at https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M501/K654/501654066.PDF

charge their personal devices and obtain resiliency items. SCE encourages customers who visit our CRCs and CCVs to complete a survey about their experience and captures direct feedback from all customers, including those with AFN.

Plans to address specific needs of the AFN customer base throughout the service territory specific to the unique threats that wildfires and PSPS events may pose for those populations before, during, and after the incidents. This should include high-level strategies, policies, programs, and procedures for outreach, engagement in the development and implementation of the AFN-specific risk mitigation strategies, and ongoing feedback practices.

Pursuant to the CPUC Decision in Phase Two and Phase Three of Rulemaking 18-12-005, SCE submits an annual AFN Plan for PSPS Support.[266] The AFN Plan focuses on mitigating the impacts of a power shutoff on individuals with AFN who depend on electricity. Quarterly updates are also submitted that measure progress on implementing that plan.

This plan is focused on the specific approach for serving individuals with AFN leading to and during PSPS. It summarizes the research, feedback, and external input that has shaped the support strategy for populations with AFN, the programs that serve these individuals, the preparedness outreach approaches focused on populations with AFN, and the in-event customer communications, which serve populations with AFN.

Reference the Utility Initiative Tracking ID where appropriate.

8.5.4 Collaboration on Local Wildfire Mitigation Planning

In this section, the electrical corporation must provide a high-level overview of its plans, programs, and/or policies for collaborating with communities on local wildfire mitigation planning (e.g., wildfire safety elements in general plans, community wildfire protection plans, local multi-hazard mitigation plans) within its service territory. The narrative must be no more than one page.

As discussed in Section 8.4.1 Overview SCE's All Hazards Plan (AHP) articulates the operations and policies that guide how the company prepares for, responds to and recovers from emergency electrical incidents using the utility-specific Incident Command Structure. It is designed to facilitate safe and efficient restoration of outages caused by outside forces, through the development of accurate situational awareness and the sharing of critical information during an incident. The AHP outlines the communications strategy and notification procedures that SCE utilizes to communicate with its customers, the public, appropriate government agencies, essential service providers, critical care customers, and other important stakeholders in the restoration process. It also outlines how SCE will collaborate with the communities it serves in preparing for and responding to emergency events, which may include activities such as pre-positioning of field resources or equipment in advance of forecasted weather events.

An important component to the AHP is the California Standardized Emergency Management System (SEMS). The SEMS is a structure for coordination between the government and local emergency response organizations. It provides and facilitates the flow of emergency information and resources within and between the organizational levels of field response, local government, operational areas, regions, and state emergency management. SCE has integrated SEMS into its emergency plans and response structure.

[266] *Ibid.*

During an incident, SCE aligns its response with affected agencies. Coordination with affected agencies requires SCE to engage stakeholders for collaborative planning prior to an incident (e.g., storm, wildfire, PSPS), creating a process to request agency representation during an incident or event, and implementing an IMT structure to manage an incident. SEMS incorporates:

- Incident Command System - A field-level emergency response system based on management by objectives.
- Multi/Inter-agency coordination - Affected agencies working together to coordinate allocations of resources and emergency response activities.
- Mutual Aid - A system for obtaining additional emergency resources from non-affected jurisdictions.
- Operational Area Concept - County and its sub-divisions to coordinate damage information, resource requests and emergency response.

*I*n addition, the electrical corporation must provide the following information in tabular form, providing no more than one page of tabulated information in the main body of the WMP and the full table in an Appendix as needed.

- *List of county, city, and tribal agencies and non-governmental organizations (e.g., nonprofits, fire safe councils) within the service territory with which the electrical corporation has collaborated or intends to collaborate on local wildfire mitigation planning efforts (i.e., non-wildfire emergency planning activities)*
    - *For each entity, the local wildfire mitigation planning program/plan/document, level of collaboration (e.g., meeting attendance, verbal or written comments), and date the electrical corporation provided its last feedback. Table 8-61 provides an example of the minimum acceptable level of information. Reference the Utility Initiative Tracking ID where appropriate.*
- *In a separate table, the electrical corporation must provide a list of current gaps and limitations in its collaboration efforts with local partners on local wildfire planning efforts. Where gaps or limitations exist, the electrical corporation must indicate proposed means and methods to increase collaborative efforts. Table 8-62 provides an example of the minimum acceptable level of information.*

Below SCE lists information on collaboration with community partners.

Table 8-61 - Collaboration in Local Wildfire Mitigation Planning

Please see Appendix F: Supplemental Information for the complete table

Name of County, City, or Tribal Agency or Civil Society Organization (e.g., nongovernmental organization, fire safe council)	***Program, Plan, or Document***	***Last Version of Collaboration***	***Level of Collaboration***
Acton Town Council	General WMP Plan and PSPS Protocols	6/27/2022	Acton Town Council Wildfire Mitigation Update Completed
Acton Town Council	General WMP Plan and PSPS Protocols	6/17/2022	Acton Town Council Concerned About Uptick in Emergency Outages
Adelanto	General WMP Plan and PSPS Protocols	6/9/2022	City of Adelanto Reliability Report and WMP/PSPS Briefing Meeting
Agoura Hills	General WMP Plan and PSPS Protocols	6/21/2022	Wildfire
Full table is included in Appendix F: Supplemental Information			

Below SCE lists information on gaps and limitations in collaborating with community partners.

Table 8-62 - Key Gaps and Limitations in Collaborating on Local Wildfire Mitigation Planning

Subject of Gap or Limitation	Brief Description of Gap or Limitation	Strategy for Improvement
Community engagement feedback	Received recommendations on: • Expanding marketing and promotion of meetings • Refining messages and channels based on performance data	SCE is working on expanding outreach efforts to additional social media platforms and continuing to develop ad with relevant messaging. • Target timeline: ongoing

8.5.5 Best Practice Sharing with Other Electrical Corporations

In this section, the electrical corporation must provide a high-level overview of its policy for sharing best practices and collaborating with other electrical corporations on technical and programmatic aspects of its WMP program. The narrative must be no more than one page.

SCE continues to seek improvements to its wildfire mitigation approaches and further reduce wildfire risk by increasing opportunities to collaborate and exchange ideas with other utilities, technology developers, communities and governmental agencies. This includes memberships in industry organizations, outreach to commercial customers with national accounts, participation in technical forums and meeting regularly with electric utilities nationally and abroad.

For example, SCE has regular check-ins with other utilities through the International Wildfire Risk Management Consortium (IWRMC). IWRMC's mission is to facilitate a system of working and networking channels between members of the global utility community to support ongoing sharing of data, information, technology, and practices, and proactively address the wildfire issue through learning, innovation, analysis, and collaboration. SCE, along with SDG&E and PG&E in the United States and Powercor and AusNet Services in Australia, is a founding member and participant in the IWRMC Executive Steering Group. Today, over a dozen other utilities facing significant wildfire risks currently participate in the IWRMC, with members hailing from the United States, Canada, South America, and Australia.

IWRMC member companies address wildfire issues through participation in tactical working groups, quarterly best practice sharing webinars, and direct discussions with their peers. Through this arrangement, the consortium is designed to accelerate learning and improve existing models and approaches by providing access to more and better data while allowing for swift re-orientation and prioritization of issues as the industry adapts to the unique set of issues that arise each year. The IWRMC is oriented around four strategic areas: 1) risk management, 2) asset management, 3) vegetation management, and 4) operations & protocols. In 2021, dedicated sessions were also held that focused on Data Governance and Stakeholder Engagement. IWRMC working groups routinely conduct member surveys on specific topic areas to supplement and enhance the direct discussions that occur during working group meetings.

In addition, the electrical corporation must provide a list in tabular form of relevant electrical corporations and other entities it has shared or collaborated, or intends to continue to share or collaborate or begin sharing or collaborating, with on best practices for technical or programmatic aspects of its WMP program.

For each entity, the best practice subject, date(s) of collaboration, whether the collaboration is technical or programmatic, list of electrical corporation partners, a description of the best practice sharing/collaborative activity with a reference, and any outcomes from that sharing or activity.

Reference the Utility Initiative Tracking ID where appropriate.

The overview and table must be no longer than two pages in the main body of the WMP. The full table can be included as an appendix as needed.

Table 8-63 provides an example of the minimum acceptable level of information.

Please note that Table 8-63 is labeled as 8-64 in the OEIS Final Technical Guidelines, and the table below will be labeled as 8-64 to be consistent with the guidelines

Below SCE lists information on best practice sharing and collaboration with other electric partners.

Table 8-63 - Best Practice Sharing with Other Electrical Corporations

Best Practice Subject	***Dates of Collaboration (YYYY-YYYY)***	***Technical or Programmatic***	***Electrical Corporation Partners***	***Description of Best Practice Sharing or Collaborating***	***Outcome***
Risk Modeling Working Group	2022 – Ongoing	Technical	SDG&E, PG&E, Bear Valley, PacifiCorp, and Liberty	Working group meetings included information gathering and comparing risk modeling methodologies of the subject utilities.	Future working group meetings moving to understanding best practices and towards consistency on utility approaches to risk modeling.
Covered Conductor Working Group	2021 – ongoing	Technical	SDG&E, PG&E, Bear Valley, PacifiCorp, and Liberty	SCE conducts regular meetings with the joint IOUs regarding the effectiveness of covered conductor. These include meetings on estimated effectiveness, recorded effectiveness, laboratory testing, benchmarking, alternatives to covered conductor, new technologies, maintenance and inspection practices, PSPS impacts, and costs. In these meetings, the utilities share data, practices, methodologies, testing results, and future plans.	• Confirmed effectiveness of covered conductor to prevent ignitions from contact-from-object and wire-to-wire slapping. • Establishing workshops in 2023 to identify maintenance and inspection best practices, assess testing results, develop a methodology to calculate the estimated effectiveness of a combination of mitigations, assess the results of PSPS studies, and to assess each utilities' estimated effectiveness of new technologies
Vegetation Line Clearances Working Group	2022 – ongoing	Technical and Programmatic	SDG&E and PG&E	Increase alignment amongst California electrical corporations related to line clearing data collection practices and record keeping of tree-caused risk events.	PG&E, SDG&E, and SCE chose a third-party consultant to establish the data collection standards, create the cross-utility database, and study the relationship between enhanced vegetation clearances and tree-caused risk events.
Wildfire Mitigation	2021 – ongoing	Technical and Programmatic	Varies depending on engagement	SCE engages and shares best practices with industry trade associations and agencies, as well as other utilities by participating in conferences and other external events.	Participating in industry conferences and other forums as well as engaging with peer utilities provide regular opportunities to share best practices on topics pertaining to wildfire mitigation, including PSPS. In 2022, SCE participated in the following external engagements, including but not limited to: • Electric Utility Consultants, Inc.'s (EUCI) "Wildfire Season Recap Summit" Conference • Edison Electric Institute (EEI) FERC Transmission – Annual CEO Meetings • Western Energy Institute (WEI) Wildfire Conference • Western Electricity Coordinating Council (WECC) Summer Readiness

Best Practice Subject	*Dates of Collaboration (YYYY-YYYY)*	*Technical or Programmatic*	*Electrical Corporation Partners*	*Description of Best Practice Sharing or Collaborating*	*Outcome*
					Webinar • Institute of Electrical and Electronics Engineers (IEEE) Panels on Fire Mitigation & Grid Resiliency and Undergrounding • EEI Transmission, Distribution, Metering and Mutual Assistance Conference • North American Transmission Forum (NATF) • Tour of SCE's Emergency Operations Center for Portland General
Risk Spend Efficiency (RSE)	2021 – 2022 (Ongoing with SDG&E and PG&E)	Technical	SDG&E, PG&E, Bear Valley, PacifiCorp, and Liberty	Working group meetings focus on utility inputs and calculations used in RSE calculations with the aim of developing a standardized approach.	Continue to interpret RSE guidelines as provided in the WMP, including effectiveness of mitigation programs. Benchmarking feedback is reviewed and adjustments to RSE calculations are considered.
EPSS	2021 – 2022	Technical and Programmatic	SDG&E and PG&E	Engagements with west coast utilities to discuss protective device settings in order to mitigate utility equipment caused wildfire ignitions.	The use of fast trip settings has been widely among peer utilities and utilities continue to look at new technologies to implement into their systems.
PSPS	2021 – ongoing	Programmatic	SDG&E and PG&E	Discussion of various aspects of PSPS community outreach and engagement.	Ongoing
Distribution Aerial Resources	Q2 2022 – Ongoing	Technical and Programmatic	SDG&E, PG&E, Duke Energy, Southern Company	Discussion of programmatic and technical aspects of distribution aerial inspections, including size and scope of program, image capture and processing, and future plans.	Ongoing

8.5.6 Maturity Advancement

SCE continually seeks alignment with government and industry organizations and practices and continues to look for opportunities to improve community outreach maturity over time.

The activities discussed in this section could lead to Community Outreach and Engagement advancements. Below is a summary of broader anticipated maturity improvements over the WMP period that supplement the objectives outlined at the beginning of the Section.

Table SCE 8-17 - Community Outreach Maturity Improvements

Capability Name	Projected Maturity Improvements
Engagement with AFN and Socially Vulnerable Populations	Improvements include hosting meetings with AFN and MBL groups on effectiveness of engagements, and to update program activities based on this feedback. Other improvements are establishing working relationships with at least one community partner for each AFN, MBL and socially vulnerable groups at the county level.

9 PUBLIC SAFETY POWER SHUTOFF

9.1 Overview

In Sections 9.1–9.5 of the WMP,[267] *the electrical corporation must:*

- *Provide a high-level overview of key PSPS statistics*
- *Identify circuits that have been frequently de-energized and provide measures for how the electrical corporation will reduce the need for, and impact of, future PSPS implementation on those circuits*
- *Describe expectations for how the electrical corporation's PSPS program will evolve over*
- *the next 3 and 10 years*
- *Describe any lessons learned for PSPS events occurring since the electrical corporation's last WMP submission*
- *Describe the electrical corporation's protocols for PSPS implementation*

9.1.1 Key PSPS Statistics

In this section, the electrical corporation must include a summary table of PSPS event data. These data must be calculated from the same source used in the GIS data submission (i.e., they should be internally consistent). If it is not possible to provide these data from the same source, the electrical corporation must explain why. Table 9-1 provides an example of the minimum acceptable level of information for a summary of PSPS event data.

SCE provides key PSPS event statistics by calendar year in Table 9-1. In previous WMPs, SCE provided data by fire season to better reflect data that corresponds to SCE's tools and practices, which are updated and implemented ahead of each fire/PSPS season and revised post-season. For this WMP, SCE provides the information by calendar year pursuant to Energy Safety direction.

[267] *Annual information included in the following sections must align with Table 10 of the QDR.*

Table 9-1 - PSPS Event Statistics[268]

	No. of Events[269]	Total Circuits De-energized	Total Customers[270] Impacted	Total Customer Minutes of Interruption
Jan 1 – Dec 31 2018[271]	2	6	148	228,227
Jan 1 – Dec 31 2019	7	267	198,826	316 million
Jan 1 – Dec 31 2020	10	424	229,800	268 million
Jan 1 – Dec 31 2021	8	232	179,502	222 million
Jan 1 – Dec 31 2022	3	13	15,784	7 million

9.1.2 Identification of Frequently De-energized Circuits

Public Utilities Code section 8386(c)(8) requires the "[i]dentification of circuits that have frequently been de-energized pursuant to a PSPS event to mitigate the risk from wildfire and the measures taken, or planned to be taken, by the electrical corporation to reduce the need for, and *impact of, future PSPS of those circuits, including, but not limited to, the estimated annual decline in circuit PSPS and PSPS impact on customers, and replacing, hardening, or undergrounding any portion of the circuit or of upstream transmission or distribution lines." To comply, the electrical corporation is required to populate Table 9-2 and provide a map showing the frequently de-energized circuits.*

[268] SCE's PSPS data management capabilities and the CPUC's PSPS reporting guidelines have continuously evolved since the inception of the PSPS program in 2018, with a significant shift in 2021 when the CPUC issued a standardized PSPS post-event reporting template and SCE transitioned to a largely automated Central Data Platform (CDP) to better manage its PSPS data. Given the differences in source data systems, data quality and methodology, SCE's PSPS data for the 2018 through 2020 time period may not be directly comparable to data reported for 2021 and later PSPS events. Notwithstanding these differences, there has been a clear downward trend in PSPS customer impacts from 2020 to the present. Data for 2021 and 2022 has been updated to align with the methodology used in SCE's PSPS-related reports which provide total unique customers and unique circuits de-energized per PSPS event. SCE will align its QDR submission to this methodology going forward.

[269] The number of events includes only de-energization events (no circuits or customers are de-energized during high-threat events).

[270] *Here, "customers" is customer accounts. The electrical corporation may use electric meters as a proxy for customers.*

[271] This includes data from the de-energization event that occurred on 1/1/19 as that event started in 2018.

The map must show the following:

- *All circuits listed in Table 9-2, colored or weighted by frequency of PSPS*
- *HFTD Tiers 2 and 3 contour overlay*

Examples of the minimum acceptable level of information are provided in Table 9-2.

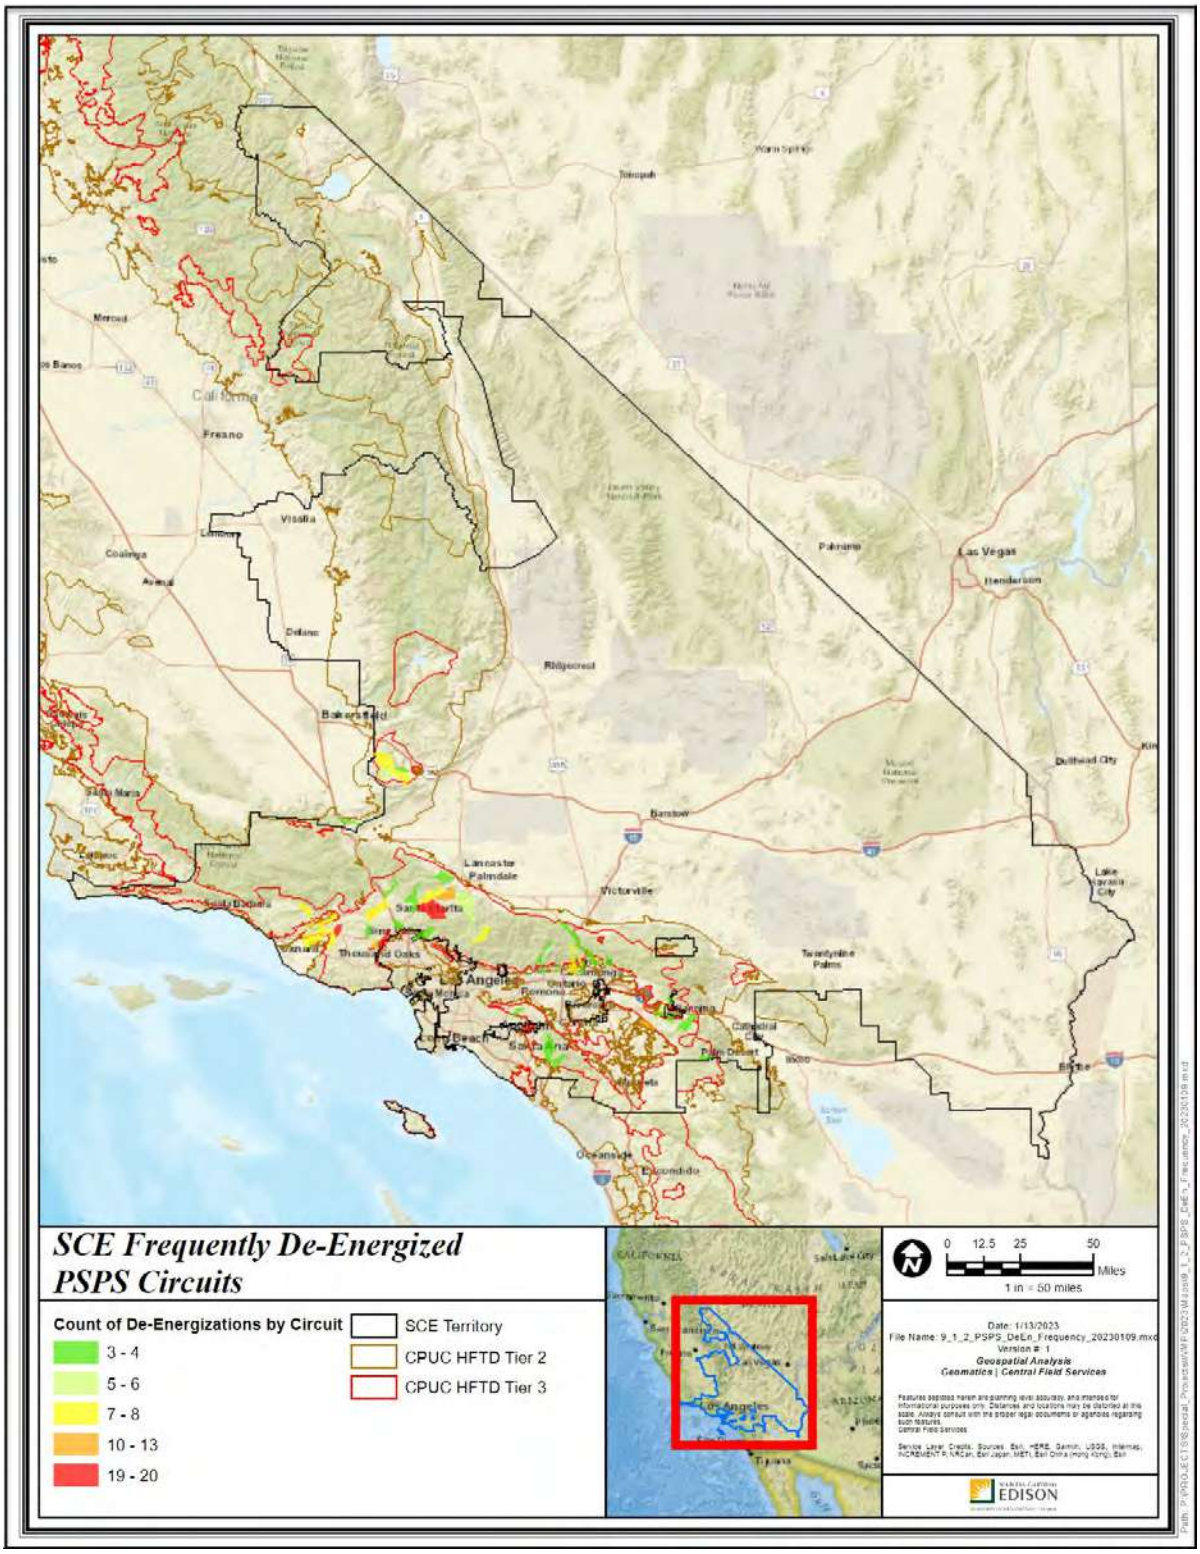


Table 9-2 - Frequently De-energized Circuits

Entry #	Circuit ID	Name of Circuit	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures Taken, or Planned to Be Taken, to Reduce the Need for and Impact of Future PSPS of Circuit
SCE provides the tabulated data for Table 9-2 in Appendix F: Supplemental Information.						

Note: Once populated, if this table is longer than two pages, the electrical corporation must append the table.

SCE provides the tabulated data for Table 9-2 in Appendix due to the size of the table. Figure SCE 9-01 below shows a map of the frequently de-energized circuits. SCE has provided spatial data for the frequently de-energized circuits, which can be found on SCE's website.

Figure SCE 9-01 - Frequently De-Energized Circuits[272]

[272] Map as of 01/09/2023. SCE has provided the spatial data of the frequently de-energized circuits. Please see https://www.sce.com/safety/wild-fire-mitigation.

9.1.3 Objectives

Each electrical corporation must summarize the objectives for its 3-year and 10-year plans to reduce the scale, scope, and frequency of PSPS events.[273] These summaries must include the following:

- *Identification of which initiative(s) in the WMP the electrical corporation is implementing to achieve the stated objective, including Utility Initiative Tracking IDs*
- *Reference(s) to applicable codes, standards, and best practices/guidelines and an indication of whether the electrical corporation exceeds an applicable code, standard, or regulation*
- *Method of verifying achievement of each objective*
- *A completion date for when the electrical corporation will achieve the objective*
- *Reference(s) to the WMP section(s) or appendix, including page numbers, where the details of the objective(s) are documented and substantiated*

This information must be provided in Table 9-3. Example of PSPS Objectives (3-year plan) for the 3-year plan and Table 9-4. Example of PSPS Objectives (10-year plan) for the 10-year plan. Examples of the minimum acceptable level of information are provided below.

SCE provides PSPS objectives for its 3-year plan in Table 9-3 and 10-year plan in Table 9-4. The objectives included in these tables focus on activities that can help to reduce the scope, duration, and frequency of PSPS events. To the extent mitigation initiatives discussed in other WMP Sections support these objectives, SCE identifies those initiative in these tables.

[273] *Annual information included in this section must align with Table 12 of the QDR.*

Table 9-3 - PSPS Objectives (3-year plan)

Objectives for Three Years (2023–2025)	Applicable Initiative(s) & Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
Re-evaluate existing PSPS windspeed thresholds using engineering-based analysis that considers, among other factors, the effectiveness of covered conductor	N/A	Best Practices	Documentation demonstrating adjustments (if any) to SCE's PSPS decision-making criteria as a result of the threshold re-evaluation	Ongoing	Appendix D: Areas for Continued Improvement, ACI SCE-22-25 Increasing PSPS Thresholds on Hardened Circuits, p. 784-788; ACI SCE-22-26 PSPS System Damage in Consequence Modeling p. 787
Perform additional grid sectionalization and automation, paired with weather stations, to reduce the scope of PSPS events	SH-5	Best practices	Grid sectionalization work is reflected in SCE's completed work orders and will be discussed in future WMP updates	Ongoing; see annual targets outlined in Table 9-5	Section 8.1.2.8 Installation of Syst. Aut. Equipment, pp. 271-273
Evaluate emerging technology for potential incorporation into PSPS protocols	REFCL (SH-17, SH-18)	Best practices	Discussion will be included in future WMP updates	Ongoing	Section 8.1.2.6 Emerging Grid Hardening Tech, pp. 266-269
Continue to increase situational awareness and improve precision of weather forecasting to help optimize the scope of PSPS events	SA-1, SA-3, SA-8, SA-10	Best practices	Discussion will be included in future WMP updates WMP updates	Ongoing; see annual targets outlined in Table 9-5	Section 8.3 Situational Awareness and Forecasting, pp. 445-520

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

Table 9-4 - PSPS Objectives (10-year plan)

Objectives for Ten Years (2026–2032)	Applicable Initiative(s) & Tracking ID(s)	Applicable Regulations, Codes, Standards, and Best Practices (See Note)	Method of Verification (i.e., program)	Completion Date	Reference (section & page #)
Sufficiently harden HFRA circuits to reduce potential PSPS impacts by up to 90%[274]	SH-1, IWMS Framework	Best Practices	Circuit threshold change log, examination of PSPS de-energization conditions	2026 - 2032	Section 8.1.2 Grid Design and Syst. Hardening pp. 250-277
Incorporate successful emerging technologies into PSPS protocols to optimize scale, scope and frequency of PSPS	REFCL (SH-17, SH-18)	Best Practices	Revised operational protocols	2026 - 2032	Section 8.1.2.6 Emerging Grid Hardening Tech, pp. 266-269

Note: An asterisk indicates that the electrical corporation exceeds a particular code, regulation, standard, or best practice. The electrical corporation must provide a reference to the appendix section and page providing further documentation, justification, and substantiation.

[274] This analysis assumes an average PSPS threshold of 31mph sustained winds or 46mph wind gusts for bare, non-hardened circuits, and compares the average exceedance of that control point versus an average threshold of 40mph sustained winds or 58mph wind gusts for circuits with full covered conductor. Based on historical wind speed and FPI, the average circuit across SCE's service territory breaches the approximated hardened threshold about 90% less.

9.1.4 Targets

Initiative targets are forward-looking quantifiable measurements of activities identified by each electrical corporation in its WMP. Electrical corporations will show progress toward completing targets in subsequent reports, including QDRs and WMP Updates.

The electrical corporation must list all targets it uses to track progress on reducing the scope, scale, and frequency of PSPS for the three years of the Base WMP. Energy Safety's Compliance Assurance Division and third parties must be able to track and audit each target.[275] *For each initiative target, the electrical corporation must provide the following:*

- *Utility Initiative Tracking IDs.*
- *Projected targets for the three years of the Base WMP and relevant units.*
- *The expected "x% risk impact" for each of the three years of the Base WMP. The expected x% risk impact is the expected percentage risk reduction per year, as described in Section 7.2.2.2.*
- *Method of verifying target completion.*

The electrical corporation's targets must provide enough detail to effectively inform efforts to improve the performance of the electrical corporation's initiatives aimed at reducing the scope, scale, and frequency of its PSPS events.

SCE provides its targets for the next three years (2023-2025) in Table 9-5. These targets focus on initiatives that reduce the scope, duration, and frequency of PSPS events, and due to their broader benefits, are also represented in prior Sections of this WMP. Targets that support reducing customer impacts from PSPS can be found in Section 8.4.

SCE's 2023 target specific to the reduction of the scale, scope, and frequency of PSPS events is the projected reduction of customer minutes of interruption due to applying SCE's 2023 mitigation scope based on the actual PSPS de-energization locations (driven by historical weather and fuel conditions) of 2020-2022. Because exact locations of mitigations impacting PSPS have not been finalized for 2024 and 2025, SCE's targets for those years assume the same reduction as 2023 and may be updated in the future to reflect actual mitigation scope.

SCE's strive targets of customer minutes of interruption in 2023, 2024, and 2025 are contingent upon weather and fuel conditions, which are factors beyond its control. SCE's strive targets assume that weather and fuel conditions will match the average of the prior three years; to the extent such conditions are worse than the average, SCE's strive targets will no longer be meaningful.

[275] *Annual information included in this section must align with Tables 1 and 12 of the QDR.*

Table 9-5 - PSPS Targets

Initiative Activity	Tracking ID	2023 Target & Unit	x% Risk Impact 2023	2024 Target & Unit	x% Risk Impact 2024	2025 Target & Unit	x% Risk Impact 2025	Method of Verification
Covered Conductor	SH-1	Install **1,100** circuit miles of covered conductor in SCE's HFRA SCE will strive to install up to as many as **1,200** circuit miles of covered conductor in SCE's HFRA, subject to resource constraints and other execution risks	See risk impact in Table 8-3	Install **1,050** circuit miles of covered conductor in SCE's HFRA SCE will strive to install up to as many as **1,200** circuit miles of covered conductor in SCE's HFRA, subject to resource constraints and other execution risks	See risk impact in Table 8-3	Install **500** circuit miles of covered conductor in SCE's HFRA SCE will strive to install up to as many as **600** circuit miles of covered conductor in SCE's HFRA, subject to resource constraints and other execution risks	See risk impact in Table 8-3	Completed work orders
Remote Controlled Automatic Reclosers Setting Update	SH-5	SCE will install **6** RAR/RCS sectionalizing devices subject to 2022 PSPS analysis and subject to change SCE will strive to install **17** RAR/RCS sectionalizing devices subject to 2022 PSPS analysis, resource constraints and other execution risks	See risk impact in Table 8-3	SCE will install **5** RAR/RCS sectionalizing devices subject to 2022 PSPS analysis and subject to change SCE will strive to install **17** RAR/RCS sectionalizing devices subject to 2022 PSPS analysis, resource constraints and other execution risks	See risk impact in Table 8-3	SCE will install **5** RAR/RCS sectionalizing devices subject to 2022 PSPS analysis and subject to change SCE will strive to install **17** RAR/RCS sectionalizing devices subject to 2022 PSPS analysis, resource constraints and other execution risks	See risk impact in Table 8-3	Completed work orders
Weather Stations	SA-1	Install **85** weather stations in SCE's HFRA SCE will strive to install up to **95** weather stations in SCE's HFRA, subject to resource and execution constraints	See risk impact in Table 8-23	Install **50** weather stations in SCE's HFRA SCE will strive to install up to **55** weather stations in SCE's HFRA, subject to resource and execution constraints	See risk impact in Table 8-23	Install **15** weather stations in SCE's HFRA SCE will strive to install up to **20** weather stations in SCE's HFRA, subject to resource and execution constraints	See risk impact in Table 8-23	List and location of installed weather stations
Weather & Fuels Modeling	SA-3	Equip **500** weather station locations with machine learning capabilities SCE will strive to equip up to **600** weather station locations with machine learning capabilities, subject to resource and execution constraints	See risk impact in Table 8-23	Equip **200** weather station locations with machine learning capabilities SCE will strive to equip up to **300** weather station locations with machine learning capabilities, subject to resource and execution	See risk impact in Table 8-23	Implement machine learning at remaining weather station locations that meet eligible criteria, and for additional variables deemed necessary to improve PSPS planning	See risk impact in Table 8-23	List and location of weather stations equipped with machine learning capabilities

Initiative Activity	Tracking ID	2023 Target & Unit	x% Risk Impact 2023	2024 Target & Unit	x% Risk Impact 2024	2025 Target & Unit	x% Risk Impact 2025	Method of Verification
				constraints				
Fire Spread Modeling	SA-8	Complete analytics report summarizing assessment of historical consequence data for improved fire spread modeling	See risk impact in Table 8-23	Provide vendor with analytics report and work with the vendor to complete a plan on future improvements	See risk impact in Table 8-23	Provide recommendation for how consequence metrics can be used for PSPS Decision-Making	See risk impact in Table 8-23	Final analytics report
High Definition (HD) Cameras	SA-10	Install **10** HD Cameras SCE will **strive** to install up to **20** HD Cameras, subject to resource and execution constraints	See risk impact in Table 8-23	Install **10** HD Cameras SCE will **strive** to install up to **20** HD Cameras, subject to resource and execution constraints	See risk impact in Table 8-23	No planned installs. Additional installs will be based on reassessment in 2024	See risk impact in Table 8-23	List and location of installed HD cameras
PSPS	PSPS.NonInitiative.01	SCE will reduce PSPS scope, frequency, and duration by 14.9M minutes of customer interruption, based on applying SCE's 2023 mitigation scope to the actual PSPS de-energization locations (driven by historical weather and fuel conditions) of 2020-2022. While predicting the exogenous factors that drive future PSPS impacts is not reasonably possible, SCE will strive to keep 2023 PSPS impacts to less than 150.6M customer minutes of interruption.	N/A	Because exact locations of mitigations impacting PSPS have not been finalized for 2024, SCE targets a reduction of 14.9M minutes of customer interruption assuming the same reduction as 2023; SCE may update this value in the future to reflect actual mitigation scope. While predicting the exogenous factors that drive future PSPS impacts is not reasonably possible, SCE will strive to keep 2024 PSPS impacts of 135.7M customer minutes of interruption.	[N/A	Because exact locations of mitigations impacting PSPS have not been finalized for 2025, SCE targets a reduction of 14.9M minutes of customer interruption assuming the same reduction as 2023; SCE may update this value in the future to reflect actual mitigation scope. While predicting the exogenous factors that drive future PSPS impacts is not reasonably possible, SCE will strive to keep 2025 PSPS impacts to less than 120.8M customer minutes of interruption.	N/A	Review of year-end PSPS event data.

9.1.5 Performance Metrics Identified by the Electrical Corporation

Performance metrics indicate the extent to which an electrical corporation's Wildfire Mitigation

Plan is driving performance outcomes. Each electrical corporation must:

- *List the performance metrics the electrical corporation uses to evaluate the effectiveness of reducing reliance on PSPS*[276]

For each of these performance metrics listed, the electrical corporation must:

- *Report the electrical corporation's performance since 2020 (if previously collected)*
- *Project performance for 2023-2025*
- *List method of verification*

The electrical corporation must ensure that each metric's name and values are the same in its WMP reporting as its QDR reporting (specifically, QDR Table 2 and QDR Table 3). Metrics listed in this section that are the same as performance metrics required by Energy Safety and reported in QDR Table 2 (Performance Metrics)[277] *must match those reported in QDR Table 2. Metrics listed in this section that are not the same as any of the performance metrics identified by Energy Safety and reported in QDR Table 2 must match those reported in QDR Table 3.*

The electrical corporation must:

- *Summarize its self-identified performance metric(s) in tabular form*
- *Provide a brief narrative that explains trends in the metrics*

In addition to the table, the electrical corporation must provide a narrative (two pages maximum) explaining its method for determining its projected performance on these metrics (e.g., PSPS consequence modeling, retrospective analysis).

SCE provides its the performance metrics that it uses to help evaluate the goal of reducing the scope, duration and frequency of PSPS in Table 9-6. The table includes recorded performance metrics for 2020, 2021 and 2022 and projected performance metrics for 2023, 2024, and 2025.

Number of CPUC reportable ignitions, wire downs, and outages in HFRA: Although these metrics benefit from the effective use of PSPS, they are driven by efforts much broader than SCE's use of PSPS. As such, SCE includes these metrics in the table below for completeness and provides a more detailed discussion of these three metrics and associated trends in Section 8.1.

[276] *There may be overlap between the performance metrics the electrical corporation uses and performance metrics required by Energy Safety. The electrical corporation must list these overlapping metrics in this section in addition to any unique performance metrics it uses.*

[277] *The performance metrics identified by Energy Safety are included in Energy Safety's Data Guidelines.*

Trends in Frequency, Scope, Duration, and Customers Impacted by PSPS Events (total)

From 2020 to 2022, SCE has experienced a general decline in frequency, scope, duration, and customers impacted by PSPS events. As reported in the 2022 WMP Update, PSPS impacts declined by a notable amount from 2020 to 2021 largely attributable to SCE's proactive PSPS mitigations and new event management tools, as well as annual variations in weather and fuel conditions. Principal among these mitigations was the expedited grid hardening performed on 72 of SCE's frequently impacted circuits. This work included the installation of covered conductor, new automated switches, approving circuit exceptions to raise PSPS thresholds or eliminated them altogether, and providing mobile generators to keep power on at some or all locations during PSPS events. PSPS impacts continued to decline from 2021 to 2022, with reductions attributable to the same factors identified above. The mitigations applied from 2021 to 2022 included targeted grid hardening plans consisting of the installation and acceleration of covered conductor scope, installation of new automated switches, and approval of new circuit exceptions to raise PSPS thresholds.

Development of Projections for Frequency, Scope, Duration, and Customers Impacted by PSPS Events (total)

To determine the 2023 projected performance metrics for scope, duration, and number of customers impacted by PSPS Events, SCE used an average of the performance metrics for 2020, 2021, and 2022, then applied a forecast reduction of expected performance improvements from targeted grid hardening work, which is 6% for scope, 9% for duration, and 15% for customers impacted by PSPS events. These percentage improvements were then extrapolated out from the 2023 projections to determine projected performance metrics for 2024 and 2025.

With regard to the performance metric for frequency of PSPS events, SCE does not project a reduction in frequency from the 2020 – 2022 average. SCE's forecast reduction is much more likely to reduce the number of circuits de-energized in its PSPS events than it is to eliminate all circuits from those events.

It is important to note that while the projected performance metrics for 2023, 2024, and 2025 are based on the recorded metrics for 2020, 2021 and 2022, the recorded metrics for 2020, 2021, and 2022 were driven by the weather and fuel conditions experienced in those years. Actual performance metrics for future years will be determined in part by as-yet unknown weather and fuel conditions in those future years and may vary from projected figures.

Table 9-6 - PSPS Performance Metrics Results by Year

Performance Metrics	2020	2021	2022	2023 Projected	2024 Projected	2025 Projected	Method of Verification (e.g., third-party evaluation, QDR)
Frequency of PSPS Events (total)[278]	10	8	3	7	7	7	QDR, Tables 3 and 10
Scope of PSPS Events (total)[279]	424	232	13	210	197	185	QDR, Tables 3 and 10
Duration of PSPS events (total)[280]	4,455,936	3,700,254	112,274	2,508,101	2,282,372	2,076,958	QDR, Tables 3 and 10
Number of customers impacted by PSPS[281]	229,800	179,502	15,784	120,441	102,375	87,019	QDR, Tables 3 and 10
Number of CPUC reportable ignitions in HFRA	50	48	40	39	38	37	QDR, Tables 2 and 3
Number of wire downs in HFRA	379	468	316	361	360	361	QDR, Tables 2 and 3
Number of outages in HFRA	2,824	2,356	2,404	2,018	1,946	1,892	QDR, Tables 2 and 3

[278] Frequency of PSPS Events definition: Number of instances where utility operating protocol requires de-energization of a circuit or portion thereof to reduce ignition probability, per year. Only include events in which de-energization ultimately occurred.
[279] Scope of PSPS Events definition: Circuit-events, measured in number of events multiplied by number of circuits de-energized per year.
[280] Duration of PSPS events definition: Customer hours per year.
[281] Number of customers impacted by PSPS definition: Number of customers impacted by PSPS (if multiple PSPS events impact the same customer, count each event as a separate customer).

9.2 Protocols on PSPS

The electrical corporation must describe its protocols on PSPS implementation including:

- *Risk thresholds (e.g., wind speed, FPI, etc.) and decision-making process that determine the need for a PSPS. Where the electrical corporation provides this information in another section of the WMP, it must provide a cross-reference here rather than duplicating responses.*

SCE deploys wildfire mitigation measures to reduce the probability of ignitions associated with electrical infrastructure in HFRA. These activities include grid hardening measures such as installation of covered conductor, repair or replacement of equipment on poles (e.g., crossarms, transformers), and installation of protective devices (e.g., fast acting fuses).[282] In addition, SCE has implemented operational practices including enhanced inspections, vegetation management, and fire climate zone operating restrictions[283] in high fire risk areas. Certain protective measures such as fast curve settings and fire climate zone operating restrictions are applied to a majority of high fire risk circuits and are typically in effect for the duration of the fire season; other activities such as covered conductor are permanent and in place year-round.

SCE's PSPS wind speed thresholds are higher for circuits or isolatable circuit segments that are fully hardened with covered conductor, thereby potentially limiting the frequency, duration and number of customers affected by PSPS during fire weather events. However, during severe conditions, there is heightened risk of ignitions at higher windspeeds primarily due to the possibility of infrastructure damage which can cause wind-driven foreign objects or airborne vegetation coming into contact with and damaging SCE's equipment. Under these circumstances, the deployment of covered conductor may not sufficiently mitigate wildfire and public safety risk, and PSPS is necessary as a last resort mitigation measure to prevent ignitions that may lead to significant wildfires.

Leading up to and during a PSPS event, SCE utilizes real-time weather station data and, if available, information from SCE field observers on the ground for enhanced situational awareness to forecast and monitor prevailing environmental conditions (e.g., wind gusts) that can lead to potential damage to equipment or the potential for airborne vegetation or flying debris to contact and damage equipment, to inform de-energization decisions. For circuits that are in scope, SCE also conducts pre-patrols to visually inspect the entire length of each circuit or circuit segment to find any imminent hazards or equipment vulnerabilities that require immediate remediation and to provide additional intelligence on field conditions. If concerns are discovered on a circuit in scope, they are addressed before the impending wind event, if possible.

[282] Fast curve settings reduce fault energy release by increasing the speed with which a protective relay reacts to most fault currents. Fast curve settings can reduce heating, arcing, and sparking for many faults compared to conventional protection equipment settings. Please see Sections 8.1.2.8.2 and 8.3.3.1.2.4 Protective Relays—Fast Curves for more details on fast curve settings technology.

[283] SCE's System Operating Bulletin No. 322 includes provisions for enabling fast curve settings on distribution reclosers and circuit breakers, recloser blocking, line patrols and requirements for personnel to be physically present when operating air-break switching devices.

SCE makes every effort to limit the scope, duration and impacts of PSPS for as many customers as possible. This includes adjusting wind speed thresholds higher for circuits or segments that have covered conductor installed and leveraging sectionalization equipment to switch some customers to adjacent circuits not impacted by PSPS or otherwise remove them from scope.

SCE's PSPS decisions are based on quantitative analyses while accounting for qualitative factors such as the impacts to emergency services. SCE uses preset thresholds for dangerous wind conditions that create increased fire potential (including wind speeds, humidity, fuel moisture levels and other factors as the basis for PSPS decision-making, as described in SCE's technical paper[284]). These thresholds are set individually for each of the circuits in SCE's HFRA.

All circuits have an activation threshold, defined by the FPI and the wind speed at which they are considered at risk. Activation thresholds are computed for each circuit.

FPI is based on weather and fuel (e.g., vegetation) conditions which include sustained wind speed, dew point depression (dryness of the air), the state of green-up or curing of the annual grasses, live fuel moisture, and dead fuel moisture. The FPI also considers fuel loading, which is the amount of vegetation on the ground. Please see Section 8.3.6 where FPI is covered in detail.

For each PSPS event, every circuit also has a de-energization threshold. De-energization thresholds are determined separately for each circuit to prioritize circuits for de-energization based on the specific risks of the event. This is particularly important for large events where many circuits must be evaluated simultaneously. There are a handful of circuits that have legacy thresholds below the National Weather Service (NWS) advisory level because they have a history of local circuit outages at lower wind speeds.

De-energization thresholds account for circuit health, including any pending maintenance issues or other concerns identified through patrols, and are also informed by a consequence score that estimates the potential impact of an ignition on communities. The higher the score, the greater the risk to a particular location from wildfires. The method for calculating this score is described in detail in Section 6.2.2.2. SCE's process for determining de-energization thresholds is outlined below.

[284] SCE's technical paper titled "Quantitative and Qualitative Factors for PSPS Decision-Making" is available at https://download.newsroom.edison.com/create_memory_file/?f_id=609d61cbb3aed37d0f3d5f6a&content_verified=True.

Figure SCE 9-02 - PSPS Decision Making Flowchart / Diagram

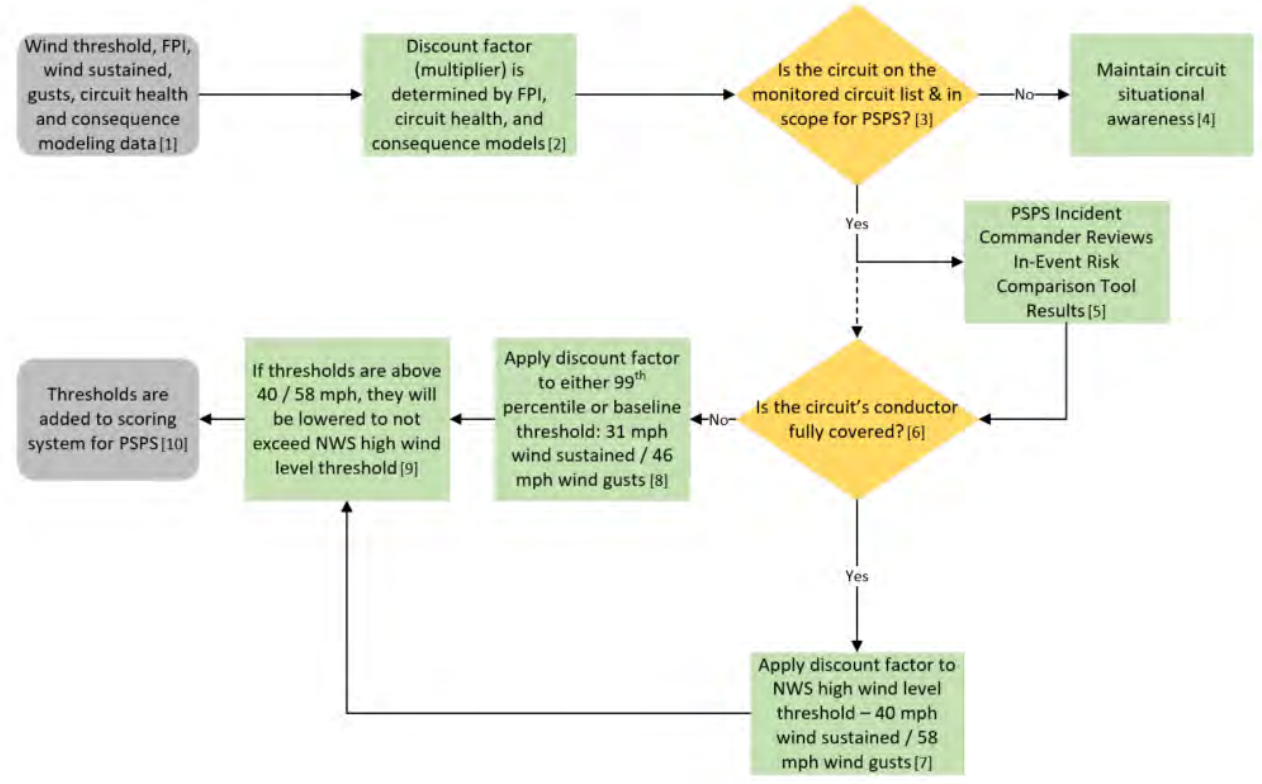

Figure SCE 9-02 shows the PSPS decision-making flowchart. The detailed flowchart steps are outlined below:

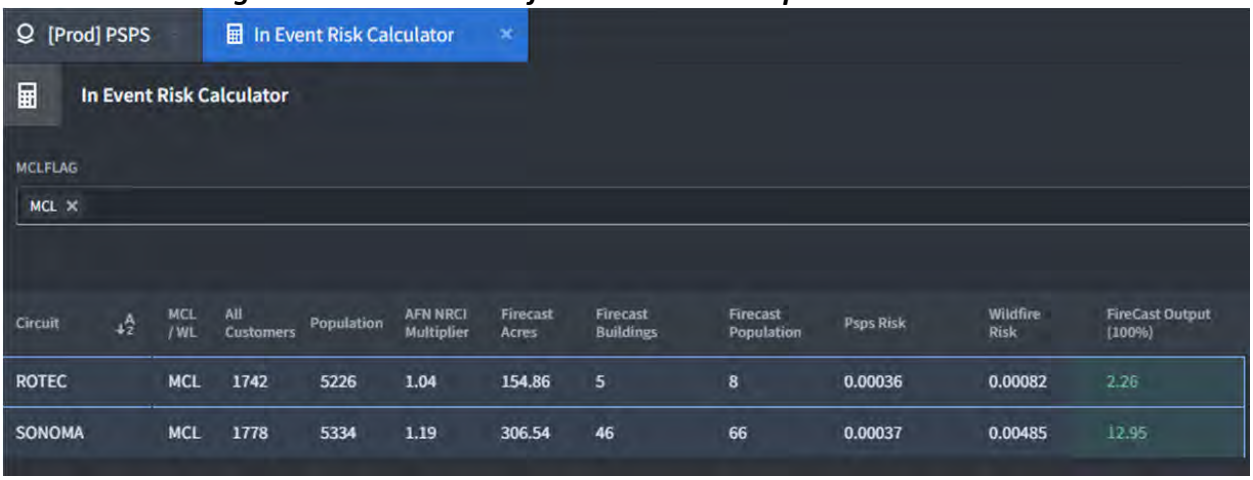
- Box 1: Data related to wind threshold, FPI, and circuit health, and consequence modeling data are gathered from various sources.
- Box 2: A discount factor may be applied based on FPI, circuit health, and consequence models to circuits which are considered to be a higher wildfire risk, or in large scale events when many circuits are under consideration for shutoffs. This discount factor will lower the threshold for potential de-energization.
- Box 3: This decision box provides direction based on whether the circuit in question is on the monitored circuit list and in scope for PSPS.
- Box 4: If the circuit is not on the monitored circuit, the IMT maintains situational awareness for increased wind speeds and risk of wildfire.
- Box 5: If the circuit is on the monitored circuit list and in scope, the Incident Commander reviews the in-event risk comparison tool results for the circuit, which compares estimated wildfire risks against potential PSPS impacts. This information helps inform the Incident Commander's decision to de-energize.
- Box 6: This decision box provides direction based on whether a circuit's conductor is fully covered.

- Box 7: If the circuit's conductor is fully covered, the discount factor (identified in box 2) is applied to the NWS high wind level threshold.
- Box 8: If the circuit's conductor is not fully covered, the discount factor (identified in box 2) is applied to either the 99th percentile or baseline threshold of 31 / 46 mph.
- Box 9: If the discounted thresholds are above the current NWS high wind level threshold of 40 / 58 mph, the thresholds will be lowered to not exceed the NWS high wind level threshold to ensure the NWS high wind level threshold is the upper threshold limit.
- Box 10: The circuit threshold outcome from this process is added to the scoring system for the PSPS event.

If actual conditions suggest more wildfire risk, or in large-scale events when many circuits are under consideration for shutoffs, the de-energization thresholds may be lowered (discounted), meaning power on a circuit will be turned off at lower wind speeds. This step prioritizes the circuits that represent the highest risk to be evaluated for de-energization before circuits at lower risk. Conversely, de-energization thresholds are raised for circuits or isolatable circuit segments that have had covered conductor installed. The de-energization threshold for segments with covered conductor is 40 mph sustained/58 mph gusts, which aligns with the NWS high wind warning level for windspeeds at which infrastructure damage may occur. Once SCE's in-house meteorologists confirm forecasts show an upcoming breach of FPI and circuit-specific wind speed thresholds, SCE activates its PSPS IMT and begins preparations for the upcoming event.

The IMT begins notifications to First Responders, Public Safety Partners, local governments, tribal governments and critical infrastructure providers in the 72-48 hour window from the anticipated start of the period of concern when possible. Notifications to all other customers are initiated 48 hours-24 hours prior to anticipated de-energization when possible. We continue to provide additional notifications as well as notifications of imminent de-energization as information becomes available during the PSPS events.

SCE also takes proactive measures to reduce the likelihood and impact of the pre-emptive de-energization of a transmission line. Since SCE's transmission lines in HFRA can transport large amounts of power to load centers (i.e., distribution networks) and are interconnected with adjacent utilities, transmission line outages have the potential to cause significant impacts to public safety and electric system reliability. To address these factors, SCE implemented PSPS protocols for transmission lines that traverse HFRAs. These operating protocols have been created to gauge the reliability risks associated with the pre-emptive de-energization of transmission lines including analyzing forecasted fire weather conditions, identifying hazardous field conditions, performing reliability risk assessments based on expected grid conditions during a PSPS event, and developing mitigation plans to address such events. Any operating conditions and assessments requiring mitigation plans to reduce potential impacts are communicated and coordinated with the CAISO so that resources and expected actions are performed in advance of a PSPS event.



Additional protocols are designed to prevent re-energizing transmission lines after a fault, when live field monitoring is taking place on a distribution line that is within one mile of a

transmission line. When a transmission line is within the one-mile boundary of a monitored distribution line, the transmission line has operating restrictions placed into effect to prevent an automated or manual re-energization if the transmission line was to relay. If the transmission line relayed, it would require a patrol of the HFRA to ensure the line is safe, prior to being re-energized.

- *Method used to compare and evaluate the relative consequences of PSPS and wildfires.*

Twenty-four hours before the onset of the period of concern, SCE assesses and compares potential public safety risks associated with proactive de-energization (PSPS risk) and simulated wildfire risk (PSPS benefit in avoiding a wildfire) for all circuits in scope, using its PSPS In-Event Risk Comparison Tool (Tool).[285] Inputs into this tool include in-event weather, wildfire simulation models, as well as circuit-specific data. The results of the analysis are displayed in the Central Data Platform (CDP) shown below, Figure SCE 9-03 and are used by SCE Incident Commanders to inform de-energization decisions, in conjunction with other quantitative and qualitative factors as described above. Incident commanders consider the output of the Tool to assess the risk versus the benefit of de-energization on a circuit-by-circuit basis. CDP is discussed in further detail in Section 8.3.3.5.2.

Figure SCE 9-03 - View of In-Event Risk Comparison Tool in CDP

Circuit	MCL / WL	All Customers	Population	AFN NRCI Multiplier	Firecast Acres	Firecast Buildings	Firecast Population	Psps Risk	Wildfire Risk	FireCast Output (100%)
ROTEC	MCL	1742	5226	1.04	154.86	5	8	0.00036	0.00082	2.26
SONOMA	MCL	1778	5334	1.19	306.54	46	66	0.00037	0.00485	12.95

[285] Pursuant to Ordering Paragraph 2 of the Order Instituting Investigation on the Commission's Own Motion on the Late 2019 Public Safety Power Shutoff Events decision issued in June 2021 (D.21-06-014, OP 2, p. 284), SCE developed its In-Event Risk Comparison Tool. This tool was used starting with the PSPS event in September 2021 and is detailed in each of SCE's subsequent post-event reports.

The comparative PSPS and wildfire risk estimates are based on the following circuit-specific criteria and information:

1. PSPS Risk: Customers served, estimated population, and the relative ranking of the circuits in scope by the percentage of Access and Functional Needs (AFN) and Non-Residential Critical Infrastructure (NRCI) customers.

2. Wildfire Risk: Wildfire simulations (using Technosylva FireCast[286] modeling) for potential ignitions based on dynamic, in-event weather and wind conditions in proximity to the circuits in scope for de-energization. These conditions are used to determine the extent of an estimated fire footprint (or fire shed). The risk of a wildfire is calculated based on the number of structures, population, and acres potentially threatened within the simulated fire shed. This information is used to calculate potential Safety, Financial, and Reliability impacts (or attributes) of: (1) a wildfire and (2) a proactive de-energization event, as summarized in the table below:

Table SCE 9-01 - Wildfire and PSPS Consequences

Risk Attribute	Wildfire Consequences	PSPS Consequences
Safety	SCE calculates the estimated number of fatalities and serious injuries based on a forecast of impacted population within the Technosylva wildfire consequence simulation. This number, in turn, is converted into the Safety index.	SCE leverages epidemiological studies and information drawn from past widespread power outage events including the 2003 Northeast Blackout, the 2011 Southwest Blackout, and the IOUs' 2019 PSPS post-event reports.[287] The resulting estimates of fatalities and serious injuries per customer minutes interrupted (CMI) are intended to approximate potential safety consequences due to the power outage, such as illnesses resulting from food spoilage or exacerbation of existing underlying health conditions. SCE enhanced the PSPS safety attribute through the application of a circuit-specific AFN/NRCI multiplier. This multiplier represents the relative ranking of each circuit based on the number of AFN and NRCI customers on the circuit.
Reliability	SCE assumes 24 hours without power per customer on each circuit in scope due to wildfire. This duration was used to maintain consistency with Technosylva fire propagation simulation, as well as the PSPS impact duration.	SCE estimates the total CMI due to proactive de-energization on a circuit. It is the product of the number of customers on a circuit and the total number of minutes of estimated interruption. SCE assumes 1,440 CMI per customer (24 hours x 60 minutes) to represent de-energization over a 24-hour period.

[286] Technosylva is a suite of wildfire simulation models or tools. While relying on a similar underlying fire propagation engine, each model is designed to support a unique use case. FireCast is specifically designed to forecast ignition risk associated with electric utility assets over a 3-day horizon based on expected short-term weather conditions.

[287] *See, e.g.,* Anderson, G.B., Bell, M.B (2012). Lights Out: Impact of the August 2003 Power Outage on Mortality in New York, NY, *Epidemiology* 23(2) 189-193. doi: 10.1097/EDE.0b013e318245c61c.

Risk Attribute	Wildfire Consequences	PSPS Consequences
Financial	SCE calculates the financial impact of wildfire by assigning a dollar value to the buildings and acres within the fire shed potentially threatened by wildfire. For buildings, SCE uses a system average replacement value assumption. For acres, SCE uses assumed costs of suppression and restoration.[288]	SCE conservatively assumes $250[289] per customer, per de-energization event to quantify potential financial losses for the purpose of comparing PSPS risk to wildfire risk. The figure represents potential customer losses, such as lost revenue/income, food spoilage, cost of alternative accommodations, and equipment/property damage. This value is based on a Value of Lost Load (VoLL), which is a widely accepted industry methodology to estimate a customer's willingness to accept compensation for service interruption. VoLL is dependent on many factors, including the type of customer, the duration of the outage, the time of year, the number of interruptions a customer has experienced. SCE's VoLL estimate is consistent with academic and internal studies to estimate VoLL for a single-family residential customer for a 24-hour period.

SCE quantifies the resulting PSPS risks and wildfire risks using natural unit consequences for each risk type or attribute—structures impacted, acres burned, customer minutes interrupted, serious injuries and fatalities, etc. "Safety" risk is expressed as an index, "Reliability" risk is measured in terms of CMI, and "Financial" risk is measured in dollar amounts.

SCE then applies a MARS framework to convert these natural unit consequences to unitless risk scores—one score for PSPS risks and one score for wildfire risks.[290] These risk scores are compared to each other by dividing the wildfire risk score (i.e., the potential benefit of PSPS) by the PSPS risk score (i.e., the potential public harm of PSPS), yielding a benefit/risk ratio for each circuit in scope of the PSPS event. If the resulting ratio is equal to 1, the risks are equivalent. If the ratio is greater than one, the wildfire risk exceeds the PSPS risk (the higher the resulting number, the more the wildfire risk outweighs the PSPS risk). If the ratio is less than 1, the PSPS risk outweighs the wildfire risk.

[288] Suppression costs are based on a five-year average of California's reported wildfire suppression costs from 2016-2020. Restoration costs are assumed to be $1,227/acre based on research papers published by the Bureau of Land Management.

[289] SCE utilizes $250 per customer, per de-energization event to approximate potential financial losses on average, recognizing that some customers may experience no financial impact, while other customers' losses may exceed $250. The $250 value is a conservative assumption used for the limited purpose of estimating the potential financial consequences of PSPS as one of many inputs into SCE's PSPS In-Event Risk Comparison Tool. It is not an acknowledgment that any given customer has or will incur losses in this amount, and SCE reserves the right to argue otherwise in litigation and other claim resolution contexts, as well as in CPUC regulatory proceedings.

[290] MARS is SCE's version of MAVF and is further described in Section 6.1.1.

- *Outline of the strategic decision-making process for initiating a PSPS (e.g., a decision tree). Where the electrical corporation provides this information in another section of the WMP, it must provide a cross-reference here rather than duplicating responses.*

SCE considers PSPS when weather and fire experts forecast dangerous conditions including strong winds, very dry vegetation and low humidity. Combined, these create the risk that flying debris or other damage to wires and equipment could cause a fire with the potential to spread rapidly. SCE's strategic decision-making process for initiating a PSPS de-energization event is described below.

At up to 72 hours before a forecast potential PSPS event (event), SCE meteorologists and fire scientists continue to review weather conditions, using both internal and external weather models and National Weather Service forecasts, alerts, and warnings. The PSPS Incident Management Team (IMT) is activated and develops a list of circuits that could potentially be impacted by a PSPS event based on the forecast and predictive modeling. If the weather report is inconclusive, SCE will wait for additional weather reports or field assessments before notifying customers. SCE confers with the National Geographic Area Coordination Center (GACC) about fire danger risks. Additionally, the PSPS IMT reviews options for supplying customers with power from alternate circuits to keep them energized.

Field crews are deployed in advance of the potential event to look for factors that could increase the risk of fire such as damage or other hazards to poles and wires. SCE also deploys live field observers (LFOs),[291] who provide critical situational awareness during the event to inform PSPS decision-making. These observers can identify flying debris, and other hazardous conditions that may be present at the impacted area. SCE also uses drones, when feasible, to provide aerial patrols of overhead lines associated with PSPS events and supplement traditional patrol methods—via truck, foot, and/or helicopter—to help identify ignition risks such as vegetation contacting lines before fire weather conditions materialize (pre-patrol).

At 48 hours before an event, the IMT looks at the daily weather report to see if the weather pattern has shifted. As the forecast becomes more precise, the IMT will update the list of circuits that might be impacted. If the weather pattern has weakened or shifted outside of high fire risk areas, the IMT will cancel the PSPS event.

At 24 hours before an event, the IMT looks at the twice-daily weather report to see if the weather pattern has shifted and updates the list of circuits that might be impacted. Additionally, the In-Event Risk Comparison Tool is run once to compare the risk of de-energization against the risk of wildfire. The Firecast does not come into play if the established FPI (discussed in section 9.2.1) does not warrant de-energization.

At 3-6 hours before winds are forecasted to breach PSPS thresholds, the IMT monitors field weather stations. A team, including experts in grid operations, meteorology and fire science, advise the Incident Commander, who will make the final decisions to shut off power. The team has access to more than 1,620 SCE weather stations to monitor changing conditions. As the winds increase, field crews provide mobile weather reports from hand-held weather and wind-speed meters and report flying debris or other hazards.

[291] Please see Section 8.3.2.1.4 for additional details on LFOs.

During the period of concern, weather station readings are routinely updated for each circuit. This near real-time information allows meteorologists to identify weather trends that could affect decisions. Based on these in-event weather readings and field observations, the Operations Section Chief recommends shutting off power to a circuit or segment when wind speeds are about to hit or exceed their pre-determined threshold for unsafe conditions, or field crews advise of an urgent hazard in the field. This recommendation is made to the incident commander, who reviews the recommendation and asks follow-up questions, if necessary, before approving the decision to de-energize.

After concerning weather conditions have abated, SCE dispatches crews to patrol all circuits that have been de-energized for PSPS to check for damage to equipment or lines and that it is safe to restore power. Drones may also be used to survey overhead lines. For multiday events, with gaps of even a few hours, field crews will attempt to restore customers before the second period of concern begins. If there is no damage to the lines, electricity will be restored to all customers when safe to do so.

SCE also describes its decision-making process in a decision-making fact sheet, in SCE's technical paper titled "Quantitative and Qualitative Factors for PSPS Decision-Making," and in its PSPS decision-making video, which are all available at https://energized.edison.com/psps-decision-making.

- *Protocols for mitigating the public safety impacts of PSPS, including impacts on first responders, health care facilities, operators of telecommunications infrastructure, and water electrical corporations/agencies.*

SCE offers assistance to Critical Facility and Infrastructure (CFI) customers who may require additional assistance and advanced planning to ensure resiliency and continuity during de-energization events. SCE conducts various outreach activities throughout the year.

SCE also works collaboratively with local governments, first responders and essential service providers to provide awareness of PSPS and to educate them on the importance of developing a resiliency plan that addresses backup power needs for facilities that provide critical life and safety functions. Many of these customers are required by law or industry standards to have backup generation in place to sustain critical operations in the event of a power outage, regardless of outage type. Other customers that are not required to have backup generation are still encouraged to consider adding this capability if they feel they have critical needs that must continue in a power outage.

In 2022, SCE conducted workshops for water agencies, communications sector, food banks, healthcare sector, school districts, chemical, sub-transmission level customers, and primary-metered customers. In these workshops, the importance of having a resiliency plan, potentially including backup generation, was discussed in preparation of the wildfire season. If essential service providers do not have the ability to sustain critical life and safety operations during an extended power outage, SCE will consider requests to provide temporary portable backup generation on a case-by-case basis. SCE typically coordinates these requests with its county emergency management agency partners to identify and prioritize backup generation needs requested by the county. Please see Section 8.5 for additional details on community engagement and outreach.

SCE fosters strong relationships with Public Safety Partners at the local and State levels to effectively coordinate and manage emergency events, including PSPS events. Section 8.4.1 discusses near and long-term objectives for emergency planning and preparedness. To continue to strengthen these relationships, SCE is working to improve engagement, help ensure timely and accurate data sharing, proactively and quickly address issues, and simplify information shared with local and State Emergency Management, first responders and Public Safety Partn

ers during PSPS events. SCE also performs surveys and in-person (or virtual) after-action reviews after PSPS events and shares the results of these surveys with partners and the CPUC to measure improvement.

In addition, a key tool used to foster this coordination and emergency event management is SCE's Public Safety Partner Portal, which was launched in June 2021 to improve situational awareness during PSPS events for first responders and operators of critical facilities and communications systems. It features near real-time PSPS information not publicly available on sce.com. Data on the Portal is also fed through SCE's PSPS representational state transfer (REST) service. Subject to appropriate confidentiality measures, expanded information is provided to enable better coordination of event response between SCE and Public Safety Partners. To gain access to the Portal, partners register, review a user agreement, and set up multi-factor authentication. The Portal is a single destination to find information regarding PSPS planning (pre-event) and active PSPS events, and to access to an archive of post-PSPS event data. SCE conducted a benchmarking review with SDG&E and PG&E concerning their experiences with a similar portal and leveraged this review to develop SCE's Portal.

Subscribers can access the following information on the Public Safety Partner Portal:

- Planning Information (Pre-Event): information for planning purposes when there is no active PSPS event. The information available will include:
    - PSPS planning interactive map (GIS layers, KMZ, Shapefile, File Geodatabase, GeoJSON), which includes outage areas and impacted circuits
    - Planning files for Outage areas and impacted circuits in various downloadable formats and API to allow integration with third-party systems.
    - Planning Reports in tabular format including summary of potentially impacted customers, Critical facilities and identified MBL and critical care customer counts.
- Circuit to zip code mapping files.
- Critical Facility and infrastructure (CFI) customers can view their own contact information.
- Event Information: active PSPS event information and certain archived PSPS event information. The information available will include:
    - PSPS event interactive map, which includes outage areas, impacted circuits, and locations of Community Resource Centers and Community Crew Vehicles.

    - Event-specific files, which includes outage areas and impacted circuits in various downloadable formats and API to allow integration with third-party systems.
    - Event-specific reports including summary of impacted customers, Critical facilities and identified MBL and critical care customer counts.
- Also available in various downloadable formats and API on the Portal are the following:
    - Reports including situational awareness and data.
    - Archive of certain information from past events.

SCE continues to assess additional functionalities for the Public Safety Partner Portal, including those suggested by partners. Updated functionality is communicated to partners through office hour meetings and direct briefings. For example, SCE has recently added transmission line layers to the Portal mapping tool based on feedback received from partners. SCE continues to solicit feedback in multiple forums, including benchmarking with other utilities, and seeks to continue to enhance the Portal for its Public Safety Partner community.

9.3 Communication Strategy for PSPS

In Section 8.4.4 of the WMP, the electrical corporation must discuss all public communication strategies for wildfires, outages due to wildfires and PSPS, and service restoration. Thus, in this section, the electrical corporation is only required to provide a cross-reference to Section 8.4.4 and any other section of the WMP providing details of the emergency public communication strategy for PSPS implementation.

Section 8.4.5 describes SCE's emergency public communication strategy for PSPS.

9.4 Key Personnel, Qualifications, and Training for PSPS

In Section 8.4.2.2 of the WMP, the electrical corporation must discuss all key personnel planning, qualifications, and training for wildfires, outages due to wildfires, and PSPS, and service restoration. Thus, in this section, the electrical corporation is only required to provide a cross-reference to Section 8.4.2.2 and any other section of the WMP providing details of key personnel, qualifications, and training for PSPS implementation.

Section 8.4.2.2 describes SCE's key personnel planning, qualifications, and training for wildfires, outages due to wildfires, and PSPS, and service restoration.

9.5 Planning and Allocation of Resources for Service Restoration due to PSPS

In Section 8.4.5.2 of the WMP, the electrical corporation must address planning of appropriate resources (e.g., equipment, specialized workers) and allocation of those resources to assure the safety of the public during service restoration. Thus, in this section, the electrical corporation is only required

to provide a cross-reference to Section 8.4.5.2 and any other section of the WMP providing details of *resource planning for PSPS implementation.*

Section 8.4.6.2 describes SCE's planning of appropriate resources and allocation of those resources to assure the safety of the public during service restoration.

10 LESSONS LEARNED

An electrical corporation must use lessons learned to drive continuous improvement in its WMP. Electrical corporations must include lessons learned due to ongoing monitoring and evaluation initiatives, collaboration with other electrical corporations and industry experts, and feedback from Energy Safety and other regulators.

The electrical corporation must provide a summary of new lessons learned since its most recent WMP submission, and any ongoing improvements to address existing lessons learned. This must include a brief narrative describing the new key lessons learned and a status update on any ongoing improvements due to existing lessons learned. The narrative should be limited to two pages.

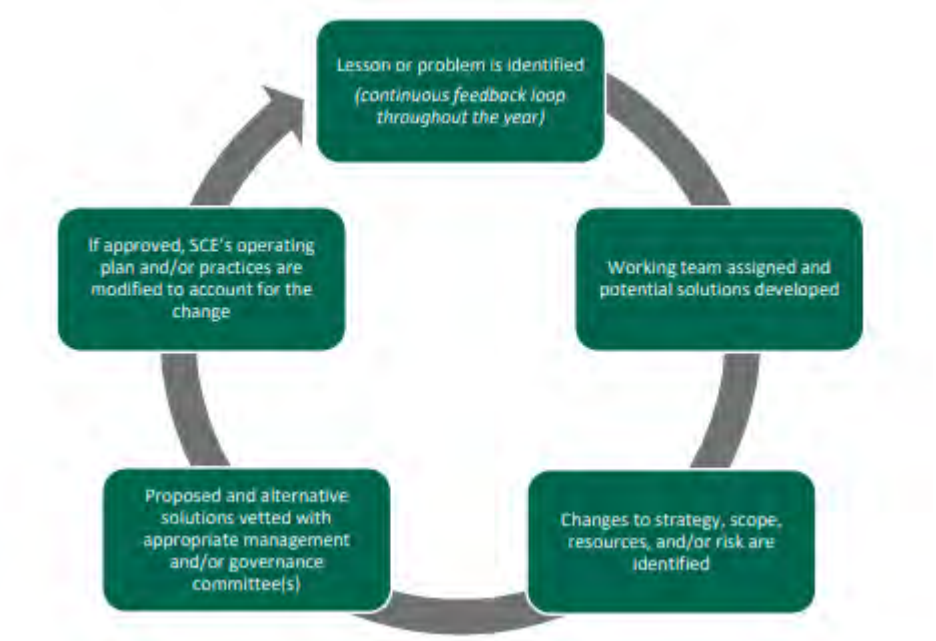
SCE provides detail, status updates, and implementation plans for various existing and new lessons learned in Table 10-01 below. In Table SCE 4-01 of its 2022 WMP, SCE identified several lessons learned across WMP categories that were in flight. SCE summarizes a few of these lessons learned as well as progress made in advancing them below.

Resource Allocation – Risk Spend Efficiency: SCE had endeavored to create additional RSEs for activities to help inform our decision-making process. SCE has continued this effort since its 2022 WMP by advancing the development of RSEs for its WMP initiatives and emerging technologies. For example, SCE developed additional RSEs for emerging technologies since our last WMP. Additional information can be found in Appendix D under the 'SCE-22-23 RSE Estimates of Emerging Initiatives' section. In addition, SCE engages an independent third-party to evaluate our RSE development process and calculations. Further information can be found in Appendix D under the 'SCE-22-23 Third Party Confirmation of RSE Estimates' section.

Risk Assessment and Mapping: In 2021-2022, SCE developed a new framework to identify locations in which the wildfire risk is not fully captured by ignition simulations alone. SCE has finalized this framework in 2022, which SCE refers to as the Integrated Wildfire Mitigation Strategy Risk Framework (IWMS Risk Framework or IWMS) in this 2023 WMP. The strategy entails identifying risk tranches within SCE's HFRA based on consequence to customers and communities in the event of an ignition. The highest risk locations, categorized as Severe Risk Areas, considers risk factors such as egress route constraints, historical fire frequency, ignitions with potential to develop into large fires, as well as locations likely to exceed PSPS thresholds even with covered conductor installed. While SCE initially used this framework to prioritize and scope grid hardening work, we have since expanded its application into Vegetation Management and Asset Inspections & Remediations areas in this WMP. SCE describes these efforts in Section 5 and 6, as well as in the relevant areas of Section 8.

Grid Design and System Hardening: In 2021, 30% of CPUC-reportable ignitions involved secondary conductors across SCE's service territory, with 25% of these ignitions occurring within HFRA. To mitigate these high-risk secondary conductor locations, SCE added questions to the inspection survey during the 3rd quarter of 2021 as well as provided additional training not only on the form but on the specific issues to look for during the inspection, such as damaged secondaries. Additional information can be found in Appendix D under "SCE-22-17 Address Secondary Conductor Issues."

Asset Management and Inspections: To reduce customer and environmental impacts, improve notification identification and safety as well as overall efficiency, SCE piloted a new approach to perform ground and aerial inspections at the same time (aka “360 inspections”) for overhead distribution (33 kV and below) in HFRA instead of performing them separately. SCE rolled out this pilot for distribution inspections during Q2 2022. Based on the results of this pilot, in 2023, SCE is expanding this approach for its HFRA distribution detailed inspections. Additional information can be found within Section 8.1.3.1 for Asset Inspections.



Stakeholder Cooperation and Community Engagement: In 2021 and 2022, the quick reaction force (QRF) of aerial resources was effective at suppressing fire activity based on performance reports and feedback from local fire agencies. The partnership with local fire agencies, which began in 2019, funds up to four aerial firefighting helicopters, support personnel as well as equipment to bolster firefighting capabilities. These resources are capable of being rapidly deployed in SCE’s service area and have proven to be extremely effective during an extended attack phase, reducing the area burned and number of structures damaged or destroyed. In 2023, SCE has entered into an agreement to fund aerial suppression resources for the entire year, instead of over a 5-6-month period as in years past. This will allow these resources to be available during what has become a year-round fire season. Additional information on this can be found within Section 8.4.3.3.1 for Emergency Preparedness.

The electrical corporation must also provide a summary of how it continuously monitors and evaluates its wildfire mitigation efforts to identify lessons learned. This must include various policies, programs, and procedures for incorporating feedback to make improvements.

SCE’s wildfire mitigation efforts have continued to grow and advance to mitigate the threat of wildfires in HFRA. SCE continuously evaluates its wildfire mitigation initiatives based on execution experience, internal analysis, stakeholder feedback, benchmarking, customer surveys and post-event PSPS reports. This evaluation process includes monitoring the implementation of WMP initiatives along with the effectiveness of those WMP initiatives. SCE also provides detail on its Corrective Action Program within Section 11 which includes discussion on how we investigate, learn from, and develop mitigations for risk events.

At a high level, SCE, as applicable, leverages a lesson learned process as depicted in Figure SCE 10-01 below.

Figure SCE 10-01 - Lessons Learned Process

Lessons learned can be divided into the three main categories: (1) internal monitoring and evaluation, (2) external collaboration with other electrical corporations, and (3) feedback from Energy Safety or other authoritative bodies. The following are examples of specific potential sources of lessons learned:

- *Internal monitoring and evaluation initiatives:*
    - *Tracking of risk events*
    - *Findings from root cause analyses and after-action reviews*
    - *Drills and exercises*
    - *Feedback from community engagement*
    - *PSPS events*
- *Feedback from Energy Safety or other authoritative bodies:*
    - *Areas for continued improvement identified by Energy Safety in the previous WMP evaluation period*
    - *Findings from wildfire investigations*
    - *Findings from Energy Safety Compliance Division assessments*
    - *Collaborations with other electrical corporations*

In addition to the above potential sources of lessons learned, the electric corporation must detail lessons learned from any and each catastrophic wildfire ignited by its facilities or equipment in the past 20 years,

as listed in Section 5.3.2. The electric corporation must also detail specific mitigation measures implemented as a result of these lessons learned and demonstrate how the mitigation measures are being integrated into the electric corporation's wildfire mitigation strategy.

Please see Section 5.3.2 where SCE addresses this prompt.

For each lesson learned, the electrical corporation must identify the following in Table 10-1:

- *Year the lesson learned was identified*
- *Subject of the lesson learned*
- *Specific type or source of lesson learned (as identified in the bullet lists above)*
- *Brief description of the lesson learned that informed improvement to the WMP*
- *Brief description of the proposed improvement to the WMP and which initiative(s) or activity(s) the electrical corporation intends to add or modify*
- *Estimated timeline for implementing the proposed improvement*
- *Reference to the documentation that describes and substantiates the need for improvement including:*
    - *Where relevant, a hyperlinked section and page number in the appendix of the WMP*
    - *Where relevant, the title of the report, date of report, and link to the electrical corporation web page where the report can be downloaded*
    - *If any lessons learned were derived from quantifiable data, visual/graphical representations of these lessons learned in the supporting documentation*

Table 10-1 provides an example of the minimum acceptable level of information.

Table 10-1 - Lessons Learned

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
1	2022	Tracking of risk events	Finding from current tracking method for the Fire Investigation team	There is a need for better capture of event information including reviewing more events to identify fire incidents.	• Evaluation of all repair order data to identify potential ignitions in our system. Maintenance Performance/Failure Report (MPFR) form to have information coming in from field personnel who have eyes on the events taking place.	• Repair Order Review implemented and being evaluated by Q1 2023	See WMP Ch 11, pages 650-652 (i.e. SCE's FIPA process)
2	2022	Root cause analysis	Findings from fire root cause analysis are discussed and evaluated with Asset Performance	Process to identify trends/upcoming concerns and translate to mitigation strategies can be improved to streamline identification.	• Dashboards and committee meeting setup to identify and present upcoming issues that can be converted to a detailed view into potential mitigations.	• Committee for review of identified trends/analysis setup and begin projects 12/2023.	See WMP Ch 11, pages 650-652 (i.e. SCE's FIPA process)
3	2019	Internal monitoring and evaluating initiatives	Drills and exercises	SCE continues to mature its training and exercises based on lessons learned from after action reports from exercises and real-world incidents.	• SCE's training and exercise program continually updates and improves training and exercises to incorporate changes to procedures and tools used for activations. • SCE will conduct a PSPS Full-Scale Exercise in 2023, increasing complexity from the 2022 Functional Exercise.	• All PSPS Readiness Exercises must be conducted by July 1 annually.	2023 WMP Section 8.4.2.2 (Emergency Responder Training)

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
4	2022	Internal monitoring and evaluating initiatives	After-action reviews	After action reports are conducted after all PSPS exercises and real-world events to evaluate lessons learned and areas of improvement. These are then translated into formal corrective actions that are tracked and monitored through completion.	**Notifications:** • SCE is in the process of auto-enrolling all customers that live in the High Fire Risk Areas but are not currently enrolled to ensure they receive PSPS alerts. • In December 2022, discontinued the customer opt-out feature for PSPS alerts and begin auto-enrolling customers during account sign-up. • Initiate enhanced outreach to the customers that previously opted out to confirm their contact information and enroll them in PSPS notifications. • Evaluate process for sending imminent restoration notifications to identify possible opportunities to reduce end-to-end processing time. • Evaluate process for sending cancellation notices to customers on circuit segments removed from scope to reduce end-to-end processing time in situations where segment-level (and sub-segment level) decision making is necessary to minimize customer impacts. **Technology**: • SCE will continue refining its PSPS event management capabilities to improve timeliness and accuracy of notifications.	• After Action reports are produced after the completion of IMT activations and exercises. PSPS Post Event reports incorporate lessons learned and are available in the docket of R.18-12-005, posted on SCE's website and distributed to impacted public safety partners.	After Action Reports and PSPS Post Event Reports

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
5	2022	Internal monitoring and evaluating initiatives	Feedback from community engagement	Received recommendation to expand marketing and promotion of meetings. Refine messages and channels based on 2022 performance data	• Expand outreach to additional social media platforms. • Continue to develop ads with relevant messages.	• Ongoing	Based on SCE's internal assessment, not a specific report per se.
6	2022	Internal monitoring and evaluating initiatives	Performance of mitigation initiatives: Customer Care Programs	In 2022, the WMP compliance targets for the Customer Service activities (namely PSPS-2.A: Critical Care Battery Back-Up Enrollments and PSPS-2.B: Customer Care Portable Power Station & Generator Rebates) were set based on 2021 historical program performance and assumed 2022 would have more PSPS events and customers de-energized. With fewer PSPS events in 2022, and even fewer customers de-energized, the need for customer resiliency products greatly diminished.	• Given this shift, the compliance targets for future years will pivot focus from an enrollment / rebate target which is heavily dependent on a customer's need for resiliency products and will instead focus on timely issuance of batteries / rebates.	• 2023	See 2023 targets for activities PSPS-2 and PSPS-3 in Table 8-35.
7	2020	Collaboration withother electrical corporations	Risk modeling working group	Wildfire risk models can be improved to establish standard weather and vegetative coverage scenarios, as well as extreme-event conditions,	• Continue ongoing engagement in wildfire risk modeling working group.	• Ongoing	Weblink to wildfire risk modeling working group and summary report

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
				for design purposes and long-term contingency planning.			
8	2022	Collaboration with other electrical corporations	International Wildfire Risk Management Consortium (IWRMC)	Hazard tree definition, assessment, risk analysis, and mitigation techniques, in addition to regulatory controls and budget treatment, all vary widely across member utilities	• SCE will serve as the lead utility of the joint Hazard/Strike Tree Benchmarking and Best Practices Study to be conducted in 2023. Lessons learned and best practices are anticipated to influence future activities and/or programs related to hazard tree mitigation and will be included, as applicable, in future WMP submittals.	• Draft report by 12/2023 • Final report by 2/2024	This lesson learned is not documented in a specific report; it arose from verbal discussions within the working group.
9	2022	Collaboration with other electrical corporations	SCE regularly collaborates with the other California utilities on covered conductor, new technologies, and enhanced vegetation management practices	Please see the IOU working groups reports in Appendix F for descriptions of lessons learned.	• As a result of laboratory testing of covered conductor, SCE has increased its estimated effectiveness of covered conductor from approximately 67% to 72%. SCE will be further collaborating with the joint utilities in 2023 and conducting workshops on further assessing the covered conductor testing results, M&I practices, new technologies and other items. The results of these workshops could lead to improved practices.	• SCE has implemented the change in estimated effectiveness of covered conductor in its risk-based decision making.	See the Joint IOU CC Working Group Report in Appendix F for further details
10	2021	San Jose State University's (SJSU) Wind Profiler Project	Wind profiling pilot project using LiDAR technology	Desire to continue evaluation of ability to use LiDAR to accurately predict surface-level winds during PSPS events.	• SCE will continue the pilot project through the 2023 fire season to make a final determination on if this effort will add value to the de-energization decision process during PSPS events.	• Funds are expected to run out in 2023 and thus the project will be completed by 2024	See WMP 8.3.2.3.1 (Remote Sensing)

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
11	2022	SJSU's Wildfire Interdisciplinary Research Center	A membership with SJSU allows for voting privileges to decide what potential projects will be funded.	Projects are underway; lessons yet to be learned.	• University collaboration is ongoing and future research will allow for continuous improvement.	• Ongoing • Next project cycle begins in 2023. • Continued membership though 2025.	See WMP 8.3.2.1.3 (Fire Science Enhancements)
12	2022	University of Colorado Boulder Vegetation Build-Up Index	Development of the vegetation build-up index which will systematically and objectively help determine areas of high fire potential.	An index that identifies elevated areas of vegetation vulnerability to wildfire would support SCE's efforts for mitigation selection and prioritization.	• SCE will continue to work with the University of Colorado, Boulder, to create an algorithm that will use remote sensing observations of vegetation to determine areas of vulnerability on the landscape.	• Ongoing • Algorithm completion by 2024 • Product support through 2025	See WMP 8.3.2.3.1 (Remote Sensing)
13	2022	Cal Poly San Luis Obispo's Wildland Urban Interface Fire Information Research and Education Institute (WUI FIRE Institute)	SCE sponsors this program through a financial commitment of $110k per year.	Projects are underway; lessons yet to be learned.	• University collaboration is ongoing and future research will allow for continuous improvement.	• Ongoing • Continued membership though 2023.	See WMP 8.3.2.1.3 (Fire Science Enhancements)
14	2022	Collaboration with industry trade associations	Industry collaboration and engagement	Share and gain insights on best practices on utility wildfire mitigation and response by engaging with industry trade associations, including but not limited to Electric Utility Consultants, Inc. (EUCI), Western Energy Institute (WEI), Institute of Electrical and Electronics	• Continue to share best practices and engage with industry trade associations and utilities by participating in industry conferences and events.	• Ongoing	There was not a specific report that recommended SCE to perform this activity. It is understood as a best practice generally and an expectation from OEIS.

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
				Engineers (IEEE) and Western Electricity Coordinating Council (WECC)			
15	2022	Collaboration with other electrical corporations	Vegetation Line Clearances Working Group	Increase alignment amongst California electrical corporations related to line clearing data collection practices and record keeping of tree-caused risk events.	• PG&E, SDG&E, and SCE chose a third-party consultant to establish the data collection standards, create the cross-utility database, and study the relationship between enhanced vegetation clearances and tree-caused risk events.	• Contract with third-party evaluator to conclude in 2025	Third-party evaluator will issue a report on its findings and a joint database for all participating utilities.
16	2022	Collaboration with other electrical corporations	Risk Modeling Working Group	Information gathering from utilities and comparing risk modeling methodologies.	• Upcoming 2023 discussions will move to understanding best practices and towards consistency on utility approaches to risk modeling.	• Ongoing	Conducted per OEIS direction. https://efiling.energysafety.ca.gov/Lists/DocketLog.aspx?docketnumber=risk-model-group
17	2022	Collaboration with other electrical corporations	Joint IOU PSPS Working Group	Increase alignment amongst California electrical corporations related to PSPS lessons learned and best practices.	• For example, PG&E, SDG&E and SCE are collaborating to enhance the process for identifying and notifying shared customers[292] during PSPS events.	• Ongoing	In compliance with D. 21-06-014. Joint Working Group Reports are filed in R.18-12-005 and can be found in the docket.
18	2021	Feedback from Frontline Workers	Safety Culture Assessment	Enhance feedback loop and communications with frontline workers and supervisors and leaders.	• Update current safety leader activities to address issues noted by the workforce concerning wildfire communications, roles, and decisions.	• While initial completion is anticipated in Q1 2023, SCE will continue to engage and obtain feedback from the workforce on an ongoing basis.	SCE 2022 Q4 WMP Quarterly Notification Letter

[292] A shared customer is defined as a customer whose electrical distribution circuit is sourced by a utility other than the one billing that customer.

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
19	2022	Feedback from Energy Safety or other authoritative bodies	Independent Third-Party Evaluation	Improvements can be explored for non-exempt equipment replacements on HFRA hardened circuits.	1. Continue working with Cal Fire and the Board of Forestry for unique product testing for exemption status and California Codes and Regulations updates for exemption classifications. 2. Continue tracking opportunities to replace material by bunding with other work. 3. Make improvements to SCE standards for guidance on exempt material use and replacement and evaluate/ improve training for inspectors.	1. Ongoing 2. Ongoing 3. Complete 12/31/22	The need for improvement was communicated to SCE by Filsinger Energy Partners, who were brought in on behalf of the Governor's Office to provide oversight and potential enhancement opportunities for SCE's wildfire mitigation strategies. SCE understands a report was provided to the Governor.
20	2022	Feedback from Energy Safety or other authoritative bodies	Independent Third-Party Evaluation	Restrictive permitting potentially increases wildfire risk because Vegetation Management activities to address wildfire risk occur on lands administered by State and Federal agencies.	1. Continue working with the LA Department of Regional Planning (LADRP) to prioritize and process local coastal permits. Continue ongoing regular communication with LADRP. 2. Improve efficient use of the Forest Service Master Special Use Permit (MSUP) to facilitate SCE's work by increasing external engagement with agency leadership. 3. Continue using Instruction Memorandum with Bureau of Land Management (BLM) to decrease agency permitting time. 4. Continue working on finalizing an Operations and Maintenance Plan with BLM that can be used more broadly within the agency once completed. 5. Increase targeted external engagement with BLM leadership through executive	1. Ongoing 2. Ongoing 3. Complete 4. Pilot Q4 2023	Section 8.2

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
					stakeholder working groups; focus on our activities in or near wilderness areas. 6. Increase external engagement and communication to share priorities, wildfire risk concerns, and mitigation strategies with the California Department of Fish and Wildlife. 7. Increase external engagement with Department of Water Resources (DWR) related to work permitting within their right of way. Engagement is ongoing on a monthly basis and has resulted in a dedicated DWR staff member to prioritize and process SCE encroachment permits and temporary entry permits.	5. Ongoing 6. Ongoing 7. Ongoing	
21	2022	Feedback from Energy Safety or other authoritative bodies	Independent Third-Party Evaluation	A high volume of environmental holds could impede wildfire mitigation work.	1. Explore the adjustment of work management processes in SCE Environmental 2. Pursue incidental take permits for greater operational flexibility in key regions. 3. Apply for a Master Streambed Alteration Agreement (MSAA) for work in jurisdictional waters. 4. Benchmark with other IOUs to ascertain best practices in environmental hold processes.	1. Initial implementation Q1 2023 2. Yosemite Toad and Arroyo Toad complete; Pacific Fisher, San Bernardino Kangaroo Rat, and Santa Catalina Island Fox ongoing 3. Estimated permit approval in 2024 4. Ongoing	See comments in item #19.

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
22	2022	Feedback from Energy Safety or other authoritative bodies	Independent Third-Party Evaluation	Clarity of written checklist for long span length and slack inspection work could be improved.	1. Review existing survey questions and responses to ensure alignment with long span requirements, making changes to survey and updating Long Span standards as necessary. 2. Review cancelled long span notifications to ensure remediations are not required.	1. In progress; target completion Q2 2023 2. In progress; target completion Q2 2023	See comments in item #19.
23	2022	Feedback from Energy Safety or other authoritative bodies	Independent Third-Party Evaluation	A significant number of questions on the inspection form address asset inventory rather than ignition/wildfire risk reduction.	1. Evaluate survey questions to identify opportunities to streamline unnecessary questions; implement survey question updates as identified. 2. Explore feasibility of adjusting to a time-based or work-based data capture approach for asset inventory questions. 3. Investigate long term solutions for optimizing inspection survey completion for asset inventory, including potential use of drone pictures and AI/ML to automate survey completion.	1. Q2 2023 2. Q2 2023 3. Q4 2023	See comments in item #19.
24	2022	Feedback from Energy Safety or other authoritative bodies	Independent Third-Party Evaluation	Decision-making criteria for PSPS thresholds could be more transparent in terms of how thresholds are set and updated and how covered conductor and Priority 2 conditions inform and influence thresholds.	• Engage a third-party vendor expert to assess methodology for wind speed threshold development.	• Target completion Q3 2023	See comments in item #19.

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
25	2022	Feedback from Energy Safety or other authoritative bodies	Independent Third-Party Evaluation	Improvements can be explored to improve quality assurance and quality control of equipment inspections.	1. Review the inspection questionnaire related to compliance, safety, and reliability. 2. Incorporate data capture conditions into the current QC program to ensure a QC finding is identified whenever a data capture notification is not generated by the inspector. 3. Pilot then implement QC improvements to address exempt/non-exempt equipment status. 4. Identify opportunities to better align QC with evolving risk mitigation strategies.	1. Complete 2. Q2 2023 3. Q2 2023 4. Q1 2023	See comments in item #19.
26	2022	Feedback from Energy Safety or other authoritative bodies	Independent Third-Party Evaluation	Opportunities may exist to integrate and improve vegetation management programs to reduce potential wildfire risk.	1. Continue with SCE plan to integrate the vegetation line clearing, dead and dying tree, and hazard tree management plan vegetation programs. 2. Continue with SCE plan to transition from grid-based vegetation management work to a circuit-based approach. 3. Explore then implement opportunities to improve post-work verification, including documentation updates and process enhancements. 4. Identify opportunities to improve pre-inspection quality in order to reduce tree trimming prescription changes by contractors.	1. Q2 2023 2. Q4 2025 3. Q1 2023 4. Q2 2023	See Section 8.2 for further discussion on these items

ID #	Year of Lesson Learned	Subject	Type or Source of Lesson Learned	Description of Lesson Learned	Proposed WMP Improvement	Timeline for Implementation	Reference
					5. Improve contractor field coordination with SCE Environmental Services to improve efficiency when working in Environmentally Sensitive Areas (ESA). 6. Address timeliness of vegetation constraint resolution by clarifying Priority 1 criteria in HFRA to mitigate emergency conditions and develop plans to reduce non-emergency encroachment work volume. 7. Please see Section 8.2 for further discussion on these items.	5. Issue field guidance and embed field monitors 3/31/23; implement Environmental Field Support Scheduling Model throughout 2023 6. Partially complete with full implementation of new plans 6/30/23	

11 CORRECTIVE ACTION PROGRAM

In this section, the electrical corporation must describe its corrective action program. The electrical corporation must present a summary description of the relevant portions of its existing procedures.

The electrical corporation must report on how it maintains a corrective action program to track formal actions and activities undertaken to:

- *Prevent recurrence of risk events*
- *Address findings from wildfire investigations (both internal and external)*
- *Address findings from Energy Safety's Compliance Assurance Division (i.e., audits and notices of defect and violation)*
- *Address areas for continued improvement identified by Energy Safety as part of the WMP evaluation*

SCE has multiple corrective action programs to identify issues, address findings, and evaluate efforts to prevent recurrence of those issues. These include:

- **Repair Order Review Process**: Evaluates repair orders and considers opportunities to prevent the recurrence of risk events.
- **Fire Investigation Preliminary Analysis (FIPA):** Investigates ignitions, reviews findings from external wildfire investigations, and considers opportunities to improve mitigation strategies
- **Compliance Review of Audits and Notices of Defect and Violation**: Tracks and addresses findings from Energy Safety's Compliance Assurance Division (i.e., audits and notices of defect and violation)
- **Internal Audit Services and Compliance and Quality Departments:** Assesses WMP implementation independent of the responsible operating unit, conducts risk-informed audits of wildfire mitigation programs, and develops QA and QC processes.

SCE details these efforts below. Please see Appendix D: Areas for Continued Improvement for a full discussion for how SCE is addressing the Areas for Continued Improvement identified by Energy Safety as part of its 2022 WMP Decision. Finally, beyond these programs listed above, the crews that implement the mitigation work are trained to execute the work in accordance with established construction methods and standards. If crews identify any issues or opportunities for improvement, they are encouraged to share these as applicable to inform continuous improvement opportunities.

Repair Order Review Process (Prevent recurrence of risk events)

SCE expanded the process for its Fire Investigation team to now review all repair orders as of March of 2022 and to avoid missing those for which the key words were not present.[293] In this review, engineers evaluate the description of the event that occurred by viewing pictures taken by responders and gathering other geographic and equipment related information. If further information needs to be

[293] A repair order is a document written up to initiate repairs on our distribution system.

collected to assess if an ignition took place, the engineers reach out to the responders to get clarification on the event and details pertaining to the ignition. Data collected can be flagged as an ignition event which will feed into SCE's FIPA review process, detailed below, where further information is documented on the ignition. The intent of this review is to promptly obtain information on the event from the field personnel who observed and/or reported it. Prompt discussion with field personnel[294] is necessary to help ensure all the facts and observations are captured. The information obtained through discussions with field personnel as well as the engineering reviews of repair orders is then used to assess wildfire mitigation options, asset management and performance improvement opportunities, and near-miss analysis and proactive remediation.

Fire Investigation Preliminary Analysis (Address findings from wildfire investigations (both internal and external))

In April 2019, SCE launched the FIPA process to perform more in-depth investigations into all ignitions that occur in connection with SCE facilities.[295] The FIPA process has been continuously improving since inception to enhance efficiency of the investigation process related to ignitions and other data pertaining to near-miss events, such as wire downs and underground equipment failures.

SCE currently accounts for risk events in several databases:

- Wire Down Database - Monitors wire-downs based on wire-down calls and repair orders across the entire SCE service area.
- ODRM - Monitors distribution, substation, and transmission unplanned outages that affect a single line transformer or more on SCE's grid.
- FIPA Database - Collects and annually reports information that would be useful in identifying operational and/or environmental trends relevant to fire-related events.

The FIPA process has three levels of investigation, depending on the complexity of the ignitions, including factors such as the potential severity of the situation, the extent of condition, and what is already known of the event. A brief description of the actions taken for each level are listed below:

- Level 1 - May include a review of pictures, telephone interviews, and repair orders.
- Level 2 - In addition to Level 1, may include site visits and fault analysis.
- Level 3 - In addition to Level 2, may include evaluating the equipment/material by a engineer.

As part of the FIPA process, SCE also evaluates existing maintenance notifications as well as other asset and circuit level data associated with the equipment under evaluation such as circuit topology, circuit loading at location, weather, reliability, and operational history. SCE is conducting pilots to expand investigation methods and failure types.

SCE monitors ignition information for its entire service area. Although SCE prioritizes incidents that

[294] Field personnel in this Repair Order process includes Troublemen who respond to incidents or "trouble" on the system. They identify any concerns on our system and write up a Repair Order identifying the issue and equipment that needs to be replaced/repaired.

[295] This is exclusive of attorney-directed investigations into ignitions which potentially involve SCE facilities.

occur in HFRA, SCE also collects information in non-HFRA because there may be common failure modes that occur throughout the service area. SCE can then use this information to target risk mitigations where needed.

SCE has expanded its FIPA team and refined the tools and processes used. In 2022, the FIPA team updated its Repair Order (document written up to initiate repairs on our distribution system) Review Process to analyze all repair order events taking place in our system. This extended review beyond recorded ignition events allows engineers to better capture additional ignition events. In reviewing within a day, if the engineers do not have clear images or information to determine an ignition happened, they reach out to interview the field personnel to get additional insights. In 2022, the FIPA team analyzed roughly 1000 ignition events as well as about 16,000 repair orders.

Through this plan period, SCE will enhance its post failure data collection tools and processes to make data collection more consistent, relevant, and efficient. For 2023, SCE will update its database for storing this information and its processes for root cause analysis. SCE is updating the failure event database to include wire-down, underground equipment failures and ignitions to assist in identifying related failures in a single database. For example, an underground equipment failure may cause an ignition that burns a pole that in turn may result in a wire-down. Currently, these are recorded as three separate events. Under the new structure, all three events will be related and analyzed as a single incident. SCE is also incorporating additional transmission outage data as an improvement to its outage reporting.[296] SCE is working towards aligning pre-failure inspection data with post-failure data which would give a holistic view of overall asset health. We anticipate these dataset alignments to be completed in 2023.

For 2024 and 2025, SCE will continue to make improvements based on lessons learned including modeling of failures and ignitions, utilization of machine learning, and root cause analyses.

SCE documents and analyzes risk event data to gain insights and gather lessons learned to help mitigate risks by reducing or preventing risk events from occurring. Previously, data collection on fault and failure events were captured on multiple forms that did not collect data in a standardized electronic format, resulting in inconsistent data capture and the need for linguistical analysis to capture trend data from free text responses.

SCE has also begun to roll out an electronic form called the Material Performance Failure Report (MPFR) that allows for dynamic data collection from failures of the electric grid. The MPFR addresses two previous issues with respect to ignition data collection and storage, providing a centralized location allowing incoming ignition data to be more efficiently captured and improvements to the robustness of the ignition data for more in-depth analysis and trending.

Compliance Review of Audits and Notices of Defect and Violation (Address findings from Energy Safety's Compliance Assurance Division (i.e., audits and notices of defect and violation))

SCE documents audit findings and notices of defect and violations. SCE reviews and provides a response to any audit finding and enters them in a database for tracking any lessons learned and as needed track and implement corrective actions.

Energy Safety instituted a new process for identifying their field inspection instances of non-compliance.

[296] Historical reporting has been revised to reflect the additional Transmission outage data.

Energy Safety may issue the following notices:

- **Notices of violation (NOVs)** identify instances in which an electrical corporation is non-compliant with its approved WMP or any law, regulation, or guideline within Energy Safety's authority
- **Notices of defect (NODs)** identify deficiencies, errors, or conditions that increase the risk of ignition posed by electrical lines and equipment requiring correction.

This new process also provides the electric corporations the right to request a written hearing if the electrical corporation does not agree with any violation or defect.

SCE reviews all notices of defects and violations to determine whether to correct the noncompliance within the established[297] corrective action timeline or to request a written hearing. SCE tracks all violations and defects until OEIS officially closes them out. For any violation or defect that needs to be corrected, SCE notifies its field crews to correct these within the established timeline. See Section 12 Table 12-1 for a list of open violations or defects.

SCE continues to look for ways to prevent future occurrences of these violations and/or defects. SCE's field inspections (both ground and aerial) are a detective control used to identify items that need to be remediated. Additionally, SCE is performing quality control reviews of completed construction in HFAs using a risk-based approach, which includes increased sampling levels in higher risk areas. The reviews occur for construction in general, but also addresses projects within the scope of the WMP, such as covered conductor. These quality control reviews help drive continuous improvement by identifying non-conformances with SCE standards, determining causes of non-conformance, and/or driving corrective actions to improve performance. If performance falls below certain thresholds, SCE will require corrective actions.

Internal Audit Services and Compliance and Quality Departments: SCE's Audit Services Department (ASD) assesses WMP implementation independent of the responsible operating unit. Audits are determined via a risk assessment informed by SCE's Board of Directors (Board), senior management and regulatory requirements. ASD has conducted risk-informed audits of SCE's system hardening and operations, inspection, maintenance, and vegetation management programs and WMP-related Compliance and Quality (C&Q) processes. These audits are conducted through desktop reviews and, in some instances, field inspections of assets to provide reasonable assurance that mitigations are deployed according to plan, that SCE facilities are appropriately inspected, and that identified conditions are timely remediated according to applicable requirements. ASD documents audit tasks and monitors corrective actions using industry standard auditing software in accordance with the International Standards for the Professional Practice of Internal Auditing.

In addition, the C&Q group develops QC and QA processes to help ensure that mitigation activities are proceeding as planned. C&Q performs testing and assessment of wildfire and non-wildfire activities to measure conformance and drive continuous improvement throughout the organization. Section 8.1.6 provides an overview of its QA/QC activities for asset management and inspections. Section 8.2.5 provides an outline of its QA/QC activities for vegetation management.

[297] See Energy Safety Compliance Process issued October 13, 2021

The electrical corporation must report on how it reviews each improvement area in accordance with its corrective action program. At a minimum, the electrical corporation must:

- ***Identify insufficient occurrence and response****: Identify targeted corrective actions for areas where the event occurrence, response, or feature was insufficient.*

SCE performs an investigation for each ignition on its system, determines if mitigations were in place that did not perform as intended, and identifies opportunities for correcting insufficiencies with mitigations or adopting new practices to prevent further recurrence. These efforts are performed through collaborative process involving SCE's FIPA engineers and asset management organization through a framework that seeks to continuously improve SCE's asset performance.

The FIPA process for individual ignitions was described above. The following steps describe SCE's efforts to use this data to evaluate trends or issues on the system.

- **Documenting Events and Trends**: SCE tracks asset failures, ignition events, wire-downs, and underground equipment failures through material performance failure reports and internal databases. SCE also captures data from its various inspection programs, including findings and responses to inspection survey questions. The data serves as the basis for the evaluation of asset performance and trends.

- **Evaluation of Events and Trends:** SCE evaluates the risk event by reviewing the data captured in the failure reports and databases, perform additional engineering studies, research the occurrence of similar risk events in the past to identify trends and potential systemic issues, evaluate the condition of the associated asset(s) against equipment and manufacturer performance standards, etc. This may also include a review of past inspection and maintenance trends associated with the asset.

- **Consult Stakeholders on Findings and Determine Solution or Mitigation Approach:** The engineering review team consolidates its failure and trend analysis for review and calibration with a broader stakeholder group. This will generally involve reviewing the identified asset performance issue and any associated trends, including failures (e.g., ignitions, wire downs, faults and underground explosions) and inspection findings. Based on this collective understanding, SCE will evaluate mitigation opportunities and develop an engineering solution and/or mitigation strategy to prevent recurrence of the event in the future.

- **Mitigation Deployment and Evaluation:** If necessary, SCE implements a new solution and mitigation strategy, then evaluates its performance post-implementation. This can involve updating SCE standards or equipment specifications, training, deploying proactive infrastructure replacement programs, performing subsequent ad hoc inspections, modifying maintenance & inspection programs, and evaluating the asset performance over time to determine effectiveness of mitigation strategy.

SCE seeks to continuously improve this general process to further refine the evaluation and mitigation of risk events on SCE's system. SCE identifies specific additional actions taken to reduce recurrence of risk events in the section below.

- ***Identify actions to reduce recurrence****: Identify improvement actions (as applicable) to reduce the likelihood of recurrence, improve response/mitigation actions, or improve operational procedures or practices.*

SCE identifies various improvement actions taken to reduce the likelihood of recurrence, improve mitigation actions, and improve operational procedures and practices below. Below, SCE lists several examples of actions taken because of this process.

- Secondaries – SCE's FIPA analysis identified a growing trend in ignitions associated with secondary conductors related to: (1) open, bare, and aged conductor; (2) animal contact with unprotected secondary/service connectors; (3) tree abrasion; (4) overloading due to illegal growth; and (5) secondary overloading given the record level heat waves experienced in 2022. To address issues on secondary conductors related to strain and abrasion, SCE modified its inspection form with new questions to capture information around these issues. SCE is also replacing secondary/service conductor concurrent with replacement of primary covered conductor. In addition, SCE has instituted new work methods governing how field personnel cover secondary/service connectors to prevent animal contact.

- Aerial Inspections – In another example, a small fire (<1 acre) occurred in 2019 associated with SCE equipment, due to degradation occurring at the top of a crossarm. In response to this evaluation, SCE began inspecting transmission and distribution structures both from the ground and aerially, to develop a 360-degree inspection of the structure. This has served as the basis for SCE's asset inspection programs which are detailed in Section 8.1.3

- C-Hooks – SCE's former C-Hooks Replacement initiative (formerly SH-13) was included in SCE's 2021 and 2022 WMP Updates to address the potential for a C-Hook to fail and lead to downed high voltage wire, which could pose wildfire and public safety risks. While SCE had no historical incidents or records of failed C-Hooks in its service area, given the inability to ascertain the hardware condition visually[298] and the lessons learned from the 2018 Camp Fire which was believed to have been started by the failure of a C-Hook, SCE decided to proactively remove all C-Hooks on its system to remove this risk.

- ***Track implementation****: Track the improvement action plan and schedule in the electrical corporation's action tracking system.*

SCE describes the processes used to track the identified improvements for risk events, fire investigations, and notices of violation or defect below.

- Risk events: After SCE performs an analysis of each risk event, it will identify opportunities to address the root cause of that risk event in the form of new work procedures, modifications to equipment used, etc. To the extent these improvement opportunities are identified, the risk event analysis team will work with the requisite asset management, new technology, planning and operational organizations to review, gain approval for, and implement the identified improvement opportunities.

[298] Due to their small size, C-Hooks are also difficult to inspect for degradation, even using aerial inspections, which increases the uncertainty of the probability of failure.

- **Fire investigations**: The fire investigation team reviews repair orders for any sign in description or pictures of an ignition taking place. They reach out to field personnel, review repair order details, and review incident log sheets to identify an ignition. From there, the identified ignition is tracked in a database and a deeper analysis into the cause of the ignition is performed. This includes system studies, equipment characteristics, weather conditions at time of event, etc. This is all captured and tracked for analysis and trending purposes.

- **NOV/NODs:** As noted above, SCE reviews all notices of defects and violations to determine whether to correct the noncompliance within the established corrective action timeline or to request a written hearing. SCE tracks all violations and defects until OEIS officially closes them out. For any violation or defect that needs to be corrected, SCE notifies its field crews to correct these within the established timeline. SCE's evaluation and efforts to address the issue are intended to prevent re-occurrence, and if needed, will update processes or procedures. See Section 12, Table 12-1 for a list of open violations or defects and planned corrective actions.

- ***Improve external communication****: For areas where weaknesses were identified in the response of external agencies, develop a communication plan to share the information and conclusion with the responsible agency. The completion of this action and the agency's response must be documented.*

SCE has established a Standardized Emergency Management System (SEMS), National Incident Management System (NIMS) and Incident Command System (ICS) compliant incident management structure built around Incident Management Teams (IMTs). Using this framework, during PSPS events and other emergencies, SCE engages with its emergency management partners at the county and state level by hosting daily coordination calls with impacted agencies.

In addition, SCE also conducts daily personalized PSPS outreach and engagement calls for both critical infrastructure providers and the AFN community. For the 2023 season, SCE will evaluate its current strategy for conducting multiple daily operational briefings to identify opportunities and to optimize engagement with public safety partners while reducing possible redundancy.

SCE communicates with OEIS on NOVs and NODs regarding issues OEIS has found and how SCE can improve. Furthermore, SCE works with CalFire, the CPUC/and the California Governor's Office of Emergency Services to respond to their findings, feedback, and identify appropriate responses.

In advance of fire season, SCE partners closely with local and tribal governments to identify and secure locations for Community Resource Centers (CRCs) and Community Crew Vehicles (CCVs). Although SCE has preestablished optimal locations for CRC/CCV deployments in most communities, there are still a few areas where preestablished locations have not been determined. In advance of the 2023 fire season, SCE will work with local and tribal governments and Community Based Organizations to identify pre-established locations for these communities.

More broadly, SCE describes its collaboration and partnerships with external agencies in Section 8.4 SCE values these opportunities to partner with local, state and federal agencies, particularly in the response to wildfire and PSPS risk events and will continue to seek opportunities to improve and refine our communication, emergency response, and restoration efforts to help ensure the safety of our customers and the reliability of our electric system.

- ***Integrate lessons learned from across the industry****: Identify applicable generic lessons learned to improve the overall effectiveness of the electrical corporation WMP.*

Please see SCE's response to Section 10 which details numerous lessons learned and opportunities that SCE and its stakeholder partners have identified, and for which SCE is planning to implement going forward.

SCE engages utilities across California and the rest of the country to share best practices, mitigation strategies, and approaches for mitigating wildfire and PSPS risk. These collaborations can result in the ideation of new and/or more effective ways of planning for and implement the WMP. This includes understanding how other utilities identify, evaluate, and determine appropriate mitigation options for risk events, fire ignitions, and other issues on the system. Additional topical areas that are discussed to identify lessons learned typically include:

  - Risk modeling, including understanding how and why utilities use different inputs, data sources, calculations, etc., and how the risk modeling results inform mitigation strategies;
  - Execution of work, including resourcing strategies and execution processes;
  - Engineering standards and construction methods, particularly for new technologies and mitigations being deployed in the field

SCE also appreciates the guidance and feedback from Energy Safety throughout the WMP process and incorporates that feedback into our WMP to make it more effective with each successive submission.

- ***Share lessons learned with others****: Identify and communicate any significant generic lessons learned that should be disseminated broadly (i.e., to other electrical corporations and responsible regulatory authorities, such as Energy Safety or CAL FIRE).*

Please see SCE's response to Section 10, which details numerous lessons learned and opportunities that SCE and its stakeholder partners have identified.

12 NOTICES OF VIOLATION AND DEFECT

Within a Notice of Violation (NOV) or Notice of Defect (NOD), Energy Safety directs an electrical corporation to correct a violation or defect within a specific timeline, depending on the risk category of the violation or defect. The electrical corporation has 30 days to respond to the NOV or NOD and provide a plan for corrective action. Following completion of the corrective action, the electrical corporation must provide Energy Safety with documentation validating the resolution or correction of the identified violation or defect. Energy Safety includes the electrical corporation's response and the resolution status of any violations or defects in the summaries it provides to the CPUC.

In Table 12-1 of the WMP, the electrical corporation must provide a list of all open violations and defects as of January 1, 2023.

The WMP should not include detailed corrective action plans for each risk event, finding, and/or improvement area. However, this documentation must be made available to Energy Safety upon request.

Table 12-1 provides a list of all open violations and defects as of January 1, 2023. Corrective actions are planned and scheduled for all of these.

Table 12-1 - List of Open Compliance Violations and Defects

Report ID	Type	Severity	Date of Notice	Date of Response	Summary Description of Violation/Defect	Estimated Completion Date	Summary Description of Correction
NOV_SCE_EDC_ 20211207-01	Violation	Minor	3/23/22	5/20/2022	Vibration Damper - Missing	3/23/23	Install Vibration Damper

APPENDIX A: DEFINITIONS

Unless otherwise expressly stated, the following words and terms, for the purposes of these Guidelines, have the meanings shown in this chapter.

Terms Defined in Other Codes

Where terms are not defined in these Guidelines and are defined in the Government Code, Public Utilities Code, or California Public Resources Code, such terms have the meanings ascribed to them in those codes.

Terms Not Defined

Where terms are not defined through the methods authorized by this section, such terms have ordinarily accepted meanings such as the context implies.

Definition of Terms

Term	Definition
Access and functional needs population (AFN)	Individuals, including, but not limited to, those who have developmental or intellectual disabilities, physical disabilities, chronic conditions, or injuries; who have limited English proficiency or are non-English speaking; who are older adults, children, or people living in institutionalized settings; or who are low income, homeless, or transportation disadvantaged, including, but not limited to, those who are dependent on public transit or are pregnant. (California Government Code 8593.3(f)(1)
Asset (utility)	Electric lines, equipment, or supporting hardware.
At-risk species	See "high-risk species."
Benchmarking	A comparison between one electrical corporation's protocols, technologies used, or mitigations implemented, and other electrical corporations' similar endeavors.

Term	Definition
Calibration	Adjustment of a set of code input parameters to maximize the resulting agreement of the code calculations with observations in a specific scenario.[1]
Catastrophic wildfire	A fire that caused at least one death, damaged over 500 structures, or burned over 5,000 acres.
Circuit miles	The total length in miles of separate transmission and/or distribution circuits, regardless of the number of conductors used per circuit (i.e., different phases).
Consequence	The adverse effects from an event, considering the hazard intensity, community exposure, and local vulnerability.
Contact by object ignition likelihood	The likelihood that a non-vegetative object (such as a balloon or vehicle) will contact utility-owned equipment and result in an ignition.
Contact by vegetation ignition likelihood	The likelihood that vegetation will contact utility-owned equipment and result in an ignition.
Contractor	Any individual in the temporary and/or indirect employ of the electrical corporation whose limited hours and/or time-bound term of employment are not considered "full-time" for tax and/or any other purposes.
Critical facilities and infrastructure	Facilities and infrastructure that are essential to public safety and that require additional assistance and advance planning to ensure resiliency during PSPS events. These include the following: Emergency services sector: Police stations Fire stations Emergency operations centers

[1] Adapted from T. G. Trucano, L. P. Swiler, T. Igusa, W. L. Oberkampf, and M. Pilch, 2006, "Calibration, validation, and sensitivity analysis: What's what," *Reliability Engineering and System Safety*, vol. 91, no. 10–11, pp. 1331– 1357.

Term	Definition
	• Public safety answering points (e.g., 9-1-1 emergency services) Government facilities sector: • Schools • Jails and prisons Health care and public health sector: • Public health departments • Medical facilities, including hospitals, skilled nursing facilities, nursing homes, blood banks, health care facilities, dialysis centers, and hospice facilities (excluding doctors' offices and other non-essential medical facilities) Energy sector: • Public and private utility facilities vital to maintaining or restoring normal service, including, but not limited to, interconnected publicly owned electrical corporations and electric cooperatives Water and wastewater systems sector: • Facilities associated with provision of drinking water or processing of wastewater, including facilities that pump, divert, transport, store, treat, and deliver water or wastewater Communications sector: • Communication carrier infrastructure, including selective routers, central offices, head ends, cellular switches, remote terminals, and cellular sites Chemical sector: • Facilities associated with manufacturing, maintaining, or distributing hazardous materials and chemicals (including Category N-Customers as defined in D.01-06- 085) Transportation sector:

Term	Definition
	• Facilities associated with transportation for civilian and military purposes: automotive, rail, aviation, maritime, or major public transportation (D.19-05-042 and D.20-05-051)
Customer hours	Total number of customers, multiplied by average number of hours (e.g., of power outage).
Danger tree	Any tree located on or adjacent to a utility right-of-way or facility that could damage utility facilities should it fall where (1) the tree leans toward the right-of-way, or (2) the tree is defective because of any cause, such as: heart or root rot, shallow roots, excavation, bad crotch, dead or with dead top, deformity, cracks or splits, or any other reason that could result in the tree or main lateral of the tree falling. (California Code of Regulation Title 14 § 895.1)
Data cleaning	Calibration of raw data to remove errors (including typographical and numerical mistakes).
Dead fuel moisture content	Moisture content of dead vegetation, which responds solely to current environmental conditions and is critical in determining fire potential.
Detailed inspection	In accordance with General Order (GO) 165, an inspection where individual pieces of equipment and structures are carefully examined, visually and through routine diagnostic testing, as appropriate, and (if practical and if useful information can be so gathered) opened, and the condition of each is rated and recorded.
Disaster	A serious disruption of the functioning of a community or a society at any scale due to hazardous events interacting with conditions of exposure, vulnerability, and capacity, leading to one or more of the following: human, material, economic, and environmental losses and impacts. The effect of the disaster can

	be immediate and localized but is often widespread and could last a long time. The effect may test or exceed the capacity of a community or society to cope using its own resources. Therefore, it may require assistance from external sources, which could include neighboring jurisdictions or those at the national or international levels. (United Nations Office for Disaster Risk Reduction [UNDRR].)

Term	Definition
Discussion-based exercise	Exercise used to familiarize participants with current plans, policies, agreements, and procedures or to develop new plans, policies, agreements, and procedures. Often includes seminars, workshops, tabletop exercises, and games.
Electrical corporation	Every corporation or person owning, controlling, operating, or managing any electric plant for compensation within California, except where the producer generates electricity on or distributes it through private property solely for its own use or the use of its tenants and not for sale or transmission to others.
Emergency	Any incident, whether natural, technological, or human caused, that requires responsive action to protect life or property but does not result in serious disruption of the functioning of a community or society. (FEMA/UNDRR.)
Enhanced inspection	Inspection whose frequency and thoroughness exceed the requirements of a detailed inspection, particularly if driven by risk calculations.
Equipment ignition likelihood	The likelihood that utility-owned equipment will cause an ignition through either normal operation (such as arcing) or failure.
Exercise	An instrument to train for, assess, practice, and improve performance in prevention, protection, response, and recovery capabilities in a risk-free environment. (FEMA.)

Term	Definition
Exposure	The presence of people, infrastructure, livelihoods, environmental services and resources, and other high-value assets in places that could be adversely affected by a hazard.
Fire ecology	A scientific discipline concerned with natural processes involving fire in an ecosystem and its ecological effects, the interactions between fire and the abiotic and biotic components of an ecosystem, and the role of fire as an ecosystem process.
Fire Potential Index (FPI)	Landscape scale index used as a proxy for assessing real-time risk of a wildfire under current and forecasted weather conditions.
Fire season	The time of year when wildfires are most likely for a given geographic region due to historical weather conditions, vegetative characteristics, and impacts of climate change. Each electrical corporation defines the fire season(s) across its service territory based on a recognized fire agency definition for the specific region(s) in California.
Frequency	The anticipated number of occurrences of an event or hazard over time.
Frequent PSPS events	Three or more PSPS events per calendar year per line circuit.
Fuel density	Mass of fuel (vegetation) per area that could combust in a wildfire.
Fuel management	Removal or thinning of vegetation to reduce the potential rate of propagation or intensity of wildfires.
Fuel moisture content	Amount of moisture in a given mass of fuel (vegetation), measured as a percentage of its dry weight.
Full-time employee (FTE)	Any individual in the ongoing and/or direct employ of the electrical corporation whose hours and/or term of

Term	Definition
	employment are considered “full-time” for tax and/or any other purposes.
Game	A simulation of operations that often involves two or more teams, usually in a competitive environment, using rules, data, and procedures designed to depict an actual or assumed real-life situation.
Goals	The electrical corporation’s general intentions and ambitions.
GO 95 nonconformance	Condition of a utility asset that does not meet standards established by GO 95.
Grid hardening	Actions (such as equipment upgrades, maintenance, and planning for more resilient infrastructure) taken in response to the risk of undesirable events (such as outages) or undesirable conditions of the electrical system to reduce or mitigate those events and conditions, informed by an assessment of the relevant risk drivers or factors.
Grid topology	General design of an electric grid, whether looped or radial, with consequences for reliability and ability to support PSPS (e.g., ability to deliver electricity from an additional source).
Hazard	A condition, situation, or behavior that presents the potential for harm or damage to people, property, the environment, or other valued resources.[3]
Hazard tree	See danger tree
High Fire Threat District (HFTD)	Areas of the state designated by the CPUC as having elevated wildfire risk, where each utility must take additional action (per GO 95, GO 165, and GO 166) to mitigate wildfire risk. (D.17-01-009.)
High Fire Risk Area (HFRA)	Areas that the electrical corporation has deemed at high risk from wildfire, independent of HFTD designation.

Term	Definition
Highly rural region	In accordance with 38 CFR 17.701, area with a population of less than seven persons per square mile, as determined by the United States Bureau of the Census. For purposes of the WMP,"area" must be defined as a census tract.
High-risk species	Species of vegetation that (1) have a higher risk of either coming into contact with powerlines or causing an outage or ignition, or (2) are easily ignitable and within close proximity to potential arcing, sparks, and/or other utility equipment thermal failures. The status of species as "high-risk" must be a function of species-specific characteristics, including growth rate; failure rates of limbs, trunk, and/or roots (as compared to other species); height at maturity; flammability; and vulnerability to disease or insects.
High Wind Warning (HWW)	Level of wind risk from weather conditions, as declared by the National Weather Service (NWS). For historical NWS data, refer to the Iowa State University archive of NWS watches/warnings.[2]
HWW overhead (OH) circuit mile day	Sum of OH circuit miles of utility grid subject to a HWW each day within a given time period, calculated as the number of OH circuit miles under a HWW multiplied by the number of days those miles are under said HWW. For example, if 100 OH circuit miles are under a HWW for one day, and 10 of those miles are under the HWW for an additional day, then the total HWW OH circuit mile days would be 110.
Ignition consequence	The total anticipated adverse effects from an ignition at each location in the electrical corporation service territory. This considers the likelihood that an ignition will transition into a wildfire (wildfire spread likelihood) and the consequences that the wildfire will have on each community it reaches (wildfire consequence).

[2] https://mesonet.agron.iastate.edu/request/gis/watchwarn.phtml.

Term	Definition
Ignition likelihood	The total anticipated annualized number of ignitions resulting from utility-owned assets at each location in the electrical corporation service territory. This considers probabilistic weather conditions, type and age of equipment, and potential contact of vegetation and other objects with utility assets.
Ignition probability	The relative possibility that an ignition will occur, quantified as a number between 0 percent (impossibility) and 100 percent (certainty). The higher the probability of an event, the more certainty there is that the event will occur. (Often informally referred to as likelihood or chance.)
Ignition risk	The total anticipated annualized impacts from ignitions at a specific location. This considers the likelihood that an ignition will occur, the likelihood the ignition will transition into a wildfire, and the potential consequences – considering hazard intensity, exposure potential, and vulnerability – the wildfire will have on each community it reaches.
Impact/consequence of ignition	The effect or outcome of a wildfire ignition upon objectives that may be expressed by terms including, although not limited to, maintaining health and safety, ensuring reliability, and minimizing economic and/or environmental damage.
Incident command system (ICS)	A standardized on-scene emergency management construct. It is specifically designed to provide an integrated organizational structure that reflects the complexity and demands of single or multiple incidents, without being hindered by jurisdictional boundaries. The ICS is the combination of facilities, equipment, personnel, procedures, and communications operating within a common organizational structure, designed to aid in the management of resources during incidents.
Initiative	Measure or activity, either proposed or in process, designed to reduce the consequences and/or probability of wildfire or PSPS.

Term	Definition
Integrated public alert warning system (IPAWS)	System allowing the President to send a message to the American people quickly and simultaneously through multiple communications pathways in a national emergency. IPAWS also is available to United States federal, state, local, territorial, and tribal government officials to alert the public via the Emergency Alert System (EAS), Wireless Emergency Alerts (WEA), National Oceanic and Atmospheric Administration (NOAA) Weather Radio, and other NWS dissemination channels; the internet; existing unique warning systems; and emerging distribution technologies.
Invasive species	A species (1) that is non-native (or alien) to the ecosystem under consideration and (2) whose introduction causes or is likely to cause economic or environmental harm or harm to human health.
Level 1 finding	In accordance with GO 95, an immediate safety and/or reliability risk with high probability for significant impact.
Level 2 finding	In accordance with GO 95, a variable safety and/or reliability risk (non-immediate and with high to low probability for significant impact).
Level 3 finding	In accordance with GO 95, an acceptable safety and/or reliability risk.
Limited English proficiency (LEP) population	Population with limited English working proficiency based on the International Language Roundtable scale.
Line miles	The number of miles of transmission and/or distribution conductors, including the length of each phase and parallel conductor segment.
Live fuel moisture content	Moisture content within living vegetation, which can retain water longer than dead fuel.

Term	Definition
Locally relevant	In disaster risk management, generally understood as the scale at which disaster risk strategies and initiatives are considered the most effective at achieving desired outcomes. This tends to be the level closest to impacting residents and communities, reducing existing risks, and building capacity, knowledge, and normative support. Locally relevant scales, conditions, and perspectives depend on the context of application.
Match-drop simulation	Wildfire simulation method forecasting propagation and consequence/impact based on an arbitrary ignition.
Memorandum of Agreement (MOA)	A document of agreement between two or more agencies establishing reciprocal assistance to be provided upon request (and if available from the supplying agency) and laying out the guidelines under which this assistance will operate. It can also be a cooperative document in which parties agree to work together on an agreed-upon project or meet an agreed objective.
Mitigation	Activities to reduce the loss of life and property from natural and/or human-caused disasters by avoiding or lessening the impact of a disaster and providing value to the public by creating safer communities.
Model uncertainty	The amount by which a calculated value might differ from the true value when the input parameters are known (i.e., limitation of the model itself based on assumptions).[3]
Multi-attribute value function (MAVF)	Risk calculation methodology introduced during CPUC's Safety Model Assessment Proceedings (S-MAP) and Risk Assessment and Mitigation Phase (RAMP) proceedings. This methodology is established in D.18-12-014 but may be subject to change pursuant to R.20-07-013.

[3] Adapted from SFPE, 2010, "Substantiating a Fire Model for a Given Application," *Society of Fire Protection Engineers Engineering Guides*.

Term	Definition
Mutual aid	Voluntary aid and assistance by the provision of services and facilities, including but not limited to electrical corporations, communication, and transportation. Mutual aid is intended to provide adequate resources, facilities, and other support to electrical corporations whenever their own resources prove inadequate to cope with a given situation.
National Incident Management System (NIMS)	A systematic, proactive approach to guide all levels of government, nongovernment organizations, and the private sector to work together to prevent, protect against, mitigate, respond to, and recover from the effects of incidents. NIMS provides stakeholders across the whole community with the shared vocabulary, systems, and processes to successfully deliver the capabilities described in the National Preparedness System. NIMS provides a consistent foundation for dealing with all incidents, ranging from daily occurrences to incidents requiring a coordinated federal response.
Near miss	Term previously used for an event with probability of ignition (now "Risk event").
Objectives	Specific, measurable, achievable, realistic, and timely outcomes for the overall WMP strategy, or mitigation initiatives and activities that a utility can implement to satisfy the primary goals and subgoals of the WMP program.
Operations-based exercise	Type of exercise that validates plans, policies, agreements, and procedures; clarifies roles and responsibilities; and identifies resource gaps in an operational environment. Often includes drills, functional exercises (FEs), and full-scale exercises (FSEs).
Overall utility risk	The comprehensive risk due to both wildfire and PSPS incidents across a utility's territory; the aggregate potential of adverse impacts to people, property, critical infrastructure, or other valued assets in society.

Term	Definition
Overall utility risk, ignition risk	See Ignition risk.
Overall utility risk, PSPS risk	See PSPS risk.
Parameter uncertainty	The amount by which a calculated value might differ from the true value based on unknown input parameters. (Adapted from Society of Fire Protection Engineers [SFPE] guidance.)
Patrol inspection	In accordance with GO 165, a simple visual inspection of applicable utility equipment and structures designed to identify obvious structural problems and hazards. Patrol inspections may be carried out in the course of other company business.
Performance metric	A quantifiable measurement that is used by an electrical corporation to indicate the extent to which its WMP is driving performance outcomes.
Population density	Population density is calculated using the American Community Survey (ACS) one-year estimate for the corresponding year or, for years with no such ACS estimate available, the estimate for the immediately preceding year.
Preparedness	A continuous cycle of planning, organizing, training, equipping, exercising, evaluating, and taking corrective action in an effort to ensure effective coordination during incident response. Within the NIMS, preparedness focuses on planning, procedures and protocols, training and exercises, personnel qualification and certification, and equipment certification.
Priority essential services	Critical first responders, public safety partners, critical facilities and infrastructure, operators of telecommunications infrastructure, and water electrical corporations/agencies.
Property	Private and public property, buildings and structures, infrastructure, and other items of value that may be destroyed

Term	Definition
	by wildfire, including both third-party property and utility assets.
Protective equipment and device settings	The electrical corporation's procedures for adjusting the sensitivity of grid elements to reduce wildfire risk, other than automatic reclosers (such as circuit breakers, switches, etc.). For example, PG&E's "Enhanced Powerline Safety Settings" (EPSS).
PSPS consequence	The total anticipated adverse effects of a PSPS for a community. This considers the PSPS exposure potential and inherent PSPS vulnerabilities of communities at risk.
PSPS event	The period from notification of the first public safety partner of a planned public safety PSPS to re-energization of the final customer.
PSPS exposure potential	The potential physical, social, or economic impact of a PSPS event on people, property, critical infrastructure, livelihoods, health, local economies, and other high-value assets.
PSPS likelihood	The likelihood of a PSPS being required by a utility given a probabilistic set of environmental conditions.
PSPS risk	The total anticipated annualized impacts from a PSPS event at a specific location. This considers the likelihood a PSPS event will be required due to environmental conditions exceeding design conditions and the potential consequences – considering exposure potential and vulnerability – of the PSPS event for each affected community.
Public safety partners	First/emergency responders at the local, state, and federal levels; water, wastewater, and communication service providers; community choice aggregators (CCAs); affected publicly owned electrical corporations/electrical cooperatives; tribal governments; Energy Safety; the Commission; the California Office of Emergency Services; and CAL FIRE.

Term	Definition
Red Flag Warning (RFW)	Level of wildfire risk from weather conditions, as declared by the NWS. For historical NWS data, refer to the Iowa State University archive of NWS watches/warnings.[4]
RFW OH circuit mile day	Sum of OH circuit miles of utility grid subject to RFW each day within a given time period, calculated as the number of OH circuit miles under RFW multiplied by the number of days those miles are under said RFW. For example, if 100 OH circuit miles are under RFW for one day, and 10 of those miles are under RFW for an additional day, then the total RFW OH circuit mile days would be 110.
Risk	A measure of the anticipated adverse effects from a hazard considering the consequences and frequency of the hazard occurring.[5]
Risk component	A part of an electric corporation's risk analysis framework used to determine overall utility risk.
Risk evaluation	The process of comparing the results of a risk analysis with risk criteria to determine whether the risk and/or its magnitude is acceptable or tolerable. (ISO 31000:2009.)
Risk event	An event with probability of ignition, such as wire down, contact with objects, line slap, event with evidence of heat generation, or other event that causes sparking or has the potential to cause ignition. The following all qualify as risk events: • Ignitions • Outages not caused by vegetation • Outages caused by vegetation

[4] https://mesonet.agron.iastate.edu/request/gis/watchwarn.phtml.

[5] Adapted from D. Coppola, 2020, "Risk and Vulnerability," *Introduction to International Disaster Management*, 4th ed.

Term	Definition
	• Wire-down events • Faults • Other events with potential to cause ignition
Risk management	Systematic application of management policies, procedures, and practices to the tasks of communication, consultation, establishment of context, and identification, analysis, evaluation, treatment, monitoring, and review of risk. (ISO 31000.)
Rule	Section of Public Utilities Code requiring a particular activity or establishing a particular threshold.
Rural region	In accordance with GO 165, area with a population of less than 1,000 persons per square mile, as determined by the U.S. Bureau of the Census.[6] For purposes of the WMP, "area" must be defined as a census tract.
Seminar	An informal discussion, designed to orient participants to new or updated plans, policies, or procedures (e.g., to review a new external communications standard operating procedure).
Sensitivity analysis	Process used to determine the relationships between the uncertainty in the independent variables ("input") used in an analysis and the uncertainty in the resultant dependent variables ("output"). (SFPE guidance.)
Slash	Branches or limbs less than four inches in diameter, and bark and split products debris left on the ground as a result of utility vegetation management. (This definition is consistent with California Public Resources Code section 4525.7.)
Span	The space between adjacent supporting poles or structures on a circuit consisting of electric lines and equipment. "Span level" refers to asset-scale granularity.

6 https://www.cpuc.ca.gov/gos/GO95/go_95_rule_18.htm

Term	Definition
Tabletop exercise (TTX)	A discussion-based exercise intended to stimulate discussion of various issues regarding a hypothetical situation. Tabletop exercises can be used to assess plans, policies, and procedures or to assess types of systems needed to guide the prevention of, response to, or recovery from a defined incident.
Target	A forward-looking, quantifiable measurement of work to which an electrical corporation commits to in its WMP. Electrical corporations will show progress toward completing targets in subsequent reports, including QDRs and WMP Updates.
Trees with strike potential	Trees that could either "fall in" to a power line or have branches detach and "fly in" to contact a power line in high-wind conditions.
Uncertainty	The amount by which an observed or calculated value might differ from the true value. For an observed value, the difference is "experimental uncertainty"; for a calculated value, it is "model" or "parameter uncertainty." (Adapted from SFPE guidance.)
Urban region	In accordance with GO 165, area with a population of more than 1,000 persons per square mile, as determined by the U.S. Bureau of the Census. For purposes of the WMP, "area" must be defined as a census tract.
Utility-related ignition	See reportable ignition.
Validation	Process of determining the degree to which a calculation method accurately represents the real world from the perspective of the intended uses of the calculation method without modifying input parameters based on observations in a specific scenario. (Adapted from ASTM E 1355.)
Vegetation management (VM)	Trimming and removal of trees and other vegetation at risk of contact with electric equipment.

Term	Definition
Verification	Process to ensure that a model is working as designed, that is, that the equations are being properly solved. Verification is essentially a check of the mathematics. (SFPE guidance.)
Vulnerability	The propensity or predisposition of a community to be adversely affected by a hazard, including the characteristics of a person, group, or service and their situation that influences their capacity to anticipate, cope with, resist, and recover from the adverse effects of a hazard.
Wildfire consequence	The total anticipated adverse effects from a wildfire on a community that is reached. This considers the wildfire hazard intensity, the wildfire exposure potential, and the inherent wildfire vulnerabilities of communities at risk.
Wildfire exposure potential	The potential physical, social, or economic impact of wildfire on people, property, critical infrastructure, livelihoods, health, environmental services, local economies, cultural/historical resources, and other high-value assets. This may include direct or indirect impacts, as well as short- and long-term impacts.
Wildfire intensity	The potential intensity of a wildfire at a specific location within the service territory given a probabilistic set of weather profiles, vegetation, and topography.
Wildfire mitigation strategy	Overview of the key mitigation initiatives at enterprise level and component level across the electrical corporation's service territory, including interim strategies where long-term mitigation initiatives have long implementation timelines. This includes a description of the enterprise-level monitoring and evaluation strategy for assessing overall effectiveness of the WMP.
Wildfire risk	See Ignition risk.
Wildfire spread likelihood	The likelihood that a fire with a nearby but unknown ignition point will transition into a wildfire and will spread to a location

Term	Definition
	in the service territory based on a probabilistic set of weather profiles, vegetation, and topography.
Wildland-urban interface (WUI)	The line, area, or zone where structures and other human development meet or intermingle with undeveloped wildland or vegetation fuels (National Wildfire Coordinating Group). Enforcement agencies also designate the WUI as the area at significant risk from wildfires, established pursuant to Title 24, Part 2, Chapter 7A.
Wire down	Instance where an electric transmission or distribution conductor is broken and falls from its intended position to rest on the ground or a foreign object.
Work order	A prescription for asset or vegetation management activities resulting from asset or vegetation management inspection findings.
Workshop	Discussion that resembles a seminar but is employed to build specific products, such as a draft plan or policy (e.g., a multi- year training and exercise plan).

Definitions of Initiatives by Category

Category	Section #	Initiative	Definition
Overview of the Service Territory	5.4.5	Environmental compliance and permitting	Development and implementation of process and procedures to ensure compliance with applicable environmental laws, regulations, and permitting related to the implementation of the WMP.
Risk Methodology and Assessment	6	Risk Methodology and Assessment	Development and use of tools and processes to assess the risk of wildfire and PSPS across an electrical corporation's service territory.
Wildfire Mitigation Strategy Development	7	Wildfire Mitigation Strategy Development	Development and use of processes for deciding on a portfolio of mitigation initiatives to achieve maximum feasible risk reduction and that meet the goals of the WMP.
Grid Design, Operations, and Maintenance	8.1.2.1	Covered conductor installation	Installation of covered or insulated conductors to replace standard bare or unprotected conductors (defined in accordance with GO 95 as supply conductors, including but not limited to lead wires, not enclosed in a grounded metal pole or not covered by: a "suitable protective covering" (in accordance with Rule 22.8), grounded metal conduit, or grounded metal sheath or shield). In accordance with GO 95, conductor is defined as a material suitable for: (1) carrying electric current, usually in the form of a wire, cable or bus bar, or (2) transmitting light in the case of fiber optics; insulated conductors as those which are surrounded by an insulating material (in accordance with Rule 21.6), the dielectric strength of which is sufficient to withstand the

			maximum difference of potential at normal operating voltages of the circuit without breakdown or puncture; and suitable protective covering as a covering of wood or other non-conductive material having the electrical insulating efficiency (12kV/in. dry) and impact strength (20ft.-lbs) of 1.5 inches of redwood or other material meeting the requirements of Rule 22.8-A, 22.8-B, 22.8-C or 22.8-D.
Grid Design, Operations, and Maintenance	8.1	Undergrounding of electric lines and/or equipment	Actions taken to convert overhead electric lines and/or equipment to underground electric lines and/or equipment (i.e., located underground and in accordance with GO 128).
Grid Design, Operations, and Maintenance	8.1.2.3	Distribution pole replacements and reinforcements	Remediation, adjustments, or installations of new equipment to improve or replace existing distribution poles (i.e., those supporting lines under 65kV), including with equipment such as composite poles manufactured with materials reduce ignition probability by increasing pole lifespan and resilience against failure from object contact and other events.
Grid Design, Operations, and Maintenance	8.1.2.4	Transmission pole/tower replacements and reinforcements	Remediation, adjustments, or installations of new equipment to improve or replace existing transmission towers (e.g., structures such as lattice steel towers or tubular steel poles that support lines at or above 65kV).
Grid Design, Operations, and Maintenance	8.1.2.5	Traditional overhead hardening	Maintenance, repair, and replacement of capacitors, circuit breakers, cross-arms, transformers, fuses, and connectors (e.g., hot line clamps) with the intention of minimizing the risk of ignition.

Grid Design, Operations, and Maintenance	8.1.2.6	Emerging grid hardening technology installations and pilots	Development, deployment, and piloting of novel grid hardening technology.
Grid Design, Operations, and Maintenance	8.1.2.7	Microgrids	Development and deployment of microgrids that may reduce the risk of ignition, risk from PSPS, and wildfire consequence. "Microgrid" is defined by Public Utilities Code section 8370(d).
Grid Design, Operations, and Maintenance	8.1.2.8	Installation of system automation equipment	Installation of electric equipment that increases the ability of the electrical corporation to automate system operation and monitoring, including equipment that can be adjusted remotely such as automatic reclosers (switching devices designed to detect and interrupt momentary faults that can reclose automatically and detect if a fault remains, remaining open if so).
Grid Design, Operations, and Maintenance	8.1.2.9	Line removals (in HFTD)	Removal of overhead lines to minimize the risk of ignition due to the design, location, or configuration of electric equipment in HFTDs.
Grid Design, Operations, and Maintenance	8.1.2.10	Other grid topology improvements to minimize risk of ignitions	Actions taken to minimize the risk of ignition due to the design, location, or configuration of electric equipment in HFTDs not covered by another initiative.
Grid Design, Operations, and Maintenance	8.1.2.11	Other grid topology improvements to mitigate or reduce PSPS events	Actions taken to mitigate or reduce PSPS events in terms of geographic scope and number of customers affected not covered by another initiative.

Grid Design, Operations, and Maintenance	8.1.2.12	Other technologies and systems not listed above	Other grid design and system hardening actions which the electrical corporation takes to reduce its ignition and PSPS risk not otherwise covered by other initiatives in this section.
Grid Design, Operations, and Maintenance	8.1.3.1	Asset inspections	Inspections of overhead electric transmission lines, equipment, and right-of-way.
Grid Design, Operations, and Maintenance	8.1.4	Equipment maintenance and repair	Remediation, adjustments, or installations of new equipment to improve or replace existing connector equipment, such as hotline clamps.
Grid Design, Operations, and Maintenance	8.1.5	Asset management and inspection enterprise system(s)	Operation of and support for centralized asset management and inspection enterprise system(s) updated based upon inspection results and activities such as hardening, maintenance, and remedial work.
Grid Design, Operations, and Maintenance	8.1.6	Quality assurance / quality control	Establishment and function of audit process to manage and confirm work completed by employees or contractors, including packaging QA/QC information for input to decision-making and related integrated workforce management processes.
Grid Design, Operations, and Maintenance	8.1.7	Open work orders	Actions taken to manage the electrical corporation's open work orders resulting from inspections that prescribe asset management activities.
Grid Design, Operations, and Maintenance	8.1.8.1	Equipment Settings to Reduce Wildfire Risk	The electrical corporation's procedures for adjusting the sensitivity of grid elements to reduce wildfire risk.
Grid Design, Operations, and Maintenance	8.1.8.2	Grid Response Procedures and Notifications	The electrical corporation's procedures it uses to respond to faults, ignitions, or other issues detected on its grid that may result in a wildfire.

Grid Design, Operations, and Maintenance	8.1	Personnel Work Procedures and Training in Conditions of Elevated Fire Risk	Work activity guidelines that designate what type of work can be performed during operating conditions of different levels of wildfire risk. Training for personnel on these guidelines and the procedures they prescribe, from normal operating procedures to increased mitigation measures to constraints on work performed.
Grid Design, Operations, and Maintenance	8.1.9	Workforce Planning	Programs to ensure that the electrical corporation has qualified asset personnel and to ensure that both employees and contractors tasked with asset management responsibilities are adequately trained to perform relevant work.
Vegetation Management and Inspection	8.2.2.1	Vegetation inspections	Inspections of vegetation around and adjacent to electrical facilities and equipment that may be hazardous by growing, blowing, or falling into electrical facilities or equipment.
Vegetation Management and Inspection	8.2.3.1	Pole clearing	Plan and execution of vegetation removal around poles per Public Resources Code section 4292 and outside the requirements of Public Resources Code section 4292 (e.g., pole clearing performed outside of the State Responsibility Area).
Vegetation Management and Inspection	8.2.3.2	Wood and slash management	Actions taken to manage all downed wood and "slash" generated from vegetation management activities.
Vegetation Management and Inspection	8.2.3.3	Clearance	Actions taken after inspection to ensure that vegetation does not encroach upon electrical equipment and facilities, such as tree trimming.
Vegetation Management and Inspection	8.2.3.4	Fall-in mitigation	Actions taken to identify and remove or otherwise remediate trees that pose a high risk of failure or fracture that could potentially strike electrical equipment.

Vegetation Management and Inspection	8.2.3.5	Substation defensible space	Actions taken to reduce ignition probability and wildfire consequence due to contact with substation equipment.
Vegetation Management and Inspection	8.2.3.6	High-risk species	Actions taken to reduce the ignition probability and wildfire consequence attributable to high-risk species of vegetation.
Vegetation Management and Inspection	8.2.3.7	Fire-resilient rights-of-way	Actions taken to promote vegetation communities that are sustainable, fire-resilient, and compatible with the use of the land as an electrical corporation right-of- way.
Vegetation Management and Inspection	8.2.3.8	Emergency response vegetation management	Planning and execution of vegetation activities in response to emergency situations including weather conditions that indicate an elevated fire threat and post-wildfire service restoration.
Vegetation Management and Inspection	8.2.4	Vegetation management enterprise system	Operation of and support for centralized vegetation management and inspection enterprise system(s) updated based upon inspection results and activities such as hardening, maintenance, and remedial work.
Vegetation Management and Inspection	8.2.5	Quality assurance / quality control	Establishment and function of audit process to manage and confirm work completed by employees or contractors, including packaging QA/QC information for input to decision-making and related integrated workforce management processes.
Vegetation Management and Inspection	8.2.6	Open work orders	Actions taken to manage the electrical corporation's open work orders resulting from inspections that prescribe vegetation management activities.

Vegetation Management and Inspection	8.2.7	Workforce planning	Programs to ensure that the electrical corporation has qualified vegetation management personnel and to ensure that both employees and contractors tasked with vegetation management responsibilities are adequately trained to perform relevant work.
Situational Awareness and Forecasting	8.3.2	Environmental monitoring systems	Development and deployment of systems which measure environmental characteristics, such as fuel moisture, air temperature, and velocity.
Situational Awareness and Forecasting	8.3.3	Grid monitoring systems	Development and deployment of systems that checks the operational conditions of electrical facilities and equipment and detects such things as faults, failures, and recloser operations.
Situational Awareness and Forecasting	8.3.4	Ignition detection systems	Development and deployment of systems which discover or identify the presence or existence of an ignition, such as cameras.
Situational Awareness and Forecasting	8.3.5	Weather forecasting	Development methodology for forecast of weather conditions relevant to electrical corporation operations, forecasting weather conditions and conducting analysis to incorporate into utility decision-making, learning and updates to reduce false positives and false negatives of forecast PSPS conditions.
Situational Awareness and Forecasting	8.3.6	Fire potential index	Calculation and application of a landscape scale index used as a proxy for assessing real-time risk of a wildfire under current and forecasted weather conditions.
Emergency Preparedness	8.4.2	Emergency preparedness plan	Development and integration of wildfire- and PSPS-specific emergency strategies, practices, policies, and procedures into the electrical corporation's overall emergency plan based on the minimum standards described in GO 166.

Emergency Preparedness	8.4.3	External collaboration and coordination	Actions taken to coordinate wildfire and PSPS emergency preparedness with relevant public safety partners including the state, cities, counties, and tribes.
Emergency Preparedness	8.4.5	Public emergency communication strategy	Development and integration of a comprehensive communication strategy to inform essential customers and other stakeholder groups of wildfires, outages due to wildfires, and PSPS and service restoration, as required by Public Utilities Code section 768.6.
Emergency Preparedness	8.4.6	Preparedness and planning for service restoration	Development and integration of the electrical corporation's plan to restore service after an outage due to a wildfire or PSPS event.
Emergency Preparedness	8.4.6	Customer support in wildfire and PSPS emergencies	Development and deployment of programs, systems, and protocols to support residential and non-residential customers in wildfire emergencies and PSPS events.
Community Outreach and Engagement	8.5.2	Public outreach and education awareness program	Development and deployment of public outreach and education awareness program(s) for wildfires; outages due to wildfires, PSPS events, and protective equipment and device settings; service restoration before, during, and after the incidents and vegetation management.
Community Outreach and Engagement	8.5.3	Engagement with access and functional needs populations	Actions taken understand, evaluate, design, and implement wildfire and PSPS risk mitigation strategies, policies, and procedures specific to access and functional needs customers.

Community Outreach and Engagement	8.5.4	Collaboration on local wildfire mitigation planning	Development and integration of plans, programs, and/or policies for collaborating with communities on local wildfire mitigation planning, such as wildfire safety elements in general plans, community wildfire protection plans, and local multi-hazard mitigation plans.
Community Outreach and Engagement	8.5.5	Best practice sharing with other utilities	Development and integration of an electrical corporation's policy for sharing best practices and collaborating with other electrical corporations on technical and programmatic aspects of its WMP program.

APPENDIX B: SUPPORTING DOCUMENTATION FOR RISK METHODOLOGY AND ASSESSMENT

Note: As part of its 2023-2025 WMP, the electrical corporation is required to provide the "Summary Documentation" as defined by this appendix. For all other requirements in this appendix, the electrical corporation must be readily able to provide the defined documentation in response to a data request by Energy Safety or designated stakeholders.

The risk modeling and assessment in the main body of these Guidelines and electrical corporation's WMP are focused on providing a streamlined overview of the electrical corporation risk framework and key findings from the assessment necessary to understand the wildfire mitigation strategy presented in Section 7.

The focus of this appendix is to provide additional information pertaining to the risk modeling approach used by the electrical corporation. This includes the following:

- *Additional detail on model calculations supporting the calculation of risk and risk components*
- *Additional detail on the calculation of risk and risk components*
- *More detailed presentation of the risk findings*

The following sections establish the reporting requirements for the approaches used by the electrical corporation to calculate each risk and risk component. These have been synthesized and adapted from guidance documents on model quality assurance developed by many agencies, with a focus on guidance related to machine learning, artificial intelligence, and fire science and engineering. These guidance documents include those from the Institute of Electrical and Electronics Engineers (IEEE),[299] the Society of Fire Protection Engineers (SFPE),[300] the American Society for Testing and Materials (ASTM International),[301] the U.S. Nuclear Regulatory Commission (NRC),[302] the Electric Power Research Institute

[299] *IEEE, 2022, "P2841/D2: Draft Framework and Process for Deep Learning Evaluation."*

(EPRI),[52] the National Institute of Standards and Technology (NIST),[303] and the International Organization for Standardization (ISO).[304]

Summary Documentation

The electrical corporation must provide high-level information on the calculation of each risk and risk component used in its risk analysis.

***High-level bow tie schematic** showing the inputs, outputs, and interaction between risk components in the format shown in Figure SCE B-01. An example is provided below.*

***High-level calculation procedure schematic** in the format shown in Figure SCE B-02 This schematic must show the logical flow from input data to outputs, including separate items for any intermediate calculations in models or sub-models and any input from subject matter experts.*

***High-level narrative describing the calculation procedure** in a concise executive summary. This narrative must include the following:*

- *Purpose of the calculation/model*
- *Assumptions and limitations*
- *Description of the calculation procedure shown in the bow tie and high-level schematics*
- *Description of how outputs will be characterized and presented (e.g., visualization) to decision makers*
- *Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.*

[303] *NIST, 1981, "NBS SP 500-73: Computer Model Documentation Guide."*

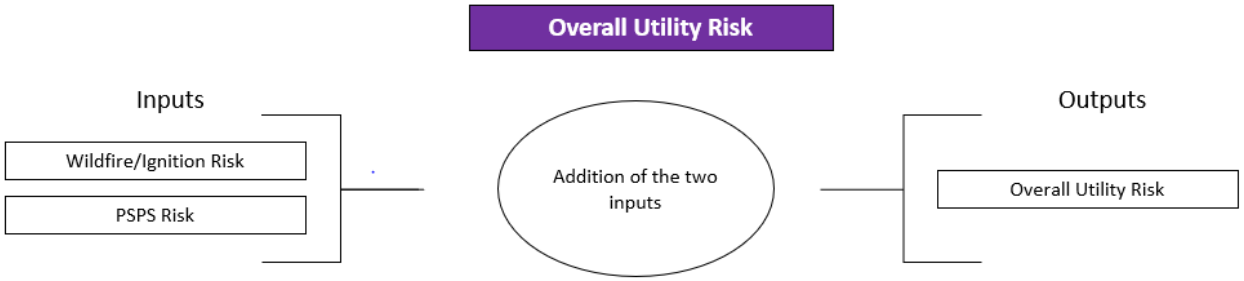
R1: Overall Utility Risk

Figure SCE B-01 - SCE's Overall Utility Risk Bow Tie Schematic



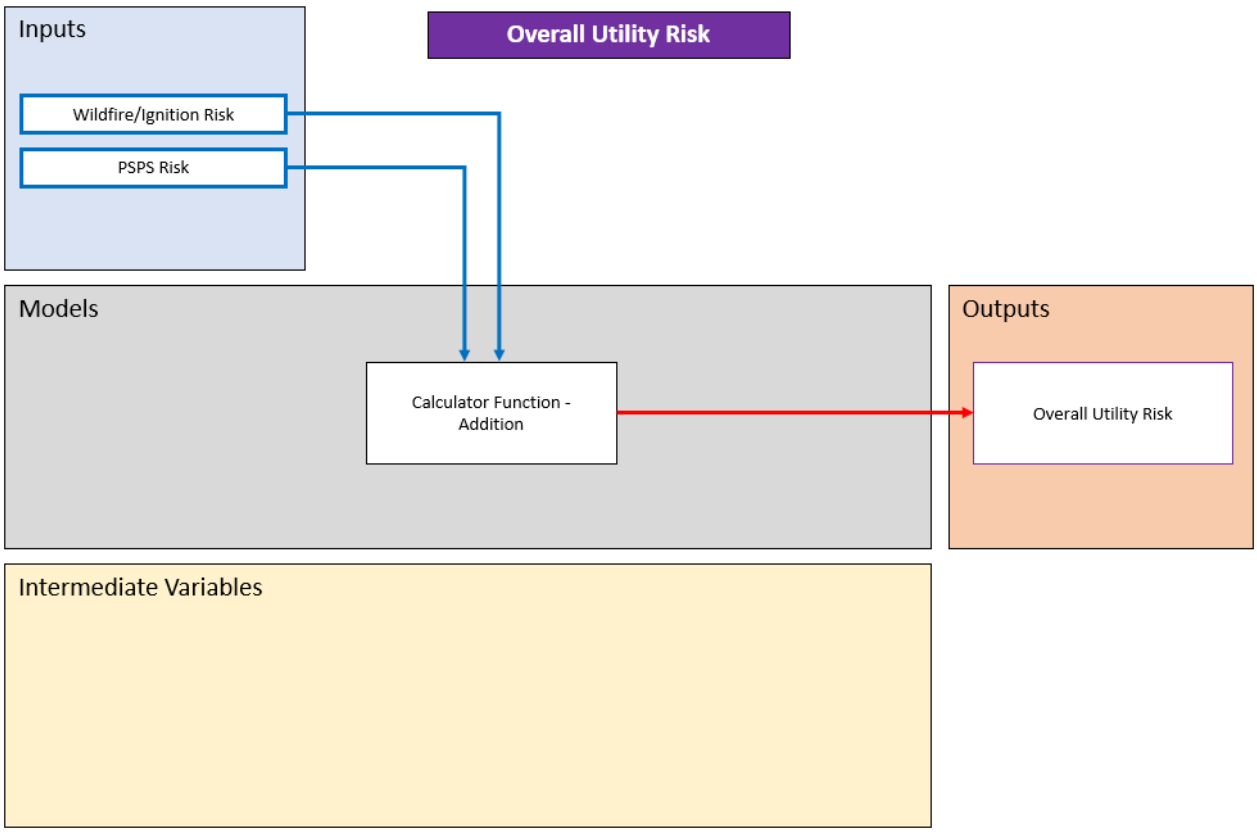


Figure SCE B-02 - SCE's Overall Utility Risk Calculation Procedure Schematic

Purpose of the calculation/model

Overall Utility Risk calculates the overall risk, based on its two sub-components; Wildfire/Ignition Risk and PSPS Risk.

Assumptions and limitations

The risk calculation is based on assumptions and limitations from more granular sub-components (e.g., Likelihood of Ignition, Wildfire Consequences, etc.).

Description of the calculation procedure shown in the bow tie and high-level schematics

Overall Utility Risk is a summation of the Wildfire and PSPS Risk components.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

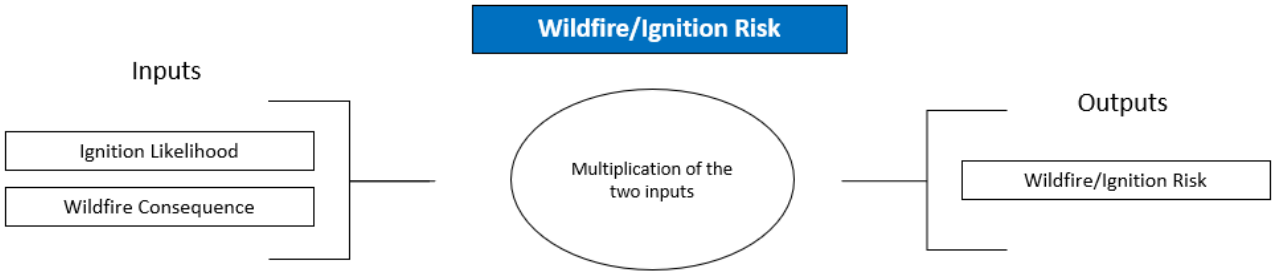
Overall Utility Risk can be broken down into its two components (Wildfire/Ignition Risk and PSPS Risk) and shown in aggregate or individually, depending on the purpose of the presentation.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

Overall Utility Risk is a composite of all the individual sub-components. Please refer to the individual sub-components for description and timeline of key improvements.

R2: Ignition Risk

Figure SCE B-03 - SCE's Ignition Risk Bow Tie Schematic



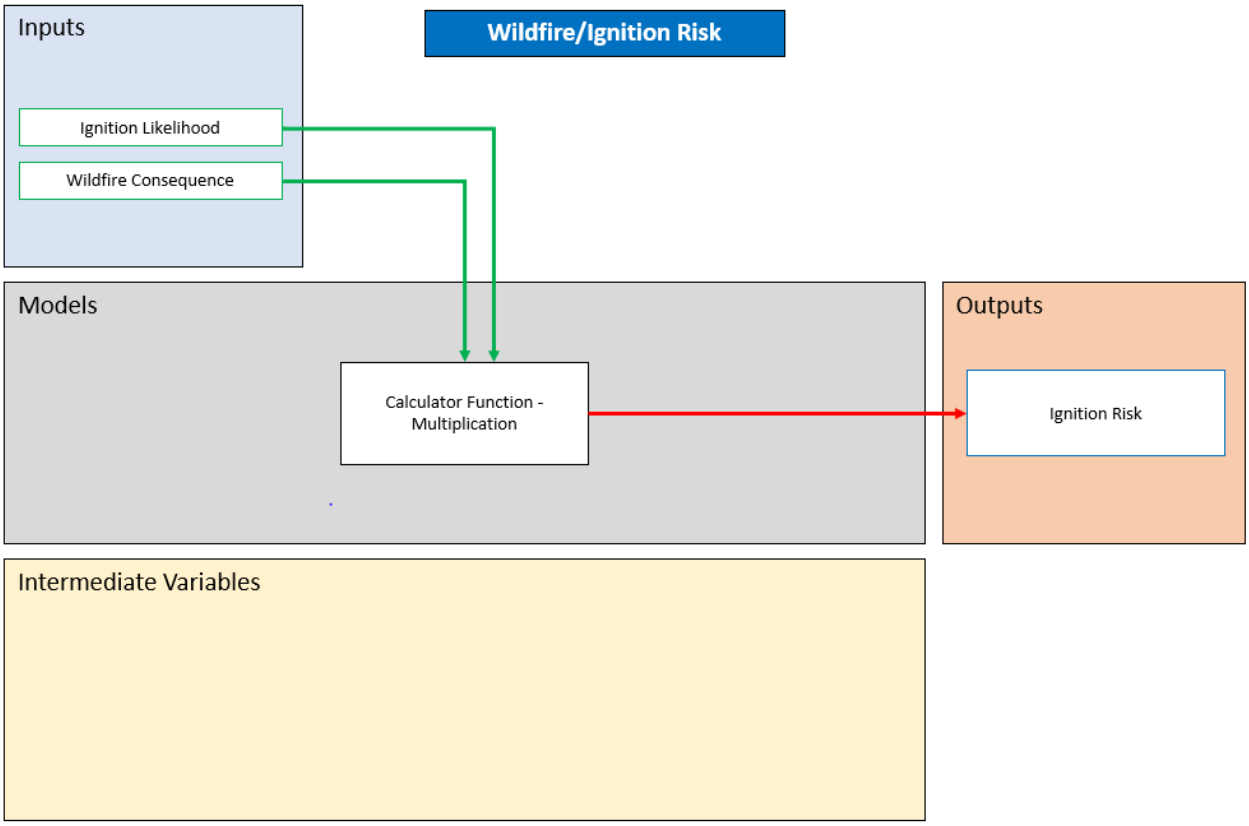


Figure SCE B-04 - SCE's Ignition Risk Calculation Procedure Schematic

Purpose of the calculation/model

SCE considers Ignition Risk synonymous with Wildfire Risk, which is based on its two sub-components, Ignition Likelihood (IRC1) and Wildfire Consequence (IRC3).

Assumptions and limitations

The risk calculation is based on assumptions and limitations from more granular sub-components (e.g., Likelihood of Ignition, Wildfire Consequences, etc.)

Description of the calculation procedure shown in the bow tie and high-level schematics

Ignition or Wildfire Risk is a multiplication of the Ignition Likelihood (IRC1) and Wildfire Consequence (IRC3).

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

Ignition or Wildfire Risk can be broken down into its two components (Ignition Likelihood (IRC1) and Wildfire Consequence (IRC3) and can be further broken down into the subcomponents (e.g. Equipment or Contact from Object Likelihood), depending on the purpose of the presentation.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

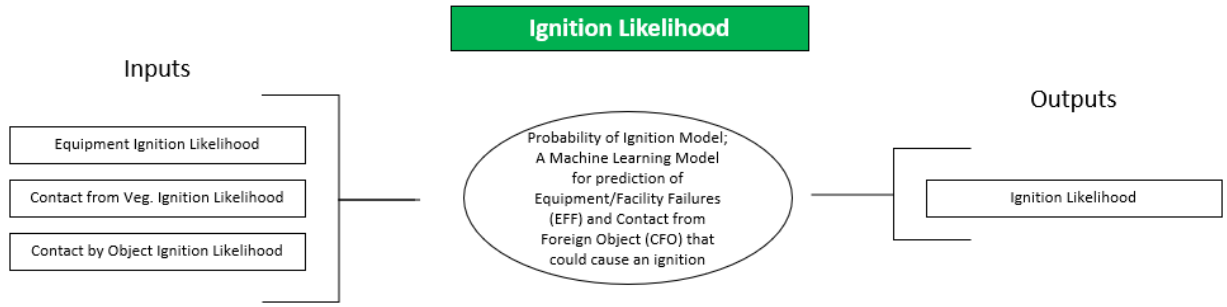
Ignition Risk is a composite of the individual sub-components. Please refer to the individual sub-components for description and timeline of key improvements.

IRC2: Wildfire Likelihood

Please see Section 6.2.1 for SCE's approach to this risk component.

IRC1: Ignition Likelihood

Figure SCE B-05 - SCE's Ignition Likelihood Bow Tie Schematic



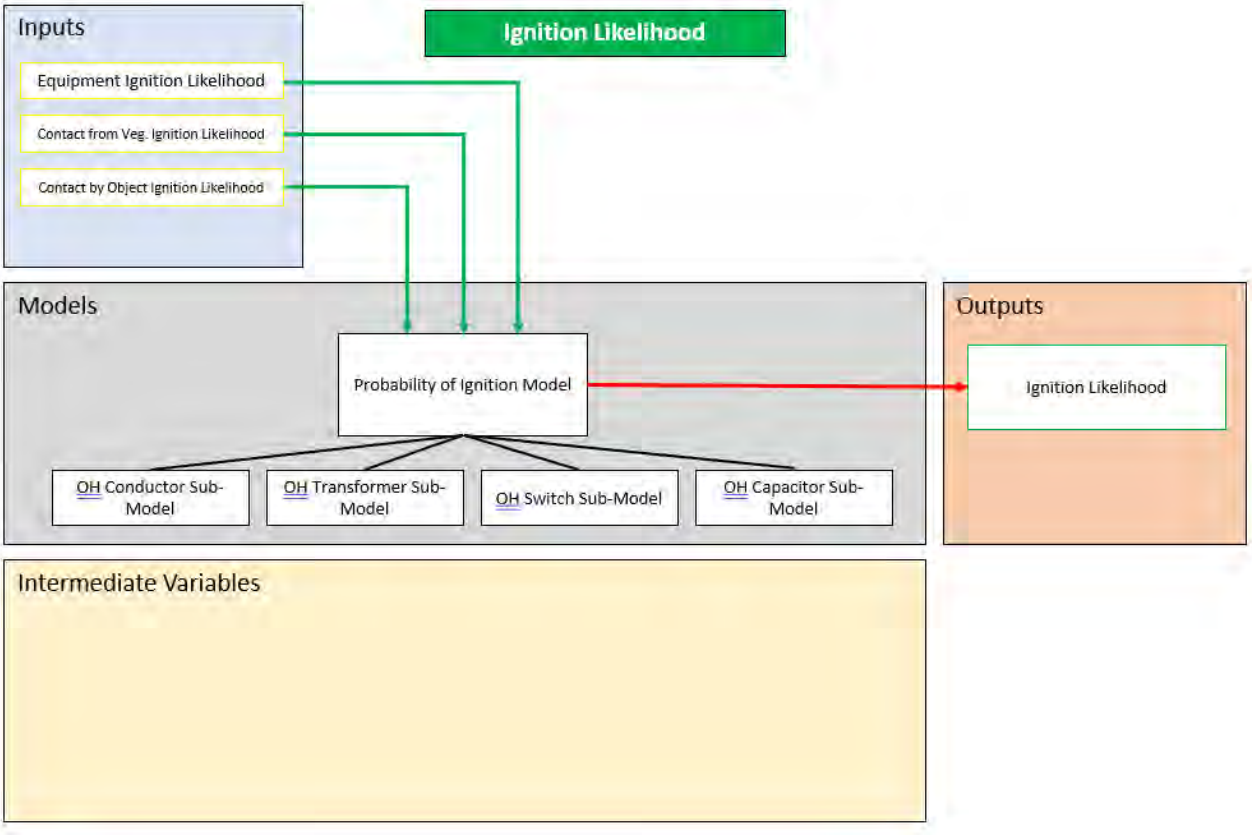


Figure SCE B-06 - SCE's Ignition Likelihood Calculation Procedure Schematic

Purpose of the calculation/model

SCE considers Ignition Likelihood (IRC1) to be synonymous with Probability of Ignition (POI), which is based on inputs of the sub-component likelihood models (Equipment Likelihood of Ignition (FRC1), Contact from Vegetation Likelihood (FRC2), and Contact from Object Likelihood)

Assumptions and limitations

The probability of ignition is a probabilistic assessment of each asset's pre-mitigated ignition likelihood prior to mitigation deployment. SCE does not differentiate between Ignition Likelihood and Wildfire Likelihood. As described in Section 6.1.1, SCE models potential fire behavior and spread from individual utility asset locations.

Description of the calculation procedure shown in the bow tie and high-level schematics

POI is the sum of the ignition component probabilities at that location (i.e., Equipment Ignition Likelihood (FRC1), Contact from Vegetation Ignition Likelihood (FRC2), and Contact by Object Ignition Likelihood (FRC3).

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

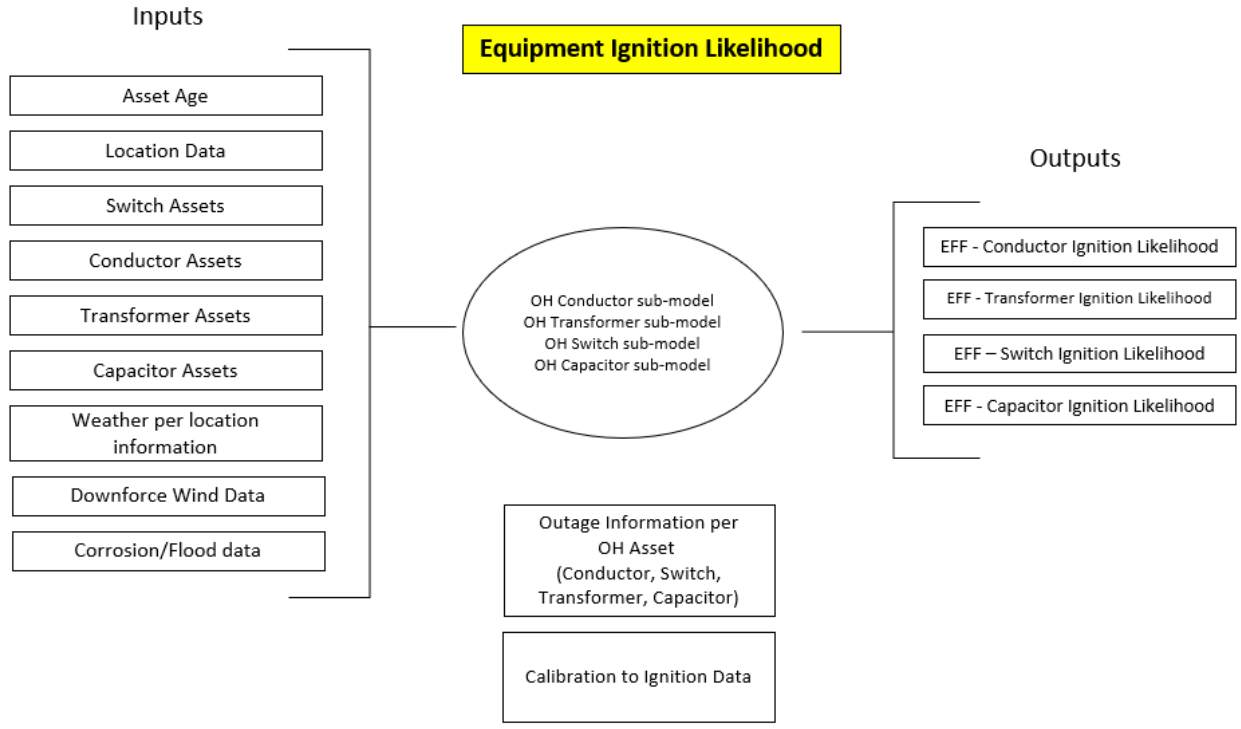
Ignition Likelihood can be broken down into its components (i.e., Equipment Ignition Likelihood (FRC1), Contact from Vegetation Ignition Likelihood (FRC2), and Contact by Object Ignition Likelihood (FRC3) and can be further broken down into the subdrivers (e.g. EFF - Transformers, CFO – Balloon, CFO – Animal, CFO – Vehicles, etc.), depending on the purpose of the presentation.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

Ignition Likelihood is a key component in the calculation of the Ignition Risk. As described in Section 6.7, SCE will develop and evaluate an additional predictive model for secondary conductor as an enhancement to the OH Conductor model to more obtain more granular data for equipment related failures for secondary conductor that contributes to POI sub-drivers. This will ideally provide more accuracy in our asset models between primary and secondary failures for both EFF and CFO subdrivers.

FRC1: Equipment Likelihood of Ignition

Figure SCE B-07 - SCE's Equipment Likelihood of Ignition Bow Tie Schematic



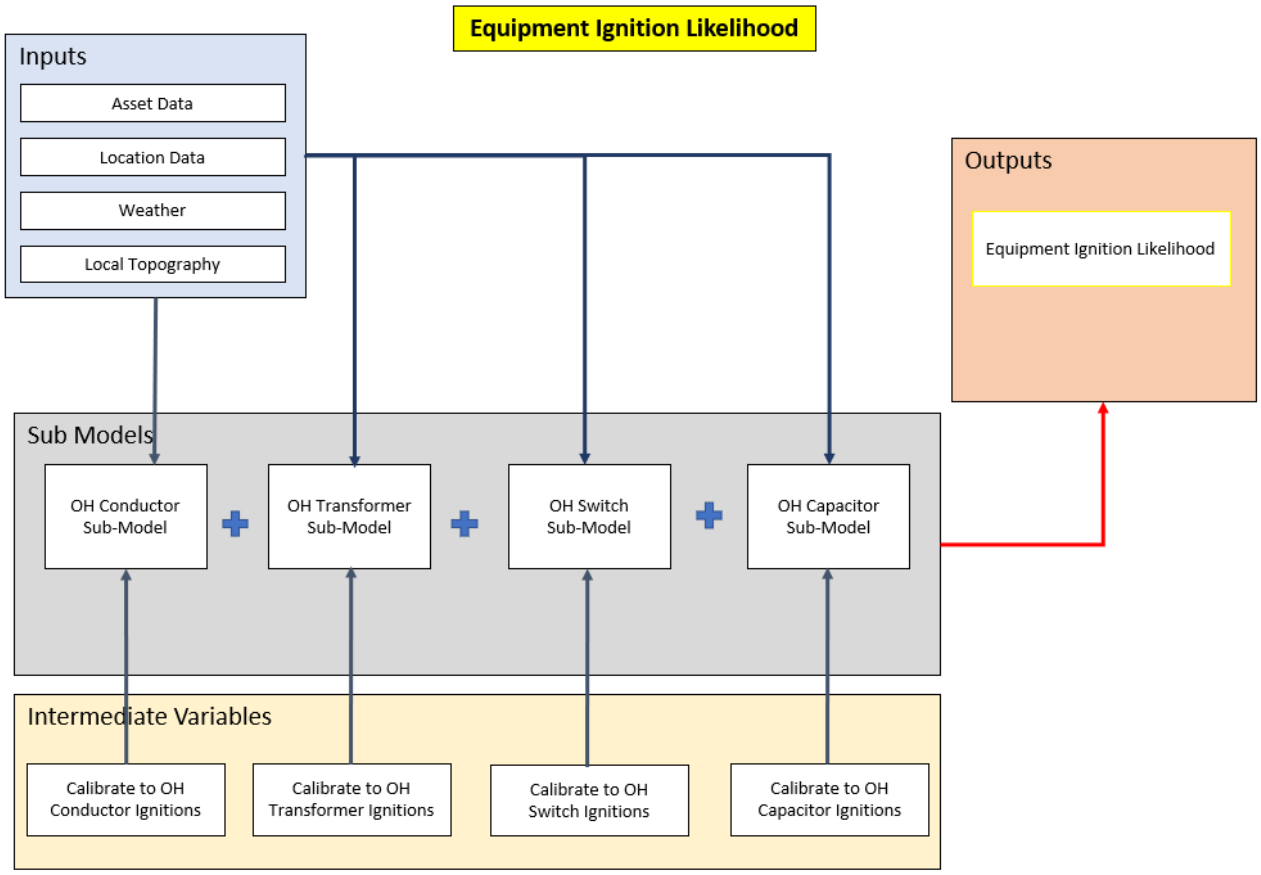


Figure SCE B-08 - SCE's Equipment Likelihood of Ignition Calculation Procedure Schematic

Purpose of the calculation/model

Equipment Ignition Likelihood (FRC1), a subcomponent of Ignition Likelihood (IRC1), calculates the likelihood that electrical corporation-owned equipment will cause an ignition either through normal operation (such as arcing) or through failure.

Assumptions and limitations

The probability of ignition of an Equipment/Facility Failure (EFF POI) is a probabilistic assessment of each asset's pre-mitigated ignition likelihood prior to mitigation deployment.

Description of the calculation procedure shown in the bow tie and high-level schematics

EFF POI is the sum of the ignition component probabilities at that location of the ignition component sub models (e.g. conductor POI, transformer POI, switch POI, capacitor POI). These subcomponent asset models utilize machine learning (ML) algorithms to assess the relevance of ignition drivers relevant to that subcomponent type. Each EFF related subcomponent model uses historical asset outage data, current asset condition (e.g., age, voltage, inspection results, etc.) and relevant environmental attributes (e.g. historical wind, asset loading, number of customers, temperature, relative humidity, etc.). Each model is calibrated with associated outage data for the OH asset type and ignition data.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

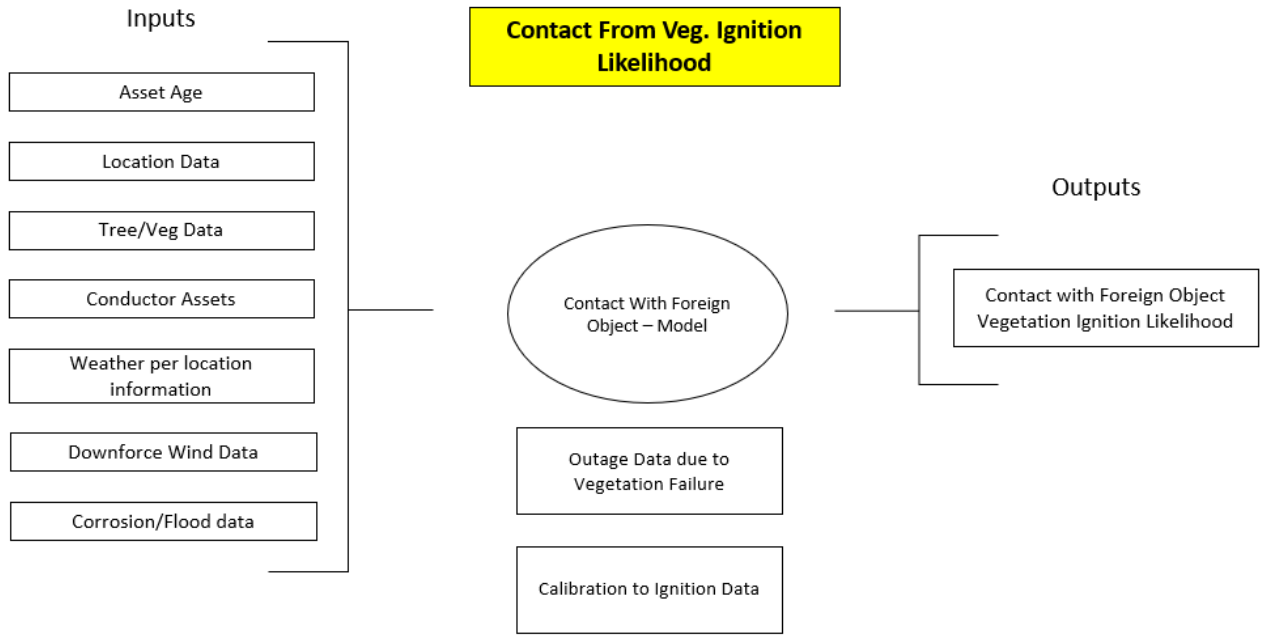
Equipment Ignition Likelihood can be broken down into its subcomponents for each asset model or shown in aggregate for overall SCE system EFF POI depending on the purpose of the presentation.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

In addition to the improvements listed in Section 6.7, SCE will review feedback from the Wildfire Risk Modeling Working group and other stakeholder forums to assess key improvements or changes.

FRC2: Contact from Vegetation Likelihood

Figure SCE B-09 - SCE's Contact from Vegetation Likelihood Bow Tie Schematic



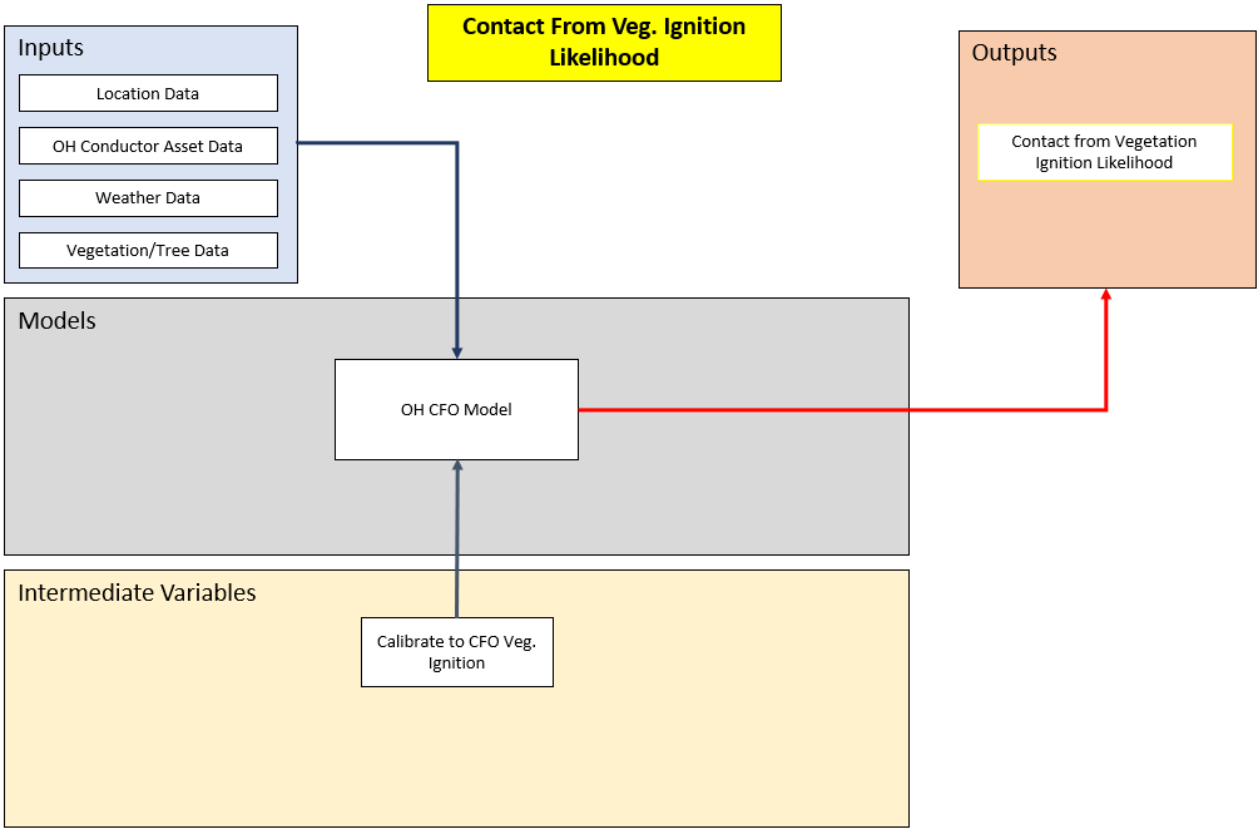


Figure SCE B-10 - SCE's Contact from Vegetation Likelihood Calculation Procedure Schematic

Purpose of the calculation/model

Contact from Vegetation Ignition Likelihood (FRC2), a subcomponent of Ignition Likelihood (IRC1), calculates the likelihood that vegetation will contact electrical corporation-owned equipment and cause an ignition either through a fault or arcing event at a given location.

Assumptions and limitations

The probability of ignition of a Contact from Foreign Object - Vegetation (CFO-Veg POI) is a probabilistic assessment of each asset's pre-mitigated ignition likelihood prior to mitigation deployment.

Description of the calculation procedure shown in the bow tie and high-level schematics

CFO-Veg POI is the output of the Contact from Foreign Object model that utilizes machine learning (ML) algorithms to assess the relevance of ignition subdrivers relevant to vegetation subdrivers. The CFO model uses historical asset outage data, current asset condition (e.g., age, voltage, inspection results, etc.) and relevant environmental attributes (e.g. historical wind, asset loading, number of customers, temperature, relative humidity, etc.). The model is calibrated with associated outage data and ignition data.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

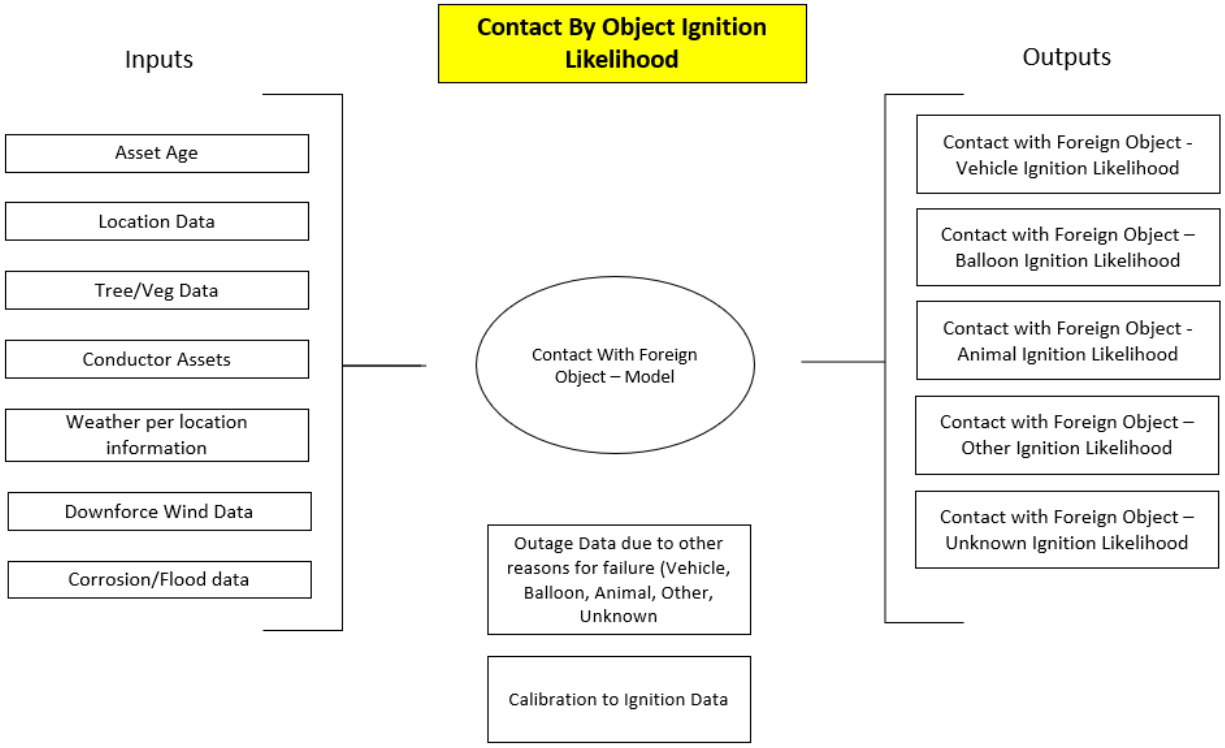
Contact from Vegetation Ignition Likelihood is a subcomponent of the CFO Model and is typically shown in conjunction with other CFO subdrivers (as detailed in Contact by Object Likelihood (FRC3).

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

In addition to the improvements listed in Section 6.7, SCE will review feedback from the Wildfire Risk Modeling Working group and other stakeholder forums to assess key improvements or changes.

FRC3: Contact from Object Likelihood

Figure SCE B-11 - SCE's Contact from Object Likelihood Bow Tie Schematic



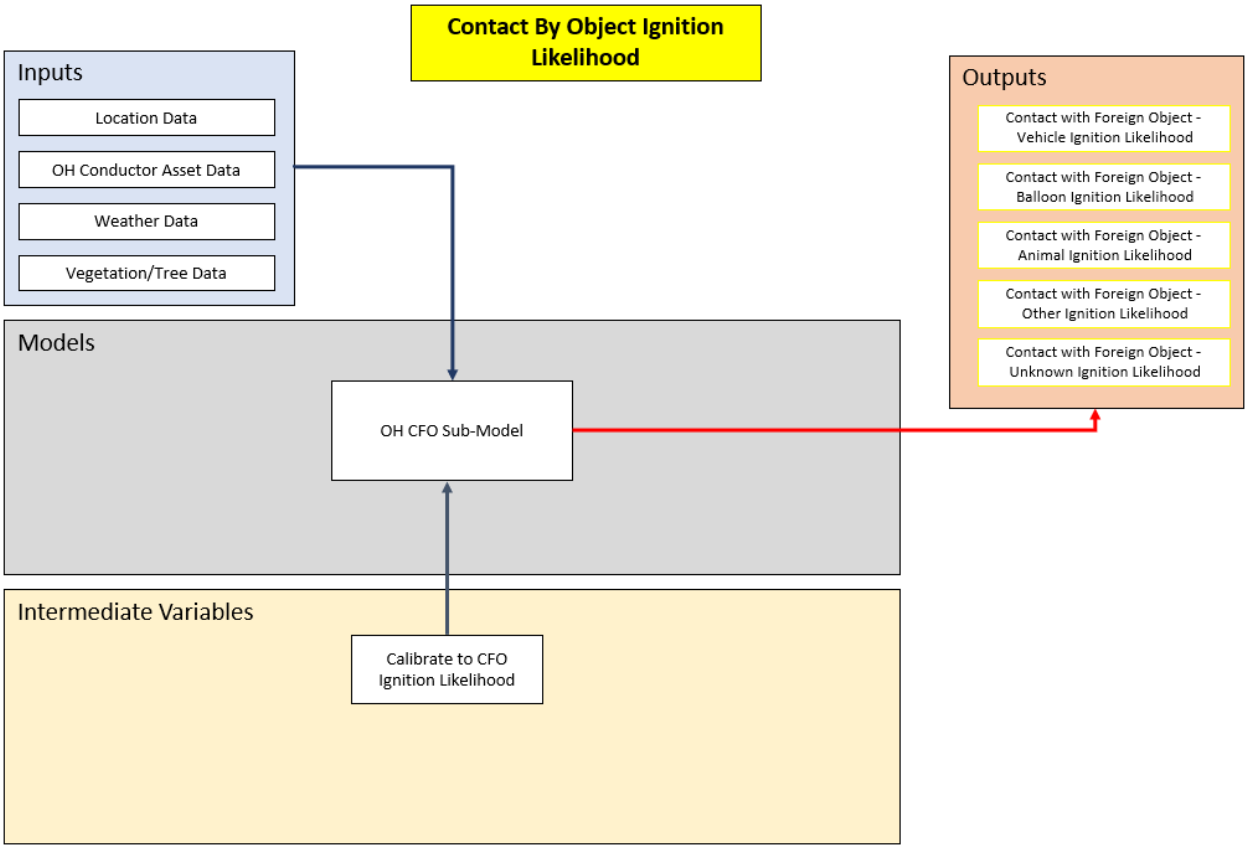


Figure SCE B-12 - SCE's Contact from Object Likelihood Calculation Procedure Schematic

Purpose of the calculation/model

Contact by Object Ignition Likelihood (FRC3), a subcomponent of Ignition Likelihood (IRC1), calculates the likelihood that a non-vegetative object (e.g., vehicle, balloon, animal, other, unknown) will contact electrical corporation-owned equipment and cause an ignition either through a fault or arcing event at a given location.

Assumptions and limitations

The probability of ignition of a Contact from Foreign Object (CFO POI) is a probabilistic assessment of each asset's pre-mitigated ignition likelihood prior to mitigation deployment.

Description of the calculation procedure shown in the bow tie and high-level schematics

CFO POI is the output of the Contact from Foreign Object model that utilizes machine learning (ML) algorithms to assess the relevance of ignition subdrivers relevant to non-vegetative subdrivers (e.g. vehicle, balloon, animal, other, unknown). The CFO model uses historical asset outage data, current asset condition (e.g., age, voltage, inspection results, etc.) and relevant environmental attributes (e.g. historical wind, asset loading, number of customers, temperature, relative humidity, etc.). The model is calibrated with associated outage data for each subdriver and ignition data.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

Contact by Object Ignition Likelihood are subcomponents of the CFO Model and is typically shown in conjunction with other CFO subdrivers (as detailed in Contact from Vegetation Likelihood (FRC2)).

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

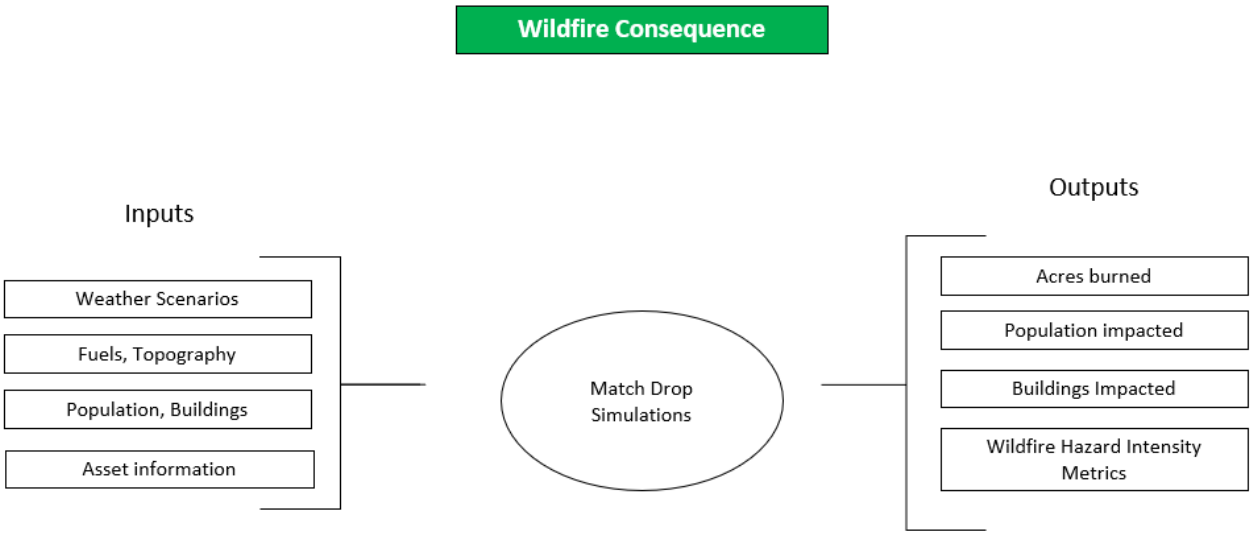
In addition to the improvements listed in Section 6.7, SCE will review feedback from the Wildfire Risk Modeling Working group and other stakeholder forums to assess key improvements or changes.

FRC4: Burn Probability

Please see Section 6.2.1 for SCE's approach to this risk component.

IRC3: Wildfire Consequence

Figure SCE B-13 - SCE's Wildfire Consequence Bow Tie Schematic



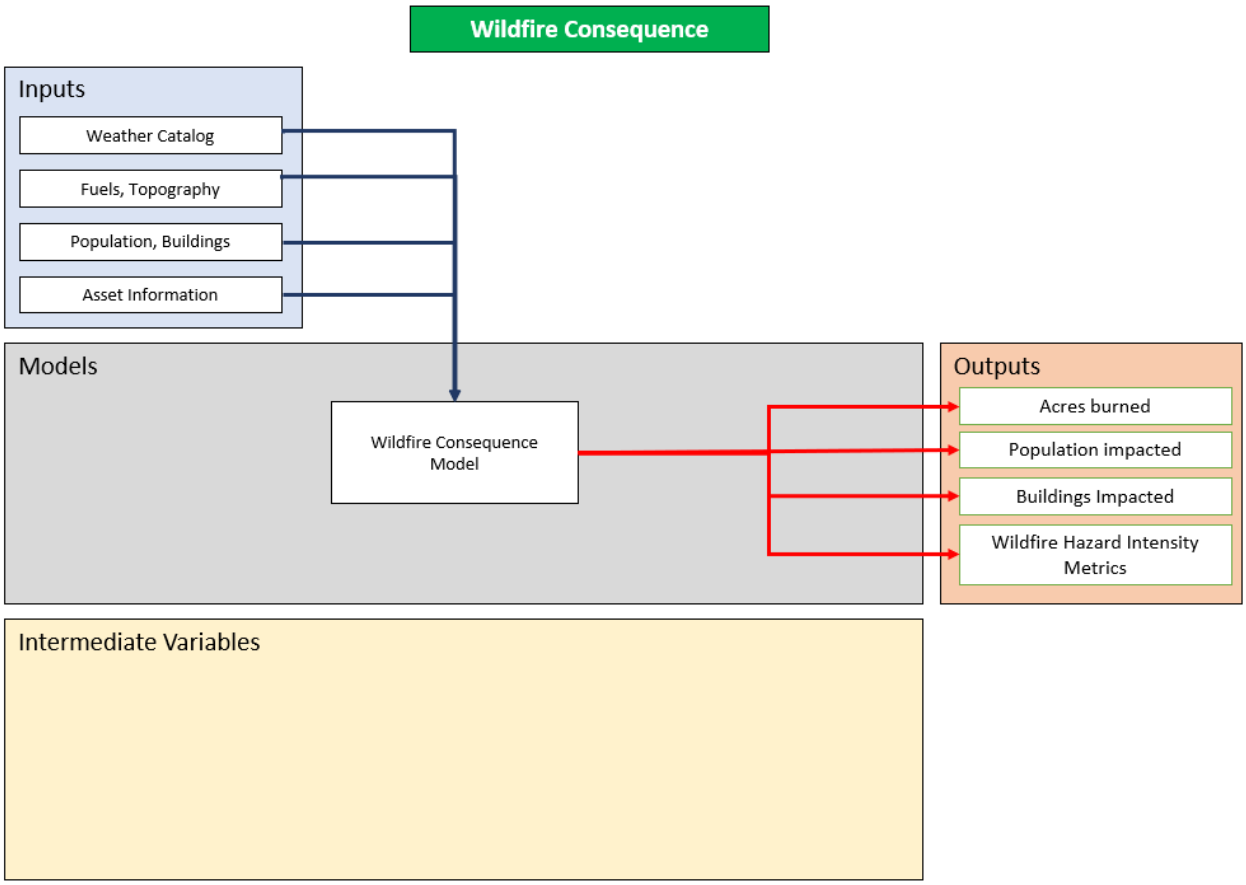


Figure SCE B-14 - SCE's Wildfire Consequence Calculation Procedure Schematic

Purpose of the calculation/model

Wildfire Consequence is used, in conjunction with Wildfire Vulnerability, to assess the impact of potential consequences associated with an ignition event in proximity to overhead assets.

Assumptions and limitations

SCE assumes an eight-hour, unsuppressed burn time for all ignition events. These simulations are representative of a deterministic maximum first burning period. These simulations are intended to provide a relative comparison of the wildfire risk across the landscape in proximity to overhead utility assets.

Description of the calculation procedure shown in the bow tie and high-level schematics

SCE estimates Wildfire Consequences (e.g., acres burned, structures impacted, population impacted) and their associated safety and financial impacts for a given set of deterministic match drop simulations for all overhead assets in SCE's HFTD across 444 weather scenarios using a 2030 fuel projection.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

SCE utilities these natural unit consequences to estimate risk reduction using SCE's MARS Risk Framework (see Section 6.4), as well as to categorize risk within the context of SCE's IWMS Risk Framework.

In the IWMS Risk Framework, SCE categorizes simulated wildfires based on three definitions:

> Significant Fires are simulated fires that, at 8 hours after ignition, burned more than 10,000 acres or had at least one fatality or had at least 50 structures impacted
>
> Destructive Fires are simulated fires that, at 8 hours after ignition, burned between 300 acres and 10,000 acres with zero fatalities and/or had fewer than 50 structures impacted
>
> Small Fires are simulated fires that, at 8 hours after ignition, burned less than 300 acres with zero fatalities and no structures impacted

These three categories inform the risk tranches of Severe Risk Areas (Significant Fires), High Consequence Areas (Destructive Fires), and Other HFRA (Small Fires) that SCE uses to determine mitigation selection, prioritization, and scope deployment. Please see the description of the IWMS methodology in Section 6.2.1 for additional factors considered such as egress and burn-in buffer.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

In addition to the improvements listed in Section 6.7, SCE will review feedback from the Wildfire Risk Modeling Working group and other stakeholder forums to assess key improvements or changes.

FRC5: Wildfire Hazard Intensity

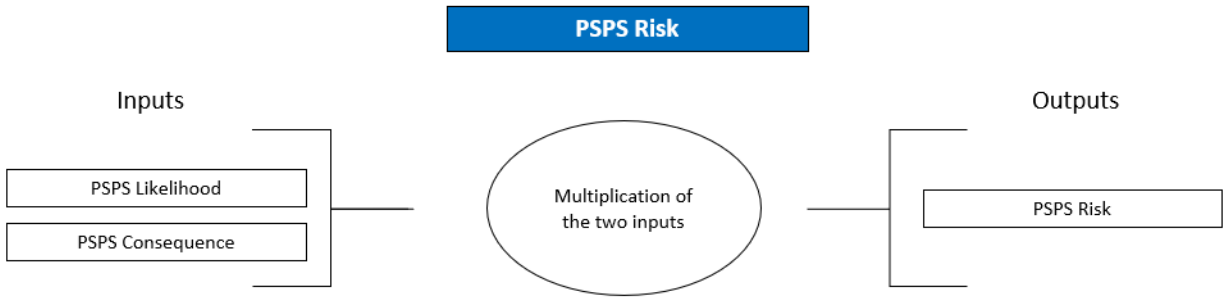
Please see Section 6.2.1 for SCE's approach to this risk component.

FRC6: Wildfire Exposure Potential

Please see Section 6.2.1 for SCE's approach to this risk component.

R3: PSPS Risk

Figure SCE B-15 - SCE's PSPS Risk Bow Tie Schematic



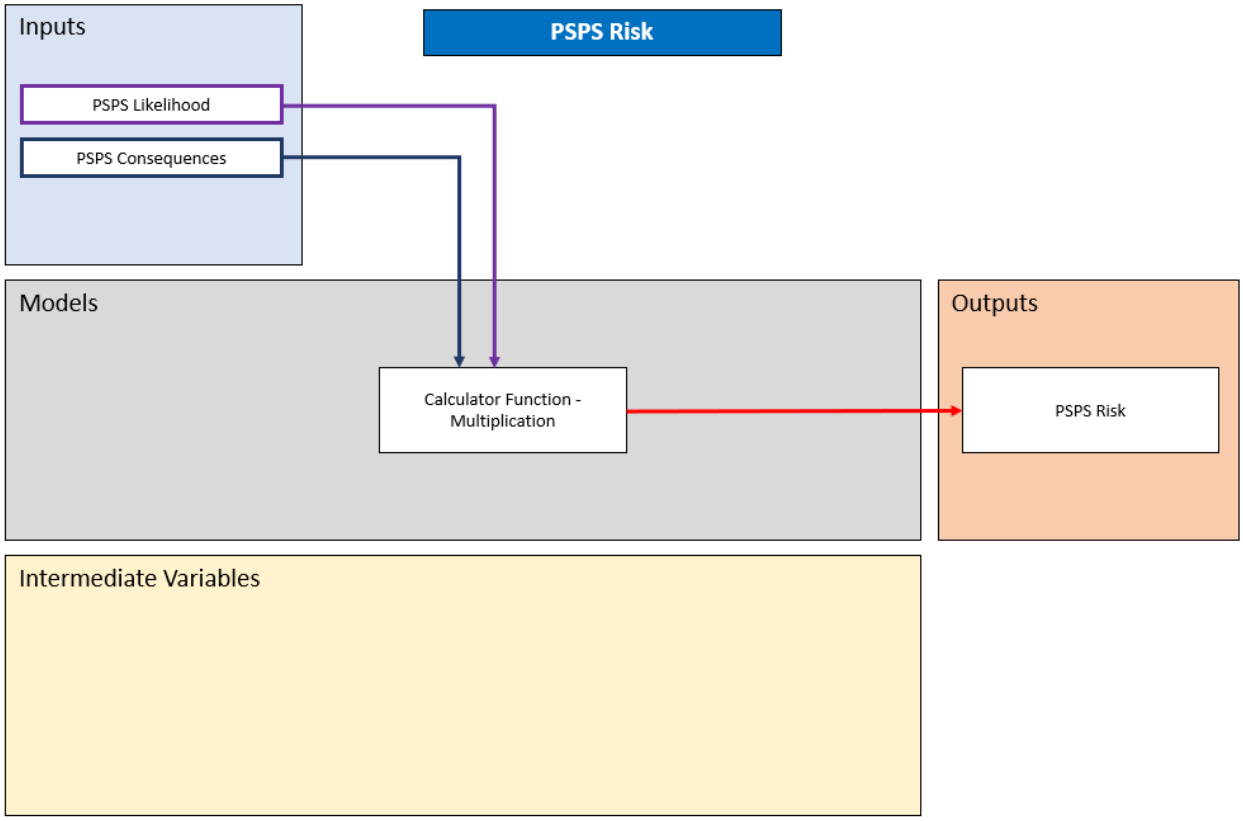


Figure SCE B-16 - SCE's PSPS Risk Calculation Procedure Schematic

Purpose of the calculation/model

PSPS Risk (R3) calculates the overall PSPS risk, based on two inputs – PSPS Likelihood (IRC4) and PSPS Consequences (IRC5).

Assumptions and limitations

The risk calculation is based on assumptions and limitations from more granular sub-components – PSPS Likelihood and PSPS Consequences.

Description of the calculation procedure shown in the bow tie and high-level schematics

PSPS Risk is a product of PSPS Likelihood and PSPS Consequences.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

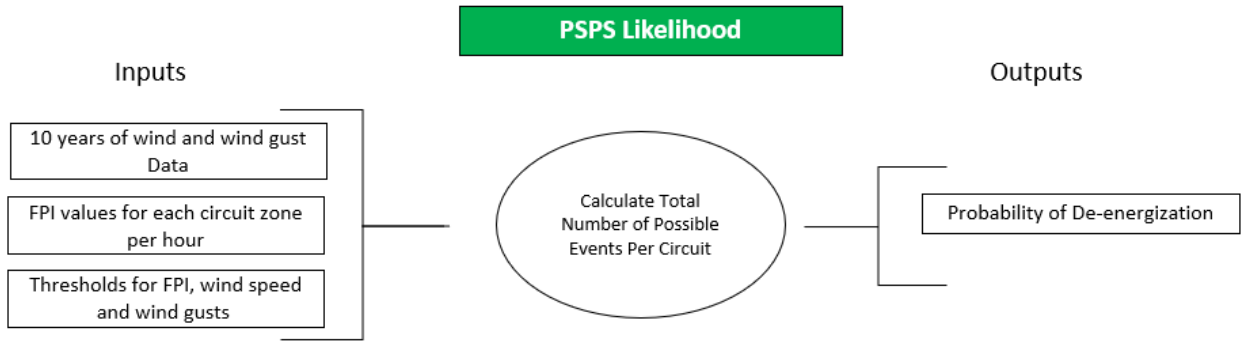
PSPS Risk components (likelihood and consequences) can be shown individually or shown as a single risk score per circuit, depending on the purpose of the presentation.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

PSPS Risk is a composition of the individual sub-components. Please refer to the individual sub-components for description and timeline of key improvements.

IRC4: PSPS Likelihood

Figure SCE B-17 - SCE's PSPS Likelihood Bow Tie Schematic



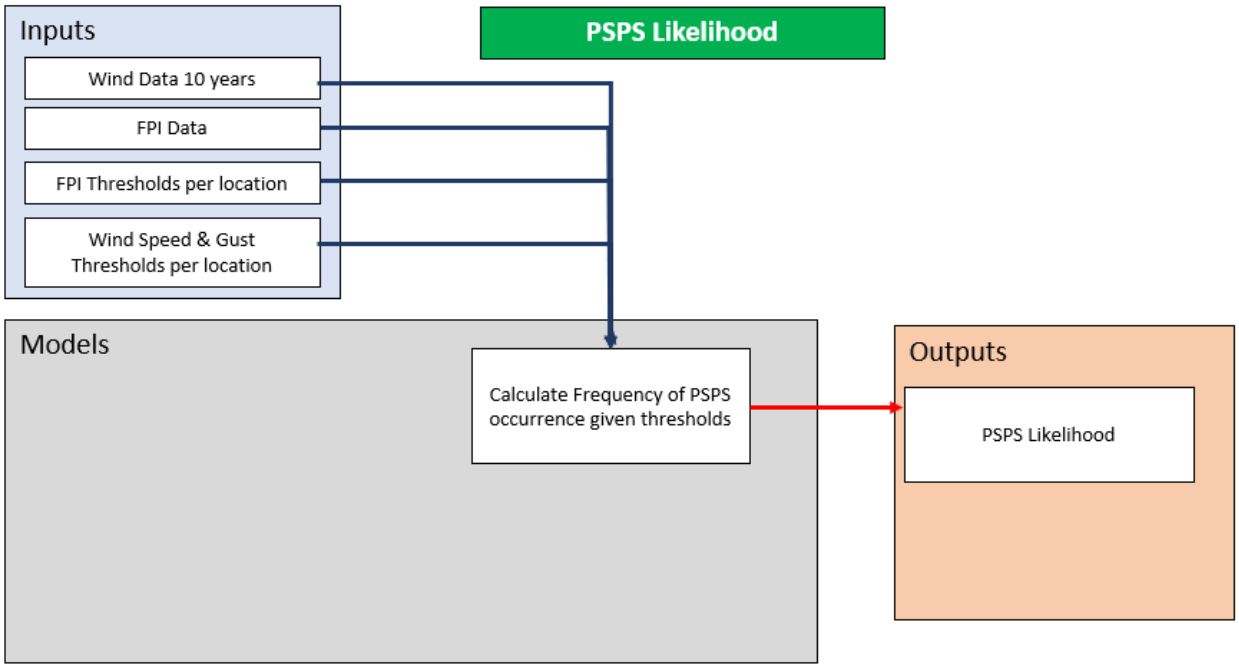


Figure SCE B-18 - SCE's PSPS Likelihood Calculation Procedure Schematic

Purpose of the calculation/model

SCE considers PSPS Likelihood as synonymous with Probability of De-energization (POD). POD is used to estimate the projected frequency and duration of future PSPS events.

Assumptions and limitations

SCE assumes future wind conditions will resemble past conditions. Additionally, SCE assumes current de-energization thresholds will remain in place.

Description of the calculation procedure shown in the bow tie and high-level schematics

Depending on the current state of grid hardening on each individual circuit, the Probability of De-energization is based on the frequency and duration estimates in terms of total annual hours for each circuit. SCE utilizes de-energization thresholds based on historical wind speed, and wind gusts conditions and hourly FPI values to approximate the likely frequency and duration of PSPS events for both harden and unharden circuits. See De-energization Thresholds in Table SCE-B-01 below.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

Table SCE B-01 provides the de-energization thresholds of harden and unhardened circuits. The hardened or unharden calculated exceedance will determine the projected frequency and duration of future PSPS events

Table SCE B-01 - De-energization Thresholds

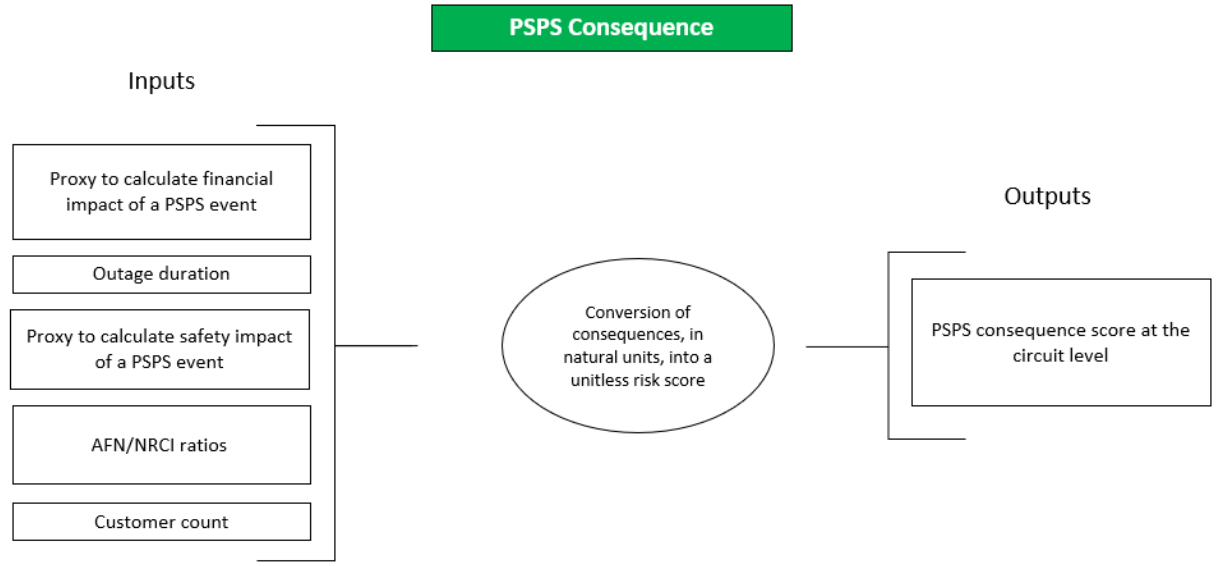
Unhardened Thresholds)	FPI > 12 AND Wind (Sustained) > 31 mph OR Wind (Gust) > 46 mph
Hardened Thresholds	FPI > 13 in all Fire Climate Zones (FCZs) except Zone 1 “Coastal” where FPI > 12 is used AND Wind (Sustained) > 40 mpg OR Wind (Gust) > 58 mph.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

In addition to the improvements listed in Section 6.7, SCE will review feedback from the Wildfire Risk Modeling Working group and other stakeholder forums to assess key improvements or changes.

IRC5: PSPS Consequence

Figure SCE B-19 - SCE's PSPS Consequence Bow Tie Schematic



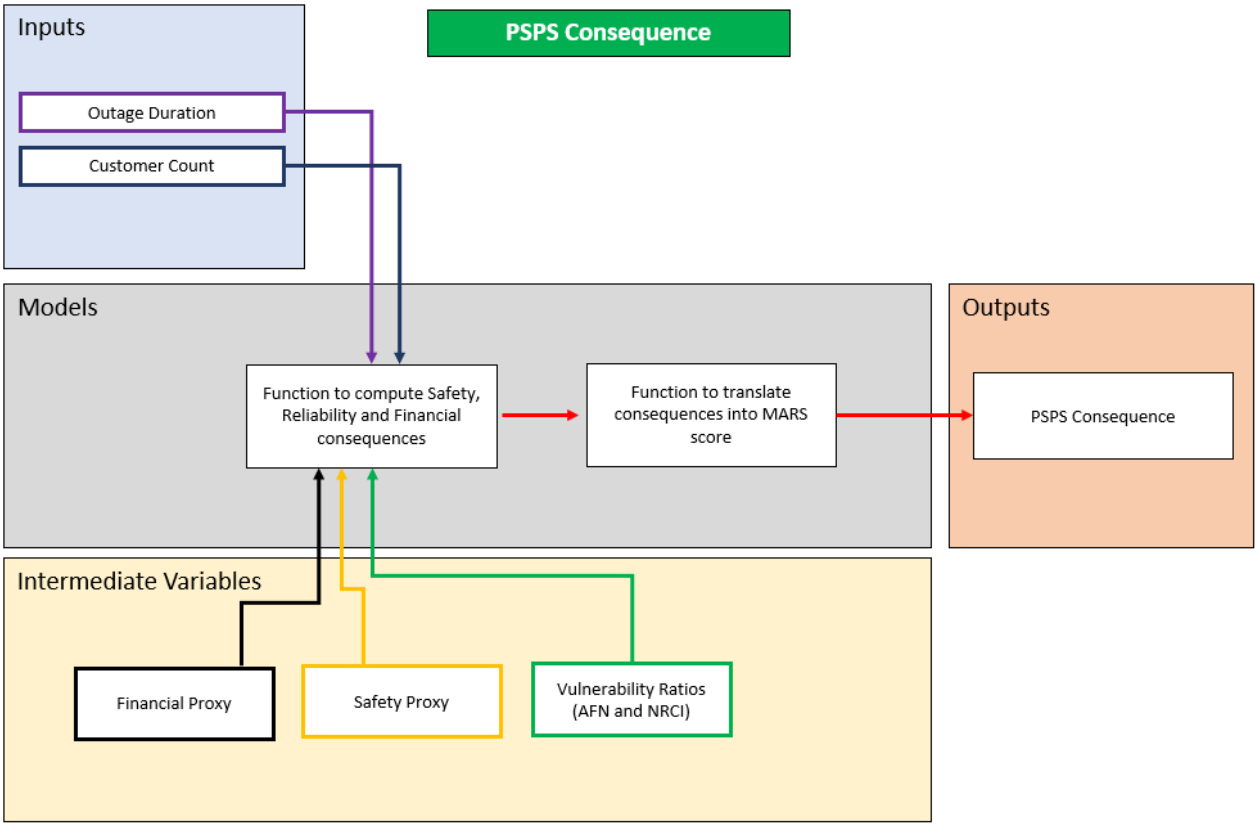


Figure SCE B-20 - SCE's PSPS Consequence Calculation Procedure Schematic

Purpose of the calculation/model

PSPS Consequences (IRC5) calculates the consequence components (Safety, Reliability, and Financial) from a PSPS event and then translates it into a MARS score.

Assumptions and limitations

This component assumes an 8-hour outage duration, which was chosen to be consistent with the duration of the wildfire simulation. In addition, SCE developed proxies to convert customers' outage duration into financial and safety consequences. Limitations can include using a singular proxy value for safety and especially financial consequences, acknowledging that there can be a broad range of outcomes.

Description of the calculation procedure shown in the bow tie and high-level schematics

SCE takes two inputs, number of customers and outage duration, in combination with the financial and safety proxies to compute safety, reliability and financial consequences as described in Section 6.2.2. A PSPS vulnerability multiplier is applied to the safety component to factor in access and functional needs customers. The last step is to translate the consequences, in natural units of measurement, to a unitless MARS risk score using the MAVF framework.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

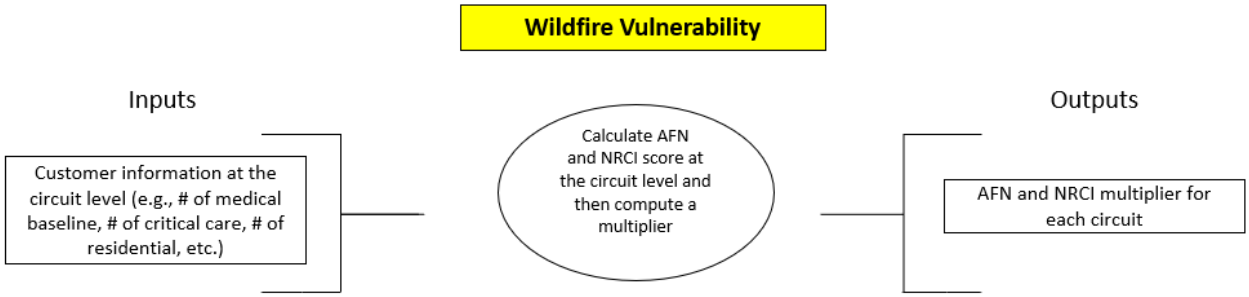
The consequence components of safety, reliability and financial can be presented individually or in aggregate at the circuit level.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

In addition to the improvements listed in Section 6.7, SCE will review feedback from the Wildfire Risk Modeling Working group and other stakeholder forums to assess key improvements or changes.

FRC7: Wildfire Vulnerability

Figure SCE B-21 - SCE's Wildfire Vulnerability Bow Tie Schematic



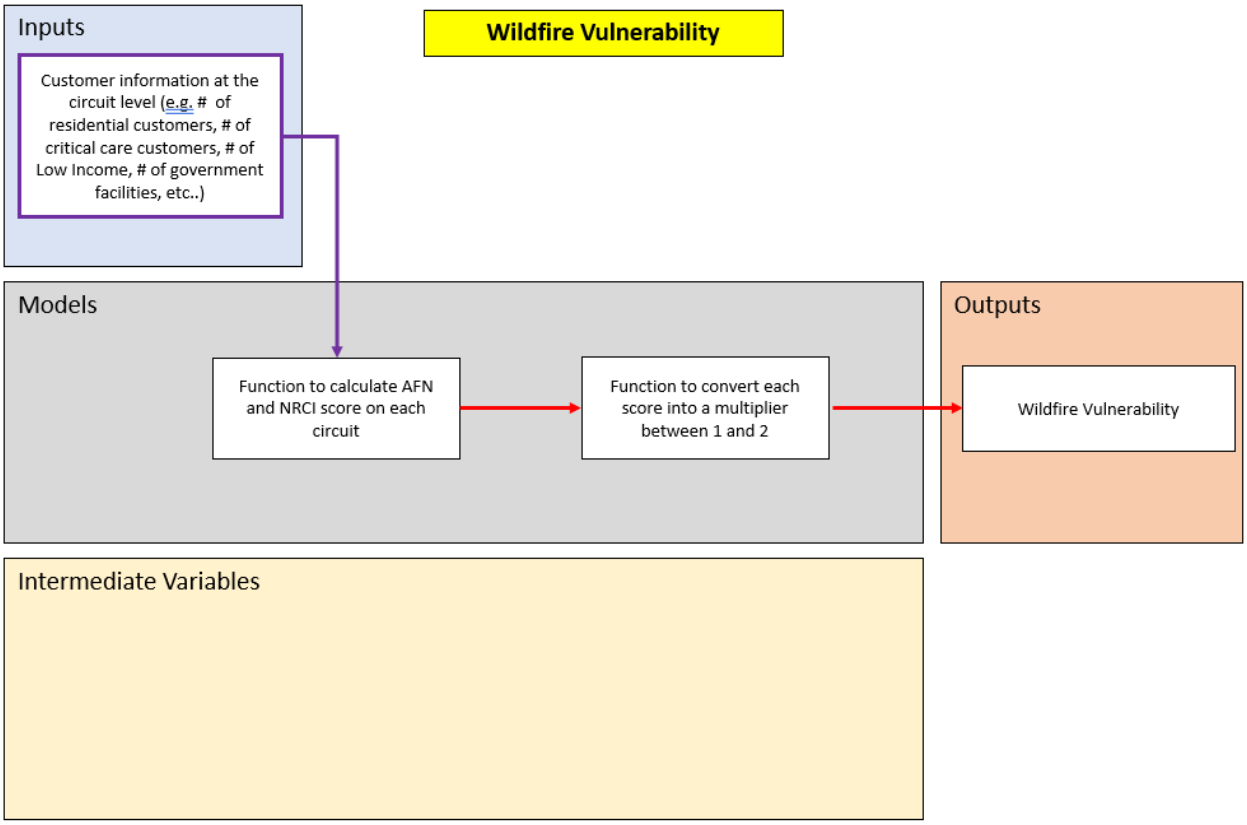


Figure SCE B-22 - SCE's Wildfire Vulnerability Calculation Procedure Schematic

Purpose of the calculation/model

Wildfire Vulnerability (FRC7) calculates the AFN/NRCI multiplier to be used as an amplifier to the Wildfire Safety consequence.

Assumptions and limitations

SCE assumes certain weightings for AFN characteristics (# of critical care, # of medical baseline, etc.) in its formulation of a composite score at the circuit level. Limitations may include availability to the latest data or data lag.

Description of the calculation procedure shown in the bow tie and high-level schematics

The methodology to calculate the multiplier is described in Section 6.2.2.2. SCE takes the composite score on each circuit and develops a multiplier for each circuit based on the calculation below:

$$AFN_{CircuitMultiplier} = 1 + \frac{AFN_{Score\_circuit}}{AFN_{Score\_MAX}}$$

A similar framework is used to develop the NRCI multiplier.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

The output is a multiplier that is used to amplify the Wildfire Safety Consequences. It is not viewed directly by decision makers because it is an intermediate calculation.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

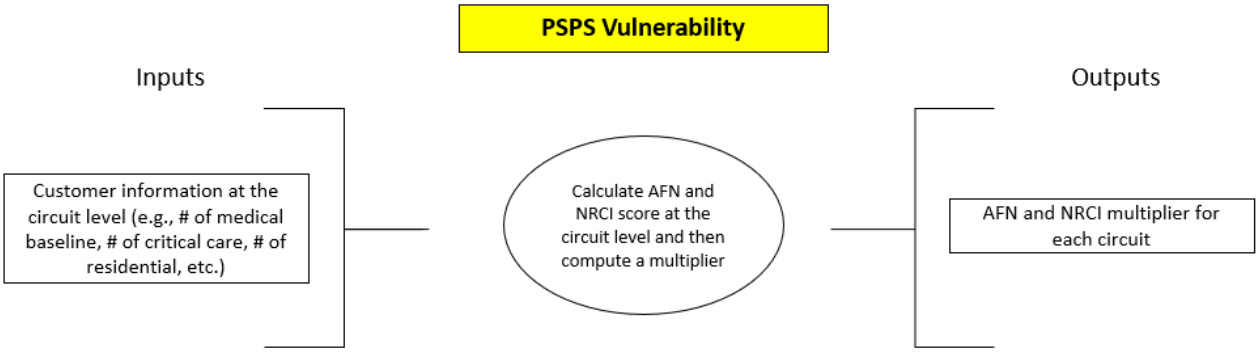
In addition to the improvements listed in Section 6.7 , SCE will review feedback from the Wildfire Risk Modeling Working group and other stakeholder forums to assess key improvements or changes.

FRC8: PSPS Exposure Potential

Please see Section 6.2.1 for SCE's approach to this risk component.

FRC9: PSPS Vulnerability

Figure SCE B-23 - SCE's PSPS Vulnerability Bow Tie Schematic



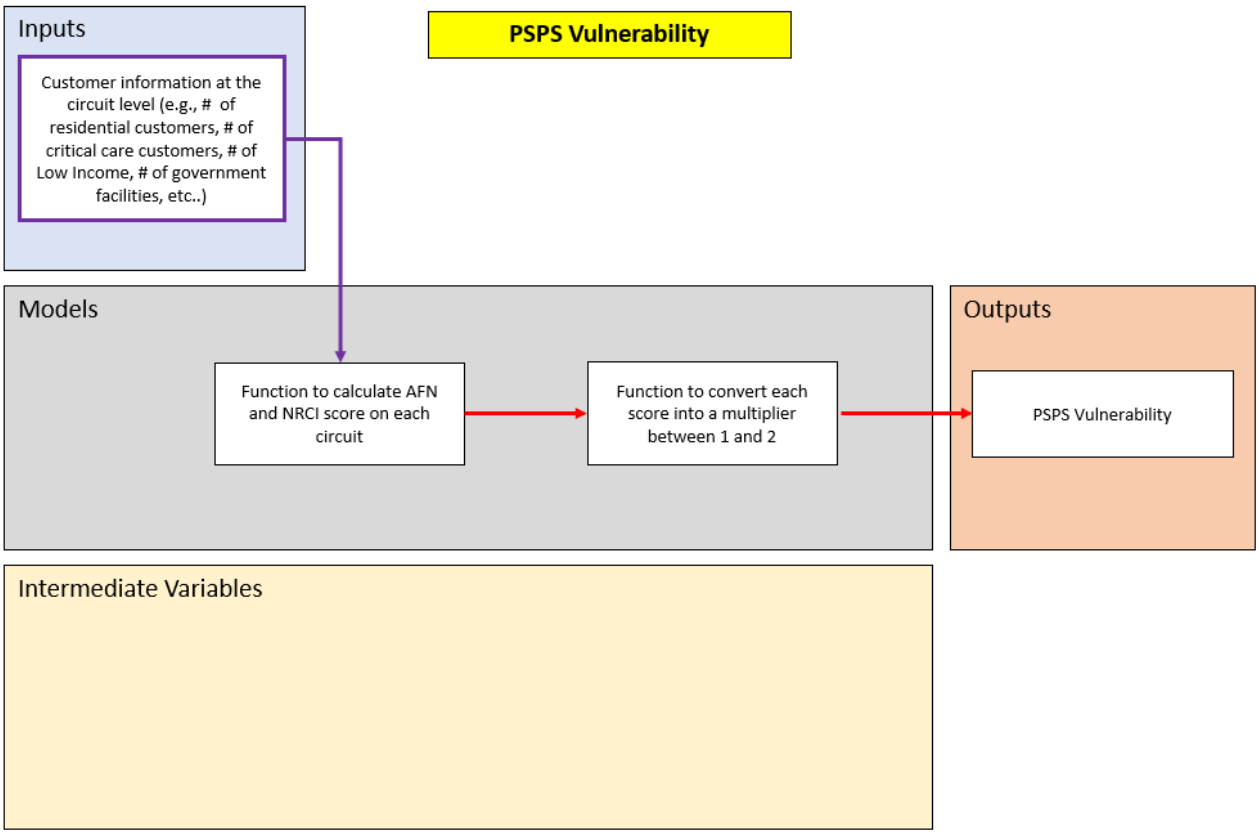


Figure SCE B-24 - SCE's PSPS Vulnerability Calculation Procedure Schematic

Purpose of the calculation/model

PSPS Vulnerability (FRC9) calculates the AFN/NRCI multiplier to be used as an amplifier to the PSPS Safety consequence.

Assumptions and limitations

SCE assumes certain weightings for AFN characteristics (# of critical care, # of medical baseline, etc.) in its formulation of a composite score at the circuit level. Limitations may include availability to the latest data or data lag.

Description of the calculation procedure shown in the bow tie and high-level schematics

The methodology to calculate the multiplier is described in Section 6.2.2.2. SCE takes the composite score on each circuit and develops a multiplier for each circuit based on the calculation below:

$$AFN_{CircuitMultiplier} = 1 + \frac{AFN_{Score\_circuit}}{AFN_{Score\_MAX}}$$

A similar framework is used to develop the NRCI multiplier.

Description of how outputs will be characterized and presented (e.g., visualization) to decision makers

The output is a multiplier that is used to amplify the PSPS Safety Consequences. It is not viewed directly by decision makers because it is an intermediate calculation.

Concise description and timeline of planned changes to the calculation procedure over the triennial WMP cycle, including any key improvements from the Energy Safety Wildfire Risk Modeling Working Group and plans to align with the consensus Risk Modeling Requirements by January 1, 2024.

In addition to the improvements listed in Section 6.7, SCE will review feedback from the Wildfire Risk Modeling Working group and other stakeholder forums to assess key improvements or changes.

APPENDIX C: ADDITIONAL MAPS

In this appendix, the electrical corporation must provide the additional maps required by the Guidelines. As stated in the General Directions, if any additional maps needed for clarity (e.g., the scale is insufficiently large to show useful detail), the electrical corporation must either provide those additional maps in this appendix or host applicable geospatial layers on a publicly accessible web viewer. If the electrical corporation chooses the latter option, it must refer to the specific web address in appropriate places throughout its WMP. Additionally, the electrical corporation must host these layers until the submission of its 2026-2028 WMP or until otherwise directed by Energy Safety. The electrical corporation may not modify these publicly available layers without cause or without notifying Energy Safety.

SCE provides additional maps for the following Section in the pages that follow.

Section	Section Title
5.1	Catastrophic Wildfire History

SCE provides spatial data in the zip file "WMP_2023_GIS_Layers.zip", which can be found at https://www.sce.com/safety/wild-fire-mitigation, for the following Section(s):

Section	Section Title	File Name
5.1	Service Territory	WMP_2023_5_1_Customer_Density
0	Individuals at Risk from Wildfire	WMP_2023_5_4_3_1_AFN_Customer_Density
5.4.4	Critical Facilities and Infrastructure at Risk from Wildfire	WMP_2023_5_4_4_Critical_Facilities_Density
6.4.1.1	Geospatial Maps of Top-Risk Areas within the HFRA	WMP_2023_6_4_4_1_Wildfire_Risk_Ranking_CONFIDENTIAL
9.1.2	Identification of Frequently De-energized Circuits	WMP_2023_9_1_2_PSPS_Frequently_DeEnergized_Circuits

SCE provides confidential spatial data in the zip file "WMP_2023_GIS_Layers_Confidential.zip" for the following Section(s):

Section	Section Title	File Name
6.4.1.1	Geospatial Maps of Top-Risk Areas within the HFRA	WMP_2023_6_4_4_1_Wildfire_Risk_Ranking_CONFIDENTIAL

5.3.2 Catastrophic Wildfire History

In addition to the catastrophic wildfires map provided in Section 5.3.2, SCE provides 12 maps reflecting individual catastrophic wildfire below. The source data for the 12 maps are from data CAL Fire and Resource Assessment Program (FRAP) GIS Database (https://frap.fire.ca.gov/mapping/gis-data/)

Figure SCE C-01 - Catastrophic Wildfire History Map (Ranch Fire)

Figure SCE C-09 - Catastrophic Wildfire History Map (Saddle Ridge Fire)

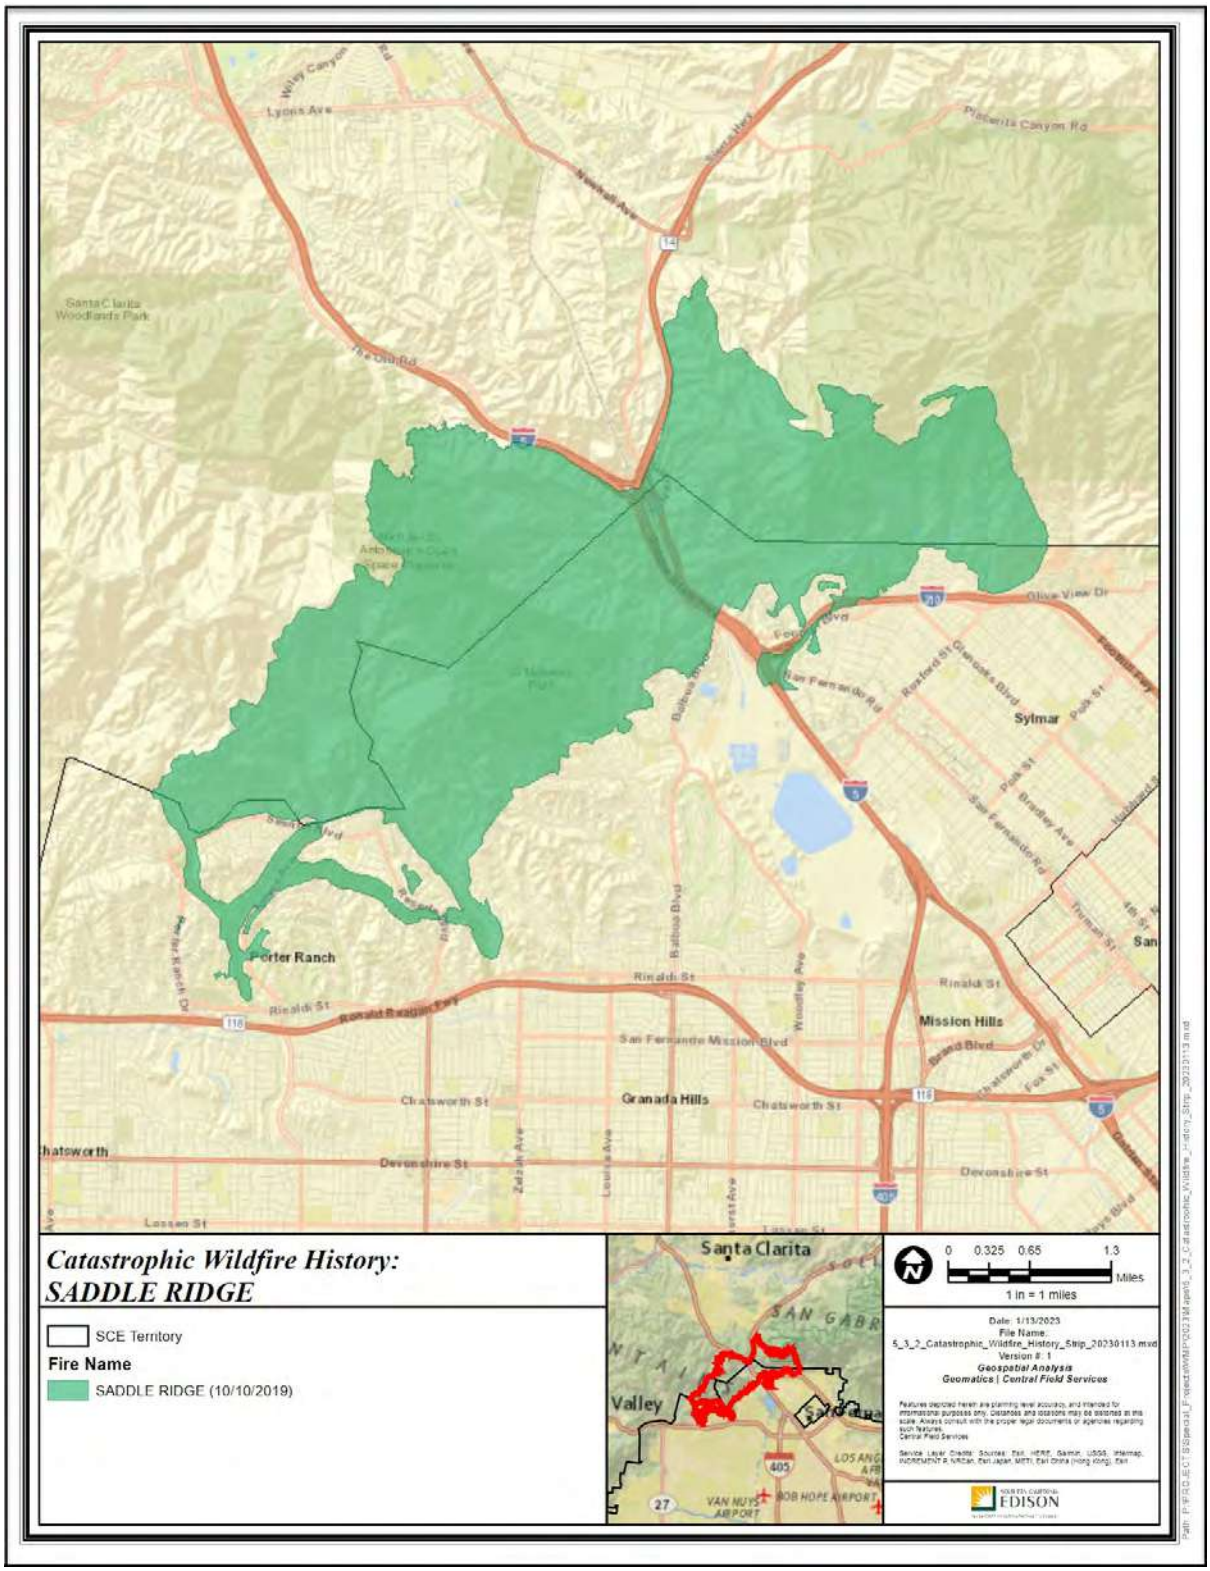

Figure SCE C-10 - Catastrophic Wildfire History Map (Bobcat Fire)

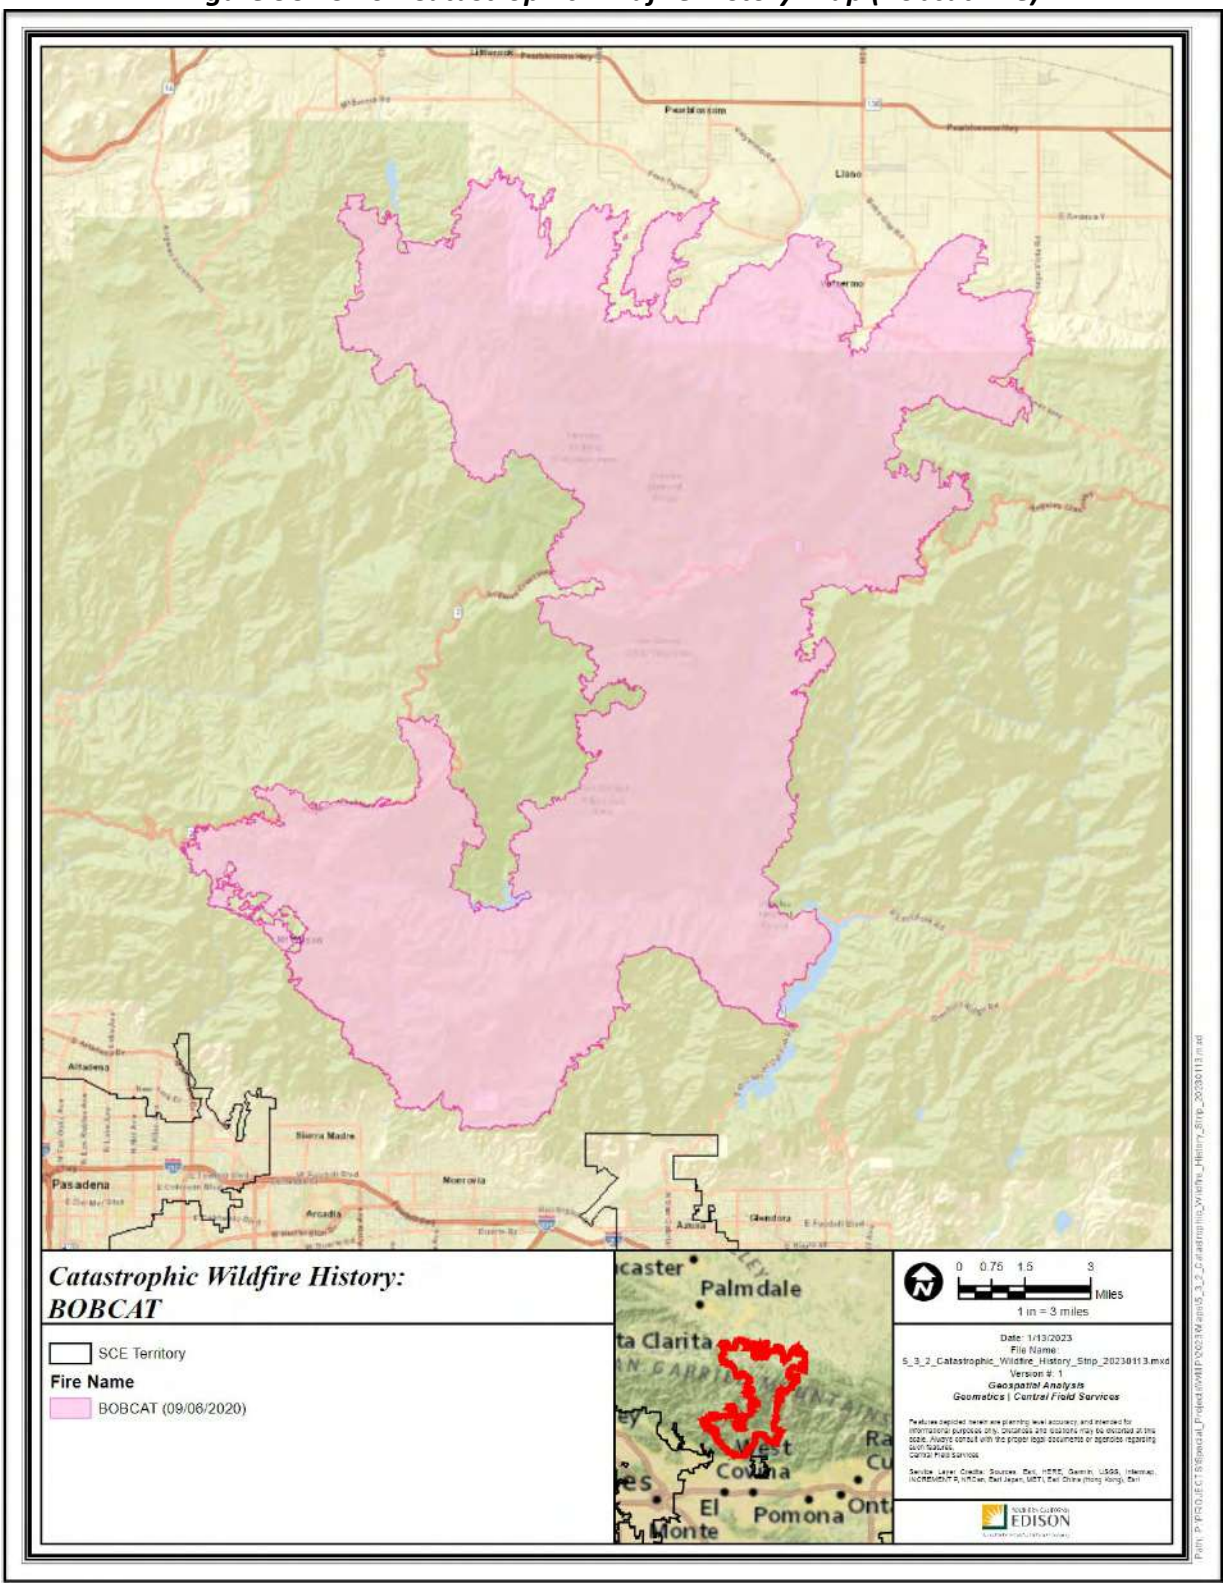

Figure SCE C-11 - Catastrophic Wildfire History Map (Silverado Fire)

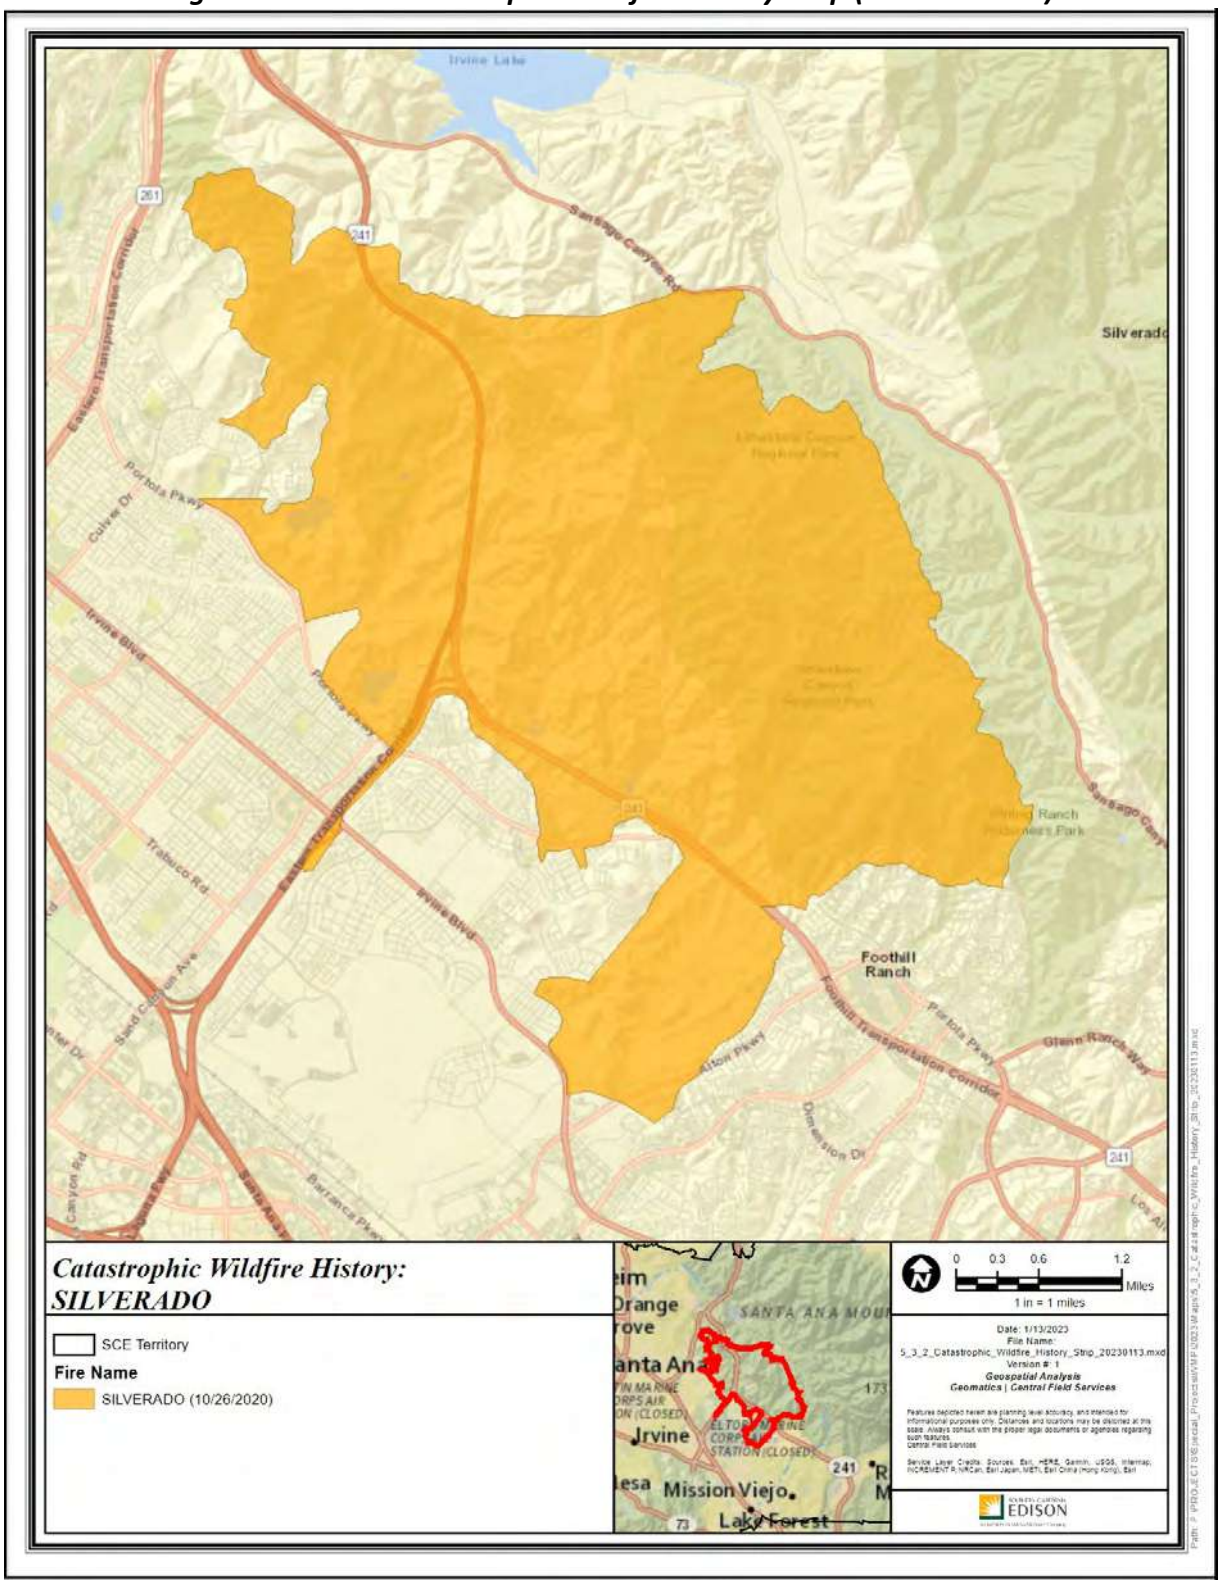

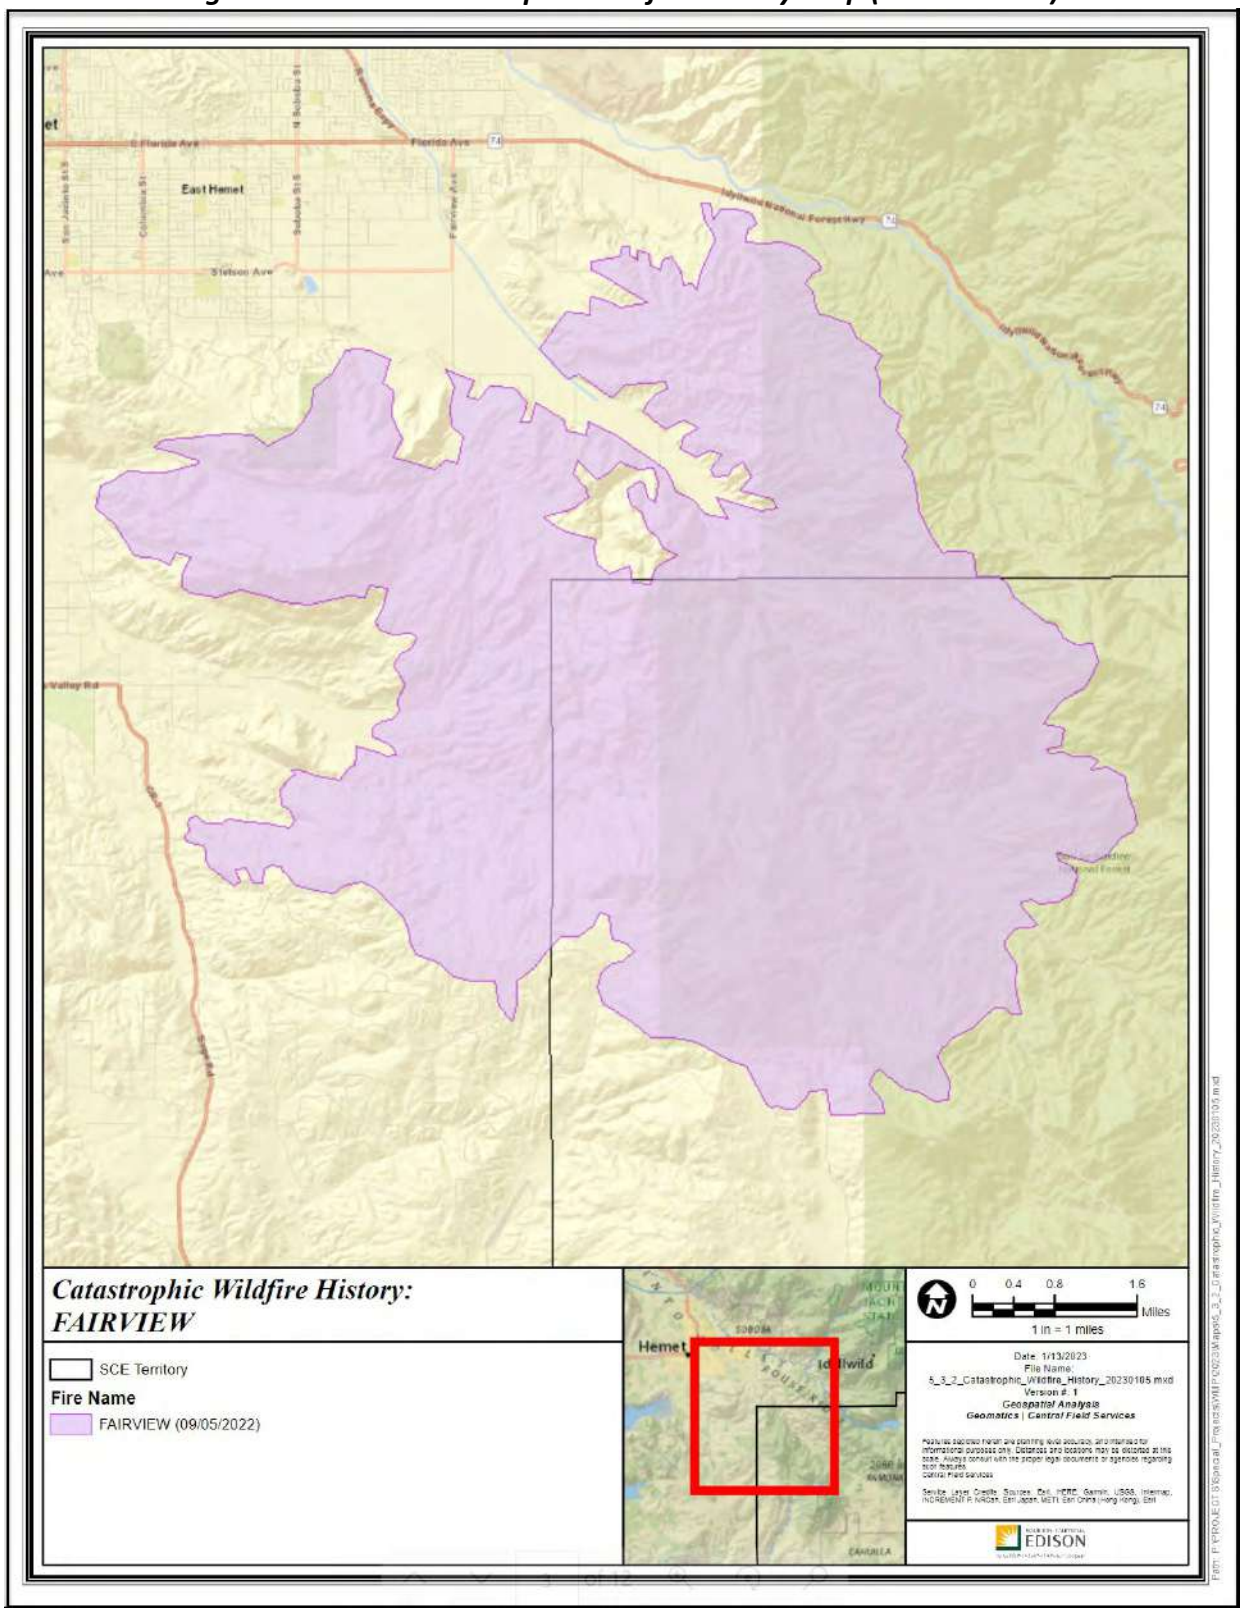

Figure SCE C-12 - Catastrophic Wildfire History Map (Fairview Fire)

APPENDIX D: AREAS FOR CONTINUED IMPROVEMENT

In this appendix, the electrical corporation must provide responses to its areas for continued improvement as identified in the Decisions on the 2022 WMP Updates in the following format: Code and Title; Description; Required Progress; [Electrical Corporation] Response.

SCE-22-01 Prioritized List of Wildfire Risks and Drivers

***Description**: Currently, SCE's prioritized list of wildfire risks and drivers (Table 4-6) weights the risk drivers by average outage multiplied by ignition rate; it does not account for the likelihood of the ignition to cause a catastrophic wildfire.*

***Required Progress:** In its 2023 WMP, SCE must further refine its prioritized list of wildfire risks and drivers. It must do so by weighting each risk driver by likelihood of causing a catastrophic wildfire (e.g., does this ignition tend to happen in high wildfire risk areas identified by SCE's risk models, including the HFTD).*

SCE's Response

As described in Section 6 and Appendix B, SCE's Probability of Ignition (POI) model uses advanced predictive analytics and machine learning techniques to model and forecast potential ignitions at thousands of unique utility asset locations. This model includes asset-specific failure modes and predicts ignition probabilities using three-years historical data.

The potential for ignitions to develop into a catastrophic wildfire is primarily determined by local conditions at the point of ignition, such as vegetation, moisture, topography, and wind. SCE's Wildfire Consequence model uses this data, along with an extensive data set of 444 historical weather days, to model how an ignition might progress given a unique assumed starting point.

SCE is not able to control external environmental factors, such as moisture, topography, wind, and suppression response, which drive fire propagation and development into catastrophic wildfire. SCE also cannot control the deployment, timing, and scale of fire suppression, which also factors into the growth of fires. However, SCE can influence the potential of ignitions started from SCE lines and equipment by performing grid hardening, such as covered conductor and targeted undergrounding, to reduce the likelihood of sparks and ignitions associated with SCE's infrastructure.

SCE notes that its POI model uses both historical ignition and asset failure information, along with machine learning. First, the machine learning models build probability of failure (POF) models for various drivers that may lead to equipment failures and subsequently lead to ignitions. Next a calibration of the POF to POI based on how often an asset failure may transition into an ignition.

SCE's approach considers unique, asset-specific failure modes, the potential for those failures to develop into ignitions, and then a highly localized fire spread model. For those reasons, SCE believes that its ignition and wildfire consequence modeling appropriately accounts for the potential for ignitions to develop into catastrophic wires.

SCE-22-02 Collaboration and Research in Best Practices in Relation to Climate Change Impacts and Wildfire Risk & Consequence Modeling

Description: *SCE and the other large IOUs are currently pursuing their own efforts at integrating the potential impacts of climate change in their risk and consequence modeling. They are not actively collaborating with each other on these efforts nor taking advantage of the existing climate change modeling expertise of state agencies and academic institutions.*

Required Progress: *Prior to the submission of their 2023 WMPs, all electrical corporations (not including independent transmission operators) must participate in an Energy Safety-led scoping meeting to discuss how utilities can best learn from each other, external agencies, and outside experts. In addition, the climate change and risk modeling scoping meeting will identify future topics to explore regarding climate change modeling and impacts relating to wildfire risk. This scoping meeting may result in additional meetings or workshops or the formation a working group. Energy Safety will provide additional details on the specifics of this scoping meeting in due course.*

SCE's Response

As of this writing, SCE has engaged and participated in all Energy Safety workshops and activities related to this topic, including the Risk Model Working Group (RMWG).

SCE-22-03 Three-Year Objectives and Supporting Programs' Performance Targets

Description: *SCE's 2022 Update did not include any quantitative targets for WMP mitigation measures that would contribute to reaching its stated three-- year objectives.*

Required Progress: *SCE must include the near-term and three-year objectives related program performance targets, whether quantitative or qualitative, into Table 5.3-1 (or its successor in the 2023 Guidelines). This integration must include program performance targets through the end of 2025.*

SCE's Response:

SCE has provided all tables related to this ACI in its 2023-2025 WMP:

- WMP Plan Objective (Section 4.2)
- and 10 year objectives (see Sections 8 and 9)
- Program Targets (see Sections 8 and 9)

SCE-22-04 Inclusion of Community Vulnerability in Consequence Modeling

Description: *SCE does not adequately include the impacts of wildfire on communities, including considerations of community vulnerability, within consequence modeling.*

Required Progress: *Prior to the submission of their 2023 WMPs, all electrical corporations (not including independent transmission operators) must participate in an Energy Safety-led scoping meeting to discuss how to best learn from each other, external agencies and outside experts. In addition, the community vulnerability scoping meeting will identify future topics to explore regarding integration of community vulnerability into consequence modeling and impacts relating to wildfire risk. This scoping meeting may result in an additional meetings or workshops or the formation of a working group. Energy Safety will provide additional details on the specifics of this scoping meeting in due course.*

SCE's Response

SCE is awaiting details on the scoping meeting from Energy Safety and will engage when those details have been released.

Please also see the response to ACI SCE-22-02 regarding SCE's participation in Risk Model RMWG meetings.

Finally, please see Section 6.2.1 and 6.2.2, which describes how SCE models the risk components of Wildfire Vulnerability and PSPS Vulnerability.

SCE-22-05 Fire Suppression Considerations

Description: *SCE's fire spread modeling does not currently factor in fire suppression effects (e.g., fire department efforts).*

Required Progress: *Prior to the submission of its 2023 WMP, SCE must work with other utilities to evaluate how to best account for, quantify, and model suppression effects on wildfire spread. Further guidance will be determined and covered during the risk model working group meetings established by Energy Safety's 2021 WMP Action Statements, including participation from CAL FIRE.*

SCE's Response

As noted in the response to SCE-22-03, SCE continues to actively participate in the Risk Model Working Group (RMWG), which SCE understands will address this topic.

SCE-22-06 Ignition Risk Reduction

Description: *From 2020 to 2021, SCE reported an increase in total ignition rates, particularly from wire-to-wire contacts.*

Required Progress: *In SCE's 2023 WMP, SCE must:*

- Analyze root causes and trends for the increases in ignitions broken down by sub-driver, including wire-to-wire contacts.

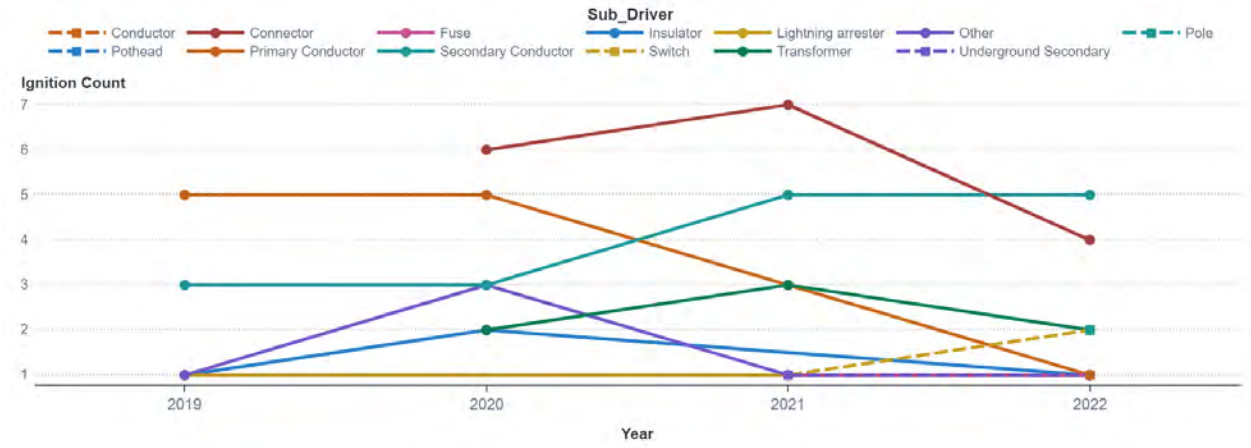
- Provide SCE's plans to address increases in ignition rates broken down by risk drivers and sub-drivers, including efforts to address the root cause(s) outside of routine or program-level WMP initiatives.

- Describe and quantify how SCE anticipates covered conductor and undergrounding initiatives will impact expected ignitions due to conductor damage or failure.

Required Progress #1:

Analyze root causes and trends for the increases in ignitions broken down by sub-driver, including wire-to-wire contacts.

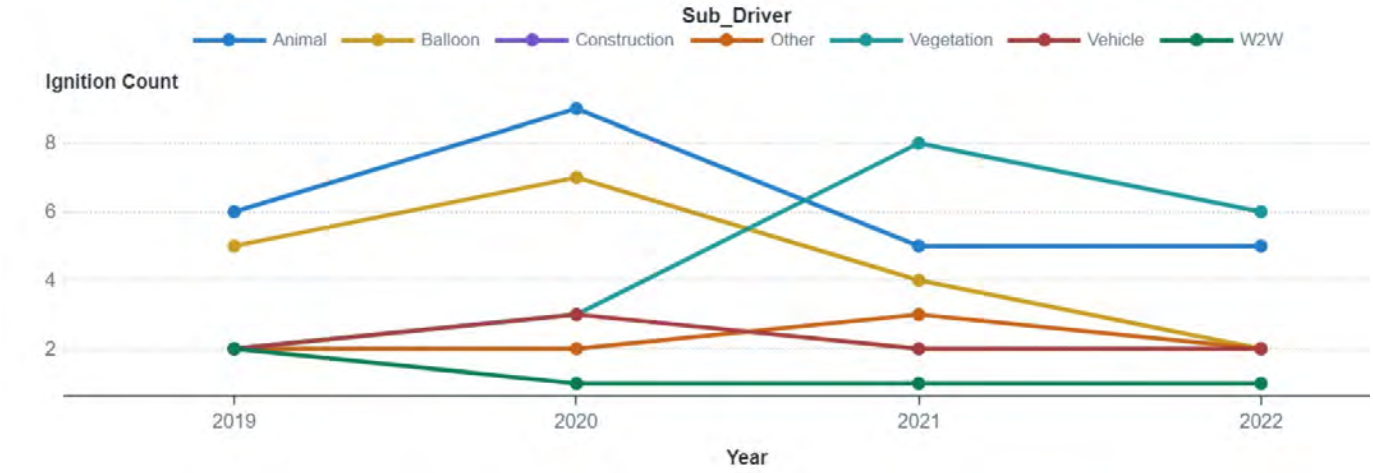
SCE's Response:



As part of its Fire Investigation Preliminary Analysis (FIPA) process, SCE engineers evaluate causes and risk drivers for ignition events within SCE's service territory. Since the launch of SCE's FIPA process, SCE has improved the process and the information collected. For more information on and improvements made to the FIPA process see Section 11.

The two charts below present SCE's current analysis of trends at the sub-driver level within SCE's HFRA. *Figure ACI-06-01* shows data for Equipment and Facility Failure (EFF), while Figure ACI 06-02 presents data for Contact from Object (CFO) including wire-to-wire (W2W) as a sub-driver under this category.

SCE notes that year-to-year changes in ignitions may be due to external conditions that are independent from SCE's wildfire mitigation activities. As a hypothetical example, a relatively dry year may feature more ignitions because of fuel receptivity, and thus may not necessarily indicate inherent deficiencies in mitigation activities or other utility practices. SCE performs robust ignition analysis to better understand and improve its understanding of wildfire risk and mitigation development but notes that indicators such as acres burned, and structures are more appropriate for medium and longer-term evaluations.



Ignitions caused by switches saw a slight increase since 2021 in most part due to installation-related issues. To mitigate, SCE has been working on a more stringent process in order to assure all pieces of the switch mechanism are properly inspected prior to completing the installation. Switches have many components that are essential to operation, and these need additional scrutiny when assessing if the equipment is seated correctly and constructed properly. Additionally, SCE is in the process of incorporating lessons learned from the switch failures into its High Fire Risk Informed Inspection form to add more clarity to the inspectors on potential failure modes of switches.

Figure ACI-06-01 - Annual Ignition Counts by EFF Sub-Drivers (HFRA only), 2019-2022

Regarding Figure ACI-06-022, for CFO caused ignitions, as noted above, ignitions may vary year over year for factors outside of SCE's control. SCE notes that balloon, W2W, and animal caused ignitions have decreased since 2020, which appears to be primarily driven by SCE's covered conductor program.

Figure ACI-06-02 - Annual Ignition Counts by CFO Sub-Drivers (HFRA only), 2019-2022

Required Progress #2:

Provide SCE's plans to address increases in ignition rates broken down by risk drivers and sub-drivers, including efforts to address the root cause(s) outside of routine or program-level WMP initiatives.

SCE's Response

Regarding wire-to-wire related ignitions, although there has not been an increase as shown above in Figure ACI-06-02, SCE has continued with the installation of covered conductor, as well as the long span initiative Please see section 8.1.2.5.2 for more information on the long span initiative.

Figure ACI-06-01 above shows that connector-related ignitions have had a small increase from six in 2020 to seven in 2021 followed by a decrease to three in 2022. SCE's mitigation approaches towards reducing connector-related ignitions include: (1) covered conductor, which replaces existing connectors during the installation, (2) infrared scanning of overhead facilities, which identifies connectors with elevated temperatures for replacement, and (3) new technology evaluation of Early Fault Detection

(EFD), which identify degraded connections that produce radio frequency emissions, for replacement.

Transformer caused ignitions increased in 2022 when compared to 2021 and earlier. This is mainly due to the extended heat wave during the summer of 2022, which lasted for approximately two weeks and required transformers to maintain consistently high loading with minimal opportunities for cooling due to persistently high temperatures. SCE continues to evaluate this issue and potential mitigations.

The CFO sub-driver chart shown in Figure ACI-06-02 above demonstrates that vehicle-caused ignitions remain flat from year to year, with vegetation-related ignitions relatively stable when comparing 2022 to 2021. Balloon-related ignitions dropped from previous years, partly due to covered conductor installations.

SCE has seen an increasing trend of animal-related ignitions, which have been mainly driven by nesting birds. SCE is evaluating options to obtain expedited environmental clearances to address bird nesting issues and the deployment of nesting platforms which will move the bird nest to a location off the utility structure.

Required Progress #3:

Describe and quantify how SCE anticipates covered conductor and undergrounding initiatives will impact expected ignitions due to conductor damage or failure.

Response to SCE-22-06 Required Progress #3:

SCE performed an analysis of covered conductor installations from 2019 to 2022. This analysis indicates that covered conductor experiences approximately 70% fewer ignitions per mile relative to bare conductor. The methodology utilized for the analysis includes comparing ignition incidents per mile of bare conductor and covered conductor.

Furthermore, based on SME judgment, SCE estimates undergrounding is approximately 95% effective at mitigating ignition risk relative to bare conductor. Collectively, we expect covered conductor and underground initiatives to help reduce ignitions. Please also see Section 7.1.4, which describes SCE's mitigation selection process, including evaluations of mitigation effectiveness.

SCE-22-07 Wildfire Consequence Modeling Improvements

Description: *SCE does not use its wildfire consequence modeling as a tool to model potential ignitions in near real-time as faults/outages occur in the HFTD*

Required Progress: *In its 2023 WMP, SCE must discuss how it explored the use of its wildfire consequence modeling and/or developed processes to prioritize, and respond to the locations of faults/outages in the HFTD as they happen.*

SCE's Response

In 2022, SCE implemented a system in its Distribution Operations Centers to prioritize responding to hazards and outages in HFRA. As hazards and outages occur on SCE's system, an algorithm cross references meter data with its associated transformer to verify its location in HFRA. SCE's Distribution Operations Centers use this information to prioritize dispatching troublemen to hazards and outages in HFRA. Dispatchers also have HFTD tier information to further prioritize responses, if necessary.

SCE is considering the use of more granular consequence modeling and incorporating it into an automated system like HERMES. However, the cost-benefit of such a solution is unclear, given that SCE already prioritizes responding to hazards and outages in HFRA.

SCE-22-08 Weather Station Improvements

Description: *SCE weather station observation intervals are not reported as frequently as peer utilities.*

Required Progress: *SCE must improve its weather station observation intervals to collect weather data more frequently than six times per hour. In its 2023 WMP SCE must improve the frequency that data is collected from its weather station network to match that of its peers. If unable to increase the data collection from its weather station network to that of its peers, SCE must present a plan to develop that functionality in its 2023 WMP.*

SCE's Response

SCE can receive 30-second (effectively real time) reads on a portion of its weather station network, and piloted this functionality during PSPS events in 2022. Stations with this capability must have cellular communication modems (currently 866 stations out of 1,620 as of January 2023).

SCE anticipates adding approximately 85 stations with the ability to relay data via cellular communications and retrofit approximately 400 satellite-only stations into dual communication stations in 2023, pending cellular network availability at those sites, providing these stations with the capability to receive more frequent reads. Not every satellite station will be able to be converted to dual communications due to a lack of cellular reception. SCE will conduct an analysis at the end of 2023 to determine how many of the remaining stations can be converted.

When SCE tested the 30 second read functionality during PSPS activations in 2022, and within the scope of the weather stations utilized, it did not encounter major technical challenges with the ability of the weather stations to provide 30 second data.

In 2023, SCE plans on continuing to test more frequent reads during PSPS activations to test how the data can be used in varying event sizes. SCE will also assess whether the increased data reads can help SCE improve its decision-making regarding when to de-energize customers, improve its assessment of real time field conditions, and enhance re-energization timeline and process. SCE will also evaluate if its systems are able to process and analyze the increased data load.

In the interim, SCE plans to continue to read data at 10-minute intervals. The World Meteorological Organization recommends measuring the wind gust speed as a 3-second maximum during a 10-minute sampling period for accurate wind gust measurement (https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5948875/).

SCE-22-09 Joint Covered Conductor Lessons Learned

Description: *SCE has yet to provide goals and timelines for implementing lessons learned from the covered conductor joint effectiveness study.*

Required Progress: *In its 2023 WMP, SCE must:*
- Provide a concrete list of goals with planned dates of implementation for any lessons learned in the covered conductor effectiveness joint study.
- Provide a table indicating which WMP sections include changes (compared to its 2021 and 2022 Updates) as a result of the covered conductor effectiveness joint study. This should include, but not be limited to:
— Changes made to covered conductor effectiveness calculations.
— Changes made to initiative selection based on effectiveness and benchmarking across alternatives.
— Inclusion of rapid earth fault current limiter (REFCL), open phase detection (OPD), early fault detection (EFD), and distribution fault anticipation (DFA) as alternatives, including for PSPS considerations.
— Changes made to cost impacts and drivers.
— An update on data sharing across utilities on measured effectiveness of covered conductor in-field and pilot results, including collective evaluation.

Required Progress #1

Provide a concrete list of goals with planned dates of implementation for any lessons learned in the covered conductor effectiveness joint study.

SCE's Response

SCE is leading the Joint IOU Covered Conductor Effectiveness Working Group and the utilities continue to make progress on the objectives. The utilities progress on these efforts is described in the Joint IOU Working Group Report in Appendix F. The utilities have set forth a plan for 2023 to conduct several workshops to assess covered conductor testing results, maintenance and inspection practices, new technologies, and other items. As discussed below, the primary lessons learned resulting from the study thus far has been the increase in effectiveness of covered conductor, which SCE has incorporated into its risk analysis for this WMP.

Please see Appendix F for the progress report on the Joint IOU Covered Conductor Effectiveness Group that addresses lessons learned.

Required Progress #2

Provide a table indicating which WMP sections include changes (compared to its 2021 and 2022 Updates) as a result of the covered conductor effectiveness joint study. This should include, but not be limited to:
— Changes made to covered conductor effectiveness calculations.
— Changes made to initiative selection based on effectiveness and benchmarking across alternatives.
— Inclusion of rapid earth fault current limiter (REFCL), open phase detection (OPD), early fault detection (EFD), and distribution fault anticipation (DFA) as alternatives, including for PSPS considerations.

— Changes made to cost impacts and drivers.
— An update on data sharing across utilities on measured effectiveness of covered conductor in-field and pilot results, including collective evaluation.

SCE's Response

As a result of the testing SCE conducted with Exponent in collaboration with PG&E and SDG&E, and in addition to more granular analysis, SCE made changes to its estimated effectiveness of covered conductor increasing it from approximately 67% to approximately 72%. As noted in the Joint IOU Covered Conductor Working Group Report, testing results will be further discussed in 2023 through meetings and workshops to determine any additional potential lessons learned. Additionally, and as part of the Joint IOU CC Working Group, SCE has provided its 2022 cost per mile for CC which has increased compared to its 2021 cost per mile. The utilities also continue to share data regarding recorded effectiveness and, in 2023, will further evaluate several covered conductor-related subject areas including M&I practices, new technologies, and a framework for calculating the effectiveness of the combination of mitigations.

Please see below for current status on items mentioned under "Required Progress" for ACI SCE-22-09.

Effectiveness Calculations

SCE reviewed mitigation effectiveness for all activities and where appropriate, updated the underlying analysis based on available data. In addition, SCE continued its shift toward data-driven inputs to inform mitigation effectiveness. Additionally, the independent 3rd party study led by Exponent demonstrated an increase in mitigation effectiveness at the contact from object – vegetation contact and vehicle contact driver level. This additional data input increased the overall effectiveness of CC. Please see Table SCE 7-12 and Appendix F: Supplemental Information for further details.

Initiative Selection

SCE has not materially changed its approach to prioritization and selection of covered conductor as a wildfire mitigation. The Exponent study on the effectiveness of covered conductor validated our understanding of the mitigation effectiveness for covered conductor, which served to further validate covered conductor as a selected initiative in our mitigation portfolio. Please see Section Mitigation Selection Process and Section 8.1.2.1 for further details. As part of the joint study, SCE will continue to evaluate the physical and performance characteristics of covered conductor.

REFCL, OPD, EFD, and DFA as CC alternatives (including for PSPS considerations)

SCE does not consider OPD (either for distribution or transmission), EFD, or DFA as alternatives to covered conductor or as a basis to increase PSPS wind speed thresholds. However, these mitigations can be understood as complementary to covered conductor and part of SCE's overall mitigation portfolio and selection strategy.

As discussed in Section 7.1.4 in some cases, a combination of REFCL and covered conductor may be viable as an alternative to undergrounding. However, REFCL mitigation effectiveness needs to be field validated over the coming years, and at this point in time SCE does not see REFCL as an alternative to covered conductor or as a basis for increased PSPS wind speed thresholds.

Cost Impacts and Drivers

In Table 11 of SCE's Wildfire Mitigation Data Tables, SCE includes an updated cost forecast for its Wildfire Covered Conductor Program over the 2023 – 2025 WMP period. This cost forecast is based on the volume of miles SCE anticipates installing over the WMP period and the estimated cost per mile to perform the work. While the Joint Covered Conductor Effectiveness Working Group did not directly drive the unit cost used by SCE to develop SCE's WCCP forecast, the discussions pertaining to covered conductor costs across utilities were informative and provided insights into the various costs associated with covered conductor across utilities.

SCE-22-10 Covered Conductor Inspection and Maintenance

Description: *SCE must evaluate and update its covered conductor inspection and maintenance program.*

Required Progress: *All electrical corporations (not including independent transmission operators) must work to share and determine best practices for inspecting and maintaining covered conductor, including either augmenting existing practices or developing new programs. This should be considered as a continuation of the covered conductor study established by Energy Safety's 2021 WMP Action Statements. The study will continue to be utility-led, with the expectation for Energy Safety to be included as a participant.*

SCE's Response

Please see the Joint IOU Covered Conductor Effectiveness Working Group Report included in Appendix F that describes the efforts of the joint utilities to share and determine best practices for inspecting and maintaining covered conductor.

SCE-22-11 New Technologies Evaluation and Implementation

Description: *SCE needs to work and benchmark with other utilities to further evaluate new technologies and share progress on pilots and implementation.*

Required Progress: *All electrical corporations must collaborate to evaluate the effectiveness of new technologies that support grid hardening and situational awareness such as REFCL and DFA/EDF, particularly in combination with other initiatives. Utilities must also share practices and evaluate implementation strategies for these new technologies.*

SCE's Response

Please see the Joint IOU Covered Conductor Effectiveness Working Group Report included in Appendix F which describes the efforts of the joint utilities to evaluate the effectiveness of new technologies that support grid hardening and situational awareness, such as REFCL and DFA/EFD, particularly in combination with other initiatives. Additionally, SCE meets regularly with IOUs to discuss practices, studies, performance, and technical matters related to REFCL. These meetings generally occur monthly and include both domestic and international companies to share best practices and lessons learned.

SCE-22-12 Residual Risk Reduction Associated with Covered Conductor

Description: *SCE is deploying a suite of mitigations under CC++ that should be seen as temporary solutions. SCE must strive to find more permanent solutions to address the remaining ignition risk.*

Required Progress*: In the 2023 WMP filing, SCE must:*

- *Provide SCE's plan and timeline for moving forward with REFCL, including mileage and risk addressed.*
- *Provide SCE's plan and timeline for moving forward with additional pilot technologies, such as DFA and EFD.*
- *Include effectiveness evaluations of added mitigation measures for CC++ in comparison to undergrounding when determining initiative selection.*

SCE's Response

SCE seeks to clarify that CC++ is not a temporary solution. As discussed in Section 7.1.4, CC++ is SCE's preferred and long-term solution for High Consequence Areas as defined by its IWMS Framework. Please also refer to Section 7.2.3 where SCE discusses interim mitigation strategies.

REFCL

At the end of 2023, SCE expects to have REFCL on three substations covering 847 miles of circuitry of which 373 miles is in HFRA. In 2024, we expect to increase that to 1,321 circuit miles of which 650 miles are in HFRA. SCE will complete its analysis of installations at the end of 2022 to inform plans for 2025 as described in Section 8.1.2.11.3.

DFA

DFA and EFD technologies both offer capabilities for situational awareness of incipient fault and undesirable conditions. However, SCE does not have further plans to deploy additional DFA after further evaluation of the technology and determining the technology is not yet mature.

EFD

Between October 2020 to the end of 2021, SCE evaluated 10 instances where the EFD technology (SA – 11) detected undesirable, degraded, or pre-failure system conditions where repairs have subsequently been completed. SCE will target 50 installations of EFD in each year of 2023 and 2024 and 200 installations of EFD in 2025. Additional information about EFD and the timeline for planned installations may be found in Section 8.3.3.

These new installations will test next generation EFD equipment, which is intended to increase sampling rates, and improve the signal-to-noise ratio in comparison to current EFD equipment. Installations will focus on testing the use of the new generation hardware, and further installations on sub-transmission system voltages. New installations in both Distribution and Transmission are expected to expand application capabilities for different line construction configurations, such as horizontal or vertical. SCE also intends to further explore different EFD detection capabilities, by completing staged testing to simulate vegetation grow-in and bridging of covered conductor phases.

Undergrounding Compared to CC++

In addition to Table SCE 7-06, which provides effectiveness values for SCE's initiatives, please also see Table SCE 7-07 that indicates risk reduction assessments for CC++ along with REFCL/CC++ and targeted undergrounding on a standalone basis. As noted above, SCE considers CC++ as a preferred mitigation approach for High Consequence Areas, and as such has not scoped or modeled "added mitigation measures" incremental to CC++. However, in Severe Risk Areas, SCE intends to scope REFCL in addition to more frequent asset inspections.

SCE-22-13 Remaining Severe Risk Areas

***Description**: SCE does not have 36.36% of its self-defined severe risk areas accounted for within its grid hardening scope.*

***Required Progress**: In the 2023 WMP filing, SCE must:*

- Provide a plan, including timeline, for scoping and addressing the remaining severe risk areas by the end of the 2023-25 WMP cycle.

- Provide a plan for addressing the near-term risk in the remaining 36% of severe risk areas in the interim.

Required Progress #1

Provide a plan, including timeline, for scoping and addressing the remaining severe risk areas by the end of the 2023-25 WMP cycle.

SCE's Response

The 36% was derived using 2022 WMP Table SCE 7-3 (below), which stated that 700 of 1,925 miles were not yet scoped at the time of submission of the 2022 WMP:

Table SCE 7-3

Distribution Grid Hardening Analysis Results

Category	Currently Hardened	Currently Unhardened		Total
		In-Flight CC Scope	Not Currently Scoped	
Severe Risk Areas Miles • Egress Areas • Burn-in-Buffer • Exceptionally High Standard Consequence Areas • Extreme High Wind Areas	725	500	700	**1,925**
High Consequence Segments Miles • 300 Acres at 8 hours[98]	1,700	1,350	2,025	**5,075**
Other HFRA Miles	475	550	1,675	**2,700**
Total	**2,900**	**2,400**	**4,400**	**9,700**

SCE submitted its 2022 Risk Assessment Mitigation Phase (RAMP) to the CPUC on May 13, 2022 and stated its intention to scope the remaining unhardened overhead circuit miles in Severe Risk Areas by 2028 (see 2022 RAMP, Ch 4, page 11, Table I-1).

Table I-1
2025-2028 Scope of WCCP and TUG for Proposed Plan

	Estimated Unhardened Overhead Circuit Miles by end of 2024	2025 - 2028 Scope (Circuit Miles)	
		Wildfire Covered Conductor Program	Targeted Undergrounding
Severe Risk Areas	580	0	580
High Consequence Segments plus Buffer	1,400	1,250	0
Total	**1,980**	**1,250**	**580**

As of the end of 2022, SCE has hardened approximately 4,400 miles with covered conductor and undergrounding. As discussed in Section 8.1, SCE anticipates undergrounding 75 miles of overhead lines in Severe Risk Areas between 2023 and 2025. This includes 11, 16, and 48 miles for years 2023, 2024, and 2025, respectively. SCE will strive to complete up to 20, and 60 miles in 2024, and 2025, respectively. As seen in the RAMP table above, of the estimated 580 unhardened overhead circuit miles in Severe Risk Areas by the end of 2024, SCE will strive to complete 60 miles in 2025. SCE anticipates completing the remaining 520 miles between 2026 and 2028 to have fully hardened the 580 miles by the end of SCE's GRC period.

Please also see Section 7.1.4 for discussion of SCE's continued commitment to targeted undergrounding as the preferred mitigation for Severe Risk Areas. Details on SCE's mitigation scoping and planning process, including for mitigations with long lead times, such as undergrounding are discussed in Section 7.1.4.3. SCE notes that the scoping and planning process is a multi-year effort, and that all undergrounding prioritization and scoping decisions are manually reviewed by an expert team within SCE to consider factors, such as risk, constructability, potential to bundle work, line routing, and overall schedule priority. In some cases, specific terrain or local issues may require alternatives, such as covered conductor with supplementary mitigations. While projects are scoped and awaiting construction, SCE considers interim mitigations to reduce risk, as further discussed in Section7.2.3

Required Progress #2

Provide a plan for addressing the near-term risk in the remaining 36% of severe risk areas in the interim.

SCE's Response

Please see Section 7.2.3 for SCE's discussion of interim mitigation strategies for mitigations with long lead times such as undergrounding.

SCE-22-14 Evaluation of Vibration Dampers

***Description**: SCE is scaling back on its vibration dampers retrofitting for installed covered conductor.*

***Required Progress**: In its 2023 WMP, SCE must:*

- Provide a description of the analysis performed to determine local wind conditions that lead to Aeolian vibrations.

- Provide further justification for why SCE is scaling back vibration damper installation for covered conductor retrofits.

- Explain why it has not performed similar analysis for all covered conductor installations.

Required Progress #1:

Provide a description of the analysis performed to determine local wind conditions that lead to Aeolian vibrations.

SCE Response:

Aeolian vibrations may occur when smooth, non-turbulent wind passes across the conductor. Wind speeds that induce Aeolian vibrations range from 2 to 15 mph. Aeolian vibrations are more likely to occur in flat and open terrain. Based on these criteria, SCE used terrain and wind conditions to analyze vibration susceptibility of covered conductor installations. SCE focused on installations 3,000 feet and below, which is consistent with SCE's standard vibration damper requirements under the GO95 definition of light loading areas (e.g., no weight from snow anticipated). SCE used three categories for vibration susceptibility (high, medium, and low).

SCE used wind data from its weather stations and performed an analysis based on factors including the average daily duration of wind speeds from 2 to 15 mph and the wind direction. SCE accounted for wind direction and only counted durations when the wind was flowing perpendicular to the conductor.

For terrain, SCE used terrain categories defined in CIGRE[305] 273: Overhead Conductor Safe Design Tensions with Respect to Aeolian Vibration. The terrain categories are defined as follows:

Table ACI 14-01 – Aeolian Vibration Terrain Categories

Category	Description
Terrain 1	Near large bodies of water or flat desert. No obstruction.
Terrain 2	Flat farmland. Small agriculture is fine. No obstruction (limited number of buildings, etc.). If building is not an obstruction & there is perpendicular wind path to circuit, this is fine.
Terrain 3	Flat open land with few obstacles. Undulating terrain with no obstacles. Hilly area, but line is at top of hill with clear perpendicular with path.
Terrain 4	Residential suburbs, small town, some trees and obstacles, small buildings, woodland.

SCE conducted a mapping review and assigned a terrain category at the covered conductor locations

[305] Global International Council on Large Electric Systems for sharing of end-to-end power system expertise. The community features thousands of professionals from over 90 countries and 1250 member organizations.

based on satellite and street view images.

A combination of the average daily duration of wind speeds between 2-15 mph and terrain categories were used to determine the vibration susceptibility. The table below provides the guidelines used. Wind condition is defined as the average daily duration of wind speeds from 2 to 15 mph flowing perpendicular to the conductor.

Table ACI 14-02 – Aeolian Vibration Susceptibility Categories

Rank	Terrain	Wind Frequency (Average Daily Duration)
High	Terrain 1	All Wind Condition
	Terrain 2	Wind Condition ≥ 20%
	Terrain 3	Wind Condition > 60%
Medium	Terrain 2	Wind Condition < 20%
	Terrain 3	20 < Wind condition < 60%
	Terrain 4	Wind Condition > 80%
Low	Terrain 3	Wind Condition < 20%
	Terrain 4	Wind Condition < 80%

Required Progress #2

Provide further justification for why SCE is scaling back vibration damper installation for covered conductor retrofits.

SCE's Response

SCE has not reduced vibration damper installations and continues to prioritize areas most susceptible to Aeolian vibrations for targeted retrofit installations. SCE does not consider its risk-based approach as equivalent to generally "scaling back" the program. Consistent with many mitigation programs, SCE is focusing its efforts on the highest-value areas and uses cases, which is prudent and appropriate from the perspectives of wildfire mitigation and cost effectiveness.

For retrofits, SCE prioritizes spans ranked as either "high" or "medium." In new line installations, dampers will be installed in all high, medium, and low categories, which are defined above, except in most cases above 3,000 ft, which can be subject to added weight from snow and in reduced tension spans, which have limited potential for Aeolian vibration.

Required Progress #3

Explain why it has not performed similar analysis for all covered conductor installations.

SCE's Response

SCE has performed similar engineering analysis to establish the criteria detailed above for new covered conductor construction. To evaluate all other spans would not be fruitful as the methodology described above is effective in prioritizing and identifying areas and conditions in which Aeolian vibration may be a concern.

SCE-22-15 Targets Relating to Addressing Inspection Findings

Description: *SCE's increased inspections (performed to exceed existing GO requirements and better address wildfire risk) resulted in a backlog of repairs*

Required Progress: *In its 2023 WMP, SCE must:*

- Identify which open work orders directly present ignition risks and provide a plan to prioritize repairs that address the highest risk. This plan should cover a time period up to the end of 2023.
- Provide quantitative targets for addressing repairs for infractions found during inspections, broken down by severity level of the finding.

SCE's Response

As part of SCE's standard operating procedure, any notification that may result in an imminent ignition risk (P1) is made safe within 24 hours and the remediation is started within 72 hours, and thus P1s do not contribute to the scope of notifications past their compliance due date. As a result, SCE limited the scope of its response to its backlog of repairs stemming from P2 notifications, as this focuses on the next level of risk after P1s.

P2 notifications in elevated (Tier 2) and extreme (Tier 3) high fire risk areas are generally remediated within 12 months or six months respectively. SCE did not include P3s in this scope because they are low risk and/or do not pose an ignition risk. As part of SCE's internal process for notifications, if a P2 or P3 notification was created and an imminent safety hazard discovered (i.e., via inspections or patrols), SCE would treat it as a P1 and take immediate action to make the condition safe.

The scope for the backlog of notifications used is based on a snapshot in time (October 26, 2022). This baseline starting point allowed SCE to develop a plan to work down its backlog of notifications. SCE is continually improving its inspection programs to identify issues based on field and engineering lessons learned, which may result in increases in notifications created (similar to what occurred when the Enhanced Overhead Inspection program first launched). Additionally, SCE strives to complete its HFRA inspections prior to peak fire season which can have the side effect of larger populations of notifications due around the same time.

- *Identify which open work orders directly present ignition risks and provide a plan to prioritize repairs that address the highest risk. This plan should cover a time period up to the end of 2023.*

In response to this prompt, SCE will explain how it: (1) identified the scope of notifications within its backlog that could potentially present an ignition and risk, and (2) created a prioritization method which may inform SCE's plan to work down the backlog in 2023.

1. Scope

SCE identified the scope of its backlog by focusing on asset notifications that pose a potential ignition risk[306] that are past their compliance due date from a specific snapshot in time. The total backlog

[306] A notification is classified as an ignition risk if the identified issue has the potential to cause a fire. An example of an ignition risk is an active deteriorated pole that is in a forested area. A notification is not considered an ignition risk if the issue has no potential to cause a fire. An example of a non-ignition risk is a customer attaching a mailbox to an SCE pole that is close to the ground or grading in an area with no surrounding vegetation.

included approximately 11,100 transmission and distribution asset notifications that pose a potential ignition risk that were not closed by their targeted completion date and considered priority 2 notifications. Each day, notifications are opened, closed, and a small number invariably become past due. Thus, this static population represents a baseline for SCE to track progress against.

SCE grouped the ~11,100 asset notifications into four categories. Each category represents a key driver for delays in work order remediation. These categories are: Pending Late, GO 95 Exceptions, Notify Third Party, and Inactive Equipment and/or FLOC[307]. Notify Third Party and Inactive Equipment and/or FLOC are included here for completeness, however, may not have ignition risk due to their underlying characteristics as described below.

SCE notes that the majority of notifications falling into the Pending Late and GO 95 Exception categories are on structures with lower risk based on SCE's preliminary analysis of their combined probability of ignition and wildfire consequence scores.

Scope Category (1 of 4): Pending Late

A pending late notification signifies a notification that is past due and does not fall within the other scope categories defined below (i.e., GO 95 exception, notify third-party, or inactive equipment and/or FLOC issues).

Scope Category (2 of 4): GO 95 Exceptions

A General Order 95 (GO 95) exception applies when an external constraint prevents a utility from completing work within a compliance timeframe. There are several scenarios which qualify for the GO 95 exceptions: (1) permitting, (2) third party refusal, (3) no access, and (4) system-wide emergency. For GO 95 exceptions, SCE evaluated all its notifications within the GO 95 Exceptions category to assess whether the notification was still constrained and could be remediated. While resolution of GO 95 exceptions is largely outside of SCE's control, for transparency SCE will include GO 95 exception details as part of its backlog reporting.

Scope Category (3 of 4): Notify Third Party

A "notify third party" notification occurs when SCE finds that a third party (either customer or a communication infrastructure provider) has created an issue that requires remediation on an SCE asset, most commonly a pole. Although SCE cannot force the third party to remediate, SCE notifies them of the outstanding issue. Examples of unauthorized alterations include incorrect attachments (e.g., wrong type of guywire utilized by a communication infrastructure provider), reduced clearances (e.g., broken communication lashing wire that could contact SCE conductors), unauthorized attachments (e.g., basketball hoop attached to a pole, unauthorized signage), etc.

Scope Category (4 of 4): Inactive Equipment and/or FLOC

SCE found that part of its notification backlog was caused by a latency in updating the system of record related to: (1) inactive equipment or FLOC; and/or (2) reject notifications. While this category may pose a lower ignition risk than other categories, SCE will strive to streamline its operating procedures across organizations to address these notifications.

Inactive Equipment or FLOC: This scenario stems from errors with dispositioning inactive equipment or

[307] FLOC stands for Functional Location of Overhead Conductor.

FLOCs in our system of records. For example, when poles and equipment are replaced or deactivated in the system of record during emergency conditions such as storm work or fire restoration, open notifications may not be promptly updated once the asset is re-activated or replaced.

Reject Notifications: This type of scenario occurs when a notification is no longer needed because the issue has been resolved, but the notification is not yet closed in the system of record. This may occur if a notification is kept open for visibility while the underlying condition is remediated by another program.

Figure ACI-15-01 and Figure ACI-15-02 below provide a breakdown of the total count of notifications for transmission and distribution. Each chart provides the total notification counts by scope category as of 10/26 (Total (as of 10/26)). Each chart then delineates of that total, how many notifications are closed, scheduled to be closed by the end of the first quarter of 2023, open (not closed), and those that are either externally or internally constrained.

Figure ACI-15-01 - Transmission Notification Backlog Scope Breakdown

Transmission Total Counts

Category	Details	Total (as 10/26)	Closed	Close by Q1 2023	Not Closed	Constrained
Pending Late	Repair notification pending late with no documented exception, and work is SCE responsibility	340	160	0	10	170
GO 95 Exceptions	Repair Notification Pending Late with documented exception per GO 95 Rule 18 (e.g., third party refusals, no access, permits required), and work is SCE responsibility	1,815	135	80	515	1,085
Notify Third Party	Notification requires SCE to work with a third party to correct issue	10	0	0	10	0
Inactive Equipment / FLOC	Notification is pending on inactive equipment/FLOC or is rejected and not yet flagged for deletion	950	725	225	0	0
		3,115	**1,020**	**305**	**535**	**1,255**

Figure ACI-15-02 - Distribution Notification Backlog Scope Breakdown

Distribution Total Counts

Category	Details	Total (as 10/26)	Closed	Close by Q1 2023	Not Closed	Constrained
Pending Late	Repair notification pending late with no documented exception, and work is SCE responsibility	1,190	640	0	285	265
GO 95 Exceptions	Repair Notification Pending Late with documented exception per GO 95 Rule 18 (e.g., third party refusals, no access, permits required), and work is SCE responsibility	1,390	290	0	0	1,100
Notify Third Party	Notification requires SCE to work with a third party to correct issue	2,880	750	215	1,915	0
Inactive Equipment /FLOC	Notification is pending on inactive equipment/FLOC or is rejected and not yet flagged for deletion	2,565	0	1,835	730	0
		8,025	**1,680**	**2,050**	**2,930**	**1,365**

2. Plan to Prioritize and Work Down Notification Backlog

SCE has historically prioritized notifications based on the severity of the finding and the associated compliance deadline based on HFTD location (i.e., HFRA Tier 2, HFRA Tier 3, or Non-HFRA). In 2020, SCE introduced a notification prioritization algorithm to accelerate the timing for completion of remediation in AOCs on the FLOCs with the highest risk notifications. In Q4 2022, after considering existing risk processes and incorporating lessons learned, SCE expanded on the AOC prioritization methodology to inform its plan to work down the backlog.

SCE's notification backlog prioritization methodology assigns weights to multiple factors (Technosylva consequence, how long the notification has been in place since identified, probability of ignition, and problem statement), and normalizes each factor to have values between 0 and 1, which is aggregated to result in a percentile ranking scale. Figure ACI-15-03 below is an illustration of the calculation utilized to prioritize the backlog of notifications. The algorithm is run for transmission and distribution notifications separately to prioritize for each program. Additionally, to manage the individual categories more closely, each scope category within the T&D programs was prioritized, depicted in Figure ACI-15-01 and Figure ACI-15-02 above. The higher the score, the higher the risk.

Figure ACI-15-03 - Notification Backlog Prioritization Methodology

$$\left(\frac{TS}{3}\right)+\left(\frac{TPD}{3}\right)+\left(\frac{0.5\times\left(POI+PS\right)}{3}\right)$$

Key Terms
- TS: Technosylva
- TPD: Time Past Due
- POI: Probability of Ignition
- PS: Problem Statement Score

This new prioritization method allowed SCE to rank each notification based on risk in order to accomplish the various 2023 quantitative targets discussed in the following section.

- *Provide quantitative targets for addressing repairs for infractions found during inspections, broken down by severity level of the finding. This should include a description of SCE's methodology for reaching these quantitative targets and preventing the occurrence of past due work orders.*

In June of 2022, SCE had approximately 17,500 pending notifications which were past due (approximately 12,700 for distribution; 4,800 for transmission). Since then, SCE has made significant progress by reducing the backlog by approximately 9,200 as of December 31, 2022 and expects to close another 2,400 past-due notifications by end of Q1 2023 of the backlog scope. Of the remaining past-due notifications, SCE is committed to the various quantitative targets depending on the scope category, which are discussed below.

SCE continues to work both the backlog discussed and all open notifications in tandem. Furthermore, SCE will investigate how to utilize its new prioritization methodology, which risk ranked all of its notifications in the backlog, to inform the order in which issues are remediated in 2023.

3. Quantitative Targets

Pending Late

From the static list of pending late notifications, SCE achieved completion of approximately 75% (800 out of 1,095 notifications across transmission and distribution) of its total unconstrained scope in the category by January 2023. SCE used its prioritization method to risk rank its notifications in this category. SCE's initial objective was to remediate all unconstrained[308] ignition risk notifications. However, some of these notifications had operational constraints, such as unavailability of materials, that made it difficult to close by a defined date.

SCE will strive to substantially complete the static list of unconstrainted notifications by the end of Q3 in 2023.

GO 95 Exceptions

External parties, such as the government agencies or other third parties constraining work are outside of SCE's control, SCE will continue to work with external parties to address notifications held due to GO95 exceptions. SCE is interested in partnering with Energy Safety to develop ways to establish a better feedback loop for notifications with GO95 exceptions, which would involve agencies notifying utilities when constraints are lifted or provide a firm timeline for responding to requests to expedite these matters to conclusion. Additionally, SCE is interested in working with Energy Safety on updating the GO 95 remediation compliance timelines to be more risk informed.

From the static list of GO 95 exception notifications, SCE successfully closed approximately 13% (425 out of 3,250 total notifications across transmission and distribution) of this category as of January 2023. Since these issues are externally constrained, SCE cannot commit to a specific target for when this scope category will be closed. In 2023, SCE will continue to monitor and drive the remaining GO 95 exception notifications to closure as expeditiously as possible.

Notify Third Party

[308] A notification is constrained if there is an external reason (such as GO 95 exception) or an internal reason (such as a lack of necessary resources, such as wood for a pole installation).

From the static list of notify third-party notifications, SCE successfully closed 25% (750 out of 2,890 notifications across transmission and distribution) of this category by January 2023. Additionally, of the remaining open notifications, SCE has sent letters notifying third parties of the issue they have created on SCE assets. While this action technically satisfies SCE's obligation with respect to these issues, SCE will continue to monitor these notifications and request the third parties remediate the identified issues.

It is difficult to create a quantitative target for this scope category when remediation is dependent upon an external third-party. However, SCE will continue to strive for closure by notifying third parties of the issues they've created on SCE assets.

Inactive FLOC and/or Equipment

From the static list of inactive FLOC and/or equipment notifications, SCE was able to close 20% (725 out of 3,515 total notifications across transmission and distribution) of this category as of January 2023. Given that the repairs have been completed, this type of notification represents the lowest ignition risk of the categories.

SCE's initial analysis revealed that both Inactive Equipment or FLOC and Reject Notification populations can generally be remediated via desktop review and without field resources. Thus, SCE will continue to perform quality checks on remaining notifications and take appropriate action as needed to work the backlog down. SCE commits to closure of the static list of approximately 1,800 distributions notifications by the end of the first quarter of 2023. For those notifications in which a desktop review will not suffice, SCE will deploy field crews to assess whether the issues still remain, or the notification should be closed in the system of record.

4. Preventing the Occurrence of Past-Due Notifications

SCE is working diligently to address the current backlog and prevent the occurrence of new past-due notifications by implementing new processes and resources. As discussed in this response, there are factors that may lead to past due notifications in the future. While SCE is committed to remediating issues within the required timelines, we are also focused on remediating the highest risk items first. Accordingly, SCE will analyze how it can prioritize all open notifications in a risk-informed manner. In 2023, SCE plans to update its prioritization methodology for its backlog and apply it to all open notifications. SCE will also investigate the possibility of informing open notification prioritization methodology with additional factors such as PSPS and AOCs. Similarly, SCE will investigate how it can de-prioritize low-risk notifications while balancing compliance requirements to reduce the backlog and continue to prioritize higher ignition risk open notifications.

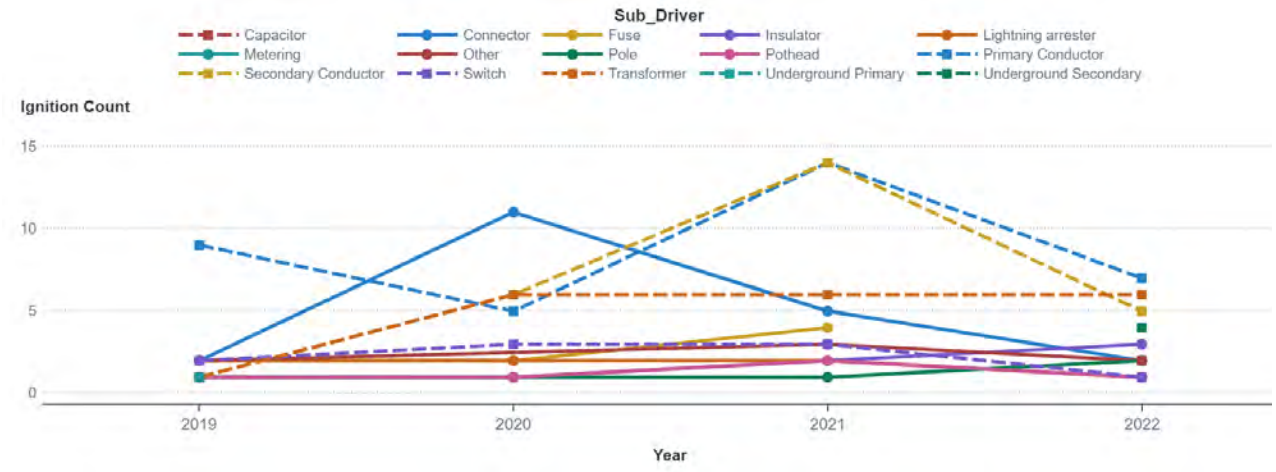
SCE-22-16 Increases in Equipment Related Ignitions

Description: *SCE's equipment-related ignitions outside of the HFRA have increased, particularly those related to conductor damage and failures.*

Required Progress*: In its 2023 WMP, SCE must:*

- Provide failure mode, event, and trend analyses relating to recent increases in ignitions from equipment failures, including conclusions, root cause analysis, and lessons learned.

- Provide a plan to specifically address ignitions in high-risk areas caused by conductor, transformer, and connection device damages and failure.



Required Progress #1

Provide failure mode, event, and trend analyses relating to recent increases in ignitions from equipment failures, including conclusions, root cause analysis, and lessons learned.

SCE's Response

The following table provides annual ignition counts over 2019 through 2022 for the sub-drivers that collectively represent equipment failure (EFF):

Figure ACI-16-01 - Annual Ignition Counts by EFF Sub-Drivers (Non-HFRA), 2019-2022

As stated previously in the response to ACI.22.06, external factors such as moisture, fuel load, and wind are likely to influence ignition trends, and hence variations from one year to the next may not necessarily indicate meaningful trends. SCE analyzes ignition events from the perspective of distinguishing factors that may be linked to short-term or unique external conditions from factors that may be indicative of more inherent issues that are less linked to short-term or external conditions that vary from one year to the next. Below SCE provides its analysis of EFF ignitions by sub-driver.

In 2022, SCE expanded the process for its Fire Investigation team to review all repair orders to avoid missing some potential ignitions, which may have caused an increase in events in 2022, for more information please see Section 11. Even with this additional review, almost all EFF ignition drivers decreased in 2022 outside of HFRA. This has been driven in part by SCE's Overhead Conductor Program

(OCP) addressing conductor related failures[309]. Moreover, as noted in ACI SCE-22-17, below, SCE modified its inspection form to add more details concerning secondary conductors.

Regarding underground cable, SCE has seen a slight increase from 2019 to 2022 in part due to overloading caused by recent heat waves that SCE's service territory has experienced. Lessons learned include increasing trends regarding underground related ignitions which is SCE is currently evaluating potential solutions to mitigate against future.

From 2019 to 2021, SCE saw over a 200% increase in ignitions from secondary conductor. Please see SCE's response to ACI SCE-22-17, which provides data on secondary conductor, including SCE's plan to mitigate and reduce secondary conductor ignitions in the future.

Required Progress #2:

Provide a plan to specifically address ignitions in high-risk areas caused by conductor, transformer, and connection device damages and failure.

SCE's Response

Conductor: Please see Section 7.1.4 for SCE's discussion of conductor-related mitigations, such as covered conductor and undergrounding. In addition, SCE's response to ACI SCE-22-17 details SCE approach to addressing secondary conductor-related ignitions.

Transformer: SCE is in the process of replacing mineral oil-filled transformers with ester fluid-filled transformers. Envirotemp FR3 Fluid, or ester fluid, is a derivative of renewable vegetable oil, and has a higher flash point rating than mineral oil. This decreases the likelihood that the fluid and/or fluid vapors will ignite and stay lit during a catastrophic event. This in turn reduces the chance of igniting surrounding brush and/or other flammable material surrounding the pole and transformer. Also, distribution transformers that are filled with ester fluid can operate at higher temperatures than mineral oil-filled transformers, and still have the same life as the mineral oil-filled transformer. This increases the transformer kVA capacity. This added kVA capacity will prolong the life of the transformer's internal insulation system and improve summer heat storm performance.

Starting in 2018, all standard pole-type transformers supplied to SCE are filled with ester fluid. Ester fluid transformers are installed to support new constructions, as well as transformers replacements driven by inspections and maintenance programs, load growth and voltage cutover programs, and other activities. Because transformer replacements will occur through these programs over time, the full benefits and reduced ignition risks for distribution transformers is expected to increase over time as the percentage of FR-3 filled transformers on the system rises.

Connection Device Damages and Failure: SCE's covered conductor and undergrounding programs address this by replacing or eliminating connection devices. SCE's mitigation approaches towards reducing connector-related ignitions include: (1) covered conductor, which replaces existing connectors during the installation, (2) infrared scanning of overhead facilities, which identifies connectors with elevated temperatures for replacement, and (3) new technology evaluation of Early Fault Detection (EFD), which identifies degraded connections that produce radio frequency emissions, for replacement.

[309] SCE's OCP is focused in reducing Contact with Energized Equipment risk and the reduction of wire down events, and does provide a secondary benefit in reducing ignitions caused by conductor failure, connectors and splices.

SCE-22-17 Address Secondary Conductor Issues

Description: *SCE has a high percentage of ignitions from secondary conductor, and a high find rate for findings relating to secondary conductor during inspections' QA/QC.*

Required Progress: *In its 2023 WMP, SCE must:*

- Provide its plan to mitigate and reduce secondary conductor ignitions in the future, including a timeline and status for the plan it provided in its 2022 Update.

- Demonstrate a decrease in the percentage of QA/QC findings relating to secondary conductor.

Required Progress #1:

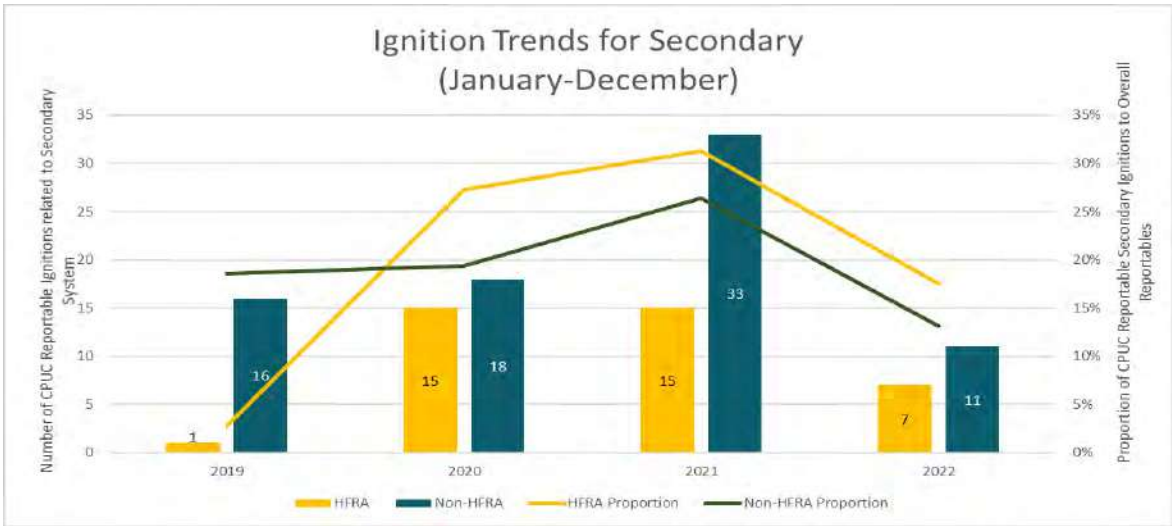
Provide its plan to mitigate and reduce secondary conductor ignitions in the future, including a timeline and status for the plan it provided in its 2022 Update.

SCE's Response:

From 2019 to 2021, SCE saw over a 200% increase in ignitions from overhead secondary conductor as shown below in Figure ACI-17-01, as well as a high number of QC findings regarding overhead secondary/service conductor conditions. In 2022, the main driver of secondary ignitions was Equipment/Facility Failure (EFF) (approximately 70%) followed by Contact Foreign Object (CFO) (approximately 15%) as shown below in Figure ACI-17-02.

SCE added questions to the inspection survey in Q2 of 2021 (e.g., copper vise connector, no non-exempt connector present), which is utilized in the field by the inspector (who is an Electric System Inspector (ESI)) who performs a comprehensive inspection survey. Additional training was provided to the ESIs not only on the form but on the specific issues to look for while performing the inspections, such as damaged secondaries. These changes have resulted in an increase in inspection repair notifications from 4,502 to 8,322 in 2021 to 2022, respectively relate to secondary conductors.

Figure ACI-17-01 - Ignition Trends for Overhead Secondary



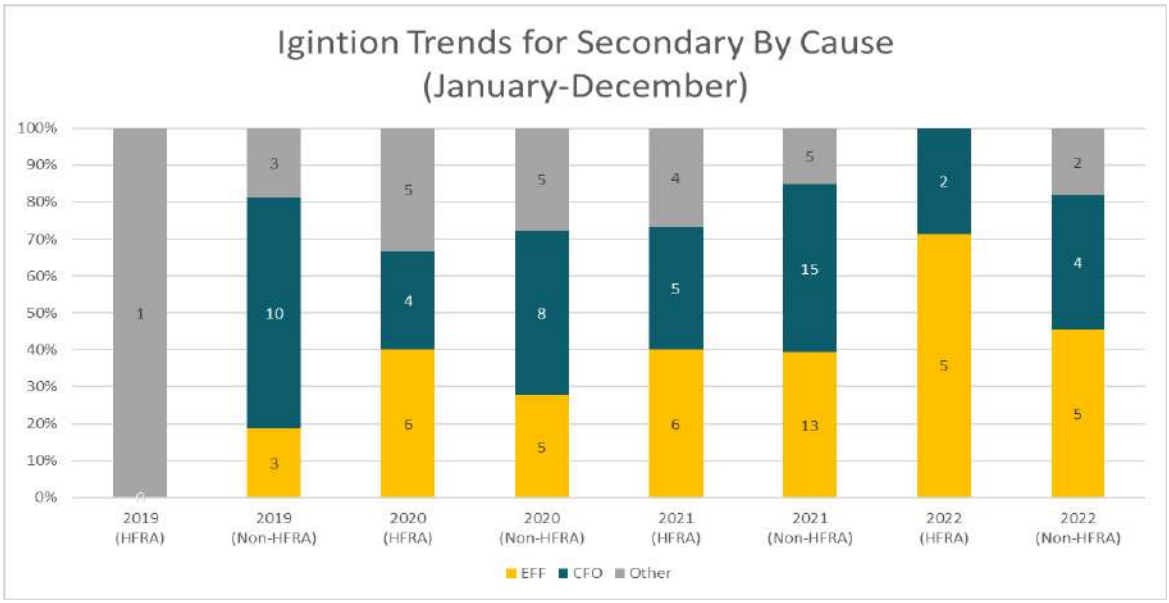


Figure ACI-17-02 - Ignition Trends for Overhead Secondary by Cause

In addition, in 2022, SCE inspected and trimmed vegetation around approximately 700 secondary structures and taped connectors on approximately 3,000 secondary structures in SCE's HFRA. In 2023, SCE will continue vegetation management work by inspecting approximately 1,000 secondary structures and perform trimming as necessary. SCE is also developing a secondary connection covering to replace temporary taping and evaluating a breakaway that disconnects and de-energizes service and secondary connector at predetermined mechanical load, which prevents ignitions if the wires fall due to fallen trees or excessive winds. Notifications were created to replace all identified high fire open-wire bare secondaries with multiplex conductor within a three-year timeframe. Lastly, SCE has seen a reduction in reportable ignitions caused by secondary conductors from 30% in 2021 to 20% in 2022.

Required Progress #2:

Demonstrate a decrease in the percentage of QA/QC findings relating to secondary conductor.

SCE's Response

SCE clarifies that a Quality Control (QC) inspection is "conducted by evaluating the results of a sample of completed inspections after the fact" while a Quality Assurance (QA) review "evaluates the process and supporting evidence to provide reasonable assurance to management that the WMP goals/activities have been met." In addition, SCE further clarifies that QA is "process oriented" to focus on preventing future defects, while QC is "product oriented" and focuses on identifying each defect.

In 2021, 1.4% of structures had a QC finding (Priority 1 and/or Priority 2 condition not identified during an inspection) related to secondary/service conductor damaged/clearance issues. In 2022, 0.6% of structures had a QC finding related to secondary/service conductor damaged/clearance issues. This represents a 57% reduction in secondary/service conductor findings per structure, which SCE attributes to the process improvements noted above concerning form enhancements and improved inspector training.

SCE's pass rate (percentage of inspections for which a QC finding was not identified) for its QA/QC of overhead detailed inspections within high-fire areas improved from 92 percent in 2021 to 94 percent in 2022, in part due to the reduction of QC secondary findings. The increase in repair notifications identified by SCE inspectors as well as a corresponding decrease in QC findings related to damaged secondary conductors can be attributed in part to the recent improvements to the inspection form.

SCE-22-18 Progression of Joint Effectiveness of Enhanced Clearances Study

***Description**: The 2021 Action Statements required the Large IOUs to conduct a study assessing the effectiveness of enhanced clearances. Progress has been made in the study; however, the study must continue to progress.*

***Required Progress**: By the submission of the 2023 WMPs, SDG&E, along with PG&E and SCE, must (1) standardize the data collection process for the cross-utility database of tree-caused risk events, (2) determine where and in what form the database will exist, (3) examine, to the best of their ability, whether the correlation between enhanced clearances and the lower number of tree-caused outage events may be attributable to other factors beyond clearances, such as the management of hazard trees and the installation of covered conductor. Energy Safety expects the large IOUs to make incremental progress and update their analyses with each WMP submission through at least 2025.*

2023 – 2025 WMP
Areas for Continued Improvement and Required Progress of the IOUs' 2022 WMP Update
Progression of Effectiveness of Enhanced Clearances Joint Study

Response:
The utilities have prepared a joint response to this Area for Continued Improvement.

SDG&E, PG&E, and SCE (jointly, investor-owned utilities or IOUs) have continued collaboration on the vegetation clearance study. Bi-weekly meetings occurred throughout 2022 with attendees from the IOUs and Energy Safety attending.

The IOUs are focused on addressing the required progress of this study, which include:

- Standardize the data collection process for the cross-utility database of tree-caused risk events
- Determine where and in what form the database will exist
- Examine, to the best of our ability, whether correlation between enhanced clearances and the lower number of tree-caused outage events may be attributable to other factors beyond clearances, such as the management of hazard trees and the installation of covered conductor

In order to achieve the results of the study most effectively, the IOUs chose to hire a third-party to establish the data collection standards, create the cross-utility database, and study the relationship between enhanced vegetation clearances and tree-caused risk events. A third-party vendor to assist with the study will provide both experience in data analysis and an independent review of the data and conclusions.

To select a qualified vendor for this multi-year engagement the IOUs nominated potential bidders for the work, and SDG&E led a Request for Information (RFI) event that was sent to eight different vendors to understand their capabilities in performing this study. The RFI was distributed in February, with responses due back in early March. After reviewing and scoring the information received from the vendors, three were then invited to participate in a Request for Proposal (RFP). The documentation for

the RFP was prepared and distributed to the vendors in early June and responses were received in July. The RFP materials were scored, and negotiations began with the selected vendor in August. The completed and signed contract was completed in October and the vendor began attending the joint IOU meetings and beginning data collection for the study. Progress on each of the required areas is provided below:

The EPRI research team is implementing a phased approach to the study consisting of 1) Database Evaluation, 2) Database Development, and 3) Data Analysis. The first step has been for EPRI to request a sample set of data from each of the participating IOUs. This data includes information from relevant vegetation, outage, GIS, weather, and related data sets. The data samples are currently under review and a meeting with the research team and the IOUs is planned for Q1 of 2023 to discuss the data fields. After this discussion, a larger sample of data will be requested from each of the IOUs, including relevant metadata, and including historical data. These will be pulled together into a combined database, and jointly evaluated. The EPRI team will consider how best to combine the three separate groups of data into a single database. This will begin the second phase of the study: Database Development. The database will exist on the EPRI Server. The three phases are described in more detail below.

The database will exist on the EPRI Server, and outage data will be pushed to EPRI at a time step discussed over the course of the project, likely weekly. Vegetation, weather, GIS, and other datasets will also be pushed to the database at selected, regular intervals. The outage data will include outages that are not vegetation related. EPRI will query the freeform notes to extract possible tree related outages that were coded erroneously. EPRI will examine and put the utility data into a common format and create a new database of the combined utility data. This data will be accessible for queries by the participants. If all the participants agree, the data can also be available for downloading, and can be obfuscated to the degree necessary by the providing utility prior to transfer.

This will be done by first examining a selection of each IOU's databases including weather, vegetation management, GIS, Outage Management Systems (OMS), and other related databases. This review will first include a review of the datasets, the frequency of collection, the quality of the data, the confidence in the data, historical data available from each IOU, the metadata, variables, definitions, and identify a data steward from each company. Using this information from the sample selection, and a second request for larger dataset, we will create a data dictionary. After reviewing the samples of each utility, and during the immersive discussions described below, we will develop the joint database. The fields and coding systems in the joint database will be designed with the utilities and using the experience of the vendor in similar projects. The EPRI Data Science Platform will be able to integrate data of various formats and types, facilitating the data analysis described below.

The study intends to create the joint database across the three utilities which would be able to establish uniform data collection standards, focus on tree-caused risk events, incorporate both biotic and abiotic factors, and assess the effectiveness of enhanced clearances. Once the database is created, there is an opportunity for researchers and practitioners to gain deep insight on the causes of ignition events and the potential vegetation management options to mitigate them.

The following steps will be implemented between January 2023 and June 2024.

1) Database Evaluation:

a. First, to evaluate existing data, and recognizing that each IOU's database has some common fields and other fields that are not common across all IOUs, a sample of each database will be evaluated, and then a larger section of the data will be evaluated. This will be to review existing data and guidelines for data collection and determine if the current structures allow the key research questions for this project to be addressed. To that end, and to help ensure that the data curated can acceptably inform the questions to be answered, EPRI plans to have immersive discussions with each IOU's respective vegetation management and outage management teams to better understand what data is currently curated and to evaluate the level of quality and certainty of data contained in the database fields. The purpose of the immersive discussions is to understand the current database structures used by each utility, the method of recording data, the type of historical records available, the definitions of specific tree-pruning activities, the differences in the outage management systems, and other information that may vary from utility to utility.

b. Parallel or after the individual meetings, the research team and SMEs from each of the three IOUs will attend a follow up workshop to be hosted by SDG&E, or one of the participating utilities. This is scheduled for February 6-7. During this meeting, we will discuss the key questions raised at the individual meetings and discuss organizing outage cause codes into common groupings to best capture the information needed to perform a meaningful study, including sharing ideas regarding additional data fields. As a team (research team and utility SMEs) we will decide on the design of a consolidated database structure to be used moving forward.

c. Third, once outage cause codes are determined, a survey/coding workshop will be developed describing scenarios that should be coded. This survey will be administered to all employees that input cause codes in the outage management system (OMS). While the survey will capture the initial inputs, the survey will also present the user with the desired coding based upon the decisions made in the group workshop.

2) Database Development:

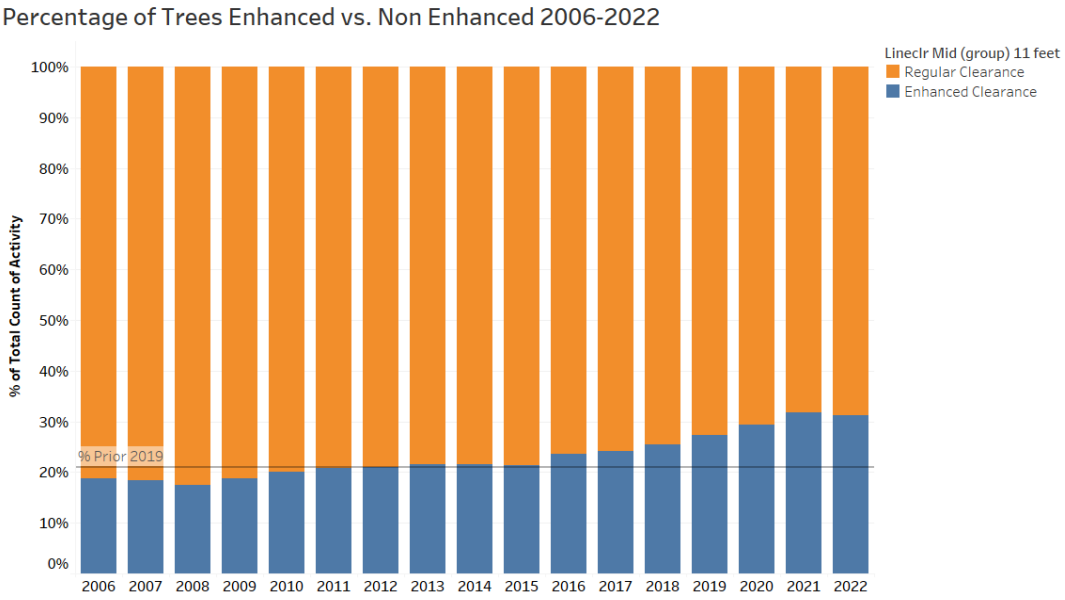
a. EPRI will base the database development on previous experience with cross utility databases such as the industry wide databases for T&D asset performance, inspections, and maintenance. Before defining the final database structure, EPRI will follow a phased approach. Initially, EPRI will investigate each utility's data individually. Then, they will look at the lessons learned to assess the broader applicability. At that stage, EPRI can initiate the development of a cross utility database by designing the criteria around how the common database is set up and populated, as well as the data management lifecycle criteria.

3) Data Analysis:

a. In addition to a single-unified database structure and the data to support that structure that allows IOUs to understand every vegetation contact with the lines, there is a need to drill down to understand vegetation treatments and their effectiveness. Assuming adequate history on circuits that have data before and after enhanced clearance work was performed, we would conduct statistically valid and defensible analyses on that group of circuits. The general objective of the data analysis would be to understand the effect of enhanced vegetation clearances on outage performance. The results would likely lead to other insightful analyses and comparison with other treatment approaches and to different weather conditions. Depending on the type of data received, its granularity, the temporal scale, length of time that enhanced vegetation management has been implemented in the circuits, and how many

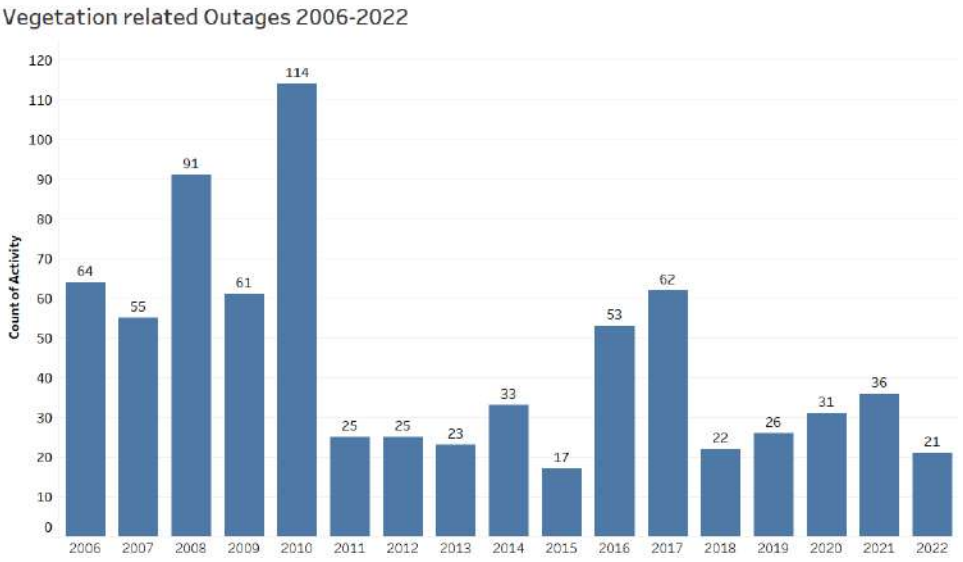
variations the utility has used, there are many different directions of analysis. For example, if the circuit characteristics and approaches are substantially different from one another (circuit to circuit or utility to utility) a self-benchmarking or baseline extrapolation might be possible if sufficient historical data is also provided. Similarly, other data analysis possibilities exist that will be determined as the scope of the data becomes available.

b. EPRI will share the results of Data Analysis in a technical memo which will include data, graphs, charts, and narrative text. This information can be used to share results with joint IOU stakeholders, including agencies, and the general public, regarding results of the data analysis and any insights regarding the potential links between enhanced vegetation clearing, outages, and ignition risk.



Separate from the joint IOU database study on enhanced clearances, each of the large IOUs have completed work to understand the effectiveness of enhanced clearances within their respective service territories. Details on these efforts are described below.

SDG&E



San Diego Gas & Electric (SDG&E) has implemented several initiatives within its Vegetation Management program to reduce power outages and mitigate the risk of wildfire. These initiatives include covered conductor, undergrounding, enhanced inspection processes, and enhanced line clearance. To assess the impact of the Enhanced Clearance Vegetation Management program, which was launched in 2019, we conducted an analysis. Our goal was to understand the effectiveness of this program in reducing outages and potential wildfire.

According to the California Public Utilities Commission (CPUC) General Order 95, Rule 35, distribution voltage lines in California must have a minimum clearance of 18 inches. In the High Fire Threat District (HFTD) region of the state, the minimum clearance is 4 feet for distribution lines. For the purposes of this analysis, "enhanced clearance" refers to trees that were trimmed to a height above 11 feet. In 2019, SDG&E increased the percentage of trees managed at enhanced clearance distances (11 feet or higher) to 25% of its inventory and saw a reduction in power outages. The graph below illustrates the percentage of inventory trees that were managed at enhanced clearance distances versus not enhanced from 2006 to 2022.

Distribution of Tree Inventory Line Clearance Distance

Historical Vegetation related Outage Count

To understand its outage reduction over recent years, SDG&E analyzed historical data. When comparing the years 2019-2022 to 2014-2018, SDG&E observed approximately a 20% improvement in outages.

Year	Group	Count of FACILITYIDs	Outage Count	Outage Rate (Outage Count/Count of FACILITYIDs)	% of FACILITYIDs less or equal to 11 feet	% of FACILITYIDs greater than 11 feet	Avg % of FACILITYIDs greater than 11 feet	% Change	Average Outage Count	Outage Improvement (count)	Outage Improvement (% change)	Average Outage Rate	Outage Rate Improvement	Outage Rate Improvement (% change)
2014	Prior EVM (14-18)	393,217	33	0.008%	78.4%	21.6%								
2015	Prior EVM (14-18)	388,903	17	0.004%	78.6%	21.4%								
2016	Prior EVM (14-18)	383,351	53	0.014%	76.3%	23.7%								
2017	Prior EVM (14-18)	379,431	62	0.016%	75.8%	24.2%								
2018	Prior EVM (14-18)	381,170	22	0.006%	74.6%	25.4%	23.2%		37.4			0.010%		
2019	EVM (19-YTD 22)	377,554	26	0.007%	72.7%	27.3%								
2020	EVM (19-YTD 22)	377,919	31	0.008%	70.7%	29.3%								
2021	EVM (19-YTD 22)	384,613	36	0.009%	68.2%	31.9%								
2022	EVM (19-YTD 22)	*372,472*	*24*	*0.006%*	*68.8%*	*31.2%*	29.9%	6.67%	29.3	8	21.8%	0.008%	0.0020%	20.7%

To determine the contribution of the enhanced clearance initiative to the observed improvement in outages, we employed a machine learning model (logistic regression) to analyze the relationship between line clearance distance and the probability of tree-caused power outages. The logistic regression model considered various variables that may impact outage probability, and we conducted a sensitivity analysis to examine the effect of line clearance distance on outages while holding other factors constant.

SDG&E analyzed all activities from 2014 to 2022 to understand the relationship between line clearance distance and the probability of tree-caused power outages. We linked each outage event to its corresponding inspection or trim activity to determine the most recent line clearance distance before the outage occurred. The variable "outage" served as the flag variable that was predicted in the model.

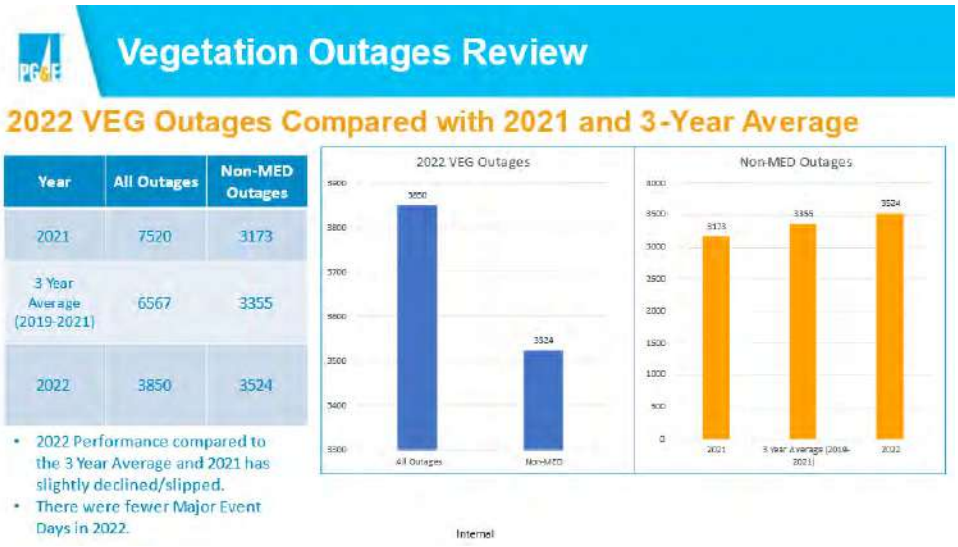
The following features were included in the model:

- Species
- Line Clearance Distance
- Enhanced Clearance (yes or no)
- Tree Height
- Diameter at Breast Height (DBH)

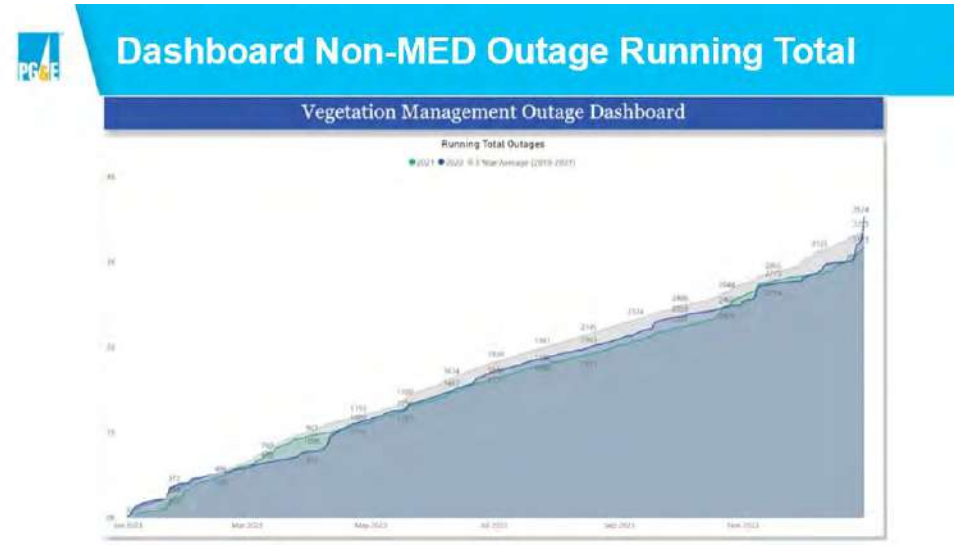
To evaluate the performance of the model, the entire dataset was split into training and test data sets. The training set was used to build the model, and the test set was used to evaluate the model's performance on unseen data. Once we understood the model's performance, we altered the line clearance distance in the sensitivity analysis to understand its effect on the predicted probability of outages for each activity.

The sensitivity analysis reduced the line clearance distance of all activities with a line clearance distance above 11 feet (enhanced clearance level) to 11 feet. We then reran these activities through the model using the same threshold value to make predictions. We assumed that the new distribution of activities would have the same performance distribution as the actual data, allowing us to determine the number of outages that were potentially prevented for these trees.

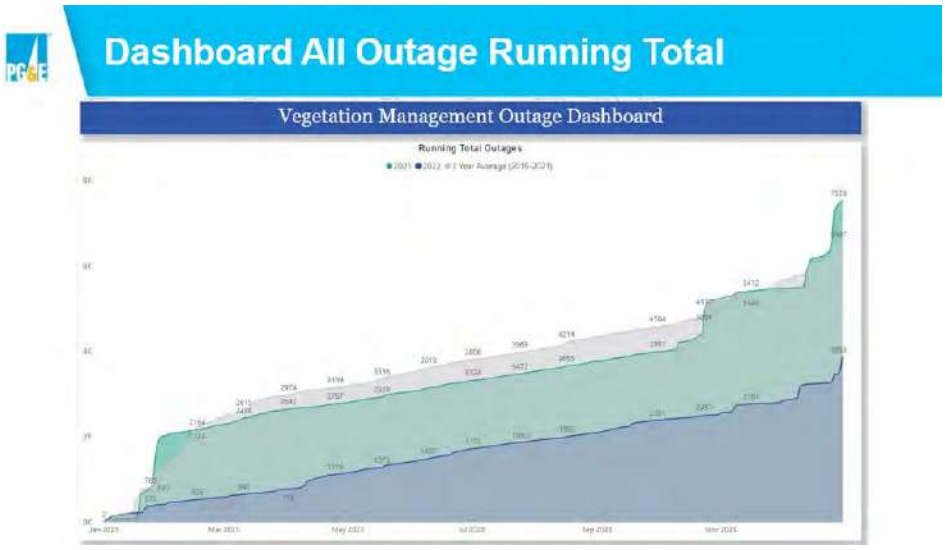
By altering the line clearance distance value, but holding other factors constant, we were able to evaluate the impact of line clearance on tree-related outages. Our results revealed that reducing line clearance from enhanced levels (>11 ft) to regular levels (11 ft) led to an increase in the number of predicted tree-caused outages. Specifically, the model predicted a reduction in tree-related outages by approximately 12% attributed to enhanced clearances.



PG&E

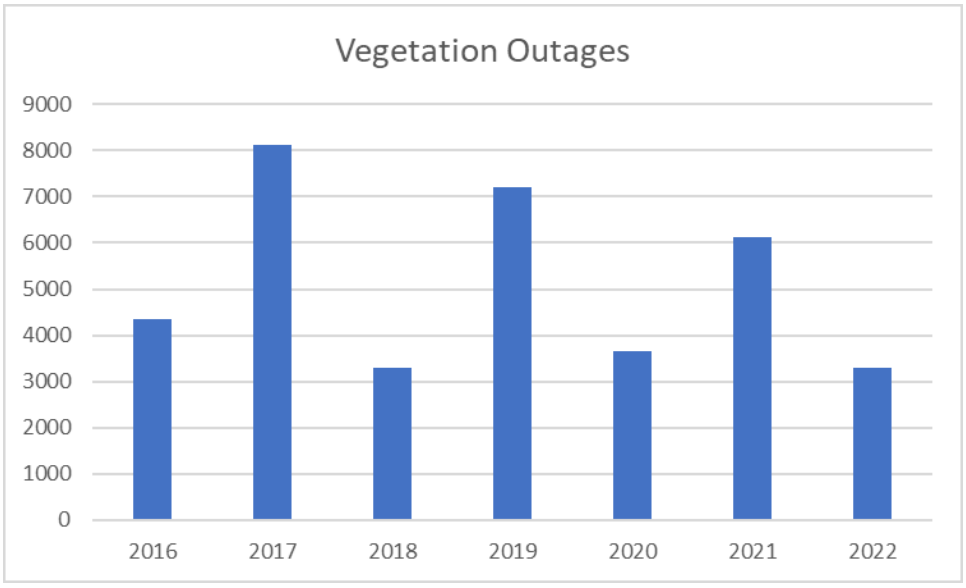


Pacific Gas & Electric (PG&E) launched the Enhanced Vegetation Management (EVM) program in response to changing environmental conditions and based on our best view of risk mitigation at the time. Since launching EVM in 2019, PG&E’s wildfire capabilities have continued to evolve and mature; we now have solutions that provide more effective and efficient wildfire risk reduction such as Public Safety Power Shutoff (PSPS), Enhanced Powerline Safety Settings (EPSS), System Hardening and other operational mitigations. We are also evaluating additional operational mitigations, including partial voltage detection, downed conductor detection, and breakaway connectors, each of which will further



reduce the risk of catastrophic wildfires. The data below shows the 2022 non-MED (Major Event Days) Outages performance compared to the 3 Year Average and 2021 has slightly declined.

The good measure is to compare the outages reduction because ignitions are impacted due to other wildfire reduction mitigation.



Data in the table below is not Normalized for Non-MED Outages (i.e., there are more non-MED in 2022 compared to 2021).

Total Vegetation Outages 2016-2022

SCE

Beginning in late 2018, SCE began implementing enhanced clearance programs to achieve greater trimming distances consistent with D.17-12-024, which amended GO 95 to increase recommended clearance distances at time of trimming in HFTD. SCE believes that tree-caused circuit interruption (TCCI) data serves as an appropriate data point to use in assessing the impact of SCE's enhanced clearance programs on reducing the risk of wildfires.

Outage data in Table 1 represents TCCIs on SCE's distribution system as confirmed through SCE field verification. The data shows a significant decline of 53% in the average annual number of TCCI's between the pre-enhanced clearance period of 2017 through 2019 compared to 2022. In the pre-enhanced clearance period in SCE's HFRA, SCE experienced an annual average of approximately 141 TCCIs, while in 2022, the annual number of TCCIs is currently 66, a reduction of approximately 53%.

As of Q4 2022, there were no reported events on SCE's transmission circuits.

Table 1: Average Events Pre & Post Enhanced Clearances[1]

Average Events Pre and Post Enhanced Clearances	Pre-Enhanced Clearances	Post Enhanced Clearances[2]	Difference
	Avg of Annual TCCIs (2015-2019)	Annual TCCIs (2022[3])	
HFTD	141	66	-53%
Non-HFTD	320	160	-50%
All	461	226	-51%

Notes: 1) SCE's TCCI data categorization in this table is grow-in, blow-in and fall-in events with six total fault type categories: Grow-In, Blow-In, Fall-In, Human Caused, No Cause/Not tree related, and Uncategorized. This data excludes Human Caused and No Cause/Not tree related recorded events. SCE has maintained data for annual outages since 2015 and for enhanced clearances since 2020.
2) While SCE began implementing enhanced clearances in 2019, "post-enhanced" is focused on 2022, in consideration of the time required to execute and advance expanded clearance work across SCE's HFTD.
3) December 2022 data is subject to change pending final verification.

Though SCE has tracked TCCIs since 2015, advancements in its work management system have allowed SCE to associate specific outage events with the specific tree(s) in its inventory since 2021. With this consideration, SCE's analysis is currently looking at correlation and expects that more robust regression analysis may be possible in future years. Starting in 2021, SCE's legacy outage data was updated to newer data collection standards and inputted into Fulcrum, one of SCE's data collection tools. This additional functionality helps further SCE's insight into outage events and potentially informs future mitigation strategy.

Additionally, SCE has enhanced the functionality of its outage dashboard to facilitate a more holistic view of TCCIs across the system. The dashboard provides insight into TCCI trending as well as factors that may affect outage frequencies, such as at-risk species, time of year, and related weather events. SCE has actively participated in this joint IOU working group, and appreciates the partnership with all stakeholders involved. Over the next few years, SCE anticipates this effort will yield additional evidence of the impact enhanced clearances have on the reduction of tree-related events.

SCE-22-19 Participation in Vegetation Management Best Management Practices Scoping Meeting

Description: *Vegetation management processes and protocols for the reduction of wildfire risk are not uniform across electrical corporations*

Required Progress: *SCE and all other electrical corporations (not including independent transmission operators) must participate in an Energy Safety-led scoping meeting to discuss how utilities can best learn from each other and future topics to explore regarding vegetation management best management practices for wildfire risk reduction.*

SCE's Response

SCE has participated in a pre-scoping meeting with Energy Safety in advance of the scoping meeting and looks forward to collaborating with Energy Safety and other stakeholders in this effort.

SCE-22-20 Protective Device Settings Sensitivity Impacts

Description: *Although SCE estimates reduced reliability impacts from new sensitivity setting for protective devices, SCE has not performed full analysis on reliability and related public safety impacts for changes to its FCS*

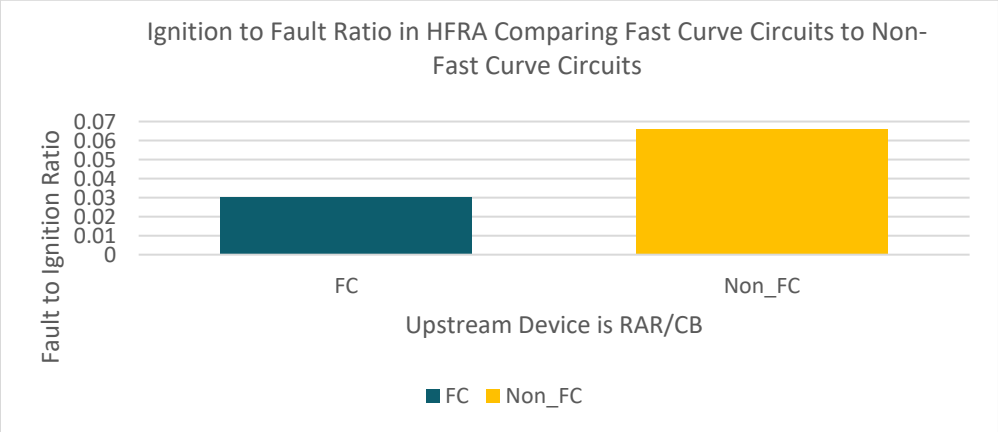
Required Progress: *- Analyze any reliability impacts associated with changes in sensitivity of protective device settings, including a lookback for 2022 performance compared to 2021.*
- Describe mitigations implemented to reduce reliability impacts of FCS if noticeable impacts are observed.

SCE's Response:

SCE began its fast curve program in 2018. To measure the reliability impacts from the fast curve program, SCE compares reliability prior to and after fast curve settings (FC settings) have been implemented. For this analysis, SCE used 2015-2017 outage data to create a baseline reliability performance when FC settings were not implemented and compared those data against circuits that had FC settings capabilities as of June 1, 2022. The circuit data from 2015-2017 versus 2022 data was compared between the months of June and October when elevated fire conditions typically require enablement of FC settings across SCE's HFRA. SCE then examined results at the circuit level.

SCE's analysis shows that overall, fast curve installations have not had any significant impact on customer reliability. SCE is further studying the data to understand any anomalies in reliability data occurring at the circuit level; for example, if year-to-year fluctuations in circuit performance are due to asset conditions and other externalities. SCE also believes that wildfire mitigations such as covered conductor and branch line fusing have had positive impacts to circuit outages as circuits with these mitigations generally experience fewer outages compared to pre-mitigation levels.

There has been an increase in customer outage duration from 2020 onward, which has been due to changes in SCE's operating protocols during elevated fire conditions (i.e., recloser blocking and circuit patrols) and not associated with fast curve setting installations. SCE has since implemented changes to these protocols to help mitigate the length of the outages caused by these protocols.



The table below shows the comparison of outage performance from 2018 to 2022 when compared to the annual average from 2015-2017. Performance was also based on the outages seen on the circuits that had FC settings installed by June 1st of their respective year. Performance was also based on the outages seen on the circuits that had FC settings installed by June 1 of their respective year. System level data below on fast curve enabled circuits do not show any drastic changes in outage counts since installation; however, there is an increase seen in duration due to SCE's change in operating protocols in 2020 during elevated fire conditions.

Table ACI 22-01 – Outage Data on Circuits with Fast Curve Enabled

System-Level June to October Data on Circuits where Fast Curve was Enabled						
Category	**2015 – 2017 Annual Avg**	**2018**	**2019**	**2020**	**2021**	**2022**
Outages	781	256	360	536	569	757
Circuits	956	533	757	779	793	956
Outages Per Circuits	0.85	0.50	0.48	0.69	0.72	0.79
Customers Interrupted Per Outage	1,265	1,464	1,484	1,366	1,517	1,540
Customer Minutes of Interruption (CMI) per Outages	58,669	102,332	99,096	160,684	133,212	147,436
CAIDI	46	70	67	118	88	96

By enabling fast curve settings during elevated fire conditions, SCE has not seen an increase in outage impacts. Further, when comparing the fault to ignition ratios for circuits with fast curve enabled to the circuits without fast curves, SCE has seen a significant decrease in the fault to ignition ratios. To measure wildfire ignition risk reduction, SCE evaluated fault-to-ignition ratios from June to October in 2021 and 2022 with the analysis indicating approximately a ~54% reduction between circuits with fast curve enabled (FC Circuits) versus circuits with without fast curve (Non-FC Circuit) as provided through the chart below.

Table ACI 22-02 – Fault to Ignition Ratio Comparison

SCE will continue to monitor the performance on circuits with FC settings enabled and perform analysis to understand the reliability impacts and the mitigation effectiveness of the activity in mitigating potential ignitions.

SCE-22-21 Documentation of Models

Description: *SCE does not provide sufficiently detailed information on models*

Required Progress: *SCE's 2023 WMP submission must follow the appropriate template provided in the 2023 WMP Guidelines for the metrics and underlying data section when documenting the models described in section 7.3.7.3 of its 2022 Update submission*

SCE's Response

SCE has followed the appropriate templates provided in the 2023 WMP guidelines related to the documentation of our models. This information can be largely found in Section 6 and Appendix B of this WMP, which requires SCE to provide details on risk frameworks, components, scenarios, QA/QC procedures, and calculation methodologies. SCE is committed to adhering to Energy Safety guidelines and providing straightforward and transparent information on its risk models and approaches. SCE will continue to partner with Energy Safety and stakeholders, especially through forums such as the Risk Modeling Working Group.

SCE-22-22 Third Party Confirmation of RSE Estimates

Description: *SCE does not confirm its RSE estimates with independent experts or other utilities in California*

Required Progress: *In its 2023 WMP, SCE must show that its RSE estimates are confirmed by a third party or detail an action plan and associated timeline for third party confirmation of all RSE estimates.*

SCE's Response

SCE performed a competitive solicitation to select an independent third-party expert to confirm its RSE estimates. Exponent was selected following the solicitation.

Exponent reviewed SCE's RSE process, including inputs, calculations, and results for reasonableness and accuracy. Exponent attended challenge sessions in which SCE management reviewed and validated RSE assumptions and preliminary results for all scored mitigation activities.

Additionally, Exponent performed validation of RSE accuracy by independently calculating the RSEs for comparison to SCE's results. Exponent provided SCE with its findings and recommendations for potential improvements related to RSE data, assumptions, processes, and methodologies, as applicable.

SCE has incorporated Exponent's findings to the extent feasible and will continue to evaluate longer-term recommendations for ongoing improvement of the overall RSEs.

SCE-22-23 RSE Estimates of Emerging Initiatives

Description: *SCE does not calculate RSE estimates for emerging initiatives*

Required Progress: *In its 2023 WMP, SCE must detail an action plan for calculating RSE estimates for emerging initiatives.*

SCE's Response

RSE is a tool to compare the benefits and costs across mitigation activities. The purpose of a pilot or emerging technology program is to evaluate activities and technologies in which the benefits are unknown or uncertain. Hence, it is challenging to develop risk reduction and cost estimates with a meaningful level of confidence.

Nevertheless, SCE provides RSEs for its emerging initiatives, which can serve as one of many factors to inform SCE's implementation. Instead of laying out an action plan for calculating RSE estimates for emerging initiatives, SCE has developed RSE estimates for the emerging initiatives found in its 2023 – 2025 WMP.

Table ACI 22-01 below contains a list of emerging initiatives and the resulting RSE.

Initiative	**2023-2025 RSE[310]**	**WMP Reference**
Transmission Open Phase Detection (TOPD): SH-8	1,795	8.3.3.1.2.1; 8.1.8.1.3.2
Distribution Open Phase Detection (DOPD)	1,994	8.3.3.1.2.2; 8.1.8.1.3.3
High Impedance (Hi-Z) Relays	6,210	8.3.3.1.2.3; 8.1.8.1.3.1
FR Wrap Retrofit	95	8.1.2.3.2
Early Fault Detection (EFD): SA-11	5,778	8.3.3.1.1
Satellite and Other Imaging Technology for Fire Spotting (part of SA-10)	40	8.3.4.1.2

[310] RSEs are a point in time estimate and may be updated to reflect changes in scope, cost and effectiveness based on new information.

SCE-22-24 RSE Estimates Used for Capital Allocation

Description: *SCE does not use RSE estimates as a factor for determining capital allocation across its portfolio of mitigation measures (e.g., prioritizing between vegetation management and grid hardening)*

Required Progress: *In its 2023 WMP, SCE must show that it is using RSE estimates to determine capital allocation across its portfolio of mitigation measures or detail an action plan and associated timeline for using RSE estimates to determine portfolio-level periodization.*

SCE's Response

RSE represents a relative measure of estimated cost-effectiveness for actions a utility takes to mitigate a specific risk. RSE scores may offer certain insights into how effective a mitigation appears to be in reducing risk at a system or portfolio level, while providing guidance on how effective new mitigations may appear to be.

RSEs continue to be an important factor in SCE's decision-making process for how to allocate scarce resources across its portfolio of mitigation measures. As is evident from SCE's response to SCE-22-22 and SCE-22-23, SCE has increased the scope of RSE measurement since its 2022 WMP and has taken definitive steps to further validate and refine its approach to RSE development and evaluation through the use of a third-party, independent evaluator.

It is important to recognize that RSEs are not and should not be the only factor used to develop a proposed risk mitigation plan. The RSE metric does not take into account certain operational realities, resource constraints, and other factors that SCE must consider in developing its mitigation plan. For example, if one were to consider PSPS as an ignition mitigation that hypothetically had a very high RSE score, there are critical practical and regulatory limits to how much PSPS can be deployed. SCE tries to minimize the use of PSPS given the hardships they cause for our customers. The California Public Utilities Commission expressly prescribes that PSPS should be used "as a last resort" despite any relatively high RSE.[311]

Accordingly, to address the most pressing safety risks facing SCE, SCE develops a comprehensive and balanced mitigation plan with activities that will collectively reduce the greatest amount of risk in the shortest amount of time, considering RSE, as well as various regulatory, operational, resource, and cost constraints. To do otherwise would not be prudent. For example, it would be inappropriate to implement a comprehensive wildfire risk mitigation plan based solely on RSEs, which would likely lead to significant parts of the system and potentially significant risk issues being left unaddressed.

SCE developed RSEs to help inform the portfolio of mitigation initiatives in SCE's 2023-2025 WMP, but notes that RSE values were not the sole barometer when making operational decisions and prioritizing mitigation efforts. SCE discusses its risk-informed decision-making process in more detail in Section 7 of this WMP.

Use of RSEs in Development of SCE's 2023 – 2025 WMP

SCE made meaningful progress incorporating RSEs into the capital allocation process for its 2023 – 2025 WMP. First, SCE refreshed and refined the inputs used to calculate RSEs for mitigations with existing RSEs, including driver and sub-driver data, consequence impacts, scope and cost forecasts, and other

[311] *See* D.21-06-034, p. 17, *citing* D.19-05-042, Appendix A at A1; D. 20-05-051, Appendix A at 9.

factors. Second, SCE developed new RSEs for mitigation initiatives not previously scored or new for considered into SCE's 2023 – 2025 WMP. The development of RSE input data was led by SCE's engineering and technical experts and generally based first on data and analytics from system and asset operations, and then supplemented by technical expertise.

SCE then calibrated and challenged the RSEs developed by these experts in a series of challenge sessions with SCE management, where the overall RSE scores and assumptions were evaluated, and action items were taken to further analyze and improve RSE scores. To enhance this evaluation, SCE developed a dashboard to visually display RSE information and enhance information sharing across relevant internal stakeholders. This dashboard allowed stakeholders to compare and contrast input data, assumptions, mitigation effectiveness factors, risk reduction, and several other data points to better understand and pressure-test the RSE scores. In addition, this tool was made available to business line planning teams to help inform their portfolio planning discussions.

As RSEs were refined, they were presented to senior leadership during various executive leadership scope and strategy sessions for final review and approval. As part of those discussions, management requested operational teams to further review scope/implementation plans for select mitigations based on the RSE to ensure appropriate portfolio optimization.

As Energy Safety notes in its final Technical Guidelines for the 2023 – 2025 WMPs, the California Public Utilities Commission is in the process of re-evaluating the appropriate metric to use to evaluate the efficiency and effectiveness of mitigation initiatives. SCE will modify its use of RSEs in accordance with the developments of that process, which may likely result in a change to how the RSE is calculated, and how it is ultimately used. SCE intends to build upon its efforts for this WMP to use RSEs to help inform capital allocation across our 2023 – 2025 wildfire mitigation portfolio in concert with those changes.

SCE-22-25 Increasing PSPS Thresholds on Hardened Circuits

Description: *SCE indicated it will gradually include the benefits of hardened circuits as inputs to its PSPS consequence model. However, SCE included no specific timeframe for when it will raise thresholds.*

Required Progress: *In its 2023 WMP, SCE must report on whether higher PSPS thresholds were adopted as a result of grid hardening measures. If so, SCE should confirm which circuits benefited and provide details on the extent to which PSPS thresholds were raised.*

SCE must clarify in its 2023 WMP whether higher PSPS thresholds were adopted prior to September 30, 2022, for potential use during the time of year when dry, windy weather conditions, combined with a heightened fire risk, are most often forecasted to drive need for PSPS events. If it has not raised thresholds, SCE must explain why and by when it will include raised thresholds.

SCE's Response

SCE may elect to raise individual circuit or circuit segment thresholds when sufficient grid hardening (primarily covered conductor) has been installed or through the circuit exception process.[312] In these instances, SCE may raise wind speed thresholds to 40mph sustained winds or 58mph gusts, which aligns with the National Weather Service high wind warning level for wind speeds at which infrastructure damage may occur. SCE is considering the creation of a new modeling criteria that would change how and where elevated thresholds are set. See SCE-22-26 for more detail.

As a result of SCE's grid hardening efforts and exception process, which are both targeted to reduce PSPS impacts, SCE raised wind speed thresholds to the higher National Weather Service High Wind Warning values on part or all of the following circuits as of September 30, 2022:

- Acosta
- Ambercrest
- Anaconda

[312] SCE removes circuit segments from PSPS protocols in situations where persistent or prevalent wildfire risk associated with these segments are temporarily abated or no longer exist, through a circuit exception process. While the potential for reducing PSPS based on circuit exceptions is much more limited than grid hardening activities, the exception process does not require installation or replacement of assets and, therefore, analysis and application of this option can typically be performed quicker than grid hardening activities when the latest information supports such exceptions. The circuit exception review process begins when SCE personnel identify a line segment which—despite being located in HFRA—might currently pose a very low risk for wildfire ignition or fire spread. For example, a portion of a circuit found to be traversing over a recent burn scar may be a candidate for circuit exception. Circuit segments can be identified as candidates for exception review as SCE begins preparing detailed designs for grid hardening activities, or through specific feedback received from field personnel. This process requires current and local knowledge of changing conditions to inform the circuit review process. Identified circuit segments are reviewed by SCE's PSPS operations, fire science, and risk management experts evaluating the circuit segment's unique characteristics (e.g., construction type, outage history) and location characteristics (e.g., fuel quantity, fuel type, fuel dryness, fuel age, history of fires in the area) to determine if that circuit segment can be exempt from PSPS monitoring and de-energization due to low wildfire risk.

Since September 30, 2022, SCE has also raised wind speed thresholds to the higher NWS High Wind Warning values on part or all of the following four circuits:

- Enchanted
- Jeep
- Julius
- Kickapoo Trail

SCE was also able to raise thresholds on at least 22 other circuits (or segments thereof) prior to the height of the 2022 fire season by either validating the installation of covered conductor upgrades outside of PSPS-Driven Grid Hardening work (formerly SH-7) or through the circuit exception process.

SCE-22-26 PSPS System Damage in Consequence Modeling

Description: *In 2021 field personnel inspecting lines prior to restoring power after PSPS events found 46 incidents of wind-related damage. This damage was on lines de-energized during PSPS events that potentially could have caused ignitions. SCE has not performed consequence modeling based on these damage points to better understand potential incidents that the shutoffs may have prevented.*

Required Progress: *In its 2023 WMP Update, SCE must report on progress to include observed PSPS event damage points as data input into its PSPS consequence models*

SCE's Response

SCE is expecting to solicit proposals this year from external technical firms to develop a defensible methodology for more predictive, risk-driven modeling that can derive wind speed thresholds down to the circuit segment level. This solution may include machine learning (ML) and artificial intelligence (AI) inputs to guide probability of failure determinations as prominent factors for de-energization thresholds. SCE's intention is to include data points from actual historical damage to SCE assets by type, associated wind speed, and more.

SCE's intention is that combining predictive modeling inputs with known historical failures should allow SCE to develop wind speed thresholds that are informed by the conditions that caused PSPS event damage points previously. SCE will develop this new methodology in 2023.

SCE is also evaluating the potential consequences should an ignition have occurred in the 46 incidents in 2021 in which wind-related damage was found after PSPS events. This analysis is underway but not yet complete as SCE is working to make sure that historical conditions for the 46 incidents are correctly accounted for in the consequence modeling. Barring unexpected challenges with the historical data or modeling calculations, SCE plans to complete the analysis by the end of Q2, 2023.

SCE-22-27 Lessons Learned from PSPS Implementation

Description: *As identified by SCE in its lessons learned from implementing 2021 PSPS events, SCE noted deficiencies regarding operations in the face of rapidly escalating events. Deficiencies were in the areas of notification and stakeholder engagement, restoration planning, resource availability, customer engagement, communication cadence, and improving forecasting models to improve communications.*

Required Progress*: In its 2023 WMP Update, SCE must report on progress in the following areas:*

1) Refining weather forecasting capabilities to improve ability to estimate wind speeds at specific locations where PSPS events have occurred most frequently.

2) Using updated air operations training protocols for timely inspections to improve restoration times.

3) Addressing gaps in logistics processes through additional staffing resources and other approaches for community resource center/community care vehicle supplies.

4) Providing customers more specific and accurate restoration time notification messages.

5) Providing sufficient notice for customers to prepare for potential de- energizations without notifying customers who are unlikely to be de- energized (over-notifying vs. under-notifying).

6) Refining its weather models to inform customers more accurately of potential de-energization ahead of time.

SCE's Response

1) Refining weather forecasting capabilities to improve ability to estimate wind speeds at specific locations where PSPS events have occurred most frequently.

SCE is in the process of adding machine learning capabilities that incorporate weather station observations to correct bias and improve model forecasts at point locations. SCE selected 64 locations in 2021, adding 500 locations in 2022, with plans to add approximately 600 in 2023. The locations have been prioritized by the frequency of reaching or exceeding PSPS wind speed criteria during low relative humidity conditions. The locations chosen must also have at least six months of observations available in order to train the new models. Please also see SCE's response to ACI SCE-22-08 (Weather Station Improvements) and Section 8.3 (Situational Awareness) for additional details on weather forecasting improvements.

2) Using updated air operations training protocols for timely inspections to improve restoration times.

In 2022, SCE created a PSPS Task Force Job Aid for Rules of Engagement (Job Aid), which includes operations training protocols for inspections to improve restoration time. SCE updated the PSPS Task Force Operations Section Chief and Task Force Unit Leader appendices of this Job Aid to add a protocol to work with the Air Operations Branch Director and Task Force Unit Leader to determine the strategy in positioning air resources (e.g., considering pre-placing aircraft to be closer to de-energized areas) as needed in support of expediting anticipated and/or actual restoration activities. The appendices were also edited to expand on reviewing the staffing strategy utilized before or during Medium and Large

events[313], such as requiring additional Task Force Units to be activated to focus on restoration activities and considering whether to activate an Electrical Service IMT Restoration Branch Director to assist with resource procurement and management to aid the Restoration Task Force Unit in restoration.

3) Addressing gaps in logistics processes through additional staffing resources and other approaches for community resource center/community care vehicle supplies.

Community resource center (CRC) and community care vehicle (CCV) logistics gaps have been addressed through: 1) reducing lead time for restocking some items where possible, 2) providing teams with lead times for restocking to inform timely restock ordering, and 3) placing supplies in three separate service centers. SCE has also addressed staffing concerns by establishing a fully rostered field staff and will grow the roster of resources by continuing to recruit for additional resources.

4) Providing customers more specific and accurate restoration time notification messages.

In 2022, SCE started the process to provide more dynamic restoration information on sce.com. Several steps were completed in 2022, including creating notification templates for both customers and public safety partner notifications, creating templated language for sce.com, and creating process flowcharts. However, the complete process was not fully available during the 2022 fire season as SCE continued to automate the restoration data and data flows between the operations and external engagement actions.

The ability to provide more dynamic restoration information is currently limited by technical constraints including a lack of historical predictive data, technical limitations in coordinating individual estimated restoration time (ERT) notifications at the circuit or circuit-segment level given the potential number of circuit segments involved, translation requirements for ad hoc messaging, and due to PSPS outages requiring patrol of the entire length of every de-energized circuit by truck, helicopter, or on foot. In large events, due to the potential size of sustained damage, it is difficult to forecast as time is required not only to patrol the circuits impacted but to remediate any hazards/damages. Additionally, larger events also often involve crews needing to patrol multiple circuits.

5) Providing sufficient notice for customers to prepare for potential de- energizations without notifying customers who are unlikely to be de- energized (over-notifying vs. under-notifying).

SCE continues to enhance operational plans to remove more customers from scope in advance of events, which also reduces over-notification to the customers who are not ultimately switched off of impacted circuits. In 2022, SCE improved weather modeling with the addition of 500 new machine learning models (see response #6 below). Additionally, we have created a program to pre-segment certain circuits in which not all segments are typically impacted similarly to PSPS events. This should remove over-notification on some frequently impacted circuits by allowing us to notify at the circuit-segment level on these circuits.

6) Refining its weather models to inform customers more accurately of potential de-energization ahead of time.

In 2022, a total of 500 new machine learning model forecast locations were developed to improve wind

[313] SCE defines small events as less than 25 circuits; medium events as 25 to 75 circuits; large events as 75 or more circuits.

speed and wind gust forecasts at select point locations. These more accurate forecasts will help better identify which customers may be subject to potential proactive de-energizations ahead of a PSPS event. The new machine learning capabilities also provide probabilistic forecasts, which allow SCE to better plan around forecast uncertainties and are intended to lead to better notification accuracy through advanced lead time. SCE will continue to prioritize the development of new machine learning forecasts in 2023 with between 500 - 600 new forecast locations expected based on available data. Even though SCE runs multiple sophisticated weather models and has added new machine learning capabilities, no forecast is perfect due to limitations in the science of numerical weather prediction and the uncertainty of weather. The California Public Utilities Commission has recognized the impact of weather forecasting limitations on the IOUs' ability to provide advance notifications. See, e.g., D.19-05-042, pp. 86, A7-A8, which states, "Recognizing that there may be times when advance notice is not possible due to emergency conditions beyond the electric investor-owned utilities' control, the electric investor-owned utilities must, whenever possible, provide advance notification"; "Electric investor-owned utilities should, whenever possible, adhere to the [] minimum notification timeline" (emphasis added).

APPENDIX E: REFERENCED REGULATIONS, CODES, AND STANDARDS

In this appendix, the electrical corporation must provide in tabulated format a list of referenced codes, regulations, and standards. An example follows.

Name of Regulation, Code, or Standard	Brief Description
14 C.F.R. § 107, et seq.	FAA certification for Unmanned Aircraft Systems & pilots
14 C.F.R. § 133, et seq.	Rotorcraft External-Load Operations
14 C.F.R. § 61, et seq.	FAA Certification: Pilots, Flight Instructors, and Ground Instructors
14 C.F.R. § 91, et seq.	General Operating and Flight Rules
16 U.S.C. § 1362 et seq. (Marine Mammal Protection Act (MMPA)	Protects endangered marine mammals
16 U.S.C. § 1451 et seq. (Federal Coastal Zone Management Act)	Bureau of Ocean Energy Management- protection, management, and development of the coastal zone
16 U.S.C. § 1451 et seq. (Federal Coastal Zone Management Act)	protect the coastal environment from growing demands associated with residential, recreational, commercial, and industrial uses
16 U.S.C. § 668 et seq. (Bald and Golden Eagle Protection Act (BGEPA)	prohibits anyone from "taking" bald or golden eagles, including their parts, including feathers, nests, or eggs.
16 U.S.C. § 703 et seq. (Migratory Bird Treaty Act (MBTA))	Outlaws the taking, killing, or possessing migratory birds
16 U.S.C. §§ 1531-1544 (Federal Endangered Species Act of 1973(ESA))	provide a means whereby the ecosystems upon which endangered species and threatened species may be conserved
16 U.S.C. §§ 470aa–470mm (Archaeological Resources Protection Act (ARPA)	Protection of archaeological resources and sites which are on public lands and Indian lands
16 U.S.C. §§ 470aaa-470aaa-11 (Paleontological Resources Preservation Act (PRPA)	provides specific mandates for administering paleontological resource research and collecting permits and the curation of fossil specimens in museum collections
25 U.S.C. § 3001 et seq. (Native American Graves Repatriation Protection Act (NAGRPA)	Gives rights of Indian tribes to obtain repatriation of human remains, funerary objects, sacred objects, and objects of cultural patrimony from federal agencies and museums.
33 U.S.C. §§ 1251-1388 (Federal Clean Water Act (CWA)	establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for surface waters.
42 U.S.C § 4321 et seq. (National Environmental Policy Act (NEPA)	policy to encourage harmony between man and his environment; promote efforts to prevent or eliminate damage to the environment; stimulate health and welfare of man; enrich understanding of ecological systems and natural resources; and to establish a Council on Environmental Quality
54 U.S.C. §§ 300101-307108 (National Historic Preservation Act (NHPA)	Preservation policy for historic property

Name of Regulation, Code, or Standard	Brief Description
54 U.S.C.§§ 320301-320303 (Antiquities Act of 1906)	provide general legal protection of cultural and natural resources of historic or scientific interest on Federal lands
A.22-05-013	Risk Assessment Mitigation Phase Proceeding (RAMP)
AB 1054 (2019)	Rules for reviewing and setting of HFTD boundaries every year
AB 2911 (2018)	Identification of fire districts without a secondary egress route that are at significant fire risk
AB 52 (2014)	California Assembly bill requiring that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource and requires consultation with Native American under CEQA
California Code of Regulations, Title 13, §§ 2450 - 2465	Portable Equipment Registration Program (PERP) and Portable Engine Airborne Toxic Control Measure
California Code of Regulations, Title 14, § 15268(d)	Definition of “ministerial projects”
California Code of Regulations, Title 14, § 15381	Definition of “responsible agency”
California Code of Regulations, Title 14, §§ 1250 - 1258	provide specific exemptions from: electric pole and tower firebreak clearance standards, electric conductor clearance standards and to specify when and where the standards apply.
California Environmental Quality Act (CEQA)	requires public agencies to “look before they leap” and consider the environmental consequences of their discretionary actions
California Fish and Game Code §§ 1600 - 1616	Protection and conservation of the fish and wildlife resources in lakes and streams
California Fish and Game Code § 2050 et seq. (California Endangered Species Act (CESA))	Legislation to conserve, protect, restore, and enhance any endangered species or any threatened species and its habitat
California Fish and Game Code § 2080 et seq.	California Endangered Species Act - prohibition of trading endangered or threatened species
California Fish and Game Code § 3503	Prohibits destruction of bird nests and eggs
California Fish and Game Code § 3503.5	Prohibits possession or destruction of birds-of-prey
California Fish and Game Code § 3511	Prohibits possession of fully protected birds without a license
California Fish and Game Code § 3513	Prohibits possession of migratory nongame bird as designated in the Federal Migratory Bird Treaty Act (16 U.S.C. Sec. 703 et seq.)
California Fish and Game Code § 3800	Definition of nongame birds and mining regulation affecting same
California Fish and Game Code § 4700	Definition of fully protected mammals
California Fish and Game Code § 5050	Protection of reptiles and amphibians
California Fish and Game Code § 5515	Definition of fully protected fish and possession prohibition
California Fish and Game Code §§ 1900-1913 (Native Plant Protection Act)	Preservation, protection and enhancement of endangered or rare native plants of California

Name of Regulation, Code, or Standard	Brief Description
California Fish and Game Code §§ 5650 - 5652	Prohibit the deposition, passage of, or disposal of deleterious materials into the waters of the state, or within 150 feet of the highwater mark of waters of the state
California Food and Agriculture Code §§ 80001-80201 (California Desert Native Plants Act)	Protection of native plants from unlawful harvesting on both public and privately owned lands
California Government Code § 8593.3(f)(1)	Definition of access and functional population
California Health and Safety Code §§ 39000 - 44474	Protection of ambient air quality, control, and maintenance
California Public Resources Code § 21069	Definition of “responsible agency,” “ministerial projects” and the Endangered Species Act
California Public Resources Code § 21080.3.2	California Environmental Quality Act permits mitigation measures capable of lessening impacts to a tribal cultural resource
California Public Resources Code § 30000, et seq. (California Coastal Act)	California Coastal Commission rules including delegation of Local Coastal Programs (LCPs) to cities and counties and guides how the land along the coast of California is developed, or protected from development
California Public Resources Code § 4290.5	Identification of fire districts without a secondary egress route that are at significant fire risk
California Public Resources Code § 4291	defensible space requirement for land covered in flammable material
California Public Resources Code § 4292	Clearance requirements around structures
California Public Resources Code § 4293	maintain a clearance of the respective distances which are specified in this section in all directions between all vegetation and all conductors which are carrying electric current; Mitigation requirement of hazards posed by dead trees or significantly compromised and maintenance of clearance of the respective distances from power lines
California Public Utilities Code § 326(a)(2)	Meaning of “maximum feasible”
California Public Utilities Code § 8386(a)	Electrical corporation’s duty to minimize catastrophic wildfires
California Water Code § 13000, et seq. (California Porter-Cologne Water Quality Control Act)	Conservation, control, and utilization of the water resources of the state, and quality protection. Water Quality Control Board including multiple Regional Water Quality Control Boards
D.12-01-032	Decision adopting regulations to reduce fire hazards associated with overhead power lines and communication facilities; and decision approving the work plan for the development of fire map 1
D.12-04-024	Decision re Electric Investor Owned Utilities reporting requirements for Resolution ESRB-8 Extending De-Energization Reasonableness, Notification, Mitigation.

Name of Regulation, Code, or Standard	Brief Description
D.14-01-010	Decision adopting regulations to reduce fire hazards associated with overhead power lines and communication facilities; and decision approving the work plan for the development of fire map 1
D.15-05-006	Decision modifying HFTD boundaries in SCE's territory
D.17-12-024	Decision adopting regulations to enhance fire safety in the HFTD
D.18-12-014	Adoption of 2018 Safety Model Assessment Proceeding (S-MAP)
D.19-05-042	PSPS Order Instituting Rulemaking (OIR) Phase 1
D.20-05-051	PSPS Order Instituting Rulemaking (OIR) Phase 2
D.20-05-051	Implementation of pilot projects to investigate the feasibility of mobile EV Level 3 fast charging for areas impacted by PSPS events.
D.20-05-051	quarterly meetings to provide updates on PSPS enhancement efforts and solicit input for improvement areas in how SCE approaches PSPS overall and provides a forum for stakeholders to propose ways to improve all aspects of PSPS
D.20-08-046	Climate Adaptation Vulnerability Assessment: utilities to study climate risks to their assets, operations, and services and to file the assessment results one year before their GRC to enable the results of the assessment to inform GRC requests
D.20-12-030	Decision modifying the high fire-threat district boundaries in SCE service territory
D.21-06-014	PSPS Order Instituting Investigation
D.21-06-034	PSPS Order Instituting Rulemaking (OIR) Phase 3
GO 128	Rules for construction of underground electric supply and communication systems.
GO 165	Inspection Requirements for Electric Distribution and Transmission Facilities
GO 166	Standards for Operation, Reliability, and Safety during Emergencies and Disasters
GO 167-B	Enforcement of Maintenance and Operation Standards for Electric Generating Facilities.
GO 174	Rules for Electric Utility Substations, governing standards for substation inspection and management
GO 95	Public Utilities Commission Rules for Overhead Electric Line Construction
GO 95 Rule 37	Minimum Clearances of Wires above Railroads, Thoroughfares, Buildings, Etc.
GO 95, Appendix E	Specifies increased time-of-trim clearances between bare-line conductors and vegetation.
GO 95, Rule 18	Prioritization of maintenance utilizing a three-tier priority maintenance system

Name of Regulation, Code, or Standard	Brief Description
GO 95, Rule 18A	Requires electric utilities to place a high priority on the correction of significant fire hazards.
GO 95, Rule 22.8-A, 22.8-B, 22.8-Cor22.8-D	Meaning of "Protective Covering, Suitable" and minimum standards for ground/bond wire, supply conductor, bolt covers, insulated flexible conduit
GO 95, Rule 31.1	Design, Construction and Maintenance of overhead lines
GO 95, Rule 35	Mitigation requirement of hazards posed by dead trees or significantly compromised. Mandate for removal of dead trees that overhang or lean toward a supply line; Mandates vegetation management to prevent encroachment into Clearance Zones
GO 95, Rule 35 Appendix E	Specifies vegetation management expanded clearances, Grid Resiliency Clearance Distance (GRCD)
GO 95, Rule 35, Table 1, Case 14	requires increased radial clearances between bare-line conductors and vegetation in high fire-threat areas of Southern California.
GO 95, Rule 44.2	Ad hoc inspections through IPI program
GO 95, Rules 31.2, 80.1A and 90.1B	sets the minimum frequency for inspections of aerial communication facilities located in close proximity to power lines.
GO 95, Sections V, VI, VII, VIII, X & XI	Height of Electrical Equipment in the Service Territory
I.14-03-004	Order Instituting Investigation on the Commission's Own Motion into the Operations and Practices of SCE Regarding the Acacia Avenue Triple Electrocution Incident in San Bernardino County and the Windstorm of 2011
Material Specifications 454	SCE's inspection and treatment of wood poles in service. Details on how to do intrusive inspection and the criteria for passing/failing of poles
R.08-11-005	Decision adopting regulations to reduce fire hazards associated with overhead power lines and communication facilities; and decision approving the work plan for the development of fire map 1
R.08-11-005	Order Instituting Rulemaking to Revise and Clarify Commission Regulations Relating to the Safety of Electric Utility and Communications Infrastructure Provider Facilities.
R.15-05-006	Order Instituting Rulemaking to Develop and Adopt Fire-Threat Maps and Fire-Safety Regulations.
R.18-04-019	Order Instituting Rulemaking to Consider Strategies and Guidance for Climate Change Adaptation
R.19-09-009	Order Instituting Rulemaking Regarding Microgrids Pursuant to Senate Bill 1339 and Resiliency Strategies
R.20-07-013	CPUC Order Instituting Rulemaking to Further Develop a Risk-Based Decision-Making Framework

Name of Regulation, Code, or Standard	Brief Description
	for Electric and Gas Utilities
R.20-07-013	Order Instituting Rulemaking to Further Develop a Risk-Based Decision-Making Framework for Electric and Gas Utilities
Resolution ESRB-4	Mitigation requirement of hazards posed by dead trees or significantly compromised. Directs Investor Owned Electric Utilities to take remedial measures to reduce the likelihood of fires started by or threatening utility facilities.
Resolution ESRB-8	Resolution Extending De-Energization Reasonableness, Notification, Mitigation, and Reporting Requirements in Decision 12-04-024 to All Electric Investor Owned Utilities
Resolution SED-5 and SED-5A	Resolution approving administrative consent order and agreement of the Safety and Enforcement Division and SCE regarding the 2017/2018 Southern California fires pursuant to Resolution M-4846
SB 901 (2018)	Senate bill requiring IOUs to file Wildfire Mitigation Plans.
Substation Construction and Maintenance; Maintenance and Inspection Manual	Policies and procedures for substation inspections and maintenance
System Operating Bulletin 21	System Emergency Response Plan
System Operating Bulletin 322	SCE's Standard Operating Bulletin criteria for FCZ, FWT, HFRA, PSPS & TT
Various Encroachment Permits	Permitting governed by CA Dept. of Transportation, CA Dept. Water Resources

APPENDIX F: SUPPLEMENTAL INFORMATION

F1: Continuation of Section 5 - Overview of Service Territory

Below is a list of the WMP Guidelines sections which require additional graphs or maps:

Section Number	Section Title
5.3.4.1 General Climate Conditions	General Climate Conditions
5.3.4.2 Climate Change Phenomena and Trends	Climate Change Phenomena and Trends

Below are the additional graphs.

5.3.4.1 General Climate Conditions

SCE provides graphs for 11 fire climate zones (FCZ) on the "Temperature & Precipitation". Figure 5-2 in Section 0 provides the temperature and precipitation from 1980 to 2021. The additional ten figures reflecting this information are provided below. Figures are as of 10/26/2022 and the data source is from the 40-year internal dataset. Data source is from SCE's 40-year internal dataset which was generated by third party vendor, Atmospheric Data Solutions (ADS) by downscaling the Climate Forecast System Reanalysis (CFSR) data which comes from the National Center for Atmospheric Research (NCAR).

Figure 5-2-1 - Annual Mean Climatology for SCE Service Territory (FCZ 2 - Inland Valleys)

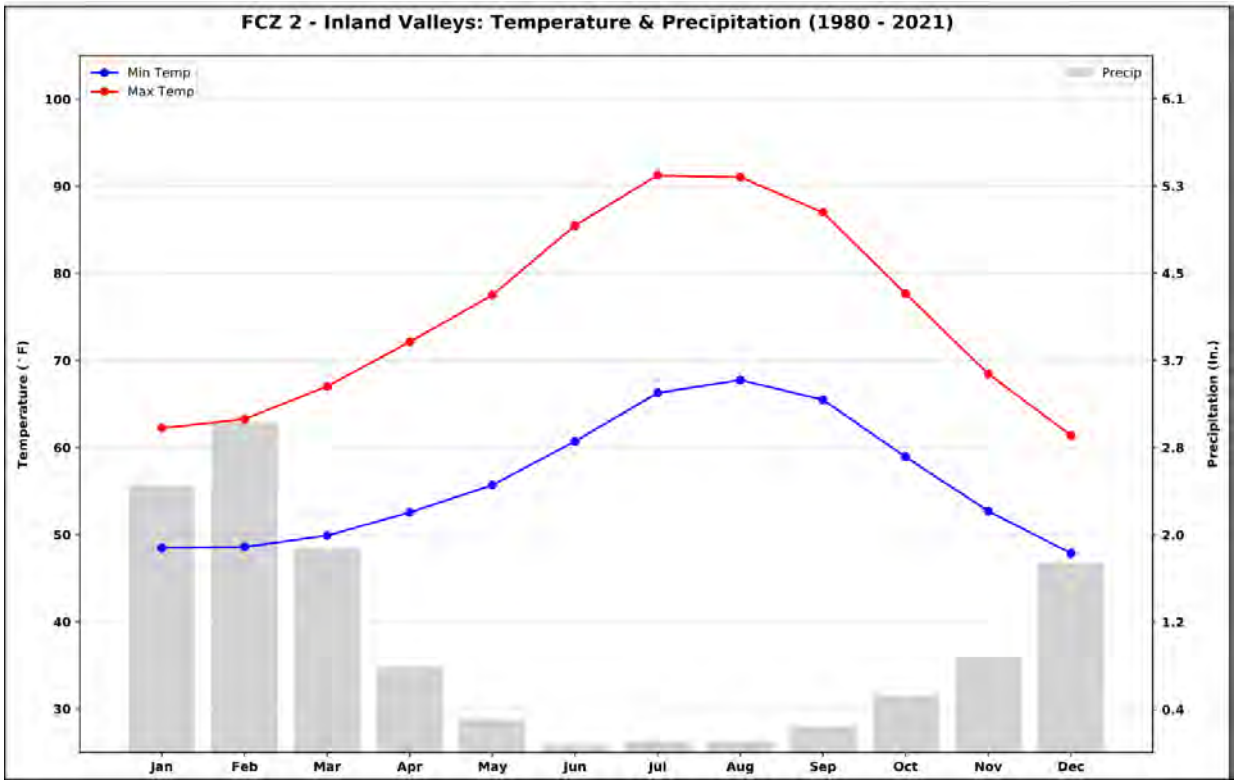

Figure 5-2-2 - Annual Mean Climatology for SCE Service Territory (FCZ 3- Western Mountains)

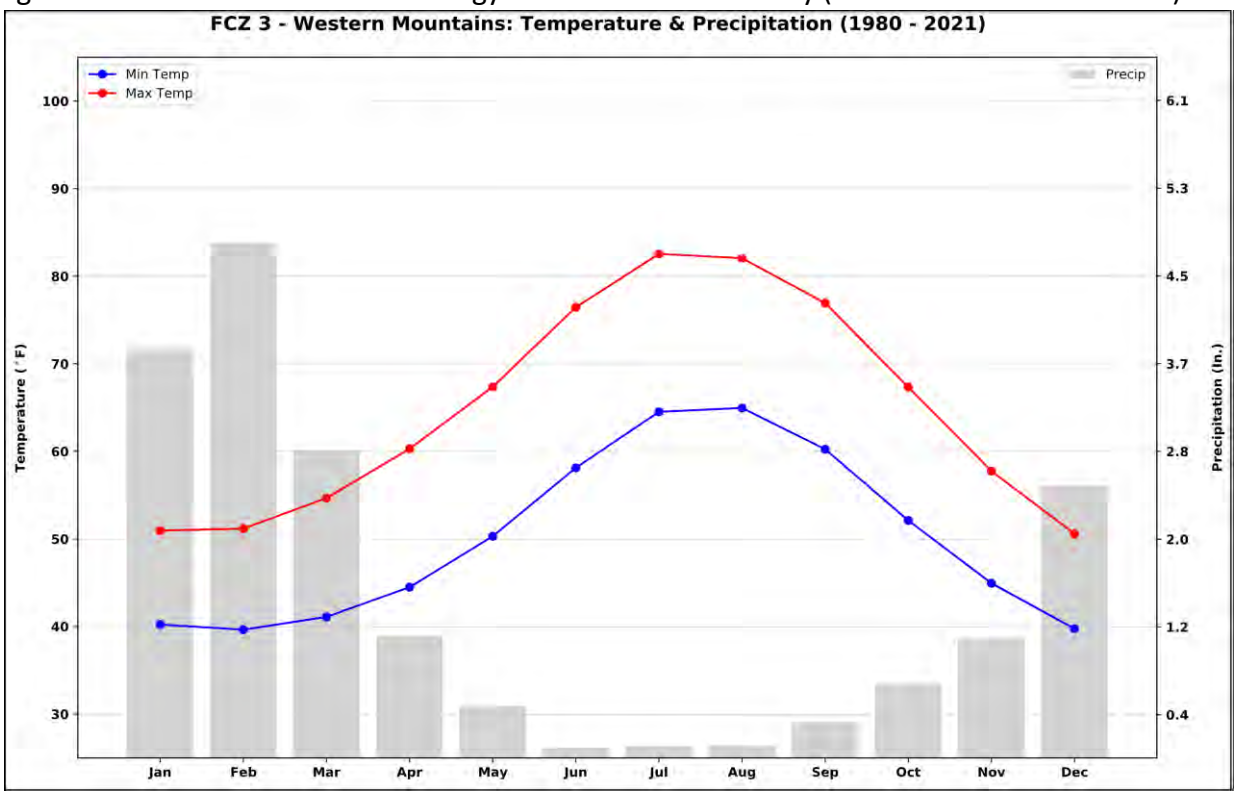

Figure 5-2-3 - Annual Mean Climatology for SCE Service Territory (FCZ 4 - Eastern Mountains)

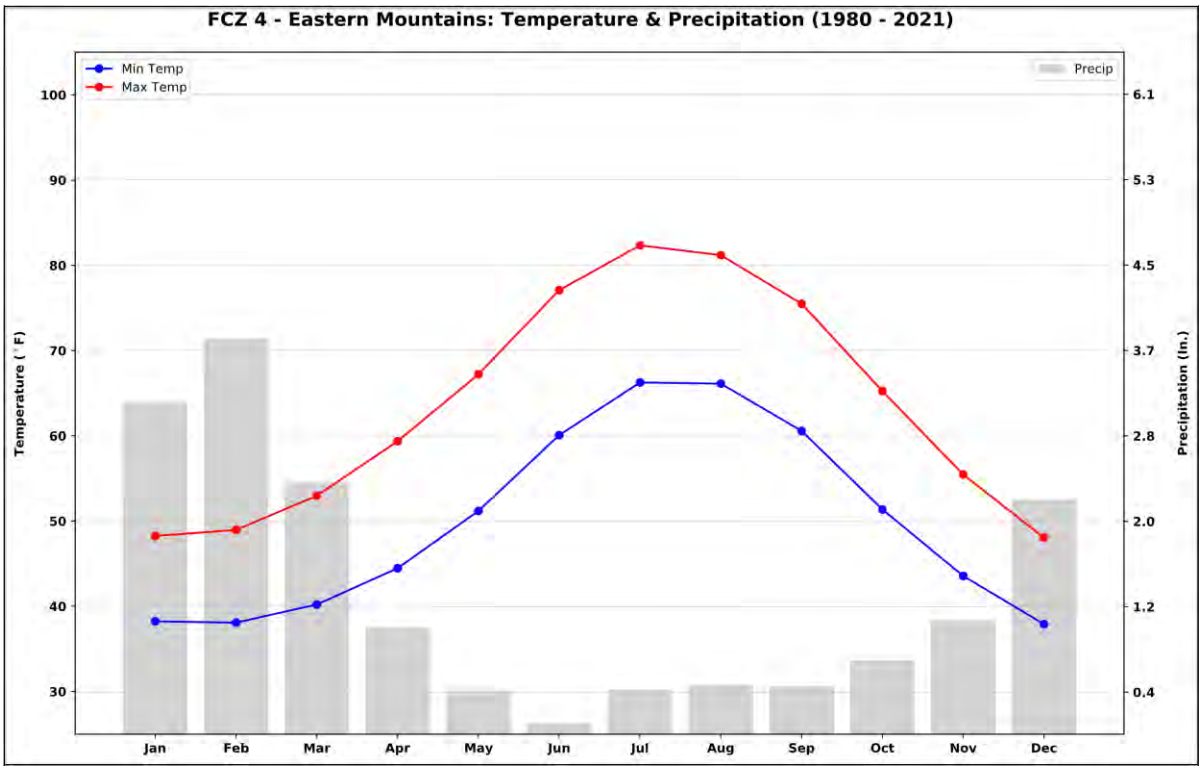

Figure 5-2-4 - Annual Mean Climatology for SCE Service Territory (FCZ 5 - Eastern Desert)

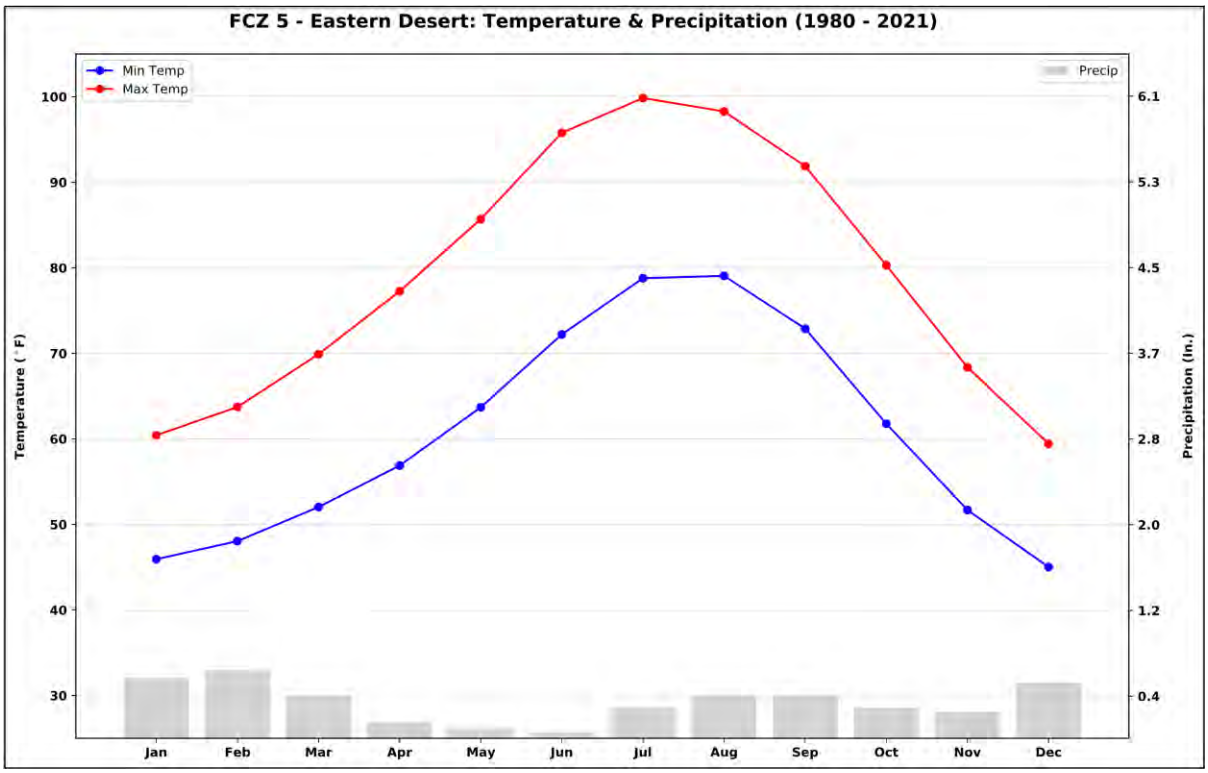

Figure 5-2-5 - Annual Mean Climatology for SCE Service Territory (FCZ 6 - Upper Desert)

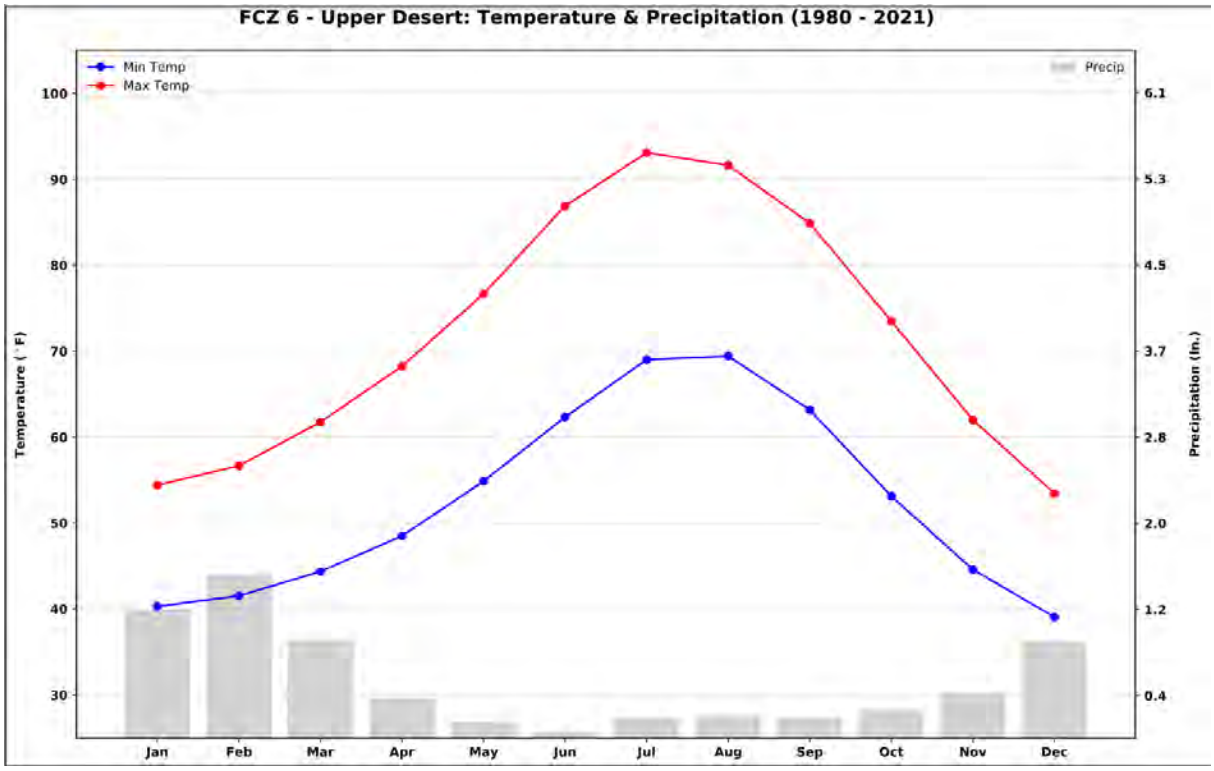

Figure 5-2-6 - Annual Mean Climatology for SCE Service Territory (FCZ 7 - Mojave)

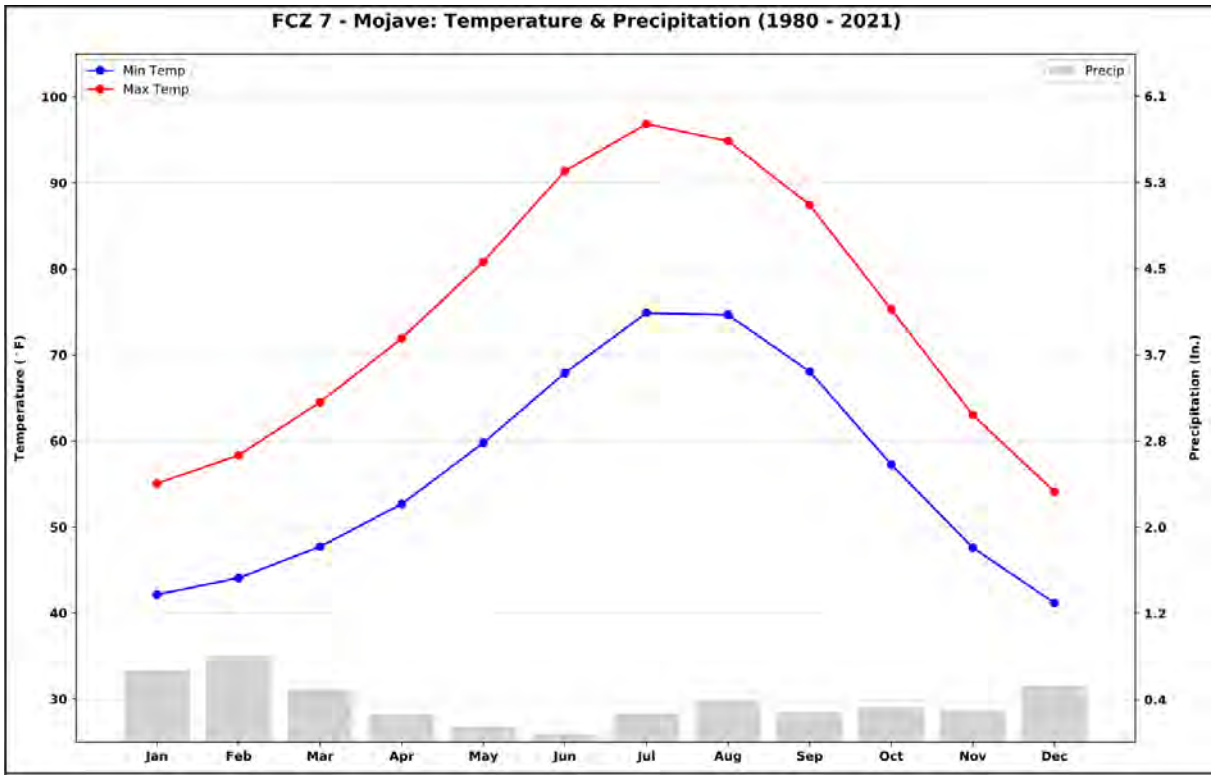

Figure 5-2-7 - Annual Mean Climatology for SCE Service Territory (FCZ 8 – Northern Desert)

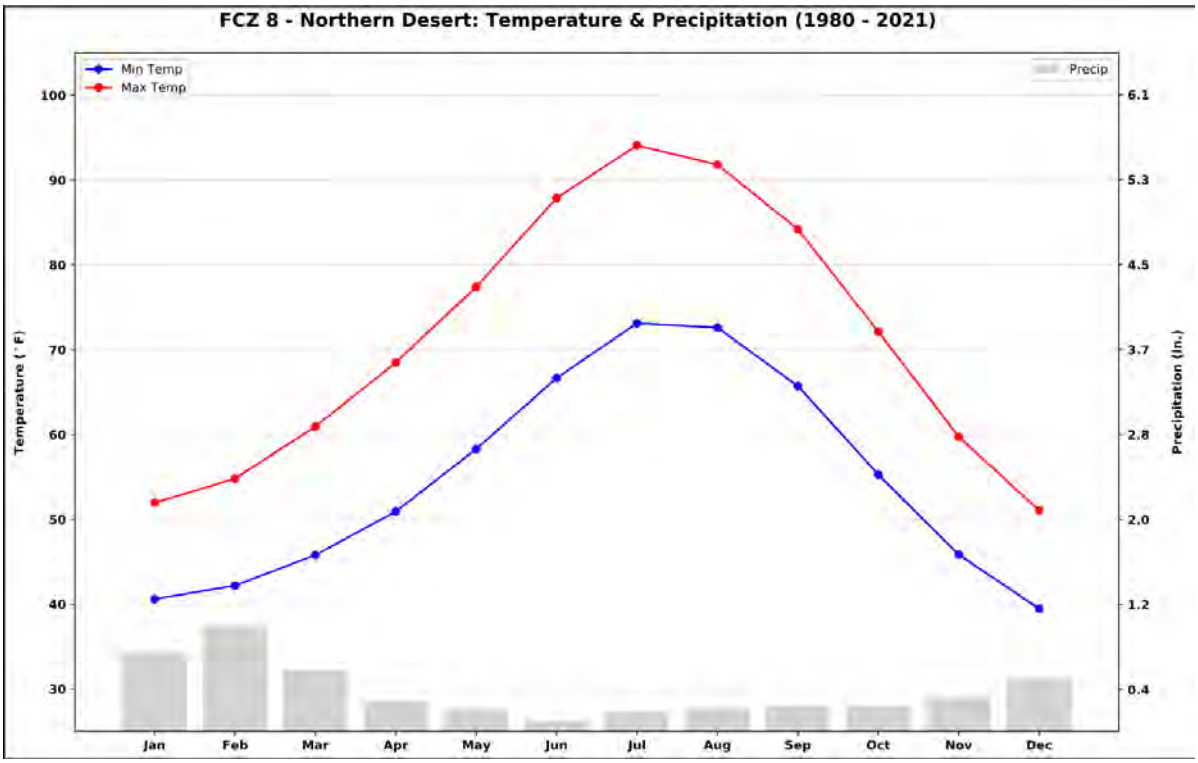

Figure 5-2-8 - Annual Mean Climatology for SCE Service Territory (FCZ 9 – Inyo)

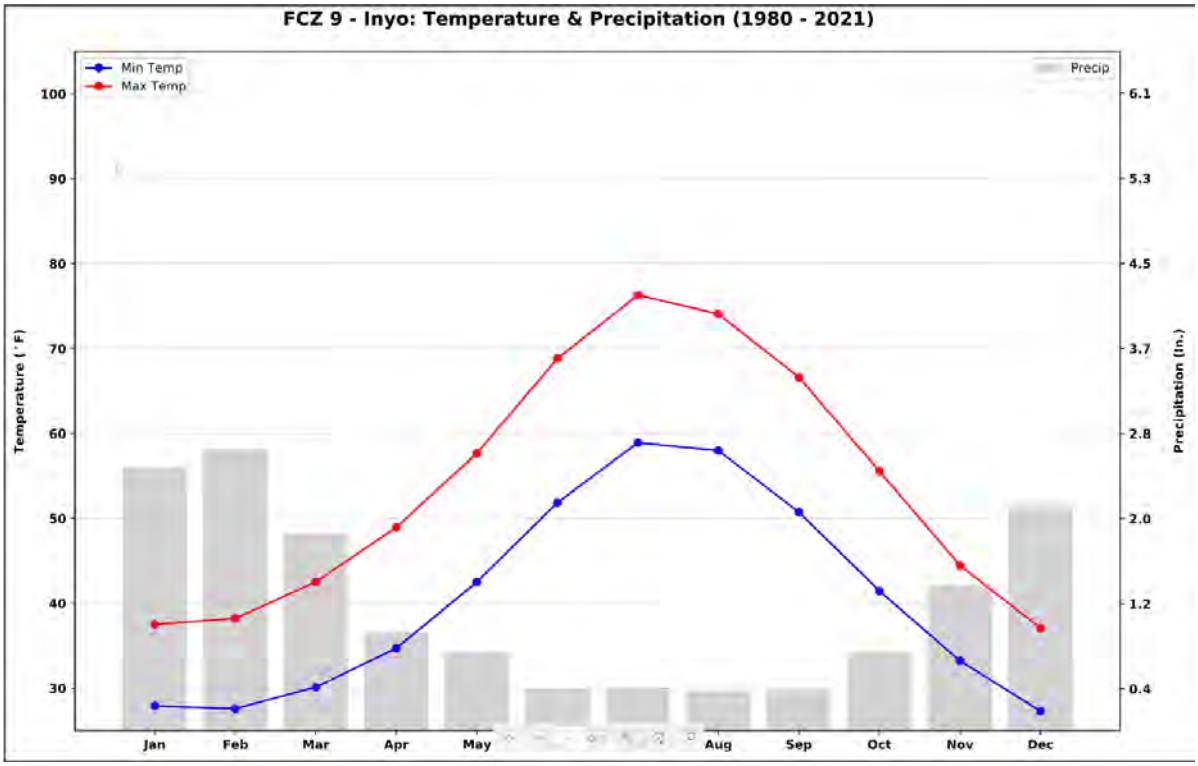

Figure 5-2-9 - Annual Mean Climatology for SCE Service Territory (FCZ 10 – Sierra)

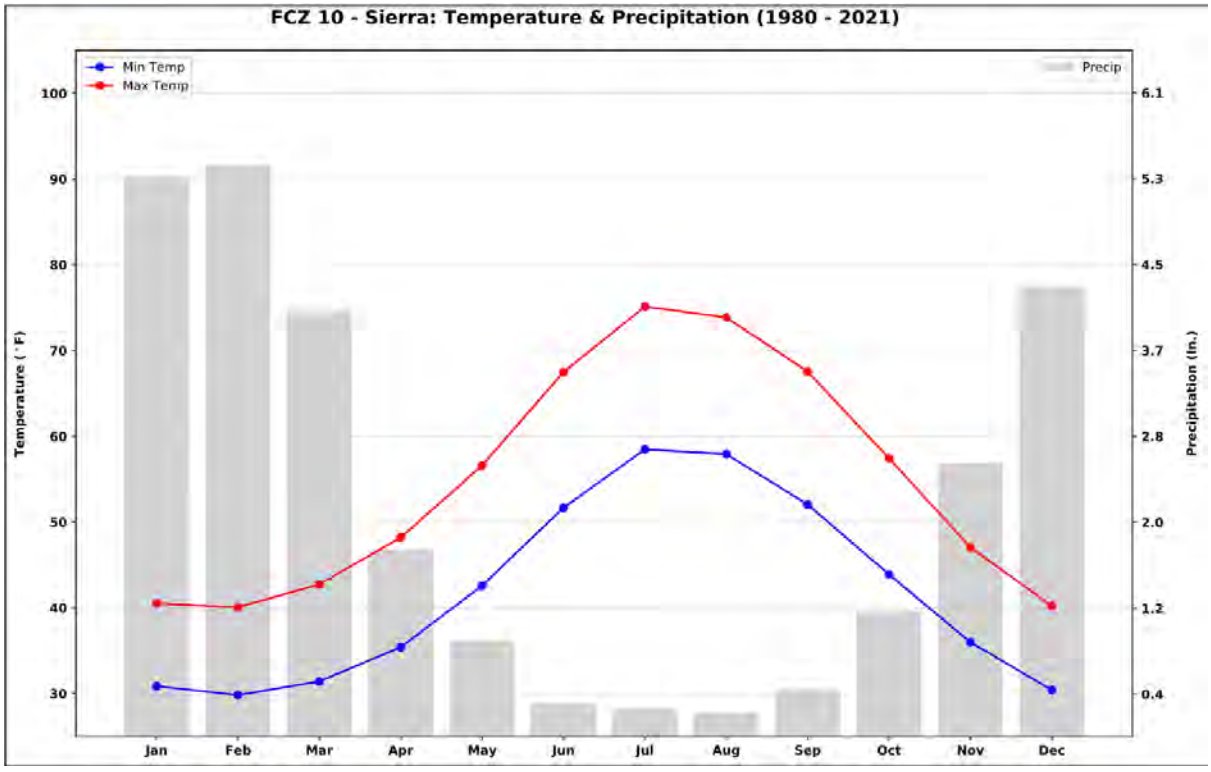

Figure 5-2-10 - Annual Mean Climatology for SCE Service Territory (FCZ 11 – San Joaquin)

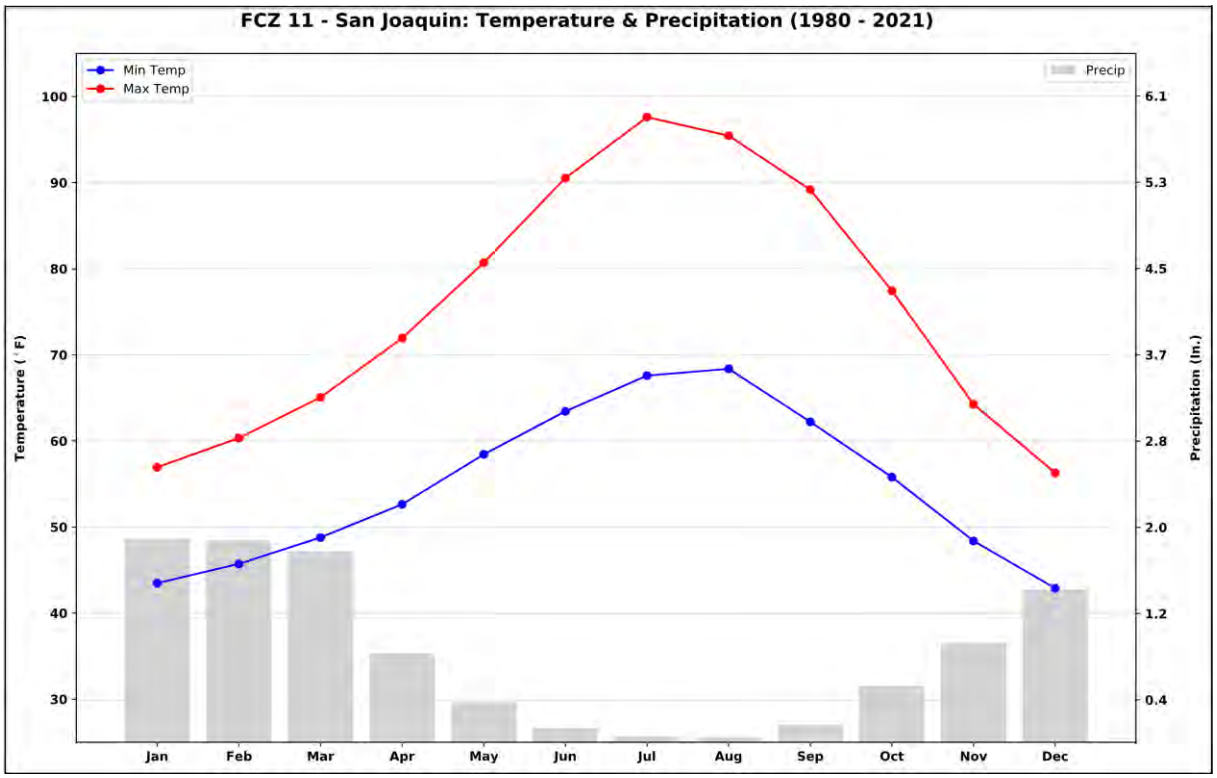

Figure 5-5 in Section 5.3.4.2 Climate Change Phenomena and Trends presents average daily maximum and minimum temperatures values observed and projected across each of SCE's 11 Fire Climate Zones using data from California's 4th Climate Change Assessment. Additional 10 Figures reflecting this information are provided below. These daily average maximum and minimum values are calculated as 365-day rolling averages. Fire Climate Zones are defined at regions in which SCE observes similar climatic conditions related to fire weather conditions.

Figure 5-5-1 - Annual Mean Climatology for SCE Service Territory (FCZ 2 - Inland Valleys)

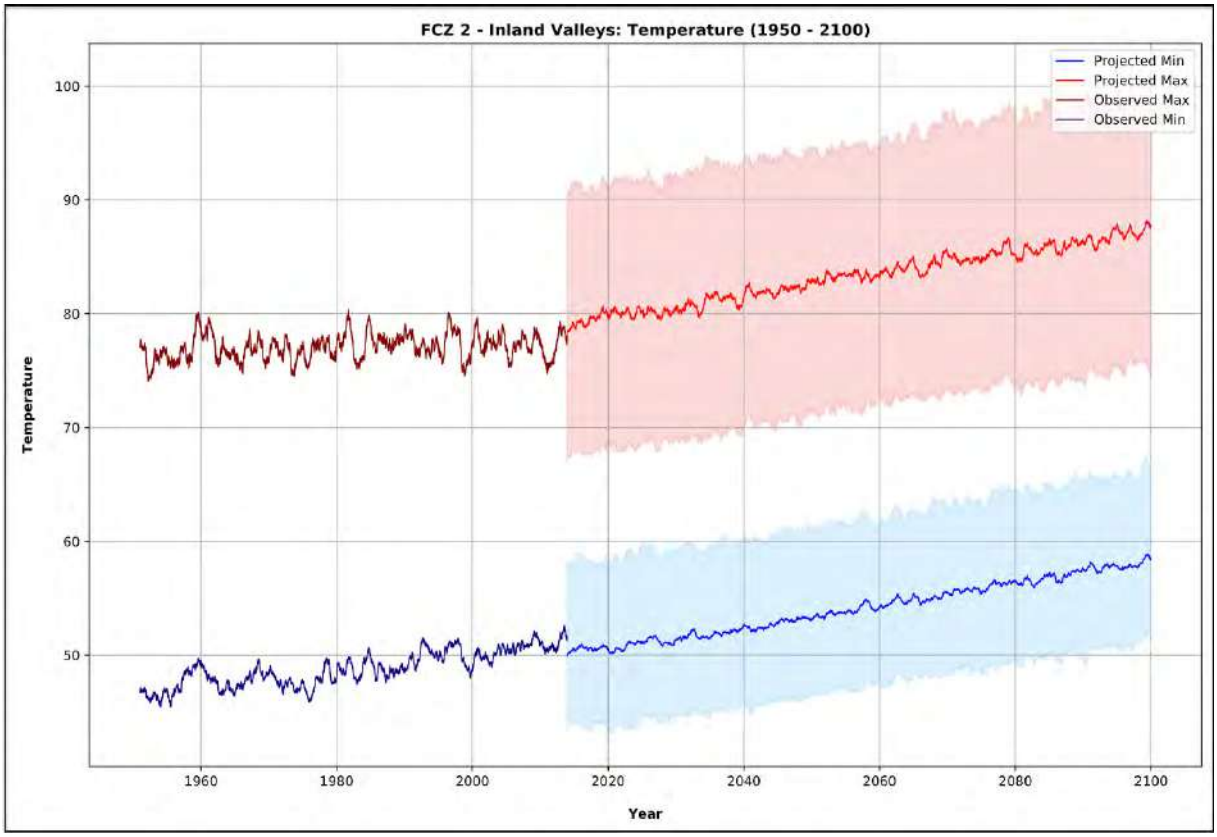

Figure 5-5-2 - Annual Mean Climatology for SCE Service Territory (FCZ 3- Western Mountains)

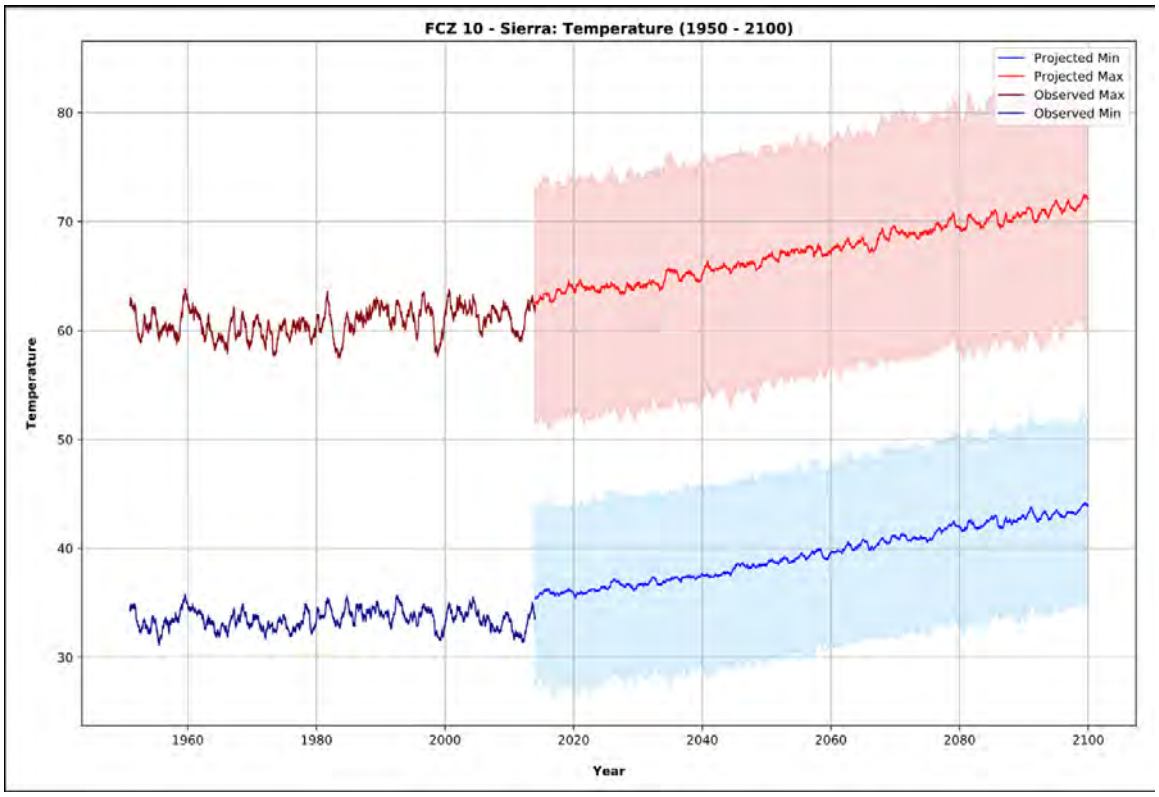

Figure 5-5-3 - Annual Mean Climatology for SCE Service Territory (FCZ 4 - Eastern Mountains)

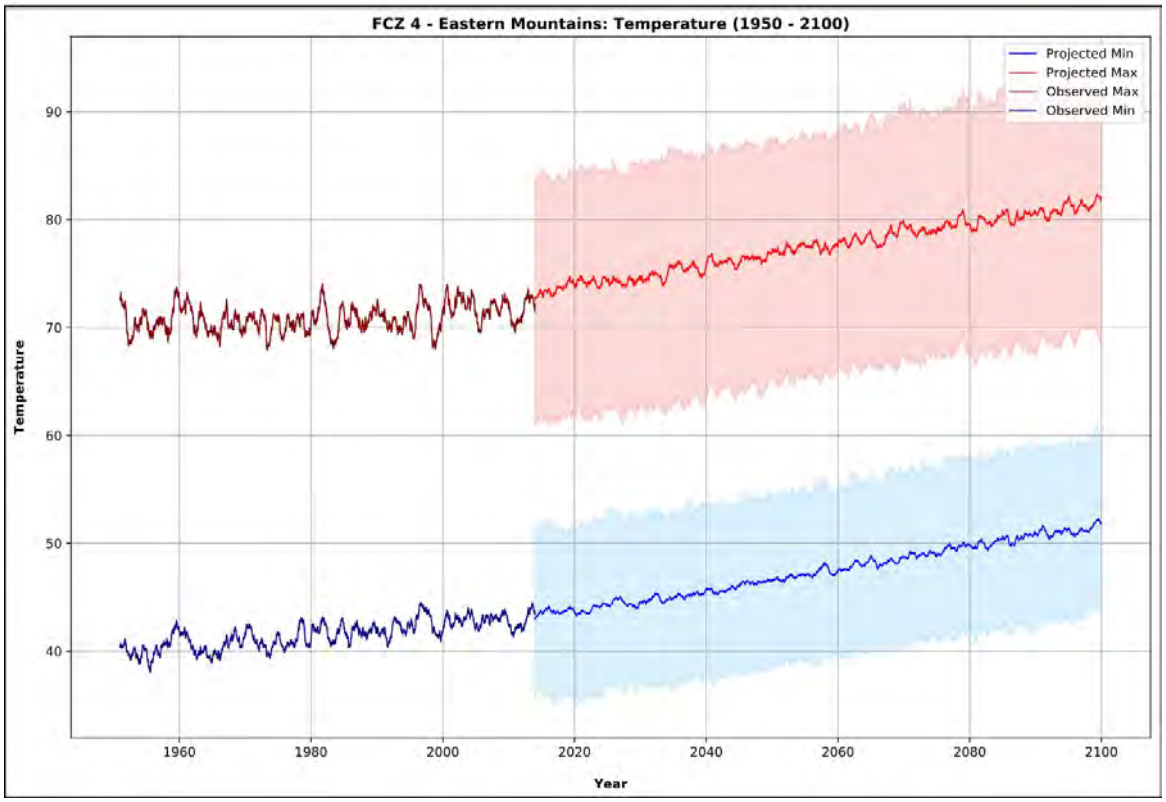

Figure 5-5-4 - Annual Mean Climatology for SCE Service Territory (FCZ 5 - Eastern Desert)

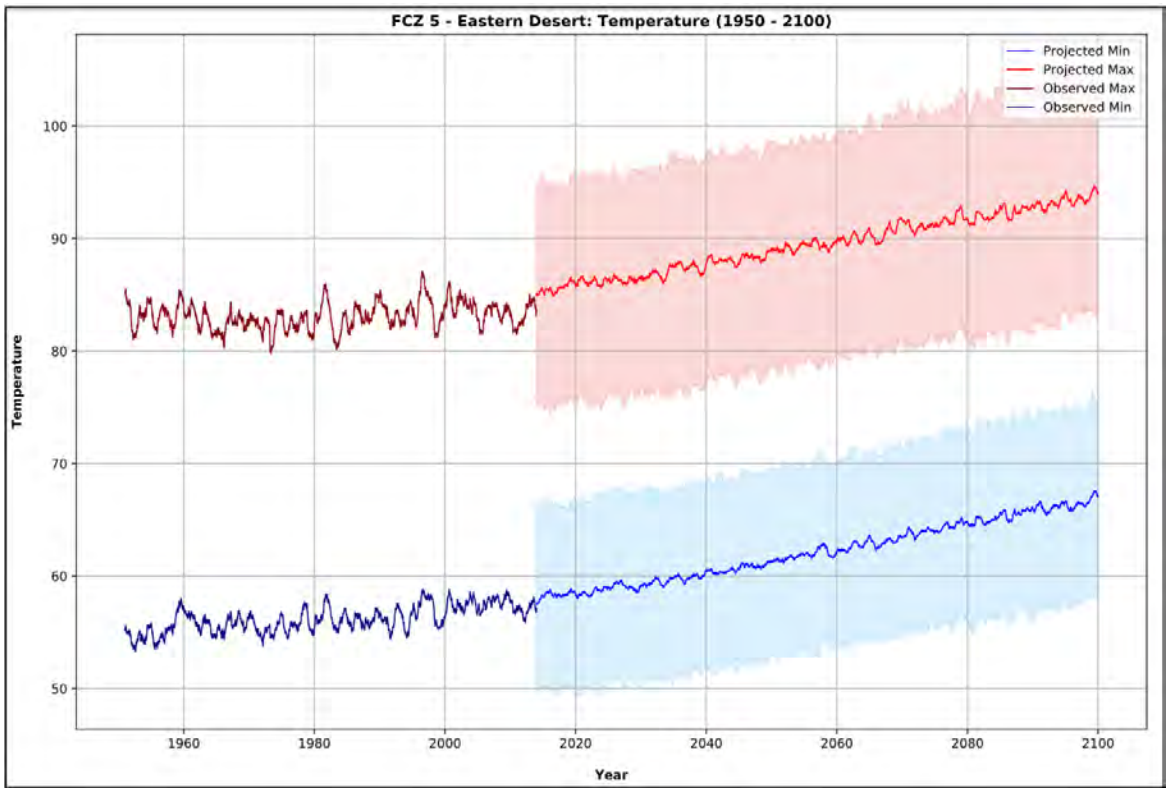

Figure 5-5-5 - Annual Mean Climatology for SCE Service Territory (FCZ 6 - Upper Desert)

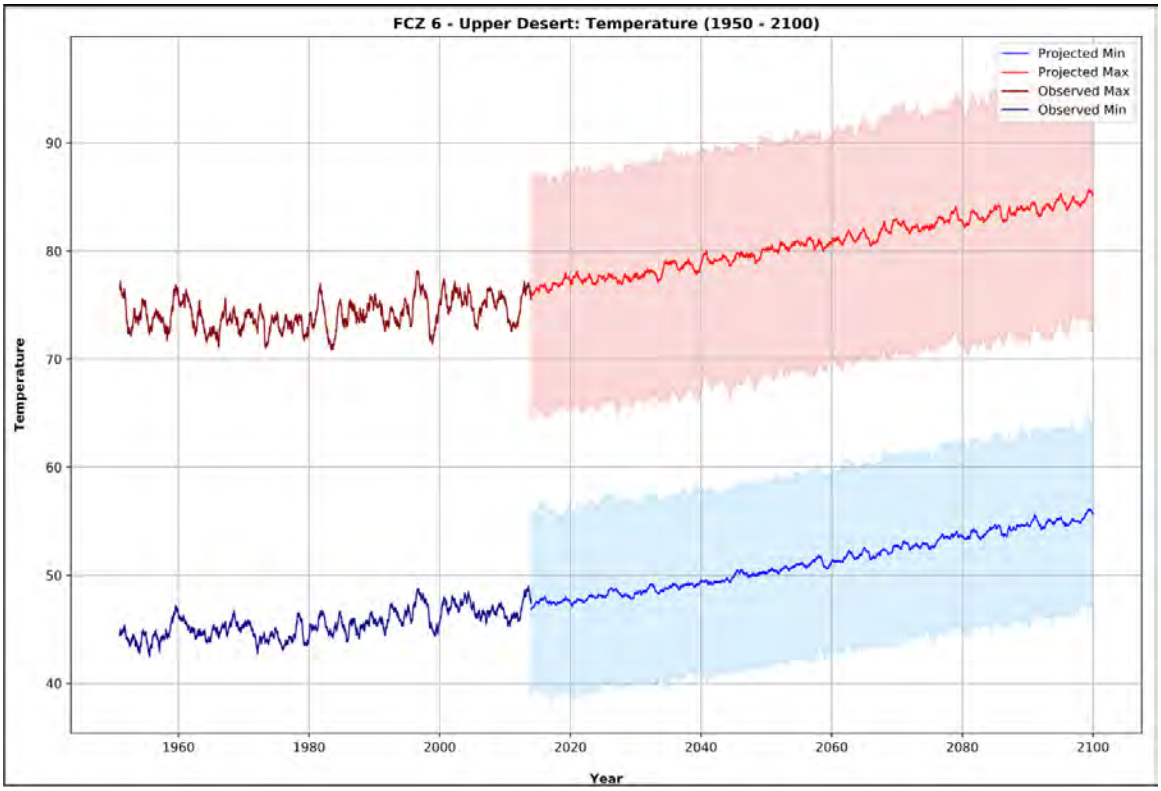

Figure 5-5-6 - Annual Mean Climatology for SCE Service Territory (FCZ 7 - Mojave)

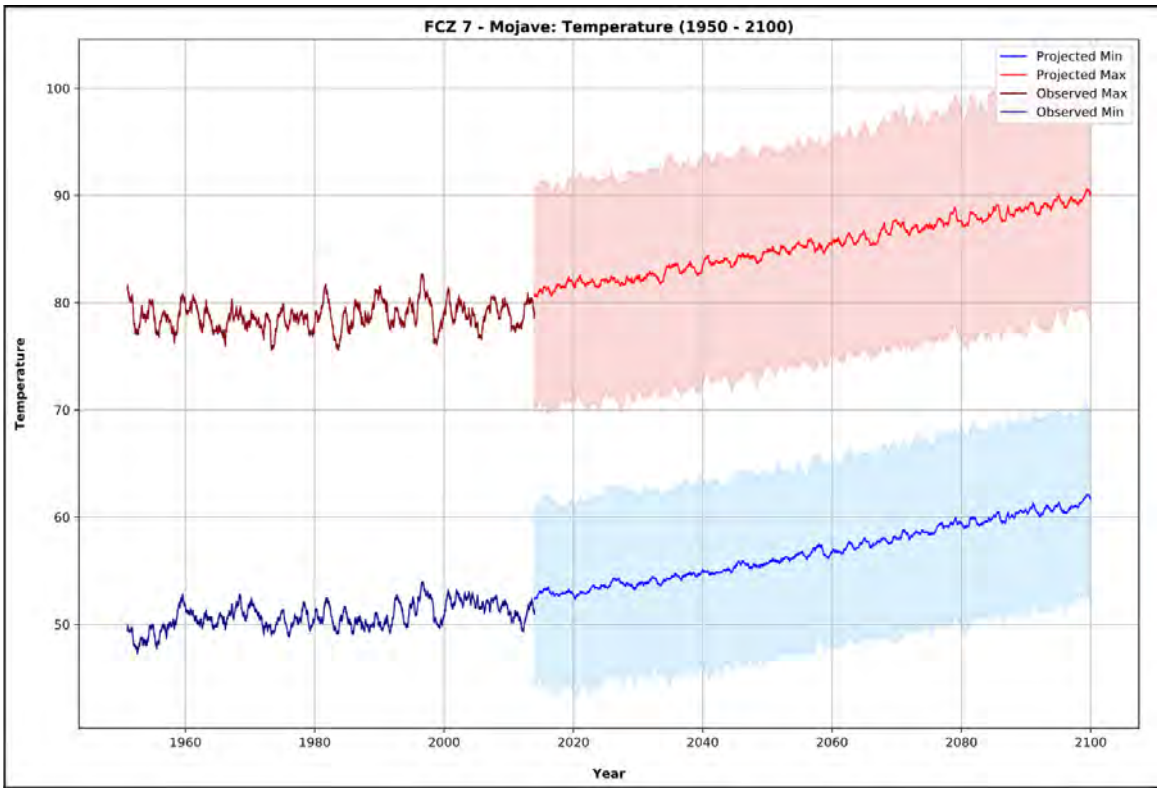

Figure 5-5-7 - Annual Mean Climatology for SCE Service Territory (FCZ 8 – Northern Desert)

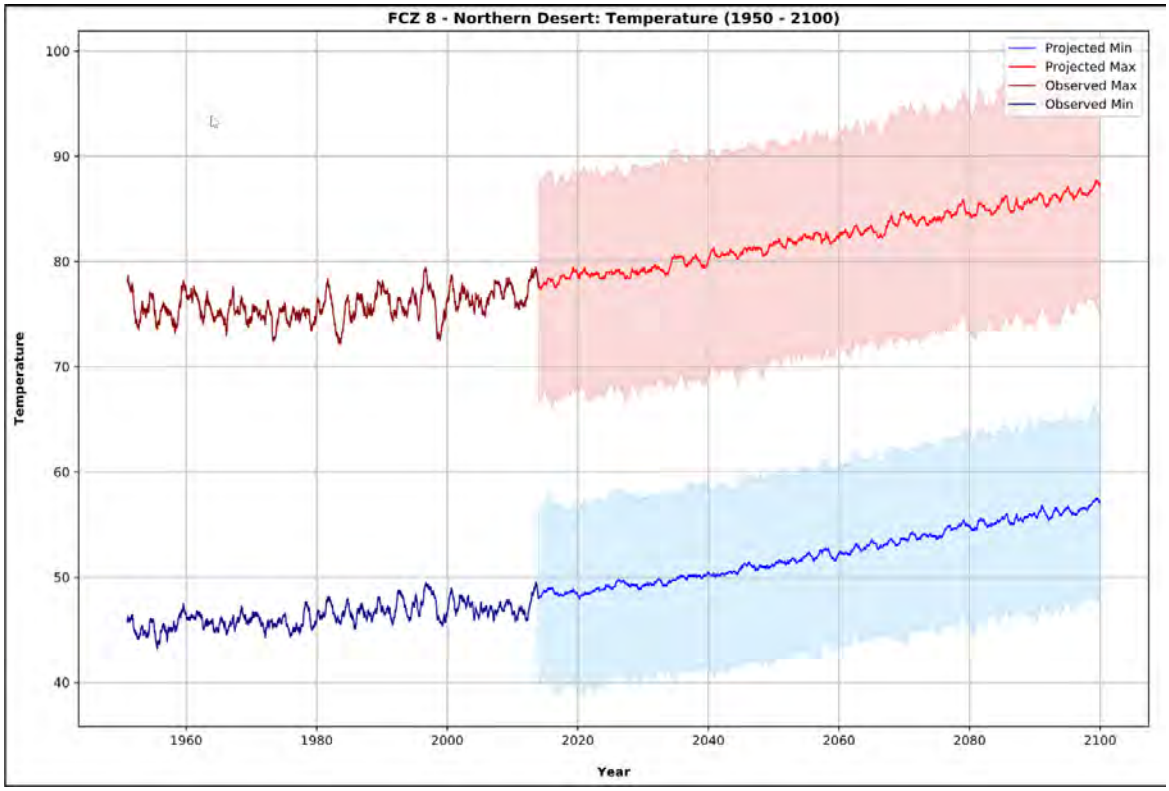

Figure 5-5-8 - Annual Mean Climatology for SCE Service Territory (FCZ 9 – Inyo)

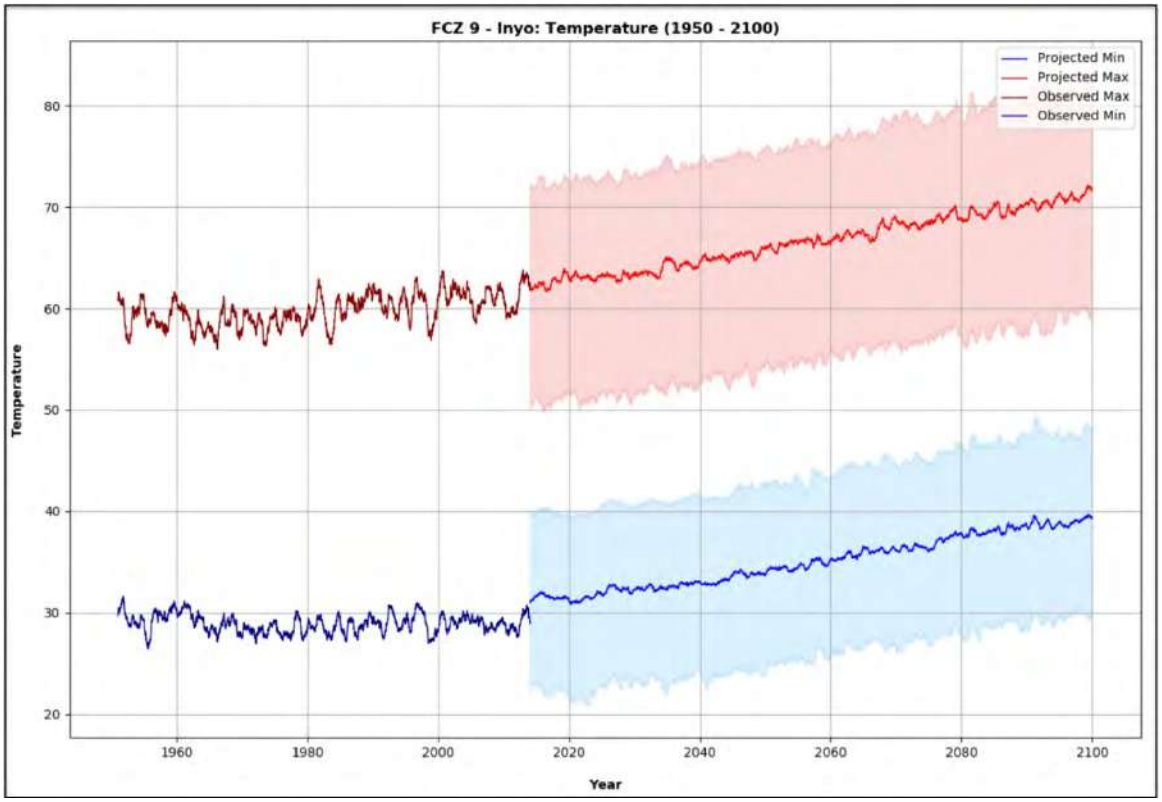

Figure 5-5-9 - Annual Mean Climatology for SCE Service Territory (FCZ 10 – Sierra)

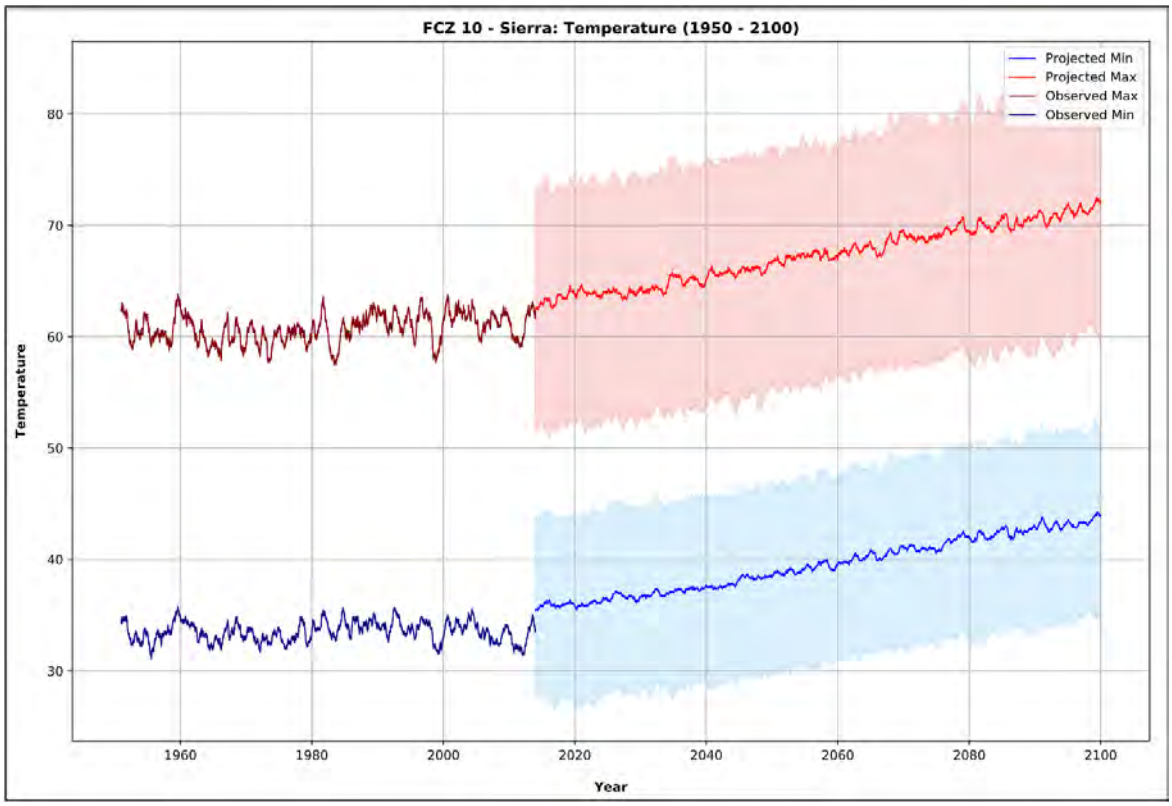

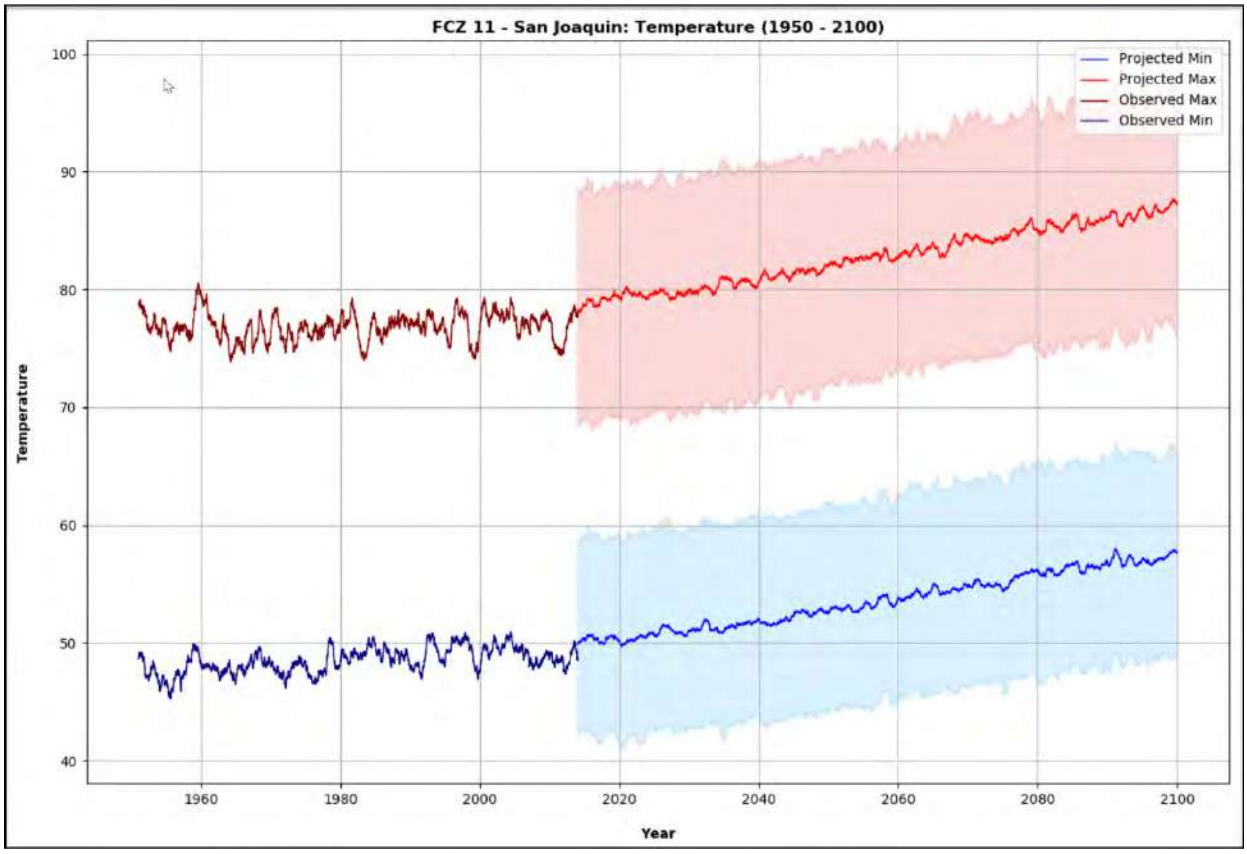

Figure 5-5-10 - Annual Mean Climatology for SCE Service Territory (FCZ 11 – San Joaquin)

Extreme fire weather day frequency is expected to increase across all SCE counties during most seasons and fuel moisture is expected to generally decrease. The largest increases in extreme fire weather days are forecast for Inyo and Mono County during the summer months. Data source is from climatetoolbox.org. Figure 5-6 in Section 5.3.4.2 Climate Change Phenomena and Trends shows the historical and projection of fuel moisture for Fresno County and the remaining additional fifteen figures are provided below.

Figure 5-6-1 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Imperial County)

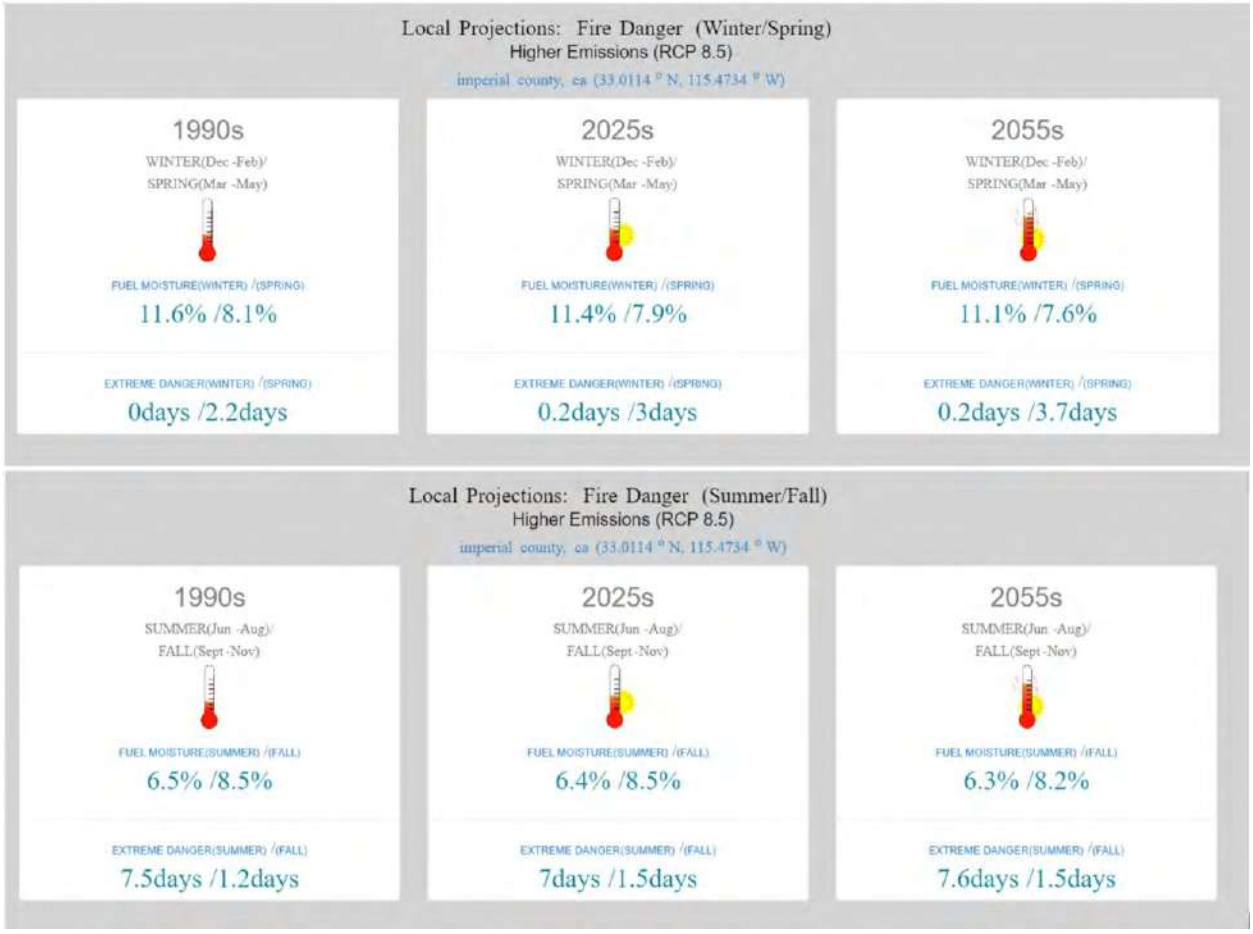

Figure 5-6-2 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Inyo County)

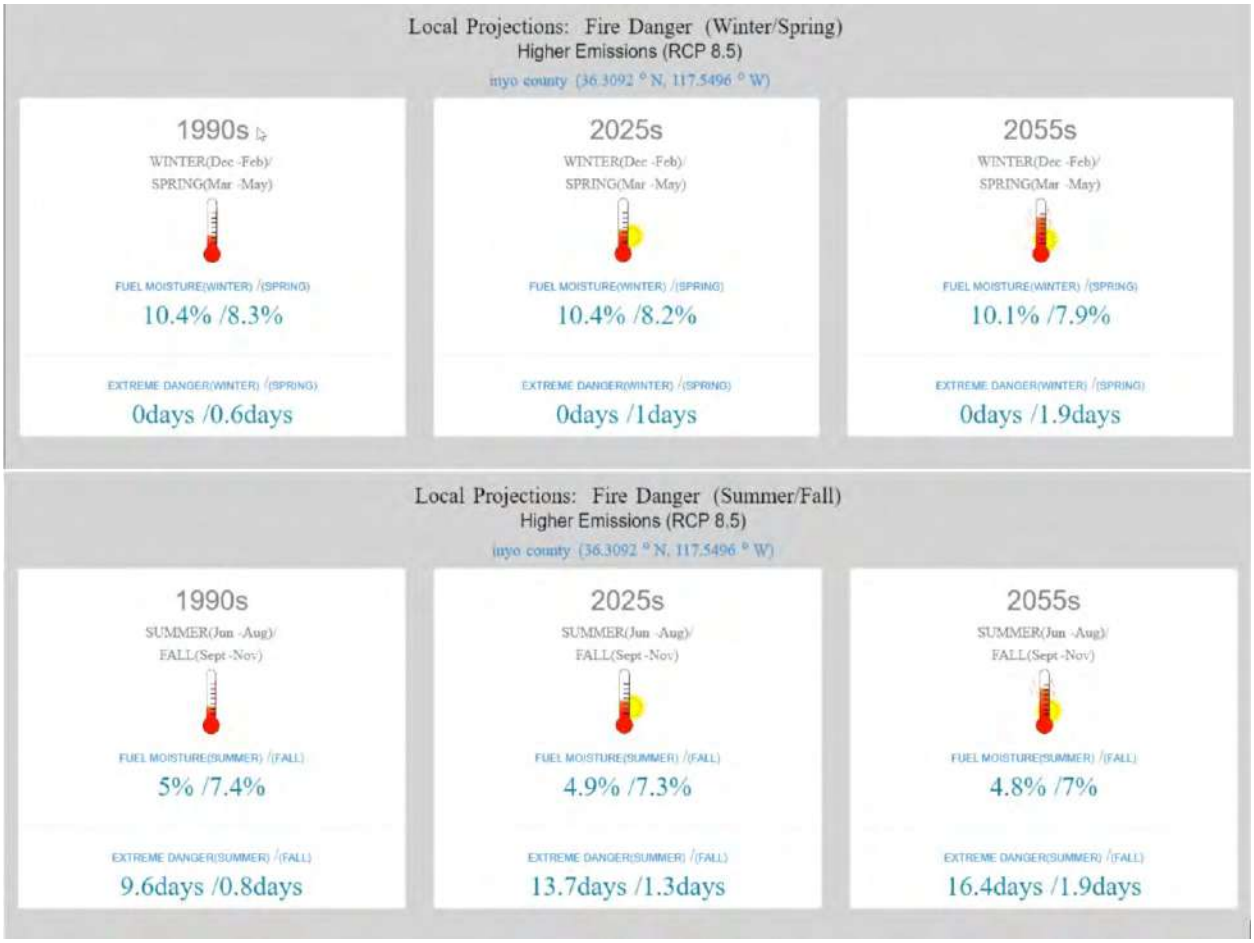

Figure 5-6-3 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Kern County)

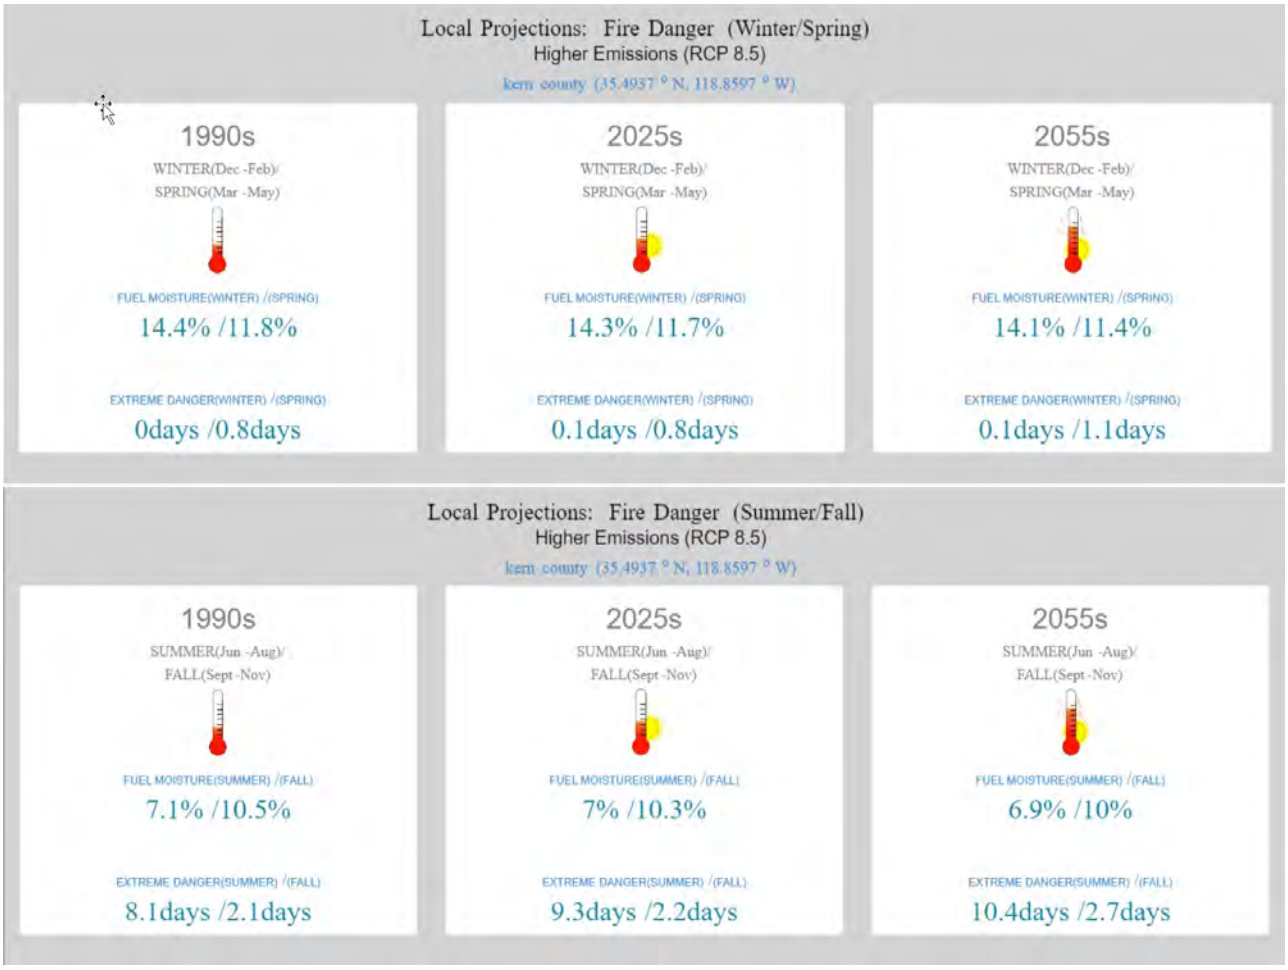

Figure 5-6-4 - Projected Changes in Average Fuel Moisture and Average Number of Days of xtreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Kings County)

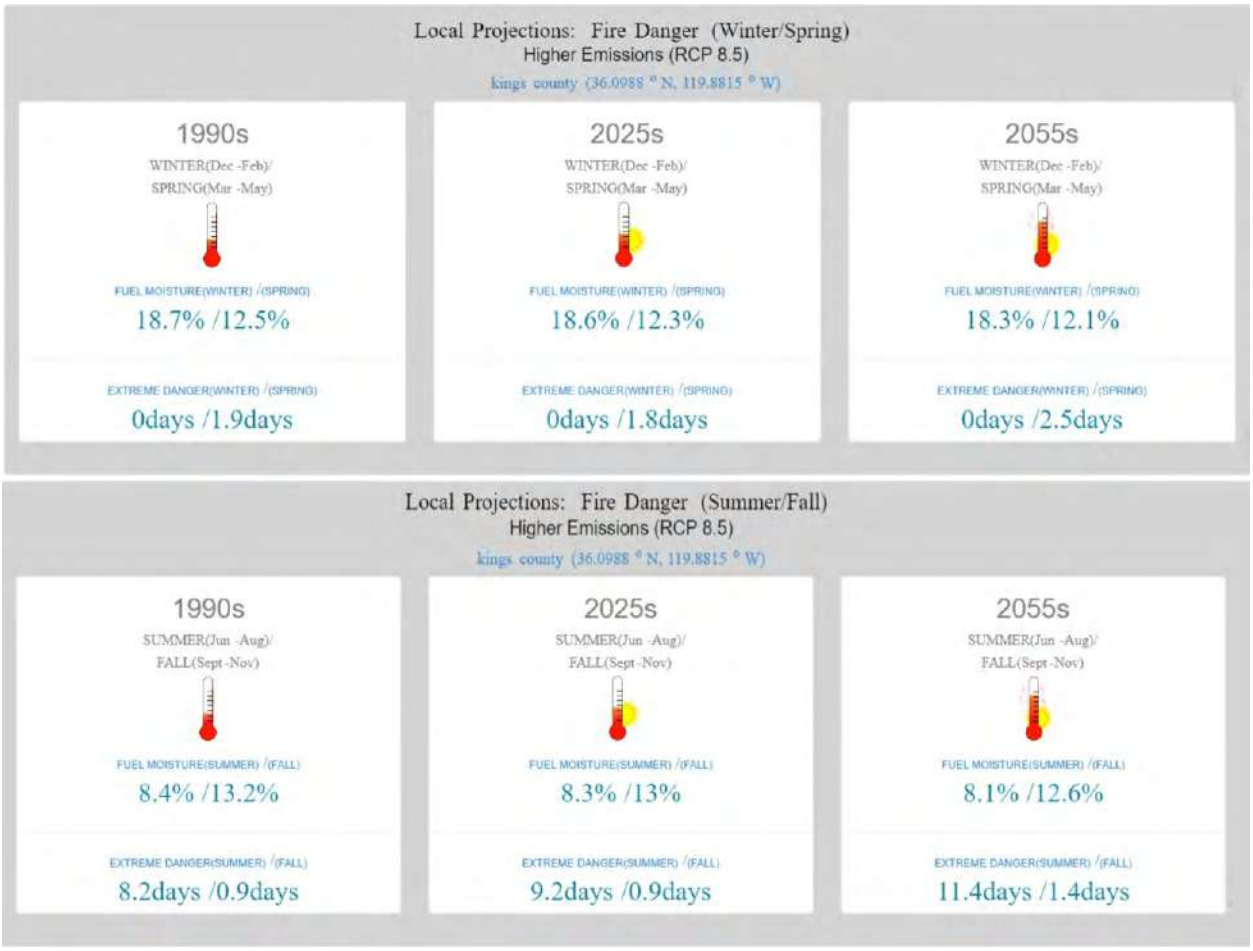

Figure 5-6-5 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Los Angeles County)

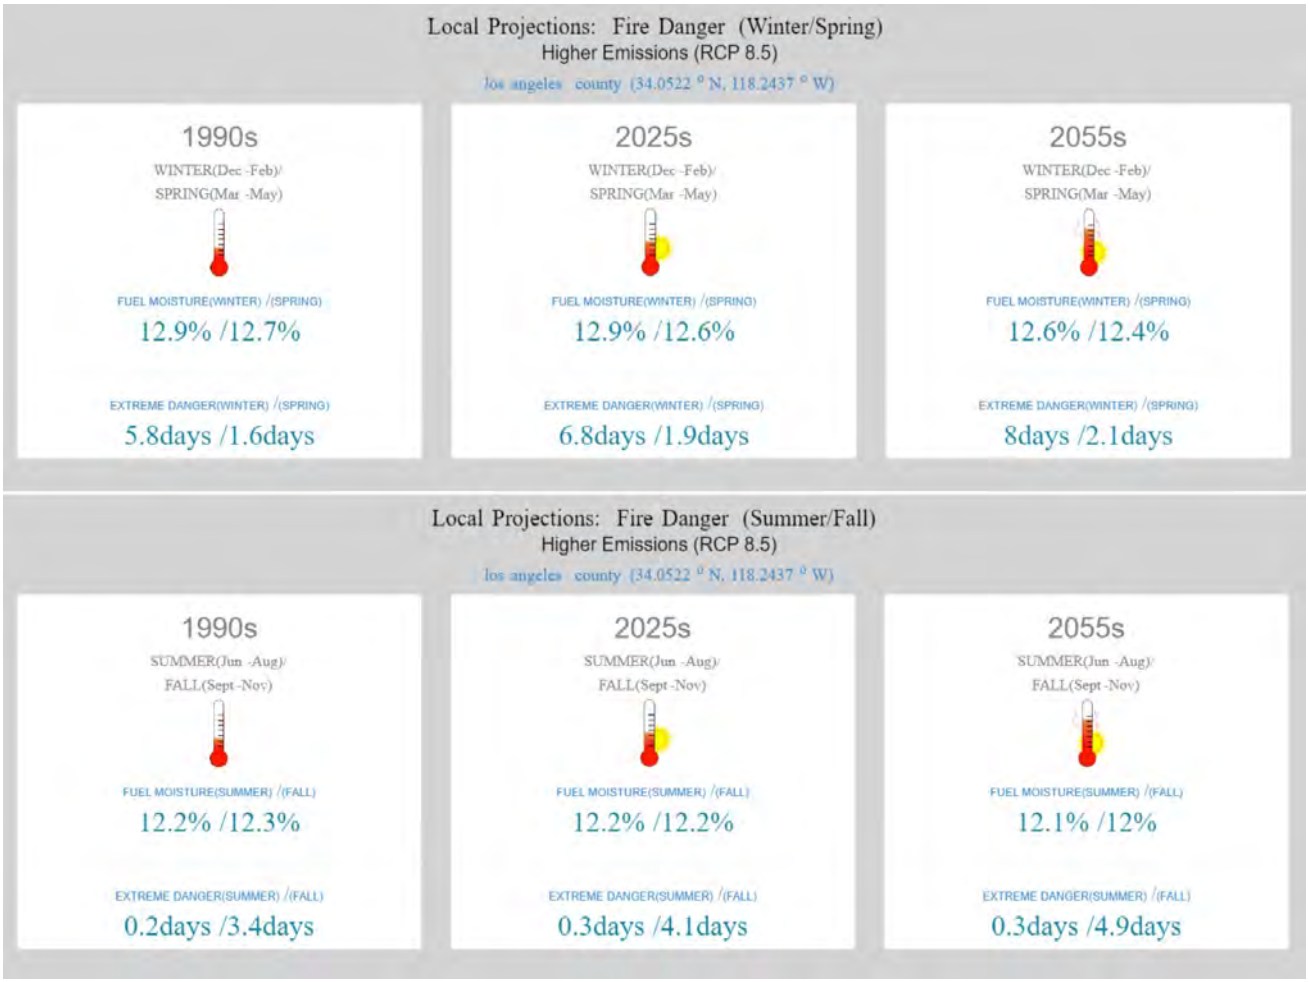

Figure 5-6-6 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Madera County)

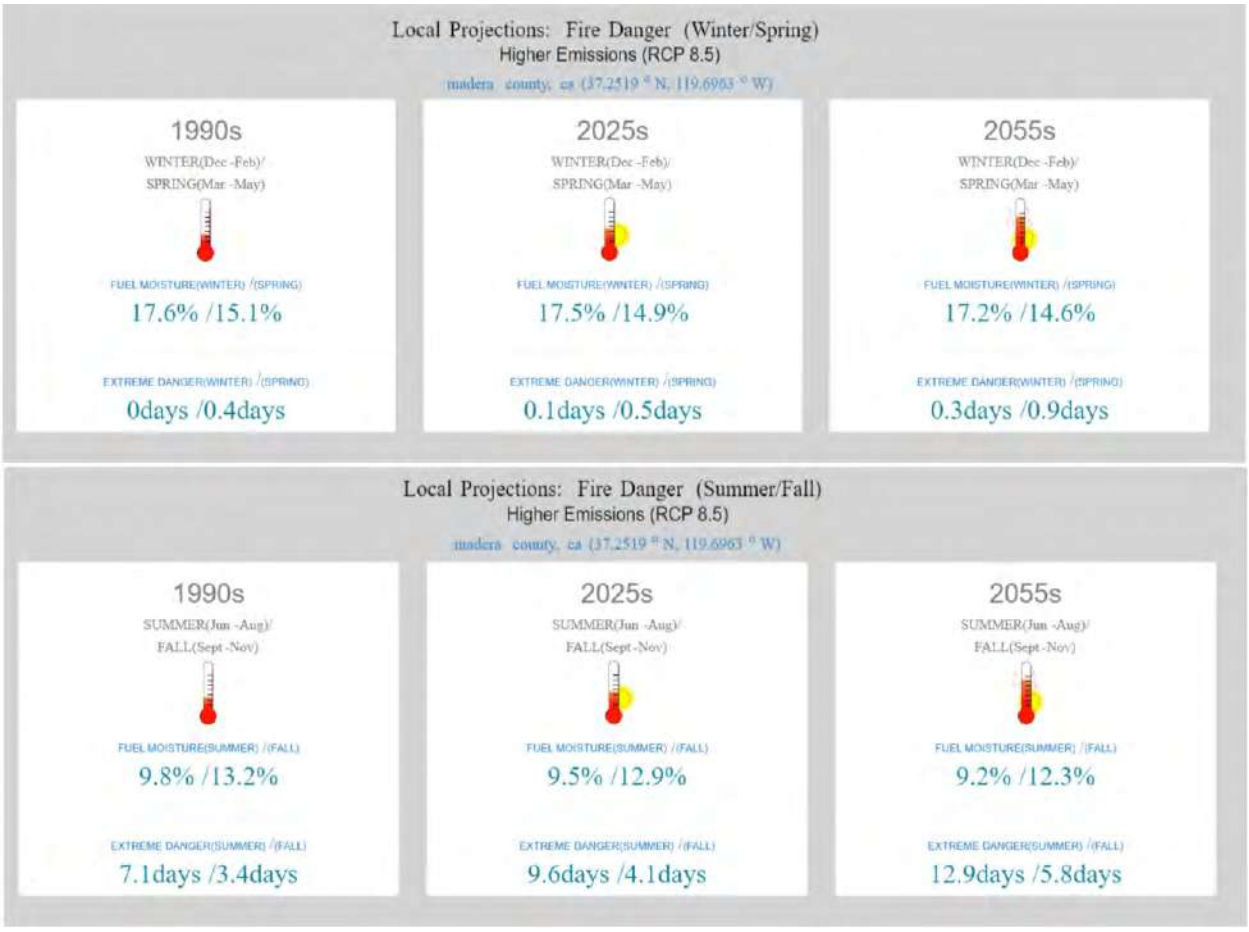

Figure 5-6-7 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Mono County)

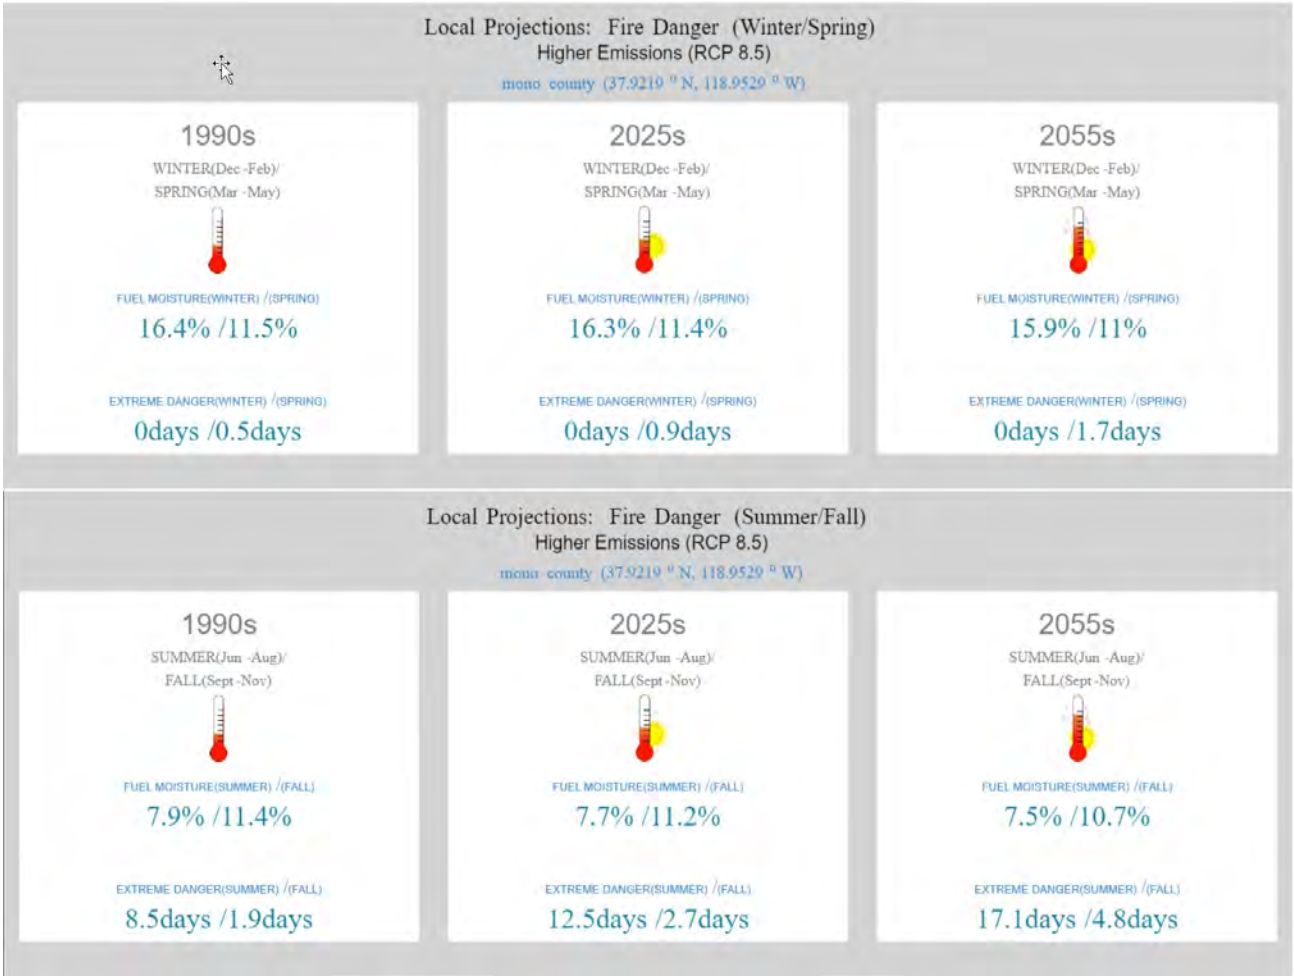

Figure 5-6-8 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Orange County)

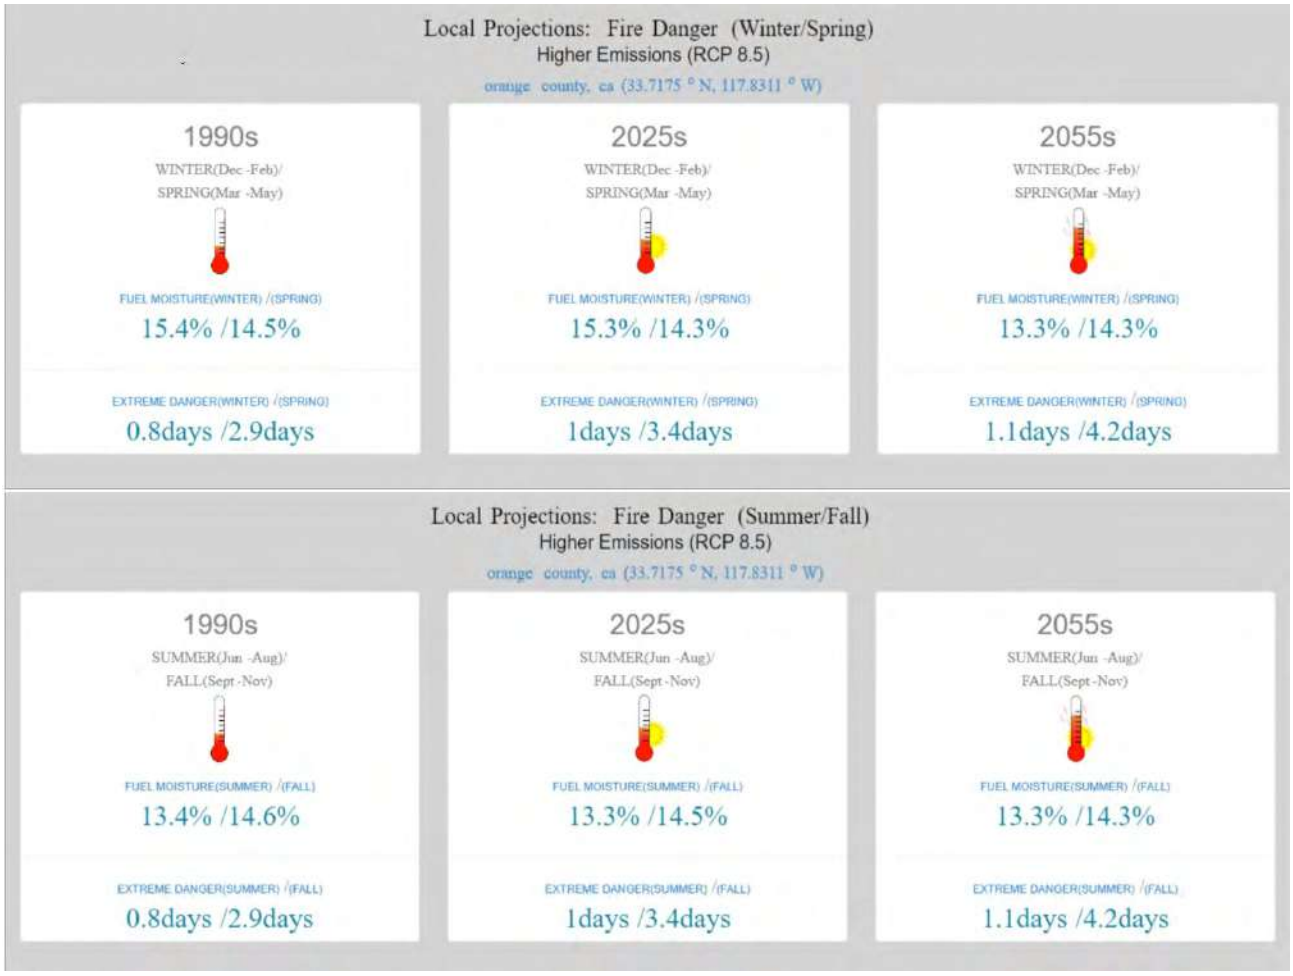

Figure 5-6-9 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Riverside County)

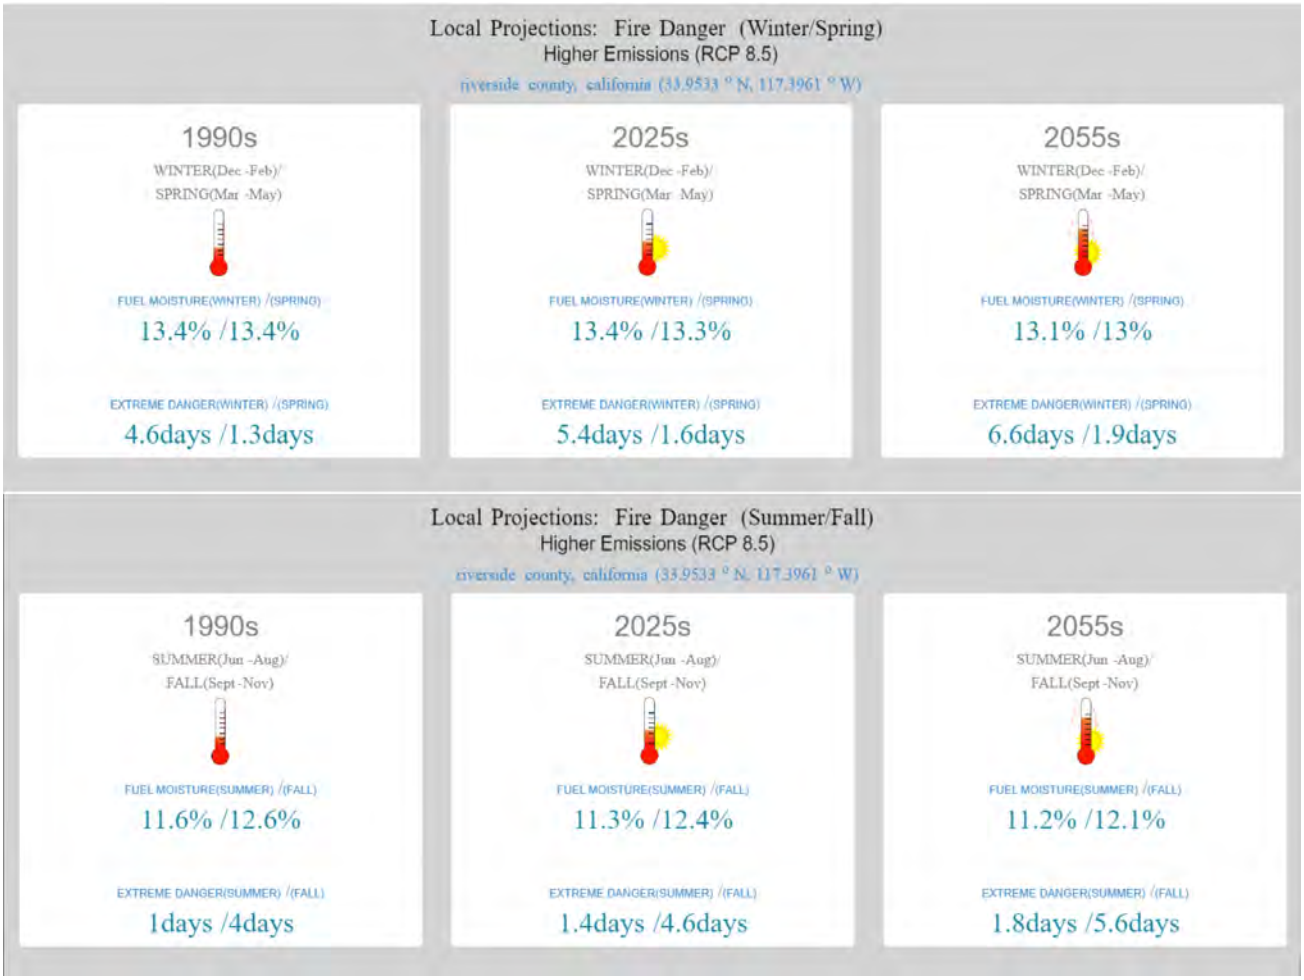

Figure 5-6-10 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (San Bernardino County)

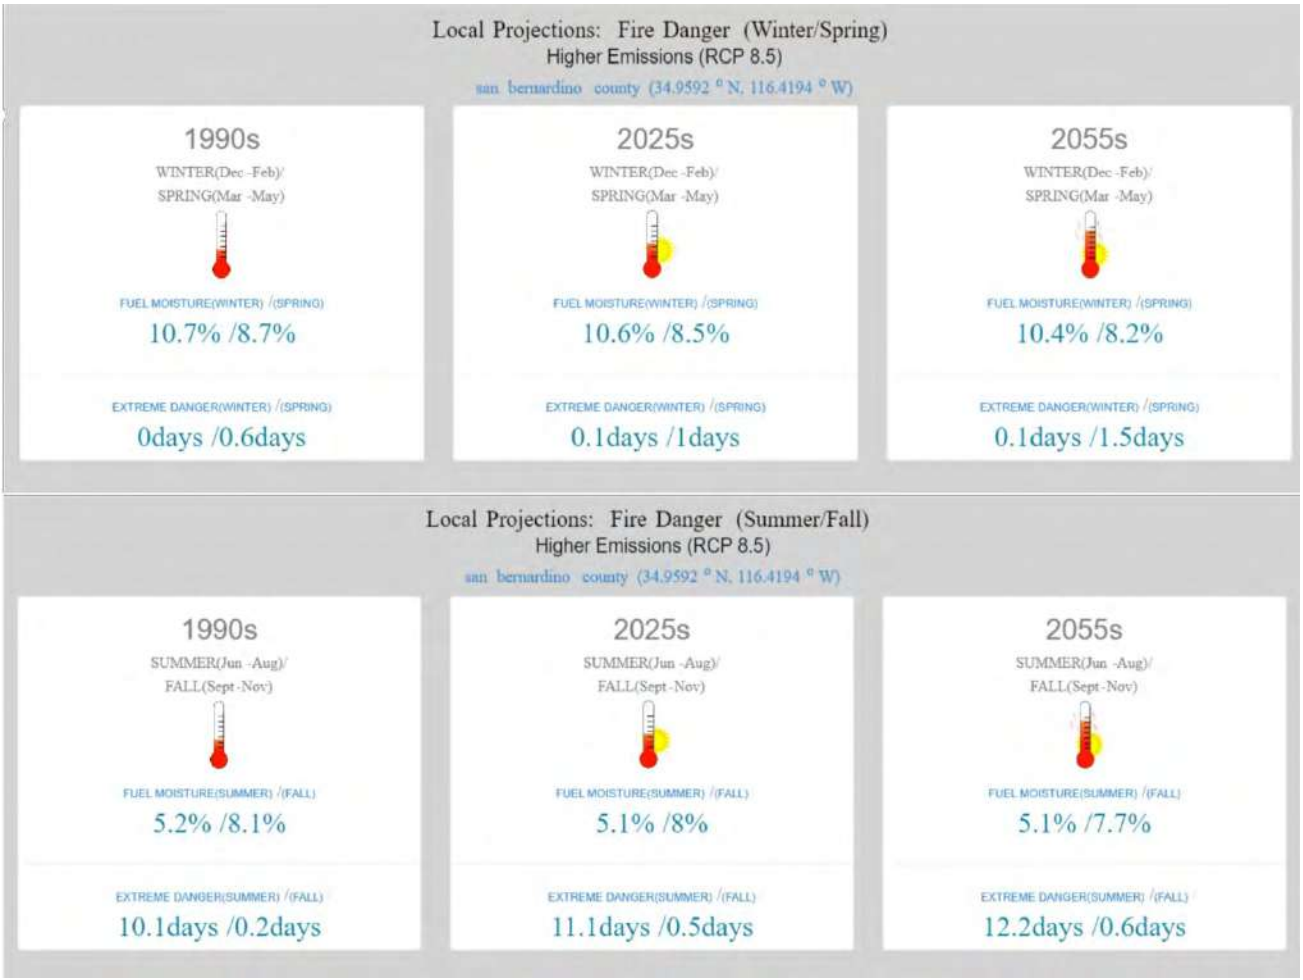

Figure 5-6-11 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (San Diego County)

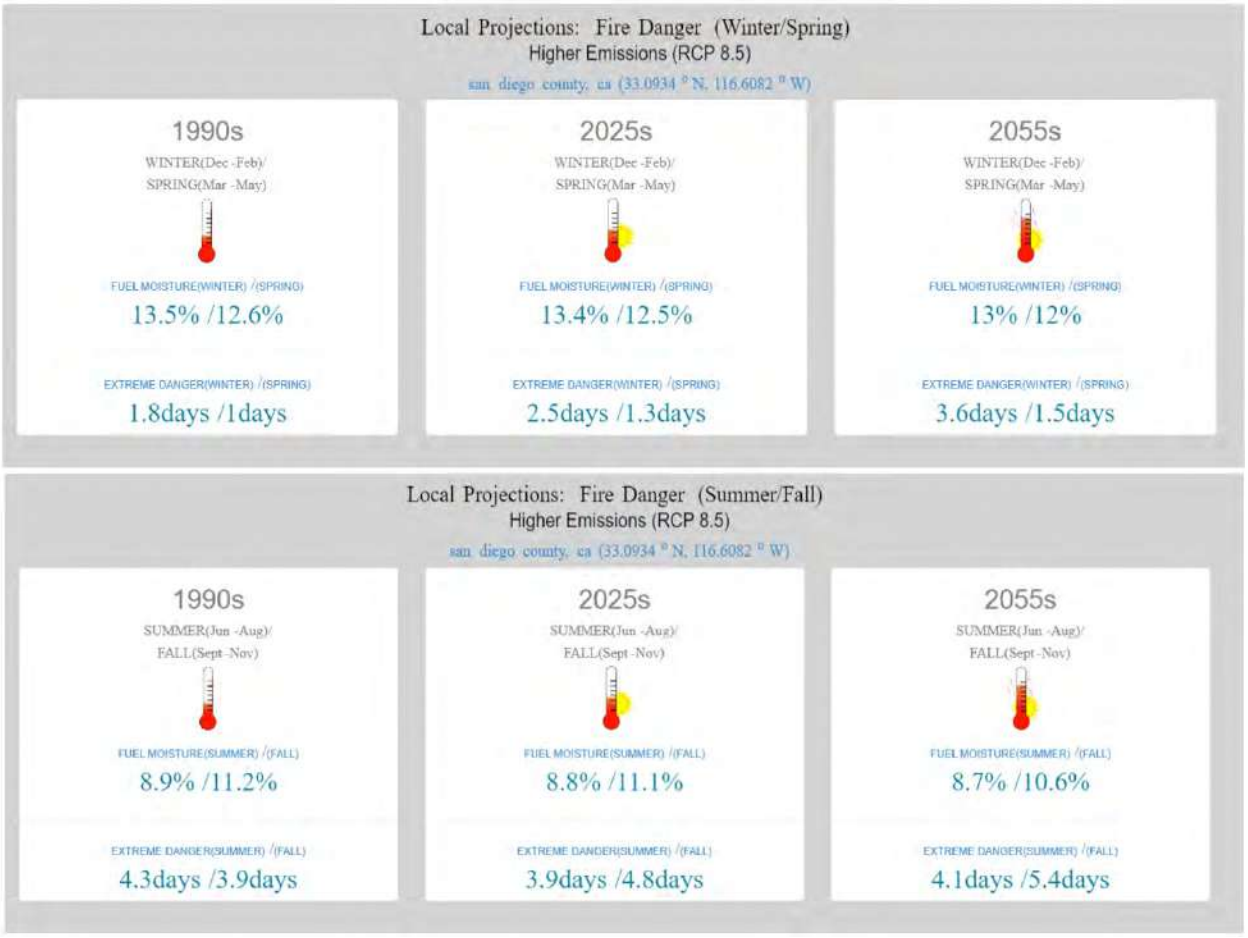

Figure 5-6-12 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Santa Barbara County)

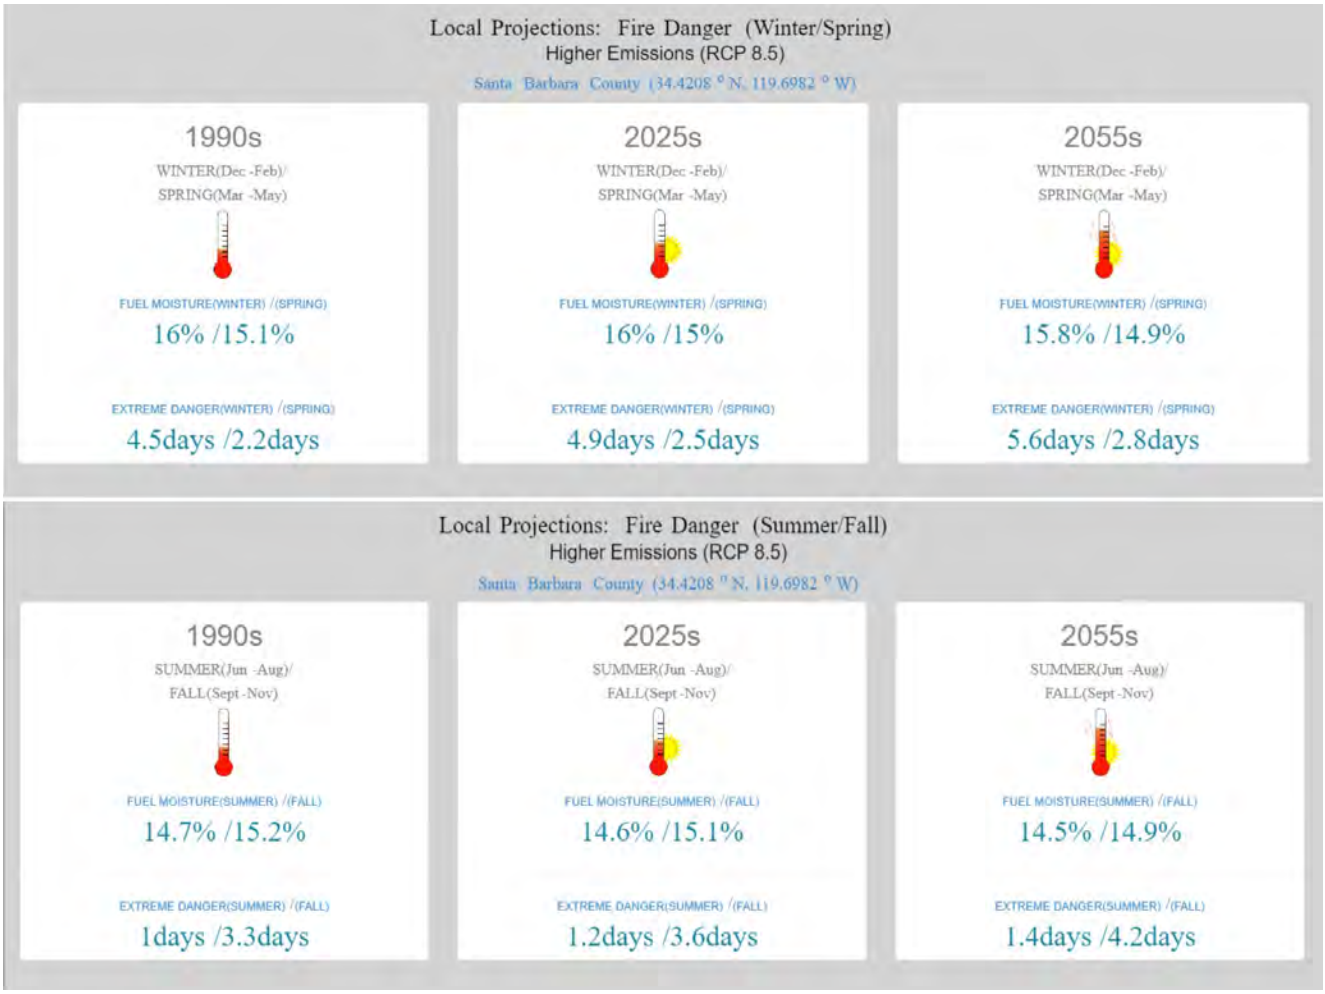

Figure 5-6-13 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Tulare County)

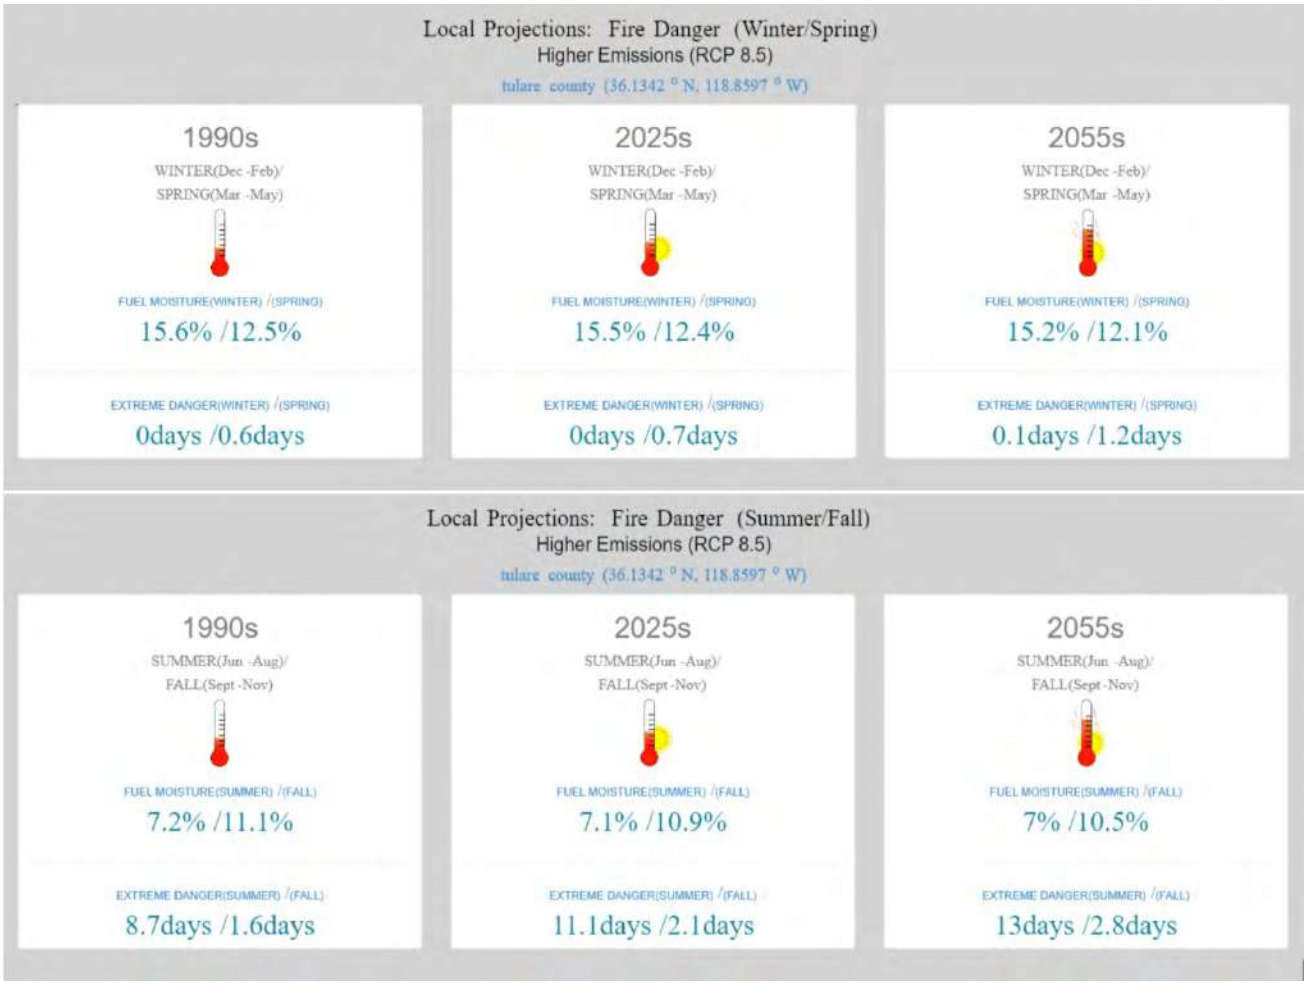

Figure 5-6-14 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Tuolumne County)

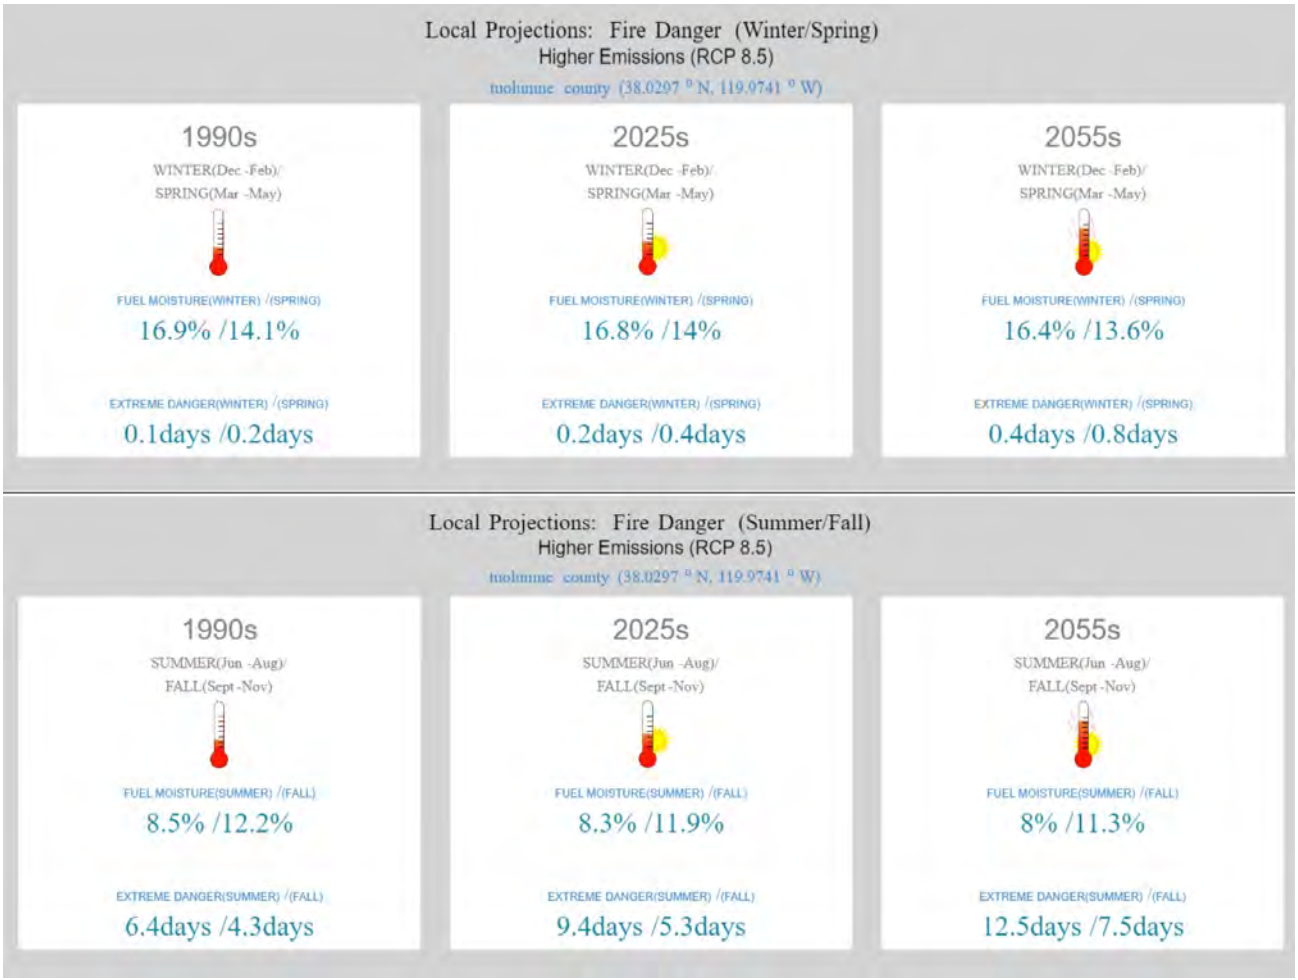

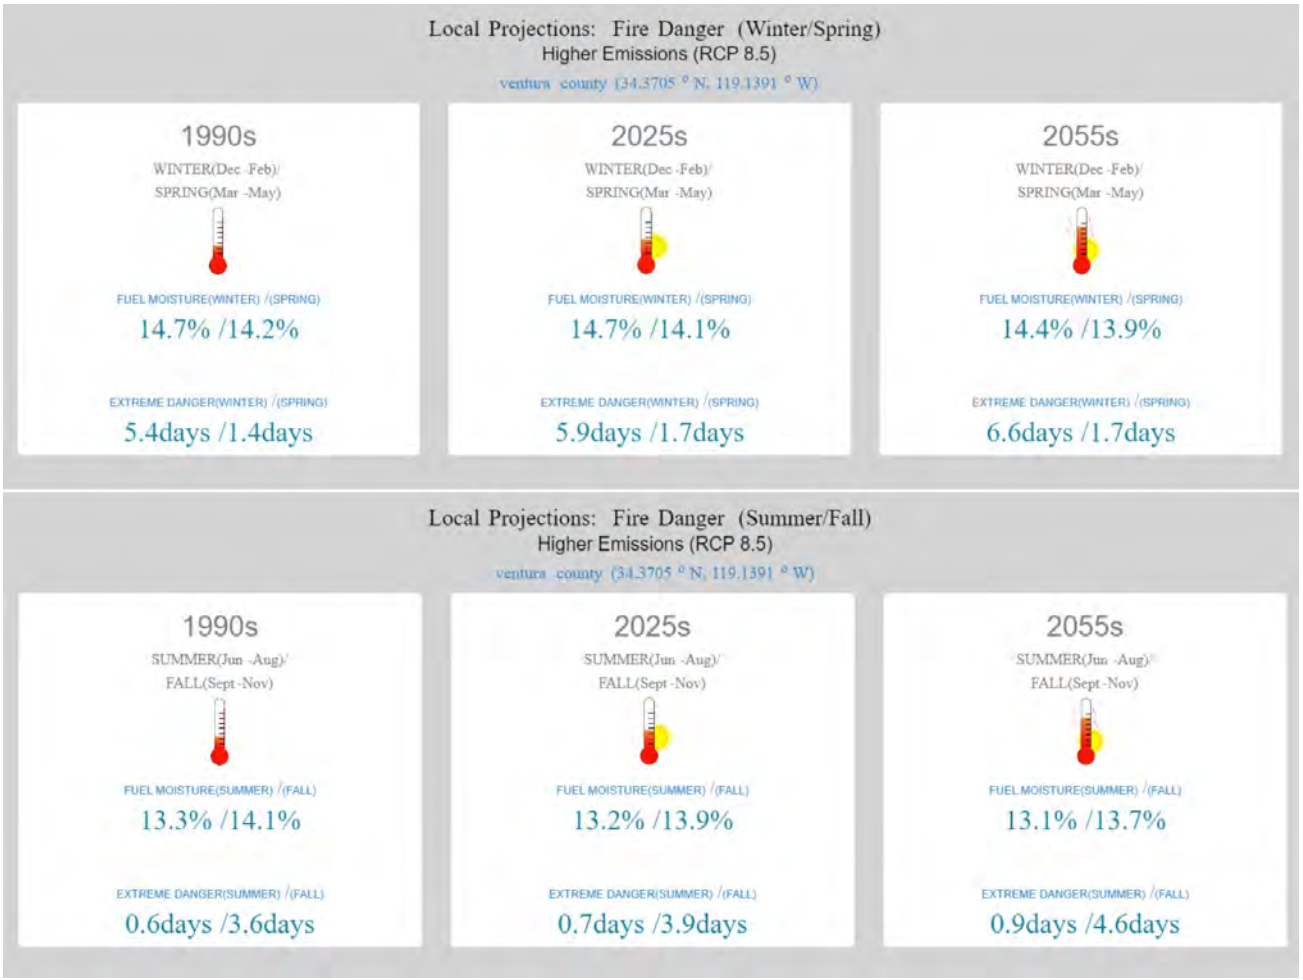

Figure 5-6-15 - Projected Changes in Average Fuel Moisture and Average Number of Days of Extreme Fire Danger for Winter/Spring and Summer/Fall Periods for SCE Service Territory Based on Global Climate Model Outputs (Ventura County)

F2: Continuation of Section 7 - Wildfire Mitigation Strategy Development

Wildfire and PSPS Mitigation Effectiveness Details

SCE provides mitigation effectiveness values for its mitigation initiatives in the tables that follow. Mitigation effectiveness percentages are based on a combination of data analysis, testing, independent, third-party engineering assessment, and SCE expert judgement. Where available, SCE uses a data driven approach that leverages historical fault and ignition data to weigh the mitigation's effectiveness at a subdriver level. SCE expert judgement, which typically involves multiple experts, is based on data and knowledge collected through benchmarking, testing, evaluation of risk in the field, calibration across mitigations, and other sources to determine reasonable mitigation effectiveness. Mitigation effectiveness percentages are also evaluated in a series of robust challenge sessions with internal experts and management to help ensure accuracy and reasonableness. For mitigations that do not target a category of risk drivers, SCE has listed "N/A" (e.g., mitigations only targeting distribution ignition risk subdrivers show N/A for all transmission subdrivers). SCE refines mitigation effectiveness values based on updated data and new information over time. The data included in this workpaper reflect updates as of January 2023.

Appendix F – Mitigation Effectiveness Values

WMP ID	SH-1	SH-2	SH-4	SH-5	SH-6	SH-10	SH-14	SH-15	SH-16*	SH-17	SH-18

F3: Continuation of Section 8.4 - Emergency Preparedness

Due to its size, SCE provides Figure SCE 8-52a PSPS Flowchart below.

PSPS-06 Public Safety Power Shutoff Protocol
Pre-Incident (Blue Sky)
Response (Black Sky)
Recovery (Return to Blue Sky)
Phase 3A: Normal Operations (Programmatic Work/Hazard Mitigation)
Phase 3B: Increased Likelihood (4-7 Days)
Phase 3C: Credible Threat (3 Days)
Phase 2A: Activation (2 hrs)
Phase 2B: Initial Response (1+ Day)
Phase 2C: Sustained Response (Period of Concern)
Phase 1: Recovery (Restoration and De-Mobilization)
Post Event Reporting (+15 Days)
IMOM
PSPS Lead Coord.

Reviews and Submits Post Event Report

Due to its size, SCE provides PSPS alert and notification schedules below.

PSPS Alert and Notification Schedules

Stakeholder	Advanced Initial	Initial *(Alert)*	Update *(Alert)*	Expected *(Imminent Shutoff) (Warning) [1]*	Shutoff *(Statement)*	Continued Shutoff *(to be sent the following morning at 9:00)*	Prep Restore *Prepare to Restore (Statement) [2]*	All Clear *PSPS All Clear - Event Avoided (Statement) [3]*	Ended *PSPS Ended/Restored & All Clear*	Not All Clear *PSPS Temporarily Restored; NOT All Clear, PSPS Risk Remains*	Language Preference
First/Emergency Responders/Public Safety Partners, local governments, and tribes	72 hours before	48 & 24 hours before	48 & 24 hours before	1-4 hours	When De-Energization Occurs	When de-energization continues overnight, sent to customers the next morning	Before Re-energization Occurs	When circuits are no longer being considered for PSPS and were not de-energized	When circuits were de-energized and have been restored and are no longer being monitored	When circuit is temporarily restored but still at risk for PSPS (usually when there is a break in POC)	Voice Calls - Select number for language preference Emails have re-direct Links to SCE.com for language preference Text has re-direct links to SCE.com for language preference
Critical Infrastructure/Service Providers	72 hours before	48 & 24 hours before	48 & 24 hours before	1-4 hours	When De-Energization Occurs	When de-energization continues overnight, sent to customers the next morning	Before Re-energization Occurs	When circuits are no longer being considered for PSPS and were not de-energized	When circuits were de-energized and have been restored and are no longer being monitored	When circuit is temporarily restored but still at risk for PSPS (usually when there is a break in POC)	Voice Calls - Select number for language preference Emails have re-direct Links to SCE.com for language preference Text has re-direct links to SCE.com for language preference
Customers	N/A	48 hours before	24 hours before	1-4 hours	When De-Energization Occurs	When de-energization continues overnight, sent to customers the next morning	Before Re-energization Occurs	When circuits are no longer being considered for PSPS and were not de-energized	When circuits were de-energized and have been restored and are no longer being monitored	When circuit is temporarily restored but still at risk for PSPS (usually when there is a break in POC)	Voice Calls - Select number for language preference Emails have re-direct Links to SCE.com for language preference Text has re-direct links to SCE.com for language preference

*SCE will target the schedule above to notify customers. Erratic or sudden onset of hazardous conditions that jeopardize public safety may impact SCE's ability to provide advance notice to customers.

[1] SCE will make every attempt to notify customers at the 1-4 hour warning stage. Given the unpredictability of shifting weather during PSPS, implentation of this timeframe may very.

[2] SCE will attempt to notify customers before re-energization when possible.

[3] SCE needs to send out notification within 2 hours of the MCL/POC is approved by the IC.

F4: Continuation of Section 8.5 – Community Outreach and Engagement

Due to its size, SCE provides Table 8-61 - Collaboration in Local Wildfire Mitigation Planning.

Name of County, City, or Tribal Agency or Civil Society Group (e.g., nongovernment organization, fire safe council)	Program, Plan, or Document	Last Version of Collaboration (Meeting Date)	Level of Collaboration (Subject)
Acton Town Council	General WMP Plan and PSPS Protocols	6/27/2022	Acton Town Council Wildfire Mitigation Update Completed
Acton Town Council	General WMP Plan and PSPS Protocols	6/17/2022	Acton Town Council Concerned About Uptick in Emergency Outages
Adelanto	General WMP Plan and PSPS Protocols	6/9/2022	City of Adelanto Reliability Report and WMP/PSPS Briefing Meeting
Agoura Hills	General WMP Plan and PSPS Protocols	6/21/2022	Wildfire
Agua Caliente Band of Cahuilla Indians	General WMP Plan and PSPS Protocols	5/19/2022	2022 Circuit Reliability Report sent
Agua Dulce Town Council	General WMP Plan and PSPS Protocols	7/13/2022	Agua Dulce Town Council Wildfire Mitigation Update Scheduled
Alhambra	General WMP Plan and PSPS Protocols	6/29/2022	Alhambra: June 2022 Vice Mayor Andrade-Stadler To Attend 6/29 EOC Tour
Aliso Viejo	General WMP Plan and PSPS Protocols	6/30/2022	AV WMP Briefing Follow-Up
Apple Valley	General WMP Plan and PSPS Protocols	6/29/2022	Request for Meeting WMP/Reliability Town of Apple Valley
Arcadia	General WMP Plan and PSPS Protocols	6/9/2022	Arcadia: Public Works Director Attends 2022 SGV Virtual WMP Presentation
Association of California Cities - Orange County (ACCOC)	General WMP Plan and PSPS Protocols	8/25/2022	SCE Presentation to L&R Committee
Avalon	General WMP Plan and PSPS Protocols	5/25/2022	Avalon WMP Briefing
Barstow	General WMP Plan and PSPS Protocols	6/14/2022	City of Barstow Reliability Report and WMP/PSPS Briefing Meeting
Beaumont	General WMP Plan and PSPS Protocols	6/8/2022	WMP Briefing Completed - City of Beaumont
Beverly Hills	General WMP Plan and PSPS Protocols	5/11/2022	Beverly Hills - 2022 Reliability Outreach, Wildfire Presentation and Quarterly Coordination Meeting
Bradbury	General WMP Plan and PSPS Protocols	8/16/2022	Bradbury: August 2022 WMP Council Presentation Held In-Person
Bradbury	General WMP Plan and PSPS Protocols	7/19/2022	Bradbury: July 2022 CM Shares Councilmember Question If City Can Pay for Covered Conductor
Bradbury	General WMP Plan and PSPS Protocols	6/9/2022	Bradbury: City Staff Attended 2022 SGV Virtual WMP Presentation
Bradbury	General WMP Plan and PSPS Protocols	5/3/2022	Bradbury: April 2022 Confirmed CM & Staff Attending 5/3 PSPS-Focused EOC Tour
Brea	General WMP Plan and PSPS Protocols	6/22/2022	2022 Wildfire Mitigation Plan Briefing
Brea	General WMP Plan and PSPS Protocols	6/22/2022	Sharing PSPS customer care program information with city
Calabasas	General WMP Plan and PSPS Protocols	7/7/2022	Wildfire
California Contract Cities Association (CCCA)	General WMP Plan and PSPS Protocols	3/2/2022	CCCA Sacramento Legislative Tour 2022
California Contract Cities Association (CCCA)	General WMP Plan and PSPS Protocols	9/2/2022	6th Annual City Managers' Summit (2022)
California State Senate District 21	General WMP Plan and PSPS Protocols	9/14/2022	Castaic Town Council Complaints About Wildfire Mitigation Road Closures in Val Verde
California State Senate District 21	General WMP Plan and PSPS Protocols	6/22/2022	Outage Update Request from Senator Wilk's Office - Concern about Acton, Medical Customer
Calimesa	General WMP Plan and PSPS Protocols	5/18/2022	WMP Update Briefing - City of Calimesa
Camarillo	General WMP Plan and PSPS Protocols	7/26/2022	Wildfire/Reliability Update
Camarillo	General WMP Plan and PSPS Protocols	2/23/2022	Camarillo City Council Wildfire Mitigation/Rates Update
Canyon Lake	General WMP Plan and PSPS Protocols	6/23/2022	Canyon Lake WMP Meeting
Castaic Area Town Council	General WMP Plan and PSPS Protocols	9/14/2022	Castaic Town Council Complaints About Wildfire Mitigation Road Closures in Val Verde
Cathedral City	General WMP Plan and PSPS Protocols	6/28/2022	Cathedral City - Reliability Report 2022 & Meeting request
Chino	General WMP Plan and PSPS Protocols	8/30/2022	Circuit Reliability & WMP Update City Of Chino 2022
Chino Hills	General WMP Plan and PSPS Protocols	7/26/2022	Wildfire Mitigation Meeting -Chino Hills
Claremont	General WMP Plan and PSPS Protocols	10/11/2022	Claremont 2022 Circuit Reliability Council Presentation
Claremont	General WMP Plan and PSPS Protocols	6/29/2022	Wave 2 - Claremont Circuit Reliability Report

Name of County, City, or Tribal Agency or Civil Society Group (e.g., nongovernment organization, fire safe council)	Program, Plan, or Document	Last Version of Collaboration (Meeting Date)	Level of Collaboration (Subject)
Claremont	General WMP Plan and PSPS Protocols	6/9/2022	2022 WMP/PSPS Email Invite
Claremont	General WMP Plan and PSPS Protocols	5/10/2022	HFRA EOC Tour of May 10
Colton	General WMP Plan and PSPS Protocols	6/20/2022	Colton 2022 Circuit Reliability / Wildfire Update staff presentation
Corona	General WMP Plan and PSPS Protocols	5/31/2022	Corona WMP Meeting
Covina	General WMP Plan and PSPS Protocols	6/9/2022	2022 WMP/PSPS Email Invite
Covina	General WMP Plan and PSPS Protocols	5/10/2022	HFRA EOC Tour
Culver City	General WMP Plan and PSPS Protocols	6/28/2022	Culver City - Wildfire and Reliability Presentation
Desert Hot Springs	General WMP Plan and PSPS Protocols	7/8/2022	Desert Hot Springs - Meeting with Councilmember Gary Gardner
Desert Hot Springs	General WMP Plan and PSPS Protocols	6/30/2022	Desert Hot Springs - WMP Reliability Report 2022 - no meeting needed.
Diamond Bar	General WMP Plan and PSPS Protocols	6/14/2022	Diamond Bar 2022 Circuit Reliability staff presentation
Diamond Bar	General WMP Plan and PSPS Protocols	5/3/2022	HFRA EOC Tour
Diamond Bar	General WMP Plan and PSPS Protocols	6/14/2022	Wave 2 - Diamond Bar Circuit Reliability Report
Duarte	General WMP Plan and PSPS Protocols	6/9/2022	2022 WMP/PSPS Presentation.
Eastvale	General WMP Plan and PSPS Protocols	6/14/2022	Eastvale 2022 Circuit Reliability staff presentation
Exeter	General WMP Plan and PSPS Protocols	6/29/2022	2022 Wildfire Safety Update: City of Exeter
Fillmore	General WMP Plan and PSPS Protocols	6/22/2022	Completed Wildfire Mitigation & Reliability Update for City of Fillmore
Fillmore	General WMP Plan and PSPS Protocols	2/22/2022	City of Fillmore council presentation following PSPS event
Fontana	General WMP Plan and PSPS Protocols	6/30/2022	2022 WMP -Fontana
Fresno County	General WMP Plan and PSPS Protocols	6/2/2022	2022 Wildfire Safety Update: Fresno County
Glendora	General WMP Plan and PSPS Protocols	6/29/2022	Glendora: June 2022 Councilmember Fredendall To Attend 6/29 EOC Tour
Glendora	General WMP Plan and PSPS Protocols	6/9/2022	Glendora: Public Works Director Attends 2022 SGV Virtual WMP Presentation
Glendora	General WMP Plan and PSPS Protocols	5/10/2022	Glendora: April 2022 Confirmed Mayor Davis Attending 5/10 All Hazards-Focused EOC Tour
Grand Terrace	General WMP Plan and PSPS Protocols	6/14/2022	Grand Terrace 2022 Circuit Reliability staff presentation
Greater Irvine Chamber of Commerce (GICC)	General WMP Plan and PSPS Protocols	3/3/2022	GICC March Govt Affairs Committee with Sup Wagner
Hemet	General WMP Plan and PSPS Protocols	6/1/2022	WMP Briefing Completed - City of Hemet
Hesperia	General WMP Plan and PSPS Protocols	6/29/2022	Hesperia 2022 Reliability Report - No meeting needed.
Hidden Hills	General WMP Plan and PSPS Protocols	7/7/2022	Wildfire
Highland	General WMP Plan and PSPS Protocols	6/14/2022	Highland 2022 Circuit Reliability staff presentation
Industry	General WMP Plan and PSPS Protocols	5/3/2022	HFRA EOC Tour
Industry	General WMP Plan and PSPS Protocols	7/14/2022	Industry WMP Communication
Institute for Local Government (ILG)	General WMP Plan and PSPS Protocols	6/23/2022	ILG Webinar - Personal and Organizational Wildfire Preparedness and Prevention.
Inyo County	General WMP Plan and PSPS Protocols	6/6/2022	2022 Wildfire Mitigation Outreach
Inyo County	General WMP Plan and PSPS Protocols	9/7/2022	Inyo County Unified Command - quarterly meeting - multiple agency/stakeholders
Inyo County	General WMP Plan and PSPS Protocols	12/7/2022	Inyo County Unified Command - quarterly meeting - multiple agency/stakeholders
Irvine	General WMP Plan and PSPS Protocols	7/20/2022	Vice Mayor Kuo Wildfire Prevention Event
Irvine	General WMP Plan and PSPS Protocols	6/21/2022	WMP & Reliability Briefing with Irvine Execs
Irvine	General WMP Plan and PSPS Protocols	6/8/2022	Irvine Green Ribbon Committee Presentation
Irvine	General WMP Plan and PSPS Protocols	3/21/2022	Meet & Greet with new City Manager
Irvine	General WMP Plan and PSPS Protocols	6/21/2022	Irvine WMP/Reliability Presentation Request
Irwindale	General WMP Plan and PSPS Protocols	6/29/2022	Tier 3: Irwindale Circuit Reliability Staff Presentation
Irwindale	General WMP Plan and PSPS Protocols	6/9/2022	2022 WMP/PSPS Email Invite
Irwindale	General WMP Plan and PSPS Protocols	5/3/2022	HFRA EOC Tour

Name of County, City, or Tribal Agency or Civil Society Group (e.g., nongovernment organization, fire safe council)	Program, Plan, or Document	Last Version of Collaboration (Meeting Date)	Level of Collaboration (Subject)
Jurupa Valley	General WMP Plan and PSPS Protocols	6/2/2022	WMP Update Briefing City of Jurupa Valley
Kern County	General WMP Plan and PSPS Protocols	6/2/2022	2022 Wildfire Mitigation Outreach
La Canada Flintridge	General WMP Plan and PSPS Protocols	8/2/2022	La Canada Flintridge City Council 2022 Annual Circuit Reliability
La Canada Flintridge	General WMP Plan and PSPS Protocols	6/27/2022	La Canada Flintridge Annual Circuit Reliability city staff presentation
La Canada Flintridge	General WMP Plan and PSPS Protocols	5/3/2022	HFRA EOC Tour
La Canada Flintridge	General WMP Plan and PSPS Protocols	6/9/2022	La Canada Flintridge Wildfire Mitigation Drone Inspections

F5: Continuation of Section 9 - PSPS

Due to its size, SCE provides Table 9-02 – Frequently De-energized Circuits below.

Entry #	Circuit ID	Name of Circuit with >2 Inc	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures taken, or planned to be taken, to reduce the need for, and impact of, future PSPS of circuit
1	ED-00108	ACOSTA	10/26/2020	1272	788	Completed: • Automate 1 existing switch and • Implement operational protocol to raise PSPS windspeed thresholds
			11/26/2020		5	
			12/2/2020		5	
			10/10/2019		5	
			10/24/2019		1243	
			10/28/2019		1244	
			10/30/2019		1243	
2	ED-00452	AMETHYST	10/26/2020	1525	630	Completed: • Replace 1.4 miles of existing overhead wire with new insulated wire • Install an additional weather station to improve situational awareness
			11/26/2020		630	
			12/2/2020		629	
			12/7/2020		629	
4	ED-01344	ANTON	11/24/2022	300	51	Completed: • Replace 25.2 miles of existing overhead wire with new insulated wire • Install an additional weather station • Install 1 automated switch and implement additional segmentation • Implement operational protocol to raise PSPS windspeed thresholds
			11/25/2021		298	
			1/15/2021		139	
			1/17/2021		139	
			1/19/2021		277	
			9/9/2020		117	
			10/16/2020		47	
			10/26/2020		137	
			11/26/2020		117	
			12/2/2020		118	
			12/3/2020		152	
			12/7/2020		138	
			12/19/2020		139	
			12/23/2020		49	
			10/10/2019		49	
			10/24/2019		287	
			10/28/2019		341	
			10/30/2019		286	
			11/17/2019		49	
5	ED-00705	ARLENE	11/26/2020	1914	1668	Completed: • Replace all 7.12 miles of existing overhead wire with new insulated wire • Updated switching protocols
			12/3/2020		703	
			12/7/2020		703	
			12/23/2020		712	
6	ED-00817	ATENTO	10/26/2020	2883	901	

Entry #	Circuit ID	Name of Circuit with >2 Inc	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures taken, or planned to be taken, to reduce the need for, and impact of, future PSPS of circuit
			11/26/2020		2680	Completed: • New insulated wire has already been installed in various places on the circuit. • Plan involves replacing an additional 25.4 miles of bare overhead wire with new insulated wire, to fully cover the circuit outside of the operational protocol area. • Implement operational protocols to raise PSPS windspeed thresholds
			12/2/2020		801	
			12/23/2020		801	
7	ED-00990	BALCO	12/2/2020	1989	359	Completed: • Replace 2.6 miles of existing overhead wire with new insulated wire • Implement switching protocols to transfer load to a less affected circuit
			12/7/2020		359	
			12/23/2020		359	
			10/10/2019		2849	
			10/24/2019		1536	
			10/28/2019		1535	
			10/30/2019		1539	
8	ED-01630	BIG ROCK	1/14/2021	3171	119	Completed: • Replace 10.2 miles of existing overhead wire with new insulated wire • Install 2 automated switches • Install an additional weather station • Implement operational and switching protocols to transfer load to a less affected circuit
			1/15/2021		2473	
			1/19/2021		119	
			10/26/2020		2839	
			11/26/2020		2841	
			11/27/2020		86	
			12/2/2020		2841	
			12/3/2020		87	
			12/7/2020		2928	
			12/23/2020		119	
9	ED-01832	BLUE CUT	10/26/2020	292	300	Planned Work: • Replace 43.2 miles of existing overhead wire with new insulated wire
			11/26/2020		25	
			12/2/2020		25	
10	ED-01954	BOOTLEGGER	9/9/2020	1571	61	Completed: • Insulated Wires: Replace 27.8 miles of existing overhead wire with new insulated wire • Implement switching protocol to remove some customers and critical businesses from PSPS
			10/26/2020		1579	
			11/26/2020		1576	
			12/3/2020		1502	
			12/7/2020		62	
			12/23/2020		62	
11	ED-02035	BOUQUET	10/10/2019	747	91	

Entry #	Circuit ID	Name of Circuit with >2 Inc	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures taken, or planned to be taken, to reduce the need for, and impact of, future PSPS of circuit
			10/24/2019		734	Completed: • Replace 28.9 miles of existing overhead wire with new insulated wire • Add temporary generator to serve approx. 250 customers during a PSPS event with minimal outages
			10/30/2019		733	
12	ED-02674	CALGROVE	1/15/2021	1903	24	Under Engineering Review
			1/16/2021		24	
			1/19/2021		24	
13	ED-02751	CALSTATE	10/26/2020	606	605	Completed: • Replace 3.0 miles of existing overhead wire with new insulated wire
			11/27/2020		614	
			12/3/2020		616	
			12/8/2020		9	
			12/23/2020		10	
			10/10/2019		10	
			10/20/2019		10	
			10/28/2019		617	
			10/24/2019		10	
			10/30/2019		617	
14	ED-02790	CAMP BALDY	10/26/2020	0	154	Completed: • Install insulated wire
			11/26/2020		154	
			12/7/2020		152	
15	ED-03099	CASMALIA	10/10/2019	2111	665	Completed: • All existing overhead in HFRA was previously switched to the Impala 12kV
			10/24/2019		2023	
			10/28/2019		2021	
			10/30/2019		1988	
16	ED-04632	CASTRO	12/2/2020	2379	21	Completed: • Add a new switch to improve segmentation and reduce customer impacts
			12/7/2020		224	
			12/24/2020		20	
			10/10/2019		2379	
			10/23/2019		2395	
			10/28/2019		2298	
			10/30/2019		2291	
17	ED-03714	COBRA	12/2/2020	1712	1705	Completed: • Replace 0.2 miles of existing overhead wire with new insulated wire • Automate 2 existing switches • Install an additional weather station
			12/7/2020		1705	
			12/23/2020		1711	
18	ED-03885	CONDOR	11/27/2020	1463	1464	

Entry #	Circuit ID	Name of Circuit with >2 Inc	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures taken, or planned to be taken, to reduce the need for, and impact of, future PSPS of circuit
			12/2/2020		1466	Completed: • New insulated wire has already been installed on nearly all existing overhead portions of the circuit • Replace an additional 1.7 miles of existing overhead wire with new insulated wire near the substation
			12/7/2020		1466	
			12/8/2020		34	
			12/23/2020		1463	
			10/10/2019		1463	
			10/24/2019		1464	
			10/29/2019		1464	
19	ED-04495	CUDDEBACK	10/10/2019	338	325	Completed: • Replace 7.53 miles of existing overhead wire with new insulated wire
			10/24/2019		325	
			10/28/2019		326	
			10/30/2019		326	
20	ED-04526	CUTHBERT	11/21/2021	2397	1129	Completed: • Replace 0.8 miles of existing overhead wire with new insulated wire • Implement operational protocols to raise PSPS windspeed thresholds, and transfer load to a less affected circuit • Install 1 automated switch
			11/24/2021		2384	
			1/14/2021		2439	
			1/15/2021		498	
			1/19/2021		76	
21	ED-04706	DAVENPORT	10/26/2020	1454	762	Completed: • Replace 17.07 miles of existing overhead wire with new insulated wire
			11/26/2020		452	
			12/2/2020		765	
			12/7/2020		1468	
			10/10/2019		2678	
			10/24/2019		1393	
			10/30/2019		1461	
			10/28/2019		1458	
22	ED-04900	DE MILLE	10/26/2020	0	243	Completed: • Replace 6.0 miles of existing overhead wire with new insulated wire • Circuit will be cutover to Lopez 16kV which will have higher PSPS thresholds
			12/3/2020		243	
			12/7/2020		243	
23	ED-05376	DUKE	12/2/2020	1143	1140	Completed: • New insulated wire on most overhead portions of the circuit within HFRA • Replace 0.4 miles of remaining bare overhead wire within HFRA with new insulated wire
			12/3/2020		1118	
			12/7/2020		23	
			12/23/2020		23	
24	ED-05483	DYSART	12/2/2020	70	4	
			12/7/2020		75	

Entry #	Circuit ID	Name of Circuit with >2 Inc	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures taken, or planned to be taken, to reduce the need for, and impact of, future PSPS of circuit
			12/23/2020		75	Completed: • Replace 12.9 miles of overhead bare wire with new insulated wire
25	ED-05591	ECHO	10/26/2020	1761	117	Completed: • Replace 2.2 miles of existing overhead wire with new insulated wire
			12/7/2020		1775	
			12/18/2020		117	
26	ED-05930	ENERGY	11/19/2022	1667	29	Completed: • Replace 14.9 miles of existing overhead wire with new insulated wire • Install 3 automated switches and implement additional segmentation • Add temporary generator to serve approx. 120 customers during a PSPS event with minimal outages
			10/11/2021		37	
			10/15/2021		74	
			11/21/2021		37	
			11/24/2021		1702	
			1/14/2021		2495	
			1/18/2021		900	
			10/16/2020		37	
			10/26/2020		849	
			11/26/2020		1861	
			12/2/2020		2664	
			12/7/2020		1857	
			12/19/2020		870	
			12/23/2020		46	
			10/10/2019		625	
			10/24/2019		1809	
			10/30/2019		1811	
			10/28/2019		1808	
			11/25/2019		36	
27	ED-06065	ESTABAN	12/2/2020	2100	156	Completed: • Replace 13.8 miles of existing overhead wire with new insulated wire
			12/3/2020		93	
			12/7/2020		249	
			12/23/2020		312	
			10/10/2019		2128	
			10/24/2019		2133	
			10/30/2019		1628	
28	ED-06357	FERRARA	10/26/2020	1927	242	Planned Work: • Replace existing overhead wire with new insulated wire
			11/26/2020		242	
			12/7/2020		242	
29	ED-06432	FINGAL	12/2/2020	826	230	Completed: • Replace approximately 35.1 miles of existing overhead wire with new insulated wire
			12/7/2020		1426	
			12/23/2020		232	

Entry #	Circuit ID	Name of Circuit with >2 Inc	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures taken, or planned to be taken, to reduce the need for, and impact of, future PSPS of circuit
30	ED-04170	FROZEN	1/18/2021	0	1	Completed: • Replace < 0.1 miles of existing overhead wire with new insulated wire
			11/16/2020		1	
			12/2/2020		1	
			12/23/2020		1	
31	ED-07382	GNATCATCHER	11/27/2020	1474	1446	Completed: • New insulated wire has already been installed on nearly all existing overhead portions of the circuit • Replace an additional 3.53 miles of existing overhead wire with new insulated wire at various locations
			12/2/2020		1445	
			12/7/2020		1450	
			12/23/2020		1451	
			10/10/2019		1447	
			10/24/2019		1448	
			10/29/2019		1446	
32	ED-07742	GUITAR	10/26/2020	250	42	Completed: • Replaced 10.0 miles of existing overhead wire with new insulated wire
			11/27/2020		42	
			12/3/2020		42	
			12/23/2020		42	
			10/10/2019		197	
			10/24/2019		43	
			10/28/2019		255	
			10/30/2019		255	
33	ED-08446	HILLFIELD	10/26/2020	1980	2373	Completed: • Replace 3.6 miles of existing overhead wire with new insulated wire • Automate 3 switches • Update switching protocols • Implement operational protocol for portions of the circuit
			12/7/2020		2373	
			12/23/2020		2057	
34	ED-08795	HUCKLEBERRY	10/10/2019	181	4	Completed: • Replaced 17.8 miles of existing overhead wire with new insulated wire and Implement protocols to transfer load to a less affected circuit
			10/24/2019		173	
			10/27/2019		174	
			10/30/2019		174	
35	ED-08880	ICE HOUSE	10/26/2020	12	12	Planned Work: • Replace existing overhead wire with new insulated wire
			11/26/2020		12	
			12/7/2020		12	
36	ED-08904	IMPALA	11/21/2021	824	463	Completed: • Replace 25.8 miles of existing overhead wire with new insulated wire
			11/24/2021		463	
			11/25/2021		361	
			1/19/2021		776	

Entry #	Circuit ID	Name of Circuit with >2 Inc	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures taken, or planned to be taken, to reduce the need for, and impact of, future PSPS of circuit
			10/26/2020		751	• Existing overhead in HFRA will be fully covered with insulated wire
			11/27/2020		760	
			12/3/2020		764	
			12/7/2020		763	
37	ED-10705	LOPEZ	10/26/2020	1759	168	Completed: • Replace 22.4 miles of existing overhead wire with new insulated wire, and Install a new automated switch
			12/2/2020		49	
			12/3/2020		96	
			12/7/2020		145	
38	ED-10729	LOUCKS	9/9/2020	57	14	Completed: • Replace 3.2 miles of existing overhead wire with new insulated wire
			10/26/2020		55	
			11/26/2020		55	
			12/7/2020		55	
			10/10/2019		56	
			10/24/2019		56	
			10/30/2019		56	
			10/28/2019		52	
39	ED-11500	MCKEVETT	10/10/2019	297	289	Completed: • Implement operational protocol to raise PSPS windspeed thresholds
			10/23/2019		578	
			10/28/2019		289	
			10/30/2019		289	
40	ED-11760	METTLER	11/16/2020	517	8	Completed: • Replace 38.0 miles of existing overhead wire with new insulated wire
			12/2/2020		527	
			12/7/2020		527	
			10/10/2019		514	
			10/24/2019		514	
			10/28/2019		516	
			10/30/2019		516	
41	ED-12485	NAPOLEON	12/2/2020	2935	45	Completed: • Replace 5.8 miles of existing overhead wire with new insulated wire
			12/3/2020		1028	
			12/7/2020		45	
			12/8/2020		527	
			12/23/2020		45	
42	ED-12847	NORTHPARK	11/26/2020	2155	552	Completed: • Replace 18.6 miles of existing overhead wire with new insulated wire • Implement switching protocols to transfer load to a less affected circuit • Automate 2 existing sectionalizing devices
			12/2/2020		550	
			12/18/2020		1101	
			12/23/2020		623	

Entry #	Circuit ID	Name of Circuit with >2 Inc	Dates of Outages	Number of Customers Served by Circuit	Number of Customers Affected	Measures taken, or planned to be taken, to reduce the need for, and impact of, future PSPS of circuit
43	ED-13983	PETIT	10/24/2019	1163	22	Completed: • Implement operational protocols to raise PSPS windspeed thresholds
			10/25/2019		11	
			10/28/2019		1076	
			10/29/2019		42	
			10/30/2019		1074	
			10/31/2019		42	
44	ED-14005	PHEASANT	12/2/2020	176	178	Completed: • Replace 9.3 miles of existing overhead wire with new insulated wire
			12/7/2020		178	
			12/23/2020		178	
45	ED-14603	RACER	12/3/2020	724	722	Completed: • Replace 0.6 miles of existing overhead wire with new insulated wire • Implement operational protocol for portions of the circuit
			12/7/2020		723	
			12/23/2020		723	
46	ED-14645	RAINBOW	12/2/2020	395	180	Completed: • Replace 15 miles of existing overhead wire with new insulated wire
			12/7/2020		180	
			12/23/2020		179	
			10/24/2019		19	
			10/28/2019		343	
			10/30/2019		399	
			10/31/2019		399	
47	ED-14758	RED BOX	1/19/2021	27	30	Completed: • Install an additional weather station • Adjustments to switching plans and weather station assignments in order to leverage better situational awareness and reduce PSPS use
			9/9/2020		20	
			10/26/2020		20

F7: Joint IOU Covered Conductor Working Report

2023 -2025 WMP
Joint IOU Covered Conductor Working Group Report

Introduction:
In the 2021 WMP Update Final Action Statements, Energy Safety ordered the Joint IOUs[314] to coordinate to develop a consistent approach to evaluating the long-term risk reduction and cost-effectiveness of covered conductor (CC) deployment, including 1) the effectiveness of CC in the field in comparison to alternative initiatives and 2) how CC installation compares to other initiatives in its potential to reduce PSPS risk. The utilities thus formed a Joint IOU Covered Conductor Working Group and developed an approach, assumptions, and preliminary milestones to enable the utilities' to better discern the long-term risk reduction effectiveness of CC to reduce the probability of ignition, assess its effectiveness compared to alternative initiatives, and assess its potential to reduce PSPS risk in comparison to other initiatives. The approach consisted of multiple workstreams including: Benchmarking, Testing, Estimated Effectiveness, Recorded Effectiveness, Alternatives Comparison, Potential to Reduce PSPS Risk, and Costs. In the 2022 WMP Update filings, the utilities produced a joint report that provided an update on their progress for each of the workstreams, added efforts, and preliminary plans for 2023.

In the 2022 WMP Update Final Decisions, Energy Safety identified Areas of Continued Improvement and Required Progress (ACI) for all utilities to expand this working group to include: 1) Joint CC Lessons Learned, 2) CC Maintenance and Inspection (M&I) Practices, and 3) New Technologies Implementation. Given these directions, the utilities expanded the Joint IOU Covered Conductor Working Group to include 10 workstreams and began meeting on the new workstreams in Q3/Q4 2022.

Overview:
The information compiled and assessments completed in 2022 continue to indicate CC effectiveness between approximately 60 to 90 percent in reducing the drivers of wildfire risk, consistent with benchmarking, testing and utility estimates. In 2022, laboratory testing on CC has largely been completed with a few tests remaining.

In 2023, the utilities plan to conduct workshops across several workstreams to assess testing results, identify CC M&I best practices, develop a common framework for calculating the effectiveness of a combination of alternatives, assess data and information for effectiveness of new technologies and share practices and implementation strategies, and assess studies to be performed on CC's ability to reduce PSPS impacts amongst other actions. The utilities will also continue to meet to further benchmark efforts, improve methods for estimating and measuring effectiveness, and continue to track and compare unit costs. Below, the utilities describe the progress made on each workstream and steps planned to continue this effort in 2023.

As explained in the 2022 WMP Update report, the current type of CC being installed in each of the utilities' service areas is an extruded multi-layer design of protective high-density or cross-linked polyethylene material. In this report, "covered conductor" or "CC" refers generally to a system installed

[314] In this progress report, "Joint IOUs," "IOUs," or "utilities" refers to SDG&E, PG&E, SCE, PacifiCorp, BVES, and Liberty.

on cross-arms, in a spacer cable configuration, or as aerial bundled cable (ABC). Distinctions are made

where utilities install CC on cross arms and in a spacer cable configuration. Table CC-1, below, provides an updated snapshot of the approximate amount and types of CC installed in the utilities' service areas through 2022.

Table CC-1
Covered Conductor Type and Approximate Circuit Miles Deployed by Utility

Utility	First covered conductor installation (year)	Type of covered conductor installed	Approx. miles of covered conductor deployed through 2022	Notes
SCE	2018	Covered Conductor	4,400	Includes WCCP and Non-WCCP
	2022	Spacer Cable	0.15	Pilot
	Installed Historically	Tree Wire	50	
	Installed Historically	ABC	64	
PG&E	2018	Covered Conductor	960	Primary distribution overhead only
	2022	ABC	3	Like for like replacement
SDG&E	2020	Covered Conductor	84	
		Tree Wire	2	
		Spacer Cable	6	
Liberty	2019	Covered Conductor	11	
	2019	Spacer Cable	9	
Pacificorp	2007	Spacer Cable	76	
	2022	Covered Conductor	7	
Bear Valley	2018	Covered Conductor	34	

Testing:

Introduction:

In 2022, the joint IOUs performed Phase 2, or testing of CC, to better understand the advantages, operative failure modes, and current state of knowledge regarding CCs. As explained in the utilities' 2022 WMP Update filings, the utilities contracted with Exponent, Inc. (Exponent) to develop a report for a Phase 1 study. The Phase 1 study consisted of a literature review, discussions with SMEs, a failure mode identification workshop, and a gap analysis comparing expected failure modes to currently available test and field data. The Phase 1 report was completed in December 2021 and was an attachment to the utilities' 2022 WMP Update filings. The outcome of the Phase 1 report identified gaps in previous testing and informed the scope of laboratory testing. For the remainder of 2022, the IOUs executed Phase 2 to perform testing and analyses of CC, which had the following objectives:

Within Phase 2 of the study, SCE, SDG&E, and PG&E all performed specific testing scopes of work, informed by the findings and recommendations of the Phase 1 report issued by Exponent. The three utilities, led by SCE, contracted with Exponent to independently investigate the effectiveness of CC for overhead distribution systems and, in the case of PG&E and SDG&E, executed additional testing plans as

part of this joint effort.[315] Exponent conducted several testing scenarios that covered various contact-from-object, wire down, system strength, flammability, and water ingress scenarios. PG&E developed an additional test plan to ensure coverage of failure modes and additional CC types. SDG&E's additional test plan included environmental, service life, UV exposure, degradation, and mechanical strength tests. Exponent's investigation included lab-based testing of 15 kV rated 1/0 aluminum conductor, steel reinforced (ACSR) CC provided by SDG&E, 17 kV and 35 kV rated 1/0 ACSR provided by SCE, 22 kV rated 397.5 kcmil all aluminum conductor (AAC) provided by PG&E, and 17 kV rated 2/0 copper CC provided by SCE (corrosion testing only). PG&E's additional testing included 15 kV rated 397.5 AAC and 15 kV rated 1/0 ACSR. SDG&E's additional testing included a 15 kV rated 1/0 ACSR conductor.

SCE's testing began in Q1 2022 and was completed in Q4 2022. Exponent completed its final report in late December 2022.[316] SDG&E and PG&E began testing in Q2 2022. PG&E completed its testing and finalized its report in December 2022.[317] SDG&E has not completed all its testing with some tests anticipated to be competed in Q1 and early Q2 2023. All testing is not yet complete; however, the utilities have recently started to collaborate on the results of the tests that have been completed. This report provides a summary of the test results that have been completed. In 2023, the utilities plan to continue discussing the results of the tests as further described below.

Based on all the testing completed as of the end of December 2022, the following high-level conclusions were made:[318]

Summary of Testing Results:

Arc Testing

The purpose of the Arc testing was to understand the effectiveness of CC in mitigating faults and ignition for various contact-from-object scenarios. These tests involved simulating wire-to-wire contact and contact from foreign objects by bridging two conductors, one energized and one grounded. Several permutations of CC, sheath damage, and bare conductors were tested. Overall, CC was successful at mitigating arcing/ignition under all tested conditions at their design voltages. Current flows for CC were recorded to be less than 2.5 mA. In comparison, current flows for bare wire were recorded to be greater than 2,000 mA. For a five-minute contact duration, no arcing, insulation breakdown, or visual damage was observed.

The testing of phase-to-phase contact demonstrates that CC is effective at reducing arcing and the potential for ignitions whenever the insulation is intact, and the operating voltage is within normal ranges. Potential for ignition exists when the insulation is damaged/removed which may occur when objects collide with the CC. This testing also involved energizing the CC at extreme voltages much higher

[315]To distinguish between the results described below, "SCE testing" refers to the joint IOU Exponent testing, "PG&E testing" refers to the testing PG&E conducted, and "SDG&E testing" refers to the testing SDG&E has completed and is still conducting for the Joint IOU effort.

[316] The joint IOU Exponent report entitled, "Joint-IOU Covered Conductor Testing Cumulative Report 12-22-22" is included in each utility's Supporting Documents.

[317] The PG&E report entitled, "PGE Covered Conductor Testing-1219" is included in each utility's Supporting Documents.

[318]All tests were performed under controlled conditions. Actual field performance may vary depending on a variety of factors.

than the CC was designed to withstand. At 90 kV, which far exceeds the conductor ratings, there was no insulation breakdown, pinhole formation, or arcing/ignition observed.

These test results illustrate the effectiveness of CC at mitigating ignitions due to contact-from-object events. Future testing may be done to simulate branches or other debris striking the conductor at speed to determine the ability of the insulation to withstand impact. Future testing may also include simulating the effects of long-term object contact.

Simulated Wire-down Testing

The wire-down testing investigated ignition risk posed by CC and bare wire wire-down events. Flaws were introduced to the covering to represent various scenarios during a CC wire-down. These flaws included the full removal of the covering, removing half the thickness of the covering, and having a broken end. The SCE wire-down testing demonstrated that conductors whose covering was still intact upon contacting the dry brush did not result in an ignition. Upon introducing a full thickness flaw into the covering, which exposed the bare conductor, arcing and ignition were observed. PG&E testing showed that Individual conductor strands can be exposed from the covering during simulated conductor breaks.

SCE testing was also performed by inserting a half-thickness flaw into the covering which did not result in arcing or ignition; this indicates that the CC can sustain significant damage without exposing the bare conductor and still be effective at mitigating ignitions. This conclusion is also corroborated through testing that showed that the CCs had a minimum of 66% of the insulation rating even with 50% abraded insulation.

Fire risk / Flammability Testing

SCE's Fire Risk testing subjected a small segment of conductor to local radiant heat to simulate how CCs would react to various magnitudes of wildfires. The magnitude of the heat represents surface fires, brush fires, and crown fires. Crown fires with a long residence time have the highest potential to cause damage to the covering of the conductor. The study noted that the measurements were taken with direct contact of the flame; however, properly maintained vegetation clearances would decrease an overhead primary distribution line's potential of being in contact with a flame. According to the inverse square law for heat, the intensity of the flame is inversely proportional to the distance squared X=1/d^2. Using this equation, we can approximate the amount of radiated heat the conductor might experience at a particular distance away from a flame. The shortest distance that should be expected between vegetation and the conductor would be when there are crowns of trees nearby (6-foot clearance, GO 95). There would be a significantly greater distance between the conductor and vegetation for surface and brush fires. At 6 feet, the heat flux is approximately 30% of what would be felt directly at the flame. At a distance of 6 feet (1.8288m) and utilizing the scenario-based heat fluxes provided, we can approximate the amount of heat the conductor would encounter. See Table CC-2 below that shows the heat flux ranges for direct contact and contact at six feet for the different fire types.

Table CC-2

Heat Flux Ranges by Fire Type

Fire Type	Heat Flux (kW/m^2) Range with Direct Contact	Heat Flux (kW/m^2) Range with Contact at 6 feet (1.8288m)

Surface fires	18	77	5	23
Brush fires	97	110	29	33
Crown fires	179	263	54	79

Corrosion Testing

To make electrical and structural connections, some utilities remove the covering of the conductor to expose bare wire. When a bare wire is exposed to the elements, it becomes more susceptible to various types of corrosion. This was a common failure mode that was identified when benchmarking with other utilities. To mitigate this failure mode, some utilities use medium voltage fusion tape (MVFT) on electrical connections to the line. SDG&E utilizes Insulated Piercing Connectors (IPCs) to make electrical connections and a tensioning clamp for structural connections. Water ingress testing was performed by both SCE and PG&E to evaluate the corrosion susceptibility for instances when the covering is removed. SCE varied the test by utilizing a tool specifically designed to remove the covering to expose a length of bare conductor and removing the covering manually without unique tools; they also varied the conductor material to include copper and aluminum. The conductor was then placed vertically with a dedicated reservoir of fluorescent water at the top to simulate moisture intrusion. In all the tests, water was visible at the opposite end of the conductor segment within 5-10 minutes. PG&E's version of the testing was varied to test various types of CC with and without water-blocking agents. PG&E's test was also slightly different because a length of exposed conductor was not left at the top, but rather a clean cut was made on each of the conductors. For the conductors without water-blocking agents, fluorescent water was observed at the opposite ends of the conductor while there was no liquid observed for the conductors with water-blocking.

Although the water ingress testing setup, conducted in a submersible configuration, is not likely to occur in the field, water ingress can lead to accelerated corrosion. Additional preventative actions taken during installation and/or maintenance, such as the use of IPCs, tension clamps, gel wraps/packs, wildlife covers, or MVFT, may help limit moisture ingress and related corrosion effects. For example, PG&E's water immersion test of gel wraps demonstrates this mitigation's ability to prevent water intrusion for splice and other electrical connections. Additionally, corrosion can potentially be mitigated with the use of copper CCs due to copper being less susceptible to corrosion than aluminum in high corrosive areas.

Salt spray testing was performed by SCE to evaluate the susceptibility of exposed ends of CC to corrosion in coastal and industrial environments. This testing utilized a 5% salt solution for 168 hours with a SO2 solution introduced intermittently. The testing varied like the water intrusion testing, but also added artificial defects to simulate mid-span damage and performed the testing on bare conductors as well. Corrosion was identified on the exposed portion of the CC as well as under the covering. When a conductor had simulated damage, the most severe corrosion occurred. Exponent did identify that a segment of CC was evaluated which utilized an IPC; however, this did not demonstrate corrosion.

PG&E's atmospheric corrosion tests consisted of 1,000 hours of exposure using a 5% salt solution. This test evaluated bare conductor, CC, and splice connections with MVFT or gel packs. PG&E summarized that aluminum CCs are more susceptible to corrosion compared to bare conductor when exposed to a corrosive environment. This ingress is reduced with the application of MVFT and altogether eliminated

with the use of gel packs. It is also important to note that all conductors met the rated breaking strength after the testing was completed.

Aging Susceptibility Testing

PG&E performed UV weathering tests with 1,000 hours of exposure time (ASTM G155-21). Two types of CCs were tested and neither met the tensile or elongation requirements of ANSI/ICEA S-121-733 to be considered resistant to sunlight. The results indicate that the covering is susceptible to degradation and cracking after long-term exposure to UV for the conductors tested.

Exponent, with SDG&E, performed accelerated aging testing by monitoring a segment of the cover at 10% thickness. It is assumed that the rate of change that is observed with a segment at 10% thickness can be used to anticipate the amount of deterioration over 40 years. Three tests were performed at 80C, 110C, and 130C; one test was performed at 80C with 1.60W/m^2 at 340nm UV. The UV data would then be interpolated with the results of the 110C and 130C samples to test the properties of interest; those include dielectric constant, mechanical strength, chemical changes, and visual changes. The results of this test also indicate that the covering is susceptible to degradation and cracking after long-term exposure to UV.

System Strength Testing

After the salt-spray corrosion testing, Exponent evaluated the tensile testing strength of the various aluminum, copper, and steel strand samples. The results from the individual strands can be used to assess the condition of the whole conductor. They showed that even though the aluminum strands underwent corrosion due to the accelerated aging, there was not a significant loss of strength in the conductor overall. For conductors with IPCs installed, there was a measurable decrease in tensile strength of the conductor strands related to the damage caused by the IPC, the degradation was not due to corrosion. Other utilities that utilize IPC's to make electrical connections have not identified this to be a concern.

PG&E evaluated the tensile strength of the conductors to confirm that they met the rated breaking strength and to evaluate how the conductor and cover would react. Both conductors tested exceeded the rated breaking strength. At the point of fracture, necking occurred but was more significant for the covering than the aluminum and steel wires. Small segments of exposed conductor could be seen protruding from the covering. Because of this, breaks in the conductor could result in phase-to-ground contact, which could lead to an ignition.

SCE's system strength tests included a splice maximum load test, insulator slip test, and a tree fall test. For the splice max load test, all spices met or exceeded specifications. For the insulator slip test and tree fall test, two different types of insulators were used. One experienced deformation of the metal pin while the other showed signs of slippage with no apparent damage. For a simulated tree fall on a dead-end configuration, a failure occurred with smaller sized conductor due to it slipping out of the dead-end shoe. It was noted that the failure likely occurred above the rated strength of the conductor. For larger conductors, the failure point was at the crossarm.

Electrical Properties Testing

PG&E performed leakage current and dielectric withstand tests on the covering and various splice coverings. For the covering tests, two different types and sizes of conductor were used, both with full cover thickness and 50% cover thickness to simulate a flaw. In all the covering test cases, the insulation failed at a voltage level that greatly exceeded its rated value. The splice covers tests consisted of a

compression splice with gel pack, compression splice with MVFT, and a fired wedge connector with a cover. In all cases the splice coverings met or exceeded the ratings of the CC insulation rating.

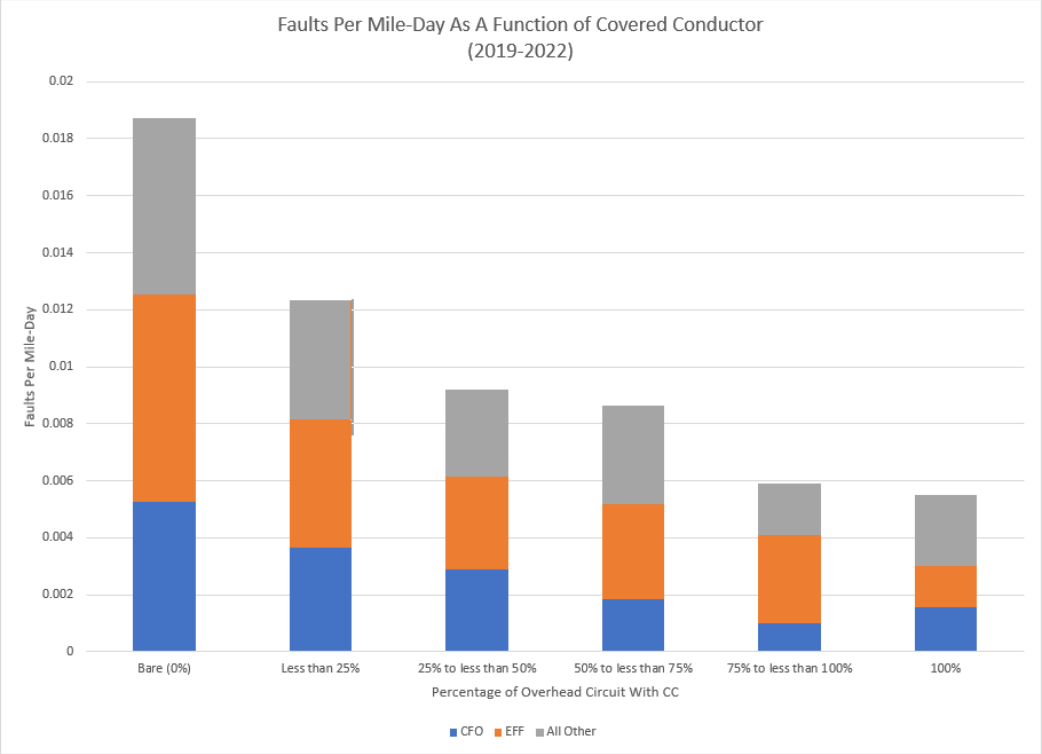
To understand if CC could be susceptible to tracking damage, inclined plane tracking and erosion tests and tracking resistance with salt fog tests were performed. For the inclined plane and erosion tests, both conductor samples passed; however, one of the conductors showed a greater erosion depth. The tracking resistance with salt fog tests were designed to understand the impacts of long-term vegetation contact. Again, for these tests, both conductors met the passing criteria but, again, the same conductor showed a greater erosion depth.

PG&E tested the damaging effects that lightning might have on the covering. This was a custom test with guidance from IEEE Std. 4 and IEC 60060-1. The conductor samples were subjected to lightning impulses starting at 85 kV and then increased in the magnitude of the voltage until a breakdown occurred. Both of the conductor samples tested experienced breakdowns between 90-110 kV for each of the 5 samples. The conclusion of the lightning tests is that both coverings have the potential to be damaged by lightning; however, damage is expected to be localized and would be unlikely to cause auto-ignition of the covering.

Covering Properties Testing

The thermal properties of conductor layers were tested by PG&E to verify the glass transition temperatures for each layer of two different conductors. One of the conductors exhibited an onset of glass transition in the conductor shield layer at a lower than emergency temperature rating which could indicate possible early covering degradation if exposed to emergency temperatures repeatedly. The other conductor showed no signs of degradation up to the emergency operating temperatures.

Next Steps:



As explained above, several testing results were completed in December 2022 with a few still remaining. The utilities have met to overview the results of some completed tests but have not yet discussed all results nor in detail yet. In 2023, the utilities will conduct meetings and workshops to assess the testing results, determine if any additional tests are needed, determine if any mitigations are warranted (such as changes to materials, construction methods, or inspection practices), and will meet to assess whether changes to effectiveness estimates are warranted. Additionally, and as part of the workshops, the utilities will discuss the testing results in relation to PSPS de-energization thresholds. Below, we present a preliminary schedule for workshops and discussion themes.

Once the utilities finalize the workshop schedule, Energy Safety will be invited. Based on findings from the workshops, additional workshops may be scheduled in 2023. Additionally, the utilities will continue to meet on a biweekly basis. Should the results of the workshops lead to changes in materials, construction practices, effectiveness values, etc., the utilities will establish plans to implement these changes and document as part of lessons learned.

Recorded Effectiveness:
As explained throughout this report, the utilities have continued to implement CC and are using recorded data to help assess its effectiveness in the field. Though the utilities' data is still relatively limited, the outcomes in 2022 in addition to previous years outcomes, as presented below, continue to show CC effectiveness at reducing the risk drivers that can lead to wildfires range between approximately 60 to 90 percent, which is consistent with the utilities' estimated effectiveness values and supported by recent testing results. Below, the utilities provide an update on its 2022 WMP Update report describing data and analyses used to measure recorded effectiveness of CC and plans for 2023 to continue to discuss and share recorded data and methods to measure effectiveness, and document lessons learned.

Covered Conductor Recorded Effectiveness:
SCE
SCE has continued to refine its data and methods to measure the effectiveness of CC in the field. In 2022, SCE set up a CC dashboard that tracks fault rates on overhead distribution circuits with 100% CC installed, circuits that are partially covered, and circuits with no CC installed (bare wire). The data can be broken down by fault sub-drivers such as CFO, EFF, and Other. The data is based on all circuits that traverse HFTD and includes a breakdown of how many miles fall into the fully covered, partially covered, and not covered categories. The dashboard refreshes daily with updated fault and CC data. Because faults that occur on partially covered circuits are difficult to determine if occurred on the covered or bare portion, SCE has further delineated this data into the following partially covered groups: Less than 25%, 25% to 49%, 50% to 74%, 75% to less than 100%. Furthermore, SCE is now using a faults per mile-day method that factors in how long the circuit was fully or partially covered. In 2022, SCE provided overviews of its dashboard, grouping and methods to this working group. Faults per mile-day data from 2019-2022 are shown in Figure CC-1 below.

Figure CC-1
SCE Faults Per Mile-Day as a Function of Covered Conductor

By comparing fault events on fully and partially covered circuits to bare circuits in its HFRA on a per mile-day basis from 2019 to 2022, the data shows that circuits fully covered experience approximately 70% less faults than bare conductor when factoring in all sub-drivers (see Table X below). Additionally, circuits that are in the 75% to less than 100% covered group experience a similar improvement over bare conductor at approximately 69% less faults. The data also shows a predicted trend with an increasing reduction in faults as more of a circuit is covered. Furthermore, on segments where SCE has covered bare wire, there has not been a CPUC-reportable ignition from the drivers that CC is expected to mitigate.

Table CC-3
SCE Fault Events on Fully and Partially Covered Circuits Compared to Bare Circuits

Grouping	Reduction Compared to Bare			
	CFO	EFF	All Other	Total
Bare (0%)	0.0%	0.0%	0.0%	0.0%
Less than 25%	30.6%	38.3%	32.0%	34.1%
25% to less than 50%	45.3%	54.9%	50.7%	50.8%
50% to less than 75%	65.0%	54.0%	43.9%	53.8%
75% to less than 100%	81.0%	57.6%	70.8%	68.5%

100%	70.3%	80.3%	59.2%	70.5%

PG&E

As of the end of 2022, the number of ignitions observed on the CC lines does not provide statistically significant data for calculating effectiveness with respect to ignitions. As most distribution outages (momentary and sustained) typically involve a fault condition, PG&E assumes that all distribution outages can potentially result in an ignition, regardless of other prevailing conditions. Therefore, PG&E is measuring the recorded effectiveness of CC by comparing the outages on the circuit segments with CCs to outages on circuit segments with bare conductors.

PG&E's recorded effectiveness is calculated in three different snapshots. The first snapshot considers all CC installations by the end of 2019 and average yearly outages in 2020-2022. The 2nd snapshot considers the CC installations by the end of 2020 and average yearly outages in 2021-2022. Lastly, all CC installations by the end of 2021 and outages in 2022 are considered in the 3rd snapshot.

PG&E has not included CC installations that were completed in the middle of year 2022. PG&E is only including locations that were completed by end of year (EOY) 2021, so that there is a minimum of 1 year of outage performance data to be able to compare with outage performance in areas with bare conductor.

The comparison was conducted on an outages per year, per mile basis to normalize outage rates pre- and post- CC. Table CC-4 below presents the results of this preliminary recorded effectiveness analysis.

Table CC-4
PG&E Recorded Effectiveness Snapshots

Snapshot	Category of OH HFTD circuit segments (downstream of SSDs)	Total CC miles in this category	Total OH HFTD miles in this category	% CC'ed	Average yearly HFTD outages	Outage / Total OH HFTD miles / year	Improvement compared to Category 1
1: CC miles % of total OH miles by the end of 2019	**Outages considered: 2020-2022**						
	Category 1: not covered at all	0	24,849	0%	9339.7	0.38	-
	Category 2: 1-80% (partial)	27	242	11%	53.7	0.22	**41%**
	Category 3: 80%+ (mostly)	36	38	95%	4.3	0.11	**69%**
2: CC miles % of total OH miles by the end of 2020	**Outages considered: 2021-2022**						
	Category 1: not covered at all	0	24,950	0%	9544	0.38	-
	Category 2: 1-80% (partial)	122	640	19%	157.5	0.25	**36%**
	Category 3: 80%+ (mostly)	178	185	96%	19.5	0.11	**72%**
3: CC miles % of total OH miles by the end of 2021	**Outages considered: 2022**						
	Category 1: not covered at all	0	24,942	0%	5978	0.24	-
	Category 2: 1-80% (partial)	148	877	17%	151	0.17	**28%**
	Category 3: 80%+ (mostly)	238	248	96%	18	0.07	**70%**

The calculated outage reduction percentage (used as a measure for the recorded effectiveness) shows that CC sections experience approximately 28-70% fewer faults compared to bare conductor circuit segments.

PG&E's results are presented in Table CC-4. These results are preliminary due to the following factors:

- Using an averaged per mile rate for the outages inherently omits the granular perspective related to each individual section of the circuits in PG&E's service area because it does not capture the impact of localized environmental/weather conditions. Hence, this analysis may over or under-represent effectiveness.
- It is assumed that all distribution outages could potentially result in an ignition. It does not factor in if one type of outage is more or less likely to result in an ignition. However, there are several failure modes such as tie-wire failure that have a much lower likelihood of ignition compared to an outage due to a broken conductor.
- The outages in partially covered and mostly covered categories (category 2 and 3) could have occurred on parts of the line that are not covered, which cannot be validated due to lack of exact geospatial information for the outages.

As part of PG&E's ignition investigation process, it is incorporating additional review of ignition identification that occurs on a CC line to ensure visibility of failures based on observed incidents. Below are some examples related to the effectiveness of CCs in the field that have been observed in PG&E's service area.

Example 1:
On 5/10/2021, a 125-foot ponderosa pine that was 55-feet away from a pole, failed approximately 40-feet above ground, severing the CC, causing a wire down, and a subsequent CPUC reportable ignition.

Figure CC-2
PG&E Covered Conductor Effectiveness – Example 1

Example 2:
On 5/2/2022, a 120-foot ponderosa pine that was being abated for previously reported structural concerns, fell on a CC line, severing it, and starting a CPUC reportable ignition.

Figure CC-3
PG&E Covered Conductor Effectiveness – Example 2

These two incidents highlight some limitations concerning CC. In both incidents, there were vegetation management inspections and CC deployed. But even with the combined mitigations, it still resulted in an ignition.

Example 3:
On 12/27/2021, two CCs were supporting an entire tree. There was no ignition; however, an electrical outage did occur on the line.

Figure CC-4
PG&E Covered Conductor Effectiveness – Example 3

SDG&E
As CCs become a larger part of the system, the performance indicators that impact the efficacy of this mitigation will continue to be monitored and measured, including the measured effectiveness. As there are approximately 84 miles of CC installed with an average age of less than one year, SDG&E does not have sufficient data yet to draw any conclusions on the recorded effectiveness of CC.

Moving forward, SDG&E will continue to track the mileage, years of service, and faults on all CC circuit segments and will continue to collaborate with this working group to improve methods to measure the effectiveness of its system hardening initiatives. SDG&E's approach is to calculate the risk events per one hundred miles per year on segments that have been covered and compare the risk event rate before and after the installation of CC.

PacifiCorp
PacifiCorp continues to track risk events within each zone of protection (ZOP) with known conductor types and assumes homogenous performance across the ZOP. Current processes do not establish specific locations where fault events occur, but are reconciled to the device that protects the ZOP. To establish the recorded effectiveness, PacifiCorp queried pre- versus post-installation performance with risk event drivers for all ZOPs having CC (specifically spacer cable construction). It was important to recognize that legacy projects were focused on reliability and thus did not require reconductoring of the entire ZOP. As such, the recorded effectiveness calculations accounted for the percentage of the ZOP that wasn't reconductored. The smaller the percentage of the ZOP the less the confidence of the recorded effectiveness, while the higher the percentage of the ZOP the higher the confidence of the calculation.

PacifiCorp has also documented known contact-related events with CC. As shown in Figure CC-5 below, these events did not result in faults, wires down, or ignitions because spacer cable was deployed and provide examples of effectiveness in the field.

Figure CC-5
PacifiCorp Covered Conductor Effectiveness Examples

PacifiCorp will continue to monitor and track all faults on our CC circuits and track performance as compared to bare wire installs. PacifiCorp will also continue to collaborate in this working group to ensure we gather and share information from the other IOUs.

Bear Valley

BVES has approximately 211 circuit miles of overhead conductor between 34.5 kV and 4.16 kV in its system. BVES started a CC pilot program in Q2 2018 and completed it in Q3 2019 using two different type of cover conductor wires (394.5 AAAC Priority wire and 336.4 ACSR Southwire). Then, BVES started the cover conductor WMP in late 2019 with plans to cover 4.3 circuit miles on 34.5 kV over the next 4 years and 8.6 circuit miles on 4.16 kV over the next 10 years. As of end of Dec. 2022, BVES has covered approximately 34 miles between its 34 kV and 4 kV systems.

In Q3 2018, BVES started a new tree-trimming contract with a new tree service contractor. BVES has been very aggressive with its vegetation manage program having up to four tree crews or more at a time to complete its three-year cycle and remediating any issue trees which has helped reduce outages from vegetation contacts. As of end of 2021, BVES has completed its vegetation three-year cycle and in 2022 has started a new three-year cycle vegetation manage program.

As part of its wildfire mitigation efforts, in June 2019, BVES began replacing all explosion fuses in its service area with Trip Savers and Elf Fuses. BVES completed this project in May 2021, which eliminated the potential for ignitions from explosion fuses.

Though 2022, BVES has still not had any outages, wire down, tree limbs and/or ignitions on the lines that have been covered. BVES is still in the early stages of its CC program. As more areas are covered and as more time passes, BVES will compile more recorded data to inform on the effectiveness of CC. The table below provides a simple assessment of recorded outages since 2016 and through 2022.

Table CC-5
BVES Recorded Outages (2016-2022)

Year	# of Outages
2016	75
2017	95
2018	34
2019	26
2020	57
2021	46
2022	52

Liberty

Liberty's CC program is relatively new, having begun in 2020. Because the program is new, data on the performance of CC effectiveness do not yet demonstrate meaningful recorded effectiveness results based on the limited sample period and the wide variations in weather conditions from year-to-year. In addition, the CC projects completed thus far represent a small percentage of each circuit's total line miles.

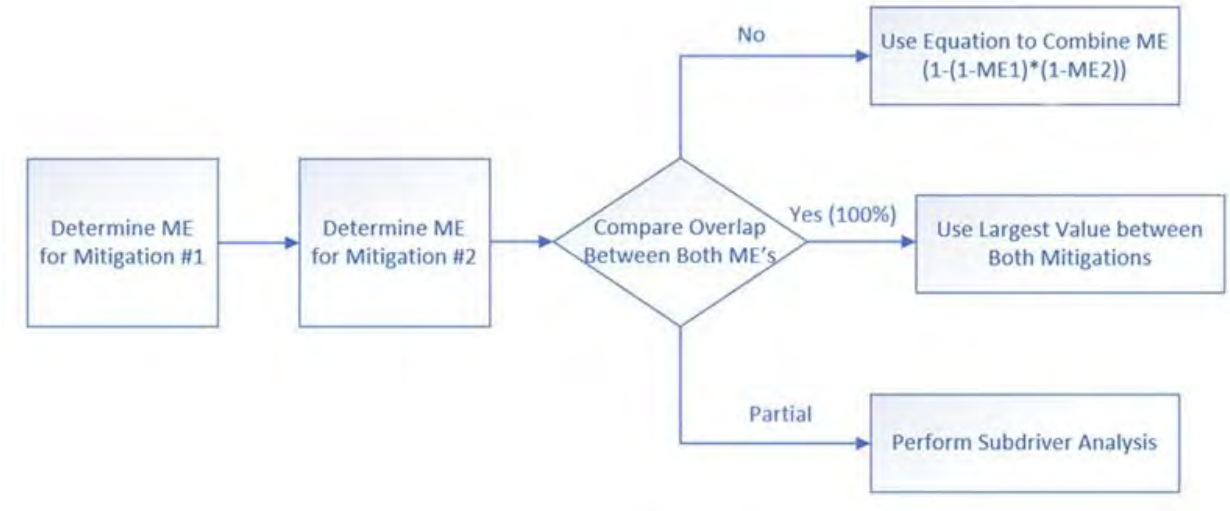
Based on a review of Liberty's Outage Management System (OMS) data, there have been zero reported outages or ignitions caused by an event on CC spans. The only known event that occurred on a CC span, in a spacer cable configuration, happened during a winter storm in early January 2023. The event did not create an outage or ignition and it was found as a result of a post-storm aerial patrol. In this incident, a tree fell across a spacer cable span that was installed in 2020. The tree pulled down the span and caused three poles to lean significantly; however, the messenger wire held up the tree and prevented a fault and a wire from falling to the ground. The figures below represent this one incident.

Figure CC-6
Liberty Spacer Cable System Preventing a Fault – Viewpoint 1

Figure CC-7
Liberty Spacer Cable System Preventing a Fault – Viewpoint 2

Upon finding the damage, the poles were reset to vertical and the damaged support brackets were replaced. No damage was found related to the conductor.

Liberty intends to continue to monitor CC effectiveness and reinforce the need to collect and highlight any events that occur on CC. As more CC is installed and is in service for a longer period of time, the data collected will become more meaningful.



Next Steps:
In 2023, the utilities will continue meet on a regular basis, provide updates on risk event recorded data, discuss the methods used to measure the effectiveness of CC in the field, and continue to work towards developing consistent methods to measure the effectiveness of CC for better comparability. The utilities also plan to discuss outage data, causation identification and reporting. These efforts will require SME discussions and review of outage, wire-down and ignition data across the utilities. The utilities will also document any lessons learned.

Alternatives:
Overview:
In the 2022 WMP Update filings, the utilities identified a list of viable alternatives to CC and conducted workshops with SMEs that assessed the effectiveness of those alternatives against the same risk drivers that CC is designed to mitigate. In 2022, the utilities focused on the combination of mitigations utilities deploy as it relates to CC and alternatives to CC and discussing a framework to calculate the effectiveness of the combination of mitigations deployed on the same circuit or circuit-segment. Below, we describe these efforts and plans for 2023 to further this workstream.

Combination of Mitigations:
The combination of mitigations refers to the suite of mitigations utilities deploy in relation to CC and alternatives to CC on circuits or circuit-segments to mitigate wildfire risk and/or reduce the impacts of PSPS. For example, all utilities deploy CC and where CC is installed all utilities conduct vegetation management mitigations and asset inspection mitigations. Additionally, circuits that have CC are still in scope for potential PSPS and most utilities also employ fast curve settings on these circuits during elevated fire-weather conditions. Likewise, several utilities deploy undergrounding to mitigate wildfire risk and PSPS impacts and where circuits are undergrounded, vegetation management mitigations are significantly lessened if not eliminated, the potential for PSPS is in most cases eliminated, and asset inspection mitigations can also be reduced. Notwithstanding system configuration, geography, terrain, permitting, costs, the time to deploy, operational/resource constraints, environmental constraints and other considerations, utilities can choose to install CC or other mitigations such as traditional hardening, new bare conductor, undergrounding, a remote grid, and/or new technologies to mitigate wildfire risk and/or reduce the impacts of PSPS. In choosing between CC and alternatives to CC, utilities will also deploy other mitigations. As such, the utilities understand the need to explore methods to assess the effectiveness of a combination of mitigations.

Historically, utilities have largely estimated the effectiveness of mitigations separately. The utilities have discussed methods to calculate the effectiveness of multiple mitigations deployed on the same circuit or circuit-segment. In 2022, the utilities discussed efforts to perform such a combination of mitigations calculation. While PG&E and SDG&E have not yet adopted a framework for this evaluation, SCE shared its preliminary framework (Figure CC-8) to calculate the effectiveness of a combination of mitigations.

Figure CC-8
SCE Preliminary Framework – Calculation of a Combination of Mitigations

SCE's preliminary framework includes three prongs given that mitigation measures can target the same or different risk drivers. For example, CC is highly effective at reducing most contact-from-object sub-drivers such as light vegetation contact, animal contact, and metallic balloons. However, CC is not highly effective at reducing faults/ignitions from large trees that can fall into lines. The framework thus distinguishes the overlap of multiple mitigations. In the first prong, if multiple mitigations have no overlap in the risk drivers they mitigate, a standard equation can be used to calculate the combined effectiveness, as seen in Figure X. In the second prong, SCE considers where mitigations directly overlap with one another for a particular risk driver. In these instances, the mitigation with the highest effectiveness would be the combined effectiveness value. In the third prong, SCE considers where mitigations may target the same risk driver but they reduce the risk differently. In these situations, further analysis is needed to determine the incremental effectiveness prior to then combining the effectiveness values. Additionally, once the effectiveness of combined mitigations by driver are calculated, those values then need to be applied to the frequency of the driver risk events. Given that these estimated values are based on calculations and quantitative data can be limited and not always available, the utilities have also discussed discounting the individual estimated mitigation values.

To illustrate this framework, we use a subset of SCE's CC++ portfolio mitigation strategy. CC++ represents deploying CC, vegetation management, asset inspections, and other mitigations on the same circuit / circuit-segment that work collectively to better address the risk drivers than each by themselves. The tables and descriptions below are based on assessing the combination of CC, asset ground inspections, enhanced line clearing, pole brushing, and SCE's HTMP.
Table X shows independent estimated mitigation effectiveness values for the selected mitigations across selected contact-from-object and equipment failure sub-drivers. For purposes of this illustration, no discounting of individual estimated mitigation values was included.

Table CC-6
SCE Independent Mitigation Effectiveness Values

Risk Driver Description	WCCP	Distr Ground Asset Inspections	VM - Hazard Tree	VM - Expanded Pole Brushing	VM - Expanded Line Clearing
Animal contact- Distribution	65%	48%	0%	0%	0%
Balloon contact- Distribution	99%	0%	0%	0%	0%
Other contact from object - Distribution	77%	0%	0%	0%	0%
Unknown contact - Distribution	80%	0%	0%	0%	0%
Veg. contact- Distribution	71%	77%	64%	33%	36%
Vehicle contact- Distribution	82%	0%	0%	0%	0%
Capacitor bank damage or failure- Distribution	20%	87%	0%	20%	0%
Conductor damage or failure — Distribution	82%	80%	0%	7%	0%
Switch damage or failure- Distribution	2%	76%	0%	20%	0%
Transformer damage or failure - Distribution	20%	66%	0%	20%	0%

Using the risk driver vegetation contact, Table CC-6, above, shows varying estimated effectiveness values for WCCP, asset inspection, HTMP, expanded pole brushing, and expanded line clearing. All these mitigations work together to reduce the risk of vegetation contact causing a fire. For example, though CC addresses vegetation making contact with wires, line clearance and HTMP activities are also necessary to reduce heavy branches or trees falling into lines that CC may not be able to withstand. Asset inspection work assures equipment is in good condition, covers are in place, and if abnormalities are found, these are scheduled for remediation. These inspections also identify where vegetation may be in contact with equipment and conductors. While CC has shown, in the field, that there are times where it can withstand a large limb / tree fall-in and not create an outage and/or ignition, CC is not designed to withstand tree fall-ins. As such, and for purposes of this illustration, it is assumed these two mitigations do not overlap. Using the formula, described above, these two mitigations have an estimated combined mitigation effectiveness of approximately 90% (1-(1-71%)*(1-64%)). Asset inspections, expanded pole bushing, and expanded line clearing all have overlaps with CC for mitigating vegetation contact and thus require separate analyses. For purposes of this illustration, we assume these mitigations provide an approximate 9% incremental effectiveness for reducing vegetation contact risk. Combining all these values provides an estimated approximately 99% effectiveness value for risk of vegetation contact when all five mitigations are deployed on the same circuit / circuit-segment.

Following the same process, Table CC-7, below, shows the illustrative combined effectiveness values without considering quality control discounts. Additionally, applying the average annual frequency of historic faults and ignitions for these risk drivers, the table also shows the combined weighted average estimated effectiveness value for the selected mitigations.

Table CC-7
SCE Combined Mitigation Effectiveness Values

Risk Driver Description	Combined Effectiveness	Annual Fault Frequency in HFRA (2015-2020 Avg)	Fault-Weighted Combined Effectiveness	Annual Ignition Frequency in HFRA (2015-2020 Avg)	Ignition-Weighted Combined Effectiveness
Animal contact- Distribution	71%	644	6%	4.8	12%
Balloon contact- Distribution	99%	866	11%	5.0	17%
Other contact from object - Distribution	77%	420	4%	1.7	4%
Unknown contact - Distribution	80%	0	0%	0.0	0%
Veg. contact - Distribution	99%	469	6%	4.7	16%
Vehicle contact - Distribution	82%	550	6%	3.7	10%
Capacitor bank damage or failure- Distribution	92%	382	4%	0.2	1%
Conductor damage or failure - Distribution	85%	2,280	24%	8.3	24%
Switch damage or failure - Distribution	82%	58	1%	0.0	0%
Transformer damage or failure - Distribution	78%	2,334	23%	1.3	4%
Total Estimated Combined Effectiveness			84%		86%

In this illustration, Table X shows that when you combine WCCP with asset inspections, HTMP, expanded pole brushing, and expanded line clearing, the combined estimated effectiveness in mitigating faults and ignitions for the selected risk drivers and without discounting is approximately 84% and 86%, respectively.

Understanding the effectiveness of the combination of mitigations can be a helpful guide in utility decision-making. A common framework could also assist in greater comparability across the utilities. Challenges to developing such calculations include data availability, disaggregating effectiveness below the driver/sub-driver level to determine mitigation overlaps, and limitations in a purely formulaic method.

Next Steps:
In 2023, the utilities will meet regularly to discuss methods to determine effectiveness for the combination of mitigations. This will include building on the preliminary framework described above by detailing examples across the utilities. Because many mitigations overlap with one another and can reduce a driver of a risk event differently, the utilities will also discuss and share available data and analytical methods to determine these differences. Additionally, the utilities will explore the process to develop suites of mitigation measures that include new technologies in continuing to evaluate methods to calculate the effectiveness of a combination of mitigations.

New Technologies:
Introduction:
In the utilities' 2022 WMP Update Action Statements, Energy Safety identified an ACI for all utilities to collaborate to evaluate the effectiveness of new technologies supporting grid hardening and situational awareness such as REFCL and DFA/EFD, particularly in combination with other initiatives. The utilities were also ordered to share practices and evaluate implementation strategies and that this effort should be a continuation of the CC study from the 2021 WMP Action Statements, including Energy Safety as a

participant. Below, we outline the utilities' approach, information gathered to date, and 2023 milestones to assess the effectiveness of new technologies and share practices and implementation strategies.

Summary of Approach:
The utilities initiated this workstream in Q4 2022 and have since conducted bi-weekly meetings. The initial meetings focused on identifying utility SMEs, discussing types of alternative technologies employed by the utilities, the status of those technologies, effectiveness values, approaches to sharing practices and implementation strategies and how to meet the ACI requirements, timelines/milestones. Evaluating the effectiveness of the technologies in combination with other mitigations is addressed in the scope for the Alternatives workstream, as described in the section above. Based on these initial discussions, it was first decided to document the various alternative technologies the utilities are employing. As seen below, very few technologies are employed across all utilities. The utilities then generally discussed effectiveness values and whether the new technologies can help reduce the impact of PSPS. It was learned that the majority of new technologies are still undergoing investigation and have limited data regarding effectiveness values. The utilities also discussed practices of how the technologies are being employed and learned that where utilities all employ a technology such as disabling reclosing settings, the practices are not all consistent. These areas of focus are further described below along with 2023 plans to conduct regular meetings and workshops focused on specific technologies. Beyond assessing the new technologies, the utilities also plan to document questions for benchmarking with other utilities and discuss any new research and/or other new technologies that the utilities are made aware of.

<u>New Technologies</u>
The utilities have identified 15 new technologies that one or more utilities employ, are piloting, and/or investigating. These include, for example, disabling reclosing settings, fuse replacements, fast curve settings, RAR/RCS, DFA, EFD, REFCL, and OPD. Table CC-8, below, identifies the new technologies or protection strategies being employed, piloted, and/or investigated to either mitigate wildfire risk and/or reduce the impacts of PSPS.

Table CC-8
New Technologies By Utility

New Technology / Protection Strategy	SCE	SDG&E	PG&E	Liberty	BVES	PacifiCorp
Fuse replacement (current limiting fuses, expulsion fuses)	Yes	Yes	Yes	Yes	Yes	Yes
Reclosing Settings (Disabling)	Yes	Yes	Yes	Yes	Yes	Yes
Fast curve settings / EPSS / SRP	Yes	Yes	Yes	Yes	No	Yes
Remote Controlled Automatic Reclosers / Remote Controlled Switches (RAR/RCS)	Yes	Yes	Yes	Yes	Yes	Yes
Distribution Fault Anticipation (DFA)	Yes	Yes	Pilot - Moving to Deployment	Investigating	No	Pilot
Early Fault Detection (EFD)	Yes	Yes	Pilot	No	No	No
Rapid Earth Fault Current Limiter (REFCL)	Pilot - Moving to Deployment	No	Pilot	No	No	No
Open Phase Detection (OPD)	Yes	No	Yes	No	No	No
Falling Conductor Protection (FCP)	No	Yes	Pilot	No	No	No
Smart meter (MADEC)	Yes	Yes	Yes	No	No	No
Household Outlet	Pilot	No	Pilot	No	No	No
Sensitive ground fault detection (relays)	Pilot	Yes	Yes	No	No	No
Electrical Grid Monitoring (EGM)	No	No	No	No	Pilot	No
Thor Hammer	No	No	Pilot	No	No	No
Intumescaent wrap / Fire-wrap poles	Yes	No	Yes	No	Yes	Yes

As seen in Table CC-8, there are only three types of new technology or protection strategies employed by all utilities. These include fuse replacements, disabling reclosing settings, and RAR/RCS. The other technologies are either being deployed, piloted, and/or investigated by a few utilities. Two technologies, DFA and REFCL, are moving from a pilot phase to deployment for PG&E and SCE, respectively. The utilities will further discuss the differences of these technologies to understand overlaps and similarities. For example, OPD and FCP have a similar purpose.

Practices and Implementation Strategies

The utilities have started to share practices for the new technologies. For example, while all utilities disable reclosing settings to mitigate wildfire risk, utility practices vary. For instance, SCE, PG&E and Liberty disable reclosing settings on circuits in HFRA during fire season, SDG&E disables settings, also on circuits in HFRA, but does it year-round, and BVES disables from April to October. The utilities believe that focused meetings and workshops on specific technologies are needed to share practices and implementation strategies. As such, the utilities will conduct focused workshops for specific technologies, as described below, to determine if best practices can be identified and will continue to share practices and implementation strategies in bi-weekly meetings.

Effectiveness Values

In many instances, the utilities are still investigating or have limited data as it relates to effectiveness values. The utilities have documented and shared effectiveness values for a few technologies but have not yet discussed these in detail. For example, effectiveness values for fast curve settings (when operating) range from approximately 49% to 100% effective at reducing ignitions (based on limited data

that is not statistically significant). Given the large range, the utilities will conduct a workshop on the effectiveness of fast curve settings to share data and methods. Additionally, the utilities will discuss whether the technologies help reduce the impact of PSPS. As described in the next steps, the utilities have identified certain technologies for workshops and will continue to document estimated effectiveness values and the potential to reduce PSPS across all technologies.

Next Steps:
In 2023, the utilities will continue to document and assess the estimated effectiveness of new technologies where data is available, their ability to reduce PSPS impacts, and will continue to document and share practices and implementation strategies. These objectives will be accomplished through biweekly meetings and a series of workshops. Based on discussions to date, the utilities provide the following preliminary workshop schedule and themes.

Once the utilities finalize the workshop schedule, Energy Safety will be invited. Additional workshops may also be scheduled in Q3/Q4 2023. Should the results of the workshops lead to best practices, the utilities will establish plans to implement the changes and document as part of lessons learned.

M&I Practices:
Introduction:
In the utilities' 2022 WMP Update Action Statements, Energy Safety identified an ACI for all utilities to share and determine best practices for inspecting and maintaining CC, including either augmenting existing practices or developing new programs, to include this effort as part of the Joint IOU Covered Conductor Working Group, and for the IOUs to continue to lead this study and to include Energy Safety as a participant. Below, we outline the utilities' approach, information gathered to date, and 2023 milestones to assess the utilities' CC M&I practices, determine if best practices can be identified, and if best practices can be identified, put in place plans to implement those best practices.

Summary of Approach:
The utilities initiated this workstream in Q4 2022 and have since conducted weekly meetings. The initial meetings focused on identifying utility SMEs, discussing approaches to determine best practices and how to meet the ACI requirements, and timelines and milestones. Based on these initial discussions, the utilities agreed to a common approach that is both broad and focused. The approach includes first capturing information such as each key utility facts (e.g., service area size in HFRA), types of inspections utilities perform on distribution overhead conductor, general M&I practices for distribution overhead conductor, specific practices for CC, general and specific training the utilities conduct, and QA/QC information. Capturing broad information such as the types of inspections utilities perform provides a high-level understanding of how each utility performs inspections, the frequency it performs them at, and other related information. In assessing these sets of information, the utilities believe the determination of best practices will require a series of focused workshops and follow up meetings with SMEs, engineers, inspectors, QA/QC personnel and other resources as needed. Focused workshops are needed to facilitate determining if best practices can be identified. For example, all utilities perform ground and aerial inspections which are generally conducted similarly; however, they are not all performed the same way. Determining a best practice relating to performing a ground and/or aerial

inspection for CC will require detailed discussions focusing on very specific aspects of the resources that do the work, tools and equipment used, the methods used, and other factors, some of which may only be obtained by conducting field observations across the utilities. It is also important to note that while there are differences in practices, determining best practices can take months, if not years, and that a best practice for one utility may not be a best practice for another utility for reasons such as costs, geographic size of the utility, and resource limitations. Given these facts, the utilities will also document any lessons learned that may be helpful for one or more utilities and can be added to existing M&I practices. Beyond assessing existing practices, the utilities also plan to document M&I-related questions for benchmarking with other utilities, learn from the testing workstream (should any CC inspection and/or maintenance practice be recommended from that workstream), and discuss any new research and/or new technologies that the utilities are made aware of as it relates to CC M&I practices.

Key Distribution Data

The joint utilities vary in size and it is important to consider this information when assessing best practices. Table CC-9, below, provides a few data points in HFRA, unless as otherwise noted, regarding the utilities' service area size, the facilities they maintain, and the average number of distribution inspectors. The figures in the table are approximate values.

Table CC-9
Key Distribution Data by Utility

Key Data in HFRA	PG&E	SCE	SDG&E	PacifiCorp	Liberty	BVES
Distribution Overhead Circuit Miles	25,200	9,600	3,400	813	676	211
Distribution Poles	630,000	290,000	81,000	20,378	23,058	8,860
Square Miles	41,000	14,000	2,600	7,155	938	32
Average Number of Ground Inspectors (Systemwide)	203	153	50	5	4	2

As illustrated in Table CC-9 above, PG&E has significantly more square miles, distribution overhead circuit miles, and distribution poles in its HFRA to inspect and maintain. Conversely, BVES has the smallest HFRA square miles and least amount of distribution overhead circuit miles and distribution poles to maintain and inspect. As described more below, due to HFRA size alone, a best practice at PG&E may not be an ideal practice for BVES and vice versa.

Types of Distribution Inspections

The utilities perform several types of inspections on distribution facilities. These include detailed ground inspections, aerial inspections, infrared, patrols, Areas of Concern (AOCs) and LiDAR. These distribution inspection types are designed to meet or exceed GO 95 and GO 165, and also to mitigate wildfire risk. Tables CC-10 and CC-11 below highlight the types of distribution inspections the utilities perform.

Table CC-10
Types of Distribution Inspections performed by SCE, PG&E and SDG&E

Types of Distribution Inspections	SCE	PG&E	SDG&E
Detailed - Ground	Every distribution structure inspected between twice a year and up to once every 3 years, and high-risk structures inspected at least every year; Inspectors on the ground can use binoculars and/or cameras when needed	HFTD: Structures inspected every 1-3 years based on wildfire consequence; Top 10% risk structures inspected every year; Non-HFTD: every 5 years Inspectors use binoculars when needed	Every distribution structure inspected every 5 years
Detailed - Aerial	Every distribution structure inspected between twice a year and up to once every 3 years, and high risk structures inspected at least every year; SCE does 360 degree inspection from ground and the air with the same resources (drone) in the same time period	Will cover ~48K distribution structures in 2023 in the highest wildfire consequence areas; Longer-term plan will be developed based on the learnings from 2023 drone program	Drone inspections are performed on high-risk assets each year; Risk assessment performed annually to determine scope of assets to be inspected that year; Approximately 15,000 structures inspected per year.
Infrared	5,100 distribution overhead circuit miles targeted for inspection in 2023; performed on the ground	Conducted at high risk locations on an ad hoc basis	18,000 structures per year; plus ad hoc based on cause-unknown outages; Combination of aerial and ground
Patrol	100% of above ground and subsurface assets inspected annually; Conducted by ground mostly and helicopter/drone if needed (e.g., access issues)	HFTD: 100% of assets that are not inspected each year Non-HFTD: Based on urban/rural designations	100% of assets inspected annually
Areas of Concern (AOCs)	Additional inspections based on area of concern analysis conducted in late spring / early summer	Additional inspections are performed in areas of concern when needed.	See drone inspections - areas of concern determined by risk assessment and these are performed via drone
LiDAR	In 2023, will evaluate the use of this technology for asset-condition assessments; Historically, used for construction, planning, crew access, vegetation, etc.	Utilized to update pole orientation and associated attributes such as communication line, guy, anchor Database is then leveraged to conduct pole loading assessment to identify overloaded poles for replacement	Only utilized for construction planning purposes

Table CC-11
Types of Distribution Inspections performed by PacifiCorp, BVES, and Liberty

Types of Distribution Inspections	PacifiCorp	BVES	Liberty
Detailed - Ground	Every distribution structure inspected every 5 years; Inspections on ground use cameras and binoculars	Every distribution structure inspected every 5 years	Every distribution structure inspected every 5 years
Detailed - Aerial	Every distribution structure is inspected every year in Tier 2/3 areas and every 2 years in non-Tier areas; Inspection is performed from the ground with same resources in the same time period	Contractor performs drone inspections yearly with infrared on 100% of 34 kV and 4 kV distribution circuits	No aerial inspections on distribution at this time.
Infrared	Only when requested	100% of 34 kV and 4 kV distribution circuits per year	No infrared at this time
Patrol	100% of assets inspected annually	100% of assets inspected annually	100% of assets inspected annually
Areas of Concern (AOC)	Additional inspections performed when requested	May complete addition patrol inspection during extreme dry day with possible high fire risk	Additional inspections are performed in areas of concern when needed
LiDAR	Not performed on distribution circuits, but has been used in the past for vegetation	Use yearly for vegetation management (Check to see if vegetation is near lines)	Use for vegetation management

As shown in the tables above, the utilities perform similar types of inspections. Given the requirements of GO 95 and GO 165, this was to be expected. There are differences, however, in some inspection types as well as in some practices. For example, not all utilities conduct detailed ground inspections on high-risk / high consequence structures (and conductor) every year. Being that the focus of this effort is on CC M&I practices, obtaining findings for CC during these inspections and discussing amongst the utilities will help inform if a best practice can be identified and whether that best practice should and can be applied to all utilities. Similarly, some utilities conduct Areas of Concern (AOCs) inspections and SCE is evaluating LiDAR for asset condition assessments, which has historically been used for vegetation clearances and construction-related purposes. The utilities will discuss these types of inspections, focused on CC, and assess how useful they are in maintaining CC to determine if they should and can be utilized across all utilities.

<u>General M&I Practices</u>

Because utilities have performed inspections and remediation on overhead facilities for decades, the utilities have shared and discussed various aspects of what inspectors look for when assessing the condition of overhead conductor, regardless if covered or bare (as most assessments for bare will also

apply to covered). For example, during detailed ground inspections, inspectors will assess (naked eye and/or binoculars) all components and equipment attached to a pole and any materials connected to conductors. These inspections look for deterioration/corrosion, pitting, damage, clearance issues, sagging, loading, alignment issues (e.g., dead-end covers), misconfigurations, conformance with construction standards (e.g., missing covers/guards), exposed sections for splices, connectors, vegetation in immediate need for remediation, and other abnormal conditions. All of these potential issues apply to bare and CC. In large part, many of the methods and potential issues inspectors look for with bare conductor equally apply to CC. Given this fact, it is important to understand the general M&I practices for overhead conductor that utilities use. The utilities will also explore determining abnormal conditions that could cause a safety or fire ignition risk resulting in remediation and how these are prioritized. Additionally, inspectors that perform this work have understanding and knowledge that can inform the assessment of potential best practices and the utilities intend to include these resources in the workshops. The utilities will continue to discuss and document these practices and prepare for workshops to determine if best practices for CC can be determined.

Specific M&I Practices

This category refers to specific M&I practices for CC. SCE has shared its specific M&I practices which include prompts for data accuracy including types of CC and directions CC is installed, construction standard checks including any missing items such as dead-end covers, connector covers, fuse covers, lightning arrestors and covers, and pothead covers, and identifying abnormal conditions such as visible signs of tracking or damage on the outer jacket. Additionally, in 2023, PG&E updated their Detailed Ground Inspection checklist to include prompts for identifying failure modes that are unique to CC such as CC wire jacket cut into and bare conductor exposed, CC exposed and burnt, and dead-end cover mis-aligned on CC construction. While other utilities may not have tools that have these specific prompts, as part of their training, they look for visible signs of tracking and/or damage on the covering as well as discoloration. As noted above, the majority of M&I practices for bare conductor apply to CC. Because damage to the outer layer of CC may lead to faults/failures, this is an important inspection assessment all utility inspectors perform. Likewise, all utility inspectors are trained on their CC construction standards and thus assess conformance to the construction standard in the field. Most utilities do not collect asset information for data quality checks as some SCE prompts provide for; however, if deficiencies are noted during other utilities' inspections, they can be submitted through their processes. The utilities will assess these details in workshop settings to determine if best practices can be identified. Field observations may also be conducted to capture additional information.

Training

All utility inspectors are trained to understand CC construction standards and maintenance of CC through new inspector training, refresher training, ad hoc training and/or training conducted by the conductor manufacturer or through industry partners. The large utilities have similar types of training including new inspector training, refresher training, and ad hoc training for changes to standards, materials, etc. that may occur. The small utilities have few inspectors and typically are trained linemen with 20+ years' experience. These inspectors are trained on CC through industry organizations and/or the manufacturer as opposed to through a utility-developed training curriculum. For example, BVES has two inspectors that are trained lineman with over 20 years' experience. As such, developing a training curriculum for two inspectors may not be cost-effective when alternative training through the

manufacturer or industry partner is available. The utilities will continue to collect training information and conduct a workshop to determine any best practices.

QA/QC

All utilities employ a quality assurance / quality check (QA/QC) process for asset inspections as well as construction of CC lines. For example, the large utilities will QA/QC CC as part of their QA/QC program, which are based on sampling methods. BVES and Liberty QA/QC all CC installations. Given the difference in size of utilities, it makes sense that the large utilities use QA/QC sampling methods whereas the small utilities QA/QC all new CC work. The utilities will further discuss and assess each utilities QA/QC practices related to CC in a workshop setting to determine if best practices can be identified.

Next Steps:

In 2023, the utilities will continue to capture general and specific CC M&I practices across the utilities and will conduct workshops to determine if best practices can be identified. Meetings will also be held to follow up on the workshops and set plans to implement any best practices that are identified. Below, the utilities provide a preliminary workshop schedule and themes.

Once the utilities finalize the workshop schedule, Energy Safety will be invited. Additional workshops may also be scheduled if needed. Should the workshops lead to best practices, the utilities will establish plans to implement the changes and document as part of lessons learned.

Estimated Effectiveness:

Overview:

As explained in the 2022 WMP Update report, each utility's CC programs are different due to factors such as location, terrain, and existing overhead facilities. The utilities also have different frequencies of risk drivers. Additionally, the utilities are still at different phases of installing CC as some have limited miles deployed while others have deployed thousands of miles of CC. These features, amongst others, result in data, calculations, and methods of estimating effectiveness that are different. As such, the utilities have been working on understanding differences and discussing methods for better consistency. In 2022, the utilities focused on testing, recorded effectiveness, and the new requirements. The utilities' continue to estimate CC effectiveness from approximately 60 to 90 percent at reducing outages/ignitions and/or the drivers of wildfire risk.

Below, the utilities describe any updates to their data, analyses, and methods used to estimate the effectiveness of CC to mitigate outages/ignitions and/or the drivers of wildfire risk and present their

estimated effectiveness values, and describe next steps to improve consistency of data, calculations and methods.

Covered Conductor Estimated Effectiveness:

SCE:

SCE's Wildfire Covered Conductor Program (WCCP) consists of replacing bare conductor with CC, the installation fire-resistant poles (FRPs) where applicable, wildlife covers (animal safe construction), lighting arresters, and vibration dampers below 3,000 feet. Additionally, in 2022, SCE modified its CC construction standard to include the replacement of open wire secondary or weather-resistant aluminum (OWS or WAL) with multiplex secondary conductors. Weather resistant aluminum wire on the secondary system are outdated technology and will be updated to the new standard when WCCP is installed. Because this standard update will only affect WCCP installations starting in 2024, and not WCCP completed in 2022 or planned for 2023, This activity is not yet accounted for in determining the overall mitigation effectiveness of SCE's WCCP.

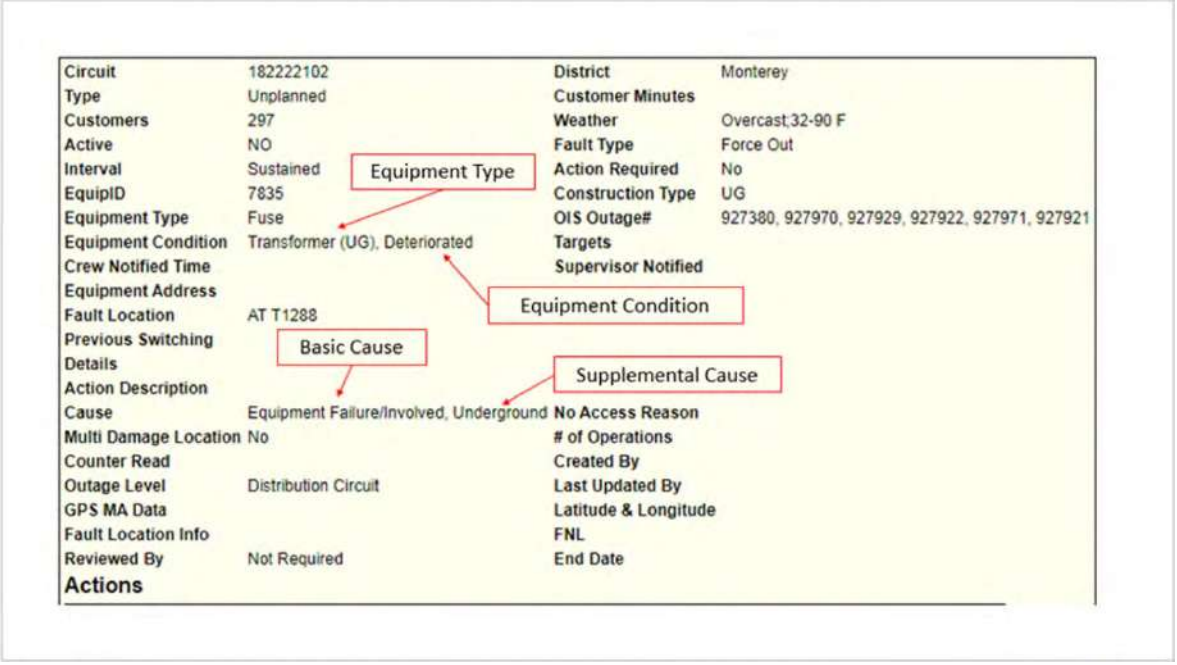
In 2022, SCE assessed the Joint IOU testing results and mapped the test results to risk drivers and sub-drivers to determine if any changes were warranted. Results from the Wire Down Event Scenarios demonstrate that the bare portion of the conductor must be exposed to lead to an ignition. The System Strength Tests demonstrates that tangent structures will not significantly damage the conductor enough to expose the bare conductor. Tangent structures without equipment do not have any exposed bare conductor or taps (~50% of all structures are tangent). As a result, the current mitigation effectiveness of Vehicle Contacts did not account for the performance of CC on tangent structures, therefore SCE increased the mitigation effectiveness from 50% to 82%. SCE also evaluated phase-to-phase contact and simulated wire-down testing. CCs were 100% effective at preventing arcing and ignition in tested scenarios at rated voltage, consistent Exponent's Phase I field reporting. Per the testing results, adjustments were also made for vegetation contact and unknown contacts. Below, SCE provides the updated estimated mitigation effectiveness for WCCP. Overall, the estimated mitigation effectiveness for WCCP increased from approximately 67% to 72%.

Table CC-12
SCE Covered Conductor Mitigation Effectiveness Estimate

Driver Type	Sub-Driver/ Consequence Type	% Drivers	Current Driver ME	New Drive ME	Directional Change	Indicative Test Result
D-CFO	Vegetation contact	12%	60%	71%	Increased	Wire Down Events + System Strength
D-CFO	Animal contact	13%	65%	65%	No Change	Wildlife cover test
D-CFO	Balloon contact	13%	99%	99%	No Change	
D-CFO	Vehicle contact	10%	50%	82%	Increased	Wire Down Events + System Strength
D-CFO	Unknown contact	8%	77%	80%	Increased	Aggregate of CFO Result
D-CFO	Other contact from object	3%	77%	77%	No Change	
D-WTW	Wire-to-wire contact / contamination	3%	99%	99%	No Change	
D-EFF	Conductor damage or failure	13%	90%	90%	No Change	Degraded covering
D-EFF	Connection device damage or failure	5%	90%	90%	No Change	
D-EFF	Connector damage or failure	5%	90%	90%	No Change	
D-EFF	Crossarm damage or failure	~0%	50%	50%	No Change	System Strength
D-EFF	Insulator and brushing damage or failure	4%	90%	90%	No Change	
D-EFF	Splice damage or failure	5%	90%	90%	No Change	

PG&E:

PG&E's overhead hardening program consists of primary and secondary CC replacement along with pole replacements, replacement of non-exempt equipment, replacement of overhead distribution line transformers, framing and animal protection upgrades, and vegetation clearing. PG&E understands the focus of this request to be centered on CC, however our efforts to estimate effectiveness include all elements of our Overhead Hardening program, which PG&E believes is more complete.



Determining whether a specific event could result in an ignition depends upon a wide variety of factors, including the nature of the event itself and prevailing environmental conditions (e.g., weather, ground moisture level, time of year). As PG&E does not have complete information to make this determination for each event, estimating overhead hardening effectiveness relies upon the following proxy to derive its estimates. Most distribution outages (momentary and sustained) typically involve a fault condition. Thus, for purposes of estimating overhead hardening effectiveness, it is assumed that all distribution outages could potentially result in an ignition, regardless of other prevailing conditions. This approach aligns with what has been previously stated in PG&E's 2020 WMP as well as its 2020 RAMP filing.

In early 2023, PG&E assessed the Joint IOU testing results to re-evaluate the SME effectiveness designations and adjusted the effectiveness in a few key areas. While this is expected to be an ongoing process, we have refreshed our effectiveness values based on updated designations and the data as follows:

Additionally, PG&E has refreshed our data for estimated effectiveness to include outage data through 2022. Previously, the last PG&E update including outage data was from PG&E's 2023 GRC filing, which had data through 2020.

With the above assumptions from the PG&E's 2020 WMP as well as our 2020 RAMP filing, PG&E updated the estimated effectiveness factor for overhead hardening in 2023, incorporating the 2023 re-evaluated SME effectiveness designations:

Figure CC-9
PG&E Distribution Outage Database Record

- **All** = Eliminates likelihood of a certain type of outage occurring resulting in an ignition
- **High** = Reduces likelihood significantly of a certain type of outage occurring resulting in an ignition
- **Medium** = Reduces likelihood moderately of a certain type of outage occurring resulting in an ignition
- **Low** = Reduces likelihood minimally of a certain type of outage occurring resulting in an ignition
- **None** = Will not affect the likelihood of a certain type of outage occurring resulting in an ignition

- **All =** 90%
- **High =** 70%
- **Medium =** 40%
- **Low =** 20%
- **None =** 0%

Table CC-13
PG&E Covered Conductor Mitigation Effectiveness Estimate

Driver	Average Yearly Count of Incident ID	Average of SH_Effect_Pct
Animal	429	75%
D-Line Equipment Failure	2233	69%
Environmental/External	255	42%
Third Party	397	57%
Vegetation	2735	62%
Grand Total	**6049**	**64%**

Based on the latest update using outage data through 2022 and repeating the process from PG&E's 2020 WMP filing, the updated estimated effectiveness is 64% where Overhead Hardening has been completed. Therefore, a section of a line that has been hardened is approximately 64% less likely to have an outage of any type. Similarly, a section of a line that has been hardened is approximately 64% less likely to have an outage of each of the drivers. This result is consistent with the previous results that were completed using data for the 2020 WMP.

SDG&E:

SDG&E initially began to examine CC from a personnel safety and reliability standpoint. The three-layered construction showed prospective reduction of injuries to people in the event of an energized wire-down in which the wire contacted a person and/or also might reduce the step potential to people in the vicinity. Outages that result from light momentary contacts (i.e. mylar balloons, birds, palm fronds) also have shown the potential to be reduced. In late 2018, focus was shifted towards using CC as an alternative to SDG&E's traditional overhead hardening program with the primary focus of reducing utility-caused ignitions.

SME's conducted research on the history and use of CC in the industry. Additionally, the SMEs reached out to utilities on the East Coast and internationally to receive their feedback of the effectiveness and work methods for installation purposes.

In addition to other studies/tests that have been and will be performed by SCE and PG&E, as described in the Testing section, SDG&E will have a third-party evaluate the likelihood and effect specific to conductors clashing at various wind speeds. Accelerated aging studies will also be performed to mimic a 40-year service life; after which, the samples will be subjected to tests designed to understand the potential for both mechanical degradation, as well as reduction in dielectric strength. These tests will be performed in accordance with ASTM or other industry recognized standards. Final reports for this testing are expected to be completed in April 2023.

In order to quantify the risk reduction of wildfires that would be achieved by CC, SDG&E evaluated 80 events that resulted in ignitions. SME's weighed in on the likelihood that CC installation would prevent an ignition for the particular type of outage depending on the severity of the incident. As seen in Table X

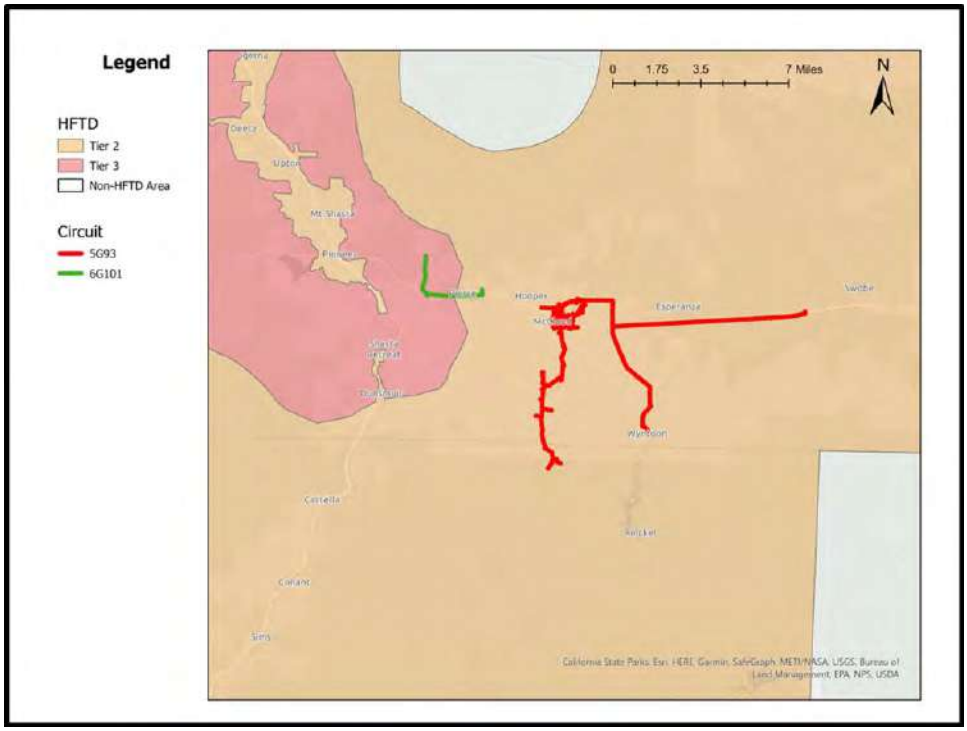
below, the result is a reduction in ignitions from 60 to 20.6, and a resulting effectiveness estimate of 65.7%.

In 2022, SDG&E has been participating in collaborating with other utilities as part of the Joint IOU working groups in the evaluation of the testing that has been and is currently still being performed. Once all testing has been completed in 2023, SDG&E will perform an analysis based on risk drivers to re-evaluate the estimated efficacy of CC.

Table CC-14
SDG&E Covered Conductor Mitigation Effectiveness Estimate

Fault/Ignition Cause	***Number of Ignitions***	***SME Effectiveness***	***Post-Mitigation Ignitions***
Animal contact	7	90%	0.7
Balloon contact	9	90%	0.9
Vegetation contact	2	90%	0.2
Vehicle contact	8	20%	6.4
Other contact	3	10%	2.7
Other	4	10%	3.6
Equipment - All	26	80%	5.2
Unknown	1	10%	0.9
Total	60	65.7%	20.6

The table above was updated with the number of ignitions occurring between 2017-2021 compared to last year's report that was based on 2016-2020 data. Updates to SDG&E's overall effectiveness methodology are anticipated to be completed by December 2023.



PacifiCorp:

Prior to development of the WMP, PacifiCorp historically pursued CC designs and systems due to historical experience with elevated outage count from trees, limbs, and incidental contact (resulting in grow in) throughout its service area. Additionally, access conditions on some of its circuits are extremely difficult in certain times of the year, and those circuits also tend to have elevated outage rates. For the above-mentioned reasons, when siting its historic CC pilot projects, PacifiCorp tended to focus its deployment on circuit-segments that had above average vegetation and/or animal outage rates in conjunction with difficult access. Now, as part of the company's line rebuild program to install CC and mitigate wildfire risk, PacifiCorp is actively pursuing both CC and spacer cable systems. Most projects

completed so far as part this program have leveraged a spacer cable system, which primarily includes CC, a structural member (messenger), and specialized attachment brackets. Therefore, the effectiveness examples and estimations were determined for spacer cable.

As an example of how to assess the effectiveness of newly installed spacer cable, PacifiCorp compared two circuits, one with bare wire and one with spacer cable installed. Both circuits are in the same general geographic area and shown in Figure CC-10 below. Additionally, the circuits are in a HFTD, with the spacer cable partially located in a tier 3 area near Mt. Shasta and the bare conductor located completely within a tier 2 area, though it is still located within a few miles of the tier 3 boundary.

Figure CC-10
PacifiCorp Map Showing the Two Circuits Plotted with the HFTD Overlay

To begin characterizing outage frequency variation prior to and after the installation of spacer cable, 18 years of outage data (2005-present) for both circuits was reviewed and is summarized in Table CC-15, below.

Table CC-15
PacifiCorp Outage Frequency for Bare Wire and Spacer Cable Circuits (2005 – present; Asterisk (*) indicates the year spacer cable was installed)

Year:	Outages - Bare Wire Circuit:	Outages - Spacer Cable Circuit (Q4 2021):
2005	8	0
2006	6	2
2007	2	2
2008	10	10
2009	0	0
2010	6	12
2011	42	18
2012	6	4
2013	10	2
2014	2	0

2015	2	2
2016	2	2
2017	2	4
2018	0	0
2019	4	2
2020	4	0
2021	2	4 *
2022	8	**0**
2023	4	**0**

Generally, the data demonstrates that outage frequency can significantly vary year over year. Additionally, in this example, the bare wire circuit has historically experienced either an equivalent or higher frequency of outages than the circuit the spacer cable was installed, except in 2010. While many factors can impact outages and reliability, this general trend is expected given the significant differences in circuit length. This same data was then normalized based on circuit mile and summarized in Table X below.

In both tables, the data generally shows that for the spacer cable installation (completed in Q4 2021), there was a reduction in outages in all years following the rebuild project (0 for 2022 and 2023 so far). Additionally, the nearby bare wire circuit experienced a total of 12 outage events in 2022 and 2023 (as of January 2023). While certainly not conclusive or representative of a clear trend, the data does support that potential impact spacer cable can have on outage frequency.

A further analysis into outage causes for each circuit at the time of spacer cable installation was performed and included in Table CC-16 below. The table shows the spacer cable experienced 0 outages in 2022 and 2023 (as of January 2023) for all risk drivers. However, for the bare wire circuit, there was a total of 12 outages across all risk drivers, with trees being the main driver in 2022.

Table CC-16
PacifiCorp Risk Drivers for Bare Wire and Spacer Cable Circuits (2021 – present; Asterisk (*) indicates the year spacer cable was installed)

Year:	Risk Drivers:	Bare Wire Circuit:	Spacer Cable Circuit (Q4 2021):
2021	TREES	2	0 *
2021	LOSS OF SUPPLY	0	4 *
2022	TREES	4	**0**
2022	INTERFERENCE	2	**0**
2022	PLANNED	2	**0**
2023	TREES	2	**0**
2023	WEATHER	2	**0**

While promising, this analysis is neither conclusive nor representative of a clear trend. Additionally, this individual analysis may not be representative of macro trends. The circuit that has the spacer cable is

installed on only 6.1 miles which serves only 12 customers and has been in place since Q4 2021. Furthermore, PacifiCorp believes that determining the long-term effectiveness of CC, both in its ability to reduce wildfire risk and PSPS impacts, requires additional data and time. At a minimum, a longer history of outage data would be necessary to fully understand the impacts of the spacer cable.

BVES

BVES has approximately 211 circuit miles of overhead conductor between 34.5 kV and 4.16 kV in its system. BVES started a CC pilot program in Q2 2018 and completed it in Q3 2019 using two different types of cover conductor wires (394.5 AAAC Priority wire and 336.4 ACSR Southwire). Then BVES started the cover conductor WMP in late 2019 with a plan to cover 4.3 circuit miles on 34.5kV over the next 5 years and 8.6 circuit miles on 4.16 kV over the next 10 years. As of the end of Dec. 2021, BVES has covered approximately 21.1 miles between its 34 kV and 4 kV systems. BVES' average span length is approximately 150 feet and installing CC on cross arms. As part of its CC program when there are spliced locations, BVES installs premade cold shrink kits (3M) and installs avian protection (raptor protection/wildlife guard).

Based on benchmarking with other utilities' estimated effectiveness against ignition risks, discussions with its CC supplier, and the short amount of time that it has installed CC, BVES continues to believe that the estimate of effectiveness on ignition risk drivers in its service area is approximately 90%. As BVES installs more CC and gathers more historical data, it will continue to assess the estimate of effectiveness. BVES presents its estimated effectiveness in Table CC-17 below.

Table CC-17
BVES Covered Conductor Mitigation Effectiveness Estimate

Ignition Risk Driver	Percent Reduction	Discussion (Contacts on Cover Conductor cable)
Vegetation Contact	90% +	Vegetation contact on 1, 2, 3 phase and/or neutral wire.
Animal Contact	90% +	Animal contact on 1, 2, 3 phase and/or neutral wire.
Balloon Contact	90% +	Balloon contact on 1, 2, 3 phase and/or neutral wire.
Wire down contact	90% +	Due to the following: tree/tree limb fallen on line, car hit pole, wind gust, etc.
Vehicle Contact	90% +	Vehicle Contact due to wire down on vehicle.
Wire to Wire Contact	90% +	Due to the wind gust forces causing tree/tree limb fall on line or just wire to wire contact.

Splice location contact	90% +	BVES installs Avian protection/raptor protection/wildlife guards and uses premade cold shrink kits (3M) on splice locations.
Vandalism/Theft	90% +	In BVES' service area there is a low risk of conductor theft as well as vandalism. If vandalism occurs, Ex. damage from "gunshot" to the conductor covering installed.
Lightning Contact	90% +	During raining seasons, sometimes encounter a good amount of lightning strikes in BVES' service area. BVES using priority covered conductor (flame resistant) cable.
Third Party	90% +	Third party including contact from joint use, boom arms, etc. should be mostly mitigated with covered conductor cable.
Flame Propagation along the covered conductor	90% +	Caused by Lightning or other.
Flame particle dripping	90% +	Caused by Lightning or other.

Liberty

The CC mitigation estimated effectiveness values for the various ignition risk drivers in 2023 remain unchanged from values in Liberty's 2022 WMP report update. The estimated effectiveness ranges from 95% for vegetation contact risk driver to 15% for lightning risk driver.

Next Steps:

As detailed above, the utilities estimate the effectiveness of CC between approximately 60 and 90 percent. In 2023, the utilities will continue to meet on a regular basis to discuss estimated effectiveness methods, data and calculations. The utilities will learn from the testing, and recorded results and collaborate to improve each utilities' understanding and approach to estimate effectiveness. The utilities will also discuss opportunities to align data and methods for greater comparability and will document any lessons learned.

PSPS:

Introduction:

In the 2022 WMP Update report, the utilities described their general PSPS approach and how a CC system can reduce PSPS impacts, and provided an assessment of alternatives and their ability to reduce PSPS impacts compared to CC. As described in the 2022 WMP Update report, only SCE has increased PSPS thresholds for fully-isolatable circuit-segments that are covered in comparison to bare conductor. Other utilities, such as SDG&E, informed that circuits with CC could likely withstand higher wind speed tolerances; however, more real-world experience and studies would be required prior to increasing PSPS thresholds. As SDG&E completes construction and obtains this data, it will inform wind-speed tolerances

for PSPS. Below, the utilities describe its efforts to better understand the ability of CC and alternatives to reduce the impacts of PSPS as well as plans for 2023 to further this effort.

Summary:
In 2022, the utilities continued to meet and discuss CC and its ability to reduce the impact of PSPS. No utility made changes, per descriptions in last year's report, to their general PSPS practices and thresholds in 2022. The utilities did discuss studies being considered to further assess CC and other mitigations in their ability to reduce the impact of PSPS. Additionally, the utilities have recently discussed the testing results in relation to reducing the impact of PSPS. For example, SCE described how the testing results can provide boundary conditions/limits that enable more granular analysis. While other data such as improved understanding of local hazards are needed to fully inform of potential changes to PSPS thresholds, the testing results can help enable analyses that could provide additional benefits like changes in PSPS de-energization thresholds. SCE and SDG&E will be conducting studies to investigate different aspects and conditions of CC and local conditions to further inform potential changes to PSPS de-energization thresholds. Additionally, and as identified in the Testing workstream, the utilities will discuss the results of the testing in relation to PSPS de-energization thresholds in the testing workshops.

Next Steps:
In 2023, the utilities will assess new technologies in their ability to reduce PSPS impacts as part of the New Technology workstream. Additionally, the utilities will discuss the testing results to further inform PSPS de-energization thresholds as part of the testing workshops. The utilities will also regularly meet to assess the status of related studies and discuss any changes to PSPS practices. If changes to PSPS de-energization thresholds are made and/or to general PSPS practices, the utilities will document any lessons learned.

Benchmarking:
In 2021, the utilities benchmarked with utilities around the world to improve its understanding of CC deployment and applications. A survey was sent to over 150 utilities around the globe. In total, 19 utilities participated in the benchmarking survey. The survey consisted of 24 questions that focused on CC usage, performance metrics, conductor applications, and system protection. While a limited number of utilities responded (compared to the outreach), the benchmarking survey provided helpful information on CC deployment and performance metrics. This information supported the utilities understanding of the benefits of CC including reliability and safety improvements and wildfire risk reduction. The utilities did not conduct additional benchmarking outside of this joint IOU effort in 2022. In 2023, the utilities will develop a new survey that accounts for results from the testing workstream, learnings from the M&I best practices and new technologies workstreams, and other information that becomes available. The utilities will deploy a new survey in Q3/Q4 2023. Based on the results of the survey and the collaboration and learnings from the other workstreams, the utilities will look to continue to benchmark over this WMP period.

Costs:
Introduction:
In the 2022 WMP Update filings, the utilities presented an initial capital cost per circuit mile comparison of installation of CC and described the types of costs incurred, cost accounting methods, and the factors

that can drive CC costs higher or lower. The utilities demonstrated that based on each utilities' CC / system hardening program, costs are relatively comparable taking into account each utilities' resources, scope, and operational constraints. Since the 2022 WMP Update, the utilities have continued to meet and discuss CC unit costs and undergrounding unit costs. Below, the utilities provide an updated CC capital cost per circuit mile, initial undergrounding unit costs, and plans for 2023.

Updated Covered Conductor Capital Cost Per Circuit Mile:
The utilities have prepared an updated capital cost per circuit mile comparison of the installation of CC. To construct this unit cost comparison, the utilities used the same six cost categories presented in the 2022 WMP Update filings including labor, material, contract, overhead, other, and financing.[319] These cost categories are intended to capture the total capital cost per circuit mile of CC installations. For purposes of this report, the utilities obtained recorded and/or estimated costs for construction that occurred during 2022. Table CC-18, below, shows the current CC capital unit cost per circuit mile comparison across the six utilities.

Table CC-18
IOU Comparison of Covered Conductor Capital Costs Per Circuit Mile

Cost Components	SCE		PG&E		SDG&E		Liberty		PacifiCorp		BVES	
	Cost per Circuit Mile	%	Cost per Circuit Mile	%	Cost per Circuit Mile	%	Cost per Circuit Mile	%	Cost per Circuit Mile	%	Cost per Circuit Mile	%
Labor (Internal)	$ 9,000	1%	$ 130,000	16%	$ 321,000	22%	$ 117,000	10%	$ 18,000	2%	$ 18,000	2%
Materials	$ 132,000	19%	$ 151,000	18%	$ 84,000	6%	$ 73,000	6%	$ 218,000	28%	$ 360,000	49%
Contractor	$ 383,000	56%	$ 394,000	48%	$ 303,000	21%	$ 857,000	70%	$ 446,000	57%	$ 300,000	41%
Overhead (division, corporate, etc.)	$ 141,000	20%	$ 140,000	17%	$ 355,000	24%	$ 163,000	13%	$ 50,000	6%	$ 60,000	8%
Other	$ 14,000	2%	$ 3,000	0%	$ 317,000	22%		0%	$ 25,000	3%		0%
Financing Costs	$ 9,000	1%	$ 8,000	1%	$ 71,000	5%	$ 10,000	1%	$ 21,000	3%		0%
2022 Total	$ 688,000	100%	$ 826,000	100%	$1,451,000	100%	$ 1,220,000	100%	$ 777,000	100%	$ 738,000	100%

As illustrated in Table CC-18, the 2022 CC capital cost per circuit mile ranges from approximately $688 thousand to approximately $1.45 million. While not a true comparison, because the figures are in nominal dollars, the 2022 unit cost range is similar to the 2021 unit cost range of approximately $565 thousand to approximately $1.5 million. As discussed in the 2022 WMP Update report, the capital cost per circuit mile for CC can vary due to multiple factors such as type of CC system and components installed, terrain, access limitations, permitting, environmental requirements and restrictions, construction method (e.g., helicopter use), amount of poles/equipment replaced, degree of site

[319] Labor represents internal utility resources, such as field crews, that charge directly to a project work order. Materials include conductor, poles, etc. that get installed as part of a project. Contract represents all contractors, such as field crews and planners, and consultants utilities use as part of their CC programs. Overhead represents costs, such as engineers, project managers and administrative and general, that get allocated to project work orders. Other represents costs such as land fees, permit fees and costs not assignable to the other categories. Financing represents allowance for funds used during construction (AFUDC) which is the estimated cost of debt and equity funds that finance utility plant construction and is accrued as a carrying charge to work orders.

clearance and vegetation management needed, and economies of scale. Below, the utilities describe any changes to their cost make-up and the factors that contribute to the cost changes from 2021.

Initial Undergrounding Capital Cost Per Circuit Mile:
PG&E, SCE and SDG&E have prepared an initial capital cost per circuit mile comparison of the conversion of overhead conductor to underground. Liberty and BVES are not installing undergrounding as part of their wildfire mitigations. PacifiCorp has only installed one half of a mile so does not have sufficient recorded data to add; however, PacifiCorp is installing undergrounding projects over this WMP period and thus unit cost data will be assembled once more undergrounding is installed. Similar to the construction of the CC unit cost comparison, the utilities organized their capital costs (and/or estimates) into the same six cost categories. These cost categories are intended to capture the total capital cost per circuit mile of undergrounding. For purposes of this report, the utilities obtained recorded and/or estimated costs for construction that occurred during 2022. Table CC-19, below, shows the initial undergrounding capital unit cost per circuit mile comparison across the three large utilities.

Table CC-19
SCE, PG&E and SDG&E Comparison of Undergrounding Capital Costs Per Circuit Mile

Cost Components	SCE		PG&E		SDG&E	
	Cost per Circuit Mile	%	Cost per Circuit Mile	%	Cost per Circuit Mile	%
Labor (Internal)	$ 25,000	1%	$ 231,000	9%	$ 45,000	2%
Materials	$ 417,000	19%	$ 271,000	11%	$ 165,000	7%
Contractor	$ 1,201,000	56%	$ 1,665,000	66%	$ 1,754,000	71%
Overhead (division, corporate, etc.)	$ 438,000	20%	$ 247,000	10%	$ 417,839	17%
Other	$ 35,000	2%	$ 63,000	3%	$ 14,654	1%
Financing Costs	$ 29,000	1%	$ 31,000	1%	$ 77,756	3%
Total	$ 2,145,000	100%	$ 2,508,000	100%	$ 2,474,739	100%

As illustrated in Table CC-19, the 2022 undergrounding capital cost per circuit mile ranges from approximately $2.03 million to approximately $2.51 million. The capital cost per circuit mile for undergrounding across the three utilities is remarkably consistent given that undergrounding costs typically have a much larger cost range than CC. Similar to CC, undergrounding costs vary due to multiple factors such as type of undergrounding system and conductor, terrain, access limitations, route changes, permitting, environmental requirements and restrictions, construction methods, and economies of scale. Below, SCE, SDG&E and PG&E describe the make-up of their undergrounding capital costs and the factors that contribute to the cost differences.

SCE

CC Unit Cost Make Up:

The 2022 CC costs are based on work completed in 2022. Some projects completed in 2022 have incurred costs from prior years. SCE's unit cost is based on the average cost of nine different regions within SCE's service area. SCE's unit costs are typically presented as direct costs only (exclude corporate overheads and financing costs). For purposes of this report, SCE has added corporate overheads (to the overhead cost category) and financing costs to its direct unit cost for comparison with the other utilities. SCE continues to use two CC designs, a 17 kV and 35 kV CC with multiple ACSR and copper conductor sizes.

In 2022, SCE did make a change to its WCCP construction standard by adding the replacement of open wire secondary or weather-resistant aluminum (OWS or WAL) with multiplex secondary conductors; however, this change is not anticipated to show up in the unit costs until 2024. No CC projects completed in 2022 included replacement of secondaries. SCE estimates, on average, replacing secondaries will cost approximately $60 thousand per circuit mile.

CC 2022 Cost Changes:

Using the nominal amounts of the 2021 and 2022 unit costs, SCE experienced an approximate 16% increase. The primary drivers of this increase include a combination of a larger percentage of work in the Rural region, e.g., the Arrowhead District, and contractor rate increases. Work in higher elevations in rugged areas tend to take longer, increasing contract labor costs. This increase coupled with higher contractor rates were the main cost drivers. Additionally, SCE experienced material and supply price increases. Also, in 2022, SCE began to use SCE labor in some regions.

Undergrounding Cost Make up:

The 2022 undergrounding costs are based on work completed in 2022. Projects completed in 2022 have incurred costs from prior years. SCE's unit cost is based on approximately 14 miles of undergrounding. The 14 miles of undergrounding had a low level of difficulty and did not include secondaries or services. A low difficulty level means the terrain was relatively flat, there was less civil construction due to existing infrastructure, and there were none to minimal re-routing required. SCE anticipates higher costs in future unit cost assessments because the projects will have a mix of low to high difficulty.

Undergrounding Cost Drivers:

For undergrounding projects, SCE leverages its Integrated Wildfire Mitigation Strategy consequence model, which defines the most severe locations in SCE's HFRA. These are locations that meet one or more of the following characteristics: 1) egress constrained, 2) burn-in buffer, 3) 10,000+ acres burned at 8 hours, 4) extreme high wind areas, and 5) communities of elevated fire concern. The costs to underground in these areas can vary significantly. Below, SCE describes several cost drivers that could lead to increased costs.

Construction – in various types of terrain, geography, topography, and population density. Different levels of difficulty in construction can significantly impact the costs. For example, a low difficulty level project that includes straight/minimal bends and minimal re-routing will likely be a lower cost compared to a high difficulty level project, which can have rocky, hilly terrain requiring significant re-routing.

Additionally, any unanticipated changes in design after release can impact costs. For example, sometimes, during construction, a trench is not able to be constructed due to other infrastructure already there (an outcome of outdated basemaps). In this type of circumstance, the planning department would re-design the route including seeking agency feedback which would take additional time to complete and impact schedule and costs.

Permitting and environmental clearances – acquiring permits, resolving land rights and agency requirements, and curing cultural discoveries can be a lengthy process. The number of permits, the types of permits, the amount of land right issues that need to be resolved, and the types of cultural discoveries can increase the costs of a project.

Labor type and resource availability – Both civil crews and QEW electrical crews are required and using internal SCE labor versus contract labor may impact costs.

Additionally, delays can occur due to weather (e.g., rain/snow, RFW days, etc.), supply chain constraints, permit requirements, and environmental constraints (e.g., nesting birds), which can also increase costs.

PG&E

CC Unit Cost Make Up:

PG&E's unit cost analysis is based on completed projects. Projects are defined by circuit and span. Costs are recorded using SAP software. Of the 335 miles used to analyze the unit cost, these were projects that were marked completed in 2022. Some of the mileage may have been constructed in previous years. Five of the miles were fire rebuild, which typically have a lower unit cost. 329 miles completed were regular system hardening work and one mile was classified as other.

Costs were organized per the six main categories agreed upon with the other utilities. 200 miles were constructed using external crews, categorized as Contract and 135 miles were constructed using Internal labor, categorized as Labor.

PG&E's Overhead Hardening (CC Installation) scope achieves risk reduction through these foundational elements: bare primary and secondary conductor replacement with covered equivalent, pole replacements, non-exempt equipment replacement, overhead distribution line transformer replacement, framing (composite crossarms and insulators) and animal protection, and vegetation clearing.

CC Cost Drivers:

PG&E's CC installation costs are driven by these key contributors:

CC Cost and Impact Driver changes for 2022:

For PG&E, unit costs have steadily decreased for the Overhead System Hardening program, that includes CC, into 2022. Major cost drivers include a decreased volume of vegetation impacts on overhead hardened lines and unit cost RFPs (request for proposals) to stabilize contract pricing.

It is likely that these unit costs have mostly leveled off and will only increase due to inflation and economic pressures as this program continues.

Continued costs for PG&E are labor costs, both internal and external (contractor) costs.

For impact drivers to CCs, PG&E is continuing to utilize a combination of undergrounding and microgrids as the primary system hardening effort to reduce wildfire risks. Where these efforts are less feasible,

PG&E may use CC as a wildfire mitigation tool for Overhead System Hardening. As PG&E continues undergrounding efforts and finds additional areas that are prohibitive to the undergrounding program, PG&E may increase CC use for those specific areas.

Undergrounding Cost Make up:
PG&E's unit cost analysis is based on completed projects with costs recorded in our SAP software. Of the 76 miles used to analyze the unit cost, these were projects that were marked completed in 2022. Some of the mileage may have been constructed in previous years, 46 of the miles were fire rebuild, which typically have a lower unit cost, and 30 miles completed were regular system hardening work.

Costs were organized per the six main categories agreed upon with the other utilities, 53 miles were constructed using external crews, categorized as Contract, and 23 miles were constructed using internal labor, categorized as Labor.

Undergrounding Cost Drivers:
In executing the System Hardening program, PG&E first uses a scoping criterion that identifies the highest risk areas, and then selects the appropriate risk mitigation approach for that circuit which may include undergrounding, remote grid installation, line removal, or overhead hardening (depending on the local circumstances). Since late 2021, PG&E has prioritized undergrounding as the preferred approach to reduce the most system risk. Once a circuit is selected for undergrounding, PG&E evaluates each proposed circuit segment quantitatively and qualitatively to mitigate the maximum amount of risk and evaluate feasibility and executability. Potential cost drivers can include:

Any of the above considerations may create delays or complexities that can impact the scope, cost, and schedule of undergrounding projects.

Furthermore, undergrounding projects are executed in multiple stages once the circuit segment has been identified based on the criterion described above for undergrounding:

As projects move through each stage, schedule certainty improves. Project schedules can change at any time from project dependencies, which may cause specific projects to move across years. Generally, if a project is not completed during the year that it was originally targeted for completion, it will continue through all the job phases and be completed in a subsequent year.

PG&E works closely with customers, governments, agencies, tribes, and regulatory officials to manage these issues within the program to minimize delays and optimize the efficiency of projects wherever possible.

SDG&E

CC Cost Make Up:

Each project goes through a six-stage gate process as follows:

Stage 1 – Project Initiation (duration ~1-3 months)

Stage 2 – Preliminary Engineering & Design (duration ~6-9 months)

Stage 3 – Final Design (duration ~3-5 months)

Stage 4 – Pre-Construction (duration ~1-2 months)

Stage 5 – Construction (duration ~3-4 months)

Stage 6 – Close Out (duration ~6-12 months)

The total duration of a project has an estimated duration of approximately 20 to 35 months.

SDG&E's CC per mile unit capital costs is made up of the following six major cost categories:

CC Cost Drivers Update:

Costs can vary significantly from project to project for a variety of reasons, including engineering and design, land rights, environmental, permitting, materials, and construction. Below is a description of these factors and why the costs can vary from project-to-project.

Engineering & Design:

SDG&E collects LiDAR (Light Imaging Data and Ranging) survey data before the start of design and again after construction is completed. During the LiDAR data capture, other data including photos (i.e., ortho-rectified images of the poles and surrounding area, and oblique pole photos), and weather data is acquired. After collection of the raw LiDAR and Imagery data, it is processed to SDG&E's specification and includes feature coding and thinning of the LiDAR data, and selection and processing of the imagery data. The entire process for delivery to SDG&E's specification can take weeks to months depending on the size of the data capture. This LiDAR data capture is used to support the base-mapping, engineering, and design processes (Stage 1 and Stage 6).

Currently, the engineering and design of all CC projects are conducted by engineering and design consultants, and their deliverables are reviewed by a separate Owner's Engineering (OE) consultant to ensure compliance with SDG&E standards and guidelines. At this time, SDG&E does not have the resources to conduct the engineering and design required at this scale of work; however, there are assigned SDG&E full time engineering staff that provide oversight of all engineering and design consultants, including the OE. The engineering component of work relates to the structural analysis,

including Power Line Systems – Computer Aided Drafting and Design (PLS-CADD) modeling, foundation calculations, or geotechnical studies. The design component includes the drafting, entering design units into SAP for material ordering and costing system, and building the job packages that are sent to construction. In some cases, one consultant can perform both the engineering and design function, and in others cases an engineering consultant collaborates with a design consultant. In all cases, SDG&E's Owner's Engineer will perform both engineering and design review support. Costs from consultants can vary depending on the size and complexity of the project, and due to various other factors including environmental constraints, land constraints, permitting requirements, or scoping changes that can occur from the start of design and throughout construction. The design stage (i.e., start of design to issuance of job package to construction) typically takes anywhere from six months to two years depending on the size and complexity of the project and the challenges with acquisition of land rights, environmental release, and/or permits. In some cases, our environmental releases cannot be released until we receive the permit from the agency as they may require additional environmental measure to be placed on the work and will need to be outlined in the environmental release.

SDG&E requires every pole be engineered using PLS-CADD software during the design phase and the post-construction phase. This software allows SDG&E to leverage LiDAR survey data (pre- and post-construction) and AutoCAD drawings, and to design the poles, wire, and anchors to meet General Order (GO) 95 Loading (Light and Heavy Loading) and Clearance Requirements, as well as to meet Known Local Wind requirements (e.g., 85 mph and in some cases 111 mph wind). SDG&E also requires its engineering and design contractors who use PLS-CADD software to have a California-registered Professional Engineer review and approve the final PLS-CADD model.

Land and Environmental**:**
SDG&E requires all projects to go through a land and environmental review process at each stage of the design process. These processes are predominantly supported with the help of land management and environmental service consultants but are overseen by SDG&E representatives in each respective department. The land process includes research of our land rights, interpretation, and may include support obtaining the proper land rights when required. Through the land rights design review process, SDG&E determines the land ownership of facilities (e.g., poles and wire) to determine if the scope of work is will stay within existing land rights or if new/amendment land rights would be necessary. These results are shared with the engineering, design, and environmental teams. Once the land rights are determined, environmental performs an assessment, determines the environmental impacts if any, and provides input to the design process to minimize and/or avoid environmental impacts. These land and environmental reviews can drive changes to the design and add time and cost to the project. For example, in many cases, SDG&E does not have the land rights to build the overhead CC design within its existing easement, or in some cases it only has prescriptive rights. In those cases, SDG&E has to amend or acquire the proper land rights, or redesign the project, if possible, to stay within the land and/or environmental constraints. If acquiring or amending land rights is required, this can take weeks to months depending on the property owner (e.g., private, BIA, State, Federal, or Municipality) and the level of change to the existing conditions.

Materials:
SDG&E's philosophy with CC, like SCE, is to install it in an open-crossarm configuration. In this configuration, the conductor is self-supporting and attached to insulators on crossarms at the structure.

Where connections are necessary, insulation piercing connectors (IPCs) are used to avoid stripping the wire and causing damage to the conductor and negating the need to wrap the connection with insulating tape. SDG&E also requires the use of vibration dampers, where necessary, to mitigate conductor damage due to Aeolian vibration. SDG&E replaces most wood poles to steel, and in some cases replaces existing steel poles if they are not adequate to support the new wire (e.g., inadequate clearance and/or mechanical loading capacity). In many cases equipment is replaced during these reconductor projects if it is older, is showing signs of failure, and/or needs to be brought up to current standards. The reason to replace wood poles with steel is due to several reasons, including the fact steel is more resilient to fires than wood and is seen as a defensive measure, steel is a man-made material and the strength and dimensions are consistent and have much smaller tolerances than wood, and because many of SDG&E's wood poles are over 50 years old. In some cases, SDG&E may also need to relocate the pole line to an area where it is more accessible to build and maintain but will require obtaining a new easement. SDG&E also replaces wood crossarms with fiberglass crossarms, insulators with polymer insulators, and replaces switches and regulators as necessary. For transformers, SDG&E developed specific criteria for replacement. A transformer will be replaced if it is internally-fused regardless of age, if it's greater than 7 years old, if it has visual defects or damage (leaks, burns, corrosion, etc.), is less than 25 kVA, or if the transformer does not pass volt-drop-flicker calculation. SDG&E also replaces secondary wire that is either open (non-insulated) or "grey wire" (covered secondary wire where the insulation is grey in color). On most projects, there is a smaller underground job associated with the overhead work. This typically occurs when a pole feeds underground (aka a Cable or Riser Pole) and the new pole location may be too far from the existing position such that the existing cable, conduit, and terminations may not reach the new pole position. In these cases, a small underground job will be initiated to have the crews intercept the run of underground conduit, install a new handhole, install a new run of conduit and cable to the new pole location, and splice the cable in the new handhole to make the connection to the existing underground system.

In 2021 and 2022, SDG&E experienced material supply chain issues, with CC materials as well as materials common to bare and CC. These supply chain issues were the result of various factors including impacts from COVID-19. In the case of CC, SDG&E currently sources the conductor from multiple suppliers; however, the associated materials such as piercing connectors and clamp dead-ends come from one supplier out of Europe and experienced significant delivery delays due to COVID-19 and issues with US Customs paperwork in 2021. In 2022 SDG&E had material delays with secondary conductor, 10 ft fiberglass guy strain insulators, transformers, guy grips, and fiberglass crossarms. SDG&E also experienced delays receiving other material due to COVID-19 supply chain disruptions and competition for the same materials used by other utilities including transformers and other materials common to various utilities across the country. Material delays can cause construction delays or cause construction to work less efficiently, thus impacting project schedules and costs. To mitigate material delays SDG&E's engineering and design team, as well as suppliers, work together to provide long term forecasting and ensures materials are ordered with enough lead time to receive the materials in time for construction, and when necessary, substituting material.

Construction:
One of the most significant variables, and most difficult to predict, is the civil portion of construction. The civil portion of a project includes the pole hole, anchor, and handhole digging and can vary significantly depending on several factors including accessibility (truck accessible versus non-truck

accessible), soil conditions (rock versus soft soil), methods of digging (hand tools versus machine), and environmental constraints that may limit the method of digging or access protocols. For example, a 0.7 miles project completed a couple of years ago was on the side of a steep mountain side and all the material, equipment (pneumatic drill and hand tools), and crews had to be flown in and out every day for months. The civil crews encountered significant rock at most locations and the spoils from the digging had to be flown out due via helicopter to environmental concerns rather than spreading the spoils on location. Each pole and anchor were back-filled with concrete using helicopters because of the slope of the mountain and due to the significant mechanical loading due to winter storms (wind and ice loading). In contrast to this mountain side project example, SDG&E has had other projects that are truck accessible, that do not require concrete backfill and allow the spoils to be spread out on location.

Another reason costs can vary significantly from project to project is due to the time of year and location. SDG&E often deals with elevated fire weather conditions which requires a dedicated fire watch crew to be present at each location where there is work happening that can pose a fire risk. In some cases, SDG&E has multiple dedicated fire watch crews on a project as there may be multiple civil and electric crews working at different locations at the same time on the same project. Some locations are also so remote that the drive time from the staging yard to the site can take a significant amount of time out of each workday that the crew may work longer hours and/or over the weekend, including Sundays, thus increasing overtime hours for the construction crew and all other support services (e.g., traffic control, environmental monitors, etc.). In some cases, generators are used due to the remote nature of some customers and the lack of ties with other circuits in SDG&E's service area. Generators require special protection schemes, equipment, and resources to adequately plan, deploy, setup, monitor, and tear-down which increase the installation costs.

Lastly, construction costs can vary depending on the crew building the project and issues encountered during construction that were not anticipated during design. SDG&E currently uses four primary construction contractors who perform the electrical construction and typically sub-contract the civil work (e.g., pole hole, anchor, handhole digging), helicopter, traffic control and dedicated fire watch. SDG&E also uses internal electric construction teams who typically contract out the helicopter, traffic control, dedicated fire watch and civil work (pole hole and anchor digging). Based on SDG&E's experience with its traditional hardening program, in 2023 it is estimated that 50% of the construction work costs will be performed by contractors and 50% by internal crews. The costs between external and internal crews can vary depending on the work scope, location (rural versus very rural), methods of construction (e.g., truck accessible versus non-truck accessible), time of year (e.g., fire season and non-fire season, and wet versus dry conditions), and issues encountered during construction. Larger projects (typically 20 or more poles) that are not assigned to an internal crew are sent out to bid with the three prime electrical construction contractors and are often bundled with other projects on the same circuit to gain economies of scale. SDG&E has determined that its ideal bid size is 100-200 poles; however, some bids have been significantly greater and some can be much smaller. The size of bids can change significantly depending on the location of a project, time of year, and schedule of the project. SDG&E has seen changes with pricing due to competition for construction resources with the other utilities in the state and this can drive-up costs depending on the volume of work and timing with other projects statewide.

PacifiCorp

CC Unit Cost Make Up:

For purposes of this comparison, PacifiCorp has again aligned its costs into the six major categories. No changes were made in 2022 related to how costs are organized into the six main categories. PacifiCorp is basing the cost per mile on ten projects totaling about 33 miles of primarily spacer cable. These projects were placed in service during 2022; however, design, material procurement, permitting, and some construction may have taken place prior to 2022.

CC Cost Drivers:

PacifiCorp has identified eight main cost drivers for the installation of CC. The cost drivers are discussed below in terms of cost increases that have been experienced, highlighting how impactful these components can be on the overall project cost.

Access: PacifiCorp includes costs for required access to facilitate project construction in projects charged to the work order. These costs may include vegetation clearing, road construction, or other site preparation activities. These costs will typically be included in the contractor total for purposes of this cost analysis as this work is predominantly contracted. Additionally, these costs can also range significantly between projects based on the specific location and terrain where work is conducted. Projects that include significant off-road scopes tended to be most impacted, though this is somewhat offset by limited flagging costs.

Pole Replacement: PacifiCorp evaluates all poles for strength and clearance using PLS CADD on spacer cable projects. Poles are then selected for replacement for the following reasons: insufficient strength to accommodate CC, insufficient minimum clearance, relocation is required, or not constructible in the current state. Projects completed in 2022 averaged 25 poles per mile due to projects with larger conductor sizes, short spans on in-town projects, and two projects designed for double circuits. Additionally, nearly all poles identified are replaced with non-wood fire resistant materials (predominantly fiberglass) at a greater cost than like-for-like replacement with wood.

Construction Labor: In 2022, PacifiCorp continued to receive higher bid prices. Contractors reported needing to include incentives to attract adequate labor to complete projects. Increases in construction labor costs were the single largest driver in project cost increases. As of January 31, 2023, PacifiCorp has awarded approximately one third of the 2023 planned construction work scope and is forecasting that these higher costs will continue.

Post Construction Inspections: In 2022, it was recognized that the total amount of construction exceeded the capacity of internal staff to adequately inspect as the construction was taking place. Based on this, external construction inspectors have been hired to monitor construction, while it is taking place, and complete a formal inspection of each line segment as it is placed into service. While this comes at a higher cost per line mile, it assures that the completed project matches the design. This will be on ongoing addition to project costs.

Permitting: As included in the company's 2021 Change Order, significant cost increases have been experienced for locations requiring access into seasonal wetlands and transmission under build projects.

Future projects include environmentally sensitive areas that have been in NEPA or CEQA review with high environmental review costs. Additionally, projects scheduled for completion in 2023 have required cultural monitors for all ground disturbing activities and several re-designs to accommodate changes in current infrastructure layout requested by permitting agencies.

Materials: PacifiCorp experienced material cost increases on most commodity materials in 2022; however, this impact was limited for the group of projects in this analysis as much of the material was on order prior to 2022. Projects scheduled for completion in 2023 are expecting to experience more impact from these cost increases.

.

Internal Labor and Overhead: Internal labor increased on a per mile basis while overhead costs decreased. This is largely driven by a shift in staff charging directly to projects they are working on rather than an overhead account. These should be viewed largely as offsetting cost shifts.

Design Type: In 2022, PacifiCorp rebuilt approximately 7 miles of overhead distribution lines with CC. While there are many factors impacting the projects overall costs, a cursory review indicates a lower cost per mile as compared to spacer cable, generally attributed to the lower cost of materials, shortened project timeline, and reduction in engineering and design requirements. However, some of these costs are offset by the increase in pole replacements required with using a more standardized product. Based on this one project, PacifiCorp expects that CC could be a cost-effective option in many locations but requires more experience to understand the cost variability.

Based on the cost drivers discussed above, PacifiCorp anticipates higher costs for projects in 2023 and beyond.

Bear Valley

CC Unit Cost Make Up:

BVES continues to contract out most of the work with an internal Field Inspector overseeing the whole project. The design consists of our contractor performing field visits, wind loading calculations, developing the design and assembling the material lists. BVES purchases the materials and its contractor does the construction. The overhead costs consist of BVES internal groups. The capital cost per circuit mile are based on a double circuits' area in 2022.

CC Cost Drivers:

CC unit costs decreased in 2022 compared to 2021. A higher percentage of poles were installed which support both 34.4 kV and 4 kV CC lines. These double circuit lines reduce installation and material costs. In addition, the construction crews have gained more experience installing CC and are more efficient.

Liberty

CC Unit Cost Make Up:

Liberty's CC program is still relatively new and limited in scope compared to the large utilities. Liberty first piloted CC projects in 2020 in select areas that already needed line upgrades because of asset age and condition, and later focused on projects that targeted short line segments in HFTD areas, had reliability issues, and were in remote areas. An average of recent CC projects amounted to less than one circuit mile per project and only a total of 20 miles of CC were installed over the last 3 years. Liberty's CC work is

substantially less than, for example, SCE's approximate 1,000+ miles of CC installed each year. Liberty's CC unit costs vary depending on terrain, number of poles replaced, type of conductor installed, project design and permitting requirements, and amount of vegetation management work required for the job order. Liberty used the same cost categories as described in the 2022 WMP Update report and did not make any major changes to its CC program.

CC Cost Drivers:

Liberty's project life cycle ranges from 18-36 months depending on project scope and permitting complexity. There are many factors that may impact the total project life cycle and costs, including permitting and environmental requirements, easements, geography and terrain, and construction resource availability. Contractor costs for construction in its service area are a major cost driver for Liberty. Projects typically take longer to construct because of the mountainous terrain and require more costly construction methods like helicopter use and hand digging. Other cost factors include permitting, weather, and environmental restrictions that limit scheduling flexibility and reduce productivity, causing construction costs to increase.

Conductor Type: Liberty has two CC designs that vary depending on project site access and terrain. These include 14.4 kV delta Aerial Spacer Cable (ACS or spacer cable) and CC solutions at this voltage level. In addition, because some of Liberty's service area includes 12.5 kV grounded Wye system, Liberty has piloted the use of CC. Liberty selects the two different system options based on the installation and maintenance of the two solutions.

The ACS solution has two or three covered conductors supported by a steel messenger. The framing for ACS includes brackets that hold the messenger under tension and for the current carrying conductors at full sag or zero tension. Installing and maintaining spacers requires a bucket truck; however, if accessibility is an issue, crews may require a bosun's chair to access the line adding to the costs.

The covered conductor solution includes various sizes of covered wire such as a 1/0, 2/0, or 397 kcmil AAC. The ACS solution projects have installed 1/0 AA wire with 1-052 AWA messenger and 1/0 AAC with 6AW messenger. Covered conductor is installed with framing similar to bare conductor wire in an open-crossarm configuration for framing and installation. CC is the preferred solution in areas with limited bucket truck access. Conductors are sized based on circuit load for both solutions. Wind and ice loading are major concerns in the Liberty service area and do not utilize conductors smaller than 1/0.

Location: A vast majority of Liberty's service area is in HFTD Tier 2 and Tier 3. In the initial phases of its covered conductor program, Liberty selected areas of its service area based on local knowledge of the wildland/urban interface, locations of high fire threat districts, remoteness of overhead lines, and the age and condition of the infrastructure. Areas were also chosen based on their accessibility and egress options during an emergency. Most of Liberty's covered conductor projects are in Tier 2 and Tier 3 at elevations between 6,200 to 7,500 feet over rugged, rocky terrain with limited seasonal access. Projects typically utilize helicopter pole sets, and crews are tasked with digging pole holes with pneumatic tools by hand versus trucks with augers. Pole holes take days versus hours to excavate, increasing labor hours and costs.

Pole and Asset Replacements: Most of the covered conductor projects Liberty has designed and constructed have required a significant number of pole replacements per circuit mile. When replacing existing poles, Liberty uses taller and larger class poles. This is due to new loads and increased weights of the covered conductor, as well as the age of existing infrastructure. Projects include installation of poles, insulators, crossarms, anchors (rock anchors), down guys, transformers, and switches.

Economies of Scale: Liberty has limited contract resources available during its construction period compared to the larger IOUs that have replaced thousands of circuit miles with CC. Liberty's contract costs are higher on a per mile basis than those of large IOUs, given Liberty's ratio of miles installed as compared to IOUs with significantly more miles installed. This factor has likely contributed to Liberty's higher CC cost per circuit mile.

Construction: Liberty's primary construction window is May 1 to October 15 due to weather and Tahoe Regional Planning Agency (TRPA) dig season restrictions. The construction window also coincides with seasonal tourism, a high number of RFW days, and during the typical fire season that further limits construction efforts and effects costs. These restrictions also constrain resources and add a premium on labor during construction season.

Vegetation Management: Liberty's service area is in a high elevation and mountainous terrain that is densely forested, averaging over one hundred trees per mile within maintenance distance of the conductor, given recent LiDAR data. Vegetation management inspectors and tree crews often need to access work sites on foot while carrying tools and equipment, resulting in much higher labor costs compared to typical work areas. In addition, due to the robust tree canopy in the Tahoe region, tree crew cost per circuit mile of construction has increased significantly due to SB 247 labor rate increases. Tree removals and pruning costs are unique to Liberty's service area and will increase the overall CC project costs.

In 2022, Liberty experienced an approximate 20% decrease in CC costs compared to 2021. This cost decrease was mainly due to Liberty's use of internal construction crews instead of contractors in 2021. Additionally, 2022 projects required fewer helicopter pole sets and less hand-digging than 2021 projects.

Next Steps:
In 2023, the utilities will continue this workstream and further discuss and document CC recorded/estimated unit costs, undergrounding unit costs and cost drivers as well as assess adding initial unit costs for other alternatives. The utilities will also document any lessons learned.

Lessons Learned:
Introduction:
In the utilities' 2022 WMP Update decisions, Energy Safety identified an ACI for all utilities to provide goals and timelines for implementing lessons learned from the CC joint effectiveness study. Specifically, Energy Safety ordered all utilities to:

As described in the sections above, the utilities are sharing and documenting information and lessons learned, and are driving to understand if best practices, common methods, and greater comparability

can be established. Where utilities have made improvements based on this working group, they are described in the sections above. Importantly, consistent with the 2022 WMP Update filings, while not an objective of the working group, the utilities anticipated that there could be lessons to learn from one another such as construction methods, engineering/planning, execution tactics, etc. that could help improve each utilities' deployment of CC. Since the final decisions on the utilities' 2022 WMP Update filings and as part of each workstream meeting, the utilities have discussed whether or not there are lessons learned and if so, documented these and any plans the utilities have to implement those lessons. In the limited time the utilities have had in 2022 to meet this requirement, we have documented a few lessons learned; however, it is important to note that each utilities' CC program (the initial focus of this effort) had been previously established and was based on past benchmarking, research, testing, and lessons learned from other utilities including SCE (see, e.g. the Covered Conductor Compendium), i.e., many lessons learned were already incorporated into each utilities' CC program. Notwithstanding this, and considering the expansion of this working group, the utilities are committed to documenting lessons learned and plans to implement them.

Lessons Learned:
The utilities agree that it is helpful to share information, practices, and data across the utilities as this can lead to improvements in reducing wildfire risk, safety incidents, and the impacts of PSPS, and improvements with other utility objectives. In furtherance of this objective, and given that a simple table cannot provide the information in a readable format with the ACI requirements, the utilities describe their lessons learned for this working group by the required subject areas.

<u>CC Effectiveness Values</u>
Pursuant to the testing results and further analysis, SCE and PG&E modified their estimated effectiveness values for certain risk drivers since its 2022 WMP Update submissions and have implemented these changes. SDG&E refreshed its effectiveness analysis per previous methodology but have not yet incorporated the updated value in its decision making. SDG&E anticipates completing this by December 2023. Based on the other utilities' previous estimates, the testing results, and their own data, no changes to CC effectiveness values were warranted at this time. These changes are described above in the Estimated Effectiveness workstream. The changes to effectiveness values have and are being incorporated into RSE calculations which in turn will feed into the utilities' decision-making processes. These updated RSE calculations will also be incorporated into utilities' future filings such as RAMP, GRC, and as applicable the WMP. If additional changes are made to effectiveness values, the utilities will document those lessons learned.

<u>Data Sharing</u>
An update on data sharing across utilities on measured effectiveness of CC in-field and pilot results, including collective evaluation. The utilities have and continue to share information across all workstreams. During 2022, utilities provided updates on recorded effectiveness. These included presentations and overviews on data, dashboards, and areas of continued improvement. The utilities also discussed their CC efforts including any pilots and shared these experiences.

<u>Inclusion of REFCL, OPD, EFD, and DFA as alternatives, including for PSPS considerations</u>
As described in the New Technologies section of this report, the utilities will discuss and document data and methods that can be used to estimate the effectiveness of these technologies. This workstream is new and the utilities have identified a series of workshops to develop this workstream. To date, the

utilities have not documented any lessons learned or changes from 2021 or 2022 for inclusion of new technologies.

Cost Impacts and Drivers

As described in the Cost section of this report, the utilities have provided an updated CC capital cost per circuit mile and document the cost changes and drivers. As explained in last year's report, each CC project is unique and will have different costs. Additionally, there are many factors that can increase costs including, for example, economies of scale, the mix of work across regions and differing terrain, contractor rates, permitting, resource constraints, and environmental restrictions. In 2022, the utilities provided updates with one another on these costs through presentations and overviews including trends, material price changes, and other cost-related information. Please see the Cost section in this report for further details the changes in cost impacts and drivers from last year's report.

Changes made to initiative selection based on effectiveness and benchmarking across alternatives.

The utilities have not made changes to initiative selection based on this joint IOU effort. The data and information compiled has confirmed the utilities understanding that CC is effective at reducing wildfire risk and highly effective at reducing most contact from object and wire-to-wire risk drivers. The testing has also shown CC is effective at reducing other risk drivers as well. Should one or more utilities make changes to initiative selection as a result of this effort, we will document those lessons learned as well as plans to implement them.

Next Steps:

In 2023, the utilities will document all lessons learned across all workstreams and will develop plans to implement those lessons learned, as applicable.

Conclusion:

This joint IOU report provides descriptions of the progress the utilities have made to better understand the long-term effectiveness of CC and its ability to reduce wildfire risk and PSPS impacts (and, in comparison to alternatives) as well as CC M&I practices, new technologies, and lessons learned. The utilities have made progress on this effort and describe plans for 2023 to conduct a large number of workshops to further understand the data and analyses that have been compiled, identify best practices for CC M&I, assess new technology effectiveness and the sharing of practice and implementation strategies, and discuss methodologies that can be employed across all utilities to improve comparability. The utilities look forward to continuing these efforts in 2023 and providing future updates.

Routing Report

INSIGNIA ENVIRONMENTAL

SOUTHERN CALIFORNIA EDISON

CAL CITY SUBSTATION 115 KV UPGRADE PROJECT

ROUTING REPORT

MARCH 2022

PREPARED FOR:

SOUTHERN CALIFORNIA EDISON®
An *EDISON INTERNATIONAL*® Company

EXECUTIVE SUMMARY

This Routing Report (Report) documents and summarizes the results of the process used by Southern California Edison (SCE) to select route options for the two discrete required subtransmission lines that comprise the Cal City Substation 115 Kilovolt (kV) Upgrade Project (Project).

PROJECT BACKGROUND

Under the rules, guidelines, and regulations of the Federal Energy Regulatory Commission, North American Electric Reliability Council, Western Energy Coordinating Council, and California Public Utilities Commission, electrical transmission, subtransmission, and distribution systems must have sufficient capacity to maintain safe, reliable, and adequate service to customers. The Project has been developed to serve the forecasted demand for the Electrical Needs Area (ENA), which includes portions of California City and surrounding portions of unincorporated Kern County, and to provide a second 115 kV source line to Edwards Substation.

METHODS

The routing process included the following steps:

1. **Study Area Development:** The high-level scope descriptions for each alternative were reviewed and one study area was established to accommodate the required scope elements (i.e., subtransmission lines). The study area is depicted in Figure 2: Study Area Location Map of the Report.

2. **Opportunities, Constraints, and Concerns (OCC) Analysis:** The OCC Analysis began with the review of SCE's standardized routing score sheet that had been used on previous projects. These score sheets were then adapted for Project use during the OCC Analysis. This process began by identifying environmental factors that could be readily mapped. Characteristics for each factor were reviewed and separated into the categories of opportunity, constraint, or concern as summarized in Attachment D: OCC Results Summary of the Report. The following three characteristics were used for this analysis:

    - opportunities, which were areas with characteristics that were conducive to the routing of overhead power lines[1] (e.g., industrial areas with existing above-ground utilities, designated utility corridors, and areas with existing SCE rights-of-way);

    - constraints, which were areas with characteristics that could make permitting, constructing, and/or maintaining overhead power lines extremely difficult and/or costly (e.g., areas with known jurisdictional water features, special-status species habitat, and within a 100-year floodplain); and

[1] Areas that were "neutral" were not included as opportunities. (Neutral areas were locations that did not represent an opportunity, constraint, or concern.)

- concerns, which were areas with characteristics that could make permitting, constructing, and/or maintaining overhead power lines challenging, though they were not considered infeasible or "show-stoppers" (e.g., areas with suitable habitat for fully protected species, with a high probability of encountering significant archaeological/historic resources, and within 25 feet of underground natural gas pipelines).

3. **Score Sheet Development:** SCE has developed and maintained a comprehensive set of standard score sheets used for the routing of its facilities. These score sheets identify scoring factors, separated by category, and provide the criteria for assigning a numerical score between 1 and 5 for each scoring factor. If a route segment or site did not meet Project objectives for an individual scoring factor, an "F" score was provided, eliminating the route segment from further consideration. The score sheets, with scoring criteria, are included as Attachment E: Completed Score Sheet of the Report.

4. **Initial Route Segment Identification:** Utilizing the results of the OCC Analysis and score sheets, an initial set of potential subtransmission route segments was identified. Efforts were made to avoid areas with one or more constraints identified in the OCC Analysis; however, in some instances, constraints could not be avoided. The initial route segments are depicted in Figure 3: Initial Route Segments of the Report.

5. **Scoring:** The previously described score sheets were populated for each route segment identified in the previous step. The scoring process was conducted with input from Subject Matter Experts (SMEs) from SCE, Insignia Environmental, and Rincon Consultants, as well as by using Geographic Information System data. Following the route segment scoring process, multiple route segments were combined to develop individual end-to-end routes. The scores from each route segment were combined using a weighted-average method to determine a total score for each end-to-end route. End-to-end routes were combined to create route combinations for each alternative. In total, 92 route segments and 20,152 end-to-end route combinations were scored, as reported in Attachment F: Route Combination Scores of the Report.[2] The completed score sheets have been included as Attachment E: Completed Score Sheets of the Report.

6. **Site and Route Selection Meetings:** Following the scoring process, the end-to-end route combinations were ranked using the previously developed scores. These rankings were reviewed with the team during route selection meetings on August 26, August 27, September 3, and September 30, 2021. The team utilized the following steps to evaluate the routes:

    a. SMEs from SCE reviewed the scores associated with each route combination and conducted an additional qualitative review to determine whether any constraints or "F" scores existed that were not included in the score sheets. If warranted, score sheets were adjusted in real time to account for any new information; if the results of the discussion were significant enough to disqualify an individual route

[2] Attachment F: Route Combination Scores includes scores from the 1,000 best-scoring route combinations. Scores from all 20,152 route combinations are available upon request.

segment, all end-to-end route combinations utilizing the segment were disqualified from future consideration.

b. The best-scoring route combinations were identified and displayed to the team.

c. If, following any subsequent input, the route combination being discussed remained the best-scoring route, it was retained. If not, the team restarted the process with the current best-scoring route combination. If route combinations had similar scores, a qualitative comparison between route combinations was performed to arrive at a selection.

This process was repeated to arrive at the preferred and alternative route combinations. The rankings of the 1,000 best scoring route combinations are provided as Attachment F: Route Combination Scores of the Report.[2]

RESULTS

Option 3 was chosen as the Preferred Route and Option 4 was chosen as the Alternative Route. The justifications for the route combination selections are included in Section 4.3 Initial Route Selections of the Report. The final route descriptions have been provided in Section 4.4 Final Route Selections of the Report. The selected route combinations have been included as Figure 7: Option 3 – Preferred Route Map and Figure 8: Option 4 – Alternative Route Map of the Report.

1 – INTRODUCTION

Under the rules, guidelines, and regulations of the Federal Energy Regulatory Commission, North American Electric Reliability Council, Western Energy Coordinating Council, and California Public Utilities Commission, electrical transmission, subtransmission, and distribution systems must have sufficient capacity to maintain safe, reliable, and adequate service to customers. The Cal City Substation 115 Kilovolt (kV) Upgrade Project (Project) has been developed to serve the forecasted demand for the Electrical Needs Area (ENA) and to provide a second 115 kV source line to Edwards Substation.

This Routing Report documents the process used to select two route combinations to satisfy the subtransmission line requirements for the Project and summarizes the results of this process.

2 – ALTERNATIVES ANALYZED

SCE initiated the routing process by evaluating a range of potential system alternatives that would provide additional reliable capacity to the ENA. These alternatives included a wide range of wire and non-wire alternatives within SCE's service territory. SCE selected the following three alternatives to be included in this routing process:

- Alternative 0,
- Alternative 1, and
- Alternative 4.

The scope elements (i.e., subtransmission lines) requiring routing for each of these alternatives are summarized in Table 1: Alternative Scope Element Summary. Additional scope elements that were not routed or sited would occur at or adjacent to existing Southern California Edison (SCE) facilities or are distribution lines that would be routed outside of this process.

Table 1: Alternative Scope Element Summary

Alternative	Kramer-Cal City	Cal City-Edwards-Holgate	Cal City-Edwards	Cal City-Edwards and Edwards-Holgate	Cal City-Randsburg
0	✓	✓			
1	✓			✓	
4			✓		✓

Note: The Cal City-Edwards-Holgate line would involve a single-circuit tap to Edwards Substation.

3 – METHODS

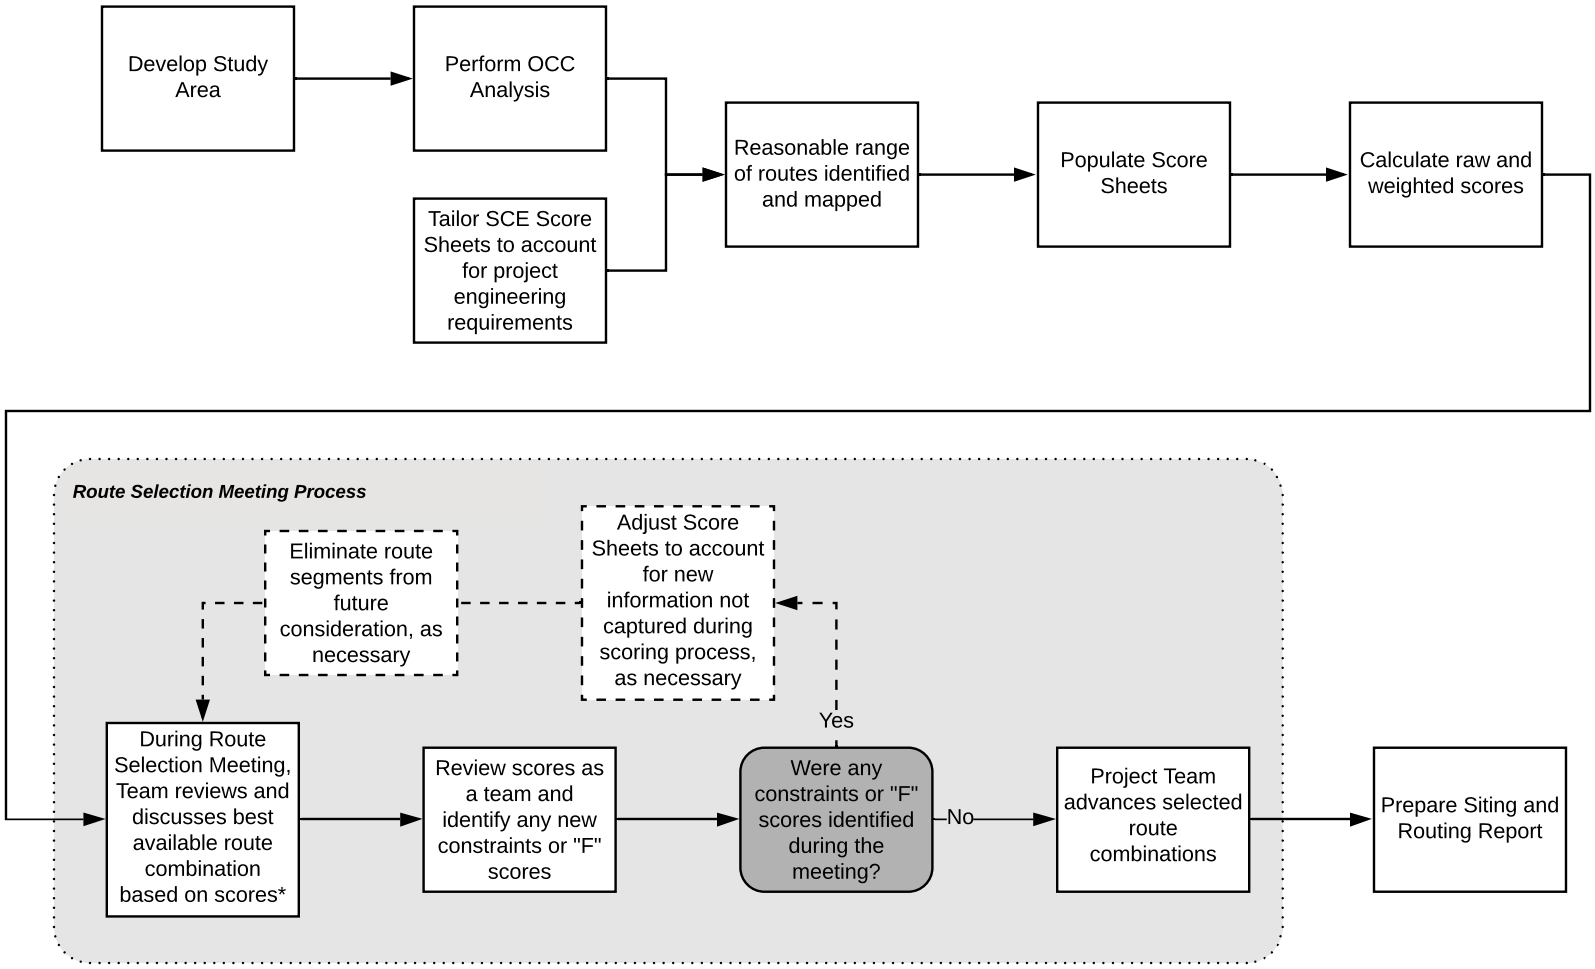
The subsections that follow describe the individual steps taken to identify the preferred and alternative route combination options for the Project. A flowchart depicting the process has been included as Figure 1: Routing Process Overview.

3.0 STUDY AREA DEVELOPMENT

Prior to initiating the Opportunities, Constraints, and Concerns (OCC) Analysis, the high-level scope descriptions for each system alternative were reviewed and a study area was established, as depicted in Figure 2: Study Area Location Map. The extents of the study area were established by evaluating the potential geographic range of the scope elements associated with all of the alternatives. Once the total envelope of all scope elements was understood study area boundaries were defined by expanding this envelope to natural features (e.g., mountains, ridges, or other areas of steep terrain) or human-made features (e.g., highways).

3.1 OPPORTUNITIES, CONSTRAINTS, AND CONCERNS ANALYSIS

A thorough OCC Analysis was conducted for all areas within 5 miles of the study area. The OCC Analysis began with the review of SCE's standardized route score sheets that had been used on previous projects. These score sheets were then adapted for Project use during the OCC Analysis. This process began by identifying environmental factors that could be readily mapped. Characteristics for each factor were reviewed and separated into the categories of opportunity, constraint, or concern. The resulting list of factors included the following resource areas:



- aesthetics,
- biological resources,
- community,
- cultural resources,
- design,
- geology and soils,
- hazards,
- land acquisition,
- land use, and
- wildfire.

A complete list of OCC factors used in the OCC Analysis is included in Attachment A: OCC Factors. The following three characteristics were used for this analysis:

- opportunities, which were areas with characteristics that were conducive to the routing of overhead power lines;[3]

[3] Areas that were "neutral" were not included as opportunities. (Neutral areas were locations that did not represent an opportunity, constraint, or concern.)

Figure 1: Routing Process Overview

* In instances where route combination scores were very similar, a qualitative analysis was performed to identify the best route.

- constraints, which were areas with characteristics that could make permitting, constructing, and/or maintaining overhead power lines extremely difficult and/or costly; and

- concerns, which were areas with characteristics that could make permitting, constructing, and/or maintaining overhead power lines challenging, though they were not considered infeasible or "show-stoppers."

Following the completion of the OCC factors, Geographic Information System (GIS) data were obtained from public data sources, clipped to within 5 miles of the study area, and incorporated into a file geodatabase. All data were categorized by resource area, factor, and factor type (i.e., opportunity, concern, or constraint). Data that were not available in GIS were researched and digitized to be included in the GIS dataset. Once all of the data were gathered and incorporated into the GIS dataset, the layers were assigned colors to represent their levels of compatibility with the planned facilities. All data were posted to Insignia Environmental's (Insignia's) ArcGIS Online portal in order to be shared with SCE and Rincon Consultants (Rincon). This online portal also allowed SCE Subject Matter Experts (SMEs) to review the OCC data and provide comments electronically. These comments were incorporated into the GIS data and the final OCC data were prepared.

3.2 SCORE SHEET DEVELOPMENT

SCE has developed and maintained a comprehensive set of standard score sheets used for the routing of its facilities. These score sheets identify scoring factors, separated by category, and provide the criteria for assigning a numerical score between 1 and 5 for each scoring factor. These sheets also assign a relative weight to each factor (ranging from 0.25 to 1), allowing select factors to have more influence in a route's overall score. If a route segment did not meet Project objectives for an individual scoring factor, an "F" score was provided, eliminating the segment from further consideration.

Project-specific engineering data were reviewed and used to modify the applicable criteria within each score sheet (e.g., minimum right-of-way [ROW] widths to accommodate potential overhead subtransmission line configurations). The score sheet, which includes the criteria for assigning scores to each factor, is included as Attachment B: Score Criteria Sheet.

3.3 INITIAL ROUTE IDENTIFICATION PROCESS

Insignia began the route segment identification process by reviewing the OCC data and required scope elements for each alternative. Insignia created individual route segments within the study area that could be connected to create end-to-end routes. Efforts were made to avoid areas with one or more constraints identified in the OCC Analysis; however, in some instances, constraints could not be avoided. Efforts were also made to reduce the overall length of the end-to-end routes, locate new segments within existing or expanded SCE ROWs, and reduce the number of parcels affected. Route segments were split at all intersections with other segments and given

unique identifiers[4] to eliminate overlap between segments and to allow unique end-to-end routes for each scope element to be constructed. These unique end-to-end routes for each scope element were then combined to create unique route combinations for each alternative.

3.4 SCORING

As described in Section 3.2 Score Sheet, a routing score sheet was developed using SCE's standard score sheet and Project-specific engineering data. Each scoring factor was categorized to indicate the scoring method as follows:

- SCE: Scoring factors that SCE SMEs would score qualitatively
- Consultant: Scoring factors that Insignia or Rincon staff would score qualitatively
- GIS: Scoring factors that Insignia staff would score quantitatively using GIS data

A total of 57 factors were scored.[5] Because each alternative analyzed in this Report required two scope elements and the two scope elements could each utilize the same route segment, it was assumed that a parallel-circuit or double-circuit configuration could be used in these instances. As a result, the score sheet was modified to request scores for all three potential circuit configurations (single-, double-, and parallel-circuit) if the following criteria were met:

- the route segment had the potential to be used by more than one scope element to satisfy the same Project alternative; and
- the scoring factor results could change as a result of the selected configuration.

3.4.0 Raw Scores

Route Segment Scoring

All route segment scoring assigned to SCE, Insignia, or Rincon SMEs was performed qualitatively. Existing GIS data, aerial photography, and professional judgement were used to assign an integer score between 1 and 5 for each segment in each factor. Scoring determined by GIS began by categorizing the available GIS data using the corresponding criteria descriptions (i.e., 1 through 5). The length of each segment within each criteria area was calculated, and then a weighted-average score for each segment was calculated for each factor as described in the following equation:

$$GIS\ factor\ score = \sum_{i=1}^{n} critera\ score_i \times \frac{segment\ lenth\ in\ criteria\ area_i}{total\ segment\ length}$$

In this equation, *n* is the total number of criteria crossed by the route segment. Lower scores represented segments that were less constrained than those with a higher score. If a segment was determined to be incompatible with a scoring factor, then an "F" score was provided, eliminating

[4] Unique route segment identifiers were constructed by assigning a two-digit number to each segment (e.g., 01) and then prepending the segment's intended configuration (i.e., SC for single-circuit, DC for double-circuit, and PC for parallel-circuit) (e.g., SC-01).

[5] The 57 factors scored included 29 by SCE SMEs, seven by Insignia SMEs, 12 by Rincon SMEs, and nine by GIS.

the route segment from further consideration.[6] For each segment, the factor scores were summed to create a raw segment score as described in the following equation:

$$raw\ segment\ score = \sum_{i=1}^{n} factor\ score_i$$

In this equation, *n* is total number of scoring factors associated with route segments.

Route Combination Scoring

Following the route segment scoring process, multiple route segments were combined to develop individual end-to-end routes for each scope element. Each end-to-end route was given a unique three-digit identifier. For each Project alternative, potential combinations of scope elements were combined to create route combinations. Each route combination was given a seven-character unique identifier.[7]

If the two unique end-to-end routes that created the route combination utilized one or more of the same route segments, two versions of that combination were created. One version assumed that a double-circuit configuration would be utilized for all shared route segments and the second version assumed that a parallel-circuit configuration would be utilized for all shared route segments.

The total length of each route combination was then calculated, and raw segment scores and segment lengths were used to develop a raw route combination score as described in the following equation:

$$raw\ route\ combination\ score = \sum_{i=1}^{n} raw\ segment\ score_i \times \frac{segment\ lenth_i}{total\ route\ length}$$

In this equation, *n* is total number of route segments included in the route combination.

3.4.1 Weighted Scores

As described in Section 3.2 Score Sheet Development, relative weights for each scoring factor were developed by SCE and were included in its standard score sheets. Weighted scores were developed by multiplying the individual factor scores for each segment by their associated

[6] "F" scores were substituted with a value of 1,000 to facilitate the score calculation process.

[7] The naming convention was generated using a single-digit identifier representing the alternative number, a four-digit unique identifier representing the combination of end-to-end routes, and a two-character identifier representing the type of shared route segments (i.e., double-circuit [DC] or parallel-circuit [PC]). Each identifier was separated by a hyphen (e.g., X-XXXX-XX).

weights prior to summation. The following equation describes the method used to calculate the weighted route segment scores:

$$weighted\ segment\ score = \sum_{i=1}^{n} factor\ score_i \times factor\ weight_i$$

In this equation, *n* is total number of scoring factors associated with route segments. The following equation describes the method used to calculate the weighted route scores:

$$weighted\ route\ combination\ score = \sum_{i=1}^{n} weighted\ segment\ score_i \times \frac{segment\ lenth_i}{total\ route\ length}$$

In this equation, *n* is total number of route segments included in the route combination.

3.5 ROUTE SELECTION MEETINGS

Following the scoring process, the end-to-end routes were ranked by raw and weighted scores. These rankings were reviewed with the team during route selection meetings on August 26, August 27, September 3, and September 30, 2021. The team utilized the following steps to evaluate the routes:

1. SMEs from SCE, Rincon, and Insignia reviewed the scores associated with each route combination and conducted an additional qualitative review to determine whether any constraints or "F" scores were not included in the existing scores.

    a. If necessary, score sheets were adjusted in real time to account for this new information.

    b. If the results of the discussion were significant enough to disqualify an individual route segment, all route combinations utilizing the segment were disqualified from future consideration.

2. The best-scoring route combinations were identified and displayed to the team.

3. If, following any subsequent input, the route combination being discussed remained the best-scoring route, it was retained. If not, the team restarted the process with the current best-scoring route combination. If route combinations had similar scores, a qualitative comparison between route combinations was performed to arrive at a selection.

This process was repeated to select two route combinations.

4 – RESULTS

The subsections that follow document the results from each step in the routing process. The route combination selections are documented in Section 4.3 Initial Route Selections.

4.0 OCC PROCESS

Attachment C: OCC Results Map visualizes the OCC data, representing areas of opportunity and constraint merged by factor type. Areas of concern, while considered as part of the OCC process, were not included in Attachment C: OCC Results Map to provide a clearer visualization of OCC data. Attachment D: OCC Results Summary describes the types of opportunities, concerns, and constrains within the study area by resource.

4.1 ROUTE SEGMENTS

Figure 3: Initial Route Segments depicts the 92 route segments that were identified as described in Section 3.3 Initial Route Identification Process.

4.2 SCORING

The subsections that follow describe the resulting scores from the routing process.

4.2.0 Route Segments

Attachment E: Completed Score Sheet contains the final score sheets that were developed during the routing process. Both raw and weighted scores have been included for all route segments. These score sheets include any adjustments made during the route selection meetings conducted in August and September 2021, as described in Section 3.5 Route Selection Meetings.

4.2.1 Route Combinations

As described in Section 3.4 Scoring, individual route segments were connected to generate unique, end-to-end routes for each scope element. The end-to-end routes were then combined, as appropriate, to create route combinations for the scope elements of each alternative. Attachment F: Route Combination Scores lists the 1,000 best-scoring route combinations that were identified, including the route segments and end-to-end routes that comprised each combination, the raw and weighted scores, and each route combination's relative ranking.[8] Table 2: End-to-End Route Summary identifies the number of end-to-end routes that were created for each scope element and Table 3: Route Combination Summary identifies the number of route combinations that were created for each alternative.

4.3 INITIAL ROUTE SELECTIONS

This section summarizes the discussion and decisions that were made during the meetings described in Section 3.5 Route Selection Meetings to arrive at the selected route combinations. Table 4: Initial Route Combination Selection Summary lists the resulting route combination selections. As described in Section 3.5 Route Selection Meetings, individual route segments were eliminated from future consideration during the selection process. These decisions also caused individual route segments to lose their value (i.e., they no longer connected to viable segments). These decisions are depicted graphically in Figure 4: Route Segments Eliminated

[8] Scores from all 20,152 route combinations are available upon request.

from Consideration. The selected route combinations are depicted in Figure 5: Option 1 Route Map and Figure 6: Option 2 Route Map.

Option 2	0	054	170	0-5055-PC

4.3.0 F-Score Review

The Route Selection Meetings began with a review of all "F" scores that were supplied as a part of the scoring process as described in the subsections that follow.

Randsburg Substation

Segments 07 and 08 each received eight "F" scores due to the current condition of Randsburg Substation. Alternative 4 would requires the installation of a new subtransmission line between Cal City Substation and Randsburg Substation.

Randsburg Substation does not have the required infrastructure or space to accommodate an additional source line; therefore, Alternative 4 would require the entire substation to be rebuilt and expanded on adjacent property. Initial cost estimates indicated that this process would cost approximately $90 million.

As a result, "F" scores for Segments 07 and 08 were provided for the following reasons:

- SCE does not own any additional land in the vicinity of Randsburg Substation.
- Randsburg Substation is located in an area of hilly terrain; therefore, any expansion of the substation would require significant grading and ground disturbance.
- Randsburg Substation itself is considered to be a potentially significant historical resource and the surrounding area has a high potential for cultural resources.

Due to the complications associated with rebuilding Randsburg Substation, the team confirmed the "F" scores that were provided for Segments 07 and 08 as they are the only segments that connected to the substation. Due to these "F" scores, Segments 13, 60, 61, 62, and 74 also lost all further utility and were eliminated from further consideration.

Edwards Air Force Base

Segment 18 received two "F" scores due to this segment's total length on Edwards Air Force Base. One of the primary considerations for the Project was to serve off-base load using off-base infrastructure. Segment 18 would require the installation of approximately 8.8 miles of new 115 kV subtransmission line within Edwards Air Force Base while a combination of Segments 27, 36, and/or Segment 47 provided significantly shorter routes across the base. In addition, the access challenges and potential for unexploded ordnance along Segment 18 made this segment undesirable. As a result, the team confirmed the "F" scores provided for Segment 18 and it was eliminated from further consideration.

4.3.1 Kramer-Cal City

Following the "F" score review, all potential route combinations associated with Alternative 4 were eliminated from further consideration. The team then decided to focus on the Kramer-Cal City scope element, as it is the only scope element common to the two remaining alternatives. Because the 100 top-scoring route combinations were separated by less than 0.5 percent,[9] the team qualitatively analyzed the route combinations. The following discussion summarizes the decisions made to select the preferred end-to-end route for the Kramer-Cal City scope element:

- Of the 50 top-scoring route combinations, 39 combinations utilized the Highway 395 and 20 Mule Team Parkway Road corridors. The remaining 11 combinations utilized a shorter segment of the Highway 395 corridor and a combination of roads including Farmington Road and Lorraine Avenue to traverse the study area. Because of the established paved access along 20 Mule Team Parkway Road and the added diversity provided by using a route that is located further north, the team initially focused on route combinations along this portion of the study area.

[9] The scores ranged between 71.61 and 71.97.

- All route combinations that utilize 20 Mule Team Parkway Road would have to approach Cal City Substation from Segments 03, 29, or 72.

    - Segment 03 is located adjacent to an existing desert tortoise (*Gopherus agassizii*) ecological reserve and is located along an existing dirt access road.

    - Segment 29 is primarily located along Mendiburu Road within an existing residential area where all existing distribution lines have been placed underground. This segment is included in the top 35 best-scoring route combinations.

    - Segment 72 is located outside of the ecological reserve; however, it is located adjacent to planned future development. This segment is primarily located along an existing dirt access road, but portions of it would require new access.

- Upon review of the three options to exit Cal City Substation to the north/northeast, the team decided that Segment 29 was the least favorable due to the existing residences located along Mendiburu Road and the potential that underground construction would be required. Mendiburu Road likely contains various other underground utilities; therefore, additional delays and costs associated with the engineering and construction methods to avoid those facilities would likely be required. The increased road traffic along Mendiburu Road would also increase the risk of car-pole interface.

- Understanding that a second line would need to exit Cal City Substation toward Edwards Substation, the team then reviewed the potential to utilize double- or parallel-circuit construction along Segment 72.

    - The team recognized that while double-circuit construction is feasible, it is not preferred due to the desire for diversity between the two new sources to Cal City Substation. Any impact to a pole along the double-circuit line could potentially remove all sources to Cal City Substation. A tubular steel pole line could mitigate this risk; however, it would add significant cost to the Project. As a result, the team decided that double-circuit construction was not preferred in this location.

    - A parallel circuit along Segment 72 was determined to be feasible, but it would reduce the potential diversity between the two scope elements.

- The team agreed that a single-circuit line along Segment 03 and a second single-circuit line along Segment 72 would provide enough diversity to satisfy system planning requirements while reducing construction costs.

- The team reviewed other options for exiting Cal City Substation to the south, including Segments 31, 48, and 69.

    - Segment 31 is located along an existing dirt access road with a short portion parallel to California City Boulevard. This segment is located east of the most populated portion of California City.

  - Segment 48 is located along Neuralia Road and Redwood Boulevard and is surrounded by commercial and residential development. The majority of Neuralia Road is a divided four-lane paved road with a vegetated median.

  - Segment 69 is located along Hacienda Boulevard and is surrounded by commercial and residential development. This segment also passes adjacent to Hacienda Elementary School.

- The team strongly preferred avoiding Segments 48 and 69 due to the potential for underground requirements, the likely presence of existing underground utilities, the increased road traffic resulting in increased risk for car-pole interface, and the potential traffic controls required during construction. In addition, traffic would be a concern during the operation and maintenance (O&M) phase of the Project. As a result, the team decided to eliminate route combinations utilizing Segments 48 and 69 from further consideration.

- Following these decisions, Segments 03 and 72 were the only remaining segments exiting Cal City Substation and connecting to other viable route segments. Because the team preferred diversity over double- or parallel-circuit construction, the team decided that Segment 03 would be utilized for the Kramer-Cal City scope element and Segment 72 would be used for the subtransmission line connecting to Edwards and Holgate.

- The best-scoring end-to-end route for the Kramer-Cal City scope element utilizing Segments 03 and 28 in a single-circuit configuration was combination 041 (i.e., Segments 03, 04, 22, 28, 41, 42, 43, 44, 45, 51, 54, 55, 56, 59, and 63). As a result, the team decided to look for additional route combinations using this end-to-end route for the Kramer-Cal City scope element.

The team also worked to select a second end-to-end route option for the Kramer-Cal City scope element that did not utilize segments along 20 Mule Team Parkway Road. This process started by identifying and comparing route segments that crossed the study area from east to west, all of which are located in the vicinity of an existing mining facility operated by Rio Tinto. The discussion that follows summarizes the team's decision-making process in selecting this second option:

- The team identified Segments 01, 39, 40, and 08 as the only four options to traverse the study area from east to west while also avoiding 20 Mule Team Parkway Road.

  - Segment 18 was eliminated from further consideration as described in Section 4.3.0 F-Score Review.

  - Segment 39 is the only remaining segment that would efficiently connect to Holgate Substation. In order to maintain diversity with the Cal City-Edwards-Holgate scope element, combinations that utilized this segment were eliminated from further consideration.

  - Segments 01 and 40 are parallel and both pass the Rio Tinto mining facility to the north. During the August 2021 site visit, the team determined that the combination of Segments 01 and 02 was flatter than the combination of Segments 05, 06, 40, and 89 and would require less grading to establish a safe access road. As a result, all end-to-end routes that utilized Segments 05, 06, 40 and 89 were eliminated from further consideration.

- As described previously, all of the best end-to-end routes utilized Segments 41, 42, and 43 within the designated utility corridor along Highway 395 and all combinations utilizing Segment 23 were eliminated from further consideration.

- As described previously, the team compared the three potential north-to-south route segments that would allow access from the intersection of Segments 01 and 33 to Cal City Substation (Segments 31, 48, and 69). Due to the potential for underground requirements, the likely presence of existing underground utilities, the increased road traffic resulting in increased risk for car-pole interface, and the potential traffic controls required during construction, route combinations utilizing Segments 48 and 69 were eliminated from further consideration. As a result, route combinations utilizing Segments 31 and 32 were advanced forward.

- From the northernmost point of Segment 31, Segments 29 and 72 provided the most efficient routes to connect to Cal City Substation. As described previously, the team compared these two route segments and eliminated Segment 29 due to the potential for underground requirements, the likely presence of existing underground utilities, the increased road traffic resulting in increased risk for car-pole interface, and the potential traffic controls required during construction. As a result, Segments 30, 51, and 72 were selected to complete this end-to-end route combination (054).

4.3.2 Cal City-Edwards-Holgate

Following the selection of the Kramer-Cal City scope element, the team reviewed the remaining 164 route combinations. Of these, all of the top 50 remaining combinations were associated with Alternative 0, which would require the construction of the Cal City-Edwards-Holgate subtransmission line. As a result, the team focused its review on the remaining 143 route combinations associated with Alternative 0. By eliminating Segments 48 and 69, as described previously in Section 4.3.1 Kramer-Cal City, 70 route combinations remained. The following discussion summarizes the decisions made to select the preferred end-to-end route for the Cal City-Edwards-Holgate scope element:

- By eliminating Segments 48 and 69 from further consideration, Segment 31 was the last remaining route segment to exit Cal City Substation to the south. While this would require parallel construction with the Kramer-Cal City scope element, the team decided that the lines could be constructed with sufficient separation to provide diverse feeds to Cal City Substation.

- From Segment 31, there are two general paths that could be followed further south:
    - Segment 12 is located along California City Boulevard, the primary paved road connecting California City to Highway 58.
    - Segments 33, 34, 35, and 90 are located along existing dirt access roads and 140th Street. An existing distribution line is also located along a portion of these segments.
- Due to the increased vehicle speeds along California City Boulevard, a pole line built along Segment 12 would need to be constructed further from the roadway within a new ROW and would require the construction of additional spur/access roads for construction and O&M purposes. The increased vehicle speeds in this area may make ingress and egress to theses access roads challenging. In addition, a new subtransmission line would introduce a change in the existing visual character.
- Segments 33, 34, 35, and 90 have limited vehicular traffic, an existing access road along the majority of the route segments, and an existing electric distribution line in the area. This segment combination was utilized on 17 of the top 20 best-scoring route combinations that remained.
- As a result, the team preferred route combinations that utilized Segment 34 over those that used Segment 12, reducing the remaining route combinations to 21.
- The team reviewed the options to approach Edwards Substation from the southern end of Segment 35.
    - Segments 27 and 36 currently have existing electrical lines along them and are located along the paved entrance to Edwards Air Force Base.
    - Segments 16, 27, and 37 are partially located along the paved entrance to the base; however, a majority of this combination of segments would be located along sandy, unpaved access roads.
    - Segment 47 would require a new access road across known occupied desert tortoise and Mohave ground squirrel (*Xerospermophilus mohavensis*) habitat.
- Due to the desire to minimize the length of line on Edwards Air Force Base, utilize the existing access, minimize new impacts, and reduce sharp angles, the team decided to advance route combinations utilizing Segments 27 and 36.
- End-to-end Route 196 was the top-scoring option that remained; however, it introduced five additional 90-degree turns (along Segments 14, 15, 17, 26, and 92) that could be avoided by selecting end-to-end Route 170. End-to-end Route 170 provided a direct route from Segment 35 east to Holgate Substation. As a result, end-to-end Route 170 (i.e., Segments 26, 27, 30, 31, 32, 33, 34, 35, 36, 38, 39, 51, 71, 72, 75, and 90) was retained as the team's first route selection.

4.4 FINAL ROUTE SELECTIONS

During a field visit conducted on August 16 and 17, 2021, the team observed a closed gate along Segment 26. This gate indicated that a portion of Segment 26 is located within a potential conservation easement associated with Rio Tinto's mining facility. Since the time of the site visit, SCE conducted outreach to both Rio Tinto and the California Department of Fish and Wildlife (CDFW) to obtain and review the terms and conditions associated with the potential conservation easement. As a result of this outreach, SCE was able to determine that the conservation easement had not been finalized with the CDFW; however, the planned easement would prevent the installation of any new infrastructure.

Due to the presence of the conservation easement, SCE decided to eliminate any route combinations that utilize Segment 26—thus eliminating Option 1 and 2—and select a new route combination for the Cal City-Edwards-Holgate scope element. The following discussion summarizes the decisions made to select the preferred end-to-end route for the Cal City-Edwards-Holgate scope element that avoids Segment 26 while continuing to utilize Segments 31, 35, 36, and 72:

- Of the remaining 20 route combinations, the 10 top-scoring combinations were separated by less than 3 percent. End-to-end Route 278 was the best-scoring option; it utilizes Segments 77, 82, and 83 to skirt the boundary of the potential conservation easement.

- Due to the small variation between scores among the top route combinations, the team reviewed the three best-scoring options to head west to connect to Segment 34 or Segment 90.

    - Segment 77 is located along Schultz Road and connects to Suckow Road; these are both existing dirt roads. This segment is included in the best-scoring route combinations.

    - Segment 84 is located along Denise Avenue in a rugged portion of the study area and may require the construction of new access roads. This segment is included in the average-scoring route combinations.

    - Segment 89 is located along Rosewood Boulevard, an existing dirt road, and would require some improvements prior to use. This segment is included in the worst-scoring route combinations.

- Due to the limited access along Segment 84 and rugged terrain, this segment was eliminated from further consideration.

- The team reviewed end-to-end Route 229 to exhaust the options to head west toward Cal City Substation. This combination was the worst-performing of those that remained. No existing access was identified near the intersection of Segments 05 and 19. As a result, significant ground disturbance within rugged terrain would be required to provide access to these segments. Access along portions of Segment 05 was also observed as rugged

during the August 2021 site visit. As a result, this route option was eliminated from further consideration.

- Of the remaining options, end-to-end Route 278, which utilizes Segment 77, was the top-scoring route combination; however, it introduced two additional 90-degree angles when compared to end-to-end Route 277 (near Segments 77 and 92). As a result, the team elevated end-to-end Route 277 (i.e., Segments 14, 17, 27, 30, 31, 32, 33, 34, 35, 36, 39, 51, 72, 75, 77, 82, 83, 90, and 91), which continues directly west from the end of Segment 77 to the second route selection.

As summarized in Table 5: Final Route Combination Selection Summary, end-to-end Route 277 when combined with Kramer-Cal City end-to-end Routes 041 and 054 create Option 3 and Option 4, respectively. The selected route combinations are depicted in Figure 7: Option 3 – Preferred Route Map and Figure 8: Option 4 – Alternative Route Map.

Table 5: Final Route Combination Selection Summary

Selection	Alternative	Kramer-Cal City End-to-End Route	Cal City-Edwards-Holgate End-to-End Route	Route Combination	Final Decision
Option 3	0	041	277	0-8971-PC	Preferred
Option 4	0	054	277	0-8984-PC	Alternative

4.4.0 Environmental Impact Comparison

Following the selection of Option 3 and Option 4, the team prepared a qualitative environmental impact comparison to assist with elevating one of the options to the preferred route. This comparison relied upon the desktop-level analysis described in Section 3.1 Opportunities, Constraints, and Concerns Analysis and the observations made during the August 2021 fieldwork.

Option 3

Kramer-Cal City

Option 3's Kramer-Cal City scope element route generally follows Highway 395 north from Kramer Substation until generally paralleling 20 Mule Team Parkway Road to the southwest. This option would place the new 115 kV subtransmission line within existing designated transmission corridor along Highway 395. In addition, its proximity to Highway 395 and 20 Mule Team Parkway Road would reduce the total length of new access roads that would be required to facilitate construction and O&M of the new line. Limiting the required ground disturbance would translate into reduced impacts to potential biological, cultural, paleontological, and hydrologic resources in the vicinity of the alignment. As a tradeoff, the line would be visible to motorists along Highway 395 and 20 Mule Team Parkway Road. In addition, portions of this route span or are located adjacent to a CDFW-managed ecological reserve and BLM-managed desert tortoise natural areas near Cal City Substation.

Cal City-Edwards-Holgate

Option 3's Cal City-Edwards-Holgate scope element route travels generally southeast from Cal City Substation, following an existing distribution line and existing roads until reaching Holgate Substation. The tap to Edwards Substation is also generally parallel to an existing distribution line and existing roads. While this route would require the construction of some access roads in the vicinity of Cal City Substation, it is primarily located along existing roadways reducing the need for significant grading. By limiting the grading required, this route would limit the potential impacts to biological, cultural, paleontological, and hydrologic resources in the vicinity of the alignment. With the exception of the crossing of Highway 58 and a short segment parallel to California City Boulevard, this route is generally located along roadways with limited vehicular traffic.

Option 4

Kramer-Cal City

Similar to Option 3, this scope element route generally follows Highway 395 north from Kramer Substation for a shorter distance (approximately 7.6 miles rather than approximately 18.5 miles for Option 3) until turning west and traveling overland until reaching Sequoia Road. The route then follows Sequoia Road west until reaching California City Boulevard. At this point, the line would parallel the proposed Cal City-Edwards-Holgate line in a generally northwest direction until reaching Cal City Substation. When compared to Option 3, this option places a shorter segment of the new 115 kV subtransmission line within existing designated transmission corridor along Highway 395. In addition, the east-to-west segment that is overland and generally parallel to Sequoia Road would require significant grading to establish an access road that is suitable for the construction and O&M of the new line. This grading would translate into increased impacts to potential biological, cultural, paleontological, and hydrologic resources in the vicinity of the alignment when compared to Option 3. As a tradeoff, the line would be visible to fewer motorists along Highway 395 and would avoid 20 Mule Team Parkway Road. In addition, this route would avoid the CDFW-managed ecological reserve and BLM-managed desert tortoise natural areas in the vicinity of 20 Mule Team Parkway Road and Cal City Substation.

Cal City-Edwards-Holgate

Option 4's Cal City-Edwards-Holgate scope element route is identical to the one identified for Option 3; however, it would place both 115 kV subtransmission lines in the same corridor for approximately 6.6 miles. This portion of parallel circuit may reduce the total length of ROW within the study area when compared to Option 3, potentially reducing the overall visual impacts in the vicinity of California City. This parallel segment would also reduce the overall access roads construction/improvement requirements, reducing the potential impacts to biological, cultural, paleontological, and hydrologic resources along this portion of the route. With the exception of the crossing of Highway 58 and a short segment parallel to California City Boulevard, this route is generally located along roadways with limited vehicular traffic.

4.4.1 Comparison Summary

While Option 3 would require the construction of approximately 15 additional circuit miles of 115 kV subtransmission line, it

- Provides additional diversity for the two 115 kV subtransmission sources to Cal City Substation by reducing the amount of parallel circuit construction from 6.6 miles to 0.4 mile when compared to Option 4;

- Constructs an additional 10.9 miles of 115 kV subtransmission line within a designated utility corridor when compared to Option 4; and

- Significantly reduces the length of access road improvement/construction, reducing the potential biological, cultural, paleontological, and hydrologic resource impacts along this portion of the route when compared to Option 4.

As a result, the team selected Option 3 as the preferred route and Option 4 as the alternative route. These selections are summarized in Table 5: Final Route Combination Selection Summary.

4.5 SUPPLEMENTAL ENVIRONMENTAL JUSTICE ANALYSIS

Following the selection of the final route combinations described in Section 4.4 Final Route Selections, SCE elected to conduct a supplemental analysis to screen for potential environmental justice (EJ) communities within the study area. The following two demographic indicators from the United States Environmental Protection Agency's Environmental Justice Screening and Mapping Tool were used in this process:

- People of Color: The percent of individuals in a Census block group who list their racial status as a race other than white alone and/or list their ethnicity as Hispanic or Latino. That is, all people other than non-Hispanic white-alone[10] individuals.

- Low-Income: The percent of a Census block group's population in households where the household income is less than or equal to twice the federal poverty level.[11]

A Census block group was identified as a potential EJ community if:

- the Census block group's population of people of color exceeded the county average, or
- the Census block group's low-income population exceeded the county average by 10 percent.

As depicted in Figure 9: EJ Demographic Indicator Map, eight Census block groups were identified as potential EJ communities related to the people of color indicator and two additional

[10] The word "alone" in this case indicates that the person is of a single race, not multiracial.

[11] More precisely, percent low-income is calculated as a percentage of those for whom the poverty ratio was known, as reported by the Census, which may be less than the full population in some block groups. The federal poverty level is defined by the Census.

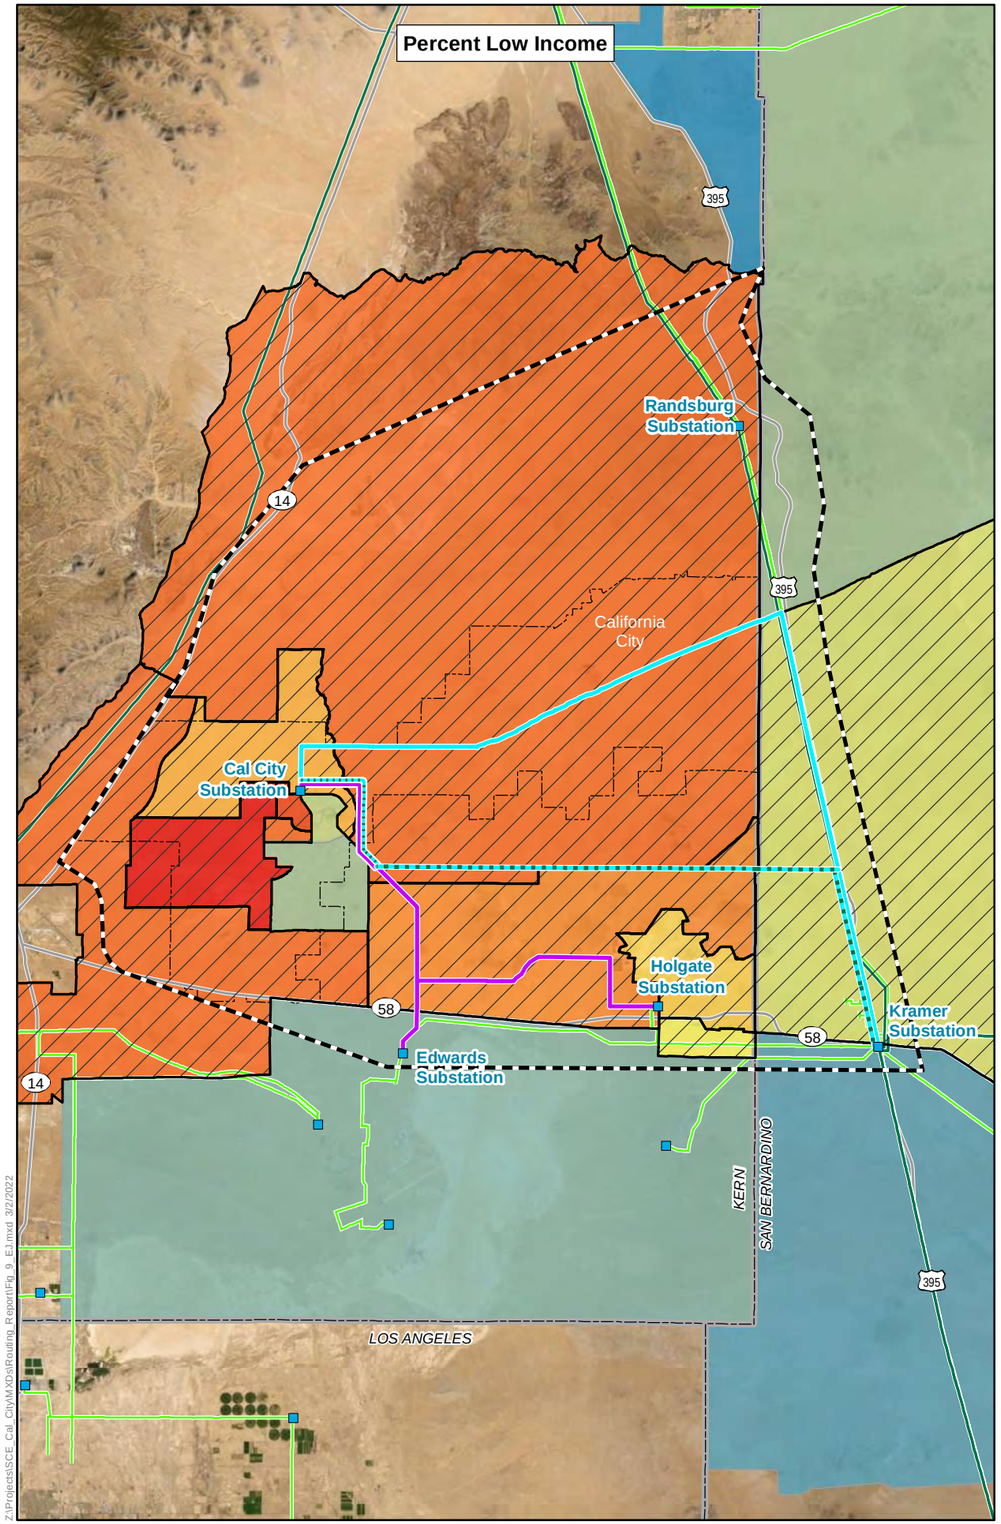
Census block groups were identified as potential EJ communities related to both people of color and low-income indicators. As depicted in Figure 10: Potential EJ Community Map, approximately 90 percent of the study area is within a potential EJ community. In addition, SCE's Cal City, Edwards, Holgate, and Kramer substations are all within or adjacent to potential EJ communities. As a result, it would not be feasible to identify efficient route combinations that avoid potential EJ communities.

4.6 ROUTE DESCRIPTIONS

The subsections that follow describe the end-to-end route for each scope element included as part of a selected route combination. These route combinations are depicted in Figure 7: Option 3 – Preferred Route Map and Figure 8: Option 4 – Alternative Route Map.

4.6.0 Option 3 – Preferred Route Combination

Kramer-Cal City



The Kramer-Cal City 115 kV subtransmission line would exit Cal City Substation to the north and travel for approximately 0.3 mile along an existing unnamed dirt road until reaching 90th Street. The line would continue north along 90th Street for approximately 1.5 miles until reaching Rudnick Boulevard. At the intersection of 90th Street and Rudnick Boulevard, the line would turn east and continue for approximately 7.3 miles until reaching 20 Mule Team Parkway Road. The line would then continue northeast along 20 Mule Team Parkway Road for approximately 17.8 miles until reaching Highway 395. At the intersection with the highway, the line would continue southeast and generally parallel to Highway 395 for approximately 18.5 miles before terminating at Kramer Substation.

Cal City-Edwards-Holgate

Option 3 of the Cal City-Edwards-Holgate 115 kV subtransmission line would exit Cal City Substation to the north and travel for approximately 0.3 mile along an existing unnamed dirt road until reaching 90th Street. At the intersection of 90th Street and Lindbergh Boulevard, the line would turn east and continue for approximately 2.5 miles and then turn south for approximately 2.9 miles along unnamed dirt roads. At the intersection with California City Boulevard, the line would head southeast for approximately 3.3 miles until intersecting with 140th Street. The line would then turn south and generally follow 140th Street for approximately 3.1 miles until intersecting Suckow Road.

At this point, the single-circuit tap to Edwards Substation would continue south, crossing over Highway 58, and then generally following Rosamond Boulevard into Edwards Air Force Base for approximately 3.3 miles before terminating at Edwards Substation.

From the intersection of 140th Street and Suckow Road, the line would continue east for approximately 4 miles along Suckow Road until intersecting with Schultz Road. The line would head northeast and generally parallel to Schultz Road for approximately 1.4 miles, and then head east and parallel to an unnamed dirt road for approximately 3 miles. At the intersection with Gephart Road, the line would head south for approximately 2 miles, and then east for approximately 2 miles along an unnamed road before terminating at Holgate Substation.

4.6.1 Option 4 – Alternative Route Combination

Kramer-Cal City

The Kramer-Cal City 115 kV subtransmission line would exit Cal City Substation to the north and travel for approximately 0.3 mile along an existing unnamed dirt road until reaching Lindbergh Boulevard. The line would continue east along Lindbergh Boulevard for approximately 2.5 miles. The line would then turn south and continue overland for approximately 2.8 miles until reaching California City Boulevard. The line would then head southeast for approximately 1 mile, reaching Sequoia Boulevard. The line would then travel east along Sequoia Boulevard for approximately 15 miles. The line would continue overland for approximately 4.3 miles until reaching Highway 395. At the intersection with the highway, the line would continue southeast and generally parallel to Highway 395 for approximately 7.6 miles before terminating at Kramer Substation.

Cal City-Edwards-Holgate

Option 4 would utilize the same route for the Cal City-Edwards-Holgate 115 kV subtransmission line scope element as Option 3.

ATTACHMENT A: OCC FACTORS

ATTACHMENT A: OCC FACTORS

Category	Factor	Opportunity	Concern	Constraint
Aesthetics	Visual Character/Quality	Areas with heavy industrial structures, existing above-ground utilities, and/or visually cluttered landscape.	Areas within 100 feet of a school, church, park, or residential area.	Areas with pristine environment, with view corridors, or naturally evolving landscape character; or residential area with lots of existing or future vantage points.
	Locally Valued Places		Areas within 500 feet of an identified or eligible place, landmark or structure in California Registry of Historic Resources (CRHR) or identified in the City/County General Plans as a place of relevance.	Areas within 100 feet of an identified or eligible place, landmark or structure in CRHR or identified in the City/County General Plans as a place of relevance.
	Scenic Highways		Areas between 0.25 and 0.5 mile from a scenic or eligible scenic highway.	Areas within 0.25 mile of a Caltrans Designated Scenic Highway; and/or a highway that is proposed for listing.
Biology	Water Bodies[1]		Areas with known potentially jurisdictional water features.	
	Special-status Species Critical Habitat		Areas within federally designated critical habitat for special-status species.	Areas within federally designated critical habitat for fully protected species
	Special-status Species		Areas with suitable habitat for special-status species or areas considered an Area of Critical Environmental Concern or Desert Conservation Area.	Areas with suitable habitat for fully protected species.
Community	Community Development Guidelines	Areas within designated utility corridors.		
	Planned Future Development			Areas of planned future development (posted on city/county websites) potentially eliminating potential subtransmission lines rights-of-way (ROWs).
Cultural Resources	Cultural Resource Probability		Areas with a moderate or higher probability of encountering significant archaeological/historical resources.	Areas with a high probability of encountering significant archaeological/historical resources.
Design	Availability of ROW	Areas with existing Southern California Edison (SCE) power line ROW with sufficient properties to accommodate an additional 115 kilovolt (kV) power line	Areas with existing SCE power line ROW with the potential to accommodate an additional 115 kV power line	Areas within existing SCE power line ROW without the potential to accommodate an additional 115 kV power line
Geology	Flooding Potential		Areas within a mapped 100-year flood plain.	
	Liquefaction Potential		Areas with very high liquefaction potential.	
	Fault Rupture Hazard Zones		Areas with documented active faults (or A-P Fault Rupture Hazard Zones).	
	Soil Contamination		Parcels with potential known soil contamination according to the Envirostor database	
	Paleontological Sensitivity		Areas with a moderate or higher probability of encountering significant paleontological resources.	Areas with a high probability of encountering significant paleontological resources.
Hazards	Proximity to Natural Gas Pipeline		Areas within 100 feet of underground natural gas pipelines.	Areas within 25 feet of underground natural gas pipelines.
Land Acquisition	Easement/Rights Required		Federally or State-owned areas or Native American/Bureau of Indian Affairs (BIA) where SCE has no existing rights.	Areas with existing or planned conservation easements.

[1] Due to the numerous known waterbodies throughout the study area, this data was not mapped. The majority of the study area should be considered a concern with regard to this factor and site-specific surveys will be conducted at a later date.

Category	Factor	Opportunity	Concern	Constraint
Land Use	Zoning/General Plan Land Use(s)		Areas within 100 feet of public facilities (e.g., schools, hospitals, libraries), parks, open space areas, recreational facilities.	Areas containing public facilities (e.g., schools, hospitals, libraries), parks, open space areas, recreational facilities.
	Airport Land Use Plan		Areas within an Extended Approach/Departure, Primary Traffic Patterns and Runway Buffer Area, and Other Airport Environs zones.	Areas within a Runway Protection, Inner Approach/Departure, and Adjacent to Runway zones.
	Existing Land Use(s) on the Site (Physical)		Areas with existing residential structures.	Areas with existing land uses that would preclude the installation of new overhead facilities.
Wildfire	Fire Threat		Areas within Zone 2 or 3 of the California Public Utilities Commission's (CPUC's) High Fire Threat District	
	Fire Severity		Areas within a high or very high California Department of Forestry and Fire Protection (CAL FIRE) Fire Severity Zone	

ATTACHMENT B: SCORE CRITERIA SHEET

Cal City Substation 115 kV Upgrade Project
Attachment B: Score Criteria Sheet

Category	Responsible Company	Responsible Party	Scoring Criteria					
			1	2	3	4	5	F
Aesthetics								
Visual Character/Quality	Rincon	Brenda Eells	Heavy industrial structures, existing above-ground utilities, and / or visually-cluttered landscape.	Light industrial area or intensive agricultural landscape character. Existing above-ground utilities.	Route segment is on a local roadway and/or through a residential area with above-ground utilities. Or, segment is in an area with a mix of residential and commercial uses. Or, segment is in an area that has a rural landscape character.	City / County Architectural Development Standards apply to the properties surrounding the segment; segment is within a residential area; or, segment is in an urban / rural interface area (e.g. wildland urban interface), or an area with a pastoral landscape character.	Route segment is within a pristine environment with view corridors or naturally evolving landscape character; or residential area with lots of existing or future vantage points. Segment is in an area with no above-ground utility structures.	Does not meet project objectives (Provide detailed explanation).
Locally Valued Places	GIS	Brenda Eells	Proposed route segment is not visible from an identified or eligible place, landmark or structure in CRHR or identified in the City / County General Plans as a place of relevance.	There is an identified or eligible place, landmark or structure in the CRHR, or identified in the City / County General Plans as a place of relevance within the vicinity of the proposed route segment but but man-made visual clutter and / or natural terrain would completely block or obscure view of the site from the place of relevance.	There is an identified or eligible place, landmark or structure in CRHR or identified in the City / County General Plans as a place of relevance within the vicinity of the route segment, but not directly adjacent to the segment. The view of the segment from the place is partially or largely (but not completely) obscured by man-made visual clutter and / or natural terrain.	Proposed route segment is in the vicinity of and partially to wholy visible from an identified or eligible place, landmark or structure in CRHR or identified in the City / County General Plans as a place of relevance. While visible from the place, the segment is not directly adjacent to the place of note.	Proposed route segment would directly impact or is within 100 feet of an identified or eligible place, landmark or structure in CRHR or identified in the City / County General Plans as a place of relevance.	Does not meet project objectives (Provide detailed explanation).
Impacts to Scenic Vistas	Rincon	Brenda Eells	No impacts to any viewsheds or scenic vistas.	Minor change to undesignated scenic vistas or viewsheds.	Minor change to designated scenic vista or viewshed or moderate change to undesignated scenic vista or viewshed. Consider number of residential or recreational viewers of the project.	Site would partially block view of officially designated scenic vista or viewshed. (list the specific designation and designating agency). Consider number of residential or recreational viewers of the project.	Blocks or markedly impedes officially designated scenic vista or viewshed (list the specific designation and designating agency). Site is in the foreground view of large number of viewers who would otherwise / also be viewing the scenic vista.	Does not meet project objectives (Provide detailed explanation).

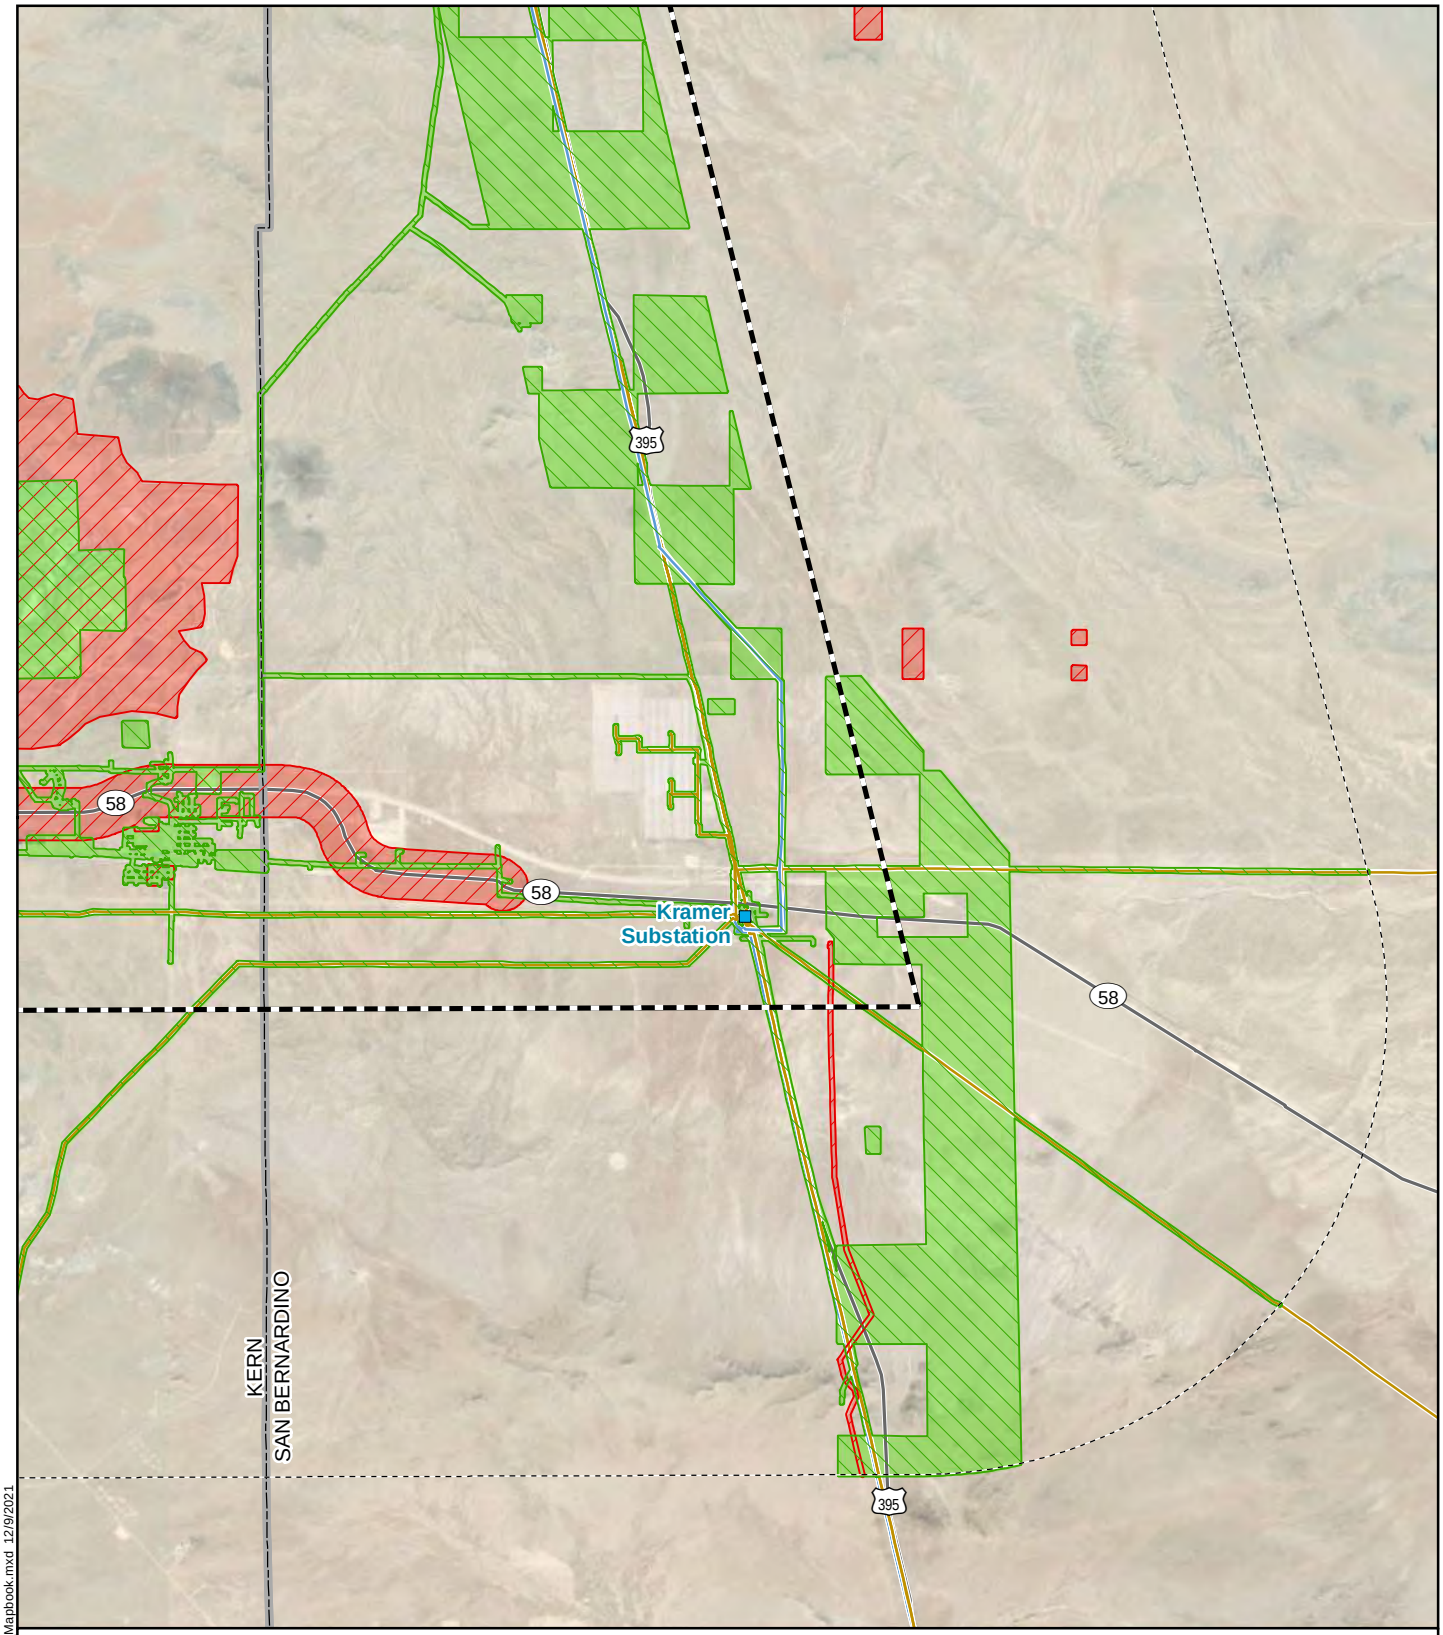
Category	Responsible Company	Responsible Party	Scoring Criteria					
			1	2	3	4	5	F
Scenic Highways	Rincon	Brenda Eells	There is no scenic highway or corridor w/in the project area or the route segment is not in the viewshed / is fully obscured from view of a locally-designated scenic corridor or road.	There is a scenic highway (eligible or designated State, County or Federal) within or adjacent to the project area, but man-made visual clutter and / or natural terrain would completely block or obscure view of the route segment from the highway. Or, segment would blend with the visual clutter or terrain already visible from the highway. Or, the segment is partially obscured from view of a locally-designated scenic corridor or road.	The route segment can be seen from an eligible (but not designated) scenic highway, but e3isting visual clutter, built environment, or natural terrain would partially obscure views of the segment from the scenic highway. Segment would be a noticeable feature within the landscape with minimal blending and would be visible from a locally-designated scenic corridor or road.	The route segment is located along or is adjacent to and fully visible from a locally designated scenic corridor or road, or an eligible but not designated State scenic highway; or, it is present and visible (but not adjacent to) and can be seen from a scenic highway, and man-made visual clutter or natural terrain would not obscure views of the segment from the highway. Route segment would be a noticeable feature within the landscape, and would not blend with the existing visual clutter, built environment, or natural terrain as viewed from the scenic highway.	Route segment can be seen from or is along a scenic corridor, or along a Caltrans Designated Scenic Highway, and/or a highway that is proposed for listing, or is listed, on the National Register of Historic Places, or California Register for Historic Resources. A “Corridor Protection Plan” exists for the area.	Does not meet project objectives (Provide detailed explanation).
Biology								
Wildlife Corridors	Rincon	John Hindley	No wildlife movement; (Project surrounded by developed areas with no habitat, project area does not connect habitat or open space areas)	Low potential for wildlife movement. (eg. Disturbed or low quality habitat in project area with limited connection to other habitat areas)	Moderate potential for wildlife movement (e.g. Project area provides connection to other habitat areas)	Moderate potential for wildlife movement and project will not significantly impede movement (eg. Project area connects native habitat and project will not significantly impede wildlife movement project area is in known or designated wildlife corridor)	High potential for wildlife movement and project will impede wildlife movement; (eg. Project area connects native habitat and project will impede wildlife movement, project area is in known or designated wildlife corridor)	Does not meet project objectives (Provide detailed explanation).
Avian Collision	Rincon	John Hindley	No collision risk (eg. Developed areas; not in bird flight path or critical habitats)	Low potential for collision risk (eg. Low use by birds, habitat quality low)	Moderate potential for collision risk (Line will be placed in existing ROW; Line is in proximity to where birds are landing and taking off. Other transmission lines already exist in proximity to proposed line with no known issues).	Moderate potential for avian collision (Line divides roosting and feeding habitats; Line is in close proxilmity to where birds are landing and taking off. No other transmission lines in area.)	High Potential for avian collision (eg. Line divides roosting and feeding habitats; Line is in proximity to where a high concentration of birds aree landing and taking off. No other transmission lines in area)	Does not meet project objectives (Provide detailed explanation).

Category	Responsible Company	Responsible Party	Scoring Criteria 1	2	3	4	5	F
Permitting Time Required	Rincon	John Hindley	Approx. 1 year or less permitting required	Approx. 2 years or less permitting required	Approx. 3 years or less permitting required	Approx. 4 years or less permitting required	Approx. 5 years or less permitting required	Does not meet project objectives (Provide detailed explanation).
Water Bodies	GIS	Bradley Jacobsen	No known water body within 500' of site	Waterbody within 500' of site, no vegetation or habitat for listed species, potential indirect impact	Water body within 500' of site, riparian vegetation present, no/low potential for listed species	Within jurisdictional waterway. No/low potential for listed species. Potential direct impacts.	Within a jurisdictional waterway, has listed species, potential direct impacts	Does not meet project objectives (Provide detailed explanation).
Special-status Species	Rincon	John Hindley	No known biological sensitivities, disturbed land (e.g. No T&E or sensitive species (sp. of concern or CNPS list, wetlands)	Some potential biological sensitivities, potential for permit (e.g. Potential for sensitive species, no T&E species, lower quality habitat)	T&E species likely to be in general area, medium to good quality habitat (e.g. Potentially suitable habitat, no T&E species from CNDDB in project area, but T&E species in adjacent areas)	Has T&E species, requires species specific surveys.Permit likely with mitigation (e.g. T&E species present, species specific surveys, permits likely and mitigation)	T&E species, extensive mitigation, likely opposition; alternative site recommended (e.g. T&E species, extensive mitigation, permit difficult to aquire)	Does not meet project objectives (Provide detailed explanation).
Community								
Potential Route Segment-Specific Stakeholders (schools, churches, community centers, etc.)	SCE	Calvin Rossi	There are no groups that would likely intervene with project siting.	Low likelihood of groups with an interest in the route segment or lands directly adjacent to intervene with project siting.	Potential for groups with an interest in the route segment or lands direclty adjacent to organize and intervene. Potential route segment ROW is not owned by groups with potential interest.	Route segment or lands directly adjacent are the subject of interest of an existing organized group and/or is owned by a stakeholder group (i.e. Land Trust, Conservation Agency, church, school district, etc.).	Existing, organized groups are very likely to actively intervene in the siting process if this route segment is carried forward. Groups have expressed intent to intervene and/or have intervened with prior proposed projects along the route segment.	Does not meet project objectives (Provide detailed explanation).
Community Development Guidelines	Insignia	Calvin Rossi	Area has no established guidelines for development design standards.	Some guidelines exist but have not been implemented (e.g. existing development pattern includes a mix of styles and/or is incohesive).	Some guidelines exist but do not specifically address utility or infrastructure development. Guidelines are not fully implemented in vicinity of the route segment.	Design guidelines exist and are fully implemented in the vicinity of the site, but do not specifically address utility or infrastructure development.	Local development guidelines and / or community plans specifically constrain or prohibit new infrastructure or infrastructure upgrades (e.g. segment is located in an underground district). Formal design guidelines are in place and evident in existing development.	Does not meet project objectives (Provide detailed explanation).
Current / Past Controversy Along or Near the Route Segment	SCE	Calvin Rossi	No prior controversy along or near the route segment.	--	Any prior controversy at or near the route segment (regardless of project type involved in the controversy).	--	Prior organized community opposition to related industrial development(s) at or near the route segment.	Does not meet project objectives (Provide detailed explanation).

Category	Responsible Company	Responsible Party	Scoring Criteria 1	2	3	4	5	F
Planned Future Development Near the Route Segment	GIS	Calvin Rossi	No known development planned or in progress in the area. Easement or ROW for route segment is part of a developer's plan (e.g. would be included in the developer's EIR / EIS).	--	Route segment is located in an undeveloped area and / or redevelopment zone but there are no pending plans for the area.	--	Planned future development potentially incompatible with subtransmission line.	Does not meet project objectives (Provide detailed explanation).
Cultural Resources								
Paleontological Resources	Rincon	Jennifer DiCenzo	Low probability of encountering sensitive paleontological resources.	Moderate probability of encountering sensitive paleontological resources.	High probability of encountering sensitive paleontological resources.	--	--	Does not meet project objectives (Provide detailed explanation).
Cultural Resources	GIS	Alyssa Newcomb	Low probability of encountering significant archaeological / historical resources.	Moderately low probability of encountering significant archaeological / historical resources.	Moderate probability of encountering significant archaeological / historical resources.	Moderately high probability of encountering significant archaeological / historical resources.	High probability of encountering significant archaeological / historical resources.	Does not meet project objectives (Provide detailed explanation).
Cultural Resources Permitting Time	Rincon	Alyssa Newcomb	Private/public land with no federal nexus, CEQA compliance -- low to moderate probability to encounter significant resources.	Private/public land with federal nexus, NHPA Section 106 Consultation & CEQA compliance -- low to moderate probability to encounter significant resources.	Private/public land with no federal nexus, CEQA compliance -- moderate probability to encounter significant resources.	Private/public land with federal nexus, NHPA Section 106 Consultation & CEQA compliance -- moderate probability to encounter significant resources.	Private/public land with federal nexus, NHPA Section 106 Consultation and CEQA compliance -- high probability to encounter significant resources.	Does not meet project objectives (Provide detailed explanation).
Native American Resource Issues	Rincon	Alyssa Newcomb	No known or potential for Native American or other ethnic issues.	Low potential for Native American or other ethnic issues either based on cultural resource data and/ or inactive or dispersed NA or ethnic community.	Moderate potential for Native American or ethnic issues due to the presence of sensitive cultural resources and/ or an active NA or ethnic community.	Moderate to high potential due to the presence of cultural resources considered important to the NA community, Tribal Lands, and/ or an active NA or ethnic community.	Highly sensitive cultural properties, tribal lands, and likely vehemently opposed Native American or other ethnic community in the project area.	Does not meet project objectives (Provide detailed explanation).
Subtrans/Trans Design Mgmt								
Slope of Segment	GIS	Chad Packard/ Britton Miller/ Balmores Marin	Segment has completely flat terrain with good / safe construction and maintenance access.	Terrain is moderately sloped or curved (slopes greater than 3%, less than 5%). Good / safe construction and maintenance access.	Terrain is steep and/or rugged for a portion of the segment. Average access for construction and maintenance.	Majority of segment is very steep and/or rugged terrain (slope greater than 5%, less than 8%). Poor access for construction and maintenance.	Entire segment slope greater than 8.0%. Entire segment is hilly with minimal opportunities to work around the slopes.	Does not meet project objectives (Provide detailed explanation).
Remove / Replace Existing Structures	SCE	Chad Packard/ Britton Miller/ Balmores Marin	Existing transmission structures along segment and/or substructure with vacancy available. Minimal replacements or upgrade only anticipated.	Possible modifications to existing transmission structures to accommodate new circuit or line.	New structures required. No existing distribution or subtransmission facilities present.	New structures required; would require some relocation of existing transmission.	New structures required; requires significant effort to accommodate subtransmission or transmission.	Does not meet project objectives (Provide detailed explanation).

Cal City Substation 115 kV Upgrade Project
Attachment B: Score Criteria Sheet

Category	Responsible Company	Responsible Party	Scoring Criteria					
			1	2	3	4	5	F
Pole/Tower Design	SCE	Chad Packard/ Britton Miller/ Balmores Marin	Standard SCE overhead construction throughout.	Standard SCE overhead construction with minimal custom or specialized engineering necessary.	Mixed standard and non-standard design towers.	Multiple engineered TSP or tower using non-standard structures with complicated design factors.	Unique structures require high level of engineering. Non-standard design	Does not meet project objectives (Provide detailed explanation).
Permits and Restrictions	SCE	Chad Packard/ Britton Miller/ Balmores Marin	Low-impact permits anticipated along transmission route segment. Based on anticipated permit type(s), permits would not be anticipated to add significant time or cost to the project.	Medium-impact permits anticipated along transmission route segment anticipated to add minimal time or cost to the project.	Multiple medium and low impact permits anticipated along transmission route segment. Permitting process could add time and/or moderate costs to the project.	Multiple permits likely, including at least one of a more time consuming / costly nature (e.g. airport, flood control crossing, caltrans ROW, etc.) and/or large amount of unknown information about required permits.	Multiple permits required with a degree of complexity expected to add time and cost to the project.	Does not meet project objectives (Provide detailed explanation).
Surface and Subsurface Obstacles (Visual Observation Only)	SCE	Chad Packard/ Britton Miller/ Balmores Marin	No apparent overhead or underground obstacles (pipes, trees, etc.)	A few known overhead or underground obstacles which can be avoided with little effort.	Multiple underground and/or overhead obstacles. Can be mitgated.	Multiple underground and/or overhead obstacles. Requires extensive effort to mitigate.	Extensively known underground or overhead obstacles which negate any possibility of mitigation in route segment.	Does not meet project objectives (Provide detailed explanation).
Difficulty Scheduling Outages on Existing Lines to Proceed with Construction	SCE	Chad Packard/ Britton Miller/ Balmores Marin	No outages required.	Outages required. (Switchable).	Multiple outages Trans and Distribution required. (Switchable).	Outage restriction. Requires PM and Weekend work.	Major Outage Required. Customer Outage. May require temporary line construction.	Does not meet project objectives (Provide detailed explanation).
Availability of ROW for O&M	SCE	Chad Packard/ Britton Miller/ Balmores Marin	Likely no new ROW required.	Possible existing ROW of sufficient width. Likely able to use existing ROW pending Rights Check information.	Existing distribution route along segment. Upgraded rights likely required.	ROW width slightly deficient. Special and / or more numerous structures required.	All new ROW required. Extremely steep and/or rugged terrain. Poor access for maintenance.	Does not meet project objectives (Provide detailed explanation).
Terrain along Segment	SCE	Chad Packard/ Britton Miller/ Balmores Marin	Terrain flat with good maintenance access.	Terrain moderately sloped/curved. Good maintenance access.	Very steep and/or rugged terrain. Average access for maintenance.	Special and/or more numerous structures required. Very steep and/or rugged terrain. Poor access for maintenance.	Special and/or more numerous structures required. Extremely steep and/or rugged terrain. Poor access for maintenance.	Does not meet project objectives (Provide detailed explanation).
Access to the Segment for Construction / Operations	SCE	Chad Packard/ Britton Miller/ Balmores Marin	Existing roads/streets to the segment; sufficient turning space for large vehicles and loads.	Existing access to the segment. Minimal additional grading / construction would be required.	Some existing and some new roads required to access segment. Spur roads may be necessary. (Please indicate approximate percent of segment for which new road would be required).	Majority of segment will require new access roads and/or spur roads.	Lengthy, level, relatively straight road has to be built to get to the segment. Segment is not accessible.	Does not meet project objectives (Provide detailed explanation).



Category	Responsible Company	Responsible Party	Scoring Criteria					
			1	2	3	4	5	F
Constructability - Trans Project Delivery								
Slope of Segment for Access Roads	SCE	Joel Bondoc	Segment has completely flat terrain with good / safe construction and maintenance access.	Terrain is moderately sloped or curved (slopes greater than 3%, less than 5%). Good / safe construction and maintenance access.	Terrain is steep and/or rugged for a portion of the segment. Average access for construction and maintenance.	Majority of segment is very steep and/or rugged terrain (slope greater than 5%, less than 8%). Poor access for construction and maintenance.	Entire segment slope greater than 8.0%. Entire segment is hilly with minimal opportunities to work around the slopes.	Does not meet project objectives (Provide detailed explanation).
Constructability-Pole/Tower Design for Subtransmission	SCE	Joel Bondoc	Standard SCE overhead construction throughout.	Standard SCE overhead construction with switches, taps or underbuild.	Engineered TSPs, high speed or 3-way switches. riser poles or underbuild.	Multiple engineered TSP w/ taps, risers, switches and/or underbuild.	Unique structures require high level of engineering. Non-standard design (i.e. all tubular steel pole line and / or lattice towers).	Does not meet project objectives (Provide detailed explanation).
Constructability - Permits and Restrictions	SCE	Joel Bondoc	Low-impact permits anticipated along transmission route segment. Based on anticipated permit type(s), permits would not be anticipated to add significant time or cost to the project.	Medium-impact permits anticipated along transmission route segment anticipated to add minimal time or cost to the project.	Multiple medium and low impact permits anticipated along transmission route segment. Permitting process could add time and/or moderate costs to the project.	Multiple permits likely, including at least one of a more time consuming / costly nature (e.g. airport, flood control crossing, caltrans ROW, etc.) and/or large amount of unknown information about required permits.	Multiple permits required with a degree of complexity expected to add time and cost to the project.	Does not meet project objectives (Provide detailed explanation).
Surface and Subsurface Obstacles (Visual Observation Only)	SCE	Joel Bondoc	No apparent overhead or underground obstacles (pipes, trees, etc.)	A few known overhead or underground obstacles which can be avoided with little effort.	Multiple underground and/or overhead obstacles. Can be mitgated.	Multiple underground and/or overhead obstacles. Requires extensive effort to mitigate.	Extensively known underground or overhead obstacles which negate any possibility of mitigation in route segment.	Does not meet project objectives (Provide detailed explanation).
Access to the Segment for Construction	SCE	Joel Bondoc	Existing roads/streets to the segment; sufficient turning space for large vehicles and loads.	Existing access to the segment. Minimal additional grading / construction would be required.	Some existing and some new roads required to access segment. Spur roads may be necessary. (Please indicate approximate percent of segment for which new road would be required).	Majority of segment will require new access roads and/or spur roads.	Lengthy, level, relatively straight road has to be built to get to the segment. Segment is not accessible.	Does not meet project objectives (Provide detailed explanation).
Access Roads Needed for Construction	SCE	Joel Bondoc	Existing roads and ROWs acceptable. No access concerns at this time.	Existing roads and ROWs require some minor grading.	Existing roads and ROWs require minor grading and tree trimming. If possible, document approximate location and length of access roads needed.	Existing roads and ROWs require major grading, tree trimming and removal (permits required). If possible, document approximate location and length of access roads needed.	No existing access. Requires new roads. Major grading and tree trimming and removal. Potential fly-in location.	Does not meet project objectives (Provide detailed explanation).
Terrain along Segment	SCE	Joel Bondoc	Terrain flat with good maintenance access.	Terrain moderately sloped/curved. Good maintenance access.	Very steep and/or rugged terrain. Average access for maintenance.	Special and/or more numerous structures required. Very steep and/or rugged terrain. Poor access for maintenance.	Special and/or more numerous structures required. Extremely steep and/or rugged terrain. Poor access for maintenance.	Does not meet project objectives (Provide detailed explanation).

Category	Responsible Company	Responsible Party	Scoring Criteria					
			1	2	3	4	5	F

Existing distribution route along segment. Upgraded rights likely required.	ROW width slightly deficient. Special and / or more numerous structures required.	All new ROW required. Extremely steep and/or rugged terrain. Poor access for construction.	Does not meet project objectives (Provide detailed explanation).
Electrical Needs - Field Engineering								
Difficulty Scheduling Outages on Existing Lines to Proceed with Construction	SCE	Haroun Idris	No outages required.	Outages required. (Switchable).	Multiple outages Trans and Distribution required. (Switchable).	Outage restriction. Requires PM and Weekend work.	Major Outage Required. Customer Outage. May require temporary line construction.	Does not meet project objectives (Provide detailed explanation).
Remove / Replace / Relocate Existing Distribution Structures	SCE	Haroun Idris	No new distribution facilities needed along segment and no distribution crossings.	Possible modifications to existing structures to accommodate distribution facilities needed for project or to accommodate crossing of existing distribution facilities.	Some relocation or replacement of existing structures required to accommodate crossing of existing distribution facilities.	Some new structures required; would require some relocation or replacement of existing structures.	New structures required; requires significant effort to accommodate distribution needs.	Does not meet project objectives (Provide detailed explanation).
Civil Engineering - Access Roads								
Access to the Segment for Construction / Operations	SCE	Ruben Mazzei	Existing roads/streets to the segment; sufficient turning space for large vehicles and loads.	Existing access to the segment. Minimal additional grading / construction would be required.	Some existing and some new roads required to access segment. Spur roads may be necessary. (Please indicate approximate percent of segment for which new road would be required).	Majority of segment will require new access roads and/or spur roads.	Lengthy, level, relatively straight road has to be built to get to the segment. Segment is not accessible.	Does not meet project objectives (Provide detailed explanation).
Access Roads Needed	SCE	Ruben Mazzei	Existing roads and ROWs acceptable. No access concerns at this time.	Existing roads and ROWs require some minor grading.	Existing roads and ROWs require minor grading and tree trimming. If possible, document approximate location and length of access roads needed.	Existing roads and ROWs require major grading, tree trimming and removal (permits required). If possible, document approximate location and length of access roads needed.	No existing access. Requires new roads. Major grading and tree trimming and removal. Potential fly-in location.	Does not meet project objectives (Provide detailed explanation).

Category	Responsible Company	Responsible Party	Scoring Criteria 1	2	3	4	5	F
EMF								
Setbacks from Prioritized Land Uses	GIS	Bradley Jacobsen	Near undeveloped, agricultural, or US Forest Service land	Near recreational or park lands	Site is located near commercial, industrial or, agricultural or undeveloped lands with scattered residences	Near more densely populated residential areas, licensed day care and hospitals, or schools (but beyond the CDE setback guidance - see "Score 5")	Within CDE guidance setbacks from a school: 66 and 115kV lines - 100 feet, 230 kV lines - 150 feet, and 500 kV lines - 350 feet	Does not meet project objectives (Provide detailed explanation).
Geology								
Adverse Soil Conditions Along Segment	Insignia	Rob Curley	No known adverse soil conditions along segment.	Low likelihood for adverse soil conditions along segment.	--	--	Documented adverse soil conditions along segment.	Does not meet project objectives (Provide detailed explanation).
Erosion Potential	Insignia	Rob Curley	No problem	Low likelihood of erosion potential.	Moderate likelihood of erosion potential.	--	High likelihood of erosion potential.	Does not meet project objectives (Provide detailed explanation).
Flooding Potential	GIS	Bradley Jacobsen	No visible watercourse or natural drainage on or near the segment.	--	--	--	Serious documented flood hazards associated with the segment.	Does not meet project objectives (Provide detailed explanation).
Slope Stability/Landslide Hazards	Insignia	Rob Curley	No documented landslides at or surrounding the segment.	--	--	--	Major, documented landslide at or directly above the segment.	Does not meet project objectives (Provide detailed explanation).
Liquefaction Potential	GIS	Bradley Jacobsen	Very low or no liquefaction potential.	--	--	--	Very high liquefaction potential.	Does not meet project objectives (Provide detailed explanation).
Fault Rupture Hazard Zones	GIS	Bradley Jacobsen	No active or potentially active documented faults crossing adjacent to or beneath the segment.	--	--	--	Presence of documented active fault (or A-P Fault Rupture Hazard Zone) crossing adjacent to or beneath the segment.	Does not meet project objectives (Provide detailed explanation).
Soil Contamination	GIS	Bradley Jacobsen	No or very low likelihood of soil contamination.	Low likelihood of soil contamination.	Moderate likelihood of soil contamination.	--	High likelihood of soil contamination.	Does not meet project objectives (Provide detailed explanation).
Land Acquisition								
Easement/Rights Required	GIS	Bradley Jacobsen	No new rights required; franchise; or, existing corridor with sufficient rights for proposed segment.	Lands underlying segment owned by a partnership / trust; business; corporation; multiple owners; or, would require an upgrade of existing rights on government-owned lands.	Lands underlying segment owned by City, State or County.	Lands underlying segment have federal ownership and SCE has no existing rights; or encroachments are visible along all or a portion of the segment (based on field observation).	All new easement acquision required.	Does not meet project objectives (Provide detailed explanation).
Land Use								
Zoning / General Plan Land Use(s) Surrounding the Segment	Insignia	Lily Matlof	Industrial	Business Park / Office, Agriculture	Commercial	Residential, Mixed Use	Public Facilities (school, hospital, library, etc.), Park, Open Space, Recreation, Airport, Utilities	Does not meet project objectives (Provide detailed explanation).

Category	Responsible Company	Responsible Party	Scoring Criteria					
			1	2	3	4	5	F
Existing Land Use(s) Surrounding the Segment	Insignia	Lily Matlof	Vacant, Industrial	Business Park / Office, Agriculture	Commercial	Residential, Mixed Use	Public Facilities (school, hospital, library, etc.), Park, Open Space, Recreation, Airport, Utilities	Does not meet project objectives (Provide detailed explanation).
Special Districts, Specific Plans, Redevelopment Project Area	Insignia	Lily Matlof	Route segment is not located in a special district, specific plan or redevelopment project area.	Potential for Specific Plan (e.g. General Plan has called it out but Plan is not developed and/or approved yet). Site is in the sphere of influence of a city and / or is in a County Area Plan.	Route segment is located in a Specific Plan, designated Scenic Highway corridor, or in an area with design / development guidelines (e.g. lighting, walls, landscaping).	Route segment is in a Special District, has an Overlay Zone or is part of a Redevelopment Project Area.	Multiple plans / overlay zones are applicable to the site.	Does not meet project objectives (Provide detailed explanation).
Airport Land Use Plan	GIS	Bradley Jacobsen	Route is not located in an Airport Land Use Plan Area.	Route is 20,000 feet from the nearest point of the nearest runway. May interfere with ancillary airport uses.	Route is located in Zone E (Other Airport Environs) of an Airport Land Use Plan. Airspace Review will be required for structures over 100 feet tall.	Route is located in Zone C (Extend Approach / Departure Zone) or D (Primary Traffic Patterns and Runway Buffer Area) of an Airport Land Use Plan. Airspace Review required for structures over 70 feet tall.	Route is located in Zone B1 (Inner Approach / Departure Zone) or B2 (Adjacent to Runway) of an Airport Land Use Plan. Airspace review required for structures over 35 feet tall.	Does not meet project objectives (Provide detailed explanation).
IT/Telecom								
Cable Distance to Existing Telecom Facilities	SCE	Fred Moreno	No distance; co-located.	Within 1/2 mile.	1/2 mile to 1 mile.	1 to 3 miles.	More than 3 miles.	Does not meet project objectives (Provide detailed explanation).
Telecommunications Permitting Requirements (ROW, easements, franchise, etc.)	SCE	Fred Moreno	No permits or restrictions likely for telecom route.	One jurisdiction; few permits likely.	One jurisdiction; potential for one crossing (freeway, railroad, flood control, etc.) based on the route segment location.	Multiple jurisdictions; Rule 20 areas; freeway crossings; railroad crossings; potential for multiple crossings.	Outside of SCE territory; federal lands/agencies (USFS, BLM, Army Corps, military, etc.); Large number/multiple easements could be required.	Does not meet project objectives (Provide detailed explanation).
Telecommunications Route Constructability	SCE	Fred Moreno	Existing, accessible OH pole line along route segment.	Some existing OH and some new OH with potential existing UG available along segment.	Combination of existing and new OH and UG telecom lines likely along segment.	All new OH and/or UG telecom lines likely along segment.	All new UG telecom lines required along segment.	Does not meet project objectives (Provide detailed explanation).
Wildfire								
Fire Threat	GIS	Bradley Jacobsen	Outside CPUC fire threat areas	--	Inside CPUC fire threat zone 2	Inside CPUC fire threat zone 3	--	Does not meet project objectives (Provide detailed explanation).
Fire Severity	GIS	Bradley Jacobsen	Outside FRAP fire severity zones	Inside moderate frap zone	Inside high frap zone	Inside very high frap zone	--	Does not meet project objectives (Provide detailed explanation).

ATTACHMENT D: OCC RESULTS SUMMARY

ATTACHMENT D: OCC RESULTS SUMMARY

Category	Factor	Opportunity	Concern	Constraint
Aesthetics	Visual Character/Quality	Southern California Edison (SCE) operates multiple existing overhead powerlines within the study area. Existing transmission and subtransmission lines were identified within California City and Randsburg, and along United States (U.S.) Highway 395, State Route (SR) 58, SR-14, and Redrock Ransburg Road.	Zoning for residential housing, schools, and parks were identified throughout the entire study area, particularly within and in the vicinity of California City.	No areas with pristine environment, with view corridors, or naturally evolving landscape character; or residential area with lots of existing or future vantage points were identified within the study area.
	Locally Valued Places		No areas within 500 feet of an identified or eligible place, landmark or structure in California Registry of Historic Resources (CRHR) or identified in the City/County General Plans as a place of relevance were identified within the study area.	No areas within 100 feet of an identified or eligible place, landmark or structure in CRHR or identified in the City/County General Plans as a place of relevance were identified within the study area.
	Scenic Highways		SR- 58, also known as the Mojave-Barstow Highway, runs through the southern portion of the study area from South 10th Street to Kramer Station Road. In addition, SR-14 runs along the western border of the study area from the intersection of SR-14 and SR-58 to Red Rock Canyon State Recreation Area.	SR-58 runs through the southern portion of the study area from South 10th Street to Kramer Station Road. In addition, SR-14 runs along the western border of the study area from the intersection of SR-14 and SR-58 to Red Rock Canyon State Recreation Area.
Biology	Water Bodies		Jurisdictional water features were identified throughout the study area.	
	Special-status Species Critical Habitat		Desert tortoise critical habitat areas were identified within the northern and eastern portions of the study area.	No federally designated critical habitat for fully protected species was identified in the study area.
	Special-status Species		Suitable habitat for a variety of special-status species was identified throughout the entire study area in undeveloped locations.	No fully protected species are known to occur in the study area.
Community	Community Development Guidelines	Designated utility corridors were identified around the borders of the study area, specifically along SR-14 in the west and U.S. Highway 395 in the east.		
	Planned Future Development			Large portions of the study area have been planned for future residential development, primarily around 20 Mule Team Parkway Road and in the vicinity of the existing Cal City Substation.
Cultural Resources	Cultural Resource Probability		Areas with a moderate or higher probability of encountering significant archaeological/historical resources were identified around the Mojave-Barstow Highway between the Mojave Airport and U.S. Highway 395, SR-14 and Redrock Randsburg Road into Randsburg, and Twenty Mule Team Parkway Road into California City.	One area with a high probability of encountering significant archaeological/historical resources was identified southeast of California City between Hacienda Road and California City Boulevard.
Design	Availability of ROW	One existing SCE power line ROW with sufficient properties to accommodate an additional 115 kilovolt (kV) power line was identified along Mojave-Barstow Highway from Muroc Road to U.S. Highway 395, continuing north along the highway towards Randsburg.	Multiple existing SCE power line ROWs with the potential to accommodate an additional 115 kV power line have been identified throughout the study area.	One existing SCE power line ROW without the potential to accommodate an additional 115 kV power line was identified to the east of California City Boulevard between Sequoia Boulevard and North Base Road.

Category	Factor	Opportunity	Concern	Constraint
Geology	Flooding Potential		Multiple flood zones were identified throughout the entire study area.	
	Liquefaction Potential		No areas with very high liquefaction potential were identified within the study area.	
	Fault Rupture Hazard Zones		Documented active faults (or A-P Fault Rupture Hazard Zones) were identified throughout the entire study area with a particular concentration in the northwest portion of the study area.	
	Soil Contamination		Multiple parcels with potential known soil contamination were identified throughout the study area, particularly in the vicinity of the Rio Tinto mining facility in the southeast portion of the study area.	
	Paleo Sensitivity		Marine and nonmarine sedimentary rock resources have been identified throughout the entire study area.	
Hazards	Proximity to Natural Gas Pipeline		One underground natural gas pipeline was identified in the southeast portion of the study area along Rosario Avenue south of East State Highway 58.	One underground natural gas pipeline was identified in the southeast portion of the study area along Rosario Avenue south of East State Highway 58.
Land Acquisition	Easement/Rights Required		A large portion of the study area within San Bernardino County and north of California City is managed by the Bureau of Land Management (BLM). Additional BLM land is dispersed throughout the center of the study area. Edwards Air Force Base is located in the southern portion of the study area. The northern and eastern portions of the study area are within DRECP Desert Tortoise Conservation Areas. Fremont-Kramer Reserve is located in the northern portion of the study area. Other areas where SCE has no existing rights include Fremont Valley Ecological Reserve and Red Rock Canyon State Park.	Future development parcels and conservation easements were identified throughout the study area, particularly northeast of California City along 20 Mule Team Parkway Road between 140th Street and Tulare Street. In addition, a potential conservation easement is located west of Rio Tinto's mining facility just north of SR-58.
Land Use	Zoning/General Plan Land Use(s)		Multiple schools, recreational facilities and parks were identified within California City, Randsburg, Boron and North Edwards. Galileo Park is located directly off of 20 Mule Team Parkway Road between Rutgers Road and Bucknell Road. One existing off-highway vehicle (OHV) designated area located on BLM land was identified 2 miles north of California City, spanning northeast for approximately 12 miles.	Multiple schools, recreational facilities and parks were identified within California City, Randsburg, Boron and North Edwards. Galileo Park is located directly off of 20 Mule Team Parkway Road between Rutgers Road and Bucknell Road. One OHV designated area located on BLM land was identified 2 miles north of California City, spanning northeast for approximately 12 miles.
	Airport Land Use Plan		California City Airport is located 2.75 miles northwest of Cal City Substation. The Mojave-Barstow Airport Land Use Plan extends into the southwest portion of the study area.	California City Airport is located 2.75 miles northwest of Cal City Substation.
	Existing Land Use(s) on the Site (Physical)	Industrial zoned parcels were identified in the vicinity of Rio Tinto's mining facility in the southeast portion of the study area.	Existing residential zoning was identified within California City and along Twenty Mule Team Parkway Road, north of California City along Neuralia Road, east between George Boulevard and Rosewood Boulevard, and south along California City Boulevard. In addition, North Edwards, Boron, Kramer and Randsburg have existing residential zoning.	Mining land was identified in the southeast portion of the study area north of Suckow Road and east of Gephart Road. Solar fields and a car testing facility are located north of California City along Neuralia Road. An additional car testing facility is located southwest of California City within the study area.
Wildfire	Fire Threat		No areas within Zone 2 or 3 of the California Public Utilities Commission's (CPUC's) High Fire Threat District were identified within the study area.	
	Fire Severity		No areas within a high or very high California Department of Forestry and Fire Protection (CAL FIRE) Fire Severity Zone were identified within the study area.

Mitigation Monitoring, Compliance, and Reporting Program

This page intentionally left blank

DRAFT MITIGATION MONITORING, COMPLIANCE, AND REPORTING PROGRAM

Southern California Edison's Cal City Substation 115 kV Upgrade Project

(APPLICATION NO. A.23-03-005)

Introduction

This document describes the mitigation monitoring, compliance, and reporting program (MMCRP) for ensuring the effective implementation of the mitigation measures required for the California Public Utilities Commission (CPUC) approval of the Southern California Edison (SCE) application to construct, operate, and maintain the Cal City Substation 115 kV Upgrade Project (Project). The MMCRP includes all measures proposed by SCE, also referred to as Applicant Proposed Measures (APMs) and Best Management Practices (BMPs), and all mitigation measures identified by the CPUC to reduce potentially significant impacts. All APMs, BMPs, and mitigation measures are presented in **Table N-1** provided at the end of this MMCRP.

If the Project is approved by the CPUC, this MMCRP would serve as a self-contained general reference for the Mitigation Monitoring, Compliance, and Reporting Program adopted by the CPUC for the Project. If and when the Project is approved by the Commission, the CPUC will compile the Final Plan from the MMCRP in the Final Environmental Impact Report (FEIR), as adopted.

MMCRP Authority

The California Public Utilities Code in numerous places confers authority upon the CPUC to regulate the terms of service and the safety, practices, and equipment of utilities subject to its jurisdiction. It is the standard practice of the CPUC, pursuant to its statutory responsibility to protect the environment, to require that mitigation measures stipulated as conditions of approval are implemented properly, monitored, and reported on. In 1989, this requirement was codified statewide as Section 21081.6 of the Public Resources Code. Section 21081.6 requires a public agency to adopt a reporting or monitoring program when it adopts an environmental impact report for a project that could have potentially significant environmental effects. California Environmental Quality Act (CEQA) Guidelines Section 15097 was added in 1999 to further clarify lead agency requirements for mitigation monitoring and reporting.

The purpose of an MMCRP is to ensure that measures adopted to mitigate or avoid significant impacts of a project are implemented. The CPUC views the MMCRP as a working guide to

facilitate not only the implementation of mitigation measures by the project proponent, but also the monitoring, compliance, and reporting activities of the CPUC and any monitors it may designate.

The CPUC will address its responsibility under Public Resources Code Section 21081.6 when it takes action on SCE's application. If the CPUC approves the application, it will also adopt an MMCRP that includes the mitigation measures ultimately made conditions of approval by the CPUC. Because the CPUC must decide whether or not to approve the SCE application and because the application may cause either direct or reasonably foreseeable indirect effects on the environment, CEQA requires the CPUC to consider the potential environmental impacts that could occur as the result of its decision and to consider mitigation for any identified significant environmental impacts.

If the CPUC approves SCE's application to construct and operate the Project, SCE would be responsible for implementation of all of the adopted Applicant Proposed Measures (APM), BMPs, and mitigation measures governing the construction, operation, and maintenance of the Project. Though other federal, State, and local agencies would have permit and approval authority over some aspects of the Project, the CPUC would continue to act as the lead agency for monitoring compliance with all mitigation measures required by the adopted FEIR. All approvals and permits obtained by SCE, the Applicant, would be submitted to the CPUC prior to starting the activity for which the permits and approvals were obtained.

Primary Components of the Project

In accordance with CEQA, the CPUC reviewed the impacts that would result from approval of the application. The activities considered include construction and operation of subtransmission lines, substation and switchyard upgrades, distribution, and telecommunications components. The Project's primary components and subtransmission line lengths are identified below.[1]

The following facilities would be installed for the new Kramer–Cal City 115 kV Subtransmission Line:

- Approximately 685 single-circuit lightweight steel (LWS) poles and tubular steel poles (TSPs).
- Approximately 42 circuit-miles of new 954 SAC Magnolia and/or 954 Aluminum Core. Steel Reinforced (ACSR) Rail conductor in a single-circuit configuration on new poles.
- Approximately 42 miles of optical ground wire (OPGW) on new poles.
- Marker balls on OPGW, as required.

The following facilities would be installed for the new Cal City–Edwards-Holgate 115 kV Subtransmission Line:

- Approximately 463 single-circuit LWS poles (including LWS H-frames) and TSPs.

[1] The facilities listed here are for the Project as proposed. In its final decision, the Commission may elect to approve a project that was not proposed by SCE. In the event that the approved project varies from the proposed Project, the final MMCRP will be revised to identify the primary components of the approved project.

- Approximately 28 circuit miles of new 954 SAC Magnolia and/or 954 ACSR Rail conductor in a single-circuit configuration on new poles.
- Approximately 28 miles of OPGW on new poles.
- Approximately 1,600 feet of all-dielectric self-supporting fiber optic cable on new poles connecting into the Cal City Substation.
- Marker balls on OPGW, as required.

The existing 5-acre Cal City Substation would be expanded by approximately 10 acres. Substation improvements would consist of demolition of the existing 33/12 kV substation facility infrastructure and installation of a new five-position 115 kV switchrack, a new five-position 33 kV switchrack, and a new 21-position 12 kV switchrack with vacuum circuit breakers and other equipment at the Cal City Substation. Improvements and telecommunications upgrades at the Kramer and Edwards substations and Holgate Switchyard are also proposed as part of the Project.

Based on the analysis in the EIR and the substantial evidence supporting the analysis, it has been determined that all significant environmental impacts of the Project would be avoided or reduced to below significant level with the incorporation of all feasible mitigation measures with the exception of aesthetics, noise, recreation, and tribal cultural resources.

Roles and Responsibilities

As the lead agency under CEQA, the CPUC is responsible for monitoring the Project to ensure that the required mitigation measures and proposed APMs and BMPs are implemented, as described in the EIR. The CPUC will be responsible for ensuring full compliance with the provisions of the MMCRP and has primary responsibility for implementation of the monitoring program. The purpose of the monitoring program is to document that the mitigation measures, APMs, and BMPs required and relied upon by the CPUC are implemented and that mitigated environmental impacts are reduced. The CPUC has the authority to halt any activity associated with the Project if the activity is determined to be a deviation from the approved Project or the adopted APMs, BMPs, and mitigation measures.

The CPUC may delegate duties and responsibilities for monitoring to third-party mitigation monitors or consultants as deemed necessary. The CPUC will ensure that the person(s) delegated any duties or responsibilities are qualified to monitor compliance.

The CPUC and its mitigation monitors will ensure that any variance process, which will be designed specifically for the Project, or deviation from the procedures identified under the monitoring program, is consistent with CEQA requirements. No Project variance will be approved by the CPUC if it creates a new significant environmental impact. As defined in this MMCRP, a variance should be strictly limited to minor Project changes that will not trigger other permit requirements, that does not increase the severity of an impact or create a new impact, and that clearly and strictly complies with the intent of the mitigation measure and/or Project. A change to the Project that has the potential for creating significant environmental effects will be evaluated to determine whether supplemental CEQA review is required. Any proposed deviation from the

approved Project and adopted mitigation measures, including correction of such deviation, shall be reported immediately to the CPUC and the SCE Mitigation Monitor assigned to the construction for their review and CPUC approval. In some cases, a variance also may require approval by a CEQA responsible agency.

Enforcement and Responsibility

The CPUC is responsible for enforcing the procedures for monitoring through the environmental monitor. The environmental monitor shall note problems with monitoring, notify appropriate agencies or individuals about any problems, and report the problems to the CPUC. The CPUC has the authority to halt any construction, operation, or maintenance activity associated with the Project if the activity is determined to be a deviation from the approved Project or adopted APMs, BMPs, or mitigation measures. The CPUC may assign its authority to its environmental monitor.

Mitigation Compliance Responsibility

SCE is responsible for successfully implementing all of the adopted APMs, BMPs, and mitigation measures identified in Table N-1. The MMCRP contains defined success criteria. Standards for successful mitigation also are implicit in many mitigation measures that include such requirements as obtaining permits or avoiding a specific impact entirely. Additional mitigation success thresholds will be established by applicable agencies with jurisdiction through the permit process and through the review and approval of specific plans for the implementation of mitigation measures.

SCE shall inform the CPUC and its third-party compliance monitor in writing of any mitigation measures that are not or cannot be successfully implemented. The CPUC, in coordination with its mitigation monitor, will assess whether substitute mitigation is appropriate and specify to SCE the subsequent actions required.

Dispute Resolution Process

The MMCRP is expected to reduce or eliminate potential disputes between CPUC staff and SCE concerning implementation of the adopted APMs, BMPs, and mitigation measures. Issues should first be addressed informally at the field level between the CPUC Environmental Monitoring Team and the SCE Environmental Compliance Team with questions that may be raised to the SCE Project Manager or Construction Manager, as necessary. Should the issue not be resolved at the field level, the following procedure will be observed for dispute resolution between CPUC staff and SCE:

- Disputes and complaints should be directed first to the CPUC's designated Project Manager for resolution. The Project Manager will attempt to resolve the dispute.
- Should this informal process fail, the CPUC Project Manager may initiate enforcement or compliance action to address deviations from the approved Project or MMCRP.

General Monitoring Procedures

Mitigation Monitor

Many of the monitoring procedures will be conducted during the construction phase of the Project. The CPUC and SCE's designated Mitigation Monitor are responsible for integrating the mitigation monitoring procedures into the construction process in coordination with SCE. To oversee the monitoring procedures and to ensure success, the Mitigation Monitor assigned to the construction must be on site during that portion of construction that has the potential to create a significant environmental impact or other impact for which mitigation is required. The Mitigation Monitor is responsible for ensuring that all procedures specified in the MMCRP are followed.

Construction Personnel

A key feature contributing to the success of mitigation monitoring will be obtaining the full cooperation of construction personnel and supervisors. Many of the mitigation measures, APMs, and BMPs require action on the part of the construction supervisors or crews for successful implementation. To ensure success, the following actions, detailed in specific measures included in the MMCRP, will be taken:

- SCE shall require all contractors to comply with the conditions of Project approval, including all applicable APMs, BMPs, and mitigation measures.
- One or more pre-construction meetings will be held to inform and train all construction personnel and staff about the requirements of the MMCRP.
- A written summary of mitigation monitoring procedures will be provided to construction supervisors for all adopted APMs, BMPs, and mitigation measures that require their attention.

General Reporting Procedures

Site visits and specified monitoring procedures performed by third-party individuals will be reported to SCE's Mitigation Monitor assigned to the construction. A monitoring record form will be submitted to the Mitigation Monitor by the individual conducting the visit or procedure so that details of the visit can be recorded and progress tracked by the Mitigation Monitor. A checklist will be developed and maintained by the mitigation Monitor to track all procedures required for each mitigation measure and to ensure that the timing specified for the procedures is adhered to. The Mitigation Monitor will note any problems that may occur and take appropriate action to rectify the problems. SCE shall provide the CPUC with written quarterly reports of the Project, which shall include progress of construction, resulting impacts, mitigation implemented, and all other noteworthy elements of the Project. Quarterly reports shall be required as long as mitigation measures are applicable.

Public Access to Records

The public is allowed access to records and reports used to track the monitoring program. Monitoring records and reports will be made available for public inspection by the CPUC on request. The CPUC and SCE will develop a filing and tracking system

Condition Effectiveness Review

In order to fulfill its statutory mandates to mitigate or avoid significant effects on the environment and to design a MMCRP to ensure compliance during project implementation (Pub. Res. Code §21081.6):

- The CPUC may conduct a comprehensive review of conditions that do not effectively mitigating impacts at any time it deems appropriate, including as a result of the Dispute Resolution procedure outlined above; and
- If in either review, the CPUC determines that any conditions are not adequately mitigating significant environmental impacts caused by the project, or that recent proven technological advances could provide more effective mitigation, then the CPUC may impose additional reasonable conditions to effectively mitigate these impacts.

These reviews will be conducted in a manner consistent with the CPUC's rules and practices.

Mitigation Monitoring, Compliance, and Reporting Program

Table N-1, below, presents a compilation of the proposed APMs and BMPs and the recommended mitigation measures. The purpose of the table is to provide a single comprehensive list of the proposed APMs and BMPs and recommended mitigation measures, monitoring and reporting requirements, and timing. SCE proposed APMs and BMPs to minimize environmental impacts associated with implementation of the Project. In some instances, APMs have been superseded by CPUC-recommended mitigation measures, as described in the EIR. The table below identifies only those APMs that have not been superseded and will be implemented as part of the Project.

TABLE N-1
MITIGATION MONITORING, COMPLIANCE, AND REPORTING PROGRAM FOR THE CAL CITY SUBSTATION 115 KV UPGRADE PROJECT

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
Aesthetics			
APM AES-1: Glare and Color Contrast Reduction for Subtransmission Structures and Conductors. To reduce potential significant impacts associated with glare and color contrast for components of the Proposed Project, the finish on all new subtransmission structures will be non-reflective, such as steel that has been galvanized and treated to create a dulled finish or color treated or other functionally equivalent product/process. These types of finishes are designed to reduce light reflection and color contrast and help blend the structures into the landscape setting. All new subtransmission conductors shall be non-specular and non-reflective and the insulators shall be non-reflective and non-refractive to help reduce glare and minimize contrast with the surrounding environment.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during Project operation and maintenance.
APM AES-2: Substation Visual Treatments. To minimize potential significant aesthetic impacts associated with expansion of Cal City Substation, the applicant will prepare a surface treatment plan for the aboveground non-steel structural elements associated with the substation. Colors will be selected according to their ability to reduce the aesthetic impact of the substation and ancillary infrastructure. All color finishes will be flat and non-reflective. The applicant will consult with the City of California City prior to the submittal of the plan to the California Public Utilities Commission (CPUC) 60 days prior to start of construction for comments and approval.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during operation and maintenance
Mitigation Measure 3.1-2c: Treat Surfaces with Appropriate Colors, Finishes, and Textures. For all structures that are visible from moderate to highly sensitive viewing locations (e.g., Kramer–Cal City 115 kV Subtransmission Line at KOPs 2 and 3 and BLM-suggested KOP 3), SCE shall apply surface coatings with appropriate colors, finishes, and textures to most effectively blend the structures with the visible backdrop landscape. For subtransmission structures and lines that are visible from more than one sensitive viewing location, if backdrops are substantially different when viewed from different vantage points, the darker color shall be selected, because darker colors tend to blend into landscape backdrops more effectively than lighter colors, which may contrast and produce glare. At locations where a subtransmission structure and/or lines would be silhouetted against the skyline, non-reflective, light-gray colors shall be selected to blend with the sky. SCE shall develop a SCE Structure Surface Treatment Plan for the lightweight steel (LWS) poles, tubular steel poles, and any other visible structures in consultation with a visual specialist designated by CPUC, as appropriate, to ensure that the objectives of this measure are achieved. SCE shall submit the Structure Surface Treatment Plan to CPUC for review and approval at least 90 days before the start of construction.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction
Air Quality			
APM AIR-1: Tier 4 Construction Equipment. All construction equipment with rating between 100 and 750 hp will be required to use engines compliant with EPA Tier 4 non-road engine standards. In the event a Tier 4 engine is not available for any off-road construction equipment with rating at or higher than 100 hp, that documentation of the unavailability will be provided.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During all phases of construction
APM AIR-2: Dust Control. During construction, fugitive dust will be controlled by implementing the following measures: • Surfaces disturbed by construction activities will be covered or treated with a dust suppressant or water until the completion of activities at each site of disturbance.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
• Inactive, disturbed (e.g., excavated or graded areas) soil and soil piles will be sufficiently watered or sprayed with a soil stabilizer to create a surface crust, or will be covered. • Drop heights from excavators and loaders will be minimized to a distance of no more than 5 feet. Vehicles hauling soil and other loose material will be covered with tarps or maintain at least 6 inches of freeboard. • Vehicles will adhere a speed limit of 15 miles per hour on Project-specific construction routes and within temporary work areas.			
BMP WE-1, Wind Erosion Control. The construction team will apply water or other chemical dust suppressants as necessary to prevent or alleviate dust nuisance generated by construction activities. Covering small stockpiles or areas is an alternative to applying water or other dust palliatives.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction
Biological Resources			
APM BIO-GEN-1: Pre-construction biological clearance surveys and monitoring. Pre-construction clearance surveys will be performed by a qualified biologist (i.e., a biologist with the requisite education and experience to address specific resources), which may be chosen from a previously approved CPUC approved biologist, to avoid or minimize impacts on special-status plants and wildlife species, habitat, nesting birds and other sensitive biological resources in areas with the potential for resources to be present. Sensitive resources identified during the clearance survey will be either: • flagged for avoidance; • moved to outside impact areas; • avoided by implementing procedures to avoid impacts to individuals while impacting habitat (e.g., burrows, dens, etc.); • or documented based on permit authorizations. Specific details on the pre-construction survey requirements may be found within measures for each individual species. Where special-status species (e.g., reptiles, birds, mammals, and bat roosts) or unique resources (defined by regulations and local conservation plans) are known to occur and there is a potential for significant impacts, qualified biologists will monitor construction activities to ensure that impacts to special-status species, sensitive vegetation types, wildlife habitat, and unique resources are avoided and minimized.	SCE and its contractors to implement measure as defined.	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to construction as defined by related measures
APM ENV-GEN-1 WEAP: Worker's Environmental Awareness Training Program. All workers on the Proposed Project site shall be required to attend a Worker's Environmental Awareness Training Program (WEAP). Training shall inform all construction personnel of the resource protection and avoidance measures as well as procedures to be followed upon the discovery of environmental resources. The WEAP training will include, at a minimum, the following topics so crews will understand their obligations: • ESA boundaries • Housekeeping (Trash and equipment cleaning) • Safety • Work stoppage • Communication Protocol • Consequences of non-compliance	SCE and its contractors to implement measure as defined	SCE or designated contractor to develop WEAP and provide to CPUC prior to construction. SCE to maintain documentation of WEAP training (i.e., brochures, sign in sheets) and provide to CPUC prior to construction and upon request as new personnel are trained. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
APM BIO-AVI-2: Nesting Bird Management Plan. SCE shall prepare a Nesting Bird Management Plan (NBMP) in coordination with the CPUC, Bureau of Land Management (BLM), CDFW, and USFWS. The NBMP shall describe methods to minimize potential Proposed Project effects to nesting birds and avoid any potential for unauthorized take. Proposed Project-related disturbance including construction and pre-construction activities shall not proceed within 300 feet of active nests of common bird species or 500 feet of active nests of raptors or special-status bird species (except for golden eagle as described in APM BIO-AVI-4) until approval of the NBMP by the CPUC and BLM in consultation with the CDFW and USFWS. ***NBMP Content*.** The NBMP shall include: (1) definitions of default nest avoidance buffers for each species or group of species, depending on characteristics and conservation status for each species; (2) a notification procedure for buffer distance reductions should they become necessary; (3) a rigorous monitoring protocol, including qualifications of monitors, monitoring schedule, and field methods, to ensure that any Proposed Project-related effects to nesting birds will be minimized; and (4) a protocol for documenting and reporting any inadvertent contact or effects to birds or nests. The paragraphs below describe the NBMP requirements in further detail. ***Background*.** The NBMP shall include the following: 1. A summary of applicable state and federal laws and regulations, including definition of what constitutes a nest or active nest under state and federal law. 2. A procedure for amendment of the NBMP, should there be changes in applicable state or federal regulations. 3. A list of bird species potentially nesting on or near the ROW or other work areas, indicating approximate nesting seasons, nesting habitat, typical nest locations (e.g., ground, vegetation, structures, etc.), tolerance to disturbance (if known) and any conservation status for each species. This section will also note any species that do not require avoidance measures (e.g., rock pigeons). 4. A list of the types of Proposed Project construction activities that may occur during nesting season, with a short description of the noise and physical disturbance resulting from each activity. 5. Clearing of any vegetation, site preparation in open or barren areas, or other Proposed Project-related activities that may adversely affect breeding birds shall be scheduled outside the nesting season, as feasible. ***Pre-construction nest surveys*.** Pre-construction nest surveys will be conducted prior to any construction activities scheduled during the breeding period. For the Proposed Project, the breeding period will be defined as January 1 through August 31. The NBMP shall describe the proposed field methods, survey timing, and qualifications of field biologists. Field biologist qualifications will be subject to review by the CPUC and BLM. The avian biologists conducting the surveys shall be experienced bird surveyors and familiar with standard nest-locating techniques such as those described in Martin and Guepel (1993). Nest surveys will focus on visual searches for nest locations and observations of bird activities and movement to detect nesting activity (e.g., carrying nest materials or food, territorial displays, courtship behavior). Surveys shall be conducted in accordance with the following guidelines. 1. Surveys shall cover all potential nesting habitat within the ROW or other work areas within 500 feet of these areas for raptors and 300 feet for non-raptors. 2. Pre-construction surveys shall be conducted for each work area, no longer than 10 days prior to the start of construction activity. On the first day of construction at any given site, a qualified Avian Biologist will perform a pre-construction “sweep” to identify any bird nests or other resources that may have appeared since the 10-day survey.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction, during all ground disturbing and vegetation removal activities

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
3. SCE shall provide the CPUC and BLM a report describing the findings of the pre-construction nest surveys, including the time, date, and duration of the survey; identity of the surveyor(s); a list of species observed; and electronic data identifying nest locations and the boundaries of buffer zones. The electronic data set will be updated following each preconstruction nest survey throughout the nesting season. The format and contents of this report will be described in the draft NBMP and will be subject to review and approval by the CPUC and BLM. ***Nest Buffers and Acceptable Activities.*** The NBMP shall specify measures to delineate buffers on the work site, to consist of clearly visible marking and signage. Buffer locations shall be communicated to the construction contractor and shall remain in effect until formally discontinued (when each nest is no longer active). In addition, the NBMP shall specify measures to ensure the buffers are observed, including a direct communication and decision protocol to stop work within buffer areas. In some cases, active nests may be found while work is underway. Therefore, the NBMP shall include a protocol for stopping ongoing work within the buffer area, securing the work site, and removing personnel and equipment from the buffer. The NBMP shall describe proposed measures to avoid take or adverse effects to nests, such as buffer distances from active nests. These measures shall be based on the specific nature of the bird species and conservation status, and other pertinent factors. The NBMP will identify bird species (or groups of species) that are relatively tolerant or intolerant of human activities and specify smaller or larger buffer distances as appropriate for each species. If no information is available to specify a buffer distance for a species, then the NBMP shall specify 300 feet as a standard buffer distance, and 500 feet for raptors and special-status species. Nest management for listed threatened or endangered species will be prescribed in a USFWS Biological Opinion, CDFW Incidental Take Permit, or both. All applicable avoidance measures, including buffer distances, must be continued until nest monitoring (below) confirms that the nestlings have fledged and dispersed, or the nest is no longer active. For each special-status species potentially nesting within or near Proposed Project work areas, the NBMP shall specify applicable buffers and any additional nest protection measures, specialty monitoring, or restrictions on work activities, if needed. The NBMP shall identify acceptable work activities within nest buffers (e.g., pedestrian access for inspection or BMP repair) including conditions and restrictions, and any monitoring required. The NBMP shall include pictorial representation showing buffer distances for ground buffers, vertical helicopter buffers, and horizontal helicopter buffers for nests near the ground and nests in towers. ***Nest Buffer Modification or Reduction.*** At times, SCE or its contractor may propose buffer distances different from those approved in the NBMP. Buffer adjustments shall be reviewed and recommended by a qualified avian biologist, who has been approved by the CPUC and BLM in consultation with the CDFW and USFWS. The NBMP shall provide a procedure and timing requirements for notifying the CPUC, BLM, CDFW, and USFWS of any planned adjustments to nest buffers. Separate and distinct procedures will be provided for special-status birds. The NBMP will list the information to be included in buffer reduction notifications in a standardized format. ***Nest deterrents.*** The NBMP shall describe any proposed measures or deterrents to prevent or reduce bird nesting activity on Proposed Project equipment or facilities, such as buoys, visual or auditory hazing devices, bird repellents, securing of materials, and netting of materials, vehicles, and equipment. It shall also include timing for installation of nest deterrents and field confirmation to prevent effects to any active nest; guidance for the contractor to install, maintain, and remove nest deterrents according to product specifications; and periodic monitoring of nest deterrents to ensure proper installation and functioning and prevent injury or entrapment of birds or other animals. In the event that an active nest is located on Proposed Project facilities, materials or equipment, SCE will avoid disturbance or use of the facilities, materials or equipment (e.g., by red-tag) until the nest is no longer active.			

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
***Communication*.** The NBMP shall specify the responsibilities of construction monitors in regards to nests and nest issues, and specify a direct communication protocol to ensure that nest information and potential adverse impacts to nesting birds can be promptly communicated from nest monitors to construction monitors, so that any needed actions can be taken immediately. The NBMP shall specify a procedure to be implemented following accidental disturbance of nests, including wildlife rehabilitation options. It also shall describe any proposed measures, and applicable circumstances, to prevent take of precocial young of ground-nesting birds such as killdeer or quail. For example, chick fences may be used to prevent them from entering work areas and access roads. Finally, the NBMP will specify a procedure for removal of inactive nests, including verification that the nest is inactive and a notification/approval and approval process prior to removal. ***Monitoring*.** SCE shall be responsible for monitoring the implementation, conformance, and efficacy of the avoidance measures (above). The NBMP shall include specific monitoring measures to track any active bird nest within or adjacent to Proposed Project work areas, bird nesting activity, Proposed Project-related disturbance, and outcome of each nest. For nests with reduced buffers, SCE shall monitor each nest until nestlings have fledged and dispersed or until the nest becomes inactive. Nests with default buffers do not require further monitoring once construction work is completed in the area. New nests discovered after work completion in an area will not require monitoring. In addition, monitoring shall include pre-construction surveys, daily sweeps of work areas and equipment, and any special monitoring requirements for particular activities (tree trimming, vegetation removal, etc.) or particular species (noise monitoring, etc.). Nest monitoring shall continue throughout the breeding season during each year of the Proposed Project's construction activities. ***Reporting*.** Throughout the construction phase of the Proposed Project, nest locations, Proposed Project activities in the vicinity of nests (including helicopter traces), and any adjustments to buffer areas shall be updated and available to CPUC monitors on a daily basis in the Field Reporting Environmental Database (FRED). All buffer reduction notifications and prompt notifications of nest-related non-compliance and corrective actions will be made via email to CPUC monitors. In addition, the NBMP shall specify the format and content of nest data to be provided in regular monitoring and compliance reports. At the end of each year's nest season, SCE will submit an annual NBMP report to the CPUC, BLM, CDFW, and USFWS. ***Implementation locations*:** Project-wide			
APM BIO-AVI-3: *Burrowing Owl* ***Pre-construction survey*.** A pre-construction, focused burrowing owl survey will be conducted no more than 30 days prior to initial start of construction within habitat to determine if any occupied burrows are present. If occupied burrows are found, adequate buffers shall be established around burrows. Adequate buffers will be determined by a Project Avian Biologist based upon field conditions and resource agency guidelines for wintering burrows and breeding season burrows. ***Prepare Burrowing Owl Management Plan*.** SCE will develop a Burrowing Owl Management Plan for the Proposed Project. The Plan will include information related to: 1. assessment of burrow suitability; 2. replacement burrows; 3. methods for relocation; 4. monitoring and reporting; 5. implementation locations.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
***Conduct surveys and avoidance for burrowing owl*.** Burrowing owl surveys shall be conducted in accordance with the most current CDFW guidelines (CDFG, 2012; or updated guidelines as they become available). SCE shall take measures to avoid impacts to any active burrowing owl burrow within or adjacent to a work area. The default buffer for a burrowing owl burrow is 300 feet for ground construction, and 300 feet horizontal and 200 feet vertical for helicopter construction. The Nesting Bird Management Plan will specify a procedure for adjusting this buffer, if needed. Binocular surveys may be substituted for protocol field surveys on private lands adjacent to the Proposed Project site only when SCE has made reasonable attempts to obtain permission to enter the property for survey work but was unable to obtain such permission. If active burrowing owl burrows are located within Proposed Project work areas, SCE may passively relocate the owls, by preparing and implementing a Burrowing Owl Passive Relocation Plan, as described below. SCE shall prepare a draft Burrowing Owl Passive Relocation Plan for review and approval by CPUC and BLM in consultation with CDFW and USFWS prior to the start of any ground-disturbing activities. No passive relocation of burrowing owls shall be permitted during breeding season, unless a qualified biologist verifies through noninvasive methods that an occupied burrow is not occupied by a mated pair, and only upon authorization by CDFW. The Plan shall include, but not be limited to, the following elements: ***Assessment of Suitable Burrow Availability*.** The Plan shall include an inventory of existing, suitable, and unoccupied burrow sites within 300 feet of the affected Proposed Project work site. Suitable burrows will include inactive desert kit fox, ground squirrel, or desert tortoise burrows that are deep enough to provide suitable burrowing owl nesting sites, as determined by a qualified biologist. If two or more suitable and unoccupied burrows are present in the area for each burrowing owl that will be passively relocated, then no replacement burrows will need to be built. ***Replacement Burrows*.** For each burrowing owl that will be passively relocated, if fewer than two suitable unoccupied burrows are available within 300 feet of the affected Proposed Project work site, then SCE shall construct at least two replacement burrows within 300 feet of the affected Proposed Project work site, or in suitable locations within ¼ mile when suitable locations within 300 feet are not available. Burrow replacement sites shall be in areas of suitable habitat for burrowing owl nesting, and subject to minimal human disturbance and access. The Plan shall describe measures to ensure that burrow installation or improvements would not affect sensitive species habitat or any burrowing owls already present in the relocation area. The Plan shall provide guidelines for creation or enhancement of at least two natural or artificial burrows for each active burrow within the Proposed Project disturbance area, including a discussion of timing of burrow improvements, specific location of burrow installation, and burrow design. Design of the artificial burrows shall be consistent with CDFW guidelines (CDFG, 2012; or more current guidance as it becomes available) and shall be approved by the CPUC, BLM, CDFW, and USFWS. ***Methods*.** Provide detailed methods and guidance for passive relocation of burrowing owls, outside the breeding season. An occupied burrow may not be disturbed during the nesting season (generally, but not limited to, February 1 to August 31), unless a qualified biologist determines, by non-invasive methods, that it is not occupied by a mated pair. Passive relocation will include installation of one-way doors on burrow entrances that will let owls out of the burrow but will not let them back in. Once owls have been passively relocated, burrows will be carefully excavated by hand and collapsed by, or under the direct supervision, of a qualified biologist. ***Monitoring and Reporting*.** Describe monitoring and management of the replacement burrow site(s), and provide a reporting plan. The objective shall be to manage the relocation area for the benefit of burrowing			

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
owls, with the specific goal of maintaining the functionality of the burrows for a minimum of two years. Monitoring reports shall be available to the CPUC and BLM on a weekly basis. ***Implementation locations*:** Project-wide.			
APM BIO-HERP-1: Desert Tortoise ***Pre-construction surveys/Construction monitoring*.** Prior to initial ground-disturbing activities, a biological monitor under the supervision of a USFWS- or CDFW-approved biologist—with experience monitoring and handling desert tortoise—will conduct a pre-activity survey in all work areas within potential desert tortoise habitat, plus an approximately 100-foot buffer. All desert tortoise burrows within the pre-activity survey area (including desert tortoise pallets) will be prominently flagged at that time so that they may be avoided during work activities. An approved biologist will be onsite to monitor vegetation removal and grading and provide regular inspections of all other construction activities within desert tortoise habitat. The approved biologist will have the authority to halt all non-emergency actions (as soon as safely possible) that may result in harm to the desert tortoise and will assist in the overall implementation of APMs for the tortoise. In the event a desert tortoise is encountered in the work area, all work will cease, and the approved biologist will be contacted. Work will not commence until the animal has voluntarily moved to a safe distance away from the work area. If it does not move on its own within 15 minutes, an authorized biologist may remove and relocate the animal to a safe location if authorized under existing permit conditions. No tortoise will be handled except under authorization from the USFWS and CDFW. Encounters with desert tortoise will be documented and provided to the appropriate wildlife resource agencies. In the event a dead or injured desert tortoise is observed, the approved biologist will be responsible for notifying SCE's Herpetologist and reporting the incident to the wildlife resource agencies. ***Avoid and minimize impacts*.** All Proposed Project activities located within areas identified as desert tortoise habitat shall implement the following avoidance and minimization measures: 1. Under Vehicle Checks. Desert tortoises commonly seek shade during the hottest times of the day. Employees working within the geographic range of this species will be required to check under their equipment or vehicles before they are moved. If desert tortoises are encountered, the vehicle will not be moved until the tortoise has voluntarily moved away from the equipment or vehicle. 2. Disposal of Trash. Trash and food items will be contained in closed containers and removed daily to reduce attractiveness to opportunistic predators, such as common ravens (Corvus corax), coyotes (Canis latrans), and feral dogs (Canis lupus familiaris). 3. Pets Prohibited. Employees will not bring pets or other animals to the Proposed Project area, unless the animal is ADA compliant. 4. Vehicle Travel. During construction-related activities, motor vehicles will be limited to maintained roads, designated routes, and areas identified as being permanently or temporarily affected by construction within the Proposed Project footprint. Motor vehicle speeds will not exceed 15 miles per hour on Proposed Project-specific construction routes and temporary work areas within habitat for desert tortoise. 5. Trapped Animal Prevention. All auger holes, trenches, pits, or other steep-sided excavations that may pose a hazard to desert tortoise will be either constructed with escape ramps (earthen or wooden) or securely covered when unattended to prevent entrapping animals. At the start and end of each workday, and just before backfilling, all excavations will be inspected for trapped animals. If found, trapped animals will be removed by the qualified biologist and relocated to outside the Proposed Project footprint, as required in all applicable permits or habitat conservation plans.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
***Coordinate with agencies*.** SCE will obtain take coverage and consult with the USFWS, CDFW, and/or land management agencies. In addition to obtaining the necessary permits and authorizations, which may include conducting protocol surveys as required by the agencies, the Proposed Project will be included in SCE's programmatic raven management plan upon completion of construction to minimize the effects of raven predation on desert tortoises as a result of SCE infrastructure.			
APM BIO-MAM-1: Mohave Ground Squirrel ***Coordinate with CDFW*.** SCE intends to apply for a state Incidental Take Permit (ITP) for Mohave ground squirrel through the California Department of Fish and Wildlife (CDFW). In collaboration with CDFW, SCE will develop construction minimization measures and habitat conservation measures during the 2081 (b) ITP consultation. Permit conditions that will be implemented include, but are not limited to: 1. Relocation plan. An MGS relocation plan will be developed by SCE and approved by CDFW prior to the beginning of Proposed Project activities in identified MGS habitat. The relocation plan will include, but not be limited to, survey methods, timing, burrow excavation methods and implementation area, release locations, and identification of wildlife rehabilitation or veterinary facilities for injured animals. The designated biologist will be responsible for the capture, handling, and relocation of MGS. 2. Designated biologist. A qualified MGS biologist authorized by CDFW to handle MGS will be on-site or available for a same day response when Proposed Project activities occur in identified MGS habitat. 3. Biological monitors. Qualified biological monitors will monitor all construction activities in occupied habitat and areas adjacent to occupied habitat. The qualified biologist will have the authority to stop all activities with the potential to impact MGS. The qualified biologist will immediately contact the designated biologist for guidance in the event MGS are encountered. Work will not resume in that area until appropriate measures have been implemented. 4. Pre-construction surveys. Prior to initial ground-disturbing activities, a qualified MGS biologist will conduct pre-construction surveys within identified MGS habitat areas. The preconstruction surveys will identify MGS individuals or burrows for avoidance. 5. Burrow avoidance. A qualified biologist will demarcate [e.g., flagging, signage, fencing, construction maps, etc.] avoidance areas around MGS burrows as needed to prevent impacts. 6. Exclusion Fencing. Temporary Exclusion Fencing may be used to avoid MGS burrows or exclude MGS from work areas when necessary. The designated biologist will oversee exclusion fencing installation to ensure there are no impacts to MGS. The integrity of the exclusion fencing will be checked regularly and repaired as needed. 7. Vehicle Travel. During construction-related activities, motor vehicles will be limited to maintained roads, designated routes, and areas identified as being permanently or temporarily affected by construction within the Proposed Project footprint. Motor vehicle speeds along Proposed Project specific construction routes and temporary work areas within MGS habitat will not exceed 15 miles per hour. 8. Trapped animal prevention. All auger holes, trenches, pits, or other steep-sided excavations that may pose a hazard to MGS will be either constructed with escape ramps (earthen or wooden) or securely covered when unattended to prevent entrapping animals. At the start and end of each workday, and just before backfilling, all excavations will be inspected for trapped animals. Any MGS found will be allowed to escape unimpeded. If an MGS is trapped and does not leave on its own, the designated biologist will move the animal according to the ITP conditions.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
9. Cover Materials. All pipes or other construction materials or supplies shall be covered or capped in storage or laydown areas at the end of each workday to prevent entrapping animals. No pipes or tubing of sizes or inside diameters ranging from 3 to 10 inches shall be left open either temporarily or permanently. All pipes or other construction materials shall be inspected for wildlife prior to moving or installing. If present, MGS will be allowed to leave on their own accord or will be removed by the designated biologist according to the ITP conditions. 10. Trash disposal. Trash and food items will be contained in closed containers and removed daily to reduce attracting predators. 11. Pets Prohibited. Employees will not bring pets or other animals to the Proposed Project area, unless the animal is ADA compliant.			
APM BIO-MAM-2: Desert Kit Fox Preconstruction Surveys. Surveys for desert kit fox shall be conducted within 14 days prior to the start of construction. The survey area shall include the Proposed Project disturbance areas plus a 300-foot buffer during the breeding season (February 1 through April 30) and a 100-foot buffer outside the breeding season. Potentially occupied burrows in Proposed Project disturbance areas and the survey buffer shall be mapped and Qualified Biologist(s) shall utilize tracking stations and/or wildlife cameras to determine whether the burrows are occupied. If a burrow is determined to be occupied by desert kit fox or other special-status mammal species during the breeding season, the burrow shall be demarcated with a 300-foot buffer. If a burrow is determined to be occupied outside the breeding season it shall be demarcated with a 100-foot buffer. Burrows determined to be unoccupied shall be demarcated with a 50-foot buffer. If occupied burrows are found in Proposed Project disturbance areas and cannot be avoided, Qualified Biologist(s) shall passively relocate the occupying animals through the use of one-way doors at burrow entrances that allow the animals to leave on their own. Once vacant, burrows shall be excavated by hand and collapsed. Passive relocation will be avoided from February 1 through April 30 and shall not occur while young are in the burrow and still dependent upon their parents. The CDFW shall be consulted prior to any relocation of desert kit fox during the breeding season. Additionally, the following measure will be implemented to minimize the likelihood of distemper transmission: • Any documented kit fox mortality shall be reported to the CDFW within 24 hours of identification. If a dead kit fox is observed, it shall be retained and protected from scavengers until the CDFW determines if the collection of necropsy samples is justified.	SCE and its contractors to implement measure as defined.	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Within 14 days prior to construction of the Project
APM BIO-RES-1: Develop and Implement Habitat Restoration Plan (HRP). Temporary impacts to regulated species' habitats, plant species, and vegetation communities shall be restored. Regulated species and vegetation communities include all species designated as threatened, endangered or rare, sensitive, or of concern by resource or land agencies. Species and vegetation communities that require restoration will be determined by the resource agencies through the permitting process. Temporary impacts to all other categories of land such as private lands or disturbed areas (e.g., agricultural lands, existing roads, OHV trails, grazing areas, trash/dump site, etc.) shall only be subject to the requirements of the Storm Water Pollution Prevention Plan (SWPPP) and the Invasive Plant Management Plan (IPMP, APM BIO-RES-2). No additional goals, objectives, or success criteria regarding habitat condition are required for these sites. SCE shall develop and implement a Habitat Restoration Plan (HRP). SCE will consult with appropriate agencies during development of the HRP and implement the HRP in conjunction with applicable permit conditions and mitigation measures. The HRP shall be submitted to the CPUC and BLM for review and approval prior to the start of construction. Invasive plant management will be performed in conjunction with the HRP per the Invasive Plant Management Plan (BIO-RES-2).	SCE and its contractors to implement measure as defined	SCE to provide draft and final HRP and annual HRP monitoring reports to the CPUC (and BLM). SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Develop plan and provide to CPUC and BLM prior to construction and implement plan in conjunction with permit conditions as defined by the measure

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
***Habitat Restoration Plan*.** For all restoration sites, the HRP shall include: 1. Restoration goals and objectives based on vegetation type and jurisdictional status of each site. 2. Quantitative restoration success criteria. 3. Implementation details as applicable. Details may include topsoil stockpiling and handling, postconstruction site preparation, soil decompaction and recontouring, planting and seeding palettes to include only native, locally sourced materials with confirmed ability to produce from suppliers, fall or other suitable season-season planting or seeding dates. 4. Maintenance details, which may include weeding, irrigation, or hand-watering schedule and equipment, and erosion control. 5. Monitoring and Reporting, specifying monitoring schedule and data collection methods throughout establishment of vegetation with key indicators of successful or unsuccessful progress, and quantitative criteria values to objectively determine success or failure at the conclusion of the monitoring period. 6. Adaptive management procedures such as reseeding, re-planting, drainage repairs, adjustments to irrigation schedule, and repair or remediation of sites to meet success criteria on schedule. For species and vegetation communities with permit requirements including wetlands and riparian habitats, the goal of the HRP will be to restore plant species, habitat values, or vegetation communities. For restoration sites, the goals, objectives, and success criteria specified in the HRP will include native species cover and species richness compatible with the specific vegetation and habitat type. If an unforeseen catastrophic event (e.g., flood, fire, or other event beyond SCE control) damages a restoration site within the monitoring period, SCE will assess adjacent areas to adjust maintenance activities and success standards in coordination with the agencies. In all areas, seed and/or potted nursery stock of locally native species will be used. The list of plants observed during botanical surveys of the Proposed Project area will be used as a guide to site-specific plant selection, additional appropriate species may be included. Monitoring of the restoration sites will continue annually until HRP success criteria are achieved. SCE will be responsible for implementing adaptive management as needed. For all restoration areas, SCE will provide annual reports to the CPUC and BLM to verify the total vegetation acreage subject to restoration, areas that have been completed, and areas still outstanding. The annual reports will also include a summary of the restoration and adaptive management activities for the previous year, success criteria progress and completion, and any adjustments to planned activities, for the upcoming year.			
APM BIO-RES-2: Develop Invasive Plant Management Plan. SCE shall prepare and implement an Invasive Plant Management Plan (IPMP). This plan shall include measures designed to avoid the introduction and spread of new nonnative invasive plant species (invasive plants) and minimize the spread of existing invasive plants resulting from Proposed Project activities. The IPMP must meet the BLM's requirements for NEPA disclosure and analysis if herbicide use is proposed for the Proposed Project. The IPMP shall be submitted to the CPUC and BLM for review and approval prior to the start of construction. For the purpose of the IPMP, invasive plants shall include plants that (1) are invasive and rated high or moderate for negative ecological impact in the California Invasive Plant Inventory Database (Cal-IPC, 2006), or (2) aid and promote the spread of wildfires (such as Bromus tectorum (cheatgrass), Brassica tournefortii (Sahara mustard), and Bromus madritensis spp. rubens (red brome)) or (3) are identified by	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
the BLM as special concern. The IPMP will be implemented throughout Proposed Project pre-construction, construction, and restoration phases. ***Invasive Plant Management Plan*.** The IPMP will include the information defined in the following sections: *Assessment.* An assessment of the Proposed Project's potential to cause spread or the introduction of invasive plants into new areas, or to introduce new invasive plants into the ROW. This section will list known and potential invasive plants occurring on the ROW and in the Proposed Project region and identify threat rankings and potential for Proposed Project-related occurrence or spread for each species. This section will identify control goals (e.g., eradication, suppression, or containment) for invasive plants of concern with potential to occur on the ROW. *Pre-construction invasive plant inventory.* SCE shall inventory all invasive plants of concern in areas (both within and outside the ROW) subject to Proposed Project-related vegetation removal/disturbance, "drive and crush," and ground-disturbing activity. The invasive plants inventory area shall also include vehicle and equipment access routes within the ROW and all Proposed Project staging and storage yards. Invasive plants of concern shall be mapped by area of occurrence and percent cover. The map will be updated with new occurrences at least once a year. *Pre-construction invasive plants treatment.* Invasive plant infestations identified in the pre-construction invasive plants inventory shall be evaluated to identify potential for Proposed Project-related spread and potential benefits (if any) of pre-construction treatment. Pre-construction treatment will consider the specific invasive plants, potential seed banks, or other issues. The IPMP will identify any infestations to be controlled or eradicated prior to Proposed Project construction. Control and follow-up monitoring of pre-construction invasive plants treatment sites will follow methods identified in appropriate sections of the IPMP. *Prevention.* The IPMP will specify methods to minimize potential transport of new invasive plant seeds onto the ROW, or from one section of the ROW to another. The ROW may be divided into "weed zones," based on invasive plants of concern in the ROW. The IPMP will specify inspection procedures for construction equipment entering the Proposed Project area. Vehicles and equipment may be inspected and cleaned at entry points to specified sections of the ROW, and before leaving work sites where invasive plants of concern must be contained locally. Off road construction equipment shall be inspected to ensure it is free of any dirt or mud that could contain invasive plant seeds, roots, or rhizomes, and the tracks, outriggers, tires, and undercarriage will be carefully washed, with special attention being paid to axles, frame, cross members, motor mounts, underneath steps, running boards, and front bumper/brush guard assemblies. Other construction vehicles (e.g., pick-up trucks) that will be frequently entering and exiting the site will be inspected and washed on an as-needed basis. Tools such as chainsaws, hand clippers, pruners, etc., shall be cleaned of dirt and mud before entering Proposed Project work areas. All vehicles will be washed off-site when possible. If off-site washing is infeasible, on-site cleaning stations (including air washing) will be set up at specified locations to clean equipment before it enters the work area. Wash stations will be located away from native habitat or special-status species occurrences. Wastewater from cleaning stations will not be allowed to run off the cleaning station site. When vehicles and equipment are washed, a daily log must be kept stating the location, date and time, types of equipment, methods used, and personnel present. The log shall contain the signature of the responsible crewmember. Written or electronic logs shall be available to the BLM and CPUC monitors on request.			

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
Erosion control materials (e.g., straw bales) must be certified free of invasive plant seed ("weed-free") before they are brought onto the site. The IPMP must prohibit on-site storage or disposal of mulch or green waste that may contain invasive plant material. Mulch or green waste will be removed from the site in a covered vehicle to prevent seed dispersal and transported to a licensed landfill or composting facility. The IPMP will specify guidelines for any soil, gravel, mulch, or fill material to be imported into the Proposed Project area, transported from site to site within the Proposed Project area, or transported from the Proposed Project area to an off-site location, to prevent the introduction or spread of invasive plants to or from the Proposed Project area. *Monitoring.* The IPMP shall specify methods to survey for invasive plants of concern during pre-construction, construction, and restoration phases; and shall specify qualifications of specialists responsible for invasive plant monitoring and identification. It must include a monitoring schedule to ensure timely detection and immediate control of new invasive plant infestations to prevent further spread. Surveying and monitoring for invasive plant infestations shall occur at least two times per year, to coincide with the early detection period for early season and late season invasive plants. The monitoring section shall also describe methods for post-eradication monitoring to evaluate success of control efforts and any need for follow-up control. *Control.* The IPMP must specify manual and chemical invasive plant control methods to be employed. The IPMP shall include only invasive plant control measures with a demonstrated record of success for target invasive plants, based on the best available information. The plan shall describe proposed methods for promptly scheduling and implementing control activity when any Proposed Project-related invasive plant infestation is located (e.g., located on a Proposed Project disturbance site), to ensure effective and timely invasive plant control. Invasive plant infestations must be controlled or eradicated as soon as possible upon discovery, and before they go to seed, or when appropriate with the goal to prevent further spread. All proposed invasive plant control methods must minimize disturbance to native vegetation, limit ingress and egress to defined routes, and avoid damage to any environmentally sensitive areas (ESAs) identified within or adjacent to the ROW. New infestations by invasive plants of concern will be treated at a minimum of once annually until eradication, suppression, or containment goals are met. Invasive plant occurrences can be considered eradicated when no new seedlings or resprouts are observed for three consecutive years, or a single season where new seedlings or resprouts are observed in reference populations but not at the control site. Invasive plant control efforts may cease when eradication is complete. Manual control shall specify well-timed removal of invasive plants or their seed heads with hand tools; seed heads and plants must be disposed of in accordance with guidelines from the Kern County and San Bernardino County Agricultural Commissioners if such guidelines are available. The chemical control section must include specific and detailed plans for any herbicide use. It must indicate where herbicides will be used, which herbicides will be used, and specify techniques to be used to avoid drift or residual toxicity to native vegetation or special-status plants, consistent with BLM's Vegetation Treatments Using Herbicides on BLM Lands in 17 Western States (BLM, 2007) and National Invasive Species Management Plan (NISC, 2008). All herbicide applications will follow U.S. Environmental Protection Agency label instructions and will be in accordance with federal, state, and local laws and regulations. Only state and BLM-approved herbicides may be used. Herbicide treatment will be implemented by a Licensed Qualified Applicator. Herbicides shall be applied in accordance with product labels and applicator licenses. Herbicides shall not be applied during or within 24 hours of high confidence predicted rain. Only water-safe herbicides shall be used in riparian areas or within channels			

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
(engineered or not) where they could run off into downstream areas. Herbicides shall not be applied in high wind conditions. *Reporting schedule and contents.* The IPMP shall specify reporting schedule and contents of each report.			
APM BIO-BOT-1: Special-status Herbaceous Plants. SCE shall avoid, minimize or mitigate impacts to any state or federally listed or California Rare Plant Rank (CRPR) 1 or 2 herbaceous plants that may be located on the Proposed Project disturbance areas or surrounding buffer areas. Pre-construction survey. Pre-construction clearance surveys in areas where special-status plant species potentially occur will be performed by a qualified biologist (i.e., a biologist with the requisite education and experience to address specific resources), which may be chosen from a previously approved CPUC approved biologist, to avoid or minimize impacts on special-status plants. Disturbance free buffers for herbaceous species shall be 25-ft from the individual and/or occurrence boundary. These buffers shall be established from the previously conducted focused surveys and preconstruction survey results. If a smaller buffer is required, SCE shall develop and implement site-specific monitoring plan to minimize direct impacts to the species. The plan will be submitted to the CPUC for review and approval. In the event of a discovery of previously undescribed species, the boundary of the occurrence (defined by CNDDB as all individuals within a ¼ mile of each other) will be flagged, avoided, and monitored as discussed above and the CPUC, CDFW, and/or USFWS will be notified. ***Focused Survey*.** For construction areas where special-status plant species potentially occur and focused surveys have not occurred, focused surveys will take place prior to construction. Focused surveys will be conducted consistent with methodology described in the Proposed Project Biological Technical Report. ***Restoration and Mitigation*.** SCE will implement the following activities; other conflicting permit conditions will supersede the activities below. 1. Coordinate with Agencies. Agencies shall approve any impacts to special-status plants. Impacts in excess of 10% of any occurrence, or other percentage required by agency regulations on lands under their jurisdiction, shall be restored or mitigated. 2. Habitat Restoration and Revegetation. A Habitat Restoration Plan (HRP) shall address topsoil, plant or propagules salvage, and restoration. A Habitat Mitigation and Management Plan (HMMP) shall address mitigation. Approval of the HRP by appropriate agencies is required before impacts to special-status plant occurrences are allowed. A draft HMMP will be submitted to the appropriate agencies prior to impacts to special-status plants. For more information see APM BIO-RES-1. 3. Salvage. If required by agency regulations on lands under their jurisdiction, SCE shall consult with a qualified restoration ecologist or horticulturist regarding the feasibility and likely success of salvage efforts for each species. If salvage is feasible, based on prior success with similar species, SCE shall include salvage methods in the HRP. For special-status plants, the goal shall be to preserve existing populations or establish new populations. The HRP will include at minimum: (a) species and locations of plants identified for salvage; (b) criteria for determining whether a species is appropriate for salvage; (c) the appropriate season for salvage; (d) equipment and methods for collection, transport, and re-planting plants or propagules, to retain intact soil conditions and maximize success; (e) details regarding storage of plants or propagules for each species; (f) location of the proposed recipient site, and detailed site preparation and plant introduction techniques, as applicable; (g) a description of the irrigation, and other maintenance activities, as applicable; (h) success criteria, including specific timeframe for survivorship of each species; and (i) a detailed monitoring program, commensurate with	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
the HRP goals. Invasive plant control for special-status plants will be addressed in the Invasive Plant Management Plant (IPMP, APM BIO-RES-2). 4. Off-site compensation. Where restoration is not feasible, SCE shall provide compensation lands consisting of habitat occupied by the impacted CRPR 1 or 2 ranked plant occurrences at a 1:1 ratio of acreage for any occupied habitat affected by the Proposed Project. Occupied habitat will be calculated on the Proposed Project site and on the compensation lands as including each special-status plant occurrence. If compensation is selected as a means of mitigating special-status plant impacts, it may be accomplished by purchasing credit in an established mitigation bank, acquiring conservation easements, or direct purchase and preservation of compensation lands. Compensation for these impacts may be "nested" or "layered" with compensation for habitat loss. ***Agency Coordination*.** Annual construction monitoring reports shall be submitted to the CPUC and BLM. Reports shall include, but not be limited to, number of plants impacted, details of plants or propagules salvaged, stored, and transplanted (salvage and transplanting locations, species, number, size, condition, etc.); adaptive management efforts implemented (date, location, type of treatment, results, etc.); and evaluation of success of transplantation. After construction, salvage status will be described in the HRP annual report. In the event of an unexpected discovery of a new species or previously undocumented occurrence, the same steps will be used as discussed above. In addition, when there is an unexpected discovery of a new species, the CPUC and CDFW and/or BLM will be notified.			
APM BIO-BOT-2: Special-status Perennial Plants and Other Species. SCE shall avoid, minimize or mitigate impacts to western Joshua tree (*Yucca brevifolia var. brevifolia*). Pre-construction survey. Pre-construction surveys will be conducted by a qualified specialist to identify any western Joshua trees in the Proposed Project area. Where western Joshua trees are known to occur, all work shall occur outside an appropriate buffer to avoid individual western Joshua trees, seeds, and seedbank as agreed to by CDFW. If impacts that would result in take cannot be avoided, SCE will obtain a Section 2081(b) ITP from CDFW if the species is CESA listed or a candidate for listing, and will implement additional measures pursuant to the ITP. Buffer reductions may occur with the implementation of appropriate ITP measures. A qualified botanist/arborist monitor, with the authority to halt work, shall be present whenever work occurs within reduced buffers for Joshua tree as required by CDFW. **Compensatory Restoration.** If an ITP for western Joshua tree is obtained, then compensation for impacts to western Joshua tree will be addressed through the permit conditions.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction
APM WET-1: Avoid and/or Minimize Impacts to Jurisdictional Waters, Wetlands, and Riparian Habitats. (Refer to Hydrology and Water Quality below for text of measure)			
Mitigation Measure 3.4-1a: Invasive Plant Management Plan. In addition to the requirements of APM BIO-RES-2, the Invasive Plant Management Plan's chemical control section must indicate where herbicides will be used and which herbicides will be used. The section also must specify techniques to be used to avoid drift or residual toxicity to native vegetation or special-status plants, consistent with BLM's *Vegetation Treatments Using Aminopyralid, Fluoroxypyr, and Rimsulfuron on Bureau of Land Management Lands in 17 Western States* (BLM 2016b), BLM's *Approval of Seven Herbicide Active Ingredients for Use on Public Lands to Treat Invasive Plants* (BLM 2024), and the National Invasive Species Council's *Management Plan 2016–2018* (NISC 2016), or most recent guidance from BLM and/or the National Invasive Species Council regarding herbicide use.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
Mitigation Measure 3.4-1b: Special-Status Herbaceous Plants Compensatory Mitigation and Restoration. The types of compensation specified in APM BIO-BOT-1—purchase of credit in an established mitigation bank, acquisition of conservation easements, or direct purchase and preservation of compensation lands—may be used to mitigate impacts on special-status plants. However, if on-site restoration is infeasible or unsuccessful, compensation will be required to offset impacts on special-status plants (ranked CRPR 1 or 2). Such compensation will include purchasing credits or acquiring, preserving, and protecting existing populations at a minimum 3:1 ratio, or as otherwise specified by resource agencies, to reduce the potential significant impact on habitat to a less-than-significant level. SCE must coordinate with CDFW (or BLM, depending upon land ownership) and request that the agency review and accept the proposed compensatory mitigation involving off-site conservation. **Requirement for Mitigation.** Unless otherwise specified by BLM, CDFW, or other applicable resource agencies, rare-plant restoration or compensatory mitigation shall be provided for any impact on special-status plants under the agencies' jurisdiction, not just impacts in excess of 10 percent of an occurrence or population. **Performance Criteria.** The following quantitative restoration success criteria apply to special-status plant restoration areas and temporarily affected sensitive vegetation areas that are restored under the habitat restoration plan described in APM BIO-RES-1. 1. Vegetation Establishment: • At least 70 percent of the total vegetative cover shall consist of native species appropriate to the habitat type, or similar to baseline conditions. • Invasive species shall not exceed 5 percent cover in any monitoring year. • Supplemental water shall be provided as necessary, depending upon target species' needs. • Minimum 80 percent survival of planted container stock shall be required after the first year, with replanting/reseeding as needed to maintain at least 70 percent survival after 5 years. 2. Monitoring and Adaptive Management: • Minimum of 5 years of post-restoration monitoring shall occur, to ensure that performance standards are tracked and met for a minimum 3-year period, or until pre-Project conditions are restored to equivalent or better condition. • Adaptive management: Implement corrective actions if success criteria are not met within the expected time frame. 3. Compliance and Reporting: • Annual reporting: Submit annual monitoring reports to CPUC and CDFW for review. • A final report shall be prepared, reviewed, and approved by CPUC and/or CDFW that demonstrates all success criteria have been met.	SCE and its contractors to implement measure as defined	SCE to provide evidence of compensatory mitigation and agency acceptance of the compensatory mitigation (as applicable) to CPUC. SCE to provide annual monitoring reports and final report to CPUC. CPUC to review documentation and confirm compliance	Prior to and during construction
Mitigation Measure 3.4-1c: Western Joshua Tree. The Western Johsua Tree Conservation Act authorizes CDFW to issue permits for the incidental take of one or more western Joshua trees. If all Joshua trees within and outside of the Project site can be avoided with a minimum 50-foot (15-meter) buffer, then no further action is required. If actions are proposed within this buffer, SCE shall confer with and submit a western Joshua tree CDFW-protocol census survey report to CDFW in accordance with the requirements of the Western Joshua Tree Conservation Act (CDFW 2025b). Although a western Joshua tree census survey (Artemis Environmental Services 2024c) was conducted in 2024, CDFW may require	SCE and its contractors to implement measure as defined	SCE to provide evidence of ITP to CPUC (if obtained) for impacts to western Joshua trees that cannot be avoided. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	SCE to provide ITP prior to construction and implement its conditions during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
that the census survey be repeated and/or that the census study and report be supplemented to include all the requisite information described below. The census shall include every western Joshua tree on the Project site and within a 50-foot buffer. The following information shall be provided in the census report: • Project name and permittee name. • Project address/assessor's parcel number or location description. • Datum of the coordinates. • Project site boundary corners (latitude and longitude). • Name, business, title, and contact information for the person(s) preparing the census. • Date(s) on which the census was performed. • Any other site condition notes. The following information shall be provided for each tree in the census report: • Unique identifier corresponding to the census map. • Global Positioning System (GPS) location for each tree (latitude and longitude). • Size class for each western Joshua tree, categorized as follows: *Class A*, less than 1 meter in height; *Class B*, 1 meter or greater but less than 5 meters in height; and *Class C,* 5 meters or greater in height. • Actual height of each tree to the nearest one-tenth of a meter (optional). • Indication of whether each tree is live or dead. • Indication of whether each tree is mature (a branched tree is considered mature). • Indication of whether each tree is currently producing flowers, fruits, or none. • Indication of how each tree would be affected by the Project (i.e., removal, trim, relocation, other, or none). • Indication of whether Project activities would take place within 15 meters of the base of the tree. • Proposed relocation site for each tree (if applicable). Before any work within 50 feet (15 meters) of a Joshua tree, SCE shall coordinate with CDFW to determine whether a Section 2081(b) incidental take permit is required for direct or indirect impacts on individual trees. SCE shall comply with the mitigation requirements specified by the ITP, including payment of standard mitigation fees and/or other mitigation actions (e.g., relocation of western Joshua trees).			
Mitigation Measure 3.4-2a: Crotch's Bumble Bee. A habitat assessment shall be completed by a qualified biologist with demonstrated knowledge of the requirements of Crotch's bumble bee. If no suitable habitat for this species is identified within 300 feet of proposed construction activity areas, no further measures are required. If a qualified biologist has evaluated the property and found suitable foraging or nesting habitat for Crotch's bumble bee within 300 feet of proposed construction activity areas, SCE shall retain a qualified entomologist to conduct surveys to determine presence or absence in accordance with the most current protocols established by CDFW (currently, the *Survey Considerations for California Endangered Species Act Candidate Bumble Bee Species*). If Crotch's bumble bee or nests are detected, SCE shall consult with CDFW to develop adequate take avoidance measures, which may include protections for underground overwintering queens. If impacts on this species cannot be avoided, SCE shall obtain the appropriate take authorization from CDFW (pursuant	SCE and its contractors to implement measure as defined	SCE to provide evidence of consultation with CDFW and associated ITP as applicable. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
to Fish and Game Code Section 2080 et seq.). Early consultation is required, as modification to the Project and mitigation measures may be required to obtain an incidental take permit.			
Mitigation Measure 3.4-2b: Raven Management to Protect Desert Tortoise. SCE shall develop and implement a raven management plan (RMP) for the Project, subject to review and approval by the CPUC and relevant wildlife agencies, to be deployed during the Project's construction and operation and maintenance phases. The purpose of the RMP is to reduce avian predation on juvenile desert tortoises by employing deterrent strategies that specifically target ravens known to prey on tortoises. The plan will not be designed to broadly eliminate or control raven populations. The RMP shall follow an adaptive management approach to reduce trash, debris, micro-trash, and organic waste that may attract ravens during construction; and shall remain in place after Project completion. The RMP will be evaluated after 3 years of implementation, or sooner if evidence of avian predation emerges. Key components of the RMP may include (1) monitoring power lines to discourage raven nesting; (2) funding targeted raven control efforts in cooperation with the U.S. Department of Agriculture; and (3) if an issue is identified, using alternative raven control strategies developed in coordination with USFWS and/or CDFW (e.g., egg-addling, nesting habitat removal). The RMP shall include specific measures to limit raven subsidies during Project construction and during post-construction operation. Such measures will include a trash collection and management system that ensures the proper disposal of food and other trash in self-closing, sealable trash containers, and the regular inspection and removal of trash receptacles to avoid attracting tortoise predators; removal of road-killed animals or other carcasses within the Project area during construction activities; raven nest management, removal, and the use of nesting deterrents during and after construction; and post-construction raven nest surveys on SCE facilities, nest monitoring, and removal for a period of 3 years after Project completion.	SCE and its contractors to implement measure as defined	SCE to provide draft and final raven management plans to CPUC prior to construction. CPUC to review raven management plan; SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction
Mitigation Measure 3.4-2c: Nesting Bird Management Plan. In addition to the requirements of APM BIO-AVI-2, the nesting bird management plan shall be prepared by a qualified biologist and submitted for CPUC review at least 30 days before the start of construction activities. In addition to the commitments described in APM BIO-AVI-2, the plan shall include the following provisions: • If a nest is suspected but not confirmed, the qualified biologist shall establish a no-disturbance buffer until additional surveys can be completed or until the location can be inferred based on observations. If a nest is observed but thought to be inactive, the qualified biologist shall monitor the nest for 1 hour (4 hours for raptors during the non-breeding season) before approaching the nest to determine status. The qualified biologist shall use their best professional judgment regarding the monitoring period and whether approaching the nest is appropriate. • Appropriate buffer distances, as stipulated in the nesting bird management plan, are generally 300 feet for passerine species and 500 feet for listed special-status birds and raptors; however, these recommended buffer distances may be increased or reduced at the discretion of the qualified biologist depending on site-specific factors such as the location of the nest and the species' tolerance to human presence. If construction temporarily ceases for a period greater than 7 days and activities resume during the avian nesting season, the Project site and buffer areas shall be resurveyed.	SCE and its contractors to implement measure as defined	SCE to provide nesting bird management plan to CPUC prior to construction. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction, during all ground disturbing and vegetation removal activities
Mitigation Measure 3.4-2d: Burrowing Owl. SCE shall consult with CDFW to obtain the appropriate take authorization pursuant to Fish and Game Code Section 2081 et seq. before the start of construction activities. Avoidance and minimization measures established under an incidental take permit issued by CDFW may include the following:	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction, during all ground disturbing and vegetation removal activities

<table>
<tr><th>Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR</th><th>Implementing Actions</th><th>Monitoring/ Reporting Requirements</th><th>Timing</th></tr>
<tr><td>

Avoiding construction within buffer areas around active nest sites during the nesting period (February 1–August 31).
Establishing buffers around nesting sites in accordance with the recommended buffer distances included in the Staff Report on Burrowing Owl Mitigation (CDFG 2012), as shown below:

Burrowing Owl Nesting Sites Recommended Buffers
<table>
<tr><th rowspan="2">Time of Year</th><th colspan="3">Level of Disturbance</th></tr>
<tr><th>Low</th><th>Medium</th><th>High</th></tr>
<tr><td>April 1–August 15</td><td>200 meters</td><td>500 meters</td><td>500 meters</td></tr>
<tr><td>August 16–October 15</td><td>200 meters</td><td>200 meters</td><td>500 meters</td></tr>
<tr><td>October 16–March 31</td><td>50 meters</td><td>100 meters</td><td>500 meters</td></tr>
</table>

Periodic monitoring to determine whether burrowing owls have colonized or recolonized the site during construction.
If allowed by CDFW, to avoid impacts where burrowing owls are detected in or immediately adjacent to construction areas, a burrow exclusion plan may be prepared and implemented by qualified biologists. The burrow exclusion plan shall meet the requirements specified in Appendix E of the Staff Report on Burrowing Owl Mitigation (CDFG 2012) and shall be approved by CDFW before implementation.

Conservation of mitigation lands shall offset impacts on burrowing owl, including permanent loss or displacement of habitat and temporary impacts during construction. The conservation of mitigation lands shall be determined through consultation with and approval by CDFW depending on the ownership of the occupied land, which shall be established before the start of construction activities. At minimum, temporary impacts shall be offset at a 1:1 ratio by restoring affected habitat and/or placing equivalent habitat in permanent conservation. Permanent habitat impacts shall be compensated at a minimum 2:1 ratio, or as otherwise required by CDFW. With CDFW concurrence, compensatory mitigation provided for desert tortoise that involves habitat conservation, including restoration or enhancement of degraded land placed under conservation, may concurrently be used as mitigation for impacts on burrowing owl because both species may benefit.
</td><td></td><td></td><td></td></tr>
<tr><td>
Mitigation Measure 3.4-2e: Mohave Ground Squirrel Protection. Within all areas identified as potential Mohave ground squirrel (MGS) habitat (see the Cal City Substation 115 kV Upgrade Project Biological Resources Technical Report, Appendix G), SCE shall presume the presence of MGS and implement the protection measures outlined in APM BIO-MAM-1, Mohave Ground Squirrel. SCE shall obtain MGS take authorization through a CDFW incidental take permit, which will encompass these and additional mitigation requirements. In accordance with the permit, the following avoidance and minimization measures shall also be implemented:

Avoidance of High-Quality Habitat. High-quality MGS habitat and areas with known species presence shall be avoided and direct impacts minimized to the greatest extent feasible. These areas shall be clearly marked for avoidance using high-visibility flagging, construction fencing, or similar methods, and maintained throughout the duration of nearby construction activities.
Revegetation of Temporarily Disturbed Habitat: To mitigate temporary impacts on MGS habitat, SCE shall revegetate disturbed areas in accordance with Mitigation Measure 3.4-4, Sensitive Natural Communities. Restoration efforts shall comply with the restoration requirements, performance

</td><td>SCE and its contractors to implement measure as defined</td><td>SCE to provide ITP and related agency correspondence (i.e., permit approval and amendments, as applicable) to CPUC. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.</td><td>Prior to and during construction, during all ground disturbing and vegetation removal activities</td></tr>
</table>

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
standards, and maintenance and monitoring protocols outlined in Mitigation Measure 3.4-1d and the Sensitive Natural Community Mitigation and Monitoring Plan referenced in Mitigation Measure 3.4-4. • *Compensation for Permanent Habitat Loss:* For permanent losses of MGS habitat, compensatory mitigation shall be provided at a minimum 1:1 impact-to-mitigation ratio (based on acreage) for affected habitat, or as otherwise directed by CDFW or other applicable resource agencies. Where impacts occur within Areas of Critical Environmental Concern designated under the BLM Desert Renewable Energy Conservation Plan Land Use Plan Amendment, and where such impacts exceed applicable ground disturbance caps, a higher mitigation ratio shall be applied. Compensatory mitigation shall be implemented in accordance with the Desert Renewable Energy Conservation Plan Land Use Plan Amendment (as applicable) and the terms of the CDFW incidental take permit. Acceptable compensatory mitigation may include but is not limited to: – Purchase of credits from an approved mitigation bank or in-lieu fee program; – On-site and/or off-site land acquisition and permanent preservation; and/or – On-site and/or off-site restoration and/or enhancement of MGS habitat.			
Mitigation Measure 3.4-2f: American Badger Protection. To ensure that the American badger is adequately protected during Project construction, all survey methods and protective measures established for the desert kit fox under APM BIO-MAM-2 shall also be applied to the American badger. Among other requirements, these include the use of buffers around active dens, relocation procedures, and the requirement to coordinate with CDFW before any relocation of the species.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Within 14 days prior to construction of the Project
Mitigation Measure 3.4-3: APMs and Protection Measures Applicable during Operation and Maintenance Activities. For all operation and maintenance activities within potential habitat for special-status wildlife species, the following APMs shall be applied: • APM ENV-GEN-1 WEAP, *Worker's Environmental Awareness Training Program*. • APM BIO-AVI-2, *Nesting Bird Management Plan*. For general operation and maintenance activities that do not require ground disturbance, the above APMs shall be supplemented by the following mitigation measures: • Mitigation Measure 3.4-1a, *Biological Clearance Surveys, Monitoring, and Avoidance*. • Mitigation 3.4-1b, *Construction Worker Environmental Awareness Training Program (WEAP).* • Mitigation Measure 3.4-1c, *Invasive Plant Management Plan*. If ground disturbance is required in areas that provide habitat for special-status wildlife species, the following APMs and mitigation measures shall also be applied: • APM BIO-GEN-1, *Pre-construction Biological Clearance Surveys and Monitoring.* • APM BIO-HERP-1, *Desert Tortoise.* • APM BIO-MAM-1, *Mohave Ground Squirrel.* • APM BIO-MAM-2, *Desert Kit Fox Preconstruction Surveys.* • APM BIO-RES-1, *Develop and Implement Habitat Restoration Plan (HRP).* • Mitigation Measure 3.4-2a, *Crotch's Bumble Bee*. • Mitigation Measure 3.4-2b, *Raven Management to Protect Desert Tortoise*. • Mitigation Measure 3.4-2d, *Burrowing Owl*.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction, during all ground disturbing and vegetation removal activities

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
• Mitigation Measure 3.4-2e, *Mohave Ground Squirrel Protection*. • Mitigation Measure 3.4-2f, *American Badger Protection*.			
Mitigation Measure 3.4-4: Sensitive Natural Communities. Sensitive natural communities shall be avoided and direct impacts minimized whenever possible. Areas identified for avoidance shall be demarcated (e.g., using brightly colored flagging or similar) and avoided during construction of the Project. The marked boundaries shall be maintained for the duration of construction activities in each work area and shall be clearly visible to personnel on foot and by heavy equipment operators. If sensitive natural communities can be avoided, no further mitigation is necessary. If permanent impacts on sensitive natural communities cannot be avoided, impacts shall be mitigated by providing comparable habitat at a 1:1 impact-to-mitigation ratio based on acreage for any habitat affected by the Project, or as otherwise directed by resource agencies. This may include but is not limited to the following measures: • The purchase of credits from a mitigation bank or in-lieu fee program. • On- and/or off-site land acquisition and preservation. • On- and/or off-site creation, restoration, and/or enhancement of sensitive natural communities. If compensatory mitigation is to occur on- or off-site (i.e., not a mitigation bank or in-lieu fee program), a Sensitive Natural Community Mitigation and Monitoring Plan shall be prepared by a qualified biologist/restoration ecologist. The plan shall include details related to implementation requirements (e.g., seeding, planting, and/or staking of sensitive natural community species; salvage/dispersal of duff and seed bank; and/or removal of invasive, non-native species), performance standards as identified in Mitigation Measure 3.4-1d, maintenance requirements, and future monitoring requirements.	SCE and its contractors to implement measure as defined	SCE to provide draft and final Sensitive Natural Community Mitigation and Monitoring Plan to CPUC prior to construction (if impacts cannot be avoided). SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction
Cultural Resources			
APM CUL-1: Develop a Cultural Resource Management Plan (CRMP). SCE shall prepare and submit for approval a Cultural Resource Management Plan (CRMP) to guide all cultural resource management activities during Proposed Project construction. Management of cultural resources shall follow all applicable federal and state standards and guidelines for the management of historic properties/historical resources. The CRMP shall be submitted to CPUC and BLM for review and approval at least 90 days prior to the start of construction. The CRMP shall be prepared by a qualified archaeologist who meets the Secretary of Interior's standards for archaeology and include, but not be limited to, the following sections: • *Cultural Resource Managemen*t Plan: The CRMP shall define and map all known NRHP- and CRHR-eligible properties in or within 100 feet (30.5 meters) of the Proposed Project APE/API. A cultural resources protection plan shall be included that details how NRHP- and CRHR-eligible properties will be avoided and protected during construction. Measures shall include, at a minimum, designation and marking of Environmentally Sensitive Areas (ESAs), archaeological monitoring, personnel training, and reporting. The plan shall also detail which avoidance measures will be used, where and when they will be implemented, and how avoidance measures and enforcement of ESAs will be coordinated with construction personnel. • *Cultural Resource Monitoring and Field Reporting*: The CRMP shall detail procedures for archaeological monitoring and Tribal participation, define the reporting matrix, and establish criteria for when the monitoring effort should increase or decrease if monitoring results indicate that a change is warranted. The CRMP shall also include guidelines for monitoring in areas of high sensitivity for the	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
discovery of buried NRHP- and/or CRHR-eligible cultural resources, burials, cremations, tribal cultural resources, or sacred sites. • *Unanticipated Discovery Protocol*: The CRMP shall detail procedures for temporarily halting construction, defining work stoppage zones, notifying stakeholders (e.g., agencies, Native Americans, utilities), and assessing NRHP and/or CRHR eligibility in the event unanticipated discoveries are encountered during construction. It shall include methods, timelines for assessing NRHP and/or CRHR eligibility, formulating mitigation plans, and implementing treatment. Mitigation and treatment plans for unanticipated discoveries shall be reviewed by tribal stakeholders and approved by CPUC prior to implementation. Data Analysis and Reporting: The CRMP shall detail methods for data analysis in a regional context, reporting of results within one year of completion of field studies, curation of artifacts and data (maps, field notes, archival materials, recordings, reports, photographs, and analysts' data) at a facility that is approved by CPUC and dissemination of reports to appropriate repositories.			
APM CUL-2: Avoid Environmentally Sensitive Areas (ESA). SCE shall perform cultural resource surveys for any portion of the Proposed Project APE not yet surveyed (e.g., new or modified staging areas, pull sites, or other work areas). Cultural resources discovered during surveys will be subject to APM CUL-1 (Develop CRMP). Where operationally feasible, all NRHP- and CRHR-eligible resources shall be protected from direct project impacts by project redesign (i.e., relocation of the line, ancillary facilities, or temporary facilities or work areas). In addition, all historic properties/historical resources shall be avoided by all project construction, operation and maintenance, and restoration activities, where feasible. Avoidance measures shall include, but not be limited to, fencing off ESAs for the duration of the Proposed Project or as outlined in the CRMP.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction
APM CUL-3: Train Construction Personnel. Prior to initiating construction, all construction personnel shall be trained by a qualified archaeologist regarding the recognition of possible buried cultural resources (i.e., prehistoric and/or historical artifacts, objects, or features) and paleontological resources (i.e., fossils), and protection of these resources during construction. Training shall also inform all construction personnel of the procedures to be followed upon the discovery of cultural materials. All personnel shall be instructed that unauthorized removal or collection of artifacts is a violation of federal and state laws. Any excavation contract (or contracts for other activities that may have subsurface soil impacts) shall include clauses that require construction personnel to attend a Worker's Environmental Awareness Training Program (WEAP). The WEAP will include the Proposed Project's potential for the post-discovery review of archaeological deposits, how to operate adjacent to and avoid all ESAs, and procedures to treat post-discovery reviews.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction
APM CUL-4: Conduct Construction Monitoring. Archaeological monitoring shall occur as outlined in the CRMP. Archaeological monitoring shall be conducted by a qualified archaeologist familiar with the types of historic and prehistoric resources that could occur within the Proposed Project areas. The qualifications of the principal archaeologist and monitors shall be approved by the CPUC and BLM. Monitoring reports shall be submitted to the CPUC on a monthly basis. A Tribal Participant may be required at culturally sensitive locations in consultation with the CPUC and/or as outlined in the CRMP.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction
APM CUL-5: Properly Treat Human Remains. SCE shall follow all federal and state laws, statutes, and regulations that govern the treatment of human remains. All work in the vicinity of a find will cease within a 200-foot radius of the remains, the area will be protected to ensure that no additional disturbance occurs. Should inadvertent discovery of human remains be made on federal lands, the federal agency and County Coroner (California Health and Safety Code 7050.5(b)) shall be notified immediately. If the remains are determined to be Native American or if Native American cultural items pursuant to the Native American Graves Protection and Repatriation Act (NAGPRA) are uncovered, the remains shall be treated in	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During all project activities

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
accordance with the provisions of NAGPRA (43 CFR 10) and the Archaeological Resources Protection Act (43 CFR 7). If the remains are not on federal land, the County Coroner and CPUC shall be notified immediately and the remains shall be treated in accordance with Health and Safety Code section 7050.5, CEQA Guidelines section 15064.5(e), and Public Resources Code section 5097.98. SCE shall assist and support the BLM and DoD as appropriate in all required NAGPRA and Section 106 actions, government to-government consultations with Native Americans, agencies, and consulting parties as requested by the BLM, DoD, or CDFW. SCE shall comply with and implement all required actions and studies that result from such consultations.			
Geology, Soils, and Paleontological Resources			
APM PAL-1: Develop Paleontological Resource Mitigation and Monitoring Plan. SCE shall prepare a Paleontological Resources Mitigation and Monitoring Plan (PRMMP) to guide all paleontological management activities during project construction. The PRMMP shall be submitted to the CPUC and BLM for review and approval at least 90 days prior to the start of construction. The PRMMP shall be prepared by a qualified paleontologist, based on SVP (2010) guidelines, and meet all regulatory requirements. The qualified paleontologist shall have a Master's Degree or Ph.D. in paleontology, have local paleontology knowledge, and shall be familiar with paleontological procedures and techniques. The PRMMP will include, but not be limited to, the following sections: • *Paleontological Resource Monitoring and Reporting*: Detail monitoring procedures and methodologies, which shall require a qualified paleontological monitor for all construction-related ground disturbance that reach approximate depths for significant paleontological resources in sediments with a high paleontological sensitivity (i.e., Quaternary older alluvium and Tropico Group [lower], granitic fanglomerate and sandstone). Sediments with no (i.e., Saddleback Basalt and quartz monzonite) will not require monitoring. Paleontological monitors shall meet standard qualifications per the SVP (2010). • *Unanticipated Discovery Protocol*: Detail procedures for temporarily halting construction, defining work stoppage zones, notifying stakeholders, and assessing the paleontological find for scientific significance. If indicators of potential microvertebrate fossils are found, screening of a test sample shall be carried out as outlined in SVP (2010). • *Data Analysis and Reporting*: Detail methods for data recovery, analysis in a regional context, reporting of results within one year of completion of field studies, curation of all fossil specimens in an accredited museum repository approved by the CPUC and BLM and dissemination of reports to appropriate repositories.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prepare PRMMP prior to and implement PRMMP during construction
APM PAL-2: Train Construction Personnel. Prior to the initiation of construction, all construction personnel shall be trained, regarding the recognition of possible buried paleontological resources (i.e., fossils) and protection of all paleontological resources during construction. Training shall inform all construction personnel of the procedures to be followed upon the discovery of paleontological materials. All personnel shall be instructed that unauthorized removal or collection of fossils is a violation of Federal and state laws. Any excavation contract (or contracts for other activities that may have subsurface soil impacts) shall include clauses that require construction personnel to attend a Worker's Environmental Awareness Training Program (WEAP). The WEAP will include the project's potential for inadvertently exposing buried paleontological resources, how to operate adjacent to and avoid any potential Environmentally Sensitive Area, and procedures to treat unanticipated discoveries.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
APM PAL-3: Conduct Paleontology Resources Construction Monitoring. Paleontological monitoring shall be conducted by a qualified paleontologist familiar with the types of resources that could occur within the project area. Monitoring reports shall be submitted to the CPUC and BLM on a monthly basis.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction
BMP EC-1: Scheduling. The construction team shall reduce the discharge of pollutants to storm drain facilities caused by construction activities by scheduling activities in a manner that will limit exposure of disturbed soils to wind, rain, non-storm water run-off, and storm water run-on and run-off.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP EC-2: Preservation of Existing Vegetation. The construction team will protect and preserve existing vegetation in work areas as long as practicable before disturbing them. The construction team shall also preserve and protect existing vegetation adjacent to work areas. This protection and preservation of such vegetation will serve to control erosion and filter out sediment.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP EC-3: Hydraulic Mulch. The construction team will implement this BMP, if necessary, to disturbed soil areas requiring temporary protection until permanent stabilization is established, and disturbed areas that will be re-disturbed following an extended period of inactivity.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP EC-4: Hydroseeding. The construction team will implement this BMP, if necessary, to disturbed soil areas requiring temporary protection until permanent stabilization is established, and disturbed areas that will be re-disturbed following an extended period of inactivity.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP EC-5: Soil Binders. The construction team will implement this BMP, if necessary, to disturbed soil areas requiring short term temporary protection. Because soil binders can often be incorporated into the work, they are a good alternative to mulches in areas where grading activities will soon resume. Soil binders are also suitable for use on stockpiles. Non-toxic soil binders, equivalent or better in efficiencies than the California Air Resources Board (CARB)-approved soil binders, shall be applied per the manufacturer recommendations to active unpaved roadways, unpaved staging areas, and unpaved parking area(s) throughout construction to reduce fugitive dust emissions. Soil binders will be non-toxic and MSDS will be present at site.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP EC-6: Straw Mulch. The construction team will implement this BMP, if necessary, to disturbed soil areas requiring temporary protection until permanent stabilization is established, and disturbed areas that will be re-disturbed following an extended period of inactivity. Straw mulch will be certified weed free.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP EC-7: Geotextiles and Mats. The construction team will implement one or more of these measures to stabilize disturbed soil areas (stockpiles, slopes, embankments, conveyances, etc.) and protect these soils from erosion by rain, wind or storm water run-on and run-off where applicable to reduce soil erosion from wind and rain. Plastic micro-filament matting will not be used, only natural fiber mats to prevent trapping of birds and reptiles.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP EC-8: Wood Mulch. The construction team will implement this BMP, if necessary, to disturbed soil areas requiring temporary protection until permanent stabilization is established, and disturbed areas that will be re-disturbed following an extended period of inactivity. Wood mulch shall be untreated.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
BMP EC-15: Soil Preparation and Roughening. The construction team will implement this BMP to assess and prepare surface soils for other BMP installation. This can include soil testing (for seed base, soil characteristics, or nutrients), as well as roughening surface soils by mechanical methods (including sheepsfoot rolling, track walking, scarifying, stair stepping, and imprinting) to prepare soil for additional BMPs, or to break up sheet flow. Soil preparation can also involve tilling topsoil to prepare a seed bed and/or incorporation of soil amendments, to enhance vegetative establishment.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP EC-16, Non-Vegetative Stabilization. The construction team will utilize non-vegetative stabilization methods for temporary or permanent stabilization of areas prone to erosion; this would be used only where vegetative options are not feasible.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
Runoff Controls The following BMPs may be implemented to manage stormwater runoff and control sediment. **BMP SE-4: Check Dam.** The construction team will implement this BMP to reduce scour and channel erosion by reducing flow velocity and increasing residence time within the channel, allowing sediment to settle.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP SE-5: Fiber Rolls. The construction team will implement this BMP to eliminate the erosion of slopes. The rolls are widely used to prevent sediment from running off site.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP SE-6: Gravel Bag Berm. The construction team will implement this BMP to eliminate erosion of slopes. This BMP is particularly useful with steep slopes and a high potential for runoff.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP SE-7: Street Sweeping and Vacuuming. The construction team will implement this BMP when soils and miscellaneous debris are tracked from the construction site to areas outside the site. This measure prevents sediments from reaching the drop inlets and stormwater system and prevents unsafe driving conditions.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP SE-10: Storm Drain Inlet Protection. The construction team will implement this BMP if any runoff from the construction site drains directly into a drop inlet. The protection will prevent debris and soils from clogging drop inlets and storm drain systems.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP TC-1: Stabilized Construction. The construction team will implement this BMP to remove all construction site soil and miscellaneous debris prior to leaving the site. The BMP will depend on the soil, site, and type of surface outside the staging area.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
BMP TC-2: Stabilized Construction Roadway. A stabilized construction roadway is a temporary access road. It is designed for the control of dust and erosion created by vehicular tracking.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
BMP WM-3: Stockpile Management. The construction team will implement this BMP whenever there are stockpiles of asphalt, concrete, wood, or soil. This includes temporary stockpiles and stockpiles existing for periods longer than one working day.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
Mitigation Measure 3.10-1a: Erosion Control Plan. SCE shall develop and submit to CPUC for review and approval a Project-specific Erosion Control Plan at least 60 days prior to the start of construction. The Erosion Control Plan may be part of the Storm Water Pollution Prevention Plan (SWPPP) and WDR permit and shall be kept on-site and be readily available upon request. The Erosion Control Plan shall be in effect for Project sites as determined by the SWPPP and WDR or permit conditions, as applicable, at the discretion of the Regional Water Quality Control Board. Soil disturbance at structure sites and access roads shall be minimized and designed such that long-term soil erosion is prevented. The Erosion Control Plan shall include, but not be limited to, the following: • Specific locations for all soil disturbing construction activities including but not limited to new and improved access roads, staging areas, work sites, etc. • Specific locations of all watercourses, ephemeral and perennial drainages (as applicable) that would be directly affected by soil disturbing activities (such as water crossings, and public storm drains by rights-of-way and access roads). • Identify specific BMPs to protect drainage structures such as public storm drains downstream of soil disturbing activities. • Temporary and permanent design features to minimize erosion during construction and (if permanent) during operation of the Project. • Specific location and type of BMPs proposed to be installed to prevent off-site sedimentation and to protect aquatic resources/drainages. • Specifications for the implementation and maintenance of erosion control measures and site specific BMPs, including design, installation, maintenance, and effectiveness monitoring details. • Proposed schedule including intervals for inspection of erosion control/SWPPP measures and schedule for corrective actions/repairs, as necessary. Erosion control/SWPPP inspection reports shall be provided to the CPUC environmental monitor. Inspection and monitoring for erosion control/SWPPP measures shall be performed in compliance with the applicable federal (as required by BLM and/or DoD) and/or the California Construction General Permit and/or WDR conditions, as applicable. The minimum inspection schedule shall be as follows as required by the NPDES Construction General Permit: – Erosion control BMPs shall be inspected at least monthly. BMPs not performing as designed shall be replaced or repaired to restore the BMP function. – BMPs shall be inspected within 72 hours of a forecasted Qualifying Precipitation Event, defined as a rain event that produces 0.5 inch or more of precipitation with a period of 48 hours or more between rain events. BMPs not performing as designed shall be replaced or restored to restore the BMP function. – BMPs shall be inspected within 48 hours after a Qualifying Precipitation Event. BMPs not performing as designed shall be replaced or repaired to restore the BMP function. • The discharger shall use non-structural and/or structural measures to replicate the pre-construction water balance (for the General Permit, this is defined as the volume of rainfall that ends up as runoff) for the smallest storms up to and including the 85th percentile, 24-hour precipitation event (or the smallest precipitation event that generates runoff, whichever is larger).	SCE and its contractors to implement measure as defined	SCE to provide draft and final grading plans and erosion control plans to CPUC prior to construction. SCE to provide CPUC with evidence of NPDES discharge permit prior to initiating soil disturbing (construction) activities. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	At least 60 days prior to the start of construction and during all phases of the Project

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
SCE shall provide draft and final grading plans to the CPUC for approval that define the locations of the specific features listed above and in the Erosion Control Plan. SCE shall submit evidence of possession of required permits prior to initiating soil disturbing activities. Permits may include NPDES California General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Report of Waste Discharge (ROWD), and associated WDR, CDFW Lake and Streambed Alteration Agreement, and potentially others, as applicable to the Project's use of federal and non-federal lands.			
Hazards and Hazardous Materials			
APM HAZ-1: SCE will prepare and implement a HMMP/Hazardous Materials Business Plan during project construction. The program will outline proper hazardous materials handling, use, storage, and disposal requirements, as well as hazardous waste management procedures. This plan will be developed to ensure that all hazardous materials and wastes will be handled and disposed of according to applicable rules and regulations. The HMMP will address: the types of hazardous materials to be used during the Project, hazardous materials storage, employee training requirements, hazard recognition, fire safety, first aid/emergency medical procedures, hazardous materials release containment/control procedures, hazard communication training, personal protective equipment (PPE) training, and release reporting requirements. It will also include fueling and maintenance procedures for helicopters and construction equipment.	SCE and its contractors to implement measure as defined	CPUC to review and verify compliance. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Develop HMMP prior to and implement HMMP during construction
APM HAZ-2: A Soil Management Plan will be developed and implemented for the Proposed Project. The Soil Management Plan will provide guidance for the proper handling, on-site management, and disposal of impacted soil that may be encountered during construction activities.	SCE and its contractors to implement measure as defined	CPUC to review and verify compliance. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction activities
APM HAZ-3: Prior to construction, SCE shall consult with the FAA regarding helicopter flight plans that will take place during construction. This consultation will would include, but not be limited to: • Providing locations of helicopter construction staging and work areas • Establishing designated flight corridors between staging and work areas • Means to ensure external load operations avoid occupied structures and roadways • Locations of traffic control where external load operations will cross public roadways • Locations where Congested Area Plans may be required for filing with the FAA • Identifying any flight restrictions recommended/required by the FAA The results of this coordination will be provided to the CPUC.	SCE and its contractors to implement measure as defined	CPUC to review and verify compliance. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction
APM HAZ-4: All workers on the project site shall be required to attend a Worker's Environmental Awareness Training Program (WEAP). The training shall inform all construction personnel of the UXO avoidance measures, including general precautions as well as specific procedures to be followed upon the discovery of UXO. The WEAP training will include, at a minimum, the following topics so crews will understand their obligations: • Safety and situational awareness in areas where UXO are likely to be encountered • Identification of UXO • Work stoppage and work area evacuation • Communication protocol	SCE and its contractors to implement measure as defined	SCE prepare and provide to CPUC WEAP training materials and sign in sheets for trained workers. SCE to repeat training for added construction personnel, as needed. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
• Treatment of UXO, including avoiding disturbance of the UXO and flagging the item with a visible marker, if it may be done safely • Consequences of non-compliance			
BMP NS-9: Vehicle and Equipment Fueling. The construction team will implement this BMP when fueling of equipment occurs on site. The equipment should be monitored before and after fueling. This will prevent any fuel from reaching the construction site soils and possible groundwater. Diapers, pans, or tarps will be used under fueling areas. Spill kits will be on-site at fueling locations. Fueling areas will be located at least 100 feet from drainages.	SCE to implement measures as defined.	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During all phases of the project
BMP WM-1: Material Delivery and Storage. The construction team will implement this BMP to prevent, reduce, or eliminate the discharge of pollutants from material delivery and storage to the stormwater system or watercourses by minimizing the storage of hazardous materials on-site, storing materials in watertight containers and/or a completely enclosed designated area, installing secondary containment, conducting regular inspections, and training applicable employees and subcontractors.	SCE to implement measures as defined.	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During all phases of the project
BMP WM-2: Material Use. The construction team will implement this BMP to prevent or reduce the discharge of pollutants to the storm drain system or watercourses from material use by using alternative products, minimizing hazardous material use on-site, and training applicable employees and subcontractors.	SCE to implement measures as defined.	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During all phases of the project
Incidental Leak or Spill The following BMPs would be followed in the event of an incidental leak or spill of hazardous materials: **BMP WM-4: Spill Prevention and Control.** The construction team will implement this BMP to prevent or reduce the discharge of pollutants to drainage systems or watercourses from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training applicable employees.	SCE to implement measures as defined.	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During all phases of the project
BMP WM-6: Hazardous Waste Management. The construction team will implement this BMP to prevent or reduce the discharge of pollutants to stormwater from hazardous waste through proper material use, waste disposal, and training of applicable employees and subcontractors.	SCE to implement measures as defined.	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During all phases of the project
BMP WM-7: Contaminated Soil Management. The construction team will implement this BMP to prevent or reduce the discharge of pollutants to stormwater from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.	SCE to implement measures as defined.	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During all phases of the project
Mitigation Measure 3.9-6a: EAFB Communication Plan. SCE shall prepare and implement an EAFB Communication Plan in accordance with standards set forth in the R-2508 User Handbook and the R-2515 User Handbook. SCE will coordinate with both the R-2508 Central Coordinating Facility (CCF) and the R-2515 Airspace Management Office prior to the commencement of subtransmission line construction and operational maintenance activities. In areas designated as R-2515 Airspace, SCE shall establish flight schedules and paths in accordance with EAFB Aircraft and Air/Ground Support Scheduling Guide available on the R-2515 public website and with coordination with the R-2515 Airspace Management Office. SCE shall also be required to: • Provide annual briefings to EAFB during the construction of the Project,	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to subtransmission line construction and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
• Identify any flight restrictions recommended/required by EAFB, • Avoid No-Fly zones such as the Air Force Research Lab, the Boron mine property, and the Edwards Main Base.			
Mitigation Measure 3.9-6b: EAFB Obstruction Evaluation. Based on information obtained through preparation of the EAFB Communication Plan and any other follow-up coordination with EAFB, SCE shall prepare an obstruction evaluation for Project structures proposed to be within restricted airspace by EAFB. The evaluation shall be provided to EAFB's R-2508 Central Coordinating Facility (CCF) and/or the R 2515 Airspace Management Office for review and input. EAFB may recommend alterations to Project design, including height reduction, the addition of lighting, or the placement of marker balls/wire spans. SCE shall review the EAFB recommendations for reasonableness and feasibility and in accordance with EAFB requirements and make any necessary design alterations.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction
Hydrology and Water Quality			
APM WET-1: Avoid and/or Minimize Impacts to Jurisdictional Waters, Wetlands, and Riparian Habitats. The Proposed Project shall avoid and/or minimize impacts to all state jurisdictional waters, wetlands, and riparian habitat that occur within the Proposed Project area where feasible. All grading, fill, staging of equipment, infrastructure construction or removal, and all other construction activities shall be designed, sited, and conducted outside of state and federally jurisdictional waters, wetlands, and riparian habitat. The implementation of appropriate Best Management Practices (BMPs) (e.g., silt fencing, straw wattles, secondary containment, avoiding fueling within 100 feet of jurisdictional waters, etc.) shall be utilized to ensure that indirect impacts to jurisdictional waters, wetlands, and riparian areas are avoided or minimized. BMPs are also necessary to reduce the risk of an unintended release of sediment or other material into jurisdictional waters. New and upgraded roadways shall use at-grade type stream crossings unless installation or repair of culverts is required. Stockpiled and bermed sediment will be redistributed or removed from the site so as not to alter flows. New poles shall be sited outside stream channels. If permanent impacts to waters, wetlands, and riparian habitats are unavoidable, they shall be mitigated at a minimum of a 1:1 ratio, or at a ratio determined by the applicable Resource Agencies (i.e., U.S. Army Corps of Engineers, the State Water Resources Control Board/Regional Water Quality Control Boards, and California Department of Fish and Wildlife). Temporary impacts to jurisdictional waters shall be returned to pre-existing contours upon completion of the work.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all phases of construction; temporary impacts to jurisdictional waters to be returned to pre-existing contours upon completion of construction.
BMP EC-1 through BMP EC-8, BMP EC-15, BMP EC-16, BMP SE-4, BMP SE-6, BMP SE-7, BMP SE-10, BMP TC-1, BMP TC-2, BMP TC-3 (as described under Geology, Soils, and Paleontology)	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
Mitigation Measure 3.10-1a: Erosion Control Plan. SCE shall develop and submit to CPUC for review and approval a Project-specific Erosion Control Plan at least 60 days prior to the start of construction. The Erosion Control Plan may be part of the Storm Water Pollution Prevention Plan (SWPPP) and WDR permit and shall be kept on-site and be readily available upon request. The Erosion Control Plan shall be in effect for Project sites as determined by the SWPPP and WDR or permit conditions, as applicable, at the discretion of the Regional Water Quality Control Board. Soil disturbance at structure sites and access roads shall be minimized and designed such that long-term soil erosion is prevented. The Erosion Control Plan shall include, but not be limited to, the following:	SCE and its contractors to implement measure as defined	SCE to provide draft and final grading plans and erosion control plans to CPUC prior to construction. SCE to provide CPUC with evidence of NPDES discharge permit prior to initiating soil disturbing (construction) activities. SCE Mitigation Monitor and CPUC	At least 60 days prior to the start of construction and during all phases of the Project

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
• Specific locations for all soil disturbing construction activities including but not limited to new and improved access roads, staging areas, work sites, etc. • Specific locations of all watercourses, ephemeral and perennial drainages (as applicable) that would be directly affected by soil disturbing activities (such as water crossings, and public storm drains by rights-of-way and access roads). • Identify specific BMPs to protect drainage structures such as public storm drains downstream of soil disturbing activities. • Temporary and permanent design features to minimize erosion during construction and (if permanent) during operation of the Project. • Specific location and type of BMPs proposed to be installed to prevent off-site sedimentation and to protect aquatic resources/drainages. • Specifications for the implementation and maintenance of erosion control measures and site specific BMPs, including design, installation, maintenance, and effectiveness monitoring details. • Proposed schedule including intervals for inspection of erosion control/SWPPP measures and schedule for corrective actions/repairs, as necessary. Erosion control/SWPPP inspection reports shall be provided to the CPUC environmental monitor. Inspection and monitoring for erosion control/SWPPP measures shall be performed in compliance with the applicable federal (as required by BLM and/or DoD) and/or the California Construction General Permit and/or WDR conditions, as applicable. The minimum inspection schedule shall be as follows as required by the NPDES Construction General Permit: – Erosion control BMPs shall be inspected at least monthly. BMPs not performing as designed shall be replaced or repaired to restore the BMP function. – BMPs shall be inspected within 72 hours of a forecasted Qualifying Precipitation Event, defined as a rain event that produces 0.5 inch or more of precipitation with a period of 48 hours or more between rain events. BMPs not performing as designed shall be replaced or restored to restore the BMP function. – BMPs shall be inspected within 48 hours after a Qualifying Precipitation Event. BMPs not performing as designed shall be replaced or repaired to restore the BMP function. • The discharger shall use non-structural and/or structural measures to replicate the pre-construction water balance (for the General Permit, this is defined as the volume of rainfall that ends up as runoff) for the smallest storms up to and including the 85th percentile, 24-hour precipitation event (or the smallest precipitation event that generates runoff, whichever is larger). SCE shall provide draft and final grading plans to the CPUC for approval that define the locations of the specific features listed above and in the Erosion Control Plan. SCE shall submit evidence of possession of required permits prior to initiating soil disturbing activities. Permits may include NPDES California General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Report of Waste Discharge (ROWD), and associated WDR, CDFW Lake and Streambed Alteration Agreement, and potentially others, as applicable to the Project's use of federal and non-federal lands.		Third-Party Compliance Monitor to inspect and report out on compliance.	

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
Noise			
APM NOI-1: SCE shall employ the following noise-control techniques, at a minimum, to reduce construction noise exposure at noise-sensitive receptors during construction: • Construction activities shall be confined to daytime, weekday and weekend hours established by Kern County, San Bernardino County, and the City of California City. In the event construction is required beyond those hours, SCE will notify the appropriate local agency or agencies regarding the description of the work, location, and anticipated construction hours. • Construction equipment shall use noise reduction features (e.g., mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer. • Stationary noise sources (e.g., generators, pumps) and staging areas shall be shielded by an enclosure, temporary sound walls, acoustic blankets, or other barrier where noise levels are above 80 dBA at sensitive receptor locations. Heights and specifications of noise barriers will be designed to reduce construction noise to below 80 dBA (FTA 2006). • Construction traffic and helicopter flight shall be routed away from residences and schools. • Unnecessary construction vehicle use and idling time shall be minimized. If a vehicle is not required for use immediately or continuously for construction activities, its engine shall be shut off.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction
Mitigation Measure 3.13-1a: Construction Noise Reduction Plan. SCE and/or its contractors shall develop a Construction Noise Reduction Plan for the residence near Borax Bill Park. The Plan shall be submitted to the CPUC for review and approval prior to the commencement of construction activities. The Plan shall include, but not be limited to, the following measures for construction activities: • Provide the residence with a "hotline" telephone number, which shall be attended during active construction working hours in order to register complaints. All complaints shall be logged noting date, time, complainants' name, nature of complaint, and any corrective action taken. • Use construction noise barriers such as temporary sound walls, acoustic blankets, or other barriers to shield construction noise at the residence from activities involving heavy equipment. Heights and specifications of noise barriers shall be designed to ensure that the line of sight is broken between the active construction activities and the residence. • If nighttime construction activities are proposed to occur within 400 feet of the residence, SCE shall offer to provide the residents with temporary relocation for the duration of such activities.	SCE and its contractors to implement measure as defined	SCE to provide construction noise reduction plan to CPUC prior to construction. SCE to make available to CPUC all logged complaints and corrective actions taken. CPUC mitigation monitor to confirm compliance	Prior to and during construction
Mitigation Measure 3.13-1b: Construction Helicopter Flight Restrictions. SCE shall ensure that Project helicopter construction activities do not occur within 3,600 feet of residences in California City or at any location during nighttime hours (i.e., 7:00 a.m. to 7:00 p.m.).	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During construction
Recreational Resources			
APM REC-1: When temporary closures to recreational areas are necessary for construction activities, SCE will coordinate those closures with recreational facility owners.	SCE and its contractors to implement measure as defined	SCE to provide communications to CPUC as applicable. CPUC to confirm compliance	Prior to and during construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
Mitigation Measure 3.1-2c: Treat Surfaces with Appropriate Colors, Finishes, and Textures (see Aesthetics, above, for the text of this mitigation measure)	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during construction
Transportation			
Mitigation Measure 3.17-2a: Traffic Management Plan. SCE shall prepare and implement a Traffic Management Plan in consultation with Caltrans and the applicable local government(s)/entities, including agencies that operate alternative modes of transportation (e.g., Kern Transit, Burlington Northern Santa Fe). The Traffic Management Plan and documentation of agency consultation shall be submitted to the CPUC for review and approval at least 30 days prior to the commencement of construction activities. At a minimum, the plan shall: • Include a discussion of work hours, haul routes, and work area delineation within public road rights-of-way; • Require construction work to utilize traffic control and flagging when construction vehicles are present; • Identify and provide all access and parking restrictions and signage requirements; • Require workers to park personal vehicles at the approved staging area(s) and take only necessary project vehicles to the work sites; • Lay out plans for notifications and a process for communication with adjacent residents and landowners prior to the start of construction. Advance public notification shall include posting of notices and appropriate signage of construction activities. The written notification shall include the construction schedule, the exact location and duration of activities within each street (i.e., which road/lanes and access point/driveways would be blocked on which days and for how long), and a toll-free telephone number for receiving questions or complaints; • Describe coordination of all construction activities with emergency service providers in the area prior to construction to ensure that construction activities and associated lane closures would not substantially affect emergency response vehicles. Emergency services providers shall be notified of the timing, location, and duration of construction activities. The plan shall include verification of its consultation with emergency service providers to the CPUC. • Include the requirement that all roadways shall remain passable to emergency service vehicles at all times. • Identify all roadway locations where special construction techniques (e.g., night construction) would be used to minimize impacts to traffic flow. • Identify alternate or detour paths that would minimize interference with walking or bicycling accessibility.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	At least 30 days prior to construction and during construction
Tribal Cultural Resources			
APM TCR-1: Tribal Monitoring. An archaeological monitor, and tribal monitor that is culturally affiliated with the Project area, may be present for ground-disturbing activities within or directly adjacent to identified tribal cultural resources. The archaeological and tribal monitors will consult the Cultural Resource Management Plan (CRMP; APM CUL-1) to determine when to increase or decrease the monitoring effort should the monitoring results indicate a change is warranted. Monitoring reports shall be prepared and submitted to the CPUC on a monthly basis.	SCE and its contractors to implement measure as defined	SCE to provide monthly monitoring reports to CPUC. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	During ground disturbing project construction activities

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
APM TCR-2: Tribal Engagement Plan. A tribal engagement plan shall be prepared, which will detail how Native American tribes will be engaged and informed throughout the Proposed Project. The tribal engagement plan will be included in the CRMP (APM CUL-1).	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project activities
Mitigation Measure 3.18-1: Public Interpretation Land Acknowledgement. SCE shall, in coordination with Consulting Native American tribes, design and implement a public interpretation land acknowledging that this project is built on indigenous land. The public interpretive land acknowledgement program may include a land acknowledgement, information on local Native Americans, or artwork, preferably by local Native American artists, to be included as part of public outreach and education about the project, such as project notifications sent to the public or project websites. Prior to completion of project construction, SCE shall prepare and implement land acknowledgement interpretation plan in consultation with affiliated local Native American representatives to guide the acknowledgment program. The plan shall be reviewed by CPUC and shall identify, as appropriate, the proposed location or distribution for the acknowledgement program to include project outreach materials such as project webpages or other online project education or notification outreach and the proposed content of the land acknowledgement public interpretation program. The detailed content, media, and other characteristics of such an interpretive program shall be coordinated by the Consulting Native American tribes and the CPUC, and be approved by CPUC. The final components of the public interpretation program shall be distributed following the agreed upon schedule in the public interpretation land acknowledgement plan. Tribal representatives shall be compensated for their work as identified in the agreed-upon scope of work for the plan.	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project activities
Utilities			
BMP SE-4, *Check Dam*; BMP SE-6, *Gravel Bag Berm*; BMP SE-7, *Street Sweeping and Vacuuming*; BMP SE-10, *Storm Drain Inlet Protection*; BMP TC-1, *Stabilized Construction*; and BMP TC-2, *Stabilized Construction Roadway* (as described in Geology/Hydrology and Water Quality)	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	Prior to and during all project construction activities
Mitigation Measure 3.19-5: Construction Solid Waste Management Plan. SCE shall comply with the minimum construction and demolition debris diversion requirements found within the local waste diversion ordinances in effect for the City of California City. In order to document and track such diversions, the applicant shall provide the following to the CPUC: • Prior to construction, SCE will submit to CPUC a properly completed initial Waste Management Plan, on a form as prescribed by the City. The Plan will demonstrate how SCE will satisfy the diversion requirement by diverting specific materials (such as concrete, scrap metals or other salvageable materials) from disposal. • During construction activities, SCE or its authorized agent will evaluate and monitor the Project site to gauge the percentage of materials recycled, salvaged, and disposed from the project. The required diversion of a minimum of the required percentages of the demolition and construction debris will be measured separately with respect to the demolition segment and the construction segment of a project where both demolition and construction are involved.	SCE and its contractors to implement measure as defined	SCE to provide construction solid waste management plan to CPUC prior to construction. CPUC mitigation monitor to inspect compliance	During construction

Applicant Proposed Measures (APMs), Best Management Practices (BMPs), and Mitigation Measures (MMs) Identified in the EIR	Implementing Actions	Monitoring/ Reporting Requirements	Timing
Wildfire			
Mitigation Measure 3.10-1a: Erosion Control Plan (see Hydrology and Water Quality for the text of this mitigation measure)	SCE and its contractors to implement measure as defined	SCE to provide draft and final grading plans and erosion control plans to CPUC prior to construction. SCE to provide CPUC with evidence of NPDES discharge permit prior to initiating soil disturbing (construction) activities. SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	At least 60 days prior to the start of construction and during all phases of the Project
Mitigation Measure 3.17-2a: Traffic Management Plan (see Transportation for the text of this mitigation measure)	SCE and its contractors to implement measure as defined	SCE Mitigation Monitor and CPUC Third-Party Compliance Monitor to inspect and report out on compliance.	At least 30 days prior to construction and during construction
