EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 332 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Tetra Tech Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Contact: Tanya Maclean

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Tetra Tech Inc. were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:

P.O.# NA

Project: T37254.13

Coordinates:

Latitude:	33.998102 33° 59' 53" North
Longitude:	-118.262105 -118° 15' 44" West
UTM Zone:	Zone 11 North
UTM X Meters:	383441.19
UTM Y Meters:	3762663.44
Elevation:	181.00' above sea level

Maps Provided:

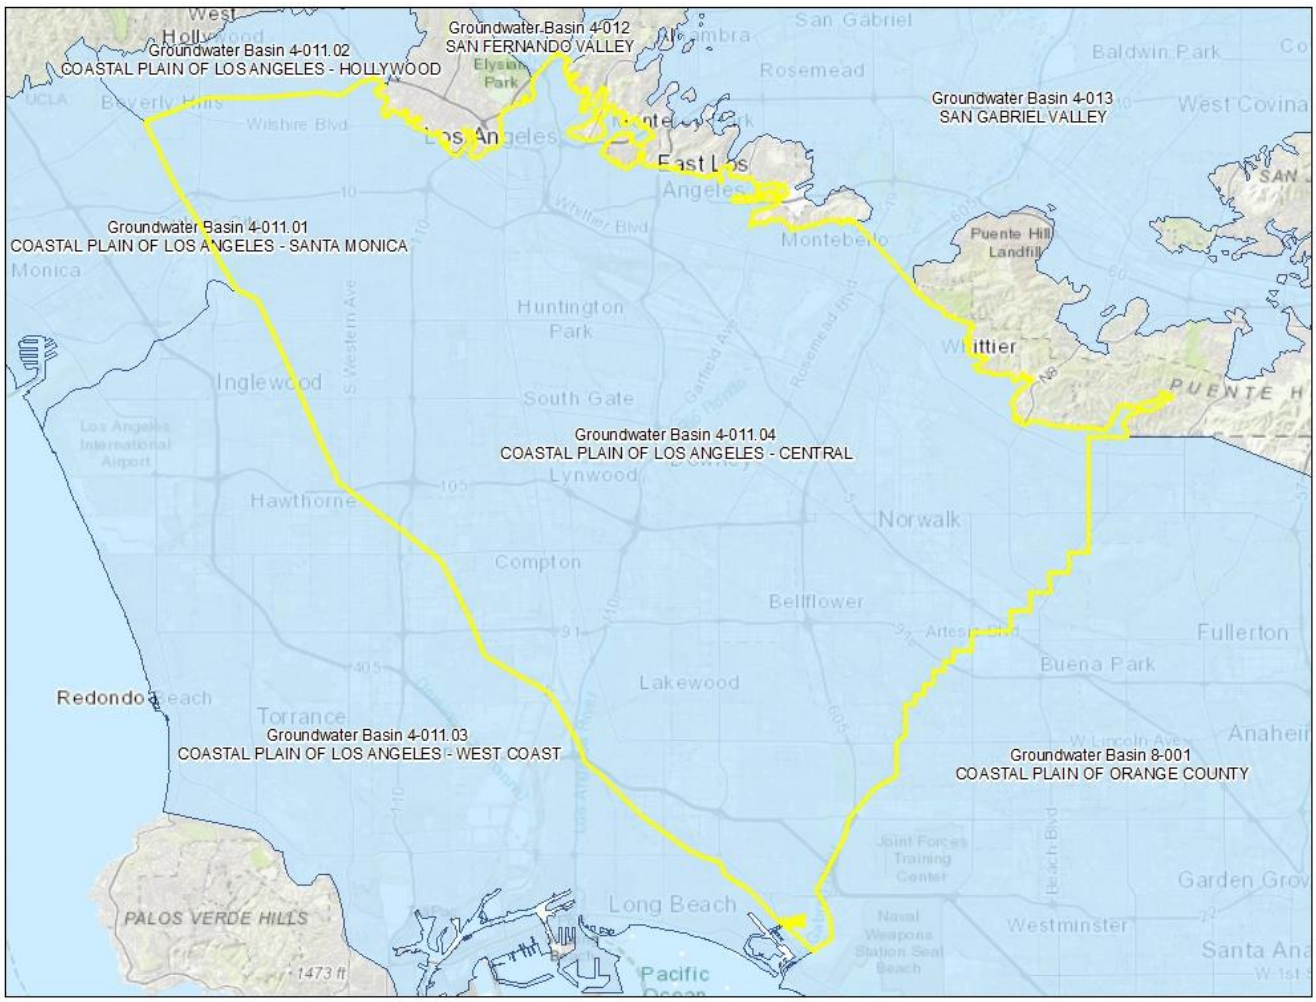
4-011.04 COASTAL PLAIN OF LOS ANGELES – CENTRAL

Basin Boundaries Description

2003



- County: Los Angeles
- Surface Area: 177,000 acres (277 square miles)

Summary

The Central Subbasin occupies a large portion of the southeastern part of the Coastal Plain of Los Angeles Groundwater Basin. This subbasin is commonly referred to as the “Central Basin” and is bounded on the north by a surface divide called the La Brea high, and on the northeast and east by emergent less permeable Tertiary rocks of the Elysian, Repetto, Merced and Puente Hills. The southeast boundary between Central Basin and Orange County Groundwater Basin roughly follows Coyote Creek, which is a regional drainage province boundary. The southwest boundary is formed by the Newport Inglewood fault system and the associated folded rocks of the Newport Inglewood uplift.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Los Angeles County, California, Southeastern Part
Survey Area Data: Version 8, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Nov 21, 2020—Dec 2, 2020

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
1000	Urban land-Hueneme, drained-San Emigdio complex, 0 to 2 percent slopes	5.7	100.0%
Totals for Area of Interest		**5.7**	**100.0%**

Los Angeles County, California, Southeastern Part

1000—Urban land-Hueneme, drained-San Emigdio complex, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: 2lts5
Elevation: 10 to 300 feet
Mean annual precipitation: 12 to 16 inches
Mean annual air temperature: 64 to 66 degrees F
Frost-free period: 350 to 365 days
Farmland classification: Prime farmland if irrigated and drained

Map Unit Composition

Urban land: 45 percent
Hueneme, drained, and similar soils: 20 percent
San emigdio and similar soils: 15 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Urban Land

Setting

Landform: Alluvial fans

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: 0 inches to manufactured layer
Runoff class: Very high
Frequency of flooding: RareNone

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Ecological site: R019XG911CA - Loamy Fan
Hydric soil rating: No

Description of Hueneme, Drained

Setting

Landform: Alluvial fans
Landform position (three-dimensional): Talf
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Discontinuous human-transported material over mixed alluvium derived from granite and/or sedimentary rock

Typical profile

A - 0 to 5 inches: sandy loam
C1 - 5 to 16 inches: sandy loam
C2 - 16 to 22 inches: loamy fine sand
C3 - 22 to 31 inches: very fine sandy loam

C4 - 31 to 53 inches: fine sandy loam
C5 - 53 to 77 inches: silt loam
C6 - 77 to 79 inches: loamy sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Somewhat poorly drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: RareNone
Frequency of ponding: None
Calcium carbonate, maximum content: 5 percent
Maximum salinity: Very slightly saline to slightly saline (2.0 to 4.0 mmhos/cm)
Sodium adsorption ratio, maximum: 8.0
Available water supply, 0 to 60 inches: Moderate (about 8.0 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3w
Hydrologic Soil Group: B
Ecological site: R019XG911CA - Loamy Fan
Hydric soil rating: No

Description of San Emigdio

Setting

Landform: Alluvial fans
Landform position (three-dimensional): Rise
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Discontinuous human-transported material over mixed alluvium derived from granite and/or sedimentary rock

Typical profile

A - 0 to 4 inches: fine sandy loam
C1 - 4 to 16 inches: fine sandy loam
C2 - 16 to 20 inches: silt loam
C3 - 20 to 39 inches: sandy loam
C4 - 39 to 67 inches: loamy sand

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: RareNone

Frequency of ponding: None
Calcium carbonate, maximum content: 5 percent
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water supply, 0 to 60 inches: Moderate (about 6.5 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3e
Hydrologic Soil Group: B
Ecological site: R019XG911CA - Loamy Fan
Hydric soil rating: No

Minor Components

Pico

Percent of map unit: 10 percent
Landform: Alluvial fans

Application for the Erection of Frame Buildings

CLASS "D"

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

CITY OF LOS ANGELES

DEPARTMENT OF BUILDING AND SAFETY

BUILDING DIVISION

Application to Alter, Repair, Move or Demolish

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

BOARD OF PUBLIC WORKS

DEPARTMENT OF BUILDINGS

Application for the Erection of Frame Buildings

CLASS "D"

To the Board of Public Works of the City of Los Angeles:

Application is hereby made to the Board of Public Works of the City of Los Angeles, through the office of the Chief Inspector of Buildings, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

Application for the Erection of Frame Buildings

CLASS "D"

To the Board of Public Works of the City of Los Angeles:

Application is hereby made to the Board of Public Works of the City of Los Angeles, through the office of the Chief Inspector of Buildings, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

DEPARTMENT OF BUILDING AND SAFETY

Application for the Erection of Frame Buildings

CLASS "D"

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

DEPARTMENT OF BUILDING AND SAFETY

Application to Alter, Repair or Demolish

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

To the Board of Public Works of the City of Los Angeles:

Application is hereby made to the Board of Public Works of the City of Los Angeles, through the office of the Chief Inspector of Buildings, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

REMARKS

I hereby agree to locate and erect this building or structure and every portion thereof, except unenclosed porches, back a distance from the front property line equal to the set-back line of the nearest building now erected on any lot in this block in Zone "A" on the same side of the street.

There will be an unobstructed passageway, at least 10 feet wide, extending from any dwelling on lot to a public street, or to a public alley at least 10 feet in width.

Application for the Erection of Frame Buildings

CLASS "D"

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

BUILDING DIVISION

Application to Alter, Repair, Move or Demolish

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

OF

CLASS "D"

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

DEPARTMENT OF BUILDING AND SAFETY

BUILDING DIVISION

REVOCABLE PERMIT

Application for the Erection of a Building

OF

CLASS "D"

To the Board of Building and Safety Commissioners of the City of Los Angeles:

Application is hereby made to the Board of Building and Safety Commissioners of the City of Los Angeles, through the office of the Superintendent of Building, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

Lot No. .....

Forty-Ninth Street Tract

Tract .....

Location of Building 4917 McKinley Avenue (House Number and Street)

Application to Alter, Repair or Demolish

To the Board of Public Works of the City of Los Angeles:

Application is hereby made to the Board of Public Works of the City of Los Angeles, through the office of the Chief Inspector of Buildings, for a building permit in accordance with the description and for the purpose hereinafter set forth. This application is made subject to the following conditions, which are hereby agreed to by the undersigned applicant and which shall be deemed conditions entering into the exercise of the permit:

First: That the permit does not grant any right or privilege to erect any building or other structure therein described, or any portion thereof, upon any street, alley, or other public place or portion thereof.

Second: That the permit does not grant any right or privilege to use any building or other structure therein described, or any portion thereof, for any purpose that is, or may hereafter be prohibited by ordinance of the City of Los Angeles.

Third: That the granting of the permit does not affect or prejudice any claim of title to, or right of possession in, the property described in such permit.

EJSCREEN EJ Indexes

Eleven primary environmental justice (EJ) indexes of EJSCREEN, EPA's screening tool for EJ concerns. EPA uses these indexes to identify geographic areas that may warrant further consideration or analysis for potential EJ concerns. The index values below are for the Census block group in which the facility is located. Note that use of these indexes does not designate an area as an "EJ community" or "EJ facility." EJSCREEN provides screening level indicators, not a determination of the existence or absence of EJ concerns. For more information, see the EJSCREEN home page.

Census Block Group EJ Indexes (percentile)	
Particulate Matter (PM 2.5)	98.8
Ozone	97.9
NATA Diesel PM	98.4
NATA Air Toxics Cancer Risk	98.5
NATA Respiratory Hazard Index (HI)	98.8
Traffic Proximity	97.7
Lead Paint Indicator	99.8
National Priority List (NPL) Site Proximity	95
Risk Management Plan (RMP) Site Proximity	99.6
Hazardous Waste Proximity	98.6
Wastewater Discharge Proximity	73.4

Number of EJ Indexes Above 80th Percentile
10

Demographic Profile of Surrounding Area (1 Mile)

This section provides demographic information regarding the community surrounding the facility. ECHO compliance data alone are not sufficient to determine whether violations at a particular facility had negative impacts on public health or the environment. Statistics are based upon the 2010 U.S. Census and 2014 - 2018 American Community Survey (ACS) 5-year Summary and are accurate to the extent that the facility latitude and longitude listed below are correct. EPA's spatial processing methodology considers the overlap between the selected radii and the census blocks (for U.S. Census demographics) and census block groups (for ACS demographics) in determining the demographics surrounding the facility. For more detail about this methodology, see the DFR Data Dictionary.

General Statistics	
Total Persons (U.S. Census)	73,983
Population Density	23,646/sq.mi.
Percent People of Color	99%

Re: Soil Certification Report, LAUSD 49th Street Elementary School, 750 East 49th Street, Los Angeles, California 90011

Dear Ms. Boczarski-Daniel:

Lindmark Engineering (LE) has prepared this report to summarize the results of soil characterization including stockpiled soil sampling and laboratory analysis at the referenced site. The work was conducted in accordance with LE's *Proposal for Stockpiled Soil Characterization* dated August 17, 2007, and the Los Angeles Unified School District's (LAUSD) *Environmental Import/Export Materials Testing Section 01440* dated January 31, 2006. This *Soil Certification Report* is based on the LAUSD's requirements for sampling, testing, and certification of imported or exported soil materials for school sites.

Background

During construction at the 49th Street Elementary School, approximately 5 cubic yards of soil and/or base material was excavated and stockpiled by an LAUSD contractor to prepare the surface for new paving. The excavated and stockpiled soil was temporarily stored on the school property. Prior to reuse of the excavated material at a school site or transportation to an off-site disposal facility, laboratory analysis is required to determine any hazardous characteristics. The report herein summarizes the procedures for sampling and analysis of the stockpiled soil, as well as LE's findings, conclusions, and recommendations.

Soil Sampling

On September 10, 2007, LE collected one soil sample from the stockpile temporarily stored on-site. LE collected a composite grab sample from three to four locations and approximately 1 to 2 feet below the surface of the stockpiled soil. The composite sample was stored in 8-ounce glass jars and capped with Teflon-lined lids.

The containers were labeled with the sample identification number, stored on ice at 4°C, and transported immediately to a state-certified laboratory. The sample was recorded on a chain-of-custody record identifying the sampler, date, time, couriers used, responsible laboratory personnel, and requested analyses. Details of the soil stockpile and soil sample location are shown on Figure 1, Attachment A.

Chemical Analysis

The soil sample retained for chemical analysis was submitted to American Scientific Laboratories, LLC, a state-certified laboratory, and analyzed for total petroleum hydrocarbons as gasoline, diesel, and oil (TPH[g], TPH[d], TPH[o]), volatile organic compounds (VOCs), semi-volatile organic compounds

(SVOCs), polychlorinated biphenyls (PCBs), organochlorine pesticides (OCPs), organophosphorous compounds, chlorinated herbicides, California Code of Regulations Title 22, California Assessment Manual (CAM) metals, arsenic, thallium, and hexavalent chromium.

The table below summarizes the sampling and laboratory analysis schedule for the stockpile sample. See Table 1, Attachment B, for a summary of laboratory analytical data and Attachment C for a copy of the laboratory report and chain-of-custody record.

Sampling Schedule for Laboratory Analysis of Stockpiled Soil

Location	*Contaminant(s) of Concern*	*Laboratory Analysis for Soil Sample*	*Number of Analyses*
Stockpile	TPH(g)	EPA Method 8260B	1 each per sample
	TPH(d) & TPH(o)	EPA Method 8015B	
	VOCs	EPA Method 8260B	
	SVOCs	EPA Method 8270C	
	Organochlorine pesticides	EPA Method 8081A	
	PCBs	EPA Method 8082	
	Organophosphorus compounds	EPA Method 8141A	
	Chlorinated herbicides	EPA Method 8151A	
	Title 22 CAM metals	EPA Method 6010B/7471A	
	Hexavalent chromium	EPA Method 7199	
	Arsenic and Thallium	EPA Method 6020B	

Findings and Conclusions

- Approximately 5 cubic yards of soil and/or base material was excavated and temporarily stockpiled on the school property by an LAUSD contractor.

- Metals analysis identified the presence of 14 metals in the soil sample at concentrations above laboratory practical quantitation limits (PQLs). Two additional metals were identified as an estimated value above the laboratory method detection limit (MDL) and below the PQL. Arsenic was detected at a concentration of 3.07 milligrams per kilogram [mg/kg] by EPA Method 6010B, and 2.4 mg/kg by EPA Method 6020. No metal concentrations exceeded either the DTSC screening level or the EPA residential Preliminary Remediation Goal (PRG).

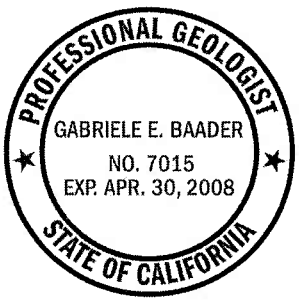
- Concentrations of the OCPs gamma- and alpha-chlordane (7.04 and 5.01 µg/kg, respectively), dichloro-diphenyl-dichloroethylene (DDE, 7.84 µg/kg), and 4,4'-(2,2,2-trichloroethane-1,1-diyl)bis(chlorobenzene) (DDT, 14.4 µg/kg) were detected in the sample well below the screening values based on the California Human Health Screening Levels (CHHSLs; Cal/EPA, 2006) for OCPs. No other OCPs with concentrations exceeding the CHHSLs were detected at or above the PQLs.

- No TPH compounds, VOCs, SVOCs, PCBs, organophosphorus compounds, or chlorinated herbicides were detected at or above PQLs.

- Based on the laboratory analytical results of the soil sample collected from the stockpiled soil, no elevated concentrations of compounds tested were detected. However, based on the LAUSD guidelines, the soil is not eligible for re-use at any LAUSD school site with OCP concentrations above the laboratory detection limits.

Recommendations

Based on the findings and conclusions, LE recommends disposing the soil at a local landfill or at a licensed recycling facility. However, a local landfill may not accept soil with OCP concentrations.



Statement of Limitations

The services described in this report were performed in a manner consistent with Lindmark Engineering's agreement with the client and in accordance with generally accepted professional consulting principles and practices. Opinions and recommendations contained in this report apply to conditions existing at certain locations when services were performed and are intended only for the specific purposes, locations, time frames, and project parameters indicated. Lindmark Engineering cannot be responsible for the impact of any changes in environmental standards, practices, or regulations after performance of services. Any use of this report by a third party is expressly prohibited without a written, specific authorization from the client and Lindmark Engineering. Such authorization will require a signed waiver and release agreement. This report is issued with the understanding that the client, the property owner, or its representative is responsible for ensuring that the information, conclusions and recommendations contained herein are brought to the attention of the appropriate regulatory agencies, as required.

Please call us at 562-423-0600 if you have any questions.

Very truly yours,

ELAP # 1132
LACSD # 10143
NELAC # 04229CA

The results in this report apply to the samples analyzed in accordance with the chain of custody document. Weck Laboratories certifies that the test results meet all requirements of NELAC unless noted in the Case Narrative. This analytical report must be reproduced in its entirety.

Notes:
The Chain of Custody document is part of the analytical report.
Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
All results are expressed on wet weight basis unless otherwise specified.
ND = NOT DETECTED at or above the Reporting Limit. If J-value reported, then NOT DETECTED at or above the Method Detection Limit (MDL).
Sub = Subcontracted analysis, original report enclosed.
Dil = Dilution Factor
MDL = Method Detection Limit
MDA = Minimum Detectable Activity

An Absence of Total Coliform meets the drinking water standards as established by the State of California Department of Health Services.
The Reporting Limit (RL) is referenced as laboratory's Practical Quantitation Limit (PQL).
For Potable water analysis, the Reporting Limit (RL) is referenced as Detection Limit for reporting purposes (DLRs) defined by EPA.

If sample collected by Weck Laboratories, sampled in accordance to lab SOP MIS002

Re: Soil Certification Report Phase II, LAUSD 49th Street Elementary School, 750 East 49th Street, Los Angeles, California 90011

Dear Ms. Boczarski-Daniel:

Baader Environmental Services (BE) has prepared this report to summarize the results of soil characterization, including soil sampling and laboratory analysis, at the referenced site. The work was conducted in accordance with BE's *Sampling Strategy Plan for Stockpile Soil Characterization* (SSP) dated October 15, 2008, approved by the Los Angeles Unified School District's (LAUSD), the LAUSD *Environmental Import/Export Materials Testing Section 01440* dated January 31, 2006, and the LAUSD e-mail correspondence detailing revised sampling procedures dated June 18, 2008. This *Soil Certification Report* is based on the LAUSD's requirements for sampling, testing, and certification of imported or exported soil materials for school sites.

Background

During construction at the referenced LAUSD school site, soil and base material was excavated and stockpiled by the LAUSD contractor, Enterprise Construction, Inc., to prepare the surface for new paving. The excavated and stockpiled soil was placed in the playground of the school site near 50th Street and covered with plastic sheeting.

Originally, as proposed in the SSP, approximately 250 cubic yards were estimated. However, prior to soil sampling, the stockpile was re-measured and determined to contain as much as 700 cubic yards. Based on Table 1: Minimum Sampling Frequency (LAUSD Guidance Section 01440), one sample for each 250 cubic yards is required for a volume of up to 1,000 cubic yards. Therefore, BE collected three composite samples. Prior to reuse of the excavated material, laboratory analysis is required to determine whether the soil can be used at a LAUSD school site or requires transportation to an off-site disposal facility. The report herein summarizes the procedures for sampling and analysis of the stockpiled soil, as well as BE's findings, conclusions, and recommendations.

Soil Sampling

On October 15, 2008 BE collected three soil samples from the stockpile temporarily stored in the southwestern area of the school property. BE collected each composite grab sample from a minimum of two locations at the bottom and one at the top at approximately 3 feet below the surface of the stockpiled soil. The composite samples were mixed and each was preserved in two 9-ounce glass container sealed with Teflon-lined lids and En Core® samplers by EPA Method 5035.

The containers were labeled with the sample identification number. The samples were recorded on a chain-of-custody record identifying the sampler, date, time, couriers used, responsible laboratory personnel, and requested analyses. The samples were then stored on ice at 4°C and immediately

transported to a state-certified laboratory. Details of the stockpile and soil sample locations are indicated on Figure 1, Attachment A.

Chemical Analysis

The soil samples retained for chemical analysis were submitted to American Scientific Laboratories, LLC, a state-certified laboratory, and analyzed for total petroleum hydrocarbons as gasoline, diesel, and oil (TPH[g], TPH[d], TPH[o]), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), organochlorine pesticides (OCPs), organophosphorous compounds, chlorinated herbicides, California Code of Regulations Title 22, California Assessment Manual (CAM) metals, arsenic, thallium, and hexavalent chromium.

The table below summarizes the sampling and laboratory analysis schedule for the stockpile samples. See Table 1, Attachment B, for a summary of laboratory analytical data and Attachment C for a copy of the laboratory report and chain-of-custody record.

Sampling Schedule for Laboratory Analysis of Stockpiled Soil

Location	*Contaminant(s) of Concern*	*Laboratory Analysis for Soil Samples*	*Number of Analyses*
Stockpile	TPH(g)	EPA Method 8260B	1 each per sample
	TPH(d) & TPH(o)	EPA Method 8015B	
	VOCs	EPA Method 8260B	
	SVOCs	EPA Method 8270C	
	Organochlorine pesticides	EPA Method 8081A	
	PCBs	EPA Method 8082	
	Organophosphorus compounds	EPA Method 8141A	
	Chlorinated herbicides	EPA Method 8151A	
	Title 22 CAM metals	EPA Method 6010B/7471A	
	STLC lead	EPA Method 6010B	
	TCLP lead	EPA Method 6010B	
	Hexavalent chromium	EPA Method 7199	
	Arsenic and Thallium	EPA Method 6020B	

Findings and Conclusions

- Approximately 700 cubic yards of soil and/or base material were excavated and temporarily stockpiled on the school property by the LAUSD contractor.

- Metals analysis identified the presence of 13 metals at concentrations above laboratory practical quantitation limits (PQLs) in the samples (three additional metals were reported at an estimated concentration above the laboratory method detection limits and below the PQLs). All reported metals are below their respective Total Threshold Limit Concentrations (TTLC) and none of the concentrations exceed their respective State and Federal health-risk based screening levels for use in residential soil, aside from arsenic and lead.

  - The maximum reported arsenic concentration of 11 milligrams per kilogram (mg/kg), in composite sample SP2, exceeds the United States Environmental Protection Agency (USEPA) Preliminary Remediation Goal (PRG) for residential soil of 0.062 mg/kg and the screening level set forth in LAUSD Guidance Section 01440 of 6.0 mg/kg. However, the arsenic concentration is below the screening level of 12.0 mg/kg applied by the LAUSD throughout the District. The screening level is based on the Department of Toxic Substances Control (DTSC) *Arsenic Strategies - Determination of Arsenic Remediation, Development of Arsenic Cleanup Goals For Proposed and Existing School Sites* dated March 21, 2007.

  - Lead concentrations ranged from 50.5 mg/kg to the maximum reported concentration of 85.6 mg/kg, detected in composite sample SP1. These concentrations are less than the DTSC

screening level of 255 mg/kg. However, lead concentrations exceeding 50 mg/kg require further analysis for the leaching potential of lead. Therefore, BE recommended to analyze all samples for the Soluble Threshold Limit Concentration (STLC) and Toxic Characteristic Leaching Procedure (TCLP) in accordance with the procedures in Title 22 of the *California Code of Regulations* to determine the appropriate waste classification and whether the soil will be disposed of as non-hazardous, California-designated hazardous, or RCRA-hazardous waste.

- Based on laboratory results, the STLC regulatory limit for lead of 5 milligrams per liter (mg/l) was exceeded in one of the three composite samples (SP1, 5.50 mg/l). All three samples were also analyzed for TCLP of lead to determine whether the stockpiled soil would be a RCRA-hazardous waste. Based on the laboratory results, soluble lead concentrations were below the laboratory detection limits in all samples. Based on the STLC and TCLP results, the soil was classified as non-RCRA, California-designated hazardous waste. The laboratory results for STLC and TCLP are summarized in Table 1 and provided in Attachment C.

- Concentrations of the OCPs alpha- and gamma-chlordane, dichloro-diphenyl-dichloroethane (DDD), dichloro-diphenyl-dichloroethylene (DDE), dichloro-diphenyl-trichloroethane (DDT), and dieldrin were detected in the samples at low and estimated concentrations well below the screening values based on the California Human Health Screening Levels (CHHSLs; Cal/EPA, 2006) for OCPs. No other OCPs with concentrations exceeding the CHHSLs were detected at or above the PQLs.

- No TPH(g) was reported by the laboratory in the composite samples. TPH(d) and TPH(o) was reported at low and estimated concentrations well below the California Regional Water Quality Control Board (CRWQCB) Maximum Soil Screening Levels of 100 mg/kg for diesel and 1,000 mg/kg for heavy range hydrocarbons and the acceptance criteria level specified in LAUSD Section 01440 of 1,000 mg/kg for diesel and heavy range hydrocarbons.

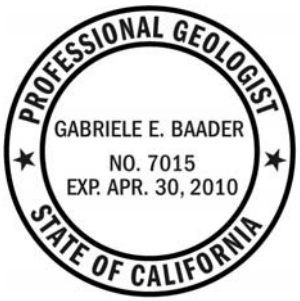
- Concentrations of the PCB aroclor-1260 were detected in two of the samples (SP2 and SP3) at elevated concentrations (785 and 491 micrograms per kilogram [µg/kg]) exceeding the screening values based on the California Human Health Screening Levels (CHHSLs; Cal/EPA, 2006) for PCBs (89 µg/kg). No other PCBs with concentrations exceeding the CHHSLs were detected at or above the PQLs.

- No VOCs, SVOCs, organophosphorus compounds, or chlorinated herbicides were detected at or above the PQLs.

- Analytical results of the stockpile sample have been compared to hazardous waste disposal threshold criteria, state, federal and DTSC health-risk based screening levels, and to criteria presented in LAUSD Guidance Section 01440. Results of the sample analyses indicate that all constituents are below their respective TTLC concentrations except lead. Based on the reported STLC result for lead of 5.50 mg/l, exceeding the regulatory threshold of 5.0 mg/l, the stockpiled soil is considered non-RCRA, California-designated hazardous waste for disposal purposes.

- Based on the laboratory analytical results of the composite samples collected from the stockpiled soil, and local, state and federal guidelines, the soil is not eligible for reuse at any LAUSD school site or other sites with lead concentrations above 5.0 mg/l.

Recommendations



Based on the findings and conclusions, BE recommends disposing the soil excavated and stockpiled at a non-RCRA, California-designated hazardous waste facility. The analytical data must be presented to potential disposal facilities for profiling and acceptance.

Statement of Limitations

The services described in this report were performed in a manner consistent with Baader Environmental's agreement with the client and in accordance with generally accepted professional consulting principles and practices. Opinions and recommendations contained in this report apply to conditions existing at certain locations when services were performed and are intended only for the specific purposes, locations, time frames, and project parameters indicated. Baader Environmental cannot be responsible for the impact of any changes in environmental standards, practices, or regulations after performance of services. Any use of this report by a third party is expressly prohibited without a written, specific authorization from the client and Baader Environmental. Such authorization will require a signed waiver and release agreement. This report is issued with the understanding that the client, the property owner, or its representative is responsible for ensuring that the information, conclusions and recommendations contained herein are brought to the attention of the appropriate regulatory agencies, as required.

Please call us at 626-712-0589 if you have any questions.

Sincerely,

Gabriele E. Baader, PG

Notes:
The Chain of Custody document is part of the analytical report.
Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
All results are expressed on wet weight basis unless otherwise specified.
ND = NOT DETECTED at or above the Reporting Limit. If J-value reported, then NOT DETECTED at or above the Method Detection Limit (MDL).
Sub = Subcontracted analysis, original report enclosed.
Dil = Dilution Factor
MDL = Method Detection Limit
MDA = Minimum Detectable Activity

An Absence of Total Coliform meets the drinking water standards as established by the State of California Department of Health Services.
The Reporting Limit (RL) is referenced as laboratory's Practical Quantitation Limit (PQL).
For Potable water analysis, the Reporting Limit (RL) is referenced as Detection Limit for reporting purposes (DLRs) defined by EPA.

If sample collected by Weck Laboratories, sampled in accordance to lab SOP MIS002

Converse Consultants
Over 50 Years of Dedication in Geotechnical Engineering and Environmental Sciences

July 27, 2009

Mr. Rosendo Plasencia
Los Angeles Unified School District
1000 South Fremont Avenue
Building A10, 3rd Floor, Unit 10
Alhambra, CA 91803

Subject: **Export Soil Sampling Report**
49th Street Elementary School
750 East 49th Street
Los Angeles, CA 90011
Converse Project No. 09-41-154-01

Mr. Plasencia:

We have received and reviewed the analytical results of the soil samples collected from the soil stockpile at 49th Street Elementary School, located at 750 East 49th Street, in Los Angeles, California (Site), in accordance with our Proposal dated March 30, 2009.

The volume of stockpiled soil material to be exported from the Site was reported to be approximately 30 cubic yards. Observations of the stockpile on July 15, 2009 confirmed this estimate to be accurate. On July 15, 2009, three (3) discrete soil samples were collected for various depths of the stockpile at locations depicted on Figure 1 – Stockpile Location.

The laboratory was requested to prepare one (1) composite sample from the set of three (3) discrete samples. One (1) composite sample and one (1) discrete sub-sample were analyzed in accordance with our Proposal dated March 30, 2009, which was prepared in accordance with the Los Angeles Unified School District (LAUSD) Specification Section 01440 – Environmental Import/Export Materials Testing (Section 01440), revision dated August 1, 2008, and approved by the LAUSD – Office of Environmental Health and Safety (OEHS).

Soil for the analyses was collected in laboratory-supplied 4 oz. glass jars, and sub-samples were collected in accordance with EPA Method 5035 using EnCore sample containers from location 49th-1A. The sample containers were stored in a chilled container and transported to American Environmental Testing Laboratory (AETL) in Burbank under chain-of-custody documentation for analysis. Analyses for Total Petroleum Hydrocarbons in the gasoline range (TPH-gas) and Volatile Organic Compounds (VOCs) were performed from the discrete samples collected in the EnCore sample containers, and all other analyses were performed from the laboratory-prepared composite samples. In addition, a portion of the soil samples from each location were collected into sealable plastic bags and screened in the field for the presence of VOCs

using a Photo-ionization Detector (PID). No VOCs were detected in any of the samples screened in the field.

Analytical results of the stockpile samples have been compared to hazardous waste disposal threshold criteria, Department of Toxic Substance Control (DTSC) health-risk based screening levels, and to criteria presented in LAUSD Section 01440.

The laboratory analytical results are presented on Tables 1 and 2, and summarized as follows:

- Metals – All reported metals are below their respective Total Threshold Limit Concentrations (TTLC). The reported arsenic concentration of 10.5 milligrams per kilogram (mg/kg) is below the DTSC screening level of 12.0 mg/kg. The reported lead concentration of 17.8 mg/kg is below the DTSC screening level of 255 mg/kg for lead.
- Total Petroleum Hydrocarbons (TPH) was not reported in the gasoline (C4-C12) or diesel (C13-C22) ranges. However, TPH was reported in the heavy hydrocarbon (C23-C40) range with a concentration of 42.1 mg/kg, which is below the California Regional Water Quality Control Board (CRWQCB) Maximum Soil Screening Level (MSSL) of 1,000 mg/kg for heavy range hydrocarbons. The combined diesel and heavy range hydrocarbon concentration (42.1 mg/kg) is also below the acceptance criteria level specified in LAUSD Section 01440 of 1,000 mg/kg for diesel and heavy range hydrocarbons.
- Three (3) Organochlorine Pesticides (OCPs) were reported in the soil sample. Chlordane, DDE, and DDT were reported with concentrations of 2.61, 1.84, and 3.77 micrograms per kilogram (ug/kg), respectively. All reported OCPs are below their respective TTLC value.
- Organophosphorous Pesticides (OPPs) were not reported in the soil sample.
- Chlorinated Herbicides (CHs) were not reported in the soil sample.
- Polychlorinated bi-phenyls (PCBs) were not reported in the soil sample.
- Volatile Organic Compounds (VOCs) were not reported in the soil sample.
- Semi-Volatile Organic Compounds (SVOCs) were not reported in the soil sample.

Results of the sample analyses indicate that all constituents are below their respective TTLC concentrations, and therefore the soil is considered to not be hazardous for disposal purposes.

Based on LAUSD Section 01440, the soil may not be acceptable for use onsite or at other LAUSD school sites due to the detections of OCPs at any concentration without further evaluation and possible health risk screening. The acceptance criteria for

metals, TPH, and OCP concentrations vary between locations that may accept this soil, so the analytical data should be presented for acceptance.

This report has been prepared for the exclusive use of Los Angeles Unified School District in accordance with the terms and conditions under which these services were provided. Any reliance on this report by third parties shall be at third party's sole risk. Our services have been performed in accordance with applicable state and local ordinances, and generally accepted practices in the geosciences. No other warranty, either expressed or implied, is made.

Converse Consultants is not responsible or liable for the accuracy or completeness of available information provided by others. Site exploration identifies actual conditions only at those points where samples are taken, when they are taken.

Data derived through sampling and analytical testing are extrapolated by geoscientists who then render an opinion about overall conditions. Actual conditions in the areas not sampled may differ from the predictions. This report should not be regarded as a guarantee that no further contamination, beyond that which was detected in our investigation, is present beneath the property. In the event that changes to the property occur, or additional, relevant information about the property is brought to our attention, the recommendations contained in this report may not be valid unless these changes and additional relevant information are reviewed and the recommendations of this report are modified in writing.

Attached are summary tables for all reported constituents and the final laboratory analytical report for the sample.

We appreciate this opportunity to be of service. Please feel free to contact Norman Eke at (626) 930-1260, should you have any questions.

Sincerely,

CONVERSE CONSULTANTS

Data Qualifiers and Descriptors

Data Qualifier:

*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

American Environmental Testing Laboratory Inc.
2834 & 2908 North Naomi Street, Burbank, CA 91504 • DOHS NO: 1541, LACSD NO: 10181
Tel: (888) 288-AETL • (818) 845-8200 • Fax: (818) 845-8840 • www.aetlab.com

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

Preliminary Environmental Screening of Proposed Project at Existing School Site

Appendix A: Environmental Existing School Screening Criteria Checklist	Project: 49th Street Elementary School 750 E. 49th Street, Los Angeles, CA 90011		
Selection Criteria	**Yes**	**No**	**Comments**
Powerlines/Electromagnetic Fields [CCR, Title 5, 14010(c)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from 50-133 kV powerlines/electromagnetic fields within 100 feet of the Site?		**X**	Based on the Site reconnaissance, overhead electrical lines were observed along East 50th Street, bordering the Site to the south. The voltage rating of these lines is unknown. Because the proposed project is within the existing school campus, it would not create or exacerbate safety risks from high voltage power transmission lines.
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from 220-230 kV powerlines/electromagnetic fields within 150 feet of the Site?		**X**	
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from 500-550 kV powerlines/electromagnetic fields within 350 feet of the Site?		**X**	
Railroads [CCR, Title 5, 14010(d)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from railroads within 1,500 feet of the Site?		**X**	No railroad tracks were observed within 1,500 feet of the Site. The project would not create or exacerbate safety risks from railroads.
Traffic Noise [CCR, Title 5, 14010(e)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from adjacent roads or freeways that will adversely affect the educational program?		**X**	The project is within the existing campus and therefore will not place students nearer to adjacent roadways or freeways, and will not create or exacerbate noise impacts to students.
Faults [CCR, Title 5, 14010(f)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from an active earthquake fault or fault trace which may be on-Site?		**X**	The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students in regards to an active earthquake fault or fault trace which may be on-Site. A review of the available Alquist-Priolo Special Studies Zone mapping at the California Geological Survey, California Earthquake Hazards Zone Application (EQ Zapp) indicated that the Site is not located within an Alquist-Priolo Special Studies Zone. No further review of mapped or unmapped faults in the area was included in the scope of work.
Flood or Inundation Area [CCR, Title 5, 14010(g)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from flooding or dam inundation?		**X**	The Federal Emergency Management Administration (FEMA) Flood Insurance Rate Map (FIRM) and Environmental Data Resources, Inc. (EDR) database report were reviewed to determine if the Site is located in a designated flood hazard area. Based on the review of the applicable FEMA FIRM and EDR database report, the Site is not located in either a 100- or a 500-year potential flood hazard area. According to the Zone Information and Map Access System (ZIMAS) website, the Site is not identified as within a Tsunami Inundation Zone. According to the United States Army Corps of Engineers, no dams in the Los Angeles County area have emergency plans that identify the Site area as lying within the within a possible flood inundation area. No aboveground water reservoirs were observed or noted on topographic maps within one mile of the Site. The proposed project is within the existing campus and does not change the Site elevation or drainage patterns, and therefore would not create or exacerbate the risk of flood or inundation.
Liquefaction and Landslides [CCR, Title 5, 14010(i)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from liquefaction or landslides?		**X**	The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students in regards to liquefaction and landslides. A review of the available mapping of liquefaction and landslide hazard zones at the California Geological Survey, California Earthquake Hazards Zone Application (EQ Zapp) indicated that the Site is not located within a known liquefaction or landslide hazard zone. According to the ZIMAS website, the Site is not identified as within a Landslide or Liquefaction Zone. The proposed project is within the existing campus, and therefore would not create or exacerbate the risk of liquefaction or landslide.

Preliminary Environmental Screening of Proposed Project at Existing School Site

Appendix A: Environmental Existing School Screening Criteria Checklist	Project: 49th Street Elementary School 750 E. 49th Street, Los Angeles, CA 90011		
Selection Criteria	**Yes**	**No**	**Comments**
Pipelines and Above-Ground Tanks [CCR, Title 5, 14010(h)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from nearby above-ground water or fuel storage tanks?		X	No aboveground tanks were noted in the Site vicinity. The project is within the existing campus and therefore unlikely to exacerbate safety risks to students related to off-Site aboveground tanks.
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from above-ground or underground pipelines located within 1,500 feet of the Site?		X	There are no high pressure gas or hazardous liquid pipelines within 1,500 feet of the Site based on review of the National Pipeline Mapping System (NPMS) public viewer website. Pipelines were not observed on or near the Site during the Site reconnaissance. The project is within the existing campus and, therefore, unlikely to exacerbate safety risks to students related to offsite pipelines.
Traffic and Pedestrian Safety [CCR, Title 5, 14010(l)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from an adjacent major arterial street?		X	LAUSD will complete comprehensive modernization of the existing school site and there will be no expected increase in student population, nor increase in pedestrians and traffic on adjacent streets.
Compatible Zoning [CCR, Title 5, 14010(m)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from the zoning surrounding the Site?		X	The project is within the existing campus and therefore has no impact on the surrounding zoning.
Light, Wind, Air Pollution [CCR, Title 5, 14010(q)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from light, wind or air pollution?		X	The project and existing campus are not located with 500 feet of a major transportation corridor. No major stationary source of emissions was noted within 500 feet of the Site. However, a search of SCAQMD records was not requested for the area surrounding the Site. LAUSD OEHS reported that the Site is not on its Priority List of Schools Most at Risk from Air Pollution. OEHS reported that the Site is not in the vicinity of any previously identified high-risk facility.
Easements [CCR, Title 5, 14010(r)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from easements on or adjacent to the site which may restrict access or building placement?		X	No documents were provided by LAUSD that showed building easements that could be used to evaluate access or building placement restrictions. No easements that could create new significant safety hazardous were reported by LAUSD.
Border Zone Property [CCR, Title 5, 14010(t)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a significant disposal of hazardous waste within 2,000 ft. of the Site?		X	According to the EDR database report, no facilities within 2,000 feet of the Site are classified as hazardous waste disposal sites. In addition, the Site is not classified as a Border Zone property according to the ZIMAS website.
Cellular Phone Towers [LAUSD Board Resolution]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a cellular phone tower on or adjacent to the Site?		X	No telecommunication towers were observed on or adjacent to the Site.
Air Pollution [LAUSD Board Resolution]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a major transportation corridor (freeway, major rail line) within 500 feet?		X	No major transportation corridors are located within 500 feet of the Site.
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a major stationary source of emissions within 500 feet?		X	No major stationary source of emissions was noted within 500 feet of the Site. However, a search of SCAQMD records was not requested for the area surrounding the Site.
Is the school on the Priority List of Schools Most at Risk from Air Pollution?		X	LAUSD OEHS reported that the Site is not on its Priority List of Schools Most at Risk from Air Pollution.
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a high-risk facility previously identified by OEHS?		X	OEHS reported that the Site is not in the vicinity of any previously identified high-risk facility.
Methane Zone			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a known methane zone or oil field?		X	Based on a review of the City of Los Angeles Methane Zone Map and the ZIMAS website, the Site is not located within either a Methane Zone or a Methane Buffer Zone.

Preliminary Environmental Screening of Proposed Project at Existing School Site

Appendix A: Environmental Existing School Screening Criteria Checklist	Project: 49th Street Elementary School 750 E. 49th Street, Los Angeles, CA 90011		
Selection Criteria	**Yes**	**No**	**Comments**
Oil Wells			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from an on-Site oil well?		**X**	No oil wells were found within the Site nor within 0.25 mile of the Site.
Airports			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from an airport within two nautical miles of the Site?		**X**	The project is not located with 2 nautical miles of an airport.

Re: Request to Review California EPA, DTSC, Files

Attn: Records Clerk

We are representing a client with interests in properties located in Los Angeles, California. The concern is for knowledge of hazardous materials investigations and regulatory status of the property. This letter is intended as a formal request for photocopies of files that the California EPA, DTSC, may have for the property at the following locations:

- 676 and 750 E. 49th Street, Los Angeles, CA 90011
- 677, 685, 687, 689, 695, 693, 701, and 711 E. 50th Street, Los Angeles, CA 90011

We are also concerned with any activity and use limitations [such as institutional controls (e.g. deed restrictions, restrictive covenants, restrictive easements, or restrictive zoning) or engineering controls (e.g. capping, slurry walls, or point of use water treatment)] or environmental liens associated with the property.

Please contact us if no records are found, or so we can arrange to come in and review the files. If there are any questions regarding this request, please call me directly at (949) 809-5080. Thank you for your time and help.

Sincerely,
Tetra Tech, Inc.

REQUESTS FOR NON-PARTICIPATING DEPARTMENTS

If you have a request for a department not on that list, visit that department's website and follow the instructions there for submitting a request. Requests submitted through this portal for non-participating departments will be closed out.

REQUESTS FOR MULTIPLE DEPARTMENTS

If you would like to submit a request to multiple departments, please submit a separate request to each department.

INCLUDING DOCUMENTS WITH REQUESTS

If you would like to include a document with your request you can upload it to the request after the request has been submitted.

ANONYMOUS REQUESTS

You are not required to include any contact information with a request, however if you submit an anonymous request you will not receive updates about your request or be able to log in to access documents. The only way you will be able to receive responsive documents is if the department posts them publicly on the portal or if you contact the department directly. If the department needs clarification on your request and has no way to contact you your request may be closed out without a response.

Dear Requestor:

We have received your Public Records Act Request from the Department of Toxic Substances Control (DTSC). After a thorough review of our files, no site records were found pertaining to the sites/facilities referenced above.

A large number of our records are available on EnviroStor, an online database that provides non-confidential, public access to DTSCs Data Management System. It tracks our cleanup, permitting, enforcement and investigation efforts at hazardous waste facilities and sites with known or suspected contamination issues. EnviroStor is available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone, the local library – anywhere Internet access is available. Just go to www.envirostor.dtsc.ca.gov. You'll find a step-by-step tour of EnviroStor under the "How to Use EnviroStor" menu on the website.

If you have any questions or would like further information regarding your request, please contact me at 714-4845337 or via email at CypressFileRoom@dtsc.ca.gov.

Sincerely,

Julie Johnson

Subject: Records Request

EXTERNAL:

I would like to review LARWQCB files for the property with the following addresses:

- 676 and 750 E. 49th Street, Los Angeles, CA 90011
- 677, 685, 687, 689, 695, 693, 701, and 711 E. 50th Street, Los Angeles, CA 90011

Please contact me so I can arrange to come in and review the files or if no files are found. If there are any questions regarding this request, please call me directly at 949.809.5080.

Thank you in advance for your time and help,
Tanya

City of Los Angeles Public Records

Record request #21-11301 has been closed and published. The closure reason supplied was:

Dear Requester,

Unfortunately, the requested facility yielded no search results. If this is an inactive hazardous materials site, please be advised that our department only keeps records pertaining to the storage of hazardous materials for up to five years. If the site in question has been inactive for longer than those 5 years, it's possible all related files have been expunged.

We also urge you to please visit the CALEPA Regulated Site Portal which is a website that combines data about environmentally regulated sites and facilities in California into a single, searchable database and interactive map. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials.

Respectfully,

The Los Angeles Fire Department

Re: Request to Review California EPA, DTSC, Files

Attn: Records Clerk

We are representing a client with interests in properties located in Los Angeles, California. The concern is for knowledge of hazardous materials investigations and regulatory status of the property. This letter is intended as a formal request for photocopies of files that the California EPA, DTSC, may have for the property at the following property with multiple historical addresses:

- 676-794 East 49th Street (even numbers only), Los Angeles, CA 90011
- 677-795 East 50th Street (odd numbers only), Los Angeles, CA 90011
- 4917-4927 McKinley Avenue (odd numbers only), Los Angeles, CA 90011

We are also concerned with any activity and use limitations [such as institutional controls (e.g. deed restrictions, restrictive covenants, restrictive easements, or restrictive zoning) or engineering controls (e.g. capping, slurry walls, or point of use water treatment)] or environmental liens associated with the property.

Please contact us if no records are found, or so we can arrange to come in and review the files. If there are any questions regarding this request, please call me directly at (949) 809-5080. Thank you for your time and help.

Sincerely,
Tetra Tech, Inc.

USER QUESTIONNAIRE FOR PHASE I ENVIRONMENTAL SITE ASSESSMENT

Instructions for User Questionnaire:

1. Please complete the following questionnaire, sign, date, and return to:
   Tetra Tech
   17885 Von Karman Avenue, Suite 500
   Irvine, CA, 92614
   Phone: (949) 809-5000
   Fax: (949) 809-5010
   Attention: Steven Grod or Tanya MacLean
   E-mail: Steven.Grod@tetratech.com or Tanya.MacLean@tetratech.com

2. Wherever you answer "YES" please provide all relevant information either on the following pages or provide copies of relevant documents, reports, documents, and/or correspondence.

3. If you cannot provide the answer to a question, please indicate a person to contact who would be able to provide this information and include contact information for this individual (phone number, e-mail, etc.).

4. This questionnaire is intended for the User to provide Tetra Tech, Inc. with the information required to comply with ASTM E1527-21.

5. The User of the Phase I Environmental Site Assessment may not be able to qualify as an innocent landowner under the ASTM standard unless the information in this questionnaire is provided.

6. Please provide complete copies of all prior reports for the property to Tetra Tech. If already provided to Tetra Tech, please note.

7. Please note that this completed questionnaire will be included in the appendix of the Phase I Environmental Site Assessment report to be issued by Tetra Tech, Inc. By signing, dating, and returning this document to Tetra Tech, Inc., you are acknowledging and agreeing to the inclusion of this document in Tetra Tech Inc.'s Phase I ESA report.

1. **Environmental cleanup liens that are filed or recorded against the site (40 CFR 312.25)**

Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state or local law?

Yes___ No X

If yes, please provide as much detail as possible about the liens against the property and provide copies of any related reports or paperwork.

2. **Activity and land use limitations that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26)**

Are you aware of any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

Yes___ No X

If yes, please provide as much detail as possible about the AULs present and provide copies of any related reports or paperwork.

3. Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28)

Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

Yes___ No_X_

If yes, please provide as much detail as possible about the specialized knowledge or experience and provide copies of any related reports or paperwork.

_____

_____

_____

_____

_____

_____

4. Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29)

Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

Yes___ No_X_

If there is a difference, please provide as much detail as possible about the difference between the expected and actual purchase price, and any reasons this difference may be present.

_____

_____

_____

_____

_____

_____

TETRA TECH

5. Commonly known or reasonably ascertainable information about the property (40 CFR 312.30)

Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example:

(a.) Do you know the past uses of the property?

Yes___ No_X_

(b.) Do you know of specific chemicals that are present or once were present at the property?

Yes___ No_X_

(c.) Do you know of spills or other chemical releases that have taken place at the property?

Yes___ No_X_

(d.) Do you know of any environmental cleanups that have taken place at the property?

Yes___ No_X_

If yes, please provide as much detail as possible and provide copies of any related reports or paperwork.

6. The degree of obviousness of the presence of likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31)

Based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of releases at the property?

Yes_X_ No____

If yes, please provide as much detail as possible about the indicators of releases, and provide copies of any related reports or paperwork.

LAUSD school sites typically have environmental concerns with arsenic, lead, and OCPs in shallow soil.

TETRA TECH

7. Is/Are/Were there any of the following?

	YES	NO
Chain-of-Title Report		X
Environmental Liens/Activity and Use Limitations (AULs)		X
Hazardous Materials Business Plan		X
Emergency Response Plan		X
Spill Prevention Control and Contingency (SPCC) Plan		X
Community Right-to-Know Plan		X
Environmental Assessments (complete copies including all appendices)	X

Fire Insurance Maps		X

If you answered YES to any of the items on this questionnaire, please provide all information and copies of relevant documents to Tetra Tech or note if already provided to Tetra Tech.

Soil export reports and vault maps provided to Tetra Tech.

APPENDIX F
RESUMES

Tanya MacLean

Due Diligence Scientist – Environmental Scientist

EXPERIENCE SUMMARY

Ms. MacLean has been primarily responsible for conducting Phase I Environmental Site Assessments (ESAs) and tenant audits since August 2005. Specific duties involve the completion of historical public record/photo reviews, review and evaluation of computer-compiled government agency databases, on-site reconnaissance, interviews, review of hydrogeological and wetlands information, preliminary asbestos-containing materials (ACM) surveys, preliminary lead-based paint surveys, data interpretation, evaluation of recognized environmental conditions (RECs) and environmental concerns, and report preparation. Ms. MacLean has also performed field oversight of groundwater monitoring activities for a former industrial property.

RELEVANT EXPERIENCE

SITE ASSESSMENT

- **Phase I ESA, Confidential Client, Kern County, California, 2020.** Performed inspection, agency review, and report write-up and data compilation for a Phase I ESA in 2020 for a property in Kern County, CA. Property was comprised of a design, research and development, and manufacturing facility totaling 9.32 acres.
- **Phase I ESA, Confidential Client, Los Angeles County, California, 2020.** Performed inspection, agency review, and report write-up and data compilation for a Phase I ESA in 2020 for a property in Los Angeles County, CA. Property was comprised of a research and development facility totaling approximately 10,000 square feet.
- **Phase I ESA, Confidential Client, San Bernardino County, California, 2020.** Performed inspection, agency review, and report write-up and data compilation for a Phase I ESA in 2020 for a property in San Bernardino County, CA. Property was comprised of a sand and gravel processing facility totaling approximately 100 acres.
- **Phase I ESA, Confidential Client, Los Angeles County, California, 2020.** Performed inspection, agency review, and report write-up and data compilation for a Phase I ESA in 2020 for a property in Los Angeles County, CA. Property was comprised of school facility totaling approximately 28 acres.
- **Phase I ESA, Confidential Client, Los Angeles County, California, 2020.** Performed inspection, agency review, and report write-up and data compilation for a Phase I ESA in 2020 for a property in Los Angeles County, CA. Property was comprised of agricultural property totaling approximately 14 acres.

- **Phase I ESA, Confidential Client, Ventura County, California, 2016, 2018, and 2019.** Performed inspections, agency reviews, and report write-up and data compilation for Phase I ESAs in 2016, 2018, and 2019 for a property in Ventura County, CA. Property was comprised of a wind energy facility totaling approximately 1,500 acres.
- **Phase I ESA, Confidential Client, Clark County, Nevada, 2013 and 2014.** Performed inspections, agency reviews, and report write-up and data compilation for Phase I ESAs in 2013 and 2014 for a property in Clark County, NV. Property was comprised of a natural gas-powered, combined-cycle electricity generating facility totaling 90 acres.
- **Phase I ESAs, Los Angeles Department of Water and Power (LADWP), Multiple locations in Los Angeles/Kern/Inyo Counties, CA, 2008 and 2009.** Performed inspections, agency reviews, and report write-up and data compilation Phase I ESAs for a total of 31 properties to date for LADWP including a 23-Site portfolio in the Bishop/Big Pine area of Inyo County.
- **Phase I ESA, Various Clients, Southern California, Arizona, Nevada, and Oregon**, **2005-present.** Performing inspections, agency reviews, and report write-up and data compilation for Phase I Environmental Site Assessments for various clients, including lending institutions, large corporations, and private clients on hundreds of sites including gasoline stations, dry cleaners, large industrial properties, and commercial and residential properties.
- **Tenant Inspection Program, Nationwide, 2005-Present.** Performing inspections, data entry, and report write-up, review, and finalizing for tenant audits of warehouse, light industrial, and commercial facilities at a number of business parks in Arizona, California, Colorado, Florida, Georgia, Illinois, Nevada, New Jersey, North Carolina, Oregon, Pennsylvania, Tennessee, Texas, and Washington.

TETRA TECH

Steven Grod
Senior Project Manager

EXPERIENCE SUMMARY

Mr. Grod has over 25 years of experience in the conducting of environmental studies in the United States. This experience includes property transfer evaluation of individual residential, commercial, industrial, manufacturing, and energy properties, portfolios primarily across the western United States, and soil and groundwater characterization. Currently, Mr. Grod serves as a Senior Project Manager of Tetra Tech Inc.'s Irvine, California office. As Senior Project Manager, Mr. Grod is responsible for performing and/or overseeing/ supervising environmental assessments, environmental sampling, compliance audits, regulatory records research and review, subsurface investigations, and preparation of AutoCAD-based drawings.

RELEVANT EXPERIENCE

ENVIRONMENTAL ASSESSMENT

- **Phase I Environmental Site Assessments (ESAs).** Manages and/or performs Phase I ESAs for a variety of properties including residential, commercial, industrial, manufacturing, oil field, and energy properties. Property types have included energy facilities (wind, solar, steam and power cogeneration [natural gas-powered combined-cycle electricity generating], and hydro-electric facilities), multi-tenant/strip mall shopping centers, multi-level anchor-store shopping malls, high-rise office buildings, dry cleaners, gasoline/service stations, metal and powder coating facilities, wire manufacturing facilities, injection molding facilities, medical and biological research and development facilities, aerospace facilities, computer parts manufacturing facilities, an ink manufacturing facility, plastics manufacturing facilities, and a construction company equipment yard and maintenance facility (located within an oil field; with oil wells on-Site).
- **Tenant Inspection Program, Nationwide, 2005-Present.** Manages the performance of quarterly tenant inspection reviews of approximately 150 million square feet of tenant space in 29 major city regions nationwide. Has conducted tenant inspections at properties in the following regions: Los Angeles CA, Northern California, Atlanta GA, Dallas TX, Denver CO, Harrisburg PA, Kansas City KS, and Portland OR. Also performs data entry, report write-up, review, and finalizing reports.
- **TC LA Healthcare Development, Inc., Commercial Property, Pasadena, CA.** Project Manager for a Phase I ESA of an approximately 0.45-acre Site occupied by multiple tenants including food establishments and a gym. Historical uses of the Site included residential and light industrial uses (including a facility that performed dry cleaning). Several previous subsurface investigations as well as remedial activities were performed with respect to volatile organic compounds (VOCs) in soil gas, and a no further action letter for the case was subsequently issued by the California Regional Water Quality Control Board – Los Angeles Region (LARWQCB). Several historical uses at adjacent properties were considered to be off-Site recognized environmental conditions (RECs) to the Site including a dry cleaner, bulk oil storage and depot facilities, and an industrial property that included plating and manufacturing activities. Soil and soil gas sampling and analyses were subsequently performed at the Site.
- **Velco Tool & Die, Inc., Light Industrial Property, Lake Forest, CA.** Project Manager for a Phase I ESA of an approximately 3.2-acre Site occupied by two tenants that were in process of moving out of the building. A majority of the Site building was occupied by a company that designed and developed prototype radio-controlled model cars and trucks. Equipment formerly used by the tenant included a computer numerical controlled (CNC) milling machine, a manual milling machine, a manual lathe, a band saw, a belt sander, and a drill press, which were used for prototype development activities. Several

areas of minor staining were observed on the concrete floor in the warehouse area of the Site building, including minor lubrication oil staining areas of less than approximately 10 square feet in the former area of the CNC milling machine, white staining below a sink, and white/rusty staining below a piece of unidentified equipment wrapped for shipping. The observed staining was considered to be a *de minimis* condition. The project was completed on time and within budget. Historical uses of the Site included agricultural and light industrial uses. Based on the results of the Phase I ESA, no further assessment or investigation was recommended.

- **TC LA Development, Inc. and LA Brickyard, LLC, Industrial Property, Compton, CA.** Project Manager for a Phase I ESA of an approximately 60-acre Site occupied by a number of tenants whose activities include asphalt and concrete recycling operations, brick storage, a small redi-mix-type facility, pipe storage, and a truck maintenance facility. Historical uses of the Site included agricultural land, clay mining, and brick manufacturing and storage. Two localized areas of groundwater at the Site were historically reported to have somewhat elevated concentrations of benzene and trichloroethene (TCE). Based on the results of the Phase I ESA, Tetra Tech was contracted by the client to perform additional work/investigation which included a remedial action plan, human health risk assessment, soil management plan, groundwater monitoring, underground storage tank removals, remedial action completion report, corrective measures report, and groundwater monitoring well abandonment. The additional work/investigation was performed with oversight by the Los Angeles County Fire Department, Health Hazardous Materials Division-Site Mitigation Unit (LACFD HHMD-SMU), which issued a Site-wide no further action letter for the project. The client filed a notice of environmental condition and environmental restriction for the Site with the Los Angeles County Recorder's office for an area on the Site where impacted soil was to remain in place. The Site was subsequently redeveloped with two industrial warehouse buildings.
- **City of Industry, Municipal Park Properties, Los Angeles County, CA.** Project Manager for a Phase I ESA portfolio of seven municipal park Sites totaling approximately 87 acres. The Phase I ESAs were part of a multi-benefit stormwater capture project for the Upper San Gabriel River Enhanced Watershed Management Program. In general, historical records indicated fill material of unknown origin was located at the Sites and considered to be a potential environmental concern. Based on the results of the Phase I ESA, sampling and analyses of fill material for chemicals of potential concern (COPCs) was recommended.
- **Palmdale School District, Vacant School Facility, Palmdale, CA.** Project Manager for a Phase I ESA of an approximately 28-acre vacant school Site. The Site was developed with three buildings, basketball courts, a partially constructed running track/football field that was overgrown with vegetation, a partially constructed baseball field that was overgrown with vegetation, a storm water basin, and vacant land that is overgrown with vegetation. The Site was undeveloped land prior to construction of the school. Non-hazardous debris (wood, plastic, paper debris, etc.) was observed scattered throughout the undeveloped southern portion of the Site. Dirt piles were observed on the western part of the undeveloped southern portion of the Site and adjacent to two metal shipping containers with trusses inside. No obvious indicators of hazardous substances were observed in the surficial areas of the dirt piles. When the school becomes active and operational, wastewater from the science laboratories would be discharged to two underground neutralization tanks prior to discharge to the municipal sewer system. Since the school had never been occupied, the underground neutralization tanks had never been used. The project was completed on time and within budget. Based on the results of the Phase I ESA, no further assessment or investigation was recommended.
- **City of Industry, Municipal Park Properties, Los Angeles County, CA.** Project Manager for a Phase I ESA portfolio of seven municipal park Sites totaling approximately 87 acres. The Phase I ESAs were part of a multi-benefit stormwater capture project for the Upper San Gabriel River Enhanced Watershed Management Program. In general, historical records indicated fill material of unknown origin was located at the Sites and considered to be a potential environmental concern. Based on the results of the Phase I ESA, sampling and analyses of fill material for chemicals of potential concern (COPCs) was recommended.
- **The Trust For Public Land, Three Agricultural Ranch Properties, Imperial County, CA.** Project Manager for three Phase I ESAs of active agricultural ranch properties totaling approximately 1,553-acres. The Sites were undeveloped land prior to use as agricultural ranch properties. Based on the results of the Phase I ESAs, Tetra Tech recommended removing and disposing stained soil by a diesel aboveground storage tank (AST) and where farming equipment was parked/stored in accordance with all applicable local, state, and federal regulations and laws, including post-remediation confirmation soil sampling/analysis. Tetra Tech also recommended that if a higher degree of confidence was needed by the client with respect to on-Site farm equipment maintenance areas and septic systems, a subsurface investigation should be conducted.
- **Environmental Sampling.** Performed or assisted with AHERA, modified AHERA, and comprehensive asbestos surveys in residential, commercial and industrial buildings, modified HUD lead-based paint sampling utilizing wipe sampling and chip sampling techniques, lead-based paint surveys using gamma ray spectrometer, radon gas sampling, and lead in drinking water sampling, soil and groundwater sampling.
- **Regulatory Agency Records Reviews.** Reviewing of records for Sites that have included National Priority List (NPL; also known as Superfund) sites. Additional regulatory agency records reviews have been performed for cases pertaining to soil, soil gas, and/or groundwater impacted with hazardous substances that are overseen by regional and local regulatory agencies. Specific property types for the cases have included a former oil refinery, existing and former landfills, dry cleaning facilities, gasoline/service stations, historical manufacturing facilities, and aerospace/related facilities.

Mark Feldman, CHG CEG
Principal Geologist

Mr. Feldman is a geologist and geochemist with 29 years of professional experience focusing on the characterization, remediation, and regulatory closure of environmentally impacted properties. His experience ranges from environmental due diligence investigations to characterization and remediation of large, complex sites with multiple environmental concerns and a significant regulatory component. Mr. Feldman's broad range of experience and strong technical background enable him to work effectively with colleagues in other disciplines, including engineers, toxicologists, biologists, and chemists, as well as clients and the regulatory community. Mr. Feldman manages projects and serves as a senior technical resource.

Education:
MS, Geology, Arizona State University, Tempe, AZ

BS, Geology, University of California, Los Angeles, CA

Registrations/Certifications:
California, Professional Geologist, No. 7349

California, Certified Hydrogeologist, No. HG747

California, Certified Engineering Geologist, No. EG2387

Professional Affiliations

Member, Geological Society of America

Member, National Ground Water Association

Years of Experience:
Twenty-nine

Years with Tetra Tech:
Twenty-three

RELEVANT EXPERIENCE

Former Aluminum Plant, Torrance, California – Project manager and technical lead for investigation and remedial planning for a former aluminum forging and extrusion facility impacted by chlorinated solvents, hexavalent chromium, and 1,4-dioxane. The site is regulated under RCRA. The initial work performed or led by Mr. Feldman included installation of background monitoring wells and development of a Groundwater Corrective Measures Study (the functional equivalent of a Feasibility Study). The Tetra Tech team worked closely with the client and regulatory agency personnel to complete the study under a tight approval deadline. The final document won praise for timeliness and quality from both the client and the agency. Subsequent work at this site has included development of a Human Health Risk Assessment Addendum to address potential vapor intrusion issues; development and implementation of a Remedial Design Investigation, a focused investigation designed to fill significant data gaps in the conceptual site model; cooperative groundwater modeling with consultants for an adjacent site for settlement purposes; development of the Statement of Basis (the functional equivalent of a Record of Decision) and CEQA Initial Study for the groundwater remedy; performing additional soil vapor and indoor air sampling to address changes in the inhalation toxicity factors for TCE; aquifer testing; development of a Corrective Measures Implementation Work Plan; and routine groundwater monitoring and site maintenance.

Former Rocket Motor Test Facility, Riverside County, California — Project manager and technical lead for investigation of a former rocket motor test facility with multiple areas of perchlorate-, chlorinated solvent-, and 1,4-dioxane-impacted soil and/or groundwater. The lead regulatory agency for this project is the California Department of Toxic Substances Control (DTSC). Work performed or led by Mr. Feldman has included a major soil and groundwater investigation to fill data gaps in the conceptual site model using the USEPA Triad approach; characterization of groundwater in an off-site riparian corridor; aquifer testing, including three constant rate aquifer tests and slug tests on more than 50 groundwater monitoring wells; numerical groundwater flow and contaminant transport modeling; a quantitative monitored natural attenuation evaluation; human health and ecological risk assessments; design and implementation of a treatability study to evaluate in situ bioremediation of perchlorate in soil and groundwater; development of the Feasibility Study which established the proposed remedy; development of the Remedial Action Plan and Environmental Impact Report for the proposed remedy; development of the 30% Design for the proposed remedy, and routine groundwater monitoring and site maintenance.

Former Aerospace Facility, Costa Mesa, California — Project manager and technical lead for characterization and remediation of a former aerospace manufacturing facility with multiple areas of chlorinated solvent-impacted soil gas, soil, and groundwater, which was being considered for residential development. Cone penetration testing and discrete-depth groundwater sampling found a groundwater plume characterized by persistent, moderately high TCE concentrations underlain by a relatively small area with TCE concentrations near 100,000 µg/L. Other areas of the site were also investigated, and were found to have not contributed significantly to groundwater contamination. An in situ chemical

oxidation (ISCO) treatability study using potassium permanganate was subsequently conducted and was used as the basis for developing a Corrective Action Plan to address groundwater remediation and a Soil Management Plan to address the potential for discovery of previously unknown contamination during site redevelopment. After full-scale ISCO implementation and post-remediation groundwater monitoring, the site was closed by the Santa Ana RWQCB.

Superfund Site, San Fernando Valley, California — Technical lead for two projects at a federal Superfund site in the San Fernando Valley. The lead agencies for this site are the USEPA and the Los Angeles Regional Water Quality Control Board. The first project was an investigation to address high residual VOC concentrations detected in soil vapor after the cessation of vapor extraction at the site. Work consisted of two rounds of soil sampling and deep soil vapor monitoring probe installation to define the extent of residual VOCs in soil and soil vapor located in the immediate vicinity of fine-grained soil horizons at two former source areas. Ongoing work includes the vapor extraction testing and the design of a focused vapor extraction system to address the residual contamination. The second project is a focused feasibility study to address the impacts of the emerging compounds 1,4-dioxane and hexavalent chromium on the pump-and-treat remedy for the site. This work has included refinement of the conceptual site model, groundwater modeling to evaluate various groundwater extraction scenarios, and the development of remedial improvement alternatives to address

Vehicle Maintenance Facility, Los Angeles, California — Project manager and technical lead for site characterization and remedial action plan development at an active vehicle maintenance facility with PCE-impacted groundwater. The lead agency for this site is the Los Angeles Regional Water Quality Control Board. Previous investigations found relatively high, persistent concentrations of PCE in groundwater at the site, which is located immediately downgradient from a former dry cleaning facility. Site characterization work included direct-push soil and groundwater sampling to complete characterization of on-site PCE impacts, and a soil gas survey to assess potential vapor intrusion concerns. These results, combined with the results of previous investigations, strongly suggested that the source of the PCE was the former dry cleaning facility rather than releases from the site. The lead agency subsequently issued an investigation order pursuant to the California Water Code to the owner of the upgradient dry cleaner, and subsequent investigations found PCE concentrations greater than 1,000,000 µg/kg in soil at the dry cleaner. A remedial action plan to address on-site migration of the off-site PCE source and on-site impacts due to fuel releases is currently under development.

High-Rise Condominium Project, San Diego, California — Project manager and technical lead for the characterization and remediation of metals-impacted soil at a property in downtown San Diego that was being redeveloped as a high-rise condominium complex. The lead agency for this site was the San Diego County Department of Environmental Health. Work for this project included developing a site mitigation plan, characterizing the extent of impacted soils, developing site-specific cleanup goals for lead and cadmium, and remediation of the site by excavation and off-site disposal of the impacted soil in two phases: one for the on-site area, and one for the area beneath the adjacent public sidewalks. On-site x-ray fluorescence analysis of lead was used throughout this project to expedite the identification and removal of lead-impacted soils. Based on the results of post-remediation confirmation sampling, the site was closed by the lead regulatory agency.

Former Dry Cleaning Facility, Northridge, California — Technical lead for characterization and remediation of PCE-impacted soil at a former dry cleaning facility. The lead agency for this site was the Los Angeles Regional Water Quality Control Board. Work included characterization of the extent of PCE-impacted soil, developing remedial cost estimates for use by legal counsel in a cost-recovery lawsuit, conducting a vapor extraction feasibility study, developing site-specific cleanup goals for the protection of water resources, developing a remedial action plan which addressed both water quality and human health concerns, and developing a vapor extraction system design which addressed impacts to both shallow clayey soils and deeper sandy soils, and which could be used without modification after the completion of remediation to mitigate potential vapor intrusion concerns. After operating the vapor extraction system for approximately two years and conducting post-remediation rebound testing, the site was closed by the lead agency.

Active Printed Circuit Board Manufacturing Facility, Canoga Park, California — Project manager and technical lead for the characterization and remediation of soil impacted by lead, chromium, nickel, and copper at an active printed circuit board manufacturing facility. The lead agency for this site was the California Department of Toxic Substances Control. Work performed included precision locating and leak testing of a PVC floor drain system, investigation of numerous potential release locations, and excavation and off-site disposal of all identified areas of metals-impacted soil. All work on this project was performed while the plant was operating or during scheduled maintenance shutdowns. As a result, the client was able to satisfy all regulatory agency requirements and obtain site closure while maintaining production quotas.

Former Aerospace Manufacturing Facility, Pomona, California — Project manager and technical lead for characterization, remediation, and closure of a 20-acre former aerospace manufacturing facility which was being redeveloped for single-family residential development. The lead agency for the site was the Los Angeles County Fire Department. Investigation of the site found several areas of low-level chlorinated solvent, petroleum hydrocarbon, and metals impacts in soil. These data were used as the basis for conducting a human health risk assessment with oversight from the California Office of Environmental Health Hazard Assessment (OEHHA). Based on the risk assessment results, a vapor extraction system was installed and operated for a period of one month to remediate two chlorinated solvent hot spots. Soil closure was then granted by the Los Angeles County Fire Department. To satisfy Los Angeles Regional Water Quality Control Board concerns regarding groundwater, three monitoring wells installed and sampled. These results were used as the basis for obtaining groundwater closure for the site from the Los Angeles Regional Water Quality Control Board and the Los Angeles County Fire Department.

Multiple Oil Field Projects, Huntington Beach, California — Project manager and technical lead for ten projects involving the redevelopment of 200 acres of former oil field property in Huntington Beach, California as residential communities. The lead agency for these sites was the Huntington Beach Fire Department. Mr. Feldman's responsibilities included overall project management and technical direction of the project, acting as primary client contact, and serving as regulatory agency liaison on behalf of the client. Soil remediation for all of these projects was performed in conjunction with mass grading, and involved excavation, segregation, and blending of up to 20,000 cubic yards of soil per day. Based on the results of post-remediation confirmation sampling, all of the sites were closed and have since been redeveloped.

Former Burn Dump, Vista, California — Task manager for investigation of a former burn dump landfill which had been repurposed as a Little League baseball field. The lead agency for this site was the California Department of Toxic Substances Control. Potential concerns at the site included burn waste with high lead concentrations that was locally exposed at the ground surface, potential groundwater impacts from the waste, potential methane and VOC impacts in soil gas, and potential dioxin impacts, both on-site and in an adjacent creek. Work included excavating test pits and drilling soil borings to assess the extent of burn waste, inert waste, and construction debris that had been used as fill prior to constructing the baseball field; installing groundwater monitoring wells; conducting a soil gas survey to evaluate both methane and VOCs; and conducting surface water and sediment sampling. The investigation successfully characterized the extent of the former burn pits and other waste, and found that groundwater, sediment, and soil gas were not significantly impacted. The investigation results were used to develop a plan for capping the former landfill.

Former Tank Farm, Richmond, California — Project manager and technical lead for a project involving the redevelopment of a former tank farm property as a multifamily residential community. The lead agency for this site was the San Francisco Bay Regional Water Quality Control Board. The property had been mired in regulatory red tape for years as a result of earlier remediation activities, which included placing petroleum-impacted soil in "repositories" which were subsequently classified as Class II landfills by the lead agency. Mr. Feldman developed an approach for obtaining agency closure for the site which included redrawing parcel boundaries to exclude the "repositories" from the site, conducting additional soil sampling in areas where impacted soil had been left in place during the prior remediation activities, and conducting a human health risk assessment to show that impacted soil remaining in place was not

significant health risk. Based on this work, the lead agency issued a closure letter for the property, which allowed the client to obtain financing for the redevelopment project.

Environmental Due Diligence, 13,000-Acre Portfolio, California — Mr. Feldman managed environmental due diligence investigations related to the acquisition of a portfolio of California properties totaling approximately 13,000 acres. The portfolio included former oil field properties, commercial and residential properties, and undeveloped land. This project involved performing 36 Phase I Environmental Site Assessments, 11 Phase II investigations, 10 geotechnical investigations, remediation cost estimating, assisting the client in negotiating environmental indemnifications with the seller, and providing extensive technical support to legal counsel.

Environmental Due Diligence, 1,300-Acre Portfolio, Multiple States — Mr. Feldman managed environmental due diligence investigations related to the acquisition of a portfolio of ten properties totaling 1,300 acres in California, Texas, and Mississippi. The portfolio included several properties located within the Norton Air Force Base NPL site, and a property formerly used by the U.S. Army for munitions manufacturing and testing during World War II. In addition, several properties included wetlands and/or threatened and endangered species habitat. Mr. Feldman coordinated the environmental due diligence activities, including biological constraints surveys, and was responsible for review and analysis of previous studies conducted by the U.S. Air Force and U.S. Army, which included site characterization, site remediation, and groundwater monitoring work.

Per- and Polyfluoralkyl Substances Screening Investigations, Southern California – Project manager and technical lead for per- and polyfluoralkyl substances (PFAS) screening investigations at three sites in southern California. Work included the development of sampling and analysis plans (including sections on avoiding cross-contamination from field equipment and common consumer products), quality assurance project plans, oversight of field work, and reporting.

PFAS Training, Los Alamos Legacy Cleanup, Los Alamos, New Mexico – Developed and presented a PFAS sampling training program for the Los Alamos Legacy Cleanup. Groundwater and surface water sampling for PFAS was required at the site under the 2020 Interim Facility-Wide Groundwater Monitoring Plan. Attendees at the training sessions included groundwater sampling field technicians, technical staff, the project management team, and staff from the New Mexico Environment Department. The primary emphasis of the training program was on understanding and minimizing potential sources of PFAS cross-contamination, including identifying potential issues with field equipment and consumer products that could be encountered during sampling.

APPENDIX G
PHASE I ESA SHELF LIFE SUMMARY

PHASE I ESA SHELF LIFE SUMMARY

Effective Date of the Phase I ESA Report:
March 22, 2022.

Date Site Inspection Reconnaissance was Performed:
January 7, 2022.

Dates Interviews were Performed:
Between December 17, 2021 and January 7, 2022.

Dates Records Reviews were Performed:
Between December 17, 2021 and January 28, 2022.

Date Lien Search was Performed:
Texas Environmental Research, 2021, Environmental Lien and Other Activity Use Limitations (AULs) Search, Parcels 5108-011-909 and 5108-011-910, 750 East 49th Street, Los Angeles County, California: dated December 27, 2021.

Shelf Life:
The shelf life (continued viability) of the Phase I ESA Report is pursuant to the time frame specified within ASTM Standard Practice E1527-21. Tetra Tech understands the ASTM time frame to be 180 days from the first of the following dates: of interviews, environmental liens and other AULs searches, records review, visual inspection of the Site and, from curbside or the Site, adjacent properties, and declaration by the environmental professional(s) responsible for the assessment.

Appendix G. Preliminary Environmental Assessment Equivalent Report - 49th Street Elementary School – Major Modernization Project

FROM: Filmon Tesfaslasie,
Site Assessment Project Manager (CP)
Office of Environmental Health and Safety

SUBJECT: 49TH STREET ELEMENTARY SCHOOL
PRELIMINARY ENVIRONMENTAL ASSESSMENT – MAJOR MODERNIZATION

The Los Angeles Unified School District (LAUSD) has completed a Preliminary Environmental Assessment Equivalent (PEA-E) for the major modernization Project at 49th Street Elementary School (the "Site") located at 750 E 49th St, Los Angeles, CA. Attached herewith is the Draft PEA-E Report, which presents the findings of the environmental investigation performed at the Site.

The PEA-E reported elevated chemicals of concern above their respective screening level or regulatory threshold. The report noted the following regarding the elevated chemicals of concern.

1. Arsenic. Elevated arsenic concentration was reported in the north, northeast, and south portion of the Site. The arsenic-impacted soil is estimated to be 1,400 cubic yards (yd^3). Part of the arsenic-impacted soil is characterized to be federal and state (California) regulated hazardous waste when excavated.
2. Lead. Elevated lead concentrations were reported in the central portion of the Site covered under the asphalt pavement. The lead-impacted soil is estimated to be 10 $yd^3$and is characterized to be state regulated hazardous waste when excavated.
3. Abandoned fuel pipe. Approximately 100 feet of abandoned fuel pipeline leading from E. 49th Street to the former oil tank was identified at the northern portion of the Site using a geophysical investigation. In addition, petroleum hydrocarbon (diesel and motor) impacted soil was encountered in the parking area located northwest portion of the site. The impacted soil is estimated to be 4 yd^3.

The PEA-E recommends the completion of a Removal Action Workplan (RAW) that will provide the removal plan, health and safety procedures, air monitoring and soil confirmation sampling procedures, transportation and disposal requirements, and estimated removal costs. Once the removal action is completed, Removal Action Completion Report (RACR) will be prepared.

All other remaining chemicals of concern, including the ones listed under the South Coast Air Quality Monitoring District (SCAQMD) Rule 1466, were not reported above their respective screening level or above the 95 percent upper confidence limit of the arithmetic mean for the Site. Therefore, compliance with SCAQMD Rule 1466 is not required.

As a general note, dust mitigation measures shall be implemented during any project-related excavation and/or earth-disturbing activities at the Site. Additionally, if any stained or odorous soil is observed during construction, stop work shall be initiated and OEHS shall be notified. In the event that the project requires the disposal of excess soil, soil sampling per the LAUSD Specification Section 01-4524 will be required prior to characterization and acceptance for off-site disposal.

Should you have any questions or concerns regarding this memorandum, please contact OEHS Site Assessment Project Manager Filmon Tesfaslasie at (213) 241-4578 or at cp-f.tesfaslasie@lausd.net.

1 INTRODUCTION AND SUMMARY

This report presents a summary of the Preliminary Environmental Assessment (PEA) Equivalent work conducted for the 49th Street Elementary School Major Modernization Project. The PEA was conducted within the boundaries of the 49th Street Elementary School at 750 E. 49th Street in Los Angeles, California (site; Figure 1), under the oversight of the Los Angeles Unified School District (LAUSD) Office of Environmental Health and Safety (OEHS).

A Phase I Environmental Site Assessment (ESA) of the 49th Street Elementary School was prepared by Tetra Tech in 2022 (Tetra Tech, 2022). Based on the findings of the Phase I ESA, Tetra Tech recommended that a PEA be conducted at the site to characterize potential environmental conditions that may be present in the site's soil and soil vapor.

In response to this, LAUSD released a Request for Proposals (RFP) to address the recognized environmental conditions and potential environmental concerns outlined in Tetra Tech's Phase I ESA (LAUSD, 2022).The PEA was conducted in general accordance with the Los Angeles Unified School District RFP Scope of Services, dated November 14, 2022 (LAUSD, 2022); proposal for PEA Equivalent, dated December 2, 2022 (Ninyo & Moore, 2022); and Amendment 1, dated March 15, 2023 (Ninyo & Moore, 2023).Additionally, Ninyo & Moore prepared a PEA Equivalent Work Plan that consisted of a sampling rationale table and figure showing the proposed sampling locations. The table and figure presented proposed sampling locations and target contaminants of concern, which were based on the review of the Phase I ESA conducted by Tetra Tech (Tetra Tech, 2022) and other site background documents provided by LAUSD, which are discussed further in Section 4.3.

2 SITE DESCRIPTION

The following discusses site information in more detail.

2.1 Site Name

The site is identified by LAUSD as the 49th Street Elementary School.

2.2 Site Address

The current site address is:

750 E. 49th Street
Los Angeles, California 90011

2.3 Designated Contact Person

The designated LAUSD contact person for this project is Mr. Filmon Tesfaslasie, Site Assessment Project Manager.

2.4 Mailing Address

The mailing address designated for this project is:

Office of Environmental Health and Safety
Los Angeles Unified School District
333 South Beaudry Avenue, 21st Floor
Los Angeles, California 90017
Attention: Mr. Tony Espinoza

2.5 Site Location

The site is located within the property boundaries of 49th Street Elementary School at 750 E. 49th Street, in Los Angeles, California (Figure 1). According to the United States Geological Survey (USGS) Inglewood Quadrangle Map, dated 2015, the site is at an elevation of approximately 180 feet above mean sea level. The site slopes gently to the southwest (USGS, 2015). According to the Los Angeles County Assessor's office, the site consists of parcels that are assigned Assessor's Parcel Numbers 5108-011-909 and 5108-011-910.

2.6 Proposed Project

LAUSD is undertaking a major modernization project at the 49th Street Elementary School.

3 PRELIMINARY ENVIRONMENTAL ASSESSMENT OBJECTIVES

The overall objectives of the PEA included:

- Evaluating historical information for indications of the past use, storage, disposal, or release of hazardous wastes/substances at the site.
- Assessing whether historic or current uses have resulted in releases of chemicals of potential concern (COPCs) to the site.
- Establishing, through a field sampling and analysis program, the nature of COPCs that may be present in soil at the site, their concentrations, and general extent.
- Estimating the potential threat to public health and the environment posed by COPCs at the site.

The following regulatory agency screening criteria were used to evaluate the laboratory soil and soil vapor sampling results.

- United States Environmental Protection Agency's (EPA's) Regional Screening Levels (RSLs) for residential soils (EPA, 2023).
- The Department of Toxic Substances Control's (DTSC's) background concentration for arsenic in Southern California (DTSC, 2008a).
- The Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note Number: 3, DTSC-modified Screening Levels (DTSC SLs) (DTSC, 2020).

4 BACKGROUND RESEARCH FOR THE SITE

4.1 Site Information

The site is located on 5.73 acres at the southwest corner of the intersection of East 49th Street and McKinley Avenue in Los Angeles, California. The western portion of the site was developed and occupied by single-family residences starting in 1900 while the eastern part was undeveloped. Around 1922, the eastern portion of the site was developed and occupied by the 49th Street Elementary School. The existing main building (Building ID # 14040) was the only building at the site during this time. Between 1962 and 1970, most of the single-family residences were demolished and the site was developed to the existing site configuration. The current site includes one administration/classroom building (Building ID # 14036), four classroom buildings (classroom building [Building ID # 13718], the west building [Building ID # 13933], main building [Building ID # 14040], south building [Building ID #13583]), an auditorium building (Building ID # 14196), and a cafeteria building (Building ID # 13566). The remainder of the site (the western portion) is paved with asphalt and is used as a playground and parking area.

4.2 Surrounding Land Use

The site vicinity consists primarily of residential properties with some dispersed commercial properties. The site is bordered by East 49th Street to the north, McKinley Avenue to the east, East 50th Street to the south, and 49th Street Park and residential properties in the west (Figure 1).

4.3 Previous Site Investigations

Ninyo & Moore reviewed the Phase I ESA Report prepared by Tetra Tech, dated March 22, 2022 (Tetra Tech, 2022). Based on the findings of the Phase I ESA, several Recognized Environmental Conditions (REC) were identified for the site. These are:

- The potential presence of lead-contaminated soils associated with the potential use of lead-based paint in the buildings,
- The potential presence of organochlorine pesticide (OCP)-contaminated soils associated with the potential application of OCPs,

- The potential presence of polychlorinated biphenyl (PCB)-contaminated soils due to the potential use of PCB-containing caulking and paints in the buildings,
- The Potential presence of arsenic-contaminated soils due to LAUSD's former standard practice of applying herbicides containing arsenic prior to paving,
- The historical presence of a concrete incinerator,
- The presence of an oil tank between the main building and the west building,
- The presence of a second oil tank south of the southwest corner of the existing west building (unknown if the oil tanks are aboveground storage tanks [ASTs] or underground storage tanks [USTs]),
- The presence of two boiler rooms.

RECs and other potential environmental concerns identified in Tetra Tech's Phase I ESA were used to create our sampling rationale table (Table 1) and location of soil/soil vapor borings (Figure 2). Other site-specific documents that were provided by LAUSD, reviewed by Ninyo & Moore, and incorporated into our rationale table and selection of boring locations included the following:

- Asbestos/asphalt survey of Modification Development Zone
- July 27, 2009, Converse Consultants, Export Soil Sampling Report
- October 15, 2007, Lindmark Engineering, Soil Certification Report
- October 30, 2008, Baader Env Services, Soil Certification Report
- Board of Education Map, Historic Central Avenue Community of Schools, Local District Central, Board District 7
- Vault drawings of incinerator Oil Tank (Grading Plan & Piping Plan), 1934 & 1935
- Two plot plans showing locations of the Oil Tank, 1934 & 1948
- Stantec Survey Topographic & Utility Map (July, 2022) 11 individual maps
- GPI Preliminary Geotechnical Investigation, Proposed Major Modernization Project (revised January 2022)
- Auto CADD Files of Site Survey maps

5 GEOLOGY AND HYDROLOGY

The following sections provide a description of the site geology and hydrology.

5.1 Geologic and Soil Conditions

Based on a review of the California Department of Conservation 2010 Geologic Map online, the site is mapped with generalized soil types primarily comprised of Holocene alluvial gravel, sand, and clay, derived mostly from Santa Monica mountains (Dibblee & Minch, 2007).

Soils encountered during this PEA Equivalent consisted of fill material and native alluvium to the maximum depth explored of 15 feet below ground surface (bgs). The fill material was primarily a brown, loose silty sand and fine-grained sand, which was encountered from surface or directly below pavement until total depth of native alluvium was encountered. Fill was encountered up to the maximum depth explored of 15 feet bgs in borings located near the former suspected UST pit in the eastern portion of the site. The alluvium encountered during this PEA consisted primarily of light brown poorly graded sand and well-graded sand. Native alluvium was encountered at 3.5 to 4 feet bgs in the western portion of the site, and generally increased in depth encountered eastward as the age of site development increased (see Figure 2 for different periods of development).

5.2 Site Hydrology

The following sections discuss the site hydrology in terms of both surface waters and groundwater.

5.2.1 Surface Waters

There are no natural surface water bodies, such as streams, rivers, ponds, and lakes, at the site.

5.2.2 Groundwater

According to information reviewed on State Water Resources Control Board's (SWRCB's) GeoTracker website related to the closed leaking underground storage tank case associated with the Winall Oil Company Station No. 9 (4442 Avalon Boulevard), located approximately 0.3 miles to the north-northwest of the site, groundwater was measured in May 2013 at depths ranging from approximately 189.45 to 190.61 feet bgs. The approximate groundwater flow direction was reported to be toward the east. Groundwater levels can fluctuate due to seasonal variations, groundwater withdrawal or injection, and other factors.

6 PUBLIC PARTICIPATION

Prior to the start of field activities, a notice of fieldwork was prepared and posted on the site perimeter fences. The field notices were prepared on LAUSD's letterhead printed double-sided with both English and Spanish languages, and delivered to residences and businesses within line-

of-sight of the school. In addition, field notices were provided to the school students, faculty, and parents to keep them informed about the PEA work. Copies of the English and Spanish versions of the field notices are included in Appendix A.

7 CONCEPTUAL SITE MODEL

A Conceptual Site Model (CSM) was developed to achieve a preliminary understanding of the potential risks to human health and the environment at the site and to assist in developing the sampling plan. The CSM accounts for site-specific conditions and potential impact receptors, and illustrates possible contaminant transport mechanisms and exposure pathways assuming the proposed site condition for the 49th Street Elementary School Major Modernization Project. The CSM presented within this report may be updated as necessary as new information is obtained. Currently, the CSM is informed by review of readily available information and is presented as Figure 3. Given the redevelopment plan for the Site, outside of the potential for direct exposure to site soil during intermittent subsurface maintenance work, direct exposure to subsurface soil is expected to be limited for most site users and residents. However, given all of these factors, the exposure pathways within the CSM are as followed:

- School staff and students are assumed have a limited potential to come into direct contact with surface soils, including through accidental ingestion, inhalation, and dermal contact.
- School staff and students are assumed have a limited potential for inhalation of volatilized soil gas in indoor air.
- Site construction workers for the 49th Street Elementary School Major Modernization Project will, in the course of their work, have the potential to intermittently come into contact with surface and subsurface soils during site redevelopment, excavation, paving, grading, or other earthmoving activities.

Potential impacts related to stormwater runoff or surface water are expected to be nominal for this project, as related media (e.g. shallow soil) and exposure pathways will be mitigated during site construction activities, and will be nominal following project completion.

8 RATIONALE FOR SAMPLING STRATEGY

Prior to initiating field sampling, Ninyo & Moore developed a work plan, in coordination with LAUSD, with the purpose of recognizing COPCs and corresponding Areas of Concern (AOCs) at the site that were identified during our background research (Section 4). The rationale for the sampling strategy implemented for this PEA and the COPCs for each AOC are provided in Table 1 and are summarized below:

- **AOC1** – AOC1, which consists of shallow soil surrounding buildings planned for demolition (West Building, Auditorium, Cafeteria) was assessed for the presence of lead-based paint, arsenic-containing termiticides and chlorinated pesticides around building footprints, and PCBs in caulking of building materials. COPCs include lead, arsenic, OCPs, and PCBs. Title 22 Metals, Hexavalent chromium, asbestos, and polycyclic aromatic hydrocarbons (PAHs) were also assessed for SCAQMD Rule 1466 requirements.

- **AOC2** – AOC2, which consists of shallow soil underlying paved areas throughout the site, was assessed for the potential historical application of arsenic-containing herbicides and lead, PCBs, and asbestos from historical buildings that were demolished. Title 22 Metals, hexavalent chromium, and PAHs were also assessed for SCAQMD Rule 1466 requirements.

- **AOC3** – AOC3, which consists of shallow soil around an electrical transformer at the southern portion of the site, was assessed for the potential use and spillage of PCB-containing oil. COPCs include PCBs.

- **AOC4** – AOC4, which consists of four discrete locations placed adjacent to GPI geotechnical borings B-2 through B-5, was sampled to assess uncertified fill against native soil conditions in portions of the site that represents different time periods of site development. COPCs include Title 22 Metals, volatile organic compounds (VOCs), total petroleum hydrocarbons (TPH), and OCPs.

- **AOC5** – AOC5, which consists of the former location of a concrete incinerator south of the West Building, was assessed for potential contaminants associated with the historical use of a concrete gas-fired incinerator. COPCs include Title 22 metals, VOCs, TPH, PAHs, dioxins & furans, and hexavalent chromium

- **AOC6** – AOC6, which consists of the area around a potential former oil tank used for storing petroleum products (likely heating oil) and associated product pipeline identified in historical vault drawings, was assessed for potential spills and leaks associated with its use. COPCs include Title 22 Metals, VOCs in soil and soil vapor, TPH, and PCBs.

- **AOC7** – AOC7, located between the Main Building and the West Building, consists of a former oil tank and the associated product pipeline, the presence of which was indicated in historical vault drawings and the geophysical survey. AOC7 was assessed for potential impacts from leaks or spills associated with a former operation of heating oil tank. COPCs include Title 22 Metals, VOCs in soil and soil vapor, TPH, and PCBs.

- **AOC8** – AOC8, which consists of the area of a historical boiler room that was backfilled to the west of the Main Building, was assessed for contamination associated with the use of boiler room, including heating oils, gases, and other petroleum products. COPCs include Title 22 Metals, VOCs in soil and soil vapor, TPH, and PCBs.

- **AOC9** – AOC9, located near a hazardous materials storage shed in the southern portion of the site, was assessed for the historical use and potential spillage of hazardous materials including gasoline and motor oils. COPCs include Title 22 Metals, VOCs, and TPH.

- **AOC10** – AOC10, located in the asphalt-paved parking lot in the northwest portion of the site, was assessed for vehicle oil leaks and associated subsurface impacts. COPCs include Title 22 Metals, VOCs in soil and soil vapor, and TPH.

9 SAMPLING AND ANALYSIS

Field sampling activities were performed in general accordance with the PEA Equivalent Scope of Services, dated November 14, 2022 (LAUSD, 2022); proposal for PEA Equivalent, dated December 2, 2022 (Ninyo & Moore, 2022); and Amendment 1, dated March 15, 2023 (Ninyo & Moore, 2023). The boring locations, sample depths, rationale, and analyses for each sampling location are provided in Table 1. Photographs of the PEA activities are included in Appendix B. The approximate locations of the soil borings are presented in Figure 2. Boring logs are presented in Appendix C.

9.1 Health and Safety Plan

Ninyo & Moore prepared a site-specific Health and Safety Plan (HSP) in anticipation of field activities at the site. The HSP included requirements, policies and procedures adequate to protect site workers, the public, and the environment from potential site hazards. Contractors involved in this evaluation were required to abide by these requirements. The HSP also provided site-specific scopes of work and indicated COPCs. Prior to the start of field activities, a site safety briefing was conducted to review the HSP, identify potential physical and chemical hazards, and outline measures to be taken in the event of an emergency. On-site personnel were required to sign the safety briefing form.

9.2 Underground Service Alert (USA)

Underground Service Alert (USA) of Southern California (Dig Alert) was notified of the intent to conduct subsurface vertical drilling and sampling activities at least 48 hours prior to the initiation of field tasks. Ninyo & Moore obtained inquiry identification number B230390488 from USA and responded to inquiries from local entities that have active lines in the area. The presence of potential subsurface utilities or obstructions was also checked against utility maps and drawings provided by the LAUSD.

9.3 Utility Clearance and Full-Scan Geophysical Survey

An initial geophysical survey was performed at each proposed sampling location, with the intent to locate utilities and other subsurface structures that could impede the proposed sampling locations. Few borings were moved slightly from their original location to avoid impacts with utilities.

After the initial scan and clearance for utilities at each boring location, a full-scan geophysical survey was conducted in the southern, eastern, and western perimeter of the West Building (highlighted area of Figure 2). The purpose of the full-scan geophysical survey was to identify

subsurface structures and anomalies, namely those identified in the Tetra Tech Phase I ESA (Tetra Tech, 2022) and LAUSD-provided historical drawings and plans. These suspected historical structures included:

- A concrete incinerator
- A heating oil tank between the main building and the west building and associated pipeline and filler box
- A second oil tank south of the southwest corner of the existing west building
- Former boiler room, demolished and backfilled (located west of the main building)

On February 18th and 20th, Subsurface Surveys & Associated, Inc. (SSS) of Carlsbad, California performed the full-scan geophysical survey of the area around the West Building in the northeast portion of the site. Findings of the geophysical survey included the following:

- No evidence of a former incinerator was detected in the area indicated from historical drawings and plans
- In the area of the heating oil tank identified from historical drawings located between the main building and west building, a deep soil disturbance was detected measuring approximately 11 feet 9 inches by 11 feet 6 inches. This coincides well with the location and extent of the former heating oil tank identified during background research. Due to the presence of an access concrete ramp, some of the surrounding areas could not be properly assessed.
- An abandoned fuel line was detected leading to the former heating oil tank area from an oil filler box along East 49th Street and associated sidewalk to the north.
- No evidence of a second oil tank was detected in the area indicated from historical drawings and plans
- In the area of the former boiler room to the west of the Main Building, a shallow soil disturbance was detected measuring approximately 10 feet 8 inches by 6 feet 6 inches, and coincides well with the approximate location and extent of the former boiler room in this area.

Geophysical investigative methods employed for both the utility clearance and full-scan geophysical survey included a combination of electromagnetic induction (EM) and ground penetrating radar (GPR). The geophysical survey report is presented in Appendix D.

9.4 Soil Sampling Activities

On February 18 and February 20, 2023, 36 soil boring locations were advanced to depths ranging between 2.5 to 10 feet bgs to assess COPCs outlined in Table 1. Based on the findings of this first phase of work, and to complete additional borings not previously advanced, 28 additional soil borings were advanced on April 3 and April 5, 2023. These included a number of borings around

the West Building and Cafeteria and from the planter boxes in the northern perimeter of the site to delineate elevated arsenic (Section 10.1.1). Multi-depth soil vapor probes were installed in six borings during this second phase at depths of approximately 5 and 15 feet bgs.

On May 6, 2023, six additional step-out borings were advanced around B34 to define the extents of lead impacts detected at approximately 2.5-feet in boring B34 and two co-located borings were advanced around B40 (B40A) and B41 (B41A) to further delineate the extent of arsenic at the east side of West Building. The locations of the soil borings advanced between February 18 and May 6 are displayed in Figure 2. Sampling protocol, observed site conditions, and observations during this PEA include the following:

- Most of the soil borings advanced for this PEA Equivalent were located in paved areas. Borings located within asphalt or concrete were cored to expose the underlying soil for sampling.
- Borings were advanced up to approximately 5 feet bgs using a stainless-steel hand auger.
- A Geoprobe 6620DT was used to advance below 5 feet bgs in borings scheduled for deeper sampling to a maximum depth of approximately 15 feet bgs.
- Interphase Environmental (Interphase) of Commerce, California, provided coring, auguring, and drilling services.
- Soil samples scheduled for VOC analyses were screened in the field for VOCs using a photo-ionization detector (PID). The PID readings detected at the site ranged from 0.0 to 5.5 ppm.
- Soils encountered during this PEA consisted of fill material and native alluvium to the maximum depth explored of 15 feet below ground surface (bgs) and were logged in accordance with standard USGS classification. See Section 5.1 for a description of encountered soils and Appendix C for boring logs.
- Groundwater was not encountered during PEA field sampling activities.

9.5 Sample Handling

Samples collected were labeled with the sample identification, collection date and time, and sampler's initials. Project number, sampling information, time, date of sample collection, sample matrix type, turn-around-time, container type, requested analysis, and other information were recorded on the chain-of-custody (COC) form. Soil samples were stored in a cooler containing ice and transported under COC protocol to Orange Coast Analytical, Inc. (OCA) in Tustin, California, a State-certified environmental fixed laboratory for various analytical constituents (see Table 1 for details). Soil vapor sampling was conducted on-site using a mobile laboratory administered by Jones Environmental, Inc. (Jones) of Santa Fe Springs, California. Soil vapor samples were

collected in accordance with DTSC protocol (DTSC, 2023) and analyzed at a mobile laboratory for VOCs by EPA Method 8260B.

9.6 Decontamination

A clean and decontaminated hand auger sampler was used for each borehole location. Sampling equipment was decontaminated between sampling intervals and borehole locations using standard industry practices (3-stage rinse of DI Water, Alconox Wash, and DI Water again) to avoid introduction of foreign materials and cross contamination between sampling locations.

9.7 Investigation Derived Wastes

Soil cuttings and decontamination water were stored in three Department of Transportation-approved 55-gallon drums and were staged adjacent to the west boundary of the cafeteria building in co-ordination with the LAUSD representative. The drums were labeled with generator information including: Site name and address, generator name and phone number, contents, date of accumulation, and designated 'pending analysis' for the waste classification. The drums were characterized as non-hazardous waste and removed from the site on June 13, 2023 for disposal at Soil Safe in Adelanto, California. The signed non-hazardous waste manifest is included in Appendix E.

10 ANALYTICAL RESULTS

The following presents the results of PEA sampling activities. Analytical results are presented in Tables 2, 3, 4, 5, and 6. Laboratory reports are presented in Appendix F.

10.1 Soil Sampling for Metals

Concentrations of metals other than arsenic and lead were not detected above the laboratory reporting limits and/or above the residential screening levels. Analytical results for Title 22 metals analyzed are summarized in Table 2.

10.1.1 Arsenic

Arsenic were reported in of the soil samples analyzed. Eighteen (18) soil samples were reported as having arsenic concentrations above the DTSC Acceptable Clean Up Level of 12 milligrams per kilogram (mg/kg). Soluble threshold limit concentration (STLC) and toxicity characteristic leaching procedure (TCLP) concentrations were analyzed in all samples that exceeded the 20 times TCLP value and/or 10 STLC value. Four soil samples (B4-0.5, B4-2.5, B4-W2-0.5, and B41A-0.5) were reported exceeding the STLC level of 5.0 milligrams per liter (mg/l), and one soil sample (B4-0.5) exceeding TCLP waste level of 5.0 mg/l.

Elevated arsenic concentrations (above 12 mg/kg) were encountered in the northern portion of the site (north of the West Building, Administration/Library Building, Classroom Buildings) and in the southern portion of the Site (south of Cafeteria Building). The extent of the elevated arsenic is defined in the northern portion of the site by borings B20 to the west and B40 to the east. The maximum arsenic concentration (720 mg/kg) was reported along the northeastern perimeter of the West Building (sample collected from boring B4). The soluble arsenic (STLC) and leaching (TCLP) concentrations exceeded their respective values. Therefore, soil excavated from this area should be characterized as Federal (Resources Conservation and Recovery Act [RCRA]) hazardous waste upon excavation. Elevated concentrations of arsenic are shown in Figure 4.

10.1.2 Lead

Three near-surface (0 to 0.5 feet bgs) soil samples collected from primary borings (B10, B16, and B45) during this PEA contained lead at concentrations of 91 mg/kg, 92 mg/kg, and 200 mg/kg, respectively. These concentrations exceed the DTSC residential SL of 80 mg/kg. Additionally, soil samples from B34 and step-out boring B34-NE, collected from approximately 2 to 2.5 feet bgs, contained reported concentrations of lead at 230 and 360 mg/kg, respectively. Additionally, soil sample B34-2.5 exceeded the STLC level of 5.0 mg/l, characterizing the soil as California hazardous. California hazardous soil in this area was delineated to the northeast by sample B34-NE2-2.5. No samples reported exceedances of the lead TCLP of 5 mg/l. Elevated lead concentrations from this PEA are displayed in Figure 4.

Based on the results of lead above 80 mg/kg discovered in certain locations, the 95 Percent Upper Confidence Limit (95% UCL) for lead in soil (excluding B34 and associated step out borings) was calculated in ProUCL to assess whether lead detected at the site represents an unacceptable risk to site occupants. The 95% UCL for lead in soils at the site was calculated as 36.8 mg/kg, which is below the DTSC SL of 80 mg/kg. The 95% UCL calculation for lead is provided in Appendix G. Based on this result, lead is not considered an environmental concern at the site, with the exception of the “hot spot” located around B34 at approximately 2.5 feet bgs.

10.2 Soil Sampling for TPHs

TPH as gasoline, diesel, and motor oil range organics was analyzed in 44 samples collected throughout the site. Diesel range organics (DROs) One sample (B45-0.5) collected in the parking lot area in the northwest portion of the site, contained a reported concentration of DRO of 490

mg/kg, which exceeds the San Francisco Regional Water Quality Control Board (SFRWQCB) Tier 1 Environmental Screening Level (ESL) of 260 mg/kg, but does not exceed the LAUSD's Section 01 4524 Import Fill Testing Requirement of 1,000 mg/kg. The motor oil range organic (MRO) concentration in this sample was detected at 1,900 mg/kg, which exceeds the SFRWQCB Tier 1 ESL of 1,600 mg/kg and exceeds the LAUSD Section 01 4524 Important Fill Testing Requirement of 1,000 mg/kg. These elevated concentrations are likely the result of oil and fuel leaks associated with the use of the parking lot. It should be noted that the surrogate recovery for this sample was above laboratory acceptance limits.

Concentrations of MROs and gasoline range organics (GROs) were not detected above the EPA RSLs in any of the samples analyzed. Analytical results are presented in Table 3.

10.3 Soil Sampling for VOCs

Concentrations of VOCs were not detected above the laboratory reporting limits in the 38 soil samples analyzed. Analytical results are summarized in Table 3.

10.4 Soil Sampling for PAHs

Concentrations of PAHs were not detected above the laboratory reporting limits in the 15 samples analyzed. Analytical results are presented in Table 3.

10.5 Soil Sampling for Asbestos

Asbestos was initially estimated via polarized light microscopy (PLM) in soil sample B20-0.5 but was not detected in the soil samples B20-0.5 and B20-2.5 when using 1,000-point count analysis. This soil is not considered a regulated waste on the federal, state, or local level and therefore no additional action is required with respect to asbestos. Asbestos was not detected in any other sample analyzed. Analytical results are presented in Table 3.

10.6 Soil Sampling for OCPs

Concentrations of OCPs were not detected above the laboratory reporting limits in the nine discrete or 12 composite samples analyzed. Analytical results are presented in Table 4.

10.7 Soil Sampling for PCBs

One sample (B19-0.5) reported an Aroclor 1254 concentration of 250 µg/kg, which exceeds EPA's RSL of 240 µg/kg. Concentrations of other PCBs were either not detected above the laboratory reporting limits or above associated residential screening levels. Analytical results are summarized in Table 4.

Based upon these results, the 95% UCL for PCB-Aroclor 1254 in soils was assessed in ProUCL. The 95% UCL for PCB-Aroclor 1254 in soils at the site was calculated as 46.59 µg/kg, which is below the EPA RSL of 240 µg/kg. The 95% UCL calculation for PCB-Aroclor 1254 is provided in Appendix G.

10.8 Soil Sampling for Dioxins and Furans

One sample collected at the surface near the former extent of the concrete incinerator (B36-0.5) was analyzed for dioxin and furans by EPA Method 8290A. Dioxin and furan compounds 1,2,3,7,8,9-HxCDF, 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, OCDD, and OCDF were reported in this sample ranging between 0.13 to 2.3 picograms per gram (pg/g). The remaining dioxins and furans compounds were not detected above the laboratory detection limits. The five dioxins and furans with reported results were below the reporting limit and are considered estimated concentrations (detected between the reporting limit and detection limit). Additionally, these compounds were reported below EPA RSLs for dioxin-like compounds, using EPA-recommended Toxic Equivalency Factors (TEFs).

All analytes yielding results were also found in the method blank. Method 8290A is an ultra-low sensitive method and it is a common occurrence to see low level detections in samples and method blanks. It also is possible that the detections in this sample are a “false positive” and were also a result of residuals from prior samples, but these instances cannot be confirmed. Analytical results are summarized in Table 5.

10.9 Soil Vapor Sampling for VOCs

Soil vapor samples were collected from six (6) borings with dual-nested probes at 5 and 15 feet bgs (12 primary samples plus one replicate sample). The analytical results of the VOCs in soil vapor were compared to the modified EPA RSLs for residential air and the modified DTSC HERO SLs for residential air calculated, with vapor intrusion attenuation factor of 0.03. Analytical results for VOCs at the site are summarized in Table 6. The results of soil vapor sampling are summarized as followed:

- Tetrachloroethene (PCE) was reported in the 12 samples ranging from 16 to 91 micrograms per cubic meter (µg/m^3). All reported PCE concentrations exceed the modified DTSC SL of 15.3 µg/m^3 (using an attenuation factor of 0.03).
- Other VOCs detected included 1,2,4-trimethylbenzene, ethylbenzene, Freon 112, Toluene, and Xylenes. These VOCs were detected at levels below applicable screening levels using an attenuation factor of 0.03.

Due to the detection of PCE at the site at levels exceeding the modified DTSC SL, a Human Health Screening Risk Evaluation was performed to calculate and assess risks to human health from vapor intrusion, which is presented in the following section.

11 HUMAN HEALTH SCREENING RISK EVALUATION

Ninyo & Moore conducted a Vapor Intrusion Risk Evaluation (VIRE) for the site, with the purpose to assess whether the VOCs detected in soil gas under the property are likely to exceed levels considered acceptable to California health and environmental protection agencies. The risk evaluation was based on soil gas analytical data collected at the site on April 6, 2023 for the PEA. A summary of soil gas analytical data is provided in Table 6. Vapor intrusion risk calculation tables referenced throughout this section are provided in Appendix H.

Environmental investigations conducted at the site revealed that traces of VOCs exist in soil gas at the site. The potential for VOC vapor intrusion into one of the onsite buildings was evaluated in this VIRE. Based on current land use, a school exposure scenario was evaluated. The school-based land-use scenario was developed to reflect actual occupancy rates for staff and students at the elementary school site. Therefore, a set of receptor-specific exposure assumptions were used for each type of individual.

The 49th Street Elementary School operates on a two-semester school schedule. Exposure parameters used to characterize school staff and students were taken directly from the Cal-EPA's *Guidance for School Site Risk Assessment Pursuant to Health and Safety Code Section 901(f): Guidance for Assessing Exposures and Health Risks at Existing and Proposed School Sites (Cal-EPA 2003)*. Exposure parameters used to characterize school staff and students are presented in Table G1.

11.1 Vapor Intrusion Risk Evaluation Methodology

Risk characterization involves estimating the magnitude of the potential adverse health effects that could occur due to chronic, long-term exposure to chemicals identified in soil gas at the site. The risk characterization is based on the results of the dose-response (toxicity) and exposure assessment.

It is known that chemicals may migrate through environmental media from their source to a point where human receptors may be exposed. Therefore, it was necessary to determine if the detected VOCs – given their residual concentrations, locations, soil physical characteristics, weather conditions, etc. – could potentially migrate up to the surface (where human receptors may be exposed).

Screening-level models were used to predict indoor air concentrations that may result from the chemical vapors potentially released from soil gas under the site. The estimated vapor flux and indoor air concentrations were then used to estimate potential health risks that may result from onsite exposures. For purposes of this evaluation, it was assumed that the land use is a middle school campus. The only exposure pathway that was considered complete was the volatilization of VOCs from soil gas and the subsequent emission to indoor air.

In this evaluation, maximum detected chemical concentrations (Table 6) were considered representative of chemical concentrations present in soil gas under the site. A copy of the soil gas laboratory analytical report is included in Appendix F.

The DTSC guidance recommends that multiple lines of evidence be used when evaluating the potential risk and hazards posed by vapor intrusion. DTSC recommends that the indoor air chemical concentrations that can result from vapor intrusion be estimated using the following equation:

$$AF = \frac{C_{indoor}}{C_{soil\ gas}}$$

Where:

AF = Attenuation factor (unitless)

C_{indoor} = Indoor air concentration (micrograms per cubic meter [ug/m^3])

$C_{soil\ gas}$ = Soil gas concentration (ug/m^3)

Using the above equation, the indoor air chemical concentration can be estimated by multiplying the known soil gas concentration by the default attenuation factor (AF).

In accordance with DTSC (2011) guidance, the default AF for residential buildings (0.001) was used in this VIRE along with the maximum subsurface concentrations (Table 6). The DTSC default AF reflects reasonably protective assumptions for conditions in California for the contamination of indoor air due to vapor intrusion (DTSC, 2011). However, DTSC (2023) also recommends that risk assessments evaluate vapor intrusion using the United States Environmental Protection Agency (USEPA) default AF of 0.03 (USEPA, 2015).

The AF of 0.03 was developed by the USEPA for the evaluation of sub-slab soil gas data (https://www.epa.gov/vaporintrusion/visl-users-guide). The AF of 0.03 assumes the source of contamination is located directly under the floor slab of the building. It is well known that soils

have the capacity to reduce vapor flow in the subsurface. The vapor flow mitigating capacity of soils is directly proportional to the depth of the soil layer that separates the building from the source of VOCs. Specifically, the soil's combined physical, chemical and/or lithological properties act to reduce or limit the migration of VOCs through the soil's pore spaces (Little, Daisey and Nazaroff, 1992). The natural ability of soils to reduce vapor migration is not taken into consideration when the AF of 0.03 is assumed. Indoor air VOC concentrations estimated using the AFs of 0.001 and 0.03 are presented in Tables G2 and G3, respectively.

The vapor intrusion model assumes that the concentrations in indoor air are proportional to the flux throughout the soil column, and that a gas infiltrating into the building through the foundation floor is uniformly and instantaneously mixed within the air space above the lowest occupied floor of the building. Because this model ignores a number of possible mitigating factors, it is likely that it over-predicts the chemical flux to indoor air. However, because of its simplicity, this approach provides a simple method to estimate the likely maximum rate at which chemicals would be transported to the surface soils and into a building.

The indoor air chemical concentrations estimated to result from the volatilization of VOCs could be considered to represent a "worst-case" estimate. In the calculations, it was assumed that single chemical compounds are volatilizing, traveling alone through the vadose zone and escaping to ambient air. In reality, all chemicals detected at the site are competing with each other for available soil-pore space. It is well known that chemical volatilization and migration is limited by the vapor saturation in the vadose zone. Indoor air VOC concentrations estimated using the AFs of 0.001 and 0.03 are presented in Tables G2 and G3, respectively.

11.2 Toxicity Values

The toxicity assessment characterizes the relationship between the magnitude of exposure to a COPC and the nature and magnitude of adverse health effects that may result from such exposure. For the purposes of calculating exposure criteria to be used in risk assessments, adverse health effects are classified into two broad categories – carcinogens and non-carcinogens. Toxicity values/exposure criteria are generally developed based on the threshold approach for non-carcinogenic effects and the non-threshold approach for carcinogenic effects. Toxicity values may be based on epidemiological studies, short-term human studies, and sub-chronic or chronic animal data.

A reference concentration (RfC) is an exposure concentration in air that is not expected to cause adverse health effects over a lifetime of daily exposure in the most sensitive population. All RfCs

used in this evaluation to estimate non-carcinogenic chronic health hazards are presented in Table G4.

Health risks for exposures to carcinogens are defined in terms of probabilities. The probabilities quantify the likelihood of a carcinogenic response in an individual that receives a given dose of a particular compound. These probabilities are calculated based on the potential exposure concentration and the inhalation unit risk (IUR) for a chemical.

The IUR, which is expressed in units of inverse micrograms per cubic meter $(ug/m^3)^{-1}$, is the 95% Upper Confidence Limit (UCL) of the probability of carcinogenic response per unit daily exposure to a given chemical concentration over a lifetime. The IUR multiplied by the lifetime exposure concentration of the chemical provides an estimate of the 95% UCL of the theoretical cancer risk for the specific chemical. The IURs used in this evaluation to estimate carcinogenic dose-assessment risks are presented in Table G4.

In this assessment, chronic toxicity criteria were selected in accordance with the DTSC Regulation "Toxicity Criteria for Human Health Risk Assessment" (effective September 2018) (https://dtsc.ca.gov/LawsRegsPolicies/Regs/Toxicity-Criteria-for-Human-Health-Risk-Assessment). Toxicity information was obtained from the DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note 10, Toxicity Criteria (DTSC, 2019b).

11.3 Risk Characterization

This section discusses the methods used to quantify the exposure concentration (EC) for potential receptors at the site. The estimated ECs for each VOC were used to estimate the potential for carcinogenic health risks and non-carcinogenic adverse health effects. The potential inhalation exposures were calculated using the following equation (USEPA, 2009):

$$EC = \frac{CA \bullet ET \bullet EF \bullet ED}{AT}$$

Where:

EC = Exposure concentration, ug/m^3

CA = Chemical concentration in air, ug/m^3

ET = Exposure time, hours/day

EF = Exposure frequency, days/year

ED = Exposure duration, years

AT = Averaging time, hours (used the equivalent of 70 years for carcinogens and same value as ED for non-carcinogens).

Inhalation intake factors were combined with estimated indoor air chemical concentrations (CA) to obtain the exposure concentration for onsite school staff. Exposure parameters used to characterize onsite school staff (workers) are presented in Table G1. Students were not evaluated here as their exposure is expected to lower than those assumed for school staff.

11.3.1 Non-Carcinogenic Health Hazard Evaluation

The evaluation of non-carcinogenic health hazards began with a calculation of the hazard quotient or HQ for each chemical. The HQ is defined as the ratio of the exposure concentration (EC) to the reference concentration (RfC). The HQ can be expressed according to the following equation:

$$HQ = \frac{EC}{RfC}$$

Where:

HQ = Hazard quotient, unitless

EC = Exposure concentration, ug/m^3

RfC = Reference concentration, ug/m^3

The estimated HQs are compared to an acceptable hazard level. Implicit in the HQ is the assumption of a threshold level of exposure below which no adverse effects are expected to occur. For example, if the HQ exceeds unity (because site-specific exposure exceeds the RfC), then the potential for non-cancer adverse effects may exist. In general, the greater the value above 1.0, the greater the potential hazard. In contrast, HQs of less than 1.0 indicate that no adverse health effects are expected to occur from exposure to chemicals at the site.

According to the USEPA (1989), if the HQ for a combination of chemicals is less than unity (1.0), there is no concern for potential chronic adverse health effects from the chemical exposures. The HQs estimated for school receptors are:

Students

- 0.0008 using an AF of 0.001 (Table 6).
- 0.02 using an AF of 0.03 (Table 7).

School Staff

- 0.001 using an AF of 0.001 (Table 8).
- 0.03 using an AF of 0.03 (Table 9).

The HQs estimated for both school staff and students are below the DTSC (2015) benchmark value of 1. All estimated HQs are within levels considered acceptable to California health and environmental protection agencies.

11.3.2 Cancer Risk Estimates

Cancer risks were estimated as the incremental probability of an individual developing cancer over a lifetime as a result of exposure to a potential carcinogen (i.e., incremental or excess individual lifetime cancer risk; USEPA, 1989). Cancer risks were calculated in accordance with DTSC (2015) and USEPA (1989) guidelines.

$$Risk = EC \bullet IUR$$

Where:

Risk = Upper bound incremental lifetime carcinogenic risk, unitless

EC = Exposure concentration, ug/m^3

IUR = Inhalation unit risk, $(ug/m^3)^{-1}$

The excess cancer risk was compared to the risk level considered acceptable by federal and state regulatory agencies. The target cancer risk level identified by the DTSC in the Preliminary Endangerment Assessment (PEA) Guidance Manual is 1 in 1 million (1.0E-06). However, the USEPA has established acceptable incremental cancer risk levels to be within the risk range of 1 in 10,000 (1.0E-04) and 1.0E-06; risks greater than 1.0E-04 are generally considered unacceptable. Cal-EPA has defined a risk of 1 in 100,000 (1.0E-05) as the “no significant level” for carcinogens under California Proposition 65. Further, most California air districts use the 1.0E-05 risk level as the notification trigger level under California’s AB2588 Toxic Hot Spots Program.

Using the maximum detected VOC concentrations (Table 1), the cancer risk estimated for the school receptors are:

Students

- 9E-09 using an AF of 0.001 (Table 10).

- 3E-07 using an AF of 0.03 (Table 11).

School Staff

- 5E-08 using an AF of 0.001 (Table 12).
- 2E-06 using an AF of 0.03 (Table 13).

The cancer risks estimated for students are below the DTSC (2015) benchmark value of 1E-06). The cancer risks estimated for school staff are below the "significant risk level" established by California Proposition 65. All estimated cancer risks are within levels considered acceptable to California health and environmental protection agencies.

11.4 VIRE Conclusions and Recommendations

Environmental investigations conducted at the site by N&M and others revealed that traces of VOCs exist at the site. The potential for VOC vapor intrusion into an onsite building was evaluated in this VIRE. Results of the VIRE indicate that the probability of developing cancer as a result of exposures to indoor air at the site is less than 3E-07 for students and 2E-06 for school staff. These estimated cancer risks are well below the known cancer risk for the United States population and are deemed acceptable by the DTSC. Similarly, the estimated Hazard Quotients are below the hazard quotient of 1.0, which is considered acceptable to the California Environmental Protection Agency. In other words, no significant cancer risks or health hazards are anticipated to occur as a result of exposures to chemicals detected in soil gas under the site.

It should be noted that the VIRE was based on conservative (health-protective) assumptions, estimates, models, and parameters. Therefore, the results are not absolute estimates of health risks at the site but are health-protective estimates.

The conclusions and recommendations presented in this report are professional opinions based solely upon the data described in this report. They are intended exclusively for the purpose outlined herein and the property's location and project indicated. The scope of services performed in execution of this investigation may not be appropriate to satisfy the needs of users other than LAUSD. Any use or reuse of this document or the findings, conclusions, or recommendations presented herein is at the sole risk of said user.

Given that the scope of services for this investigation was limited, and that conditions may vary between the points explored, it is possible that currently unrecognized subsurface contamination might be present at the site. Should site use or conditions change, the information and conclusions in this report may no longer apply. Opinions relating to environmental and public health conditions

are based on limited data and actual conditions may vary from those encountered at the times and locations where data were obtained. No express or implied representation or warranty is included or intended in this report except that the work was performed within the limits prescribed by the Client with the customary thoroughness and competence of professionals working in the same area on similar projects.

12 FINDINGS AND CONCLUSIONS

Based on the results of this evaluation, Ninyo & Moore provides the following findings and conclusions:

12.1 Soil

- The full-scan geophysical survey conducted between the Main Building and West Building revealed the presence of a deep soil disturbance that coincides with the likely location of a heating oil tank. The deep borings advanced to 15 feet bgs in the vicinity of the likely location of the tank did not encounter the tank or any contamination that could have result from a release. It is most likely the disturbed soil identified during the geophysical survey is the former location of the tank.
- DROs were detected in three of the samples analyzed, ranging from 12 to 490 mg/kg. One sample (B45-0.5) collected in the parking lot area in the northwest portion of the site, contained a reported concentration of DRO of 490 mg/kg, which exceeds the SFRWQCB Tier 1 ESL of 260 mg/kg, but does not exceed the LAUSD's Section 01 4524 Import Fill Testing Requirement of 1,000 mg/kg. The MRO concentration in this sample was detected at 1,900 mg/kg, which exceeds the SFRWQCB Tier 1 ESL of 1,600 mg/kg and exceeds the LAUSD Section 01 4524 Important Fill Testing Requirement of 1,000 mg/kg. Elevated TPH concentrations at B45 are likely the result of oil and fuel leaks associated with the use of the parking lot.
- VOCs, PAHs, OCPs, and asbestos were not detected above the laboratory reporting limits in the soil samples collected at the site for this PEA.
- One sample (B19-0.5) had a reported concentration of PCB Aroclor 1254 of 250 µg/kg, which exceeds EPA's RSL of 240 µg/kg. Concentrations of other PCBs were either not detected above the laboratory reporting limits or above associated residential screening levels. Based on the results of a 95% UCL calculation, PCBs are not considered a concern at the site.
- Dioxins and furans concentrations ranged between 0.13 and 2.3 pg/g below the EPA RSLs using EPA-recommended TEFs.
- Arsenic was detected above the DTSC-established background concentration of 12 mg/kg in eighteen (18) soil samples up to a maximum concentration of 720 mg/kg. Elevated arsenic was found primarily in the northern portion of the site. Select samples around the West Building in the northeast portion of the site contained arsenic concentrations above the STLC of 5 mg/l and/or TCLP of 5 mg/l, which should be characterized and disposed as hazardous material.
- Lead was detected above the DTSC SL of 80 mg/kg in six soil samples collected at the site, up to a maximum concentration of 360 mg/kg. The results of a 95% UCL calculation indicate

that lead is not an environmental concern at the site, with the exception of the "hot spot" identified at B34 approximately 2.5 feet bgs which should be characterized and disposed as hazardous material.

- Except for lead and arsenic, constituents listed under SCAQMD Rule 1466 were not reported above the laboratory reporting limit or their respective screening level for residential scenarios.

12.2 Soil Vapor

- PCE was reported in the soil vapor samples collected during this PEA ranging from 16 to 91 µg/m^3 and collected throughout various areas the site. Reported PCE concentrations exceeded the modified DTSC SL of 15.3 µg/m^3 (applying an attenuation factor of 0.03).

- Due to the exceedance of modified DTSC SLs, Ninyo & Moore conducted a VIRE to assess vapor intrusion health risks to site occupants. Results of the VIRE indicate that the probability of developing cancer as a result of exposures to indoor air at the site is less than 3E-07 for students and 2E-06 for school staff. These estimated cancer risks are well below the known cancer risk for the United States population and are deemed acceptable by the DTSC.

- Other VOCs were detected at levels below applicable DTSC screening levels using an attenuation factor of 0.03 or were not detected above laboratory reporting limits.

13 RECOMMENDATIONS

Based on the findings of this investigation, Ninyo & Moore provides the following recommendations:

- A Removal Action Workplan (RAW) be prepared detailing the proper management, characterization, and disposal requirements for subsurface structures and impacted soil in the following areas identified during this PEA:
    - The abandoned fuel line identified leading from East 49th Street to the former suspected heating oil tank located between the West and Main Buildings
    - TPH DRO and MRO-impacted soil around boring B45 in the northern parking area (approximately 4 cubic yards [yd^3])
    - Lead impacted soil in the vicinity of boring B34 (approximately 10 yd^3)
    - Arsenic impacted soil in the northern portion of the site delineated by B20 to the west and B40 to the east-southeast; and arsenic-impacted soil south of the Cafeteria Building (approximately 1,400 yd^3)

- SCAQMD Rule 1466 is not applicable for the remaining areas within the Major Modernization Project limits that are outside the areas subject to the RAW described above.

14 LIMITATIONS

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is

made regarding the professional opinions presented in this report. Variations in Site conditions may exist and conditions not observed or described in this report may be encountered during subsequent activities. Please also note that this study did not include an evaluation of geotechnical conditions or potential geologic hazards.

Ninyo & Moore's opinions and recommendations regarding environmental conditions, as presented in this report, are based on limited subsurface assessment and chemical analysis. Further assessment of potential adverse environmental impacts from past on-Site and/or nearby use of hazardous materials may be accomplished by a more comprehensive assessment. The samples collected and used for testing, and the observations made, are believed to be representative of the area(s) evaluated; however, conditions can vary significantly between sampling locations. Variations in soil and/or groundwater conditions will exist beyond the points explored in this evaluation.

The environmental interpretations and opinions contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and concentration of specific chemical or physical constituents in samples collected from the subject Site. The testing and analyses have been conducted by an independent laboratory which is certified by the State of California to conduct such tests. Ninyo & Moore has no involvement in, or control over, such testing and analysis. Ninyo & Moore, therefore, disclaims responsibility for any inaccuracy in such laboratory results.

Our conclusions, recommendations, and opinions are based on an analysis of the observed Site conditions. It should be understood that the conditions of a Site could change with time as a result of natural processes or the activities of man at the subject Site or nearby Sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

TABLES

Table 1 – Preliminary Environmental Assessment Sampling Rationale Matrix for Soil and Soil Vapor - First and Second Phase of Work

Area of Concern	# of Borings	Boring ID	Location	Sampling Rationale	Matrix	Sample Depths (ft, bgs)	# of Samples Analyzed	Proposed Chemical Analysis
AOC1	6	B1-B6	West Building	Lead-based paint, use of termiticides and herbicides around building footprint, PCBs in caulking of building materials	Soil	0.5, 2.5	18 (18 on hold) 12 composites	Lead and arsenic by EPA Method 6010B in surface, hold 2.5-foot samples, OCPs* composited and analyzed by EPA Method 8081A, PCBs analyzed in 10% of samples collected by EPA Method 8082. Title 22 Metals by 6010B/7471A, hexavalent chromium by EPA Method 7199, Asbestos by PLM, PAHs by EPA Method 8270-SIM in 50% of samples (for SCAQMD Rule 1466)
	6	B7-B12	Auditorium					
	6	B13-B18	Cafeteria					
	7	B4-5W, -10W, -5N, -10N, -5E, -10E ; B2-10N	West Building	5 to 10-foot lateral step-out borings to asses extent of arsenic impacts >12 mg/kg	Soil	0.5, 2.5, 5	7 (14 on hold)	Arsenic by EPA Method 6010B
	1	B4-V	West Building	Co-located boring to assess vertical extents of arsenic impacts >12 mg/kg	Soil	0.5, 2.5, 5, 7.5	2 (2 on hold)	Arsenic by EPA Method 6010B
	2	B4-W3, W4	West Building	Additional step-out borings to asses extent of arsenic impacts >12 mg/kg	Soil	0.5, 2.5	2 (2 on hold)	Arsenic by EPA Method 6010B
	2	B14-20S, -20E	Cafeteria	20-foot lateral step-out borings to asses extent of arsenic impacts >12 mg/kg	Soil	0.5, 2.5	2 (2 on hold)	Arsenic by EPA Method 6010B
AOC2	12	B19-B30	Paved/Landscaped Areas	Application of arsenic-containing herbicides	Soil	0.5, 2.5, 5	12 (24 on hold)	Lead and arsenic by EPA Method 6010B in subsurface, hold 2.5-foot and 5-foot samples, PCBs analyzed in 10% of samples collected by EPA Method 8082. Title 22 Metals by 6010B/7471A, hexavalent chromium by EPA Method 7199, Asbestos by PLM, PAHs by EPA Method 8270-SIM in 30% of samples (for SCAQMD Rule 1466)
	3	B21-50W, B20-50E, B20-50W	Paved/Landscaped Areas	Step-out borings 50 feet west to asses extent of arsenic impacts >12 mg/kg	Soil	0.5, 2.5	1 (1 on hold)	Arsenic by EPA Method 6010B
	5	S-1 - S-5	Planter Boxes at Northern Perimeter	Application of arsenic-containing herbicides, assess extents of arsenic impacts >12 mg/kg	Soil	0.5	5	Arsenic by EPA Method 6010B
AOC3	1	B31	Electrical Transformer	PCB-containing oil used adjacent to Electrical Transformer	Soil	0.5, 2.5	1 (1 on hold)	PCBs by EPA Method 8082 in subsurface, hold 2.5-foot sample
AOC4	2	B32-B33	Co-located adjacent to Geotechnical Borings	Assess uncertified fill vs. native soil conditions in GPI geotechnical borings B-2 - B-5 representing different time periods of site development	Soil	2.5, 5, 10	4 (2 on hold)	Title 22 Metals by 6010B/7471A, VOCs by EPA Method 8260B, TPH-g/d/o by EPA Method 8015B, OCPs by EPA Method 8081A
	2	B34-B35	Co-located adjacent to Geotechnical Borings	Assess uncertified fill vs. native soil conditions in GPI geotechnical borings B-2 - B-5 representing different time periods of site development	Soil	2.5, 5, 10	4 (2 on hold)	Title 22 Metals by 6010B/7471A, VOCs by EPA Method 8260B, TPH-g/d/o by EPA Method 8015B, OCPs by EPA Method 8081A
		SV5	Probes Installed in B34	Spatial distribution of vapor probes around the site	Soil Vapor	5, 15	2	VOCs by EPA Method 8260B (using a mobile lab)
	6	B34-NE, -NE2, -NW, -NW2, -SW, SW2	Paved Area in Central Portion of Site	Step-out boring to assess extent of lead impacts with STLC>5 mg/l	Soil	0.5, 2.5	6 (6 on hold)	Lead by EPA Method 6010B
AOC5	1	B36	Former Incinerator	Historical use of gas-fired incinerator	Soil	0.5, 2.5, 5, 10	2 (2 on hold)	Title 22 Metals by 6010B/7471A, VOCs by EPA Method 8260B, TPH-g/d/o by EPA Method 8015B, PAHs by EPA Method 8270-SIM, Dioxins & Furans by EPA Method 8290A (surface only), Hexavalent chromium by EPA Method 7199 (surface only). Hold 5 and 10-foot samples
AOC6	1	B37	Former Oil Tank #1	Historical use of oil tank for storing petroleum products and potential spills or leaks	Soil	0.5, 2.5, 5, 10, 15	5	Title 22 Metals by 6010B/7471A, VOCs by EPA Method 8260B (not analyzed at surface), TPH-g/d/o by EPA Method 8015B, PCBs by EPA Method 8082
		SV1			Soil Vapor	5, 15	2	VOCs by EPA Method 8260B (using a mobile lab)
AOC7	2	B38-B39	Former Oil Tank #2 (Potential heating oil tank)	Historical use of 1,000-gallon UST for storing petroleum products and potential spills or leaks	Soil	0.5, 2.5, 5, 10, 15	10	Title 22 Metals by 6010B/7471A, VOCs by EPA Method 8260B (not analyzed at surface), TPH-g/d/o by EPA Method 8015B, PCBs by EPA Method 8082
		SV2-SV3			Soil Vapor	5, 15	4	VOCs by EPA Method 8260B (using a mobile lab)
	3	B40-B42	Associated product pipeline to 1,000-gallon UST	Historical use of 6-inch diameter oil pipeline leading from oil filler box to 1,000-gallon UST	Soil	2.5, 5	3 (3 on hold)	VOCs by EPA Method 8260B, TPH-g/d/o by EPA Method 8015B (2.5-foot sample, hold 5-foot)
	1	B46	Former UST	Assess impacts directly within and underneath former tank pit area where subsurface anomalies were found	Soil	0.5, 2.5, 5, 10	2 (2 on hold)	Title 22 Metals by 6010B/7471A, VOCs by EPA Method 8260B (not analyzed at surface), TPH-g/d/o by EPA Method 8015B
AOC8	1	B43	Former Boiler Room	Historical use of boiler room, heating using oils, gases, and other petroleum products	Soil	0.5, 2.5, 5, 10, 15	5	Title 22 Metals by 6010B/7471A, VOCs by EPA Method 8260B (not analyzed at surface), TPH-g/d/o by EPA Method 8015B, PCBs by EPA Method 8082
		SV4			Soil Vapor	5, 15	2	VOCs by EPA Method 8260B (using a mobile lab)
AOC9	1	B44	Hazardous Materials Storage Container	Use of hazardous materials such as gasoline and motor oils and potential leaks or spills	Soil	0.5, 2.5, 5	2 (1 on hold)	Title 22 Metals by 6010B/7471A, VOCs by EPA Method 8260B, TPH-g/d/o by EPA Method 8015B. Analysis will be conducted based on 2 highest PID readings, and if all zero, then 2 shallowest.

Table 1 – Preliminary Environmental Assessment Sampling Rationale Matrix for Soil and Soil Vapor - First and Second Phase of Work

Area of Concern	# of Borings	Boring ID	Location	Sampling Rationale	Matrix	Sample Depths (ft, bgs)	# of Samples Analyzed	Proposed Chemical Analysis
AOC10	1	B45	Parking Lot	Surface staining from vehicle oil leaks in asphalt-paved parking lot. 		SV6			Soil Vapor	5, 15	2	VOCs by EPA Method 8260B (using a mobile lab)
Total for 1st Phase	36							
Total for 2nd Phase	31							

Notes:

Sampling completed in the first phase of work

Sampling completed in the second phase of work

Sampling completed during additional step-out sampling

* - Samples analyzed for OCPs around building exteriors will be composited in accordance with DTSC Guidance Documents (DTSC, 2006). Discrete analysis will be conducted pending the results of the composite sample.

A,B,C - step-out sampling convention will be in a triangle formation, with the "A" sample 5-feet to the north, "B" 5-feet to the southwest, and "C" 5-feet to the southeast, This is subject to change based on conditions observed in the field.

AOC - Area of Concern

AST - aboveground storage tank

B - soil boring

DTSC - Department of Toxic Substances Control

DTSC, 2006 - Interim Guidance Evaluation of School Sites with Potential Soil Contamination as a Result of Lead from Lead-based Paint, Organochlorine Pesticides from termiticides, and Polychlorinated Biphenyls from Electrical Transformers (Revised June 9, 2006)

DTSC, 2008 - Interim Guidance for Sampling Agricultural Properties (Third Revision)

EPA - United States Environmental Protection Agency

ft, bgs - feet below ground surface

PAHs - polycyclic aromatic hydrocarbons

PCBs - polychlorinated biphenyls

PLM - polarized light microscopy

OCPs - organochlorine pesticides

SCAQMD - South Coast Air Quality Management District

SV - soil vapor

TPH - total petroleum hydrocarbons

TPH-g/d/o - TPH-gasoline/diesel/oil

UST - underground storage tank

VOCs - volatile organic compounds

CARLOS A. TORRES
Director, Environmental Health and Safety

JENNIFER FLORES
Deputy Director, Environmental Health and Safety

February 1, 2023

TO: Neighbors and Community Members of the
49th Street Elementary School

FROM: Los Angeles Unified School District
Office of Environmental Health and Safety

REGARDING: Preliminary Environmental Assessment
49th Street Elementary School, Los Angeles, California

The Los Angeles Unified School District (LAUSD) - Office of Environmental Health and Safety (OEHS) would like to provide you with advance notice for a Preliminary Environmental Assessment (PEA) that will be conducted within the boundaries of the 49th Street Elementary School, located at 750 East 49th Street, Los Angeles, California 90011. This PEA is one of the first steps for the overall comprehensive modernization project planned for the elementary school.

A licensed contractor, working on behalf of LAUSD, will perform the PEA field activities under the oversight of the LAUSD-OEHS. The PEA will consist of a subsurface investigation around the footprints of existing buildings that will be removed, where historical structures were present, or where other recognized environmental concerns were identified. Soil and soil vapor samples collected will be analyzed for various chemicals of concern. If necessary, soil cleanup will be performed prior to construction activities to protect students, faculty, and staff.

Fieldwork will be conducted intermittently and is anticipated to be completed over multiple days between February and December, 2023. Intrusive fieldwork, such as coring of the concrete or asphalt pavement and soil sampling will only be conducted on school holidays or weekends. Fieldwork will be conducted at the Site between the hours of 7AM and 5 PM.

The results of the PEA investigation will be submitted to LAUSD-OEHS in a report for review. The report will include an assessment of whether any of the above listed compounds are present in soil and/or soil vapor at concentrations that would require further delineation, or if a response action will be necessary before the Site is cleared for construction activities. When the OEHS's review is complete, OEHS will issue an official determination with regard to the assessment.

If you have any questions concerning the upcoming environmental investigation or other related activities for the proposed project, please contact Filmon Tesfaslasie, LAUSD-OEHS, Site Assessment Project Manager at (213) 241-4674 (email at cp-f.tesfaslasie@lausd.net).

1 de Febrero de 2023

PARA: Vecinos y Miembros de la Comunidad de la Escuela Primaria de la Calle 49

DE: Los Angeles Unified School District
Office of Environmental Health and Safety

EN LO QUE RESPECTA: Evaluación Ambiental Preliminar
49th Street Elementary School, Los Angeles, California

El Los Angeles Unified School District (LAUSD) – Office of Environmental Health and Safety (OEHS) le gustaría avisarle con antelación de una Evaluación Ambiental Preliminar (EAP) que se llevará acabo dentro de los límites del 49th Street Elementary School, ubicado en 750 East 49th Street, Los Angeles, California 90011 (en lo sucesivo se denominará como "el Sitio"). Esta EAP es uno de los primeros pasos para el Proyecto general de modernización integral planeado para la escuela primaria.

Un contratista con licencia, trabajando en nombre del LAUSD llevará a cabo las actividades de campo de la EAP bajo la supervisión del LAUSD-OEHS. La EAP consistirá en una investigación del subsuelo alrededor de las huellas del los edificios existentes que se eliminarán, donde estuvieran presentes estructuras históricas o donde se identificaron otras preocupaciones ambientales reconocidas. Muestras de suelo y vapor de suelo se analizarán por varios químicos en cuestión. Si es necesario, la limpieza del suelo se realizará antes de las actividades de construccion para proteger a los estudiantes, el profesorado, y el personal.

El trabajo de campo se llevará a cabo de forma intermitente y se prevé que se complete durante varios dias entre Febrero y Diciembre del 2023. El trabajo de campo intrusive, por ejemplo la perforacion de pavimento de hormigón o asfalto y el muestreo del suelo, solo se llevarán a cabo en vacaciones escolares o fines de semana. El trabajo de campo se llevará a cabo en el Sitio entre las 7 A.M. y las 5 P.M.

Los resultados de la investigación del EAP se presentará a LAUSD-OEHS en un informe para su revisión. El informe incluirá una evaluación de si alguno de los compuestos enumerados anteriormente está presente en el suelo y/o en el vapor del suelo a concentraciones que requerirán una mayor delineación, o si será necesaria una acción de respuesta antes de que el Sitio sea autorizado para actividades de construcción. Cuando se complete la revision de la OEHS, la OEHS emitirá una determinación official con respecto a la evaluación.

Si tiene alguna pregunta sobre la próxima investigación ambiental o otras actividades relacionadas con el proyecto propuesto, póngase en contacto con Filmon Tesfaslasie, LAUSD-OEHS, Gerente de Proyecto de Evaluación del Sitio al (213) 241-4674 (correo electrónico: cp-f.tesfaslasie@lausd.net).

BORING LOG EXPLANATION SHEET

Bulk sample.

Modified split-barrel drive sampler.

No recovery with modified split-barrel drive sampler.

Sample retained by others.

Standard Penetration Test (SPT).

No recovery with a SPT.

Shelby tube sample. Distance pushed in inches/length of sample recovered in inches.

No recovery with Shelby tube sampler.

Continuous Push Sample.

Seepage.

Groundwater encountered during drilling.

Groundwater measured after drilling.

MAJOR MATERIAL TYPE (SOIL):

Solid line denotes unit change.

Dashed line denotes material change.

Attitudes: Strike/Dip
b: Bedding
c: Contact
j: Joint
f: Fracture
F: Fault
cs: Clay Seam
s: Shear
bss: Basal Slide Surface
sf: Shear Fracture
sz: Shear Zone
sbs: Shear Bedding Surface

The total depth line is a solid line that is drawn at the bottom of the boring.

Re: Geophysical Investigation Report, 49th Street Elementary School; 750 East 49th Street, Los Angeles, California 90043

This report is to present the results of our geophysical survey carried out at 49th Street Elementary School located at 750 East 49th Street, Los Angeles, California 90043 (Figure 1). The survey was performed on February 18th & 20th, 2023, and its primary purpose was to detect and delineate, insofar as possible, underground fuel storage tanks (UST), a former incinerator, evidence of a former above ground storage tank (AST), and a former boiler room. A secondary purpose of the survey was to detect and delineate, insofar as possible, pipes, conduits, utilities, and other underground obstructions within a five (5) foot radius of forty-six (46) proposed boreholes and three (3) alternate drill locations.

A combination of electromagnetic induction (EM), magnetometry, and ground penetrating radar (GPR) were brought to the field in anticipation of use. Utility locators with line tracing capabilities were also used where applicable.

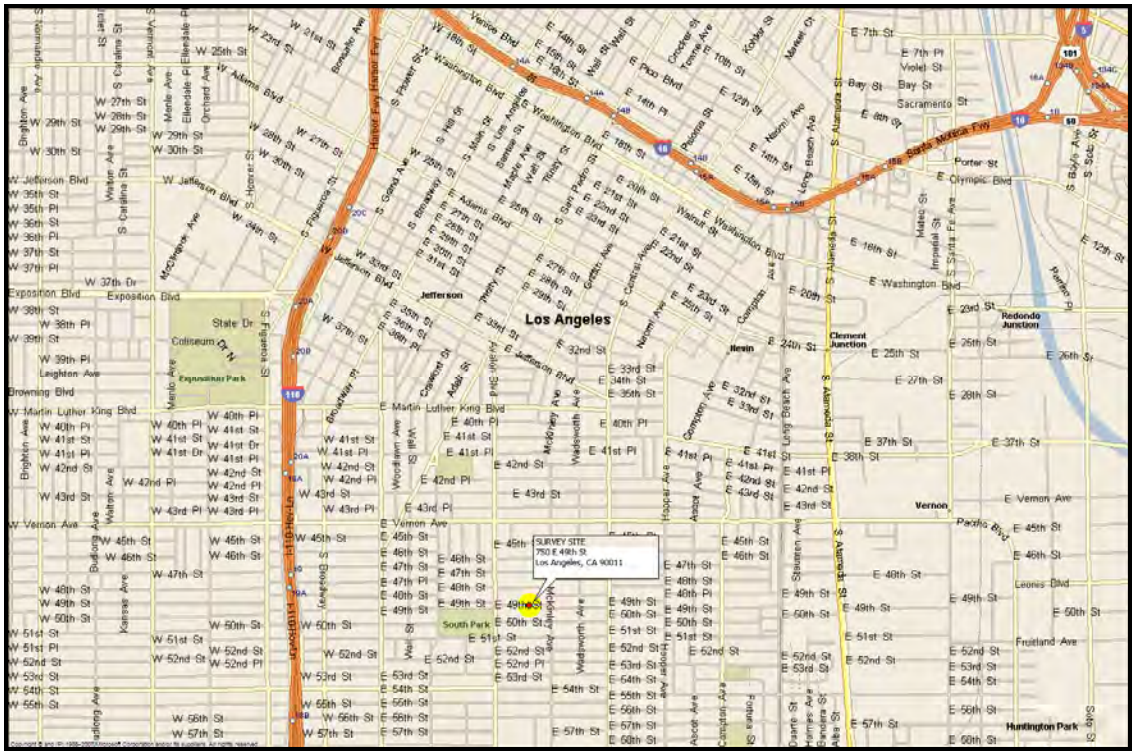

FIGURE 1. Site location map.

Survey Design – The area of investigation for the UST, AST, Boiler Room and incinerator included the northeastern portion of the school with a focus around the West Building. The forty-six boreholes and three alternate drill locations were located throughout the campus with their exact locations indicated in the field by the client.

For all survey objectives, the best use of time was achieved by systematically free-traversing with the instruments while monitoring them manually, continuously, and in real-time to determine which responses were significant and due to true subsurface targets, and which were due to other non-target or above-ground features and must be ignored (an example being nearby rebar reinforced concrete and ADA Ramp). In these situations, the free-traversing method is advantageous in that it allows for immediate detection of anomalous objects and facilitates the opportunity to investigate them further despite the obstructions and without the need to first download data. Where space was available for traversing, the EM devices, magnetic gradiometer, and GPR were traversed systematically over the survey areas in multiple, organized directions. Other traverses were taken for detailing and confirmation where anomalous conditions were found.

In addition, the line tracers were used to impress signals onto pipes, generally through accessible risers and tracer wires when present, to delineate the lines' locations and orientations. The instruments were also used in passive mode, configured to detect 60 Hz electrical signals and other common radio-frequency signals found in active electrical and communication lines.

A Geonic's model EM61 and a Fischer M-Scope was used for the EM sampling. A Sensors & Software Noggin Ground Penetrating Radar unit with a 500 MHz antenna produced the radar images. The magnetic gradiometer was a Schonstedt GA-52, and a Metrotech 9890 and RIDGID SR-60 SeekTech utility locator rounded out the tools applied.

Brief Description of the Geophysical Methods Applied – The EM61 instrument is a high resolution, time-domain device for detecting buried conductive objects. It consists of a powerful transmitter that generates a pulsed primary magnetic field when its coils are energized, which induces eddy currents in nearby conductive objects. The decay of the eddy currents, following the input pulse, is measured by the coils, which in turn serve as receiver coils. The decay rate is measured for two coils, mounted concentrically, one above the other. By making the measurements at a relatively long time interval (measured in milliseconds) after termination of the primary pulse, the response is nearly independent of the electrical conductivity of the ground. Thus, the instrument is a super-sensitive metal detector. Due to its unique coil arrangement, the response curve is a single well-defined positive peak directly over a buried conductive object. This facilitates quick and accurate location of targets.

The M-Scope device energizes the ground by producing an alternating primary magnetic field with AC current in a transmitting coil. If conducting materials are within the area of influence of the primary field, AC eddy currents are induced to flow in the conductors. A receiving coil senses the secondary magnetic field produced by these eddy currents, and outputs the response as anomalous conditions. The strength of the secondary field is a function of the conductivity of the object; say a pipe, tank or cluster of drums, its size, and its depth and position relative to the instrument's two coils. Conductive objects, to a depth of approximately 7 feet below ground surface (bgs) for the M-Scope are sensed. The device is also somewhat focused; that is, it is more sensitive to conductors below the instrument than they are to conductors off to the side.

The GPR instrument beams energy into the ground from its transducer/antenna, in the form of electromagnetic waves. A portion of this energy is reflected back to the antenna at a boundary in the subsurface across which there is an electrical contrast. The instrument produces a continuous record of the reflected energy as the antenna is traversed across the ground surface. The greater the electrical contrast, the higher the amplitude of the returned energy. The radar wave travels at a velocity unique to the material properties of the ground being investigated, and when these velocities are known, the two-way travel times can be converted to depth. The depth of penetration and image resolution produced are a function of ground electrical conductivity and dielectric constant.

The magnetic gradiometer has two flux gate magnetic fixed sensors that are passed closely to and over the ground. When not in close proximity to a magnetic object, that is, only in the earth's field, the instrument emits a sound signal at a low frequency. When the instrument passes over a buried iron or steel object, so that locally there is a high magnetic gradient, the frequency of the emitted sound increases. The frequency is a function of the gradient between the two sensors.

The line locator is used to passively detect energized high voltage electric lines and electrical conduit (50-60 Hz), VLF signals (14-22 kHz), as well as to actively trace other utilities. Where risers are present, the utility locator transmitter can be connected directly to the object, and a signal (9.8-82 kHz) is sent traveling along the conductor, pipe, conduit, etc. In the absence of a riser, the transmitter can be used to impress an input signal on the utility by induction. In either case, the receiver unit is tuned to the input signal, and is used to actively trace the signal along the pipe's surface projection.

Interpretation and Conclusions – The interpretation took place in real time as the survey progressed, and accordingly, the findings of our investigation were marked on the ground cover at the site with spray chalk, reported directly to the client, and are further documented with a site map of notable findings (Figure 2) and site photographs of notable findings and proposed boreholes (Figures 3-50). Note that boreholes **B11, B13 & B14** were not cleared as they had already been hand augured before subsurface survey personnel could scan the locations.

Detected items were painted out on site and are additionally highlighted in all accompanying graphics in coordinated colors including red for electric, orange for communication, blue for water, green for sewer and drain, yellow for gas and former fuel lines, and white for unknown lines. Additionally, orange was used to mark out the extent of a deep soil disturbance, yellow was used to mark out a shallow soil disturbance and pink was used to mark out a shallow EM anomaly. Please review the site map and site photographs for the locations and orientations of all detected items.

No evidence of a former incinerator was detected within the survey area (Figure 2 & 37).

No evidence of a former AST was detected within the survey area (Figures 2 & 38).

A shallow soil disturbance was detected in the survey area measuring approximately 10 feet 8 inches by 6 feet 6 inches and was located adjacent to the west side of the Main Building near the reported location of a former boiler room (Figures 2 & 49). This anomaly coincides with the reported location of the former boiler room and is most likely a result of the removal of the former boiler room footing or foundations.

A deep soil disturbance was detected in the survey area near the south edge of the ADA Ramp measuring approximately 11 feet 9 inches by 11 feet 6 inches (Figures 2 & 46-50). This anomaly is near the reported

location of the UST however due to the presence of the highly reinforced ADA Ramp overlying part of the anomaly we are unable to determine if any large metallic anomalies lay within the deep soil disturbance. Additionally the ADA Ramp prevented full and complete radar passes across the anomaly and reduced our detection capabilities near the ramp. Therefore while no UST was detected we cannot say with 100% certainty that a UST is not present underlying or immediately adjacent to the ADA Ramp.

A former fuel line was also detected within the survey area leading to a concrete patch within the sidewalk north of the survey area (Figures 2 & 50). This fuel line could only be traced from the concrete patch south into the survey area up to the canopy connecting the West Building and the Main Building. After the canopy the ADA Ramp prevented detection of the fuel line as full radar traverses could not traverse the potential path of the fuel line.

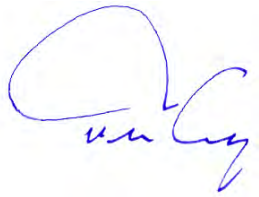
An EM anomaly measuring approximately 4 feet 6 inches in diameter was detected just west of the base of the ADA Ramp and Deep Soil Disturbance (Figures 2 & 46-47). This anomaly appears to be a near surface metallic object at approximately 2-3 feet bgs. Further information about this anomaly could not be ascertained as it was not visible on radar and the nearby concrete encased electrical conduit and ADA Ramp masked the presence of any deeper metallic responses.

The forty-nine proposed boreholes were either clear as where originally positioned by the client or were moved slightly to better avoid detected obstructions. In their final locations all were marked in white with a yellow "SSS" to indicate that each had been checked by company personnel.

Limitations and Further Recommendations - It should be understood that limitations inherent in geophysical instruments and/or surveying techniques exist at all sites, and nearly all sites exhibit conditions under which such might not perform optimally. Consequently, the detection of buried objects in all circumstances **cannot be guaranteed**. Such limitations are numerous and include, but are not limited to, rebar-reinforced ground cover, abrupt changes in ground cover type, above-ground obstacles preventing full traverses or traverses in one direction only, above-ground conductive objects interfering with instrument signal, nearby powerlines or EM transmitters, highly conductive background soil conditions, limited GPR penetration, non-metallic targets, shallower or larger objects shielding deeper or smaller targets, tracing signal jumping from one line to another, and inaccessible risers, cleanouts, valve boxes, and manholes. If one or more geophysical instrument is rendered ineffective and cannot be utilized, the quality of the survey can be somewhat degraded.

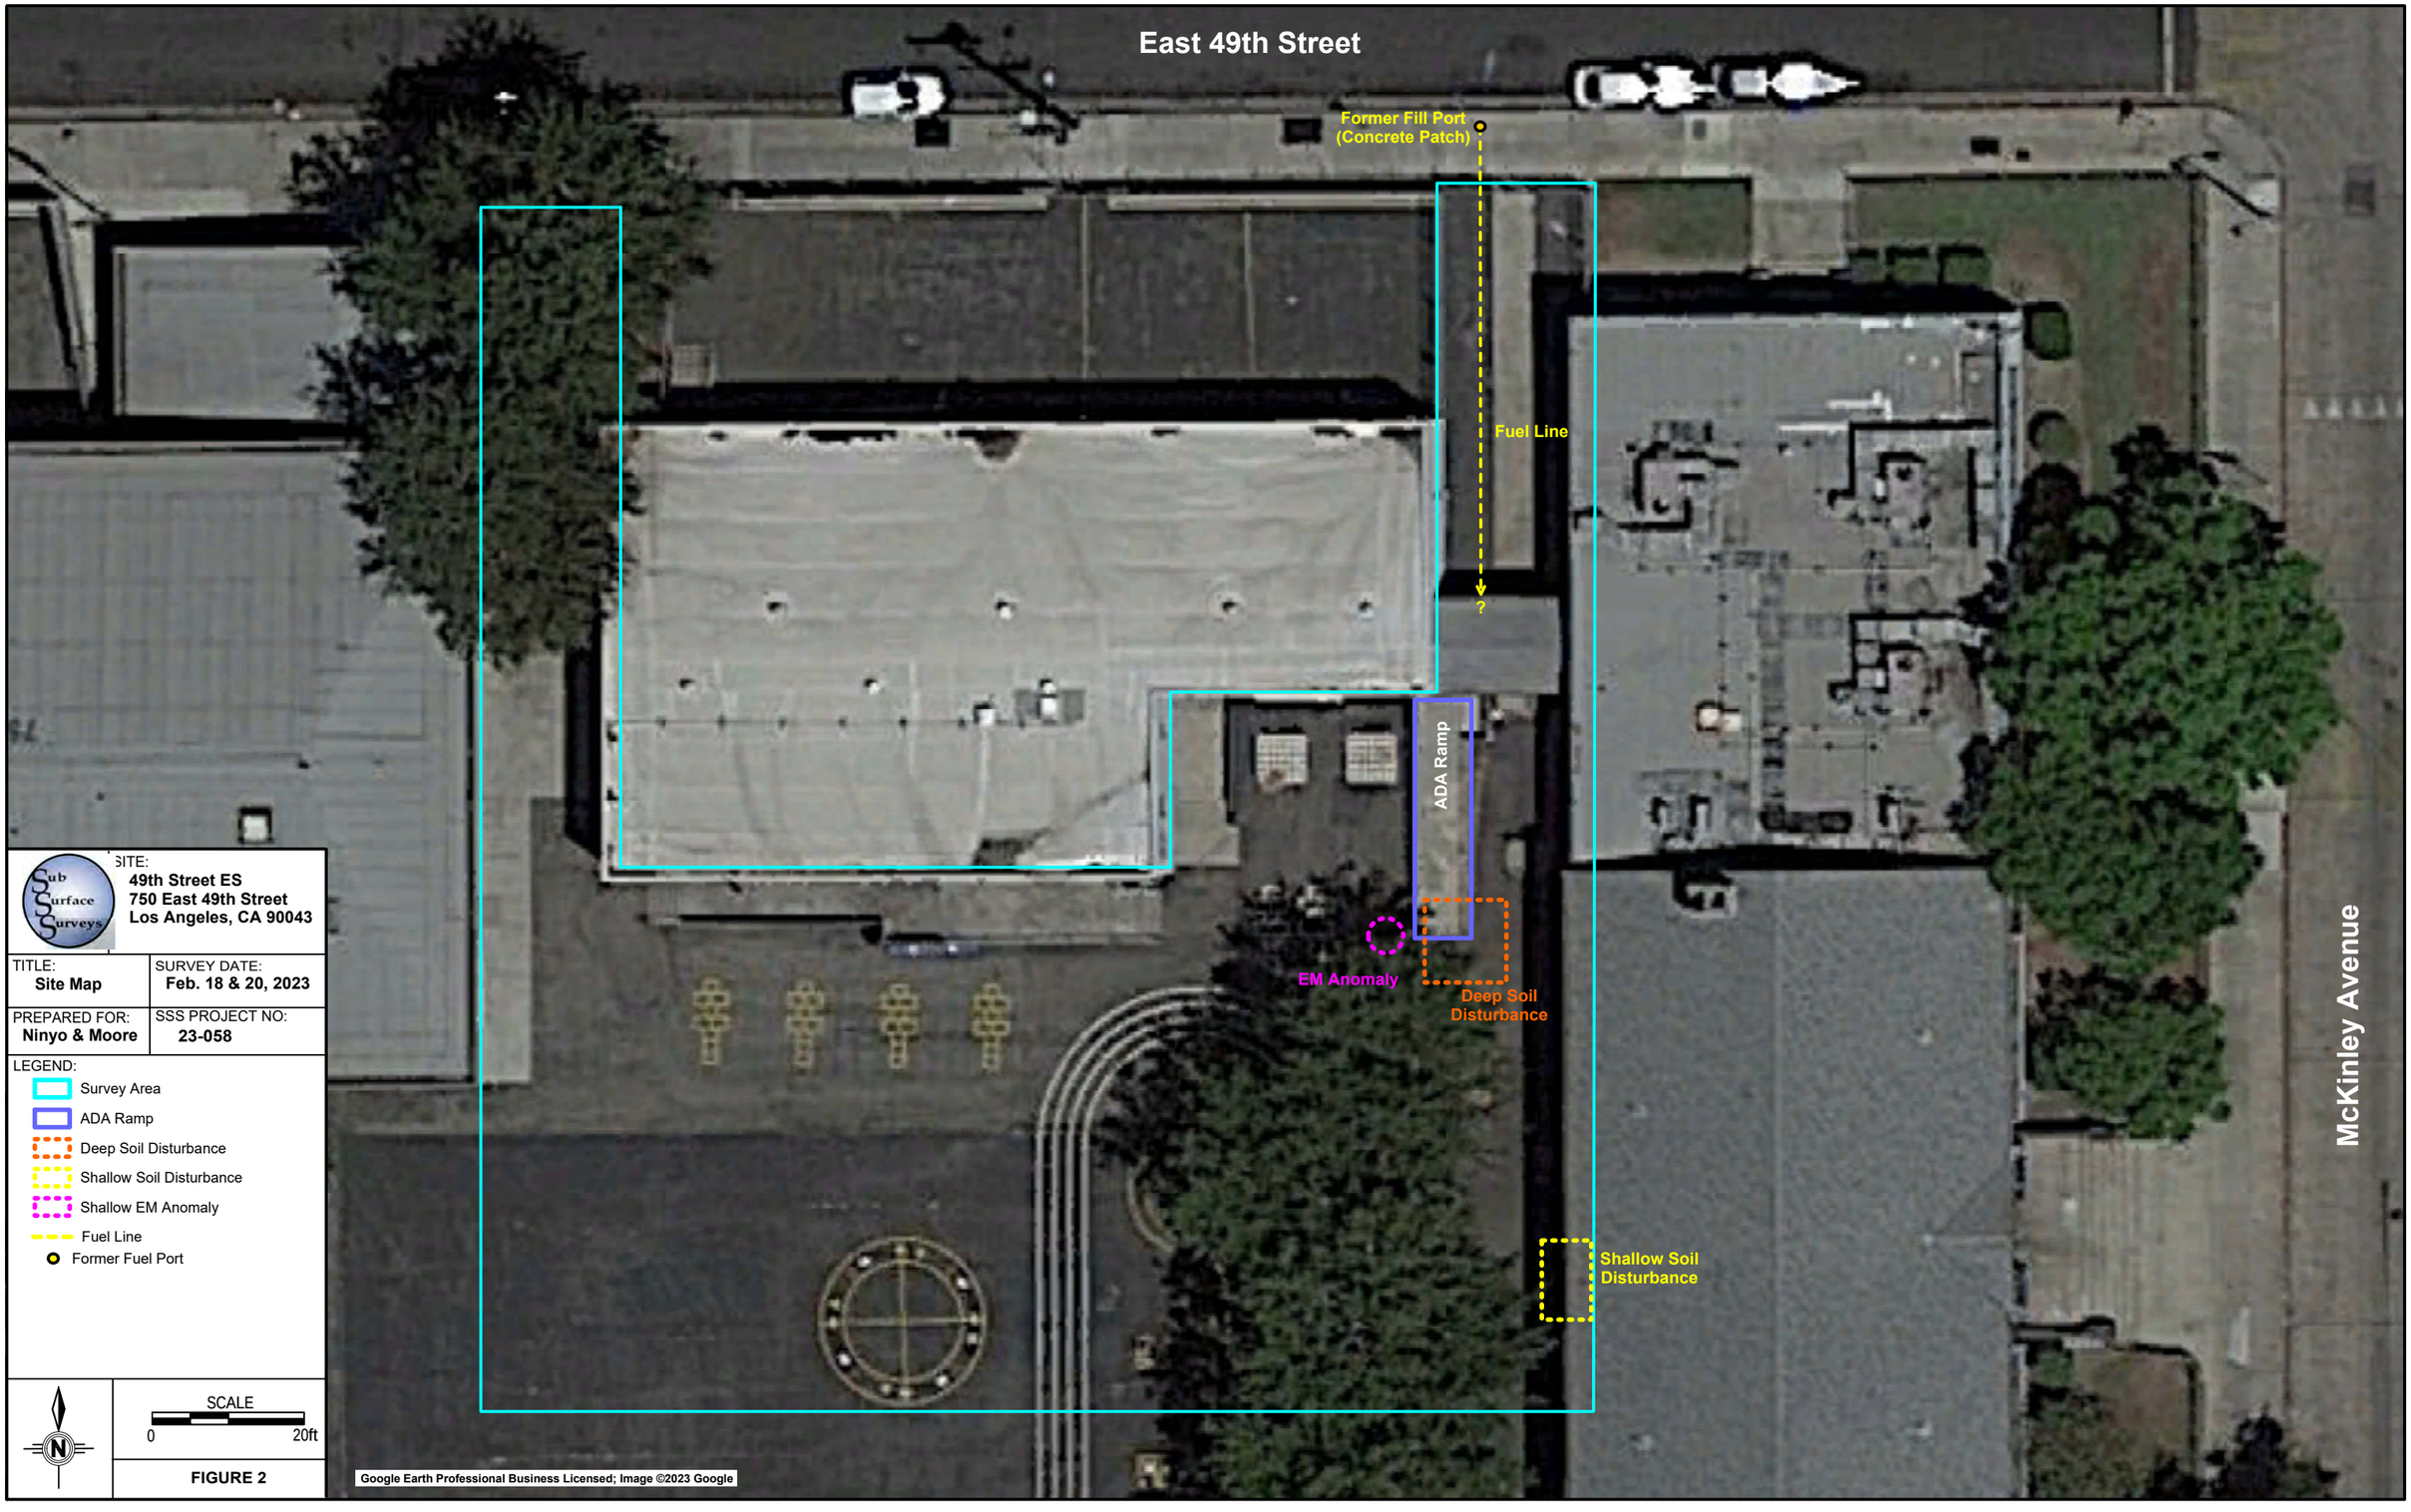
For the above reasons, and in the interest of maximum safety, we encourage our clients to take advantage of Underground Service Alert (USA), Dig Alert, or other similar services, when possible. Furthermore, we recommend hand-auguring and the use of a drilling method known as air knifing or vacuum extraction, when feasible or if applicable to this project. These methods may significantly limit damage to underground pipes, conduits, and utilities that might not have been detectable during the course of this survey. Please bear in mind, that geophysical surveying is only one of several levels of protection that is available to our clients.

SubSurface Surveys may include maps in some reports. While they are an accurate general representation of the site and our findings, they are not of engineering quality (i.e., measured and mapped by a licensed land surveyor).



SubSurface Surveys and Associates makes no guarantee either expressed or implied regarding the accuracy

of the findings and interpretations present. And, in no event will SubSurface Surveys and Associates be liable for any direct, indirect, special, incidental, or consequential damages resulting from interpretations and opinions presented herewith.



All data generated on this project are in confidential file in this office, and are available for review by authorized persons at any time. The opportunity to participate in this investigation is very much appreciated. Please call, if there are questions.

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 2ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Comments:

Data Qualifier Definitions

Qualifier

D1 = Sample required dilution due to matrix.

L2 = The associated blank spike recovery was below laboratory acceptance limits.

GS0221231	8270C	Fluorene	LCS/LCSD

M2 = Matrix spike recovery was low, the associated blank spike recovery was acceptable.

27693-001	6010B	Antimony	MS/MSD
27693-001	6010B	Mercury	MS/MSD
27693-001	6010B	Thallium	MS/MSD
27693-026	8270C	Phenanthrene	MS/MSD

M2 = Matrix spike recovery was low.

27693-026	8270C	Fluorene	MS/MSD

R2 = RPD/RSD exceeded the laboratory acceptance limit.

HV0221231	6010B	Cobalt	LCS/LCSD

R7 = LFB/LFBD RPD exceeded the laboratory acceptance limit. Recovery met acceptance criteria.

VV0221231	8081A	Endosulfan I	LCS/LCSD
VV0221231	8081A	gamma-BHC (Lindane)	LCS/LCSD
VV0221231	8081A	Methoxychlor	LCS/LCSD

S1 = Surrogate recovery was above laboratory acceptance limits.

27693-026	8270C	Nitrobenzene-d5	MSD
GS0221231	8270C	Nitrobenzene-d5	LCS/LCSD

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

LA Testing maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by LA Testing. LA Testing bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. LA Testing suggests that samples reported as none detected undergo additional analysis via TEM to avoid the possibility of false negatives.

Job Notes

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender and destroy this report immediately. This report shall not be reproduced except in full, without prior express written approval by the laboratory.

The data in the report relate to the field sample(s) as received by the laboratory and associated QC. All results have been reviewed and have been found to be compliant with laboratory and accreditation requirements, with the exception of the noted deviation(s). For questions, please contact the Project Manager.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 2/22/2023 1:54 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.1º C.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Orange Coast Analytical Inc
Project/Site: 211936010

Job ID: 570-128722-1

Client Sample ID: B2-05 — Lab Sample ID: 570-128722-1

No Detections.

Client Sample ID: B3-0.5 — Lab Sample ID: 570-128722-2

No Detections.

Client Sample ID: B5-0.5 — Lab Sample ID: 570-128722-3

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 2ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Comments:

None

Data Qualifier Definitions

Qualifier

D1 = Sample required dilution due to matrix.

L1 = The associated blank spike recovery was above laboratory acceptance limits.

VV0303231	8082	PCB-1016	LCSD

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 4ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Data Qualifier Definitions

Qualifier

D1 = Sample required dilution due to matrix.

L2 = The associated blank spike recovery was below laboratory acceptance limits.

GS0221231	8270C	Fluorene	LCS/LCSD

M2 = Matrix spike recovery was low, the associated blank spike recovery was acceptable.

27693-001	6010B	Antimony	MS/MSD
27693-001	6010B	Mercury	MS/MSD
27693-001	6010B	Thallium	MS/MSD
27693-026	8270C	Phenanthrene	MS/MSD

M2 = Matrix spike recovery was low.

27693-026	8270C	Fluorene	MS/MSD

R2 = RPD/RSD exceeded the laboratory acceptance limit.

HV0221231	6010B	Cobalt	LCS/LCSD

R7 = LFB/LFBD RPD exceeded the laboratory acceptance limit. Recovery met acceptance criteria.

VV0221231	8081A	Endosulfan I	LCS/LCSD
VV0221231	8081A	gamma-BHC (Lindane)	LCS/LCSD
VV0221231	8081A	Methoxychlor	LCS/LCSD

S1 = Surrogate recovery was above laboratory acceptance limits.

27693-026	8270C	Nitrobenzene-d5	MSD
GS0221231	8270C	Nitrobenzene-d5	LCS/LCSD

S8 = The analysis of the sample required a dilution such that the surrogate recovery calculation does not provide any useful information. The associated blank spike recovery was acceptable.

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

LA Testing maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by LA Testing. LA Testing bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. LA Testing suggests that samples reported as none detected undergo additional analysis via TEM to avoid the possibility of false negatives.

Job Notes

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender and destroy this report immediately. This report shall not be reproduced except in full, without prior express written approval by the laboratory.

The data in the report relate to the field sample(s) as received by the laboratory and associated QC. All results have been reviewed and have been found to be compliant with laboratory and accreditation requirements, with the exception of the noted deviation(s). For questions, please contact the Project Manager.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Definitions/Glossary

Client: Orange Coast Analytical Inc
Project/Site: 211936010

Job ID: 570-128723-1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 2/22/2023 1:54 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.1° C.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Orange Coast Analytical Inc
Project/Site: 211936010

Job ID: 570-128723-1

Client Sample ID: B20-0.5 — Lab Sample ID: 570-128723-1

No Detections.

Client Sample ID: B23-0.5 — Lab Sample ID: 570-128723-2

No Detections.

Client Sample ID: B25-0.5 — Lab Sample ID: 570-128723-3

No Detections.

Client Sample ID: B26-0.5 — Lab Sample ID: 570-128723-4

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Chromium, hexavalent	230	J	400	190	ug/Kg	10		7199	Total/NA

This Detection Summary does not include radiochemical test results.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 4ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Comments:

None

Data Qualifier Definitions

Qualifier

D1 = Sample required dilution due to matrix.
D2 = Sample required dilution due to high concentration of target analyte.

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

LA Testing maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by LA Testing. LA Testing bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. LA Testing suggests that samples reported as none detected undergo additional analysis via TEM to avoid the possibility of false negatives.

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 3ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Preliminary

Data Qualifier Definitions

Qualifier

M2 = Matrix spike recovery was low, the associated blank spike recovery was acceptable.

27815-012	6010B	Lead	MS

Preliminary

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 2ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Comments:

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 3ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Data Qualifier Definitions

Qualifier

M2 = Matrix spike recovery was low, the associated blank spike recovery was acceptable.

27815-001	6010B	Antimony	MS/MSD
27815-001	6010B	Selenium	MS
27815-001	6010B	Thallium	MS/MSD

M3 = The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.

27815-001	6010B	Barium	MS/MSD
27815-001	6010B	Copper	MS/MSD
27815-001	6010B	Lead	MS/MSD
27815-001	6010B	Vanadium	MS
27815-001	6010B	Zinc	MS/MSD

R2 = RPD/RSD exceeded the laboratory acceptance limit.

27815-001	6010B	Selenium	MS/MSD

S1 = Surrogate recovery was above laboratory acceptance limits.

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 3ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Data Qualifier Definitions

Qualifier

M2 = Matrix spike recovery was low, the associated blank spike recovery was acceptable.

27815-012	6010B	Lead	MS

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Lab Reference # NAM 27815B
Project Name: LAUSD 49th Street PEA
Project #: 211936010

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 3ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Comments:

None

Data Qualifier Definitions

Qualifier

M3 = The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.

27815-021	STLC CCR	STLC Arsenic	MS/MSD

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at ºC, on ice.

2 coolers at 3 and 1 °C IR#3 correction =+0 °C

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Data Qualifier Definitions

Qualifier

D1 = Sample required dilution due to matrix.

M2 = Matrix spike recovery was low, the associated blank spike recovery was acceptable.

27827-001	6010B	Arsenic	MS
27827-001	6010B	Beryllium	MS
27827-001	6010B	Chromium	MS
27827-001	6010B	Cobalt	MS/MSD
27827-001	6010B	Copper	MS
27827-001	6010B	Molybdenum	MS/MSD
27827-001	6010B	Nickel	MS
27827-001	6010B	Selenium	MS/MSD
27827-001	6010B	Thallium	MS/MSD
27827-001	6010B	Vanadium	MS
27827-024	6010B	Antimony	MS/MSD
27827-024	6010B	Thallium	MS/MSD

M3 = The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.

27827-001	6010B	Antimony	MS/MSD
27827-001	6010B	Barium	MS/MSD
27827-001	6010B	Lead	MS/MSD
27827-001	6010B	Zinc	MS/MSD
27827-024	6010B	Barium	MS/MSD

R2 = RPD/RSD exceeded the laboratory acceptance limit.

27827-024	6010B	Antimony	MS/MSD

R5 = MS/MSD RPD exceeded the laboratory acceptance limit. Recovery met acceptance criteria.

27827-007	8015B	VFH	MS/MSD

S1 = Surrogate recovery was above laboratory acceptance limits.

27827-024	8015B	Octacosane	MS/MSD

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Job Notes

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender and destroy this report immediately. This report shall not be reproduced except in full, without prior express written approval by the laboratory.

The data in the report relate to the field sample(s) as received by the laboratory and associated QC. All results have been reviewed and have been found to be compliant with laboratory and accreditation requirements, with the exception of the noted deviation(s). For questions, please contact the Project Manager.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The sample was received on 4/11/2023 11:15 AM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.2º C.

HPLC/IC
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Orange Coast Analytical Inc
Project/Site: 211936010

Job ID: 570-134446-1

Client Sample ID: B36-0.5

Lab Sample ID: 570-134446-1

No Detections.

This Detection Summary does not include radiochemical test results.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Received project as a subcontract.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at ºC, on ice.

2 coolers at 3 and 1 °C IR#3 correction =+0 °C

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Comments:

None

Data Qualifier Definitions

Qualifier

M3 = The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.

27827-001	STLC CCR	STLC Lead	MS/MSD

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at ºC, on ice.

2 coolers at 3 and 1 °C IR#3 correction =+0 °C

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Data Qualifier Definitions

Qualifier

M3 = The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.

27859-001	6010B	Lead	MS/MSD

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Hi Miriam,

I have one more round of analyses for 49th Street PEA. Please analyze the following samples on 2-day rush TAT so we have results by end of day Thursday:

- B4-W2-0.5: Arsenic STLC & TCLP -27815-021
- B34-5: Lead by EPA 6010B - 27827-002

Thanks,

Dennis Fee, EIT

Company: Ninyo & Moore		Company: OCAA	

Sample Matrix: DW - Drinking Water; GW - Groundwater; AQ - Aqueous; WW - Wastewater; SS - Soil / Solid; SW - Stormwater; OT - Other

Sample Integrity: Intact: ____ On Ice: Yes / No @ ____ °C

By signing above, client acknowledges responsibility for payment of all services requested on this chain of custody form and any additional services provided in support of this project. Payment is due within 30 days of invoice date unless otherwise agreed upon, in writing, by Orange Coast Analytical, Inc. All samples remain the property of the client. A disposal fee may be imposed if client fails to pickup samples upon completion of all analyses.

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at ºC, on ice.

2 coolers at 0 and 1 °C IR#3 correction =+0 °C

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Data Qualifier Definitions

Qualifier

M2 = Matrix spike recovery was low, the associated blank spike recovery was acceptable.

27827-024	6010B	Antimony	MS/MSD
27827-024	6010B	Thallium	MS/MSD

M3 = The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.

27827-024	6010B	Barium	MS/MSD

R2 = RPD/RSD exceeded the laboratory acceptance limit.

27827-024	6010B	Antimony	MS/MSD

R4 = MS/MSD RPD exceeded the method acceptance limit. Recovery met acceptance criteria.

27829-001	8015B	EFH	MS/MSD

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 4ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Notes and Definitions

DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
RPD	Relative Percent Difference
E	Estimated Concentration; concentration exceeds calibration range.
LCC	Leak Check Compound
1	Recovery outside of acceptable limits. LCS/LCSD recoveries and %RSD were within QC limits, therefore data was accepted.
SMSR	Sample matrix prevented adequate surrogate recovery.
J	Value less than PQL but greater than MDL
HHSR	High hydrocarbon concentration in this sample prevented adequate surrogate recovery.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northern California, LLC Project Manager.

Job ID: 320-98788-1

Qualifiers

Dioxin

Qualifier	Qualifier Description
*1	LCS/LCSD RPD exceeds control limits.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Job ID: 320-98788-1

Laboratory: Eurofins Sacramento

Narrative

Job Narrative
320-98788-1

Comments
The following samples were submitted on a HOLD basis and canceled on April 27, 2023: B36-2.5 (320-98788-2), B36-5 (320-98788-3) and B36-10 (320-98788-4).

Receipt
The samples were received on 4/11/2023 9:25 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.4º C.

Dioxin
Method 8290A: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for Prep Batch 320-667350 was outside control limits for 1,2,3,7,8,9-HxCDD. The percent recoveries (%Rec) were within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 4ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Definition of terms:

R	Result of unspiked laboratory sample used for matrix spike determination.
SP CONC (or Spike Conc.)	Spike concentration added to sample or blank
MS	Matrix Spike sample result
MSD	Matrix Spike Duplicate sample result
%MS	Percent recovery of MS: {(MS-R1) / SP CONC} x100
%MSD	Percent recovery of MSD: {(MSD-R1) / SP CONC} x 100
RPD (for MS/MSD)	Relative Percent Difference: {(MS-MSD) / (MS+MSD)} x 100 x 2
LCS	Laboratory Control Sample result
LCSD	Laboratory Control Sample Duplicate result
%LCS	Percent recovery of LCS: {(LCS) / SP CONC} x100
%LCSD	Percent recovery of LCSD: {(LCSD) / SP CONC} x 100
RPD (for LCS/LCSD)	Relative Percent Difference: {(LCS-LCSD) / (LCS+LCSD)} x 100 x 2
ACP %LCS	Acceptable percent recovery range for Laboratory Control Samples.
ACP %MS	Acceptable percent recovery range for Matrix Spike samples
ACP RPD	Acceptable Relative Percent Difference
D	Detectable, result must be greater than zero
Qual	A checked box indicates a data qualifier was utilized and/or required for this analyte see attached explanation.
ND	Analyte Not Detected

Case Narrative

Sample Receipt:

All samples on the Chain of Custody were received by OCA at 4ºC, on ice.

Holding Times:

All samples were analyzed within required holding times unless otherwise noted in the data qualifier section of the report.

Analytical Methods:

Sample analysis was performed following the analytical methods listed on the cover page.

Data Qualifiers:

Within this report, data qualifiers may have been assigned to clarify deviations in common laboratory procedures or any divergence from laboratory QA/QC criteria. If a data qualifier has been used, it will appear in the back of the report along with its description. All method QA/QC criteria have been met unless otherwise noted in the data qualifier section.

Definition of Terms:

The definitions of common terms and acronyms used in the report have been placed at the back of the report to assist data users.

Comments:

Los **A**ngeles **U**nified **S**chool **D**istrict
Office of Environmental Health and Safety

DATE: August 31, 2023

TO: Leah Guthrie
Facilities Development Manager
FSD – Asset Management

FROM: Filmon Tesfaslasie,
Site Assessment Project Manager (CP)
Office of Environmental Health and Safety

SUBJECT: **49TH STREET ELEMENTARY SCHOOL**
REMOVAL ACTION PLAN (RAW) – MAJOR MODERNIZATION

The Los Angeles Unified School District (LAUSD) has completed a Removal Action Workplan (RAW) for the Major Modernization Project at 49th Street Elementary School (the "Site") located at 750 E 49th St, Los Angeles, CA. The Draft RAW (attached) presents the removal action plan of approximately 1,568 cubic yards of impacted soil identified in the Preliminary Environmental Assessment (PEA). The plan details the soil excavation, segregation, stockpiling, characterization, transportation, and disposal procedures. It also describes the verification sampling procedure, air monitoring requirements, and health and safety plan.

The RAW will be implemented as part of the Major Modernization Project. In the meantime, direct exposure and immediate health risk to students is not anticipated as the impacted soils are currently covered with asphalt.

As a general note, dust mitigation measures shall be implemented during any project-related excavation and/or earth-disturbing activities at the Site. Additionally, if any stained or odorous soil is observed during construction, stop work shall be initiated and OEHS shall be notified. In the event that the project requires the disposal of excess soil, soil sampling per the LAUSD Specification Section 01-4524 will be required prior to characterization and acceptance for off-site disposal.

Should you have any questions or concerns regarding this memorandum, please contact OEHS Site Assessment Project Manager Filmon Tesfaslasie at (213) 241-4578 or at cp-f.tesfaslasie@lausd.net.

Attachment: Removal Action Workplan (RAW), 49th Street Elementary School – Major Modernization Project, 750 E 49th Street, Los Angeles, California 90011, dated August 25, 2023.

APPENDICES

A – 2023 PEA Sampling Results (Tables and Figures)
B – Air Monitoring Plan

1 INTRODUCTION AND SUMMARY

This document presents a Removal Action Workplan (RAW) for the removal of arsenic, lead, and total petroleum hydrocarbon (TPH) impacted soil located within the 49th Street Elementary School Major Modernization Project (MMP) area at 750 East 49th Street, in Los Angeles, California (site; Figure 1). This RAW has been prepared by Ninyo & Moore Geotechnical and Environmental Sciences Consultants (Ninyo & Moore) on behalf of the Los Angeles Unified School District (LAUSD), under the oversight of the LAUSD's Office of Environmental Health and Safety.

Based on the results of Preliminary Environmental Assessment (PEA) investigation, elevated concentrations of arsenic, lead, and TPH were reported above the applicable regulatory screening levels in certain areas within the site (Ninyo & Moore, 2023). The screening level for arsenic of 12 milligrams per kilogram (mg/kg)is based on the Department of Toxic Substances Control's (DTSC's) statistical evaluation of arsenic concentrations at 19 school sites within southern California (DTSC, 2007). The screening level for lead is based on DTSC Human and Ecological Risk Office Human Health Risk Assessment (HERO HHRA) for Residential Soil, which is 80 mg/kg. The screening level for TPH diesel range organics (DROs) and motor oil range organics (MROs) is based on the San Francisco Regional Water Quality Control Board's (SFRWQCB) Tier 1 Environmental Screening Levels (ESLs) of 260 and 1,600 mg/kg, respectively.

Based on the recommendations of the PEA, a "Response Action" is required to address the potential threat or hazard posed by the presence of elevated levels of arsenic, lead, and TPH at concentrations above the site-specific cleanup goal (CG) of 12 mg/kg, 80 mg/kg, and 260 mg/kg, respectively, at the site. The RAW includes a description of the on-site impact, a plan for conducting the removal action (RA), and the goals to be achieved by the RA, as required by the California Health and Safety Code (H&SC) Section 25323.1. The RAW is also consistent with the criteria specified in the H&SC Section 25356.1(h).

1.1 Purpose of the RAW

Based on the PEA performed by Ninyo & Moore (Ninyo & Moore, 2023), shallow soil at the site has been impacted by arsenic, lead, and TPH in select areas. The purposes of this RAW are to:

- Summarize previous investigation,
- Estimate the surface area and volumes of soil impacted with chemicals of concern, and;
- Propose measures to remove the arsenic, lead, and TPH concentrations in the affected areas of the site to levels below regulatory screening levels for the protection of human health and the environment.

1.2 Removal Action Objectives

Site-specific RA objectives (RAOs) have been established to protect human health and the environment, and serve as a means of screening potential remedial alternatives for further evaluation. Ninyo & Moore has identified the following RAOs:

- Minimize potential exposure through ingestion, inhalation, or direct contact with the shallow soils containing elevated concentrations of arsenic, lead, and TPH that may pose risk to human health;
- Protect human health and the environment by minimizing generation and release of fugitive dust potentially containing elevated concentrations of arsenic, lead, and TPH into the ambient air in excess of South Coast Air Quality Management District (SCAQMD) requirements; and
- Minimize potential migration of elevated concentrations of arsenic, lead, and TPH from soils into air, surface water, or groundwater.

The remedial goals developed and adopted for arsenic, lead, and TPH impacted soil at the site will be responsive to these RAOs. The primary remedial goal for the site is performance-based and focuses on restoring the near-surface soils to conditions protective of human health with regards to the elevated arsenic, lead, and TPH detected in shallow soil.

Ninyo & Moore has preliminarily determined that the proposed action (excavation and off-site disposal) is the preferred RA remedy based on an assessment of the three broad technology evaluation criteria: effectiveness, implementability, and cost (see Section 5). The objective of this proposed action is for impacted soil with arsenic, lead, and TPH concentrations exceeding the CG to be excavated, removed from the site, and placed at a licensed disposal facility. The proposed action at the site focuses on reducing the threat to human health, and the environment, and to provide a solution that reduces the toxicity, mobility, and volume of impacted soil.

2 SITE DESCRIPTION

The following discusses site information in more detail.

2.1 Site Name

The site is identified by LAUSD as 49th Street Elementary School.

2.2 Site Address

The current site address is:

750 East 49th Street
Los Angeles, California

2.3 Designated Contact Person

The designated LAUSD contact person for this project is Mr. Filmon Tesfaslasie, Site Assessment Project Manager.

2.4 Contact Person, Mailing Address, and Telephone Number

Contact information for this project is provided below:

Anthony Espinoza
Environmental Health Manager
Los Angeles Unified School District
Office of Environmental Health and Safety
333 South Beaudry Street, 21st Floor
Los Angeles, California 90017

Mr. Espinoza can be reached at (213) 241-5487. His facsimile number is (213) 241-6816.

2.5 EPA Identification Number

The Environmental Protection Agency (EPA) Identification Number for the site is CAD982025165.This EPA ID number must be used for waste profiling and disposal purposes during the implementation of the RAW.

2.6 Assessor's Parcel Number(s) and Maps

According to the Los Angeles County Assessor's office, the site consists of parcels that are assigned Assessor's Parcel Numbers 5108-011-909 and 5108-011-910.

2.7 Ownership

The LAUSD is the current owner of the site.

2.8 Site Location

The site is located within the boundaries of 49th Street Elementary School at 750 E. 49th Street, in Los Angeles, California (Figure 1), located at the southwest corner of the intersection of East 49th Street and McKinley Avenue in Los Angeles, California. According to the United States Geological Survey (USGS) Inglewood Quadrangle Map, dated 2015, the site is at an elevation of approximately 180 feet above mean sea level. The site slopes gently to the southwest (USGS, 2015).

3 BACKGROUND INFORMATION

The following discusses background information in more detail.

3.1 Site Information

The site is a 5.73 acre-property currently used as an elementary school. The western portion of the site was developed and occupied by single-family residences starting in 1900. Around 1922, the eastern portion of the site was developed and occupied by the 49th Street Elementary School. The existing main building (Building ID # 14040) was the only building at the site during this time. Between 1962 and 1970, most of the single-family residences were demolished and the site was developed to the existing site configuration. The current site includes one administration/classroom building (Building ID # 14036), four classroom buildings (classroom building [Building ID # 13718], the west building [Building ID # 13933], main building [Building ID # 14040], south building [Building ID #13583]), an auditorium building (Building ID # 14196), and a cafeteria building (Building ID # 13566). The remainder of the site (the western portion) is paved with asphalt and is utilized as a playground and parking area.

3.2 Surrounding Land Use

The site vicinity consists primarily of residential properties with some dispersed commercial properties. The site is bordered by East 49th Street to the north, McKinley Avenue to the east, East 50th Street to the south, and 49th Street Park and residential properties in the west (Figure 1).

3.3 Geologic and Soil Conditions

Based on a review of the California Department of Conservation 2010 Geologic Map online, the site is mapped with generalized soil types primarily comprised of Holocene alluvial gravel, sand, and clay, derived mostly from Santa Monica mountains (Dibblee & Minch, 2007).

Soils encountered during the PEA Equivalent consisted of fill material and native alluvium to the maximum depth explored of 15 feet below ground surface (bgs). The fill material was primarily a brown, loose silty sand and fine-grained sand, which was encountered from surface or directly below pavement until total depth of native alluvium was encountered. Fill was encountered up to the maximum depth explored of 15 feet bgs in borings located near the former suspected UST pit in the eastern portion of the site. The alluvium encountered during the PEA consisted primarily of light brown poorly graded sand and well-graded sand. Native alluvium was encountered at 3.5 to 4 feet bgs in the western portion of the site, and generally increased in depth encountered eastward as the age of site development increased.

3.4 Site Hydrogeology

According to information reviewed on State Water Resources Control Board's (SWRCB's) GeoTracker website related to the closed leaking underground storage tank case associated with

the Winall Oil Company Station No. 9 (4442 Avalon Boulevard), located approximately 0.3 miles to the north-northwest of the site, groundwater was measured in May 2013 at depths ranging from approximately 189.45 to 190.61 feet bgs. The approximate groundwater flow direction was reported to be toward the east. Groundwater levels can fluctuate due to seasonal variations, groundwater withdrawal or injection, and other factors.

There are no natural surface water bodies, such as streams, rivers, ponds, and lakes, at the site.

3.5 Previous Site Investigations

The following sections describe previous site investigations.

Phase I Environmental Site Assessment Report

Ninyo & Moore reviewed the Phase I ESA Report prepared by Tetra Tech, dated March 22, 2022 (Tetra Tech, 2022). Based on the findings of the Phase I ESA, several Recognized Environmental Conditions (RECs) were identified for the site. These are:

- The potential presence of lead-contaminated soils associated with the potential use of lead-based paint in the buildings,
- The potential presence of organochlorine pesticide (OCP)-contaminated soils associated with the potential application of OCPs,
- The potential presence of polychlorinated biphenyl (PCB)-contaminated soils due to the potential use of PCB-containing caulking and paints in the buildings,
- The Potential presence of arsenic-contaminated soils due to LAUSD's former standard practice of applying herbicides containing arsenic prior to paving,
- The historical presence of a concrete incinerator,
- The presence of an oil tank between the main building and the west building,
- The presence of a second oil tank south of the southwest corner of the existing west building (unknown if the oil tanks are aboveground storage tanks [ASTs] or underground storage tanks [USTs]),
- The presence of two boiler rooms.

Recommendations from the Phase I ESA included the following:

- Conduct a PEA Equivalent (PEA-E) to evaluate the site's subsurface soil to determine the presence, if any, of chemicals of potential concern (COPCs) including petroleum hydrocarbons, volatile organic compounds (VOCs), metals, organochlorine pesticides (OCPs), and polychlorinated biphenyl (PCBs).
- Prior to any demolition, remodeling, and/or renovations, sample untested suspected asbestos containing materials (ACMs), lead-based paint (LBP), lead-containing materials (LCMs), and potential PCB-containing building material, and abatement of any known ACMs, LBP, LCMs, and PCB-containing building material.

- Prior to redevelopment, applicable agencies should be contacted for storm water run-off requirements and other development- and construction-related environmental requirements.

RECs and other potential environmental concerns identified in Tetra Tech's Phase I ESA were used to create the sampling rationale for the PEA and select the locations of soil/soil vapor borings. Additional site-specific documents were provided by LAUSD, reviewed by Ninyo & Moore, and incorporated into the PEA rationale and selection of boring locations.

Preliminary Environmental Assessment Report

Ninyo & Moore conducted a PEA at 49th Street Elementary School starting February 2023. The final PEA Report was submitted July of 2023 (Ninyo & Moore, 2023). The primary objectives of the PEA were to evaluate if soils were impacted by historical or current uses of hazardous wastes or substances at the site, if those uses resulted in releases of COPCs, delineate any COPC-impacted soils, and evaluate risk to human health and/or the environment. The PEA Sampling Locations are displayed in Figure 2.

The following summarizes the major findings of the 2023 PEA investigation (Ninyo & Moore, 2023):

- A full-scan geophysical survey conducted between the Main Building and West Building revealed the presence of an anomaly in the deep soil that coincides with the likely location of a heating oil tank. The deep borings advanced to 15 feet bgs in the vicinity of the likely location of the tank did not encounter the tank or any contamination that could have resulted from a release. The anomaly identified is most likely the material used to backfill the former location of the tank.

- TPH DROs were detected ranging from 12 to 490 mg/kg. One sample collected in the parking lot area in the northwest portion of the site reported a concentration of 490 mg/kg, which exceeds SFRWQCB Tier 1 ESL of 260 mg/kg. The MRO concentration in this sample was also detected at 1,900 mg/kg in the surface sample. Elevated TPH concentrations at B45 are likely the result of oil and fuel leaks associated with the use of the parking lot.

- Elevated concentrations of arsenic exceeding the DTSC's established upper limit threshold of 12 mg/kg for Southern California soils (DTSC, 2007) were detected in the northern portion of the site and also south of the Cafeteria Building. Select samples around the West Building in the northeast portion of the site contained arsenic concentrations above the soluble threshold limit concentration (STLC) of 5 milligrams per liter (mg/l) and/or toxicity characteristic leaching procedure (TCLP) of 5 mg/l, which should be characterized and disposed as Resource Conservation and Recovery Act (RCRA)-hazardous material.

- Lead was detected in six soil samples above the DTSC screening level (SL) of 80 mg/kg, up to a maximum concentration of 360 mg/kg. The results of a 95% UCL calculation indicate that lead is not an environmental concern at the site, with the exception of a "hot spot" identified at the central portion of the site at 2.5 feet bgs, which should be characterized and disposed as hazardous material.

- PCE was detected in soil vapor samples in concentrations ranging between 16 and 91 micrograms per cubic meter (µg/m^3). Reported PCE concentrations exceeded the modified DTSC SL of 15.3 µg/m^3 (applying an attenuation factor of 0.03). Based on this, a Vapor Intrusion Risk Evaluation (VIRE) was conducted by Ninyo & Moore. The VIRE determined

that the probability of developing cancer as a result of exposures to indoor air at the site is less than 3E-07 for students and 2E-06 for school staff. These estimated cancer risks are below the known cancer risk for the United States population and are deemed acceptable by the DTSC.

The PEA recommended the following:

- Removal Action Workplan (RAW) be prepared detailing the proper management, characterization, and disposal requirements for subsurface structures and impacted soil, including the abandoned fuel line leading from East 49th Street to the former suspected heating oil tank, TPH DRO-impacted soil in the northern parking area, lead-impacted soil in the vicinity of boring B34, and arsenic-impacted soil in the northern portion of the site and south of the Cafeteria Building. SCAQMD Rule 1466 is not applicable to the remaining areas of the MMP limits that are outside the areas subject to the RAW.

4 NATURE, SOURCE, AND EXTENT OF CONTAMINATION

Summary of the nature, source, and extent of arsenic, lead, and TPH in soil is presented below.

4.1 Type, Source, and Location of Contaminants

The elevated arsenic concentrations in soil are located in the northern portion of the site, including around the northern and eastern edges of the West Building and north of the Administration/Library Classroom Building. Elevated arsenic concentrations were also detected south of the Cafeteria Building. The source of the arsenic-impacted soil may be the attributed to the historical use of arsenic-containing herbicides in open areas and the historical use of arsenic-based termiticides around building foundations.

The elevated lead concentrations in soil is located at a “hot spot” at the central portion of the site. The source of the lead-impacted soil may be attributed to use of artificial fill or from lead-based paint applied to the building materials of historical residential structures on the site.

Elevated concentrations of TPH were reported in one sample at a depth of 0.5 feet bgs, located in the asphalt paved parking lot in the northwest portion of the site. This may be attributed to oil leaks from vehicles.

Specific locations where arsenic, lead, and TPH-impacted soil were identified and delineated at the site is summarized in Ninyo & Moore’s PEA report (Ninyo & Moore, 2023). Tables and Figures from the PEA are presented in Appendix A.

4.2 Extent and Volume of Contamination

The lateral and vertical extents of the “hotspots” were established during the PEA based on results of subsequent step outs (in three to four primary directions) or step down sample results above 12 mg/kg, 80 mg/kg, and 260 for arsenic, lead, and TPH DRO respectively (Figure 2). Ninyo &

Moore estimated the volume of soil with elevated arsenic, lead, and TPH concentrations above respective RSLs, which are shown on Figure 3. The volume of soil with elevated concentrations of arsenic, lead, and TPH are presented in Table 2 and discussed in Section 7.3.2. The total volume of impacted soil is approximately 1,568 cubic yards. This volume assumes an expansion factor of 1.4x, since soil will expand from its original volume due to high compaction. The impacted soil weighs approximately 2,195 tons, using a conversion factor of 1.4 tons per cubic yard of soil.

4.3 Potential Health Effects of Arsenic

Potential exposure to arsenic in soil can affect receptors when airborne dust is inhaled, ingested, or by passing through the skin. Long term exposure to arsenic can damage many body organs, including the skin, gastrointestinal tract, lungs, heart, blood vessels, immune system, urinary system, reproductive organs and the nervous system. Symptoms may include headache, drowsiness, confusion, convulsions, sore throat, irritated lungs, ulceration of nasal septum, dermatitis, respiratory distress, vomiting, diarrhea, possible liver damage, muscular tremors, and reproduction damage. Exposure to arsenic can also cause hyperpigmentation of the skin (darkening) and the appearance of scaly skin on the palms and soles.

4.4 Potential Health Effects of Lead

Lead may be encountered as a contaminant of soil in locations near tanks and other process equipment as a result of painting operations. Lead may also be encountered as a result of spills or leakage of lead additives to motor fuels. Lead-based paint is a major source of lead at the site. Lead is a toxic heavy metal and a suspected carcinogen that may be encountered in inorganic or organic forms.

Heavy metals such as lead can affect the nervous system, gastrointestinal system, cardiovascular system, blood production, kidneys, and reproductive system. Symptoms of heavy metal toxicity include mental confusion, pain in muscles and joints, headaches, short-term memory loss, gastrointestinal upsets, food intolerances/allergies, vision problems, chronic fatigue, and others.

4.5 Potential Health Effects of TPH

TPH is a term used to describe a large family of several hundred chemical compounds that originally come from crude oil. TPH is a mixture of chemicals, but they are all made mainly from hydrocarbons. Some chemicals that may be found in TPH are hexane, jet fuels, mineral oils, benzene, toluene, xylenes, naphthalene, and fluorene, as well as other petroleum products and gasoline components. Some of the TPH compounds can affect your central nervous system. One compound can cause headaches and dizziness at high levels in the air. Another compound can cause a nerve disorder called "peripheral neuropathy," consisting of numbness in the feet and

legs. Other TPH compounds can cause effects on the blood, immune system, lungs, skin, and eyes.

Animal studies have shown effects on the lungs, central nervous system, liver, and kidney from exposure to TPH compounds. Some TPH compounds have also been shown to affect reproduction and the developing fetus in animals. The International Agency for Research on Cancer (IARC) has determined that one TPH compound (benzene) is carcinogenic to humans. IARC has determined that other TPH compounds (benzo[a]pyrene and gasoline) are probably and possibly carcinogenic to humans. Most of the other TPH compounds are considered not to be classifiable by IARC.

4.6 Exposure Pathways and Media of Concern

As discussed in the preceding sections, the site is developed as an elementary school and consists of vegetated planters, hardscape (concrete and asphalt pavements, sidewalk), and buildings. The receptor population includes school children, faculty, and staff.

In its current condition, soil impacted with arsenic, lead, and TPH lies underneath pavement, which therefore does not have a current exposure route to onsite receptors. However, during the implementation of the MMP, pavement will be demolished and underlying soils exposed for grading, thus necessitating the need for the proper handling of these soils to prevent potential exposures to onsite receptors, construction workers, and the general public.

A Conceptual Site Model describes potential chemical sources, release mechanisms, transport media, routes of environmental transport, exposure media, and potential human receptors. Exposure to chemicals can occur only if a complete pathway exists by which human receptors may be exposed to chemicals in soil, water, or air. For the arsenic, lead, and TPH concentrations found in shallow soil, the potentially complete exposure pathways could include dermal contact, dust inhalation, and incidental ingestion. The Conceptual Site Model is shown in Figure 4.

5 ENGINEERING EVALUATION/COST ANALYSIS (EE/CA)

The following discusses cost analysis information in more detail.

5.1 Removal Action Scope

The purpose of this section of the RAW is to identify and screen possible RA alternatives that achieve the RAO discussed in Section 1.2. The screening of remedial action alternatives was conducted in general accordance with the EPA Guidance on Conducting Non-Time-Critical Removal Actions under Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (EPA, 1993). The proposed RA will be conducted in accordance with protocols of

the CERCLA and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). Under 40 Code of Federal Regulations (CFR) 300.415 of the NCP, an EE/CA is required to address the implementability, effectiveness, and cost of a non-time-critical RA. This section was prepared, as part of the RAW developed for the site, to aid in the evaluation of remediation alternatives for the mitigation of arsenic, lead, and TPH impacted soil at the site, as such, were screened and evaluated on the basis of their effectiveness, implementability, and cost, as defined below.

- **Effectiveness** – This criterion focuses on the degree to which a remedial action reduces toxicity, mobility, and volume through treatment; minimizes residual risk and affords long-term protection; minimizes short-term impacts and how quickly it achieves protection.
- **Implementability** – Remedial actions are evaluated with respect to technical feasibility and applicability to site conditions. Some examples of this criterion include the ability to obtain necessary permits, regulatory approval of remedial actions, and availability of necessary equipment and skilled workers to implement the RA.
- **Cost** – This criterion relates to relative cost screening based on approximate capital and operation and maintenance (O&M) costs.

Following the initial screening, each remedial action alternative presented in this RAW is independently analyzed without consideration to the other alternatives. The analysis addresses the criteria listed below.

- **Short-term effectiveness** – This criterion evaluates the effects of the implementation of the remedial alternative during the construction and implementation phase through completion of remediation. It accounts for the protection of workers and the community during remedial activities and considers the environmental impacts resulting from implementing the action.
- **Long-term effectiveness and permanence** – This criterion addresses issues related to the management of residual risk remaining on site following implementation of a given remedial action. The primary focus is placed on the long-term controls that may be required to manage the risk posed by treating remaining residuals or by leaving untreated wastes on site.
- **Reduction of toxicity, mobility, or volume** – This criterion evaluates whether the remedial technology employed results in significant reduction in toxicity, mobility, or volume of the hazardous substances.
- **Implementability** – This criterion evaluates the technical and administrative feasibility of the alternatives, as well as the availability of the necessary equipment, material, and services to complete the RA. This includes the ability to construct and operate the alternative, ability to obtain services and equipment, ability to monitor the performance and effectiveness of technology, and the ability to obtain necessary approvals from oversight agencies.
- **Overall protection of human health and the environment** – This criterion evaluates whether the remedial alternative provides acceptable protection of human health and the environment.
- **Cost effectiveness** – This criterion includes both capital and O&M costs and is based on a variety of information. The actual costs will depend on true labor and material costs, competitive market conditions, the final project scope, and the implementation schedule.

5.2 Evaluation of Removal Action Alternatives

Three RA alternatives were evaluated for the arsenic-impacted soil at the site. These alternatives were evaluated using the criteria listed above. The three alternatives are:

- Alternative 1 – No Action
- Alternative 2 – Containment Through Surface Cap, and
- Alternative 3 – Excavation/Off-site Recycling or Disposal

A description and evaluation of each of the three RA alternatives is discussed in the following sections.

5.2.1 Alternative 1 – No Action

The no action alternative (Alternative 1) has been included to provide a baseline for comparison among other RAs. This alternative includes no institutional controls, no treatment of soil, and no monitoring.

Alternative 1 would not require the implementation of any removal measures at the site.

Since elevated arsenic, lead, and TPH concentrations are present in shallow soils under pavement, this alternative would not reduce the health risk to onsite receptors due to the exposure to soil unearthed from the MMP. In addition, as future construction work is proposed, workers and the public may be exposed to impacted soil during the MMP, making this alternative unacceptable. There is no cost associated with this alternative.

5.2.2 Alternative 2 – Containment through Surface Cap

Containment treatment as implemented at the site would consist of capping the surface of the impacted areas with an engineered soil cover and/or membrane. The cap would be used to minimize surface exposure. The following paragraphs present an evaluation of this alternative with respect to the feasibility criteria.

Short-term effectiveness – The containment alternative would involve some disturbance of the COPC-impacted soil during placement of the surface cap. Therefore, potential short-term risks to on-site workers, public health, and the environment could result from dust or particulates that may be generated during these activities. These risks could be mitigated using personal protective equipment for on-site workers and implementing engineering controls, such as dust suppression and additional traffic and equipment operating safety procedures, for protection of the surrounding community. The short-term risks associated with this alternative would be low.

Long-term effectiveness and permanence – The installation of a surface cap would require long-term inspection and maintenance. Periodic inspections for settlement, ponding of liquids, erosion, and naturally occurring invasion by deep-rooted vegetation or burrowing animals would be required. In addition, precautions would have to be taken to ensure that the integrity of the cap is not compromised by land-use activities. Based on these factors, the effort required to ensure long-term effectiveness is considered high.

Reduction of toxicity, mobility, or volume – Containment through surface capping would not lessen toxicity or volume of arsenic, lead, and TPH, but would limit mobility, specifically, accessibility to the contaminant. Proper maintenance of the cap would reduce accessibility to impacted soils.

Implementability – Containment is a relatively simple technology that is easily implemented and offers quick installation times. Because of the permanence of leaving the arsenic, lead, and TPH on the site, obtaining and renewing permits and regulatory approval may be difficult. Local land use restrictions would also be required to eliminate future disturbances of these areas during any school property redevelopment.

Overall protection of human health and the environment – The overall protection of human health is good, provided the long-term O&M is continued.

Cost effectiveness – Containment technologies are typically a low to moderate cost treatment group. A rough industry cost for containment can be approximately between $175,000 to $225,000 per acre for a soil and asphalt or concrete cap. The existing surface area that would need to be capped for the school site encompasses approximately 14,000 square feet, which will total $75,000. Additional costs of approximately $100,000 are estimated for preparation of engineering plans, preparation of the O&M Plan, and establishment and recording of land use restrictions. Additionally, the annual cap inspection for the next 20 years is estimated as $15,000 per year, or $300,000. A summary of the estimated costs to implement this alternative is presented in Table 3.

Because the arsenic, lead, and TPH-impacted soil would remain in place, it is likely that it would be necessary to restrict land use at the site through a land-use covenant (LUC).

5.2.3 Alternative 3 – Excavation/Off-site Recycling or Disposal

This alternative includes excavation and off-site recycling, reuse, or direct landfilling of soils containing concentrations of chemicals of concern above their respective CGs. The following areas were identified in the PEA as containing impacted soils that require removal:

- Area A: An estimated 487 cubic yards (682 tons) of arsenic-impacted soil would be excavated to depths ranging from surface to approximately 2 feet bgs.
- Area B: An estimated volume of 182 cubic yards (254 tons) of arsenic-impacted soil and soil surrounding the heating oil pipeline would be excavated to depths ranging from surface to approximately 5 feet bgs.
- Area C: An estimated volume of 78 cubic yards (109 tons) of arsenic-impacted soil would be excavated to depths ranging from surface to approximately 2 feet bgs.
- Area D: An estimated volume of 796 cubic yards (1,115 tons) of arsenic-impacted soil would be excavated to depths ranging from surface to approximately 2 feet bgs.
- Area E: An estimated 19 cubic yards (27 tons) of lead-impacted soil would be excavated to depths ranging from surface to approximately 5 feet bgs.
- Area F: An estimated 5 cubic yards (7 tons) of lead- and TPH-impacted soil would be excavated to depths ranging from surface to approximately 1 foot bgs.

Combining these areas, approximately 1,568 cubic yards (2,195 tons) of impacted soil will be excavated and removed from the site under this remedial method. Excavated soils would be stockpiled, loaded onto trucks, and transported to the appropriate approved receiving facility. If existing analytical data needs to be supplemented for waste characterization, soils would be sampled and analyzed to determine its classification as either non-hazardous or hazardous waste pursuant to EPA SW-846. Excavation and offsite disposal is an effective means of removing impacted soil and would allow the site's RAO to be met.

Long-term effectiveness and permanence – This alternative provides long-term effectiveness by permanently removing the impacted soils from the site.

Short-term effectiveness – This alternative would potentially cause temporary short-term impacts (including dust, noise, and traffic) to the local area. However, these impacts would be mitigated through control measures to an acceptable level. Even though there will be temporary neighborhood disruption during field activities from excavation noise and truck traffic, all field activities would be performed in accordance with applicable regulations, setting noise and traffic issues to acceptable levels. Public issues concerning this alternative would be addressed satisfactorily by the LAUSD and community acceptance is anticipated. thereby providing short-term effectiveness to this alternative upon completion

Reduction of toxicity, mobility, or volume – Because this alternative would remove impacted soils from the site, the accompanying mobility and volume would be reduced to zero by removing the impacted soils and eliminating the exposure pathway to onsite receptors.

Implementability – This alternative is technically and administratively feasible, and would be relatively easy to permit. All of the activities involved are well proven and straightforward including: soil sampling and analysis, excavation, potential temporary stockpiling, loading and transport, soil recycling, soil disposal, and preliminary rough grading. All activities would be conducted in accordance with local permits by properly licensed contractors and transporters, which would also achieve State and Federal acceptance.

Overall protection of human health and the environment – This alternative would remove impacted soils with the planned control measures of this RAW and protect human health and the environment. Soil removal activities would be conducted in accordance with applicable local permit requirements (if any) and the requirements of this RAW after its approval by LAUSD, thus complying with applicable or relevant and appropriate requirements (ARARs) (Section 7.0).

Cost effectiveness – One potential negative aspects of this alternative are its implementation cost, due primarily to high transportation and disposal costs. Please see Section 6.3 and Table 3 for a breakdown of the cost.

In summary, Alternative 3, Excavation/Off-site Recycling or Disposal is a proven, readily implementable remedial approach commonly used to address shallow soil contamination. The process is straightforward and the equipment and labor required to implement this alternative are simple and readily available. Based on the past success related to the excavation and offsite disposal of shallow soil contamination at other LAUSD school sites, it is anticipated that this approach would be acceptable to the community.

5.3 Costs of Removal Action Alternatives

The estimated cost for implementing each of the three RA alternatives is presented in Table 3.

There is no cost associated with Alternative 1 – No Action.

The estimated cost for Alternative 2 is $75,000 to cap the surface of the approximately 14,000 square feet area impacted by arsenic, lead, and TPH. This cost would be increased with additional site area that may need to be surface capped. Annual post-surface capping inspection and repair costs of $15,000 per year for 20 years, or $300,000. Additional costs will be required for project coordination and management (approximately $20,000), as well as for negotiations with the DTSC, preparation of engineering plans, preparation of the O&M Plan, and establishment and recording of land use restriction (approximately $150,000). Adding a 15% contingency, the total estimated cost for Alternative 2 - Containment through Surface Cap, is approximately $655,500.

The major cost components for implementing Alternative 3 -Excavation/Off-site Recycling or Disposal are soil excavation, soil loading, transportation, disposal, dust suppression, and backfilling with imported soil. No permits from the local agencies are expected to be needed to complete the excavation, transportation, and disposal of affected soil. The estimated project costs for Alternative 3 include the cost incurred by the environmental consultant to coordinate the work, oversee the excavation, conduct dust monitoring, complete the confirmation soil sampling, analyze samples at a laboratory, and prepare a Removal Action Completion Report (RACR). The estimated cost for the excavation, off-site disposal or recycling of the arsenic, lead, and TPH-impacted soils (2,195 tons) in Alternative 3 is approximately $243,000 or $110.70 per ton, which includes landfill disposal fees. A cost of $10,000 would also apply for backfilling and compaction activities. If alternative appropriate facilities are used with the approval of the LAUSD and DTSC, costs per ton may vary. This estimate assumes the excavated soil (arsenic, lead, and TPH-impacted) will be characterized as 95.6 percent non-hazardous impacted soil, 4.4 percent hazardous impacted soil. Additional costs of approximately $180,000 will be required for project coordination, excavation oversight, field supplies, air monitoring, confirmation sampling, waste profiling, laboratory services, reporting, and planning documents. Indirect costs include a $50/ton hazardous waste handling and disposal fee and ($5,898) and approximately $15,000 for licenses, permits, and supplies. Adding a 15% contingency, the total estimated cost for Alternative 3 with2,195 tons of arsenic, lead, and TPH-impacted soil for disposal is approximately $527,733 (Table 3).

5.4 Comparative Analysis of Removal Action Alternatives

A comparative analysis was conducted to identify the advantages and disadvantages of each RA alternative. The comparative analysis was conducted to address the criteria listed in the beginning of Section 6.0. Site-specific conditions used in the comparative analysis considered the time constraints imposed on each of the remedial alternatives due to the projected LAUSD construction schedule. The comparison of the three alternatives is the table below:

Remedial Alternatives Comparison

Assessment Criterion	Alternative 1	Alternative 2	Alternative 3
Long-term effectiveness	3	2	1
Short-term effectiveness	3	1	2
Reduction of toxicity, mobility, volume	3	2	1
Implementability	1	3	2
Protection of human health and environment	3	2	1
Cost Effectiveness	1	3	2
Total Rank:	**3**	**2**	**1**

Notes:
Each Alternative is assigned a ranking 1-3
Alternative 1 – No Action
Alternative 2 – Containment
Alternative 3 – Excavation & Offsite Disposal

5.5 Description of Selected Remedy

Alternative 3 – Excavation and Offsite Disposal is selected as the preferred alternative because it is easily implemented, cost-effective, and provides long-term assurance that future occupants of the site will not face significant health risks due to elevated levels of arsenic, lead, and TPH in soil. Additionally, this method will allow LAUSD to proceed with the MMP and other future developments as planned without disruption and without land use restrictions.

Soil excavation involves the use of conventional excavation equipment, such as backhoes, loaders, and dozers to remove the estimated 1,568 cubic yards (2,195 tons) of impacted soil from the site. Excavated soil is either directly loaded into staged trucks, or temporarily stockpiled on plastic sheeting next to the excavation areas until it is loaded out for offsite disposal.

The soils removed from the excavations are transported offsite to an appropriate, licensed facility for disposal. After completion of the soil RAs at each location, confirmation soil sampling are conducted along the excavation sidewalls and bottoms to verify that the CGs have been met. Imported soil that have been tested and certified to be clean, or soil from onsite borrow areas not impacted by the chemicals of concern, are used to backfill the excavations.

The cost to implement Alternative 3 (Excavation and Offsite Disposal) is estimated to be $437,000 as shown in Table 3. This cost estimate is based on the excavation, load-out, transport, and disposal of an estimated 1,568 cubic yards (2,195 tons) of impacted soil, after which the excavations will be backfilled and compacted with a similar volume of clean imported fill. Costs are also included for environmental management and oversight of the remedial activities.

6 APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS (ARARs)

Remedial actions selected under Federal, State, and local ARARs as required under Section 121(d) of the CERCLA must comply with ARARs under federal environmental law or, where more stringent than the federal requirements, state or local environmental or facility sitting law. Where a State is the delegated authority to enforce a federal statute, such as the Resource Conservation and Recovery Act (RCRA), the delegated portions of the statute are considered to be a federal ARAR unless the State law is broader or more stringent than the federal requirement.

ARARs are categorized as chemical-specific, location-specific, or action-specific. Chemical-specific ARARs are health- or risk-based cleanup standards or methodologies that, when applied to site-specific conditions, result in the development of cleanup standards for contaminants in environmental media. Location-specific ARARs are restrictions placed on the concentration of

hazardous substances or the conduct of activities because of the special location of the site, which have important geographical, biological, or cultural features. Examples of special locations include wetlands, flood plains, sensitive ecosystems, and seismically active areas. Action-specific ARARs are technology-based or activity-based requirements or limitations on actions taken to handle hazardous wastes. They are triggered by the particular remedial activities to accomplish a remedy.

6.1 Chemical-Specific ARARs

Chemical-specific ARARs are health- or risk-based numerical values or methodologies that, when applied to site-specific conditions, establish the allowable amount or concentration of a chemical that may be found in, or discharged to, the ambient environment. A summary of chemical-specific ARARs are provided below:

- The site CG of 12 mg/kg for arsenic in soils (DTSC Acceptable Southern California background).
- The site CG of 80 mg/kg for lead in soils (DTSC SL for residential soil).
- The site CG of 260 and 1,600 mg/kg for TPH DRO and MRO in soils (SFRWQCB Tier 1 ESLs).

The preferred remedial action will involve the generation of hazardous waste (e.g., excavation of impacted soil) during remediation activities. The federally authorized RCRA program implemented in the State of California requires that excavated wastes be characterized to determine if they are hazardous under RCRA's definition.

6.2 Location-Specific ARARs

Location-specific ARARs include restricted areas such as the vicinity of wetland, endangered species, or areas of historical or cultural significance. No location-specific ARARs were identified under regulatory agencies definition.

6.3 Action-Specific ARARs

Action-specific ARARs address requirements or limitations for treatment, transportation, and disposal of hazardous waste for remedial activities. These action-specific ARARs are triggered by the particular remedial activities conducted at the site. Remedial activities associated with the excavation have the potential to generate air contaminants, particulate matter, and hazardous waste. A summary of action-specific ARARs is provided below:

- **Health and Safety** - All contractors will be responsible for operating in accordance with the most current requirements of Title 8, California Code of Regulations, section 5192 (8 CCR 5192) and Title 29, Code of Federal Regulations, section 1910.120 (29 CFR 1910.120), Standards for Hazardous Waste Operations and Emergency Response (HAZWOPER). On-site personnel are responsible for operating in accordance with all applicable regulations of

the Occupational Safety and Health Administration (OSHA) outlined in 8 CCR General Industry and Construction Safety Orders and 29 CFR 1910 and 29 CFR 1926, Construction Industry Standards, as well as other applicable federal, state, and local laws and regulations. All personnel shall operate in compliance with all California OSHA requirements. To comply with 29 CFR 1910.120, a Site Specific Health and Safety Plan (HSP) should be prepared by the general contractor. The HSP will identify and describe potentially hazardous substances that may be encountered during remedial activities. The HSP will also prescribe the appropriate personal protective equipment for site conditions and activities, and lists procedures to undertake in the event of an emergency. All personnel will review the HSP prior to field work. Site safety briefings will be conducted daily prior to starting field work to identify potential physical and chemical hazards and to go over procedures to be taken in the event of an emergency. Personnel on site will be required to sign the HSP after each daily briefing.

- **Hazardous Waste** - Hazardous waste excavation activities are regulated by RCRA, CFR, Occupational Safety and Health Administration (OSHA), and California Code of Regulations, which evaluate if the waste generated during excavation activities is hazardous waste; management of hazardous wastes; transport of hazardous waste on highways and freeways; and health and safety issues for workers on- and off-site and the public. Hazardous waste is expected to be generated. Soils to be excavated have been characterized as either RCRA-hazardous, California hazardous, or non-hazardous depending on location.

- **Air Monitoring** - The South Coast Air Quality Management District (SCAQMD) governs air emissions within the Los Angeles Basin. The site is located within the jurisdiction of SCAQMD. The SCAQMD has three rules that address excavation (Rules 1150, 1166, and 1466), and one that addresses fugitive dust (Rule 403). Rule 1150 applies to the excavation of sanitary landfills and does not apply to this project. Rule 1166 applies “Volatile Organic Compound Emissions from Decontamination of Soil” to the excavation of soils containing VOCs and does not apply to this RAW. Rule 1466 “Control of Particulate Emissions from Soils with Toxic Air Contaminants” applies to the excavation of soils containing arsenic and lead and does apply to this RAW. Several elements of Rule 1466, such as school-related protocols for soil excavation schedules and soil excavation handling, have been incorporated into this RAW. Excavation, loading, and transport of impacted soils will be in compliance with Rule 1466 measures to conduct activities when school is not in session and to handle lead-impacted soils by removing lead or arsenic-impacted soils from the site within five days of excavation. Several elements of Rule 403, such as protocols for mitigation of potential fugitive dust emissions, have been incorporated into this RAW, and are included in Appendix B.

- **Storm Water** - SWRCB regulates storm water runoff for projects disturbing more than one acre of soil. However, since less than one acre of soil will be disturbed, a storm water pollution prevention plan is not required for the RAW implementation.

7 REMOVAL ACTION IMPLEMENTATION

This section describes the field procedures and the methods expected to be used to implement the RA:

7.1 Site Preparation and Security Measures

The following control measures will be implemented during field activities during RA implementation.

7.1.1 Delineation of Excavation Areas

The excavation areas are shown in Figures 3 and 5 through 7. The excavation boundaries will be marked with flags or spray paint prior to initiating excavation. The site will be enclosed

by a fence to protect workers and the public. At least 5 days prior to the start of excavation, a Start Work Notice will be submitted to the adjacent residences and businesses.

7.1.2 Utility Clearance

Prior to commencing excavation activities, Underground Service Alert (USA) will be contacted at least 48 hours in advance to identify the location of utilities that enter the property. Proposed excavation areas will be clearly marked with white paint or surveyors flagging as required by USA. USA will contact member utility owners of record within the site vicinity and notify them of the intent to excavate. Utility owners of record will be expected to clearly mark the position of their utilities on the ground surface throughout the designated area. The contractor will be responsible for protecting existing utilities.

7.1.3 Security Measures

Appropriate barriers and/or privacy fencing should be installed prior to beginning the excavation process to ensure that work areas are secure and safe and that trespassers or unauthorized personnel are not allowed on site. Security measures may include, but are not limited to the following.

- Posting notices directing visitors to the Site Manager.
- Maintaining a visitor's log. Visitors must have prior approval from the Site Manager to enter the site. In addition, visitors will not be permitted to enter the site without first receiving site-specific health and safety training from the Site Safety Manager.
- Installing barrier fencing to restrict access to sensitive areas such as exclusion zones.
- Providing adequate site security to ensure that unauthorized personnel do not have access to work areas and/or excavated materials.
- Before leaving the site, all personnel must sign out in the visitors' log.
- Maintaining a safe and secure work area, including areas where equipment is stored or placed, at the close of each workday.
- A visual plastic barrier should be installed along the fence.
- Persons requesting site access will be required to demonstrate a valid purpose for access and provide appropriate documentation to demonstrate they have received proper training. After work hours, access to the site will be controlled by the perimeter fence and a locked gate.

7.1.4 Contaminant Control

It is anticipated that excavated material generated from the shallow excavations will either be immediately loaded onto trucks and hauled off site or temporarily stockpiled. In the event of

stockpiling, heavy tarpaulins or plastic sheeting will be used to separate stockpiles or impacted soil from the ground during excavation activities. As a precautionary measure to avoid fugitive dust from stockpiled soil, a reasonable effort will be made to ensure that stockpiles do not exceed the height of the fence line or greater than 10 feet. Stockpiles will be covered or kept moist during non-work hours or overnight to minimize the potential for fugitive dust. Contaminant control measures are not required because the COPCs in the soil are not expected to migrate. However, the COPCs in dust during excavation activities is a potential contamination migration route. This potential concern will be controlled by dust mitigation measures described in the Air Monitoring Plan (Appendix B). Additionally, an air monitoring station will be placed on site, and careful visual monitoring will be conducted to ensure dust suppression techniques are effective in minimizing dust from traveling off site during excavation and loading. Due to the small area of disturbance for on-site soil removal (less than one acre), a storm water pollution prevention plan will not be prepared. However, Best Management Practices will be implemented to minimize transportation of soil off site due to storm water runoff.

7.1.5 Permits and Plans

No permits for grading from City of Los Angeles, Division of Public Works are required for this LAUSD soil RA. No specific air or other permitting requirements have been identified for the proposed RA activities at this time.

7.1.6 Demolition of Pavements

The excavation areas are mostly paved. Prior to excavating the arsenic, lead, and TPH-impacted soil, the concrete or the asphalt pavement in the excavation areas will be carefully removed and separately stockpiled for disposal, so as not to disturb the surrounding soil. The demolition of overlying pavement is planned to expose the impacted soil for excavation.

7.2 Field Documentation

The following paragraphs discuss the field documentation procedures for this work.

7.2.1 Field Logbooks

Field activity logs will document where, when, how, and from whom project information was obtained. Log entries will be complete and accurate enough to permit reconstruction of field activities. Each page will be consecutively numbered, dated, and noted with the time of entry. Entries will be legible, written in ink, and signed by the individual making the entries. Language will be factual, objective, and free of personal opinions or other terminology which might prove inappropriate. If an error is made, a line will be made through the error and the

correct information will be entered. Corrections will be dated and initialed. No entries will be obliterated or rendered unreadable.

7.2.2 Chain-of-Custody Records

Chain-of-custody (COC) records are used to document sample collection and shipment to laboratory(ies) for analyses. Sample shipments for analyses will be accompanied by a COC record. Form(s) will be completed and transported with the samples for each laboratory and each shipment. If multiple coolers are transported to a single laboratory on a single day, COC form(s) will be completed and transported with the samples for each cooler. The COC record will identify the contents of each shipment and maintain the custodial integrity of the samples. Generally, a sample is considered to be in someone's custody if it is either in someone's physical possession, in someone's view, locked up, or kept in a secured area that is restricted to authorized personnel. Until receipt by the laboratory, the custody of the samples will be the responsibility of the sample collector.

7.2.3 Photographs

Photographs will be taken at selected excavation locations and at other areas of interest on the site. They will serve to complement information entered in the field activity logbooks. When a photograph is taken, the following information will be written in the activity logbooks, or will be recorded in a separate field photography log.

- Time, date, location, direction, and if appropriate, weather conditions.
- Description of the subject photographed.
- Name of person taking the photograph.

7.3 Excavation

The following paragraphs describe the procedures during soil excavation at the site.

7.3.1 Proposed Excavation Plan

The summary table below presents the 6 excavation areas (Areas A-F), including their corresponding COPC, surface area, depth, estimated volume, and estimated weight of each excavation. Area B has been split into two subareas, one for the removal of RCRA-hazardous arsenic-impacted soil and one for the removal of the abandoned product line. The total volume of impacted soil to be excavated and removed from the site is approximately 1,568 cubic yards. This estimated volume assumes an expansion factor of 1.4x, since soil will expand from its original volume due to high compaction. The impacted soil weighs approximately 2,195 tons, using a conversion factor of 1.4 tons per cubic yard of soil.

RAW Soil Excavation Area Summary						
Excavation Area	COPC	Soil Classification	Excavation Surface Area (ft^2)	Depth of Excavation (ft bgs)	Volume of Excavation (yd^3)	Excavation Weight (Tons)
Area A	Arsenic	Non-hazardous	4,700	2.0	487	682
Area B	Arsenic	RCRA-hazardous	250	5.0	64.8	90.7
Area B*	TPH	Non-hazardous	450	5.0	116.7	163
Area C	Arsenic	Non-hazardous	750	2.0	77.8	108.9
Area D	Arsenic	Non-hazardous	7,680	2.0	796	1115
Area E	Lead	California-hazardous	75	5.0	19.4	27.2
Area F	TPH	Non-hazardous	100	1.0	5.2	7.3
Total Volume/Weight of RCRA-Hazardous Soil					65	91
Total Volume/Weight of California Hazardous					19.4	27.2
Total Volume/Weight of Non-Hazardous Soil					1,483.5	2077
Total					1,568	2,195

Notes:
* The eastern portion of Area B is designated for the excavation and removal of the former product line
bgs – below ground surface
COPC – contaminant of potential concern
ft – feet
ft^2 – square feet
ft^3 – cubic feet
RCRA – Resource Conservation and Recovery Act
TPH – total petroleum hydrocarbons
yd^3 – cubic yard

Excavation and removal of impacted soil will be performed in stages due to site area constraints. Soil will be removed to the lateral and vertical extents shown on Figure 3, and Figures 5 through 7 using a backhoe, rubber-tired front-end loader, excavator, and/or shovels. Excavations Areas A through F will be excavated to depths ranging between 1 and 5 feet bgs, depending on the vertical extents of known contamination (Table 2). Additional excavation may be necessary based on the results of confirmation sampling as discussed in Section 8. If excavation depth exceeds approximately 4 feet bgs, a 1:1 or flatter slope will be maintained during the excavation. No shoring is anticipated.

As the proposed vertical limits of excavation are reached, confirmation soil samples will be collected and submitted to the laboratory for analysis of arsenic, lead, or TPH to guide the removals. The confirmation sampling procedure is described in Section 8. At the end of each work day, excavated areas will be secured with fencing, delineators, and caution tape to minimize the occurrence of accidents or unauthorized entry.

7.3.2 Temporary Stockpile Operations

Site stockpile management activities will consist of oversight and direction of stockpile segregation into three main categories:

- Non-Hazardous Waste – Disposed of at a Class III Landfill.

- Total Arsenic > 12 mg/kg and <500 mg/l, STLC<5 mg/l, and TCLP<5 mg/l, or
- Total Lead > 80 mg/kg and <1,000 mg/kg, STLC<5 mg/l, and TCLP<5 mg/l

- Non-RCRA Hazardous Waste (California Hazardous Waste) – Disposed of at a Class I Landfill.
  - Total Arsenic > 500 mg/kg or STLC>5 mg/l and TCLP<5 mg/l, or
  - Total Lead > 1,000 mg/kg or STLC>5 mg/l and TCLP<5 mg/l
- RCRA-Hazardous Waste – Disposed of at a Class I Landfill that can specifically handle RCRA-hazardous waste
  - Arsenic TCLP >5 mg/l
  - Lead TCLP >5 mg/l

Based on the results of environmental investigations at the site, RCRA Hazardous Waste is expected to be encountered in Excavation Area B, and California Hazardous Waste is expected to be encountered in Excavation Area E (see Table 2). Most soil generated during the implementation of the RAW will be Non-Hazardous Waste that will be disposed of at a Class III Landfill. Soils will be segregated so that there will be no mixing of soils between excavation areas.

Soil will be initially profiled and segregated into stockpiles based on XRF readings of total arsenic and lead. Once stockpiles have been generated and segregated, waste characterizations samples will be collected and sent to a fixed-base laboratory for analysis of VOCs, TPH, and Title 22 Metals by EPA Methods 8260B, 8015B, and 6010B. Waste characterization samples of stockpiles will be collected at a frequency of approximately one sample per excavation area. Arsenic and/or lead STLC and TCLP will also be analyzed in stockpile soil samples based on XRF readings and known hot spots (i.e. if arsenic concentrations are greater than 20 times the STLC/TCLP limit of 5 mg/l). Soil stockpiles will be placed on plastic sheeting, covered, and clearly labeled on site with colored flags designating Non-Hazardous Waste for disposal, or California Hazardous Waste for disposal. Daily inspection of the stockpiles will be performed. Stockpiles cannot be greater than 400 cubic yards or higher than the perimeter fencing in accordance with SCAQMD Rule 1466.

The soil staging process will be conducted in a manner to minimize the generation of dust. At the staging areas, excavated soil will be placed on an impermeable barrier base (e.g., plastic sheeting) and at the end of each day, covered with tarps or other proper materials (e.g., plastic sheeting) to prevent any storm water run-on and/or dust generation. If significant rainfall is anticipated, the staging areas will be bermed to contain any runoff. When possible,

excavated soil may be placed in covered roll-off bins or drums, or may be loaded onto transportation trucks. In no case will the waste storage be longer than five days after its generation, in accordance with SCAQMD Rule 1466. Direct loading will take place concurrently with excavation operations, with access of loaders to the stockpile from outside of the excavation areas, while excavation operations deposit impacted soil from the excavation areas to the staging areas.

7.3.3 Decontamination Area

Vehicles, excavation, and hand-held equipment will be decontaminated prior to leaving the site. A decontamination area will be prepared on site prior to impacted-soil excavation. This area will be designed to contain liquids and residue generated during the decontamination process. The decontamination area will be in an area easily accessible to incoming and outgoing vehicles and equipment, and will include methods for removing soil from vehicle tires. In addition, personnel overseeing decontamination procedures will be responsible for ensuring soil is not tracked off site. Materials removed from impacted equipment and rinsate collected during decontamination of impacted equipment will be containerized and stored on site pending profiling and disposal. After decontamination, the equipment will be visually inspected for signs of residue. Decontamination rinsate will be appropriately disposed of upon receipt of laboratory profiling data.

7.3.4 Confined Space Entry Requirements

Confined space entry permitting is not required for the removal activities at the site.

7.4 Air / Meteorological Monitoring & Dust Control

An Air Monitoring Plan that identifies methods to properly monitor and mitigate the amount of fugitive dust in the ambient air resulting from project-related soil removal activities is presented in Appendix B. The Air Monitoring Plan sets forth the required measures that the construction contractor will implement during remediation and how those measures will be implemented during remediation in accordance with SCAQMD Rules 403 and 1466. These protocols will be implemented in order to protect the community and ensure that site workers react quickly to make appropriate changes to emission control measures, as needed.

7.5 Transportation Plan for Off-Site Disposal

A transportation plan indicating how the excavated soil will be hauled off from the site, describing truck routes for off-site disposal, and listing the frequency of truck trips and any holding areas at the site should be prepared by the remedial contractor or consultant. The plan should be prepared in general accordance with the DTSC's Transportation Plan, Preparation Guidance for Site

Remediation (DTSC, 1994) and should identify entrance and exit gates, truck routes, truck and heavy equipment decontamination area, truck inspection/check point, and personnel and small equipment decontamination areas. Areas of the site outside of the decontamination areas may be used for truck staging and loading. All truckloads will be documented by the appropriate hazardous or non-hazardous bill of lading waste manifest.

Prior to the start of field work, the relevant agencies will be contacted regarding potential road construction. If there is impact from road construction along the planned truck route, then the transportation plan should have an alternative route. Dust mitigation measures will be implemented at the on-site truck routes in accordance with the Air Monitoring Plan in Appendix B.

7.6 Site Restoration

Upon completion of the removal of impacted soils and confirmation sampling, the excavation areas will be redeveloped as part of the MMP, which may include further excavation, backfilling, grading, and/or repaving. Since the area of disturbance is less than one acre, a Storm Water Pollution Prevention Plan is not necessary for the RAW implementation. If weather conditions prevent immediate restoration of the excavation areas, erosion controls will be established as necessary.

8 CONFIRMATION SAMPLING AND IMPORT SOIL EVALUATION

8.1 Confirmation Sampling and Analyses

Following the RA, soil samples will be collected and analyzed from the bottom and sidewalls of the excavation to evaluate if the excavation extended a sufficient distance laterally and vertically to remove the soil that exceeds the CG for the chemicals of concern. Confirmation soil sample locations will be determined in the field, as the excavation progresses and based on observations made in the field.

As discussed in Section 5.2, the extents of the proposed soil excavations are shown in Figure 3. Excavation depths will vary from approximately 0.5 to 5 feet bgs depending on the depth to which arsenic, lead, or TPH were detected above CGs.

Confirmation soil samples will be collected on a systematic basis from the nodes of a generally square grid with a spacing of approximately 20 feet. In areas where the excavation sidewalls are approximately 4 feet bgs or deeper, two sidewall samples will be collected at the indicated 20-foot grid node. A minimum of one sidewall sample collected from each excavation sidewall. Bottom floor samples will be collected at the rate of one sample for each 400 square feet of excavation area at the midpoint of each interval, and at a minimum of one sample per excavation bottom. For

the planned excavation, approximately 111 confirmation samples will be collected from the bottom and sidewalls at the locations and depths shown on Figures 5 through 7, and in Table 4.

Samples will be collected using a clean trowel or plastic disposal trowels and transferred directly into glass jars. Upon retrieval, the samples will be capped, labeled, placed in individual zip-lock bags and placed in an ice-cooled chest pending delivery to a State-certified laboratory for chemical analyses under proper chain-of-custody documentation. These samples will be analyzed for arsenic, lead, or TPH in general accordance with EPA Methods 6010B (arsenic and lead), and 8015B (TPH). If the results of these samples exceed respective CGs, then additional excavation will be performed within the excavation area until the impacted soil is removed from the site. Confirmation soil sampling, analysis, and evaluation will be repeated, as previously described, within any resulting excavation. The excavation will be considered complete if the concentrations detected in the confirmation samples are less than CGs.

8.2 Borrow Source Evaluation

Clean fill material will be imported to the site to backfill excavations and grade the site. The amount of clean fill material to be imported to the site will depend on the final extent of excavation and the quantity of stockpiled soil which is determined to be suitable for re-use as backfill material on site. Any soil imported to the Site will be tested and certified in accordance with LAUSD Section 01 4524 specifications – “Environmental Import/Export Materials Testing” (August 2018). The contractor will be responsible for providing documentation of the source of clean fill material and will be responsible for performing or providing documentation of the required geotechnical and environmental analysis of the clean import fill material.

9 PUBLIC PARTICIPATION

To fulfill the requirements of public participation for the RAW process, a project spokesperson will be designated. The spokesperson will coordinate news releases, notify affected citizens, establish an administrative record (as defined in the NCP 300.820) and notify the public of the Administrative Record. A mailing list will be generated (for properties within a ¼-mile radius of the site) and a key contacts list (local elected representatives, school officials, and local organizations) will be created. A community survey, mailing list, and key contact list will be submitted to the LAUSD for review and approval.

A public notice will be published in local newspapers (including one in Spanish, if available) informing the community of this proposed RAW and for public inspection at established Information Repositories, which are listed below.

- LAUSD Office of Environmental Health and Safety located at 333 S. Beaudry Avenue, 21st Floor, Los Angeles, CA 90017.
- 49th Street Elementary School located at 750 East 49th Street, Los Angeles, CA 90017.
- Junipero Serra Branch Library, 4607 South Main Street, Los Angeles, CA 90037

Copies of this RAW will be placed in the Information Repositories for access by community members.

The date and location, if required, of the public meeting will be indicated in the public notice. A 30-day public comment period will be held to accept public comments on the proposed RA. Following the public meeting, and at the close of the public comment period, LAUSD will evaluate the comments and make appropriate revisions and finalize the RAW.

Prior to RAW implementation, a notice of field work will be prepared and posted at perimeter site locations, and distributed by the LAUSD five days prior to the start of RAW field activities. The work notice will be distributed to 49th Street Elementary School students, staff and faculty, and nearby residents and businesses (i.e., within line-of-sight). The notice will also be laminated and posted along the fence line of the project. In addition, field notices will be mailed to the elected officials in order to keep them informed about their neighborhood school. The public notice will provide a general description of the fieldwork, along with the telephone number of the LAUSD Project Manager for further information.

10 PROJECT SCHEDULE AND REPORTING

An anticipated tentative schedule for RAW implementation is shown below. Proposed work will be completed during weekends or holidays, when school is not in session.

Task	Calendar Days to Complete	Tentative Start Date
Field Preparation	5 days	June 2024
RAW implementation and Confirmation Sampling.	20 days	July 2024
Preparation of Draft RACR	20 days	August 2024

Following completion of the RA, a RACR will be prepared and submitted to the LAUSD for review and approval. The RACR will include a summary of the RA field activities and the following items:

- Site plan, soil excavation extents and confirmation sample location map;
- Tabulated analytical results;
- Air monitoring results;

- Certified analytical laboratory reports;
- Copies of the waste manifests.

Notes:
-- - not applicable
* - non-cancer endpoint
[1] - Two co-located samples were collected with corresponding ID of B34-2.5 due to refusal encountered in the original boring B34 on February 20, 2023. The report text refers to the second B34 sample collected on April 5, 2023
bold indicates exceedance of regulatory screening level(s) **and applicable screening levels (CGs)**
CGs - cleanup goals
DROs - diesel range organics
DTSC Acceptable Clean Up Levels- DTSC's Determination of a Southern California Regional Background Arsenic concentrations in soil (March 2008)
DTSC HERO HHRA - Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment, Note 3, Recommended Screening Levels for Soil (June 2020)
EPA - United States Environmental Protection Agency
ID - Identification
mg/kg - milligrams per kilogram
mg/l - milligrams per liter
MROs - motor oil range organics
NA - not analyzed
ND< - not detected above the laboratory reporting limit
NL - not listed
RSLs - United States Environmental Protection Agency Regional Screening Levels (May 2023)
STLC - soluble threshold limit concentration
TCLP - toxicity characteristic leaching procedure
TPH - total petroleum hydrocarbons
TTLC - total threshold limit concentration
µg/kg - micrograms per kilogram

Table 2 – Soil Excavation Areas and Estimated Volume/Weight

Excavation Area	PEA Borings with As > 12 mg/kg	PEA Borings with Pb > 80 mg/kg	PEA Borings with TPH> 260 mg/kg	PEA Maximum COC Concentration (mg/kg) / (Sample ID)	Soil Classification	Length (ft)	Width (ft)	Excavation Surface Area (ft^2)[a]	Depth of Excavation (ft bgs)	Volume of Excavation* (ft^3)[1]	Volume of Excavation (yd^3)	Excavation Weight (Tons)[2]
Area A	B3, B22, B42A	--	--	64 (B22-0.5)	Non-hazardous	148	30	4,700	2.0	13,160	487	682

Area E	--	B34, B34-NE, B34-	--	360 (B34-NE-2.5)	California-hazardous	15	10	75	5.0	525	19.4	27.2
Area F	--	B45	B45	Pb: 200 (B45-0.5) TPH: 490 (B45-0.5)	Non-hazardous	10	10	100	1.0	140	5.2	7.3
									Total Volume/Weight of As-Impacted Soil	38,514	1,426	1,997
									Total Volume/Weight of Pb-Impacted Soil	525	19.4	27.2
									Total Volume/Weight of TPH-Impacted or Product Line Soil	3,290	121.9	171
									Total	42,329	1,568	2,195

Notes:

* - The eastern portion of Area B is designated for the excavation and removal of the former product line

[a] - Some removal areas are not rectangular, so various formulas are used to calculate surface area. Lengths and widths for some removal areas are estimated measurements between edges of overall removal shape.

[1] - sloughing factor of 1.4x used to estimate total volume of soil.

[2] - conversion factor of 1.4x from cubic yards to tons used

As of 12 mg/kg- DTSC's Determination of a Southern California Regional Background Arsenic concentrations in soil (March 2008)

Pb of 80 mg/kg - DTSC HERO HHRA Screening Level for Residential Soil (DTSC, 2020)

TPH DRO of 260 mg/kg - SFRWQCB Tier 1 ESL for Diesel (SFRWQCB, 2019)

-- - not applicable

As - arsenic

bgs - below ground surface

COC - Constituent of Concern

DRO - diesel range organics

DTSC - Department of Toxic Substances Control

DTSC HERO HHRA - Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment

ft - feet

ft^2 - square feet

ft^3 - cubic feet

mg/kg - milligrams per kilogram

N/A - not applicable

Pb - lead

PEA - Preliminary Environmental Assessment

RAW - removal action work plan

RCRA - Resource Conservation and Recovery Act

SFRWQCB - San Francisco Regional Water Quality Control Board

TPH - total petroleum hydrocarbons

yd^3 - cubic yard

Table 3 – Remedial Alternative Cost Comparison

Task	Remedial Alternatives*		
	Alternative 1	Alternative 2	Alternative 3
Depth of Excavation	0	0	Up to 5 feet bgs
Volume of Soil to be Transported (cubic yards)	0	0	1,568
Direct Costs			
Excavation, Transportation, Disposal, and Dust Suppression	$0	$0	$243,000
Soil Capping	$0	$75,000	$15,000
Oversight, Planning, and Maintenance Costs			
Project Coordination	$0	$20,000	$30,000
Field Sampling Layout and Excavation Boundary Markout	$0	$0	$5,000
Excavation Oversight and Air Monitoring	$0	$0	$50,000
Confirmation Soil Sampling and Waste Characterization Analysis	$0	$0	$20,000
Annual Cap Inspection (20 years)	$0	$300,000	$0
Removal Action Completion Report	$0	$0	$25,000
Public Participation Activities	$0	$0	$20,000
Engineering and O&M Plans, Land Use Restrictions, Stormwater Pollution Prevention Plan	$0	$150,000	$30,000
Indirect Costs			
Hazardous Waste Generator and Handling Fee	$0	$0	$5,898
Licenses, Permits, and Supplies	$0	$25,000	$15,000
Total Cost Before Contingency	$0	$570,000	$458,898
Contingency (15%)	$0	$85,500	$68,835
Total	**$0**	**$655,500**	**$527,733**

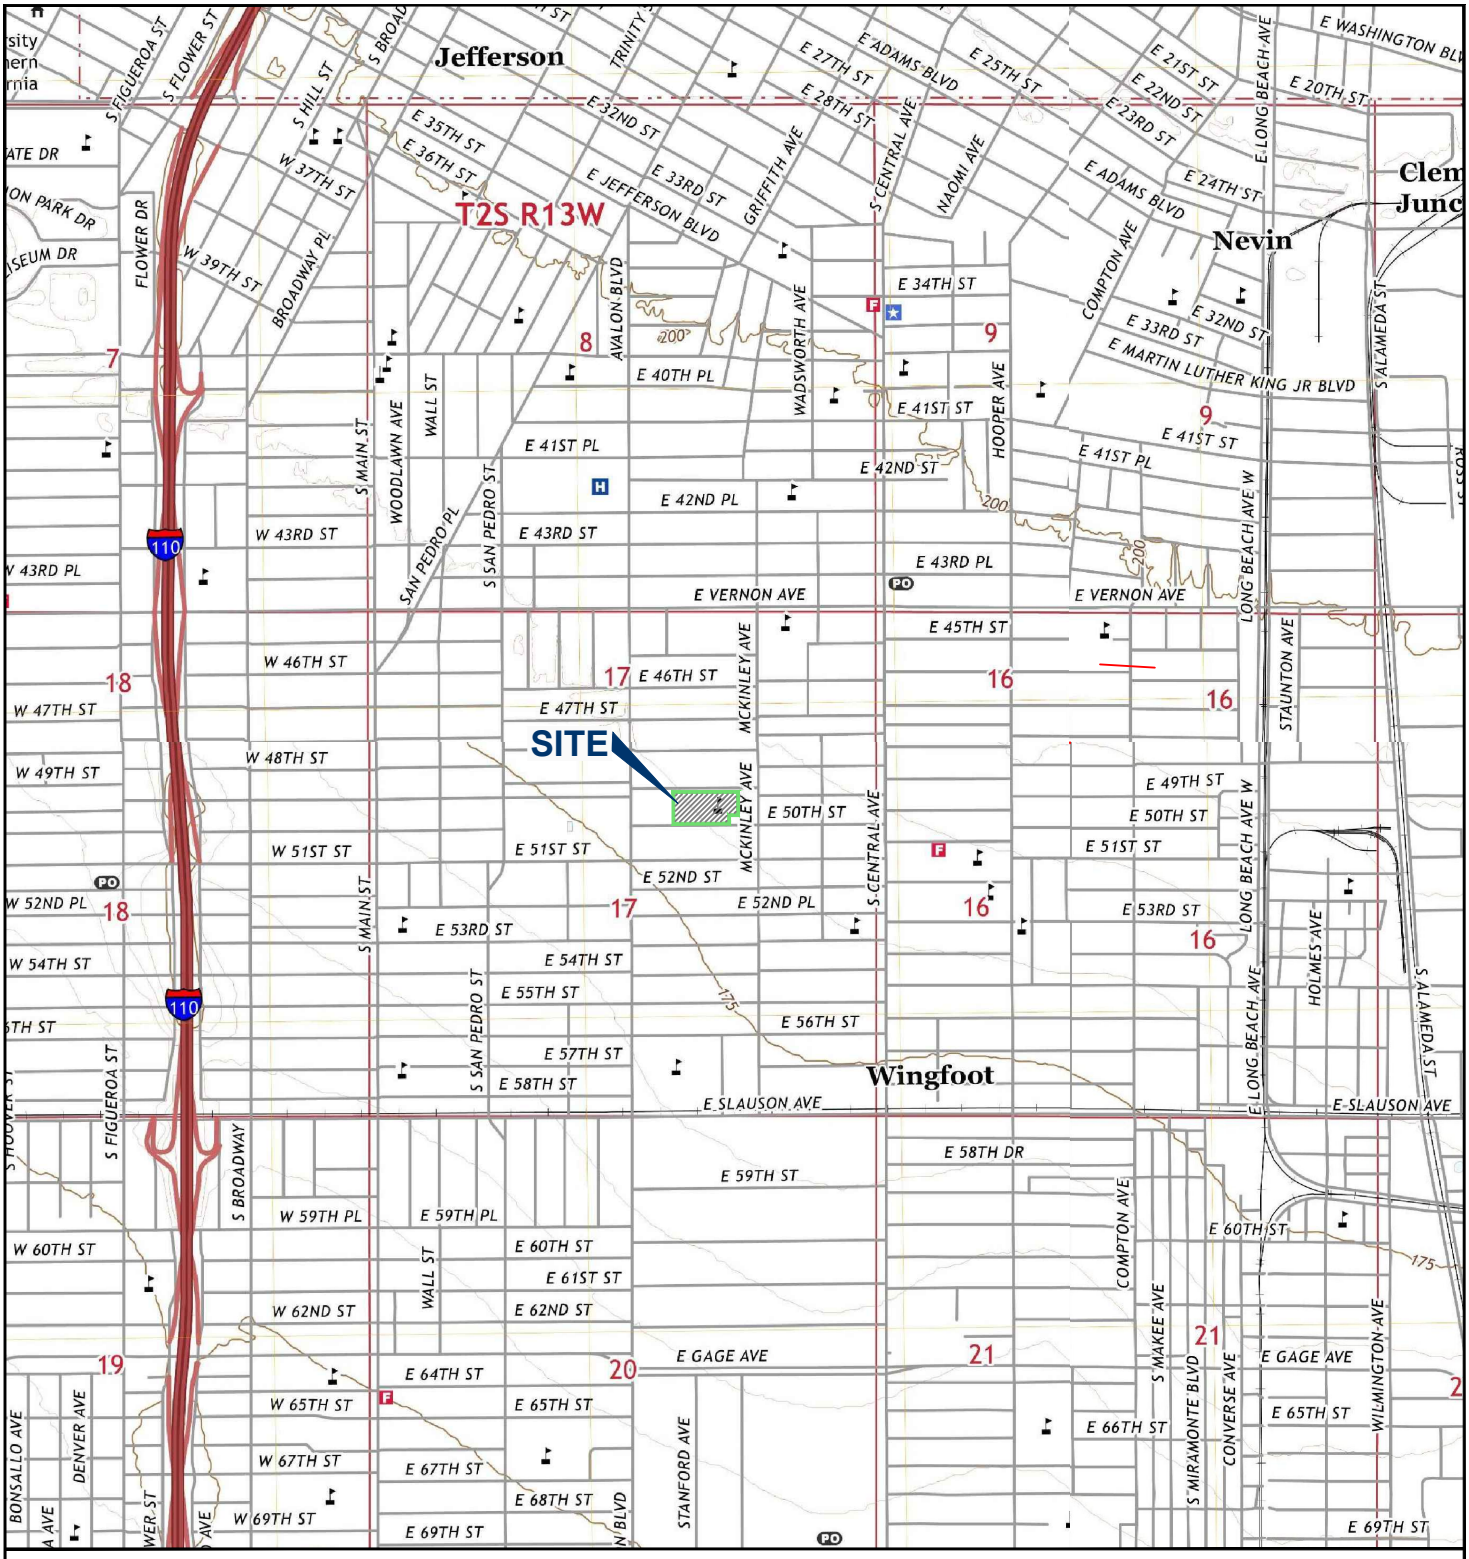
Notes:

* Alternative 1 - No Action.

* Alternative 2 - Containment Through Surface Cap.

* Alternative 3 - Excavation and Off-site Recycling or Disposal.

bgs - below ground surface



O&M - Operation and Maintenance

Table 4 – Proposed RAW Soil Confirmation Sampling Program

Excavation Area	No. of Confirmation Samples (Estimated)	Depth of Bottom Samples (ft. bgs)	Depth of Sidewall Samples (ft. bgs)	Laboratory Analytical Method(s)
Area A	36	2.5	1	Arsenic by EPA Method 6010B
Area B	8	5	2, 4	Arsenic by EPA Method 6010B
Area B	7	5	--*	TPH by EPA Method 8015B
Area C	8	2.5	1	Arsenic by EPA Method 6010B
Area D	40	2.5	1	Arsenic by EPA Method 6010B
Area E	7	5	2, 4	Lead by EPA Method 6010B
Area F	5	1	0.5	TPH by EPA Method 8015B
Total No. of confirmation samples = 111				

Notes:
ft bgs - feet below ground surface
Depth of excavation sidewalls are approximate
EPA - United States Environmental Protection Agency
No. - number
RAW - removal action workplan
* - sidewall samples will not be collected for removal of the former oil pipeline in Area B, but may be gathered from excavation bottom as needed.

APPENDIX B

Air Monitoring Plan

APPENDIX B

Air Monitoring Plan

Introduction

This Air Monitoring Plan for the 49th Street Elementary School RAW reports methods to mitigate the amount of fugitive dust in the ambient air resulting from project-related construction activities. This Plan complies with the regulations for controlling fugitive dust emissions as specified in:

- South Coast Air Quality Management District (SCAQMD) Rule 403 for Fugitive Dust
- SCAQMD Rule 1466 for Control of Particulate Emissions from Soils with Toxic Air Contaminants

The Plan sets forth the required measures that the construction contractor will implement during remediation and how those measures will be implemented during remediation in accordance with SCAQMD Rules 403 and 1466. Implementation of available fugitive dust control measures will help reduce the total airborne suspended particulate matter generated by construction activities, thus reducing fugitive dust emissions. The scope of this Plan will be revised to reflect changes in fugitive dust control strategy as site conditions or activities may change in the future.

Potential Dust Sources

Based on our understanding and review of the project description, the following potential fugitive dust sources may exist for this project:

- Site grading and other miscellaneous construction activities during demolition and reconstruction phases;
- Vehicles and equipment driving on paved roads during construction and operations;
- Vehicles and equipment driving on unpaved areas during construction and operations;
- Aggregate and soil loading and unloading operations;
- Wind erosion of areas disturbed during construction activities; and/or
- Significant wind action on unprotected spoil piles or topsoil storage areas.

Impacted soils will be removed using heavy earth-moving equipment and may involve the use of a backhoe, rubber-tired, front-end loader, and/or excavator.

Applicable Dust Control Requirements

The SCAQMD is responsible for planning, implementing, and enforcing federal and state ambient air standards within its district boundary. SCAQMD Rule 403 was adopted on May 7, 1976 with several amendments from 1992 to 2005. Fugitive dust contains varying sizes of respirable particulate matter including those with an aerodynamic diameter of 10 micrometers or less (PM_{10}). The purpose of Rule 403 is to prevent, reduce, and mitigate ambient concentrations of anthropogenic fugitive dust emissions to an amount sufficient to attain and maintain the National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS).

SCAQMD Rule 1466 was adopted on July 7, 2017 and amended on December 1, 2017. The purpose of Rule 1466 is to minimize the amount of off-site fugitive dust emissions containing toxic air contaminants by reducing particulate emissions in the ambient air as a result of earth-moving activities, including: excavating, grading, handling, treating, stockpiling, transferring, and removing soil that contains applicable toxic air contaminants from sites that meet applicability requirements.

Meteorological Monitoring

On-site ambient weather conditions (wind speed and direction, and relative humidity) will be monitored by an on-site meteorological station. On-site meteorological monitoring will be performed simultaneously with the excavation activities to provide information on potential precautions to be taken if weather conditions exceed limits outlined in this plan. Meteorological monitoring will be conducted over the duration of the field operations for:

- Air temperature;
- Wind direction;
- Wind speed;
- Wind chill;
- Heat index;
- Barometric pressure;
- Relative humidity; and
- Rainfall (if any).

Wind direction will be monitored with a windsock or equivalent device, such as a portable Wind Dancer™ windsock system for relatively low wind speeds. Rainfall at the site will be measured

with a rain gauge. The remaining meteorological parameters listed above will be measured with a Kestrel® 4000 Pocket Weather™ Tracker™, or equivalent.

If the wind speed is greater than 15 miles per hour (mph) averaged over a 15 minute period or instantaneous wind speeds exceed 25 mph, excavation and earth moving activities will cease.

Air Monitoring

Air monitoring will be performed during all site activities in which impacted or potentially impacted materials are being disturbed or handled. The RA contractor will staff the site with an air monitoring/health and safety professional whose responsibilities will include:

- Monitoring dust levels in the exclusion zone and other locations. The site air monitoring professional will have the authority to stop-work in the event that on site activities generate dust levels that exceed the site action levels. The air-monitoring professional will monitor on-site meteorological instrumentation and/or coordinate with off-site meteorological professionals to evaluate conditions that may trigger cessation of work, e.g. wind speeds high enough to result in visible dust emissions from the point-of-origin or crossing the property line, despite the application of dust mitigation measures.
- Check that real-time aerosol monitors are properly calibrated and in good working condition. Real-time, data-logging aerosol monitors (personal data RAM or equivalent) will be used to measure dust levels. Real-time information will be posted daily, and discussed with site workers.
- Coordinate general site safety activities including all daily hazard communication, safety practices and procedure briefings.
- Oversight of personal decontamination practices.
- General site safety leadership, support and recordkeeping activities.

Air Monitoring Strategy and Methodologies

The RA contractor will monitor dust levels and airborne levels of the COPCs in the following locations:

- One location upwind of excavation operations (based on wind direction meter measurements).
- Three locations downwind of excavation operations.
- One location within the exclusion zone (with a technician).

Actual locations will be determined in the field. Air monitoring will be performed during an 8-hour period each day that RAW activities are conducted. The air-monitoring professional will check the equipment every 15 minutes during operation. Since several excavations are planned for the RA, locations of upwind and downwind monitors will vary.

Because the site COPCs requiring soil excavation are primarily particulate-type contaminants, the RA contractor will focus on monitoring of airborne total dust levels generated by removal activities. The RA contractor will base dust control measures on the Action Levels specified in the chart below. The RA contractor will have the authority to stop work in the event that onsite activities generate dust levels which exceed the Action Levels specified in the chart.

Chemical Name	CAL/OSHA PEL [a]	ACGIH TLV [b]	Site Action Levels [c]	Community Action Level (Fence Line) [d]
Total Dust	10 mg/m^3	10 mg/m^3	1.0 mg/m^3	50 µg/m^3
Arsenic	0.005 mg/m^3	0.01 mg/m^3	0.001 mg/m^3	N/A
Lead	0.05 mg/m^3	0.05 mg/m^3	0.005 mg/m^3	1.5 µg/m^3
TPH	1 ppm	0.5 ppm	Background to 5 ppm above background	See Site Action Level

Notes:
mg/m^3 – milligrams per cubic meter
µg/m^3 – micrograms per cubic meter
ACGIH – American Conference of Governmental Industrial Hygienists
AOC – Area of Concern
CAL/OSHA – California
N/A – not applicable
ppm – parts per million
TLV – threshold limit value

[a] Permissible Exposure Limits (Cal/OSHA Article 107, Table AC1)

[b] 1990-1991 Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices, American Conference of Government Industrial Hygienists.

[c] Site Action Level for total dust is calculated as 20 percent of the threshold limit value of Permissible Exposure Limit (PEL) as measured by National Institute for Occupational Safety and Health (NIOSH) methods. If this action level is met or exceeded, then additional dust mitigation measures will be implemented. If the site dust levels cannot be reduced reliably within 15 minutes, work will cease and a certified Industrial Hygienist will be consulted.

[d] Community Action Level (fence line) of 50 µg/m^3 total dust/particulate is based on the SCAQMD regulation of 50 µg/m^3 of total dust. For lead, the National Ambient Air Quality Standard for lead is 1.5 µg/m3 and selected as the fence-line community action level.

Fugitive Dust Monitoring Plan

A monitoring program will be implemented to evaluate if dust control procedures are effectively mitigating fugitive dust conditions. The monitoring program will include real-time recordings of PM_{10}. Particulate dust monitoring will be performed in accordance with SCAQMD Rules 403, and 1466 and Cal-EPA/DTSC CAMP Guidance, where appropriate. This monitoring will be conducted during construction activities and will be designed to be protective of both worker health and the surrounding community.

A total dust fence line action level of 50 micrograms per cubic meter (µg/m^3) above up-wind background, for particulate matter with an aerodynamic diameter smaller than or equal to 10 microns will be established. Measurements will be conducted by PM_{10} monitoring in accordance with State and Federal requirements and as described below.

A conservative action level will be used to evaluate if off-site migration of fugitive dust is in compliance with SCAQMD and Cal-EPA/DTSC requirements. A total dust action level of 0.5 milligrams per cubic meter (as measured with direct-reading instrumentation) will be utilized for

engineering (dust) control actions at work operations. This level, easily detected with field instruments, will help to keep perimeter dust levels within the expected low range. Field instruments used for air monitoring will be operated, maintained, and calibrated in accordance with 40 Code of Federal Regulations (CFR), Part 50, Appendix J.

The dust-monitoring program will aid in minimizing off-site migration of contaminated soil (as airborne dust) and protect both on-site workers and off-site public from exposure to high levels of dust. The dust-monitoring program will include meteorological monitoring and real-time monitoring of dust using portable aerosol monitors.

Baseline meteorological monitoring will begin at least two days prior to field activities to evaluate prevailing wind patterns, and will continue during construction activities. The baseline monitoring will be conducted for eight to 10 hours to represent a construction work shift. One wind speed and direction monitor will be set up at the site to collect continuous wind data during the monitoring events. The wind speed and direction data are needed to support each upwind and downwind monitoring event and to locate sampler downwind locations. A wind system consists of a Climatronics monitoring system with Model F4450 wind sensors (or similar system), with threshold speeds of 0.5 miles per hour. The wind instrument must meet regulatory specifications. The wind data will be collected through a data acquisition system equipped with a back-up recording device.

Due to the variability of early morning winds, portable aerosol monitors, similar to the MIE Dataram 2000 Aerosol Monitor or the P-5 Digital Dust Indicator manufactured by MDA Scientific, may be used to monitor airborne dust concentrations until conditions are suitable for monitoring. Monitoring using the portable monitors should continue during the work day, including after startup of the PM_{10} samplers, to provide real-time coverage and provide information for the effectiveness of engineering controls. These monitors will be placed on adjacent corners of the construction site boundaries, as close to the property lines as feasible, and in such a way that other sources of fugitive dust between the sampler and the property line are minimized. Additional monitors may be utilized upwind and downwind of the work area based on field conditions. Since several excavations are planned for the removal action (RA), locations of upwind and downwind monitors will vary.

Occasional perimeter monitoring with direct reading instruments will be performed when appropriate. If particulate levels downwind of the work area are detected in excess of 50 $\mu g/m^3$, the upwind background level will be measured immediately using the same portable monitor. If the working site particulate measurement is above 50 $\mu g/m^3$ above the upwind background level,

additional dust suppression techniques should be implemented to reduce the generation of fugitive dust.

Fugitive Dust Control Plan

The purpose of this plan is to establish procedures for air monitoring to mitigate fugitive dust during the remedial activities at the site. Implementation of available fugitive dust control measures will help reduce the total airborne suspended particulate matter generated by field activities thus reducing fugitive dust emissions during remediation. Tentative locations of dust monitoring equipment will be based on prevailing wind directions. These locations will be relocated as needed based on changes in wind direction, based on monitoring by an on-site weather station, and on excavation locations.

The emission of fugitive dust will not be allowed from any active operation, open storage pile, or disturbed surface area such that:

- The dust remains visible in the atmosphere beyond the property line of the emission source; or,
- The dust emission exceeds 20 percent opacity (estimated visually), if the dust emission is the result of movement of a motorized source.

Perimeter air monitoring will be conducted with a MIE DataRAM 2000 aerosol monitor, or equivalent. The DataRAM aerosol monitor measures concentrations of airborne dust, smoke, mists, haze and fumes and will be used for continuous unattended environmental monitoring of the site perimeter monitoring. The DataRAM will be used in place of alternative dust samplers that require off site laboratory sample analysis by OSHA Method 0500 to evaluate if the designated perimeter dust threshold has been exceeded. The DataRAM will provide continuous real-time data measurement of the total dust fence line action level of 50 µg/m^3 above up-wind background dust concentration.

DataRAM meters will be set up at approximately 5 feet above grade at the following site locations and operated for the duration of daily field activities.

- One location upwind of excavation operations (based on wind direction meter measurements).
- Two locations downwind of excavation operations.

The DataRAM meters will be set with a flow rate of 2 liters per minute and will collect minimum, maximum, and average total aerosol concentration (ug/m^3) every 10 minutes of operating time.

Each daytime hour of field time, the meters will be visually checked and the meter results will be reviewed and manually recorded.

Appendix I. Noise and Vibration Background and Modeling Data

Appendices

This page intentionally left blank.

Fundamentals of Noise

NOISE

Noise is most often defined as unwanted sound; whether it is loud, unpleasant, unexpected, or otherwise undesirable. Although sound can be easily measured, the perception of noise and the physical response to sound complicate the analysis of its impact on people. People judge the relative magnitude of sound sensation in subjective terms such as "noisiness" or "loudness."

Noise Descriptors

The following are brief definitions of terminology used in this chapter:

- **Sound.** A disturbance created by a vibrating object, which, when transmitted by pressure waves through a medium such as air, is capable of being detected by a receiving mechanism, such as the human ear or a microphone.

- **Noise.** Sound that is loud, unpleasant, unexpected, or otherwise undesirable.

- **Decibel (dB).** A unitless measure of sound, expressed on a logarithmic scale and with respect to a defined reference sound pressure. The standard reference pressure is 20 micropascals (20 μPa).

- **Vibration Decibel (VdB).** A unitless measure of vibration, expressed on a logarithmic scale and with respect to a defined reference vibration velocity. In the U.S., the standard reference velocity is 1 micro-inch per second ($1x10^{-6}$ in/sec).

- **A-Weighted Decibel (dBA).** An overall frequency-weighted sound level in decibels that approximates the frequency response of the human ear.

- **Equivalent Continuous Noise Level (L_{eq}); also called the Energy-Equivalent Noise Level.** The value of an equivalent, steady sound level which, in a stated time period (often over an hour) and at a stated location, has the same A-weighted sound energy as the time-varying sound. Thus, the L_{eq} metric is a single numerical value that represents the equivalent amount of variable sound energy received by a receptor over the specified duration.

- **Statistical Sound Level (L_n).** The sound level that is exceeded "n" percent of time during a given sample period. For example, the L_{50} level is the statistical indicator of the time-varying noise signal that is exceeded 50 percent of the time (during each sampling period); that is, half of the sampling time, the changing noise levels are above this value and half of the time they are below it. This is called the "median sound level." The L_{10} level, likewise, is the value that is exceeded 10 percent of the time (i.e., near the maximum) and this is often known as the "intrusive sound level." The L_{90} is the sound level exceeded 90 percent of the time and is often considered the "effective background level" or "residual noise level."

- **Maximum Sound Level (L_{max})**. The highest RMS sound level measured during the measurement period.
- **Root Mean Square Sound Level (RMS).** The square root of the average of the square of the sound pressure over the measurement period.
- **Day-Night Sound Level (L_{dn} or DNL).** The energy-average of the A-weighted sound levels occurring during a 24-hour period, with 10 dB added to the sound levels occurring during the period from 10:00 PM to 7:00 AM.
- **Community Noise Equivalent Level (CNEL).** The energy average of the A-weighted sound levels occurring during a 24-hour period, with 5 dB added from 7:00 PM to 10:00 PM and 10 dB from 10:00 PM to 7:00 AM. NOTE: For general community/environmental noise, CNEL and L_{dn} values rarely differ by more than 1 dB (with the CNEL being only slightly more restrictive – that is, higher than the L_{dn} value). As a matter of practice, L_{dn} and CNEL values are interchangeable and are treated as equivalent in this assessment.
- **Peak Particle Velocity (PPV).** The peak rate of speed at which soil particles move (e.g., inches per second) due to ground vibration.
- **Sensitive Receptor.** Noise- and vibration-sensitive receptors include land uses where quiet environments are necessary for enjoyment and public health and safety. Residences, schools, motels and hotels, libraries, religious institutions, hospitals, and nursing homes are examples.

Characteristics of Sound

When an object vibrates, it radiates part of its energy in the form of a pressure wave. Sound is that pressure wave transmitted through the air. Technically, airborne sound is a rapid fluctuation or oscillation of air pressure above and below atmospheric pressure that creates sound waves.

Sound can be described in terms of amplitude (loudness), frequency (pitch), or duration (time). Loudness or amplitude is measured in dB, frequency or pitch is measured in Hertz [Hz] or cycles per second, and duration or time variations is measured in seconds or minutes.

Amplitude

Unlike linear units such as inches or pounds, decibels are measured on a logarithmic scale. Because of the physical characteristics of noise transmission and perception, the relative loudness of sound does not closely match the actual amounts of sound energy. Table 1 presents the subjective effect of changes in sound pressure levels. Ambient sounds generally range from 30 dBA (very quiet) to 100 dBA (very loud). Changes of 1 to 3 dB are detectable under quiet, controlled conditions, and changes of less than 1 dB are usually not discernible (even under ideal conditions). A 3 dB change in noise levels is considered the minimum change that is detectable with human hearing in outside environments. A change of 5 dB is readily discernible to most people in an exterior environment, and a 10 dB change is perceived as a doubling (or halving) of the sound.

Table 1 Noise Perceptibility

Change in dB	Noise Level

± 3 dB	Barely perceptible increase
± 5 dB	Readily perceptible increase
± 10 dB	Twice or half as loud
± 20 dB	Four times or one-quarter as loud

Source: California Department of Transportation (Caltrans). 2013, September. Technical Noise Supplement ("TeNS").

Frequency

The human ear is not equally sensitive to all frequencies. Sound waves below 16 Hz are not heard at all, but are "felt" more as a vibration. Similarly, though people with extremely sensitive hearing can hear sounds as high as 20,000 Hz, most people cannot hear above 15,000 Hz. In all cases, hearing acuity falls off rapidly above about 10,000 Hz and below about 200 Hz.

When describing sound and its effect on a human population, A-weighted (dBA) sound levels are typically used to approximate the response of the human ear. The A-weighted noise level has been found to correlate well with people's judgments of the "noisiness" of different sounds and has been used for many years as a measure of community and industrial noise. Although the A-weighted scale and the energy-equivalent metric are commonly used to quantify the range of human response to individual events or general community sound levels, the degree of annoyance or other response also depends on several other perceptibility factors, including:

- Ambient (background) sound level
- General nature of the existing conditions (e.g., quiet rural or busy urban)
- Difference between the magnitude of the sound event level and the ambient condition
- Duration of the sound event
- Number of event occurrences and their repetitiveness
- Time of day that the event occurs

Duration

Time variation in noise exposure is typically expressed in terms of a steady-state energy level equal to the energy content of the time varying period (called L_{eq}), or alternately, as a statistical description of the sound level that is exceeded over some fraction of a given observation period. For example, the L_{50} noise level represents the noise level that is exceeded 50 percent of the time; half the time the noise level exceeds this level and half the time the noise level is less than this level. This level is also representative of the level that is exceeded 30 minutes in an hour. Similarly, the L_2, L_8 and L_{25} values represent the noise levels that are exceeded 2, 8, and 25 percent of the time or 1, 5, and 15 minutes per hour, respectively. These "n" values are typically used to demonstrate compliance for stationary noise sources with many cities' noise ordinances. Other values typically noted during a noise survey are the L_{min} and L_{max}. These values represent the minimum and maximum root-mean-square noise levels obtained over the measurement period, respectively.

Because community receptors are more sensitive to unwanted noise intrusion during the evening and at night, state law and many local jurisdictions use an adjusted 24-hour noise descriptor called the Community Noise Equivalent Level (CNEL) or Day-Night Noise Level (L_{dn}). The CNEL descriptor requires that an artificial increment (or "penalty") of 5 dBA be added to the actual noise level for the hours from 7:00 PM to 10:00 PM and 10 dBA for the hours from 10:00 PM to 7:00 AM. The L_{dn} descriptor uses the same methodology

except that there is no artificial increment added to the hours between 7:00 PM and 10:00 PM. Both descriptors give roughly the same 24-hour level, with the CNEL being only slightly more restrictive (i.e., higher). The CNEL or L_{dn} metrics are commonly applied to the assessment of roadway and airport-related noise sources.

Sound Propagation

Sound dissipates exponentially with distance from the noise source. This phenomenon is known as "spreading loss." For a single-point source, sound levels decrease by approximately 6 dB for each doubling of distance from the source (conservatively neglecting ground attenuation effects, air absorption factors, and barrier shielding). For example, if a backhoe at 50 feet generates 84 dBA, at 100 feet the noise level would be 79 dBA, and at 200 feet it would be 73 dBA. This drop-off rate is appropriate for noise generated by on-site operations from stationary equipment or activity at a project site. If noise is produced by a line source, such as highway traffic, the sound decreases by 3 dB for each doubling of distance over a reflective ("hard site") surface such as concrete or asphalt. Line source noise in a relatively flat environment with ground-level absorptive vegetation decreases by an additional 1.5 dB for each doubling of distance.

Psychological and Physiological Effects of Noise

Physical damage to human hearing begins at prolonged exposure to noise levels higher than 85 dBA. Exposure to high noise levels affects the entire system, with prolonged noise exposure in excess of 75 dBA increasing body tensions, thereby affecting blood pressure and functions of the heart and the nervous system. Extended periods of noise exposure above 90 dBA results in permanent cell damage, which is the main driver for employee hearing protection regulations in the workplace. For community environments, the ambient or background noise problem is widespread, through generally worse in urban areas than in outlying, less-developed areas. Elevated ambient noise levels can result in noise interference (e.g., speech interruption/masking, sleep disturbance, disturbance of concentration) and cause annoyance. Since most people do not routinely work with decibels or A-weighted sound levels, it is often difficult to appreciate what a given sound pressure level number means. To help relate noise level values to common experience, Table 2 shows typical noise levels from familiar sources.

Table 2 Typical Noise Levels

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
Onset of physical discomfort	120+	
	110	Rock Band (near amplification system)
Jet Flyover at 1,000 feet		
	100	
Gas Lawn Mower at three feet		
	90	
Diesel Truck at 50 feet, at 50 mph		Food Blender at 3 feet
	80	Garbage Disposal at 3 feet
Noisy Urban Area, Daytime		
	70	Vacuum Cleaner at 10 feet
Commercial Area		Normal speech at 3 feet
Heavy Traffic at 300 feet	60	
		Large Business Office
Quiet Urban Daytime	50	Dishwasher Next Room
Quiet Urban Nighttime	40	Theater, Large Conference Room (background)
Quiet Suburban Nighttime		
	30	Library
Quiet Rural Nighttime		Bedroom at Night, Concert Hall (background)
	20	
		Broadcast/Recording Studio
	10	
Lowest Threshold of Human Hearing	0	Lowest Threshold of Human Hearing

Vibration Fundamentals

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Vibration is normally associated with activities stemming from operations of railroads or vibration-intensive stationary sources, but can also be associated with construction equipment such as jackhammers, pile drivers, and hydraulic hammers. As with noise, vibration can be described by both its amplitude and frequency. Vibration displacement is the distance that a point on a surface moves away from its original static position; velocity is the instantaneous speed that a point on a surface moves; and acceleration is the rate of change of the speed. Each of these descriptors can be used to correlate vibration to human response, building damage, and acceptable equipment vibration levels. During construction, the operation of construction equipment can cause groundborne vibration. During the operational phase of a project, receptors may be subject to levels of vibration that can cause annoyance due to noise generated from vibration of a structure or items within a structure.

Vibration amplitudes are usually described in terms of either the peak particle velocity (PPV) or the root mean square (RMS) velocity. PPV is the maximum instantaneous peak of the vibration signal and RMS is the

square root of the average of the squared amplitude of the signal. PPV is more appropriate for evaluating potential building damage and RMS is typically more suitable for evaluating human response.

As with airborne sound, annoyance with vibrational energy is a subjective measure, depending on the level of activity and the sensitivity of the individual. To sensitive individuals, vibrations approaching the threshold of perception can be annoying. Persons accustomed to elevated ambient vibration levels, such as in an urban environment, may tolerate higher vibration levels. Table 3 displays the human response and the effects on buildings resulting from continuous vibration (in terms of various levels of PPV).

Table 3 Human Reaction to Typical Vibration Levels

Vibration Level, PPV (in/sec)	Human Reaction	Effect on Buildings
0.006–0.019	Threshold of perception, possibility of intrusion	Vibrations unlikely to cause damage of any type
0.08	Vibrations readily perceptible	Recommended upper level of vibration to which ruins and ancient monuments should be subjected
0.10	Level at which continuous vibration begins to annoy people	Virtually no risk of "architectural" (i.e. not structural) damage to normal buildings
0.20	Vibrations annoying to people in buildings	Threshold at which there is a risk to "architectural" damage to normal dwelling – houses with plastered walls and ceilings
0.4–0.6	Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges	Vibrations at a greater level than normally expected from traffic, but would cause "architectural" damage and possibly minor structural damage
