Air Quality and Greenhouse Gas Background and Modeling Data

AIR QUALITY

Air Quality Regulatory Setting

The proposed project has the potential to release gaseous emissions of criteria pollutants and dust into the ambient air; therefore, it falls under the ambient air quality standards promulgated at the local, state, and federal levels. The project site is in the SoCAB and is subject to the rules and regulations imposed by the South Coast Air Quality Management District (South Coast AQMD). However, South Coast AQMD reports to California Air Resources board (CARB), and all criteria emissions are also governed by the California and national Ambient Air Quality Standards (AAQS). Federal, state, regional, and local laws, regulations, plans, or guidelines that are potentially applicable to the proposed project are summarized below.

AMBIENT AIR QUALITY STANDARDS

The Clean Air Act (CAA) was passed in 1963 by the US Congress and has been amended several times. The 1970 Clean Air Act amendments strengthened previous legislation and laid the foundation for the regulatory scheme of the 1970s and 1980s. In 1977, Congress again added several provisions, including nonattainment requirements for areas not meeting National AAQS and the Prevention of Significant Deterioration program. The 1990 amendments represent the latest in a series of federal efforts to regulate the protection of air quality in the United States. The CAA allows states to adopt more stringent standards or to include other pollution species. The California Clean Air Act (CCAA), signed into law in 1988, requires all areas of the state to achieve and maintain the California AAQS by the earliest practical date. The California AAQS tend to be more restrictive than the National AAQS, based on even greater health and welfare concerns.

These National AAQS and California AAQS are the levels of air quality considered to provide a margin of safety in the protection of the public health and welfare. They are designed to protect "sensitive receptors" most susceptible to further respiratory distress, such as asthmatics, the elderly, very young children, people already weakened by other disease or illness, and persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollutant concentrations considerably above these minimum standards before adverse effects are observed.

Both California and the federal government have established health-based AAQS for seven air pollutants. As shown in Table 1, *Ambient Air Quality Standards for Criteria Pollutants*, these pollutants include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), coarse inhalable particulate matter (PM_{10}), fine inhalable particulate matter ($PM_{2.5}$), and lead (Pb). In addition, the state has set standards for

sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. These standards are designed to protect the health and welfare of the populace with a reasonable margin of safety.

Table 1 Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Time	California Standard[1]	Federal Primary Standard[2]	Major Pollutant Sources
Ozone (O_3)[3]	1 hour	0.09 ppm	*	Motor vehicles, paints, coatings, and solvents.
	8 hours	0.070 ppm	0.070 ppm	
Carbon Monoxide (CO)	1 hour	20 ppm	35 ppm	Internal combustion engines, primarily gasoline-powered motor vehicles.
	8 hours	9.0 ppm	9 ppm	
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	0.030 ppm	0.053 ppm	Motor vehicles, petroleum-refining operations, industrial sources, aircraft, ships, and railroads.
	1 hour	0.18 ppm	0.100 ppm	
Sulfur Dioxide (SO_2)	Annual Arithmetic Mean	*	0.030 ppm	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
	1 hour	0.25 ppm	0.075 ppm	
	24 hours	0.04 ppm	0.14 ppm	
Respirable Coarse Particulate Matter (PM_{10})	Annual Arithmetic Mean	20 µg/m^3	*	Dust and fume-producing construction, industrial, and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays).
	24 hours	50 µg/m^3	150 µg/m^3	
Respirable Fine Particulate Matter ($PM_{2.5}$)[4]	Annual Arithmetic Mean	12 µg/m^3	12 µg/m^3	Dust and fume-producing construction, industrial, and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays).
	24 hours	*	35 µg/m^3	
Lead (Pb)	30-Day Average	1.5 µg/m^3	*	Present source: lead smelters, battery manufacturing & recycling facilities. Past source: combustion of leaded gasoline.
	Calendar Quarter	*	1.5 µg/m^3	
	Rolling 3-Month Average	*	0.15 µg/m^3	
Sulfates (SO_4)[5]	24 hours	25 µg/m^3	*	Industrial processes.
Visibility Reducing Particles	8 hours	ExCo =0.23/km visibility of 10≥ miles	No Federal Standard	Visibility-reducing particles consist of suspended particulate matter, which is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt.

Table 1 Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Time	California Standard[1]	Federal Primary Standard[2]	Major Pollutant Sources
Hydrogen Sulfide	1 hour	0.03 ppm	No Federal Standard	Hydrogen sulfide (H_2S) is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. Also, it can be present in sewer gas and some natural gas and can be emitted as the result of geothermal energy exploitation.
Vinyl Chloride	24 hours	0.01 ppm	No Federal Standard	Vinyl chloride (chloroethene), a chlorinated hydrocarbon, is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents.

Source: CARB 2016.
Notes: ppm: parts per million; µg/m^3: micrograms per cubic meter
* Standard has not been established for this pollutant/duration by this entity.
1 California standards for O_3, CO (except 8-hour Lake Tahoe), SO_2 (1 and 24 hour), NO_2, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2 National standards (other than O_3, PM, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The O_3 standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
3 On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
4 On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m^3 to 12.0 µg/m^3. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standard of 15 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
5 On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. The 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

California has also adopted a host of other regulations that reduce criteria pollutant emissions, including:

- AB 1493: Pavley Fuel Efficiency Standards
- Title 20 California Code of Regulations (CCR): Appliance Energy Efficiency Standards
- Title 24, Part 6, CCR: Building and Energy Efficiency Standards
- Title 24, Part 11, CCR: Green Building Standards Code

AIR POLLUTANTS OF CONCERN

Criteria Air Pollutants

The air pollutants emitted into the ambient air by stationary and mobile sources are regulated by federal and state law. Air pollutants are categorized as primary or secondary pollutants. Primary air pollutants are those that are emitted directly from sources and include CO, VOC, NO_2, SO_X, PM_{10}, $PM_{2.5}$, and Pb. Of these, CO, SO_2, NO_2, PM_{10}, and $PM_{2.5}$ are "criteria air pollutants," which means that ambient air quality standards (AAQS) have been established for them. VOC and oxides of nitrogen (NO_x) are air pollutant precursors that form secondary criteria pollutants through chemical and photochemical reactions in the atmosphere. Ozone (O_3) and NO_2 are the principal secondary pollutants. A description of each of the primary and secondary criteria air pollutants and their known health effects is presented below.

Carbon Monoxide (CO) is a colorless, odorless, toxic gas produced by incomplete combustion of carbon substances, such as gasoline or diesel fuel. CO is a primary criteria air pollutant. CO concentrations tend to be the highest during winter mornings with little to no wind, when surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion, engines and motor vehicles operating at slow speeds are the primary source of CO in the SoCAB. The highest ambient CO concentrations are generally found near traffic-congested corridors and intersections. The primary adverse health effect associated with CO is interference with normal oxygen transfer to the blood, which may result in tissue oxygen deprivation (South Coast AQMD 2005; US EPA 2023). The SoCAB is designated as being in attainment under the California AAQS and attainment (serious maintenance) under the National AAQS (CARB 2023a).

Volatile Organic Compounds (VOC) are composed primarily of hydrogen and carbon atoms. Internal combustion associated with motor vehicle usage is the major source of VOCs. Other sources include evaporative emissions from paints and solvents, asphalt paving, and household consumer products such as aerosols (South Coast AQMD 2005). There are no AAQS for VOCs. However, because they contribute to the formation of O_3, South Coast AQMD has established a significance threshold (South Coast AQMD 2023). The health effects for ozone are described later in this section.

Nitrogen Oxides (NO_X) are a by-product of fuel combustion and contribute to the formation of ground-level O_3, PM_{10}, and $PM_{2.5}$. The two major forms of NO_X are nitric oxide (NO) and nitrogen dioxide (NO_2). NO is a colorless, odorless gas formed from atmospheric nitrogen and oxygen when combustion takes place under high temperature and/or high pressure. The principal form of NO_X produced by combustion is NO, but NO reacts quickly with oxygen to form NO_2, creating the mixture of NO and NO_2 commonly called NO_X. NO_2 is an acute irritant and more injurious than NO in equal concentrations. At atmospheric concentrations, however, NO_2 is only potentially irritating. NO_2 absorbs blue light; the result is a brownish-red cast to the atmosphere and reduced visibility. NO_2 exposure concentrations near roadways are of particular concern for susceptible individuals, including asthmatics, children, and the elderly. Current scientific evidence links short-term NO_2 exposures, ranging from 30 minutes to 24 hours, with adverse respiratory effects, including airway inflammation in healthy people and increased respiratory symptoms in people with asthma. Also, studies show a connection between elevated short-term NO_2 concentrations and increased visits to emergency departments and hospital admissions for respiratory issues, especially asthma (South Coast AQMD 2005; USEPA 2023a). On February 21, 2019, CARB's Board approved the separation of the area that runs along the State Route 60 corridor through portions of Riverside, San Bernardino, and Los Angeles counties from the remainder of the SoCAB for state nonattainment designation purposes. The Board designated this corridor as nonattainment.[1] The remainder of the SoCAB is designated in attainment (maintenance) under the National AAQS and attainment under the California AAQS (CARB 2023a).

Sulfur Dioxide (SO_2) is a colorless, pungent, irritating gas formed by the combustion of sulfurous fossil fuels. It enters the atmosphere as a result of burning high-sulfur-content fuel oils and coal and chemical processes at plants and refineries. Gasoline and natural gas have very low sulfur content and do not release

[1] CARB is proposing to redesignate SR-60 Near-Road Portion of San Bernardino, Riverside, and Los Angeles Counties in the SoCAB as attainment for NO_2 at the February 24, 2022 Board Hearing (CARB 2023d).

significant quantities of SO_2. When sulfur dioxide forms sulfates (SO_4) in the atmosphere, together these pollutants are referred to as sulfur oxides (SO_X). Thus, SO_2 is both a primary and secondary criteria air pollutant. At sufficiently high concentrations, SO_2 may irritate the upper respiratory tract. Current scientific evidence links short-term exposures to SO_2, ranging from 5 minutes to 24 hours, with an array of adverse respiratory effects, including bronchoconstriction and increased asthma symptoms. These effects are particularly adverse for asthmatics at elevated ventilation rates (e.g., while exercising or playing) at lower concentrations and when combined with particulates, SO_2 may do greater harm by injuring lung tissue. Studies also show a connection between short-term exposure and increased visits to emergency facilities and hospital admissions for respiratory illnesses, particularly in at-risk populations such as children, the elderly, and asthmatics (South Coast AQMD 2005; US EPA 2023). The SoCAB is designated as attainment under the California and National AAQS (CARB 2023a).

Suspended Particulate Matter (PM_{10} and $PM_{2.5}$) consists of finely divided solids or liquids such as soot, dust, aerosols, fumes, and mists. Two forms of fine particulates are now recognized and regulated. Inhalable coarse particles, or PM_{10}, include particulate matter with an aerodynamic diameter of 10 microns or less (i.e., ≤0.01 millimeter). Inhalable fine particles, or $PM_{2.5}$, have an aerodynamic diameter of 2.5 microns or less (i.e., ≤0.002.5 millimeter). Particulate discharge into the atmosphere results primarily from industrial, agricultural, construction, and transportation activities. Both PM_{10} and $PM_{2.5}$ may adversely affect the human respiratory system, especially in people who are naturally sensitive or susceptible to breathing problems. The EPA's scientific review concluded that $PM_{2.5}$, which penetrates deeply into the lungs, is more likely than PM_{10} to contribute to health effects and at far lower concentrations. These health effects include premature death in people with heart or lung disease, nonfatal heart attacks, irregular heartbeat, aggravated asthma, decreased lung function, and increased respiratory symptoms (e.g., irritation of the airways, coughing, or difficulty breathing) (South Coast AQMD 2005). There has been emerging evidence that ultrafine particulates, which are even smaller particulates with an aerodynamic diameter of <0.1 microns or less (i.e., ≤0.0001 millimeter) have human health implications because their toxic components may initiate or facilitate biological processes that may lead to adverse effects to the heart, lungs, and other organs (South Coast AQMD 2013). However, the EPA and the California Air Resources Board (CARB) have not adopted AAQS to regulate these particulates. Diesel particulate matter is classified by CARB as a carcinogen (CARB 2023e). Particulate matter can also cause environmental effects such as visibility impairment,[2] environmental damage,[3] and aesthetic damage[4] (South Coast AQMD 2005; US EPA 2023). The SoCAB is a nonattainment area for $PM_{2.5}$ under California and National AAQS and a nonattainment area for PM_{10} under the California AAQS (CARB 2023a).[5]

---

[2] $PM_{2.5}$ is the main cause of reduced visibility (haze) in parts of the United States.

[3] Particulate matter can be carried over long distances by wind and then settle on ground or water, making lakes and streams acidic; changing the nutrient balance in coastal waters and large river basins; depleting the nutrients in soil; damaging sensitive forests and farm crops; and affecting the diversity of ecosystems.

[4] Particulate matter can stain and damage stone and other materials, including culturally important objects such as statues and monuments.

[5] CARB approved the South Coast AQMD's request to redesignate the SoCAB from serious nonattainment for PM_{10} to attainment for PM_{10} under the National AAQS on March 25, 2010, because the SoCAB did not violate federal 24-hour PM_{10} standards from

Ozone (O_3) is a key ingredient of "smog" and is a gas that is formed when VOCs and NO_X, both by-products of internal combustion engine exhaust, undergo photochemical reactions in sunlight. O_3 is a secondary criteria air pollutant. O_3 concentrations are generally highest during the summer months when direct sunlight, light winds, and warm temperatures create favorable conditions for its formation. O_3 poses a health threat to those who already suffer from respiratory diseases as well as to healthy people. Breathing O_3 can trigger a variety of health problems, including chest pain, coughing, throat irritation, and congestion. It can worsen bronchitis, emphysema, and asthma. Ground-level O_3 also can reduce lung function and inflame the linings of the lungs. Repeated exposure may permanently scar lung tissue. O_3 also affects sensitive vegetation and ecosystems, including forests, parks, wildlife refuges, and wilderness areas. In particular, O_3 harms sensitive vegetation during the growing season (South Coast AQMD 2005; US EPA 2023). The SoCAB is designated extreme nonattainment under the California AAQS (1-hour and 8-hour) and National AAQS (8-hour) (CARB 2023a).

Lead (Pb) is a metal found naturally in the environment as well as in manufactured products. Once taken into the body, lead distributes throughout the body in the blood and accumulates in the bones. Depending on the level of exposure, lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems, and the cardiovascular system. Lead exposure also affects the oxygen-carrying capacity of the blood. The effects of lead most commonly encountered in current populations are neurological effects in children and cardiovascular effects in adults (e.g., high blood pressure and heart disease). Infants and young children are especially sensitive to even low levels of lead, which may contribute to behavioral problems, learning deficits, and lowered IQ (South Coast AQMD 2005; USEPA 2018). The major sources of lead emissions have historically been mobile and industrial sources. As a result of the EPA's regulatory efforts to remove lead from gasoline, emissions of lead from the transportation sector dramatically declined by 95 percent between 1980 and 1999, and levels of lead in the air decreased by 94 percent between 1980 and 1999. Today, the highest levels of lead in air are usually found near lead smelters. The major sources of lead emissions today are ore and metals processing and piston-engine aircraft operating on leaded aviation gasoline. However, in 2008 the EPA and CARB adopted more strict lead standards, and special monitoring sites immediately downwind of lead sources recorded very localized violations of the new state and federal standards.[6] As a result of these violations, the Los Angeles County portion of the SoCAB is designated as nonattainment under the National AAQS for lead (South Coast AQMD 2012; CARB 2023a). However, lead concentrations in this nonattainment area have been below the level of the federal standard since December 2011 (South Coast AQMD 2012). CARB's State Implementation Plan (SIP) revision was submitted to the EPA for approval. Because emissions of lead are found only in projects that are permitted by South Coast AQMD, lead is not a pollutant of concern for the proposed project.

2004 to 2007. The EPA approved the State of California's request to redesignate the South Coast PM_{10} nonattainment area to attainment of the PM_{10} National AAQS, effective on July 26, 2013.

6 Source-oriented monitors record concentrations of lead at lead-related industrial facilities in the SoCAB, which include Exide Technologies in the City of Commerce; Quemetco, Inc., in the City of Industry; Trojan Battery Company in Santa Fe Springs; and Exide Technologies in Vernon. Monitoring conducted between 2004 through 2007 showed that the Trojan Battery Company and Exide Technologies exceed the federal standards (South Coast AQMD 2012).

Toxic Air Contaminants

The public's exposure to air pollutants classified as toxic air contaminants (TACs) is a significant environmental health issue in California. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health. The California Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." A substance that is listed as a hazardous air pollutant (HAP) pursuant to Section 112(b) of the federal Clean Air Act (42 United States Code §7412[b]) is a toxic air contaminant. Under state law, the California Environmental Protection Agency (Cal/EPA), acting through CARB, is authorized to identify a substance as a TAC if it determines that the substance is an air pollutant that may cause or contribute to an increase in mortality or to an increase in serious illness, or may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act) and AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987). The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit designated TACs. If there is a safe threshold for a substance (i.e., a point below which there is no toxic effect), the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions. To date, CARB has established formal control measures for 11 TACs, all of which are identified as having no safe threshold.

Air toxics from stationary sources are also regulated in California under the Air Toxics "Hot Spot" Information and Assessment Act of 1987. Under AB 2588, toxic air contaminant emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

By the last update to the TAC list in December 1999, CARB had designated 244 compounds as TACs (CARB 1999). Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines.

Diesel Particulate Matter

In 1998, CARB identified particulate emissions from diesel-fueled engines (diesel PM) as a TAC. Previously, the individual chemical compounds in diesel exhaust were considered TACs. Almost all diesel exhaust particle mass is 10 microns or less in diameter. Because of their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lung.

CARB has promulgated the following specific rules to limit TAC emissions:

- 13 CCR Chapter 10, Section 2485, Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling
- 13 CCR Chapter 10, Section 2480, Airborne Toxic Control Measure to Limit School Bus Idling and Idling at Schools
- 13 CCR Section 2477 and Article 8, Airborne Toxic Control Measure for In-Use Diesel-Fueled Transport Refrigeration Units (TRU) and TRU Generator Sets and Facilities Where TRUs Operate

Community Risk

In addition, to reduce exposure to TACs, CARB developed and approved the *Air Quality and Land Use Handbook: A Community Health Perspective* (2005) to provide guidance regarding the siting of sensitive land uses in the vicinity of freeways, distribution centers, rail yards, ports, refineries, chrome-plating facilities, dry cleaners, and gasoline-dispensing facilities. This guidance document was developed to assess compatibility and associated health risks when placing sensitive receptors near existing pollution sources. CARB's recommendations on the siting of new sensitive land uses were based on a compilation of recent studies that evaluated data on the adverse health effects from proximity to air pollution sources. The key observation in these studies is that proximity to air pollution sources substantially increases exposure and the potential for adverse health effects. There are three carcinogenic toxic air contaminants that constitute the majority of the known health risks from motor vehicle traffic, DPM from trucks, and benzene and 1,3-butadiene from passenger vehicles. CARB recommendations are based on data that show that localized air pollution exposures can be reduced by as much as 80 percent by following CARB minimum distance separations.

AIR QUALITY MANAGEMENT PLANNING

The South Coast AQMD is the agency responsible for improving air quality in the SoCAB and ensuring that the National and California AAQS are attained and maintained. South Coast AQMD is responsible for preparing the air quality management plan (AQMP) for the SoCAB in coordination with the Southern California Association of Governments (SCAG). Since 1979, a number of AQMPs have been prepared.

2022 AQMP

South Coast AQMD adopted the 2022 AQMP on December 2, 2022, which serves as an update to the 2017 AQMP. On October 1, 2015, the EPA strengthened the National AAQS for ground-level ozone, lowering the primary and secondary ozone standard levels to 70 parts per billion (ppb) (2015 Ozone National AAQS.). The SoCAB is currently classified as an "extreme" nonattainment for the 2015 Ozone National AAQS. Meeting the 2015 federal ozone standard requires reducing NO_x emissions, the key pollutant that creates ozone, by 67 percent more than is required by adopted rules and regulations in 2037. The only way to achieve the required NO_x reductions is through extensive use of zero emission (ZE) technologies across all stationary and mobile sources. South Coast AQMD's primary authority is over stationary sources which account for approximately 20 percent of NO_x emissions. The overwhelming majority of NO_x emissions are from heavy-duty trucks, ships and other State and federally regulated mobile sources that are mostly beyond the South Coast AQMD's control. The region will not meet the standard absent significant federal action. In addition to

federal action, the 2022 AQMP requires substantial reliance on future deployment of advanced technologies to meet the standard. The control strategy for the 2022 AQMP includes aggressive new regulations and the development of incentive programs to support early deployment of advanced technologies. The two key areas for incentive programs are (1) promoting widespread deployment of available ZE and low-NO_x technologies and (2) developing new ZE and ultra-low NO_x technologies for use in cases where the technology is not currently available. South Coast AQMD is prioritizing distribution of incentive funding in Environmental Justice areas and seeking opportunities to focus benefits on the most disadvantaged communities (South Coast AQMD 2022).

Lead State Implementation Plan

In 2008, EPA designated the Los Angeles County portion of the SoCAB nonattainment under the federal lead (Pb) classification due to the addition of source-specific monitoring under the new federal regulation. This designation was based on two source-specific monitors in Vernon and the City of Industry exceeding the new standard. The rest of the SoCAB, outside the Los Angeles County nonattainment area remains in attainment of the new standard. On May 24, 2012, CARB approved the SIP revision for the federal lead standard, which the EPA revised in 2008. Lead concentrations in this nonattainment area have been below the level of the federal standard since December 2011. The SIP revision was submitted to EPA for approval.

South Coast AQMD PM2.5 Redesignation Request and Maintenance Plan

In 1997, the EPA adopted the 24-hour fine $PM_{2.5}$ standard of 65 micrograms per cubic meter ($\mu g/m^3$). In 2006, this standard was lowered to a more health-protective level of 35 $\mu g/m^3$. The SoCAB is designated nonattainment for both the 65 and 35 $\mu g/m^3$ 24-hour $PM_{2.5}$ standards (24-hour $PM_{2.5}$ standards). In 2020, monitored data demonstrated that the SoCAB attained both 24-hour $PM_{2.5}$ standards. The South Coast AQMD has developed the 2021 Redesignation Request and Maintenance Plan for the 1997 and 2006 24-hour $PM_{2.5}$ Standards demonstrating that the SoCAB has met the requirements to be redesignated to attainment for the 24-hour $PM_{2.5}$ standards (South Coast AQMD 2021b).

AB 617, Community Air Protection Program

Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) requires local air districts to monitor and implement air pollution control strategies that reduce localized air pollution in communities that bear the greatest burdens. In response to AB 617, CARB has established the Community Air Protection Program.

Air districts are required to host workshops to help identify disadvantaged communities disproportionately affected by poor air quality. Once the criteria for identifying the highest priority locations have been identified and the communities have been selected, new community monitoring systems would be installed to track and monitor community-specific air pollution goals. In 2018 CARB prepared an air monitoring plan (Community Air Protection Blueprint), that evaluates the availability and effectiveness of air monitoring technologies and existing community air monitoring networks. Under AB 617, the Blueprint is required to be updated every five years.

Under AB 617, CARB is also required to prepare a statewide strategy to reduce TACs and criteria pollutants in impacted communities; provide a statewide clearinghouse for best available retrofit control technology;

adopt new rules requiring the latest best available retrofit control technology for all criteria pollutants for which an area has not achieved attainment of California AAQS; and provide uniform, statewide reporting of emissions inventories. Air districts are required to adopt a community emissions reduction program to achieve reductions for the communities impacted by air pollution that CARB identifies.

Existing Conditions

CLIMATE/METEOROLOGY

South Coast Air Basin

The project site lies in the South Coast Air Basin (SoCAB), which includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The SoCAB is in a coastal plain with connecting broad valleys and low hills and is bounded by the Pacific Ocean in the southwest quadrant, with high mountains forming the remainder of the perimeter. The general region lies in the semi-permanent high-pressure zone of the eastern Pacific. As a result, the climate is mild, tempered by cool sea breezes. This usually mild weather pattern is interrupted infrequently by periods of extremely hot weather, winter storms, and Santa Ana winds (South Coast AQMD 2005).

Temperature and Precipitation

The annual average temperature varies little throughout the SoCAB, ranging from the low to middle 60s, measured in degrees Fahrenheit (°F). With a more pronounced oceanic influence, coastal areas show less variability in annual minimum and maximum temperatures than inland areas. The climatological station nearest to the project site with temperature data is the Los Angeles Downtown USC Campus, California Monitoring Station (ID No. 045115). The lowest average temperature is reported at 48.3°F in January, and the highest average temperature is 83.1°F in August.

In contrast to a very steady pattern of temperature, rainfall is seasonally and annually highly variable. Almost all rain falls from October through April. Summer rainfall is normally restricted to widely scattered thundershowers near the coast, with slightly heavier shower activity in the east and over the mountains. Rainfall averages 14.77 inches per year in the vicinity of the area (WRCC 2023).

Humidity

Although the SoCAB has a semiarid climate, the air near the earth's surface is typically moist because of the presence of a shallow marine layer. Except for infrequent periods when dry, continental air is brought into the SoCAB by offshore winds, the "ocean effect" is dominant. Periods of heavy fog, especially along the coast, are frequent. Low clouds, often referred to as high fog, are a characteristic climatic feature. Annual average humidity is 70 percent at the coast and 57 percent in the eastern portions of the (South Coast AQMD 2005).

Wind

Wind patterns across the south coastal region are characterized by westerly or southwesterly onshore winds during the day and by easterly or northeasterly breezes at night. Wind speed is somewhat greater during the dry summer months than during the rainy winter season.

Between periods of wind, periods of air stagnation may occur, both in the morning and evening hours. Air stagnation is one of the critical determinants of air quality conditions on any given day. During the winter and fall months, surface high-pressure systems over the SoCAB, combined with other meteorological conditions, can result in very strong, downslope Santa Ana winds. These winds normally continue a few days before predominant meteorological conditions are reestablished.

The mountain ranges to the east affect the transport and diffusion of pollutants by inhibiting their eastward transport. Air quality in the SoCAB generally ranges from fair to poor and is similar to air quality in most of coastal southern California. The entire region experiences heavy concentrations of air pollutants during prolonged periods of stable atmospheric conditions (South Coast AQMD 2005).

Inversions

In conjunction with the two characteristic wind patterns that affect the rate and orientation of horizontal pollutant transport, there are two similarly distinct types of temperature inversions that control the vertical depth through which pollutants are mixed. These are the marine/subsidence inversion and the radiation inversion. The combination of winds and inversions are critical determinants in leading to the highly degraded air quality in summer and the generally good air quality in the winter in the project area (South Coast AQMD 2005).

AREA DESIGNATIONS

The AQMP provides the framework for air quality basins to achieve attainment of the state and federal ambient air quality standards through the State Implementation Plan (SIP). Areas are classified as attainment or nonattainment areas for particular pollutants, depending on whether they meet ambient air quality standards. Severity classifications for ozone nonattainment range in magnitude from marginal, moderate, and serious to severe and extreme.

- **Unclassified:** a pollutant is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment.

- **Attainment:** a pollutant is in attainment if the CAAQS for that pollutant was not violated at any site in the area during a three-year period.

- **Nonattainment:** a pollutant is in nonattainment if there was at least one violation of a state AAQS for that pollutant in the area.

- **Nonattainment/Transitional:** a subcategory of the nonattainment designation. An area is designated nonattainment/transitional to signify that the area is close to attaining the AAQS for that pollutant.

The attainment status for the SoCAB is shown in Table 2, *Attainment Status of Criteria Pollutants in the South Coast Air Basin*.

Table 2 Attainment Status of Criteria Pollutants in the South Coast Air Basin

Pollutant	State	Federal
Ozone – 1-hour	Extreme Nonattainment	No Federal Standard
Ozone – 8-hour	Extreme Nonattainment	Extreme Nonattainment
PM_{10}	Serious Nonattainment	Attainment
$PM_{2.5}$	Nonattainment	Nonattainment[2]
CO	Attainment	Attainment
NO_2	Nonattainment (SR-60 Near Road only)[1]	Attainment/Maintenance
SO_2	Attainment	Attainment
Lead	Attainment	Nonattainment (Los Angeles County only)[3]
All others	Attainment/Unclassified	Attainment/Unclassified

Source: CARB 2023c.

1 On February 21, 2019, CARB's Board approved the separation of the area that runs along State Route 60 corridor through portions of Riverside, San Bernardino, and Los Angeles counties from the remainder of the SoCAB for State nonattainment designation purposes. The Board designated this corridor as nonattainment. The remainder of the SoCAB remains in attainment for NO_2 (CARB 2019a). CARB is proposing to redesignate SR-60 Near-Road Portion of San Bernardino, Riverside, and Los Angeles Counties in the SoCAB as attainment for NO_2 at the February 24, 2022 Board Hearing (CARB 2023c).

2 The SoCAB is pending a resignation request from nonattainment to attainment for the 24-hour federal $PM_{2.5}$ standards. The 2021 $PM_{2.5}$ Redesignation Request and Maintenance Plan demonstrates that the South Coast meets the requirements of the CAA to allow US EPA to redesignate the SoCAB to attainment for the 65 µg/m^3 and 35 µg/m^3 24-hour $PM_{2.5}$ standards. CARB will submit the 2021 $PM_{2.5}$ Redesignation Request to the US EPA as a revision to the California SIP (CARB 2021).

3 In 2010, the Los Angeles portion of the SoCAB was designated nonattainment for lead under the new 2008 federal AAQS as a result of large industrial emitters. Remaining areas in the SoCAB are unclassified.

EXISTING AMBIENT AIR QUALITY

Existing levels of ambient air quality and historical trends and projections in the vicinity of the project site are best documented by measurements taken by the South Coast AQMD. The project site is located within Source Receptor Area (SRA) 1: Central Los Angeles. The air quality monitoring station closest to the proposed project is the Los Angeles – North Main Street Monitoring Station, which is one of 31 monitoring stations South Coast AQMD operates and maintains within the SoCAB.[7] Data from this station includes O_3, NO_2, PM_{10}, and $PM_{2.5}$ and is summarized in Table 3, *Ambient Air Quality Monitoring Summary*. The data show regular violations of the state and federal O_3, state PM_{10}, and federal $PM_{2.5}$ standards in the last five years.

[7] Locations of the SRAs and monitoring stations are shown here: http://www.aqmd.gov/docs/default-source/default-document-library/map-of-monitoring-areas.pdf.

Table 3 Ambient Air Quality Monitoring Summary

Pollutant/Standard	Number of Days Threshold Were Exceeded and Maximum Levels during Such Violations[1,2]				
	2017	2018	2019	2020	2021
Ozone (O_3)					
State 1-Hour ≥ 0.09 ppm (days exceed threshold)	14	4	2	22	2
State & Federal 8-hour ≥ 0.070 ppm (days exceed threshold)	9	0	1	16	1
Max. 1-Hour Conc. (ppm)	0.116	0.098	0.093	0.185	0.099
Max. 8-Hour Conc. (ppm)	0.086	0.073	0.080	0.118	0.085
Nitrogen Dioxide (NO_2)					
State 1-Hour ≥ 0.18 ppm (days exceed threshold)	0	0	0	0	0
Max. 1-Hour Conc. (ppb)	0.0806	0.0701	0.0697	0.0618	0.0778
Coarse Particulates (PM_{10})					
State 24-Hour > 50 µg/m^3 (days exceed threshold)	40	31	15	34	14
Federal 24-Hour > 150 µg/m^3 (days exceed threshold)	0	0	0	1	0
Max. 24-Hour Conc. (µg/m^3)	96.2	81.2	93.9	185.2	138.5
Fine Particulates ($PM_{2.5}$)					
Federal 24-Hour > 35 µg/m^3 (days exceed threshold)	6	6	1	12	13
Max. 24-Hour Conc. (µg/m^3)	54.9	61.4	43.5	175.0	61.0

MULTIPLE AIR TOXICS EXPOSURE STUDY V

The Multiple Air Toxics Exposure Study (MATES) is a monitoring and evaluation study on existing ambient concentrations of TACs and the potential health risks from air toxics in the SoCAB. In April 2021, South Coast AQMD released the latest update to the MATES study, MATES V. The first MATES analysis, MATES I, began in 1986 but was limited because of the technology available at the time. Conducted in 1998, MATES II was the first MATES iteration to include a comprehensive monitoring program, an air toxics emissions inventory, and a modeling component. MATES III was conducted in 2004 to 2006, with MATES IV following in 2012 to 2013.

MATES V uses measurements taken during 2018 and 2019, with a comprehensive modeling analysis and emissions inventory based on 2018 data. The previous MATES studies quantified the cancer risks based on the inhalation pathway only. MATES V includes information on the chronic noncancer risks from inhalation and non-inhalation pathways for the first time. Cancer risks and chronic noncancer risks from MATES II through IV measurements have been re-examined using current Office of Environmental Health Hazards Assessment (OEHHA) and CalEPA risk assessment methodologies and modern statistical methods to examine the trends over time.

The MATES V study showed that cancer risk in the SoCAB decreased to 454 in a million from 997 in a million in the MATES IV study. Overall, air toxics cancer risk in the SoCAB decreased by 54 percent since 2012 when MATES IV was conducted. MATES V showed the highest risk locations near the Los Angeles International Airport and the Ports of Long Beach and Los Angeles. Diesel particulate matter continues to be

the major contributor to air toxics cancer risk (approximately 72 percent of the total cancer risk). Goods movement and transportation corridors have the highest cancer risk. Transportation sources account for 88 percent of carcinogenic air toxics emissions, and the remainder is from stationary sources, which include large industrial operations such as refineries and power plants as well as smaller businesses such as gas stations and chrome-plating facilities. (South Coast AQMD 2021a).

SENSITIVE RECEPTORS

Some land uses are considered more sensitive to air pollution than others due to the types of population groups or activities involved. Sensitive population groups include children, the elderly, the acutely ill, and the chronically ill, especially those with cardio-respiratory diseases.

Residential areas are also considered to be sensitive receptors to air pollution because residents (including children and the elderly) tend to be at home for extended periods of time, resulting in sustained exposure to any pollutants present. Schools are also considered sensitive receptors, as children are present for extended durations and engage in regular outdoor activities. Recreational land uses are considered moderately sensitive to air pollution. Although exposure periods are generally short, exercise places a high demand on respiratory functions, which can be impaired by air pollution. In addition, noticeable air pollution can detract from the enjoyment of recreation. Industrial and commercial areas are considered the least sensitive to air pollution. Exposure periods are relatively short and intermittent, as the majority of the workers tend to stay indoors most of the time. In addition, the working population is generally the healthiest segment of the public.

The nearest offsite sensitive receptors are the single-family residences along East 49th Street to the north and west, McKinley Avenue to the east, and East 50th Street to the south of the project site.

Thresholds of Significance

The analysis of the proposed project's air quality impacts follows the guidance and methodologies recommended in South Coast AQMD's *CEQA Air Quality Handbook* and the significance thresholds on South Coast AQMD's website (South Coast AQMD 1993). CEQA allows the significance criteria established by the applicable air quality management or air pollution control district to be used to assess impacts of a project on air quality. South Coast AQMD has established thresholds of significance for regional air quality emissions for construction activities and project operation. In addition to the daily thresholds listed above, projects are also subject to the AAQS. These are addressed though an analysis of localized CO impacts and localized significance thresholds (LSTs).

REGIONAL SIGNIFICANCE THRESHOLDS

The South Coast AQMD has adopted regional construction and operational emissions thresholds to determine a project's cumulative impact on air quality in the SoCAB. Table 4, *South Coast AQMD Significance Thresholds*, lists South Coast AQMD's regional significance thresholds that are applicable for all projects uniformly regardless of size or scope. There is growing evidence that although ultrafine particulates contribute a very small portion of the overall atmospheric mass concentration, they represent a greater

proportion of the health risk from PM. However, the EPA or CARB have not yet adopted AAQS to regulate ultrafine particulates; therefore, South Coast AQMD has not developed thresholds for them.

Table 4 South Coast AQMD Significance Thresholds

Air Pollutant	Construction Phase	Operational Phase
Reactive Organic Gases (ROGs)/ Volatile Organic Compounds (VOCs)	75 lbs/day	55 lbs/day
Nitrogen Oxides (NO_X)	100 lbs/day	55 lbs/day
Carbon Monoxide (CO)	550 lbs/day	550 lbs/day
Sulfur Oxides (SO_X)	150 lbs/day	150 lbs/day
Particulates (PM_{10})	150 lbs/day	150 lbs/day
Particulates ($PM_{2.5}$)	55 lbs/day	55 lbs/day

Source: South Coast AQMD 2023.

Projects that exceed the regional significance threshold contribute to the nonattainment designation of the SoCAB. The attainment designations are based on the AAQS, which are set at levels of exposure that are determined to not result in adverse health. Exposure to fine particulate pollution and ozone causes myriad health impacts, particularly to the respiratory and cardiovascular systems:

- Linked to increased cancer risk ($PM_{2.5}$, TACs)
- Aggravates respiratory disease (O_3, $PM_{2.5}$)
- Increases bronchitis (O_3, $PM_{2.5}$)
- Causes chest discomfort, throat irritation, and increased effort to take a deep breath (O_3)
- Reduces resistance to infections and increases fatigue (O_3)
- Reduces lung growth in children ($PM_{2.5}$)
- Contributes to heart disease and heart attacks ($PM_{2.5}$)
- Contributes to premature death (O_3, $PM_{2.5}$)
- Linked to lower birth weight in newborns ($PM_{2.5}$) (South Coast AQMD 2015a)

Exposure to fine particulates and ozone aggravates asthma attacks and can amplify other lung ailments such as emphysema and chronic obstructive pulmonary disease. Exposure to current levels of $PM_{2.5}$ is responsible for an estimated 4,300 cardiopulmonary-related deaths per year in the SoCAB. In addition, University of Southern California scientists responsible for a landmark children's health study found that lung growth improved as air pollution declined for children aged 11 to 15 in five communities in the SoCAB (South Coast AQMD 2015b).

South Coast AQMD is the primary agency responsible for ensuring the health and welfare of sensitive individuals exposed to elevated concentrations of air pollutants in the SoCAB and has established thresholds that would be protective of these individuals. To achieve the health-based standards established by the EPA, South Coast AQMD prepares an AQMP that details regional programs to attain the AAQS. Mass emissions thresholds shown in Table 4 are not correlated with concentrations of air pollutants but contribute to the cumulative air quality impacts in the SoCAB. These thresholds are based on the trigger levels for the federal

New Source Review Program, which was created to ensure projects are consistent with attainment of health-based federal AAQS. Regional emissions from a single project do not trigger a regional health impact, and it is speculative to identify how many more individuals in the air basin would be affected by the health effects listed previously. Projects that do not exceed the South Coast AQMD regional significance thresholds in Table 4 would not violate any air quality standards or contribute substantially to an existing or projected air quality violation.

If projects exceed the emissions levels presented in Table 4, then those emissions would cumulatively contribute to the nonattainment status of the air basin and would contribute to elevating health effects associated with these criteria air pollutants. Known health effects related to ozone include worsening of bronchitis, asthma, and emphysema and a decrease in lung function. Health effects associated with particulate matter include premature death of people with heart or lung disease, nonfatal heart attacks, irregular heartbeat, decreased lung function, and increased respiratory symptoms. Reducing emissions would contribute to reducing possible health effects related to criteria air pollutants. However, for projects that exceed the emissions in Table 4, it is speculative to determine how exceeding the regional thresholds would affect the number of days the region is in nonattainment, because mass emissions are not correlated with concentrations of emissions or how many additional individuals in the air basin would be affected by the health effects cited previously.

South Coast AQMD has not provided methodology to assess the specific correlation between mass emissions generated and the effect on health to address the issue raised in *Sierra Club v. County of Fresno* (Friant Ranch, L.P.) (2018) 6 Cal.5th 502, Case No. S21978. South Coast AQMD currently does not have methodologies that would provide the District with a consistent, reliable, and meaningful analysis to correlate specific health impacts that may result from a Proposed Project's mass emissions.[8] Ozone concentrations are dependent on a variety of complex factors, including the presence of sunlight and precursor pollutants, natural topography, nearby structures that cause building downwash, atmospheric stability, and wind patterns. Because of the complexities of predicting ground-level ozone concentrations in relation to the National and California AAQS, and the absence of modeling tools that could provide statistically valid data and meaningful additional information regarding health effects from criteria air pollutants generated by individual projects, it is not possible to link specific health risks to the magnitude of emissions exceeding the significance thresholds. However, if a project in the SoCAB exceeds the regional significance thresholds, the project could contribute to an increase in health effects in the basin until the attainment standards are met in the SoCAB.

[8] In April 2019, the Sacramento Metropolitan Air Quality Management District (SMAQMD) published an Interim Recommendation on implementing Sierra Club v. County of Fresno (2018) 6 Cal.5th 502 ("Friant Ranch") in the review and analysis of proposed projects under CEQA in Sacramento County. Consistent with the expert opinions submitted to the court in Friant Ranch by the San Joaquin Valley Air Pollution Control District (SJVAPCD) and South Coast AQMD, the SMAQMD guidance confirms the absence of an acceptable or reliable quantitative methodology that would correlate the expected criteria air pollutant emissions of projects to likely health consequences for people from project-generated criteria air pollutant emissions. The SMAQMD guidance explains that while it is in the process of developing a methodology to assess these impacts, lead agencies should follow the Friant Court's advice to explain in meaningful detail why this analysis is not yet feasible. Since this interim memorandum SMAQMD has provided methodology to address health impacts. However, a similar analysis is not available for projects within the South Coast AQMD region.

CO HOTSPOTS

Areas of vehicle congestion have the potential to create pockets of CO called hot spots. These pockets have the potential to exceed the state one-hour standard of 20 ppm or the eight-hour standard of 9 ppm. Because CO is produced in greatest quantities from vehicle combustion and does not readily disperse into the atmosphere, adherence to ambient air quality standards is typically demonstrated through an analysis of localized CO concentrations. Hot spots are typically produced at intersections, where traffic congestion is highest because vehicles queue for longer periods and are subject to reduced speeds. With the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities, CO concentrations in the SoCAB and in the state have steadily declined.

In 2007, the SoCAB was designated in attainment for CO under both the California AAQS and National AAQS. The CO hotspot analysis conducted for the attainment by the South Coast AQMD for busiest intersections in Los Angeles during the peak morning and afternoon periods plan did not predict a violation of CO standards.[9] As identified in the South Coast AQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan), peak carbon monoxide concentrations in the SoCAB in previous years, prior to redesignation, were a result of unusual meteorological and topographical conditions and not a result of congestion at a particular intersection. Under existing and future vehicle emission rates, a project would have to increase traffic volumes at a single intersection to more than 44,000 vehicles per hour—or 24,000 vehicles per hour where vertical and/or horizontal air does not mix—in order to generate a significant CO impact (BAAQMD 2017).

LOCALIZED SIGNIFICANCE THRESHOLDS

The South Coast AQMD developed LSTs for emissions of NO_2, CO, PM_{10}, and $PM_{2.5}$ generated at the project site (offsite mobile-source emissions are not included in the LST analysis). LSTs represent the maximum emissions at a project site that are not expected to cause or contribute to an exceedance of the most stringent federal or state AAQS and are shown in Table 5, *South Coast AQMD Localized Significance Thresholds*.

Table 5 South Coast AQMD Localized Significance Thresholds

Air Pollutant (Relevant AAQS)	Concentration
1-Hour CO Standard (CAAQS)	20 ppm
8-Hour CO Standard (CAAQS)	9.0 ppm
1-Hour NO_2 Standard (CAAQS)	0.18 ppm
Annual NO_2 Standard (CAAQS)	0.03 ppm
24-Hour PM_{10} Standard – Construction (South Coast AQMD)[1]	10.4 µg/m^3
24-Hour $PM_{2.5}$ Standard – Construction (South Coast AQMD)[1]	10.4 µg/m^3
24-Hour PM_{10} Standard – Operation (South Coast AQMD)[1]	2.5 µg/m^3

[9] The four intersections were: Long Beach Boulevard and Imperial Highway; Wilshire Boulevard and Veteran Avenue; Sunset Boulevard and Highland Avenue; and La Cienega Boulevard and Century Boulevard. The busiest intersection evaluated (Wilshire and Veteran) had a daily traffic volume of approximately 100,000 vehicles per day with LOS E in the morning peak hour and LOS F in the evening peak hour.

24-Hour $PM_{2.5}$ Standard – Operation (South Coast AQMD)[1]	2.5 µg/m^3

Source: South Coast AQMD 2023.
ppm – parts per million; µg/m^3 – micrograms per cubic meter
[1] Threshold is based on South Coast AQMD Rule 403. Since the SoCAB is in nonattainment for PM_{10} and $PM_{2.5}$, the threshold is established as an allowable change in concentration. Therefore, background concentration is irrelevant.

To assist lead agencies, South Coast AQMD developed screening-level LSTs to back-calculate the mass amount (lbs. per day) of emissions generated onsite that would trigger the levels shown in Table 5 for projects under 5-acres. These "screening-level" LSTs tables are the localized significance thresholds for all projects of five acres and less; however, it can be used as screening criteria for larger projects to determine whether or not dispersion modeling may be required to compare concentrations of air pollutants generated by the project to the localized concentrations shown in Table 5.

In accordance with South Coast AQMD's LST methodology, the screening-level construction LSTs are based on the acreage disturbed per day based on equipment use. The screening-level construction LSTs for the project site in SRA 1 are shown in Table 6, *South Coast AQMD Screening-Level Localized Significance Thresholds,* for sensitive receptors within 82 feet (25 meters) of the project site.

Table 6 South Coast AQMD Screening-Level Localized Significance Thresholds

	Threshold (lbs/day)[1]			
Acreage Disturbed	Nitrogen Oxides (NO_X)	Carbon Monoxide (CO)	Coarse Particulates (PM_{10})	Fine Particulates ($PM_{2.5}$)
≤1.00 Acre Disturbed Per Day	74	680	5.00	3.00
1.31 Acres Disturbed Per Day	85	795	5.93	3.62
2.50 Acres Disturbed Per Day	117	1,183	9.33	5.50
3.50 Acres Disturbed Per Day	135	1,454	11.99	6.50

Source: South Coast AQMD 2008 and 2011.
[1] LSTs are based on sensitive receptors within 82 feet (25 meters) of the project site in Source Receptor Area (SRA) 1.

HEALTH RISK

Whenever a project would require use of chemical compounds that have been identified in South Coast AQMD Rule 1401, placed on CARB's air toxics list pursuant to AB 1807, or placed on the EPA's National Emissions Standards for Hazardous Air Pollutants, a health risk assessment is required by the South Coast AQMD. Table 7, *South Coast AQMD Toxic Air Contaminants Incremental Risk Thresholds*, lists the TAC incremental risk thresholds for operation of a project. The type of land uses that typically generate substantial quantities of criteria air pollutants and TACs from operations include industrial (stationary sources) and warehousing (truck idling) land uses (CARB 2005). School uses do not use substantial quantities of TACs, thus these thresholds are typically applied to new industrial projects only. Additionally, the purpose of this environmental evaluation is to identify the significant effects of the proposed project on the environment, not the significant effects of the environment on the proposed project (*California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369 (Case No. S213478)).

Table 7 South Coast AQMD Toxic Air Contaminants Incremental Risk Thresholds

Maximum Incremental Cancer Risk	≥ 10 in 1 million
Hazard Index (project increment)	≥ 1.0
Cancer Burden in areas ≥ 1 in 1 million	> 0.5 excess cancer cases

GREENHOUSE GAS EMISSIONS

Scientists have concluded that human activities are contributing to global climate change by adding large amounts of heat-trapping gases, known as GHG, to the atmosphere. Climate change is the variation of Earth's climate over time, whether due to natural variability or as a result of human activities. The primary source of these GHG is fossil fuel use. The Intergovernmental Panel on Climate Change (IPCC) has identified four major GHG—water vapor,[10] carbon (CO_2), methane (CH_4), and ozone (O_3)—that are the likely cause of an increase in global average temperatures observed within the 20th and 21st centuries. Other GHG identified by the IPCC that contribute to global warming to a lesser extent include nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons, perfluorocarbons, and chlorofluorocarbons (IPCC 2001).[11] The major GHG are briefly described below.

- **Carbon dioxide (CO_2)** enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and respiration, and also as a result of other chemical reactions (e.g. manufacture of cement). Carbon dioxide is removed from the atmosphere (sequestered) when it is absorbed by plants as part of the biological carbon cycle.

- **Methane (CH_4)** is emitted during the production and transport of coal, natural gas, and oil. Methane emissions also result from livestock and other agricultural practices and from the decay of organic waste in municipal landfills and water treatment facilities.

- **Nitrous oxide (N_2O)** is emitted during agricultural and industrial activities as well as during combustion of fossil fuels and solid waste.

- **Fluorinated gases** are synthetic, strong GHGs that are emitted from a variety of industrial processes. Fluorinated gases are sometimes used as substitutes for ozone-depleting substances. These gases are

[10] Water vapor (H_2O) is the strongest GHG and the most variable in its phases (vapor, cloud droplets, ice crystals). However, water vapor is not considered a pollutant, but part of the feedback loop rather than a primary cause of change.

[11] Black carbon contributes to climate change both directly, by absorbing sunlight, and indirectly, by depositing on snow (making it melt faster) and by interacting with clouds and affecting cloud formation. Black carbon is the most strongly light-absorbing component of particulate matter (PM) emitted from burning fuels such as coal, diesel, and biomass. Reducing black carbon emissions globally can have immediate economic, climate, and public health benefits. California has been an international leader in reducing emissions of black carbon, with close to 95 percent control expected by 2020 due to existing programs that target reducing PM from diesel engines and burning activities (CARB 2017a). However, state and national GHG inventories do not yet include black carbon due to ongoing work resolving the precise global warming potential of black carbon. Guidance for CEQA documents does not yet include black carbon.

typically emitted in smaller quantities, but because they are potent GHGs, they are sometimes referred to as high global-warming-potential (GWP) gases.

- ***Chlorofluorocarbons (CFCs***) are GHGs covered under the 1987 Montreal Protocol and used for refrigeration, air conditioning, packaging, insulation, solvents, or aerosol propellants. Since they are not destroyed in the lower atmosphere (troposphere, stratosphere), CFCs drift into the upper atmosphere where, given suitable conditions, they break down ozone. These gases are also ozone-depleting gases and are therefore being replaced by other compounds that are GHGs covered under the Kyoto Protocol.

- ***Perfluorocarbons (PFCs)*** are a group of human-made chemicals composed of carbon and fluorine only. These chemicals (predominantly perfluoromethane [CF_4] and perfluoroethane [C_2F_6]) were introduced as alternatives, along with HFCs, to the ozone-depleting substances. In addition, PFCs are emitted as by-products of industrial processes and are used in manufacturing. PFCs do not harm the stratospheric ozone layer, but they have a high global warming potential.

- ***Sulfur Hexafluoride (SF_6)*** is a colorless gas soluble in alcohol and ether, slightly soluble in water. SF_6 is a strong GHG used primarily in electrical transmission and distribution systems as an insulator.

- ***Hydrochlorofluorocarbons (HCFCs)*** contain hydrogen, fluorine, chlorine, and carbon atoms. Although ozone-depleting substances, they are less potent at destroying stratospheric ozone than CFCs. They have been introduced as temporary replacements for CFCs and are also GHGs.

- ***Hydrofluorocarbons (HFCs)*** contain only hydrogen, fluorine, and carbon atoms. They were introduced as alternatives to ozone-depleting substances to serve many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are also used in manufacturing. They do not significantly deplete the stratospheric ozone layer, but they are strong GHGs (IPCC 2001; USEPA 2022).

GHGs are dependent on the lifetime or persistence of the gas molecule in the atmosphere. Some GHGs have stronger greenhouse effects than others. These are referred to as high GWP gases. The GWP of GHG emissions are shown in Table 8, *GHG Emissions and Their Relative Global Warming Potential Compared to CO_2*. The GWP is used to convert GHGs to CO_2-equivalence (CO_2e) to show the relative potential that different GHGs have to retain infrared radiation in the atmosphere and contribute to the greenhouse effect. For example, under IPCC's Fourth Assessment Report (AR4) GWP values for CH_4, a project that generates 10 MT of CH_4 would be equivalent to 250 MT of CO_2.[12]

[12] The global warming potential of a GHG is dependent on the lifetime, or persistence, of the gas molecule in the atmosphere.

Table 8 GHG Emissions and Their Relative Global Warming Potential Compared to CO_2

GHGs	Second Assessment Report (SAR) Global Warming Potential Relative to CO_2[1]	Fourth Assessment Report (AR4) Global Warming Potential Relative to CO_2[1]	Fifth Assessment Report (AR5) Global Warming Potential Relative to CO_2[1]
Carbon Dioxide (CO_2)	1	1	1
Methane[2] (CH_4)	21	25	28
Nitrous Oxide (N_2O)	310	298	265

Source: IPCC 1995, 2007, 2013.

Notes: The IPCC published updated GWP values in its Fifth Assessment Report (AR5) that reflect new information on atmospheric lifetimes of GHGs and an improved calculation of the radiative forcing of CO_2. However, GWP values identified in AR4 are used by South Coast AQMD to maintain consistency in statewide GHG emissions modeling. In addition, the 2017 Scoping Plan Update was based on the GWP values in AR4.

1 Based on 100-year time horizon of the GWP of the air pollutant compared to CO_2.

2 The methane GWP includes direct effects and indirect effects due to the production of tropospheric ozone and stratospheric water vapor. The indirect effect due to the production of CO_2 is not included.

GHG Regulatory Setting

REGULATION OF GHG EMISSIONS ON A NATIONAL LEVEL

The US Environmental Protection Agency (EPA) announced on December 7, 2009, that GHG emissions threaten the public health and welfare of the American people and that GHG emissions from on-road vehicles contribute to that threat. The EPA's final findings respond to the 2007 U.S. Supreme Court decision that GHG emissions fit within the Clean Air Act definition of air pollutants. The findings do not in and of themselves impose any emission reduction requirements but allow the EPA to finalize the GHG standards proposed in 2009 for new light-duty vehicles as part of the joint rulemaking with the Department of Transportation (USEPA 2009).

To regulate GHGs from passenger vehicles, EPA was required to issue an endangerment finding. The finding identifies emissions of six key GHGs—CO_2, CH_4, N_2O, hydrofluorocarbons, perfluorocarbons, and SF_6—that have been the subject of scrutiny and intense analysis for decades by scientists in the United States and around the world. The first three are applicable to the project's GHG emissions inventory because they constitute the majority of GHG emissions and, per South Coast AQMD guidance, are the GHG emissions that should be evaluated as part of a project's GHG emissions inventory.

US Mandatory Report Rule for GHGs (2009)

In response to the endangerment finding, the EPA issued the Mandatory Reporting of GHG Rule that requires substantial emitters of GHG emissions (large stationary sources, etc.) to report GHG emissions data. Facilities that emit 25,000 MT or more of CO_2 per year are required to submit an annual report.

Update to Corporate Average Fuel Economy Standards (2021 to 2026)

The federal government issued new Corporate Average Fuel Economy (CAFE) standards in 2012 for model years 2017 to 2025, which required a fleet average of 54.5 miles per gallon in 2025. On March 30, 2020, the EPA finalized an updated CAFE and GHG emissions standards for passenger cars and light trucks and established new standards covering model years 2021 through 2026, known as the Safer Affordable Fuel Efficient (SAFE) Vehicles Final Rule for Model Years 2021 to 2026. Under SAFE, the fuel economy

standards will increase 1.5 percent per year compared to the 5 percent per year under the CAFE standards established in 2012. Overall, SAFE requires a fleet average of 40.4 MPG for model year 2026 vehicles (85 Federal Register 24174 (April 30, 2020)).

On December 21, 2021, under direction of Executive Order (EO) 13990 issued by President Biden, the National Highway Traffic Safety Administration repealed Safer Affordable Fuel Efficient Vehicles Rule Part One, which had preempted state and local laws related to fuel economy standards. In addition, on March 31, 2022, the National Highway Traffic Safety Administration finalized new fuel standards in response to EO 13990. Fuel efficiency under the standards proposed will increase 8 percent annually for model years 2024 to 2025 and 10 percent annual for model year 2026. Overall, the new CAFE standards require a fleet average of 49 MPG for passenger vehicles and light trucks for model year 2026, which would be a 10 MPG increase relative to model year 2021 (NHTSA 2022).

EPA Regulation of Stationary Sources under the Clean Air Act (Ongoing)

Pursuant to its authority under the Clean Air Act, the EPA has developed regulations for new, large, stationary sources of emissions, such as power plants and refineries. Under former President Obama's 2013 Climate Action Plan, the EPA was directed to develop regulations for existing stationary sources as well. On June 19, 2019, the EPA issued the final Affordable Clean Energy (ACE) rule, which became effective on August 19, 2019. The ACE rule was crafted under the direction of President Trump's Energy Independence EO. It officially rescinded the Clean Power Plan rule issued during the Obama Administration and set emissions guidelines for states in developing plans to limit CO_2 emissions from coal-fired power plants. The Affordable Clean Energy rule was vacated by the United States Court of Appeals for the District of Columbia Circuit on January 19, 2021. The Biden Administration is assessing options on potential future regulations.

REGULATION OF GHG EMISSIONS ON A STATE LEVEL

Current State of California guidance and goals for reductions in GHG emissions are generally embodied in EO S-03-05 and EO B-30-15, EO B-55-18, Assembly Bill 32 (AB 32), Senate Bill 32 (SB 32), and SB 375.

Executive Order S-3-05

Executive Order S-3-05, signed June 1, 2005. Executive Order S-3-05 set the following GHG reduction targets for the State:

- 2000 levels by 2010
- 1990 levels by 2020
- 80 percent below 1990 levels by 2050

Assembly Bill 32, the Global Warming Solutions Act (2006)

AB 32 was passed by the California state legislature on August 31, 2006, to place the state on a course toward reducing its contribution of GHG emissions. AB 32 follows the 2020 tier of emissions reduction targets

established in EO S-03-05. CARB prepared the 2008 Scoping Plan to outline a plan to achieve the GHG emissions reduction targets of AB 32.

Executive Order B-30-15

EO B-30-15, signed April 29, 2015, set a goal of reducing GHG emissions within the state to 40 percent of 1990 levels by year 2030. EO B-30-15 also directed CARB to update the Scoping Plan to quantify the 2030 GHG reduction goal for the state and requires state agencies to implement measures to meet the interim 2030 goal as well as the long-term goal for 2050 in EO S-03-05. It also requires the Natural Resources Agency to conduct triennial updates of the California adaption strategy, "Safeguarding California", in order to ensure climate change is accounted for in state planning and investment decisions.

Senate Bill 32 and Assembly Bill 197

In September 2016, Governor Brown signed SB 32 and AB 197 into law, making the Executive Order goal for year 2030 into a statewide mandated legislative target. AB 197 established a joint legislative committee on climate change policies and requires the CARB to prioritize direction emissions reductions rather than the market-based cap-and-trade program for large stationary, mobile, and other sources.

Executive Order B-55-18

Executive Order B-55-18, signed September 10, 2018, set a goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." Executive Order B-55-18 directs CARB to work with relevant state agencies to ensure that future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. The goal of carbon neutrality by 2045 is in addition to other statewide goals, meaning that not only should emissions be reduced to 80 percent below 1990 levels by 2050, but that, by no later than 2045, the remaining emissions should be offset by equivalent net removals of CO_2e from the atmosphere, including through sequestration in forests, soils, and other natural landscapes.

Assembly Bill 1279

AB 1279, signed by Governor Newsom in September 2022, codified the carbon neutrality targets of EO B-55-18 for year 2045 and sets a new legislative target for year 2045 of 85 percent below 1990 levels for anthropogenic GHG emissions. SB 1279 also requires CARB to update the Scoping Plan to address these new targets.

2022 Climate Change Scoping Plan

CARB adopted the *2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan) on December 15, 2022, which lays out a path to achieve carbon neutrality by 2045 or earlier and to reduce the State's anthropogenic GHG emissions (CARB 2022). The Scoping Plan provides updates to the previously adopted 2017 Scoping Plan and addresses the carbon neutrality goals of EO B-55-18 (discussed below) and the ambitious GHG reduction target as directed by AB 1279. Previous Scoping Plans focused on specific GHG reduction targets for our industrial, energy, and transportation sectors—to meet 1990 levels by 2020, and then the more aggressive 40 percent below that for the 2030 target. The 2022 Scoping Plan updates the target of reducing anthropogenic emissions to 85 percent below 1990 levels by 2045. Carbon neutrality takes it one

step further by expanding actions to capture and store carbon including through natural and working lands and mechanical technologies, while drastically reducing anthropogenic sources of carbon pollution at the same time.

The path forward was informed by the recent Sixth Assessment Report (AR6) of the IPCC and the measures would achieve 85 percent below 1990 levels by 2045 in accordance AB 1279. CARB's 2022 Scoping Plan identifies strategies as shown in Table 11, *Priority Strategies for Local Government Climate Action Plans*, that would be most impactful at the local level for ensuring substantial process towards the State's carbon neutrality goals.

Table 11 Priority Strategies for Local Government Climate Action Plans

Priority Area	Priority Strategies
Transportation Electrification	Convert local government fleets to zero-emission vehicles (ZEV) and provide EV charging at public sites.
	Create a jurisdiction-specific ZEV ecosystem to support deployment of ZEVs statewide (such as building standards that exceed state building codes, permit streamlining, infrastructure siting, consumer education, preferential parking policies, and ZEV readiness plans).
VMT Reduction	Reduce or eliminate minimum parking standards.
	Implement Complete Streets policies and investments, consistent with general plan circulation element requirements.
	Increase access to public transit by increasing density of development near transit, improving transit service by increasing service frequency, creating bus priority lanes, reducing or eliminating fares, microtransit, etc.
	Increase public access to clean mobility options by planning for and investing in electric shuttles, bike share, car share, and walking
	Implement parking pricing or transportation demand management pricing strategies.
	Amend zoning or development codes to enable mixed-use, walkable, transit-oriented, and compact infill development (such as increasing allowable density of the neighborhood).
	Preserve natural and working lands by implementing land use policies that guide development toward infill areas and do not convert "greenfield" land to urban uses (e.g., green belts, strategic conservation easements)
Building Decarbonization	Adopt all-electric new construction reach codes for residential and commercial uses.
	Adopt policies and incentive programs to implement energy efficiency retrofits for existing buildings, such as weatherization, lighting upgrades, and replacing energy-intensive appliances and equipment with more efficient systems (such as Energy Star-rated equipment and equipment controllers).
	Adopt policies and incentive programs to electrify all appliances and equipment in existing buildings such as appliance rebates, existing building reach codes, or time of sale electrification ordinances.
	Facilitate deployment of renewable energy production and distribution and energy storage on privately owned land uses (e.g., permit streamlining, information sharing) .
	Deploy renewable energy production and energy storage directly in new public projects and on existing public facilities (e.g., solar photovoltaic systems on rooftops of municipal buildings and on canopies in public parking lots, battery storage systems in municipal buildings) .

Source: CARB 2022

Based on Appendix D of the 2022 CARB Climate Change Scoping Plan, for residential and mixed-use development projects, CARB recommends first demonstrating that these land use development projects are aligned with State climate goals based on the attributes of land use development that reduce operational

GHG emissions while simultaneously advancing fair housing. Attributes that accommodate growth in a manner consistent with the GHG and equity goals of SB 32 have all the following attributes:

- Transportation Electrification
  - Provide EV charging infrastructure that, at a minimum, meets the most ambitious voluntary standards in the California Green Building Standards Code at the time of project approval.

- VMT Reduction
  - Is located on infill sites that are surrounded by existing urban uses and reuses or redevelops previously undeveloped or underutilized land that is presently served by existing utilities and essential public services (e.g., transit, streets, water, sewer).
  - Does not result in the loss or conversion of the State's natural and working lands;
  - Consists of transit-supportive densities (minimum of 20 residential dwelling units/acre), or is in proximity to existing transit stops (within a half mile), or satisfies more detailed and stringent criteria specified in the region's Sustainable Communities Strategy (SCS);
  - Reduces parking requirements by:
    - Eliminating parking requirements or including maximum allowable parking ratios (i.e., the ratio of parking spaces to residential units or square feet); or
    - Providing residential parking supply at a ratio of <1 parking space per dwelling unit; or
    - For multifamily residential development, requiring parking costs to be unbundled from costs to rent or own a residential unit.
  - At least 20 percent of the units are affordable to lower-income residents;
  - Result in no net loss of existing affordable units.

- Building Decarbonization
  - Use all electric appliances without any natural gas connections and does not use propane or other fossil fuels for space heating, water heating, or indoor cooking (CARB 2022).

If the first approach to demonstrating consistency is not applicable (such as in the case of this school modernization project), the second approach to project-level alignment with state climate goals is to achieve net zero GHG emissions. The third approach to demonstrating project-level alignment with state climate goals is to align with GHG thresholds of significance, which many local air quality management (AQMDs) and air pollution control districts (APCDs) have developed or adopted (CARB 2022).

Senate Bill 375

In 2008, SB 375, the Sustainable Communities and Climate Protection Act, was adopted to connect the GHG emissions reductions targets established in the 2008 Scoping Plan for the transportation sector to local land

use decisions that affect travel behavior. Its intent is to reduce GHG emissions from light-duty trucks and automobiles (excludes emissions associated with goods movement) by aligning regional long-range transportation plans, investments, and housing allocations to local land use planning to reduce VMT and vehicle trips. Specifically, SB 375 required CARB to establish GHG emissions reduction targets for each of the 18 metropolitan planning organizations (MPO). The Southern California Association of Governments (SCAG) is the MPO for the Southern California region, which includes the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial.

Pursuant to the recommendations of the Regional Transportation Advisory Committee, CARB adopted per capita reduction targets for each of the MPOs rather than a total magnitude reduction target. SCAG's targets are an 8 percent per capita reduction from 2005 GHG emission levels by 2020 and a 13 percent per capita reduction from 2005 GHG emission levels by 2035 (CARB 2010). The 2020 targets are smaller than the 2035 targets because a significant portion of the built environment in 2020 is defined by decisions that have already been made. In general, the 2020 scenarios reflect that more time is needed for large land use and transportation infrastructure changes. Most of the reductions in the interim are anticipated to come from improving the efficiency of the region's transportation network. The targets would result in 3 $MMTCO_2e$ of reductions by 2020 and 15 $MMTCO_2e$ of reductions by 2035. Based on these reductions, the passenger vehicle target in CARB's Scoping Plan (for AB 32) would be met (CARB 2010).

2017 Update to the SB 375 Targets

CARB is required to update the targets for the MPOs every eight years. CARB adopted revised SB 375 targets for the MPOs in March 2018. The updated targets became effective in October2018. All SCSs adopted after October 1, 2018, are subject to these new targets. CARB's updated SB 375 targets for the SCAG region were an 8 percent per capita GHG reduction in 2020 from 2005 levels (unchanged from the 2010 target) and a 19 percent per capita GHG reduction in 2035 from 2005 levels (compared to the 2010 target of 13 percent) (CARB 2018).

The targets consider the need to further reduce VMT, as identified in the 2017 Scoping Plan Update (for SB 32), while balancing the need for additional and more flexible revenue sources to incentivize positive planning and action toward sustainable communities. Like the 2010 targets, the updated SB 375 targets are in units of "percent per capita" reductions in GHG emissions from automobiles and light trucks relative to 2005; this excludes reductions anticipated from implementation of state technology and fuels strategies and any potential future state strategies, such as statewide road user pricing. The proposed targets call for greater per-capita GHG emission reductions from SB 375 than are currently in place, which for 2035 translate into proposed targets that either match or exceed the emission reduction levels in the MPOs' currently adopted SCSs to achieve the SB 375 targets. CARB foresees that the additional GHG emissions reductions in 2035 may be achieved from land use changes, transportation investment, and technology strategies (CARB 2018).

SCAG's Regional Transportation Plan / Sustainable Communities Strategy

SB 375 requires each MPO to prepare a sustainable communities strategy in its regional transportation plan. For the SCAG region, the 2020-2045 RTP/SCS (Connect SoCal) was adopted on September 3, 2020, and is an update to the 2016-2040 RTP/SCS. In general, the SCS outlines a development pattern for the region that,

when integrated with the transportation network and other transportation measures and policies, would reduce vehicle miles traveled from automobiles and light duty trucks and thereby reduce GHG emissions from these sources.

Connect SoCal focuses on the continued efforts of the previous RTP/SCSs to integrate transportation and land use strategies in development of the SCAG region through horizon year 2045 (SCAG 2020). Connect SoCal forecasts that the SCAG region will meet its GHG per capita reduction targets of 8 percent by 2020 and 19 percent by 2035. Additionally, Connect SoCal also forecasts that implementation of the plan will reduce VMT per capita in year 2045 by 4.1 percent compared to baseline conditions for that year. Connect SoCal includes a "Core Vision" that centers on maintaining and better managing the transportation network for moving people and goods while expanding mobility choices by locating housing, jobs, and transit closer together and increasing investments in transit and complete streets (SCAG 2020).

Transportation Sector Specific Regulations

Assembly Bill 1493

California vehicle GHG emission standards were enacted under AB 1493 (Pavley I). Pavley I is a clean-car standard that reduces GHG emissions from new passenger vehicles (light-duty auto to medium-duty vehicles) from 2009 through 2016 and is anticipated to reduce GHG emissions from new passenger vehicles by 30 percent in 2016. California implements the Pavley I standards through a waiver granted to California by the EPA. In 2012, the EPA issued a Final Rulemaking that sets even more stringent fuel economy and GHG emissions standards for model years 2017 through 2025 light-duty vehicles. (See also the discussion on the update to the Corporate Average Fuel Economy standards at the beginning of this Section 5.5.2 under "Federal.") In January 2012, CARB approved the Advanced Clean Cars program (formerly known as Pavley II) for model years 2017 through 2025. The program combines the control of smog, soot, and GHGs with requirements for greater numbers of ZE vehicles into a single package of standards. Under California's Advanced Clean Car program, by 2025 new automobiles will emit 34 percent less GHG emissions and 75 percent less smog-forming emissions.

Executive Order S-01-07

On January 18, 2007, the state set a new LCFS for transportation fuels sold in the state. Executive Order S-01-07 sets a declining standard for GHG emissions measured in CO_2e gram per unit of fuel energy sold in California. The LCFS required a reduction of 2.5 percent in the carbon intensity of California's transportation fuels by 2015 and a reduction of at least 10 percent by 2020. The standard applies to refiners, blenders, producers, and importers of transportation fuels, and uses market-based mechanisms to allow these providers to choose how they reduce emissions during the "fuel cycle" using the most economically feasible methods.

Executive Order B-16-2012

On March 23, 2012, the state identified that CARB, the California Energy Commission (CEC), the Public Utilities Commission, and other relevant agencies worked with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to accommodate ZE vehicles in major

metropolitan areas, including infrastructure to support them (e.g., electric vehicle charging stations). The executive order also directed the number of ZE vehicles in California's state vehicle fleet to increase through the normal course of fleet replacement so that at least 10 percent of fleet purchases of light-duty vehicles are ZE by 2015 and at least 25 percent by 2020. The executive order also establishes a target for the transportation sector of reducing GHG emissions to 80 percent below 1990 levels.

Executive Order N-79-20

On September 23, 2020, Governor Newsom signed Executive Order N-79-20, whose goal is that 100 percent of in-state sales of new passenger cars and trucks will be ZE by 2035. Additionally, the fleet goals for trucks are that 100 percent of drayage trucks are ZE by 2035, and 100 percent of medium- and heavy-duty vehicles in the state are ZE by 2045, where feasible. The Executive Order's goal for the State is to transition to 100 percent ZE off-road vehicles and equipment by 2035, where feasible.

Renewables Portfolio: Carbon Neutrality Regulations

Senate Bills 1078, 107, and X1-2 and Executive Order S-14-08

A major component of California's Renewable Energy Program is the renewables portfolio standard established under Senate Bills 1078 (Sher) and 107 (Simitian). Under the RPS, certain retail sellers of electricity were required to increase the amount of renewable energy each year by at least 1 percent in order to reach at least 20 percent by December 30, 2010. Executive Order S-14-08, signed in November 2008, expanded the state's renewable energy standard to 33 percent renewable power by 2020. This standard was adopted by the legislature in 2011 (SB X1-2). Renewable sources of electricity include wind, small hydropower, solar, geothermal, biomass, and biogas. The increase in renewable sources for electricity production will decrease indirect GHG emissions from development projects because electricity production from renewable sources is generally considered carbon neutral.

Senate Bill 350

Senate Bill 350 (de Leon) was signed into law September 2015 and establishes tiered increases to the RPS—40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. SB 350 also set a new goal to double the energy-efficiency savings in electricity and natural gas through energy efficiency and conservation measures.

Senate Bill 100

On September 10, 2018, Governor Brown signed SB 100. Under SB 100, the RPS for public-owned facilities and retail sellers consist of 44 percent renewable energy by 2024, 52 percent by 2027, and 60 percent by 2030. SB 100 also established a new RPS requirement of 50 percent by 2026. Furthermore, the bill establishes an overall state policy that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all state agencies by December 31, 2045. Under the bill, the state cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

Senate Bill 1020

Senate Bill 1020 was signed into law on September 16, 2022. It requires renewable energy and zero-carbon resources to supply 90 percent of all retail electricity sales by 2035 and 95 percent by 2040. Additionally, SB 1020 requires all state agencies to procure 100 percent of electricity from renewable energy and zero-carbon resources by 2035.

Energy Efficiency Regulations

California Building Code: Building Energy Efficiency Standards

Energy conservation standards for new residential and nonresidential buildings were adopted by the California Energy Resources Conservation and Development Commission (now the CEC) in June 1977 (Title 24, Part 6, of the California Code of Regulations [CCR]). Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods.

On August 11, 2021, the CEC adopted the 2022 Building Energy Efficiency Standards, which were subsequently approved by the California Building Standards Commission in December 2021. The 2022 standards went into effect on January 1, 2023, replacing the existing 2019 standards. The 2022 standards would require mixed-fuel single-family homes to be electric-ready to accommodate replacement of gas appliances with electric appliances. In addition, the new standards also include prescriptive photovoltaic system and battery requirements for high-rise, multifamily buildings (i.e., more than three stories) and noncommercial buildings such as hotels, offices, medical offices, restaurants, retail stores, schools, warehouses, theaters, and convention centers (CEC 2021).

California Building Code: CALGreen

On July 17, 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (24 CCR, Part 11, known as "CALGreen") was adopted as part of the California Building Standards Code. CALGreen established planning and design standards for sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and internal air contaminants.[13] The mandatory provisions of CALGreen became effective January 1, 2011. In 2021, the CEC approved the 2022 CALGreen, which went into effect on January 1, 2023, replacing the existing 2019 standards.

2006 Appliance Efficiency Regulations

The 2006 Appliance Efficiency Regulations (20 CCR §§ 1601–1608) were adopted by the CEC on October 11, 2006, and approved by the California Office of Administrative Law on December 14, 2006. The regulations include standards for both federally regulated appliances and non–federally regulated appliances.

[13] The green building standards became mandatory in the 2010 edition of the code.

Though these regulations are now often viewed as "business as usual," they exceed the standards imposed by all other states, and they reduce GHG emissions by reducing energy demand.

Solid Waste Diversion Regulations

AB 939: Integrated Waste Management Act of 1989

California's Integrated Waste Management Act of 1989 (AB 939, Public Resources Code §§ 40050 et seq.) set a requirement for cities and counties throughout the state to divert 50 percent of all solid waste from landfills by January 1, 2000, through source reduction, recycling, and composting. In 2008, the requirements were modified to reflect a per capita requirement rather than tonnage. To help achieve this, the act requires that each city and county prepare and submit a source reduction and recycling element. AB 939 also established the goal for all California counties to provide at least 15 years of ongoing landfill capacity.

AB 341

AB 341 (Chapter 476, Statutes of 2011) increased the statewide goal for waste diversion to 75 percent by 2020 and requires recycling of waste from commercial and multifamily residential land uses. Section 5.408 of CALGreen also requires that at least 65 percent of the nonhazardous construction and demolition waste from nonresidential construction operations be recycled and/or salvaged for reuse.

AB 1327

The California Solid Waste Reuse and Recycling Access Act (AB 1327, Public Resources Code §§ 42900 et seq.) requires areas to be set aside for collecting and loading recyclable materials in development projects. The act required the California Integrated Waste Management Board to develop a model ordinance for adoption by any local agency requiring adequate areas for collection and loading of recyclable materials as part of development projects. Local agencies are required to adopt the model or an ordinance of their own.

AB 1826

In October of 2014, Governor Brown signed AB 1826 requiring businesses to recycle their organic waste on and after April 1, 2016, depending on the amount of waste they generate per week. This law also requires that on and after January 1, 2016, local jurisdictions across the state implement an organic waste recycling program to divert organic waste generated by businesses and multifamily residential dwellings with five or more units. Organic waste means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed with food waste.

Water Efficiency Regulations

SBX7-7

The 20x2020 Water Conservation Plan was issued by the Department of Water Resources (DWR) in 2010 pursuant to Senate Bill 7, which was adopted during the 7th Extraordinary Session of 2009–2010 and therefore dubbed "SBX7-7." SBX7-7 mandated urban water conservation and authorized the DWR to prepare a plan implementing urban water conservation requirements (20x2020 Water Conservation Plan). In addition, it required agricultural water providers to prepare agricultural water management plans, measure

water deliveries to customers, and implement other efficiency measures. SBX7-7 required urban water providers to adopt a water conservation target of 20 percent reduction in urban per capita water use by 2020 compared to 2005 baseline use.

AB 1881: Water Conservation in Landscaping Act

The Water Conservation in Landscaping Act of 2006 (AB 1881) requires local agencies to adopt the updated DWR model ordinance or an equivalent. AB 1881 also requires the CEC to consult with the DWR to adopt, by regulation, performance standards and labeling requirements for landscape irrigation equipment, including irrigation controllers, moisture sensors, emission devices, and valves to reduce the wasteful, uneconomic, inefficient, or unnecessary consumption of energy or water.

Short-Lived Climate Pollutant Reduction Strategy

Senate Bill 1383

On September 19, 2016, the Governor signed SB 1383 to supplement the GHG reduction strategies in the Scoping Plan to consider short-lived climate pollutants, including black carbon and CH_4. Black carbon is the light-absorbing component of fine particulate matter produced during the incomplete combustion of fuels. SB 1383 required the state board, no later than January 1, 2018, to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants to achieve a reduction in methane by 40 percent, hydrofluorocarbon gases by 40 percent, and anthropogenic black carbon by 50 percent below 2013 levels by 2030. The bill also established targets for reducing organic waste in landfills. On March 14, 2017, CARB adopted the Short-Lived Climate Pollutant Reduction Strategy, which identifies the state's approach to reducing anthropogenic and biogenic sources of short-lived climate pollutants. Anthropogenic sources of black carbon include on- and off-road transportation, residential wood burning, fuel combustion (charbroiling), and industrial processes. According to CARB, ambient levels of black carbon in California are 90 percent lower than in the early 1960s, despite the tripling of diesel fuel use (CARB 2017a). In-use on-road rules were expected to reduce black carbon emissions from on-road sources by 80 percent between 2000 and 2020. South Coast AQMD is one of the air districts that requires air pollution control technologies for chain-driven broilers, which reduces particulate emissions from these charbroilers by over 80 percent (CARB 2017a). Additionally, South Coast AQMD Rule 445 limits installation of new fireplaces in the South Coast Air Basin.

Existing Conditions

CALIFORNIA'S GREENHOUSE GAS SOURCES AND RELATIVE CONTRIBUTION

In 2021, the statewide GHG emissions inventory was updated for 2000 to 2019 emissions using the GWPs in IPCC's AR4 (IPCC 2013). Based on these GWPs, California produced 418.2 $MMTCO_2e$ GHG emissions in 2019. California's transportation sector was the single largest generator of GHG emissions, producing 39.7 percent of the state's total emissions. Industrial sector emissions made up 21.1 percent, and electric power generation made up 14.1 percent of the state's emissions inventory. Other major sectors of GHG emissions include commercial and residential (10.5 percent), agriculture and forestry (7.6 percent), high GWP (4.9 percent), and recycling and waste (2.1 percent) (CARB 2021).

Since the peak level in 2004, California's GHG emission shave generally followed a decreasing trend. In 2016, California statewide GHG emissions dropped below the AB 32 target for year 2020 of 431 $MMTCO_2e$ and have remained below this target since then. In 2019, emissions from routine GHG-emitting activities statewide were almost 13 $MMTCO_2e$ lower than the AB 32 target for year 2020. Per-capita GHG emissions in California have dropped from a 2001 peak of 14.0 $MTCO_2e$ per person to 10.5 $MTCO_2e$ per person in 2019, a 25 percent decrease.

Transportation emissions continued to decline in 2019 statewide as they had done in 2018, with even more substantial reductions due to a significant increase in renewable diesel. Since 2008, California's electricity sector has followed an overall downward trend in emissions. In 2019, solar power generation continued its rapid growth since 2013. Emissions from high-GWP gases comprised 4.9 percent of California's emissions in 2019. This continues the increasing trend as the gases replace ozone-depleting substances being phased out under the 1987 Montreal Protocol. Overall trends in the inventory also demonstrate that the carbon intensity of California's economy (the amount of carbon pollution per million dollars of gross domestic product) has declined 45 percent since the 2001 peak, though the state's gross domestic product grew 63 percent during this period (CARB 2021).

Thresholds of Significance

The CEQA Guidelines recommend that a lead agency consider the following when assessing the significance of impacts from GHG emissions on the environment:

1. The extent to which the project may increase (or reduce) GHG emissions as compared to the existing environmental setting;

2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project;

3. The extent to which the project complies with regulations or requirements adopted to implement an adopted statewide, regional, or local plan for the reduction or mitigation of GHG emissions.[14]

SOUTH COAST AQMD WORKING GROUP

To provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents, South Coast AQMD convened a GHG CEQA Significance Threshold Working Group (Working Group). The South Coast AQMD Working Group (Meeting No. 15) identified a tiered approach for evaluating GHG emissions for development projects where South Coast AQMD is not the lead agency (South Coast AQMD 2010):

[14] The Governor's Office of Planning and Research recommendations include a requirement that such a plan must be adopted through a public review process and include specific requirements that reduce or mitigate the project's incremental contribution of GHG emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable, notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

- **Tier 1.** If a project is exempt from CEQA, project-level and cumulative GHG emissions are less than significant.

- **Tier 2.** If the project complies with a GHG emissions reduction plan or mitigation program that avoids or substantially reduces GHG emissions in the project's geographic area (i.e., city or county), project-level and cumulative GHG emissions are less than significant.

- **Tier 3.** If GHG emissions are less than the screening-level threshold, project-level and cumulative GHG emissions are less than significant.

  For projects that are not exempt or where no qualifying GHG reduction plans are directly applicable, South Coast AQMD requires an assessment of GHG emissions. The South Coast AQMD Working Group identified a screening-level threshold of 3,000 $MTCO_2e$ annually for all land use types or the following land-use-specific thresholds: 1,400 $MTCO_2e$ for commercial projects, 3,500 $MTCO_2e$ for residential projects, or 3,000 $MTCO_2e$ for mixed-use projects. These bright-line thresholds are based on a review of the Governor's Office of Planning and Research database of CEQA projects. Based on their review of 711 CEQA projects, 90 percent of CEQA projects would exceed the bright-line thresholds identified above. Therefore, projects that do not exceed the bright-line threshold would have a nominal, and therefore, less than cumulatively considerable impact on GHG emissions:

- **Tier 4.** If emissions exceed the screening threshold, a more detailed review of the project's GHG emissions is warranted.

  The South Coast AQMD Working Group has identified an efficiency target for projects that exceed the screening threshold of 4.8 $MTCO_2e$ per year per service population ($MTCO_2e$/year/SP) for project-level analyses and 6.6 $MTCO_2e$/year/SP for plan level projects (e.g., program-level projects such as general plans) for the year 2020.[15] The per capita efficiency targets are based on the AB 32 GHG reduction target and 2020 GHG emissions inventory prepared for CARB's 2008 Scoping Plan.

The bright-line screening-level criterion of 3,000 $MTCO_2e$/yr is used as the significance threshold for this project. Therefore, if the project operation-phase emissions exceed the 3,000 $MTCO_2e$/yr threshold, GHG emissions would be considered potentially significant in the absence of mitigation measures.

[15] It should be noted that the Working Group also considered efficiency targets for 2035 for the first time in this Working Group meeting.

Re: 49th Street Elementary School – 750 East 49th Street, Los Angeles, CA 90011 – City of Los Angeles Tree Report

Dear Mr. Mele,

This letter addresses our office's site visit on July 6, 2022, to the property at 750 East 49th Street in Los Angeles, California. Carlberg Associates was retained to visit the property, inventory all qualifying private property trees and prepare a report in accordance with the City of Los Angeles' Tree Preservation Ordinance No. 186,873 (Chapter IV, Article 6 of the Los Angeles Municipal Code) and the guidelines set forth by the City of Los Angeles Planning Department. Protected trees and shrubs as set forth in the Ordinance are coast live oak, western sycamore, Southern California black walnut, California bay laurel, Mexican elderberry and toyon with trunk diameters (measured at 4.5 feet above grade) of 4 inches or greater. The Planning Division requires that all other trees with trunk diameters greater than 8 inches are included in the inventory, as well as any off-site trees whose canopies overhang the subject property.

The table on the following pages sets forth the data for the fifty-seven (57) inventoried trees: all are private property trees. There were no right-of-way trees included in this inventory. There are no additional trees whose canopies overhang the project site. ***Seven (7) of the private property trees are considered protected by the City of Los Angeles' Tree Preservation Ordinance No. 186873.*** By virtue of their trunk diameter size of eight inches and greater, thirty-seven (37) private property trees are considered 'significant' as defined by the City's Planning Division.

TABLE 1 – SUMMARY OF INVENTORIED TREES

Common Name	Botanical Name	Quantity	Protected?
carrotwood	*Cupaniopsis anacardioides*	7	No
Chinese elm	*Ulmus parvifolia*	6	No
chitalpa	*x Chitalpa tashkentensis*	3	No
coast live oak	*Quercus agrifolia*	7	Yes
crape myrtle	*Lagerstroemia indica*	5	No
floss silk	*Ceiba speciosa*	3	No
Indian laurel fig	*Ficus microcarpa*	2	No
jacaranda	*Jacaranda mimosifolia*	3	No
Modesto ash	*Fraxinus velutina 'Modesto'*	1	No
mulberry	*Morus alba*	3	No
shamel ash	*Fraxinus uhdei*	12	No
weeping bottlebrush	*Callistemon viminalis*	5	No
	TOTALS	**57**	**7**

TABLE 2 – TREE INVENTORY DATA

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	"Protected", "ROW", or "Significant" Tree	Comments
1	shamel ash	*Fraxinus uhdei*	28.1	28	12/18/17/10	B	B	Significant	in cut out on asphalt, topped, minor dieback
2	shamel ash	*Fraxinus uhdei*	35	30	26/29/26/18	B	B-	Significant	cavity on west, in cutout on asphalt, topped, stub cuts
3	coast live oak	*Quercus agrifolia*	16.1	22	17/20/15/21	C+	B-	Protected	in small cutout on asphalt, sparse, MPE, bark checking
4	coast live oak	*Quercus agrifolia*	9.9	16	10/7/9/11	B+	B+	Protected	in small cutout on asphalt, MPE
5	coast live oak	*Quercus agrifolia*	11.1	18	10/12/15/9	C	C+	Protected	in small cutout on asphalt, sparse, MPE, extensive dieback
6	coast live oak	*Quercus agrifolia*	12.9	18	14/13/15/10	B	B	Protected	in small cutout on asphalt, MPE
7	coast live oak	*Quercus agrifolia*	14	18	8/13/15/14	A-	B	Protected	in small cutout on asphalt, MPE
8	coast live oak	*Quercus agrifolia*	6.5	14	4/12/9/6	B-	B-	Protected	in small cutout on asphalt, MPE, small leaves, leans southeast, trunk buried
9	shamel ash	*Fraxinus uhdei*	25.1	35	15/16/20/13	B	B	Significant	in cutout on asphalt, MPE, asphalt cracking
10	coast live oak	*Quercus agrifolia*	10.6	16	9/12/11/12	B	B	Protected	in small cutout on asphalt, MPE, mech dam on trunk
11	shamel ash	*Fraxinus uhdei*	41.5	40	18/22/21/19	B	B	Significant	in cutout on asphalt, MPE, topped, stub cuts

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	"Protected", "ROW", or "Significant" Tree	Comments
12	shamel ash	*Fraxinus uhdei*	40.1	40	23/26/23/20	B	B	Significant	in cutout on asphalt, MPE, topped, stub cuts, active common raven nest in upper canopy as of 7.6.2022
13	mulberry	*Morus alba*	3.1	14	7/8/7/10	B+	B	No	staked, small branch tear
14	carrotwood	*Cupaniopsis anacardioides*	11.2	25	4/11/11/9	B	C+	Significant	in cutout, canker on south side of trunk - decay
15	carrotwood	*Cupaniopsis anacardioides*	13.8	22	5/12/10/11	B-	B-	Significant	canker, pipe on west under roots, MPE, leans away from building
16	carrotwood	*Cupaniopsis anacardioides*	13.6	25	3/9/9/8	B-	C	Significant	canker, COD, leans away from building, MPE
17	carrotwood	*Cupaniopsis anacardioides*	16.5	22	4/12/11/10	B-	B-	Significant	canker, sparse, leans away from building

55	chitalpa	*x Chitalpa tashkentensis*	3.6	10	0/8/7/4	B	B	No	leans away from building
56	Indian laurel fig	*Ficus microcarpa*	31.2	40	21/28/29/18	A	B-	Significant	exposed roots, roots pressing against building, sidewalk uplift, trunk leans south away from building, canopy pruned on south for powerlines
57	Indian laurel fig	*Ficus microcarpa*	42.4	45	25/34/36/33	A	B	Significant	ants, exposed roots, leans south away from building, canopy on south pruned for powerline

DBH – Diameter at breast height. A forestry term used to describe a tree's trunk diameter measured at 4.5 feet above grade. Often used as a representation of tree size.

MBA – Multiple branch attachments

MPE – Multiple pruning events

COD – Column of decay

EXHIBIT A – AERIAL IMAGE OF SUBJECT PROPERTY

HEALTH AND STRUCTURE GRADE DEFINITIONS

Health and structure ratings of the trees are based on the archetype tree of the same species through a subjective evaluation of its physiological health, aesthetic quality, and structural integrity.

Overall physiological condition (health) and structural condition were rated A-F:

Health

A. Outstanding – Exceptional trees of good growth form and vigor for their age class; exhibiting very good to excellent health as evidenced by normal to exceptional shoot growth during current season, good bud development and leaf color, lack of leaf, twig or branch dieback throughout the crown, and the absence of decay, bleeding, or cankers. Common leaf and/or twig pests may be noted at very minor levels.

B. Above average – Good to very good trees that exhibit minor necrotic or physiological symptoms of stress and/or disease; shoot growth is less than reasonably expected, leaf color is less than optimal in some areas, the crown may be thinning, minor levels of leaf, twig, and branch dieback may be present, and minor areas of decay, bleeding, or cankers may be manifesting. Minor amounts of epicormic growth may be present. Minor amounts of fire damage or mechanical damage may be present. Still healthy, but with moderately diminished vigor and vitality. No significant decline noted.

C. Average – Average, moderately good trees whose growth habit and physiological or fire-induced symptoms indicate an equal chance to either decline or continue with good health into the near future. Most of these trees exhibit moderate to significant small deadwood in outer crown areas, decreased shoot growth and diminished leaf color and mass. Some stem and branch dieback is usually present and epicormic growth may be moderate to extensive. Cavities, pockets of decay, relatively significant fire damage, bark exfoliation, or cracks may be present. Moderate to significant amounts of insect or disease symptoms may be present; the tree may be shaded or crowded in such a way that it is expected to negatively impact the lifespan of the tree. Tree may be in early decline.

D. Below Average/Poor - trees whose growth habit and physiological or fire-induced symptoms indicate significant, irreversible decline. Most of these trees exhibit significant dieback of wood in the crown, possibly accompanied by significant epicormic sprouting. Shoot growth and leaf color and mass is either significantly diminished or nonexistent throughout the crown. Cavities, pockets of decay, significant fire damage, bark exfoliation, and/or cracks may be present. Significant amounts of insect or disease symptoms may be present; the tree may be shaded or crowded in such a way that it has negatively impacted the lifespan of the tree. Tree appears to be in irreversible decline.

F. Dead or in spiral of decline – this tree exhibits very little to no signs of life.

Structure

A. Outstanding – Trees with outstanding structure for their species exhibit trunk and branch arrangement and orientation that result in a sturdy form or architecture that resists failure under normal circumstances. The spacing, orientation, and size of the branches relative to the trunk are quintessential for the species and free from defects. No outward sign of decay or pathological disease is present. Some trees exhibit naturally inherent branching defects, like multiple, narrow points of attachment from one point on the trunk, which would preclude them from achieving an “A” grade.

B. Above average - Trees with good to very good structure for their species. They exhibit trunk and branch arrangement and orientation that result in a relatively sturdy form or architecture that resists failure under normal circumstances, but may have some mechanical damage, over-pruning, or other minor structural defects. The spacing, orientation, and size of the branches relative to the trunk are still in the normal range for the species, but they exhibit a minor degree of defects. Minor, sub-critical levels of decay or pathological disease may be present, but the degree of damage is not yet structurally significant. Trees that exhibit naturally inherent branching defects, like multiple, narrow points of attachment from one point on the trunk, would generally fall into this category. A small percentage of the canopy may be shaded or crowded, but not in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree.

C. Average - Trees with moderately good structure for their species, but with obvious defects. They exhibit trunk and branch arrangement and orientation that result in a less than sturdy form or architecture, which reduces their resistance to failure under normal circumstances. Moderate levels of mechanical damage, over-pruning, or other structural defects may be present. The spacing, orientation, and size of some of the branches relative to the trunk are not in the normal range for the species. Moderate to significant levels of decay or pathological disease may be present that increase the likelihood of structural instability. Influences such as an excessive trunk lean, slope erosion, root pruning, or other growth-inhibiting factors may be present. A moderate to significant percentage of the canopy may be shaded or crowded in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree. Risk of full or partial failure in the near future appears to be moderately elevated.

D. Well Below Average/Poor - Trees poor structure for their species and with obvious defects. They exhibit trunk and branch arrangement and orientation that result in a significantly less than sturdy form or architecture, significantly reducing their resistance to failure under normal circumstances. Significant levels of mechanical damage, over-pruning, or other structural defects may be present. The spacing, orientation, and size of many of the branches relative to the trunk are not in the normal range for the species. Significant levels of decay or pathological disease may be present that increase the likelihood of structural instability. Influences such as an excessive trunk lean, slope erosion, root pruning, or other growth-inhibiting factors may be present. A significant percentage of the canopy may be shaded or crowded in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree. Risk of full or partial failure in the near future appears to be advanced.

F. Severely Compromised – trees with very poor structure and numerous or severe defects due to growing conditions, historical or recent pruning, mechanical damage, history of limb or trunk failures, advanced and irreparable decay, disease, or severe fire damage. Trees with this rating are in severe, irreparable decline, or are barely alive. Risk of full or partial failures in the near future may be severe.

ARBORIST DISCLOSURE STATEMENT

Arborists are tree specialists who use their education, knowledge, training and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near trees. Clients may choose to accept or disregard the recommendations of the arborist, or to seek additional advice.

Arborists cannot detect every condition that could possibly lead to the structural failure of a tree. Trees are living organisms that fail in ways we do not fully understand. Conditions are often hidden within trees and below ground. Arborists cannot guarantee that a tree will be healthy or safe under all circumstances, or for a specified period of time. Likewise, remedial treatments, like any medicine, cannot be guaranteed.

Treatment, pruning and removal of trees may involve considerations beyond the scope of the arborist's services such as property boundaries, property ownership, site lines, disputes between neighbors, and other issues. Arborists cannot take such considerations into account unless complete and accurate information is disclosed to the arborist. An arborist should then be expected to reasonably rely upon the completeness and accuracy of the information provided.

Trees contribute greatly to our enjoyment and appreciation of life. Nonetheless, they are subject to the laws of gravity and physiological decline. Therefore, neither arborists nor tree owners can be reasonably expected to warrant unfailing predictability or elimination of risk.

Trees can be managed, but they cannot be controlled. To live near trees is to accept some degree of risk. The only way to eliminate all risk associated with trees is to eliminate all trees.

Risk assessments were neither requested nor performed on any of the trees for this project.

CY CARLBERG
CARLBERG ASSOCIATES
828 Fifth Street, Suite 3 • Santa Monica • California • 90403
cy@cycarlberg.com • o: 310.451.4804 • www.cycarlberg.com

Education — B.S., Landscape Architecture, California State Polytechnic University, Pomona, 1985
Graduate, Arboricultural Consulting Academy, American Society of Consulting Arborists, Chicago, Illinois, February 2002
Graduate, Municipal Forestry Institute, Lied, Nebraska, 2012

Experience — Consulting Arborist, Carlberg Associates, 1998-present
Manager of Grounds Services, California Institute of Technology, Pasadena, 1992-1998
Director of Grounds, Scripps College, Claremont, 1988-1992

Certificates — Certified Arborist (#WE-0575A), International Society of Arboriculture, 1990
Registered Consulting Arborist (#405), American Society of Consulting Arborists, 2002
Certified Urban Forester (#013), California Urban Forests Council, 2004
Qualified Tree Risk Assessor, International Society of Arboriculture, 2011

AREAS OF EXPERTISE

Ms. Carlberg is experienced in the following areas of tree management and preservation:

- Tree health and risk assessment
- Master Planning
- Historic landscape assessments, preservation plans, reports
- Tree inventories and reports to satisfy jurisdictional requirements
- Expert Testimony
- Post-fire assessment, valuation, and mitigation for trees and native plant communities
- Value assessments for native and non-native trees
- Pest and disease identification
- Guidelines for oak preservation
- Selection of appropriate tree species
- Planting, pruning, and maintenance specifications
- Tree and landscape resource mapping – GPS, GIS, and AutoCAD
- Planning Commission, City Council, and community meetings representation

PREVIOUS CONSULTING EXPERIENCE

Ms. Carlberg has overseen residential and commercial construction projects to prevent damage to protected and specimen trees. She has thirty-five years of experience in arboriculture and horticulture and has performed tree health evaluation, value and risk assessment, and expert testimony for private clients, government agencies, cities, school districts, and colleges. Representative clients include:

The Huntington Library and Botanical Gardens
The Los Angeles Zoo and Botanical Gardens
The Rose Bowl and Brookside Golf Course, Pasadena
Walt Disney Concert Hall and Gardens
The Art Center College of Design, Pasadena
Pepperdine University
Loyola Marymount University
The Claremont Colleges (Pomona, Scripps, CMC, Harvey Mudd, Claremont Graduate University, Pitzer, Claremont University Center)
Quinn, Emanuel, Urquhart and Sullivan (attorneys at law)
Getty Trust – Eames House
Historic Resources Group
The City of Claremont
The City of Beverly Hills
The City of Pasadena
The City of Los Angeles
The City of Santa Monica
Santa Monica/Malibu Unified School District
San Diego Gas & Electric
Los Angeles Department of Water and Power
Rancho Santa Ana Botanic Garden, Claremont
Latham & Watkins, LLP (attorneys at law)
Architectural Resources Group
AHBE Landscape Architects
Moule and Polyzoides, Architects and Urbanists

AFFILIATIONS

Ms. Carlberg serves with the following national, state, and community professional organizations:

- California Urban Forests Council, Board Member, 1995-2006
- Street Tree Seminar, Past President, 2000-present
- American Society of Consulting Arborists Academy, Faculty Member, 2003-2005; 2014
- American Society of Consulting Arborists, Board of Directors, 2013-2015
- Member, Los Angeles Oak Woodland Habitat Conservation Strategic Alliance, 2010-present

49th Street Elementary School Historic Resources Evaluation Report

HISTORIC RESOURCES GROUP

1.0 EXECUTIVE SUMMARY

At the request of the Los Angeles Unified School District (LAUSD), Historic Resources Group (HRG) has evaluated 49th Street Elementary School located at 750 E. 49th Street in the City of Los Angeles, California for potential historic significance. This historic assessment analyzes the property's eligibility for listing in the National Register of Historic Places (National Register), California Register of Historical Resources (California Register), and for designation as a City of Los Angeles Historic-Cultural Monument (HCM). The school is located in the Southeast Los Angeles Community Plan Area (CPA) and was previously identified as eligible for listing in the California Register of Historical Resources (California Register) and for designation as a City of Los Angeles Historic-Cultural Monument (HCM).

49th Street Elementary School is re-evaluated in this report based on an observation of existing conditions on the property, primary and secondary source research related to the history of the property, review of the relevant historic contexts, and an analysis under the eligibility criteria and integrity thresholds for listing in the National Register of Historic Places (National Register), the California Register, and as a City of Los Angeles HCM. A site visit was conducted on March 17, 2022.

HRG has identified a potential historic district at the 49th Street Elementary School that is eligible for listing in the National Register, California Register, and as a City of Los Angeles HCM. The potential historic district consists of four (4) contributing buildings and three (3) contributing sheltered corridors with a period of significance from 1935 to 1936. Contributors to the potential historic district are the West Building, Main Building, South Building, Auditorium Building, and sheltered corridors #1, #2, and #3.

1.1 Project Team

Research, field inspection, and analysis were performed by Alexandra Madsen, Senior Architectural Historian; Christine Lazzaretto, Principal; and Ani Mnatsakanyan, Associate Architectural Historian. Additional assistance was provided by Molly Iker-Johnson, Architectural Historian, and Robby Aranguren, Planning Associate. All preparers are qualified professionals who meet the *Secretary of the Interior's Professional Qualification Standards* in their respective fields.

1.2 Methodology

This report was prepared using primary and secondary sources related to the history and development of the City of Los Angeles, the Los Angeles Unified School District (LAUSD), and 49th Street Elementary School.

Documents that were consulted include: historical photographs and aerial images; historical building plans; Sanborn Fire Insurance maps; historic context statements; local histories; The Built Environment Resource Directory (BERD), and the California State Historic Resources Inventory, Los Angeles County. Additionally, past surveys of the school were consulted, including the 2001-2004 historic survey and historic context statement prepared by Science

Applications International Corporation and the 2014 historic survey and historic context statement prepared by Sapphos Environmental, Inc.

2.0 INTRODUCTION

2.1 Site Location and Description

The 49th Street Elementary School is located at 750 E. 49th Street in Los Angeles, California.[1] The school occupies a 5.7-acre rectangular site comprised of two parcels (Assessor's Parcel Numbers [APNs] 5108-011-909 and 5108-011-910).

The property is located in the Southeast Los Angeles Community Plan Area (CPA) of the City of Los Angeles. It is bounded by E. 49th Street to the north, McKinley Avenue to the east, E. 50th Street to the south, and single-family and multi-family residences to the west. The site is relatively flat. The location of the campus is shown below in Figure 1.

2.2 Current Historic Status

49th Street Elementary School has previously been evaluated by various LAUSD historic surveys. Between 2001 and 2004, Science Applications International Corporation (SAIC), with funding from the Getty Research Institute completed a historic resources survey of LAUSD schools. This survey identified the 49th Street Elementary School as eligible for listing in the California Register and for designation as a City of Los Angeles HCM (3CS Status Code).[2] The 2014 survey of LAUSD schools by Sapphos Environmental, Inc. adopted these findings.[3]

The California Office of Historic Preservation (OHP) maintains the Built Environment Resources Directory (BERD), a database of previously evaluated resources throughout the state. The BERD contains information for cultural resources that have been processed through OHP. This includes resources reviewed for eligibility for the National Register of Historic Places and the California Historical Landmarks program through federal and state environmental compliance laws, and resources nominated under federal and state registration programs. 49TH Street Elementary School is not identified in the BERD as a potential historic property.

[1] An additional address that has been historically associated with the school is 4917 McKinley Avenue.

2.3 Regulatory Framework

Historical Resources under CEQA

The California Environmental Quality Act (CEQA) is the principal statute governing environmental review of projects occurring in the state and is codified in Public Resources Code (PRC) Section 21000 et seq. CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA Section 21084.1, a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.

CEQA Guidelines Section 15064.5 recognizes that historical resources include: (1) resources listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources; (2) resources included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any objects, buildings, structures, sites, areas, places, records, or manuscripts which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record.

Historic Designations

Historical and cultural resources fall within the jurisdiction of several levels of government. The framework for the identification and, in certain instances, protection of cultural resources is established at the federal level, while the identification, documentation, and protection of such resources are often undertaken by state and local governments. As described below, the principal federal, State, and local laws governing and influencing the preservation of historical resources of national, State, regional, and local significance include:

- The National Historic Preservation Act of 1966, as amended;
- The Secretary of the Interior's Standards for the Treatment of Historic Properties (Secretary's Standards);
- The California Environmental Quality Act (CEQA);
- The California Register of Historical Resources (California Register);
- The California Public Resources Code;
- The City of Los Angeles General Plan;
- The City of Los Angeles Cultural Heritage Ordinance (Los Angeles Administrative Code, Section 22.171);
- The City of Los Angeles Historic Preservation Overlay Zone Ordinance (Los Angeles Municipal Code [LAMC], Section 12.20.3); and
- The City of Los Angeles Historic Resources Survey (SurveyLA).

National Register of Historic Places

The National Historic Preservation Act of 1966 established the National Register of Historic Places (National Register) as "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the Nation's historic resources and to indicate what properties should be considered for protection from destruction or impairment."[4] The National Register recognizes a broad range of historical and cultural resources that are significant at the national, state, and local levels and can include districts, buildings, structures, objects, prehistoric archaeological sites, historic-period archaeological sites, traditional cultural properties, and cultural landscapes.[5] Within the National Register, approximately 2,500 (3 percent) of the more than 90,000 districts, buildings, structures, objects, and sites are recognized as National Historic Landmarks or National Historic Landmark Districts as possessing exceptional national significance in American history and culture.[6]

Whereas individual historic properties derive their significance from one or more of the criteria discussed in the subsequent section, a historic district derives its importance from being a unified entity, even though it is often composed of a variety of resources. With a historic district, the historic resource is the district itself. The identity of a district results from the interrelationship of its resources, which can be an arrangement of historically or functionally related properties.[7] A district is defined as a geographic area of land containing a significant concentration of buildings, sites, structures, or objects united by historic events, architecture, aesthetic, character, and/or physical development. A district's significance and historic integrity determine its boundaries.

A resource that is listed in or eligible for listing in the National Register is considered "historic property" under Section 106 of the National Historic Preservation Act.

Criteria

To be eligible for listing in the National Register, a resource must be at least 50 years of age, unless it is of exceptional importance as defined in Title 36 CFR, Part 60, Section 60.4(g). In addition, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Four criteria for evaluation have been established to determine the significance of a resource. Resources can be considered significant if they:

A. Are associated with events that have made a significant contribution to the broad patterns of our history;

B. Are associated with the lives of persons significant in our past;

[4] 36 Code of Federal Regulations (CFR) 60.
[5] The identification of archaeological sites and traditional cultural properties is outside the scope of this report.
[6] United States Department of the Interior, National Park Service, National Historic Landmarks Frequently Asked Questions. https://www.nps.gov/subjects/nationalhistoriclandmarks/faqs.htm. Accessed October 20, 2021.
[7] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 5.

C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Have yielded, or may be likely to yield, information important in prehistory or history.[8]

Context

To be eligible for listing in the National Register, a property must be significant within a historic context. National Register Bulletin #15 states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning... is made clear."[9] A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

Integrity

In addition to meeting one or more of the criteria of significance, a property must have integrity, which is defined as "the ability of a property to convey its significance."[10] The National Register recognizes seven qualities that, in various combinations, define integrity. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance. In general, the National Register has a higher integrity threshold than State or local registers.

The National Register recognizes seven aspects or qualities that comprise integrity: location, design, setting, materials, workmanship, feeling, and association. These qualities are defined as follows:

- *Location* is the place where the historic property was constructed or the place where the historic event took place.
- *Design* is the combination of elements that create the form, plan, space, structure, and style of a property.
- *Setting* is the physical environment of a historic property.
- *Materials* are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

[8] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 8. Criterion D typically applies to potential archaeological resources, which is outside the scope of this report.
[9] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, pages 7 and 8.
[10] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 44.

- *Workmanship* is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- *Feeling* is a property's expression of the aesthetic or historic sense of a particular period of time.
- *Association* is the direct link between an important historic event or person and a historic property.[11]

California Register of Historical Resources

The California Register of Historical Resources (California Register) is "an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change."[12] The California Register was enacted in 1992, and its regulations became official on January 1, 1998. The California Register is administered by the California Office of Historic Preservation (OHP). The criteria for eligibility for the California Register are based upon National Register criteria.[13] Certain resources are determined to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register. To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, State, and/or federal level under one or more of the following four criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States; or
2. It is associated with the lives of persons important to local, California or national history; or
3. It embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values; or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.[14]

A resource eligible for the California Register must meet one of the criteria of significance described above and retain enough of its historic character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

[11] U.S. Department of the Interior, *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* (Washington D.C.: National Park Service, 1995), pages 44-45.
[12] California Public Resources Code, Section 5024.1[a].
[13] California Public Resources Code, Section 5024.1[b].
[14] Criterion 4 addresses potential archaeological resources, which is outside the scope of this assessment.

Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and,
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources with a significance rating of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historical resources;
- Historic districts; and,
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone.

City of Los Angeles Historic-Cultural Monuments

The Los Angeles City Council adopted the Cultural Heritage Ordinance in 1962 and most recently amended it in 2018 (Sections 22.171 et seq. of the Administrative Code). The Ordinance created a Cultural Heritage Commission (CHC) and criteria for designating a Historic-Cultural Monument (HCM). The CHC is comprised of five citizens, appointed by the Mayor, who have exhibited knowledge of Los Angeles history, culture, and architecture. The City of Los Angeles Cultural Heritage Ordinance states that an HCM designation is reserved for those resources that have a special aesthetic, architectural, or engineering interest or value of a historic nature and meet one of the following criteria:

1. The proposed HCM is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community;
2. The proposed HCM is associated with the lives of historic personages important to national, state, city, or local history; or
3. The proposed HCM embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder, or architect whose individual genius influenced his or her age.[15]

[15] City of Los Angeles, Los Angeles Administrative Code, Section 22.171.7.

Unlike the National and California Registers, the Cultural Heritage Ordinance makes no mention of concepts such as physical integrity or period of significance. However, in practice, the seven aspects of integrity from the National Register and California Register are applied similarly and the threshold of integrity for individual eligibility is similar. It is common for the CHC to consider alterations to nominated properties in making its recommendations on designations. Moreover, properties do not have to reach a minimum age requirement, such as 50 years, to be designated as HCMs.

In addition, the LAMC Section 91.106.4.5 states that the Los Angeles Department of Building and Safety "shall not issue a permit to demolish, alter or remove a building or structure of historical, archaeological or architectural consequence if such building or structure has been officially designated, or has been determined by state or federal action to be eligible for designation, on the National Register of Historic Places, or has been included on the City of Los Angeles list of HCMs, without the department having first determined whether the demolition, alteration or removal may result in the loss of or serious damage to a significant historical or cultural asset. If the department determines that such loss or damage may occur, the applicant shall file an application and pay all fees for the CEQA Initial Study and Check List, as specified in Section 19.05 of the LAMC. If the Initial Study and Check List identifies the historical or cultural asset as significant, the permit shall not be issued without the department first finding that specific economic, social or other considerations make infeasible the preservation of the building or structure."[16]

[16] City of Los Angeles, Los Angeles Municipal Code, Section 91.106.4.5.1.

3.0 CAMPUS SITE DESCRIPTION AND HISTORY

3.1 Exterior Architectural Description

The 49th Street Elementary School campus occupies approximately 5.7 acres. The campus is bounded to the north by East 49th Street, to the east by McKinley Avenue, to the south by East 50th Street, and to the west by single-family residences. The school campus is occupied by five (5) permanent buildings, one (1) permanent structure, four (4) sheltered corridors, and various open spaces. There is one (1) portable building, the Mechanical Shed.

The buildings are clustered along the northern, eastern, and southern boundaries of the campus, forming a "U" shape around a central play yard. Most of the campus consists of play yards and parking areas paved in asphaltic concrete and surrounded by chain link fencing. Landscaping is limited to lawns, shrubs, some trees in narrow setbacks along the three street frontages, and scattered trees in the play yards. The school is currently accessed via a pedestrian entrance on the north side of the Administration, Library & Classroom Building along E. 49th Street.

Existing buildings and features are listed below and are summarized in Table 1 ("Existing Conditions"). The names and function of some campus buildings have changed and evolved over the years. To avoid confusion, whenever possible, the buildings discussed in this report have been keyed to the official building naming system of 49th Street Elementary School. A map of the campus is provided below (Figure 2). Following this figure is an architectural description of each building and feature.

Figure 2. Site Map

49th Street Elementary School Historic Resources Evaluation Report

HISTORIC RESOURCES GROUP

Administration, Library, and Classroom Building/Classroom Building

The Administration, Library, and Classroom Building was constructed in 1965; an addition, known as the Classroom Building, was constructed in 1969. Together they form a two-story building with a rectangular plan and a one-story projection on the north façade. It has complex massing and asymmetrical composition. The two-story volume has a low-pitched hipped roof with plaster eave soffits and a canted fascia; the one-story volume has an asymmetrical front gable roof with open eaves and overhanging rakes. The exterior walls are finished in brick veneer, scored concrete, and textured cement plaster. Fenestration consists primarily of ribbons of four-light fixed and two-over-two double-hung aluminum sash windows at the east portion of the building; and high ribbon windows on the west portion. The primary entrance is asymmetrically located on the north (primary) façade and consists of a pair of partially glazed, divided light doors with sidelights and transom light, accessed by a projecting porch. There is an exterior metal staircase on the west façade with guardrails of metal mesh and metal pipe.

North Façade

North Façades

South and East Façades

South Façade

West and South Façades

West Façade Staircase

West Building

The West Building was constructed in 1923 and altered in 1935. It is a one-story building with a roughly "L"-shaped plan, simple massing, and asymmetrical composition. It has a flat roof with a low parapet. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. Fenestration consists primarily of three-over-three wood sash double hung windows in single or coupled configurations, some with transom panels and others with projecting subsills. The primary entrance is asymmetrically located on the south façade and consists of a pair of flush doors with a six-light transom light; the doors are accessed by a wide concrete stoop and steps with a shaped plastered parapet. Two secondary entrances on the south façade consist of flush doors with metal canopies, accessed by a concrete ramp and steps with metal pipe guardrails.

The interior of the West Building is divided into several spaces. Most classrooms are accessible via a central hallway. Two additional rooms, a classroom and kitchen, are accessible via the concrete ramp along the primary façade. The building's interior has tile flooring, plaster walls, and acoustical tile ceilings. It has flush wood doors with flat wood casings and baseboards; some doors have flush wood transom panels. The kitchen/staff room features wood cabinets.

Main Building

The Main Building was designed by architect Harry C. Deckbar and constructed in 1935. It is a PWA Moderne style one-story building with a rectangular plan, balanced but not strictly symmetrical composition, and complex massing consisting of a central volume flanked by wings. The central volume has a moderately pitched side gable roof with asphalt composition shingle roofing and a continuous eave cornice; the flanking wings have flat roofs with built-up roofing. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. The east (primary) façade of the central volume is framed with stylized fluted pilasters. Fenestration consists primarily of horizontal groupings of six-over-six and eight-over-eight double hung wood sash windows; some window openings are infilled with solid panels. The primary entrance, now blocked features some Neoclassical elements, is symmetrically located on the east façade of the central block and consists of solid panels in the configuration of doors with sidelights and transom lights, with reeded jambs and a stylized architrave. It is recessed under a pedimented gable supported on stylized fluted pilasters and flanked by wood posts. The entrance is accessed by a wide flight of concrete steps with parastedes and balustrades. There is a secondary entrance on the north façade, consisting of a pair of flush doors in a rectangular recess flanked by stylized fluted pilasters and accessed by concrete steps with parastedes.

The interior of the Main Building features a central hallway that opens to classrooms. The building has resilient tile floors, plaster walls, and acoustical tile ceilings. It has wood baseboards and casings. Most interior doors in this building feature transom panels. A wood trophy case is located in the hallway.

South Building

The South Building was designed by architect Harry C. Deckbar and constructed in 1935. It is a one-story PWA Moderne style building with a rectangular plan, simple massing, and a flat roof with a low parapet and metal coping. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. Fenestration consists primarily of horizontal groupings of six-over-six double hung wood sash windows; some window openings are infilled with solid panels. The east façade is symmetrically composed around the primary entrance, which consists of a pair of flush doors with a divided-light transom light in a rectangular recess flanked by stylized reeded pilasters. The entrance is accessed by a flight of concrete steps with concrete parastedes.

The interior of the South Building features a central hallway that opens to classrooms. It has wood and resilient tile floors, plaster walls, and acoustical tile ceilings. It has wood cabinets, radiators, and ceramic water fountains.

Auditorium Building

The Auditorium Building was designed by architect Harry C. Deckbar and constructed in 1936. It is a PWA Moderne style one-story building with a rectangular plan, simple massing, and symmetrical composition and a bow truss roof. The exterior walls are finished in textured cement plaster and articulated with piers and a continuous stringcourse and sill course; the corners are highlighted with wide, channeled piers. Fenestration consists primarily of six-over-six double hung wood sash windows. The primary entrance is symmetrically located on the south façade and consists of a pair of flush doors with a transom panel and architrave, in a rectangular recess framed by stylized fluted pilasters supporting a pediment. The entrance is accessed by a concrete staircase flanked with parastedes and curvilinear metal pipe railings. Secondary entrances on the east and west façades consist of flush doors with metal hoods, accessed by concrete steps with metal pipe guardrails.

The interior of the Auditorium Building features an open auditorium space with a restroom set behind the stage. The building has a raked floor with resilient tile flooring, acoustical tile ceiling, and fixed seating. The walls are plaster with a wood baseboard, beaded dado rail, and plaster entablature. The stage has a proscenium framed with fluted pilasters supporting a stylized entablature.

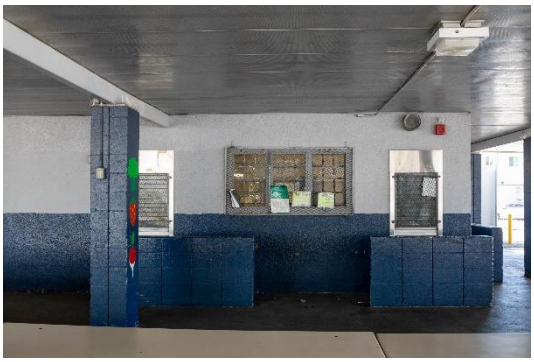
Cafeteria/Lunch Pavilion



The Cafeteria/Lunch Pavilion was constructed in 1969. It is a one-story building with an irregular plan, complex massing and asymmetrical composition. It is composed of two distinct parts: a kitchen with an L-shaped plan, shed roofs with boxed eaves and rakes, and exterior walls finished in cement plaster; and an open-sided shelter wrapping the north and west sides of the kitchen, with a flat roof supported on wood beams, concrete masonry columns and tube steel posts. The entrance consists of a flush door. Fenestration consists of a grouping of three windows with metal security screening, and service windows with metal roll-up shutters and metal security screens.

Sheltered Corridors (4)

There are four sheltered corridors on the campus, which connect separate buildings. Two elevated sheltered corridors from the 1930s (#1 and #2) connect the Main Building to the West and South Buildings. They have flat roofs with plaster soffits, wood beams with scalloped friezes, wood posts, scored concrete paving, and metal pipe guardrails. A third sheltered corridor dating from the 1930s (#3) connects the South Building to the Auditorium Building. It has a flat roof with plaster fascias and soffit supported on paired metal pipe columns, on concrete curbs with metal pipe guardrails. A fourth sheltered corridor (#4) dates from the 1960s and connects the Auditorium Building to the Lunch Pavilion; it has a flat roof supported on square steel tube posts.

3.3 Site History and Construction Chronology

The 49th Street Elementary School is situated in the Southeast neighborhood of Los Angeles. Prior to the development of the school, the block that comprises the school campus was developed with single-family residences. The first construction phase of 49th Street Elementary School was completed in the early 1910s, and the school was dedicated in 1914. The school campus was designed by Frank K. Krucker and Harry C. Deckbar of Krucker and Deckbar.[17]

At the time of its dedication, the *San Pedro Pilot* recorded that 49th Street Elementary School was "said to be the latest and best in school buildings in the entire city."[18] The campus initially consisted of one main building located near McKinley Avenue and two smaller classrooms near the west side of the lot.[19] A photograph from the period shows the 2-story masonry building that was constructed in 1913. In 1923, a single two-story brick building (West Building) was also built on the site.

Original 49th Street Elementary School Main Building, c.1913 (*Los Angeles Public Library*)

The 1933 Long Beach earthquake, and then the 1934 Field Act, hastened the need for widespread school repairs and new construction, which accelerated the stylistic shift during this period.[20] Following the Long Beach Earthquake of 1933, the Los Angeles Unified School District decided to modernize the 49th Street campus.

As a result, the original main building on the campus was demolished.[21] As recorded in the *Illustrated Daily News,* "excellent brick and steel construction now being demolished and none of which failed, but many tons of ornamental concrete fell to the ground."[22]

[17] "Krucker & Deckbar," *Los Angeles Times,* January 1, 1914.

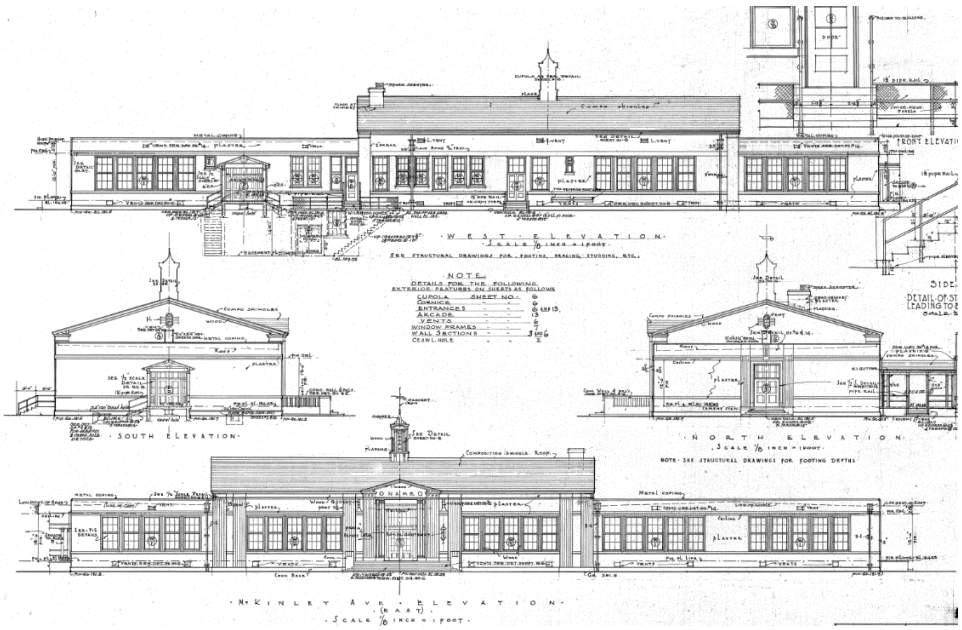
[21] City of Los Angeles building permit LA14989, issued November 5, 1934.
[22] "No Bolts in Iron," *Illustrated Daily News,* May 3, 1935.

Aerial View of 49th Street Elementary School and Vicinity, 1927 (*UCSB FrameFinder*)

While new buildings were under construction, classes were temporarily held in tents on the campus grounds.[23] The only building that was retained and retrofitted following the Long Beach Earthquake was the West Building, which is located in the northeastern region of the campus.



Students at 49th Street Elementary School Attending Classes in Temporary Tents, 1934 (*Los Angeles Public Library*)

Between 1933 and 1935, the school district spent approximately $2 million in rehabilitating schools in South Los Angeles, including 49th Street Elementary School.[24] The 49th Street

[23] "Three L.A. Schools Will Reopen Today," *Illustrated Daily News,* March 30, 1933.
[24] "Two Million Spent for Schools Locally," *The Southwest Wave,* December 31, 1935.

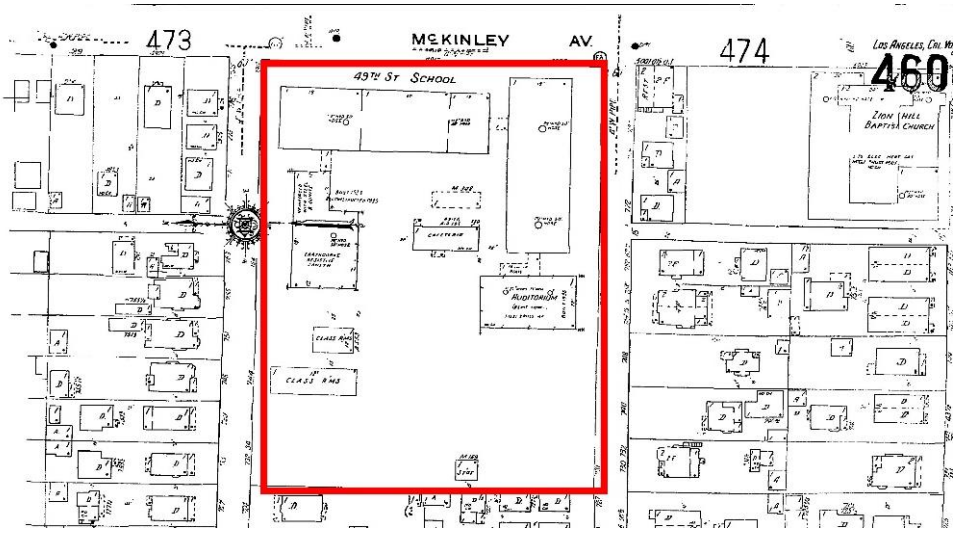
Elementary School received over $109,000, which was allotted for the construction of two new buildings (Main Building and South Building) and the reconstruction of a one-story school building (West Building). Work was completed by architect Harry C. Deckbar and contractors Johnson & Dahlquist.[25] The Main Building and South Building are both single-story wood frame buildings with concrete foundations and cement plaster exteriors. Deckbar also redesigned the West Building. Originally a two-story building, the West Building's second story was removed, and the building was reclad with cement plaster exteriors to match the design of the Main Building and South Building.

Building Plans for the Main Building, 1935 (*LAUSD*)

In 1936, Deckbar also designed the school's 1-story Auditorium Building. Unlike the other new buildings on the site, which were of wood frame construction, the Auditorium Building was of reinforced concrete and steel construction.[26] Harold A. Nelson served as the structural engineer and Brunzell & Jacobson served as the general contractors.[27]

A cafeteria building was also constructed at this time near the South Building; this cafeteria is no longer extant. All buildings designed by Deckbar were completed in the PWA Moderne style of architecture with some Neoclassical elements.

[25] "New Work Projects Scheduled," *The Los Angeles Times*, April 28, 1935.
[26] City of Los Angeles building permit LA13633, issued June 1936.
[27] "For Auditorium," *Los Angeles Times*, June 14, 1936.



PWA Moderne-style Main Building, 1935 (*Los Angeles Public Library*)

The school underwent some alterations in the 1950s. In 1950, a permit was issued to repair the school's storage shed, located at the west end of the parcel, to conform to code.[28] Simultaneously, a separate permit was issued for a 1-story building for temporary classrooms, which was located to the west of the West Building along 49th Street.[29] The repair work and temporary classrooms were designed by architect E.R.C. Billerbeck (not extant).

In the 1950s and 1960s, several additional classroom buildings were constructed on site. In 1952, a new 2-room classroom building was built, designed by A.B. Niebecker, Jr (not extant).[30] In 1960, architect Kenneth N. Bergstrom designed a larger classroom building, constructed by Carter Mack Building Inc. for the school (not extant). Both of these buildings were demolished in the late 1960s. These non-extant buildings are visible in a Sanborn Fire Insurance Map from 1950.

[28] City of Los Angeles building permit LA02875, issued January 1950.
[29] City of Los Angeles building permit LA02799, issued January 1950.
[30] City of Los Angeles building permit LA49097, issued September 10, 1952.

Sanborn Fire Insurance Map of Campus, Volume 4, Sheet 460, 1922-1950 (*Los Angeles Public Library*)

The Administration, Library & Classroom building was designed by Kent Attridge & Associates in 1965. In 1969, an addition was added to the west of the building (Classroom Building), designed by Harold L. Williams & Associates. Williams also designed the new Cafeteria/Lunch Pavilion that same year. The Administration, Library & Classroom Building/Classroom Building comprise a single building, but where they are joined is visually distinctive from the interior. The building is visible in an historical aerial photograph from 1971. In 1969, over 1,000 parents and community residents toured the new classrooms, school facilities, and newly completed 2-story annex building at the 49th Street Elementary School.[31]

Historical Aerial Photograph of 49th Street Elementary School, 1971 (*UCSB FrameFinder*)

In 1972, several buildings on campus were renamed in honor of black Americans during "Negro History Week." The theme of the program was "cementing Black greatness in the

[31] "Students Host Open House School Visitors," *Southeast Star-Wave,* May 8, 1969.

community," and names were chosen from those Black Americans who have made great contributions to the history and culture of the United States.[32]

Alterations to extant buildings on the 49th Street Elementary School campus are limited, and the school overall retains many of its character-defining features. The West Building was altered with cement plaster exterior and interior remodeling following the Long Beach Earthquake. The cupola on the Main Building was removed in the mid- to late-1970s. The Classroom Building was added to the Administration, Library, and Classroom Building as an addition in 1969.

Interior alterations have been extensive and include new resilient tile flooring, acoustical tile ceilings, the removal of interior transom lights, and alterations to fixtures. Some character-defining features have been retained, such as window and door surrounds, wood cabinets, radiators, and transom openings.

Table 1. Existing Conditions

[32] "49th Street School History Highlighted," *Southside Journal,* February 17, 1972.

4.0 FOCUSED NEIGHBORHOOD CONTEXT

The 49th Street Elementary School is located in the Southeast Los Angeles CPA, which was surveyed by SurveyLA in 2012. Background information regarding the area is excerpted from this survey report below.

Additional information regarding Central Avenue, the specific area of Southeast Los Angeles wherein 49th Street Elementary School is located, is also excerpted from the *Historic Resources Associated with African Americans in Los Angeles* National Register Nomination. This section provides information on the history of Central Avenue and redlining, as an important event/trend/development pattern associated with the area.

4.1 History of Southeast Los Angeles[33]

The northern section of the Southeast Los Angeles CPA was within the original Los Angeles city boundary (incorporated in 1850). The remainder of the CPA was consolidated or annexed into the City of Los Angeles between 1859 and 1944. The CPA includes the neighborhoods of Historic South Central, South Park, Central Alameda, Florence, Green Meadows, Broadway-Manchester, and Watts.[34] Watts was an incorporated city prior to its consolidation into the City of Los Angeles.

The Southeast Los Angeles CPA developed in a southward pattern beginning in the late 19th century, as the city's growing network of streetcars allowed for development outside the historic city center. Though the area north of Slauson Boulevard was largely built out by the late 1910s, at this time the land to the south was still largely undeveloped and relatively remote. Much of it was used for vegetable and fruit cultivation by Chinese and Japanese residents. In 1903, however, a group of investors evicted the farmers and constructed the Ascot Park horse racing track at generally the area south of Slauson Boulevard and east of Avalon Boulevard. Referred to as being located in the "no man's land" on the skinny stretch of territory "running from Los Angeles to the sea,"[35] Ascot Park quickly became known as a notorious den of gambling and drinking. Its investors hoped to incorporate the area, and though unsuccessful, the larger area was known as Ascot Park until the late teens when the park (which converted to automobile racing from horse racing in the late 1900s) was dissolved altogether. The removal of the vast acreage of Ascot Park freed the land for residential and industrial development, which ensued at a monumental pace south of Slauson Boulevard in the 1920s.

The Southeast Los Angeles CPA became the center of the city's African American community during the first half of the 20th century. The African American community in Los Angeles was first concentrated in the historic city center, around the neighborhood that is now Little Tokyo. As the community grew, it began moving

[33] This section has been excerpted and adapted from the "Southeast Los Angeles Community Plan Area" Historic Resources Survey Report, prepared for the City of Los Angeles by Galvin Preservation Associates, March 2012.
[34] Neighborhood names and boundaries were derived from: "Mapping L.A. - Los Angeles Times." Mapping L.A. Los Angeles Times. Web. 09 September 2011.
[35] "Ascot Park in 'No Man's Land," *Los Angeles Times*, January 15, 1907.

south after the turn of the 20th century. Central Avenue was the primary thoroughfare around which this movement and development was centered, and blacks created a vibrant community there. By the late 1920s, the area had become home to jazz clubs, a vibrant social scene and nightlife, as well as black-owned businesses.

During this time, the area remained racially and ethnically diverse. Despite the increasing concentration of African Americans, they remained in the minority. Whites, Asians, and Hispanics made up the remaining portion of the area's population during this period. It was not until the 1930s that the demographics in the area began to shift as these groups moved out of the area, and blacks became an increasing percentage of the population. Large numbers of African Americans moved to Los Angeles in the late 1920s and 1930s, drawn by the promise of jobs and homeownership. Prevented from moving farther west by racially restrictive covenants, they moved into the neighborhoods of Southeast Los Angeles.

4.2 History of Central Avenue[36]

The 1920s represents a turning point in the history of Black settlement patterns. Racial segregation practices intensified, hemming in the community as its population rose.[37] Residential settlement continued south around Central Avenue during the decade, but now stopped abruptly at Slauson Avenue. Black families who tried to venture south of this line met violent resistance during the 1920s and 1930s.[38] As well, the east and west borders of Alameda and San Pedro Streets continued to hold firm, buttressed by race restrictive covenants which spread widely in surrounding white suburbs, tightening the racial boundaries around Central Avenue.

In 1928, the center of gravity rapidly relocated further south down Central Avenue. The opening of the Somerville Hotel was arguably the most important catalyst for this shift, bound as it was to a momentous moment in the history of Black Los Angeles. By the late 1920s, Central Avenue and 41st Street was the new heart of Black L.A. At this electrifying intersection, three architecturally significant structures stood proudly, signs of the growth, maturation, and growing sophistication of the Black community. They included the Somerville Hotel, the Hudson-Liddell Building, and the Golden State Mutual Life Insurance Building. These enterprises drew Black settlement down and around the Avenue. This southward shift was the fastest, most dramatic relocation of the community's center in its history. Significantly, it occurred in a period when strong middle-class leadership, vibrant cultural life, and Black enterprise symbiotically coexisted in a common physical area. The forces of physical dispersal had not yet set

[36] This section has been excerpted and adapted from: Teresa Grimes, "Historic Resources Association with African Americans in Los Angeles" National Register Nomination. December 31, 2008.
[37] Lawrence de Graaf argues this ushered in the beginning of the Black ghetto in Los Angeles, although this is a point of some scholarly controversy.
[38] de Graaf, "City of Black Angels," 346.

in. This synergy bestowed even greater significance to Central Avenue as *place*—a site of meaning, identity, and rootedness for Black Angelenos.

The southward shift was not only pulled by these dynamic enterprises, but it was likely pushed by changes occurring in the northern sections of Central Avenue. In 1922, this area was rezoned for manufacturing, and by 1939 over 100 industries had located there. This precipitated a decline in housing quality, with some residential structures falling into disrepair. Some single-family homes were transformed into boarding houses, shared by four families. A number of these were owned by whites. As early as the mid-1920s, the area around northern Central Avenue already showed signs of decline.[39]

During the 1930s, the Black population in Los Angeles continued to climb, with most newcomers settling in the Central Avenue vicinity. In 1930, approximately 17,500 Blacks lived in the area; over the next decade, nearly 25,000 Blacks would join them.[40] Despite these growing numbers, the newcomers fit comfortably into the area without undue overcrowding. This was largely due to an exodus of non-Blacks from the vicinity: repatriation depleted the Mexican and Filipino population, white working-class residents were drawn to new suburban developments with Federal Housing Administration assistance (these areas and programs were largely closed to people of color), and some ethnic Japanese returned to Japan. Other areas of Los Angeles were growing in population during the 1930s; the multiethnic Eastside was not. This exodus resulted in a demographic change around Central Avenue: Blacks went from being 35 percent to 60 percent of the population between 1930 and 1940. The community was also more mixed in terms of class, as many Black newcomers came from poor or working-class backgrounds. In the 1930s, Black home seekers continued to buy properties around Central Avenue, forming a residential "strip" bounded by 4th Street to the north and Slauson Avenue to the south, and San Pedro and Alameda Streets to the west and east.[41]

The 1940s was a watershed decade for Central Avenue. The tremendous influx of Black migrants during and after World War II put major strain on the community, changing its qualitative character. During the war years, 50,000 newcomers settled in and around the Avenue, with more arriving after the war. Despite this jump in population, the racial boundaries held firm around the community: Alameda to the east and now Broadway to the west (a block west of Main Street), Slauson to the south. With each new wave of migrants, the area grew increasingly crowded and overburdened.[42] The housing shortage that plagued all of Los Angeles hit the

[39] Lawrence B. de Graaf, "City of Black Angels: Emergence of the Los Angeles Ghetto, 1890-1930," Pacific Historical Review 39 (1970), 349-50; Octavia Vivian, *The Story of the Negro in Los Angeles County* (Federal Writers Project, 1936), 30.
[40] Ervin, *The Participation of the Negro in the Community Life of Los Angeles*, 12. Technically, they moved into the 62nd Assembly district, which hugged Central Avenue. Douglas Flamming, Bound for Freedom: Black Los Angeles in Jim Crow America (Berkeley: University of California Press, 2005), 308.
[41] Flamming, *Bound for Freedom*, 306-308.
[42] Josh Sides, *L.A. City Limits: African American Los Angeles from the Great Depression to the Present* (Berkeley: University of California Press, 2003), 98.

community particularly hard, hemmed in as it was by race restrictions, even as the Black population skyrocketed. The Black influx had a compounding effect. Not only did it strain the community, but it reinforced the boundaries around it. As more Blacks arrived, they became a more visible presence in the city, provoking greater white fears, animosity, and ultimately hostile efforts to defend their communities from Black incursions. Those efforts largely succeeded through the 1940s.

Housing around Central Avenue felt the strain. Rooms were rented out and families doubled up, overtaxing many dwellings. Yet by the late 1940s, the area still had its good blocks. In 1948, Negro Digest ranked L.A.- still anchored by Central Avenue- as one of "America's Ten Best Cities for Negroes," with its decent homes, quiet streets, and good schools.

Harry C. Deckbar[43]

Harry Charles Deckbar was born in 1882 in Louisiana. By 1910, Deckbar was working in Los Angeles for architect Frank George Krucker. From 1911 to 1914, Deckbar assisted Krucker, along with Thornton Fitzhugh, on the nine-story Trinity Auditorium (later known as the Embassy Hotel). In 1913, Deckbar and Krucker started a partnership. During this period, Krucker & Deckbar built the first buildings at 49th Street Elementary School (later demolished).[44] They also designed the Crown Apartments in Pasadena.[45] The partnership lasted until about 1917.

Deckbar briefly moved to Mobile, Alabama, in 1918, where he worked as a draftsman for the Chickasaw Shipbuilding Company. He moved back to Los Angeles in 1920 where opened his own architectural firm. In 1924, he designed the 2-story Masonic Temple in Southwest Los Angeles.[46] In addition to the Masonic Temple, 49th Street Elementary School was one of the more prominent projects designed by Deckbar. He passed away in Los Angeles in 1938. Deckbar is not considered a master architect.

Kent Attridge, AIA

Kent James Attridge was born in 1920 in Los Angeles, California. He graduated from Chouinard Art Institute in 1941 with an Associate Degree in Architecture.[47]

Attridge served in the Merchant Marines during World War II; then returned to Los Angeles and began practicing architecture.[48] In 1958 and 1959, Attridge served as architectural advisor to the U.S. government and traveled to Moscow with Harold C. McClellan, where he designed the American Exhibition Facility in Solkolniki Park.[49]

Upon his return, Attridge became the Vice President of Welton Beckett and Associates and served as the director of the Beckett Office in New York. While at Welton Beckett & Associates, Attridge worked on the Los Angeles Memorial Sports Arena (demolished). Attridge then served as an associate architect for Claud Beelman, AIA, until Beelman's death in 1963. He opened his own firm, Kent Attridge and Associates, and retained Beelman's staff in his new company.[50] In 1965, the Coliseum Commission authorized Attridge to design an underground trade show center under the Sports Arena at Exposition Park.[51] In 1977, Attridge joined Albert C. Martin and Associates as a Project Director.[52] Some of his notable works, many of which are no longer extant, include the Santa Monica Civic Auditorium,

Robinson's Anaheim, various Broadway-Hale stores, Macy's stores, and Saks Fifth Avenue.[53]Attridge passed away in 1995 at the age of 75. Attridge is not considered a master architect.

Harold Louis Williams, FAIA

Harold Louis Williams was born on August 4, 1924, in Flemingsburg, Kentucky. He grew up in Cincinnati, Ohio. From an early age, Williams showed interest in art and architecture, and the minister of their family church introduced him to Paul R. Williams (no relation), who was designing homes for high-end clients in Los Angeles. After graduating high school in 1942, Williams was drafted to the U.S. Navy. While on leave in Los Angeles in 1944, he met Paul Williams and the two struck up a friendship which inspired Harold to pursue architecture. He spent 1946 at Talladega College in Alabama upon his return from the Navy and then entered Miami University in Ohio in 1947.[54]

Williams graduated from Miami University in 1952, where he was the only African American student.[55] In 1953, he was hired as a draftsman at Fulton, Krinsky, and Delamotte in Cleveland, Ohio.[56] In 1954, he moved to Los Angeles. In Los Angeles, Williams worked for Paul R. Williams & Associates.

In 1958, he became the ninth African American architect to be licensed in California and joined the Southern California Chapter of the American Institute of Architects. In 1962, he opened his own practice, Harold Williams Associates, Architects, and Urban Planners.[57] In 1967, he was one of the principal partners of Kinsey, Meeds, and Williams. He had many repeat clients, including the Los Angeles Unified School District, the City and County of Los Angeles, and California State Universities.[58]

Williams' most notable projects include the Compton City Hall (1976); the South Central Los Angeles Multi-Service and Child Development Center, Los Angeles (1976); Compton Civic Center (1977); California State Office Building, Civic Center, Van Nuys (1982); and Fire Station Number No. 3 (1989).

In addition, Harold Williams was also active in the community and provided leadership. He was the organizer, founder, and first president of the Southern California Association of Minority Architects and Planners (MAP) and co-founder of the National Organization of Minority Architects (NOMA) in 1971. From 1981-1982 he served as the NOMA National President. Under his leadership, a new Watts Towers Art Center building was built in 1967.[59] Williams died on June 21, 2015, at the age of 90.[60]

6.0 SIGNIFICANCE EVALUATION

This evaluation utilizes the framework for historic resource assessments described in the *Los Angeles Unified School District Historic Context Statement*, which "defines themes of significance, eligibility standards, and related property types. Properties sharing a theme of significance are then assessed consistently, in comparison with resources that share similar physical characteristics and historical associations."[61]

In addition to each of the applicable federal, state, and local designation criteria, two evaluation frameworks and their associated eligibility standards and integrity thresholds were identified and applied to this evaluation. These evaluation frameworks relate specifically to the themes of *Post–1933 Long Beach Earthquake School Plants, 1933-1945*; and *Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1969*. These themes were used to analyze buildings on the campus, which primarily were built or substantially altered during these periods. Buildings at 49th Street Elementary School were evaluated using these frameworks for potential eligibility both individually and as contributors to a potential historic district. Additionally, campus buildings that date to the 1930s were evaluated using *PWA Moderne* context. Buildings that date to the 1960s were evaluated using the *Mid-Century Modern/Regional Modernism* context.

Buildings that were found to be potentially eligible for listing in federal, state, or local registers were carried forward for an integrity analysis, which is included in Section 7, to determine if the building retains sufficient integrity to convey its significance.

6.1 Frameworks for Evaluation

The following frameworks are derived from the *Los Angeles Unified School District Historic Context Statement* and the "Historic Resources Associated with African Americans in Los Angeles" National Register Nomination.

Post-1933 Long Beach Earthquake School Plants, 1933-1945[62]

Property Type: Institutional/Educational
Property Subtypes: Elementary, Junior High, and High School Buildings and Campuses
Period of Significance: 1933 to 1945
Area of Significance: Education
Geographic Location: Citywide
Area of Significance: A/1

Eligibility Standards:

- Exemplifies post–Long Beach earthquake school planning and design concepts of the period, including requirements under the 1934 Field Act
- One-story massing for elementary schools; up to two-stories for junior/high schools

[61] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement*, 4.
[62] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement, 137.*

- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features - Buildings/Structures:

- One-story massing for elementary schools; up to two stories for middle and senior high schools
- Reinforced concrete, steel- or wood-frame construction
- Classroom wings designed for easy access and views to outdoors—with variations including L-, H-, T-shaped building plans
- Generous expanses of windows, including steel- and wood-framed multilight windows, awning and hopper casements, clerestories, and large-pane fixed windows; window groupings often mark the location of classrooms
- Stylistically more streamlined and less ornamental than 1920s period-revival styles
- Emphasis on "traditional Southern Californian" styles, such as Spanish Colonial and Mission Revival
- Styles can also include PWA Streamline Moderne, Art Deco, Late Moderne, and proto-modern styles
- May have been partially or fully funded through Works Progress Administration (WPA), 1935 to 1943
- WPA projects may include significant interior artwork such as murals, paintings and sculpture
- May have been designed by a prominent architect of the period

Character-Defining Features - Campus/District:

- Unified site plan consisting of buildings and structures designed and sited according to their use
- Use of designed outdoor and landscaped spaces, for outdoor study, recreation and dining
- Often displays connecting sheltered corridors throughout campus
- Emphasis on a more expansive site plan
- Varied collection of buildings, differentiated by function and use (rather than a single building with all functions inside)
- Might include an elaborate administration building, located near the campus entrance; administration buildings usually serve as the focal point of the campus
- Campus often composed of groupings of classroom wings, auditoriums, gymnasiums, cafeterias, and outdoor recreation and dining areas
- Middle or senior high schools might include a gymnasium designed in the style of the campus overall

Integrity Considerations:

- Should retain most of the essential physical features from the period of significance
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Schools from this period generally include buildings constructed after the period of significance, in particular post-World War II buildings, which may be noncontributing
- Eligible properties under this theme may be a single building, if it exemplifies the design ideals of the era, or a grouping (campus) of buildings constructed during the period of significance
- Intact campus groupings from the pre-1945 era are not common
- Many pre-1933 schools were substantially remodeled following the Long Beach earthquake—may retain a 1920s plan but with 1930s stylistic detailing.
- Pre-1933 schools rehabilitated post-1933 might exhibit added seismic supports of steel columns, beams, or diagonal bracing; original masonry might be covered by concrete/stucco sheathing
- Should retain integrity of Materials, Design, Workmanship, Feeling, and Association from its period of significance

Comments: Buildings exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type/period or method of construction, as an example of the work of a master architect, or for high artistic values.

Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1969[63]

Property Type: Institutional/Education
Property Subtypes: Elementary, Junior High Schools, and High School Buildings and Campuses
Period of Significance: 1945 to 1969
Area of Significance: Education
Geographic Location: Citywide, with concentrations in the San Fernando Valley and West Los Angeles
Area of Significance: A/1

Eligibility Standards

- Clearly embodies the characteristics of a postwar modern functionalist school campus
- Displays a unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces (courtyards, patios, outdoor play areas)
- One-story massing for elementary schools; up to two-stories for junior/high schools
- Classrooms, in detailing and plans, clearly express their function, with axial, fingerlike wings, plentiful fenestration, and connections to the outdoors

[63] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement, 141.*

- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features – Buildings/Structures

- Building plans and site design clearly express their function; classroom wings often exhibit one story "finger-like" wings, arranged on an axis
- Easily identifiable indoor-outdoor spaces, connections to classrooms through the incorporation of patios, courtyards, and outdoor canopied corridors
- One-story massing, particularly for elementary schools; up to two to three stories for junior and high schools
- Building types and plans expressive of postwar ideals in school design; these can include (1) finger-plan schools (usually in 1940s through 1950s); (2) cluster-plan schools (beginning in 1950s); and (3) variations and combinations of these typologies clearly expressive of the ideals for informality, indoor-outdoor connections, and zoned planning for the site
- Varying elevations might display differentiated window sizes and configurations, in order to tailor interior light to sun patterns and create cross-lit classrooms

Character-Defining Features – Campus/District

- Unified campus design includes most or all of the following attributes: lack of formality and monumentality; low massing (usually one stories for classrooms and up to two stories for auditoriums/multipurpose rooms); strong geometric ordering of buildings and outdoor spaces; decentralized, pavilion-like layout; rational, function driven site design; buildings extend across the site; buildings are oriented to outdoor spaces (courtyards, patios, outdoor areas), purposeful indoor-outdoor integration
- Automobile traffic/drop-off areas separated from campus; linked to interior via extended canopied corridors
- Buildings often turn inward, toward green spaces and courtyards, lawns
- Outdoor corridors, sheltered beneath simple canopies, forming links between the buildings of the campus
- Classrooms often consist of a series of axial, modular units
- An informal, domestic scale for the buildings and campus might be especially evident in elementary schools
- Swaths of patios, terraces, and plantings adjacent to and alternating with buildings
- Generous expanses of windows, including steel- and wood-framed multi-light windows, in awning and hopper casements, clerestories, and fixed panes
- Flat roof or broken-plane roof often used for lighting and acoustical issues
- Modular design, with a rhythmic, asymmetrical but balanced composition
- Usually displays a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing), International Style modernist, or, by the early 1960s, Late Modern (more expressive and sculptural)

- Some examples might include some degree of historicist detailing or styles popular in the postwar period (such as American Colonial Revival); these are less common than modernist examples
- May have been designed by a prominent architect of the period
- Often associated with post–World War II suburbanization and growth near major employment centers beyond the city periphery (such as the San Fernando Valley and southwest Los Angeles)
- Often built in residential neighborhoods on large expanses of land, with swaths of land devoted to landscape design and playing fields (in particular for high school campuses)

Integrity Considerations

- Retains most of the essential physical features from the period of significance
- School expansion and new construction over the years, in particular in the postwar period, might have resulted in the addition of in-fill buildings and structures in areas that were originally designed open spaces (such new additions should not interfere with or serve as a visual impairment to the designed connections between buildings, in particular classroom wings, and adjacent outdoor patios and spaces)
- Many postwar schools were designed to be easily expandable as enrollment increased; the original site design and building types and plans should be readily discernible. If additional wings were added or the campus extended, the additions should be compatible with and visually subordinate to the original
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Should retain integrity of setting, materials, design, workmanship, feeling, and association from its period of significance
- Addition of portable or permanent buildings after the period of significance acceptable as long as original campus design is intact

PWA Moderne[64]

The Public Works Administration (PWA) was created by the National Industrial Recovery Act within a few months of the March 1933 Long Beach Earthquake. Much school reconstruction work was funded by the PWA following widespread damage to Los Angeles public schools in the wake of the earthquake,. Consequently, a substantial number of Los Angeles public schools either built or remodeled during this time exhibit some degree of PWA Moderne styling. Also referred to as "Stripped Classicism," the PWA Moderne often incorporates elements of a number of styles, including Classical Revival, Spanish Colonial Revival, Art Deco, and Streamline Moderne.

Compared with the Streamline Moderne, the PWA Moderne was more formal and symmetrical in its overall design, with less emphasis on curvilinear shapes and horizontality.

[64] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement,* 124.

This style is found throughout the United States, particularly for institutional buildings funded through the PWA. The PWA program was terminated in 1943.

Typical Character-Defining Features

- Emphasis on the vertical axis
- Symmetrical, formal design composition and massing
- Smooth wall surfaces, generally of stucco, concrete, and/or polished stone (rarely includes brick exterior elements)
- Usually a flat roof
- Piers, often fluted or reeded, separating recessed window channels
- Incorporation of shallow relief panels and interior murals

Mid-Century Modernism/Regional Modernism (Post-1945)[65]

Mid-Century Modernism, or Regional Modernism, represents a middle ground between the formal, machine-age aesthetic of the International Style and a regional idiom reflecting local precedent and identity. In the postwar period through the 1960s, as practiced in Southern California, Mid-Century Modernism took its cues from the region's first-generation modernist architects such as Richard Neutra, Rudolph Schindler, Gregory Ain, Frank Lloyd Wright, and Harwell Hamilton Harris. In the postwar period, second-generation practitioners such as Raphael Soriano, Whitney Smith, and A. Quincy Jones, among many others, established Los Angeles as a center for innovative architectural design and culture.

Mid-Century Modernism is characterized by an honest expression of structure and function, with little applied ornament. Aesthetic effect is achieved through an asymmetrical but balanced, rhythmic design composition, often expressed in modular post-and-beam construction. Whether wood or steel, post-and-beam construction allowed for open floor plans, ease of expansion, and generous expanses of glazing to heighten indoor-outdoor integration. Infill panels of wood or glass are common, with glazing often extending to the gable. Buildings are generally one to two-stories, with an emphasis on simple, geometric forms. Capped with low-pitched gabled or flat roofs, a Mid-Century Modern building often displays wide eaves and cantilevered canopies, supported on spider-leg or post supports. Sheathing materials vary, with wood, stucco, brick and stone, or steel-framing and glass. Windows are generally flush-mounted, with metal frames.

This style was seen in postwar institutional and commercial buildings, as well as residences, from 1945 until circa 1975, when Title 24 restrictions on the use of glass curtailed the expansive glazing that characterizes the style.

Typical Character-Defining Features

- Horizontal design composition and massing; generally one to two stories

[65] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement, 126.*

- Simple, geometric volumes
- Flat or shed roof, often with wide, cantilevered overhangs
- Exterior materials include stucco, brick, or concrete
- Modular design and planning
- Aesthetic qualities derive from use of simply treated materials and excellent craftsmanship
- Direct expression of structural systems, often in wood or steel post-and-beam
- Lack of historicizing ornament
- Generous expanses of fenestration, including bands of grouped multi-light windows
- Extensive use of sheltered exterior corridors, with flat or slightly sloped roofs supported by posts, piers, or pipe columns

African American Association with Schools[66]

Description - The first dedicated public schoolhouse in Los Angeles was constructed in 1855 at the corner of 2nd and Spring Streets. A second school opened shortly thereafter on N. Main Street. Each was two stories in height and constructed of brick. The school buildings that were constructed during the latter part of the 19th and early part of the 20th century followed this same general format, only larger and somewhat more formal. The Classical Revival was especially favored with impressive porticos and colossal columns proclaiming the importance attached to education. Most of these buildings fell victim to the 1933 Long Beach Earthquake. The State passed the Field Act in response to the public outcry over the vulnerability of school buildings to earthquake damage. Severely damaged schools were demolished, while others were rehabilitated and reinforced. Most of the schools reconstructed exhibit the mix of classicism and streamlining referred to as P.W.A. Moderne. Public schools from the period of significance are generally located in the Central Avenue corridor, or the Watts, West Jefferson, West Adams, or Pacoima areas. They include the Holmes Avenue Elementary School, 9th Street Elementary School, 20th Street Elementary School, 28th Street Elementary School, Wadsworth Avenue Elementary School (formerly 35th Street School), McKinley Avenue Elementary School, Hooper Avenue Elementary School, Carver Middle School (formerly McKinley Junior High School), and Jefferson High School. Lafayette Junior High School was the other middle school in the area. The building still stands, but the school has been closed.

Significance - Schools associated with the history of African Americans in Los Angeles may qualify for listing in the National Register under Criterion A at the local level. California joined the Union in 1850. During the first legislative session, statutes were enacted that denied African Americans the right to receive a public education, among other things. Between 1872 and 1879, black children gained some access to a public education, but the law proscribing their right to a public education was not repealed until 1880. At this point in time the

[66] Grimes, "Historic Resources Association with African Americans in Los Angeles" National Register Nomination, 49-50.

population of African Americans in Los Angeles was approximately 102, out of a total population of 11,000. The number of school age black children is unknown.

To the black community, education represented a means toward upward mobility. Access to educational opportunities was a powerful factor in attracting African Americans to Los Angeles. By 1910, the African American population of Los Angeles had grown to 7,599 and began to coalesce in the area south of downtown. Many settled in the Furlong Tract where black families could buy lots for $750 dollars. Businesses and services needed by the community of 200 homes opened, including three churches and a school. After many of the homes were damaged in the 1933 Long Beach Earthquake, families began to leave the neighborhood. The remaining houses were torn down in 1942 and the Pueblo Del Rio housing project was built to house defense industry workers. All that remains of the original Furlong Tract is the Holmes Avenue Elementary School. Built as the 51st Street School in 1910, it was rebuilt after a fire in 1922 and reopened as the Holmes Avenue Elementary School. While mainly African American children attended the school, the principals and teachers were exclusively white. In 1911, Bessie Burke joined the staff. She was the first African American teacher in the Los Angeles public school system. By 1918, she was promoted to principal of the school, another first for her race.

Public schools in Los Angeles were not segregated by law, but rather racial geography and the policies of the school district. Schools often served as the educational and social focal point for their respective communities. This was particularly true of high schools that also had extracurricular activities such as athletic and music programs. Most blacks attended either Jefferson or Jordan High Schools, although they were racially mixed through the late 1950s. Many of the most distinguished African American who grew up in Los Angeles.

Registration Requirements - To be eligible under Criterion A, schools must have been constructed during the period of significance (prior to 1958) and need to represent some aspect of African American history in Los Angeles. They may reflect a particular milestone in the community's struggle for equal access to education or equal access to employment opportunities in the field of education. A school that was attended by an African American who is considered a historic personage would not be considered eligible under Criterion B, because it is highly unlikely that it would reflect the person's life work. However, a school attended by numerous African Americans who are considered historic personages may be eligible under Criterion A for the cumulative importance of those individuals in the community. Schools should retain sufficient integrity to evoke their original use and character from the period of significance. The entire campus should be evaluated, and if there are multiple buildings with integrity remaining from the period of significance, consideration should be given to nominating them as an historic district. The historic location, setting, feeling, and association must be strongly present in the evaluation of integrity. The mid-1930s may be considered the baseline for evaluating the integrity of design, materials, and workmanship even for much older schools as virtually every school in Los Angeles was rehabilitated after 1933.

6.2 Historic District Assessment

The buildings and features of the 49th Street Elementary School campus have been considered collectively for their potential eligibility for listing in the National Register, California Register, and/or listing as a City of Los Angeles HCM.

The National Park Service defines a *historic district* as "a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development."[67] Additionally, school campuses are noted as a potential example of a historic district. School campuses in the United States, especially those built in the 20th century often have definable spaces and unified site plans that were constructed as institutional complexes for educational purposes. The combination of space and purpose reflects individual school buildings' interconnectedness and functionality as a larger grouping.

Because the 49th Street Elementary School campus contains a grouping of related buildings and features and was originally developed as an elementary school, consideration of this property as a potential historic district is an appropriate analytical framework for its evaluation.[68]

Findings

HRG identified a single potential historic district at the 49th Street Elementary School with a period of significance from 1935 to 1936. The potential historic district was found eligible for listing in the National Register and California Register, and for designation as a City of Los Angeles HCM under Criteria A/1/1 and C/3/3.

Primary contributors to the potential historic district are the West Building, Main Building, South Building, Auditorium Building, and three sheltered corridors. There are no secondary or tertiary contributors to the potential historic district. Non-contributors to the potential historic district are the Administration, Library, and Classroom Building/Classroom Building and Cafeteria/Lunch Pavilion. Additionally, no hardscaping or landscaping was found to contribute to the potential historic district.

Historic Significance

Criterion A/1/1

49th Street Elementary School is significant under National Register Criterion A, California Register Criterion 1, and City of Los Angeles HCM Criterion 1 within the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context of the LAUSD Historic Context Statement. The West Building, Main Building, South Building, Auditorium Building, and sheltered corridors (#1, #2, and #3) of the 49th Street Elementary School were constructed following the Long Beach Earthquake of 1933. The campus directly reflects a design shift resulting from this major natural disaster, when school plants were reimagined for longevity in a specifically Southern California environment. These buildings meet several eligibility standards established by this context. The 49th Street Elementary School exemplifies post-Long

[67] *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation.* Washington D.C.: National Park Service, U. S. Department of the Interior, 1997. (5)
[68] Ibid.

Beach earthquake school planning and requirements of the 1934 Field Act; has one-story massing; and retains most of the associative and character-defining features from the period of significance. Character-defining features of the context that are present on the campus include: "wood frame construction; generous expanses of windows; stylistically streamlined; and … the PWA Streamline Moderne style" as identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. As a cohesively as a campus, the 49th Street Elementary School also retains character-defining features identified by the context including a "unified site plan; connecting sheltered corridors throughout campus; emphasis on a more expansive site plan; varied collection of buildings, differentiated by function and use; elaborate administration building, located near the campus entrance." Therefore, the 49th Street Elementary School meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context.

Following the comprehensive redesign of the school in the 1930s, subsequent expansion of the school was completed in a piecemeal fashion in the 1960s as the population expanded and the school required additional space. Between 1965 and 1969, the Cafeteria/Lunch Pavilion, Administration, Library, and Classroom Building/Classroom Building, and sheltered corridor #4 were constructed. These buildings/structures do not meet the eligibility standards nor character-defining features identified in the *Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1980.* They do not reflect a "unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces, do not exhibit "finger-like" wings; one-story massing; and do not exhibit the finger-plan or cluster-plan school." Moreover, buildings from this period do not "turn inward towards green spaces; do not reflect a series of axial, modular units; and do not display a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing)." For this reason, later development in the 1960s does not contribute to the potential historic district.

The period of significance for 49th Street Elementary School under Criterion A/1/1 spans from 1935 to 1936, during which architect Harry C. Deckbar designed the PWA Moderne-style school plant.

The campus was redesigned in the 1930s, around the time that the immediate vicinity was transforming into a largely Black community. As outlined in the "Historic Resources Associated with African Americans in Los Angeles" National Register Nomination:

> To be eligible under Criterion A, schools must have been constructed during the period of significance (prior to 1958) and need to represent some aspect of African American history in Los Angeles. They may reflect a particular milestone in the community's struggle for equal access to education or equal access to employment opportunities in the field of education.[69]

Although 49th Street Elementary School was constructed during the period of significance research did not indicate that the school was significant for its association with African

[69] Grimes, "Historic Resources Association with African Americans in Los Angeles" National Register Nomination, 50.

American development patterns and was not the site of significant events associated with this community. Instead, as outlined in history of Central Avenue context in Section 4, the Black community was increasingly centered around Central Avenue corridor as a result of rezoning to the north and surrounding restrictive housing. The school's increasingly African American student body was thus the result of de facto segregation and did not reflect a significant milestone in the community's struggle for equal access. Therefore, 49th Street Elementary School does not appear eligible for listing based on a significant association with the history of the African American community.

Criterion B/2/2

No information was found to suggest that the 49th Street Elementary School was associated with any historic personages, nor that any other individuals of historic significance were associated with the property. Therefore, the 49th Street Elementary School is not eligible for listing under Criterion B/2/2.

Criterion C/3/3

49th Street Elementary School is also significant under National Register Criterion C, California Register Criterion 3 and City of Los Angeles HCM Criterion 3 within the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* and the *PWA Moderne* contexts of the LAUSD Historic Context Statement. The West Building, Main Building, South Building, Auditorium Building, and sheltered corridors (#1, #2, and #3) of the 49th Street Elementary School embody the distinctive characteristics of a type, period, and method of construction, notably that of PWA Moderne-style buildings. Buildings at the campus dating to 1935-1936 were designed or remodeled by architect Harry C. Deckbar, who incorporated the clean lines of the PWA Moderne style with the popular Neoclassical style to create a unique stylistic vocabulary on the campus. Buildings reflect the planning and design concepts of the period, including "one-story massing; general expanses of windows; unified site plan with central courtyard; and sheltered corridors throughout campus." As identified in the *PWA Moderne* context, the buildings feature "symmetrical, formal design composition and massing; smooth wall surfaces; and piers, often fluted or reeded." The buildings at 29th Street Elementary School also incorporate "elements of a number of styles, including Classical Revival," as the context identifies as typical of PWA Moderne styles. Furthermore, as identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context, buildings designed during this period all reflect the period's emphasis on a varied collection of buildings differentiated by function and use, such as a separate auditorium. Features constructed in the mid-1930s include the Main Building, South Building, Auditorium Building, and three associated sheltered corridors (#1, #2, and #3). The West Building was also remodeled to follow the design vocabulary of the campus.

Buildings constructed during the 1960s were constructed incrementally with later additions completed to accommodate an increase in population. The Cafeteria/Lunch Pavilion, Administration, Library, and Classroom Building/Classroom Building, and sheltered corridor #4 do not meet the eligibility standards nor character-defining features identified in the *Mid-Century Modernism/Regional Modernism* context. These buildings are not exemplary Modern style buildings. They do not reflect "aesthetic qualities derived from use of simply treated

materials and excellent craftsmanship; direct expression of structural systems; or the extensive use of sheltered exterior corridors." Although the Classroom Building addition and Cafeteria/Lunch Pavilion were designed by notable African American architect Harold Louis Williams, the buildings are utilitarian in design and are not significant examples of Williams' work. As clarified by the National Park Service, "a property is not eligible as the work of a master, however, simply because it was designed by a prominent architect." Instead, the work must "express a particular phase in the development of the master's career, an aspect of his or her work, or a particular idea or theme in his or her craft."[70] As such, the buildings at 49th Street Elementary School are not notable examples of Williams' craft within his greater oeuvre, compared with other more notable buildings such as the Compton City Hall (1976) and Compton Civic Center (1977). Moreover, buildings completed during the 1960s on the campus are not clearly expressive of the ideals for "informality, indoor-outdoor connections, and zoned planning" that was significant in the post-war era, as identified in the *Educating the Baby Boom: The Postwar, Modern, Functionalist School Plant, 1945-1980* context. As such, later development at the school does not contribute to the potential historic district.

The period of significance for 49th Street Elementary School under Criterion C/3/3 is 1935-1936, when the campus was redesigned in the PWA Moderne style.

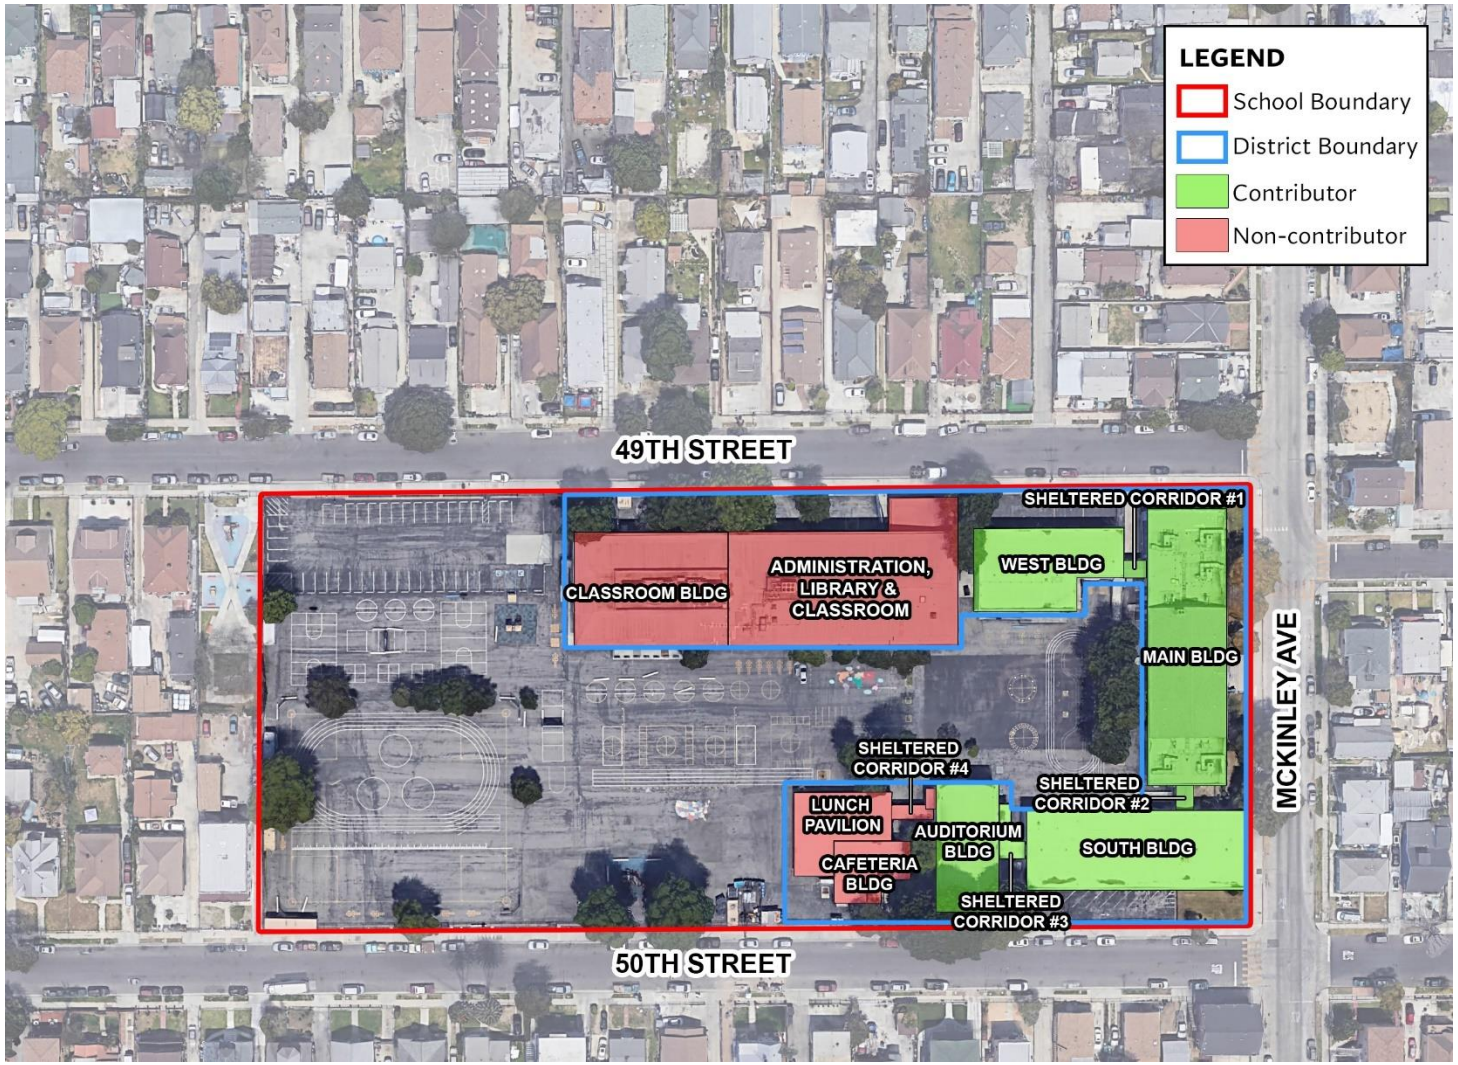
Evaluation of Eligibility

Evaluation of the Potential Historic District for the National Register

The potential historic district appears to be significant under National Register Criteria A and C at the local level for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's post-earthquake redevelopment and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a potential historic district on the National Register of Historic Places.

Evaluation of the Potential Historic District for the California Register

The potential historic district appears to be significant under California Register Criteria 1 and 3 for its for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's early development and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a potential historic district on the California Register of Historical Resources.



[70] National Park Service, "National Register Bulletin: How to Apply the National Register Criteria for Evaluation," 1995, 20.

Evaluation of the Potential Historic District for designation as an HCM

The potential historic district appears to be significant for local listing under Criteria 1 and 3 for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's early development and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a City of Los Angeles HCM.

The location of contributing buildings and site features to the potential historic district as well as the district boundary is shown below in Figure 3.

Figure 3. Potential Historic District Map

49th Street Elementary School Historic Resources Evaluation Report

HISTORIC RESOURCES GROUP

6.3 Individual Assessment

The buildings and features of the 49th Street Elementary School campus have also been considered individually for their potential eligibility for listing in the National Register, California Register, and/or listing as a City of Los Angeles HCM.

HRG did not identify any individually eligible buildings located at 49th Street Elementary School. The West Building, Main Building, South Building, Auditorium Building and three sheltered corridors (#1, #2, and #3) are not individually exceptional examples of the PWA Moderne style of architecture. Instead, the school's significance is best represented as a historic district comprised of a cohesive collection of buildings from the 1930s. Additionally, the Administration, Library, and Classroom Building/ Classroom Building, Cafeteria/Lunch Pavilion, and sheltered corridor (#4), which date to the mid- to late-1960s were not found to be individually exceptional examples of the Mid-Century Modern/Regional Modern style of architecture. None of the buildings on the campus were found to be associated with significant personages or important events or periods of development. Instead, significance is derived from the cohesive collection of buildings on the campus.

Eligibility of Buildings and Features at 49th Street Elementary School

The following table identifies the construction year, integrity, and historic status for buildings and features that are extant on the 49th Street Elementary School campus today:

Table 2. Eligibility of Buildings and Features

Current Feature Name	Year Built	Integrity	Status
Buildings			
West Building	1923	Good	Contributor
Main Building	1935	Good	Contributor
South Building	1935	Good	Contributor
Auditorium Building	1936	Good	Contributor
Administration, Library, and Classroom Building/Classroom Building	1965/1969	N/A	Non-Contributor
Cafeteria/Lunch Pavilion	1969	N/A	Non-Contributor
Site Features			
Sheltered Corridors (#1, #2, #3)	1935-1936	Good	Contributor
Sheltered Corridor (#4)	1969	Good	Non-Contributor

7.0 Historic Integrity

Historic integrity is the ability of a property to convey its significance. It is defined as the "authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period."[71] The National Park Service defines seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.[72]

Assessment of Integrity

49th Street Elementary School contains a cohesive concentration of four contributing buildings and three contributing site features that dates from the period of significance and has been identified as the potential historic district. Integrity of the property's individual buildings is varied, and all buildings and features have been subject to varying levels of alteration. However, despite some degree of alteration, the property retains much of the circulation pattern and spatial relationships established during the period of significance that characterize the potential historic district as a whole. A detailed assessment of the integrity of the potential historic district is discussed below.

- **Location:** The buildings constructed during the period of significance remain in their original locations in the eastern region of the campus. Therefore, the campus retains integrity of *location*.
- **Design:** The campus retains the buildings and sheltered corridors constructed or remodeled as part of the 1935-1936 PWA Moderne style with Neoclassical elements design of the campus. These include the West Building, Main Building, South Building, Auditorium Building, and three sheltered corridors (#1, #2, and #3). These buildings/structures retain most of their character-defining features such as symmetrical, formal design, smooth wall surfaces, fluted piers, and ornamentation associated with the Neoclassical style of architecture. Despite some alterations, a majority of the essential physical features reflecting the original design and organization of the property as a school from the 1930s remain intact within the potential historic district. Therefore, the campus retains integrity of *design*.
- **Setting:** The potential historic district is located in the eastern region of the school property. The property continues to function as a public elementary school. The surrounding area of southeast Los Angeles has a whole has experienced some development, but remains a low-density residential neighborhood. Thus, the campus retains integrity of *setting*.
- **Materials:** The potential historic district retains most of its original materials. Contributors typically retain some physical elements from the period of significance, including original cladding, including smooth wall surfaces of plaster concrete, wood detailing as seen on the Neoclassical style ornaments, and some original windows and doors. Therefore, the potential historic district's integrity of *materials* has been compromised.
- **Workmanship:** The potential historic district retains the physical evidence of crafts of a particular culture or people during any given period in history or prehistory. This includes the contributors' construction methods and design choices, such as ornaments that reflect the Neoclassical style of architecture. Moreover, most exterior cladding and even detail work have been retained. Overall, the buildings continue to retain substantial physical evidence of period

[71] Ibid.
[72] *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation.* Washington D.C.: National Park Service, U.S. Department of Interior, 1995. (44-45)

construction techniques, including finishes and design elements, such as smooth plaster exteriors, fluted pilasters, lintel and sill courses, that reflect the character and identity of the potential historic district. Therefore, the campus retains integrity of *workmanship*.

- **Feeling:** The potential historic district retains most of the character-defining features of its original construction, including representative building types as well as spatial relationships and circulation patterns that are typical of campuses from this time. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a 1930s PWA Moderne elementary school. Thus, the campus retains integrity of *feeling*.
- **Association:** Association is the direct link between an important historic event or person and a historic property. Because the campus retains integrity of *location, design, setting, workmanship,* and *feeling*, it continues to convey its direct link to the development of safer public schools following the 1933 Long Beach Earthquake utilizing new design principals. Therefore, the campus retains integrity of *association*.

49th Street Elementary School retains integrity of *location, design, setting, workmanship, feeling,* and *association* from the identified period of significance. The therefore continues to convey its significance as a post-1933 Long Beach Earthquake school plant, and as an excellent example of a WPA Moderne campus design.

8.0 CHARACTER-DEFINING FEATURES

8.1 Character-Defining Features

Character-defining features are distinctive elements and physical features that convey the historical appearance of a property and are required for it to convey its historical significance. According to Preservation Brief 17, there is a stepped process to identifying character-defining features.[73] The first step involves assessing the distinguishing physical aspects of the building as a whole. This second step involves examining the building more closely. While on their own each of the elements above may not convey historical significance, in combination they define the property and convey the associations for which it is significant.

Tables 3 through 7 below are included to provide the character-defining features of each contributor to the potential historic district. These include aspects of each contributor's shape/form, roof, openings, projections, secondary features, materials, setting, and, if applicable, interior features. Additionally, as required by LAUSD, character-defining features are ranked according to primary, secondary, and tertiary importance in order to inform advanced planning.

[73] Lee Nelson, *Architectural Character—Identifying the Visual Aspects of Historic Buildings as an Aid to Preserving their Character,* Preservation Brief No. 17, U.S. Department of the Interior, National Park Service, Technical Preservation Services.

West Building

Table 3. Character-Defining Features of West Building

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The 49th Street Elementary School campus occupies approximately 5.7 acres. The campus is bounded to the north by East 49th Street, to the east by McKinley Avenue, to the south by East 50th Street, and to the west by single-family residences. The school campus is occupied by five (5) permanent buildings, one (1) permanent structure, four (4) sheltered corridors, and various open spaces. There is one (1) portable building, the Mechanical Shed.

The buildings are clustered along the northern, eastern, and southern boundaries of the campus, forming a "U" shape around a central play yard. Most of the campus consists of play yards and parking areas paved in asphaltic concrete and surrounded by chain link fencing. Landscaping is limited to lawns, shrubs, some trees in narrow setbacks along the three street frontages, and scattered trees in the play yards. The school is currently accessed via a pedestrian entrance on the north side of the Administration, Library & Classroom Building along E. 49th Street. *(See Continuation Sheet)*

***B5. Architectural Style:** PWA Moderne with Neoclassical elements
***B6. Construction History:**
The 49th Street Elementary School is situated in the Southeast neighborhood of Los Angeles. Prior to the development of the school, the block that comprises the school campus was developed with single-family residences. The first construction phase of 49th Street Elementary School was completed in the early 1910s, and the school was dedicated in 1914. The school campus was designed by Frank K. Krucker and Harry C. Deckbar of Krucker and Deckbar.

At the time of its dedication, the *San Pedro Pilot* recorded that 49th Street Elementary School was "said to be the latest and best in school buildings in the entire city." The campus initially consisted of one main building located near McKinley Avenue and two smaller classrooms near the west side of the lot. A photograph from the period shows the 2-story masonry building that was constructed in 1913. In 1923, a single two-story brick building (West Building) was also built on the site.

***P3a. Description: (Continued…)**

Administration, Library, and Classroom Building/Classroom Building

The Administration, Library, and Classroom Building was constructed in 1965; an addition, known as the Classroom Building, was constructed in 1969. Together they form a two-story building with a rectangular plan and a one-story projection on the north façade. It has complex massing and asymmetrical composition. The two-story volume has a low-pitched hipped roof with plaster eave soffits and a canted fascia; the one-story volume has an asymmetrical front gable roof with open eaves and overhanging rakes. The exterior walls are finished in brick veneer, scored concrete, and textured cement plaster. Fenestration consists primarily of ribbons of four-light fixed and two-over-two double-hung aluminum sash windows at the east portion of the building; and high ribbon windows on the west portion. The primary entrance is asymmetrically located on the north (primary) façade and consists of a pair of partially glazed, divided light doors with sidelights and transom light, accessed by a projecting porch. There is an exterior metal staircase on the west façade with guardrails of metal mesh and metal pipe.

West Building

The West Building was constructed in 1923 and altered in 1935. It is a one-story building with a roughly "L"-shaped plan, simple massing, and asymmetrical composition. It has a flat roof with a low parapet. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. Fenestration consists primarily of three-over-three wood sash double hung windows in single or coupled configurations, some with transom panels and others with projecting subsills. The primary entrance is asymmetrically located on the south façade and consists of a pair of flush doors with a six-light transom light; the doors are accessed by a wide concrete stoop and steps with a shaped plastered parapet. Two secondary entrances on the south façade consist of flush doors with metal canopies, accessed by a concrete ramp and steps with metal pipe guardrails.

The interior of the West Building is divided into several spaces. Most classrooms are accessible via a central hallway. Two additional rooms, a classroom and kitchen, are accessible via the concrete ramp along the primary façade. The building's interior has tile flooring, plaster walls, and acoustical tile ceilings. It has flush wood doors with flat wood casings and baseboards; some doors have flush wood transom panels. The kitchen/staff room features wood cabinets.

Main Building

The Main Building was designed by architect Harry C. Deckbar and constructed in 1935. It is a PWA Moderne style one-story building with a rectangular plan, balanced but not strictly symmetrical composition, and complex massing consisting of a central volume flanked by wings. The central volume has a moderately pitched side gable roof with asphalt composition shingle roofing and a continuous eave cornice; the flanking wings have flat roofs with built-up roofing. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. The east (primary) façade of the central volume is framed with stylized fluted pilasters. Fenestration consists primarily of horizontal groupings of six-over-six and eight-over-eight double hung wood sash windows; some window openings are infilled with solid panels. The primary entrance, now blocked features some Neoclassical elements, is symmetrically located on the east façade of the central block and consists of solid panels in the configuration of doors with sidelights and transom lights, with reeded jambs and a stylized architrave. It is recessed under a pedimented gable supported on stylized fluted pilasters and flanked by wood posts. The entrance is accessed by a wide flight of concrete steps with parastedes and balustrades. There is a secondary entrance on the north façade, consisting of a pair of flush doors in a rectangular recess flanked by stylized fluted pilasters and accessed by concrete steps with parastedes.

The interior of the Main Building features a central hallway that opens to classrooms. The building has resilient tile floors, plaster walls, and acoustical tile ceilings. It has wood baseboards and casings. Most interior doors in this building feature transom panels. A wood trophy case is located in the hallway.

South Building

The South Building was designed by architect Harry C. Deckbar and constructed in 1935. It is a one-story PWA Moderne style building with a rectangular plan, simple massing, and a flat roof with a low parapet and metal coping. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. Fenestration consists primarily of horizontal groupings of six-over-six double hung wood sash windows; some window openings are infilled with solid panels. The east façade is symmetrically composed around the primary entrance, which consists of a pair of flush doors with a divided-light transom light in a rectangular recess flanked by stylized reeded pilasters. The entrance is accessed by a flight of concrete steps with concrete parastedes.

The interior of the South Building features a central hallway that opens to classrooms. It has wood and resilient tile floors, plaster walls, and acoustical tile ceilings. It has wood cabinets, radiators, and ceramic water fountains.

***P3a. Description: (Continued…)**

Auditorium Building

The Auditorium Building was designed by architect Harry C. Deckbar and constructed in 1936. It is a PWA Moderne style one-story building with a rectangular plan, simple massing, and symmetrical composition and a bow truss roof. The exterior walls are finished in textured cement plaster and articulated with piers and a continuous stringcourse and sill course; the corners are highlighted with wide, channeled piers. Fenestration consists primarily of six-over-six double hung wood sash windows. The primary entrance is symmetrically located on the south façade and consists of a pair of flush doors with a transom panel and architrave, in a rectangular recess framed by stylized fluted pilasters supporting a pediment. The entrance is accessed by a concrete staircase flanked with parastedes and curvilinear metal pipe railings. Secondary entrances on the east and west façades consist of flush doors with metal hoods, accessed by concrete steps with metal pipe guardrails.

The interior of the Auditorium Building features an open auditorium space with a restroom set behind the stage. The building has a raked floor with resilient tile flooring, acoustical tile ceiling, and fixed seating. The walls are plaster with a wood baseboard, beaded dado rail, and plaster entablature. The stage has a proscenium framed with fluted pilasters supporting a stylized entablature.

Cafeteria/Lunch Pavilion

The Cafeteria/Lunch Pavilion was constructed in 1969. It is a one-story building with an irregular plan, complex massing and asymmetrical composition. It is composed of two distinct parts: a kitchen with an L-shaped plan, shed roofs with boxed eaves and rakes, and exterior walls finished in cement plaster; and an open-sided shelter wrapping the north and west sides of the kitchen, with a flat roof supported on wood beams, concrete masonry columns and tube steel posts. The entrance consists of a flush door. Fenestration consists of a grouping of three windows with metal security screening, and service windows with metal roll-up shutters and metal security screens.

Sheltered Corridors (4)

There are four sheltered corridors on the campus, which connect separate buildings. Two elevated sheltered corridors from the 1930s (#1 and #2) connect the Main Building to the West and South Buildings. They have flat roofs with plaster soffits, wood beams with scalloped friezes, wood posts, scored concrete paving, and metal pipe guardrails. A third sheltered corridor dating from the 1930s (#3) connects the South Building to the Auditorium Building. It has a flat roof with plaster fascias and soffit supported on paired metal pipe columns, on concrete curbs with metal pipe guardrails. A fourth sheltered corridor (#4) dates from the 1960s and connects the Auditorium Building to the Lunch Pavilion; it has a flat roof supported on square steel tube posts.

***B6. Construction History (Continued…):**

The 1933 Long Beach earthquake, and then the 1934 Field Act, hastened the need for widespread school repairs and new construction, which accelerated the stylistic shift during this period. Following the Long Beach Earthquake of 1933, the Los Angeles Unified School District decided to modernize the 49th Street campus.As a result, the original main building on the campus was demolished. As recorded in the *Illustrated Daily News,* "excellent brick and steel construction now being demolished and none of which failed, but many tons of ornamental concrete fell to the ground."

While new buildings were under construction, classes were temporarily held in tents on the campus grounds. The only building that was retained and retrofitted following the Long Beach Earthquake was the West Building, which is located in the northeastern region of the campus.

Between 1933 and 1935, the school district spent approximately $2 million in rehabilitating schools in South Los Angeles, including 49th Street Elementary School. The 49th Street Elementary School received over $109,000, which was allotted for the construction of two new buildings (Main Building and South Building) and the reconstruction of a one-story school building (West Building). Work was completed by architect Harry C. Deckbar and contractors Johnson & Dahlquist. The Main Building and South Building are both single-story wood frame buildings with concrete foundations and cement plaster exteriors. Deckbar also redesigned the West Building. Originally a two-story building, the West Building's second story was removed, and the building was reclad with cement plaster exteriors to match the design of the Main Building and South Building.

In 1936, Deckbar also designed the school's 1-story Auditorium Building. Unlike the other new buildings on the site, which were of wood frame construction, the Auditorium Building was of reinforced concrete and steel construction. Harold A. Nelson served as the structural engineer and Brunzell & Jacobson served as the general contractors.

A cafeteria building was also constructed at this time near the South Building; this cafeteria is no longer extant. All buildings designed by Deckbar were completed in the PWA Moderne style of architecture with some Neoclassical elements.

***B6. Construction History (Continued…):**

The school underwent some alterations in the 1950s. In 1950, a permit was issued to repair the school's storage shed, located at the west end of the parcel, to conform to code. Simultaneously, a separate permit was issued for a 1-story building for temporary classrooms, which was located to the west of the West Building along 49th Street. The repair work and temporary classrooms were designed by architect E.R.C. Billerbeck (not extant).

In the 1950s and 1960s, several additional classroom buildings were constructed on site. In 1952, a new 2-room classroom building was built, designed by A.B. Niebecker, Jr (not extant). In 1960, architect Kenneth N. Bergstrom designed a larger classroom building, constructed by Carter Mack Building Inc. for the school (not extant). Both of these buildings were demolished in the late 1960s. These non-extant buildings are visible in a Sanborn Fire Insurance Map from 1950.

The Administration, Library & Classroom building was designed by Kent Attridge & Associates in 1965. In 1969, an addition was added to the west of the building (Classroom Building), designed by Harold L. Williams & Associates. Williams also designed the new Cafeteria/Lunch Pavilion that same year. The Administration, Library & Classroom Building/Classroom Building comprise a single building, but where they are joined is visually distinctive from the interior. The building is visible in an historical aerial photograph from 1971. In 1969, over 1,000 parents and community residents toured the new classrooms, school facilities, and newly completed 2-story annex building at the 49th Street Elementary School.

In 1972, several buildings on campus were renamed in honor of black Americans during "Negro History Week." The theme of the program was "cementing Black greatness in the community," and names were chosen from those Black Americans who have made great contributions to the history and culture of the United States.

Alterations to extant buildings on the 49th Street Elementary School campus are limited, and the school overall retains many of its character-defining features. The West Building was altered with cement plaster exterior and interior remodeling following the Long Beach Earthquake. The cupola on the Main Building was removed in the mid- to late-1970s. The Classroom Building was added to the Administration, Library, and Classroom Building as an addition in 1969.

Interior alterations have been extensive and include new resilient tile flooring, acoustical tile ceilings, the removal of interior transom lights, and alterations to fixtures. Some character-defining features have been retained, such as window and door surrounds, wood cabinets, radiators, and transom openings.

***B10. Significance (Continued…):**

HRG identified a single potential historic district at the 49th Street Elementary School with a period of significance from 1935 to 1936. The potential historic district was found eligible for listing in the National Register and California Register, and for designation as a City of Los Angeles HCM under Criteria A/1/1 and C/3/3.

Historic Significance

Criterion A/1/1

49th Street Elementary School is significant under National Register Criterion A, California Register Criterion 1, and City of Los Angeles HCM Criterion 1 within the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context of the LAUSD Historic Context Statement. The West Building, Main Building, South Building, Auditorium Building, and sheltered corridors (#1, #2, and #3) of the 49th Street Elementary School were constructed following the Long Beach Earthquake of 1933. The campus directly reflects a design shift resulting from this major natural disaster, when school plants were reimagined for longevity in a specifically Southern California environment. These buildings meet several eligibility standards established by this context. The 49th Street Elementary School exemplifies post-Long Beach earthquake school planning and requirements of the 1934 Field Act; has one-story massing; and retains most of the associative and character-defining features from the period of significance. Character-defining features of the context that are present on the campus include: "wood frame construction; generous expanses of windows; stylistically streamlined; and … the PWA Streamline Moderne style" as identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. As a cohesively as a campus, the 49th Street Elementary School also retains character-defining features identified by the context including a "unified site plan; connecting sheltered corridors throughout campus; emphasis on a more expansive site plan; varied collection of buildings, differentiated by function and use; elaborate administration building, located near the campus entrance." Therefore, the 49th Street Elementary School meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context.

***B10. Significance (Continued…):**

Following the comprehensive redesign of the school in the 1930s, subsequent expansion of the school was completed in a piecemeal fashion in the 1960s as the population expanded and the school required additional space. Between 1965 and 1969, the Cafeteria/Lunch Pavilion, Administration, Library, and Classroom Building/Classroom Building, and sheltered corridor #4 were constructed. These buildings/structures do not meet the eligibility standards nor character-defining features identified in the *Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1980.* They do not reflect a "unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces, do not exhibit "finger-like" wings; one-story massing; and do not exhibit the finger-plan or cluster-plan school." Moreover, buildings from this period do not "turn inward towards green spaces; do not reflect a series of axial, modular units; and do not display a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing)." For this reason, later development in the 1960s does not contribute to the potential historic district.

The period of significance for 49th Street Elementary School under Criterion A/1/1 spans from 1935 to 1936, during which architect Harry C. Deckbar designed the PWA Moderne-style school plant.

The campus was redesigned in the 1930s, around the time that the immediate vicinity was transforming into a largely Black community. As outlined in the "Historic Resources Associated with African Americans in Los Angeles" National Register Nomination, "To be eligible under Criterion A, schools must have been constructed during the period of significance (prior to 1958) and need to represent some aspect of African American history in Los Angeles. They may reflect a particular milestone in the community's struggle for equal access to education or equal access to employment opportunities in the field of education" (Grimes 2008).

Although 49th Street Elementary School was constructed during the period of significance research did not indicate that the school was significant for its association with African American development patterns and was not the site of significant events associated with this community. Instead, as outlined in history of Central Avenue context in Section 4, the Black community was increasingly centered around Central Avenue corridor as a result of rezoning to the north and surrounding restrictive housing. The school's increasingly African American student body was thus the result of de factor segregation and did not reflect a significance milestone in the community's struggle for equal access. Therefore, 49th Street Elementary School does not appear eligible for listing based on association with the African American community.

Criterion B/2/2
No information was found to suggest that the 49th Street Elementary School was associated with any historic personages, nor that any other individuals of historic significance were associated with the property. Therefore, the 49th Street Elementary School is not eligible for listing under Criterion B/2/2.

Criterion C/3/3
49th Street Elementary School is also significant under National Register Criterion C, California Register Criterion 3 and City of Los Angeles HCM Criterion 3 within the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* and the *PWA Moderne* contexts of the LAUSD Historic Context Statement. The West Building, Main Building, South Building, Auditorium Building, and sheltered corridors (#1, #2, and #3) of the 49th Street Elementary School embody the distinctive characteristics of a type, period, and method of construction, notably that of PWA Moderne-style buildings. Buildings at the campus dating to 1935-1936 were designed or remodeled by architect Harry C. Deckbar, who incorporated the clean lines of the PWA Moderne style with the popular Neoclassical style to create a unique stylistic vocabulary on the campus. Buildings reflect the planning and design concepts of the period, including "one-story massing; general expanses of windows; unified site plan with central courtyard; and sheltered corridors throughout campus."

As identified in the *PWA Moderne* context, the buildings feature "symmetrical, formal design composition and massing; smooth wall surfaces; and piers, often fluted or reeded." The buildings at 29th Street Elementary School also incorporate "elements of a number of styles, including Classical Revival," as the context identifies as typical of PWA Moderne styles. Furthermore, as identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context, buildings designed during this period all reflect the period's emphasis on a varied collection of buildings differentiated by function and use, such as a separate auditorium. Features constructed in the mid-1930s include the Main Building, South Building, Auditorium Building, and three associated sheltered corridors (#1, #2, and #3). The West Building was also remodeled to follow the design vocabulary of the campus.

*Recorded by: Historic Resources Group *Date: June 2022 ■ Continuation ☐ Update

***B10. Significance (Continued…):**

Buildings constructed during the 1960s were constructed incrementally with later additions completed to accommodate an increase in population. The Cafeteria/Lunch Pavilion, Administration, Library, and Classroom Building/Classroom Building, and sheltered corridor #4 do not meet the eligibility standards nor character-defining features identified in the *Mid-Century Modernism/Regional Modernism* context. These buildings are not exemplary Modern style buildings. They do not reflect "aesthetic qualities derived from use of simply treated materials and excellent craftsmanship; direct expression of structural systems; or the extensive use of sheltered exterior corridors."

Although the Classroom Building addition and Cafeteria/Lunch Pavilion were designed by notable African American architect Harold Louis Williams, the buildings are utilitarian in design and are not significant examples of Williams' work. As clarified by the National Park Service, "a property is not eligible as the work of a master, however, simply because it was designed by a prominent architect." Instead, the work must "express a particular phase in the development of the master's career, an aspect of his or her work, or a particular idea or theme in his or her craft." As such, the buildings at 49th Street Elementary School are not notable examples of Williams' craft within his greater oeuvre, compared with other more notable buildings such as the Compton City Hall (1976) and Compton Civic Center (1977). Moreover, buildings completed during the 1960s on the campus are not clearly expressive of the ideals for "informality, indoor-outdoor connections, and zoned planning" that was significant in the post-war era, as identified in the *Educating the Baby Boom: The Postwar, Modern, Functionalist School Plant, 1945-1980* context. As such, later development at the school does not contribute to the potential historic district.

The period of significance for 49th Street Elementary School under Criterion C/3/3 is 1935-1936, when the campus was redesigned in the PWA Moderne style. Contributors to the historic district are the West Building, Main Building, South Building, Auditorium Building, and Sheltered Corridors #1, #2, and #3.

Evaluation of Eligibility

Evaluation of the Potential Historic District for the National Register

The potential historic district appears to be significant under National Register Criteria A and C at the local level for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's post-earthquake redevelopment and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a potential historic district on the National Register of Historic Places.

Evaluation of the Potential Historic District for the California Register

The potential historic district appears to be significant under California Register Criteria 1 and 3 for its for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's early development and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a potential historic district on the California Register of Historical Resources.

Evaluation of the Potential Historic District for designation as an HCM

The potential historic district appears to be significant for local listing under Criteria 1 and 3 for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's early development and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a City of Los Angeles HCM.

Historic integrity is the ability of a property to convey its significance. It is defined as the "authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period." The National Park Service defines seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

***B10. Significance (Continued…):**

Assessment of Integrity

49th Street Elementary School contains a cohesive concentration of four contributing buildings and three contributing site features that dates from the period of significance and has been identified as the potential historic district. Integrity of the property's individual buildings is varied, and all buildings and features have been subject to varying levels of alteration. However, despite some degree of alteration, the property retains much of the circulation pattern and spatial relationships established during the period of significance that characterize the potential historic district as a whole. A detailed assessment of the integrity of the potential historic district is discussed below.

Location: The buildings constructed during the period of significance remain in their original locations in the eastern region of the campus. Therefore, the campus retains integrity of *location*.

Design: The campus retains the buildings and sheltered corridors constructed or remodeled as part of the 1935-1936 PWA Moderne style with Neoclassical elements design of the campus. These include the West Building, Main Building, South Building, Auditorium Building, and three sheltered corridors (#1, #2, and #3). These buildings/structures retain most of their character-defining features such as symmetrical, formal design, smooth wall surfaces, fluted piers, and ornamentation associated with the Neoclassical style of architecture. Despite some alterations, a majority of the essential physical features reflecting the original design and organization of the property as a school from the 1930s remain intact within the potential historic district. Therefore, the campus retains integrity of *design*.

Setting: The potential historic district is located in the eastern region of the school property. The property continues to function as a public elementary school. The surrounding area of southeast Los Angeles has a whole has experienced some development, but remains a low-density residential neighborhood. Thus, the campus retains integrity of *setting*.

Materials: The potential historic district retains most of its original materials. Contributors typically retain some physical elements from the period of significance, including original cladding, including smooth wall surfaces of plaster concrete, wood detailing as seen on the Neoclassical style ornaments, and some original windows and doors. Therefore, the potential historic district's integrity of *materials* has been compromised.

Workmanship: The potential historic district retains the physical evidence of crafts of a particular culture or people during any given period in history or prehistory. This includes the contributors' construction methods and design choices, such as ornaments that reflect the Neoclassical style of architecture. Moreover, most exterior cladding and even detail work have been retained. Overall, the buildings continue to retain substantial physical evidence of period construction techniques, including finishes and design elements, such as smooth plaster exteriors, fluted pilasters, lintel and sill courses, that reflect the character and identity of the potential historic district. Therefore, the campus retains integrity of *workmanship*.

Feeling: The potential historic district retains most of the character-defining features of its original construction, including representative building types as well as spatial relationships and circulation patterns that are typical of campuses from this time. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a 1930s PWA Moderne elementary school. Thus, the campus retains integrity of *feeling*.

Association: Association is the direct link between an important historic event or person and a historic property. Because the campus retains integrity of *location*, *design*, *setting*, *workmanship,* and *feeling*, it continues to convey its direct link to the development of safer public schools following the 1933 Long Beach Earthquake utilizing new design principals. Therefore, the campus retains integrity of *association*.

49th Street Elementary School retains integrity of *location*, *design*, *setting, workmanship, feeling*, and *association* from the identified period of significance. The therefore continues to convey its significance as a post-1933 Long Beach Earthquake school plant, and as an excellent example of a WPA Moderne campus design.

APPENDIX A: 2022 HISTORIC RESOURCES EVALUATION REPORT 25

APPENDIX B: RESUMES 26

1.0 EXECUTIVE SUMMARY

Los Angeles Unified School District (LAUSD) is proposing the 49th Street Elementary School Major Modernization Project to expand and improve the 49th Street Elementary School facilities.

The purpose of this report is to identify historical resources as defined by the California Environmental Quality Act ("CEQA")[1] and identify potential impacts to historical resources as a result of the Project. This report is intended to inform environmental review of the Project.

The 49th Street Elementary School is located at 750 E. 49th Street in Los Angeles, California.[2] It is bounded by E. 49th Street to the north, McKinley Avenue to the east, E. 50th Street to the south, and single-family and multi-family residences to the west. The site is relatively flat.

The Project Site contains a potential historic district with a period of significance from 1935 to 1936. The potential historic district was found eligible for listing in the National Register and California Register, and for designation as a City of Los Angeles HCM under Criteria A/1/1 and C/3/3. The potential historic district consists of four (4) contributing buildings and three (3) contributing sheltered corridors with a period of significance from 1935 to 1936.

The Project will construct a one-story kindergarten classroom building with four classrooms and associated support spaces; and a one-story building to house a multi-purpose room, food services, and a library. The project will also construct an outdoor lunch shelter, kindergarten shade structure, and additional covered walkways/arcades. In addition, the existing library and one classroom will be converted into administrative workrooms. Other site improvements include new playgrounds and play equipment, landscaping, fencing, site furnishings, and parking.

As proposed the Project will remove two of the four contributing buildings to the historic district. The two contributing buildings to be removed (West Building and Auditorium), are substantially smaller in comparison to the two contributing buildings (Main Building and South Building). that will be retained. The retained contributing buildings represent a majority of the existing contributing square footage and the highest levels of integrity among the contributing buildings. The contributing buildings to remain also include the most physically prominent contributors, including the buildings most visible to the public. As a result, the proposed removal of two contributing buildings to the historic district would not reduce the integrity of the historic district such that it can no longer convey its historic significance. Removal of contributing buildings by the proposed Project would not result in significant impacts to

[1] California PRC § 21084.1.
[2] An additional address that has been historically associated with the school is 4917 McKinley Avenue.

historical resources as defined by CEQA.

The Project will also construct new one-story buildings, as well as shade structures, landscape, and playground improvements. The new construction of modest one-story buildings would not substantially alter the historic significance or integrity of the Historic District such that its ability to convey its historic significance would be materially impaired.

Therefore, impacts to the historic district will be less than significant and the Project will avoid significant impacts to historical resources as defined by CEQA.

2.0 INTRODUCTION

2.1 Site Location

The 49th Street Elementary School is located at 750 E. 49th Street in Los Angeles, California.[3] The school occupies a 5.7-acre rectangular site comprised of two parcels (Assessor's Parcel Numbers [APNs] 5108-011-909 and 5108-011-910). The property is located in the Southeast Los Angeles Community Plan Area (CPA) of the City of Los Angeles. It is bounded by E. 49th Street to the north, McKinley Avenue to the east, E. 50th Street to the south, and single-family and multi-family residences to the west. The site is relatively flat. The location of the campus is shown below in Figure 1.

2.2 Existing Conditions

The existing Campus is located on 5.73 acres and contains seven permanent buildings: Main Classroom Building, West Classroom Building, South Classroom Building, Auditorium, Administration/Library/Classroom Building, Classroom Building, and Cafeteria. The buildings were constructed between 1923 and 1969. The existing Campus also includes 43 standard classrooms, support spaces for instruction, administrative staff, and maintenance and operations, hardcourt playgrounds, and two parking lots: one along East 49th Street with 41 parking stalls and the other along East 50th Street with seven parking stalls. The Campus does not contain any relocatable buildings. The 49th Street ES has an enrollment of 568 students in Pre-K through 5th grade in the 2022–2023 school year.

2.3 Project Description[4]

The District proposes to complete a major modernization project at the 49th Street ES Campus to provide facilities that are safe, secure, and aligned with the instructional program (proposed Project or Project). The Project would demolish three permanent buildings (West Classroom Building, Cafeteria/Lunch Pavilion, and Auditorium), and remove three sheltered corridors. To replace these structures, the Project would construct a one-story Kindergarten Classroom Building with four Kindergarten classrooms and associated support spaces; a one-story Multi-Purpose Room/Food Services/Library Building; lunch shelter; covered eating area for faculty; two shade structures; and new sheltered corridors. Additionally, the Project would include exterior painting of all existing buildings and structures to remain, as well as minor interior improvements to convert one existing classroom and the existing library into administrative workrooms. The Project would also include the installation of interim facilities to allow the school to remain operational during construction, including

[3] An additional address that has been historically associated with the school is 4917 McKinley Avenue.
[4] Draft project description to be replaced with formal written description when it is received.

relocatable kitchen/scramble building and a relocatable restroom building. No change to the school's capacity or total number of classrooms is proposed as part of the Project.

A Project site map is shown in Figure 2 below.

2.4 Methodology

This report analyzes potential impacts to historical resources that could result from the Project. Where historical resources exist within the Project Site, this report analyzes whether the Project would result in a substantial adverse change in the significance of these historical resources. This report provides a comprehensive review of historical resources that could be impacted, directly or indirectly, by the Project. In preparing this report, the following tasks were performed:

- Review of the 49th Street Elementary School Historic Resources Evaluation Report authored by Historic Resources Group in 2022. (See below.)
- Analysis of potential impacts to historical resources on the Project Site and in the Project Site Vicinity.

2.5 Current Historic Status

PREVIOUS EVALUATIONS

49th Street Elementary School has previously been evaluated by various LAUSD historic surveys. Between 2001 and 2004, Science Applications International Corporation (SAIC), with funding from the Getty Research Institute completed a historic resources survey of LAUSD schools. This survey identified the 49th Street Elementary School as eligible for listing in the California Register and for designation as a City of Los Angeles HCM (3CS Status Code).[5] The 2014 survey of LAUSD schools by Sapphos Environmental, Inc. adopted these findings.[6]

2022 HISTORIC RESOURCES EVALUATION REPORT

At the request of the Los Angeles Unified School District (LAUSD), Historic Resources Group (HRG) evaluated 49th Street Elementary School for potential historic significance in 2022. HRG identified a single potential historic district at the 49th Street Elementary School with a period of significance from 1935 to 1936. The potential historic district was found eligible for listing in the National Register and California Register, and for designation as a City of Los Angeles HCM under Criteria A/1/1 and C/3/3.

---

[5] Science Applications International Corporation, *Preliminary Historic Resources Survey of the Los Angeles Unified School District*, prepared for the Los Angeles Unified School District, Facilities Services Division (Pasadena, CA: June 2002); Science Applications International Corporation, *Historic Context Statement: Los Angeles Unified School District*, prepared for Los Angeles Unified School District (Pasadena, CA: March 2002).

[6] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement,* Prepared for the Los Angeles Unified School District, March 201

The potential historic district consists of four (4) contributing buildings and three (3) contributing sheltered corridors with a period of significance from 1935 to 1936. These are as follows:

- West Building (constructed 1923)
- Main Building (constructed 1935)
- South Building (constructed 1935)
- Auditorium Building (constructed 1936)
- The sheltered corridors connecting the Main Building and the West Building (sheltered corridor #1); the Main Building and the South Building (sheltered corridor #2); and the South Building and the Auditorium (sheltered corridor #3) are also considered contributors to the historic district.

Two buildings located within the historic district boundary but constructed outside of the period of significance are considered non-contributing buildings to the Historic district:

- Administration, Library, and Classroom Building/Classroom Building (constructed 1965/1969)
- Cafeteria/Lunch Pavilion (constructed 1969)

There are no secondary or tertiary contributors to the potential historic district. Non-contributors to the potential historic district are the Administration, Library, and Classroom Building/Classroom Building and the Cafeteria/Lunch Pavilion. Additionally, no hardscaping or landscaping was found to contribute to the potential historic district.

Based on the findings of the 2022 Historic Resources Evaluation Report, the potential historic district is treated in this report as a historical resource for the purposes of CEQA evaluation. A copy of the 2022 Historic Resources Evaluation Report is included in Appendix A of this report.

A site map delineating the Historic district is shown in Figure 3 below.

2.6 Potential Impact Area

The analysis in this report focuses on those areas reasonably foreseen to be potentially impacted by the Project. In addition to examining the Project Site, this report also defines an area outside the Project Site where potential direct or indirect impacts could reasonably be expected to occur (Potential Impact Area).

In determining the Potential Impact Area for this report, three factors were considered: (1) the existing setting of the Project Site; (2) the scale and nature of the Project; and

(3) the potential impacts the Project could have on historical resources, if such resources exist. Due to the modest scope of the Project, the Potential Impact Area has been defined as the Project Site as there is no potential for significant direct or indirect impacts to historical resources located outside the Project Site.

2.7 Project Team

Analysis of potential impacts was performed by Paul Travis, Managing Principal, a qualified professional who meets the *Secretary of the Interior's Professional Qualification Standards*. See Appendix G for resumes of contributing authors.

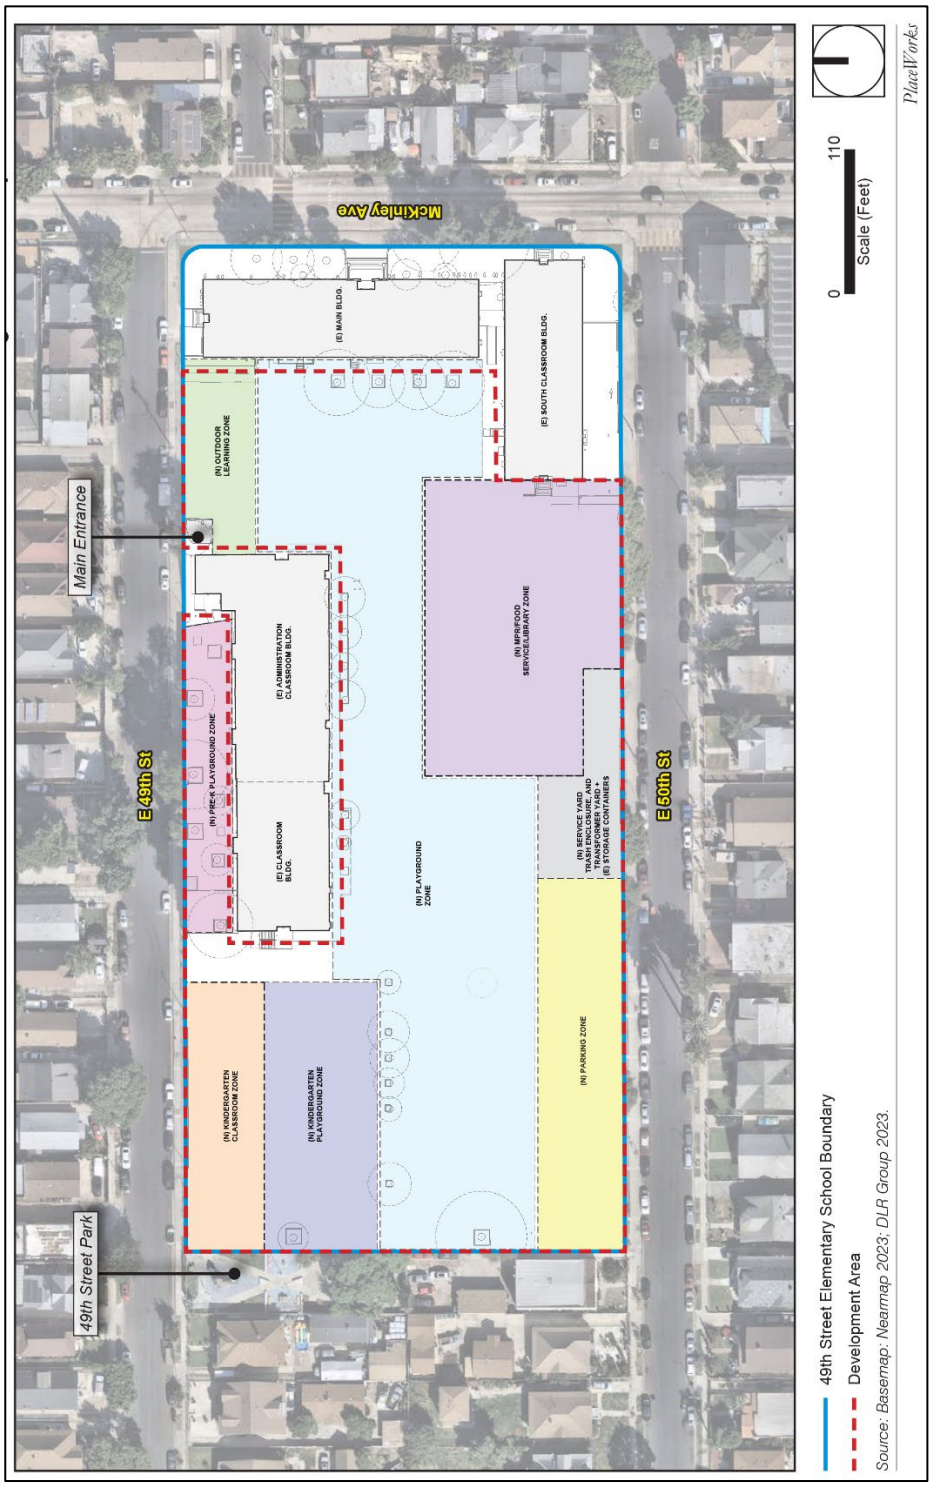

FIGURE 3: POTENTIAL HISTORIC DISTRICT

3.0 REGULATORY FRAMEWORK

3.1 Historical Resources Under CEQA

CEQA requires that environmental protection be given significant consideration in the decision-making process. Historical resources are included under environmental protection. Thus, any project or action which constitutes a substantial adverse change on a historical resource also has a significant effect on the environment and shall comply with the State CEQA Guidelines.

When the California Register of Historical Resources was established in 1992, the Legislature amended CEQA to clarify which cultural resources are significant, as well as which project impacts are considered to be significantly adverse. A "substantial adverse change" means "demolition, destruction, relocation, or alteration such that the significance of a historical resource would be impaired."

CEQA defines a historical resource as a resource listed in, or determined eligible for listing, in the California Register of Historical Resources. All properties on the California Register are to be considered under CEQA. However, because a property does not appear on the California Register does not mean it is not significant and therefore exempt from CEQA consideration. All resources determined eligible for the California Register are also to be considered under CEQA.

The courts have interpreted CEQA to create three categories of historical resources:

- *Mandatory historical resources* are resources "listed in, or determined to be eligible for listing in, the California Register of Historical Resources."
- *Presumptive historical resources* are resources "included in a local register of historical resources, as defined in subdivision (k) of § 5020.1, or deemed significant pursuant to criteria set forth in subdivision (g) of § 5024.1" of the Public Resources Code (PRC), unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant.
- *Discretionary historical resources* are those resources that are not listed but determined to be eligible under the criteria for the California Register of Historical Resources.[7]

To simplify the first three definitions provided in the CEQA statute, a historical resource is a resource that is:

- Listed in the California Register of Historical Resources (California Register);

[7] *League for the Protection of Oakland's Architectural and Historic Resources vs. City of Oakland*, 52 Cal. App. 4th 896, 906-7 (1997).

- Determined eligible for the California Register by the State Historical Resources Commission; or
- Included in a local register of historical resources.

Section 15064.5 of the CEQA Guidelines (CCR, Title 14, Chapter 3) supplements the CEQA statute by providing two additional definitions of historical resources, which may be simplified in the following manner. A historical resource is a resource that is:

- Identified as significant in a historical resource survey meeting the requirements of PRC § 5024.1(g); or
- Determined by a Lead Agency to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California. Generally, this category includes resources that meet the criteria for listing on the California Register (PRC § 5024.1, Title 14, CCR, § 4852).

The fact that a resource is not listed in, or determined eligible for listing in, the California Register, not included in a local register of historical resources, or not deemed significant pursuant to criteria set forth in subdivision (g) of PRC § 5024.1, does not preclude a lead agency from determining that the resource may be a "historical resource" for purposes of CEQA.

Properties formally determined eligible for listing in the National Register of Historic Places are automatically listed in the California Register. Properties designated by local municipalities can also be considered historical resources. A review of properties that are potentially affected by a project for historic eligibility is also required under CEQA.

3.2 Historic Designations

Historic resources may be designated at the federal, state, and local levels. Properties located in the City of Los Angeles can be listed in the National Register of Historic Places, listed in the California Register of Historical Resources, and/or designated as a City of Los Angeles Historic-Cultural Monument. In order for a property to qualify for historic listing or designation, it must meet one or more identified criteria for evaluation, identified below. The property must also retain sufficient historic integrity to evoke the sense of place and time with which it is historically associated.

NATIONAL REGISTER OF HISTORIC PLACES

The National Register of Historic Places was authorized by the National Historic Preservation Act of 1966 to serve as an authoritative guide to the nation's historic places worthy of preservation.[8] The National Register Program is administered by the

[8] 36CFR60 § 60.2.

National Park Service, U.S. Department of the Interior.

To be eligible for listing and/or listed in the National Register, a resource must possess significance in American history and culture, architecture, or archaeology. Listing in the National Register is primarily honorary and does not in and of itself provide protection of a historic resource. The primary effect of listing in the National Register on private owners of historic buildings is the availability of financial and tax incentives. In addition, for projects that receive Federal funding, a clearance process must be completed in accordance with Section 106 of the National Historic Preservation Act. Furthermore, state and local regulations may apply to properties listed in the National Register.

The criteria for listing in the National Register follow established guidelines for determining the significance of properties. The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history.[9]

Historic Significance

As defined by the National Park Service, *historic significance* is "the importance of a property to the history, architecture, archaeology, engineering, or culture of a community, state, or the nation."[10] It is achieved in several ways:

- Association with important events, activities or patterns
- Association with important persons
- Distinctive physical characteristics of design, construction, or form
- Potential to yield important information

A property may be significant individually or as part of a grouping of properties.

[9] 36CFR60 § 60.3. Criterion D addresses potential archaeological resources, which is outside the scope of this assessment.
[10] U.S. Department of the Interior, *National Register Bulletin 16A: How to Complete the National Register Registration Form* (Washington D.C.: National Park Service, 1997), 3.

Integrity

In addition to meeting any or all of the designation criteria, eligible properties must also possess historic *integrity*. Historic integrity is the ability of a property to convey its significance and is defined as "the authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period."[11]

The National Register recognizes seven aspects or qualities that comprise integrity: location, design, setting, materials, workmanship, feeling, and association. These qualities are defined as follows:

- *Location* is the place where the historic property was constructed or the place where the historic event took place.
- *Design* is the combination of elements that create the form, plan, space, structure, and style of a property.
- *Setting* is the physical environment of a historic property.
- *Materials* are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- *Workmanship* is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- *Feeling* is a property's expression of the aesthetic or historic sense of a particular period of time.
- *Association* is the direct link between an important historic event or person and a historic property.[12]

Historic Districts

Industry standard preservation practice evaluates collections of buildings from similar time periods and historic contexts as *historic districts*. The National Park Service defines a historic district as "a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development."[13] A historic district derives its significance as a single unified entity.

According to the National Park Service, "a district can comprise both features that lack individual distinction and individually distinctive features that serve as focal points. It may even be considered eligible if all of the components lack individual distinction,

[11] *National Register Bulletin 16A*, 4.

[12] U.S. Department of the Interior, *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* (Washington D.C.: National Park Service, 1995), 44-45.

[13] *National Register Bulletin 15*: *How to Apply the National Register Criteria for Evaluation*. Washington D.C.: National Park Service, U. S. Department of the Interior, 1997.

provided that the grouping achieves significance as a whole within its historic context. In either case, the majority of the components that add to the district's historic character, even if they are individually undistinguished, must possess integrity, as must the district as a whole." Some examples of districts include business districts, college campuses, large estates, farms, industrial complexes, residential areas and rural villages.[14]

Resources that have been found to contribute to the historic identity of a district are referred to as *district contributors*. Properties located within the district boundaries that do not contribute to its significance are identified as *non-contributors*.

CALIFORNIA REGISTER OF HISTORICAL RESOURCES

The California Register of Historical Resources is an authoritative guide to the state's significant historical resources. For a property to be considered eligible for listing in the California Register, it must be found to be significant under at least one of the following four criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States; or
2. It is associated with the lives of persons important to local, California or national history; or
3. It embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values; or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.[15]

For integrity purposes, a resource eligible for listing in the California Register must retain enough of its historic character or appearance to be recognizable as a historical resource and to convey the reason(s) for its significance. It is possible that a resource lacking sufficient integrity for listing in the National Register may still be eligible for the California Register.[16]

CITY OF LOS ANGELES HISTORIC-CULTURAL MONUMENTS (HCMS)

The City of Los Angeles Cultural Heritage Ordinance, enacted in 1962 and amended in 2018, allows for the designation of buildings and sites as individual local landmarks in

[14] Ibid.
[15] Criterion 4 addresses potential archaeological resources, which is outside the scope of this assessment.
[16] State of California Department of Parks and Recreation, "California Office of Historic Preservation Technical Assistance Series #6: California Register and National Register: A Comparison" (Sacramento, CA: Office of Historic Preservation, 2011).

the City of Los Angeles, known as “Historic-Cultural Monuments” (HCMs).

Section 22.171.7 of Article 1, Chapter 9, Division 22 of the City of Los Angeles Administrative Code defines a Historic-Cultural Monument as “any site (including significant trees or other plant life located on the site), building or structure of particular historic or cultural significance to the City of Los Angeles.” A proposed HCM may be designated by the City Council upon the recommendation of the Cultural Heritage Commission if it meets at least one of the following criteria:

1. Is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community;
2. Is associated with the lives of historic personages important to national, state, city, or local history; or
3. Embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder, or architect whose individual genius influenced his or her age.[17]

Designation as an HCM is “reserved for those places that have unique aesthetic, architectural, cultural or historic value to the City of Los Angeles.”[18] For integrity purposes, resources eligible for local designation should retain enough of their historic character or appearance to convey the reason(s) for their significance.

[17] Los Angeles Administrative Code (LAAC) Article 1, Chapter 9, Division 22; Added by Ordinance No. 178,402, effective 4-2-07; Amended by Ordinance 185,472, effective 4-28-18.

[18] City of Los Angeles Department of City Planning, Office of Historic Resources, “Office of Historic Resources Info Brief: What Makes a Resource Significant?”

4.0 ANALYSIS OF IMPACTS

The State Legislature, in enacting the California Register of Historical Resources, amended CEQA to clarify which properties are significant, as well as which project impacts are considered to be significantly adverse. A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.[19] A substantial adverse change in the significance of a historical resource means demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired.[20]

4.1 Significance Threshold

According to Appendix G, Environmental Checklist of the State CEQA Guidelines, cultural resource impacts resulting from the implementation of the proposed project would be considered significant if a project would:

- Cause a substantial adverse change in the significance of a historical resource defined in CEQA Guidelines Section 15064.5.

The State CEQA Guidelines (2018) indicate that a project would normally have a significant impact on historical resources if it would result in a substantial adverse change in the significance of a historical resource. A substantial adverse change in significance occurs if the project involves "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired."[21]

The State CEQA Guidelines go on to state that "[t]he significance of an historic resource is materially impaired when a project... [d]emolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources... local register of historic resources... or its identification in a historic resources survey."[22]

[19] *CEQA Guidelines*, section 15064.5(b).
[20] *CEQA Guidelines*, section 15064.5(b)(1).
[21] *CEQA Guidelines*, section 15064.5(b).
[22] *CEQA Guidelines*, section 15064.5(b)(2).

4.2 Potential Impacts to the 49th Street Elementary School Historic District

The potential 49th Street Elementary School Historic district contains four contributing buildings: the West Building, the Main Building, the South Building, and the Auditorium Building. The sheltered corridors connecting the Main Building and the West Building (sheltered corridor #1); the Main Building and the South Building (sheltered corridor #2); and the South Building and the Auditorium (sheltered corridor #3) are also considered contributors to the Historic district.

The Historic district is historically significant as a grouping of school buildings representative of post-Long Beach earthquake school planning and requirements as well as the PWA Moderne architectural style. As detailed in the 2022 Historic Resources Evaluation Report, the potential Historic district contains 6 buildings of which 4 are considered contributing buildings to the Historic district.

The Project will remove the West Building and Auditorium Building, both contributors to the Historic district. In addition, the Project will remove the non-contributing Cafeteria/Lunch Shelter building. The contributing Main Building and South Building will remain intact and in their original locations.

The Project would involve the following activities that have the potential to adversely impact the potential Historic district:

- Removal of one non-contributing building, the Cafeteria/Lunch Shelter.
- Removal of the contributing West Building.
- Removal of contributing Auditorium Building.
- Construction of new buildings adjacent to the Historic district contributors.

For the above listed activities to be considered a “substantial adverse change” to the Historic district under CEQA, however, it must be shown that they would result in the physical alteration of the Historic district such that its ability to convey its historical significance and eligibility for historic listing would be threatened. Potential impacts of these activities to the potential Historic district are discussed below.

POTENTIAL IMPACTS FROM REMOVAL OF BUILDINGS FROM THE HISTORIC DISTRICT

The proposed Project would remove three (3) buildings within the boundary of the potential Historic district. Of these, two (2) buildings are considered contributors, and one (1) building is a non-contributor. Because the non-contributing Cafeteria/Lunch

Shelter building was constructed outside the period of significance and does not contribute to the historic significance of the Historic district, its removal would not reduce the historic significance and integrity of the Historic district in any way.

As proposed the Project will remove two of the four contributing buildings or 50-percent of the contributing buildings overall. The two contributing buildings to be removed (West Building and Auditorium), however, are much smaller in comparison to the two contributing buildings (Main Building and South Building). that will be retained. Together the four contributing buildings contain approximately 32,362 sq. ft. of space. The proposed Project will remove the West Building (5,580 sq. ft.) and the Auditorium (4,290 sq. ft.) or approximately 30-percent of the total square footage of contributing buildings to the Historic district. The remaining Main Building (12,923 sq. ft.) and South Building (9,569 sq. ft.) together contain 22,492 sq. ft. of space or 70-percent of the contributing square footage to the Historic district. As such, a substantial majority of contributing buildings, in terms of built structure and historic fabric, will remain intact after removal of the West Building and Auditorium.

As the largest two of the four contributing buildings, the Main Building and South Building are most responsible for establishing the U-shaped arrangement of contributing buildings along the eastern edges of the 49th Street Elementary School Property. Together, the Main Building and South Building contain all of the exterior character-defining features identified as important in conveying the historic significance of the Historic district that are also repeated on the West Building and Auditorium. These include the rectangular plans, one-story heights, side-gable and flat roofs with metal coping, textured cement plaster exterior cladding, regular arrangement of windows and doors, recessed street entrances accessed by concrete stairs, parastedes and balustrades, double-hung wood sash windows with lugs, divided-light transoms, sidelights, decorative detailing including pediment, fluted pilasters, starbursts on return cornice, patera medallions, and dentils on pilaster capitals; rounded streamlined lintel courses and squared sill course, wood windows, and metal doors. The Main Building and South Building together also represent the important public-facing aspects of the school campus as it is their primary east-facing facades that contain the historic main entrance (Main Building) and secondary entrance (South Building) to the school.

The two contributing buildings to be removed, the West Building and Auditorium, are smaller buildings with a secondary public presence in comparison to the Main Building and South Building. Although they are representative of functions characteristic of schools constructed in the 1930s, they are not critical to understanding the historic significance of the Historic district and the Historic district would still convey its significance despite their removal. After implementation of the Project, the Historic district would continue to retain its largest and most public-facing buildings that date from the period of significance and reflect its historic identity as a PWA Moderne school building constructed immediately after the 1933 Long Beach earthquake. The retained

contributing buildings represent a majority of the existing contributing square footage and the highest levels of integrity among the contributing buildings. The contributing buildings to remain also include the most physically prominent contributors, including the buildings most visible to the public.

As a result, the proposed removal of two contributing buildings to the Historic district would not reduce the integrity of the Historic district such that it can no longer convey its historic significance. Removal of contributing buildings by the proposed Project would not result in significant impacts to historical resources as defined by CEQA.

POTENTIAL IMPACTS FROM PROPOSED NEW CONSTRUCTION

The Project will construct a one-story kindergarten classroom building with four classrooms and associated support spaces; and a one-story building to house a multi-purpose room, food services, and a library. The project will also construct an outdoor lunch shelter, kindergarten shade structure, and additional covered walkways/arcades. In addition, the existing library and one classroom will be converted into administrative workrooms.

All new construction proposed by the Project will be located west of the remaining contributing buildings to the Historic district. As such, the important spatial relationships between the two remaining contributing buildings would not be interrupted by the proposed construction of new buildings. In addition, the proposed new construction would be limited to classroom, library, multi-purpose room, and food service uses, all of which currently exist on the Project Site and are in keeping with the historic uses on the property. New construction would be contemporary versions of building types and uses historically common to elementary school campuses.

New buildings would be limited to one story in height in keeping with the existing heights of buildings located on the Project Site including contributing buildings to the Historic district. The new construction of modest one-story buildings would not substantially alter the historic significance or integrity of the Historic district such that its ability to convey its historic significance would be materially impaired.

4.3 Assessment of Integrity After Project Implementation

As noted in Section 3 of this report, the National Park Service identifies historic *integrity* as the ability of a property to convey its significance and is defined as the "authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period." The National Park Service defines seven aspects of integrity: *location, design, setting, materials,*

workmanship, *feeling*, and *association*.[23] To retain historic integrity a property will always possess several, and usually most, of the aspects. The analysis above concludes that the Project will not result in a significant impact to the Historic district as defined by CEQA. This analysis is expanded below using the seven aspects of integrity.

- **Location:** The two largest contributing buildings constructed during the period of significance will remain in their original locations in the eastern region of the campus. Therefore, the Historic district retains integrity of *location* after implementation of the Project.

- **Design:** The Project will retain the two largest contributing buildings and constructed as part of the 1935-1936 PWA Moderne style with Neoclassical elements design of the campus. These include the Main Building and South Building as well as the three sheltered corridors (#1, #2, and #3). These buildings and structures will continue to retain their character-defining features such as symmetrical, formal design, smooth wall surfaces, fluted piers, and ornamentation associated with the Neoclassical style of architecture. Despite the loss of the West Building and Auditorium, the majority of the essential physical features reflecting the original design and organization of the property as a school from the 1930s will remain intact within the potential historic district. Therefore, the campus will retain integrity of *design* after implementation of the Project.

- **Setting:** The Historic district is located in the eastern region of the school property and will continue to do so after implementation of the Project. The new construction proposed by the Project will consist of modest one-story buildings in keeping with the existing scale of the school campus. Because it is contained within the school property, the proposed Project will not alter or change the surrounding low-density residential neighborhood. Thus, the Historic district retains integrity of *setting* after implementation of the Project.

- **Materials:** As noted in the 2022 Historic Resources Evaluation Report, original materials have been compromised as contributing buildings typically retain some physical elements from the period of significance, while others have been lost. Therefore, the potential historic district's integrity of *materials* has been compromised. The Project will remove the West Building and Auditorium, thereby further compromising integrity of *materials* after implementation of the Project.

- **Workmanship:** By maintaining the two largest contributing buildings, the

[23] National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation (Washington D.C.: National Park Service, United States Department of the Interior, 2002). Accessed online at: http://www.nps.gov/nr/publications/bulletins/nrb15/

Project will retain the physical evidence of crafts of a particular culture or people during any given period in history or prehistory. This includes the construction methods and design choices, exterior cladding and detail work evident in the Main Building and South Building. The Main Building and South Building will continue to retain substantial physical evidence of period construction techniques, including finishes and design elements, such as smooth plaster exteriors, fluted pilasters, lintel and sill courses, which reflect the character and identity of the potential historic district. Therefore, the campus retains integrity of *workmanship*, after implementation of the Project.

- **Feeling:** The Project will remove two of the four contributing buildings which will alter the original configuration and spatial relationships of the 49th Street Elementary School campus. As such, the historic sense of the 1930s PWA Moderne elementary school as it was originally constructed will be compromised. Thus, the Historic district will not retain integrity of *feeling* after implementation of the Project.

- **Association:** Association is the direct link between an important historic event or person and a historic property. Because the campus will retain integrity of *location*, *design*, *setting*, and *workmanship*, it will continue to convey its direct link to the development of safer public schools following the 1933 Long Beach Earthquake utilizing new design principles. Therefore, the Historic district will retain integrity of *association* after implementation of the Project.

The Historic district will retain integrity of *location*, *design*, *setting, workmanship,* and *association* from the identified period of significance after implementation of the Project. It will, therefore, continue to convey its significance as a post-1933 Long Beach Earthquake school plant, and as an excellent example of a WPA Moderne campus.

1.0 EXECUTIVE SUMMARY

At the request of the Los Angeles Unified School District (LAUSD), Historic Resources Group (HRG) has evaluated 49th Street Elementary School located at 750 E. 49th Street in the City of Los Angeles, California for potential historic significance. This historic assessment analyzes the property's eligibility for listing in the National Register of Historic Places (National Register), California Register of Historical Resources (California Register), and for designation as a City of Los Angeles Historic-Cultural Monument (HCM). The school is located in the Southeast Los Angeles Community Plan Area (CPA) and was previously identified as eligible for listing in the California Register of Historical Resources (California Register) and for designation as a City of Los Angeles Historic-Cultural Monument (HCM).

49th Street Elementary School is re-evaluated in this report based on an observation of existing conditions on the property, primary and secondary source research related to the history of the property, review of the relevant historic contexts, and an analysis under the eligibility criteria and integrity thresholds for listing in the National Register of Historic Places (National Register), the California Register, and as a City of Los Angeles HCM. A site visit was conducted on March 17, 2022.

HRG has identified a potential historic district at the 49th Street Elementary School that is eligible for listing in the National Register, California Register, and as a City of Los Angeles HCM. The potential historic district consists of four (4) contributing buildings and three (3) contributing sheltered corridors with a period of significance from 1935 to 1936. Contributors to the potential historic district are the West Building, Main Building, South Building, Auditorium Building, and sheltered corridors #1, #2, and #3.

1.1 Project Team

Research, field inspection, and analysis were performed by Alexandra Madsen, Senior Architectural Historian; Christine Lazzaretto, Principal; and Ani Mnatsakanyan, Associate Architectural Historian. Additional assistance was provided by Molly Iker-Johnson, Architectural Historian, and Robby Aranguren, Planning Associate. All preparers are qualified professionals who meet the *Secretary of the Interior's Professional Qualification Standards* in their respective fields.

1.2 Methodology

This report was prepared using primary and secondary sources related to the history and development of the City of Los Angeles, the Los Angeles Unified School District (LAUSD), and 49th Street Elementary School.

Documents that were consulted include: historical photographs and aerial images; historical building plans; Sanborn Fire Insurance maps; historic context statements; local histories; The Built Environment Resource Directory (BERD), and the California State Historic Resources Inventory, Los Angeles County. Additionally, past surveys of the school were consulted, including the 2001-2004 historic survey and historic context statement prepared by Science

Applications International Corporation and the 2014 historic survey and historic context statement prepared by Sapphos Environmental, Inc.

2.0 INTRODUCTION

2.1 Site Location and Description

The 49th Street Elementary School is located at 750 E. 49th Street in Los Angeles, California.[1] The school occupies a 5.7-acre rectangular site comprised of two parcels (Assessor's Parcel Numbers [APNs] 5108-011-909 and 5108-011-910).

The property is located in the Southeast Los Angeles Community Plan Area (CPA) of the City of Los Angeles. It is bounded by E. 49th Street to the north, McKinley Avenue to the east, E. 50th Street to the south, and single-family and multi-family residences to the west. The site is relatively flat. The location of the campus is shown below in Figure 1.

2.2 Current Historic Status

49th Street Elementary School has previously been evaluated by various LAUSD historic surveys. Between 2001 and 2004, Science Applications International Corporation (SAIC), with funding from the Getty Research Institute completed a historic resources survey of LAUSD schools. This survey identified the 49th Street Elementary School as eligible for listing in the California Register and for designation as a City of Los Angeles HCM (3CS Status Code).[2] The 2014 survey of LAUSD schools by Sapphos Environmental, Inc. adopted these findings.[3]

The California Office of Historic Preservation (OHP) maintains the Built Environment Resources Directory (BERD), a database of previously evaluated resources throughout the state. The BERD contains information for cultural resources that have been processed through OHP. This includes resources reviewed for eligibility for the National Register of Historic Places and the California Historical Landmarks program through federal and state environmental compliance laws, and resources nominated under federal and state registration programs. 49TH Street Elementary School is not identified in the BERD as a potential historic property.

[1] An additional address that has been historically associated with the school is 4917 McKinley Avenue.

HISTORIC RESOURCES GROUP

2.3 Regulatory Framework

Historical Resources under CEQA

The California Environmental Quality Act (CEQA) is the principal statute governing environmental review of projects occurring in the state and is codified in Public Resources Code (PRC) Section 21000 et seq. CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA Section 21084.1, a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.

CEQA Guidelines Section 15064.5 recognizes that historical resources include: (1) resources listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources; (2) resources included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any objects, buildings, structures, sites, areas, places, records, or manuscripts which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record.

Historic Designations

Historical and cultural resources fall within the jurisdiction of several levels of government. The framework for the identification and, in certain instances, protection of cultural resources is established at the federal level, while the identification, documentation, and protection of such resources are often undertaken by state and local governments. As described below, the principal federal, State, and local laws governing and influencing the preservation of historical resources of national, State, regional, and local significance include:

- The National Historic Preservation Act of 1966, as amended;
- The Secretary of the Interior's Standards for the Treatment of Historic Properties (Secretary's Standards);
- The California Environmental Quality Act (CEQA);
- The California Register of Historical Resources (California Register);
- The California Public Resources Code;
- The City of Los Angeles General Plan;
- The City of Los Angeles Cultural Heritage Ordinance (Los Angeles Administrative Code, Section 22.171);
- The City of Los Angeles Historic Preservation Overlay Zone Ordinance (Los Angeles Municipal Code [LAMC], Section 12.20.3); and
- The City of Los Angeles Historic Resources Survey (SurveyLA).

National Register of Historic Places

The National Historic Preservation Act of 1966 established the National Register of Historic Places (National Register) as "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the Nation's historic resources and to indicate what properties should be considered for protection from destruction or impairment."[4] The National Register recognizes a broad range of historical and cultural resources that are significant at the national, state, and local levels and can include districts, buildings, structures, objects, prehistoric archaeological sites, historic-period archaeological sites, traditional cultural properties, and cultural landscapes.[5] Within the National Register, approximately 2,500 (3 percent) of the more than 90,000 districts, buildings, structures, objects, and sites are recognized as National Historic Landmarks or National Historic Landmark Districts as possessing exceptional national significance in American history and culture.[6]

Whereas individual historic properties derive their significance from one or more of the criteria discussed in the subsequent section, a historic district derives its importance from being a unified entity, even though it is often composed of a variety of resources. With a historic district, the historic resource is the district itself. The identity of a district results from the interrelationship of its resources, which can be an arrangement of historically or functionally related properties.[7] A district is defined as a geographic area of land containing a significant concentration of buildings, sites, structures, or objects united by historic events, architecture, aesthetic, character, and/or physical development. A district's significance and historic integrity determine its boundaries.

A resource that is listed in or eligible for listing in the National Register is considered "historic property" under Section 106 of the National Historic Preservation Act.

Criteria

To be eligible for listing in the National Register, a resource must be at least 50 years of age, unless it is of exceptional importance as defined in Title 36 CFR, Part 60, Section 60.4(g). In addition, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Four criteria for evaluation have been established to determine the significance of a resource. Resources can be considered significant if they:

A. Are associated with events that have made a significant contribution to the broad patterns of our history;

B. Are associated with the lives of persons significant in our past;

[4] 36 Code of Federal Regulations (CFR) 60.
[5] The identification of archaeological sites and traditional cultural properties is outside the scope of this report.
[6] United States Department of the Interior, National Park Service, National Historic Landmarks Frequently Asked Questions. https://www.nps.gov/subjects/nationalhistoriclandmarks/faqs.htm. Accessed October 20, 2021.
[7] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 5.

C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Have yielded, or may be likely to yield, information important in prehistory or history.[8]

Context

To be eligible for listing in the National Register, a property must be significant within a historic context. National Register Bulletin #15 states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning... is made clear."[9] A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

Integrity

In addition to meeting one or more of the criteria of significance, a property must have integrity, which is defined as "the ability of a property to convey its significance."[10] The National Register recognizes seven qualities that, in various combinations, define integrity. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance. In general, the National Register has a higher integrity threshold than State or local registers.

The National Register recognizes seven aspects or qualities that comprise integrity: location, design, setting, materials, workmanship, feeling, and association. These qualities are defined as follows:

- *Location* is the place where the historic property was constructed or the place where the historic event took place.
- *Design* is the combination of elements that create the form, plan, space, structure, and style of a property.
- *Setting* is the physical environment of a historic property.
- *Materials* are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

[8] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 8. Criterion D typically applies to potential archaeological resources, which is outside the scope of this report.
[9] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, pages 7 and 8.
[10] United States Department of the Interior, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation, 1997, page 44.

- *Workmanship* is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- *Feeling* is a property's expression of the aesthetic or historic sense of a particular period of time.
- *Association* is the direct link between an important historic event or person and a historic property.[11]

California Register of Historical Resources

The California Register of Historical Resources (California Register) is "an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change."[12] The California Register was enacted in 1992, and its regulations became official on January 1, 1998. The California Register is administered by the California Office of Historic Preservation (OHP). The criteria for eligibility for the California Register are based upon National Register criteria.[13] Certain resources are determined to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register. To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, State, and/or federal level under one or more of the following four criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States; or
2. It is associated with the lives of persons important to local, California or national history; or
3. It embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values; or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.[14]

A resource eligible for the California Register must meet one of the criteria of significance described above and retain enough of its historic character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

[11] U.S. Department of the Interior, *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* (Washington D.C.: National Park Service, 1995), pages 44-45.
[12] California Public Resources Code, Section 5024.1[a].
[13] California Public Resources Code, Section 5024.1[b].
[14] Criterion 4 addresses potential archaeological resources, which is outside the scope of this assessment.

Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and,
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources with a significance rating of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historical resources;
- Historic districts; and,
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone.

City of Los Angeles Historic-Cultural Monuments

The Los Angeles City Council adopted the Cultural Heritage Ordinance in 1962 and most recently amended it in 2018 (Sections 22.171 et seq. of the Administrative Code). The Ordinance created a Cultural Heritage Commission (CHC) and criteria for designating a Historic-Cultural Monument (HCM). The CHC is comprised of five citizens, appointed by the Mayor, who have exhibited knowledge of Los Angeles history, culture, and architecture. The City of Los Angeles Cultural Heritage Ordinance states that an HCM designation is reserved for those resources that have a special aesthetic, architectural, or engineering interest or value of a historic nature and meet one of the following criteria:

1. The proposed HCM is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community;
2. The proposed HCM is associated with the lives of historic personages important to national, state, city, or local history; or
3. The proposed HCM embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder, or architect whose individual genius influenced his or her age.[15]

[15] City of Los Angeles, Los Angeles Administrative Code, Section 22.171.7.

Unlike the National and California Registers, the Cultural Heritage Ordinance makes no mention of concepts such as physical integrity or period of significance. However, in practice, the seven aspects of integrity from the National Register and California Register are applied similarly and the threshold of integrity for individual eligibility is similar. It is common for the CHC to consider alterations to nominated properties in making its recommendations on designations. Moreover, properties do not have to reach a minimum age requirement, such as 50 years, to be designated as HCMs.

In addition, the LAMC Section 91.106.4.5 states that the Los Angeles Department of Building and Safety "shall not issue a permit to demolish, alter or remove a building or structure of historical, archaeological or architectural consequence if such building or structure has been officially designated, or has been determined by state or federal action to be eligible for designation, on the National Register of Historic Places, or has been included on the City of Los Angeles list of HCMs, without the department having first determined whether the demolition, alteration or removal may result in the loss of or serious damage to a significant historical or cultural asset. If the department determines that such loss or damage may occur, the applicant shall file an application and pay all fees for the CEQA Initial Study and Check List, as specified in Section 19.05 of the LAMC. If the Initial Study and Check List identifies the historical or cultural asset as significant, the permit shall not be issued without the department first finding that specific economic, social or other considerations make infeasible the preservation of the building or structure."[16]

3.0 CAMPUS SITE DESCRIPTION AND HISTORY

3.1 Exterior Architectural Description

The 49th Street Elementary School campus occupies approximately 5.7 acres. The campus is bounded to the north by East 49th Street, to the east by McKinley Avenue, to the south by East 50th Street, and to the west by single-family residences. The school campus is occupied by five (5) permanent buildings, one (1) permanent structure, four (4) sheltered corridors, and various open spaces. There is one (1) portable building, the Mechanical Shed.

The buildings are clustered along the northern, eastern, and southern boundaries of the campus, forming a "U" shape around a central play yard. Most of the campus consists of play yards and parking areas paved in asphaltic concrete and surrounded by chain link fencing. Landscaping is limited to lawns, shrubs, some trees in narrow setbacks along the three street frontages, and scattered trees in the play yards. The school is currently accessed via a pedestrian entrance on the north side of the Administration, Library & Classroom Building along E. 49th Street.

Existing buildings and features are listed below and are summarized in Table 1 ("Existing Conditions"). The names and function of some campus buildings have changed and evolved over the years. To avoid confusion, whenever possible, the buildings discussed in this report have been keyed to the official building naming system of 49th Street Elementary School. A map of the campus is provided below (Figure 2). Following this figure is an architectural description of each building and feature.

Figure 2. Site Map

49th Street Elementary School Historic Resources Evaluation Report

HISTORIC RESOURCES GROUP

Administration, Library, and Classroom Building/Classroom Building

The Administration, Library, and Classroom Building was constructed in 1965; an addition, known as the Classroom Building, was constructed in 1969. Together they form a two-story building with a rectangular plan and a one-story projection on the north façade. It has complex massing and asymmetrical composition. The two-story volume has a low-pitched hipped roof with plaster eave soffits and a canted fascia; the one-story volume has an asymmetrical front gable roof with open eaves and overhanging rakes. The exterior walls are finished in brick veneer, scored concrete, and textured cement plaster. Fenestration consists primarily of ribbons of four-light fixed and two-over-two double-hung aluminum sash windows at the east portion of the building; and high ribbon windows on the west portion. The primary entrance is asymmetrically located on the north (primary) façade and consists of a pair of partially glazed, divided light doors with sidelights and transom light, accessed by a projecting porch. There is an exterior metal staircase on the west façade with guardrails of metal mesh and metal pipe.

North Façade

North Façades

South and East Façades

South Façade

West and South Façades

West Façade Staircase

West Building

The West Building was constructed in 1923 and altered in 1935. It is a one-story building with a roughly "L"-shaped plan, simple massing, and asymmetrical composition. It has a flat roof with a low parapet. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. Fenestration consists primarily of three-over-three wood sash double hung windows in single or coupled configurations, some with transom panels and others with projecting subsills. The primary entrance is asymmetrically located on the south façade and consists of a pair of flush doors with a six-light transom light; the doors are accessed by a wide concrete stoop and steps with a shaped plastered parapet. Two secondary entrances on the south façade consist of flush doors with metal canopies, accessed by a concrete ramp and steps with metal pipe guardrails.

The interior of the West Building is divided into several spaces. Most classrooms are accessible via a central hallway. Two additional rooms, a classroom and kitchen, are accessible via the concrete ramp along the primary façade. The building's interior has tile flooring, plaster walls, and acoustical tile ceilings. It has flush wood doors with flat wood casings and baseboards; some doors have flush wood transom panels. The kitchen/staff room features wood cabinets.

Main Building

The Main Building was designed by architect Harry C. Deckbar and constructed in 1935. It is a PWA Moderne style one-story building with a rectangular plan, balanced but not strictly symmetrical composition, and complex massing consisting of a central volume flanked by wings. The central volume has a moderately pitched side gable roof with asphalt composition shingle roofing and a continuous eave cornice; the flanking wings have flat roofs with built-up roofing. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. The east (primary) façade of the central volume is framed with stylized fluted pilasters. Fenestration consists primarily of horizontal groupings of six-over-six and eight-over-eight double hung wood sash windows; some window openings are infilled with solid panels. The primary entrance, now blocked features some Neoclassical elements, is symmetrically located on the east façade of the central block and consists of solid panels in the configuration of doors with sidelights and transom lights, with reeded jambs and a stylized architrave. It is recessed under a pedimented gable supported on stylized fluted pilasters and flanked by wood posts. The entrance is accessed by a wide flight of concrete steps with parastedes and balustrades. There is a secondary entrance on the north façade, consisting of a pair of flush doors in a rectangular recess flanked by stylized fluted pilasters and accessed by concrete steps with parastedes.

The interior of the Main Building features a central hallway that opens to classrooms. The building has resilient tile floors, plaster walls, and acoustical tile ceilings. It has wood baseboards and casings. Most interior doors in this building feature transom panels. A wood trophy case is located in the hallway.

South Building

The South Building was designed by architect Harry C. Deckbar and constructed in 1935. It is a one-story PWA Moderne style building with a rectangular plan, simple massing, and a flat roof with a low parapet and metal coping. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. Fenestration consists primarily of horizontal groupings of six-over-six double hung wood sash windows; some window openings are infilled with solid panels. The east façade is symmetrically composed around the primary entrance, which consists of a pair of flush doors with a divided-light transom light in a rectangular recess flanked by stylized reeded pilasters. The entrance is accessed by a flight of concrete steps with concrete parastedes.

The interior of the South Building features a central hallway that opens to classrooms. It has wood and resilient tile floors, plaster walls, and acoustical tile ceilings. It has wood cabinets, radiators, and ceramic water fountains.

Auditorium Building

The Auditorium Building was designed by architect Harry C. Deckbar and constructed in 1936. It is a PWA Moderne style one-story building with a rectangular plan, simple massing, and symmetrical composition and a bow truss roof. The exterior walls are finished in textured cement plaster and articulated with piers and a continuous stringcourse and sill course; the corners are highlighted with wide, channeled piers. Fenestration consists primarily of six-over-six double hung wood sash windows. The primary entrance is symmetrically located on the south façade and consists of a pair of flush doors with a transom panel and architrave, in a rectangular recess framed by stylized fluted pilasters supporting a pediment. The entrance is accessed by a concrete staircase flanked with parastedes and curvilinear metal pipe railings. Secondary entrances on the east and west façades consist of flush doors with metal hoods, accessed by concrete steps with metal pipe guardrails.

The interior of the Auditorium Building features an open auditorium space with a restroom set behind the stage. The building has a raked floor with resilient tile flooring, acoustical tile ceiling, and fixed seating. The walls are plaster with a wood baseboard, beaded dado rail, and plaster entablature. The stage has a proscenium framed with fluted pilasters supporting a stylized entablature.

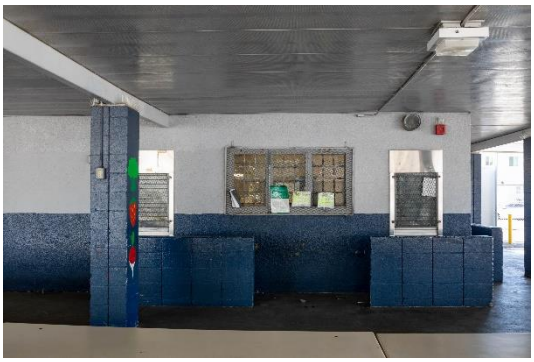
Cafeteria/Lunch Pavilion



The Cafeteria/Lunch Pavilion was constructed in 1969. It is a one-story building with an irregular plan, complex massing and asymmetrical composition. It is composed of two distinct parts: a kitchen with an L-shaped plan, shed roofs with boxed eaves and rakes, and exterior walls finished in cement plaster; and an open-sided shelter wrapping the north and west sides of the kitchen, with a flat roof supported on wood beams, concrete masonry columns and tube steel posts. The entrance consists of a flush door. Fenestration consists of a grouping of three windows with metal security screening, and service windows with metal roll-up shutters and metal security screens.

Sheltered Corridors (4)

There are four sheltered corridors on the campus, which connect separate buildings. Two elevated sheltered corridors from the 1930s (#1 and #2) connect the Main Building to the West and South Buildings. They have flat roofs with plaster soffits, wood beams with scalloped friezes, wood posts, scored concrete paving, and metal pipe guardrails. A third sheltered corridor dating from the 1930s (#3) connects the South Building to the Auditorium Building. It has a flat roof with plaster fascias and soffit supported on paired metal pipe columns, on concrete curbs with metal pipe guardrails. A fourth sheltered corridor (#4) dates from the 1960s and connects the Auditorium Building to the Lunch Pavilion; it has a flat roof supported on square steel tube posts.

3.3 Site History and Construction Chronology

The 49th Street Elementary School is situated in the Southeast neighborhood of Los Angeles. Prior to the development of the school, the block that comprises the school campus was developed with single-family residences. The first construction phase of 49th Street Elementary School was completed in the early 1910s, and the school was dedicated in 1914. The school campus was designed by Frank K. Krucker and Harry C. Deckbar of Krucker and Deckbar.[17]

At the time of its dedication, the *San Pedro Pilot* recorded that 49th Street Elementary School was "said to be the latest and best in school buildings in the entire city."[18] The campus initially consisted of one main building located near McKinley Avenue and two smaller classrooms near the west side of the lot.[19] A photograph from the period shows the 2-story masonry building that was constructed in 1913. In 1923, a single two-story brick building (West Building) was also built on the site.

Original 49th Street Elementary School Main Building, c.1913 (*Los Angeles Public Library*)

The 1933 Long Beach earthquake, and then the 1934 Field Act, hastened the need for widespread school repairs and new construction, which accelerated the stylistic shift during this period.[20] Following the Long Beach Earthquake of 1933, the Los Angeles Unified School District decided to modernize the 49th Street campus.

As a result, the original main building on the campus was demolished.[21] As recorded in the *Illustrated Daily News,* "excellent brick and steel construction now being demolished and none of which failed, but many tons of ornamental concrete fell to the ground."[22]

[17] "Krucker & Deckbar," *Los Angeles Times,* January 1, 1914.
[18] *The San Pedro Pilot,* March 22, 1913.

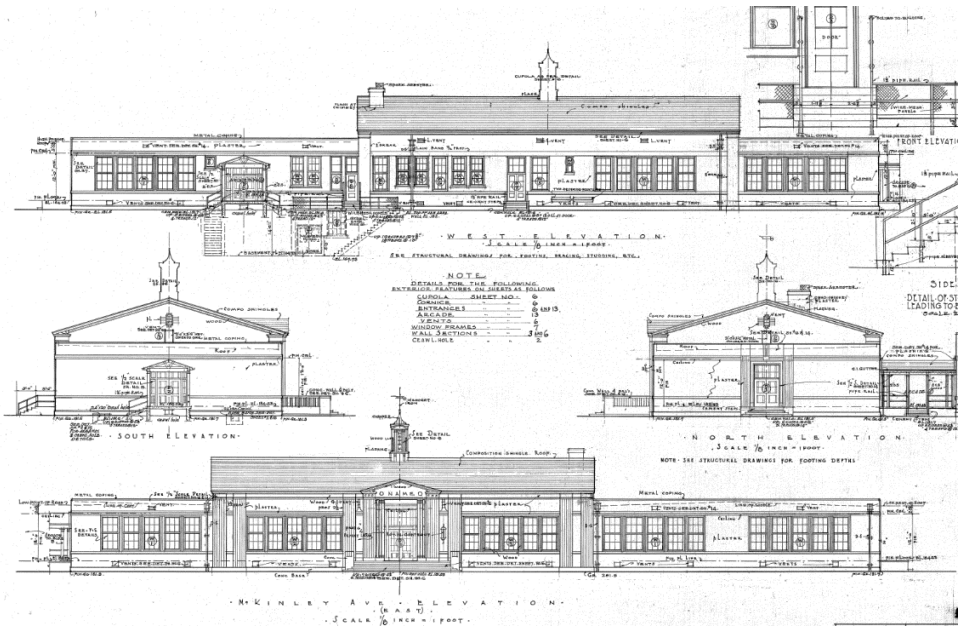
[21] City of Los Angeles building permit LA14989, issued November 5, 1934.
[22] "No Bolts in Iron," *Illustrated Daily News,* May 3, 1935.

Aerial View of 49th Street Elementary School and Vicinity, 1927 (*UCSB FrameFinder*)

While new buildings were under construction, classes were temporarily held in tents on the campus grounds.[23] The only building that was retained and retrofitted following the Long Beach Earthquake was the West Building, which is located in the northeastern region of the campus.



Students at 49th Street Elementary School Attending Classes in Temporary Tents, 1934 (*Los Angeles Public Library*)

Between 1933 and 1935, the school district spent approximately $2 million in rehabilitating schools in South Los Angeles, including 49th Street Elementary School.[24] The 49th Street

[23] "Three L.A. Schools Will Reopen Today," *Illustrated Daily News,* March 30, 1933.
[24] "Two Million Spent for Schools Locally," *The Southwest Wave,* December 31, 1935.

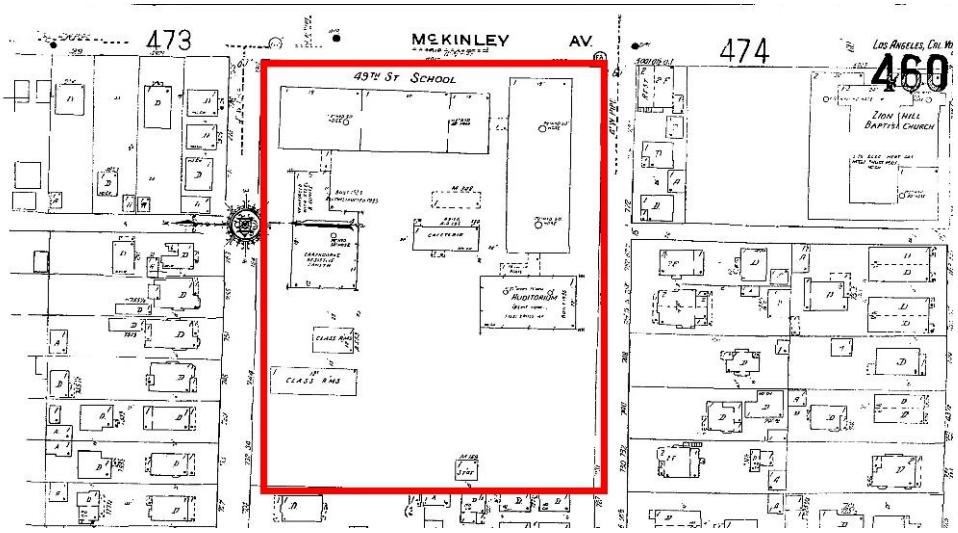
Elementary School received over $109,000, which was allotted for the construction of two new buildings (Main Building and South Building) and the reconstruction of a one-story school building (West Building). Work was completed by architect Harry C. Deckbar and contractors Johnson & Dahlquist.[25] The Main Building and South Building are both single-story wood frame buildings with concrete foundations and cement plaster exteriors. Deckbar also redesigned the West Building. Originally a two-story building, the West Building's second story was removed, and the building was reclad with cement plaster exteriors to match the design of the Main Building and South Building.

Building Plans for the Main Building, 1935 (*LAUSD*)

In 1936, Deckbar also designed the school's 1-story Auditorium Building. Unlike the other new buildings on the site, which were of wood frame construction, the Auditorium Building was of reinforced concrete and steel construction.[26] Harold A. Nelson served as the structural engineer and Brunzell & Jacobson served as the general contractors.[27]

A cafeteria building was also constructed at this time near the South Building; this cafeteria is no longer extant. All buildings designed by Deckbar were completed in the PWA Moderne style of architecture with some Neoclassical elements.

[25] "New Work Projects Scheduled," *The Los Angeles Times*, April 28, 1935.
[26] City of Los Angeles building permit LA13633, issued June 1936.
[27] "For Auditorium," *Los Angeles Times*, June 14, 1936.



PWA Moderne-style Main Building, 1935 (*Los Angeles Public Library*)

The school underwent some alterations in the 1950s. In 1950, a permit was issued to repair the school's storage shed, located at the west end of the parcel, to conform to code.[28] Simultaneously, a separate permit was issued for a 1-story building for temporary classrooms, which was located to the west of the West Building along 49th Street.[29] The repair work and temporary classrooms were designed by architect E.R.C. Billerbeck (not extant).

In the 1950s and 1960s, several additional classroom buildings were constructed on site. In 1952, a new 2-room classroom building was built, designed by A.B. Niebecker, Jr (not extant).[30] In 1960, architect Kenneth N. Bergstrom designed a larger classroom building, constructed by Carter Mack Building Inc. for the school (not extant). Both of these buildings were demolished in the late 1960s. These non-extant buildings are visible in a Sanborn Fire Insurance Map from 1950.

[28] City of Los Angeles building permit LA02875, issued January 1950.
[29] City of Los Angeles building permit LA02799, issued January 1950.
[30] City of Los Angeles building permit LA49097, issued September 10, 1952.

Sanborn Fire Insurance Map of Campus, Volume 4, Sheet 460, 1922-1950 (*Los Angeles Public Library*)

The Administration, Library & Classroom building was designed by Kent Attridge & Associates in 1965. In 1969, an addition was added to the west of the building (Classroom Building), designed by Harold L. Williams & Associates. Williams also designed the new Cafeteria/Lunch Pavilion that same year. The Administration, Library & Classroom Building/Classroom Building comprise a single building, but where they are joined is visually distinctive from the interior. The building is visible in an historical aerial photograph from 1971. In 1969, over 1,000 parents and community residents toured the new classrooms, school facilities, and newly completed 2-story annex building at the 49th Street Elementary School.[31]

Historical Aerial Photograph of 49th Street Elementary School, 1971 (*UCSB FrameFinder*)

In 1972, several buildings on campus were renamed in honor of black Americans during "Negro History Week." The theme of the program was "cementing Black greatness in the

[31] "Students Host Open House School Visitors," *Southeast Star-Wave,* May 8, 1969.

community," and names were chosen from those Black Americans who have made great contributions to the history and culture of the United States.[32]

Alterations to extant buildings on the 49th Street Elementary School campus are limited, and the school overall retains many of its character-defining features. The West Building was altered with cement plaster exterior and interior remodeling following the Long Beach Earthquake. The cupola on the Main Building was removed in the mid- to late-1970s. The Classroom Building was added to the Administration, Library, and Classroom Building as an addition in 1969.

Interior alterations have been extensive and include new resilient tile flooring, acoustical tile ceilings, the removal of interior transom lights, and alterations to fixtures. Some character-defining features have been retained, such as window and door surrounds, wood cabinets, radiators, and transom openings.

Table 1. Existing Conditions

Building Name	Building ID	Date of Construction
West Building	13933	1923
Main Building	14040	1935
South Building	13583	1935
Sheltered Corridor #1 (West Building - Main Building)	45244	1935
Auditorium Building	14196	1936
Sheltered Corridor #2 (Main Building - South Building)	45229	1936
Sheltered Corridor #3 (South Building - Auditorium)	45235	1936
Administration, Library & Classroom	14036	1965
Classroom Building	13718	1969
Cafeteria Building	13566	1969
Sheltered Corridor # 4 (Auditorium - Cafeteria)	13566	1969
Lunch Pavilion	45236	1969

[32] "49th Street School History Highlighted," *Southside Journal,* February 17, 1972.

4.0 FOCUSED NEIGHBORHOOD CONTEXT

The 49th Street Elementary School is located in the Southeast Los Angeles CPA, which was surveyed by SurveyLA in 2012. Background information regarding the area is excerpted from this survey report below.

Additional information regarding Central Avenue, the specific area of Southeast Los Angeles wherein 49th Street Elementary School is located, is also excerpted from the *Historic Resources Associated with African Americans in Los Angeles* National Register Nomination. This section provides information on the history of Central Avenue and redlining, as an important event/trend/development pattern associated with the area.

4.1 History of Southeast Los Angeles[33]

The northern section of the Southeast Los Angeles CPA was within the original Los Angeles city boundary (incorporated in 1850). The remainder of the CPA was consolidated or annexed into the City of Los Angeles between 1859 and 1944. The CPA includes the neighborhoods of Historic South Central, South Park, Central Alameda, Florence, Green Meadows, Broadway-Manchester, and Watts.[34] Watts was an incorporated city prior to its consolidation into the City of Los Angeles.

The Southeast Los Angeles CPA developed in a southward pattern beginning in the late 19th century, as the city's growing network of streetcars allowed for development outside the historic city center. Though the area north of Slauson Boulevard was largely built out by the late 1910s, at this time the land to the south was still largely undeveloped and relatively remote. Much of it was used for vegetable and fruit cultivation by Chinese and Japanese residents. In 1903, however, a group of investors evicted the farmers and constructed the Ascot Park horse racing track at generally the area south of Slauson Boulevard and east of Avalon Boulevard. Referred to as being located in the "no man's land" on the skinny stretch of territory "running from Los Angeles to the sea,"[35] Ascot Park quickly became known as a notorious den of gambling and drinking. Its investors hoped to incorporate the area, and though unsuccessful, the larger area was known as Ascot Park until the late teens when the park (which converted to automobile racing from horse racing in the late 1900s) was dissolved altogether. The removal of the vast acreage of Ascot Park freed the land for residential and industrial development, which ensued at a monumental pace south of Slauson Boulevard in the 1920s.

The Southeast Los Angeles CPA became the center of the city's African American community during the first half of the 20th century. The African American community in Los Angeles was first concentrated in the historic city center, around the neighborhood that is now Little Tokyo. As the community grew, it began moving

[33] This section has been excerpted and adapted from the "Southeast Los Angeles Community Plan Area" Historic Resources Survey Report, prepared for the City of Los Angeles by Galvin Preservation Associates, March 2012.
[34] Neighborhood names and boundaries were derived from: "Mapping L.A. - Los Angeles Times." Mapping L.A. Los Angeles Times. Web. 09 September 2011.
[35] "Ascot Park in 'No Man's Land," *Los Angeles Times*, January 15, 1907.

south after the turn of the 20th century. Central Avenue was the primary thoroughfare around which this movement and development was centered, and blacks created a vibrant community there. By the late 1920s, the area had become home to jazz clubs, a vibrant social scene and nightlife, as well as black-owned businesses.

During this time, the area remained racially and ethnically diverse. Despite the increasing concentration of African Americans, they remained in the minority. Whites, Asians, and Hispanics made up the remaining portion of the area's population during this period. It was not until the 1930s that the demographics in the area began to shift as these groups moved out of the area, and blacks became an increasing percentage of the population. Large numbers of African Americans moved to Los Angeles in the late 1920s and 1930s, drawn by the promise of jobs and homeownership. Prevented from moving farther west by racially restrictive covenants, they moved into the neighborhoods of Southeast Los Angeles.

4.2 History of Central Avenue[36]

The 1920s represents a turning point in the history of Black settlement patterns. Racial segregation practices intensified, hemming in the community as its population rose.[37] Residential settlement continued south around Central Avenue during the decade, but now stopped abruptly at Slauson Avenue. Black families who tried to venture south of this line met violent resistance during the 1920s and 1930s.[38] As well, the east and west borders of Alameda and San Pedro Streets continued to hold firm, buttressed by race restrictive covenants which spread widely in surrounding white suburbs, tightening the racial boundaries around Central Avenue.

In 1928, the center of gravity rapidly relocated further south down Central Avenue. The opening of the Somerville Hotel was arguably the most important catalyst for this shift, bound as it was to a momentous moment in the history of Black Los Angeles. By the late 1920s, Central Avenue and 41st Street was the new heart of Black L.A. At this electrifying intersection, three architecturally significant structures stood proudly, signs of the growth, maturation, and growing sophistication of the Black community. They included the Somerville Hotel, the Hudson-Liddell Building, and the Golden State Mutual Life Insurance Building. These enterprises drew Black settlement down and around the Avenue. This southward shift was the fastest, most dramatic relocation of the community's center in its history. Significantly, it occurred in a period when strong middle-class leadership, vibrant cultural life, and Black enterprise symbiotically coexisted in a common physical area. The forces of physical dispersal had not yet set

[36] This section has been excerpted and adapted from: Teresa Grimes, "Historic Resources Association with African Americans in Los Angeles" National Register Nomination. December 31, 2008.
[37] Lawrence de Graaf argues this ushered in the beginning of the Black ghetto in Los Angeles, although this is a point of some scholarly controversy.
[38] de Graaf, "City of Black Angels," 346.

in. This synergy bestowed even greater significance to Central Avenue as *place*—a site of meaning, identity, and rootedness for Black Angelenos.

The southward shift was not only pulled by these dynamic enterprises, but it was likely pushed by changes occurring in the northern sections of Central Avenue. In 1922, this area was rezoned for manufacturing, and by 1939 over 100 industries had located there. This precipitated a decline in housing quality, with some residential structures falling into disrepair. Some single-family homes were transformed into boarding houses, shared by four families. A number of these were owned by whites. As early as the mid-1920s, the area around northern Central Avenue already showed signs of decline.[39]

During the 1930s, the Black population in Los Angeles continued to climb, with most newcomers settling in the Central Avenue vicinity. In 1930, approximately 17,500 Blacks lived in the area; over the next decade, nearly 25,000 Blacks would join them.[40] Despite these growing numbers, the newcomers fit comfortably into the area without undue overcrowding. This was largely due to an exodus of non-Blacks from the vicinity: repatriation depleted the Mexican and Filipino population, white working-class residents were drawn to new suburban developments with Federal Housing Administration assistance (these areas and programs were largely closed to people of color), and some ethnic Japanese returned to Japan. Other areas of Los Angeles were growing in population during the 1930s; the multiethnic Eastside was not. This exodus resulted in a demographic change around Central Avenue: Blacks went from being 35 percent to 60 percent of the population between 1930 and 1940. The community was also more mixed in terms of class, as many Black newcomers came from poor or working-class backgrounds. In the 1930s, Black home seekers continued to buy properties around Central Avenue, forming a residential "strip" bounded by 4th Street to the north and Slauson Avenue to the south, and San Pedro and Alameda Streets to the west and east.[41]

The 1940s was a watershed decade for Central Avenue. The tremendous influx of Black migrants during and after World War II put major strain on the community, changing its qualitative character. During the war years, 50,000 newcomers settled in and around the Avenue, with more arriving after the war. Despite this jump in population, the racial boundaries held firm around the community: Alameda to the east and now Broadway to the west (a block west of Main Street), Slauson to the south. With each new wave of migrants, the area grew increasingly crowded and overburdened.[42] The housing shortage that plagued all of Los Angeles hit the

[39] Lawrence B. de Graaf, "City of Black Angels: Emergence of the Los Angeles Ghetto, 1890-1930," Pacific Historical Review 39 (1970), 349-50; Octavia Vivian, *The Story of the Negro in Los Angeles County* (Federal Writers Project, 1936), 30.
[40] Ervin, *The Participation of the Negro in the Community Life of Los Angeles*, 12. Technically, they moved into the 62nd Assembly district, which hugged Central Avenue. Douglas Flamming, Bound for Freedom: Black Los Angeles in Jim Crow America (Berkeley: University of California Press, 2005), 308.
[41] Flamming, *Bound for Freedom*, 306-308.
[42] Josh Sides, *L.A. City Limits: African American Los Angeles from the Great Depression to the Present* (Berkeley: University of California Press, 2003), 98.

community particularly hard, hemmed in as it was by race restrictions, even as the Black population skyrocketed. The Black influx had a compounding effect. Not only did it strain the community, but it reinforced the boundaries around it. As more Blacks arrived, they became a more visible presence in the city, provoking greater white fears, animosity, and ultimately hostile efforts to defend their communities from Black incursions. Those efforts largely succeeded through the 1940s.

Housing around Central Avenue felt the strain. Rooms were rented out and families doubled up, overtaxing many dwellings. Yet by the late 1940s, the area still had its good blocks. In 1948, Negro Digest ranked L.A.- still anchored by Central Avenue- as one of "America's Ten Best Cities for Negroes," with its decent homes, quiet streets, and good schools.

5.0 ARCHITECT/BUILDER/LANDSCAPE ARCHITECT

Harry C. Deckbar[43]

Harry Charles Deckbar was born in 1882 in Louisiana. By 1910, Deckbar was working in Los Angeles for architect Frank George Krucker. From 1911 to 1914, Deckbar assisted Krucker, along with Thornton Fitzhugh, on the nine-story Trinity Auditorium (later known as the Embassy Hotel). In 1913, Deckbar and Krucker started a partnership. During this period, Krucker & Deckbar built the first buildings at 49th Street Elementary School (later demolished).[44] They also designed the Crown Apartments in Pasadena.[45] The partnership lasted until about 1917.

Deckbar briefly moved to Mobile, Alabama, in 1918, where he worked as a draftsman for the Chickasaw Shipbuilding Company. He moved back to Los Angeles in 1920 where opened his own architectural firm. In 1924, he designed the 2-story Masonic Temple in Southwest Los Angeles.[46] In addition to the Masonic Temple, 49th Street Elementary School was one of the more prominent projects designed by Deckbar. He passed away in Los Angeles in 1938. Deckbar is not considered a master architect.

Kent Attridge, AIA

Kent James Attridge was born in 1920 in Los Angeles, California. He graduated from Chouinard Art Institute in 1941 with an Associate Degree in Architecture.[47]

Attridge served in the Merchant Marines during World War II; then returned to Los Angeles and began practicing architecture.[48] In 1958 and 1959, Attridge served as architectural advisor to the U.S. government and traveled to Moscow with Harold C. McClellan, where he designed the American Exhibition Facility in Solkolniki Park.[49]

Upon his return, Attridge became the Vice President of Welton Beckett and Associates and served as the director of the Beckett Office in New York. While at Welton Beckett & Associates, Attridge worked on the Los Angeles Memorial Sports Arena (demolished). Attridge then served as an associate architect for Claud Beelman, AIA, until Beelman's death in 1963. He opened his own firm, Kent Attridge and Associates, and retained Beelman's staff in his new company.[50] In 1965, the Coliseum Commission authorized Attridge to design an underground trade show center under the Sports Arena at Exposition Park.[51] In 1977, Attridge joined Albert C. Martin and Associates as a Project Director.[52] Some of his notable works, many of which are no longer extant, include the Santa Monica Civic Auditorium,

Robinson's Anaheim, various Broadway-Hale stores, Macy's stores, and Saks Fifth Avenue.[53]Attridge passed away in 1995 at the age of 75. Attridge is not considered a master architect.

Harold Louis Williams, FAIA

Harold Louis Williams was born on August 4, 1924, in Flemingsburg, Kentucky. He grew up in Cincinnati, Ohio. From an early age, Williams showed interest in art and architecture, and the minister of their family church introduced him to Paul R. Williams (no relation), who was designing homes for high-end clients in Los Angeles. After graduating high school in 1942, Williams was drafted to the U.S. Navy. While on leave in Los Angeles in 1944, he met Paul Williams and the two struck up a friendship which inspired Harold to pursue architecture. He spent 1946 at Talladega College in Alabama upon his return from the Navy and then entered Miami University in Ohio in 1947.[54]

Williams graduated from Miami University in 1952, where he was the only African American student.[55] In 1953, he was hired as a draftsman at Fulton, Krinsky, and Delamotte in Cleveland, Ohio.[56] In 1954, he moved to Los Angeles. In Los Angeles, Williams worked for Paul R. Williams & Associates.

In 1958, he became the ninth African American architect to be licensed in California and joined the Southern California Chapter of the American Institute of Architects. In 1962, he opened his own practice, Harold Williams Associates, Architects, and Urban Planners.[57] In 1967, he was one of the principal partners of Kinsey, Meeds, and Williams. He had many repeat clients, including the Los Angeles Unified School District, the City and County of Los Angeles, and California State Universities.[58]

Williams' most notable projects include the Compton City Hall (1976); the South Central Los Angeles Multi-Service and Child Development Center, Los Angeles (1976); Compton Civic Center (1977); California State Office Building, Civic Center, Van Nuys (1982); and Fire Station Number No. 3 (1989).

In addition, Harold Williams was also active in the community and provided leadership. He was the organizer, founder, and first president of the Southern California Association of Minority Architects and Planners (MAP) and co-founder of the National Organization of Minority Architects (NOMA) in 1971. From 1981-1982 he served as the NOMA National President. Under his leadership, a new Watts Towers Art Center building was built in 1967.[59] Williams died on June 21, 2015, at the age of 90.[60]

6.0 SIGNIFICANCE EVALUATION

This evaluation utilizes the framework for historic resource assessments described in the *Los Angeles Unified School District Historic Context Statement*, which "defines themes of significance, eligibility standards, and related property types. Properties sharing a theme of significance are then assessed consistently, in comparison with resources that share similar physical characteristics and historical associations."[61]

In addition to each of the applicable federal, state, and local designation criteria, two evaluation frameworks and their associated eligibility standards and integrity thresholds were identified and applied to this evaluation. These evaluation frameworks relate specifically to the themes of *Post–1933 Long Beach Earthquake School Plants, 1933-1945*; and *Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1969*. These themes were used to analyze buildings on the campus, which primarily were built or substantially altered during these periods. Buildings at 49th Street Elementary School were evaluated using these frameworks for potential eligibility both individually and as contributors to a potential historic district. Additionally, campus buildings that date to the 1930s were evaluated using *PWA Moderne* context. Buildings that date to the 1960s were evaluated using the *Mid-Century Modern/Regional Modernism* context.

Buildings that were found to be potentially eligible for listing in federal, state, or local registers were carried forward for an integrity analysis, which is included in Section 7, to determine if the building retains sufficient integrity to convey its significance.

6.1 Frameworks for Evaluation

The following frameworks are derived from the *Los Angeles Unified School District Historic Context Statement* and the "Historic Resources Associated with African Americans in Los Angeles" National Register Nomination.

Post-1933 Long Beach Earthquake School Plants, 1933-1945[62]

Property Type: Institutional/Educational
Property Subtypes: Elementary, Junior High, and High School Buildings and Campuses
Period of Significance: 1933 to 1945
Area of Significance: Education
Geographic Location: Citywide
Area of Significance: A/1

Eligibility Standards:

- Exemplifies post–Long Beach earthquake school planning and design concepts of the period, including requirements under the 1934 Field Act
- One-story massing for elementary schools; up to two-stories for junior/high schools

[61] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement*, 4.
[62] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement, 137.*

- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features - Buildings/Structures:

- One-story massing for elementary schools; up to two stories for middle and senior high schools
- Reinforced concrete, steel- or wood-frame construction
- Classroom wings designed for easy access and views to outdoors—with variations including L-, H-, T-shaped building plans
- Generous expanses of windows, including steel- and wood-framed multilight windows, awning and hopper casements, clerestories, and large-pane fixed windows; window groupings often mark the location of classrooms
- Stylistically more streamlined and less ornamental than 1920s period-revival styles
- Emphasis on "traditional Southern Californian" styles, such as Spanish Colonial and Mission Revival
- Styles can also include PWA Streamline Moderne, Art Deco, Late Moderne, and proto-modern styles
- May have been partially or fully funded through Works Progress Administration (WPA), 1935 to 1943
- WPA projects may include significant interior artwork such as murals, paintings and sculpture
- May have been designed by a prominent architect of the period

Character-Defining Features - Campus/District:

- Unified site plan consisting of buildings and structures designed and sited according to their use
- Use of designed outdoor and landscaped spaces, for outdoor study, recreation and dining
- Often displays connecting sheltered corridors throughout campus
- Emphasis on a more expansive site plan
- Varied collection of buildings, differentiated by function and use (rather than a single building with all functions inside)
- Might include an elaborate administration building, located near the campus entrance; administration buildings usually serve as the focal point of the campus
- Campus often composed of groupings of classroom wings, auditoriums, gymnasiums, cafeterias, and outdoor recreation and dining areas
- Middle or senior high schools might include a gymnasium designed in the style of the campus overall

Integrity Considerations:

- Should retain most of the essential physical features from the period of significance
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Schools from this period generally include buildings constructed after the period of significance, in particular post-World War II buildings, which may be noncontributing
- Eligible properties under this theme may be a single building, if it exemplifies the design ideals of the era, or a grouping (campus) of buildings constructed during the period of significance
- Intact campus groupings from the pre-1945 era are not common
- Many pre-1933 schools were substantially remodeled following the Long Beach earthquake—may retain a 1920s plan but with 1930s stylistic detailing.
- Pre-1933 schools rehabilitated post-1933 might exhibit added seismic supports of steel columns, beams, or diagonal bracing; original masonry might be covered by concrete/stucco sheathing
- Should retain integrity of Materials, Design, Workmanship, Feeling, and Association from its period of significance

Comments: Buildings exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type/period or method of construction, as an example of the work of a master architect, or for high artistic values.

Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1969[63]

Property Type: Institutional/Education
Property Subtypes: Elementary, Junior High Schools, and High School Buildings and Campuses
Period of Significance: 1945 to 1969
Area of Significance: Education
Geographic Location: Citywide, with concentrations in the San Fernando Valley and West Los Angeles
Area of Significance: A/1

Eligibility Standards

- Clearly embodies the characteristics of a postwar modern functionalist school campus
- Displays a unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces (courtyards, patios, outdoor play areas)
- One-story massing for elementary schools; up to two-stories for junior/high schools
- Classrooms, in detailing and plans, clearly express their function, with axial, fingerlike wings, plentiful fenestration, and connections to the outdoors

[63] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement, 141.*

- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features – Buildings/Structures

- Building plans and site design clearly express their function; classroom wings often exhibit one story "finger-like" wings, arranged on an axis
- Easily identifiable indoor-outdoor spaces, connections to classrooms through the incorporation of patios, courtyards, and outdoor canopied corridors
- One-story massing, particularly for elementary schools; up to two to three stories for junior and high schools
- Building types and plans expressive of postwar ideals in school design; these can include (1) finger-plan schools (usually in 1940s through 1950s); (2) cluster-plan schools (beginning in 1950s); and (3) variations and combinations of these typologies clearly expressive of the ideals for informality, indoor-outdoor connections, and zoned planning for the site
- Varying elevations might display differentiated window sizes and configurations, in order to tailor interior light to sun patterns and create cross-lit classrooms

Character-Defining Features – Campus/District

- Unified campus design includes most or all of the following attributes: lack of formality and monumentality; low massing (usually one stories for classrooms and up to two stories for auditoriums/multipurpose rooms); strong geometric ordering of buildings and outdoor spaces; decentralized, pavilion-like layout; rational, function driven site design; buildings extend across the site; buildings are oriented to outdoor spaces (courtyards, patios, outdoor areas), purposeful indoor-outdoor integration
- Automobile traffic/drop-off areas separated from campus; linked to interior via extended canopied corridors
- Buildings often turn inward, toward green spaces and courtyards, lawns
- Outdoor corridors, sheltered beneath simple canopies, forming links between the buildings of the campus
- Classrooms often consist of a series of axial, modular units
- An informal, domestic scale for the buildings and campus might be especially evident in elementary schools
- Swaths of patios, terraces, and plantings adjacent to and alternating with buildings
- Generous expanses of windows, including steel- and wood-framed multi-light windows, in awning and hopper casements, clerestories, and fixed panes
- Flat roof or broken-plane roof often used for lighting and acoustical issues
- Modular design, with a rhythmic, asymmetrical but balanced composition
- Usually displays a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing), International Style modernist, or, by the early 1960s, Late Modern (more expressive and sculptural)

- Some examples might include some degree of historicist detailing or styles popular in the postwar period (such as American Colonial Revival); these are less common than modernist examples
- May have been designed by a prominent architect of the period
- Often associated with post–World War II suburbanization and growth near major employment centers beyond the city periphery (such as the San Fernando Valley and southwest Los Angeles)
- Often built in residential neighborhoods on large expanses of land, with swaths of land devoted to landscape design and playing fields (in particular for high school campuses)

Integrity Considerations

- Retains most of the essential physical features from the period of significance
- School expansion and new construction over the years, in particular in the postwar period, might have resulted in the addition of in-fill buildings and structures in areas that were originally designed open spaces (such new additions should not interfere with or serve as a visual impairment to the designed connections between buildings, in particular classroom wings, and adjacent outdoor patios and spaces)
- Many postwar schools were designed to be easily expandable as enrollment increased; the original site design and building types and plans should be readily discernible. If additional wings were added or the campus extended, the additions should be compatible with and visually subordinate to the original
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Should retain integrity of setting, materials, design, workmanship, feeling, and association from its period of significance
- Addition of portable or permanent buildings after the period of significance acceptable as long as original campus design is intact

PWA Moderne[64]

The Public Works Administration (PWA) was created by the National Industrial Recovery Act within a few months of the March 1933 Long Beach Earthquake. Much school reconstruction work was funded by the PWA following widespread damage to Los Angeles public schools in the wake of the earthquake,. Consequently, a substantial number of Los Angeles public schools either built or remodeled during this time exhibit some degree of PWA Moderne styling. Also referred to as "Stripped Classicism," the PWA Moderne often incorporates elements of a number of styles, including Classical Revival, Spanish Colonial Revival, Art Deco, and Streamline Moderne.

Compared with the Streamline Moderne, the PWA Moderne was more formal and symmetrical in its overall design, with less emphasis on curvilinear shapes and horizontality.

[64] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement,* 124.

This style is found throughout the United States, particularly for institutional buildings funded through the PWA. The PWA program was terminated in 1943.

Typical Character-Defining Features

- Emphasis on the vertical axis
- Symmetrical, formal design composition and massing
- Smooth wall surfaces, generally of stucco, concrete, and/or polished stone (rarely includes brick exterior elements)
- Usually a flat roof
- Piers, often fluted or reeded, separating recessed window channels
- Incorporation of shallow relief panels and interior murals

Mid-Century Modernism/Regional Modernism (Post-1945)[65]

Mid-Century Modernism, or Regional Modernism, represents a middle ground between the formal, machine-age aesthetic of the International Style and a regional idiom reflecting local precedent and identity. In the postwar period through the 1960s, as practiced in Southern California, Mid-Century Modernism took its cues from the region's first-generation modernist architects such as Richard Neutra, Rudolph Schindler, Gregory Ain, Frank Lloyd Wright, and Harwell Hamilton Harris. In the postwar period, second-generation practitioners such as Raphael Soriano, Whitney Smith, and A. Quincy Jones, among many others, established Los Angeles as a center for innovative architectural design and culture.

Mid-Century Modernism is characterized by an honest expression of structure and function, with little applied ornament. Aesthetic effect is achieved through an asymmetrical but balanced, rhythmic design composition, often expressed in modular post-and-beam construction. Whether wood or steel, post-and-beam construction allowed for open floor plans, ease of expansion, and generous expanses of glazing to heighten indoor-outdoor integration. Infill panels of wood or glass are common, with glazing often extending to the gable. Buildings are generally one to two-stories, with an emphasis on simple, geometric forms. Capped with low-pitched gabled or flat roofs, a Mid-Century Modern building often displays wide eaves and cantilevered canopies, supported on spider-leg or post supports. Sheathing materials vary, with wood, stucco, brick and stone, or steel-framing and glass. Windows are generally flush-mounted, with metal frames.

This style was seen in postwar institutional and commercial buildings, as well as residences, from 1945 until circa 1975, when Title 24 restrictions on the use of glass curtailed the expansive glazing that characterizes the style.

Typical Character-Defining Features

- Horizontal design composition and massing; generally one to two stories

[65] Sapphos Environmental, Inc., *Los Angeles Unified School District Historic Context Statement, 126.*

- Simple, geometric volumes
- Flat or shed roof, often with wide, cantilevered overhangs
- Exterior materials include stucco, brick, or concrete
- Modular design and planning
- Aesthetic qualities derive from use of simply treated materials and excellent craftsmanship
- Direct expression of structural systems, often in wood or steel post-and-beam
- Lack of historicizing ornament
- Generous expanses of fenestration, including bands of grouped multi-light windows
- Extensive use of sheltered exterior corridors, with flat or slightly sloped roofs supported by posts, piers, or pipe columns

African American Association with Schools[66]

Description - The first dedicated public schoolhouse in Los Angeles was constructed in 1855 at the corner of 2nd and Spring Streets. A second school opened shortly thereafter on N. Main Street. Each was two stories in height and constructed of brick. The school buildings that were constructed during the latter part of the 19th and early part of the 20th century followed this same general format, only larger and somewhat more formal. The Classical Revival was especially favored with impressive porticos and colossal columns proclaiming the importance attached to education. Most of these buildings fell victim to the 1933 Long Beach Earthquake. The State passed the Field Act in response to the public outcry over the vulnerability of school buildings to earthquake damage. Severely damaged schools were demolished, while others were rehabilitated and reinforced. Most of the schools reconstructed exhibit the mix of classicism and streamlining referred to as P.W.A. Moderne. Public schools from the period of significance are generally located in the Central Avenue corridor, or the Watts, West Jefferson, West Adams, or Pacoima areas. They include the Holmes Avenue Elementary School, 9th Street Elementary School, 20th Street Elementary School, 28th Street Elementary School, Wadsworth Avenue Elementary School (formerly 35th Street School), McKinley Avenue Elementary School, Hooper Avenue Elementary School, Carver Middle School (formerly McKinley Junior High School), and Jefferson High School. Lafayette Junior High School was the other middle school in the area. The building still stands, but the school has been closed.

Significance - Schools associated with the history of African Americans in Los Angeles may qualify for listing in the National Register under Criterion A at the local level. California joined the Union in 1850. During the first legislative session, statutes were enacted that denied African Americans the right to receive a public education, among other things. Between 1872 and 1879, black children gained some access to a public education, but the law proscribing their right to a public education was not repealed until 1880. At this point in time the

[66] Grimes, "Historic Resources Association with African Americans in Los Angeles" National Register Nomination, 49-50.

population of African Americans in Los Angeles was approximately 102, out of a total population of 11,000. The number of school age black children is unknown.

To the black community, education represented a means toward upward mobility. Access to educational opportunities was a powerful factor in attracting African Americans to Los Angeles. By 1910, the African American population of Los Angeles had grown to 7,599 and began to coalesce in the area south of downtown. Many settled in the Furlong Tract where black families could buy lots for $750 dollars. Businesses and services needed by the community of 200 homes opened, including three churches and a school. After many of the homes were damaged in the 1933 Long Beach Earthquake, families began to leave the neighborhood. The remaining houses were torn down in 1942 and the Pueblo Del Rio housing project was built to house defense industry workers. All that remains of the original Furlong Tract is the Holmes Avenue Elementary School. Built as the 51st Street School in 1910, it was rebuilt after a fire in 1922 and reopened as the Holmes Avenue Elementary School. While mainly African American children attended the school, the principals and teachers were exclusively white. In 1911, Bessie Burke joined the staff. She was the first African American teacher in the Los Angeles public school system. By 1918, she was promoted to principal of the school, another first for her race.

Public schools in Los Angeles were not segregated by law, but rather racial geography and the policies of the school district. Schools often served as the educational and social focal point for their respective communities. This was particularly true of high schools that also had extracurricular activities such as athletic and music programs. Most blacks attended either Jefferson or Jordan High Schools, although they were racially mixed through the late 1950s. Many of the most distinguished African American who grew up in Los Angeles.

Registration Requirements - To be eligible under Criterion A, schools must have been constructed during the period of significance (prior to 1958) and need to represent some aspect of African American history in Los Angeles. They may reflect a particular milestone in the community's struggle for equal access to education or equal access to employment opportunities in the field of education. A school that was attended by an African American who is considered a historic personage would not be considered eligible under Criterion B, because it is highly unlikely that it would reflect the person's life work. However, a school attended by numerous African Americans who are considered historic personages may be eligible under Criterion A for the cumulative importance of those individuals in the community. Schools should retain sufficient integrity to evoke their original use and character from the period of significance. The entire campus should be evaluated, and if there are multiple buildings with integrity remaining from the period of significance, consideration should be given to nominating them as an historic district. The historic location, setting, feeling, and association must be strongly present in the evaluation of integrity. The mid-1930s may be considered the baseline for evaluating the integrity of design, materials, and workmanship even for much older schools as virtually every school in Los Angeles was rehabilitated after 1933.

6.2 Historic District Assessment

The buildings and features of the 49th Street Elementary School campus have been considered collectively for their potential eligibility for listing in the National Register, California Register, and/or listing as a City of Los Angeles HCM.

The National Park Service defines a *historic district* as "a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development."[67] Additionally, school campuses are noted as a potential example of a historic district. School campuses in the United States, especially those built in the 20th century often have definable spaces and unified site plans that were constructed as institutional complexes for educational purposes. The combination of space and purpose reflects individual school buildings' interconnectedness and functionality as a larger grouping.

Because the 49th Street Elementary School campus contains a grouping of related buildings and features and was originally developed as an elementary school, consideration of this property as a potential historic district is an appropriate analytical framework for its evaluation.[68]

Findings

HRG identified a single potential historic district at the 49th Street Elementary School with a period of significance from 1935 to 1936. The potential historic district was found eligible for listing in the National Register and California Register, and for designation as a City of Los Angeles HCM under Criteria A/1/1 and C/3/3.

Primary contributors to the potential historic district are the West Building, Main Building, South Building, Auditorium Building, and three sheltered corridors. There are no secondary or tertiary contributors to the potential historic district. Non-contributors to the potential historic district are the Administration, Library, and Classroom Building/Classroom Building and Cafeteria/Lunch Pavilion. Additionally, no hardscaping or landscaping was found to contribute to the potential historic district.

Historic Significance

Criterion A/1/1

49th Street Elementary School is significant under National Register Criterion A, California Register Criterion 1, and City of Los Angeles HCM Criterion 1 within the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context of the LAUSD Historic Context Statement. The West Building, Main Building, South Building, Auditorium Building, and sheltered corridors (#1, #2, and #3) of the 49th Street Elementary School were constructed following the Long Beach Earthquake of 1933. The campus directly reflects a design shift resulting from this major natural disaster, when school plants were reimagined for longevity in a specifically Southern California environment. These buildings meet several eligibility standards established by this context. The 49th Street Elementary School exemplifies post-Long

[67] *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation.* Washington D.C.: National Park Service, U. S. Department of the Interior, 1997. (5)
[68] Ibid.

Beach earthquake school planning and requirements of the 1934 Field Act; has one-story massing; and retains most of the associative and character-defining features from the period of significance. Character-defining features of the context that are present on the campus include: "wood frame construction; generous expanses of windows; stylistically streamlined; and … the PWA Streamline Moderne style" as identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. As a cohesively as a campus, the 49th Street Elementary School also retains character-defining features identified by the context including a "unified site plan; connecting sheltered corridors throughout campus; emphasis on a more expansive site plan; varied collection of buildings, differentiated by function and use; elaborate administration building, located near the campus entrance." Therefore, the 49th Street Elementary School meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context.

Following the comprehensive redesign of the school in the 1930s, subsequent expansion of the school was completed in a piecemeal fashion in the 1960s as the population expanded and the school required additional space. Between 1965 and 1969, the Cafeteria/Lunch Pavilion, Administration, Library, and Classroom Building/Classroom Building, and sheltered corridor #4 were constructed. These buildings/structures do not meet the eligibility standards nor character-defining features identified in the *Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1980.* They do not reflect a "unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces, do not exhibit "finger-like" wings; one-story massing; and do not exhibit the finger-plan or cluster-plan school." Moreover, buildings from this period do not "turn inward towards green spaces; do not reflect a series of axial, modular units; and do not display a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing)." For this reason, later development in the 1960s does not contribute to the potential historic district.

The period of significance for 49th Street Elementary School under Criterion A/1/1 spans from 1935 to 1936, during which architect Harry C. Deckbar designed the PWA Moderne-style school plant.

The campus was redesigned in the 1930s, around the time that the immediate vicinity was transforming into a largely Black community. As outlined in the "Historic Resources Associated with African Americans in Los Angeles" National Register Nomination:

> To be eligible under Criterion A, schools must have been constructed during the period of significance (prior to 1958) and need to represent some aspect of African American history in Los Angeles. They may reflect a particular milestone in the community's struggle for equal access to education or equal access to employment opportunities in the field of education.[69]

Although 49th Street Elementary School was constructed during the period of significance research did not indicate that the school was significant for its association with African

[69] Grimes, "Historic Resources Association with African Americans in Los Angeles" National Register Nomination, 50.

American development patterns and was not the site of significant events associated with this community. Instead, as outlined in history of Central Avenue context in Section 4, the Black community was increasingly centered around Central Avenue corridor as a result of rezoning to the north and surrounding restrictive housing. The school's increasingly African American student body was thus the result of de facto segregation and did not reflect a significant milestone in the community's struggle for equal access. Therefore, 49th Street Elementary School does not appear eligible for listing based on a significant association with the history of the African American community.

Criterion B/2/2

No information was found to suggest that the 49th Street Elementary School was associated with any historic personages, nor that any other individuals of historic significance were associated with the property. Therefore, the 49th Street Elementary School is not eligible for listing under Criterion B/2/2.

Criterion C/3/3

49th Street Elementary School is also significant under National Register Criterion C, California Register Criterion 3 and City of Los Angeles HCM Criterion 3 within the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* and the *PWA Moderne* contexts of the LAUSD Historic Context Statement. The West Building, Main Building, South Building, Auditorium Building, and sheltered corridors (#1, #2, and #3) of the 49th Street Elementary School embody the distinctive characteristics of a type, period, and method of construction, notably that of PWA Moderne-style buildings. Buildings at the campus dating to 1935-1936 were designed or remodeled by architect Harry C. Deckbar, who incorporated the clean lines of the PWA Moderne style with the popular Neoclassical style to create a unique stylistic vocabulary on the campus. Buildings reflect the planning and design concepts of the period, including "one-story massing; general expanses of windows; unified site plan with central courtyard; and sheltered corridors throughout campus." As identified in the *PWA Moderne* context, the buildings feature "symmetrical, formal design composition and massing; smooth wall surfaces; and piers, often fluted or reeded." The buildings at 29th Street Elementary School also incorporate "elements of a number of styles, including Classical Revival," as the context identifies as typical of PWA Moderne styles. Furthermore, as identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context, buildings designed during this period all reflect the period's emphasis on a varied collection of buildings differentiated by function and use, such as a separate auditorium. Features constructed in the mid-1930s include the Main Building, South Building, Auditorium Building, and three associated sheltered corridors (#1, #2, and #3). The West Building was also remodeled to follow the design vocabulary of the campus.

Buildings constructed during the 1960s were constructed incrementally with later additions completed to accommodate an increase in population. The Cafeteria/Lunch Pavilion, Administration, Library, and Classroom Building/Classroom Building, and sheltered corridor #4 do not meet the eligibility standards nor character-defining features identified in the *Mid-Century Modernism/Regional Modernism* context. These buildings are not exemplary Modern style buildings. They do not reflect "aesthetic qualities derived from use of simply treated

materials and excellent craftsmanship; direct expression of structural systems; or the extensive use of sheltered exterior corridors." Although the Classroom Building addition and Cafeteria/Lunch Pavilion were designed by notable African American architect Harold Louis Williams, the buildings are utilitarian in design and are not significant examples of Williams' work. As clarified by the National Park Service, "a property is not eligible as the work of a master, however, simply because it was designed by a prominent architect." Instead, the work must "express a particular phase in the development of the master's career, an aspect of his or her work, or a particular idea or theme in his or her craft."[70] As such, the buildings at 49th Street Elementary School are not notable examples of Williams' craft within his greater oeuvre, compared with other more notable buildings such as the Compton City Hall (1976) and Compton Civic Center (1977). Moreover, buildings completed during the 1960s on the campus are not clearly expressive of the ideals for "informality, indoor-outdoor connections, and zoned planning" that was significant in the post-war era, as identified in the *Educating the Baby Boom: The Postwar, Modern, Functionalist School Plant, 1945-1980* context. As such, later development at the school does not contribute to the potential historic district.

The period of significance for 49th Street Elementary School under Criterion C/3/3 is 1935-1936, when the campus was redesigned in the PWA Moderne style.

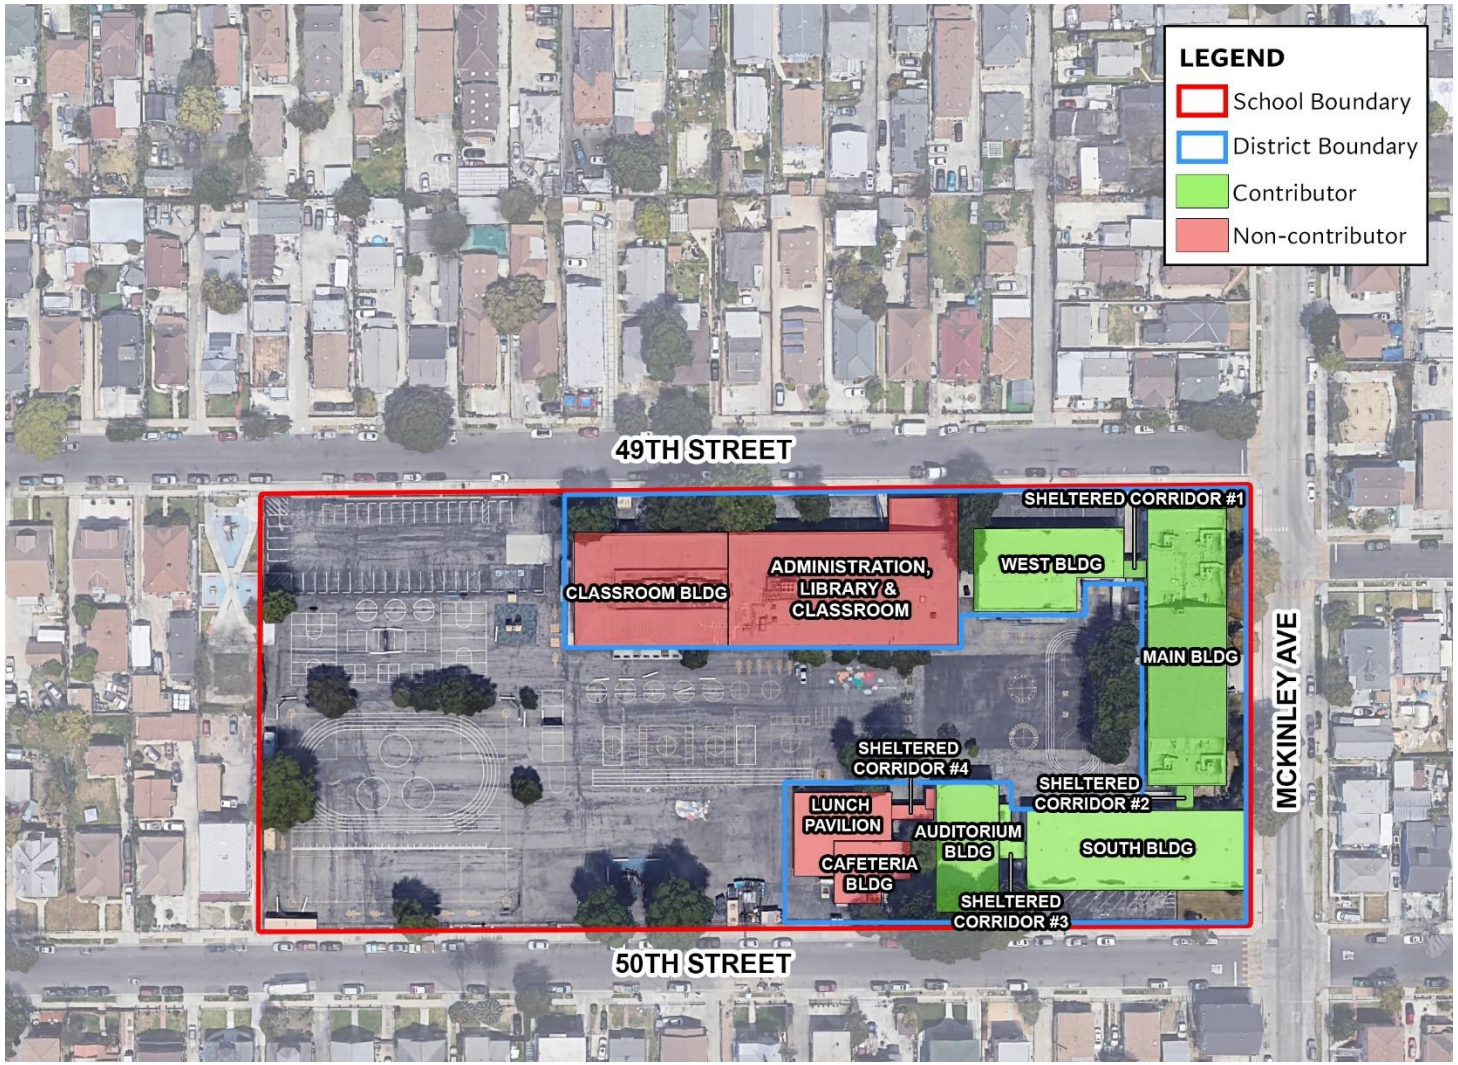
Evaluation of Eligibility

Evaluation of the Potential Historic District for the National Register

The potential historic district appears to be significant under National Register Criteria A and C at the local level for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's post-earthquake redevelopment and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a potential historic district on the National Register of Historic Places.

Evaluation of the Potential Historic District for the California Register

The potential historic district appears to be significant under California Register Criteria 1 and 3 for its for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's early development and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a potential historic district on the California Register of Historical Resources.



[70] National Park Service, "National Register Bulletin: How to Apply the National Register Criteria for Evaluation," 1995, 20.

Evaluation of the Potential Historic District for designation as an HCM

The potential historic district appears to be significant for local listing under Criteria 1 and 3 for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's early development and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a City of Los Angeles HCM.

The location of contributing buildings and site features to the potential historic district as well as the district boundary is shown below in Figure 3.

Figure 3. Potential Historic District Map

49th Street Elementary School Historic Resources Evaluation Report

HISTORIC RESOURCES GROUP

6.3 Individual Assessment

The buildings and features of the 49th Street Elementary School campus have also been considered individually for their potential eligibility for listing in the National Register, California Register, and/or listing as a City of Los Angeles HCM.

HRG did not identify any individually eligible buildings located at 49th Street Elementary School. The West Building, Main Building, South Building, Auditorium Building and three sheltered corridors (#1, #2, and #3) are not individually exceptional examples of the PWA Moderne style of architecture. Instead, the school's significance is best represented as a historic district comprised of a cohesive collection of buildings from the 1930s. Additionally, the Administration, Library, and Classroom Building/ Classroom Building, Cafeteria/Lunch Pavilion, and sheltered corridor (#4), which date to the mid- to late-1960s were not found to be individually exceptional examples of the Mid-Century Modern/Regional Modern style of architecture. None of the buildings on the campus were found to be associated with significant personages or important events or periods of development. Instead, significance is derived from the cohesive collection of buildings on the campus.

Eligibility of Buildings and Features at 49th Street Elementary School

The following table identifies the construction year, integrity, and historic status for buildings and features that are extant on the 49th Street Elementary School campus today:

Table 2. Eligibility of Buildings and Features

Current Feature Name	Year Built	Integrity	Status
Buildings			
West Building	1923	Good	Contributor
Main Building	1935	Good	Contributor
South Building	1935	Good	Contributor
Auditorium Building	1936	Good	Contributor
Administration, Library, and Classroom Building/Classroom Building	1965/1969	N/A	Non-Contributor
Cafeteria/Lunch Pavilion	1969	N/A	Non-Contributor
Site Features			
Sheltered Corridors (#1, #2, #3)	1935-1936	Good	Contributor
Sheltered Corridor (#4)	1969	Good	Non-Contributor

7.0 Historic Integrity

Historic integrity is the ability of a property to convey its significance. It is defined as the "authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period."[71] The National Park Service defines seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.[72]

Assessment of Integrity

49th Street Elementary School contains a cohesive concentration of four contributing buildings and three contributing site features that dates from the period of significance and has been identified as the potential historic district. Integrity of the property's individual buildings is varied, and all buildings and features have been subject to varying levels of alteration. However, despite some degree of alteration, the property retains much of the circulation pattern and spatial relationships established during the period of significance that characterize the potential historic district as a whole. A detailed assessment of the integrity of the potential historic district is discussed below.

- **Location:** The buildings constructed during the period of significance remain in their original locations in the eastern region of the campus. Therefore, the campus retains integrity of *location*.
- **Design:** The campus retains the buildings and sheltered corridors constructed or remodeled as part of the 1935-1936 PWA Moderne style with Neoclassical elements design of the campus. These include the West Building, Main Building, South Building, Auditorium Building, and three sheltered corridors (#1, #2, and #3). These buildings/structures retain most of their character-defining features such as symmetrical, formal design, smooth wall surfaces, fluted piers, and ornamentation associated with the Neoclassical style of architecture. Despite some alterations, a majority of the essential physical features reflecting the original design and organization of the property as a school from the 1930s remain intact within the potential historic district. Therefore, the campus retains integrity of *design*.
- **Setting:** The potential historic district is located in the eastern region of the school property. The property continues to function as a public elementary school. The surrounding area of southeast Los Angeles has a whole has experienced some development, but remains a low-density residential neighborhood. Thus, the campus retains integrity of *setting*.
- **Materials:** The potential historic district retains most of its original materials. Contributors typically retain some physical elements from the period of significance, including original cladding, including smooth wall surfaces of plaster concrete, wood detailing as seen on the Neoclassical style ornaments, and some original windows and doors. Therefore, the potential historic district's integrity of *materials* has been compromised.
- **Workmanship:** The potential historic district retains the physical evidence of crafts of a particular culture or people during any given period in history or prehistory. This includes the contributors' construction methods and design choices, such as ornaments that reflect the Neoclassical style of architecture. Moreover, most exterior cladding and even detail work have been retained. Overall, the buildings continue to retain substantial physical evidence of period

[71] Ibid.
[72] *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation.* Washington D.C.: National Park Service, U.S. Department of Interior, 1995. (44-45)

construction techniques, including finishes and design elements, such as smooth plaster exteriors, fluted pilasters, lintel and sill courses, that reflect the character and identity of the potential historic district. Therefore, the campus retains integrity of *workmanship*.

- **Feeling:** The potential historic district retains most of the character-defining features of its original construction, including representative building types as well as spatial relationships and circulation patterns that are typical of campuses from this time. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a 1930s PWA Moderne elementary school. Thus, the campus retains integrity of *feeling*.
- **Association:** Association is the direct link between an important historic event or person and a historic property. Because the campus retains integrity of *location, design, setting, workmanship,* and *feeling,* it continues to convey its direct link to the development of safer public schools following the 1933 Long Beach Earthquake utilizing new design principals. Therefore, the campus retains integrity of *association*.

49th Street Elementary School retains integrity of *location, design, setting, workmanship, feeling,* and *association* from the identified period of significance. The therefore continues to convey its significance as a post-1933 Long Beach Earthquake school plant, and as an excellent example of a WPA Moderne campus design.

8.0 CHARACTER-DEFINING FEATURES

8.1 Character-Defining Features

Character-defining features are distinctive elements and physical features that convey the historical appearance of a property and are required for it to convey its historical significance. According to Preservation Brief 17, there is a stepped process to identifying character-defining features.[73] The first step involves assessing the distinguishing physical aspects of the building as a whole. This second step involves examining the building more closely. While on their own each of the elements above may not convey historical significance, in combination they define the property and convey the associations for which it is significant.

Tables 3 through 7 below are included to provide the character-defining features of each contributor to the potential historic district. These include aspects of each contributor's shape/form, roof, openings, projections, secondary features, materials, setting, and, if applicable, interior features. Additionally, as required by LAUSD, character-defining features are ranked according to primary, secondary, and tertiary importance in order to inform advanced planning.

[73] Lee Nelson, *Architectural Character—Identifying the Visual Aspects of Historic Buildings as an Aid to Preserving their Character,* Preservation Brief No. 17, U.S. Department of the Interior, National Park Service, Technical Preservation Services.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The 49th Street Elementary School campus occupies approximately 5.7 acres. The campus is bounded to the north by East 49th Street, to the east by McKinley Avenue, to the south by East 50th Street, and to the west by single-family residences. The school campus is occupied by five (5) permanent buildings, one (1) permanent structure, four (4) sheltered corridors, and various open spaces. There is one (1) portable building, the Mechanical Shed.

The buildings are clustered along the northern, eastern, and southern boundaries of the campus, forming a "U" shape around a central play yard. Most of the campus consists of play yards and parking areas paved in asphaltic concrete and surrounded by chain link fencing. Landscaping is limited to lawns, shrubs, some trees in narrow setbacks along the three street frontages, and scattered trees in the play yards. The school is currently accessed via a pedestrian entrance on the north side of the Administration, Library & Classroom Building along E. 49th Street. *(See Continuation Sheet)*

***B5. Architectural Style:** PWA Moderne with Neoclassical elements
***B6. Construction History:**
The 49th Street Elementary School is situated in the Southeast neighborhood of Los Angeles. Prior to the development of the school, the block that comprises the school campus was developed with single-family residences. The first construction phase of 49th Street Elementary School was completed in the early 1910s, and the school was dedicated in 1914. The school campus was designed by Frank K. Krucker and Harry C. Deckbar of Krucker and Deckbar.

At the time of its dedication, the *San Pedro Pilot* recorded that 49th Street Elementary School was "said to be the latest and best in school buildings in the entire city." The campus initially consisted of one main building located near McKinley Avenue and two smaller classrooms near the west side of the lot. A photograph from the period shows the 2-story masonry building that was constructed in 1913. In 1923, a single two-story brick building (West Building) was also built on the site.

Findings
HRG identified a single potential historic district at the 49th Street Elementary School with a period of significance from 1935 to 1936. The potential historic district was found eligible for listing in the National Register and California Register, and for designation as a City of Los Angeles HCM under Criteria A/1/1 and C/3/3.

***P3a. Description: (Continued…)**

Administration, Library, and Classroom Building/Classroom Building

The Administration, Library, and Classroom Building was constructed in 1965; an addition, known as the Classroom Building, was constructed in 1969. Together they form a two-story building with a rectangular plan and a one-story projection on the north façade. It has complex massing and asymmetrical composition. The two-story volume has a low-pitched hipped roof with plaster eave soffits and a canted fascia; the one-story volume has an asymmetrical front gable roof with open eaves and overhanging rakes. The exterior walls are finished in brick veneer, scored concrete, and textured cement plaster. Fenestration consists primarily of ribbons of four-light fixed and two-over-two double-hung aluminum sash windows at the east portion of the building; and high ribbon windows on the west portion. The primary entrance is asymmetrically located on the north (primary) façade and consists of a pair of partially glazed, divided light doors with sidelights and transom light, accessed by a projecting porch. There is an exterior metal staircase on the west façade with guardrails of metal mesh and metal pipe.

West Building

The West Building was constructed in 1923 and altered in 1935. It is a one-story building with a roughly "L"-shaped plan, simple massing, and asymmetrical composition. It has a flat roof with a low parapet. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. Fenestration consists primarily of three-over-three wood sash double hung windows in single or coupled configurations, some with transom panels and others with projecting subsills. The primary entrance is asymmetrically located on the south façade and consists of a pair of flush doors with a six-light transom light; the doors are accessed by a wide concrete stoop and steps with a shaped plastered parapet. Two secondary entrances on the south façade consist of flush doors with metal canopies, accessed by a concrete ramp and steps with metal pipe guardrails.

The interior of the West Building is divided into several spaces. Most classrooms are accessible via a central hallway. Two additional rooms, a classroom and kitchen, are accessible via the concrete ramp along the primary façade. The building's interior has tile flooring, plaster walls, and acoustical tile ceilings. It has flush wood doors with flat wood casings and baseboards; some doors have flush wood transom panels. The kitchen/staff room features wood cabinets.

Main Building

The Main Building was designed by architect Harry C. Deckbar and constructed in 1935. It is a PWA Moderne style one-story building with a rectangular plan, balanced but not strictly symmetrical composition, and complex massing consisting of a central volume flanked by wings. The central volume has a moderately pitched side gable roof with asphalt composition shingle roofing and a continuous eave cornice; the flanking wings have flat roofs with built-up roofing. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. The east (primary) façade of the central volume is framed with stylized fluted pilasters. Fenestration consists primarily of horizontal groupings of six-over-six and eight-over-eight double hung wood sash windows; some window openings are infilled with solid panels. The primary entrance, now blocked features some Neoclassical elements, is symmetrically located on the east façade of the central block and consists of solid panels in the configuration of doors with sidelights and transom lights, with reeded jambs and a stylized architrave. It is recessed under a pedimented gable supported on stylized fluted pilasters and flanked by wood posts. The entrance is accessed by a wide flight of concrete steps with parastedes and balustrades. There is a secondary entrance on the north façade, consisting of a pair of flush doors in a rectangular recess flanked by stylized fluted pilasters and accessed by concrete steps with parastedes.

The interior of the Main Building features a central hallway that opens to classrooms. The building has resilient tile floors, plaster walls, and acoustical tile ceilings. It has wood baseboards and casings. Most interior doors in this building feature transom panels. A wood trophy case is located in the hallway.

South Building

The South Building was designed by architect Harry C. Deckbar and constructed in 1935. It is a one-story PWA Moderne style building with a rectangular plan, simple massing, and a flat roof with a low parapet and metal coping. The exterior walls are finished in textured cement plaster and articulated with continuous header and sill courses. Fenestration consists primarily of horizontal groupings of six-over-six double hung wood sash windows; some window openings are infilled with solid panels. The east façade is symmetrically composed around the primary entrance, which consists of a pair of flush doors with a divided-light transom light in a rectangular recess flanked by stylized reeded pilasters. The entrance is accessed by a flight of concrete steps with concrete parastedes.

The interior of the South Building features a central hallway that opens to classrooms. It has wood and resilient tile floors, plaster walls, and acoustical tile ceilings. It has wood cabinets, radiators, and ceramic water fountains.

***P3a. Description: (Continued…)**

Auditorium Building

The Auditorium Building was designed by architect Harry C. Deckbar and constructed in 1936. It is a PWA Moderne style one-story building with a rectangular plan, simple massing, and symmetrical composition and a bow truss roof. The exterior walls are finished in textured cement plaster and articulated with piers and a continuous stringcourse and sill course; the corners are highlighted with wide, channeled piers. Fenestration consists primarily of six-over-six double hung wood sash windows. The primary entrance is symmetrically located on the south façade and consists of a pair of flush doors with a transom panel and architrave, in a rectangular recess framed by stylized fluted pilasters supporting a pediment. The entrance is accessed by a concrete staircase flanked with parastedes and curvilinear metal pipe railings. Secondary entrances on the east and west façades consist of flush doors with metal hoods, accessed by concrete steps with metal pipe guardrails.

The interior of the Auditorium Building features an open auditorium space with a restroom set behind the stage. The building has a raked floor with resilient tile flooring, acoustical tile ceiling, and fixed seating. The walls are plaster with a wood baseboard, beaded dado rail, and plaster entablature. The stage has a proscenium framed with fluted pilasters supporting a stylized entablature.

Cafeteria/Lunch Pavilion

The Cafeteria/Lunch Pavilion was constructed in 1969. It is a one-story building with an irregular plan, complex massing and asymmetrical composition. It is composed of two distinct parts: a kitchen with an L-shaped plan, shed roofs with boxed eaves and rakes, and exterior walls finished in cement plaster; and an open-sided shelter wrapping the north and west sides of the kitchen, with a flat roof supported on wood beams, concrete masonry columns and tube steel posts. The entrance consists of a flush door. Fenestration consists of a grouping of three windows with metal security screening, and service windows with metal roll-up shutters and metal security screens.

Sheltered Corridors (4)

There are four sheltered corridors on the campus, which connect separate buildings. Two elevated sheltered corridors from the 1930s (#1 and #2) connect the Main Building to the West and South Buildings. They have flat roofs with plaster soffits, wood beams with scalloped friezes, wood posts, scored concrete paving, and metal pipe guardrails. A third sheltered corridor dating from the 1930s (#3) connects the South Building to the Auditorium Building. It has a flat roof with plaster fascias and soffit supported on paired metal pipe columns, on concrete curbs with metal pipe guardrails. A fourth sheltered corridor (#4) dates from the 1960s and connects the Auditorium Building to the Lunch Pavilion; it has a flat roof supported on square steel tube posts.

***B6. Construction History (Continued…):**

The 1933 Long Beach earthquake, and then the 1934 Field Act, hastened the need for widespread school repairs and new construction, which accelerated the stylistic shift during this period. Following the Long Beach Earthquake of 1933, the Los Angeles Unified School District decided to modernize the 49th Street campus.As a result, the original main building on the campus was demolished. As recorded in the *Illustrated Daily News,* "excellent brick and steel construction now being demolished and none of which failed, but many tons of ornamental concrete fell to the ground."

While new buildings were under construction, classes were temporarily held in tents on the campus grounds. The only building that was retained and retrofitted following the Long Beach Earthquake was the West Building, which is located in the northeastern region of the campus.

Between 1933 and 1935, the school district spent approximately $2 million in rehabilitating schools in South Los Angeles, including 49th Street Elementary School. The 49th Street Elementary School received over $109,000, which was allotted for the construction of two new buildings (Main Building and South Building) and the reconstruction of a one-story school building (West Building). Work was completed by architect Harry C. Deckbar and contractors Johnson & Dahlquist. The Main Building and South Building are both single-story wood frame buildings with concrete foundations and cement plaster exteriors. Deckbar also redesigned the West Building. Originally a two-story building, the West Building's second story was removed, and the building was reclad with cement plaster exteriors to match the design of the Main Building and South Building.

In 1936, Deckbar also designed the school's 1-story Auditorium Building. Unlike the other new buildings on the site, which were of wood frame construction, the Auditorium Building was of reinforced concrete and steel construction. Harold A. Nelson served as the structural engineer and Brunzell & Jacobson served as the general contractors.

A cafeteria building was also constructed at this time near the South Building; this cafeteria is no longer extant. All buildings designed by Deckbar were completed in the PWA Moderne style of architecture with some Neoclassical elements.

***B6. Construction History (Continued…):**

The school underwent some alterations in the 1950s. In 1950, a permit was issued to repair the school's storage shed, located at the west end of the parcel, to conform to code. Simultaneously, a separate permit was issued for a 1-story building for temporary classrooms, which was located to the west of the West Building along 49th Street. The repair work and temporary classrooms were designed by architect E.R.C. Billerbeck (not extant).

In the 1950s and 1960s, several additional classroom buildings were constructed on site. In 1952, a new 2-room classroom building was built, designed by A.B. Niebecker, Jr (not extant). In 1960, architect Kenneth N. Bergstrom designed a larger classroom building, constructed by Carter Mack Building Inc. for the school (not extant). Both of these buildings were demolished in the late 1960s. These non-extant buildings are visible in a Sanborn Fire Insurance Map from 1950.

The Administration, Library & Classroom building was designed by Kent Attridge & Associates in 1965. In 1969, an addition was added to the west of the building (Classroom Building), designed by Harold L. Williams & Associates. Williams also designed the new Cafeteria/Lunch Pavilion that same year. The Administration, Library & Classroom Building/Classroom Building comprise a single building, but where they are joined is visually distinctive from the interior. The building is visible in an historical aerial photograph from 1971. In 1969, over 1,000 parents and community residents toured the new classrooms, school facilities, and newly completed 2-story annex building at the 49th Street Elementary School.

In 1972, several buildings on campus were renamed in honor of black Americans during "Negro History Week." The theme of the program was "cementing Black greatness in the community," and names were chosen from those Black Americans who have made great contributions to the history and culture of the United States.

Alterations to extant buildings on the 49th Street Elementary School campus are limited, and the school overall retains many of its character-defining features. The West Building was altered with cement plaster exterior and interior remodeling following the Long Beach Earthquake. The cupola on the Main Building was removed in the mid- to late-1970s. The Classroom Building was added to the Administration, Library, and Classroom Building as an addition in 1969.

Interior alterations have been extensive and include new resilient tile flooring, acoustical tile ceilings, the removal of interior transom lights, and alterations to fixtures. Some character-defining features have been retained, such as window and door surrounds, wood cabinets, radiators, and transom openings.

***B10. Significance (Continued…):**

HRG identified a single potential historic district at the 49th Street Elementary School with a period of significance from 1935 to 1936. The potential historic district was found eligible for listing in the National Register and California Register, and for designation as a City of Los Angeles HCM under Criteria A/1/1 and C/3/3.

Historic Significance

Criterion A/1/1

49th Street Elementary School is significant under National Register Criterion A, California Register Criterion 1, and City of Los Angeles HCM Criterion 1 within the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context of the LAUSD Historic Context Statement. The West Building, Main Building, South Building, Auditorium Building, and sheltered corridors (#1, #2, and #3) of the 49th Street Elementary School were constructed following the Long Beach Earthquake of 1933. The campus directly reflects a design shift resulting from this major natural disaster, when school plants were reimagined for longevity in a specifically Southern California environment. These buildings meet several eligibility standards established by this context. The 49th Street Elementary School exemplifies post-Long Beach earthquake school planning and requirements of the 1934 Field Act; has one-story massing; and retains most of the associative and character-defining features from the period of significance. Character-defining features of the context that are present on the campus include: "wood frame construction; generous expanses of windows; stylistically streamlined; and … the PWA Streamline Moderne style" as identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. As a cohesively as a campus, the 49th Street Elementary School also retains character-defining features identified by the context including a "unified site plan; connecting sheltered corridors throughout campus; emphasis on a more expansive site plan; varied collection of buildings, differentiated by function and use; elaborate administration building, located near the campus entrance." Therefore, the 49th Street Elementary School meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context.

***B10. Significance (Continued…):**

Following the comprehensive redesign of the school in the 1930s, subsequent expansion of the school was completed in a piecemeal fashion in the 1960s as the population expanded and the school required additional space. Between 1965 and 1969, the Cafeteria/Lunch Pavilion, Administration, Library, and Classroom Building/Classroom Building, and sheltered corridor #4 were constructed. These buildings/structures do not meet the eligibility standards nor character-defining features identified in the *Educating the Baby Boom: The Postwar Modern, Functionalist School Plant, 1945-1980.* They do not reflect a "unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces, do not exhibit "finger-like" wings; one-story massing; and do not exhibit the finger-plan or cluster-plan school." Moreover, buildings from this period do not "turn inward towards green spaces; do not reflect a series of axial, modular units; and do not display a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing)." For this reason, later development in the 1960s does not contribute to the potential historic district.

The period of significance for 49th Street Elementary School under Criterion A/1/1 spans from 1935 to 1936, during which architect Harry C. Deckbar designed the PWA Moderne-style school plant.

The campus was redesigned in the 1930s, around the time that the immediate vicinity was transforming into a largely Black community. As outlined in the "Historic Resources Associated with African Americans in Los Angeles" National Register Nomination, "To be eligible under Criterion A, schools must have been constructed during the period of significance (prior to 1958) and need to represent some aspect of African American history in Los Angeles. They may reflect a particular milestone in the community's struggle for equal access to education or equal access to employment opportunities in the field of education" (Grimes 2008).

Although 49th Street Elementary School was constructed during the period of significance research did not indicate that the school was significant for its association with African American development patterns and was not the site of significant events associated with this community. Instead, as outlined in history of Central Avenue context in Section 4, the Black community was increasingly centered around Central Avenue corridor as a result of rezoning to the north and surrounding restrictive housing. The school's increasingly African American student body was thus the result of de factor segregation and did not reflect a significance milestone in the community's struggle for equal access. Therefore, 49th Street Elementary School does not appear eligible for listing based on association with the African American community.

Criterion B/2/2
No information was found to suggest that the 49th Street Elementary School was associated with any historic personages, nor that any other individuals of historic significance were associated with the property. Therefore, the 49th Street Elementary School is not eligible for listing under Criterion B/2/2.

Criterion C/3/3
49th Street Elementary School is also significant under National Register Criterion C, California Register Criterion 3 and City of Los Angeles HCM Criterion 3 within the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* and the *PWA Moderne* contexts of the LAUSD Historic Context Statement. The West Building, Main Building, South Building, Auditorium Building, and sheltered corridors (#1, #2, and #3) of the 49th Street Elementary School embody the distinctive characteristics of a type, period, and method of construction, notably that of PWA Moderne-style buildings. Buildings at the campus dating to 1935-1936 were designed or remodeled by architect Harry C. Deckbar, who incorporated the clean lines of the PWA Moderne style with the popular Neoclassical style to create a unique stylistic vocabulary on the campus. Buildings reflect the planning and design concepts of the period, including "one-story massing; general expanses of windows; unified site plan with central courtyard; and sheltered corridors throughout campus."

As identified in the *PWA Moderne* context, the buildings feature "symmetrical, formal design composition and massing; smooth wall surfaces; and piers, often fluted or reeded." The buildings at 29th Street Elementary School also incorporate "elements of a number of styles, including Classical Revival," as the context identifies as typical of PWA Moderne styles. Furthermore, as identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context, buildings designed during this period all reflect the period's emphasis on a varied collection of buildings differentiated by function and use, such as a separate auditorium. Features constructed in the mid-1930s include the Main Building, South Building, Auditorium Building, and three associated sheltered corridors (#1, #2, and #3). The West Building was also remodeled to follow the design vocabulary of the campus.

***B10. Significance (Continued…):**

Buildings constructed during the 1960s were constructed incrementally with later additions completed to accommodate an increase in population. The Cafeteria/Lunch Pavilion, Administration, Library, and Classroom Building/Classroom Building, and sheltered corridor #4 do not meet the eligibility standards nor character-defining features identified in the *Mid-Century Modernism/Regional Modernism* context. These buildings are not exemplary Modern style buildings. They do not reflect "aesthetic qualities derived from use of simply treated materials and excellent craftsmanship; direct expression of structural systems; or the extensive use of sheltered exterior corridors."

Although the Classroom Building addition and Cafeteria/Lunch Pavilion were designed by notable African American architect Harold Louis Williams, the buildings are utilitarian in design and are not significant examples of Williams' work. As clarified by the National Park Service, "a property is not eligible as the work of a master, however, simply because it was designed by a prominent architect." Instead, the work must "express a particular phase in the development of the master's career, an aspect of his or her work, or a particular idea or theme in his or her craft." As such, the buildings at 49th Street Elementary School are not notable examples of Williams' craft within his greater oeuvre, compared with other more notable buildings such as the Compton City Hall (1976) and Compton Civic Center (1977). Moreover, buildings completed during the 1960s on the campus are not clearly expressive of the ideals for "informality, indoor-outdoor connections, and zoned planning" that was significant in the post-war era, as identified in the *Educating the Baby Boom: The Postwar, Modern, Functionalist School Plant, 1945-1980* context. As such, later development at the school does not contribute to the potential historic district.

The period of significance for 49th Street Elementary School under Criterion C/3/3 is 1935-1936, when the campus was redesigned in the PWA Moderne style. Contributors to the historic district are the West Building, Main Building, South Building, Auditorium Building, and Sheltered Corridors #1, #2, and #3.

Evaluation of Eligibility

Evaluation of the Potential Historic District for the National Register

The potential historic district appears to be significant under National Register Criteria A and C at the local level for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's post-earthquake redevelopment and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a potential historic district on the National Register of Historic Places.

Evaluation of the Potential Historic District for the California Register

The potential historic district appears to be significant under California Register Criteria 1 and 3 for its for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's early development and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a potential historic district on the California Register of Historical Resources.

Evaluation of the Potential Historic District for designation as an HCM

The potential historic district appears to be significant for local listing under Criteria 1 and 3 for its association with post-Long Beach Earthquake school development and meets the eligibility standards and character-defining features identified in the *Post-1933 Long Beach Earthquake School Plants, 1933-1945* context. The PWA Moderne buildings also meet the eligibility standards and character-defining features identified in the *PWA Moderne* context. The school campus is important as a group of resources that dates from the school's early development and reflects the construction and design ethos of the mid-1930s. For these reasons, the campus appears to meet the criteria for listing as a City of Los Angeles HCM.

Historic integrity is the ability of a property to convey its significance. It is defined as the "authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period." The National Park Service defines seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

***B10. Significance (Continued…):**

Assessment of Integrity

49th Street Elementary School contains a cohesive concentration of four contributing buildings and three contributing site features that dates from the period of significance and has been identified as the potential historic district. Integrity of the property's individual buildings is varied, and all buildings and features have been subject to varying levels of alteration. However, despite some degree of alteration, the property retains much of the circulation pattern and spatial relationships established during the period of significance that characterize the potential historic district as a whole. A detailed assessment of the integrity of the potential historic district is discussed below.

Location: The buildings constructed during the period of significance remain in their original locations in the eastern region of the campus. Therefore, the campus retains integrity of *location*.

Design: The campus retains the buildings and sheltered corridors constructed or remodeled as part of the 1935-1936 PWA Moderne style with Neoclassical elements design of the campus. These include the West Building, Main Building, South Building, Auditorium Building, and three sheltered corridors (#1, #2, and #3). These buildings/structures retain most of their character-defining features such as symmetrical, formal design, smooth wall surfaces, fluted piers, and ornamentation associated with the Neoclassical style of architecture. Despite some alterations, a majority of the essential physical features reflecting the original design and organization of the property as a school from the 1930s remain intact within the potential historic district. Therefore, the campus retains integrity of *design*.

Setting: The potential historic district is located in the eastern region of the school property. The property continues to function as a public elementary school. The surrounding area of southeast Los Angeles has a whole has experienced some development, but remains a low-density residential neighborhood. Thus, the campus retains integrity of *setting*.

Materials: The potential historic district retains most of its original materials. Contributors typically retain some physical elements from the period of significance, including original cladding, including smooth wall surfaces of plaster concrete, wood detailing as seen on the Neoclassical style ornaments, and some original windows and doors. Therefore, the potential historic district's integrity of *materials* has been compromised.

Workmanship: The potential historic district retains the physical evidence of crafts of a particular culture or people during any given period in history or prehistory. This includes the contributors' construction methods and design choices, such as ornaments that reflect the Neoclassical style of architecture. Moreover, most exterior cladding and even detail work have been retained. Overall, the buildings continue to retain substantial physical evidence of period construction techniques, including finishes and design elements, such as smooth plaster exteriors, fluted pilasters, lintel and sill courses, that reflect the character and identity of the potential historic district. Therefore, the campus retains integrity of *workmanship*.

Feeling: The potential historic district retains most of the character-defining features of its original construction, including representative building types as well as spatial relationships and circulation patterns that are typical of campuses from this time. Because it retains all the preceding aspects, it continues to express the aesthetic or historic sense of a 1930s PWA Moderne elementary school. Thus, the campus retains integrity of *feeling*.

Association: Association is the direct link between an important historic event or person and a historic property. Because the campus retains integrity of *location*, *design*, *setting*, *workmanship,* and *feeling*, it continues to convey its direct link to the development of safer public schools following the 1933 Long Beach Earthquake utilizing new design principals. Therefore, the campus retains integrity of *association*.

49th Street Elementary School retains integrity of *location*, *design*, *setting, workmanship, feeling*, and *association* from the identified period of significance. The therefore continues to convey its significance as a post-1933 Long Beach Earthquake school plant, and as an excellent example of a WPA Moderne campus design.

1.0 INTRODUCTION

1.1 GENERAL

This report presents the results of a preliminary geotechnical investigation performed by Geotechnical Professionals Inc. (GPI) for the proposed comprehensive modernization at 49th Street Elementary School in Los Angeles, California. The site location is shown on the Site Location Map, Figure 1.

As requested, our scope of work was performed in compliance with the California Geologic Survey (CGS) Note 48 for geologic seismic hazard requirements. In addition, a detailed geologic-seismic evaluation was performed for the project, including site-specific response spectra, as required by the 2019 California Building Code (CBC) and in accordance with ASCE 41-17 and ASCE 7-16.

As requested, our scope included a limited number of field explorations because the project is at an early stage at this time. Additional explorations will be required to satisfy the regulatory agency requirements when further project details become available.

1.2 PROJECT DESCRIPTION

Our understanding of the proposed comprehensive campus modernization is based upon our discussions with LAUSD. Because the project is at an early stage at this time, specific details on the extent of the campus modifications and locations of the new improvements are limited. Based on our conversations with LAUSD, we understand the campus modernization will likely include new campus buildings as well as the seismic retrofit of two existing buildings: the Auditorium and West Buildings. It has not yet been determined whether the new buildings will be founded at-grade or may include subterranean levels. Additional improvements at the site will likely include new site walls and retaining walls, minor structures (e.g., equipment pads, trash enclosures, light standards), stormwater systems, pedestrian hardscape, and vehicular pavements.

The existing campus layout is shown on the Aerial Site Plan, Figure 2, and the Existing Site Plan, Figure 3.

Detailed information regarding structural loads or site topography was not available at the time this report was prepared. We have assumed that the structural loads for the new buildings will be less than 300 kips for columns, and 4 to 6 kips per lineal foot for walls. Modernization of the existing buildings may include additional loads being imposed to the existing foundations or new columns or foundations being added. Proposed grades are not anticipated to change significantly from the existing grades, with the exception of subterranean levels for new buildings, if planned.

Our recommendations are based upon the above-assumed structural and finish grade information. We should be notified if the actual loads and/or grades differ or change during the project design to allow our office to either confirm or modify our recommendations. In addition, a final comprehensive investigation, utilizing data

obtained during this preliminary investigation as well as additional field data, will be required to ultimately satisfy the requirements of CGS and CGS Note 48. As part of our future final comprehensive investigation, GPI should also be provided with copies of the project grading and structural plans for review and comment.

1.3 PURPOSE OF INVESTIGATION

The primary purpose of this investigation and report is to provide a preliminary evaluation of the existing geotechnical and geologic conditions at the site as they relate to the design and construction of the proposed development.

2.0 SCOPE OF WORK

Our scope of work included a field investigation, laboratory testing, geologic and seismic evaluation, foundation analyses, and preparation of this report.

Our field investigations consisted of three Cone Penetration Tests (CPT's) and six exploratory borings. The CPT's were performed to depths of 60 to 64 (terminated in dense deposits prior to planned depth) feet below existing grades. The borings were performed to depths of 20 to 81½ feet below the existing grade. Descriptions of field procedures and logs of the CPT's and borings are presented in Appendices A and B, respectively.

In our CPT C-2, we obtained shear-wave velocity measurements at approximate 5-foot depth intervals throughout the 64-foot explored depth. The shear-wave velocity measurements are presented in Appendix A.

Our laboratory testing program included evaluations of in-place moisture content, Atterberg Limits, fines content, direct shear, consolidation, expansion index, maximum dry density and optimum moisture content, R-value, and corrosivity. Laboratory test procedures and results are presented in Appendix C.

Soil corrosivity and R-value testing were performed by HDR and GeoLogic Inc., respectively, under subcontract to GPI. The R-value results are presented in Appendix C. The corrosion test results are presented at the end of Appendix C.

An evaluation of geologic and seismic hazards is presented in Appendix D.

Engineering evaluations were performed to provide earthwork criteria and foundation design parameters. The results of our evaluations are presented in the remainder of the report.

3.0 SITE CONDITIONS

3.1 SURFACE CONDITIONS

The school site is bounded by East 49th Street to the north, McKinley Avenue to the east, East 50th Street to the south, and existing residential developments to the west. The site is approximately 5¾ acres in plan area, with various school buildings predominantly concentrated in the eastern half of the campus, staff parking on the northwest side of the campus, and blacktop playground on the western half of the campus. The topography across the site is relatively flat, with ground surface elevations ranging from approximately 174 feet to 179 feet across the site. The pavement sections at our borings located in blacktop pavement areas consisted of 2½ to 4 inches of asphalt concrete over 3 to 4 inches of aggregate base. At our Boring B-5, located within the existing staff parking lot, we encountered 4½ inches of asphalt concrete over 6 inches of aggregate base.

We reviewed historical aerial photographs of the site dating back to 1948. In 1952, the school site appears to have been confined to the eastern half of the existing campus limits, with the western half appearing to be occupied by single-family residences. The majority of the existing school buildings are visible, with the exception of the larger two-story building along E 49th Street which is not yet present. In 1963, three smaller structures (possibly storage containers or mobile buildings) are visible on the western half of the then campus limits. By 1972, the campus size had increased to its approximate current configuration and the two-story classroom building along E 49th Street is visible. Since 1972, the site appears to have remained relatively unchanged.

3.2 SUBSURFACE SOIL CONDITIONS

Our field investigation disclosed a subsurface profile consisting of undocumented fill soils over natural soils. Detailed descriptions of the conditions encountered are shown on the Log of the CPT's and Borings in Appendices A and B, respectively.

Undocumented fill soils to depths of 5 to 7 feet were encountered in the borings. The fill soils at the boring locations consisted predominantly of slightly moist to moist silty sands and sandy silts. The fill soils are likely undocumented and relatively old, given the age of the school. Based on laboratory testing, the upper fill soils exhibited a very low potential for expansion (EI of 0).

The underlying natural materials consisted predominantly of medium dense silty sands and stiff sandy silts between approximate depths of 7 and 15 feet. Between approximate depths of 15 feet and 35 feet, the natural soils consisted predominantly of very stiff to hard sandy silts with lesser amounts of medium dense silty sands. Below depths of 35 feet, the natural soils transitioned to predominantly dense to very dense silty sands and sands. The upper natural soils are generally slightly moist to moist, with higher moisture contents encountered within the fine-grained silty soils. The moisture contents of the near-surface soils are generally below-optimum and range from approximately 1 to 20 percent, with an average moisture content of about 6 percent.

Based on laboratory testing, the near-surface soils exhibited optimum moisture contents of approximately 11 percent. In the upper 10 feet, the natural soils exhibited moderate strength and compressibility characteristics. Below depths of 10 feet, the natural soils exhibited moderate to high strength and low compressibility characteristics.

The site is not located in a Methane Buffer Zone, as designated by the City of Los Angeles.

3.3 GROUNDWATER AND CAVING

Groundwater was not encountered in our explorations performed to depths of up to 81½ feet below existing grade. Historical data provided by the California Geologic Survey (CGS) indicates historical high groundwater depth of approximately 45 to 50 feet below predominant site grades in the vicinity of the site.

Caving was not encountered in our relatively small diameter borings.

3.4 GEOLOGIC - SEISMIC HAZARDS

A detailed evaluation of the geologic conditions at the site, including seismic hazards, is presented in Appendix D. Ground motion and seismic settlement is addressed in a following section of this report.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 OVERVIEW

Based on the results of our investigation, it is our opinion that from a geotechnical viewpoint it is feasible to develop the site as proposed. The proposed structures and modifications can be supported on shallow foundations provided the geotechnical constraints discussed below are mitigated. The most significant geotechnical issues that will affect the design and construction of the proposed structures are as follows:

- The site is not located in a seismic hazard zone for soil liquefaction. Based on our analyses, we computed a potential total dry seismic settlement (above the groundwater table) of 1 to 1¾ inches, with differential seismic settlement estimated to be between ½- and 1-inch across a span of 40 feet. The majority of the dry seismic settlement was found to occur in the upper 4 to 10 feet. Following our recommended earthwork, the resulting estimated total dry seismic settlements beneath new buildings would be between ¼ and ½ inch (with differential settlements estimated to be less than ¼ inch across a 40-foot span). The seismic settlements should be added to the calculated static settlements when determined total static plus seismic settlements for the proposed improvements.

- The existing undocumented fill soils encountered to depths of up to 7 feet in our explorations are not considered to be suitable for direct support of shallow foundations and floor slabs in their current state. To provide uniform support for the proposed improvements, we recommend that these materials be removed and replaced as properly compacted fill.

- The upper natural soils are medium dense and stiff. To provide uniform support for the proposed shallow foundations and floor slabs, we recommend that the upper portion of the natural materials be removed and replaced as properly compacted fill.

- Support of the planned structures on isolated/continuous shallow footings or a mat foundation are feasible. The foundation system selected will depend on the tolerable total and differential settlements. Based on the structural loads assumed, the estimated combined static and seismic settlements for at-grade structures is approximately 1½ inches of total settlement and ¾-inch differential settlement (across a 40-foot span) for shallow spread footings. Additional static settlement analyses should be performed when more detailed structural loads are available for the project.

- Conventional cast-in-place concrete piles may be used to support light standards and similar pole structures.

- Moisture contents of the near surface soils (within 10 feet of the existing grades) are variable, ranging between roughly 1 and 20 percent. The average moisture content of the samples obtained within the upper 10 feet is approximately 7 percent, which is below the optimum moisture content for the near surface soils. Therefore, mixing and moisture conditioning of the excavated soils will be required prior to being replaced as properly compacted fill. In addition, localized over-optimum subgrade soils exposed during grading may require stabilization or removal (where the wet soil layer is thin) in order to support compaction equipment. Stabilization may be accomplished using crushed aggregate base and geogrid or in-place cement treatment.

- Corrosivity testing performed by HDR on samples provided from our borings indicates negligible levels of soluble sulfate content (Category S0) with respect to concrete and low chloride content levels (Category C1). The soils are also considered to be moderately corrosive to buried ferrous metals. A detailed report by HDR, with corrosion protection recommendations, is presented in Appendix E.

Our recommendations related to the geotechnical aspects of the development of the site are presented in the subsequent sections of this report.

4.2 SEISMIC DESIGN

4.2.1 General

Details of our geologic and seismic evaluation for the site are presented in Appendix D.

We understand the seismic design of the new buildings and the voluntary seismic retrofit of the existing buildings planned as part of the major modernization will be in accordance with the California Building Code (CBC), 2019 edition, ASCE 7-16, and ASCE 41-17.

For the above referenced codes, a Site Class D should be used. The seismic code values can be obtained directly from the tables in the building code using the above values and appropriate web site (https://seismicmaps.org). As mapped, the ASCE 7-16/ASCE41-17 seismic code values are as follows:

S_S = 1.833g	$S_{MS} = F_a * S_S$ = 1.833g	$S_{DS} = 2/3 * S_{MS}$ = 1.222g
S_1 = 0.650g	$S_{M1} = F_V * S_1$ = 1.105g	$S_{D1} = 2/3 * S_{M1}$ = 0.737g

We also present the code-mapped values on Table 1, Site-Specific Seismic Response Worksheet – New Buildings, and Table 2, Site-Specific Seismic Response Worksheet – Existing Buildings. The Project Structural Engineer should determine the seismic design method.

At the request of the Project Team and LAUSD, site-specific seismic values were determined in accordance with ASCE 41-17, which provides methodologies for

developing seismic response spectra for the evaluation and retrofit of existing buildings as well as construction of new buildings. In accordance with ASCE 41-17, we developed site-specific seismic response spectra for the following predetermined hazard levels:

- BSE-2N: Basic Safety Earthquake-2 for New Buildings. Equivalent to the Risk-Targeted Maximum Considered Earthquake (MCE_R) per Chapter 21 (§ 21.2) of ASCE 7-16 (1-percent probability of collapse within 50 years).

- BSE-1N: Basic Safety Earthquake-1 for New Buildings. Equivalent to the Risk-Targeted Design Response Spectrum per Chapter 21 (§ 21.3) ASCE 7-16 (two-thirds of BSE-2N).

- BSE-2E: Basic Safety Earthquake-2 for Existing Buildings. Taken as the seismic hazard with a 5-percent probability of exceedance in 50 years, but not greater than BSE-2N.

- BSE-1E: Basic Safety Earthquake-1 for Existing Buildings. Taken as the seismic hazard with a 20-percent probability of exceedance in 50 years, but not greater than BSE-1N.

In accordance with the requirements of the 2019 CBC, ASCE 7-16, ASCE 41-17, and CGS Note 48, the design spectral accelerations for the site should be determined based on a site-specific ground motion study. The details of our site-specific ground motion study are provided below, and the associated seismic parameters are presented on Table 1, ASCE 41-17 Site-Specific Seismic Response Spectra Worksheet – New Buildings, and Table 2, ASCE 41-17 Site-Specific Seismic Response Spectra Worksheet – Existing Buildings. The Project Structural Engineer should determine the seismic design method.

4.2.2 Site-Specific Ground Motion Analyses

The methodologies used to obtain site-specific ground motion analyses for new buildings and existing buildings are detailed in the following sections.

BSE-2N and BSE-1N Seismic Hazard Values (New Buildings)

Site-specific response spectra for the BSE-2N and BSE-1N hazard levels were generated in accordance with the 2019 California Building Code (CBC) (Section 1613A), Section 2.4 of ASCE 41-17, and Section 21.2 of ASCE 7-16. Creation of a site-specific response spectrum requires analyzing site-specific deterministic and probabilistic seismic response spectra in order to create the Risk-Targeted Maximum Considered Earthquake (MCE_R) and Design Response Spectra.

We calculated the deterministic and probabilistic site-response spectra using web-based tools that estimate uniform hazard spectra using faults as earthquake sources. The web tools include geographic and seismic information of known active faults in California based on the 2014 USGS fault model. For both our deterministic and

probabilistic analyses, we used four 2014 NGA West 2 attenuation relationships to determine the geometric-mean horizontal component of ground motion: Abrahamson-Silva-Kamai (2014), Boore-Stewart-Seyhan-Atkinson (2014), Campbell-Bozorgnia (2014), and Chiou-Youngs (2014).

For our evaluations, we used a shear wave velocity, V_{S30}, of 289 meters per second (m/s), or about 949 feet per second (fps), for the selected attenuation relationships. This value corresponds to a CBC Site Class D (stiff soil) and was determined from direct shear-wave velocity measurements obtained during our recent investigation (see Appendix A).

Probabilistic Spectra (2 percent probability of exceedance in 50 years)

The probabilistic (MCE_R) ground motion spectra (per the Method 1 requirements of Section 21.2.1.1, ASCE 7-16) were calculated using the USGS Unified Hazard Tool website. Using inputs of the site coordinates, Site Class, and time horizon (return period), the web tool outputs the Uniform Hazard Response Spectrum (UHRS) for predetermined Site Classes and shear wave velocities. For our analysis, we utilized the *Conterminous U.S. 2008 (update, v3.2.x)* edition of the web tool. We calculated response spectra for 259 m/s (Site Class D) and 360 m/s (C/D Boundary) and then linearly interpolated between those spectra based on our measured site-specific shear wave velocity of 289 m/s.

The MCE_R corresponds to an earthquake ground motion having a 2 percent probability of exceedance within a 50-year period, or an average return period of 2,475 years. The final probabilistic response spectrum was based on the geometric mean horizontal component, scaled by factors to convert the geometric-mean response to the maximum-rotated response, of the spectral response values at 5% damping for the four above noted attenuation relationships. The maximum rotated component (MRC) response factors used were based on the period dependent factors developed by Huang, Whittaker, and Luco (2008) and presented in Section 21.2 of ASCE 7-16. The weighted average, maximum-rotated site-specific probabilistic response based on the site-specific shear wave velocity is shown on Figure 4-1 (see attached).

Deterministic Spectra

Site-specific deterministic MCE response spectra were generated per the requirements of Section 21.2.2 of ASCE 7-16. The response spectrum was generated for nearby active faults, which were determined based on a combination of proximity and the table of deaggregation contributors developed with the USGS Unified Hazard Tool. We analyzed the deterministic spectrum using the Puente Hills Fault (Los Angeles segment), the Elysian Park (Upper) Fault, and the Newport-Inglewood Fault (two segments). Based on the above resources, the controlling deterministic response spectrum was found to be the Puente Hills Fault (Los Angeles segment).

Spectral acceleration ordinates were calculated utilizing the Pacific Earthquake Engineering Research Center (PEER) ground motion database and the PEER NGA-West2 Spectrum model. We utilized the four previously noted attenuation relationships

(equally weighted) and determined the required input fault parameters from USGS web resources (see References). Per the requirements of ASCE 7-16, we utilized an epsilon value of 1.0 for our analysis, which corresponds to the 84th percentile of the geometric-mean component (S_a + one standard deviation) of the spectral acceleration at 5% damping. As with the probabilistic spectrum, the geometric-mean values were scaled by period-dependent factors per Huang et al (2008) to obtain the maximum-rotated response. The site-specific 84th percentile deterministic response spectrum is also shown on Figure 4-1.

BSE-2N (MCE_R) and BSE-1N (Design) Response Spectra

The above-described analytical steps are presented in the attached Table 1, ASCE 41-17 Site-Specific Seismic Response Spectra Worksheet – New Buildings.

The BSE-2N response spectrum was generated per the requirements of Section 21.2 of ASCE 7-16 by comparing the spectral response accelerations from the probabilistic MCE_R (Section 21.2.1) and the deterministic MCE_R (Section 21.2.2), with the resulting MCE_R response spectrum being the lesser of the spectral accelerations at each period. The ordinates for the BSE-2N response spectrum are presented in Table 1 (Column 11).

The BSE-1N response spectrum was generated by taking 2/3 of the BSE-2N response spectrum but confirming that the values are not less than 80 percent of the spectral acceleration determined per Sections 11.4.6 and 21.3 of ASCE 7-16. The ordinates for the BSE-1N response spectrum are presented in Table 2-1 (Column 12).

The BSE-2N and BSE-1N response spectra, as well as the general horizontal response spectra (per Section 2.4.1.7.1 of ASCE 41-17) for each respective hazard level, are shown on Figure 4-2 and tabulated in Table 1.

BSE-2E and BSE-1E Seismic Hazard Values (Existing Buildings)

The BSE-2E response spectrum corresponds to the probabilistic ground motions resulting in a 5 percent probability of exceedance within a 50-year period (average return period of 975 years) and was determined per the requirements of Section 2.4.1.3 of ASCE 41-17. The values for the BSE-2E spectrum need not exceed those for BSE-2N. The BSE-1E response spectrum corresponds to the probabilistic ground motions resulting in a 20 percent probability of exceedance within a 50-year period (average return period of 224 years) and was determined per the requirements of Section 2.4.1.4 of ASCE 41-17. The values for the BSE-1E spectrum need not exceed those for BSE-1N.

As with the MCE_R spectrum, the BSE-2E and BSE-1E spectrum were calculated using the USGS Unified Hazard Tool website [*Conterminous U.S. 2008 (update, v3.2.x)* edition]. We calculated response spectra for shear wave velocities of 259 m/s (Site Class D) and 360 m/s (C/D Boundary) and then linearly interpolated between those spectra based on our estimated site-specific shear wave velocity of 289 m/s.

The final BSE-2E and BSE-1E response spectra were based on the geometric mean horizontal component, scaled by period-dependent factors per Huang et al (2008) to convert the geometric-mean response to the maximum-rotated response. The ordinates for the BSE-2N response spectrum are presented in Table 2 (Column 11). The ordinates for the BSE-1E spectrum are presented in Table 2 (Column 12). For the BSE-2E and BSE-1E spectra, we confirmed that the values did not exceed the BSE-2N and BSE-1N spectra, respectively.

The BSE-2E and BSE-1E response spectra, as well as the general horizontal response spectra (per Section 2.4.1.7.1 of ASCE 41-17) for each respective hazard level, are shown on Figure 4-3 and tabulated in Table 2, ASCE 41-17 Site-Specific Seismic Response Spectra Worksheet – Existing Buildings. Figure 4-4 presents the site-specific response spectra for all four BSE hazard levels (BSE-2N, BSE-1N, BSE-2E, and BSE-1E).

4.2.3 Liquefaction, Lateral Spreading, and Seismic Settlement

Liquefaction is a phenomenon in which saturated cohesionless soils undergo a temporary loss of strength during severe ground shaking and acquire a degree of mobility sufficient to permit ground deformation. In extreme cases, the soil particles can become suspended in groundwater, resulting in the soil deposit becoming mobile and fluid-like. Liquefaction is generally considered to occur primarily in loose to medium dense deposits of saturated sandy soils. Thus, three conditions are required for liquefaction to occur: (1) a sandy soil of loose to medium density; (2) saturated conditions; and (3) rapid, large strain, cyclic loading, normally provided by earthquake motions.

The site is not located in a Seismic Hazard Zone for liquefaction, as mapped by the State of California (Inglewood Quadrangle). Maps presented in the City and County of Los Angeles Seismic Safety Elements also locate the site outside of areas considered to be liquefiable (City of Los Angeles, 1996; County of Los Angeles, 1990). Groundwater was not encountered in our explorations to depths of 81½ feet below existing grade. Historical high groundwater levels provided by the California Geologic Survey indicate a shallowest groundwater table of approximately 45 to 50 feet below existing grades (CGS, 1998). Excluding the site from a liquefaction hazard zone appears to be based primarily on the lack of shallow groundwater and density of the subsurface soils.

Seismic ground subsidence (not related to liquefaction induced settlements) occurs when strong earthquake shaking results in densification of loose to medium dense sandy soils above groundwater. The materials encountered above the historical high groundwater level generally consisted of firm to stiff sandy silts overlying medium dense silty sands and stiff to very stiff sandy silts. Below depths of 35 to 40 feet, the subsurface soils transitioned to dense to very dense silty sands. Overall, the soils encountered exhibited moderate to high strength.

In accordance with the 2019 CBC, ASEC 7-16, Special Publication 117A (CGS, 2008), and the 2019 revision of CGS Note 48, the ground motion used for this evaluation should be based on the Peak Ground Acceleration (PGA_M), adjusted for site class effects, or a site-specific response spectrum. As such, we considered a ground acceleration of 0.92g for a magnitude 6.8 earthquake for our analyses, which corresponds to the PGA_M obtained from our site-specific seismic response evaluation.

We assumed a groundwater depth of approximately 45 feet from existing grades in our seismic ground subsidence evaluation. Based on our analyses, we computed potential total seismic-induced dry seismic settlements of approximately 1 to 1¾ inches, with the majority of these dry seismic settlements occurring between depths of 4 and 10 feet below existing grades. Below depths of 10 feet, the dry seismic settlements are approximately between ¼ and ½ inch.

Differential seismic settlements across a 40-foot span are estimated to between ½ and 1 inch based on the existing site conditions. Below depths of 10 feet (and following our recommendations for earthwork as presented later in this report), the differential seismic settlement across a 40-foot span is estimated to be less than ¼ inch.

4.3 EARTHWORK

The earthwork at the project site is anticipated to consist of clearing, removals of undocumented fill and loose/disturbed soils, subgrade preparation, and the placement and compaction of fill.

4.3.1 Clearing

Prior to grading, performing excavations, or constructing the proposed improvements, the areas to be developed should be cleared of debris and pavements. Buried obstructions, such as footings, abandoned utilities, and tree roots should be removed from areas to be developed. Deleterious material generated during the clearing operation, including organic topsoil or material within the existing undocumented fill, should be removed from the site. If approved by the District, inert demolition debris, such as concrete, asphalt, and brick may be crushed for reuse in engineered fills outside the planned building areas in accordance with the criteria presented in the "Materials for Fill" section of this report. It is our experience that such material will be required to be exported from the site.

If cesspools or septic systems are encountered during grading, they should be removed in their entirety. The resulting excavation should be backfilled as recommended in the "Subgrade Preparation" and "Placement and Compaction of Fill" sections of this report. As an alternative, cesspools can be backfilled with lean sand-cement slurry. At the conclusion of the clearing operations, a representative of the personnel from GPI should observe and accept the site prior to further grading.

4.3.2 Excavations

Excavations at this site will include removals of undocumented fill soils, soils disturbed during demolition and portions of the weak native soils, foundation excavations, and trenching for new utility lines.

Prior to placing fills or construction of the structures or pavement, the existing undocumented fill, loose soils disturbed during demolition, and portions of the upper soils should be removed and replaced as properly compacted fill. To provide uniform support for planned structures supported on shallow foundations, the footings and floor slabs should be underlain by properly compacted fill. Based on our limited explorations and for preliminary planning purposes, we anticipate the following average removal depths:

- For new campus buildings founded at-grade, removals across the building pad should extend to depths of at least 9 feet below existing grades or 4 feet below the base of foundations, whichever is deeper.
- For new campus buildings with subterranean levels, removals should extend to depths of at least 3 feet below the base of foundations.
- For minor structures (e.g., site walls, trash enclosures), removals should extend to depths of at least 5 feet below existing grades or 2 feet below the base of foundations, whichever is deeper.
- For new vehicular pavements and pedestrian hardscape, removals should extend at least 1 foot below the existing or proposed subgrade, whichever is deeper.
- For building retrofit where new foundations are required within the footprint of a building to remain, or where existing footings will be enlarged to carry additional loads, the extent of remedial grading will depend on the subsurface conditions encountered. For planning purposes, these foundations should be underlain by at least 1-foot of new properly compacted fill soils. Deeper removals may be required depending on the actual conditions exposed in the foundation excavations.

Existing grades refer to the grades at our exploration locations. Deeper removals may be required where deep undocumented fill soils are encountered. Removals are not required for pile-supported minor structures such as light standards. The actual depths of removals should be determined in the field during grading by a representative of GPI.

The Project Surveyor should accurately stake the corners of the areas to be overexcavated in the field. Where space is available, the base of the excavations should extend laterally at least 5 feet beyond the building line or edge of foundations, or a minimum lateral distance equal to the depth of overexcavation/compaction below the base of foundations (i.e., a 1:1 projection below the bottom outside edge of footings), whichever is greater. Building lines include the footprint of the building and other foundation supported improvements, such as canopies and attached site walls.

For shallow foundations of minor structures, including site walls, the base of overexcavation should extend laterally beyond the edge of perimeter foundations a minimum distance of 2 feet. For new footings inside an existing building related to retrofit, the limits of the removal can be limited to the lateral limits of the new foundation.

In general, the upper fill soils are considered moderately susceptible to caving in shallow excavations. Temporary construction excavations may be made vertically without shoring to a depth of 4 feet below the adjacent grade. For deeper cuts up to 10 feet, the slopes should be properly shored or sloped back to at least 1:1 or flatter. For cuts deeper than 10 feet but not exceeding 15 feet, slopes should be properly shored or sloped back to at least 1½:1 (horizontal:vertical) or flatter. Some raveling of the sandy deposits should be anticipated at the slope inclinations recommended. If raveling cannot be tolerated, flatter slope inclinations should be considered. The exposed slope face should be kept moist (but not saturated) during construction to reduce local sloughing.

Excavations adjacent to existing foundations should not extend below an imaginary plane descending at an inclination of 1:1 from a point 1-foot above the base of an existing foundation unless slot cutting or shoring are used.

“ABC” slot cuts may be utilized in place of temporary shoring where removals adjacent to existing improvements or property lines are performed (e.g., retrofits to existing foundations). Unsurcharged slot cuts up to 8 feet in height should not exceed 6 feet in width. Unsurcharged slot cuts up to 10 feet in height should not exceed 5 feet in width. Slot cuts should be backfilled immediately to finished grade prior to excavation of the adjacent slots. Slot cuts that will be surcharged by adjacent existing structures should be evaluated by GPI when details are available. If the slots are performed adjacent to an existing building that has perimeter pad footings in addition to a continuous footing, the slots should be aligned so that not more than one-half of the pad footing is exposed at a time. We should review the plans for excavation adjacent to existing buildings when they are developed.

Surcharge loads should not be permitted within a horizontal distance equal to the height of cut from the top of the excavation or 5 feet from the top of the slopes, whichever is greater, unless the cut is properly shored. Excavations that extend below an imaginary plane inclined at 45 degrees below the edge of the adjacent existing site facilities should be properly shored to maintain support of adjacent elements. Excavations and shoring systems should meet the minimum requirements given in the State of California Occupational Safety and Health Standards.

In general, the excavation can be accomplished by conventional soil excavation equipment such as backhoes, loaders, scrapers, or dozers.

4.3.3 Subgrade Preparation

Prior to placing fills, the subgrade soils at the bottom of overexcavations should be scarified to a depth of 12 inches, moisture-conditioned as necessary, and compacted to

at least 90 percent of the maximum dry density determined in accordance with ASTM D1557. This recommendation also pertains to the subgrade areas of asphalt pavement and hardscape as well as temporary modular buildings. Scarification may be omitted if very moist to wet soils are exposed.

During our investigation, soils with variable moisture contents (ranging from 1 to 20 percent) were encountered within the upper 10 feet, with an average moisture content of approximately 7 percent. The earthwork subcontractors should review the moisture content information presented on the boring logs, as localized wet soils may be encountered that will require mixing, drying, deeper removals, or stabilization prior to compaction. Also, heavy rubber-tired equipment is likely to cause pumping or yielding of wet subgrade. We do not recommend performing excavations that cannot be backfilled prior to forecast rain, as the exposed soils will be impacted and may require additional removals.

If wet soils are encountered or if the exposed soils become wet from seasonal rains, the wet, yielding soils can be removed to expose a stable subgrade or subgrade stabilization may be required to support compaction equipment. For planning purposes, the stabilization would require the placement of 12 inches of crushed aggregate base (CAB) over a geogrid, such as Tensar BX1100. A thicker section of CAB could be used if the geogrid is omitted. As an alternative, the wet soils can be cement treated. For planning purposes, we anticipate stabilization can be achieved by mixing 4 percent cement within the upper 15 inches of exposed soil by unit weight (assume 120 pcf). The cement treatment should be performed by a subcontractor experienced with the process, using equipment that can thoroughly mix the soil-cement prior to compaction.

4.3.4 Material for Fill

Soils available from on-site excavations, less debris or organic matter, will be suitable for re-use in compacted fills. Soils placed behind retaining walls and within 1-foot of the finished subgrade for building floor slabs and hardscape should be predominately granular (containing no more than 40 percent fines - portion passing No. 200 sieve) and non-expansive (E.I. of 20 or less). Such materials are anticipated to be available onsite within the upper 10 feet below existing grades.

Imported fill material should be predominately granular and non-expansive as defined above. Import or on-site materials used in compacted fills should not contain particles larger than 3 inches in diameter. GPI should be provided with a sample (at least 50 pounds) and notified of the location of soils proposed for import at least 72 hours in advance of importing. Each proposed import source should be sampled, tested, and accepted for use prior to delivery of the soils to the site. Soils imported prior to acceptance by GPI may be rejected if not suitable.

If open-graded gravel is used as backfill, such as for stormwater infiltration or retention systems, the material should be separated from the adjacent soils with a suitable non-woven filter fabric, such as Mirafi 140N. Open-graded gravel should also be placed in lifts not exceeding 2 feet in thickness, with each lift being densified using impact or vibratory compaction equipment.

4.3.5 Placement and Compaction of Fills

Fill soils should be placed in horizontal lifts, moisture-conditioned, and mechanically compacted to densities equal to at least 90 percent of the maximum dry density, determined in accordance with ASTM D1557. The optimum lift thickness will depend on the compaction equipment used and can best be determined in the field. The following uncompacted lift thickness can be used as preliminary guidelines.

Plate compactors	4-6 inches
Small vibratory or static rollers (5-ton±) or track equipment	6-8 inches
Scrapers, heavy loaders, or heavy vibratory rollers	8-12 inches

The maximum lift thickness should not be greater than 12 inches and each lift should be thoroughly compacted and accepted prior to subsequent lifts.

Fills should be placed at moisture contents of 0 to 2 percent over the optimum moisture content for granular soils and silts, and 1 to 3 percent over optimum for clays. The moisture contents of the soils encountered in the upper 10 feet in the explorations were variable but, on average, slightly below optimum. As such, adequate mixing and some moisture conditioning (wetting) may be necessary prior to replacing the soils as properly compacted fill. The properly compacted on-site soils should not be allowed to dry out prior to covering or additional moisture conditioning and processing will be required. The moisture content of the subgrade soils should be confirmed by GPI prior to covering.

During backfill of excavations, the fill should be properly benched into the construction slopes as it is placed in lifts.

4.3.6 Shrinkage and Subsidence

Shrinkage is the loss of soil volume caused by compaction of fills to a higher density than before grading. Subsidence is the settlement of in-place subgrade soils caused by loads generated by large earthmoving equipment. For earthwork volume estimating purposes, an average shrinkage value of 15 to 20 percent may be assumed for the surficial soils. Higher values may be realized if deep undocumented fills are encountered. Subsidence is anticipated to be about 0.1 feet. These values are estimates only and exclude losses due to removal of vegetation or debris. Actual shrinkage and subsidence will depend on the types of earthmoving equipment used and should be verified during grading.

4.3.7 Trench/Wall Backfill

Utility trench and wall backfill, consisting of the on-site materials or imported sand, should be mechanically compacted in lifts. Clays and silts should not be used for retaining wall or wall-below-grade backfill or for direct support of building slabs or hardscape. Lift thickness should not exceed those values given in the "Placement and Compaction of Fill" section of this report. Moisture conditioning of the on-site soils will be required prior to re-use as backfill. Jetting or flooding of backfill materials should not

be permitted. A representative of GPI should observe and test trench and wall backfill as they are placed.

In backfill areas where mechanical compaction of soil backfill is impractical due to space constraints, sand-cement slurry may be substituted for compacted backfill. The slurry should contain one sack of cement per cubic yard. Within building areas, the slurry should contain two sacks of cement per cubic yard. When set, such a mix typically has the consistency of compacted soil. Under foundations, concrete equal in strength to the foundation concrete should be used if fill is required.

4.3.8 Observation and Testing

A representative of GPI should observe excavations, subgrade preparation, and fill placement activities. Sufficient in-place field density tests should be performed during fill placement and in-place compaction to evaluate the overall compaction of the soils. Soils that do not meet minimum compaction requirements should be reworked and tested prior to placement of additional fill.

4.4 FOUNDATIONS

4.4.1 General

The proposed structures and modifications to existing buildings may be supported on conventional isolated and/or continuous shallow footings or a mat foundation, provided the subsurface soils are prepared in accordance with the recommendations given in this report. The decision to support structures on a mat foundation instead of spread footings will depend on the allowable total and differential static and seismic settlements. Shallow foundations should be supported on properly compacted fill. We are also providing recommendations for design of deep foundations for support of light standards, carports, shade covers, and similar type structures.

4.4.2 Bearing Capacity

Spread Footings

Based on the shear strength and elastic settlement characteristics of the recompacted on-site soils, a static allowable net bearing pressure of up to 3,500 pounds per square foot (psf) may be used for both continuous footings and isolated column footings. The actual bearing pressure used may be less, such that economics and structural loads will determine the minimum width for footings as discussed below. These bearing pressures are for dead load-plus-live loads, and may be increased one-third for short-term, transient, wind and seismic loading. The maximum edge pressures induced by eccentric loading or overturning moments should not be allowed to exceed these recommended values.

The following minimum footing widths and embedments are recommended for the corresponding allowable bearing pressure.

STATIC BEARING PRESSURE (psf)	MINIMUM FOOTING WIDTH (inches)	MINIMUM FOOTING* EMBEDMENT (inches)
3,500	48	24
3,000	24	24
2,500	18	18
1,500	15	15

* Depth to bottom of footing below lowest adjacent finish grade.

A minimum footing width and depth of 15 inches should be used even if the actual bearing pressure is less than 1,500 psf.

Mat Foundation

The allowable bearing pressure for a mat foundation is generally not the governing geotechnical issue as compared to the anticipated settlement. At this time, we have not been provided with estimated static mat foundation pressures for the proposed structures. If a mat foundation is to be considered, we should be provided with a detailed plot of the anticipated bearing pressures to review.

For the elastic design of the mat foundation, a modulus of subgrade reaction (k-value) of 100 pounds per cubic inch (pounds per square inch per inch of deflection) may be used. This value is for a 1-foot by 1-foot square loaded area and should be adjusted for the area of the mat foundation using appropriate elastic theory. Using generally accepted methods and our site-specific consolidation test results, we recommend using a value of 25 pci for the adjusted k-value in designing the mat foundation. As previously discussed, we should be provided with the anticipated mat pressures when they are developed so that we can review and confirm the recommendations provided, as well as provide an estimate for the anticipated maximum static settlements for the mat foundations.

The allowable soil bearing pressure will be significantly greater than the average bearing pressures required for the mat foundation as discussed above. At localized areas of the mat, such as columns and point of load applications along exterior walls, a static allowable net bearing pressure of 2,000 pounds per square foot may be used. These allowable bearing pressures are for dead-plus-live loads, and may be increased one-third for short-term, transient, wind and seismic loading.

4.4.3 Settlement

Under the static load conditions assumed (column loads of up to 300 kips and wall loads of up to 6 kips per lineal foot), maximum total static settlement of proposed at-grade structures is expected to be on the order of ¾ to 1-inch. Maximum differential static settlement between similarly loaded adjacent footings for at-grade structures is estimated to be on the order of ½-inch across a lateral distance of 40 feet. For structures with one subterranean level, found approximately 10 to 12 feet below existing site grades, maximum total static settlements are expected to be on the order of ½ to

¾-inch, with maximum differential settlements across a 40-foot span of ¼-inch to ½ inch.

As discussed earlier, we initially computed total dry seismic settlements of 1 to 1¾ inches, with the majority of that settlement occurring in the upper 10 feet. Following our recommended earthwork, total dry seismic settlements are expected to be less than ¼ to ½ inch. As such, total combined static plus seismic settlement for the purposed of determining foundation feasibility is expected to be between 1 and 1½ inches. Combined differential static plus seismic settlement is expected to be between ½ and ¾-inch across a lateral distance of 40 feet.

The above settlement estimates are based on the assumption that the recommended earthwork will be performed and that the footings will be sized in accordance with our recommendations. When detailed structural loads are available, we should be provided with the information to further evaluate the settlements.

4.4.4 Lateral Resistance

Soil resistance to lateral loads will be provided by a combination of frictional resistance between the bottom of footings and underlying soils and by passive soil pressures acting against the embedded sides of the footings. For frictional resistance, a coefficient of friction of 0.35 may be used for design. In addition, an allowable lateral bearing pressure equal to an equivalent fluid weight of 300 pounds per cubic foot may be used, provided the footings are poured tight against the compacted fill. A one-third increase in the above allowable lateral bearing pressure (but not the frictional resistance) may be taken for short-term wind and seismic loads. The passive pressure provided also assumes a level ground surface extending to a horizontal distance from the wall or footing face at least twice the depth of embedment. These values may be used in combination without reduction.

4.4.5 Light Standards and Poles

Light standards, carports, shade covers, and similar structures may be supported on drilled pier foundations. The design of such piers is typically governed by lateral loading conditions. Soil resistance to lateral loads can be provided by the piles. The design of the piles will be governed by lateral force considerations. For design by the simplified pole formula presented in Section 1807A.3.2.1 of the 2019 California Building Code, a unit passive resistance of 275 pounds per square foot per foot (to a maximum of 2,750 pounds per square foot) may be used for the piles with level ground in lieu of the presumptive lateral bearing values presented in Table 1806A.2. As stated in the code, a passive resistance of 550 pounds per square foot per foot (to a maximum of 5,500 pounds per square foot) may be used for isolated piles as determined by the Project Structural Engineer. This value incorporates the allowable increase stated in the Section 1806A.3.4 of the code for single poles that can tolerate a ½-inch of deflection under short-term loads. We recommend that the upper 1-foot of the subgrade soils be ignored in determining the required depth of embedment to allow for surface disturbance adjacent to the pile.

A pile designed for adequate embedment to resist the anticipated lateral loads will likely have adequate axial capacity to support the anticipated vertical loads. The net allowable vertical compressive capacity can be conservatively calculated based on a unit side friction of 300 pounds per square foot, neglecting end bearing contribution. For piles installed in areas where undocumented fills were removed in their entirety and properly compacted, we recommend that the upper 1 foot of the subgrade soils be ignored in determining the required depth of embedment to allow for future surface disturbance adjacent to the pile. For piles installed in areas where undocumented fills remain in place, we recommend the upper 6 feet of the subgrade soils be ignored in determining required depth of embedment allowable axial capacity.

4.4.6 Foundation Concrete

Laboratory testing by HDR (Appendix B) indicates that the on-site soils have soluble sulfate contents of 110 to 180 mg/kg (0.011 to 0.018 percent by weight). In accordance with the 2019 CBC, foundation concrete should conform to the requirements outlined to the requirements outlined in ACI 318, Section 19.3 for a negligible level of soluble sulfate exposure for soil (Category S0). Chloride contents were 3.1 to 9.4 mg/kg, which is considered to be low (Category C1). Detailed corrosion protection measures are presented in the soil corrosivity study by HDR in Appendix E. HDR should be contacted for questions on their report or for additional corrosion protection consultation.

4.4.7 Foundation Observation

Prior to placement of steel and concrete, a representative of GPI should observe and approve foundation excavations. Footing excavations should not be allowed to dry out and should be moistened immediately prior to concrete placement.

4.5 CONCRETE SLABS

Concrete slabs should be supported on non-expansive, compacted soils as discussed in the "Placement and Compaction of Fill" section. Suitable soils, such as the onsite sandy silts and silty sands, are anticipated to be readily available within the upper 10 feet below existing grades. Clays are not suitable for direct support of slabs and hardscape. The subgrade soils should not be allowed to dry out prior to concrete placement or additional processing and moisture conditioning will be required.

A moisture vapor retarder should be placed under slabs that are to be covered with moisture-sensitive floor coverings (parquet, vinyl, tile, etc.). Currently, common practice is to use a 10 or 15 mil polyolefin product such as Stego Wrap for this purpose. Whether to place the concrete slab directly on the vapor barrier or place a clean sand layer between the slab and vapor barrier is a decision for the Project Architect, as it is not a geotechnical issue. If covered by sand, the sand layer should be about 2 inches thick and contain less than 5 percent by weight passing the No. 200 sieve. Based on our explorations and laboratory testing, the soils at the site are not suitable for this purpose. The function of the sand layer is to protect the vapor retarder during construction and to aid in the uniform curing of the concrete. This layer should be nominally compacted using light equipment. The sand placed over the vapor retarder

should only be slightly moist. If the sand gets wet (for example as a result of rainfall or excessive moistening) it must be allowed to dry prior to placing concrete. Care should be taken to avoid infiltration of water into the sand layer after placement of the concrete slab, such as at slab cut-outs and other exposures. A sand layer is not required beneath the vapor retarder, but we take no exception if one is provided.

It should be noted that the material used as a vapor retarder is only one of several factors affecting the prevention of moisture accumulation under floor coverings. Other factors include maintaining a low water-cement ratio for the concrete used for the floor slab and effective sealing of joints and edges (particularly at pipe penetrations). The manufacturer of the floor coverings should be consulted for establishing acceptable criteria for the condition of the floor surface prior to placing moisture-sensitive floor coverings.

For the elastic design of slabs supporting sustained concentrated loads, a modulus of subgrade reaction (k) of 100 pounds per cubic inch (pounds per square inch per inch of deflection) may be used. This value is for a 1-foot by 1-foot square loaded area and should be adjusted by the structural designer for the area of the proposed building slab using appropriate elastic theory.

4.6 PAVED AREAS

Testing of the on-site soils indicates the upper soils have an R-value of 63. Preliminary pavement design has been based on an R-value of 50. R-value testing should be performed prior to construction of the pavement sections to confirm the preliminary design. The California Division of Highways Design Method was used for design of the recommended preliminary pavement sections. These recommendations are based on the assumption that the pavement subgrades will consist of existing near surface soils. The following pavement sections are recommended:

PAVEMENT AREA	TRAFFIC INDEX	SECTION THICKNESS (inches)	
		ASPHALT/PORTLAND CONCRETE	AGGREGATE BASE COURSE
Asphalt Concrete			
Pedestrian (no vehicles)	---	2.0	3.0
Automobile Parking	4.0	3.0	4.0
Automobile Drives	5.0	3.0	5.0
Truck/Bus Drives	6.0	3.5	7.0
Heavy Truck/Bus Drives	7.0	4.0	9.0
Portland Cement Concrete			
Pedestrian (no vehicles)	---	4.0	4.0
Automobile Parking	4.0	5.5	4.0
Automobile Drives	5.0	6.0	4.0
Truck/Bus Drives	6.0	6.5	4.0
Heavy Truck/Bus Drives	7.0	7.0	4.0

For pavement design of fire lanes, assuming an anticipated usage of one round trip per month by a 68,000-pound fire truck, a pavement section corresponding to a traffic index (TI) of 5 is considered to be suitable. If the fire lane will also accommodate additional

traffic consisting of trucks and buses, the pavement sections should correspond to either a TI of 6 (truck/bus drives) or 7 (heavy truck/bus drives).

The area surrounding temporary, interim housing, if planned, would be anticipated to support pedestrian and very light vehicle traffic only. In these temporary areas, the ground surface may be paved with 2 inches of asphalt concrete over properly compacted subgrade if the pavement will be removed when the modular buildings will be removed.

The concrete used for paving should have a modulus of rupture of at least 550 psi (equivalent to an approximate compressive strength of 3,700 psi at the time the pavement is subjected to traffic). If the site is base paved prior to the start of building construction, the above pavement sections should be re-evaluated based on the anticipated construction traffic loads.

The pavement subgrade underlying the aggregate base should be properly prepared and compacted in accordance with the recommendations outlined under "Subgrade Preparation".

The pavement base course should be compacted to at least 95 percent of the maximum dry density (ASTM D 1557). Aggregate base should conform to the requirements of Section 200-2 of the Standard Specifications for Public Works Construction (Green Book) for crushed aggregate base (CAB) materials.

The above recommendations are based on the assumption that the base course and compacted subgrade will be properly drained. The design of paved areas should incorporate measures to prevent moisture build-up within the base course, which can otherwise lead to premature pavement failure. For example, curbing adjacent to landscaped areas should be deep enough to act as a barrier to infiltration of irrigation water into the adjacent base course.

4.7 RETAINING STRUCTURES AND SHORING

Based on information available to us at the time this report was prepared, basement walls may be planned as part of the comprehensive modernization. We are not aware of other significant retaining walls being planned at this time. The following recommendations are provided for cantilevered site walls or basement walls up to 10 feet in height. We recommend that walls be properly drained and backfilled with sandy soils (less than 40 percent passing the No. 200 sieve). The onsite clays and silts are not suitable for use as retaining wall backfill where conventional backfill is used.

4.7.1 Retaining Walls

Active earth pressures can be used for designing walls that can yield at least ½-inch laterally per 10 feet of wall height under the imposed loads. For level, drained backfill, derived from non-expansive granular soils (EI $\leq$ 20), an active lateral pressure of an equivalent fluid weighing of 38 pounds per cubic foot may be used. At-rest pressures should be used for restrained walls (e.g., basement walls) that remain rigid enough to

be essentially non-yielding. For select, non-expansive, level, drained backfill, a lateral pressure of an equivalent fluid weighing 54 pounds per cubic foot can be used. If the wall backfill is not drained, the combined earth and water pressures could be much higher.

A seismic lateral pressure should be used for the design of retaining walls as required. We recommend a seismic lateral pressure of 25 pounds per cubic foot be added to the active earth pressure recommended above. If at-rest pressure is used to design the retaining wall, the total lateral pressure used (at-rest plus seismic) is not required to exceed the total active plus seismic pressure (63 pounds per cubic foot).

Walls subject to surcharge loads should be designed for an additional uniform lateral pressure equal to one-third and one-half the anticipated surcharge pressure for unrestrained and restrained walls, respectively.

The recommended pressures assume that the supported earth will be fully drained, preventing the build-up of hydro-static pressures. For traditional backfilled retaining walls, a drain consisting of perforated pipe and gravel, wrapped in a suitable filter fabric should be used. As a minimum, one cubic foot of rock should be used for each lineal foot of drain. The fabric (non-woven filter fabric, Mirafi 140N or equivalent) should be lapped at the top.

4.7.2 Temporary Shoring

Where there is not sufficient space for sloped embankments, such as along the property limits or adjacent to existing structures, shoring will be required. One method of shoring would consist of steel soldier piles placed in drilled holes and backfilled with concrete. Driven or vibrated soldier piles may also be considered as an alternative to drilled holes, and they can be used for supporting cuts that do not support existing structures.

For cantilever shoring with level backfill, the magnitude of active pressure is equivalent to the pressures imposed by a fluid weighing 35 pounds per cubic foot (pcf). For sloping backfill with a 1:1 inclination, the active pressure would be 65 pcf.

In addition to the recommended earth pressure, the shoring should be designed for surcharge loads due the adjacent structures and construction traffic surcharge loads. The upper 10 feet of the shoring adjacent to streets should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 pound per square foot surcharge behind the shoring due to normal street traffic. Existing adjacent structures will impart a surcharge load on shoring. The location and depth of the adjacent building footings, as well as the loading, will need to be determined to estimate the surcharge pressure on the shoring.

For design of soldier piles spaced at least two diameters on centers, the allowable lateral bearing value (passive value) of the soils below the excavation may be taken to be 550 pounds per square foot at the excavated surface, up to a maximum of 5,500 psf. To develop the full lateral value, provisions should be made to assure firm

contact between the soldier piles and the undisturbed soils. The concrete placed in the soldier pile excavation below the excavated level may be a lean mix, but it should be of adequate strength to transfer the imposed loads to the surrounding soils.

The shoring contractor should evaluate the potential drilling conditions when planning the installation methods.

If soldier piles are vibrated or driven, predrilling should not be allowed below the planned excavation level. Predrilling should be performed with a continuous flight auger capable of reversing the auger to minimize the removal of soil during the process. The diameter used for predrilling should not exceed 80 percent of the maximum depth of the soldier pile section. For design, the width of the driven or vibrated pile should be taken as the width of the flange.

The frictional resistance between the soldier piles and the retained earth may be used in resisting the downward component of the anchor load, if used. The coefficient of friction between the soldier pile and the retained earth may be taken as 0.35. This value is based on the assumption that uniform full bearing will be developed between the steel soldier beam and the lean-mix concrete and between the lean mix concrete and the retained earth. In addition, provided the portion of the soldier piles below the excavated level is backfilled with structural concrete, the soldier piles below the excavated level may be used to resist downward loads. The frictional resistance between the concrete soldier piles and the soils below the excavated level may be taken as equal to 400 pounds per square foot.

Continuous lagging will be required between the soldier piles. Careful installation of the lagging will be necessary to achieve bearing against the retained earth. We recommend that the voids between the lagging and retained earth be backfilled with a lean-mix sand-cement slurry prior to continuing the excavation deeper. The soldier piles should be designed for the full anticipated lateral pressure. However, the pressure on the lagging will be less because of arching of the soils between piles. We recommend that the lagging be designed for the recommended earth pressure but limited to a maximum value of 400 pounds per square foot, provided the soldier beam spacing is 8 feet or less.

It is difficult to accurately predict the amount of deflection of the shored embankment. It should be realized, however, that some deflection will occur. Adjacent to city right-of-way, the shoring should be designed to limit deflection to 1-inch. We recommend limiting the lateral deflection of shoring adjacent to structures to ½-inch. If greater deflection occurs during construction, additional bracing may be necessary. In areas where less deflection is desired, such as adjacent to existing settlement sensitive improvements, the shoring should be designed for higher lateral earth pressures.

We recommend performing a detailed survey of the improvements to be supported above the planned shoring prior to and during the shoring installation. The survey should include topographic data and a video account of the condition of the existing improvements, including cracks or signs of distress. During construction, the monitoring should consist of periodic surveying of the lateral and vertical locations of the tops of

the soldier piles. We suggest weekly readings during the excavation and for the first three weeks after achieving the bottom of the excavation. After that time, the readings should be performed every other week until the completion of the basement walls.

4.8 EXTERIOR CONCRETE AND MASONRY FLATWORK

Exterior concrete and masonry flatwork should be supported on a zone of non-expansive compacted fill, which is expected to be readily available on-site. The use of clayey soils within 1-foot of concrete hardscape subgrade is not recommended. Prior to placement of concrete, the subgrade should be prepared as recommended in "Subgrade Preparation" section. The moisture content of subgrade soils should be maintained above the optimum moisture content and confirmed by a representative of GPI prior to covering. Subgrade soils allowed to dry out will require moisture conditioning, including the potential for additional processing.

We recommend the Project Structural Engineer design the building floor slabs, including determination of thickness and reinforcing. For exterior flatwork, hardscape, and sidewalks, we recommend a minimum slab thickness of 4 inches with minimum slab reinforcement of No. 3 rebar placed at 18 inches on-center, in both directions. Control joints to direct shrinkage cracking in exterior slabs and sidewalks should be provided at maximum spacing of 8 and 6 feet on center in two directions, respectively. These recommendations should be considered as minimums based on the geotechnical site conditions, and the Project Civil Engineer should confirm if more stringent recommendations are needed for other purposes.

4.9 CORROSION

Resistivity testing indicated that the on-site soils are moderately corrosive to buried ferrous metals. GPI does not practice corrosion engineering. The results of the corrosivity testing and recommendations for corrosion protection measures are presented in Appendix E. We recommend that a corrosion-engineering firm, such as HDR, be consulted if additional corrosion protection recommendations are required.

4.10 SURFACE DRAINAGE AND INFILTRATION

Positive surface gradients should be provided adjacent to structures so as to direct surface water run-off and roof drainage away from foundations and slabs toward suitable discharge facilities. Long-term ponding of surface water should not be allowed on pavements or adjacent to buildings.

The subsurface infiltration characteristics at the site were not evaluated as part of our current investigation in accordance with our approved scope. Based on the subsurface soils encountered at the site, subsurface infiltration below depths of 10 feet may be feasible but field testing will need to be performed in order to confirm suitability and provide infiltration rates.

We recommend subsurface infiltration options be located a lateral distance of at least 30 feet from existing or proposed structures. Increased lateral offsets should be used for retaining walls or planned subterranean structures.

4.11 GEOTECHNICAL OBSERVATION AND TESTING

We recommend that a representative of GPI observe the earthwork during construction to confirm that the recommendations provided in our report are applicable during construction. The earthwork activities include grading, compaction of fills, subgrade preparation, pavement construction and foundation excavations. If conditions are different than expected, we should be afforded the opportunity to provide an alternate recommendation based on the actual conditions encountered.

5.0 LIMITATIONS

This report, exploration logs, and other materials resulting from GPI's efforts were prepared exclusively for use by the Los Angeles Unified School District and their consultants in designing the proposed development. The report is not intended to be suitable for reuse on extensions or modifications of the project or for use on project other than the currently proposed development as it may not contain sufficient or appropriate information for such uses.

Soil deposits may vary in type, strength, and many other important properties between points of exploration due to non-uniformity of the geologic formations or to man-made cut and fill operations. While we cannot evaluate the consistency of the properties of materials in areas not explored, the conclusions drawn in this report are based on the assumption that the data obtained in the field and laboratory are reasonably representative of field conditions and are conducive to interpolation and extrapolation.

Furthermore, our recommendations were developed with the assumption that a proper level of field observation and construction review will be provided by GPI during grading, excavation, and foundation construction. If construction phase services are performed by others, they must accept full responsibility for geotechnical aspects of the project, including this report.

Our investigation and evaluations were performed using generally accepted engineering approaches and principles available at this time and the degree of care and skill ordinarily exercised under similar circumstances by reputable geotechnical engineers practicing in this area. No other representation, either expressed or implied, is included or intended in our report.

Respectfully submitted,
Geotechnical Professionals Inc.

APPENDIX A

APPENDIX A

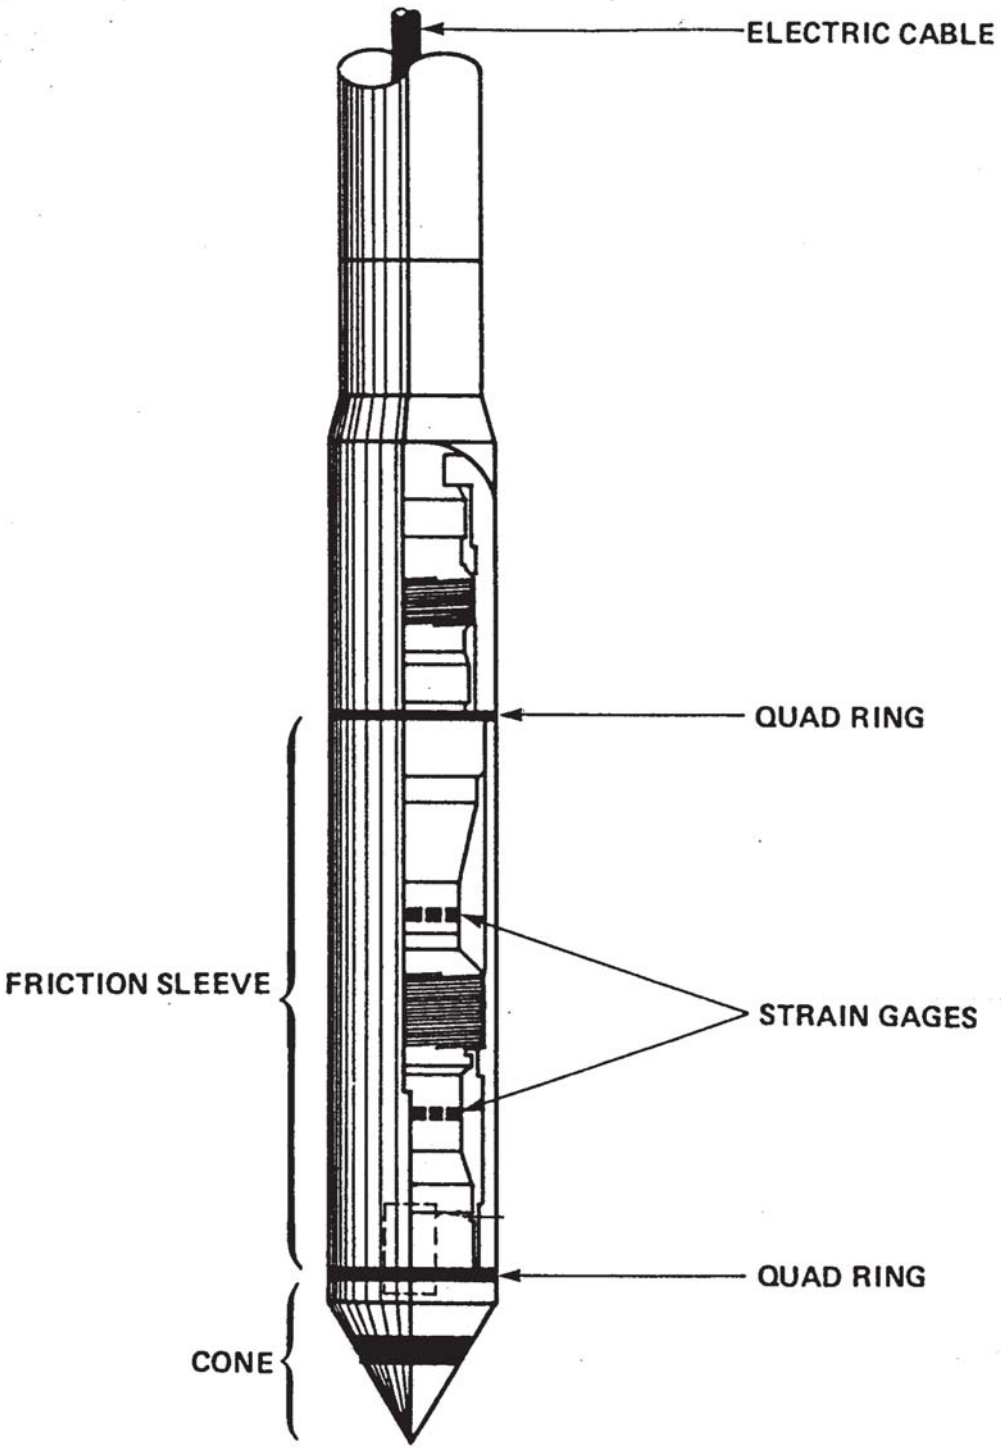
CONE PENETRATION TESTS

The subsurface conditions were investigated by performing five Cone Penetration Tests (CPT's) at the site. The soundings were advanced to depths of 60 to 64 feet below existing grades. CPT C-2 was initially planned to a depth of 100 feet but was terminated at a depth of 64 feet after refusing on very dense sands. The locations of the CPT's are shown on the Aerial and Existing Site Plans, Figures 2 and 3.

The Cone Penetration Test consists of pushing a cone-tipped probe into the soil deposit while simultaneously recording the cone tip resistance and side friction resistance of the soil to penetration (refer to Figure A-1). The CPT described in this report was conducted in general accordance with ASTM specifications (ASTM D 5778) using an electric cone penetrometer.

The CPT equipment consists of a cone assembly mounted at the end of a series of hollow sounding rods. A set of hydraulic rams is used to push the cone and rods into the soil while a continuous record of cone and friction resistance versus depth is obtained in both analog and digital form at the ground surface. A specially designed truck is used to transport and house the test equipment and to provide a 30-ton reaction to the thrust of the hydraulic rams.

Standard data obtained during a CPT consists of continuous stratigraphic information with close vertical resolution. Stratigraphic interpretation is based on relationships between cone tip resistance and friction resistance. The calculated friction ratio (CPT friction sleeve resistance divided by cone tip resistance) is used as an indicator of soil type. Granular soils typically have low friction ratios and high cone resistance, while cohesive or organic soils have high friction ratios and low cone resistance. These stratigraphic material categories form the basis for all subsequent calculations which utilize the CPT data.



Computer plots of the reduced CPT data acquired for this investigation are presented in Figures A-2 to A-4 of this appendix. The field testing and computer processing was performed by Kehoe Testing and Engineering under subcontract to Geotechnical Professionals Inc. (GPI). The interpreted soil descriptions were prepared by GPI.

In CPT C-2, shear-wave velocity measurements were obtained at approximate 5-foot depth intervals within the 64-foot explored depth. The shear wave source was horizontal impact applied at the ground surface, at a radial distance of about 2 feet from the penetrometer location. A sensor (geophone) located above the tip of the penetrometer at the test depth detected the shear wave signal traveling from the ground surface to the test depth. The shear wave trace versus time was recorded in the field and later analyzed to obtain the arrival times and to calculate the shear wave velocities. The interpreted test data is summarized in the following table:

C-2 SHEAR WAVE VELOCITY MEASUREMENTS

TIP DEPTH (ft)	GEOPHONE DEPTH (ft)	TRAVEL DISTANCE (ft)	S-WAVE ARRIVAL (millisecond)	S-WAVE VELOCITY FROM SURFACE (ft/sec)	INTERVAL S-WAVE VELOCITY (ft/sec)
5.05	4.05	4.52	6.96	649	
10.04	9.04	9.26	15.84	585	534
15.06	14.06	14.2	23.78	597	623
20.05	19.05	19.15	30.52	628	735
25.03	24.03	24.11	37.04	651	760

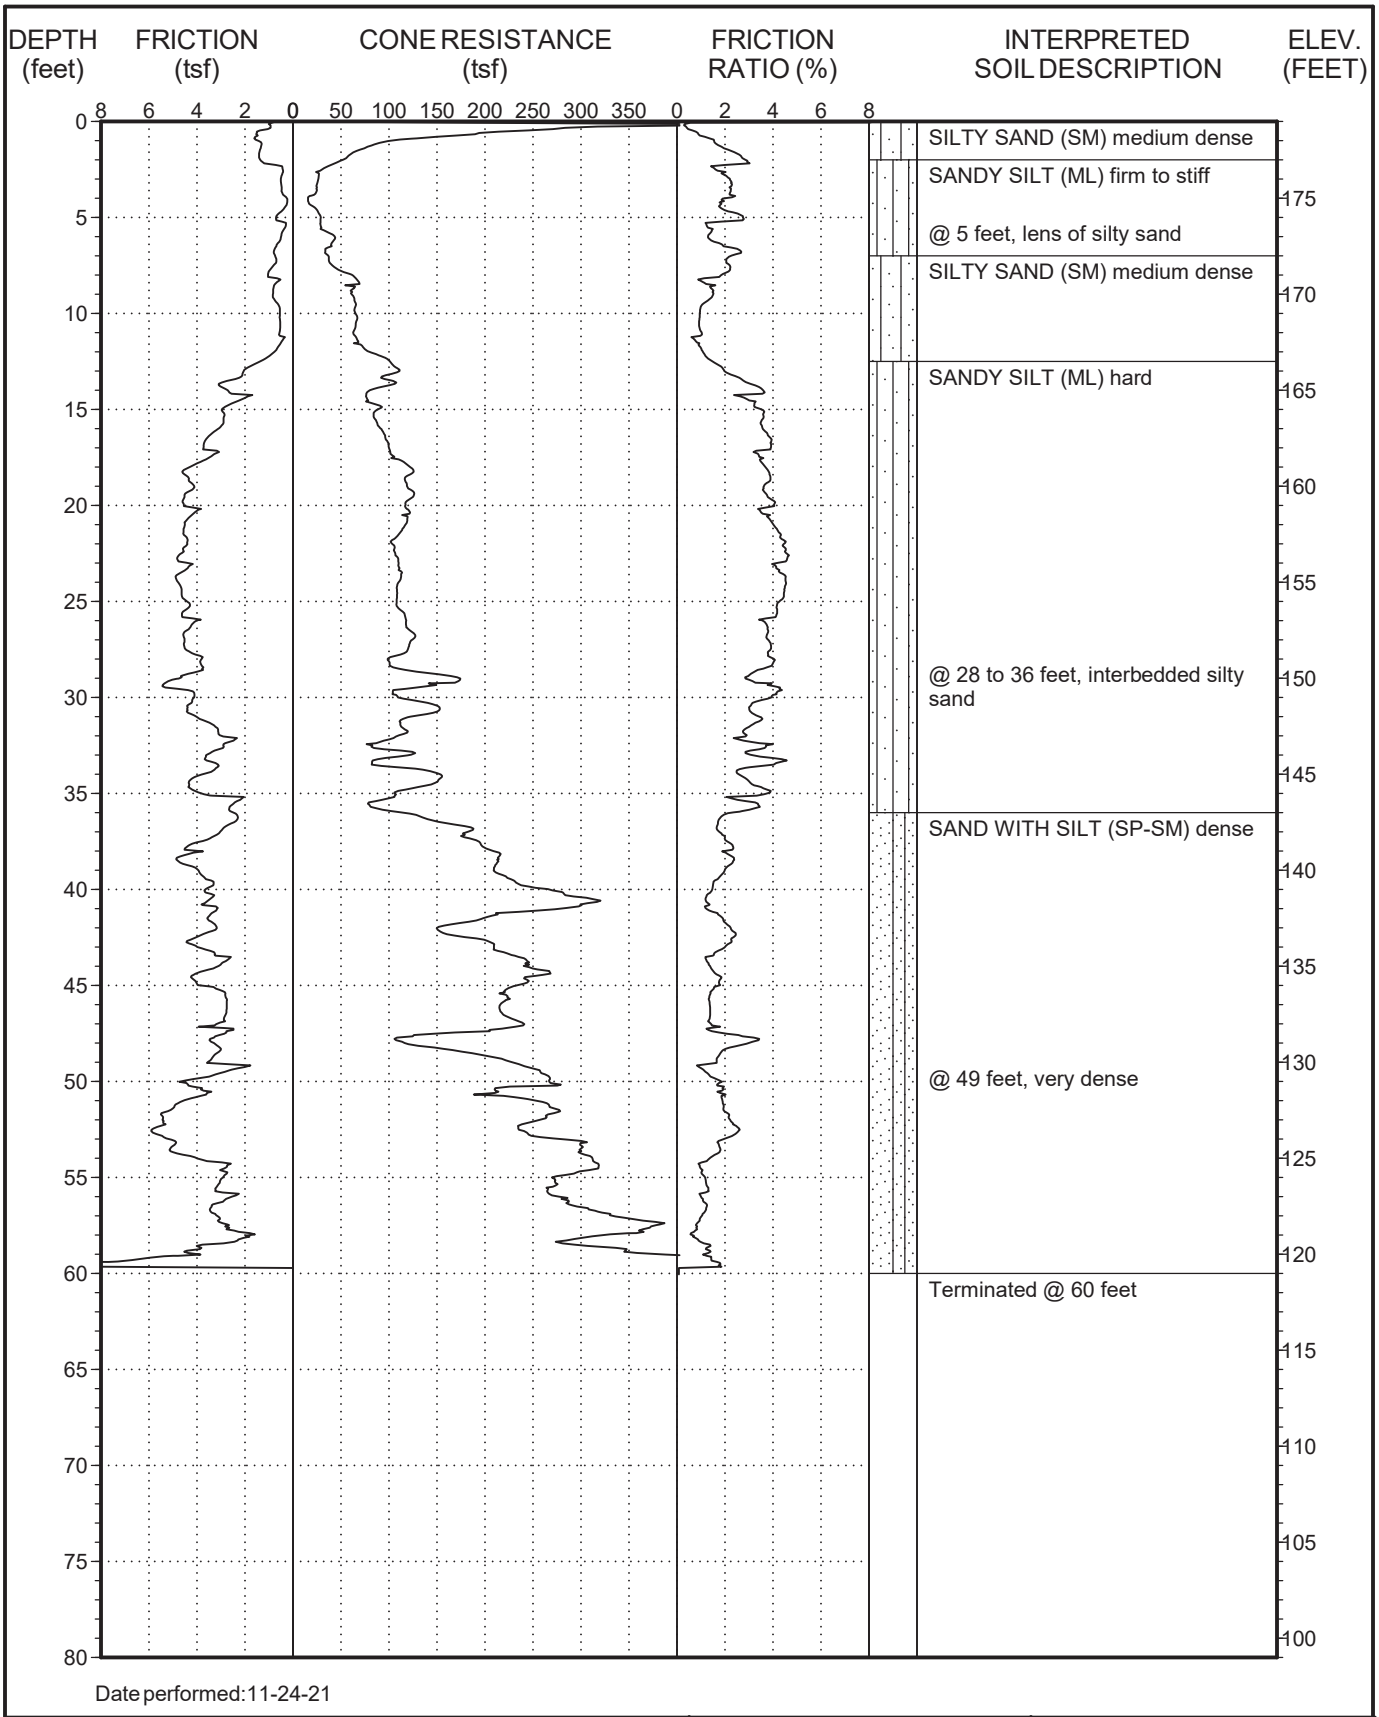
35.04	34.04	34.1	48.92	697	816
40.03	39.03	39.08	54.78	713	850
45.08	44.08	44.13	60.04	735	959
50.07	49.07	49.11	65.08	755	989
55.05	54.05	54.09	70.32	769	950
60.04	59.04	59.07	75.24	785	1014
64.17	63.17	63.2	78.24	808	1376



The CPT locations were laid out in the field by measuring from existing site features. Upon completion, the uncaved portions of the CPT holes were backfilled with bentonite chips. CPT's performed in asphalt or concrete areas were patched with cold-patch asphalt or rapid-set concrete, respectively. Ground surface elevations at the CPT locations were estimated from internet sources and should be considered approximate.

APPENDIX B

APPENDIX B

EXPLORATORY BORINGS

We investigated the subsurface conditions at the site by drilling and sampling six exploratory borings. The borings were advanced to depths ranging from 20 to 81½ feet below the existing ground surface. The locations of the explorations are shown on the Aerial and Existing Site Plans, Figures 2 and 3.

The borings were drilled using hollow-stem auger drill equipment mounted on either a truck or a limited access rig. Relatively undisturbed samples were obtained using a brass-ring lined sampler (ASTM D 3550). The brass-rings have an inside diameter of 2.42 inches. The ring samples were driven into the soil by a 140-pound hammer dropping 30 inches. The number of blows needed to drive the sampler into the soil was recorded as the penetration resistance.

At selected locations, disturbed samples were obtained using a split-spoon sampler by means of the Standard Penetration Test (SPT, ASTM D 6066). The spoon sampler was driven into the soil by a 140-pound hammer dropping 30 inches, employing the “free-fall” hammer described above. After an initial seating drive of 6 inches, the number of blows needed to drive the sampler into the soil a depth of 12 inches was recorded as the penetration resistance. These values are the raw uncorrected blowcounts.

The field explorations for the investigation were performed under the continuous technical supervision of GPI's representative, who visually inspected the site, maintained detailed logs of the borings, classified the soils encountered, and obtained relatively undisturbed samples for examination and laboratory testing. The soils encountered in the borings were classified in the field and through further examination in the laboratory in accordance with the Unified Soils Classification System. Detailed logs of the borings are presented in Figures B-1 to B-6 in this appendix.

The boring locations were laid out in the field by measuring from existing site features. Ground surface elevations at the exploration locations were estimated from internet sources and should be considered approximate.

LABORATORY TESTS

INTRODUCTION

Representative undisturbed soil samples and bulk samples were carefully packaged in the field and sealed to prevent moisture loss. The samples were then transported to our Cypress office for examination and testing assignments. Laboratory tests were performed on selected representative samples as an aid in classifying the soils and to evaluate the physical properties of the soils affecting foundation design and construction procedures. Detailed descriptions of the laboratory tests are presented below under the appropriate test headings. Test results are presented in the figures that follow.

MOISTURE CONTENT AND DRY DENSITY

Moisture content and dry density was determined from a number of the samples. The samples were weighed to determine the wet weight and then were dried in accordance with ASTM D 2216. After drying, the weight of each sample was measured, and moisture content was calculated. Moisture content values are presented on the boring logs in Appendix B.

ATTERBERG LIMITS

Liquid and plastic limits were determined for select samples in accordance with ASTM D4318. The results of the Atterberg Limits tests are presented in Figure C-1.

GRAIN SIZE DISTRIBUTION

Select soil samples were dried, weighed, soaked in water until individual soil particles were separated, and then washed on the No. 200 sieve. That portion of the material retained on the No. 200 sieve was oven-dried and weighed to determine the percentage of the material passing the No. 200 sieve. A summary of the percentages passing the No. 200 sieve is presented below.

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	PERCENT PASSING No. 200 SIEVE
B-1	0 – 5	Silty Sand (SM)	36
B-1	7	Sandy Silt (ML)	58
B-1	25	Sandy Silt (ML)	53
B-2	3	Silty Sand (SM)	41
B-2	6½	Sandy Silt (ML)	63
B-3	7	Silt (ML) with Sand	77
B-4	9	Sand with Silt (SP-SM)	6

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	PERCENT PASSING No. 200 SIEVE
B-5	0 – 5	Silty Sand (SM)	44
B-5	7	Sand (SP)	3
B-5	15	Silty Sand (SM)	46
B-6	9	Sandy Silt (ML)	64

DIRECT SHEAR

Direct shear tests were performed on select undisturbed and remolded bulk samples in accordance with ASTM D3080. Tests were performed on relatively undisturbed samples and samples remolded to 90 percent relative compaction. The sample was placed in the shear machine, and pre-selected normal loads were applied. The sample was submerged, allowed to consolidate, and then was sheared to failure. Shear stress and sample deformation were monitored throughout the test. The results of the direct shear test are presented in Figures C-2 to C-4.

CONSOLIDATION

One-dimensional consolidation testing was performed on selected undisturbed samples in accordance with ASTM D 2435. After trimming the ends, the samples were placed in the consolidometer and loaded to 0.4 ksf. Thereafter, the samples were incrementally loaded to a maximum load of 25.6 ksf. The samples were inundated at 1.6 ksf. Sample deformation was measured to 0.0001 inch. Rebound behavior was investigated by unloading the samples back to 0.4 ksf. Results of the consolidation tests, in the form of percent consolidation versus log pressure, are presented in Figures C-5 and C-6.

EXPANSION INDEX

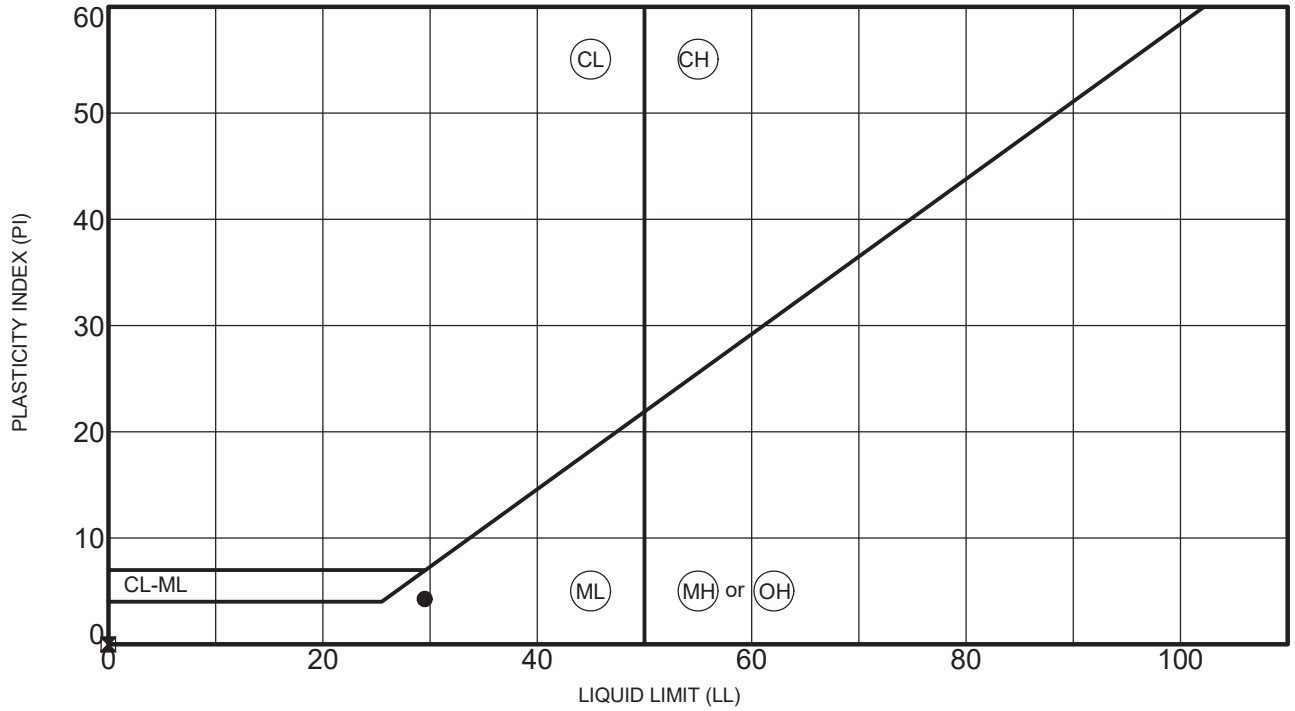
Expansion index tests were performed on select bulk samples. The test was performed in accordance with ASTM 4829, to assess the expansion potential of on-site soils. The results of the test are summarized below:

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	EXPANSION INDEX
B-1	0 – 5	Silty Sand (SM)	0

COMPACTION TEST

Maximum dry density/optimum moisture tests were performed in accordance with ASTM D1557 on representative bulk samples of the surficial soils. The test results are as follows.

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	OPTIMUM MOISTURE (%)	MAXIMUM DRY DENSITY (pcf)
B-1	0 – 5	Silty Sand (SM)	11.0	123



R-VALUE

Suitability of the near-surface soils for pavement was evaluated by conducting an R-value test. The test was performed in accordance with ASTM D 2844 by GeoLogic Associates (GLA) under subcontract to GPI. The result of the test is as follows:

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	R-VALUE BY EXPANSION
B-5	0 – 5	Silty Sand (SM)	63

CORROSIVITY

Soil corrosivity testing was performed by HDR on selected soil samples provided by GPI. The test results are summarized in the Table 1 attached to this Appendix.

APPENDIX D

APPENDIX D

GEOLOGIC-SEISMIC HAZARD EVALUATION

INTRODUCTION

This geologic and seismic assessment presents a summary of geologic and seismic conditions at 49th Street Elementary School located at 750 E. 49th Street in Los Angeles, California. The purpose of this assessment was to identify and evaluate geologic constraints, which are likely to be factors with respect to the proposed comprehensive modernization. In order to accomplish this objective, the following scope of services was performed:

- Research and review of available published and unpublished geologic literature and maps pertaining to the site and vicinity (see References), as well as subsurface exploration data from our recent investigation.

- Geologic analysis of the reviewed information.

- Preparation of this assessment report, which includes a summary of the researched information and a discussion of the possible geologic-seismic hazards that may affect the subject site and the proposed construction.

SITE CONDITIONS

The subject school site is approximately 5¾ acres and is located in an older residential neighborhood of the South Park area of Los Angeles. Site topography at the school is relatively flat, with ground surface elevations ranging from approximately +178 feet to +174 feet across the site. Within the vicinity of the site, the ground surface slopes down very gradually to the southwest (inclination of less than 1 percent).

The proposed major modernization of the existing school campus will include construction of new buildings as wells as modernization of two existing buildings (Auditorium and West Building). Because the project is at an early stage, specific details on the extent and locations of the planned improvements or modifications are limited. Based on the limited information provided, we understand the new buildings may include subterranean levels and additional site improvements may include site walls, retaining walls, minor structures, stormwater management systems, pedestrian hardscape, and vehicular pavement.

REGIONAL AND LOCAL GEOLOGIC SETTING

Regional Geology

The proposed school site is located in the Central Block of a regional geologic structure termed the Los Angeles Basin, a northeast-trending structural basin filled with Tertiary age marine sedimentary rocks mantled by Recent and Pleistocene age non-marine

alluvial sediments deposited by washes and streams flowing southward from the San Gabriel Mountains, Elysian Hills, and Repetto Hills to the north.

In the area of the site, the marine deposits are overlain by approximately 150 to 200 feet of Quaternary alluvium, including approximately 20 feet of Holocene alluvium, underlain by Pleistocene alluvium. The Holocene alluvium consists of loose to dense sands, silty sands, and silts. The Pleistocene alluvium consists of moderately to well consolidated, gravel, sand, silt, and clay (Department of Water Resources, 1961).

The nearest active faults and related geologic structures to the site are the Puente Hills Blind Thrust and Newport-Inglewood Zone of deformation, both considered active fault zones. Deformation and uplift along the Newport-Inglewood fault zone has resulted in a northwest trending series of hills, including Signal Hill and the Dominguez Hills to the southeast of the site, and the Baldwin Hills to the west and northwest of the site. Based on published maps and the USGS Source Parameter website (see References), the site is approximately 0.6 and 7.9 kilometers from the closest known traces of the Puente Hills Blind Thrust and Newport-Inglewood fault, respectively (see Table 1).

Regionally the site is located near the border between two of California's geomorphic provinces, the Transverse ranges to the north and the Peninsular Ranges to the south. The Transverse Ranges are characterized by east-west trending mountain ranges, including the Santa Monica and San Gabriel Mountains, that are oriented oblique to the trend of the other major structural trends in California, including the San Andreas Fault, Sierra Nevada Mountains, and other mountain ranges in Southern California, which trend northwesterly.

The Peninsular Ranges are characterized by northwesterly trending active faults and mountain ranges related to the San Andreas and other major fault systems in the province. The province extends from the Los Angeles Basin, where the project is located, southeast to Baja California.

Site Geologic Conditions

The site is underlain by Quaternary age alluvial sediments mapped as younger, alluvial plain deposits. These sediments are described as gravel, sand, and clay derived mostly from the Santa Monica Mountains and minor stream channels (Dibblee, 2007). The geologic conditions in the site area are shown on the quaternary Regional Geologic Map, Figure D-1.

As encountered in our explorations to depths ranging from 20 to 81½ feet, the soils consist of shallow undocumented fill soils over natural younger and older alluvial soils. The fill soils at the boring locations consisted predominantly of slightly moist to moist silty sands and sandy silts. The fill soils are likely undocumented and relatively old, given the age of the school.

The underlying natural materials consisted predominantly of medium dense silty sands and stiff sandy silts between approximate depths of 7 and 15 feet. Between approximate depths of 15 feet and 35 feet, the natural soils consisted of predominantly of very stiff to hard sandy silts with lesser amounts of medium dense silty sands. Below depths of 35 feet, the natural soils transitioned to predominantly dense to very dense silty sands and sands.

The upper natural soils are generally slightly moist to moist, with higher moisture contents encountered within the fine-grained silty soils. The moisture contents of the near-surface soils are generally below-optimum and range from approximately 1 to 20 percent, with an average moisture content of about 6 percent. Based on laboratory testing, the near-surface clays exhibited optimum moisture contents of approximately 11 percent. In the upper 10 feet, the natural soils exhibited moderate strength and compressibility characteristics. Below depths of 10 feet, the natural soils exhibited moderate to high strength and low compressibility characteristics.

Groundwater Conditions

Data published by the State of California indicates that historical high groundwater depth in the site vicinity is approximately 45 to 50 feet below existing grades. Groundwater was not encountered in our borings drilled to depths of 81½ feet below the existing ground surface. Details of the historical groundwater depths in the vicinity of the site are shown on the Historical Groundwater Map, Figure D-2.

TECTONIC SETTING

Regional Fault Systems

The geologic structure of southern California is dominated by northwest trending faults associated with the San Andreas Fault System. Faults such as the Newport-Inglewood, Whittier, Palos Verdes Hills, and San Jacinto are all considered active and are all associated with the San Andreas, which collectively form the boundary between the North American and Pacific tectonic plates. Most of these faults have ruptured the ground surface historically and/or produced significant earthquakes.

Anomalous to the general northwest structural fabric are a series of active west trending reverse or thrust faults. The majority of these occur as north dipping planes projecting along the southern base of the Santa Monica and San Gabriel Mountains in the greater Los Angeles area. The known active thrust faults in the region include the Cucamonga, Sierra Madre, San Fernando, Raymond, Santa Monica, and Hollywood faults.

Concealed Faults

Another category of fault known as "blind thrusts" was recognized as a significant seismic hazard following the 1987 magnitude 6.0 Whittier Narrows Earthquake and then again by the 1994 San Fernando magnitude 6.7 Earthquake. A blind thrust is a deeply buried shallow dipping thrust fault, which does not project to the ground surface. Blind thrusts are capable of generating a major earthquake that may cause uplift in the form of anticlinal hills. Some uplands that surround the Los Angeles Basin, including the Elysian Park and Repetto Hills, are products of blind thrusts. Because blind thrusts do not intersect the ground surface, primary surface fault rupture is considered unlikely. Major portions of the Los Angeles Basin are now believed to be underlain by various blind thrusts ramps. Due to continued north-south convergence (shortening) across the Los Angeles Basin, slippage along these features will generate earthquakes.

At the present time, the potential magnitudes and recurrence intervals of blind thrust produced earthquakes cannot be quantified with confidence due to the fact that many characteristics of these features (including areal extent and Quaternary slip rates) are poorly understood. Nonetheless, the proximity to densely populated urban centers and their history of producing damaging earthquakes clearly demonstrate the risk that blind thrusts pose to large metropolitan areas such as Los Angeles and surrounding cities.

Nearby Seismogenic Sources

We reviewed the 2008 National Seismic Hazard Maps Source Parameters (USGS, 2008) to identify known active faults within a 100 km radius of the project site. The names and distances of the faults lying within 25 kilometers of the project site are provided in the following table (Table 1). We present a map showing the significant regional faults in Figure D-3, Regional Fault Map.

Table 1 – Significant Regional Faults

Fault Name	Approximate Distance* (km)
Puente Hills Blind Thrust (Los Angeles)	0.6
Newport-Inglewood	7.9
Elysian Park (Upper)	8.1
Santa Monica	12.2
Hollywood	13.0
Raymond	14.2
Puente Hills (Santa Fe Springs)	15.2
Verdugo	17.7
Elsinore	19.7
Palos Verdes	22.2
Puente Hills (Coyote Hills)	23.3
Sierra Madre	24.5
Malibu Coast	24.6

* Defined as the closest distance to projection of rupture area along fault trace.

The site does not lie within an Alquist-Priolo Earthquake Fault Zone as designated by the California Geological Survey (CGS, 1999) as shown on Figure D-5, Seismic Hazard Zones Map. Surface faults have not been mapped projecting towards or through the site area.

Brief details for some of the faults closest to the subject site are as follows:

Puente Hills Blind Thrust

The Puente Hills Blind Thrust (Shaw, 1999) is a north dipping blind thrust extending from the Santa Fe anticline northward to the Montebello anticline. Movement on the fault is responsible for the 1987 Whittier Narrows earthquake. Research on the earthquake and its aftershocks, as well as fault plane reflections, have resulted in the conclusions that the fault is located between 3 and 7 kilometers below sea level. Data on the slip rate and possible recurrence intervals are still being researched.

Newport-Inglewood Fault

The Newport-Inglewood Fault forms the southwesterly side of the Los Angeles Basin and is defined by a series of low disconnected hills and mesa surfaces. Strike slip faulting is associated with anticlinal folding. This has resulted in the accumulation of petroleum resources along its entire length from offshore Newport Beach to the Santa Monica Mountains. In 1933 the destructive Long Beach Earthquake occurred on the fault just offshore of Newport Beach. The event caused considerable damage and a high loss of life. Since then, the various strands of the fault have produced many minor earthquakes, all of which have been at a magnitude of 4.5 or less. The fault lies at a distance of approximately 7.9 kilometers to the southwest of the project sites at its closest approach. A maximum earthquake magnitude of 6.9 and slip rate of 1.0 mm/yr has been assigned to the fault.

Elysian Park Blind Thrust

The north to south structural convergence in the region is a result of deep-seated fault movement along features called “blind thrusts”. These are buried low angle north and some south dipping faults which do not project to the ground surface but cause uplift by folding during major earthquakes. In 1987, the magnitude 5.9 Whittier Narrows Earthquake occurred on a previously unknown blind thrust, which has now been given the name Elysian Park Blind Thrust or Structural Zone. This fault underlies the Elysian Park Hills at 3 km and deepens northward to 10 km of depth. Because of the 1987 event, the fault has been placed into an active category and has been tentatively mapped to underlie a major portion of the eastern Los Angeles Basin and adjacent San Gabriel Valley to the north. Subsequent to this earthquake was the 1994 M6.7 Northridge Earthquake in the San Fernando Valley. This earthquake occurred along a previously unknown similar blind thrust fault. This type of active faulting and resulting earthquake activity are considered relatively common in regions undergoing convergence. The Elysian Park Thrust has a length of 34 km, slip rate of 1.50 mm/yr and is capable of generating a maximum earthquake of M6.7 (Shaw and Suppe, 1996).

SEISMIC EXPOSURE

As is the case with most locations in Southern California, the subject site is located in a region that is characterized by moderate to high seismic activity. The project site and vicinity has experienced strong ground shaking due to earthquakes in historic time. The locations of earthquake epicenters with respect to the subject site are shown graphically on Figure D-4, Regional Seismicity.

SECONDARY SEISMIC EFFECTS

General

Secondary effects of seismic activity normally considered as possible hazards to a particular site include several types of ground failure as well as induced flooding. Various types of ground failures, which might occur as a consequence of severe ground shaking of a site, include landsliding, ground subsidence, ground lurching, shallow ground rupture and liquefaction. The probability of occurrence of each type of ground failure depends on the

severity of the earthquake, distance from faults, topography, subsoils, and groundwater conditions, in addition to other factors. Based on a review of available published literature, landsliding, ground subsidence, ground lurching and shallow ground ruptures are considered unlikely at the site.

Various types of seismically induced flooding, which may be considered as potential hazards to a particular site, include flooding due to a tsunami (seismic sea wave), a seiche, or failure of a major water retention structure upstream of the project. Since the site is located approximately 11 miles inland from the Pacific Ocean at an elevation of approximately 175 feet above mean sea level, and since it does not lie in close proximity to an enclosed body of water, the probability of flooding due to a tsunami or seiche is considered to be nonexistent.

Liquefaction Considerations

Loosely compacted/deposited granular soils located below the water table can fail through the process of liquefaction during strong earthquake-induced ground shaking. In this process, there is a rapid decrease in shearing resistance of cohesionless soils, caused by a temporary increase in the pore water pressure. Factors known to influence liquefaction potential include soil type and depth, grain size, relative density, ground-water level, degree of saturation, and both intensity and duration of ground shaking.

As a result of liquefaction, a typical building structure may be exposed to several hazards, including liquefaction-induced settlement, foundation bearing failure, and lateral displacement or lateral spreading. The surface manifestation of liquefaction in deeper soil deposits often takes place in the form of sand boils and ground subsidence. Such phenomena often lead to loss of adequate support for building foundations (bearing failures) and cause tilting, excessive movement, and cracking of superstructures. The severity of ground subsidence depends largely on the relative thickness of the surficial non-liquefiable layer compared to the thickness of layers undergoing liquefaction.

According to the published State Seismic Hazard Zones map for the Los Angeles Quadrangle, the site is not located in an area designated by the State Geologist as a "zone of required investigation," most likely due to a historical high groundwater depth in excess of 45 feet below prevailing site grades. Details of the liquefaction potential in the vicinity of the site are shown on Figure D-5, Seismic Hazard Zones Map. For details and results on our liquefaction and seismic settlement evaluation, refer to Section 4.2.3 in the text of our main report.

SUMMARY OF GEOLOGIC CONSTRAINTS

Based on the results of our geotechnical investigation and a review of the information provided in the referenced literature, it is recommended that the following geologic constraints be taken into account during the initial planning stages of the proposed development.

- The subject site is located in a seismically active area of southern California. The type and magnitude of seismic hazards that may affect the site are dependent on both the distance to causative faults and the intensity and duration of the seismic

event. The subject site will likely experience strong ground shaking caused by earthquakes on active, regional faults in the future. The proposed project should be designed and constructed in accordance with the seismic design parameters provided in the building code and our final geotechnical investigation report.

- Faults have not been mapped projecting towards or through the site.

- The site is not located in an area designated by the State Geologist as a "zone of required investigation" for liquefaction potential. This is most likely due to the excessive depth to groundwater in the site vicinity (historical high is in excess of 45 feet below prevailing site grades). Details of our liquefaction and seismic settlement evaluation are presented in Section 4.2.3 of the main report. Based on our analysis, the potential for liquefaction settlements to negatively impact the proposed site modifications is considered to be very low.

- Based on a review of available published literature, landsliding, ground subsidence, ground lurching and shallow ground rupture are considered unlikely at the site.

Re: Soil Corrosivity Study
49th Street Elementary School
Los Angeles, CA
HDR #21-1198LAB, GPI #3077.015l

Introduction

Laboratory tests have been completed on two soil samples provided for the 49th Street Elementary School project. The purpose of these tests was to determine whether the soils are likely to have deleterious effects on underground utility piping and concrete structures. HDR assumes that the provided samples are representative of the most corrosive soils at the site.

The proposed construction consists of new campus buildings, seismic retrofit of existing buildings, and other site improvements. The new buildings are assumed to have up to two stories and one subterranean level. The site is located at 750 East 49th Street in Los Angeles, California, and the historical shallowest water table is reportedly 45 to 50 feet deep.

The scope of this study is limited to a determination of soil corrosivity and general corrosion control recommendations for materials likely to be used for construction. HDR's recommendations do not constitute, and are not meant as a substitute for, design documents for the purpose of construction. If the architects and/or engineers desire more specific information, designs, specifications, or review of design, HDR will be happy to work with them as a separate phase of this project.

Soil Corrosivity Testing

The electrical resistivity of each sample was measured in a soil box per *ASTM International (ASTM)* G187 in its as-received condition and again after saturation with distilled water. Resistivities are at about their lowest value when the soil is saturated. The pH of the saturated samples was measured per ASTM G51. A 5:1 water:soil extract from each sample was chemically analyzed for the major soluble salts commonly found in soil per ASTM D4327, ASTM D6919, and *American Water Works Association (AWWA*) Standard Method 2320-B.

The laboratory analyses were performed under HDR laboratory number 21-1198LAB. The full set of test results are shown in the attached Table A1.

Discussion

A major factor in determining soil corrosivity is electrical resistivity. The electrical resistivity of a soil is a measure of its resistance to the flow of electrical current. Corrosion of buried metal is an electrochemical process in which the amount of metal loss due to corrosion is directly proportional to the flow of electrical current (DC) from the metal into the soil. Corrosion currents, following Ohm's Law, are inversely proportional to soil resistivity. Lower electrical resistivities result from higher moisture and soluble salt contents and indicate corrosive soil. A correlation between electrical resistivity and corrosivity toward ferrous metals is shown in Table 1.[1]

Table 1: Soil Corrosivity Categories.

Soil Resistivity (ohm-cm)	Corrosivity Category
Greater than 10,000	Mildly Corrosive
2,001 to 10,000	Moderately Corrosive
1,001 to 2,000	Corrosive
0 to 1,000	Severely Corrosive

Other soil characteristics that may influence corrosivity towards metals are pH, soluble salt content, soil types, aeration, anaerobic conditions, and site drainage.

Electrical resistivities were in the mildly corrosive category with as-received moisture. When saturated, the resistivities were in the moderately corrosive category. The resistivities dropped considerably with added moisture because the samples were dry as-received.

Soil pH values varied from 7.8 to 7.9. This range is mildly to moderately alkaline.[2] These values do not particularly increase soil corrosivity.

The soluble salt content of the samples was low.

Per ACI-318, the soil is classified as S0 with respect to sulfate concentration.[3]

Ammonium and nitrate were detected in low concentrations.

Tests were not made for sulfide and oxidation-reduction (redox) potential because these samples did not exhibit characteristics typically associated with anaerobic conditions.

In conclusion, this soil is classified as moderately corrosive to ferrous metals and negligible (S0) for sulfate attack on concrete.

Corrosion Control Recommendations

The life of buried materials depends on thickness, strength, loads, construction details, soil moisture, etc., in addition to soil corrosivity, and is, therefore, difficult to predict. Of more practical value are corrosion control methods that will increase the life of materials that would be subject to significant corrosion. The following recommendations are based on the evaluation of soil corrosivity described above. Unless otherwise indicated, these recommendations apply to the entire site or alignment.

All Pipe

1. On all pipes, appurtenances, and fittings not protected by cathodic protection, coat bare metal such as valves, bolts, flange joints, joint harnesses, and flexible couplings with wax tape per AWWA C217 after assembly.

2. Where metallic pipelines penetrate concrete structures such as building floors, vault walls, and thrust blocks use plastic sleeves, rubber seals, or other dielectric material to prevent pipe contact with the concrete and reinforcing steel.

3. To prevent differential aeration corrosion cells, provide at least 2 inches of pipe bedding or backfill material all around metallic piping, including the bottom. Do not lay pipe directly on undisturbed soil.

Steel Pipe

1. Underground steel pipe with rubber gasketed, mechanical, grooved end, or other nonconductive type joints should be bonded for electrical continuity. Electrical continuity is necessary for corrosion monitoring and the possible future application of cathodic protection.

2. Install corrosion monitoring test stations to facilitate corrosion monitoring and the possible future application of cathodic protection:

    a. At each end of the pipeline.

    b. At each end of all casings.

    c. Other locations as necessary so the interval between test stations does not exceed 1,200 feet.

3. To prevent dissimilar metal corrosion cells and to facilitate the possible future application of cathodic protection, electrically isolate each buried steel pipeline per NACE SP0286 from:

    a. Dissimilar metals.

    b. Dissimilarly coated piping (cement-mortar vs. dielectric).

    c. Above ground steel pipe.

d. All existing piping.

Insulated joints should be placed above grade or in vaults where possible. Wrap all buried insulators with wax tape per AWWA C217.

4. Choose one of the following corrosion control options:

OPTION 1

a. Apply a suitable dielectric coating intended for underground use such as:

i. Polyurethane per AWWA C222 *or*

ii. Extruded polyethylene per AWWA C215 *or*

iii. A tape coating system per AWWA C214 *or*

iv. Hot applied coal tar enamel per AWWA C203 *or*

v. Fusion bonded epoxy per AWWA C213.

b. Although it is customary to cathodically protect bonded dielectrically coated structures, cathodic protection is not recommended at this time because the soil is considered only moderately corrosive to ferrous materials. Install joint bonds, test stations, and insulated joints to provide for corrosion monitoring and/or the future application of cathodic protection to control leaks if needed.

OPTION 2

a. As an alternative to the coating systems described in Option 1 and possible future cathodic protection, apply a ¾-inch cement mortar coating per AWWA C205 or encase all buried portions of metallic piping so that there is a minimum of 3 inches of concrete cover provided over and around surfaces of pipe, fittings, and valves using any type of ASTM C150 cement. Install joint bonds, test stations, and insulated joints to provide for corrosion monitoring and/or the future application of cathodic protection if needed.

NOTE: Some steel piping systems, such as for oil, gas, and high-pressure piping systems, have special corrosion and cathodic protection requirements that must be evaluated for each specific application.

Ductile Iron Pipe

1. To prevent dissimilar metal corrosion cells and to facilitate the possible future application of cathodic protection, electrically insulate underground iron pipe from dissimilar metals and from above ground iron pipe with insulating joints per NACE SP0286.

2. Bond all nonconductive type joints for electrical continuity. Electrical continuity is necessary for corrosion monitoring and possible future application of cathodic protection.

3. Install corrosion monitoring test stations to facilitate corrosion monitoring and the possible future application of cathodic protection:

    a. At each end of the pipeline.

    b. At each end of any casings.

    c. Other locations as necessary so the interval between test stations does not exceed 1,200 feet.

4. Choose one of the following corrosion control options:

    OPTION 1

    a. Apply a suitable coating intended for underground use such as:

        i. Polyethylene encasement per AWWA C105; *or*

        ii. Epoxy coating; *or*

        iii. Polyurethane; *or*

        iv. Wax tape.

        NOTE: The thin factory-applied asphaltic coating applied to ductile iron pipe for transportation and aesthetic purposes does not constitute a corrosion control coating.

    b. Although it is customary to cathodically protect coated structures, cathodic protection is not recommended at this time because the soil is considered only moderately corrosive to ferrous materials. Install joint bonds, test stations, and insulated joints to provide for corrosion monitoring and/or the future application of cathodic protection to control leaks if needed.

    OPTION 2

    a. As an alternative to the coating systems described in Option 1 and possible future cathodic protection, encase all buried portions of metallic piping so that there is a minimum of 3 inches of concrete cover provided over and around surfaces of pipe, fittings, and valves using any type of ASTM C150 cement. Install joint bonds, test stations, and insulated joints to provide for corrosion monitoring and/or the future application of cathodic protection if needed.

NOTE: Some iron piping systems, such as for fire water piping, have special corrosion and cathodic protection requirements that must be evaluated for each specific application.

Cast Iron Soil Pipe

1. Protect cast iron soil pipe with either a double wrap 4-mil or single wrap 8-mil polyethylene encasement per AWWA C105.

2. It is not necessary to bond the pipe joints or apply cathodic protection.
3. Provide 6 inches of clean sand backfill all around the pipe. Use the following parameters for clean sand backfill:
    a. Minimum saturated resistivity of no less than 3,000 ohm-cm; *and*
    b. pH between 6.0 and 8.0.
    c. All backfill testing should be performed by a corrosion engineering laboratory.

Copper Tubing

1. Use Type K or Type L copper tubing as required by the applicable local plumbing code. Type M tubing should not be used for buried applications.[4]
2. Electrically insulate underground copper pipe from dissimilar metals and from above ground copper pipe with insulating devices per NACE SP0286. Sleeve copper pipe through footings and foundations to prevent pH concentration cells and prevent leaks caused by settlement.
3. Electrically insulate cold water piping from hot water piping systems.
4. Protect cold water pipe using all of the following measures:
    a. Place cold water copper tubing in an 8-mil polyethylene sleeve or encase in double 4-mil thick polyethylene sleeves. Ensure that sleeves are intact and free of cuts, tears, punctures, or other damage.
    b. Remove any construction debris, rocks, wood, or organic matter from the trench prior to backfill.
    c. Bed and backfill with at least 2 inches of clean sand all around the tubing, including the bedding. Use the following parameters for clean sand backfill:
        i. Minimum saturated resistivity of no less than 3,000 ohm-cm; and
        ii. pH between 6.0 and 8.0.
        iii. All backfill testing should be performed by a corrosion engineering laboratory.
    d. Copper tubing for cold water can also be treated the same as for hot water.
5. Hot water tubing may be subject to a higher corrosion rate. Protect hot copper tubing using one of the following measures:

[4] *2016 California Plumbing Code (CPC), July 1, 2018 Supplement, Section 604.3.*

a. Prevent soil contact. Soil contact may be prevented by placing the tubing above ground or encasing the tubing with PVC pipe with solvent-welded joints. Either seal the PVC pipe at both ends using ammonia- and methanol-free caulk, or terminate both ends above-grade in a manner that doesn't allow water to infiltrate; *or*

b. Applying cathodic protection per NACE SP0169. The amount of cathodic protection current needed can be minimized by coating the tubing with a suitable dielectric coating that is compatible with cathodic protection, such as Polyken 930.

Plastic and Vitrified Clay Pipe

1. No special corrosion control measures are required for plastic and vitrified clay piping placed underground.

2. Protect all metallic fittings and valves with wax tape per AWWA C217, or with epoxy and appropriately designed cathodic protection system per NACE SP0169.

Concrete Structures and Pipe

1. From a corrosion standpoint, any type of ASTM C150 cement may be used for concrete structures and pipe because the sulfate concentration is negligible (S0), from 0 to 0.10 percent. Use a minimum strength of 2,500 psi per applicable codes.[5,6,7]

2. Standard concrete cover over reinforcing steel may be used for concrete structures and pipe in contact with these soils due to the low chloride concentrations found on site.[8] Limit the water-soluble chloride ion content in the concrete mix design to less than 0.3 percent by weight of cement.

Concrete Piles

Precast Concrete Piles

1. It is assumed that precast concrete piles will contain a minimum of 8 sacks of ASTM C150 Type V cement per cubic yard of concrete, a water/cement ratio not exceeding 0.45, and 2 inches of concrete cover. No further corrosion control measures are required for such piles.

Steel Reinforced Cast in Place Concrete Piles

1. Protect steel reinforced cast-in-place and cast-in-drilled-hole concrete piles in accordance with the recommendations of the concrete structures section in this report.

---

[5] *2018 International Building Code (IBC) which refers to American Concrete Institute (ACI) 318-19 Table 19.3.2.1*

[6] *2015 International Residential Code (IRC) which refers to American Concrete Institute (ACI) 318-19 Table 19.3.2.1*

[8] *Design Manual 303: Concrete Cylinder Pipe. Ameron. p.65*

2. If the piles are uncased or there is uncertainty about the shaft profile, consider whether additional concrete cover will be needed to ensure the minimum is achieved.

Closure

The analysis and recommendations presented in this report are based upon data obtained from the laboratory samples. This report does not reflect variations that may occur across the site or due to the modifying effects of construction. If variations appear, HDR should be notified immediately so that further evaluation and supplemental recommendations can be provided.

HDR's services have been performed with the usual thoroughness and competence of the engineering profession. No other warranty or representation, either expressed or implied, is included or intended.

Please call if you have any questions.

RE: Phase I Environmental Site Assessment
49th Street Elementary School
750 East 49th Street
Los Angeles, California 90011
Project No. T37254.13

Dear Mr. Morrill:

Tetra Tech, Inc. (Tetra Tech) appreciates the opportunity to submit this Phase I Environmental Site Assessment (ESA) report (Report) for the above-referenced property (Site) to Los Angeles Unified School District (LAUSD).

Tetra Tech found six recognized environmental conditions (RECs), no controlled RECs (CRECs), no historical RECs (HRECs), no potential environmental concerns (PECs), and two business environmental risks (BERs) in connection with the Site.

It is Tetra Tech's understanding that this Phase I ESA is being requested in conjunction with due diligence activities by LAUSD as part of a current transaction. Tetra Tech recognizes that this Report is to be used for the current transaction exclusively by LAUSD. It is a report for the current transaction upon which LAUSD can rely.

We appreciate the opportunity to provide you with these services. Please do not hesitate to contact us at your convenience should you have questions or comments regarding this Report or our findings. It has been a pleasure working with you on this transaction.

Sincerely,

TETRA TECH, INC.

PHASE I ENVIRONMENTAL SITE ASSESSMENT
49th Street Elementary School
750 East 49th Street
Los Angeles, California 90011
Project No. T37254.13

1.0 SUMMARY AND CONCLUSIONS

On December 15, 2021, Tetra Tech, Inc. (Tetra Tech) was authorized by Pat Schanen, Environmental Health Manager with Los Angeles Unified School District (LAUSD), to conduct a Phase I Environmental Site Assessment (ESA) of the property referenced as the 49th Street Elementary School located at 750 East 49th Street in Los Angeles, California (the Site). The Phase I ESA included visual observation of the Site, inspection of the surrounding properties from curbside, review of historical property ownership and use, review of regulatory listings, review of Internet resources, and interviews with persons knowledgeable about the Site. The following provides a summary of Tetra Tech's findings, conclusions, and recommendations.

The Site is located on 5.73 acres at the southwest corner of the intersection of East 49th Street and McKinley Avenue in Los Angeles, California. It was occupied by the 49th Street Elementary School. The Site is improved with seven buildings including one administration/library/classroom building (Building ID # 14036), four classroom buildings (classroom building [Building ID # 13718], west building [Building ID # 13933], main building [Building ID # 14040], and south building [Building ID # 13583]), an auditorium building (Building ID # 14196), and a cafeteria building (Building ID # 13566). Janitorial storage closets/rooms were observed in most of the Site buildings. The Site was occupied by a 49th Street Elementary School. The Site is improved with seven buildings as noted previously. There are a total of 46 classrooms. A boiler/incinerator room was observed in the main building (Building ID # 14040). A modern boiler was present in the boiler/incinerator room. It is presumed that the original boiler for the school was present in this room and removed, and it is unknown how the original boiler was fueled. No evidence of an active petroleum-based heating fuel source was observed at the Site. Sumps (up to four) were also observed in the boiler/incinerator room. Approximately 15 square feet of pink staining was observed around one of the sumps in the boiler/incinerator room. Current and historical use of the boiler/incinerator room in the main building, including the potential use of petroleum fuels, the presence of an incinerator, and the presence of pink staining around a sump, is considered to be a recognized environmental condition (REC).

A hazardous materials storage container was observed in the central south portion of the Site and was used for the storage of maintenance related chemicals. Several metal shipping containers were observed along the south and west borders of the Site and were used for the storage of supplies/equipment. No other areas of staining considered to be significant, or stressed vegetation, were observed at the Site.

According to the historical records reviewed, the Site was depicted as undeveloped or vacant land in 1896, and depicted with vacant lots and single-family residences and associated sheds and stables in 1906. By 1922, the east portion of the Site was redeveloped with the 49th Street Elementary School facility and included a former public school building and two smaller former classroom buildings. According to LAUSD information, the seven buildings were constructed between 1923 and 1969. By 1970, the footprint of the 49th Street Elementary School facility had expanded to almost the current layout; one single-family residence and one multi-family residential property remained in the northwest portion of the Site. By 1972, the 49th Street Elementary School facility had expanded to the existing footprint.

It is Tetra Tech's understanding that historical uses of hazardous materials at LAUSD facilities has the potential to have impacted the Site, and the following are considered to be RECs:

- The potential presence of lead-contaminated soils in the vicinity of the on-Site buildings (historic and current) associated with the potential use of lead-based paint (LBP) in the buildings.

- The potential presence of organochlorine pesticide (OCP)-contaminated soils in the vicinity of the on-Site buildings (historic and current) associated with the potential application of OCPs applied at wood building foundations for termite control.

- The potential presence of polychlorinated biphenyl (PCB)-contaminated soils in the vicinity of the on-Site buildings (historic and current) due to the potential use of PCB-containing caulking and paints in the buildings.

- The potential presence of arsenic-contaminated soils beneath the Site pavement due to LAUSD's former standard practice of applying herbicides containing arsenic prior to paving.

LAUSD also provided Tetra Tech with drawings dated from 1923 to 1995. The following features of note were depicted on the drawings:

- A concrete incinerator approximately 30 feet west and 40 feet south of the southwest corner of the existing west building on 1935 drawings.

- An oil tank between the main building and the west building on 1934, 1948, and 1950 drawings (unknown if the referenced tank is an aboveground storage tank [AST] or underground storage tank [UST]),.

- An oil tank approximately 62 feet east and 25 feet south of the southwest corner of the existing west building on a 1934 drawing (unknown if the tank is an AST or UST).

- A boiler room in the west building on 1923 drawings (specific location not clear), and a boiler room adjacent and west of the central portion of the main building on a 1934 drawing. It is unknown how the boilers at the above locations were fueled.

The referenced concrete incinerator, two oil tanks, and two additional former boiler rooms are collectively considered to be a REC.

Based on the age of the Site buildings (1923 to 1969), it is possible that asbestos-containing materials (ACMs) and lead-based paint (LBP) and other lead-containing materials (LCMs [e.g., ceramic tiles]) are present in the Site buildings. Observed or inferred suspect ACMs at the Site include: ceramic floor tile mastic, vinyl flooring (tiles and sheeting) and mastic, vinyl cove base and associated mastic, drywall and associated joint compound, acoustic ceiling tile, stucco, and roofing materials. The suspect ACMs were generally in fair condition where observed. Painted surfaces were observed to be in generally good condition, with no significant areas of damaged paint noted. Untested suspect ACMs and LBP and other LCMs are considered to be a business environmental risk (BER).

Fluorescent light fixtures (including ballasts and bulbs/tubes) were observed in the Site buildings. According to LAUSD, a fluorescent light ballast survey was conducted at the Site in January 2016 and no PCB-containing fluorescent light ballast were found. One pad-mounted transformer was observed in the

central south portion of the Site. No staining or other evidence of leaks was observed around the transformer. The presence of a potentially PCB-containing transformer is considered to be a BER.

Storm water is expected to percolate into unpaved areas at the Site parcels and to flow onto surrounding properties and streets topographically downslope from the Site. No industrial stormwater permits were found for the Site. No evidence of storm water run-off controls was observed and no storm water pollution prevention plan (SWPPP) was found for the Site during the conduct of this assessment.

Site observations and the information reviewed for this assessment did not indicate RECs, historical RECs (HRECs), PECs, or BERs associated with the Site regarding environmental liens, activity use limitations (AULs), current hazardous materials usage, solid waste management, current hazardous waste management, water supply, wastewater, storm water, radon, air emissions, dry cleaners, microbial growth and moisture intrusion, or environmental non-compliance issues.

The inspection of adjacent properties from curbside and a review of federal, state, and local regulatory agency databases/records did not reveal the presence of off-Site sources that are considered to be RECs to the Site at this time.

Tetra Tech reviewed the State Water Resources Control Board's (SWRCB's) GeoTracker website for information regarding groundwater depth and flow direction in the vicinity of the Site. Depth to groundwater at a property located approximately 0.3 miles north-northwest of the Site (Winall Oil #9 at 4442 Avalon Boulevard) was reported to range from 190.45 to 219.3 feet below ground surface (bgs), with a groundwater flow direction towards the east (California Regional Water Quality Control Board – Los Angeles Region [LARWQCB], 2014).

1.1 CONCLUSIONS

Tetra Tech has performed a Phase I ESA in general conformance with the scope of work cited in 40 Code of Federal Regulations (CFR) §312, et al., and American Society of Testing and Materials (ASTM) Standard Practice E1527-21 (including all appropriate inquiry [AAI]) of the property referenced as the 49th Street Elementary School located at 750 East 49th Street in Los Angeles, California (the Site). Any exceptions to, or deletions from, the scope of work in 40 CFR §312 or ASTM Standard Practice E1527-21 are described in this Phase I ESA report (Report) where applicable.

Based on the information gathered during the performance of this assessment, current Site use, and Tetra Tech's understanding of current regulatory guidelines and judgment, the following conclusions have been reached:

- The following RECs have been found in connection with the Site:
    - Current and historical use of the boiler/incinerator room in the main building, including the potential use of petroleum fuels, the presence of an incinerator, and the presence of pink staining around a sump.
    - The potential presence of lead-contaminated soils in the vicinity of the on-Site buildings (historical and current) associated with the potential use of LBP in the buildings.
    - The potential presence of OCP-contaminated soils in the vicinity of the on-Site buildings (historical and current) associated with the potential application of OCPs applied at wood building foundations for termite control.

- The potential presence of PCB-contaminated soils beneath in the vicinity of the on-Site buildings (historical and current) due to the potential use of PCB-containing caulking and paints in the buildings.

- The potential presence of arsenic-contaminated soils beneath the Site pavement due to LAUSD's former standard practice of applying herbicides containing arsenic prior to paving.

- The following features referenced on historical LAUSD drawings: a concrete incinerator, two oil tanks (unknown if the tanks are ASTs and/or USTs), and two additional former boiler rooms.

- No HRECs or PECs have been found in connection with the Site.

- The following BERs have been found in connection with the Site:

  - Untested suspect ACMs and LBP and other LCMs.

  - The presence of a potentially PCB-containing transformer.

- No off-Site facilities are considered to be RECs to the Site at this time.

1.2 RECOMMENDATIONS

Based on the information gathered during the performance of this assessment, current Site use, current regulatory guidelines, and the judgment of Tetra Tech, the following recommendations are presented for consideration:

- Preparation of a Preliminary Environmental Assessment Equivalent (PEA-E) scoping document is warranted in order to address the RECs identified during this assessment. The PEA-E scoping document should include a scope of work for the sampling, analysis and evaluation of on-Site subsurface soil to determine the presence or absence of COCs, including petroleum hydrocarbons, VOCs, metals including lead and arsenic, OCPs, and PCBs, as appropriate, to address the RECs identified.

- Prior to any demolition, remodeling, and/or renovation activities at the Site, untested suspect ACMs, LBP and other LCMs, and potential PCB-containing building material that may be disturbed should be sampled and analyzed in accordance with applicable regulations. Abatement of known and suspect ACMs, LBP and other LCMs, and potential PCB-containing caulk and paints and any adjacent PCB-impacted building or construction materials should be performed prior to any demolition, remodeling, and/or renovation activities (that would disturb the ACMs and LBP and other LCMs) in accordance with applicable regulations. In the event that renovation or demolition activities do not take place, known and suspect ACMs, LBP and other LCMs, and potential PCB-containing building material at the Site should be managed in accordance with applicable regulations, including the preparation and implementation of specific Operation and Maintenance (O&M) Plans.

-

- Prior to redevelopment, all applicable agencies should be contacted for requirements related to storm water run-off (including the State of Construction Storm Water Permit) and other development- and

construction-related environmental requirements (such as dust suppression). This could include the preparation and implementation of a SWPPP.

2.0 INTRODUCTION

On December 15, 2021, Tetra Tech, Inc. (Tetra Tech) was authorized by Pat Schanen, Environmental Health Manager with Los Angeles Unified School District (LAUSD), to conduct a Phase I Environmental Site Assessment (ESA) of the property referenced as the 49th Street Elementary School located at 750 East 49th Street in Los Angeles, California (Site).

This Phase I ESA was performed consistent with the terms and conditions in Work Authorization No. E-312123-1TTI signed December 15, 2021. The Phase I ESA also was performed in general accordance with the American Society for Testing and Materials (ASTM) Standard Practice E1527-21 document entitled, "Standard Practice for Environmental Assessments: Phase I Environmental Site Assessment Process" and with the All Appropriate Inquiries (AAI) Final Rule at 40 Code of Federal Regulations (CFR) Part 312.

2.1 PURPOSE AND SCOPE OF SERVICES

The primary purpose of this assessment was to identify recognized environmental conditions (RECs) in connection with the Site. ASTM defines RECs as "(1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment. A *de minimis* condition is not a recognized environmental condition." Where used in this Phase I ESA report (Report), the term REC includes controlled RECs (CRECs).

Information on the Site boundaries was obtained from publicly accessible information from the Los Angeles County Assessor's Office, information provided by the Client, and observations made during the Site vicinity reconnaissance for boundary features, such as driveways, roads, adjacent buildings, etc. It is outside the scope of this Phase I ESA, however, to independently verify Site boundaries, and all references to the Site boundaries are considered approximate.

The assessment included a visual reconnaissance of the Site, visual inspection of the surrounding properties from curbside, review of historical ownership and use, review of regulatory listings, and interviews with persons knowledgeable about the Site, as applicable. The following provides a more detailed description of the scope of services for this assessment:

- Visual inspection of the Site to identify potential for on-Site petroleum products or hazardous substance release(s).

- Visual inspection of the Site to evaluate the likelihood that polychlorinated biphenyls (PCBs) are present (e.g., in transformers and fluorescent light ballasts).

- Visual inspection and categorization of the use of abutting and adjacent properties.

- Review of local records related to historical ownership, usage, and Site development. This also included interviewing local environmental authorities, as applicable, to obtain information (if any) regarding complaints, violations, citations, or inspections related to the Site.

- Review of published federal regulatory records related to on-Site activities and to potential off-Site sources of oil or hazardous material impacts. Federal records reviewed include the following:

    - National Priorities List (NPL)
    - Delisted NPL
    - Superfund Enterprise Management System (SEMS [formerly Comprehensive Environmental Response, Compensation and Liability Information System – CERCLIS])
    - SEMS-Archive (formerly CERCLIS No Further Remedial Action Planned)
    - Resource Conservation and Recovery Act (RCRA) Corrective Action (CORRACTS)
    - Treatment, Storage and Disposal (TSD)
    - Hazardous Waste Generators (Large Quantity Generator [LQG], Small Quantity Generator [SQG])
    - Institutional Controls/Engineering Controls
    - Emergency Release Notification System (ERNS)

- Review of readily available state and tribal regulatory records and publications for environmental activities related to the Site and potential off-Site sources of oil or hazardous material impacts. State and tribal records reviewed include the following:

    - State-equivalent NPL (Envirostor, Hist Cal-Sites, CA Bond Ex. Plan)
    - State-equivalent SEMS (Response)
    - Landfill and/or Solid Waste Disposal
    - Leaking Underground Storage Tank (LUST)
    - Underground Storage Tank (UST)
    - Institutional Controls/Engineering Controls
    - Voluntary Cleanup
    - Brownfields

- Review of proprietary records maintained by Environmental Data Resources, Inc. (EDR).

- Review of readily available historic Site documents to assess for potential on-Site sources of oil or hazardous material impacts.

- Review of readily available aerial photos for the Site and Site vicinity to evaluate present and historical development/facilities.

- Review of readily available plans and documents relative to construction materials utilized at the Site and any historical renovation activities.

- Visual inspection of the interior and exterior of Site structures to confirm the presence or absence of suspect asbestos-containing materials (ACMs) and lead-based paint (LBP) and other lead-containing materials (LCMs), and to note the presence or absence of obvious (visual or olfactory) mold conditions or water damage.

- Preparation of a Phase I ESA report.

2.2 SIGNIFICANT ASSUMPTIONS, LIMITATIONS AND EXCEPTIONS, SPECIAL TERMS AND CONDITIONS

2.2.1 Significant Assumptions

Information provided by others to Tetra Tech is assumed to be accurate and complete. When provided, Tetra Tech has made reasonable inquiry into the accuracy of such information. Unless such inquiry indicated otherwise, the information was considered to be accurate and complete. As discussed below in this Section 2.2, there are limitations to this assumption.

There were no other significant assumptions made during the conduct of this Phase I ESA.

2.2.2 Limitations and Exceptions

Tetra Tech did not significantly delete or deviate from the scope and limitations set forth in the ASTM Standard Practice E1527-21 document entitled, "Standard Practice for Environmental Assessments: Phase I Environmental Site Assessment Process," except for the following:

- Tetra Tech's limited visual survey for suspect ACMs, suspect LBP and other LCMs, and obvious mold/microbial growth/moisture accumulation or water damage was limited to observations in readily and physically accessible areas of the Site. The limited visual surveys listed above were not formal surveys and were not performed by a certified asbestos, LBP/LCM, and mold inspector.

- Tetra Tech's assessment of the potential presence of radon and wetlands at the Site was limited to review of reasonably ascertainable information.

Our professional services have been performed, our findings obtained, and our conclusions prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties, either expressed or implied. Tetra Tech is not responsible for the independent conclusions, opinions, or recommendations made by others based on the records review, Site inspection, field exploration, and/or laboratory test data (if any) presented in this Report.

It should be noted that all surficial environmental assessments are inherently limited in the sense that conclusions are drawn from information obtained from limited research and Site evaluation. Subsurface conditions were not field investigated as part of this study and may differ from the conditions implied by the surficial observations. Additionally, the passage of time may result in a change in the environmental characteristics at this Site and surrounding properties. This Report does not warrant against future operations or conditions, nor does this Report warrant operations or conditions present of a type or at a location not investigated. This Report is not a regulatory compliance audit.

This assessment is not intended to assess if any soil contamination, waste emplacement, or groundwater contamination exists by subsurface sampling through the completion of soil borings and the installation of monitoring wells. The scope of work, determined by the client, did not include these activities.

Tetra Tech reviewed past ownership of the Site with the intent to evaluate past Site usage. Tetra Tech is not a professional title insurance firm and makes no guarantee, either explicit or implied, that the list which was reviewed represented a comprehensive delineation of past Site ownership or tenancy for legal purposes.

This Report was prepared, in part, based on information supplied to Tetra Tech from outside sources and from other information that is in the public domain. Tetra Tech makes no warranty as to the accuracy of statements made by others that may be contained in the Report; nor are any other warranties or guarantees, express or implied, included or intended by the Report, except that it has been prepared in accordance with current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other environmental professionals performing the same or similar services.

2.2.3 Special Terms and Conditions

There were no special terms or conditions associated with this Phase I ESA.

2.3 USER RELIANCE

It is Tetra Tech's understanding that this Phase I ESA is being requested in conjunction with due diligence activities by LAUSD as part of a current transaction. This Report for the current transaction is one upon which LAUSD may rely subject to the terms and conditions in Work Authorization No. E-312123-1TTI referenced above in Section 2.0. Except to the extent provided in this Section 2.3, no other party shall have any right to rely on any service provided in connection with this Report by Tetra Tech without Tetra Tech's prior written consent. Any authorized third-party use of this Report shall be subject to the terms and conditions governing the scope of work in Work Authorization No. E-312123-1TTI and shall be limited by the exceptions and limitations in this Report, and with the acknowledgment that actual Site conditions may change with time, and that hidden conditions may exist at the Site that were not discoverable within the authorized Phase I ESA scope of work. Any unauthorized release or misuse of this Report shall be without risk or liability to Tetra Tech.

3.0 PROPERTY DESCRIPTION

3.1 SITE RECONNAISSANCE

The Site reconnaissance was conducted by Tetra Tech representative Ms. Tanya MacLean on January 7, 2022. Ms. MacLean was accompanied during the inspection by Mr. Steven Morrill (Site Assessment Project Manager with LAUSD). Ms. MacLean interviewed Mr. Alberto Castro (Plant Manager with 49th Street Elementary School) prior to the inspection. The weather during the Site reconnaissance was characterized by clear skies with a temperature of approximately 55 to 65 degrees Fahrenheit (ºF).

In addition to the Site reconnaissance, resources such as geologic maps, wetlands maps, United States Geological Survey (USGS) topographic maps, aerial photographs, and regulatory agency records pertaining to the Site and surrounding properties were reviewed if reasonably ascertainable.

3.2 GENERAL SITE CONDITIONS

The Site is located at the southwest corner of the intersection of East 49th Street and McKinley Avenue in Los Angeles, California. It is comprised of two parcels of land totaling approximately 5.73 acres. According to information on file at the Los Angeles County Assessor's office, the Site parcels are designated by Assessor's Parcel Numbers (APNs) 5108-011-909 and 5108-011-910. The Site location is shown on Figure 1 – Site Location Map.

None of the following features were observed at the Site during the Site reconnaissance: clarifiers, oil/water separators, lifts/hoists, trench drains, wastewater treatment systems, pits, ponds, lagoons, pools of liquid or discolored water, pavement patches indicative of removed subsurface features or subsurface investigation/remediation, evidence of filling, and wells (dry wells, water supply wells, monitoring wells, extraction wells, injection wells, vapor wells). No strong, pungent, or noxious odors were noted at the Site during the Site reconnaissance.

3.3 SITE IMPROVEMENTS

The Site is improved with seven buildings including one administration/library/classroom building (Building ID # 14036), four classroom buildings (classroom building [Building ID # 13718], west building [Building ID # 13933], main building [Building ID # 14040], and south building [Building ID # 13583]), an auditorium building (Building ID # 14196), and a cafeteria building (Building ID # 13566). According to LAUSD, the existing buildings were constructed between 1923 and 1969. For a layout of the Site, please refer to Figure 2 – Site Map.

3.3.1 Exterior Improvements

The remainder of the Site is improved with asphalt-paved playground areas, asphalt-paved parking and driveways, concrete walkways, and landscaping (trees, shrubs, and grass). No areas of staining considered to be significant, or stressed vegetation, were observed at the Site.

3.3.2 Building Description

The Site buildings are of concrete and wood frame construction with concrete slab-on-grade foundations and flat built-up composition roofs. Observed interior finishes included ceramic tile, wood flooring, vinyl flooring (tiles and sheeting), vinyl cove base, acoustic ceiling tile, and painted drywall. The exterior

finish of the buildings is painted stucco. The observed building areas appeared to be in generally good condition.

3.3.3 Utilities

The following utilities are provided to the Site:

Water:	Los Angeles Department of Water and Power (LADWP).
Sewer:	Los Angeles Bureau of Sanitation (LABS).
Natural Gas:	Southern California Gas Company (SCGC).
Electricity:	LADWP.

No information on other on-Site utilities, such as dry wells, septic systems, cesspools, irrigation wells, or drinking water wells, was found during this assessment.

3.4 CURRENT SITE USE

The Site was occupied by a 49th Street Elementary School. The Site is improved with seven buildings as noted previously. There are a total of 46 classrooms. Janitorial storage closets/rooms were observed in most of the Site buildings. A boiler/incinerator room was observed in the main building. A modern boiler was present in the boiler/incinerator room. It is presumed that the original boiler for the school was present in this room and removed, and it is unknown how the original boiler was fueled. No evidence of an active petroleum-based heating fuel source was observed at the Site. Sumps (up to four) were also observed in the boiler/incinerator room. Approximately 15 square feet of pink staining was observed around one of the sumps in the boiler/incinerator room. A hazardous materials storage container was observed in the central south portion of the Site and was used for the storage of maintenance related chemicals. Several metal shipping containers were observed along the south and west borders of the Site and were used for the storage of supplies/equipment. No other areas of staining considered to be significant, or stressed vegetation, were observed at the Site. Current and historical use of the boiler/incinerator room, including the potential use of petroleum fuels, the presence of an incinerator, and the presence of pink staining around a sump, is considered to be an REC.

3.5 ENVIRONMENTAL SETTING

3.5.1 Topography

The location of the Site is shown on the 2018 USGS Inglewood, California, quadrangle topographic map. According to the contour lines on the topographic map, the Site is located at an elevation of between approximately 180 feet above mean sea level (msl). The topography in the near vicinity of the Site slopes downward to the southwest.

3.5.2 Subsurface Geologic Conditions

The Site is located within the Central Subbasin of the Los Angeles Basin (California Department of Water Resources [CADWR], 2003). The Los Angeles Basin is a structurally complex Miocene-age depositional basin that encompasses the entire Los Angeles physiographic basin, as well as the Santa Monica Mountains, San Fernando Valley, San Gabriel Valley, the southern foothills of the San Gabriel Mountains, much of the northern Santa Ana Mountains, and the San Joaquin and Palos Verdes Hills (Yerkes, et al., 1965). The Los Angeles Basin includes the low portions of the Los Angeles coastal plain, the Coyote Hills uplift, the La Habra Valley, the San Joaquin Hills, the Newport and Huntington Beach mesas, and the Santa Ana Mountains.

Throughout the Central Subbasin of the Los Angeles Basin (Central Subbasin), groundwater occurs in Holocene- and Pleistocene-age sediments at relatively shallow depths (CADWR, 2004). The Central Subbasin contains many aquifers of permeable sands and gravels separated by semi-permeable to impermeable sandy clay to clay that extend to approximately 2,200 feet below ground surface (bgs). The main productive freshwater-bearing sediments are contained within Holocene-age alluvium and the Pleistocene-age Lakewood and San Pedro Formations.

According to the United States Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS), Web Soil Survey, soils in the Site area are comprised of the urban land-Hueneme, drained-San Emigdio complex (sandy loam, loamy fine sand, very fine sandy loam, fine sandy loam, silt loam, and loamy sand).

3.5.3 Groundwater Depth and Flow Direction

Tetra Tech reviewed the State Water Resources Control Board's (SWRCB's) GeoTracker website for information regarding groundwater depth and flow direction in the vicinity of the Site. Depth to groundwater at a property located approximately 0.3 miles north-northwest of the Site (Winall Oil #9 at 4442 Avalon Boulevard) was reported to range from 190.45 to 219.3 feet below ground surface (bgs), with a groundwater flow direction towards the east (California Regional Water Quality Control Board – Los Angeles Region [LARWQCB], 2014).

4.0 HISTORICAL RECORDS REVIEW

Past land uses were reviewed to evaluate if historical practices or conditions may have negatively impacted the Site. This was accomplished via review of ownership records, agency records, and historical city directories, and review and analysis of aerial photographs, topographic maps, and Sanborn maps for the Site and immediate vicinity.

4.1 PRIOR OWNERSHIP

According to information from the Los Angeles Assessor's office and the chain-of-title information contained in the Environmental Lien and Other Activity Use Limitations (AULs) Search report obtained from Texas Environmental Research, the Site parcels have been owned By J. A. McKinley (on at least March 11, 1937), City of Los Angeles (March 11, 1937 to August 14, 1943), LA Unified School, Trustees (August 14, 1943 to September 25, 1969), and LA Unified School District (September 25, 1969 until the present). No other information regarding ownership prior to 1995 was reasonably ascertainable from the Los Angeles Assessor's office.

4.2 PRIOR SITE AND SURROUNDING PROPERTIES USES

Prior uses of the Site and surrounding properties were obtained from review of agency records and historical information obtained from EDR (city directories, aerial photographs, Sanborn maps, and topographic maps). Table 4.2 below is a summary of historical information obtained from EDR (provided in Appendix C). Information from the other historical sources is included in the summary at the end of this section and is discussed in more detail in other sections of this Report.

Table 4.2 – Prior Uses of Site and Surrounding Properties

Decade Starting	Site	Surrounding Properties	Sources
1890	Undeveloped or vacant land.	Undeveloped or vacant land.	T (1896)
1900	Single-family residences and associated sheds and stables, and vacant lots.	N: Single-family residences and associated sheds and stables, and vacant lots. E: Single-family residences and associated sheds and stables, and vacant lots. S: Single-family residences and associated sheds, and vacant lots. W: Single-family residences.	S (1906)
1910	No sources found.	No sources found.	N/A
1920	By 1922, the east portion of the Site was developed with the existing 49th Street Elementary School. A public school building and two school room structures were depicted. The remainder of the Site was depicted with single-family residences and associated sheds, automobile garages, and stables, multi-family residential properties, and vacant lots. By 1928, the existing west building was	N: No significant changes noted; however, more single-family residences were depicted. City directory listings for residential tenants (677, 683, 695, 709, 721, 727, 733, 745, 751, 755, and 763 East 49th Street). E: No significant changes noted. S: No significant changes noted. W: No significant changes noted.	A (1923, 1928) CD (1920-1929) S (1922) T (1923, 1924)

Table 4.2 – Prior Uses of Site and Surrounding Properties			
Decade Starting	**Site**	**Surrounding Properties**	**Sources**
	depicted. No city directory listings for the Site.		
1930	By 1938, the 49th Street Elementary School facility in the east portion of the Site had additional buildings including the existing south building, the existing auditorium building, and several former small additional buildings. The main building had been constructed. The remainder of the Site was depicted with single-family residences with associated buildings, multi-family residential properties, and vacant lots. No city directory listings for Site.	N: No significant changes noted. City directory listings for residential tenants (677, 683, 695, 709, 721, 727, 733, 745, 751, 755, and 763 East 49th Street). E: No significant changes noted. S: No significant changes noted. W: No significant changes noted.	A (1938) CD (1930-1939) T (1937)
1940	No significant changes noted. No city directory listings for Site.	N: No significant changes noted. City directory listings for residential tenants (677, 683, 695, 709, 721, 727, 733, 745, 751, 755, and 763 East 49th Street). E: No significant changes noted. S: No significant changes noted. W: No significant changes noted.	A (1948) CD (1940-1949) T (1948)
1950	By 1953, the 49th Street Elementary School facility in the east portion of the Site had additional buildings including a former cafeteria building, two former classroom buildings, and small former storage building. No significant changes were noted on the remainder of the Site. City directory listings for residential tenants (676, 708, 716, and 724 East 49th Street and 677, 685, 687, 689, 693, 695, 701, and 711 East 50th Street).	N: No significant changes noted. City directory listings for residential tenants (677, 695, 701, 709, 715, 727, 733, 739, 751, 763, 771, 773, and 775 East 49th Street). E: No significant changes noted. S: No significant changes noted. W: No significant changes noted.	A (1952) CD (1950-1958) S (1953, 1954, 1955) T (1950, 1952)
1960	By 1960, an additional former classroom building was depicted at the 49th Street Elementary School facility. By 1962, one former classroom had been removed and three additional former classroom buildings were depicted. By 1966, the existing administration/library/ classroom building was depicted and four of the former classroom buildings had been removed. No significant changes were noted on the remainder of the Site, although four of the lots west of the school were vacant by 1966.	N: No significant changes noted. City directory listings for residential tenants (677, 683, 687, 709, 715, 721, 727, 733, 739, 751, and 773 East 49th Street). E: No significant changes noted. S: No significant changes noted. W: No significant changes noted.	A (1964) CD (1960-1969) S (1960, 1962, 1966, 1968) T (1964)

Table 4.2 – Prior Uses of Site and Surrounding Properties			
Decade Starting	**Site**	**Surrounding Properties**	**Sources**
N = north, E = east, S = south, W = west Sources: A = aerial photograph (year in parentheses), CD = city directory abstract (year in parentheses), S = Sanborn fire insurance map (year in parentheses), T = topographic map (year in parentheses), and N/A = not applicable (no sources found).			

According to the historical records reviewed, the Site was depicted as undeveloped or vacant land in 1896, and depicted with vacant lots and single-family residences and associated sheds and stables in 1906. By 1922, the east portion of the Site was redeveloped with the 49th Street Elementary School facility and included a former public school building and two smaller former classroom buildings. According to LAUSD information, the seven buildings were constructed between 1923 and 1969. By 1970, the footprint of the 49th Street Elementary School facility had expanded to almost the current layout; one single-family residence and one multi-family residential property remained in the northwest portion of the Site. By 1972, the 49th Street Elementary School facility had expanded to the existing footprint.

It is Tetra Tech's understanding that historical use of hazardous materials at LAUSD facilities has the potential to have impacted the Site, and the following are considered to be RECs:

- The potential presence of lead-contaminated soils in the vicinity of the on-Site buildings (historic and current) associated with the potential use of LBP in the buildings.

- The potential presence of organochlorine pesticide (OCP)-contaminated soils in the vicinity of the on-site buildings (historic and current) associated with the potential application of OCPs applied at wood building foundations for termite control.

- The potential presence of PCB-contaminated soils beneath in the vicinity of the on-Site buildings (historic and current) due to the potential use of PCB-containing caulking and paints in the buildings.

- The potential presence of arsenic-contaminated soils beneath the Site pavement due to LAUSD's former standard practice of applying herbicides containing arsenic prior to paving.

4.3 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

Tetra Tech requested previous environmental investigation reports for the Site from LAUSD. Several previous environmental investigation reports were provided and are summarized below. No other previous environmental investigation reports were provided and none were found during the conducting of this assessment.

Lindmark Engineering (LE), 2007, Soil Certification Report, LAUSD 49th Street Elementary School, 750 East 49th Street, Los Angeles, California: dated October 15, 2007

This report summarized the results of soil characterization activities performed in 2007 including stockpiled soil sampling and laboratory analysis.

During construction at the 49th Street Elementary School, approximately 5 cubic yards of soil and/or base material was excavated and stockpiled by a LAUSD contractor to prepare the surface for new paving. The excavated and stockpiled soil was temporarily stored on the school property. Prior to reuse of the excavated material at a school site or transportation to an off-Site disposal facility, laboratory analysis was performed to determine any hazardous characteristics.

One soil sample was collected from the stockpile and analyzed for total petroleum hydrocarbons as gasoline, diesel, and oil (TPHg, TPHd, TPHo), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), organochlorine pesticides (OCPs), organophosphorous compounds, chlorinated herbicides, California Code of Regulations Title 22, California Assessment Manual (CAM) metals, arsenic, thallium, and hexavalent chromium.

The soil sample had detectable concentrations of the OCPs gamma- and alpha-chlordane (7.04 and 5.01 micrograms per kilogram [µg/kg], respectively), dichloro-diphenyl-dichloroethylene (DDE, 7.84 µg/kg), and 4,4'-(2,2,2-trichloroethane-1,1-diyl)bis(chlorobenzene) (DDT, 14.4 µg/kg). LE reported that the detected concentrations were below the screening values based on the California Human Health Screening Levels (CHHSLs) for OCPs. The soil sample also had detectable concentrations of fourteen metals, however LE reported that none of the metal concentrations exceeded either the DTSC screening level or the EPA residential Preliminary Remediation Goal (PRG). No TPH compounds, VOCs, SVOCs, PCBs, organophosphorus compounds, or chlorinated herbicides were detected at or above laboratory practical quantitation limits (PQLs).

Based on the laboratory analytical results of the soil sample collected from the stockpiled soil, no elevated concentrations of compounds tested were detected. However, LE concluded that based on the LAUSD guidelines, the soil was not eligible for re-use at any LAUSD school site with OCP concentrations above the laboratory detection limits. LE recommended disposal of the soil at a local landfill or at a licensed recycling facility.

Bader Environmental Services (BE), 2008, Soil Certification Report Phase II, LAUSD 49th Street Elementary School, 750 East 49th Street, Los Angeles, California: dated October 30, 2008

This report summarized the results of soil characterization activities performed in 2008 including stockpiled soil sampling and laboratory analysis.

During construction at the 49th Street Elementary School, soil and base material was excavated and stockpiled by the LAUSD contractor in order to prepare the surface for new paving. The stockpile was approximately 700 cubic yards. Three composite samples were collected from the stockpile and analyzed for TPHg, TPHd, TPHo, VOCs, SVOCs, PCBs, OCPs, organophosphorous compounds, chlorinated herbicides, CAM metals, arsenic, thallium, and hexavalent chromium.

A total of 13 metals were detected in the composite soil samples; however, BE reported that all detected metal concentrations were below their respective Total Threshold Limit Concentrations (TTLC) and none of the concentrations exceeded their respective State and Federal health-risk based screening levels for use in residential soil, except from arsenic and lead.

Lead concentrations in the soil samples ranged from 50.5 milligrams per kilogram (mg/kg) to the maximum reported concentration of 85.6 mg/kg, The soil samples were then re-analyzed using Soluble Threshold Limit Concentration (STLC) and Toxic Characteristic Leaching Procedure (TCLP) for lead. Based on laboratory results, the STLC regulatory limit for lead of 5 milligrams per liter (mg/l) was exceeded in one of the three composite samples (SP1, 5.50 mg/l). Based on the TCLP results, the soil samples were classified as non-RCRA, California-designated hazardous waste.

Soil samples had arsenic concentrations up to 11 mg/kg, in composite sample SP2, which BE reported to exceed the United States Environmental Protection Agency (USEPA) Preliminary Remediation Goal (PRG) for residential soil of 0.062 mg/kg and the screening level set forth in LAUSD Guidance Section 01440 of 6.0 mg/kg. However, the arsenic concentration was below the screening level of 12.0 mg/kg applied by the LAUSD throughout the District.

Soil samples had detectable concentrations of OCP, TPHd, TPHo, and PCBs, at concentrations reported by BE to be below applicable agency regulatory limits. No VOCs, SVOCs, organophosphorus compounds, or chlorinated herbicides were detected at or above the PQLs.

Based on the laboratory analytical results of the composite samples collected from the stockpiled soil, and local, state and federal guidelines, BE concluded that the soil was not eligible for reuse at any LAUSD school site or other sites due to detected lead STLC concentrations above 5.0 mg/l. BE recommended disposal of the soil at a non-RCRA, California-designated hazardous waste facility.

Converse Consultants (Converse), 2009, Export Soil Sampling Report, LAUSD 49th Street Elementary School, 750 East 49th Street, Los Angeles, California: dated January 27, 2009

This report summarized the results of soil characterization activities performed in 2009 including stockpiled soil sampling and laboratory analysis.

A 30 cubic yard stockpile of soil was present at the Site and was planned to be exported from the Site. Three soil samples were collected from the stockpile and combined into one composite soil sample. The composite soil sample was analyzed for TPHg, TPHd, TPHo, VOCs, SVOCs, PCBs, OCPs, organophosphorous pesticides, chlorinated herbicides, and CAM metals.

Three OCPs were reported in the soil sample including Chlordane, DDE, and DDT were reported with concentrations of 2.61, 1.84, and 3.77 µg/kg. These concentrations were reported by Converse to be below the TTLC. Converse also reported that TPH heavy hydrocarbons and metals were detected in the soil samples below applicable agency regulatory limits.

Based on the laboratory analytical results, Converse concluded that the soil may not have been acceptable for use on-Site or at other LAUSD school sites due to the detections of OCPs at any concentration without further evaluation and possible health risk screening. Converse recommended providing analytical data to any disposal facility to ensure acceptance of the soil.

Tetra Tech Conclusion

The identification of elevated concentrations of OCPs and lead in soils at the Site is consistent with the historical use of hazardous materials at LAUSD facilities previously discussed in Section 4.2 and considered to be a REC to the Site.

5.0 REGULATORY REVIEW

5.1 STANDARD ENVIRONMENTAL RECORD SOURCES

Tetra Tech procured and reviewed a computer-generated database report from EDR. The EDR database report is provided in Appendix B. A review of databases and files from federal, state, and local environmental regulatory agencies was conducted to identify use, generation, storage, treatment or disposal of hazardous materials and chemicals, or release incidents of such materials which may impact the Site. The databases discussed in the following section address ASTM requirements. Additional federal and state databases were reviewed. Please refer to the EDR database report for a detailed listing.

Included in the EDR report is an orphan summary. This summary lists facilities that are contained on one of the above-referenced databases or lists, but for which complete or accurate geographic data was not available. Consequently, EDR was unable to map the facilities in relation to the Site. This list was reviewed during Site reconnaissance to evaluate whether the properties referenced are within ASTM search distances. Properties within ASTM distances were incorporated into Tetra Tech's review.

A summary of the EDR database information is provided in Table 5.1.

Table 5.1 – EDR Database Summary

5.1.1 Federal Regulatory Records

The Site was reported by EDR to be listed in the following federal regulatory agency database in Table 5.1: RCRA Waste Generators.

Several off-Site facilities located within ASTM search distances were reported by EDR to be listed in the following federal regulatory agency databases in Table 5.1: SEMS, SEMS-Archive, CORRACTS, US

Brownfields, FUDS, and RCRA Waste Generators. Adjacent properties were listed and are discussed below. Refer to the EDR database report in Appendix B for information regarding all of the listings. Based on information contained in the EDR database report, agency information reviewed by Tetra Tech, distance from the Site, presumed groundwater flow direction, and/or regulatory agency status, there was no information indicating a REC to the Site from the off-Site listed facilities.

Site – LAUSD 49th Street Elementary School – 750 East 49th Street
This on-Site facility was listed in the RCRA Waste Generators database as a small quantity generator (SQG) of hazardous wastes in 1987. Types of hazardous waste historically generated by this facility were not reported. No violations were reported by EDR for this facility. This facility was not listed by EDR as having had any releases.

Former Residence to Become Vacant Lot – 670 East 49th Street
This former facility was located adjacent to the west of the Site and upgradient of the Site. It was listed in the RCRA Waste Generators database as a large quantity generator (LQG) of hazardous wastes in 2012. Types of hazardous wastes historically generated by this facility included lead. No violations were reported by EDR for this facility. This facility was not listed by EDR as having had any releases. Based on the regulatory status, this former adjacent facility is not considered to be of environmental concern to the Site.

Former Residence to Become Vacant Lot – 4916 McKinley Avenue
This former facility was located adjacent to the east of the Site beyond McKinley Avenue and downgradient of the Site. It was listed in the RCRA Waste Generators database as a large quantity generator (LQG) of hazardous wastes in 2012. Types of hazardous wastes historically generated by this facility included lead. No violations were reported by EDR for this facility. This facility was not listed by EDR as having had any releases. Based on the regulatory status and groundwater flow direction, this former adjacent facility is not considered to be of environmental concern to the Site.

5.1.2 State and Tribal and EDR Proprietary Regulatory Records

The Site was reported by EDR to be listed in the state, tribal, or EDR proprietary databases listed in Table 5.1: HAZMAT, HWTS, HAZNET, and ECHO.

Several off-Site facilities located within ASTM search distances were reported by EDR to be listed in the following state regulatory agency databases in Table 5.1: CA Response, Envirostor, SWRCY, LUST, Cortese/Hist Cortese, CPS-SLIC, HWP, HIST Cal-Sites, SCH, CERS Hazardous Waste, EDR Historical Auto Stations, and EDR Historical Cleaners. No adjacent properties were listed. Refer to the EDR database report in Appendix B for information regarding all of the listings. Based on information contained in the EDR database report, agency information reviewed by Tetra Tech, distance from the Site, presumed groundwater flow direction, and/or regulatory agency status, there was no information indicating a REC to the Site from the off-Site listed facilities.

Site – LAUSD 49th Street Elementary School – 750 East 49th Street
This on-Site facility was listed in the HWTS, HAZMAT, HAZNET, and ECHO databases.

This former on-Site facility was listed in the HWTS database as a facility that generated/disposed of hazardous wastes in the years 1998 to the present.

This facility was listed in the Los Angeles HM database as having a permit. The status for the permit is inactive.

This facility was listed in the HAZNET database as historically generating hazardous wastes in the form of contaminated soil from site clean-up in 2008 and 2009, and asbestos containing waste, other inorganic solid waste, other inorganic solid waste, polychlorinated biphenyls (PCBs) and materials containing PCBs in the years 1998 to 2015. Refer to Section 4.3 for further discussion of impacted soil found at the Site in 2008 and 2009.

This facility was listed in the ECHO database as a RCRA Waste Generator. No violations were reported for this facility.

5.2 ADDITIONAL ENVIRONMENTAL RECORD SOURCES

Historical addresses found for the Site include 676, 692, 708, 716, 724, 732, 734, 740, 748, 754, 764, and 794 East 49th Street; 677, 685, 687, 689, 693, 695, 701, 703, 709, 711, 713, 723, 727, 731, 733, 741, 749, 755, and 795 East 50th Street; and 4917 and 4927 McKinley Avenue. Records were requested from the agencies below for the current and historical Site addresses.

California Environmental Protection Agency, Department of Toxic Substances Control (Cal-EPA DTSC)
Tetra Tech requested records maintained by the Cal-EPA DTSC. No records were found for the Site.

California Geologic Energy Management Division (CalGEM)
Tetra Tech reviewed the CalGEM Online Mapping System database. No oil or gas wells were found on the Site or within a 0.25-mile radius of the Site. The Site is not located within the limits of a producing or abandoned oil, gas, or geothermal field.

National Pipeline Mapping System (NPMS)
Tetra Tech reviewed publicly accessible information maintained by the NPMS on its website. According to information found on this website, no underground oil or refined product pipelines are located at the Site or adjacent to the Site. No liquid or gas releases were reported for the area of the Site.

California Regional Water Quality Control Board – Los Angeles Region (LARWQCB)
Tetra Tech requested records for the Site maintained by the LARWQCB. No records were found for the Site.

South Coast Air Quality Management District (SCAQMD)
Tetra Tech reviewed publicly accessible records maintained by the SCAQMD in the Facility INformation Detail (FIND) database on its website. Records were found for the Site.

Records were found for LAUSD 49th Street Elementary School at 750 East 49th Street. The status for this facility is active. No permits were reported for the Site. Rule 222 and 1415 plan notifications were reported for the Site related to a boiler in the year 2001 and related to undesignated equipment in 2012, 2014, 2017, and 2018. No notice to comply or notices of violation were reported for this facility.

City of Los Angeles Bureau of Sanitation, Industrial Wastewater Management (LABS IWM)
Tetra Tech requested records for the Site from the LABS IWM. No records were found for the Site.

City of Los Angeles Department of Building and Safety (LADBS)
Tetra Tech reviewed information for the Site on file at the LADBS. Records found for the Site included the following:

- A permit to relocate a residential building from 733 East 50th Street in 1909 (733 East 50th Street).
- Permits for two residential buildings in 1905 (740 East 49th Street).

- A permit for a residential building in 1906 (755 East 50th Street).
- A permit for a residential building in 1906 (693 East 50th Street).
- A permit for a residential building in 1906 (677 East 50th Street).
- A permit for a new building in 1909 (732 East 49th Street).
- A permit for a multi-tenant residential building in 1910 (685 East 50th Street).
- A permit for a multi-tenant residential building in 1911 (693 East 50th Street).
- A permit to relocate a residential building from 755 East 50th Street in 1912 (755 East 50th Street).
- A permit to relocate a residential building from 732 East 49th Street in 1914 (732 East 49th Street).
- A permit for a residential building in 1915 (740 East 49th Street).
- A permit for a temporary school building in 1918 (770 East 49th Street).
- A permit for a 24-foot by 38-foot school building in 1919 (4917 McKinley Avenue).
- A permit for a residential building in 1921 (723 East 50th Street).
- A permit for a residential building in 1921 (723 ½ East 50th Street).
- A permit for a residential building in 1921 (727 ½ East 50th Street).
- A permit for a residential building in 1922 (725 East 50th Street).
- A permit for a residential building in 1922 (709 East 50th Street).
- A permit to relocate a residential building from 748 East 49th Street to 743 East 50th Street in 1923 (743 East 50th Street).
- A permit to relocate a residential building from 749 East 50th Street in 1924 (749 East 50th Street).
- A permit for a residential building in 1925 (703 East 50th Street).
- A permit to relocate a residential building from 741 East 50th Street to 733 East 50th Street in 1925 (733 East 50th Street).
- A permit to relocate a residential building from 740 East 49th Street in 1925 (740 East 49th Street).
- A permit to relocate a multi-tenant residential building to 708 ½ - 710 ½ East 49th Street in 1926 (708 ½ - 710 ½ East 49th Street).
- A permit for a new building in 1926 (768 East 49th Street).
- A permit for a new building in 1926 (710 East 49th Street).
- A permit for a new building in 1926 (708 East 49th Street).
- A permit for a new building in 1926 (719 East 50th Street).
- A permit for a new building in 1927 (734 East 49th Street).
- A permit for a lunch pavilion in 1930 (4917 McKinley Avenue).
- Permits to relocate two school bungalows to an off-Site location in 1932 (4917 McKinley Avenue).
- A permit to demolish a public school building in 1934 (4917 McKinley Avenue).
- A permit for two temporary sanitary buildings in 1934 (4917 McKinley Avenue).
- A permit for a temporary office bungalow in 1934 (4917 McKinley Avenue).
- A permit for a public school building in 1935 (4917 McKinley Avenue).
- A permit for a school auditorium in 1935 (4917 McKinley Avenue).
- A permit to relocate a school sanitary building to an off-Site location in 1932 (4917 McKinley Avenue).
- A permit to relocate a multi-tenant residential building from 732 East 49th Street in 1937 (732 East 49th Street).
- A permit for an incinerator in 1948 (4917 McKinley Avenue).
- A permit for a classroom building in 1950 (4917 McKinley Avenue).
- A certificate of occupancy for a classroom building in 1950 (4917 McKinley Avenue).
- A permit for a school building in 1952 (4917 McKinley Avenue).
- A certificate of occupancy for a school building in 1952 (4917 McKinley Avenue).
- A permit to relocate a residential building to 690 East 49th Street in 1952 (690 East 49th Street).

- A permit to relocate a multi-tenant residential building to 682-684 East 49th Street in 1956 (682-684 East 49th Street).
- A permit to relocate a multi-tenant residential building to 686-688 East 49th Street in 1956 (686-688 East 49th Street).
- A permit to relocate a multi-tenant residential building to 700-702 East 49th Street in 1956 (700-702 East 49th Street).
- A permit to relocate a multi-tenant residential building to 704-706 East 49th Street in 1956 (704-706 East 49th Street).
- A permit for a classroom building in 1960 (4917 McKinley Avenue).

According to LADBS information, the Site is not located within a LADBS-designated methane zone or methane buffer zone.

City of Los Angeles Fire Department (LAFD)
Tetra Tech reviewed the LAFD UST and LAFD Hazardous Materials Divisions listings of available records. Records were listed for the Site by the LAFD Hazardous Materials Division; however, no physical records were found for the Site. No records were found for the Site by the LAFD UST Division.

City of Los Angeles Planning Department (LAPD)
The LAPD shows the area of the Site to be zoned as public facilities (PF-1).

6.0 ON-SITE ENVIRONMENTAL ASSESSMENT

6.1 STORAGE TANKS

6.1.1 Underground Storage Tanks (USTs)

No visual evidence (i.e., pipes, vents and dispensers) indicating historical or existing on-Site USTs was observed at the Site. No information from Site history research and review of records and/or databases maintained by federal, state, county, and city agencies revealed the presence of historical or existing USTs at the Site except as noted below.

Two oil tanks were depicted at the Site on historical drawing provided by LAUSD. It is unknown if the depicted oil tanks were USTs and/or ASTs. The referenced oil tanks are considered to be a REC (refer to Section 9.2 for additional information).

6.1.2 Aboveground Storage Tanks (ASTs)

No visual evidence (i.e., concrete foundation or containment walls, pedestals or steel support structures) indicating existing or historical on-Site ASTs was observed at the Site. No information from Site history research and review of records and/or databases maintained by federal, state, county and city agencies revealed the presence of existing or historical ASTs at the Site except as noted below.

Two oil tanks were depicted at the Site on historical drawing provided by LAUSD. It is unknown if the depicted oil tanks were USTs and/or ASTs. The referenced oil tanks are considered to be a REC (refer to Section 9.2 for additional information).

6.2 ASBESTOS-CONTAINING MATERIALS (ACMs)

Based on the age of the Site buildings (1923 to 1969), it is possible that ACMs are present in the Site buildings. Observed inferred suspect ACMs noted during Tetra Tech's Site reconnaissance included ceramic floor tile mastic, vinyl flooring (tiles and sheeting) and mastic, vinyl cove base and associated mastic, drywall and associated joint compound, acoustic ceiling tile, stucco, and roofing materials. The suspect ACMs were generally in fair condition where observed. Untested suspect ACMs are considered to be a business environmental risk (BER).

6.3 LEAD-BASED PAINT (LBP) AND OTHER LEAD-CONTAINING MATERIALS (LCMs)

Based on the age of the Site buildings (1923 to 1969), it is possible that LBP and other LCMs are present in these Site buildings. The painted surfaces appeared to be in fair to good condition, with no significant areas of damaged paint noted. Other possible LCMs, such as ceramic floor tile and wall tile, also appeared to be in fair to good condition. Untested suspect LBP and other LCMs are considered to be part of the BER discussed above in Section 6.2.

6.4 HAZARDOUS MATERIALS USAGE

Hazardous materials observed at the Site included the following:

- 15 gallons of gasoline/diesel and approximately 10 gallons of maintenance chemicals in an exterior storage container in the central south portion of the Site. Tetra Tech was unable to access the interior of flammable-rated cabinet in the container to examine the contents of the cabinet.

- Two 5-gallon containers of corrosion control chemical in the boiler/incinerator room in the main building.

- Approximately 40 gallons of janitorial cleaners and 80 gallons of disinfectant in the janitorial storage room in the west building.

- Approximately 15 gallons of janitorial cleaners in the auditorium building.

- Approximately 10 gallons of cleaners in the kitchen in the cafeteria building.

- Minor amounts of janitorial supplies in the janitorial closets in the remaining Site buildings.

Hazardous materials were observed to be stored without secondary containment. No staining or other evidence of spills was observed.

6.5 SOLID WASTE MANAGEMENT

Solid wastes were collected in dumpsters in the central south portion of the Site. Tetra Tech observed no evidence of inappropriate solid waste disposal during this assessment. No staining or evidence of hazardous substance disposal was observed inside or around the solid waste dumpsters.

6.6 HAZARDOUS WASTE MANAGEMENT

No hazardous wastes were observed during the Site reconnaissance.

6.7 POLYCHLORINATED BIPHENYLS (PCBs)

Fluorescent light fixtures (including ballasts and bulbs/tubes) were observed in the Site buildings. According to LAUSD, a fluorescent light ballast survey was conducted at the Site in January 2016 and no PCB-containing fluorescent light ballast were found.

One pad-mounted transformer was observed in the central south portion of the Site. No staining or other evidence of leaks was observed around the transformer. Considering the Site buildings were constructed from 1923 to 1969, it is possible that any transformer at the Site contains PCBs. The transformer is owned by LADWP, which is presumed to be responsible for the clean-up of any leaks or spills from transformers. The presence of a potentially PCB-containing transformer is considered to be a BER.

Based on the age of these Site buildings, it is possible that caulking and paints contain PCBs. The potential presence of PCB-contaminated soils in the vicinity of the on-Site buildings (historic and current) due to the potential use of PCB-containing caulking and paints in the buildings is considered to be a REC (previously discussed in Section 4.2).

No other potentially PCB-containing equipment was observed at the Site.

6.8 MERCURY

Fluorescent lighting (bulbs/tubes) was observed at the Site buildings. Fluorescent bulbs/tubes contain mercury. Evidence of damage or leakage was not observed.

6.9 WATER AND WASTEWATER/STORM WATER

6.9.1 Water Supply

Potable water is provided to the Site by the LADWP. Site reconnaissance and review of local records did not reveal the presence of on-Site water supply or irrigation wells. According to the EDR database report, no public water supply wells were reported to be located within a 0.25-mile radius of the Site.

6.9.2 Wastewater

Domestic wastewater generated at the Site is discharged to the LABS sanitary sewer system.

No industrial wastewater is reported to be currently generated at the Site and no evidence of industrial wastewater generation was observed during the Site reconnaissance.

6.9.3 Storm Water

Storm water is expected to percolate into unpaved areas at the Site parcels and to flow onto surrounding properties and streets topographically downslope from the Site. No industrial stormwater permits were found for the Site. No evidence of storm water run-off controls was observed and no storm water pollution prevention plan (SWPPP) was found for the Site during the conduct of this assessment.

6.10 SURFACE WATER AND WETLANDS

No surface water or wetland areas were observed on or adjacent to the Site. No wetland areas were found on or adjacent to the Site during review of the United States Fish and Wildlife Service (USFWS) website interactive mapping service.

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) depicting the Site parcel, Panel No. 34005C 0232G, the Site parcels are located in Zone X (unshaded). According to FEMA website information, Zone X (unshaded) includes: areas of minimal flood hazard.

6.11 RADON

The Site is located within a Zone 2 radon area, indicating that the average indoor radon level is greater than or equal to 2.0 picoCuries (pCi/L) of air but less than or equal to 4.0 pCi/L of air. The USEPA action level for radon is 4.0 pCi/L. According to state residential radon survey information contained in the EDR database report, one test was conducted within Los Angeles County in the same zip code as the Site. The test had a radon concentration below the USEPA action level for radon. According to federal residential radon survey information contained in the EDR database report, 63 tests were conducted within Los Angeles County. All but one of these tests in first floor living areas had a radon concentration below the USEPA action level for radon. All of the tests in basement areas had radon concentrations below the USEPA action level for radon.

6.12 AIR EMISSIONS

There were no observed Site operations involving emissions that appeared to require permitting, emission controls, or abatement activities. This should not, however, be considered a regulatory compliance audit.

6.13 DRY CLEANING OPERATIONS

Site reconnaissance, as well as review of available historical and regulatory records, did not reveal the presence of current or historic on-Site dry cleaning operations.

6.14 MICROBIAL GROWTH AND MOISTURE INTRUSION

No evidence of potential microbial growth and/or moisture intrusion was observed at the Site.

6.15 ENVIRONMENTAL NON-COMPLIANCE ISSUES

No environmental non-compliance issues associated with current Site use were noted at the Site. This should not be considered a regulatory compliance audit.

6.16 VAPOR INTRUSION

No information regarding a potential vapor encroachment condition (VEC) indicative of vapor intrusion (VI) by volatile compounds at the Site was found during this assessment.

6.17 SITE-SPECIFIC ENVIRONMENTAL ISSUES

No HRECs or PECs were found to be associated with the Site during the performance of this assessment. The following Site-specific environmental issues were found to be associated with the Site:

- The following RECs have been found in connection with the Site:
    - Current and historical use of the boiler/incinerator room in the main building, including the potential use of petroleum fuels, the presence of an incinerator, and the presence of pink staining around a sump.
    - The potential presence of lead-contaminated soils in the vicinity of the on-Site buildings (historical and current) associated with the potential use of LBP in the buildings.
    - The potential presence of OCP-contaminated soils in the vicinity of the on-Site buildings (historical and current) associated with the potential application of OCPs applied at wood building foundations for termite control.
    - The potential presence of PCB-contaminated soils beneath in the vicinity of the on-Site buildings (historical and current) due to the potential use of PCB-containing caulking and paints in the buildings.
    - The potential presence of arsenic-contaminated soils beneath the Site pavement due to LAUSD's former standard practice of applying herbicides containing arsenic prior to paving.

- The following features referenced on historical LAUSD drawings: a concrete incinerator, two oil tanks (unknown if the tanks are ASTs and/or USTs), and two additional former boiler rooms.

- The following BERs have been found in connection with the Site:
  - Untested suspect ACMs and LBP and other LCMs.
  - The presence of a potentially PCB-containing transformer.

7.0 ENVIRONMENTAL SCHOOL SITE SELECTION SCREENING CRITERIA CHECKLIST

Pertinent selection criteria of the California Department of Education (CDE) Existing Schools Checklist is presented below. The completed CDE Existing Schools Checklist completed for 49th Street Elementary School is provided in Appendix D.

7.1 POWERLINES/ELECTROMAGNETIC FIELDS

The project is not anticipated to create any significant safety hazards or exacerbate any existing safety hazards to students in relation to powerlines/electromagnetic fields within the school property or within a 350-foot boundary of the Site. Apparent high voltage powerlines were not observed on or within 350 feet of the Site during the Site reconnaissance.

7.2 RAILROADS

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students in regards to railroads within a 1,500-foot radius of the Site. Railroads were not observed at the Site or surrounding area.

7.3 TRAFFIC NOISE

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students in regards to adjacent roads or freeways that would adversely affect the educational program. Freeways were not observed at the Site or surrounding area.

7.4 FAULTS

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students in regards to an active earthquake fault or fault trace which may be on-Site. A review of the available Alquist-Priolo Special Studies Zone mapping at the California Geological Survey, California Earthquake Hazards Zone Application (EQ Zapp) indicated that the Site is not located within an Alquist-Priolo Special Studies Zone.

7.5 FLOOD OR INUNDATION AREA

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students in regards to flooding or damn inundation. The FEMA FIRM and EDR Radius map were reviewed to determine if the Site is located in a designated flood hazard area. Based on the review of the applicable map, the Site is not located in either a 100- or a 500-year potential flood hazard area.

According to the Zone Information and Map Access System (ZIMAS) website, the Site is not identified as within a Tsunami Inundation Zone. According to the United States Army Corps of Engineers, no dams in the Los Angeles County area have emergency plans that identify the Site area as lying within the within a possible flood inundation area. No aboveground water reservoirs were depicted noted within one mile of the Site on topographic maps.

7.6 LIQUEFACTION AND LANDSLIDES

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students in regards to liquefaction and landslides. A review of the available mapping of liquefaction and landslide hazard zones at the California Geological Survey, California Earthquake Hazards Zone Application (EQ Zapp) indicated that the Site is not located within a known liquefaction or landslide hazard zone.

7.7 PIPELINES AND ABOVEGROUND TANKS

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from nearby water or fuel ASTs or pipelines. ASTs were not observed on the Site or adjoining properties. Pipelines were not depicted on or near the Site on the NPMS public viewer website.

7.8 TRAFFIC AND PEDESTRIAN SAFETY

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from an adjacent major arterial street.

7.9 COMPATIBLE ZONING

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from the zoning surrounding the Site.

7.10 LIGHT WIND AND AIR POLLUTION

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from light, wind or air pollution.

7.11 EASEMENTS

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from easements on or adjacent to the Site which may restrict access or building placement.

7.12 BORDER ZONE PROPERTY

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from a significant disposal or hazardous waste site within a 2,000-foot radius of the Site. No off-site properties of concern (i.e. a REC in connection with the Site) were identified during review of the EDR database report (Sections 5.1.1 and 5.1.2).

7.13 CELLULAR PHONE TOWERS

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from a cellular phone tower on or adjacent to the Site. It is Tetra Tech's understanding the LAUSD does not allow cellular sites at LAUSD schools. An apparent cellular site was not observed on the adjoining properties.

7.14 AIR POLLUTION

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from a major transportation corridor within a 500-foot radius of the Site, or a major stationary source within a 500-foot radius of the Site. 49th Street Elementary School is not listed on the Priority List of Schools Most at Risk from Air Pollution dated February 29, 2008.

7.15 METHANE ZONES

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from known methane zone or oil field. The Site and area are depicted outside of a Methane Zone or Methane Buffer Zone on the City of Los Angeles Methane and Methane Buffer Zone Map (2004). The Site is not depicted within an oil field on the CalGEM Well Finder website.

7.16 OIL WELLS

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from an on-site oil well. There are no on-site oil wells depicted on the CalGEM Well Finder website.

7.17 AIRPORTS

The project is not anticipated to create any new significant safety hazards or exacerbate any existing safety hazards to students from an airport within two nautical miles of the Site. An airport was not identified at the Site or surrounding area.

8.0 REVIEW OF NEARBY/ADJACENT PROPERTIES

The vicinity of the Site can generally be described as a mixed commercial and residential area in Los Angeles. Adjoining properties observed during the Site vicinity reconnaissance are described below.

North: Beyond East 49th Street are multi-family residential properties (671/673, 677/679, 681/683, 687/689/691, 695/697, 701/703, 709, 715, 721/723/725, 733, 739, 743/745, and 751 East 49th Street) and single-family residences (727, 755, 763, 771, 773, and 775 East 49th Street).

East: Beyond McKinley Avenue are The McKinley Avenue Park (4916 McKinley Avenue), a single-family residence (4920 McKinley Avenue), and multi-family residential properties (850 East 49th Place/4960 McKinley Avenue, 853 East 50th Street and 4970/4972 McKinley Avenue, and 854 East 50th Street).

South: Beyond East 50th Street are multi-family residential properties (670, 674/676/678, 708/7140, 724/726, 730/732, 740, 748, 758, and 760/762 East 50th Street) and single-family residences (684, 690, 700, 716, 772, and 776 East 50th Street and 5001 McKinley Avenue).

West: The 49th Street Park (670 East 49th Street) and a multi-family residential property (673 East 50th Street).

The inspection of the abutting properties from curbside and a review of federal, state, and local regulatory agency databases/records did not reveal the presence of off-Site sources that are considered to be RECs to the Site at this time.

9.0 USER PROVIDED INFORMATION

9.1 LAND TITLE AND JUDICIAL RECORDS FOR ENVIRONMENTAL LIENS OR ACTIVITY AND USE LIMITATIONS (AULs)

LAUSD provided Tetra Tech no information regarding if there are environmental liens or AULs associated with the Site.

Tetra Tech requested a search for environmental liens and other AULs for the Site parcels from Texas Environmental Research in accordance with the scope of work for this assessment. No environmental liens or other AULs were found for the Site parcels (documentation is provided in Appendix D).

9.2 COMMONLY KNOWN OR REASONABLY ASCERTAINABLE INFORMATION

Commonly known or reasonably ascertainable information provided to Tetra Tech by LAUSD included the Site location and address. LAUSD also provided Tetra Tech with historical drawings dated from 1923 to 1995. The following of note were depicted on the drawings:

- A concrete incinerator approximately 30 feet west and 40 feet south of the southwest corner of the existing west building on a 1935 drawings.
- An oil tank between the main building and the west building on 1934, 1948, and 1950 drawings (unknown if the referenced tank is an AST or UST).
- An oil tank approximately 62 feet east and 25 feet south of the southwest corner of the existing west building on a 1934 drawing (unknown if the tank is an AST or UST).
- A boiler room in the west building on 1923 drawings (specific location not clear).
- A boiler room adjacent and west of the central portion of the main building on a 1934 drawing.
- Fire-damaged areas in the main building and south building on a 1995 drawing.

The referenced concrete incinerator, two oil tanks, and two additional former boiler rooms are collectively considered to be a REC.

9.3 SPECIALIZED KNOWLEDGE OR EXPERIENCE

LAUSD had no specialized knowledge or experience regarding the Site other than noted above.

9.4 ACTUAL KNOWLEDGE

LAUSD had no other actual knowledge with respect to the Site other than noted above.

9.5 VALUATION REDUCTION FOR ENVIRONMENTAL ISSUES

LAUSD provided Tetra Tech no information regarding if there has been a valuation reduction for the Site for environmental issues.

9.6 REASONS FOR PHASE I ESA PERFORMANCE

It is Tetra Tech's understanding that this Phase I ESA is being requested by LAUSD in conjunction with due diligence activities for the Site.

10.0 INTERVIEWS

10.1 INTERVIEW WITH SITE OWNER

Tetra Tech interviewed Mr. Steven Morrill (Site Assessment Project Manager with LAUSD) during the Site reconnaissance. Information from the interview is included in applicable sections of this Report.

Mr. Morrill also completed a Phase I ESA questionnaire for the Site. Mr. Morrill was not aware of any environmental cleanup liens, AULs, or environmental cleanups for the Site.

10.2 INTERVIEW WITH SITE MANAGER

Tetra Tech interviewed Mr. Alberto Castro (Plant Manager with 49th Street Elementary School) prior to the Site reconnaissance. Information from the interview is included in applicable sections of this Report.

10.3 INTERVIEW WITH OCCUPANTS

Tetra Tech interviewed Mr. Alberto Castro (Plant Manager with 49th Street Elementary School) prior to the Site reconnaissance. Information from the interview is included in applicable sections of this Report.

10.4 INTERVIEW WITH PAST OWNERS, OPERATORS, AND OCCUPANTS

Past owners and operators could not be readily contacted by Tetra Tech. There have been no prior occupants; therefore, these interviews were not conducted. This is not considered to be a data gap, as information regarding past uses of the Site was obtained from other sources and has been previously discussed.

10.5 INTERVIEWS WITH LOCAL GOVERNMENT OFFICIALS

Tetra Tech did not interview local government officials. This is not considered to be a data gap, as information regarding past uses of the Site was obtained from other sources (including agency records) and has been previously discussed.

10.6 INTERVIEWS WITH OTHERS

No interviews were conducted with individuals other than the interview cited above in this Section 9.0.

11.0 CONCLUSIONS AND RECOMMENDATIONS

11.1 CONCLUSIONS

In the professional opinion of Tetra Tech, an appropriate level of inquiry has been made into the previous ownership and uses of the Site consistent with good commercial and customary practice with the intent to minimize environmental liability. Based on the information cited in this assessment, current Site use, and Tetra Tech's understanding of current regulatory guidelines and judgment, the following conclusions have been drawn (in addition to the conclusion in Section 11.0):

- The following RECs have been found in connection with the Site:
    - Current and historical use of the boiler/incinerator room in the main building, including the potential use of petroleum fuels, the presence of an incinerator, and the presence of pink staining around a sump.
    - The potential presence of lead-contaminated soils in the vicinity of the on-Site buildings (historical and current) associated with the potential use of LBP in the buildings.
    - The potential presence of OCP-contaminated soils in the vicinity of the on-Site buildings (historical and current) associated with the potential application of OCPs applied at wood building foundations for termite control.
    - The potential presence of PCB-contaminated soils beneath in the vicinity of the on-Site buildings (historical and current) due to the potential use of PCB-containing caulking and paints in the buildings.
    - The potential presence of arsenic-contaminated soils beneath the Site pavement due to LAUSD's former standard practice of applying herbicides containing arsenic prior to paving.
    - The following features referenced on historical LAUSD drawings: a concrete incinerator, two oil tanks (unknown if the tanks are ASTs and/or USTs), and two additional former boiler rooms.
- No HRECs or PECs have been found in connection with the Site.
- The following BERs have been found in connection with the Site:
    - Untested suspect ACMs and LBP and other LCMs.
    - The presence of a potentially PCB-containing transformer.
- No off-Site facilities are considered to be RECs to the Site at this time.

11.2 RECOMMENDATIONS

Based on the information gathered during the performance of this assessment, current Site use, current regulatory guidelines, and the judgment of Tetra Tech, the following recommendations are presented for consideration:

- Preparation of a Preliminary Environmental Assessment Equivalent (PEA-E) scoping document is warranted in order to address the RECs identified during this assessment. The PEA-E scoping document should include a scope of work for the sampling, analysis and evaluation of on-Site subsurface soil to determine the presence or absence of COCs, including petroleum hydrocarbons, VOCs, metals including lead and arsenic, OCPs, and PCBs, as appropriate, to address the RECs identified.

- Prior to any demolition, remodeling, and/or renovation activities at the Site, untested suspect ACMs, LBP and other LCMs, and potential PCB-containing building material that may be disturbed should be sampled and analyzed in accordance with applicable regulations. Abatement of known and suspect ACMs, LBP and other LCMs, and potential PCB-containing window caulk and any adjacent PCB-impacted building or construction materials should be performed prior to any demolition, remodeling, and/or renovation activities (that would disturb the ACMs and LBP and other LCMs) in accordance with applicable regulations. In the event that renovation or demolition activities do not take place, known and suspect ACMs, LBP and other LCMs, and potential PCB-containing building material at the Site should be managed in accordance with applicable regulations, including the preparation and implementation of specific Operation and Maintenance (O&M) Plans.

- Prior to redevelopment, all applicable agencies should be contacted for requirements related to storm water run-off (including the State of Construction Storm Water Permit) and other development- and construction-related environmental requirements (such as dust suppression). This could include the preparation and implementation of a SWPPP.

12.0 CONCLUSION

In the professional opinion of Tetra Tech, an appropriate level of inquiry has been made into the previous ownership and uses of the Site consistent with good commercial and customary practice with the intent to minimize environmental liability. Based on the information cited in this assessment and Tetra Tech's understanding of current regulatory guidelines and judgment, the following conclusion has been drawn:

- Tetra Tech has performed a Phase I ESA of the property referenced as the 49th Street Elementary School located at 750 East 49th Street in Los Angeles, California, (the Site) in general conformance with the scope of work cited in 40 CFR §312, et al., and ASTM Standard Practice E1527-21. This assessment revealed evidence of RECs in connection with the Site:

    - Current and historical use of the boiler/incinerator room in the main building, including the potential use of petroleum fuels, the presence of an incinerator, and the presence of pink staining around a sump.

    - The potential presence of lead-contaminated soils in the vicinity of the on-Site buildings (historical and current) associated with the potential use of LBP in the buildings.

    - The potential presence of OCP-contaminated soils in the vicinity of the on-Site buildings (historical and current) associated with the potential application of OCPs applied at wood building foundations for termite control.

    - The potential presence of PCB-contaminated soils beneath in the vicinity of the on-Site buildings (historical and current) due to the potential use of PCB-containing caulking and paints in the buildings.

    - The potential presence of arsenic-contaminated soils beneath the Site pavement due to LAUSD's former standard practice of applying herbicides containing arsenic prior to paving.

    - The following features referenced on historical LAUSD drawings: a concrete incinerator, two oil tanks (unknown if the tanks are ASTs and/or USTs), and two additional former boiler rooms.

13.0 DEVIATIONS

There have been no significant deviations from the scope and limitations set forth in the ASTM Standard Practice E1527-21 of which Tetra Tech is aware that would affect the conclusion of this Phase I ESA.

During the conduct of this assessment, there were no data gaps or data failure considered to be significant. Information provided by others to Tetra Tech is assumed to be accurate and complete. When provided, Tetra Tech has made reasonable inquiry into the accuracy of such information. Unless such inquiry indicated otherwise, the information was considered to be accurate and complete. As discussed previously in Section 2.2, there are limitations to this assumption.

15.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Ms. Tanya MacLean performed the Site reconnaissance, compiled Report data, and wrote the Phase I ESA Report. Mr. Steven Grod and Mr. Mark Feldman provided technical review. The signatures of Ms. MacLean, Mr. Grod, and Mr. Feldman are included in this section of the Report.

TANYA MACLEAN
Due Diligence Scientist
Phone: 949-809-5080

STEVEN GROD
Senior Project Manager
Phone: 949-809-5076

MARK FELDMAN, PG, CHG, CEG
Principal Geologist
Phone: 909-382-5116

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR §312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Site. We have developed and performed the AAI in conformance with the standards and practices set forth in 40 CFR Part 312.

16.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

The qualifications of Ms. MacLean, Mr. Grod, and Mr. Feldman are summarized in the resumes that are included in Appendix F.

PHOTOGRAPHIC DOCUMENTATION

Photograph No. 1: West view of the Site.

Photograph No. 2: Southeast view of the Site.

Photograph No. 3: Northwest view of the administration/library/classroom building (Building ID # 14036) in the northeast portion of the Site.

Photograph No. 4: West view of the interior of the administration/library/classroom building in the northeast portion of the Site.

Photograph No. 5: View of the administration offices in the administration/library/classroom building in the northeast portion of the Site.

Photograph No. 6: View of a typical classroom in the administration/library/classroom building in the northeast portion of the Site.

Photograph No. 7: View of janitorial supplies storage in a janitorial closet in the administration/library/classroom building in the northeast portion of the Site.

Photograph No. 8: Northeast view of the main building (Building ID # 14040) in the northeast portion of the Site.

Photograph No. 9: South view of the interior of the main building in the northeast portion of the Site.

Photograph No. 10: View of a typical classroom in the main building in the northeast portion of the Site.

Photograph No. 11: View of a janitorial closet in the main building in the northeast portion of the Site.

Photograph No. 12: View of janitorial cleaners storage in a janitorial closet in the main building in the northeast portion of the Site.

Photograph No. 13: View of the boiler/incinerator room in the main building in the northeast portion of the Site.

Photograph No. 14: View of corrosion control chemicals storage in the boiler/incinerator room in the main building in the northeast portion of the Site.

Photograph No. 15: View of a sump and pink staining in the boiler/incinerator room in the main building in the northeast portion of the Site.

Photograph No. 16: Southeast view of the south building (Building ID # 13583) in the southeast portion of the Site.

Photograph No. 17: North view of the south building in the southeast portion of the Site.

Photograph No. 18: Northeast view of the classroom building (Building ID # 13718) in the central west portion of the Site.

Photograph No. 19: East view of the interior of the classroom building in the central west portion of the Site.

Photograph No. 20: North view of the west building (Building ID # 13933) in the northeast portion of the Site.

Photograph No. 21: West view of the interior of the west building in the northeast portion of the Site.

Photograph No. 22: West view of janitorial cleaners storage in a storage room in the west building in the northeast portion of the Site.

Photograph No. 23: West view of disinfectant storage in a storage room in the west building in the northeast portion of the Site.

Photograph No. 24: South view of the auditorium building (Building ID # 14196) at the Site.

Photograph No. 25: Southwest view of the interior of the auditorium building at the Site.

Photograph No. 26: View of janitorial cleaners storage in a storage room in the auditorium building at the Site.

Photograph No. 27: Southwest view of the cafeteria building (Building ID # 13566) at the Site.

Photograph No. 28: South view of the interior of the cafeteria building at the Site.

Photograph No. 29: View of the kitchen in the cafeteria building at the Site.

Photograph No. 30: View of cleaners storage in the kitchen in the cafeteria building at the Site.

Photograph No. 31: Southwest view of the playground area at the Site.

Photograph No. 32: View of a hazardous materials storage container (center container) in the central south portion of the Site.

Photograph No. 33: View of the interior of a hazardous materials storage container in the central south portion of the Site.

Photograph No. 34: View of the storage of hazardous materials in a hazardous materials storage container in the central south portion of the Site.

Photograph No. 35: Northwest view of a pad-mounted transformer operated by LADWP in the central south portion of the Site.

Photograph No. 36: Northwest view of electrical transmission lines along East 50 Street to the south of the central portion of the Site.

Photograph No. 37: Northwest view multi-family residential properties (671, 677, 683, 687, 695, 701, 709, 715, 721, 733, 739, 745, and 751 East 49th Street) and single-family residences (727, 755, 763, 771, 773, and 775 East 49th Street), located adjacent to and north of the Site beyond East 49th Street.

Photograph No. 38: Southeast view of the McKinley Avenue Park (4916 McKinley Avenue), located adjacent to and northeast of the Site beyond McKinley Avenue.

Photograph No. 39: Northeast view of a single-family residence (4920 McKinley Avenue) and multi-family residential properties (850 East 49th Place and 853 and 854 East 50th Street), located adjacent to and east of the Site beyond McKinley Avenue.

Photograph No. 40: Southeast view of are multi-family residential properties (670, 674, 708, 724, 730, 740, 748, 758, and 762 East 50th Street) and single-family residences (684, 690, 700, 716, 772, and 776 East 50th Street and 5001 McKinley Avenue), located adjacent to and south of the Site beyond East 50th Street.

Photograph No. 41: South view of the 49th Street Park (670 East 49th Street) and a multi-family residential property (673 East 50th Street), located adjacent to and west of the Site.

Photograph No. 42: Northwest view of a multi-family residential property (673 East 50th Street), located adjacent to and west of the Site.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal sites subject to CERCLA removals and CERCLA orders

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 10/20/2021 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
HARD CHROME PRODUCTS Site ID: 0905242 EPA Id: CA0001095934	***6028 HOOPER AVENUE***	***SSW 1/4 - 1/2 (0.411 mi.)***	***I47***	***144***

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 10/20/2021 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 09/13/2021 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 09/13/2021 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 09/13/2021 has revealed that there are 3

RCRA-SQG sites within approximately 0.25 miles of the target property.

Lists of state- and tribal (Superfund) equivalent sites

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, has revealed that there are 3 RESPONSE sites within approximately 1 mile of the target property.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/22/2021 has revealed that there are 79 ENVIROSTOR sites within approximately 1 mile of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 09/13/2021 has revealed that

there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 2 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System:

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Violations:

Site ID:	172821
Site Name:	ZAPOPAN CARBURETORS
Violation Date:	09-04-2015
Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 09/04/2015. OBSERVATION: Hazardous Waste (HW) storage area: 1-275gallon tote storing used oil, no HW marking/labeling All hazardous waste containers shall be marked with the following information: 1) the words G Hazardous WasteG ; 2) name and address of generator; 3) hazardous properties; 4) physical state; 5) composition (contents); 6) accumulation start date. CORRECTIVE ACTION: Immediately label these containers and ensure that all hazardous waste containers are marked with all the required information. HW label affixed during the inspection, accumulation start date 8/13/15
Violation Division:	Los Angeles County Fire Department
Violation Program:	HW
Violation Source:	CERS

Site ID:	172821
Site Name:	ZAPOPAN CARBURETORS
Violation Date:	09-04-2015
Citation:	22 CCR 16 66266.130 - California Code of Regulations, Title 22, Chapter 16, Section(s) 66266.130
Violation Description:	Failure to properly handle, manage, label, and recycle used oil and fuel filters.
Violation Notes:	Returned to compliance on 09/04/2015. OBSERVATION: Generator failed to properly handle, manage, label, and/or recycle used oil and fuel filters. Hazardous Waste (HW) storage area 1-55gallon metal drum storing drain used oil filters with no "drained used oil filter" label. CORRECTIVE ACTION: Owner/Operator shall immediately comply with the Title 22 regulations with regards to the proper handling, management, labeling and recycling of used oil and fuel filters. Verify compliance with the PA by 10/3/15. Drained Used Oil Filter label affixed during the inspection, accumulation start date 8/13/15

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 05/05/1992
Comments: On April 28, 1992, DTSC received a referral from LA County Haz Mat Control Program. The County attempted several times to resolve problems at the site and finally recommended DTSC to enter arbitration proceedings to cleanup the site. The site is contaminated with heavy metals. Subsurface investigations indicate acidic soils with lead and total chromium above STLC. A PEA is required because of the documented evidence of contamination at the site.

Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 04/25/1995
Comments: PEA review complete. PEA indicates contamination of total Cr (42,000 mg/kg at 10'bgs), Cr6 (2,300 mg.kg at 2.5'bgs), soluable Pb (22.5 mg/l at 15'bgs) and acid waste were identified at the site Groundwater contamination of total Cr (208 mg/l) and Cr6 (192 mg/l) was also confirmed. Depth to groundwater was measured at 156'bgs. Temporary stabilization measures described in the report, including the removal of top stained soils, placement of asphalt cover for the entire site and installation of one on-site monitoring well appear to be satisfactory. Further action in the form of a Deed Restriction, cap maintenance, and groundwater monitoring is necessary. RP has been informed.

Comments: PRPs hired Fero Engineering to conduct Phase II investiga- tion and Phase III Remediation at the site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 05/05/1992
Comments: On April 28, 1992, DTSC received a referral from LA County Haz Mat Control Program. The County attempted several times to resolve problems at the site and finally recommended DTSC to enter arbitration proceedings to cleanup the site. The site is contaminated with heavy metals. Subsurface investigations indicate acidic soils with lead and total chromium above STLC. A PEA is required because of the documented evidence of contamination at the site.

Background Info:	The site is approximately 85' by 140' in size. The site was used as a plating shop from 1940 to 1991. The highest reported contaminants in soil are: total CR (42,400 mg/kg), CR VI (2300 mg/kg), and Pb (976 mg/kg). The site is currently devoid of any structures and is fenced and capped with asphalt. The primary land use to the northeast and east of the site is residential, to the north and west are commerical and light industrial, to the south across 56th Street is the Los Angeles Academy (Formerly known as the Jefferson New Middle School). The west half of the site is zoned M-1 and the eastern half is R-2.
	Not reported
	In 2002, DTSC obtained state funds to complete a Remedial Investigation/Feasibility Study and Risk Assessment for the Site. Fieldwork, which includes the installation of on and offsite groundwater monitoring wells will be completed in early 2003. Once the report and Risk Assessment are finalized a Remedial Action Plan will be developed to address the contamination at the Site.

Comments: NFA for DTSC due to local agency lead.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 05/12/1993
Comments: The Department received a notification from the current owner that a release of hazardous substance occurred at the site. The release occurred from underground storage tanks formerly located on the property. Evidence of contamination was discovered during recent testing of the soil in the former tank area, which is currently located under a concret slab. The USTs were removed prior to United Alloys's purchase of the property. Laboratory results indicated the presence of Trichlorethylene, TPH and low BTEX. Due to the evidence of contamination, staff recommends high priority PEA.

Completed Document Type: Site Screening
Completed Date: 05/12/1993
Comments: The Department received a notification from the current owner that a release of hazardous substance occurred at the site. The release occurred from underground storage tanks formerly located on the property. Evidence of contamination was discovered during recent testing of the soil in the former tank area, which is currently located under a concret slab. The USTs were removed prior to United Alloys's purchase of the property. Laboratory results indicated the presence of Trichlorethylene, TPH and low BTEX. Due to the evidence of contamination, staff recommends high priority PEA.

Quarterly Update:	This facility submitted an application for standardized permit (part A submittal) dated 12/7/93 to operate under interim status. on 3/7/94, DTSC sent a notice to facility denial to operate under interim status because facility was not engaged in operation as of 9/1/92 and thus could not qualify for interim status. The notice suggests that facility get a concent agreement to operate.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

APNS:	5104-026-005, 5104-026-006, 5104026005, 5104026006
Description:	Historic records indicate that a wire works and an iron and wire warehouse operated at the site from at least 1922 through the 1960s. The Site building was most recently used for nickel, copper, and chromium plating operations from the 1960s through 1990. The US-EPA Emergency Response Section performed a Site inspection and enforcement sampling on April 13, 2004 and a surface soils assessment on April 22, 2004. Removal activities were initiated on June 10 and were completed on June 16, 2004. Removal activities included removal of all wastes and containers from the building, removal of empty drums from the side yard on the east side of the building, removal of four to six inches of soil from the northern portion of the property, removal of a four-foot-square slab of concrete in the building, removal of any compromised concrete flooring in the plating area and sweeping of the floors. The site has been secured by chain-link fencing during the investigation and remediation phase. DTSC's investigation revealed elevated levels of metals: chromium ranging from 591 mg/kg to 49,700 mg/kg, copper from 1,065 mg/kg to 84,900 mg/kg, iron from 20,400 mg/kg to 108,000 mg/kg, lead ranging from 395 mg/kg to 3,715 mg/kg, nickel from 410 mg/kg to 44,500 mg/kg.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

SCH:

Name: CRES #16 SITE 3 5640004
Address: MAIN STREET/57TH STREET
City,State,Zip: LOS ANGELES, CA 90011
Facility ID: 60000097
Site Type: School Cleanup
Site Type Detail: School
Site Mgmt. Req.: NONE SPECIFIED
Acres: 3.18
National Priorities List: NO
Cleanup Oversight Agencies: SMBRP
Lead Agency: SMBRP
Lead Agency Description: DTSC - Site Cleanup Program
Project Manager: Amit Pathak
Supervisor: Shahir Haddad
Division Branch: Southern California Schools & Brownfields Outreach
Site Code: 304499
Assembly: 59
Senate: 30
Special Program Status: Voluntary Cleanup Program
Status: Certified
Status Date: 09/29/2008
Restricted Use: NO
Funding: School District
Latitude: 33.9902
Longitude: -118.273
APN: 5101-019-004, 5101-019-012, 5101-019-015, 5101-019-017, 5101-019-018, 5101-019-019, 5101-019-023, 5101-019-025, 5101-019-026
Past Use: MANUFACTURING - INDUSTRIAL MACHINERY
Potential COC: Arsenic, Lead, Tetrachloroethylene (PCE
Confirmed COC: Arsenic, Lead, Tetrachloroethylene (PCE
Potential Description: SOIL

Hazardous Waste Summary:
Waste Code: D007
Waste Description: CHROMIUM

Waste Code: F006
Waste Description: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS, EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC, AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste Code: F007
Waste Description: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
HAZARDOUS WASTE BIENNIAL REPORTER

Quarterly Update:	Inactive Facility. Facility stopped operating in 1988. Records validated, Liang Chiang, 11/1/05. The American Lab Inc. (ALI) facility consists of about acres located in the City of Los Angeles. It operated from 1976 until the facility closed in September 1988 managing spent mineral spirits/ kerosene, anti-freeze (ethylene glycol. These wastes were managed at a hazardous waste management unit (HWMU) under Interim Status Document (ISD) issued by the Department of Health Services, DTSC's predecessor agency, on November 19, 1985. On January 12, 1996, DTSC approved the ALI Closure Plan. DTSC subsequently received an August 8, 1997, Interim Closure Assessment Report (ICA) which identified volatile organic solvents (VOCs) were present in the HWMU. These included methylene chloride, tetrachloroethene (PCE), toluene, ethyl benzene, xylene, trichloroethene (TCE), and 1,1,1-trichloroethane (1,1,1-TCA). The ICA Report also identified three solid waste management units (SWMU) and one area of concern (AOC) that either had released or might release hazardous waste or hazardous constituents into the environment. These are (1) SWMU-1: Antifreeze Waste Storage Area; (2) SWMU-2: Antifreeze Waste process Area; (3) SWMU-3: Product Mixing Building; and (4) AOC-1: Sump at the southern corner of the mixing building. On September 28, 2000, DTSC issued an Enforcement Order for Corrective Action to ALI and other respondents. On February 15, 2005, DTSC and ALI entered into a Corrective Action Consent Agreement in which ALI would implement the CA investigations, Corrective Measure Study and

AMERICAN LABS INC (Continued) **1000360700**

the Remedy Selection and Implemented. On October 7, 2013, responsibilities for closure activities of the inactive regulated units at American Labs were transferred to Site Cleanup Program. Legal action is continuing with respect to the respondents.

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 11/19/2001
Comments: DTSC issued a Preliminary Endangerment Assessment determination, requiring further action at the proposed school site. Aprvd for public review.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 03/11/2003
Comments: The approximately 5-acre site was historically utilized for residential and light commercial properties, including an on-site carwash and clarifier, and an automotive repair shop with an underground storage tank (UST). Elevated levels of total petroleum hydrocarbons (TPH) were detected near the clarifier and the former UST; an isolated hit of benzene was also detected near the clarifier. Confirmation samples collected post-excavation indicated cleanup goals were achieved. Approximately 600 cubic yards of soil were removed and disposed of off-site (TPH 1,500 mg/kg AND benzene 12 mg/kg) when the DTSC-approved RAW was implemented.

Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 05/15/2002
Comments: CEQA and RAW approved. Implementation delayed until 12/02

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Report
Completed Date: 10/31/2003
Comments: DTSC approved the Supplemental Site Investigation (SSI) and determined neither an actual or a potential release of hazardous material, nor the presence of naturally occurring hazardous material indicated at the site pose a threat to human health or the environment under any land use. Therefore, DTSC concurred that no further environmental investigation or cleanup was required at this site, and approved the SSI. Lead-based paint, ACBM issues, UST removal issues.

AIR EMISSIONS CLASSIFICATION UNKNOWN
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/20/2021
Date Data Arrived at EDR: 11/05/2021
Date Made Active in Reports: 11/29/2021
Number of Days to Update: 24

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/20/2021
Date Data Arrived at EDR: 11/05/2021
Date Made Active in Reports: 11/29/2021

Next Scheduled EDR Contact: 01/10/2022
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/20/2021
Date Data Arrived at EDR: 11/05/2021
Date Made Active in Reports: 11/29/2021

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 05/25/2021
Date Data Arrived at EDR: 06/24/2021
Date Made Active in Reports: 09/20/2021
Number of Days to Update: 88

Telephone: 703-603-8704
Last EDR Contact: 10/01/2021
Next Scheduled EDR Contact: 01/10/2022
Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/20/2021
Date Data Arrived at EDR: 11/05/2021
Date Made Active in Reports: 11/29/2021

Data Release Frequency: Quarterly

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

CERS: CalEPA Regulated Site Portal Data

The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 07/23/2021

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

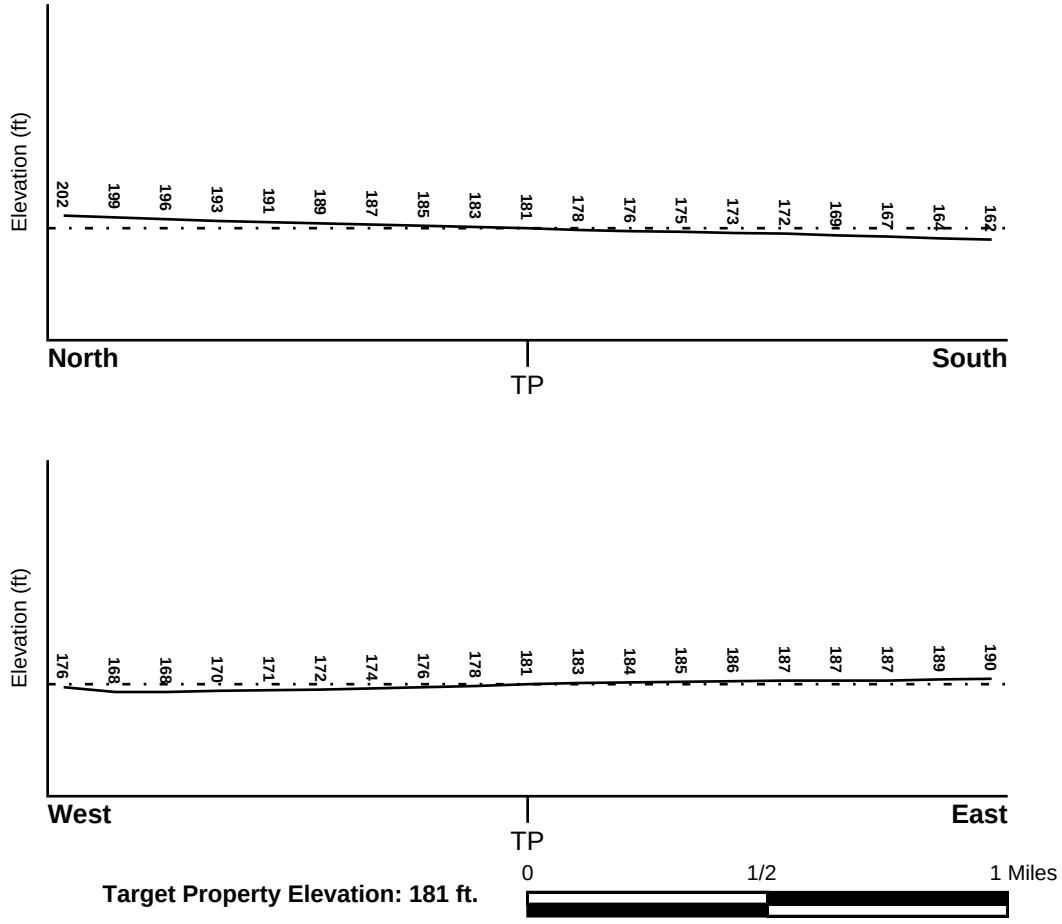
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 181 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1785F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06037C1620F	FEMA FIRM Flood data
06037C1638F	FEMA FIRM Flood data
06037C1805F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
INGLEWOOD	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
52	1/2 - 1 Mile North	Not Reported
1G	1/2 - 1 Mile North	Not Reported

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
loam
clay
silt loam
loamy sand
sandy loam
fine sand
clay loam
gravelly - sandy loam
coarse sand
gravelly - sand
sand

Surficial Soil Types:
loam
clay
silt loam
loamy sand
sandy loam
fine sand
clay loam
gravelly - sandy loam
coarse sand
gravelly - sand
sand

Shallow Soil Types:
fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types:
stratified
clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

PHYSICAL SETTING SOURCE RECORDS SEARCHED

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.
