Executive Summary

This air quality evaluation was prepared in accordance with the requirements of the California Environmental Quality Act (CEQA) to assess if any potentially significant air quality impacts are likely to occur in conjunction with the type and scale of development associated with the proposed Midway Rising Project (Project). This report was prepared in support of a Subsequent Environmental Impact Report (SEIR) for the Project that evaluates the potential for the Project to trigger new significant impacts and/or more severe impacts than those identified in the Midway-Pacific Highway Community Plan Update Revised Final Program Environmental Impact Report (Midway-Pacific Highway CPU PEIR). This analysis tiers from the analysis of air quality impacts in the Midway-Pacific Highway CPU PEIR.

The Project would result in criteria air pollutant emissions during both the construction and operational phases of the Project. Implementation of the Project would not conflict with or obstruct the implementation of the applicable San Diego County Air Pollution Control District (SDAPCD) Air Quality Plans. Emissions associated with construction of the Project would be temporary and would not exceed the screening level thresholds for criteria air pollutants. These impacts would be **Less than Significant**, consistent with the findings of the Midway-Pacific Highway CPU PEIR. The increase in operational air pollutant emissions associated with the Project would exceed the screening level threshold for volatile organic compound (VOC) emissions established by the SDAPCD. This impact would be **Less than Significant with Mitigation** with implementation of Mitigation Measure **AIR-1**.

Based on the screening process outlined in the Midway-Pacific Highway CPU PEIR, the Project would not result in a carbon monoxide (CO) hotspot. This impact would be **Less than Significant**, consistent with the findings of the Midway-Pacific Highway CPU PEIR. Construction of the Project would have the potential to result in excess cancer risk from diesel particulate matter (DPM) at nearby sensitive receptors. This impact would be **Less than Significant with Mitigation** with implementation of Mitigation Measure **AIR-2**. Implementation of a Soil Management Plan (SMP) would reduce risks related to contaminated soil and soil vapors to a less than significant level during construction. However, following construction, future site occupants may be exposed to the upward migration of VOCs in soil vapor. These impacts would be **Less than Significant with Mitigation** with implementation of Mitigation Measure **AIR-3**. The Project would not result in a source of significant odors, consistent with the findings of the Midway-Pacific Highway CPU PEIR. This impact would be **Less than Significant**.

Section 1 Project Description

1.1 Purpose of the Report

This report was prepared in accordance with the requirements of the California Environmental Quality Act (CEQA) (California Public Resources Code Section 21000 et seq.) and the CEQA Guidelines (California Code of Regulations, Title 14, Division 6, Chapter 3, Section 15000 et seq.). The redevelopment of the Project site was included in the evaluation of impacts in the Midway-Pacific Highway Community Plan Update Revised Final Program Environmental Impact Report (Midway-Pacific Highway CPU PEIR). Subsequently, revisions to the redevelopment plan for the Project site have been proposed; therefore, a Subsequent Environmental Impact Report (SEIR) is being prepared that evaluates the potential for the Project to trigger new significant impacts and/or more severe impacts than those identified in the Midway-Pacific Highway CPU PEIR. This analysis tiers from the analysis of air quality impacts in the Midway-Pacific Highway CPU PEIR, and the City of San Diego's City's CEQA Significance Determination Thresholds addressed in this report are the same as those addressed in the Midway-Pacific Highway CPU PEIR (City of San Diego 2016).

This report evaluates if any potentially significant air quality impacts would occur due to the type and scale of the Project development that would exceed the impacts identified for the Project site in the Midway-Pacific Highway CPU PEIR.

1.2 Project Location and Description

1.2.1 Project Location

The Project site is in the northernmost section of the Midway-Pacific Highway Community in San Diego, California. The Project site is south of Mission Bay; west of Mission Valley, Old Town, and Mission Hills; north of Liberty Station and the San Diego International Airport; and east of Ocean Beach and Point Loma. The Project site encompasses 52.07 acres of developed land and is generally bounded by Kurtz Street to the north, Sports Arena Boulevard to the south, Hancock Street to the northwest, and commercial properties to the west and east, east of Greenwood Street. The Project site includes the City-owned San Diego International Sports Arena (currently named Pechanga Arena) site (Assessor's Parcel Number [APN] 441-590-04) and three privately owned parcels along Kurtz Street (APNs 441-330-01, 441-330-11, and 441-330-12). Street addresses on the Project site include 3220, 3240, 3250, 3350, and 3500 Sports Arena Boulevard and 3467, 3487, and 3495 Kurtz Street. Regional transit corridors include Interstate (I-) 8 to the north, I-5 to the east, and the Old Town Transit Center offering bus and rail service (COASTER, Amtrak, and San Diego Metropolitan Transit System trolley) approximately 0.7 to 1 mile northeast of the Project. Refer to Figure 1, Regional Location, and Figure 2, Project Location.

The Project site is currently developed with the San Diego International Sports Arena, SOMA San Diego music venue, asphalt surface parking lots, a gasoline service station, restaurants, a lumber and home store, a thrift store, and various commercial/retail businesses (Figure 3, Existing Site Uses).

1.2.2 Previous Environmental Analysis

In 2018, the Midway-Pacific Highway CPU PEIR was certified. The Midway-Pacific Highway CPU PEIR analyzed environmental impacts associated with the 2018 Midway-Pacific Highway Community Plan (2018 Community Plan), including policies and recommendations related to a range of topics included in each section of the 2018 Community Plan, such as multimodal mobility, urban design, environmental conservation, recreation opportunities, neighborhood character, and historic preservation, in accordance with the general goals stated in the 2008 City of San Diego General Plan, as amended (2008 General Plan). The Midway-Pacific Highway CPU PEIR analyzed the redevelopment of the City-owned portion of the Project site with commercial retail, office, and residential uses. The privately owned parcels were identified for higher-density residential and commercial mixed use.

This report was prepared in support of an SEIR for the Project that evaluates the potential for the Project to trigger new significant impacts and/or more severe impacts than those identified in the Midway-Pacific Highway CPU PEIR. This analysis tiers from the analysis of air quality impacts in the Midway-Pacific Highway CPU PEIR. Tiering refers to using the analysis of general matters contained in a broader EIR with later EIRs on narrower projects, incorporating by reference the general discussions from the broader EIR and concentrating the later EIR solely on the issues specific to the later project.

1.2.3 Project Description

The Project proposes to redevelop the site with a mix of uses, including entertainment, retail, restaurant, residential, recreational, public, and park uses. Flexible zoning would allow for construction of a new on-site entertainment center or retention of the existing arena in its current location.

The Project includes the approval and implementation of the Midway Rising Specific Plan (Specific Plan), which provides guidance and direction on land use, development standards, site planning, building design, and landscape design, and centers on five key elements: housing, open space, entertainment, retail, and mobility. The Specific Plan would satisfy and incorporate the 2018 Community Plan's Supplemental Development Regulations to ensure that it furthers the 2018 Community Plan's vision for the site.

The Project would include up to 4,627 housing units, including affordable units, to provide a variety of housing opportunities and contribute toward improving housing affordability in the City. A central organizing element would be a network of park and public spaces consisting of approximately 15 acres that connects key land uses with each other and to the surrounding community. It is anticipated that outdoor events could be held in the park and public space areas on the Project site.

Figure 4, Illustrative Conceptual Site Map, shows an example for illustrative purposes only of how the park and public space network could be developed.

Land uses in the Specific Plan would be zoned Residential (RMX-2) and designated as Community Village, and development would be divided into two phases: Phase 1 would be located east of the planned roadway Frontier Drive (between Sports Arena Boulevard and Kurtz Street), and Phase 2 would be located west of Frontier Drive.

The Specific Plan would allow for entertainment uses across the entire Specific Plan Area and for the development of a multipurpose entertainment center that may host a range of activities. Consistent with the Project-specific transportation analysis prepared by Kimley-Horn Associates (2024a), the air quality analysis assumes that a new 380,550-square-foot, 16,000-seat entertainment center could be constructed and offer over 166 events per year, including but not limited to performing arts such as concerts, family shows, sporting events, motor sports, comedy, and musical and artistic entertainment productions. In addition, the privately owned parcels in the Specific Plan may include a theater along Kurtz Street that would host a series of events each year. It is assumed that the maximum capacity for this venue would be 3,500 spectators. The maximum event capacity for the Project site would be approximately 20,000 attendees, which could involve a combination of Project indoor and park and public space venues.

Mobility on the Project site would improve with the Project's construction of a multimodal circulation network of new and modified roadways, sidewalks, promenades, multi-use urban paths, and bicycle and pedestrian facilities. The Project would include on- and off-site mobility improvements to provide connections to the surrounding community and transit. The Specific Plan includes design standards for circulation, parking, buildings, and landscape to ensure that future development projects are implemented consistent with applicable design goals.

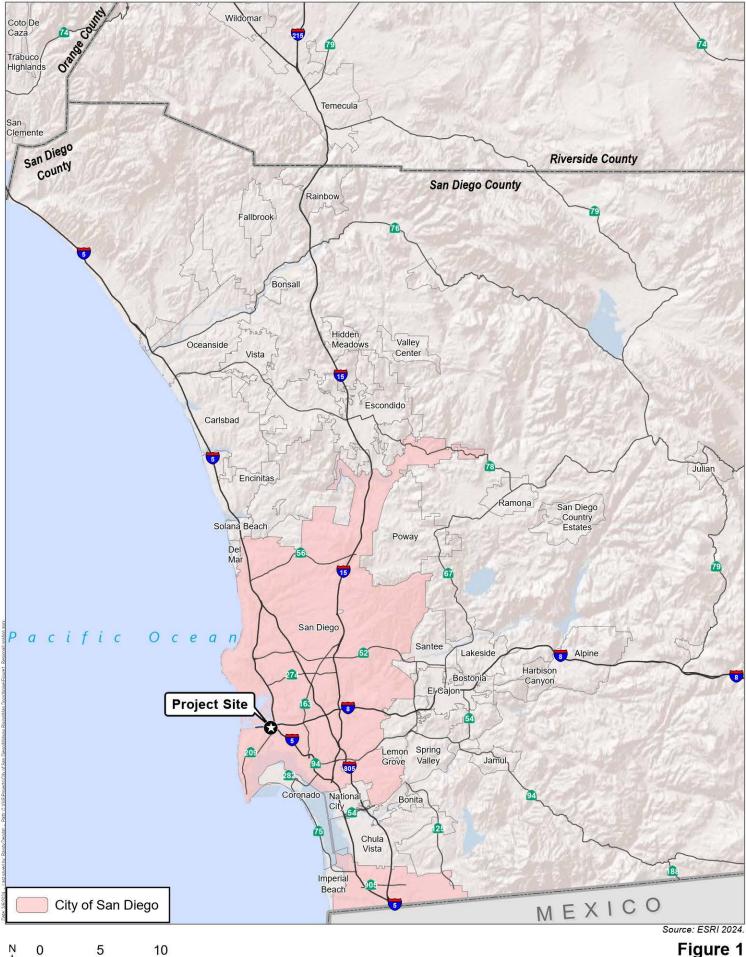

Sustainability would be an integral part of the Project, which would focus on sustainable design and Smart Growth to meet the City's 2022 Climate Action Plan goals. The Project would be in a geographic center of the City near and connected to transportation, jobs, housing, and regional park and public space.

The Project would include infrastructure improvements on the Project site and in the surrounding off-site areas, including extensions and/or upgrades of existing water, sewer, storm drain, drainage, roadways, bicycle facilities, transit, mobility, and pedestrian facilities. Heating, ventilation, and air conditioning equipment is anticipated to be in a mechanical yard on the northern side of the proposed entertainment center and would include approximately four air source heat pumps and three cooling towers surrounded by a 22-foot solid wall (Gensler 2023). Transportation improvements would be required within the Sports Arena Boulevard and Kurtz Street public rights-of-way (ROWs) for new multi-use urban paths and off site at the following roadway intersections:

- **Kurtz Street/Hancock Street Intersection:** Demolition and repaving for the construction of a new single-lane roundabout
- Sports Arena Boulevard/Midway Drive/West Point Loma Boulevard Intersection: All channelized right-turn lanes would be removed at the intersection of Sports Arena Boulevard and Midway Drive and West Point Loma Boulevard per the 2018 Community Plan. The southbound approach would be reconfigured to separate the existing southbound shared through/left-turn lane to include two left-turn lanes, one through lane, and one shared through/right-turn lane. The northbound approach would also be reconfigured to separate the existing shared through/left-turn lane to include two left-turn lanes, one through lane, and one shared through/right-turn lane. An eastbound through lane would be added by widening. Finally, the northbound and southbound signal timing would be modified to protected left-turn phasing. These improvements would require a traffic signal modification.
- **Hancock Street/Sports Arena Boulevard Intersection:** The eastbound approach would be restriped to extend the left-turn storage from 160 feet to 350 feet.
- Camino Del Rio/Sports Arena Boulevard/Rosecrans Street Intersection: Re-striping of roadways within the existing roadway ROW to modify the eastbound approach to include one left-turn lane, one shared through/left-turn lane, one slight right-turn lane, and one right-turn lane. These modifications would require a traffic signal modification.
- **Rosecrans Street/Lytton Street Intersection:** Re-striping of Lytton Street within the existing roadway ROW to include a second eastbound left-turn lane.
- West Drive/Future Frontier Drive/Sports Arena Boulevard Intersection: Signal timing optimization.
- Camino Del Rio West/Hancock Street Intersection: Signal timing optimization.
- Rosecrans Street/Midway Drive Intersection: Signal timing optimization.
- Barnett Avenue/Midway Drive Intersection: Signal timing optimization.

Construction of the Project is anticipated to occur from approximately January 2026 through December 2035 and would occur in two phases. Phase 1, proposed to occur from January 2026 to December 2029, would include Project site development of the planned Frontier Drive roadway and the area east of the planned Frontier Drive, including the entertainment center, approximately 1,242 residential units, approximately 100,888 square feet of commercial development, and park and public spaces, including The Square. The existing San Diego International Sports Arena would remain operational and be demolished following construction of the new entertainment center. Phase 2, proposed to occur from approximately October 2028 to December 2035, would include the construction of the remaining 3,385 residential units, approximately 39,112 square feet of commercial development, the park and public space development west of the proposed Frontier Drive, and the construction of Kemper Street between Sports Arena Boulevard and Kurtz Street. Both phases would include demolition of existing development, earthwork, installation of paving and building foundations, exterior building construction, and interior construction and application of

architectural coatings. Excavated soil would be stockpiled and reused on site to the extent feasible; however, truck trips would be required in each phase for demolition export, soil import and export, and building material import. A rock crusher would be used during Phase 2 to reuse some demolished material on site.

Section 2 Environmental Setting

The Midway-Pacific Highway Community planning area, including the Project site, is within the San Diego Air Basin (SDAB) of the San Diego County Air Pollution Control District (SDAPCD) (City of San Diego 2018a). The following sections summarize meteorological conditions on the Project site and in the surrounding area, as well as pollutants of concern for this analysis.

2.1 Climate and Meteorology

As described in the Midway-Pacific Highway CPU PEIR, the San Diego region, including the Project site, is influenced by its proximity to the Pacific Ocean and semi-permanent high-pressure systems that result in warm, dry summers and mild winters. The Midway-Pacific Highway Community planning area is subject to frequent offshore breezes. The mean annual temperature recorded at the closest monitoring location at the San Diego International Airport, near Downtown San Diego and Midway-Pacific Highway, is 64 degrees Fahrenheit (°F). The average annual precipitation for the area is approximately 10 inches, falling primarily from November through April. Winter mean low temperatures average 49°F, and summer mean high temperatures average 74°F (City of San Diego 2018a).

The dominant meteorological feature affecting the region is the Pacific High Pressure Zone, which produces the prevailing westerly to northwesterly winds. The high-pressure cell creates subsidence inversions, also known as temperature inversions, which occur during the warmer months as descending air associated with the Pacific high-pressure cell encounters cool marine air. The boundary between the two layers of air creates a temperature inversion that traps pollutants. In addition, the region experiences daytime onshore flow and nighttime offshore flow, which leads to emissions being blown out to sea at night and returning to land the following day. Under certain conditions, this atmospheric oscillation results in the offshore transportation of air and pollutants from the Los Angeles region to the County of San Diego (County), which typically results in higher ozone (O₃) concentrations being measured in the County (County of San Diego 2007).

2.2 Air Pollutants

Historically, air quality laws and regulations have divided air pollutants into two broad categories: criteria air pollutants and toxic air contaminants (TACs). Criteria air pollutants are a group of common air pollutants regulated by the federal and state governments by means of ambient standards based on criteria regarding health and environmental effects of pollution. TACs are pollutants with the potential to cause significant adverse health effects. The U.S. Environmental Protection Agency (USEPA) and the California Air Resources Board (CARB) adopted air quality standards for criterial pollutants to protect health and the environment, as described in Section 3, Regulatory Framework. In California, CARB identifies exposure thresholds for TACs that indicate levels below which no significant adverse health effects are anticipated from individual exposure to the identified substance. However, no

thresholds are specified for TACs found to have no safe exposure level or where insufficient data are available to identify an exposure threshold (CARB 2025a).

2.2.1 Criteria Air Pollutants

The criteria air pollutants pertinent to the analysis in this report are CO, nitrogen oxides (NO_x), O_3 , particulate matter, and sulfur dioxide (SO_2). The following describes the health effects for each of these criteria air pollutants. Lead is also a criteria air pollutant. Emissions from lead typically result from industrial processes such as ore and metals processing and leaded aviation gasoline (USEPA 2024a). These sources are not proposed as part of the Project; therefore, lead emissions are not included in this analysis.

Carbon Monoxide (CO). CO is a colorless, odorless, poisonous gas produced by combustion processes, primarily mobile sources. When CO gets into the body, it combines with chemicals in the blood and prevents blood from providing oxygen to cells, tissues, and organs. Because the body requires oxygen for energy, high-level exposure to CO can cause serious health effects, including death (USEPA 2024b).

Nitrogen Oxides (NO_x). NOx is a general term pertaining to compounds including nitric oxide, nitrogen dioxide (NO₂), and other oxides of nitrogen. NO_x is produced from burning fuels, including gasoline, diesel, and coal. NO_x reacts with volatile organic compounds (VOCs) to form ground-level O_3 (smog). NO_x is linked to a number of adverse respiratory systems effects (USEPA 2024c).

Ozone (O_3). Ground-level O_3 is not emitted directly into the air but is formed by chemical reactions of "precursor" pollutants (NO_x and VOCs) in the presence of sunlight. Major emissions sources include NO_x and VOC emissions from industrial facilities and electric utilities, motor vehicle exhaust, gasoline vapors, and chemical solvents. O_3 can trigger a variety of health problems, particularly for sensitive receptors, including children, older adults, and people of all ages who have lung diseases, such as asthma (USEPA 2024d).

Particulate Matter (PM₁₀ and PM_{2.5}). Particulate matter includes dust, metals, organic compounds, and other tiny particles of solid materials that are released into and move around in the air. Particulates are produced by many sources, including the burning of diesel fuels by trucks and buses, industrial processes, and fires. Particulate pollution can cause nose and throat irritation and heart and lung problems. Particulate matter is measured in microns, which are 1 millionth of 1 meter in length (or 1 thousandth of 1 millimeter). PM₁₀ is small (i.e., respirable) particulate matter measuring no more than 10 microns in diameter, while PM_{2.5} is fine particulate matter measuring no more than 2.5 microns in diameter (CARB 2025b).

Sulfur Dioxide (SO₂). SO_2 is formed primarily by the combustion of sulfur-containing fossil fuels, especially at power plants and industrial facilities. SO_2 is linked to a number of adverse effects on the respiratory system (USEPA 2025).

2.2.2 Toxic Air Contaminants

The two primary emissions of concern regarding health effects for land development projects are CO and diesel particulate matter (DPM). The health effects of CO are described in Section 2.2.1, Criteria Air Pollutants. DPM is a mixture of many exhaust particles and gases that is produced when an engine burns diesel fuel. Compounds found in diesel exhaust are carcinogenic. Some short-term (acute) effects of diesel exhaust exposure include eye, nose, throat, and lung irritation and headaches and dizziness. Long-term exposure is linked to the increased risk of cardiovascular, cardiopulmonary, and respiratory disease and lung cancer (OSHA 2013).

Section 3 Regulatory Framework

This section summarizes the applicable federal, state, regional, and local regulations related to air quality.

3.1 Federal

The following federal regulations are applicable to the analysis of the Project.

3.1.1 Clean Air Act

The Clean Air Act (CAA) of 1970 is the comprehensive federal law that regulates air emissions from stationary and mobile sources. The CAA authorizes the USEPA to establish National Ambient Air Quality Standards (NAAQS) to protect public health and public welfare and to regulate emissions of hazardous air pollutants. Current NAAQS are listed in Table 1, State and Federal Ambient Air Quality Standards. The USEPA classifies air basins (or portions of air basins) as being in "attainment," "non-attainment," or "unclassified" for each criteria air pollutant based on whether the NAAQS have been achieved. If an area is designated as unclassified, it is because inadequate air quality data was available as a basis for a non-attainment or attainment designation. The USEPA classifies the SDAB as in attainment for the federal CO, NO₂, lead, PM_{2.5}, and SO₂ standards. It is unclassifiable for PM₁₀ with respect to the NAAQS. The SDAB is classified as in moderate non-attainment for O₃. Table 2, San Diego Air Basin Attainment Status, lists the attainment status of the SDAB for the criteria air pollutants.

Table 1. State and Federal Ambient Air Quality Standards

	Averaging	State Standards ^a	Federal Standards ^b		
Pollutant	Time	Concentration ^c	Primary ^{c, d}	Secondary ^{c, e}	
O ₃ f	1-hour	0.09 ppm (180 μg/m³)	_	Same as primary standards	
	8-hour	0.070 ppm (137 μg/m³)	0.070 ppm (137 μg/m³)		
PM ₁₀ ^g	24-hour	50 μg/m³	150 μg/m³	Same as primary

	1-hour	0.25 ppm (655 μg/m³)	75 ppb (196 μg/m³)	_	
Lead ^{j, k}	30-day average	1.5 μg/m³	_	_	
	Calendar quarter	_	1.5 μg/m³ (for certain areas)	Same as primary standard	
	Rolling 3- month average ^g	_	0.15 μg/m³		
Visibility-reducing particles ^l	8-hour	See note l	No federa	l standards	
Sulfates	24-hour	25 μg/m³	No federa	l standards	
Hydrogen sulfide	1-hour	0.03 ppm (42 μg/m ³)	No federal standards		
Vinyl chloride ^j	24-hour	0.01 ppm (26 µg/m³)	No federa	l standards	

Source: CARB 2016, USEPA 2024e.

Notes: μ g/m³ = micrograms per cubic meter; CO = carbon monoxide; mg/m³ = micrograms per cubic meter; NO₂ = nitrogen dioxide; O₃ = ozone; PM₁₀ = respirable particulate matter; PM₂.₅ = fine particulate matter; ppb = parts per billion; ppm = parts per million; SO₂ = sulfur dioxide

^a State standards for O₃, CO, SO₂ (1-hour and 24-hour), NO₂, PM₁₀, PM_{2.5}, and visibility-reducing particles are values that are not to be exceeded. The standards for sulfates, lead, hydrogen sulfide, and vinyl chloride standards are not to be equaled

- or exceeded. California Ambient Air Quality Standards (CAAQS) are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
- Federal standards (other than O₃, particulate matter, and those based on annual averages) are not to be exceeded more than once per year. The O₃ standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM₁₀, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 μg/m³ is equal to or less than 1. For PM_{2.5}, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact the USEPA for further clarification and current national policies.
- ^c Concentration is first expressed in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25 degrees Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
- d National Primary Standards: The levels of air quality necessary with an adequate margin of safety to protect the public health.
- ^e National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
- f On October 1, 2015, the federal 8-hour O₃ primary and secondary standards were lowered from 0.075 to 0.070 ppm.
- In March 2024, the national annual PM_{2.5} primary standard was lowered from 12 μ g/m³ to 9 μ g/m³. The existing national 24-hour PM_{2.5} standards (primary and secondary) were retained at 35 μ g/m³, as was the annual secondary standard of 15 μ g/m³.
- ^h To attain the 1-hour federal standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of ppb. State standards are in units of ppm. To directly compare the national 1-hour standard to the state standards, the units can be converted from ppb to ppm. In this case, the federal standard of 100 ppb is identical to 0.100 ppm.
- ¹ On June 2, 2010, a new 1-hour SO₂ standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour federal standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO₂ federal standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated non-attainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
 - Note that the 1-hour federal standard is in units of ppb. State standards are in units of ppm. To directly compare the 1-hour federal standard to the state standard, the units can be converted to ppm. In this case, the federal standard of 75 ppb is identical to 0.075 ppm.
- CARB had identified lead and vinyl chloride as TACs with no determined threshold level of exposure for adverse health effects. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
- The federal standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 μg/m³ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated non-attainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
- In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe Air Basin 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Table 2. San Diego Air Basin Attainment Status

Pollutant	Averaging Time	State Standards	Federal Standards	
O ₃	1-hour	Non-attainment	Attainment	
	8-hour		Non-attainment	
PM ₁₀	Annual arithmetic mean	Non-attainment	No federal standard	
	24-hour		Unclassified ^a	
PM _{2.5}	Annual arithmetic mean	Non-attainment	Attainment	
	24-hour	No state standard		
CO	8-hour	Attainment	Attainment	
	1-hour			
NO ₂	Annual arithmetic mean	No state standard	Attainment	
	1-hour	Attainment	No federal standard	
Lead	Calendar quarter	No state standard	Attainment	
	30-day average	Attainment	No federal standard	
	Rolling 3-month average	No state standard	Attainment	
SO ₂	Annual arithmetic mean	No state standard	Attainment	
	24-hour	Attainment	Attainment	
	1-hour	Attainment	No federal standard	
Sulfates	24-hour	Attainment	No federal standard	
Hydrogen sulfide	1-hour	Unclassified	No federal standard	
Visibility-reducing particulates	8-hour (10:00 a.m. to 6:00 p.m. [PT])	Unclassified	No federal standard	

Source: SDAPCD 2025.

Notes: CO = carbon monoxide; NO_2 = nitrogen dioxide; O_3 = ozone; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SO_2 = sulfur dioxide

3.1.2 Resource Conservation and Recovery Act

Federal hazardous waste laws are largely promulgated under the Resource Conservation and Recovery Act (RCRA) (40 CFR, Part 260), as amended by the Hazardous and Solid Waste Amendments of 1984 (which are primarily intended to prevent releases from leaking underground storage tanks). These laws provide for the "cradle to grave" regulation of hazardous wastes. Specifically, under

^a "Unclassified" indicates data are not sufficient for determining attainment or non-attainment.

RCRA, any business, institution, or other entity that generates hazardous waste is required to identify and track its hazardous waste from the point of generation until it is recycled, reused, or disposed of. The USEPA has the primary responsibility for implementing the RCRA, although individual states can obtain authorization to implement some or all RCRA provisions.

3.1.3 Hazardous Materials Transportation Act

The U.S. Department of Transportation regulates hazardous materials transportation under Title 49 of the Code of Federal Regulations, which requires the U.S. Department of Transportation Office of Hazardous Materials Safety to generate regulations for the safe transportation of hazardous materials.

3.2 State

The following state regulations are applicable to the analysis of the Project.

3.2.1 California Ambient Air Quality Standards

CARB is part of the California Environmental Protection Agency and is responsible for the coordination and administration of both federal and state air pollution control programs in California. The CAA allows states to adopt ambient air quality standards and other regulations provided that they are at least as stringent as federal standards. California has adopted ambient standards, the California Ambient Air Quality Standards (CAAQS), that are equal to or stricter than the federal standards for six criteria air pollutants. The CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations and are provided in Table 1. Similar to the CAA, areas have been designated as attainment, non-attainment, or unclassified with respect to the state ambient air quality standards. The SDAB is in non-attainment with the CAAQS for O₃, PM₁₀, and PM_{2.5}. The SDAB is designated as an attainment area for the state CO, NO₂, SO₂, lead, and sulfates standards. Hydrogen sulfide and visibility-reducing particles are unclassified in the SDAB.

3.2.2 California Air Toxics Program

In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health (AB 1807: Health and Safety Code Sections 39650–39675). The California Legislature established a two-step process to address the potential health effects from TACs. The first step is the risk assessment (or identification) phase. The second step is the risk management (or control) phase of the process.

The California Air Toxics Program establishes the process for the identification and control of TACs and includes provisions to make the public aware of significant toxic exposures and for reducing risk. Additionally, the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987, Connelly Bill) was enacted in 1987 and requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, ascertain health risks, notify nearby

residents of significant risks, and reduce those significant risks to acceptable levels. The Children's Environmental Health Protection Act, California Senate Bill 25 (Chapter 731, Escutia, Statutes of 1999), focuses on children's exposure to air pollutants. The Air Toxics "Hot Spots" Information and Assessment Act requires CARB to review its air quality standards from a children's health perspective, evaluate the statewide air monitoring network, and develop any additional air toxic control measures needed to protect children's health. Locally, toxic air pollutants are regulated through the SDAPCD's Regulation XII.

Of particular concern statewide are DPM emissions. DPM was established as a TAC in 1998 and is estimated to represent the majority of the cancer risk from TACs statewide (based on the statewide average). Diesel exhaust is a complex mixture of gases, vapors, and fine particles. This complexity makes the evaluation of health effects of diesel exhaust a complex scientific issue. Some of the chemicals in diesel exhaust, such as benzene and formaldehyde, have been previously identified as TACs by CARB and are listed as carcinogens under California's Proposition 65 or under the Federal Hazardous Air Pollutants program.

Following the identification of DPM as a TAC in 1998, CARB has worked on developing strategies and regulations aimed at reducing the risk from DPM. The overall strategy for achieving these reductions is found in the Risk Reduction Plan to Reduce Particulate Matter Emissions from diesel-fueled engines and vehicles (State of California 2000). A stated goal is to reduce the cancer risk from exposure to DPM statewide by 85 percent by 2020 (City of San Diego 2018a).

3.2.3 State Implementation Plan

The CAA requires states to develop a plan to attain and maintain the NAAQS in all areas of the country and a Specific Plan to attain the standards for each area designated as non-attainment for the NAAQS. These plans, known as State Implementation Plans (SIPs), are developed by state and local air quality management agencies and submitted to the USEPA for approval. SIPs include strategies and control measures to attain the NAAQS by deadlines established by the CAA. SIPs are modified periodically to reflect the latest emissions inventories, plans, and rules and regulations of air basins as reported by the agencies with jurisdiction over them. The SDAPCD is responsible for preparing and implementing the portion of the SIP applicable to the SDAB. The SDAPCD adopts rules, regulations, and programs to attain state and federal air quality standards, and appropriates money (including permit fees) to achieve these objectives. As mentioned previously, the County is currently designated as a non-attainment area for the 8-hour O₃ NAAQS. The SDAPCD prepared and submitted its Ozone Attainment Plan (i.e., 2020 Plan) in January 2021. The plan is currently being reviewed by the USEPA.

3.2.4 California Code of Regulations

Most state and federal regulations and requirements that apply to generators of hazardous waste are codified in California Code of Regulations, Title 22, Division 4.5. Title 22 contains detailed compliance

requirements for hazardous waste generation, transportation, treatment, storage, and disposal facilities. Because California is a fully authorized state under the RCRA, most RCRA regulations are integrated into Title 22. The California Environmental Protection Agency and California Department of Toxic Substances Control regulate hazardous waste more stringently than the USEPA through Title 22, which does not include as many exemptions or exclusions as the equivalent federal regulations. Similar to the California Health and Safety Code, Title 22 also regulates a wider range of waste types and waste management activities than the RCRA does. The state has compiled a number of additional regulations from various California Code of Regulations titles related to hazardous materials, wastes, and toxics into California Code of Regulations, Title 26 (Toxics), and provides additional related guidance in Titles 23 (Waters) and 27 (Environmental Protection), although California hazardous waste regulations are still commonly referred to as Title 22.

3.2.5 Hazardous Materials Transportation

The California Highway Patrol and California Department of Transportation are the state agencies with primary responsibility for enforcing federal and state regulations and responding to hazardous materials transportation emergencies. These agencies also govern permitting for hazardous materials transportation within the state.

3.2.6 Air Quality and Land Use Handbook: A Community Health Perspective

CARB has also developed the Air Quality and Land Use Handbook: A Community Health Perspective to provide guidance on land use compatibility with sources of TACs (CARB 2005). These sources include freeways and high-traffic roads, commercial distribution centers, rail yards, refineries, dry cleaners, gasoline stations, and industrial facilities. The handbook is not a law or adopted policy but offers advisory recommendations for the siting of sensitive receptors near uses associated with TACs and odors. The handbook indicates that land use agencies have to balance a number of other considerations, including housing and transportation needs, economic development priorities, and other quality of life issues.

3.3 Regional

The following regional plans and regulations are applicable to the analysis of the Project. The SDAPCD has jurisdiction over air quality programs in the City. State and local government projects, as well as projects proposed by the private sector, are subject to the SDAPCD requirements if the sources are regulated by the SDAPCD.

3.3.1 Regional Air Quality Strategy

CARB requires air districts to attempt, achieve, and maintain the state ambient air quality standards by the earliest practicable date. To this end, districts are required to develop plans for attaining the

CAAQS. A regional air quality strategy (RAQS) was initially adopted by the SDAPCD in 1992 and has generally been updated on a triennial basis in accordance with state requirements. The SDAPCD most recently adopted the 2022 Revision of the RAQS for San Diego County (SDAPCD 2023). The RAQS was developed pursuant to California CAA requirements and identifies feasible emission control measures to provide progress toward attaining the state O₃ standard in the County. The pollutants addressed are VOCs and NOx, which are precursors to the photochemical formation of O₃ (the primary component of smog). Reductions in greenhouse gases and particulate matter are indirectly addressed. The RAQS control measures focus on emission sources under the SDAPCD's authority, specifically stationary emission sources (such as power plants and manufacturing and industrial facilities) and some area-wide sources (such as water heaters, architectural coatings, and consumer products). However, the emissions inventories and projections in the RAQS reflect the impact of all emissions sources and control measures, including those under the jurisdiction of CARB (on-road and off-road motor vehicles) and the USEPA (aircraft, ships, and trains). Thus, while legal authority to control various pollution sources is divided among agencies, the SDAPCD is responsible for reflecting federal, state, and local measures in a single plan to achieve state O₃ standards in the County.

3.3.2 Measures to Reduce Particulate Matter in the County of San Diego

Neither the RAQS nor the SIP address emissions of particulate matter in the SDAB. The SDAPCD prepared the Measures to Reduce Particulate Matter in San Diego County in December 2005. The report identifies existing federal, state, and local measures to control particulates in the SDAB and outlines potential measures for particulate matter control that the SDAPCD may further evaluate for future rule adoption. The report does not outline a plan for ambient air quality standards compliance that the Project would need to implement or demonstrate compliance with. As such, the report is not discussed further in this analysis.

3.3.3 San Diego County Air Pollution Control District Rules

The SDAPCD is also responsible for establishing and enforcing local air quality rules and regulations that address the requirements of federal and state air quality laws. Development projects within the County may be subject to the following SDAPCD rules (as well as others):

- **Rule 51, Nuisance:** Prohibits emissions that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; or that endanger the comfort, repose, health, or safety of any such persons or the public; or that cause injury or damage to business or property.
- Rule 52, Particulate Matter: Establishes limits to the discharge of any particulate matter from non-stationary sources.
- **Rule 54, Dust and Fumes:** Establishes limits to the amount of dust or fume discharged into the atmosphere in any 1 hour.
- **Rule 55, Fugitive Dust Control:** Sets restrictions on visible fugitive dust from construction and demolition projects.

• **Rule 67, Architectural Coatings:** Establishes limits to the VOC content for coatings applied within the SDAPCD.

In addition, Rule 1200 applies to any new, relocated, or modified emission unit that may increase emissions of one or more TAC. Rule 1210 implements the public notification and risk reduction requirements of the state Air Toxics "Hot Spots" Information and Assessment Act and requires facilities to reduce risks to acceptable levels within 5 years.

3.4 Local

The following local regulations are applicable to this analysis.

3.4.1 2008 City of San Diego General Plan

The Conservation Element of the 2008 City of San Diego General Plan, as amended, contains policies to guide the conservation of resources that are fundamental components of San Diego's environment, help define the City's identity, and are relied upon for continued economic prosperity. San Diego's resources include but are not limited to water, land, air, biodiversity, minerals, natural materials, recyclables, topography, views, and energy. The Conservation Element contains policies for City action designed to support regional air quality that meets federal and state standards and to reduce greenhouse gas emissions (2008 General Plan). The policies include City action for sustainable land use patterns, increased fuel and energy efficiency, improved air quality in City buildings, habitat conservation, encouraging of the use of alternative fuels, and limiting of unnecessary idling of equipment operated by the City. The policies do not include requirements applicable to individual projects.

Recent amendments to the 2008 General Plan, including the Conservation Element, were adopted in July 2024 as a part of a refresh to the 2008 General Plan (Blueprint SD). The amendment to the Conservation Element was adopted after the after the issuance of the Notice of Preparation for the Project (December 2023) and is noted for information only.

3.4.2 2018 City of San Diego Midway-Pacific Highway Community Plan

The Conservation Element of the 2018 Community Plan includes policies to protect public health from vehicle exhaust pollutants. Applicable policies include the following (City of San Diego 2018b):

- **CE-4.1:** Consider air quality and air pollution sources in the siting, design, and construction of residential development and other development with sensitive receptors.
- CE-4.2: Incorporate building features into new buildings with residential units and other sensitive receptors located within 500 feet of the outside freeway travel lane to reduce the effects of air pollution.

City of San Diego Off-Site Development Impact Regulations

Section 142.0710 of the San Diego Municipal Code (SDMC), Air Contaminant Regulations, prohibits air contaminants including smoke, charred paper, dust, soot, grime, carbon, noxious acids, toxic fumes, gases, odors, and particulate matter, or any emissions that endanger human health, cause damage to vegetation or property, or cause soiling to emanate beyond the boundaries of the premises upon which the use emitting the contaminants is located.

Section 4 Existing Air Quality

The following section describes ambient air quality on the Project site and in the surrounding area.

4.1 Air Quality Monitoring Data

Air quality at a particular location is a function of the kinds, amounts, and dispersal rates of pollutants being emitted into the air locally and throughout the basin. The major factors affecting pollutant dispersion are wind speed and direction, the vertical dispersion of pollutants (which is affected by inversions), and the local topography.

Air quality is commonly expressed as the number of days in which air pollution levels exceed state standards set by the CARB or federal standards set by the USEPA. The SDAPCD maintains 11 air quality monitoring stations throughout the greater San Diego metropolitan region. Air pollutant concentrations and meteorological information are continuously recorded at these 11 stations. Measurements are then used by scientists to help forecast daily air pollution levels (City of San Diego 2018a).

The closest air quality monitoring station to the Project site that monitors O_3 , $PM_{2.5}$, and NO_x is the Sherman Elementary School station, approximately 6 miles from the Project site. Table 3, Air Quality Monitoring Data, presents a summary of the highest pollutant concentrations monitored during the 3 most recent years (2020 through 2022) for which the SDAPCD has reported data for the station. No CO data is available from any monitoring site in the SDAB after 2012, no SO_2 data is available after 2013, and no PM_{10} data is available after 2019.

Table 3. Air Quality Monitoring Data

Pollutant	Monitoring Station	2020	2021	2022
	O ₃			
Maximum 1-hour concentration (ppm)	San Diego –	0.115	0.076	0.087
Days above 1-hour state standard (>0.09 ppm)	Sherman Elementary School	2	0	0
Maximum 8-hour concentration (ppm)	3011001	0.088	0.063	0.063
Days above 8-hour state standard (>0.07 ppm)		3	0	0
Days above 8-hour federal standard (>0.075 ppm)		3	0	0

Table 3. Air Quality Monitoring Data

Pollutant	Monitoring Station	2020	2021	2022
	PM _{2.5}			
Peak 24-hour concentration (μg/m³)	- San Diego –	51.9	25.6	20.8
Days above federal standard (>35 μg/m ³)	Sherman Elementary School	6	0	0
	NO ₂			
Peak 1-hour concentration (ppm)	- San Diego –	53	54	53.8
Days above state 1-hour standard (0.18 ppm)	Sherman Elementary School	0	0	0

Source: CARB 2025c.

Notes: μ g/m³ = micrograms per cubic meter; NO₂ = nitrogen dioxide; O₃ = ozone; PM₂.₅ = fine particulate matter; ppm = parts per million

As shown in Table 3, the 1-hour O_3 concentration exceeded the state standard twice in 2020, and no violations occurred in 2021 or 2022. The 8-hour O_3 concentration exceeded both the state and federal standards in 2020, but no violations occurred in 2021 or 2022. The federal 24-hour $PM_{2.5}$ standard was violated for 6 days in 2020 but was not exceeded in 2021 or 2022. Neither the state nor federal standards for NO_2 were exceeded from 2020 through 2022.

4.2 Regional Background Toxic Air Pollutants

As reported in the Midway-Pacific Highway CPU PEIR, data from the SDAPCD monitoring stations in El Cajon and Chula Vista indicated that the background cancer risk in 2008 due to air toxics was 135 in 1 million in Chula Vista and 150 in 1 million in El Cajon. There is no current methodology for directly measuring DPM concentrations. Based on CARB estimates, DPM emissions could add an additional 420 in 1 million to the ambient cancer risk levels in the County. Thus, the combined background ambient cancer risk due to air toxins in the urbanized areas of the County could potentially range from around 555 to 570 in 1 million (City of San Diego 2018a). As such, DPM is the air toxin of primary concern on a regional basis.

4.3 Existing Site Emissions

The Project site is currently a source of criteria air pollutant emissions from operation of existing commercial and entertainment land uses. Existing emissions from area (consumer products and landscaping) and energy demand (natural gas use) were calculated using the California Emissions Estimator Model (CalEEMod) based on default assumptions, as described in Section 5, Methods and

Significance Criteria. Stationary equipment includes emergency generators, as described in Section 5. Table 4, Existing Site Operation Emissions (pounds/day), provides estimated existing emissions from site operation. As described in Section 5, the Project's impact on regional emissions related to vehicle emissions is based on its impact on Citywide vehicle miles traveled (VMT). Existing daily Citywide VMT is 36,786,770 (Kimley-Horn 2024c). Existing vehicle emissions were estimated using the CARB Emissions Factor (EMFAC) model and are provided in Table 4.

Table 4. Existing Site Operation Emissions (pounds/day)

Pollutant	VOC	NOx	СО	SO ₂	PM ₁₀	PM _{2.5}
Area	13.6	0.16	19.4	<0.005	0.03	0.03
Energy	0.13	2.31	1.94	0.01	0.18	0.18
Stationary	1.64	7.34	4.18	0.01	0.24	0.24
Total Site Emissions	15.37	9.81	25.52	0.02	0.45	0.45
Citywide Mobile Emissions	22,444	42,942	207,304	358	2,403	1,176

This page intentionally left blank.

Section 5 Methods and Significance Criteria

The methods and significance criteria applicable to each analysis issue are described in this section. This analysis tiers from the analysis of air quality impacts in the Midway-Pacific Highway CPU PEIR. As such, the City of San Diego CEQA Significance Determination Thresholds addressed in this report are the same as those addressed in the Midway-Pacific Highway CPU PEIR (City of San Diego 2016). This report follows the Midway-Pacific Highway CPU PEIR. However, a more detailed analysis that incorporates Project-specific information is provided, as described below.

5.1 Methods

This section describes the methods used for each issue topic.

5.1.1 Consistency with Regional Air Quality Plans

The plans applicable to the Project are the SDAPCD RAQS and the SIP. The SDAPCD relies on information from CARB and the San Diego Association of Governments (SANDAG), including projected growth in the County and mobile, area, and all other source emissions, to project future emissions and to develop appropriate strategies for the reduction of source emissions through regulatory controls. The majority of regional emissions (62 percent) result from motor vehicle emissions. These emissions are primarily reduced through emissions standards, which are established by CARB, and further reduced at the air district level through incentive programs to encourage the use of alternative transportation and VMT reduction (SDAPCD 2023). Because of the limited jurisdiction that the SDAPCD has over mobile source emissions and even smaller control that individual projects have on influencing the public's ultimate use of motor vehicles, compliance with the RAQS is based on if an individual project would comply with the emissions projections in the plan. Reduction strategies are applied to the region as a whole and determined to be adequate or not to meet the NAAQS based on the regional emissions projections. A project that proposes growth that exceeds planned growth assumptions would potentially conflict with the RAQS and SIP because it would potentially result in mobile source emissions that would exceed the projected emissions inventory.

5.1.2 Ambient Air Quality Standards

Daily air pollutant emissions during construction were estimated using the assumed worst-case activity data and the emission factors included in CalEEMod, Version 2022.1.1.22. Construction of the Project in anticipated to occur in two phases from approximately January 2026 through December 2035. Phase 1 would occur from January 2025 to December 2030 and would include development east of Frontier Drive, including the new entertainment center, and mixed-use buildings. Phase 2 would occur from October 2028 to December 2035 and include development of the remaining mixed-use buildings and park and public space west of Frontier Drive. Although development in this area is considered part of development of Phase 2, two separate construction schedules are anticipated

within construction of Phase 2. For this analysis, construction west of Frontier Drive to Kemper Street is referred to as Phase 2a, and construction west of Kemper Street in referred to as Phase 2b.

All phases would include demolition of existing development, earthwork, installation of paving and building foundations, exterior building construction, and interior construction and application of architectural coatings. Excavated soil would be stockpiled and reused on site to the extent feasible; however, truck trips would be required in each phase for demolition export, soil import and export, and building material import. In addition to on-site development, off-site construction would be required within the Sports Arena Boulevard and Kurtz Street public ROWs for new multi-use urban paths and on the roadway intersections as detailed in Section 1.2.3, Project Description.

Anticipated construction schedule equipment fleet and fuel type, worker and truck trip estimates, and demolition and haul quantities were developed for the Project and provided by the Project applicant (AECOM 2023a, 2024). Assumptions for construction schedule, material quantities, and worker and truck trips are summarized in Table 5, Construction Assumption Summary. The assumed construction fleet is summarized in Table 6, Anticipated Construction Equipment. Truck trips were assumed to be 25 miles each way, with the exception of hazardous materials. Hazardous materials are assumed to be hauled to Yuma, Arizona, approximately 175 miles from the site. Detailed modeling inputs are provided in Appendix A, CalEEMod Modeling Data. The analysis assumed that standard dust and emission control during grading and demolition operations would be implemented to reduce potential nuisance impacts and to ensure compliance with SDAPCD Rule 50 (Visible Emissions), Rule 51 (Nuisance), and Rule 55 (Fugitive Dust Control). Watering exposed surfaces twice daily is assumed in modeling.

Table 5. Construction Assumption Summary

				Average	Haul/Ve	ndor Trucks
Construction Activity	Start Date	Total Working Days	Demolition/Earthwork Material Movement Quantity	Daily Worker Trips	Total Number of Trucks	Average Daily One-Way Truck Trips
	•	Phas	se 1 (East of Frontier Drive)

Operational emissions for the Project and existing land uses were also estimated using CalEEMod, with the exception of vehicle emissions. It is assumed that proposed buildings would be all-electric, except for commercial kitchens and emergency generators. Default natural gas use is assumed for restaurant uses. It is assumed that proposed residences would not include hearths. Two diesel emergency generators are assumed for the proposed entertainment center that would be tested for 30 minutes per month. Three cooling towers are also assumed for the proposed entertainment center. Generator and heating, ventilation, and air conditioning system size are based on information from similar facilities and CalEEMod default inputs (Central States Diesel Generators 2025; Buel 2018). Low-VOC architectural coatings and cleaning products are assumed. Default operational assumptions were assumed for existing land uses under existing (2016) and future (2035) conditions, including default natural gas use. Detailed modeling inputs are provided in Appendix A.

Mobile emissions were estimated using the CARB EMFAC model, Version 1.0.2, and Citywide daily VMT data provided by Kimley-Horn & Associates (2024c). With Project implementation, daily Citywide VMT would be approximately 37,076,262 in year 2035. Without Project implementation, daily Citywide VMT would be approximately 37,014,678 in year 2035. The estimated daily Citywide VMT with Project implementation used for air quality modeling is approximately 37,076,262 VMT, compared to 37,014,678 VMT without the Project, as provided by Kimley-Horn & Associates (2024c). This figure is lower than the 41,736,405 Citywide VMT estimated for the entire Project as part of the VMT analysis (Kimley-Horn 2024b). It is important to note that VMT calculations for air quality purposes rely on a different methodology than VMT impact analysis for transportation purposes. The estimate used for air emissions modeling assumes 50 percent of Internal-External (I-E) and External-Internal (E-I) trip VMT. The VMT impact analysis assumes 100 percent of all trips, as required by the City's Transportation Study Manual for regional and Citywide impacts. However, the 50 percent attribution for I-E and E-I trips in the air quality VMT ensures fair and consistent responsibility for trips crossing jurisdictional boundaries. This prevents double-counting of VMT for neighboring cities and supports equitable mitigation efforts, with each jurisdiction accountable only for the portion of travel it influences. The air quality VMT isolates I-E and E-I VMT based on origindestination trips, whereas the total VMT for the transportation analysis uses the boundary method, where daily vehicle traffic volumes on roadway segments are multiplied by the segment lengths within the study area. Therefore, the VMT results for air quality and transportation analyses differ. The EMFAC model provides County-wide VMT and emissions data. The proportion of total County emissions attributable to the Citywide VMT was assumed to be equal to the proportion of Citywide VMT to total County VMT. EMFAC output is provided in Appendix B, EMFAC Modeling Data.

5.1.3 Sensitive Receptors

Sensitive receptors include children, older adults, and people of all ages who have lung diseases, such as asthma. The City's General Plan identifies places where this population spends a significant

amount of time as sensitive land uses, including residences, schools, daycare centers, medical facilities, or parks (City of San Diego 2024). The applicable sensitive land use within the Project vicinity is residences. The closest schools are Captivate Academy and Dewey Elementary School, located approximately 1,800 southeast of the Project site on Rosecrans Boulevard. Potential excess cancer and non-cancer risk to sensitive receptors in existing residences was evaluated using the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD), Version 12.0.0, and risk calculations consistent with the California Office of Environmental Health Hazard Assessment (OEHHA) guidance (OEHHA 2015). Modeling assumptions incorporate applicable guidance from the OEHHA and SDAPCD (SDACPD 2022). The meteorological data between the years of 2019 and 2021 at the San Diego International Airport meteorological station was provided by the SDAPCD and used in the AERMOD modeling.

DPM is the pollutant of concern for existing sensitive receptors that may be exposed to exhaust from truck and heavy equipment operation for the duration of Project construction. In accordance with CARB guidance, PM₁₀ exhaust emissions are used to represent DPM exposure (CARB 1998). PM_{10} exhaust emissions were obtained from the CalEEMod modeling described previously. Construction was assumed to occur 5 days per week for 12 hours per day. On-site emissions were modeled as an area source over the Project site. Based on the CalEEMod output, the worst-case annual on-site PM₁₀ exhaust emissions would be approximately 0.14 ton, or approximately 0.011 grams per second, including on-site operation of construction equipment and trucks. Off-site haul emissions were also modeled as a line volume source for the truck route from the Project site to approximately the I-8/I-5 interchange. Truck traffic would enter and exit the site from Sports Arena Boulevard and would travel on Sports Arena Boulevard to or from I-8 (AECOM 2023b). Based on the CalEEMod output, worst-case annual off-site PM₁₀ exhaust emissions would be approximately 0.035 ton per year for the entire off-site haul area. The shortest trip length for heavy-duty truck trips (7.63) miles for vendor trips) was assumed to estimate the proportion of emissions that would occur in the modeling area (approximately 1.5 miles). The shortest trip length is the most conservative for this assumption because it assumes that a greater proportion of trip emissions would occur closer to the Project site. Approximately 20 percent of total haul emission, approximately 0.007 ton, or 0.0006 grams per second are assumed to occur in the modeling area.

Annual concentrations of PM₁₀ from exhaust at receptors within 2,000 meters of the Project center point are calculated using AERMOD, including discrete receptor locations at the existing sensitive receptors closest to the construction area: the Villa Marbella apartments (3142 Midway Drive), the southwestern and southeastern corners of The Orchard Senior Living facility (4040 Hancock Street), and Pointe Lux Apartment Homes (3889 Midway Drive). AERMOD also identifies a point of maximum impact (PMI). Details of the model inputs and output are provided in Appendix C, AERMOD Modeling Output and Risk Calculation.

A portion of on-site residences (approximately 1,242 units) would be constructed in Phase 1 of the Project and may be exposed to emissions from Phase 2 construction.¹ New residents would be exposed to a reduced construction duration compared to existing receptors, the Project haul route would direct truck trips away from residences, and new residences would be constructed to meet current Title 24 standards, which include upgraded filter requirements compared to previous development standards. The 2022 Title 24 standards require filters in multi-family residential ventilation systems to have a designated efficiency equal to or greater than minimum efficiency reporting value (MERV 13). For comparison, the 2016 Title 24 standards required mechanical ventilation systems to include air filters having a designated efficiency equal to or greater than MERV 6, which are rated to remove 50 percent of particulates in the 3–10 microgram range (PM₁₀) (CEC 2015). The 2022 Title 24 standards require filters in multi-family residential ventilation systems to have a designated efficiency equal to or greater than MERV 13, which are rated to remove 50 percent of particulates in the 0.3–1 microgram range (PM_{2.5}), and equal to or greater than 85 percent in the 1–3 microgram range (PM_{2.5} and PM₁₀) (CEC 2022). No particulate matter filtration system is assumed for existing receptors.

Cancer risk to existing receptors over the 10-year construction period was calculated for the inhalation pathway based on calculations and inputs provided by the OEHHA, include age sensitivity factors, breathing rates, and cancer potency factor for OEHHA-defined age groups (OEHHA 2015). Calculation details are provided in Appendix C. For sensitive receptors in the Villa Marbella apartments and the Pointe Lux Apartment Homes, the 10-year cancer risk is based on a conservative exposure that includes the third trimester to age 10 (third trimester, zero- to 2-year, and 2- to 16-year age groups). However, The Orchard Senior Living facility is a community for people ages 55 and over. Ten-year cancer risk for this receptor is based on 10-year exposure for the 16- to 70-year age group. In accordance with the OEHHA guidelines, the non-cancer risk hazard quotient for DPM is determined by dividing the concentration in micrograms per cubic meter (µg/m³) by the reference exposure level for DPM.

Localized CO concentrations are evaluated based on the results of the Local Mobility Analysis (Kimley-Horn 2024a) and the traffic volume screening levels from the Midway-Pacific Highway CPU PEIR. Intersections that would result in a Level of Service (LOS) E or F as a result of the Project are compared to a screening volume of 31,600 vehicles per hour to determine whether a potential carbon monoxide (CO) hotspot would occur as a result of the Project (City of San Diego 2018a). The analysis of localized impacts from other pollutants is based on applicable regulations and CARB siting recommendations in the Air Quality and Land Use Handbook: A Community Health Perspective (Air Quality and Land Use Handbook) (CARB 2005).

Air Quality Technical Report and HRA Midway Rising Project

CEQA is intended to protect the existing environment from impacts that would result from the Project. Generally, CEQA does not consider impacts of the existing environment on a proposed land use to be significant (refer to CEQA Guidelines Section 15126.2).

5.1.4 Odors

The potential for the Project to result in exposure to significant odors is based on the Midway-Pacific Highway CPU PEIR analysis and a review of CARB's Air Quality and Land Use Handbook. Project land uses are compared to the odor-causing uses listed in the handbook.

5.1 Significance Criteria

Based on the City's CEQA Significance Determination Thresholds addressed in the Midway-Pacific Highway CPU PEIR (City of San Diego 2016), implementation of the Project would result in a significant adverse impact if it would:

- Threshold 1: Conflict with or obstruct the implementation of the applicable air quality plan.
- **Threshold 2:** Result in a violation of any air quality standard or contribute substantially to an existing or projected air quality violation.

The SDAPCD has established trigger levels that determine when a new or modified stationary source would require an air quality analysis. These trigger levels are used by the City of San Diego in their CEQA Significance Determination Thresholds (City of San Diego 2016) as one of the considerations when determining the potential significance of air quality impacts for projects within the City. Thresholds applicable to the Project are shown in Table 7, San Diego County Air Pollution Control District Pollutant Thresholds. The Project-level thresholds are intended to ensure many individual projects would not obstruct the timely attainment of the NAAQS and CAAQS.

Table 7. San Diego County Air Pollution Control District Pollutant Thresholds

Pollutant ¹	Pounds/Day
СО	550
NO _x	250
PM ₁₀	100
PM _{2.5}	100³
SO _x	250
VOC, ROG ²	137 ⁴

Source: City of San Diego 2018a.

Notes: CO = carbon monoxide; NO_x = nitrogen oxides; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SO_x = sulfur oxides; VOC = volatile organic compound

The CEQA Significance Determination Thresholds also list the SDAPCD stationary source threshold for lead of 3.2 pounds per day. However, as noted in the City's thresholds, lead emissions have steadily declined due to catalytic converters and increased use of lead-free gasoline. San Diego is no longer required to monitor for lead (City of San Diego 2016). As previously stated, the Project does not include processes that would result in lead emissions, and lead emissions are not addressed in this analysis.

² The terms ROG and VOC are essentially synonymous and are used interchangeably.

³ PM_{2.5} threshold developed from the South Coast Air Quality Management District (SCAQMD) Final Methodology to Calculate PM_{2.5} and PM_{2.5} Significance Thresholds and the PM₁₀ standard of the SDAPCD.

- VOC thresholds are based on levels per the (SCAQMD and Monterey Bay Air Pollution Control District, which have similar federal and state attainment status as San Diego.
 - Threshold 3: Expose sensitive receptors to substantial pollutant concentrations, including toxins.
 - Construction of the Project would result in a significant impact to sensitive receptors if DPM exposure would result in an increased cancer risk greater than 10 in 1 million, or an increased chronic non-cancer hazard index of more than 1, consistent with SDAPCD Rule 1200 and County of San Diego Guidelines for Determining Significance (County of San Diego 2007). Project-generated, long-term operational local mobile source emissions of CO would result in a significant impact to sensitive receptors if it would substantially contribute to emissions concentrations that exceed the 1-hour ambient air quality standard of 20 parts per million (ppm) or the 8-hour standard of 9 ppm. For other operational impacts, the analysis considers whether the Project would be consistent with the siting distances recommended by CARB's Air Quality and Land Use Handbook: A Community Health Perspective, which provides guidance on land use compatibility with sources of TACs (CARB 2005).
 - **Threshold 4:** Create objectional odors affecting a substantial number of people. A significant impact would occur if the Project would place a new odor source near existing receptors, or develop new receptors near existing sources of odor.

Section 6 Impacts and Mitigation

The Project's potential air quality impacts are compared to those identified in the Midway-Pacific Highway CPU PEIR in the following sections. For each issue, the conclusion of the Midway-Pacific Highway CPU PEIR is summarized and followed by an evaluation and comparison of Project-specific impacts.

6.1 Threshold 1: Consistency with Regional Air Quality Plans

6.1.1 Impact Analysis

The following addresses the Project's consistency with applicable regional air quality plans.

6.1.1.1 Midway-Pacific Highway CPU PEIR Impact Summary

Consistency of the 2018 Community Plan with the RAQS and SIP was evaluated by comparing projected future emission from buildout of the land use assumptions of the previous Community Plan to calculated emissions for the growth accommodated by the 2018 Community Plan. Construction and operational emissions under the Midway-Pacific Highway CPU were calculated to slightly increase compared to future operational emissions under the previously adopted Community Plan. However, the net increase would not exceed any of the significance thresholds presented in Table 7. Therefore, the 2018 Community Plan would be consistent with the growth projections and emissions forecasts used in the RAQS. Additionally, the Midway-Pacific Highway CPU PEIR determined that the 2018 Community Plan was consistent with the goals and strategies in the 2008 General Plan. Thus, because the 2018 Community Plan would be consistent with the 2008 General Plan and the land use changes associated with the Project would not result in a significant increase in operational emissions, the 2018 Community Plan was determined to be consistent with assumptions contained in the RAQS, and impacts were determined to be Less than Significant. No mitigation measures were required.

6.1.1.2 Project-Specific Impact Analysis

As previously described, the SIP and RAQS were developed in conjunction with each other by the SDAPCD to reduce regional O₃ emissions. Compliance with the RAQS is based on if an individual project would comply with the emissions projections contained in the RAQS. The CARB mobile source emission projections and SANDAG growth projections are based on population and vehicle trends and land use plans developed by the cities and the County. The emissions estimates that CARB and the SDAPCD use to plan for achieving ambient air quality standards compliance are based on the land uses projected by SANDAG. The use of construction equipment in the RAQS is estimated for the region on an annual basis, and construction-related emissions are estimated as an aggregate in the RAQS. Redevelopment of the Project site was planned in the Midway-Pacific Highway CPU PEIR and 2008 General Plan, and the Project would not require any unusual construction practices. The Project would result in additional residential development compared to the 2018 Community Plan.

However, as demonstrated under Threshold 2, Project emissions would not exceed applicable air quality thresholds during construction. Therefore, the Project would not increase the assumptions for construction equipment use in the RAQS.

The primary source of emissions of concern from Project operation is mobile emissions as they are the greatest source of regional emissions. The Project would provide a mix of residential, commercial, and entertainment uses and parks and public spaces consistent with the land use types identified in the 2018 Community Plan. The Project is in a Transit Priority Area, consistent with regional growth strategy. The Project would accommodate additional residential development beyond the assumptions of the 2018 Community Plan within the Specific Plan Area. Because the Project site is located along an existing bus route, the Project would construct a new bus stop and upgrade two existing bus stops; one of the upgraded bus stops would be a future Bus Rapid Transit bus station in the center of the Project's Sports Arena Boulevard street frontage. The Project would include public ROW improvements for multimodal travel including improved pedestrian and bicycle facilities and improved access to transit service (Kimley-Horn 2024a). As demonstrated in the VMT analysis for the Project, the Project would result in a less than significant VMT transportation impact for the residential component of the project (Kimley-Horn 2024b). However, the commercial and entertainment uses would result in a net increase in City-wide VMT (Kimley-Horn 2024b) resulting in a significant VMT impact for these land uses. However, as demonstrated under Threshold 2, Project mobile emissions at buildout would be similar to emissions that would occur without Project implementation. The Project would result in a less than one percent increase in City-wide mobile emissions compared to emissions without Project implementation (see Table 9, Operational Daily Maximum Air Pollutant Emissions). Therefore, the Project would be consistent with the RAQS and SIP emissions inventory for mobile emissions.

As demonstrated below in Threshold 2, the net increase in Citywide mobile emissions attributable to the Project would not exceed regional criteria pollutant emissions thresholds for Project-specific impacts. Additionally, these uses would be consistent with planned development for the site. Therefore, although the Project would increase development density on the site, Citywide mobile emissions would be similar to future emissions for planned growth in the forecast for the RAQS and SIP. The Project would not result in unplanned growth that was not accounted for in the RAQS and SIP, and would implement project features that would support the use of alternative modes of transportation. As such, the Project would not conflict with the RAQS or SIP, and this impact would be **Less than Significant**.

6.1.2 Mitigation Measures

No significant impacts were identified; therefore, no mitigation is required.

6.1.3 Cumulative Impacts

The RAQS and SIP are intended to address cumulative impacts in the SDAB based on future growth predicted by SANDAG. As described previously, implementation of the Project would be consistent with the emissions projections in the RAQS and SIP. Cumulative development is not expected to result in a significant impact in terms of conflicting with the SDAPCD air quality management plans and the SIP because the majority of cumulative projects would propose development that is consistent with the applicable growth projections incorporated into local Air Quality Management Plans, including buildout of the Midway-Pacific Highway CPU. Implementation of the Project, in combination with other cumulative projects, would not conflict with or obstruct implementation of the RAQS or SIP air quality plans. A cumulative impact would not occur. This impact would be **Less than Significant**.

6.2 Threshold 2: Conformance to Federal and State Ambient Air Quality Standards

6.2.1 Impact Analysis

The following section quantifies the Project's emissions of criteria air pollutants and compares the emissions to applicable thresholds.

6.2.1.1 Midway-Pacific Highway CPU PEIR Impact Summary

The Midway-Pacific Highway CPU PEIR compared 2018 Community Plan construction emissions to those estimated for the previously adopted Community Plan to determine if the net increase attributable to the 2018 Community Plan would exceed significance thresholds. Construction of the assumed 25 percent of total buildout in a single year would have the potential to exceed the threshold for VOC, but when compared to the previously adopted Community Plan, the 2018 Community Plan's net increase would not exceed the applicable thresholds. Construction-related air quality impacts were determined to be **Less than Significant**.

The Midway-Pacific Highway CPU PEIR determined that the best indicator of the 2018 Community Plan's long-term effect on emissions was to compare future operations with the previously adopted Community Plan rather than existing development. Operational emissions associated with the 2018 Community Plan were calculated to be higher for all pollutants when compared to the previously adopted Community Plan. However, the net increase attributable to the 2018 Community Plan would not exceed any of the significance thresholds. Air quality impacts associated with the 2018 Community Plan were determined to be **Less than Significant**.

6.2.1.2 Project-Specific Impact Analysis

Implementation of the Project would result in construction and operational air pollutant emissions, as described in the following sections.

6.2.1.3 Construction Emissions

Construction activities would result in temporary increases in air pollutant emissions. These emissions would be generated as fugitive dust emissions from earth disturbance during fine site grading and exhaust emissions from operation of heavy equipment and vehicles during construction. Paving activities would emit VOCs during off-gassing.

Table 8, Construction Daily Maximum Air Pollutant Emissions, presents a summary of estimated maximum daily air pollutant emissions for each construction phase associated with the Project. Additionally, construction phases would overlap, and construction activities within phases could potentially overlap. Up to six construction activities are anticipated to occur simultaneously during two simultaneous construction phases. Table 8 also includes worst-case construction emissions from the worst-case simultaneous construction scenario based on the schedule provided by the Project applicant (AECOM 2024).

Table 8. Construction Daily Maximum Air Pollutant Emissions

	Maximum Daily Emissions (pounds/day)									
Construction Phase	VOC	NOx	со	SO _x	PM ₁₀	PM _{2.5}				
Phase 1 (Frontier Drive and East of Frontier Drive)

Worst-Case Simultaneous Construction ^a	19.29	55.72	102.38	0.23	17.04	4.39				

Table 8. Construction Daily Maximum Air Pollutant Emissions

	Maximum Daily Emissions (pounds/day)					
Construction Phase	voc	NOx	со	SO _x	PM ₁₀	PM _{2.5}
Significance Threshold	137	250	550	250	100	100
Significant Impact?	No	No	No	No	No	No

Source: CalEEMod, version 2022.1. See Appendix A for model output.

Notes: CO = carbon monoxide; NO_x = nitrogen oxides; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SO_x = sulfur oxides; VOC = volatile organic compound

The construction emissions estimate indicates that the Project would not exceed the significance thresholds for any criteria air pollutants during any phase of construction, even during simultaneous construction activities in multiple locations. The Project would result in a **Less than Significant** impact related to air pollutant emissions during construction.

Regarding health effects related to criteria air pollutant emissions, the applicable significance thresholds are established for regional compliance with the state and federal ambient air quality standards, which are intended to protect public health from both acute and long-term health impacts, depending on the potential effects of the pollutant (USEPA 2024f). Because emissions of criteria air pollutants during construction of the Project would be below the applicable thresholds, the Project would not contribute to regional acute and long-term health impacts related to non-attainment of the ambient air quality standards.

As discussed in Section 2.2, Air Pollutants, criteria air pollutants also have the potential to result in health impacts, such as headaches or throat irritation, at the time of exposure. However, individual exposure levels and individual reactions to localized short-term exposure to pollutant emissions from Project construction cannot be feasibly determined. The localized level of O_3 that receptors may be exposed to VOC emissions cannot be determined because the formation of O_3 is not directly determined by the quantity of VOC and NO_x emissions generated by a project (San Joaquin Valley APCD 2015). The amount of O_3 formed depends on heat and sunlight exposure, and once formed, O_3 is likely to be dispersed or carried away from the site by wind. Conversely, O_3 exposure on site could have been transported to the site by wind and be attributable to another source (USEPA 2024d). Currently, there are no known methods that can feasibly ascertain the ultimate locations of O_3 formation associated with the emissions of O_3 precursors such as VOC and NO_x (San Joaquin Valley APCD 2015). However, because Project construction emissions are anticipated to be below the significance thresholds, and those emissions would be spread out across the Project site and off-site haul routes, significant adverse acute health impacts because of Project construction are not anticipated. Cancer and chronic risks from Project construction are addressed under Threshold 3.

^a The worst-case simultaneous construction scenario would occur during Phase 2 and would include grading and building construction east of Kemper Street and grading, paving, building construction, and architectural coating west of Kemper Street.

6.2.1.4 Operational Emissions

Area and energy sources of air pollutant emissions associated with the Project include natural gas use in commercial kitchens, fuel combustion emissions from landscape maintenance equipment and emergency generator testing, and VOC emissions from periodic repainting of interior and exterior surfaces. The site is currently a source of these emissions from existing commercial and entertainment uses. However, the Project would increase density on the site. Increased vehicle volumes also contribute to regional emissions of criteria air pollutants. Daily Citywide VMT with Project implementation would be approximately 37,076,262 (Kimley-Horn 2024c). Table 9, Operational Daily Maximum Air Pollutant Emissions, includes the total estimated operational emissions from the Project compared to emissions from existing development calculated for year 2035. As shown in Table 9, net increase in operational emissions from the Project would exceed the significance thresholds for maximum daily emissions for VOC emissions. Therefore, future operational air quality impacts associated with operation of the Project would be **Potentially Significant**.

Table 9. Operational Daily Maximum Air Pollutant Emissions

	Maximum Daily Emissions (pounds/day)						
Emission Source	VOC	NO _x	СО	SO ₂	PM ₁₀	PM _{2.5}	
Natural Gas	0.13	2.42	2.03	0.01	0.18	0.18

Notes: CO = carbon monoxide; NO_x = nitrogen oxides; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SO_2 = sulfur dioxide; VOC = volatile organic compound

^a Consumer products include chemically formulated products such as degreasers; fertilizers/pesticides; detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Consumer products do not include other paint products or furniture coatings, which are included in architectural coatings (CARB 2022).

6.2.2 Mitigation Measures

Mitigation Measure **AIR-1** would reduce Project VOC emissions by reducing emissions from landscape equipment. As shown in Table 10, VOC emissions from Project implementation would be **Less than Significant with implementation of Mitigation Measure AIR-1**.

AIR-1: Zero-Emissions Landscape Equipment. Prior to issuance of the first certificate of occupancy, the Owner/Permittee shall submit verification that landscaping equipment operated on the Project site shall be zero-emissions, satisfactory to the City of San Diego Development Services Department's Mitigation Monitoring Coordination staff. This measure shall be incorporated into all contracts to provide landscape services to the Project site.

Table 10. Mitigated Operational Daily Maximum Air Pollutant Emissions

	Maximum Daily Emissions (pounds/day)

Notes: CO = carbon monoxide; NO_x = nitrogen oxides; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SO_2 = sulfur dioxide; VOC = volatile organic compound

6.2.3 Cumulative Impacts

An existing **Significant Cumulative Impact** exists in the SDAB related to PM_{10} , $PM_{2.5}$, and O_3 precursors (NO_x and VOC). As previously described, the thresholds in Table 7 are designed to identify those projects that would result in significant levels of air pollution and to assist the region in attaining the applicable state and federal ambient air quality standards. As such, the Thresholds in Table 7 are cumulative in nature. Projects that would not exceed the standards of significance would not contribute a considerable amount of criteria air pollutant emissions to the region's emissions profile and would not impede attainment and maintenance of ambient air quality standards. However, if the region is in nonattainment status for a particular criteria pollutant and a project's individual emissions exceed the threshold levels, its incremental contribution could be considered cumulatively considerable (County of San Diego 2007). A project that is consistent with the thresholds in Table 7 is considered to result in less than cumulatively considerable emissions. As demonstrated previously, construction of the Project would not exceed the significance thresholds. Operational emissions would be reduced to below the threshold with implementation of Mitigation Measure **AIR-1**. The Project would result in a **Less than Cumulatively Considerable Impact with Mitigation**.

6.3 Threshold 3: Impacts to Sensitive Receptors

6.3.1 Impact Analysis

The following section describes the Project's potential impacts related to sensitive receptors.

6.3.1.1 Midway-Pacific Highway CPU PEIR Impact Summary

The Midway-Pacific Highway CPU PEIR determined that estimated peak hour volumes on deficient roadways would not exceed the screening thresholds, and the Project was determined to not have the potential to result in a CO hotspot. Due to the highly dispersive nature of DPM and the fact that construction activities would occur intermittently and at various locations over approximately 18 years (i.e., 2017 to 2035), it was determined that construction under the 2018 Community Plan would not expose sensitive receptors to substantial construction-related TAC concentrations. The regulatory framework was determined to reduce impacts associated with stationary sources in the 2018 Community Plan to a less than significant level. Regarding operation, the 2018 Community Plan includes the development of residential and commercial land uses. Residential land uses were determined to not be a typical source of substantial TAC emissions. Individual development projects could be within the siting distances recommended by CARB's Air Quality and Land Use Handbook. However, the Midway-Pacific Highway CPU PEIR determined that infill development, mixed use, higher density, transit-oriented development, and other concepts that benefit regional air quality could be compatible with protecting the health of individuals at the neighborhood level with design considerations. Impacts were determined to be **Less than Significant**.

6.3.1.2 Project-Specific Impact Analysis

CO hotspots, TAC exposure from Project construction and operation, and potential release of hazardous materials are addressed below.

6.3.1.3 Carbon Monoxide Hotspots

Areas with high vehicle density, such as congested intersections and parking garages, have the potential to create high concentrations of CO, known as "CO hotspots." An air quality impact is considered significant if CO emissions create a hotspot where either the California 1-hour standard of 20 ppm or the federal and California 8-hour standard of 9 ppm is exceeded. This typically occurs at severely congested intersections (LOS E or worse), where peak hour volumes exceed 31,600 entering vehicles (City of San Diego 2018a). The Local Mobility Analysis for the Project concluded that under the Project buildout scenario, the Project would cause the following study intersections to operate at a LOS E of F in the Local Mobility Analysis (Kimley-Horn 2024a):

- Intersection #2 Midway Drive/West Point Loma Boulevard and Sports Arena Boulevard (PM: LOS F [2030/2035]; Pre-Event: LOS E [2030]/LOS F [2035]; WKND: LOS E [2030]/LOS F [2035])
- Intersection #5 West Drive/Frontier Drive and Sports Arena Boulevard (PM: LOS F; Pre-Event: LOS F; WKND: LOS F [2030/2035])
- Intersection #14 Sherman Street and Hancock Street (Pre-Event: LOS F [2030]/LOS E [2035])
- Intersection #16 Camino Del Rio West and Moore Street (PM: LOS E; Pre-Event: LOS E;
 WKND: LOS F [2030/2035])
- Intersection #17 Camino Del Rio West and Hancock Street (AM: LOS F [2030/2035])
- Intersection #19 Rosecrans Street and Sports Arena Boulevard and Camino Del Rio West (WKND: LOS F [2035])
- Intersection #20 Rosecrans Street and Midway Drive (AM: LOS E; PM: LOS E; Pre-Event: LOS E; WKND: LOS F [2030/2035])
- Intersection #22 Rosecrans Street and Lytton Street (AM: LOS E; PM: LOS E [2035])
- Intersection #26 Kurtz Street and Pacific Highway (PM: LOS F; Pre-Event: LOS F [2030])
- Intersection #27 Pacific Highway and Enterprise Street (PM: LOS E; Pre-Event: LOS E [2030/2035])
- Intersection #28 Midway Drive and Enterprise Street (PM: LOS E; Pre-Event: LOS E [2035])
- Intersection #29 Barnett Avenue and Midway Drive (PM: LOS E [2035])

However, none of the above intersections would experience a peak hour traffic volume that exceeds 31,600 vehicles (Kimely-Horn 2024a). The highest peak hour volume at any of the 12 impacted segments is 6,422 vehicles at Intersection 20. Consistent with the findings of the Midway-Pacific Highway CPU PEIR, because the Project would not increase delay at a deficient intersection with a peak hour volume of more than 31,600 vehicles, the Project would not have the potential to result in a CO hotspot. This impact would be **Less than Significant**.

6.3.1.4 Toxic Air Contaminants

Construction and operation are addressed separately below, including separate discussions related to operational stationary emissions sources and potential exposure to contaminated soil during construction.

Construction

As previously described, DPM emissions from operation of diesel equipment and vehicles are the TAC of concern resulting from construction of the Project. Cancer and chronic non-cancer risk from DPM exposure related to the Project are estimated based on the worst-case annual PM₁₀ exhaust emissions and risk calculations from the OEHHA. Risks were calculated at four discrete receptors and a PMI, as well as a grid of receptors within approximately 2,000 meters from the center of the construction area. Table 11, Calculated Cancer and Non-Cancer Risk from Construction, summarizes the cancer and non-cancer risk at the discrete receptors. As shown in Table 11, the cancer risk attributable to the Project at the Villa Marbella apartments would exceed the 10 in 1 million threshold. The threshold would also be exceeded at the PMI. However, the PMI is just outside the Project site, adjacent to where haul trucks would enter and exit the site. No sensitive receptors are located at this point. Figure 5, Unmitigated Annual Diesel Particulate Matter Concentration, shows the area surrounding the Project site and haul road where cancer risk would potentially exceed 10 in 1 million based on exposure from the third trimester to age 10 (annual DPM concentration greater than 0.02 micrograms per cubic meter [µg/m³]). As shown on Figure 5, the area of potential impact includes commercial and office development in all directions surrounding the Project site. Impacts are primarily attributable to on-site diesel equipment and trucks, and DPM exposure along the haul route does not exceed 0.02 µg/m³ beyond the office building adjacent to the western boundary of the Project site, which is not considered a sensitive land use. Project construction would not exceed a health hazard index of 1 at the PMI or any sensitive receptor. Therefore, the chronic non-cancer risk from Project construction would be Less than Significant. However, as noted, cancer risk at sensitive receptors at the Villa Marbella apartments would exceed 10 in 1 million. Therefore, impacts related to cancer risk at adjacent residences would be **Potentially Significant.** The closest schools are located approximately 1,800 feet from the Project site. Exposure duration would be less than residential use; therefore, because impacts related to cancer risk to residential uses would not occur beyond approximately 1,000 feet from the Project site, non-cancer and cancer risks at the nearest schools would be Less than Significant.

Table 11. Calculated Cancer and Non-Cancer Risk from Construction

	UTM	Annual DPM Concentrati	10-Year	Exceeds	Chronic Non-Cancer	Exceeds
Receptor	Coordinates	on (µg/m³)	Cancer Risk ^a	Threshold?	Risk	Threshold?
1. Villa Marbella apartments	(480540.66, 3623758.04)	0.02827	13.7	Yes	0.006	No
2. The Orchard Senior Living Facility – Southeast Corner	(479647.12, 3624140.12)	0.01068	0.3	No	0.002	No
3. The Orchard Senior Living Facility - Southwest Corner	479408.92, 3624187.27	0.00847	0.3	No	0.002	No
4. Pointe Luxe Apartment Homes	479469.38, 3624080.87	0.00705	3.4	No	0.001	No
PMI	(480349.48, 36239974.78)	0.12415	60.2	Yes	0.02	No

Source: Appendix B.

Notes: DPM = diesel particulate matter; PMI = point of maximum impact; UTM = Universal Transverse Mercator

Stationary Sources

The Project proposes mixed-use commercial, residential, and entertainment uses consistent with the 2018 Community Plan. As such, it does not include land uses that are typical TAC sources. Neighborhood-serving uses, such as dry cleaners, may be included in future commercial uses; however, as stated in the Midway-Pacific Highway CPU PEIR, these stationary TAC sources are regulated by the SDAPCD. In accordance with AB 2588, if adverse health impacts exceeding public notification levels are identified for a business, the facility must submit a risk reduction audit and plan to demonstrate how the facility would reduce health risks. Due to the regulatory framework, impacts associated with stationary sources would be **Less than Significant**.

^a Ten-year cancer risk at PMI, Villa Marbella apartments, and Pointe Lux Apartment Homes is based on exposure from the third trimester to age 10. Ten-year cancer risk at The Orchard Senior Living facility is based on 10-year exposure for the 16–70 year age group. Health risk for all age groups is provided in Appendix B; 10-year cancer risk is not exceeded for any age group at The Orchard Senior Living facility.

Operation

The Project would result in the development of new sensitive receptors (residences) in the Midway-Pacific Highway Community planning area.² Consistent with the Midway-Pacific Highway CPU PEIR and 2018 Community Plan Policy CE-4.1, the Project was reviewed against the applicable screening distances from CARB's Air Quality and Land Use Handbook (CARB 2005):

- Avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with 100,000 vehicles per day, or rural roads with 50,000 vehicles per day.
- Avoid siting new sensitive land uses within 1,000 feet of a distribution center (that
 accommodates more than 100 trucks per day, more than 40 trucks with operating
 transport refrigeration units (TRUs) per day, or where transport refrigeration TRU unit
 operations exceed 300 hours per week).
- Avoid siting new sensitive land uses within 300 feet of any dry cleaning operation.
- Avoid siting new sensitive land uses within 300 feet of a large gas station (defined as a
 facility with a throughput of 3.6 million gallons per year or greater). A 50-foot separation
 is recommended for typical gas dispensing facilities.

The Project would not place new sensitive receptors within the screening distances for distribution centers, dry cleaning operations, or large gas stations. However, the northwestern corner of the Project site would be within 500 feet of I-8. The Midway-Pacific Highway CPU PEIR determined that impacts related to siting sensitive receptors near freeways would be less than significant, assuming affirmative steps to reduce TAC exposure. Building design features to reduce air pollutant exposure typically consist of enhanced building ventilation or filtration systems (CARB 2005). Building design and locations are currently conceptual. As such, new residences may be within 500 feet of I-8 and design considerations would have to be incorporated to reduce potential health risks, consistent with 2018 Community Plan Policy CE-4.2.

Since the 2018 Community Plan was adopted, the Title 24 Building Energy Efficiency Standards were revised to require more efficient air filtration systems in multi-family residential buildings. As noted previously, enhanced building filtration is the CARB-recommended strategy for reducing air pollutant exposure. At the time of the Midway-Pacific Highway CPU PEIR preparation, the 2016 Title 24 standards were in place, which required mechanical ventilation systems to include air filters having a designated efficiency equal to or greater than MERV 6, which are rated to remove 50 percent of particulates in the 3–10 microgram range (PM₁₀) (CEC 2015). The 2022 Title 24 standards require filters in multi-family residential ventilation systems to have a designated efficiency equal to or greater than MERV 13, which are rated to remove 50 percent of particulates in the 0.3–1

² CEQA is intended to protect the existing environment from impacts that would result from the Project. Generally, CEQA does not consider impacts of the existing environment on a proposed land use to be significant (refer to CEQA Guidelines Section 15126.2). However, consistent with the Midway-Pacific Highway CPU PEIR, the potential exposure of Project sensitive receptors to existing TAC sources is addressed below.

microgram range (PM_{2.5}), and equal to or greater than 85 percent in the 1–3 microgram range (PM_{2.5} and PM₁₀) (CEC 2022). MERV 13 filters are consistent with County of Los Angeles Public Health recommendations for sensitive development within 500 feet of a freeway (County of Los Angeles Public Health 2019). Additionally, CARB prepared a study related to development near high-volume roadways that is intended to supplement the Air Quality and Land Use Handbook. The study acknowledges that higher-density infill development is consistent with statewide goals for reducing mobile air pollutant emissions, but in the near-term may result in the exposing new development to pollutants from high-volume roadways. Reductions in VMT and a state-wide transition to more zeroemissions vehicles are anticipated to reduce exposure over time; however, in the near-term, installation of particle filtration systems is the recommended strategy for building design. Filters that are MERV 13 and higher are identified as filters with greater efficiency and achieve substantial fine particulate matter removal compared to typical residential systems (CARB 2017). As such, health risks have already been reduced because of applicable building design regulations. Project buildings would comply with the applicable Title 24 standards, including constructing mechanical ventilation systems. Consistent with the findings of the Midway-Pacific Highway CPU PEIR and implementation of 2018 Community Plan Policy CE-4.2, because an existing regulatory system is in place requiring design considerations to reduce risk of TAC exposure in areas within the freeway screening distance, this Project impact would be **Less than Significant**.

Hazardous Materials

A Phase I Environmental Site Assessment (ESA) (SCS Engineers 2024a), Phase II ESA (SCS Engineers 2023), and Additional Phase II ESA Report (SCS Engineers 2024b) were performed for the Project site to identify the presence of recognized environmental conditions (RECs) from current or historical site land uses or from a known and reported off-site source. The Phase I ESA identified the potential for burned or incinerated ash from "backyard" incinerators or "burn pits" to be present or mixed with the soil, as well as the potential for leaked fuel and VOCs from various previous uses of the site. Testing conducted under the Phase II ESA and Additional Phase II ESA found detectable concentrations of total petroleum hydrocarbon, VOCs, and organochlorine pesticides and elevated concentrations of the metals antimony, arsenic, barium, copper, lead, mercury, and zinc. Burn ash was also encountered. As such, Project construction activities would have the potential to disturb soils containing hazardous materials. Soil disturbance without proper precaution may result in exposure to soil vapors or result in fugitive dust containing hazardous materials.

Construction contractors would be required to comply with all applicable federal, state, and local laws and regulations regarding the transport, use, and storage of hazardous construction-related materials. Soils potentially containing hazardous materials may be removed from the site, relocated within the known waste footprint, and/or left in place. Regardless of the option chosen, a Soil Management Plan (SMP) would be prepared that describes the means and methods for the proper management of impacted soils during construction and grading activities. The SMP would describe the methods and

details and other aspects of the proper handling and management of soils that exceed the remediation criteria that would be encountered during the grading and construction of the proposed Project. In conjunction with the SMP, and pursuant to the requirements of the San Diego Local Enforcement Agency, a Community Health and Safety Plan would be prepared that would address issues of potential off-site impacts, particularly the monitoring and suppression of dust generated by on-site activities.

It is anticipated that the Project would also enter into oversight agreements with the Local Enforcement Agency and other applicable regulatory agencies (such as the County of San Diego Department of Environmental Health and Quality, Regional Water Quality Control Board, and/or Department of Toxic Substances Control) prior to grading and development activities to ensure the former waste areas of the West Point Loma Dump and other areas with known environmental impacts within the Project disturbance area are properly managed during construction activities. Additional assessment of soil and/or soil gas may be conducted as requested by the overseeing regulatory agencies.

The primary health and safety issue associated with the excavation of impacted soil is the potential generation of dust that may occur during the handling of the impacted soil. Dust-minimizing measures for the three soil management options include air and dust monitoring. Required measures would be outlined as conditions in the SMP and Community Health and Safety Plan. Additionally, dust emissions would be controlled by spraying surfaces with water and the use of cyclone/covered fencing to reduce dust emissions as excavation, grading, stockpiling, and loading activities are conducted. If waste would be relocated or left in place on the site, a deed restriction would be required that limits future grading, trenching, backfilling, excavating, or other earthwork without prior written consent of the Local Enforcement Agency. Implementation of the SMP and Community Health and Safety Plan in accordance with agency requirements and recommendations would reduce impacts from known hazards to a **Less than Significant** level during construction.

Following construction, future site occupants may be exposed to the upward migration of VOCs in soil vapor. Soil vapor sampling conducted on the site as part of the Phase II ESA indicated a potential significant human health risk for portions of the current commercial and future commercial and residential buildings at the Project site as a result of vapor intrusion of VOCs (including benzene, m,p-xylene, ethylbenzene, and tetrachloroethylene). Therefore, due to the possible exceedances of commercial and residential screening levels for VOCs in indoor air, impacts would be **Potentially Significant**.

6.3.2 Mitigation Measures

Project construction would have the potential to result in an excess cancer risk (greater than 10 in 1 million) at sensitive receptors within proximity to the construction area. As shown on Figure 5, on-site construction equipment emissions are the primary source of the excess health risk.

Mitigation Measure AIR-2 requires the on-site use of higher-tier construction equipment to reduce DPM emissions from construction equipment. Mitigated DPM was modeled using AERMOD, and risk

was calculated using equations from OEHHA using the same methodology as unmitigated conditions. Worst-case annual DPM emissions was obtained from CalEEMod output for mitigated PM₁₀ exhaust. CalEEMod output is provided in Appendix A of this report and assumes approximately 50 percent of construction equipment would be Tier 4 rated equipment. Worst-case annual on-site emissions would be reduced from 0.14 ton to 0.08 ton with implementation of Mitigation Measure AIR-2. Haul road emissions would be the same as unmitigated conditions. Mitigated health risk at discrete receptors with implementation of Mitigation Measure AIR-2 is summarized in Table 12, Mitigated Cancer and Non-Cancer Risk from Construction. As shown in Table 12, health risk at the Villa Marbella apartments would be reduced to a Less than Significant level. Cancer risk at the PMI would continue to exceed 10 in 1 million; however, no sensitive receptors are located at the PMI. Figure 6, Mitigated Annual Diesel Particulate Matter Concentration, shows the mitigated area surrounding the Project site and haul road where cancer risk would potentially exceed 10 in 1 million. As shown on Figure 6, the area would continue to include non-sensitive commercial buildings north, west, and south of the Project site. As demonstrated in Table 12, cancer risk would be reduced to below the threshold at all sensitive receptors. This impact would be Less than Significant with Mitigation.

Following construction, future site occupants may be exposed to the upward migration of VOCs in soil vapor. Mitigation Measure **AIR-3** would reduce the risk of exceedance of commercial and residential screening levels for VOCs (benzene, m,p-xylene, ethylbenzene, and PCE) in indoor air. This impact would be **Less than Significant with Mitigation.**

- AIR-2: Construction Equipment Emissions Standards. Prior to issuance of a grading permit for each phase of construction, the construction contractor shall submit verification that the on-site diesel construction fleet shall include at least 50 percent equipment with engines that meet, at a minimum, the Tier 4 Final California Emissions Standards, satisfactory to the City of San Diego Development Services Department's Mitigation Monitoring Coordination staff. Alternatively, additional electric-powered equipment may be used, such that at least 50 percent of the construction fleet meets or exceeds Tier 4 Final California Emissions Standards for particulate matter emissions.
- AIR-3: Soil Vapor Sampling and Vapor Intrusion Mitigation System Where Indicated. Prior to the issuance of a grading permit, the Owner/Permittee shall collect soil vapor samples within the footprints of the proposed Project buildings to re-assess soil vapor concentrations. Where soil vapor concentrations comply with the State Water Resources Control Board Low-Threat Underground Storage Tank Case Closure Policy, which provides specific health risk-based screening criteria for the petroleum hydrocarbon-related volatile organic compounds that include benzene, ethylbenzene, and naphthalene established by the State Water Resources Control Board, as well as the applicable vapor intrusion screening levels for human health risks, the additional round of soil vapor sampling may

indicate that vapor intrusion remediation is not necessary beneath certain buildings proposed above the sampling site, and no further work is required in connection with indoor air, provided applicable regulatory agency approval is received.

For buildings proposed to be located on soil where previously collected and future soil vapor sample results indicate a vapor risk is present for future occupants, a vapor intrusion mitigation system shall be installed. The vapor intrusion mitigation system shall be installed for the enclosed occupied ground floor spaces of the residential or commercial buildings where necessary due to the high concentrations of volatile organic compounds identified in soil vapor sampling. The vapor intrusion mitigation system shall be designed by a licensed professional engineer and consist of a passive-vented system with the option to convert to an active system with a gas-tight horizontal membrane barrier above. The Owner/Permittee shall provide a verification letter to the City of San Diego Development Services Department's Mitigation Monitoring Coordination staff confirming that all regulatory requirements related to the design and construction of the vapor intrusion mitigation system have been met.

Table 12. Mitigated Cancer and Non-Cancer Risk from Construction

Receptor	UTM Coordinates	Annual DPM Concentrati on (µg/m³)	10-Year Cancer Risk ^a	Exceeds Threshold?	Chronic Non-Cancer Risk	Exceeds Threshold?
1. Villa Marbella apartments	(480540.66, 3623758.04)	0.01642	8	No	0.003	No
2. The Orchard Senior Living Facility- Southeast Corner	(479647.12, 3624140.12)	0.00758	0.2	No	0.001	No
3. The Orchard Senior Living Facility – Southwest Corner	479408.92, 3624187.27	0.00696	0.2	No	0.001	No
4. Pointe Luxe Apartment Homes	479469.38, 3624080.87	0.00513	2.5	No	0.001	No
PMI	(480349.48, 36239974.78)	0.07227	35	Yes	0.01	No

Source: Appendix B.

Notes: DPM = diesel particulate matter; PMI = point of maximum impact; UTM = Universal Transverse Mercator

^a Ten-year cancer risk at PMI, Villa Marbella apartments, and Pointe Lux Apartment Homes is based on exposure from the third trimester to age 10. Ten-year cancer risk at The Orchard Senior Living facility is based on 10-year exposure for the 16– 70 year age group. Health risk for all age groups is provided in Appendix B; 10-year cancer risk is not exceeded for any age group at The Orchard Senior Living facility.

6.3.3 Cumulative Impacts

Cumulative growth in the Midway-Pacific Highway Community planning area would have the potential to increase congestion and potentially result in CO hotspots. The discussion of CO hotspots in Section 6.3.1.3, Carbon Monoxide Hotspots, includes traffic volumes at study area intersections in combination with cumulative trips. As discussed in this section, total traffic volumes would not result in congestion at any intersection during construction or operation that exceeds screening criteria. Therefore, the cumulative impact related to CO hotspots would be **Less than Significant.**

The cumulative projects would also have the potential to result in a significant cumulative impact associated with sensitive receptors if, in combination, they would expose sensitive receptors to a substantial concentration of TACs that would significantly increase cancer risk. The cumulative projects in the Community Plan Area, including the Navy Old Town Campus Revitalization Project, generally consist of residential and commercial projects that are not typical sources of substantial TACs (CARB 2005). The Midway-Pacific Highway CPU PEIR determined that cumulative development in the area would not result in an increased risk to sensitive receptors due to the nature of allowable mixed-use development and existing regulatory processes. As described previously, the Project would not result in a new source of TACs. Additionally, impacts related to contaminated soils would be site specific, and cumulative projects would also be required to implement management plans consistent with federal, state, and local regulations. Therefore, the Project's contribution would **Not be Cumulatively Considerable**.

6.4 Threshold 4: Odor Impacts

6.4.1 Impact Analysis

The following addresses the Project's potential impacts related to odors.

6.4.1.1 Midway-Pacific Highway CPU PEIR Impact Summary

Construction under the 2018 Community Plan was assumed to use typical construction techniques. Odors would be typical of most construction sites and temporary and localized in nature, including exhaust and architectural coatings. Therefore, construction-generated odors would not result in frequent exposure of receptors to objectionable odor emissions. This impact was determined to be **Less than Significant**.

Regarding operation, the 2018 Community Plan would allow for development of multi-family residential and commercial land uses within the Midway-Pacific Highway Community planning area. Minor sources

of odors associated with the 2018 Community Plan could include restaurants, coffee roasters, and other urban land uses. However, these uses were determined to not be typical sources of significant odor complaints and would be similar to existing residential and food service uses throughout the 2018 Community Plan area. Therefore, this impact was determined to be **Less than Significant**.

6.4.1.2 Project-Specific Impact Analysis

Construction associated with the Project could result in minor amounts of odor compounds associated with diesel-heavy equipment exhaust. However, diesel equipment would operate across the site at varying distances from existing receptors, and construction near individual existing receptors would be temporary on a given day. Additionally, SO_x is the only criteria air pollutant with a strong, pungent odor (ATSDR 2015). As shown in Table 8, maximum construction emissions of SO_x would be less than 1 pound per day, which is well below the threshold of 250 pounds per day. As discussed in greater detail in Section 6.3.1.2, ground disturbance on the Project site would have the potential to disturb potentially contaminated soils, including burn dump waste. However, during sample excavations, soils containing burn dump waste did not have any obvious odor (SCS Engineers 2024b). Soil exposure would also be temporary as soil would be excavated and transported off-site. Contaminated soils would be handled in accordance with the Community Health and Safety Plan and SMP that would minimize exposure to any charred debris, dust, soot, grime, carbon, toxins, and fugitive dust potentially associated with disturbance of the burn waste. Although odors were not encountered during field testing, the Community Health and Safety Plan would include measures for assessing and addressing odor during disturbance of former dump areas. Therefore, Project construction would not result in nuisance odors or other air contaminants as defined in SDMC Section 142.0710 that would result in a significant impact.

CARB's Air Quality and Land Use Handbook (CARB 2005) includes a list of the most common sources of odor complaints received by local air districts. Typical sources of odor complaints include facilities such as sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations. The site is not located near typical sources of odor complaints such as sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations. Therefore, the Project would not result in the exposure of new receptors to substantial odors from existing off-site uses. The Project proposes new residential, commercial, entertainment, and park and public space uses on the Project site. Consistent with the Midway-Pacific Highway CPU PEIR and CARB's Air Quality and Land Use Handbook, these types of uses do not typically result in sources of nuisance odors, smoke, charred paper, dust, soot, grime, carbon, noxious acids, toxic fumes, gases, or fugitive particulate matter associated with operation. The Project would increase density on the site, which would increase the potential for nuisance odors from human activity, as well as increase receptors. The Project would result in new commercial uses, including restaurants, within proximity to residences. However, consistent with the Midway-Pacific Highway CPU PEIR, operational restaurant odors would be similar to existing restaurant uses on the site and in the surrounding area. Additionally, these uses are not a

typical source of significant odor complaints. The increased density on the site would increase solid waste generation and disposal needs. The Project area is currently served by City waste management services, and would continue to be subject to regular waste collection. A Waste Management Plan (Midway Rising, LLC 2024) was prepared and submitted for City approval that provides the proposed methodology for salvage and recycling activities for the Project. Therefore, odors would not be considered objectionable, and operational odor impacts would be **Less than Significant**.

6.4.2 Mitigation Measures

No significant impacts were identified; therefore, no mitigation is required.

6.4.3 Cumulative Impacts

Impacts relative to objectionable odors are limited to the area immediately surrounding the odor source and are not cumulative in nature because the air emissions that cause odors disperse beyond the sources of the odor. As the emissions disperse, the odor becomes decreasingly detectable. Cumulative development consistent with buildout of the 2018 Community Plan and the Navy Old Town Campus Revitalization Project would also include residential and commercial projects that would not be expected to result in objectionable odors. In addition, implementation of the Project would not generate a new source of objectionable odors. The Project and cumulative projects would be required to comply with SDMC Section 142.0710, Air Contaminant Regulations, that prohibit nuisance odors. Therefore, the Project's contribution would not be cumulatively considerable. Impacts would be **Less than Significant**.

This page intentionally left blank.

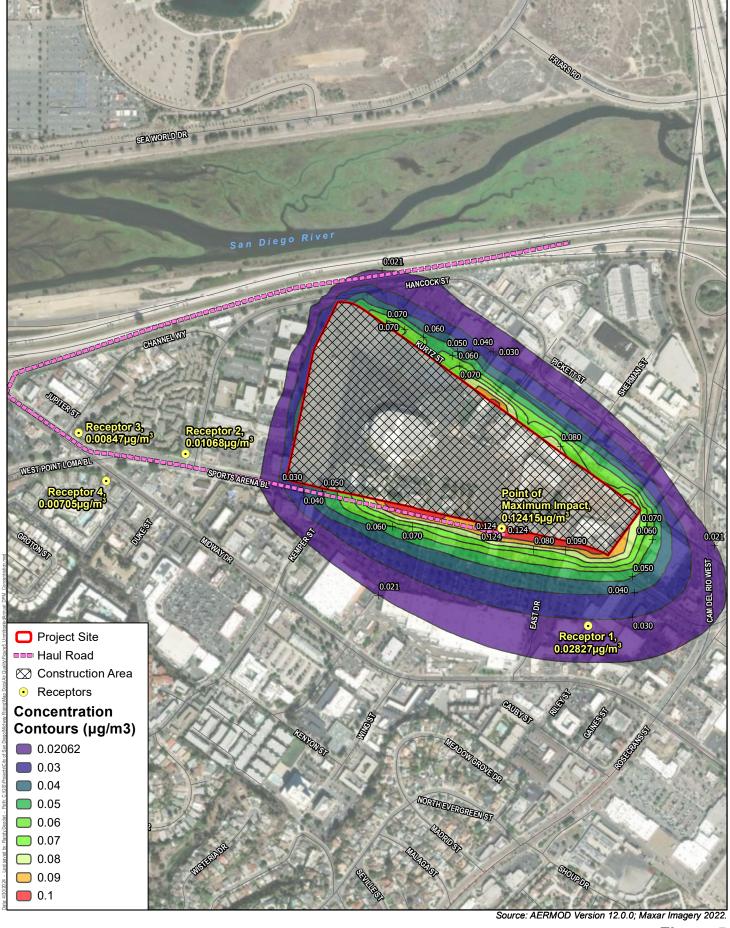

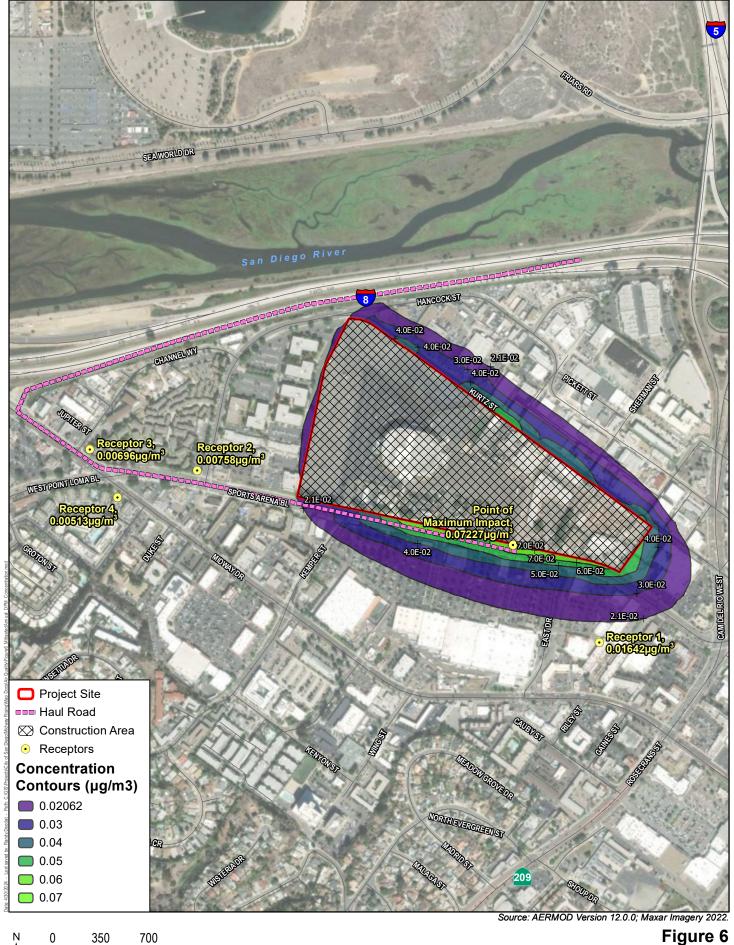

Figure 5

Feet

Section 7 Conclusion

The Project would result in criteria air pollutant emissions during both the construction and operational phases. Implementation of the Project would not conflict with or obstruct the implementation of the applicable SDAPCD Air Quality Plans. Emissions associated with construction of the Project would be temporary and would not exceed the screening level thresholds for criteria air pollutants. These impacts would be **Less than Significant**, consistent with the findings of the Midway-Pacific Highway CPU PEIR. The increase in operational air pollutant emissions associated with the Project would exceed the screening level threshold for VOC emissions established by the SDAPCD. This impact would be **Less than Significant with Mitigation** with implementation of Mitigation Measure **AIR-1**.

Based on the screening process outlined in the Midway-Pacific Highway CPU PEIR, the Project would not result in a CO hotspot. This impact would be **Less than Significant**, consistent with the findings of the Midway-Pacific Highway CPU PEIR. Construction of the Project would have the potential to result in excess cancer risk from DPM at nearby sensitive receptors. This impact would be **Less than Significant with Mitigation** with implementation of Mitigation Measure **AIR-2**. Implementation of an SMP would reduce risks related to contaminated soil and soil vapors to a less than significant level during construction. However, following construction, future site occupants may be exposed to the upward migration of VOCs in soil vapor. These impacts would be **Less than Significant with Mitigation** with implementation of Mitigation Measure **AIR-3**.

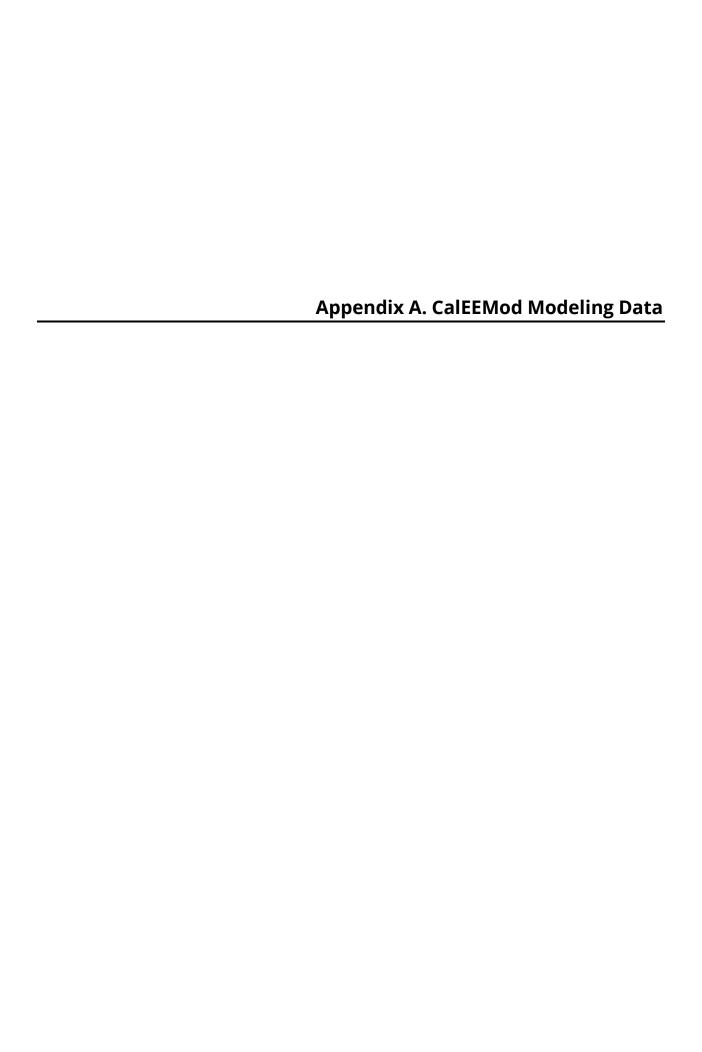

The Project would not result in a source of significant odors, consistent with the findings of the Midway-Pacific Highway CPU PEIR. This impact would be **Less than Significant**.

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Midway Rising
Construction Start Date	1/2/2026
Operational Year	2030
Lead Agency	_
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	19.0
Location	32.75564552534652, -117.21251734467774
County	San Diego
City	San Diego
Air District	San Diego County APCD
Air Basin	San Diego
TAZ	6463
EDFZ	12
Electric Utility	San Diego Gas & Electric
Gas Utility	San Diego Gas & Electric
App Version	2022.1.1.26

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)		Special Landscape Area (sq ft)	Population	Description
Apartments High Rise	4,627	Dwelling Unit	6.31	4,441,920	43,560	_	12,909	_

Strip Mall	60.0	1000sqft	6.31	60,000	0.00	_	_	_
Quality Restaurant	40.0	1000sqft	6.31	40,000	0.00	_	_	_
High Turnover (Sit Down Restaurant)	40.0	1000sqft	6.31	40,000	0.00	_	_	_
Arena	381	1000sqft	6.31	380,550	0.00	_	_	_
Enclosed Parking with Elevator	7,040	Space	6.31	2,816,000	0.00	_	_	_
City Park	14.2	Acre	14.2	0.00	239,801	239,801	_	_
Parking Lot	10.1	Acre	10.1	10.1	0.00	_	_	_

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-5	Use Advanced Engine Tiers
Energy	E-2	Require Energy Efficient Appliances
Energy	E-15	Require All-Electric Development
Energy	E-25*	Install Electric Heat Pumps
Area Sources	AS-1	Use Low-VOC Cleaning Supplies
Area Sources	LL-1	Replace Gas Powered Landscape Equipment with Zero-Emission Landscape Equipment
Area Sources	LL-3*	Electric Yard Equipment Compatibility

^{*} Qualitative or supporting measure. Emission reductions not included in the mitigated emissions results.

2. Emissions Summary

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

9.7		
Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	7.67	annual days of extreme heat
Extreme Precipitation	2.70	annual days with precipitation above 20 mm
Sea Level Rise	_	meters of inundation depth
Wildfire	1.93	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi. Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about 3/4 an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	0	0	0	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	_
AQ-Ozone	32.1
AQ-PM	49.7
AQ-DPM	92.5

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	55.0
Healthy Places Index Score for Project Location (b)	30.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No

Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	"Parking lot" includes off-site roadway improvements
Construction: Construction Phases	Revised to Applicant provided schedule. Assumes applicant provided start date and total working days due to stops/starts in some phases. Paving is for phases 1/2a/2b due to modeling constraints
Construction: Off-Road Equipment	Revised with applicant-provided equipment fleet
Construction: Trips and VMT	Average daily manpower/truck estimates from Applicant
Construction: Architectural Coatings	All coating assumed for all 3 phases. Divided between phases.
Operations: Hearths	No natural gas or wood stoves
Operations: Energy Use	All electric except commercial kitchens. Assume default for both restaurant types to represent commercial kitchens. Applicant provided electricity use for arena
Operations: Water and Waste Water	Updated per landscape plan and water use study. Res buffer included in city park
Operations: Refrigerants	Open space would not require mechanical equipment. included in other land uses
Operations: Solid Waste	Updated per waste management plan
Construction: Dust From Material Movement	Quantities provided by applicant team
Operations: Architectural Coatings	Revised per SDAPCD Rule 67 for general coatings

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	7.67	annual days of extreme heat
Extreme Precipitation	2.70	annual days with precipitation above 20 mm
Sea Level Rise	_	meters of inundation depth

Wildfire 1.93 annual hectares burned	
--------------------------------------	--

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	0	0	0	N/A
Wildfire	0	0	0	N/A
Flooding	0	0	0	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	_
AQ-Ozone	32.1
AQ-PM	49.7
AQ-DPM	92.5
Drinking Water	29.0

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	7.67	annual days of extreme heat
Extreme Precipitation	2.70	annual days with precipitation above 20 mm
Sea Level Rise	_	meters of inundation depth
Wildfire	1.93	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi. Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	0	0	0	N/A
Wildfire	0	0	0	N/A
Flooding	0	0	0	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	1	1	1	2
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	_
AQ-Ozone	32.1

AQ-PM	49.7
AQ-DPM	92.5
Drinking Water	29.0
Lead Risk Housing	42.9
Pesticides	0.00
Toxic Releases	39.3
Traffic	73.5

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	55.0
Healthy Places Index Score for Project Location (b)	30.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

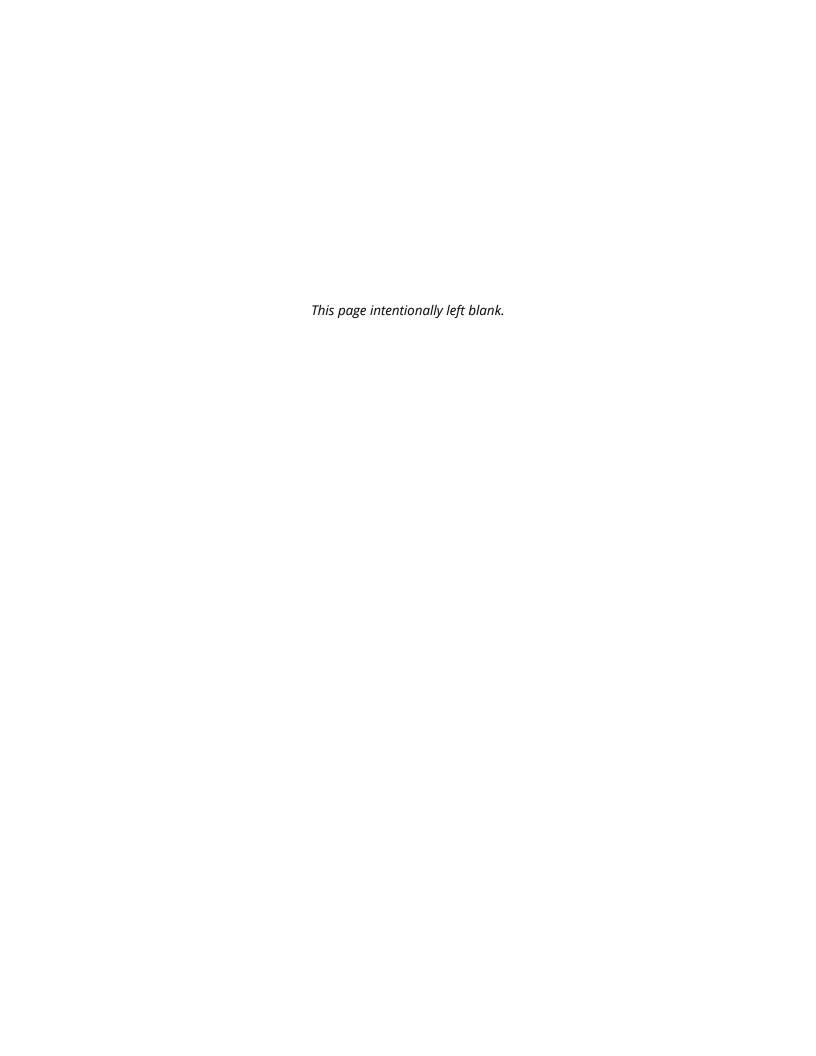

7.6. Health & Equity Custom Measures

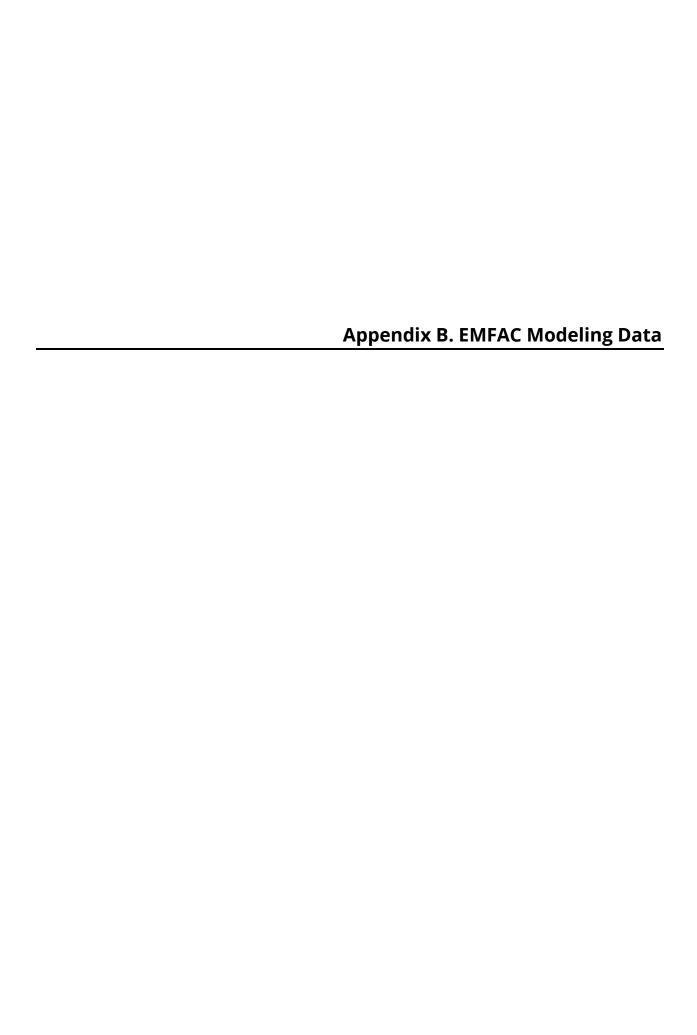

No Health & Equity Custom Measures created.

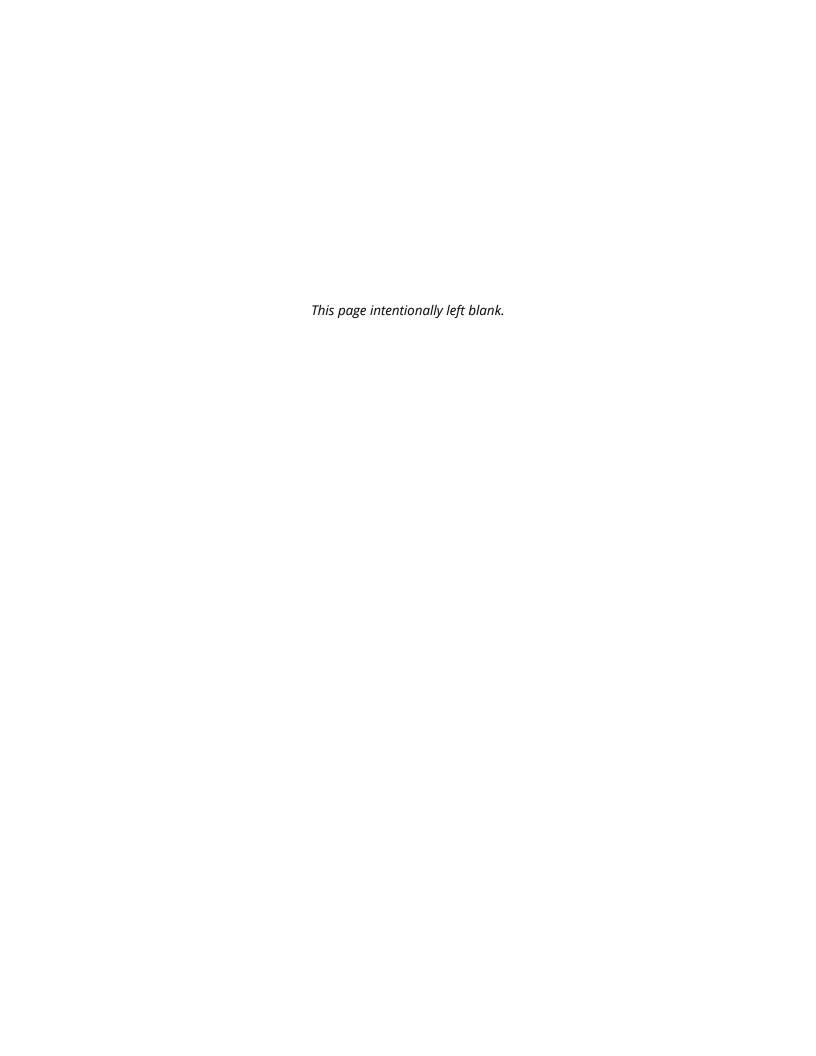

8. User Changes to Default Data

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

                and:
**Model Set To Continue RUNning After the Setup Testing.
**The AERMET Input Meteorological Data Version Date: 22112
**Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs Tables of Overall Maximum Short Term Values (MAXTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)
**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
                                                                m for Missing
Hours
                                                                b for Both Calm
and Missing Hours
 **Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 4.60; Decay
                    ; Rot. Angle =
