1.0 EXECUTIVE SUMMARY

This Hazardous Materials and Wastes Technical Report ("Hazardous Materials and Wastes TR" or "Technical Report") was prepared on behalf of BNSF Railway (BNSF) to identify potential concerns associated with hazardous materials and wastes (HMW) from construction and operation of the Barstow International Gateway (BIG). As described in **Section 2: Project Summary**, BIG consists of 443 parcels totaling 5,000 acres in the County's western portion, at the eastern extent of the City of Barstow.

The results of the assessment are briefly summarized below.

1.1 Site History

The BIG footprint is generally bound by the Mojave River to the north, Main Street (also referred to as National Trails Highway or Route 66) to the south, Highway 58 to the east, and Lords Road to the west. In general, the BIG footprint is generally flat and gradually slopes north to the Mojave River. The BIG footprint is mostly vacant with little to no improvements, and sparse rural residential uses, except the commercial and industrial uses north of Main Street on the eastern portion of this area. This area is mostly devoid of tall vegetation and trees, with structures and other elements of the built environment scattered throughout. Existing land uses within BIG's footprint include approximately 108 dwelling units and approximately 93,724 square feet of non-residential land uses (i.e., commercial, and industrial) within the BIG footprint. Additionally, a private airstrip ("Depue Airport") is within BIG's proposed solar farm footprint.

As described in **Appendix 5.5 BIG-1: Cultural Resources Assessment**, the BNSF railroad right-of-way has occupied the BIG footprint since as early as the mid- to late 1930s. The railroads were initially drawn to the barren Mojave Desert in the early 1880s as mineral deposits, were discovered. In 1885, the California Southern railroad (which would later become a subsidiary of BNSF) reached Barstow from Colton via the Cajon Pass, and soon initiated construction of its depot and other amenities on the southern bank of the Mojave River. The infrastructure and settlement brought on by the construction of the railroad and establishment of the mining industry helped populate the region and provided the foundation for Barstow's municipal growth. Barstow thus became a critical juncture of west, east, and southbound railroad routes. In 1926, Route 66 was established through Barstow's Main Street, linking it with the interstate highway system and stimulating growth. Gas and service stations, department stores, and restaurants sprang up along Main Street. Businesses that served both rail and vehicle travelers fueled the local economy, providing capital and new residents that allowed the City to thrive as a railroad and automobile travel hub.

The BIG footprint has remained primarily vacant, undeveloped land to present day, although gradually between the 1960s to 1990s rural commercial and residential uses were developed toward the eastern end of the BIG footprint within the City and unincorporated Lenwood community, primarily south of the existing BNSF mainline tracks which traverse the site in a southwest to northeast direction. Lenwood is a small community along the BIG footprint alignment that borders Barstow to the west. Like many small townsites along the Mojave River railroad alignment, it began as a railroad water stop. With Barstow's growth, several smaller neighboring communities were also established. The formation of present-day

Lenwood began in the 1920s when ranching and agricultural lots were sold in the Lenwood Townsite along the BNSF Railroad alignments and Route 66. Aside from homestead ranches and small cottages scattered in and around Lenwood, the town progressively expanded its facilities and commercial businesses over the following decades. By the early 1930s, the community boasted restaurants, service stations, cottage-camps, and an airport. However, the railroad's dominance began to decline post-World War II with the shift to trucking and personal vehicles. In 1958, the Barstow-Victorville Freeway, Interstate-15 (I-15), was constructed. While the new highway provided more expedient and integrated travel for Mojave Desert residents, it had an adverse effect on the local economy and businesses. The Barstow-Victorville Freeway bypassed Barstow and Main Street (Route 66) and as a result, downtown traffic in Barstow reduced by ninety percent, causing the decline of commercial activity along Main Street (Route 66). By the 1980s, construction of commercial buildings along Route 66 had slowed down dramatically. An assortment of small businesses, fast food establishments, and vacant and abandoned service stations were scattered along Route 66. In Lenwood, several storage warehouses, automobile parts businesses, and new duplexes could be found among boarded-up buildings and overgrown lots.

1.2 Site Reconnaissance

An environmental assessor conducted site reconnaissance from public rights-of-way on August 17, 2022, May 2, 2024, and June 3, 2025, to learn the current conditions of the environmental concern study areas, which are described in **Section 5.0: Environmental Setting** below. Where sufficient information was available, sites were classified as a recognized environmental condition (REC), historical recognized environmental condition (HREC) or a controlled recognized environmental condition (CREC) per ASTM Standard Practice E 1528-22 – Limited Environmental Due Diligence. Where there was insufficient information, but the potential for a site to contain HMW concerns, the site was classified as a potential environmental concern (PEC) per Standard Practice E 1528-22 – Limited Environmental Due Diligence. Additionally, Google Earth 2025 and detailed aerial photography provided by Environmental Data Resources, Inc. (EDR), gathered in Fall 2022, specifically for the BIG footprint and properties within 1,000 feet, were reviewed to obtain a general overview of existing conditions within and near the BIG footprint.

1.3 Environmental Records

Review of the federal, state, and local records, including a proprietary records summary provided by EDR, a third-party provider of environmental and land use records, showed more than 100 listed properties within the respective American Society for Testing and Materials (ASTM) standard search distances for each database which varied between 0.25 miles and 1.0 miles. Most of these listed properties were reviewed and removed as they did not have the potential to create a significant hazard to the public or the environment based on the type of listing, information provided for the listing, gradient, and/or the distance between the listed property and the BIG footprint. Sites identified within this search radius are detailed in **Section 4.3: Environmental Concern Sites**. However, the PG&E Hinkley Chromium Cleanup (PG&E Hinkley) site, a well-known and high-profile site involving contamination of groundwater by hexavalent chromium is located approximately between two to seven miles north, northeast, or northwest of the site (i.e., north of the Mojave River), outside of the ASTM search radius. Generally, the hexavalent chromium contamination from the PG&E Hinkley site has impacted groundwater in the Hinkley

area and PG&E provides drinking water to residents in the area surrounding the PG&E Hinkley site. There are ongoing remediation and groundwater monitoring programs, and an extensive amount of information is publicly available online. Recent plume maps and information can be reviewed here: https://hinkleygroundwater.com/site-information/groundwater-monitoring-and-plume-maps/. Review of the latest plume maps indicates that the groundwater flow direction in the PG&E Hinkley site is northerly, i.e., away from BIG. As a result, it does not appear that the PG&E Hinkley site has or would impact BIG.

1.4 Conclusions

BIG construction could result in temporary significant impacts regarding hazards to the public or environment from routine transport, use, or disposal of HMW; however, impacts would be less than significant with incorporation of mitigation which requires preparation of a limited soil management plan and associated provisions for responding to undocumented contamination. BIG operations would involve the routine transport, use, or disposal of HMW; however, compliance with established regulatory framework and existing BNSF policies and procedures would reduce impacts to less than significant. BIG construction could create a potentially significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of HMW into the environment; however, potential impacts would be less than significant with incorporation of mitigation measures which requires daily watering of exposed soil and roads to further prevent the release of fugitive dust containing contaminants during construction, preparation of a soil management plan to properly delineate any residual contaminants in soil prior to and during grading activities, adherence to state RWQCB and regional Certified Unified Program Agency (CUPA) guidelines for well abandonment or well head treatment prior to any reuse associated with BIG, and sampling, cleaning, permitting, and handling of potential on-site HMW storage if USTs are discovered during construction. BIG operations would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of HMW into the environment. BIG construction would emit hazardous emissions or handle hazardous or acutely HMW within one-quarter mile of Lenwood Elementary School; however, BNSF would comply with PRC § 21151.4 and a less than significant impact would occur.

BIG is located on a site which is included on a list of HMW sites compiled pursuant to CGC § 65962.5; see **Section 4.3.1: Cortese Sites**. However, with incorporation of mitigation which requires adherence to state RWQCB and regional CUPA guidelines for well abandonment, impacts would be less than significant. BIG is not located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport. BIG construction would temporarily impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; however, with incorporation of mitigation which requires preparation of a Construction Transportation Plan, impacts would be less than significant. BIG operations would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. BIG construction and operations would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires, and a less than significant impact would occur.

2.0 PROJECT SUMMARY

This Report has been prepared to analyze the proposed Barstow International Gateway ("BIG") and associated off-site improvements. BIG is located in the City of Barstow ("City") and in unincorporated territory in the County of San Bernardino ("County"), California (see **Figure 1: Regional Vicinity Map** and **Figure 2: Local Vicinity Map**). BIG consists of a rail yard with an intermodal facility[1] and "block swap" facility[2], a transload warehouse center[3], and a solar farm.

Additionally, to serve the proposed rail yard and transload warehouse center, BNSF Railway Company (BNSF) proposes off-site rail improvements (including lead track extensions), and off-site non-rail improvements (including drainage, utilities, and roadways).

BIG's proposed components are depicted on **Figure 3: Barstow International Gateway Conceptual Site Plan**, **Figure 4: BIG Offsite Improvements, West**, and off-site improvements are depicted on **Figure 5: BIG Off-Site Improvements, East**.

2.1 Project Location and Setting

BIG totals approximately 5,000 acres[4], and includes approximately 680 acres which would remain ungraded/undisturbed ("Mojave River buffer area"). BIG's Specific Plan area totals approximately 4,300 acres and is generally bounded by the Mojave River to the north, Main Street (also referred to as National Trails Highway or Route 66) to the south, Lenwood Road to the east, and Hinkley Road to the west.

Most of the BIG footprint is within unincorporated County lands, while the remainder is within Barstow City limits. The BIG footprint is generally flat and gradually slopes north to the Mojave River. Off-site improvements are generally within existing BNSF rail and City/County street rights-of-way. The BIG footprint is primarily vacant undeveloped land, which is traversed by an existing BNSF railroad, and which contains scattered residential, commercial, and industrial land uses. This area is mostly devoid of tall vegetation and trees, with structures and other elements of the built environment scattered throughout. Existing land uses within BIG's footprint are listed in **Table 1: Existing Land Uses**. There are approximately 108 dwelling units and approximately 94,000 square feet of non-residential land uses (i.e., commercial and industrial) within the BIG footprint. Additionally, a private airstrip ("Depue Airport") is within BIG's proposed solar farm footprint. Under BIG, this private airstrip would be demolished and replaced with the proposed solar farm.

[1] "Intermodal facility" refers to a rail yard where containerized goods are transferred between trains and trucks. Trucks arrive to either pick up containers from arriving trains or deliver containers for departing trains. However, unlike traditional intermodal facilities, at BIG the majority of containers would arrive by train and be transferred to and from electric hostlers.

[2] "Block Swap" refers to transferring a block of intermodal train cars between trains. In effect, the entire block of cars remains coupled together and is moved en masse to another train.

[3] "Transload" refers to the transfer of goods from one container to another. In this document, it specifically refers to the transfer of goods from 40-foot international containers to 53-foot domestic containers. The transload warehouse center at the BIG is designed to serve goods transported to and from the intermodal facility by rail.

[4] Although the BIG Specific Plan acreage is 4,335 acres, throughout this technical report, the BIG Specific Plan acreage is referred to as 4,300 acres. Note: all acreages in this report are preliminary and based on GIS data. Acreages will be refined with site survey.

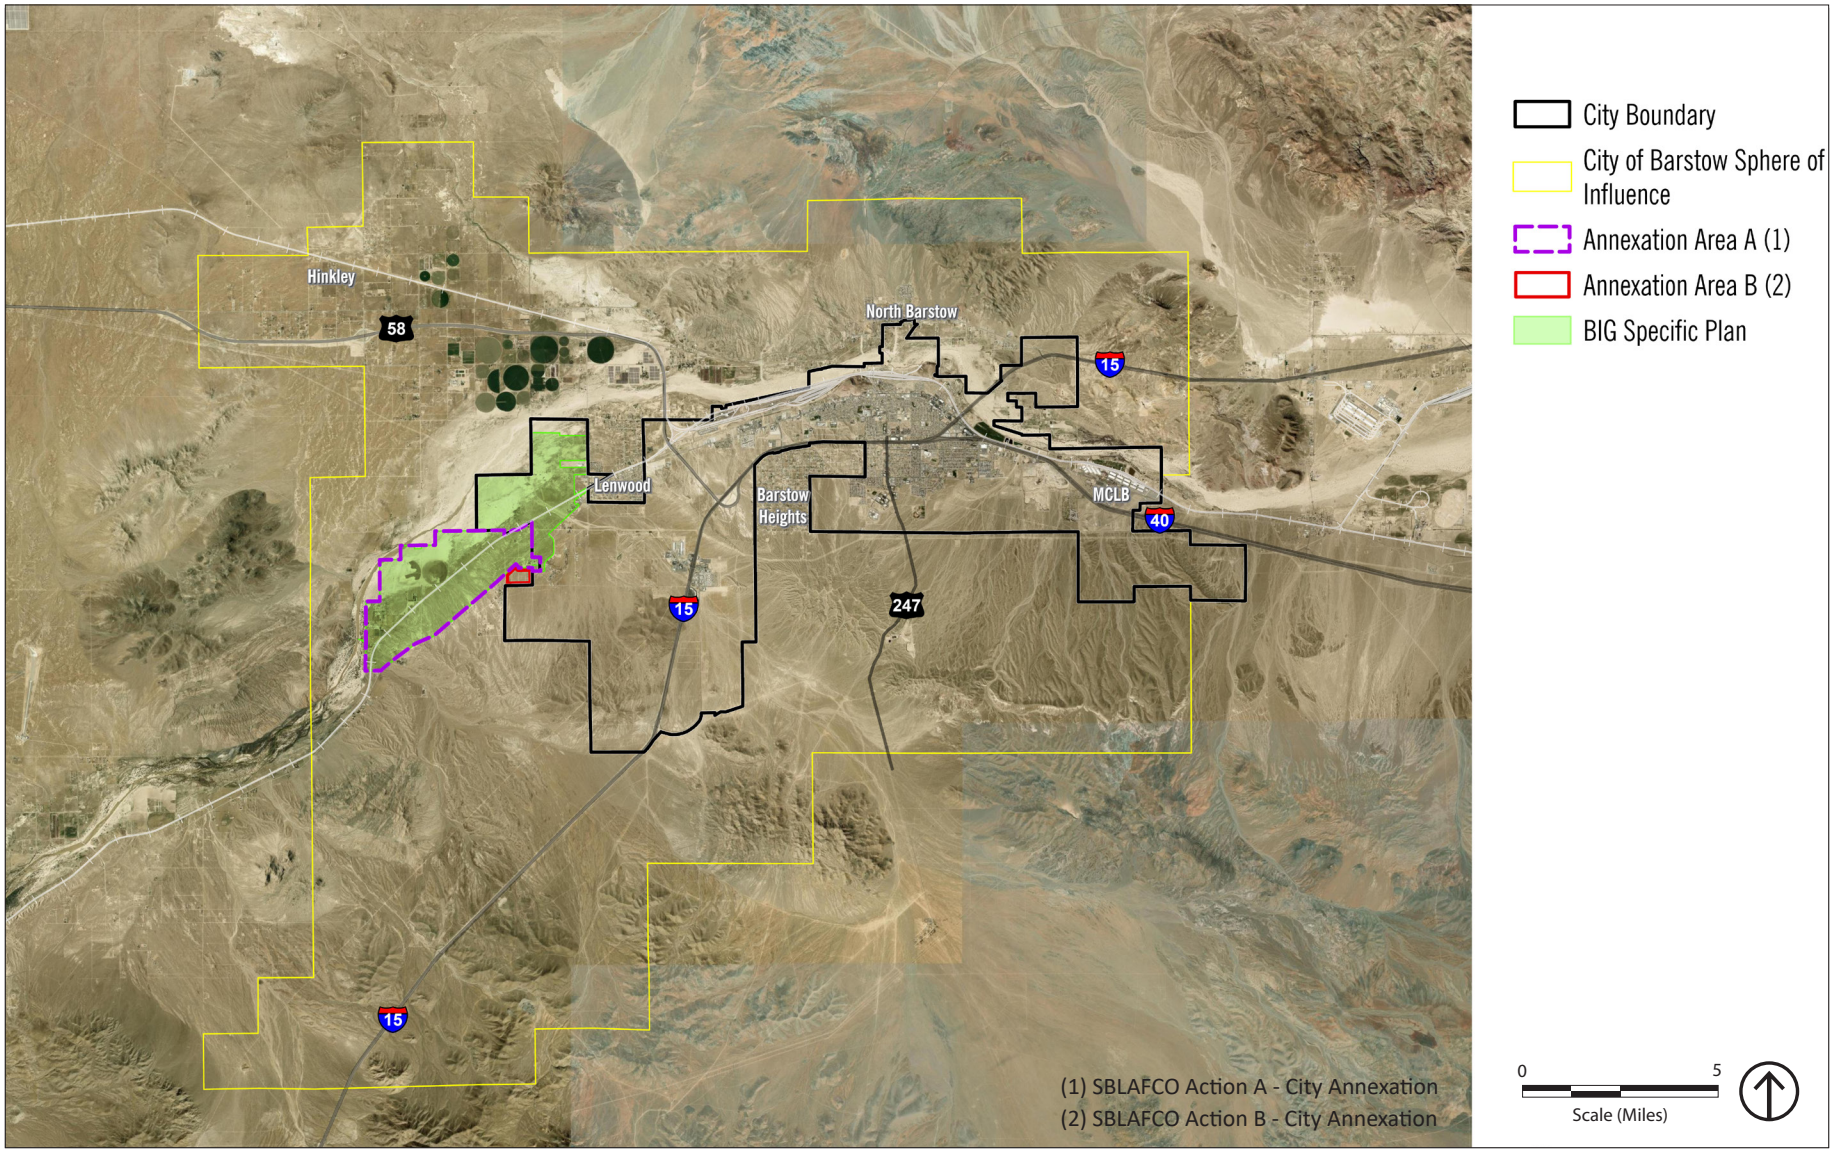

Table 1: Existing Land Uses					
Description	**Residential (DU)**	**Commercial (SF)**	**Industrial (SF)**	**TOTAL (DU)**	**TOTAL (SF)**
Existing Land Use	108	85,887	7,837	108	93,724

Regional vehicular access to BIG is provided by Main Street from the south, I-15 from the southeast, and SR-58 from the east. Local access to BIG is primarily provided by Lenwood Road and Hinkley Road from the east and west, respectively, in addition to various unpaved roads along Main Street. Regional rail access is provided from the north by BNSF's Mojave subdivision, from the west by BNSF's Cajon subdivision, and from the east by BNSF's Needles subdivision.

2.2 Project Components

Rail Yard

Overview

The rail yard would be generally bound by the existing mainline to the north, Main Street to the south, Lenwood Road to the east, and Hinkley Road to the west. The rail yard would consist of an intermodal facility (i.e., where cross-dock intermodal operations and other intermodal facility operations would occur and where support intermodal facility uses would be located), a block swap yard, and ancillary rail areas (i.e., container yard, chassis storage, and ancillary rail storage area), as described below.

BIG's proposed rail yard would operate 24 hours per day, 365 days per year. The rail yard would have approximately 860 employees during Opening Year (2028), 1,010 employees in Interim Year (2033), and 1,125 employees during Horizon Year (2048)[5], which would accommodate both the block swap yard and intermodal facility operations. Employees would be split evenly between three shifts.

While the block swap yard would change the number of trains that would arrive or depart BIG by optimizing for end destinations, it would not increase the number of containers. BIG's intermodal facility would, through the cross-dock intermodal operation, add a new volume to the BNSF network, totaling approximately 3.2 trains per day on average in 2028, approximately 4.3 trains per day on average in 2033, and approximately 4.9 trains per day on average in 2048. These train counts include eastbound and westbound trains, and as described elsewhere, trains between the Ports and the BIG intermodal facility would be comprised of dedicated Tier 4 locomotives.

Intermodal Facility

BIG's intermodal facility is proposed at the southern extent of the BIG Specific Plan area and its operations would consist of two types: cross-dock intermodal and "other" operations. BIG's intermodal facility would operate differently than typical intermodal facilities in that most of the containers processed at BIG intermodal facility would not arrive or leave externally by heavy-duty trucks. Instead, almost all of the containers would arrive or leave by train and be processed via BIG's unique "cross-dock intermodal" operation. The intermodal facility's primary purpose would be to transfer containers between railcars and electric hostlers[6] for cross-dock movements at the onsite proposed transload warehouse center, and vice versa, though a small portion would arrive by heavy-duty truck. The electric hostlers would be used to transport containers within the rail yard, and between the rail yard and transload warehouse center. The electric hostlers would be zero-emission and would not leave BIG. This differs from the operations at a traditional intermodal facility where the primary purpose is to transfer containers from heavy-duty trucks[7]

[5] A "Horizon Year" is the last year of analysis. BIG's Horizon Year is 20 years after opening.

[6] Electric hostlers are trucks used for moving trailers and containers short distances within freight terminals, rail yards, and warehouses. Electric holsters would not use public roadways outside of BIG footprint.

[7] "Heavy-duty" trucks are conventional highway trucks that travel on public roads and carry containers intra- and inter-state.

to railcars, and vice versa (defined as "other" operations). BIG also includes a dedicated fleet of Tier 4 linehaul locomotives[8] to move containers between the Ports and the BIG intermodal facility.

BIG's intermodal facility would be composed of various components including railroad tracks, cargo handling equipment, an automated gate system, circulation roadways, yard equipment parking, container parking, stormwater detention ponds, electric vehicle charging stations, and buildings and ancillary rail facilities. Containers would be stored in parking spaces and low stacks at the intermodal facility, along with the ancillary rail area, and transload warehouse center (each described further below). Although electric lift equipment would be utilized to the extent commercially feasible within BIG's intermodal facility, a small 5,000-square-foot fuel canopy would be constructed in the electric hostler maintenance area to accommodate fueling of hybrid equipment. Hybrid and diesel equipment would include rubber-tired gantry cranes, seven air compressors, welders, railcar wheel change machines, and heavy-duty truck transport refrigeration units. The fuel canopy would be served by a 10,000-gallon unleaded fuel aboveground storage tank and a 20,000-gallon diesel fuel aboveground storage tank, with both controlled by an electronic fuel control system. In addition, starting in BIG opening year 2028, BNSF would increase the renewable diesel composition within their existing southern California fueling sites, including the existing fueling sites at the Ports and Barstow classification yard from 1 percent to 10 percent, a 900 percentage point increase in renewable diesel. This would improve the emissions of all BNSF trains fueling at the Ports, including those BNSF trains that would not stop at BIG.

BIG's intermodal facility proposes approximately 134,000 square feet of support buildings and structures, as detailed in **Table 2: BIG Intermodal Facility Structures**. As described below, final building sizes may vary slightly, this EIR conservatively analyzes up to 150,000 SF of support buildings and structures.

Table 2: BIG Intermodal Facility Structures

Building/Canopy	Square Footage
Administration Building	23,000
Electric Hostler Employee and Maintenance Building	39,000
Drivers Assist Building	5,000
Crane Maintenance Employee and Storage Building	5,000
Crane Maintenance Canopies	22,500
Container Safe Haven Canopies	2,500
Quick Repair Canopy	10,000
AGS Kiosk Canopies	20,000
AGS Portals	2,000
Emergency Fuel Station Canopy for Hybrid Vehicles	5,000
Total	*134,000*
Assumed Building Total for Final Design	*150,000*

Note:
The square footage described is an estimate and may vary up to 10% depending on the final engineering, therefore, the total square footage for planning purposes is estimated at approximately 150,000 sf.

[8] "Tier" refers to emissions standards set by regulatory agencies for engine emissions, with Tier 0 referring to the oldest and having the highest emissions, while Tier 4 is the latest, more stringent standard with the fewest emissions.

Block Swap Yard

The block swap yard is proposed within the middle portion of the BIG Specific Plan area, on approximately 410 acres of the rail yard's total approximately 1,950 acres. The proposed block swap yard would allow for the transfer of multiple railcars, or "blocks" of intermodal rail cars between trains via Tier 4 switcher locomotives. A block is defined as rail cars of a similar type moving to a similar destination that are already connected and can be combined with other blocks intended for similar destinations to produce more efficient train movements. The entire block of rail cars would remain coupled together and be moved en masse, permitting the synchronizing of blocks to their destinations, so that each train would be compiled of rail car blocks travelling to similar destinations. Blocks could be assembled from inbound trains or trains processed at the intermodal facility carrying containers processed at the transload warehouse center. Certain train blocks may stage at the block swap yard until another train arrives with similar destination. The block swap yard would facilitate switching and transfer of lengthy rail car blocks between tracks for assembling departing trains. Thus, by synchronizing trains to their destinations, the block swap yard would improve train efficiency eastbound and westbound. The rail car blocks within the block swap yard would include containers from BIG's intermodal facility and containers processed at the transload warehouse center, combining as needed based on their destination.

The block swap yard's function is unique compared to a typical classification yard, such as the existing Barstow classification yard. Classification yards are where trains being processed are made up of non-intermodal railcars (i.e., individual boxcars, gondolas, open and closed hopper cars, automobile railcars, and tank cars), rather than intermodal railcars. BNSF designates these types of trains with a different train identification than those that would be processed at BIG. Further, BNSF uses different equipment to process these trains than would be used at BIG. While there is a small intermodal facility component adjacent to the existing Barstow classification yard, that intermodal facility is only used to process overflow from other BNSF intermodal facilities. By contrast, BIG's block swap yard would disassemble and assemble lengthy blocks of railcars with intermodal containers to similar destinations utilizing Tier 4 switcher locomotives. The existing Barstow classification yard also utilizes switcher locomotives as part of its operations, although they are currently Tier 0/0+/1+ switchers. Starting in BIG opening year 2028, BNSF will voluntarily retire all existing Tier 0/0+/1+ switcher locomotives at the unrelated existing Barstow classification yard, and in their place add six Tier 4 switcher locomotives.

Ancillary Rail Area

The ancillary rail storage area is an approximately 400-acre area north of the existing mainline and would be graded and covered with aggregate to be used for numerous purposes, including a container yard, truck chassis storage, and storage of maintenance equipment. A container yard would support the storage of empty containers awaiting loading while chassis storage would be used to provide parking for empty chassis awaiting use for loading, unloading, or draying of containers. The ancillary rail storage area would also be used for storage of spare parts and equipment for track maintenance, including rail, ties, turnouts, and other track material.

Mainline Improvements

BIG would retain the existing two rail mainlines ("north mainlines") within their current alignments, except at bridge crossings, which would be upgraded. BIG also proposes to construct two new mainlines ("south mainlines"), which would traverse the proposed rail yard in an east-west orientation, extending from Lenwood Road on the east to Hinkley Road on the west. During the construction phase, the south mainlines would be used to divert train traffic from the existing mainlines while they are upgraded. During BIG operations, half of the trains which would bypass BIG would use the north mainlines and half would use the south mainlines to balance train counts between the mainlines. BIG would also upgrade various bridge crossings including replacement of the crossing at Lenwood Channel to accommodate the proposed Lenwood Channel widening; removal of existing culverts[9] to accommodate proposed culverts for the overall rail yard; and replacement of two structures to meet BNSF standards regarding 50- and 100-year flood conditions.

Transload Warehouse Center

The transload warehouse center is proposed at the northern extent of the BIG Specific Plan area, on approximately 1,330 acres of BIG SP's total approximately 4,300 acres. The transload warehouses would be designed to process the contents of containers from cross-dock intermodal operations, with a small percentage dedicated to processing the contents of containers that have a portion destined for the Inland Empire (the remainder of the container's contents would be placed on trains destined eastward). A small percentage of containers processed at the transload warehouse center would arrive/leave by heavy-duty trucks, primarily from/to the Inland Empire. The transload warehouse center would process most of the containers within an on-site "closed loop" operation between BIG's intermodal facility and the transload warehouse center. The transload warehouse center would include approximately 9.0 million square feet of transload warehouses. The transload warehouse center would be fully built during construction, but operations would gradually increase as customers relocate to BIG. Transload warehouse center operations would include approximately 2,767 employees in Opening Year, approximately 3,660 employees in Interim Year, and 4,248 employees in Horizon Year.

The transload warehouse center would be composed of multiple buildings of various configurations and sizes, depending on tenant needs. As such, **Figure 3** provides a conceptual site plan for illustrative purposes showing potential transload warehouse buildings, locations, and sizes. Final transload warehouse buildings, locations, and sizes may differ from those proposed and would be processed with the City, as development occurs. Each transload warehouse would include container parking/storage areas, employee parking, stormwater/hydrology improvements, and landscaping. Finally, emergency generators are proposed throughout the transload warehouse center to provide electric power in the event of a power outage.

There would also be several areas distributed around the transload warehouse center, adding up to approximately 275 acres, for staging/overflow parking of containers accessing the transload warehouse center. These warehouse staging areas would be for truck containers only; truck "hoteling"[10] would not

[9] Culverts are drainage features, typically a pipe or arch, used to convey water under a road or rail tracks.
[10] Truck "hoteling" refers to when a heavy-duty truck parks for the driver to rest within the cab.

occur, as electric hostlers would transfer containers to/from these areas, thus, heavy-duty truck trailers would not enter or exit these areas.

Hydrology/Stormwater Drainage Improvements

BIG would construct various infiltration basins and drainage outlets to the Mojave River that would be designed for 100-year flood events. Preliminarily, BIG proposes detention ponds of various sizes throughout BIG footprint totaling approximately 165 acre-feet of storage volume, which would accommodate the 100-year flood conditions.

In addition to various ephemeral washes throughout BIG footprint, three other primary hydrologic features traverse BIG footprint, as detailed below.

Unnamed Stream (Milepost 10.9): This feature is a dry wash from Main Street to the Mojave River that includes a sharp western bend. This feature would be realigned to accommodate track mains, sidings, and support tracks and improved with a combination of bridges and box culverts spanning the channel (Bridge 10.9a and Bridge 11.2, respectively).

Hinkley Road Bridge at Mojave River (Milepost 10.5): The existing Hinkley Road Bridge, which the County owns and maintains, is at a narrowed section of the Mojave River and crosses via a concrete pier structure. Based on discussions with the County, the existing Hinkley Road Bridge over the Mojave River is experiencing structural issues and is at risk of being over-topped from seasonal flooding. Hydrology and hydraulic analyses have indicated the existing bridge is undersized. To maintain a roadway connection to Hinkley Road from the transload warehouse center, BIG proposes to replace the existing bridge with a longer structure to better match the channel width of the Mojave River at that location. The channel beneath, and immediately adjacent to, the existing bridge would be excavated and widened to match the natural channel width more closely. Portions of Hinkley Road immediately east and west of the bridge would be raised to reduce exposure to Mojave River flood events. These proposed improvements at Hinkley Road Bridge would reduce flooding compared to existing conditions. As part of the improvements, the existing at-grade crossing would be abandoned, and vehicles would instead utilize the proposed Hinkley Road extension through the transload warehouse center.

Lenwood Channel (Milepost 6.5): A portion of the BIG footprint along Lenwood Channel is currently within the Federal Emergency Management Agency's (FEMA) 100-year flood zone due to existing flooding concerns. Lenwood Channel is a north-south earthen channel used to convey water from the southeast to the Mojave River and maintained by San Bernardino County Flood District. Lenwood Channel would be widened by approximately 60 to 100 feet throughout the Specific Plan area for a length of 1.1 miles, continuing offsite south of Main Street, for an additional 1 mile. The widened channel would improve flooding compared to existing conditions. Preliminary BIG design requires the Lenwood Channel to be spanned at three locations for additional track east leads, mains, and sidings, as well as three roadway crossings: Main Street, Hinkley Road, and the private road between the intermodal facility and transload warehouse center.

Utility Improvements

To accommodate the proposed rail yard and transload warehouse center, BIG would require both relocations of existing facilities and construction of new/expanded facilities (i.e., water, wastewater, electric power, natural gas, and telecommunications). The utility improvements proposed within BIG's footprint are discussed below.

Water

BIG's construction phase water demand includes non-potable water for construction activities and potable water for onsite construction workers. To provide non-potable water during the construction phase, up to eight new private onsite temporary groundwater wells would be constructed within BIG's transload warehouse center portion.

Temporary aboveground connections from Golden State Water Company existing mains within Main Street to BIG would be constructed to supply potable water to the construction sites. Additionally, Mojave Water Agency owns and operates a 48-inch recharge water line that crosses the BIG Specific Plan area. BIG proposes to relocate this existing line to the north to avoid conflict with rail yard and transload warehouse center improvements.

Operational potable water and fire flow water would be provided by directly connecting to facilities owned and operated by the Golden State Water Company. Fire flow would be supplemented by on-site water tanks and fire pumps if necessary to meet the fire flow requirements. Power to water tanks and fire pumps would be supported by the transload warehouse diesel backup generators in the case of an emergency. Water tanks would be placed entirely within the BIG footprint. The transload warehouse center would connect to an existing water main in Jasper Road on the east end of the BIG Specific Plan area. The rail yard would connect to an existing water main on the east end of the BIG Specific Plan area near Lenwood Road on the south side of Main Street. A new public 12- to 16-inch looped water main would be constructed from the existing connection in Main Street, extending west to the edge of rail yard, north to Hinkley Rd, and then continue east in Hinkley Road to the existing connection point near Lenwood Road. A second connection from the looped water main would be provided at the northeast corner of the Specific Plan at Lenwood Road. The new onsite public water mains total approximately 10 miles in length.

Wastewater

BIG's construction-related wastewater generation would be from construction workers. Temporary portable facilities (i.e., portable restrooms and portable handwash stations) would be utilized during the construction phase.

BIG's operational wastewater generation would be from transload warehouse center and rail yard employees, and the rail yard wash bays and track pans. Wastewater generated by BIG would discharge to the City's existing wastewater system at three connection points. The transload warehouse center would discharge to the proposed new sewer main in Hinkley Road. A new 8-inch wastewater line is proposed within the Hinkley Road extension from the west end of the transload warehouse center to the northeast end of the transload warehouse center and would connect to the existing sewer main in Lenwood Road.

Within the transload warehouse center, west of the Lenwood Channel, 8-inch lines would extend north in C Street to serve the transload warehouses connecting to Lenwood Road via B Street. The rail yard would include new wastewater lines and force mains at the southern portion of the rail yard, conveying wastewater to the east and connecting to the existing sanitary sewer main in Main Street near Country Club Drive. BIG's wastewater would be conveyed by gravity flow to and treated at the Barstow Regional Wastewater Treatment Facility, which is owned and operated by the City. Wastewater conveyance and treatment would be coordinated with the City.

Electrical Power

BIG construction activities would generate temporary electric power demand from construction equipment, tools, lighting, and other necessary facilities (e.g., temporary offices). The electric power for construction activities would be supplied through connections to existing Southern California Edison (SCE) facilities.

BIG operations would generate permanent electric power demand from the transload warehouse center (lighting, electric vehicle charging for material handling, and forklifts) and rail yard (lighting, buildings, cranes, and electric hostlers (used to move containers between the rail yard and the transload warehouse center). BIG operational electric power demand would be met through connecting to the SCE Tortilla Substation and supplemented with on-site electrical generation (i.e., an approximately 140-acre, approximately 21 megawatts solar power generation facility (i.e., solar farm), which is described further below. BIG proposes to construct the following on-site electric power facilities to serve BIG:

- Three substations: two substations at the eastern and western extents of the rail yard; and one substation within the solar farm.
- Additional 33kV distribution lines connecting via underground duct banks in a loop around the west end of the intermodal facility and north end of the transload warehouse center. These proposed 33KV distribution lines would total 23 miles of ductbank within the BIG Specific Plan area.
- An approximately 140-acre solar farm is proposed south of BIG rail yard, at the southwest corner of the Main Street at Country Club Drive intersection. The solar farm is estimated to generate approximately 21 megawatts to serve BIG. The solar farm would include a battery electric storage system (BESS) and a new substation at the northwest corner to route power from the solar farm to BIG rail yard. The solar farm would be fenced to prevent trespass and would include internal roadways for maintenance vehicles. The solar farm would require minimal grading to level the site as existing topography is utilized wherever possible and excavation limited primarily to stormwater detention to capture runoff. Additionally, BIG would comply with CalGreen regulations requiring that rooftop solar generation be installed on the industrial warehouse rooftops (Title 24, Section 140.10). Based on 9.0 MSF of transload warehouse, BIG would include approximately 6.4 MW of rooftop solar generation for Title 24 compliance.
- Emergency diesel generators are proposed at various locations across the rail yard and transload warehouse center to provide backup power in the event of Tortilla Substation service interruptions. Rail yard generators would only be used if a power outage were to occur at

nighttime, as the proposed solar farm would provide sufficient power during daytime in the event of a power outage. The rail yard would include up to 10 generators at the far western extent, while the transload warehouse center would include up to 29 generators dispersed throughout. Generators would require up to 50 hours of testing and maintenance operations per year.

Solar farm maintenance would consist of cleaning, inspecting, and replacing solar panels, equipment, and other system components. Maintenance trips associated with these activities would be limited to trucks transporting materials, equipment, and supplies to and from the farm. To maintain uninterrupted power generation for BIG, maintenance activities would occur incrementally. The solar farm would also require vegetative maintenance (e.g., mowing and weeding, and other grass control measures). No grading would occur during solar farm maintenance.

Natural Gas

BIG construction activities would not require construction of new natural gas facilities, although protection in place or relocation of existing natural gas facilities would be required to accommodate BIG.

Stormwater

To collect stormwater runoff, BIG proposes stormwater basins that would detain any stormwater in excess of predevelopment flows then discharge to existing drainageways through stormwater best management practices. BIG would include various outlets to the Mojave River. Exact sizing and locations of transload warehouse center basins would be dependent on final transload warehouse location, layout, and sizing. In addition, Lenwood Channel would be modified as discussed above.

Solid Waste

BIG would result in solid waste generation from construction (demolition debris, broken or excess materials, packaging, and other construction waste), as well as during operations from the rail yard and transload warehouse center. BIG's solid waste would be collected within onsite trash bins and be disposed of at the Barstow Sanitary Landfill, with 65 percent being recycled (for instance, demolished concrete foundations can be crushed and re-used onsite as aggregate).

Telecommunications

Telecommunication lines cross BIG footprint along Lenwood Road and along the southern edge of the existing tracks. Underground utilities may also be present. All underground communication facilities are assumed to have shallow depths except those crossing under existing features such as underpasses and creeks. Lines within BIG footprint may be relocated adjacent to/within existing and proposed rights-of-way or abandoned. In addition, BNSF Telecommunications would install approximately 12 communication towers with heights generally between 100 - 120 feet, though two communication towers would be 160 feet tall. Additionally, various existing telecommunications lines owned by Frontier Communications and Lumen would be removed from within BIG footprint, and, in their place, new communications line would be run beginning at the Jasper Road at Lenwood Road intersection, running to the western extent of the BIG Specific Plan area, and then running eastward back to Lenwood Road in a "loop."

On-Site Circulation Improvements

BIG would include various on-site circulation improvements as discussed below.

Hinkley Road Realignment: BIG would vacate Hinkley Road between the south side of the Mojave River bridge crossing and Main Street, closing the existing at-grade rail crossing. Hinkley Road would be realigned beginning at the north side of the Mojave River bridge crossing to connect through the transload warehouse center to the Jasper Road/Lenwood Road intersection. Transload warehouse center employees and heavy-duty trucks destined for the transload warehouse center would enter from the Lenwood Road/Hinkley Road/Jasper Road intersection.

Internal private roadways: In addition to the realigned public Hinkley Road (discussed above), BIG would include four dedicated internal private roadways for electric hostlers (private streets A, B, D, and E), and two internal private roadways for employee, visitor, and truck access (private streets C and F).

Country Club Drive: Country Club Drive would be widened along the solar farm frontage for approximately 400 feet to the proposed realignment of Sweeten Lane. A new stop-controlled intersection is proposed at the Country Club Drive at Sweeten Lane intersection.

Main Street: Rail yard employees and heavy-duty trucks destined for the intermodal facility would enter BIG's rail yard from a new driveway on Main Street across from Country Club Road. Main Street would be widened from two lanes to four lanes for approximately 0.5 mile east of Country Club, resulting in a consistent four-lane roadway width through Barstow. Additionally, the existing two-lane Main Street over Lenwood Channel low water crossing would be replaced with a new four-lane bridge that accommodates the 100-year flood condition, substantially reducing the existing flood conditions. Main Street would be raised over Lenwood channel, modifying the vertical alignment of Main Street for approximately 0.8 mile. The intent of this design is to keep flood waters contained in Lenwood Channel and convey the flow to the Mojave River under the bridge at MP 6.5, avoiding the overflow of the bank that can occur under existing conditions.

To accommodate BIG, various on-site public rights-of-way within the City and unincorporated San Bernardino County would also need to be vacated.

Off-Site Improvements

In addition to the on-site improvements described above, BIG also proposes off-site rail and non-rail improvements, as discussed below:

Off-Site Rail Improvements

BIG proposes lead track extensions to the east of approximately two miles and lead track extensions to the west of approximately seven miles ("east lead track" and "west lead track"). These off-site rail improvements would be primarily within existing BNSF right-of-way. These improvements would enable trains to safely enter and exit the mainline at mainline speeds, rather than slower "yard" speeds and risk

fouling the track.[11] BIG east and west lead tracks would require modifications to existing culverts within the footprint; see also *Stormwater Drainage* discussion below.

Off-Site Non-Rail Improvements

BIG proposes ancillary and related stormwater drainage, utility (i.e., water, sewer, electric power, natural gas, and telecommunications), and circulation/roadway improvements and modifications, described below.

Water. North of transload warehouse center, an existing Mojave Water Agency 48-inch recharge line would be relocated. The relocated line would stretch along the north side of the transload warehouse center to the west end of the BIG Specific Plan area, then continue along the north side of the mainline and lead tracks for a total of 8.3 miles.

Wastewater. An existing approximately 27-inch sanitary sewer line is within existing BNSF ROW for approximately 1.6 miles between Lenwood Road and Pettit Road. This line includes multiple north/south lateral connections to serve the land uses between Main Street and the existing BNSF tracks. BIG would relocate this line at Phillips Street south to within Main Street. Additionally, the transload warehouse center will connect to City sewer via a new 27-inch sewer line within Jasper Road extending to north of Paris Avenue.

Electric Power. Electrical demand would be handled through connecting to the Southern California Edison Tortilla Substation, located approximately 0.4 mile south of the Veterans Parkway at Diamond Avenue intersection. Three underground duct banks with electrical conductors would connect BIG to the Tortilla Substation utilizing existing franchise agreements with the City and County on a route following Main Street, Sunrise Road, N Street, and Bonanza Road before utilizing existing easements between Bonanza Road and the substation. This proposed 33KV distribution route would extend approximately 7.1 miles underground from the Tortilla Substation to the intermodal facility's eastern extent at Country Club drive, then continue overhead approximately 3.5 miles from Country Club Drive to approximately Hinkley Road. For the 33kv line segment from Tortilla Substation to BIG, the 33kv circuits would be in underground utility lines resulting in an approximately 30-foot-wide disturbance to account for construction access and temporary spoils. From Tortilla substation to H Street (approximately 1.2 miles), the 33kv conduit could occur within a 450-foot-wide corridor, inclusive of the existing 150-foot wide SCE easement along Bonanza Road. However, the exact alignment is presently unknown and is being coordinated with SCE. Therefore, this EIR analyzes an approximately 30-foot wide disturbance within the 450-feet wide corridor ("33kv distribution corridor"). This EIR analyzes the "worst-case" environmental impacts within the 33kv distribution corridor. SCE would make modifications, which include constructing new feeders and new power distribution lines. Within the Tortilla Substation's existing fence line, SCE would also make modifications to supply the new feeders from their existing 115kV-33kV transformers. Various offsite existing electric power lines could be relocated, modified, or extended to accommodate BIG improvements.

[11] "Fouling the track" means the placement of an individual or an item of equipment in such proximity to a track that the individual or equipment could be struck by a moving train or on-track equipment, or in any case is within four feet of the field side of the near running rail (49 CFR Part 214). When a rail network becomes congested, trains can foul the track by moving slower than a train behind them.

Natural Gas. Various off-site existing natural gas lines could be relocated to accommodate BIG improvements.

Telecommunications. No offsite telecommunications improvements are proposed. Various minor existing telecommunications lines would be relocated toward the eastern end of the lead track improvements. Existing telecommunications lines passing through the intermodal facility and block swap yard would be relocated to the north side of the Main Street ROW.

Stormwater Drainage. As described above, the Lenwood Channel widening would continue offsite, south of Main Street. It would be widened by approximately 60 to 100 feet for a total of approximately 2.1 miles (of which 1 mile would be offsite) to improve flooding compared to existing conditions. At the Main Street crossing at Lenwood Channel, BIG would replace 0.8-mile of the existing Main Street low water crossing of Lenwood Channel with a bridge and raise and widen the road through this stretch west to the new intermodal facility entrance. These improvements accommodate the City/County master plan and improve flooding compared to existing conditions.

Other. To accommodate wildlife crossings from south of Main Street to the Mojave River without potential conflict with vehicular or train traffic, BIG proposes an underground wildlife crossing under Main Street west of the existing Hinkley Road.

Circulation/Roadway. Jiggs Road would be realigned generally from just east of Indian Trail to Hinkley Road to maintain emergency access from Indian Trails to Hinkley Road. In addition, a maintenance road would be constructed alongside the mainline to provide maintenance access to the tracks, generally from just east of Indian Trail to Hinkley Road. Various circulation and roadway improvements and modifications are proposed outside the BIG Specific Plan area. All circulation improvements would be permanent, except a temporary Main Street bypass. The temporary bypass would be constructed to maintain access along Main Street during Lenwood Channel Bridge reconstruction. To maintain access for adjacent residents, the temporary Main Street bypass would include private driveways for adjacent residential uses and would be open for the approximately 18-month bridge reconstruction period. Once the Lenwood Channel Bridge reconstruction is complete, the bypass would be removed and the site restored to its original condition. Additionally, construction of additional lead tracks over Pettit Road (approximately 1,100 feet west of SR-58) would require the road to be lowered by approximately 2.0 feet. BIG would also vacate various ROW within the City and County. Finally, Sweeten Lane would be vacated and realigned to eliminate the existing unimproved intersection with Main Street. A new paved access would extend from Country Club east approximately 1,000 feet and connect to the unimproved Sweeten Lane.

Maintenance Activities

While "light maintenance activities"[12] could occur at BIG, major maintenance activities[13] would still occur at the existing Barstow classification yard, thus, requiring short-distance trips via BNSF's existing mainline to and from the existing Barstow classification yard for heavy maintenance. Locomotive trips associated

[12] "Light maintenance activities" means routine locomotive servicing (e.g., window washing, fueling, inspecting fluid levels and topping off fluids, stocking cabins with crew equipment such as water and trash bags, toilet servicing) and minor railcar servicing (e.g., wheel changes, brake and friction shoes, and loose or missing bolts)

[13] "Major maintenance activities" means repair of railing and platform, railcar suspension, hitches, engine, etc.

with maintenance activities would be based on the number of linehaul locomotives needed to move trains between the Ports and BIG intermodal facility, and the number of switcher locomotives needed to haul rail cars within BIG intermodal facility and block swap yard. All switcher locomotives at BIG would be Tier 4 locomotives, and BNSF would also retire all existing Tier 0/0+/1+ locomotives at the unrelated existing Barstow yard and, in their stead, add six Tier 4 switcher locomotives.

2.3 Project Construction Activities and Phasing

For analysis purposes, construction is anticipated to occur over approximately 34 months beginning in the third quarter of 2025 and ending in the third quarter of 2028. The entirety of BIG's construction activities, including off-site improvements, are analyzed in this report and described below. The anticipated construction phase timing is shown in **Table 3: BIG Construction Schedule**. However, the current construction schedule anticipates that BIG construction would begin approximately August 2026, and end approximately July 2029, for an approximate 13-month shift from the schedule shown in **Table 3** and analyzed in this technical report. However, construction duration (34 months) would remain unchanged. Further, given fleet turnover and compliance with increased regulatory requirements, construction and operational air quality emissions would improve over time as is reflected in CalEEMod, the California Air Resource Board's air quality emissions modeling platform.

During peak construction periods, work would be under way at several locations within BIG footprint simultaneously, with overlapping construction of various elements. Construction working hours and the number of workers present at any time would vary depending on the activities being performed. BIG construction would require approximately 8,177 construction workers per year.[14]

Table 3: BIG Construction Schedule

Phase	Start Date	End Date
South Mainlines	8/7/2025	10/2/2026
Intermodal Facility	8/7/2025	1/4/2027
Block Swap Yard	1/22/2026	6/8/2028
North Mainlines	5/27/2027	6/8/2028
Transload Warehouse	2/5/2026	12/6/2027
33 kV Distribution Undergrounding	9/13/2025	5/7/2027
Solar Site	3/20/2026	2/27/2027

Nighttime construction could occur throughout the BIG footprint except where within 300 feet of sensitive receptors (along the 33kv distribution line). To avoid potential noise and vibration impacts from pile driving, BIG proposes to establish a buffer of 1,800 feet for nighttime pile driving and 500 feet for daytime pile driving from sensitive receptors. Additionally, nighttime construction would be necessary for track work adjacent to the existing mainline where lead tracks would tie into the mainline. All construction activities would occur within BIG footprint.

BIG components would involve the following construction activities:

[14] Based on 23,200 construction worker "job years".

2.4 Demolition and Grading

The BIG footprint is primarily vacant, undeveloped land traversed by an existing BNSF railroad and containing scattered residential, commercial, and industrial land uses. Existing land uses within BIG's footprint are listed in **Table 1.** All existing land uses not demolished during acquisition to avoid trespassing and safety concerns would be demolished prior to, or during, mass grading. In addition, existing utilities (underground and aboveground) within BIG footprint would be removed or temporarily relocated as needed.

Six culverts/bridges would need to be demolished within the existing BIG footprint. Demolition would involve excavators to break apart bridge abutments and foundations.

Mass grading would occur in one phase across the BIG footprint and require approximately 26 million cubic yards of cut and fill. Mass grading would be typified by large construction equipment establishing the area's general grading contours. For locations supporting future buildings, roadways, or track, mass grading would include watering and compaction of soil to provide a stable subgrade. Earthwork onsite would be balanced, with excess cut from the rail yard being used as fill within the transload warehouse center.

Fine grading would include site-specific grading for the transload warehouse center, as well as finish grading around buildings, parking areas, curb and gutter, etc.

Construction of Rail Yard (Intermodal Facility and Block Swap Yard)

The likely sequence for BIG rail yard construction (intermodal facility and block swap yard) would include mass grading; compacting the rail bed and internal roadways/parking areas; installing underground improvements/utilities; fine grading; installing crushed rock subballast; laying track and ballast; and installing train signals and communications systems. To reduce construction trucking, BIG would bring rail ties, welded rail, and rail ballast in via train.

Rail yard construction elements would include surface and elevated track work where the track would cross a water feature, a grade-separated roadway crossing for electric hostlers to access (and return from) the transload warehouse center, and installation of an intermodal facility. Major construction activities would include grading and excavation support, underground utility installation, systems construction, bridge construction, and railway systems construction (including trackwork, signaling, and communications). High-mast lights (up to 120 feet in height) would be constructed throughout the rail yard, including foundation work, conduits, and security camera positions. Rail yard construction would also include foundations and tracks for gantry cranes.

Furthermore, the proposed rail yard area would be excavated to result in a nearly-level grade between the east and west ends. With the proposed grading, most of the rail yard would be approximately 30-45 feet below Main Street. Various key BIG elements are also shown below.

Rail materials such as rail ties, welded rails, and ballast would be delivered by train. As noted above, the two existing north mainlines would be protected in place except at the bridge crossings, and two new south mainlines constructed. The south mainlines would be constructed first, and, during the first year of

construction, existing rail traffic would use the new south mainlines so that the existing mainlines can be rebuilt and their bridge crossings upgraded. Mainline, rail yard, and lead track construction would utilize a Track-Laying Machine for approximately 20 months to lay track.

Intermodal facility construction would include various administrative and support buildings and substantial paving for the container parking and storage.

Solar Farm Construction

Solar farm construction, which would occur in a single phase, would require minimal grading to level the site as existing topography is utilized wherever possible and excavation limited primarily to stormwater detention to capture runoff. Fencing would be installed around the solar farm's perimeter of the solar farm, internal drive-aisles would be graded and paved, and the proposed substation would be constructed per SCE standards.

Construction of Transload Warehouse Center

Construction elements for the transload warehouse center would include grading, over-excavation,[15] footing and foundation excavation and pouring, tilt-up panel concrete construction, parking lot grading and paving, utility installation and undergrounding, and hydrology/drainage improvements.

Construction of On-Site Bridges and Roadway Improvements

Railroad bridge and roadway construction may use various methods including segmented pre-cast, cast-in-place, box girder or pre-cast, and span-by-span techniques.

Pre-construction activities would occur during final design and would include geotechnical investigations, identification of staging areas, initiation of site preparation and demolition, relocation of utilities, and implementation of temporary, long-term, and permanent road closures. Two bridges would be constructed over Lenwood Channel (BR 6.5D, 6.5E, and BR 6.5F) to enable traffic to flow from either side of Lenwood Channel.

Construction of Off-Site Rail Improvements

Off-site rail improvements would include clearing and grubbing, bridge crossing construction, ballast placement, track laying, and connection to the mainline. Off-site rail improvements would parallel the existing mainline and primarily be within existing BNSF right-of-way. BIG's rail deliveries of rail ties and ballast would include materials for construction of off-site rail improvement.

Construction of Off-Site Non-Rail Improvements

Off-site non-rail improvements would include construction of drainage, utility, and roadway improvements.

Drainage. Lenwood Channel improvements would consist of scouring and widening the channel. Construction equipment would be within Lenwood Channel in order to accomplish the widening.

[15] "Over-excavation" refers to removal and re-compaction of soil.

Utilities. Additionally, off-site construction would include utility improvements including the 33kv distribution/Tortilla Substation improvements. Construction processes are anticipated to include clearing and grubbing, saw cuts and demolition of existing pavement, excavation to approximately 10 feet below ground surface, installation of temporary shoring, placement of circuits and distribution lines, fill placement and removal of temporary shoring, and roadway repair.

Roadways/Intersections. A bridge over Lenwood Channel for Main Street would be constructed to replace the existing low water crossing and accommodate widening of Main Street in that immediate area. Additionally, BIG proposes roadway/intersection improvements/modifications, including the installation of traffic signals at various intersections.

Typical construction processes for these off-site non-rail improvements would include clearing and grubbing, over-excavation, bridge construction, traffic signals with associated underground conduits and cabling, and restriping and asphalt or concrete pavement placement, where needed. Laws, Regulations, and Orders.

3.0 REGULATORY SETTING

Federal, state, and local laws, regulations, orders, or plans relevant to HMW and that apply to BIG are presented below.

3.1 Federal

Comprehensive Environmental Response, Compensation and Liability Act

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, commonly known as the Superfund, was enacted to protect the water, air, and land resources from the risks created by past chemical disposal practices such as abandoned and historical hazardous wastes sites. Through the CERCLA, the US Environmental Protection Agency (EPA) was given power to seek out those responsible for any release and ensure their cooperation in the cleanup. This federal law created a tax on the chemical and petroleum industries that went to a trust fund for cleaning up abandoned or uncontrolled hazardous waste sites. The CERCLA also enabled the revision of the National Contingency Plan, which provided the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, or contaminants. The National Contingency Plan also established the National Priority List of sites, which are known as Superfund sites. The CERCLA was amended by the Superfund Amendments and Reauthorization Act on October 17, 1986.

Emergency Planning and Community Right-To-Know Act

In 1986, Congress passed the Superfund Amendments and Reauthorization Act. Title III of this regulation may be cited as the "Emergency Planning and community Right-to-Know Act of 1986" (EPCRA). The Act required the establishment of state commissions, planning districts, and local committees to facilitate the preparation and implementation of emergency plans. Under the requirements, local emergency planning committees are responsible for developing a plan for preparing for and responding to a chemical emergency, including:

- Identify local facilities and transportation routes where HMW are present.
- The procedures for immediate response in case of an accident (this must include a community-wide evacuation plan).
- A plan for notifying the community that an incident has occurred.
- The names of response coordinators at local facilities
- A plan for conducting drills to test the plan.

The emergency plan is reviewed by the State Emergency Response Commission and publicized throughout the community. The local emergency planning committee is required to review, test, and update the plan each year. The San Bernardino County Department of Environmental Health is responsible for coordinating hazardous material and disaster preparedness planning and appropriate response efforts with city departments and local and state agencies. The goal is to improve public- and private-sector readiness and to mitigate local impacts resulting from natural or man-made emergencies.

Another purpose of the Emergency Planning and community Right-to-Know Act is to inform communities and citizens of chemical hazards in their areas. EPCRA §§ 311 and 312 requires businesses to report to state and local agencies the location and quantities of chemicals stored onsite. Under EPCRA § 313, manufacturers are required to report chemical releases for more than 600 designated chemicals. In addition to chemical releases, regulated facilities are also required to report off-site transfers of waste for treatment or disposal at separate facilities, pollution prevention measures, and chemical recycling activities. The EPA maintains the Toxic Release Inventory database that documents the information that regulated facilities are required to report annually.

Resource Conservation and Recovery Act

At the federal level, the principal agency regulating the generation, transport, treatment, storage, and disposal of "hazardous wastes" is the EPA, under the authority of the Resource Conservation and Recovery Act (RCRA) (42 United States Code [USC] § 6901 et seq.). The RCRA gave the EPA authority to control hazardous waste from "cradle to grave," that is, from generation to transportation, treatment, storage, and disposal. The RCRA also sets forth a framework for the management of nonhazardous wastes. RCRA was amended in 1984 by the Hazardous and Solid Waste Amendments of 1984 which specifically prohibited the use of certain techniques for the disposal of various hazardous wastes and required phasing out land disposal of hazardous waste. The 1986 amendments to the RCRA enabled the EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. In California, the EPA has delegated many of the RCRA requirements to the state's Department of Toxic Substances Control (DTSC). It should be noted that the RCRA focuses only on active and future facilities and does not address abandoned or historical sites. Some of the other mandates of this strict law include increased enforcement authority for the EPA, more stringent hazardous waste management standards, and a comprehensive UST program.

Clean Air Act

The Clean Air Act (CAA) (42 USC § 7401 et seq.) was enacted to protect the general public from exposure to airborne contaminants that are known to be hazardous to human health. Under the CAA, the EPA established National Emissions Standards for Hazardous Air Pollutants, which are emissions standards for air pollutants, including asbestos. Under the CAA, businesses that use extremely hazardous substations must develop a Risk Management Plan. A Risk Management Plan must contain an off-site consequence analysis, five-year accident history, accident prevention program, emergency response program, and a certification of the truth and accuracy of the submitted information.

Clean Water Act

The Clean Water Act (CWA) (33 USC § 1251 et seq., also known as the Federal Water Pollution Control Act of 1972), was enacted with the intent of restoring and maintaining the chemical, physical, and biological integrity of the waters of the U.S. The CWA requires states to set standards to protect, maintain, and restore water quality through the regulation of point source and certain non-point source discharges to surface water. Those discharges are regulated by the National Pollutant Discharge Elimination System (NPDES) permit process (33 USC § 1242 or CWA § 402). In California, NPDES permitting and regulatory

authority is delegated to, and administered by, the nine Regional Water Quality Control Boards (RWQCBs). The BIG footprint is within the jurisdiction of the Lahontan RWQCB.

§ 402 of the CWA authorizes the State Water Resources Control Board (SWRCB) to issue NPDES General Construction Storm Water Permit (Water Quality Order 99-08-DWQ), referred to as the "General Construction Permit." Projects that disturb one or more acres are required to obtain NPDES coverage under the Construction General Permits. Construction activities can comply with and be covered under the General Construction Permit provided that they:

- Develop and implement a Storm Water Pollution Prevention Plan which specifies Best Management Practices (BMPs) that would prevent all construction pollutants from contacting stormwater and with the intent of keeping all products of erosion from moving offsite into receiving waters;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation; and
- Perform inspections of all BMPs.

Safe Drinking Water Act

The Safe Drinking Water Act (42 USC § 300[f] et seq.) regulates discharges of pollutants to underground aquifers and establishes standards for drinking water quality. The Act authorizes EPA to establish minimum standards to protect tap water and requires all owners or operators of public water systems to comply with these primary (health-related) standards.

Lead Exposure in Construction – Occupational Safety and Health Administration

Title 29, CFR § 1926.62, sets standards for occupational health and environmental controls for lead exposure in construction, regardless of the lead content of paints and other materials. The standards include requirements addressing exposure assessment, methods of compliance, respiratory protection, protective clothing and equipment, hygiene facilities and practices, medical surveillance, medical removal protection, employee information and training, signs, recordkeeping, and observation and monitoring.

National Emission Standard for Asbestos

Title 40, CFR Part 61 Subpart M establishes national emission standards for asbestos containing materials during demolition and renovation. Furthermore, the regulation outlines procedures for asbestos emission control during demolition or renovation activities.

Toxic Substances Control Act

The Toxic Substances Control Act of 1976 (TSCA) (15 USC § 2601 et seq.) regulates manufacturing, inventory, and disposal of industrial chemicals including Hazardous Materials and Wastes (HMW). The TSCA provides the EPA with authority to require reporting, record-keeping and testing requirements, and restrictions relating to chemical substances and/or mixtures. TSCA addresses the production, importation, use, and disposal of specific chemicals including polychlorinated biphenyls (PCBs), asbestos, radon, and lead-based paint. The EPA repeatedly screens these chemicals and can require reporting or testing of

any that may pose an environmental or human health hazard. It can ban the manufacture and import of chemicals that pose an unreasonable risk. Also, the EPA has mechanisms in place to track the thousands of new chemicals that industry develops each year with either unknown or dangerous characteristics. It can control these chemicals as necessary to protect human health and the environment. The act supplements other federal statutes, including the CAA and the Toxic Release Inventory under the EPCRA.

Federal Insecticide, Fungicide, and Rodenticide Act

The Federal Insecticide, Fungicide, and Rodenticide Act (7 USC § 136 and 40 CFR Parts 152 to 171) regulates the manufacturing, distribution, sale, and use of pesticides.

Hazardous Materials Transportation Act

The Hazardous Materials Transportation Act of 1975 (Federal Hazmat law) (49 USC § 5101 et seq. and 49 CFR Parts 101, 106, 107, and 171-180) regulates the transport of HMW by motor vehicles, railcars, marine vessels, and aircraft. Enforcement authority is shared by the Pipeline and Hazardous Materials Safety Administration (PHMSA), Federal Motor Carrier Safety Administration, Federal Railroad Administration (FRA), Federal Aviation Administration (FAA), and the United States Coast Guard. Each of these federal agencies has authority to enforce the Hazardous Materials Regulations (49 CFR Parts 171-180) against any person subject to them, but each has a particular emphasis to its enforcement activities. The federal agencies which would enforce the Hazardous Materials Regulations relevant to BIG include:

- PHMSA, which enforces the shipment of HMW and the manufacture, fabrication, marking, maintenance, reconditioning, repair, or testing of multi-modal containers that are represented, marked, certified, or sold for use in the transportation of HMW.
- Federal Motor Carrier Safety Administration, which enforces the transportation or shipment of HMW by highway, and the Federal Motor Carrier Safety Regulations (49 CFR Parts 350-399), issued under various motor carrier safety acts codified at 49 U.S.C. § 501 et seq., § 30101 et seq., § 30301 et seq., and § 31501 et seq.
- FRA, which enforces the transportation or shipment of HMW by railroad, and the safety regulations (49 CFR 200-268) issued under the Federal Rail Safety Act (49 U.S.C. § 20101 et seq.).

Within California, the state agencies with primary responsibility for enforcing federal and State laws and for responding to transportation emergencies are the California Highway Patrol and the California Department of Transportation (Caltrans). Together, federal and state agencies designate materials or a group or class of material as hazardous and issue regulations for the safe transportation, including security, of hazardous material in intrastate, interstate, and foreign commerce. Although special requirements apply to transporting HMW, requirements for transporting hazardous waste are more stringent, and hazardous waste haulers must be licensed to transport hazardous waste on public roads. Title 49 CFR reflects laws passed by Congress as of January 2, 2006.

Spill Prevention, Control, and Countermeasure Rule

As part of the CWA, the EPA oversees and enforces the Oil Pollution Prevention regulation contained in Title 40 of the CFR, Part 112 (Title 40 CFR, Part 112), which is often referred to as the “SPCC rule” because

the regulations describe the requirements for facilities to prepare, amend, and implement Spill Prevention, Control, and Countermeasures (SPCC) Plans. A facility is subject to SPCC regulations if a single oil (or gasoline, or diesel fuel) storage tank has a capacity greater than 660 gallons, the total above ground oil storage capacity exceeds 1,320 gallons, or the underground oil storage capacity exceeds 42,000 gallons, and if, due to its location, the facility could reasonably be expected to discharge oil into or upon the "Navigable Waters" of the U.S.

Hazardous Materials Transportation Uniform Safety Act of 1990

The Hazardous Materials Transportation Uniform Safety Act (Public Law 101-615) regulates the safe transport of HMW in intrastate, interstate, and foreign commerce. The law includes provisions to encourage uniformity among different state and local highway routing regulations, to develop criteria for the issuance of federal permits to motor carriers of HMW, and to regulate the transport of radioactive materials.

Occupational Safety and Health Administration Act

Congress passed the Occupation Safety and Health Administration Act (OSHA) to ensure worker and workplace safety. Their goal was to make sure employers provide their workers a place of employment free from recognized hazards to safety and health, such as exposure to toxic chemicals, excessive noise levels, mechanical dangers, heat or cold stress, or unsanitary conditions. To establish standards for workplace health and safety, OSHA also created the National Institute for Occupational Safety and Health as the research institution for OSHA. The Administration is a division of the U.S. Department of Labor that oversees the Administration of OSHA and enforces standards in all states. OSHA standards are listed in Title 29 CFR Part 1910.

OSHA's Hazardous Waste Operations and Emergency Response Standards apply to five groups of employers and their employees. This includes any employees who are exposed or potentially exposed to hazardous substances (including hazardous waste) and who are engaged in clean-up operations; corrective actions; voluntary clean-up operations; operations involving hazardous wastes at treatment, storage, and disposal facilities; and emergency response operations.

Disaster Mitigation Act of 2000

The Disaster Mitigation Act (42 USC § 5121) amends the Robert T. Stafford Disaster Relief Act of 1988 (42 USC § 5121-5207). Among other things, this legislation reinforces the importance of pre-disaster infrastructure mitigation planning to reduce disaster losses nationwide and is aimed primarily at the control and streamlining of the administration of federal disaster relief and programs to promote mitigation activities. Some of the major provisions of this Act include:

- Funding pre-disaster mitigation activities;
- Developing experimental multi-hazard maps to better understand risk;
- Establishing state and local government infrastructure mitigation planning requirements;

- Defining how states can assume more responsibility in managing the hazard mitigation grant program; and
- Adjusting ways in which management costs for projects are funded.

The mitigation planning provisions outlined in § 322 of this Act and the corresponding 42 USC § 5121-5207 establish performance-based standards for mitigation plans and require state and local governments to prepare multi-hazard mitigation plans as a precondition for receiving FEMA mitigation funds for Hazard Mitigation Grant Programs, Pre-Disaster Mitigation, and Flood Mitigation Assistance.

International Fire Code

The International Fire Code establishes minimum requirements for fire prevention and fire protection systems using prescriptive and performance-related provisions. This code regulates minimum fire safety requirements for new and existing buildings, facilities, storage, and processes. The International Fire Code includes general and specialized technical fire and life safety regulations addressing fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire, and explosion hazards safety, use and storage of HMW, protection of emergency responders, industrial processes, and many other topics. The International Fire Code is issued by the International Code Council, an international organization of building officials. The International Fire Code is the basis for the California Fire Code (CFC), discussed below.

Federal Emergency Management Agency

The FEMA mission is to lead the effort to prepare the nation for all hazards and effectively manage federal response and recovery efforts following any natural disaster, including earthquakes, flooding, and wildfires. FEMA also initiates proactive mitigation activities, trains first responders, and manages the National Flood Insurance Program and the U.S. Fire Administration. FEMA created and maintains the National Risk Index, which is a dataset and online tool to help illustrate the US communities most at risk for 18 natural hazards including avalanches, coastal flooding, cold waves, drought, earthquakes, hail, heat wave, hurricanes, ice storms, landslides, lightning, riverine flooding, strong wind, tornados, tsunamis, volcanic activity, wildfire, and winter weather. It was designed and built by FEMA in close collaboration with various stakeholders and partners in academia; local, state, and federal government; and private industry. Data is provided by federal agencies, state agencies, and academic and research institutions and risk ratings are determined by census tract and county.

Federal Response Plan of 1999

The Federal Response Plan of 1999 is a signed agreement among 27 federal departments and agencies and the American Red Cross that:

- Provides the mechanism for coordinating delivery of federal assistance and resources to augment efforts of state and local government overwhelmed by a major disaster or emergency.
- Supports implementation of the Robert T. Stafford Disaster Relief and Emergency Act, as well as individual agency statutory authorities; and
- Supplements other federal emergency operations plans developed to address specific hazards.

The Federal Response Plan is implemented in anticipation of a significant event likely to result in a need for federal assistance or in response to an actual event requiring federal assistance under a presidential declaration of a major disaster or emergency.

Federal Aviation Administration

The basic responsibilities of the FAA, under the USDOT, are the regulation of civil aviation to promote safety, airspace and air traffic management, and the regulation of commercial space transportation. The CFR contains standards for aircraft noise emission levels.

National Fire Protection Association Standards

National Fire Protection Association Standards (NFPA) codes, standards, recommended practices, and guides are developed through a consensus standards development process approved by the American National Standards Institute. NFPA standards are recommended (advisory) guidelines in fire protection but are not laws or "codes" unless adopted or referenced as such by the CFC or local fire agency. Specific standards applicable to wildland fire hazards include, but are not limited to:

- **NFPA 1141,** Fire Protection Infrastructure for Land Development in Wildlands
- **NFPA 1142**, Water Supplies for Suburban and Rural Fire Fighting
- **NFPA 1143**, Wildland Fire Management
- **NFPA 1144**, Reducing Structure Ignition Hazards from Wildland Fire
- **NFPA 1710**, Standard for the Organization and Deployment of Fire Suppression Operations, Emergency Medical Operations

3.2 State

Gas Monitoring and Control at Active and Closed Landfills

Regulations from the California Code of Regulations (CCR), Title 27, § 20917 et seq., set forth the performance standards and the minimum substantive requirements for landfill gas monitoring and control as it relates to active landfills and to proper closure, post closure maintenance, and ultimate reuse of landfills to ensure that public health and safety and the environment are protected from pollution due to the disposal of solid waste.

Asbestos, PCBs, and Lead Exposure Regulation

Regulations from the CCR, Title 8, § 1529 regulates asbestos exposure and CCR, Title 8, § 1532.1 regulates construction work where an employee may be occupationally exposed to lead in all construction work including but not limited to:

- Demolition or salvage of structures where asbestos is present;
- Removal or encapsulation of materials containing asbestos;
- Construction, alteration, repair, maintenance, or renovation of structures, substrates, or portions thereof, that contain asbestos;

- Installation of products containing asbestos;
- Asbestos spill/emergency cleanup;
- Transportation, disposal, storage, containment of and housekeeping activities involving asbestos or products containing asbestos, on the site or location at which construction activities are performed;
- Excavation, which may involve exposure to asbestos as a natural constituent which is not related to asbestos mining and milling activities;
- Routine facility maintenance; and
- Erection of new electric transmission and distribution lines and equipment, and alteration, conversion and improvement of the existing transmission and distribution lines and equipment.

Additionally, these regulations require preparation of, and compliance with, Asbestos abatement plans before disturbing asbestos.

Closure and Post Closure Maintenance of Landfills

Regulations from CCR, Title 27, Subchapter 5, provide post closure maintenance guidelines, including requirements for an emergency response plan and site security for landfills. They regulate post closure land use, requiring protection of public health and safety and the built environment, as well as the prevention of gas explosions. Construction on the site must maintain the integrity of the final cover, drainage and erosion control systems, and gas monitoring and control systems. All post-closure land use within 1,000 feet of a landfill site must be approved by the local enforcement agency.

Well Safety Devices for Critical Wells

Regulations from CCR, Title 14 § 1724.3, requires “critical wells” have both surface and subsurface safety devices and established requirements for safety devices. CCR, Title 14 § 1720 defines a “critical well” as a well within:

- 300 feet of any building intended for human occupancy that is not necessary to the operation of the well or any airport runway.
- 100 feet of any dedicated public street, highway, or nearest rail of an operating railway that is in general use; any navigable body of water or watercourse perennially covered by water; any public recreational facility such as a golf course, amusement park, picnic ground, campground, or any other area of periodic high-density population; or any officially recognized wildlife preserve.

California Environmental Quality Act

California Public Resources Code (PRC), § 21151.4, requires the CEQA lead agency to consult with any school district with jurisdiction over a school within 0.25 mile of the project about potential impacts on the school if the project might reasonably be anticipated to emit hazardous air emissions or handle an extremely hazardous substance or a mixture containing an extremely hazardous substance.

Porter-Cologne Water Quality Act

The Porter-Cologne Water Quality Control Act (California Water Code § 13000 et seq.) regulates water quality through the SWRCB and RWQCBs, including oversight of water monitoring and contamination cleanup and abatement.

Hazardous Materials Release Response Plans and Inventory Law

The provisions of the California Health and Safety Code (CHSC) § 25500 et seq., requires facilities using HMW to prepare Hazardous Materials Business Plans.

Safe Drinking Water and Toxic Enforcement Act

The Safe Drinking Water and Toxic Enforcement Act (Proposition 65, CHSC, § 25249.5 et seq.) is similar to the federal Safe Drinking Water Act and CWA on the federal level in regulating the discharge of contaminants to groundwater.

Hazardous Waste Control Act

The Hazardous Waste Control Act (Proposition 65, CHSC § 25249.5 et seq.) is similar to the federal RCRA in regulating the identification, generation, transportation, storage, and disposal of materials deemed hazardous by the state of California.

Cortese List Statute

Hazardous Waste and Substances Sites (Cortese) List is a planning document to comply with the requirements in providing information about the location of HMW release sites. CGC § 65962.5 requires the California Environmental Quality Act (CalEPA) including information from the RWQCB and the DTSC to compile and maintain lists of potentially contaminated sites located throughout the state of California.

California Code of Regulations, Title 5, Division 1, Chapter 13, Subchapter 1, School Facilities Construction

This code regulates where school facilities can be sited and constructed. Title 5, § 14010(d), requires a safety study for new school sites within 1,500 feet (approximately 0.25 mile) of an existing railroad track. The site cannot be located near an aboveground water or fuel storage tank or within 1,500 feet of the easement of an aboveground or underground pipeline. In addition, if the proposed site is on or within 2,000 feet of a significant disposal of hazardous waste, the school district shall contact the DTSC for a determination of whether the property should be considered a Hazardous Waste Property or Border Zone Property. Schools cannot be sited near formerly or acutely HMW unless it can be proven that the site would not pose a health risk.

California Department of Forestry and Fire Protection

The California Department of Forestry and Fire Protection (CAL FIRE) provides fire assessment and firefighting services for lands within State Responsibility Areas (SRAs), conducts educational and training programs, provides fire planning guidance and mapping, and reviews general plan safety elements to ensure compliance with state fire safety requirements. CAL FIRE also manages the state forest system and

has responsibility to enforce the forest practice regulations, which govern forestry practices on private and other non-federal lands.

The Office of the State Fire Marshal supports CAL FIRE's mission by focusing on fire prevention. It provides support through a variety of fire safety responsibilities including regulating buildings in which people live, congregate, or are confined; controlling substances and products that may, in and of themselves, or by their misuse, cause injuries, death, and destruction by fire; providing statewide direction for fire prevention in wildland areas; regulating hazardous liquid pipelines; reviewing regulations and building standards; and providing training and education in fire protection methods and responsibilities.

The Board of Forestry and Fire Protection is a government-appointed approval body within CAL FIRE. It is responsible for developing the general forest policy of the State, for determining the guidance policies of CAL FIRE, and for representing the State's interest in federal forestland in California. The Board of Forestry and Fire Protection also promulgates regulations and approves General Plan Safety Elements that are adopted by local governments for compliance with State statutes.

The California Office of the State Fire Marshal supports the mission of CAL FIRE by focusing on fire prevention. These responsibilities include regulating buildings in which people live, congregate, or are confined; controlling substances and products which may, in and of themselves, or by their misuse, cause injuries, death, and destruction by fire; providing statewide direction for fire prevention within wildland areas; regulating hazardous liquid pipelines; developing and renewing regulations and building standards; and providing training and education in fire protection methods and responsibilities. These are accomplished through major programs, including engineering, education, enforcement, and support from the Board of Forestry and Fire Protection. For jurisdictions within SRAs or Very High Fire Hazard Severity Zones, the Land Use Planning Program division of the Office of State Fire Marshal reviews Safety Elements during the update process to ensure consistency with California Government Code, § 65302(g)(3).

Together, the Board of Forestry and Fire Protection, Office of State Fire Marshal, and CAL FIRE protect and enhance the forest resources of all wildland areas of California that are not under federal jurisdiction.

PRC §§ 4201-4204 and CGC §§ 51175-51189 mandate CAL FIRE to map areas of substantial fire hazards or fire hazard safety zones (FHSZs), statewide. FHSZs are classified based on fuel loading, slope, fire weather, and other relevant factors present, including when winds have been identified as major cause of wildfire spread. FHSZs classify wildlands as moderate, high, or very high fire hazard zones (VHFHZs). Additionally, CAL FIRE designates areas by jurisdictional responsibility. Areas where the state has the primary financial responsibility for wildfire prevention and suppression are classified as State Responsibility Areas (SRAs) and areas where a local fire protection agency has the primary responsibility are classified as Local Responsibility Areas (LRAs) (USDA, ND). Areas administered or controlled by the Federal Government for which the Federal Agencies have administrative, and protection responsibility are identified on the CAF FIRE maps as FRAs. These classifications influence where development occurs and how an agency will respond to future wildfire emergencies. CAL FIRE designates three Wildland-Urban Interface (WUI) areas, which are areas where dense housing is adjacent to vegetation that can burn in a wildfire (CAL FIRE, 2020). The Wildland Urban Interface area is characterized as a high-density residential area in a moderate, high, or VHFHSZ which is not dominated by wildland vegetation (i.e., lifeform not herbaceous, hardwood,

conifer, or shrub) but has spatially contiguous groups of 30m cells that are 10 acres and larger. The Wildland Urban Intermix area is characterized as a housing development which is interspersed in an area dominated by wildland vegetation that is subject to wildfires and within a moderate, high or very high FHSZ, but has spatially contiguous groups of 30m cells 25 acres and larger. Wildland Urban Intermix only applies to improved parcels. The Wildfire Influence Zone is characterized as wildfire susceptible vegetation located up to 1.5 miles from a Wildland Urban Interface or Wildland Urban Intermix area (CAL FIRE, 2020). CAL FIRE applies these designations based on FHSZ, housing density, and vegetation data, among other factors.

CAL FIRE, through its Fire and Resources Assessment Program, has mapped very high FHSZs based on consistent statewide criteria and the severity of fire hazard that is expected to prevail in those areas. The Fire and Resources Assessment Program classifies land based on these fuel loading, slope, fire weather, and other relevant factors into one of three severity zones: moderate FHSZ; high FHSZ; and very high FHSZ All other areas are labeled “non-very high FHSZ.” In LRAs, CGC § 51178 requires identification of moderate FHSZ, high FHSZ, and VHFHSZs. In LRAs, Government Code 51178 requires identification of moderate, high, and very high FHSZs.

2024 CAL FIRE Strategic Plan

CAL FIRE’s multi-year strategic plan is a guiding document for operations and decision-making to ensure that efforts align with the agency’s mission of protecting people, property, and state natural resources. It outlines the agency’s goals, objectives, and strategies for addressing fire prevention within the next five years and provides information to the agency that helps effectively allocate resources, coordinate efforts, and implement initiatives that will reduce impact of wildfires, improve response capabilities, and promote resilient and fire-safe communities. The latest version of the Strategic Plan was published in July 2024.

SRA 2023 Fire Safe Regulations

CCR Title 14, § 12700 et seq., constitutes CAL FIRE’s basic building wildfire protection standards within SRAs and LRA very high FHSZs such as emergency access, signing and building numbering, emergency water reserves for fire use, and fuel modification.

California Code of Regulations Title 24 (California Building Standards and Fire Code)

CCR Title 24, also known as the California Building Standards Code (CBSC), includes regulations for how buildings are designed and constructed, and are intended to ensure the maximum structural integrity and safety of private and public buildings. The CBSC, which applies to all applications for building permits, consists of 12 parts that contain CBSC administrative regulations for all state agencies that implement or enforce building standards. Local agencies must ensure the development complies with the CBSC standards. Cities and counties can adopt additional standards beyond the CBSC including CBSC Part 2, named the California Building Code (CBC), which is based upon the 2020 International Building Code, and CBSC Part 11, named the California Green Building Standards Code, also known as the CalGreen Code.

Title 24 Part 2: California Building Code. The CBC contains general building design and construction requirements relating to fire and life safety, structural safety, and access compliance. CBC provisions

provide minimum standards to safeguard life or limb, health, property, and public welfare by regulating and controlling the design, construction, quality of materials, use and occupancy, location and maintenance of all buildings and structures and certain equipment.

CBC Chapter 7A, (CCR, Title 24, Part 2) primarily focuses on preventing ember penetration into homes, a leading cause of structure loss from wildfires. These codes have been developed through decades of after fire structure "save" and "loss" evaluations to determine what causes buildings to ignite or avoid ignition during wildfires. The resulting fire codes now focus on mitigating former structural vulnerabilities through construction techniques and materials so that the buildings are resistant to ignitions from direct flames, heat, and embers, as indicated in CBC Chapter 7A § 701A: Scope, Purpose, and Application.

CBC Chapter 9, (CCR, Title 24, Part 2) requires the installation and maintenance of smoke alarms in residential dwelling units. CBC Chapter 9 § 907.2.11.2 requires smoke alarms to be installed and maintained on the ceiling or wall outside of each separate sleeping area in the immediate vicinity of bedrooms., in each room used for sleeping purposes, and in each story within a dwelling unit. The smoke alarms shall be interconnected.

Title 24 Part 9: CFC. The CFC contains regulations consistent with nationally recognized accepted practices for safeguarding, to a reasonable degree, life, and property from various hazards, including fire and explosion, among others. The CFC also contains provisions to assist emergency response personnel. The CFC contains fire safety-related building standards that are referenced in other parts of CCR Title 24. Specifically, CFC Chapter 33 prescribes minimum fire safety requirements during construction, alteration, or demolition operations which correlates with CBC Chapter 33. Additionally, CFC Chapter 49 sets further standards for construction and development within LRA and SRA Very High Fire Hazard Severity Zones and includes many provisions found in CCR Titles 14 and 19. The chapter also includes mitigation strategies to reduce hazards originating within a structure spreading to wildland and vice versa. The CFC is updated once every three years; the 2022 CFC took effect on January 1, 2022. The CFC sets forth regulations regarding building standards, fire protection and notification systems, fire protection devices such as fire extinguishers and smoke alarms, high-rise building standards, and fire suppression training. The CFC provides minimum standards to increase the ability of a building or structure to resist the intrusion of flame or burning embers being projected by a vegetation fire and contributes to a systematic reduction in fire losses through the use of performance and prescriptive requirements. The CFC is based on the 2018 adoption of the International Fire Code (discussed above) and integrates state amendments. (California Fire Code,

Transportation of Hazardous Materials and Wastes

Transportation of HMW is regulated by CCR Title 26. The USDOT is the primary regulatory authority for the interstate transport of HMW. The USDOT establishes regulations for safe handling procedures (i.e., packaging, marking, labeling, and routing). The California Highway Patrol and Caltrans enforce federal and state laws and respond to HMW transportation emergencies. Emergency responses are coordinated as necessary between federal, state, and local governmental authorities and private persons through a state-mandated Emergency Management Plan.

California Government Code § 66474.02

This law states that before a city can approve a tentative map, or a parcel map for which a tentative map was not required, for an area (development) located in an SRA or a very high FHSZ, the following findings must be made:

- A finding supported by substantial evidence in the record that the subdivision is consistent with regulations adopted by the State Board of Forestry and Fire Protection (a governor-appointed body within CAL FIRE) pursuant to PRC § 4290 and § 4291 or consistent with local ordinances certified by the State Board of Forestry and Fire Protection as meeting or exceeding the state regulations.
- A finding supported by substantial evidence in the record that structural fire protection and suppression services will be available for the subdivision through any of the following entities:
  - A county, city, special district, political subdivision of the state, or another entity organized solely to provide fire protection services that is monitored and funded by a county or other public entity.
  - The CAL FIRE by contract entered into pursuant to PRC § 4133 (with the approval of the Department of General Services, for periods not to exceed three years, enter into a contract with any county which enacts an ordinance), § 4142 (with the approval of the Department of General Services, may enter into a cooperative agreement upon the terms and under the conditions as it deems wise, for the purpose of preventing and suppressing forest fires or other fires in any lands within a county, city, or district that makes an appropriation for that purpose), or § 4144 (the director, with the approval of the Department of General Services, may enter into a cooperative agreement for the purpose of preventing and suppressing fires with a city, county, special district, or other political subdivision of state or person, association, or corporation that requests an agreement).

Upon approving a tentative map, or a parcel map for which a tentative map was not required, for an area (development) in an SRA or very high FHSZ, the county or city must then transmit a copy of the findings and accompanying maps to the State Board of Forestry and Fire Protection.

Fires and Fire Protection

State fire laws are established in CHSC Division 12 Part 1 and include provisions for structural standards (similar to those identified in the CBC), fire protection and public notification systems, fire protection devices such as extinguishers and smoke alarms, standards for high-rise structures and childcare facilities, and fire suppression training. The State Fire Marshal is responsible for enforcement of these provisions and building standards for all state-owned buildings, state-occupied buildings, and state institutions.

Hazardous Substances Account Act

The Hazardous Substances Account Act, also known as the "California Superfund" (California Health & Safety Code § 25300, et seq.), is the state's Superfund program which authorizes the CalEPA to clean up contaminated sites and hazardous substance releases into the environment that do not qualify for cleanup under the federal CERCLA. The Hazardous Substances Account Act establishes regulations and incentives

to ensure that generators of hazardous waste use technology and BMPs for the safe handling, treatment, recycling, and destruction of their hazardous waste prior to disposal.

Unified Program

Senate Bill (SB) 1082, passed in 1993, created the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program). The Unified Program consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities of six environmental and emergency response programs, which include the:

1. Hazardous Materials Business Plan Program;
2. California Accidental Release Prevention (CalARP) Program;
3. Hazardous Waste Generator Program;
4. Aboveground Petroleum Storage Act Program;
5. Leaking Underground Storage Tank (LUST) Program; and the
6. Hazardous Materials Inventory Statements Program which implements requirements from two sections of the California Fire Code (CFC).

The CalEPA and other state agencies sets standards for the above-mentioned programs, while local CUPAs implement the standards. For each jurisdiction, the CUPA regulates/oversees the:

- Hazardous Materials Business Plan Program's Hazardous materials business plans (HM Business Plans) (discussed separately below);
- CalARP Program's Federal accidental release prevention plans or California risk management plans;
- The operation of USTs and aboveground storage tanks (ASTs), as well as the Aboveground Petroleum Storage Act Program's required Spill Prevention, Control, and Countermeasure (SPCC) plans (discussed further below);
- Universal waste and hazardous waste generators/handlers;
- On-site hazardous waste treatment;
- Inspections, permitting, and enforcement;
- Proposition 65 (i.e., the Safe Drinking Water and Toxic Enforcement Act) reporting; and
- Emergency response

The City of Barstow's CUPA is the San Bernardino County Fire Department (SBCFD), which is responsible for regulating hazardous waste and tiered permitting, USTs, ASTs, and risk management.

Hazardous Materials Business Plan

Both the federal government (CFR) and the state of California (CHSC) require all businesses that handle more than a specified amount—or "reporting quantity"—of hazardous or extremely HMW to submit a

HM Business Plan to the proper County CUPA or Participating Agency administrator. The CUPA for the City of Barstow is the SBCFPD. According to SBCFPD guidelines, any business subject to any of the CUPA permits in San Bernardino County is required to file a HM Business Plan (SBCFPD 2023a).

HM Business Plans must include an inventory of the HMW at the facility. Businesses must update their HM Business Plan annually. Also, HM Business Plans must include emergency response plans and procedures to be used in the event of a significant or threatened significant release of a hazardous material. The emergency response plans are required to identify the procedures for immediate notification of all appropriate agencies and personnel, identification of first responder medical assistance appropriate for potential accident scenarios, contact information for all company emergency coordinators, a listing and location of emergency equipment at the business, an evacuation plan, and a training program for business personnel.

California Accidental Release Prevention Program

The California Accidental Release Prevention (CalARP) Program became effective on January 1, 1997, in response to SB 1889. The CalARP Program provides for consistency with federal laws (i.e., the Emergency Preparedness and Community Right-to-Know Act and the CAA) regarding accidental chemical releases and allows local oversight of both federal and state programs. Federal and state laws are similar in their requirements; however, the California threshold planning quantities for regulated substances are lower than the federal quantities. Local agencies may set lower reporting thresholds or add additional chemicals to the program.

The CalARP Program, implemented by the local CUPAs, aims to be proactive and therefore requires any business, where the maximum quantity of a regulated substance exceeds the specified threshold quantity, register with the responsible CUPA as a manager of regulated substances and prepare risk management plans, which are detailed engineering analyses of the potential accident factors present at a business and the mitigation measures that can be implemented to reduce this accident potential. The risk management plans must identify the type of business, location, emergency contacts, emergency procedures, mitigation plans, and chemical inventory at each location. This requirement is coupled with the requirements for preparation of hazardous materials business plans under the Unified Program, which is also implemented by the CUPA. The local CUPA shares these plans with emergency response personnel.

Hazardous Waste Generator Program

CCR Title 22, Division 4.5, sets forth the regulation administered by DTSC for hazardous waste generators; transporters; and owners or operators of treatment, storage, or disposal facilities. These regulations include requirements for packaging, storage, labeling, reporting, and general management of hazardous waste prior to shipment. These regulations also identify standards applicable to transporters of hazardous waste which specify the requirements for transporting shipments of hazardous waste, including manifesting, vehicle registration, and emergency accidental discharges during transportation.

Aboveground Petroleum Storage Act

Facilities that have cumulative aboveground storage capacities of petroleum products at or exceeding 1,320 gallons or store petroleum products in a tank in an underground area are subject to the

Aboveground Petroleum Storage Act (APSA). Facilities that are subject to APSA must prepare and implement a SPCC Plan in accordance with the oil pollution prevention guidelines in 40 CFR 112.

The purpose of the APSA program is to protect public health and the environment from potential contamination or adverse effects associated with unintentional releases from the aboveground storage of petroleum based HMWs.

Leaking Underground Storage Tanks

Leaking Underground Storage Tanks (LUSTs) have been recognized since the early 1980s as the primary cause of groundwater contamination from gasoline compounds and solvents. In California, regulations aimed at protecting against LUSTs have been in place since 1983 (CHSC, § 25280 et seq.). This occurred one year before RCRA was amended to add Subtitle I, which created a leak prevention, detection, and cleanup program to address a nationwide water pollution problem caused by LUSTs and provided a comprehensive regulatory program requiring USTs to be installed in accordance with standards that address the prevention of future leaks. The SWRCB has been designated the lead California regulatory agency in the development of UST regulations and policy.

Older USTs are typically single-walled steel tanks. USTs may leak a result of corrosion, punctures, and detached fittings. As a result, the state of California required the replacement of older tanks with new double-walled fiberglass tanks with flexible connections and monitoring systems (CHSC, § 25292 et seq.). USTs owners were given 10 years to comply with the new requirements—deadline was December 22, 1998. However, many UST owners did not act by the deadline, so the state granted an extension for their replacement ending January 1, 2002. The California RWQCBs, in cooperation with the Office of Emergency Services, maintain an inventory of LUSTs in a statewide database, Geotracker.

Emergency Mutual Aid Agreements

The Emergency Mutual Aid Agreements system is a collaborative effort between city and county emergency managers in the Office of Emergency Services in the coastal, southern, and inland regions of the state. The Emergency Mutual Aid Agreements system provides service in the emergency response and recovery efforts at the Southern Regional Emergency Operations Center, the local Emergency Operations Centers, the Disaster Field Office, and community service centers. The Emergency Mutual Aid Agreements system's purpose is to support disaster operations in affected jurisdictions by providing professional emergency management personnel. In accordance with the Emergency Mutual Aid Agreements system, state and local emergency managers have responded in support of each other under a variety of plans and procedures.

California Governor's Office of Emergency Services

In 2009, the state passed legislation creating the California Governor's Office of Emergency and authorizing it to prepare a Standardized Emergency Management System program (Title 19 CCR § 2400 *et seq.*), that sets forth measures by which a jurisdiction should handle emergency disasters. In 2013, Governor Edmund G. Brown Jr.'s Reorganization Plan #2 eliminated Cal EMA and restored it to the Governor's Office, renaming it the California Governor's Office of Emergency Services, and merging it with the Office of Public Safety Communications. Non-compliance with the Standardized Emergency

Management System could result in the state withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster. The Standardized Emergency Management System provides the mechanism by which the local government requests assistance.

Cal-OES serves as the lead agency for emergency management, mobilizing the state's resources, and obtaining federal resources in the state. Cal-OES coordinates the state response to major emergencies in support of local government. The primary responsibility for emergency management resides with the local government. Local jurisdictions first use their own resources and, as these are exhausted, obtain more from neighboring cities and special districts, the county in which they are located, and other counties throughout the state through the statewide mutual aid system. Cal-OES also maintains oversight of the state's mutual aid system.

California Environmental Protection Agency

CalEPA was created in 1991 by Governor's Executive Order. Six boards, departments, and offices were placed under the CalEPA umbrella to create a cabinet-level voice for the protection of human health and the environment and to ensure the coordinated deployment of state resources. CalEPA oversees HMW compliance throughout California. Among those responsible for HMW are DTSC, Department of Pesticide Regulation, and Office of Environmental Health Hazard Assessment. CalEPA also oversees the unified hazardous waste and HMW management regulatory program (Unified Program), which consolidates and coordinates:

- Hazardous Materials Release Response Plans and Inventories (Business Plans)
- UST Program
- Aboveground Petroleum Storage Tank Act
- Hazardous Waste Generator and Onsite Hazardous Waste Treatment Programs
- California Uniform Fire Code: Hazardous Material Management Plans and Inventory Statements
- California Accidental Release Prevention Program

Hazardous Materials Release Emergency Notification

The following state statutes require emergency notification of a hazardous chemical release:

- CHSC § 25270.8 and § 25507, requires owners or operators of underground or aboveground tanks to notify the Office of Emergency Services of any spill or release.
- Vehicle Code § 23112.5, requires any vehicle owner who dumps, spills, or causes the release of HMW to notify the Office of Emergency Services.
- Public Utilities Code § 7673, General Orders #22-B, 161, requires railroads that transports HMW to provide a system map showing mileposts, stations, terminals, junction points, road crossings, and location of pipelines in its rights of way.
- CGC § 51018, 8670.25.5 (a), requires notification for any explosion or fire involving pipelines.

- Water Codes §§ 13271, 13272, requires notification for any discharge of HMW to waters of the state.
- California Labor Code § 6409.1 (b): requires an employer to immediately notify OSHA of any serious injury, illness, or death, including from HMW exposure or spill.

Requirements for immediate notification of all significant spills or threatened releases cover owners, operators, persons in charge, and employers. Notification is required regarding significant releases from facilities, vehicles, vessels, pipelines, and railroads. In addition, all releases that result in injuries or harmful exposure to workers must be immediately reported to the California OSHA pursuant to the California Labor Code § 6409.1(b).

State Water Resources Control Board

GeoTracker is the SWRCB's data management system for sites that impact groundwater or have the potential to impact groundwater. The SWRCB identifies sites that require groundwater cleanup (Leaking Underground Storage Tanks (LUSTs), Department of Defense, and Site Cleanup Program) as well as permitted facilities that could impact groundwater (Irrigated Lands, Oil and Gas Production, Operating USTs, and Land Disposal sites).

Hazardous Materials Disclosure Programs

The Unified Program administered by the State of California consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities for environmental and emergency management programs, which include Hazardous Materials Release Response Plans and Inventories (Business Plans), the CalARP Program, and the UST Program. The Unified Program is implemented at the local government level by CUPAs.

The CUPA for the City of Barstow is the San Bernardino County Fire Protection District (SBCFPD), which is responsible for regulating hazardous waste and tiered permitting, USTs; ASTs; and risk management.

Department of Toxic Substances Control Hazardous Waste Management Plan

In July 2021, SB 158 introduced programmatic reforms to the DTSC. Approval of SB 158 changed CHSC § 25135, which requires the development of Hazardous Waste Management Reports and Plans. In response to the passage of SB 158, DTSC formed the Hazardous Waste Management Plan Unit to prepare Hazardous Waste Management Reports and Plans. These plans are based on hazardous waste management reports and serve as the following:

- Comprehensive planning documents for the management of hazardous waste in the state;
- Sources of useful information to guide state and local hazardous waste management efforts; and
- Guides for implementation of DTSC's hazardous waste management program.

Since passage of SB 158, the Hazardous Waste Management Plan Unit has published a draft hazardous waste report on July 2023 and as of September 17, 2023, ended the feedback period for the draft report. The initial report is the starting point to determine the types of information and additional research

needed to generate the first hazardous waste management plan. As such, the main objectives of the first report are the following:

- Establish a baseline understanding of the management of hazardous waste in the State of California;
- Identify data gaps and items that require additional research; and
- Develop plans to fill data gaps and complete additional research.

To help achieve these objectives, the first report includes available information regarding items such as hazardous waste streams produced in the state (waste generation, transportation, treatment, and disposal) and hazardous waste facilities that operate in the state.

State Aeronautics Act

The State Aeronautics Act (Public Utilities Code §§ 21001 et seq.) is implemented by Caltrans's Division of Aeronautics. Key purposes of the act, as relevant here, include to ensure that persons residing within the vicinity of airports are protected against intrusions by unreasonable levels of aircraft noise. The Division of Aeronautics issues permit for and annually inspects hospital heliports and public-use airports, makes recommendations regarding proposed school sites within two miles of an airport runway, and authorizes helicopter landing sites at or near schools.

The State Aeronautics Act also establishes statewide requirements for airport land use compatibility plans. These plans are intended to provide for the orderly growth of a public airport and the area surrounding the airport while safeguarding the general welfare of inhabitants near the airport and the public in general. Caltrans's *California Airport Land Use Planning Handbook* provides guidelines for preparing airport land use compatibility plans that establish policies applicable to a range of issues, including the influence areas of airports, aircraft noise standards and criteria, accident potential zones, and building height zones near airports. The San Bernardino County Airport Land Use Commission is responsible for implementing this legislation.

California Health and Safety Code and Code of Regulations

CHSC Chapter 6.95 and CCR, Title 19, § 2652 describe the minimum requirements for business emergency plans and chemical inventory reporting. These regulations require businesses to provide emergency response plans and procedures; training program information; and a HMW inventory disclosing materials stored, used, or handled onsite. A business that uses HMW, or mixtures containing them, in certain quantities must establish and implement a business emergency plan.

The Tanner Act

Although numerous state policies deal with hazardous waste, the most comprehensive is the Tanner Act, adopted in 1986 (Assembly Bill 2948 (CHSC § 25135)), which governs the preparation of hazardous waste management plans and the siting of hazardous waste facilities in the state. To comply with the Tanner Act, local or regional hazardous waste management plans need to include provisions that define the:

1. Planning process for waste management;

2. Permit process for new and expanded facilities; and

3. Appeals process to the state available for certain local decisions.

Evacuation Routes

CGC § 65302 requires general plan safety elements to address evacuation routes, and SB 99 requires a safety element to identify residential developments in hazardous areas that do not have at least two emergency evacuation routes upon a city's next revision of the housing element on or after January 1, 2020. Assembly Bill 747 added, and Assembly Bill 1409 amended CGC § 65302.15 to require that, starting January 1, 2022, or upon the next revision of a local hazard mitigation plan in accordance with federal guidelines, safety elements must be reviewed and updated to identify evacuation routes, assess their capacity, safety, viability, and designate evacuation locations under various emergency scenarios. Additionally, counties or cities with existing local hazard mitigation plans, emergency operations plans, or similar documents can utilize this information in their safety element, provided that they summarize and incorporate relevant details from these sources.

California Fire Code

The California Fire Code is a series of building, property, and lifeline codes in the CCR, Title 24, Chapter 9. The California Fire Code contains fire-safety related building standards, such as construction standards, vehicular and emergency access, fire hydrants and fire flow, and sprinkler requirements. Specific chapters relevant to wildfire include Chapter 49, Requirements for Wildland-Urban Interface, and Chapter 7A of the California Building Code, Materials and Construction Methods for Exterior Wildfire Exposure.

California Public Resources Code

The Board of Forestry and Fire Protection is authorized in the Public Resources Code (§§ 4290 and 4291) to adopt minimum fire safety standards for new construction in very high FHSZs in State Responsibility Areas (SRAs). The Board publishes its fire safety regulations in the California Code of Regulations, Title 14 (these standards may differ from those in Appendix D of the California Fire Code). Fire safe regulations currently address:

- Article 1: Administration of ordinance and defensible space measures (Chapter 49)
- Article 2: Emergency access and egress standards (roadways) (California Fire Code Appendix D)
- Article 3: Standards for signs identifying streets, roads, and buildings (Chapter 5)
- Article 4: Emergency water standards for fire use (Appendix B, BB)
- Article 5: Fuel modification standards (Chapter 49)

Local ordinances adopted by local governments cannot be less restrictive than the provisions in state law. These regulations would be applied in the State Responsibility Areas (SRAs) outside of a city's boundaries, such as a SOI and surrounding unincorporated lands.

California Penal Code §374.3

California Penal Code §374.3 criminalizes the act of illegal dumping, which involves the unauthorized disposal of waste materials onto public or private property without the consent of the owner. This includes dumping garbage, hazardous waste, and other types of refuse. The statute prescribes fines for violations, which increase with the severity and repetition of the offense.

California General Plan Law, Office of Planning General Plan Guidelines

CGC § 65302(g) requires that safety elements be revised periodically to address wildfire risks in accordance with regulations and guidance promulgated by the Board of Forestry and Fire Protection. In addition, cities must submit a revised safety element to the Board for consideration and comments no later than 90 days prior to its adoption. Local governments must also respond to how they plan to address the Board's comments or make findings to the contrary prior to adoption of the safety element.

To meet the intent of state law, CGC § 65302(g)(2) requires the safety element to:

- Identify wildfire hazards with the latest state prepared, very high FHSZ maps from the Board of Forestry and Fire Protection, US Geological Survey, and other sources.
- Consider guidance given by the OPR Fire Hazard Planning document.
- Demonstrate that the city or contract agency and associated codes satisfactorily address adequate water supply, egress requirements, vegetation management, street signage, land use policies, and other criteria to protect from wildfires.
- Establish in the safety element (and other elements that must be consistent with it) a set of comprehensive goals, policies, and feasible implementation measures for protection of the community from unreasonable risks of wildfire.

3.3 Regional

Mojave Desert Air Quality Management District

The Mojave Desert Air Quality Management District is delegated to enforce the Asbestos National Emission Standard for Hazardous Air Pollutants, as specified under 40 CFR Part 61, Subpart M per District Rule 1000 as it applies to asbestos removal and demolitions (MDAQMD, 2023). The National Emission Standard for Hazardous Air Pollutants requires delegated districts be notified for certain projects containing Regulated Asbestos Containing Material. Regulated Asbestos Containing Material means:

- Friable asbestos material
- Category I nonfriable Asbestos Containing Material (ACM) that has become friable,
- Category I nonfriable ACM that will be or has been subject to sanding, grinding, cutting, or abrading, or
- Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations.

San Francisco Regional Water Quality Control Board Environmental Screening Levels

The San Francisco Regional Water Quality Control Board (SFRWQCB) has developed Environmental Screening Levels (ESLs) to assist in assessing the potential threats to human health and the environment and evaluation of potential environmental concerns at contaminated sites. Concentrations of constituents collected at a site in either soil, groundwater, or vapor samples can be directly compared to ESLs, to aid in determining the need for additional sampling efforts or assess level of potential contamination. ESLs have been developed for more than 100 commonly detected constituents. They address a full range of concerns encountered at contamination sites and are protective of human health, water quality, and the environment. The ESLs do not constitute policy or regulation, and their use is optional.

While the ESLs developed by the SFRWQCB are primarily designed for and utilized by that agency, other agencies may also adopt these levels. Since 2019, ESLs have been widely used across California. In addition to SFRWQCB ESLs, other screening levels are used in the state, such as the US Environmental Protection Agency's Regional Screening Levels and DTSC-modified Screening Levels. The conceptual site model applied to determine the ESLs applies to many sites throughout California. Generally, ESLs can be used at any site with the agreement of all stakeholders. The Lahontan Regional Water Quality Control Board, which encompasses the City of Barstow, has adopted the SFRWQCB ESLs (LRWQCB, 2022).

3.4 Local

County of San Bernardino Office of Emergency Services

The Office of Emergency Services is a division of the County Fire Protection District and is responsible for countywide emergency planning, mitigation, response, and recovery activities. The Office of Emergency Services works with all County departments and 24 cities, as well as many non-governmental organizations. In the event of an emergency, within both incorporated and unincorporated areas, the Office of Emergency Services manages the County's Emergency Operations Center and coordinates with the County's disaster response resources for recovery from state and federal requirements.

County of San Bernardino Local Enforcement Agency for Landfill

The County Solid Waste Management Division is responsible for operation and management of the County's landfill system. The system consists of five regional landfills and nine transfer stations. Additionally, the Solid Waste Management Division administers the Landfill Franchise Program and the refuse collection permit program, which authorizes and regulates trash collection by private haulers in the County's unincorporated portions.

County of San Bernardino Environmental Health Services

The County Public Health Department's Environmental Health Services Division responds to emergencies and disasters. The Division's focus is prevention of illness and injury, and includes solid waste, wastewater, sewage holding tanks, and sewage pumper trucks.

San Bernardino County Fire Hazard Abatement Program

To reduce the threat of wildfires, the San Bernardino County Fire Hazard Abatement (FHA) Program enforces the fire hazard requirements outlined in the Codified Ordinances of the County of San Bernardino (County Code) §§ 23.0301-23.0319. The FHA Program's primary function is to reduce the risk of fires within communities by proactively establishing defensible space and reduction/removal of flammable materials on properties.

The FHA Program conducts surveys to identify fire hazards throughout the year. Fire hazards are identified and notices to abate the hazard(s) are mailed to property owners. Property owners are given 30 days to abate the hazards. Failure to abate may result in citations, penalties, and/or fees for abatement by the County. The FHA Program responds to complaints year-round in the unincorporated areas and contracting cities and fire districts.

San Bernardino County Fire Protection District

The SBCFPD is a community-based, all hazard emergency services provider. SBCFPD core services include the following:

- Fire Stations: 48 Stations with 1,064 County Fire Personnel
- Emergency Medical Services, Special Operations, and Training
- CONFIRE Dispatch: The joint powers authority known as CONFIRE is the communications and dispatch hub for numerous County fire agencies, including SBCFPD. (SBCFPD, 2021)

The SBCFPD's Hazardous Materials Division is the CUPA responsible for administering the County's HMW program. The CUPA program is designed to consolidate, coordinate, and uniformly and consistently administer permits, inspection activities, and enforcement activities throughout the County. This approach strives to reduce overlapping and sometimes conflicting requirements of different governmental agencies independently managing these programs. The CUPA's responsibilities include controlling the use, disposal, and transport of flammable chemicals and liquids.

In the City and its SOI, the SBCFPD is responsible for all components of the CUPA program described above, including approving Hazardous Materials Business Plans and HMW inventories. As a CUPA, SBCFPD manages six hazardous material and hazardous waste programs. These programs are:

- Hazardous materials business plan, established in 1986, intends to prevent, or minimize the damage to public health and safety and the environment, from a release or threatened release of HMW. Businesses that handle HMW (including hazardous waste) or extremely hazardous substances are required to submit a Hazardous Materials Business Plan via the California Environmental Reporting System, if using, handling, or storing HMW in quantities equal to or greater than:
  - 55 gallons of a liquid,
  - 500 pounds of a solid,
  - 200 cubic feet of compressed gas,

  - Extremely hazardous substances above the threshold planning quantity,
  - Facilities in the County must also report any amount of hazardous waste via California Environmental Reporting System (SBCFPD 2023a).
- Hazardous waste and onsite treatment
- Aboveground petroleum storage act (APSA)
- UST program
- CalARP Program
- California Fire Code – Hazardous Materials Management Plan & Hazardous Material Inventory Statements

The CUPA program is designed to consolidate and uniformly administer permits, inspection activities, and enforcement activities throughout San Bernardino County. The CUPA is charged with the responsibility of conducting compliance inspections for regulated facilities in San Bernardino County (SBCFPD 2023b).

San Bernardino County Multi-Jurisdictional Hazard Mitigation Plan

Prepared to comply with the Federal Disaster Mitigation Act of 2000 (42 USC § 5121), the San Bernardino County Multi-Jurisdictional Hazard Mitigation Plan (HMP) identifies hazards, both natural and human-caused, within the county. The types of hazards assessed include fire, drought, earthquakes, terrorism, and floods.

The intent of the HMP is to reduce and/or eliminate loss of life and property as a result of natural hazards through appropriate hazard mitigations. Hazard mitigation is defined by FEMA as “any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards.” FEMA also defines a “hazard” as “any event or condition with the potential to cause fatalities, injuries, property damage, infrastructure damage, agricultural loss, environmental damage, business interruption, or other loss.”

The HMP’s purpose is to demonstrate the plan for reducing and/or eliminating risk in the unincorporated area of the County and within areas overseen or managed by the County Flood Control District, Fire District and Special Districts Department. The HMP is a living document that is reviewed, monitored, and updated to reflect changing conditions and new information. As required by law, the HMP is updated every five years to remain in compliance with regulations and federal mitigation grant conditions. FEMA approved the current HMP in December 2022.

San Bernardino County Hazardous Materials Release Response Plans and Inventory Program

In San Bernardino County, the Business Emergency/Contingency Plan (Business Plan) is also used to satisfy the contingency plan requirement for hazardous waste generators. Any business subject to any of the CUPA permits is required in San Bernardino County to file a Business Emergency/Contingency Plan using the California Environmental Reporting System. This submission is used as the basis for the permit application. A new business going through the process of obtaining County planning or building approval

is required to comply with the Business Emergency/Contingency Plan requirement prior to obtaining final certificate of occupancy and prior to bringing HMW onto the property.

The quantities that trigger disclosure are based on the maximum quantity onsite at any time excluding materials under active shipping papers or for direct retail sale to the public. The basic quantities are HMW at or exceeding 55 gallons, 500 pounds, or 200 cubic feet at any time in the course of a year; specified amounts of radioactive, and extremely hazardous substances above the threshold planning quantity.

County of San Bernardino Department of Airports

The County of San Bernardino Department of Airports manages, maintains, and operates six county-owned airports. They also assist the County's private and municipal airport operators with planning, interpretation, and implementation of FAA general aviation requirements.

San Bernardino County Emergency Operations Plan

The San Bernardino County Emergency Operations Plan (County EOP) addresses the County's response to emergencies associated with natural disasters or human-caused emergencies. The County EOP identifies existing conditions, infrastructure, threats, and hazards, and then describes the process and roles for the response and recovery actions.

The County EOP provides a comprehensive, single source of guidance and procedures for the County to prepare for and respond to significant or catastrophic natural, environmental, or conflict-related risks that produce situations requiring coordinated response. It further provides guidance regarding management concepts relating to response and abatement of various emergencies, identifies organizational structures and relationships, and describes responsibilities and functions necessary to protect life and property.

San Bernardino Countywide Integrated Waste Management Plan

In April 2018, the County of San Bernardino Solid Waste Management Division revised the Countywide Integrated Waste Management Plan (CIWMP), which the City of Barstow adopted through Chapter 6.34, Hazardous Waste Ordinance, of the Code of the City of Barstow (Barstow Code). The purposed of the plan is to reduce dependence on landfilling solid waste to ensure adequate disposal capacity (San Bernardino County 2018). The CIWMP consists of four elements and a Summary Plan:

- **Source Reduction and Recycling Element.** This element analyzes local waste streams to determine where to focus diversion efforts and develop diversion programs and funding.
- **Household Hazardous Waste Element.** This element provides a framework for recycling, treatment, and disposal practices.
- **Nondisposal Facility Element.** This element lists planned and existing facilities such as material recovery facilities and composting facilities that recover waste from the waste stream.
- **Countywide Siting Element.** This element is intended to demonstrate that there is at least 15 years of remaining disposal capacity to serve all the jurisdictions within the County. If there is not adequate capacity, a discussion of alternative disposal sites and additional diversion programs must be included in the Countywide Siting Element.

Countywide Summary Plan

This plan contains goals and policies as well as a summary of integrated waste management issues faced by the County. It summarizes waste management programs, and the steps needed to cooperatively implement programs among the County's jurisdictions continue to meet the statewide diversion mandates.

County of San Bernardino Countywide Plan

The County adopted the Countywide Plan (CWP) in October 2020. The CWP Policy Plan addresses the physical, social, and economic issues facing the County's unincorporated portions. **Table 4: CWP Policy Plan Relevant Goals and Policies**, includes the hazards and hazardous materials and wildfire-related goals and policies.

Table 4: CWP Policy Plan Relevant Goals and Policies	
Number	**Goal or Policy**
HAZARDS ELEMENT	
Goal HZ-1	**Natural Environmental Hazards.** Minimized risk of injury, loss of life, property damage, and economic and social disruption caused by natural environmental hazards and adaptation to potential changes in climate.
Policy HZ-1.2	**New development in environmental hazard areas.** We require all new development to be located outside of the environmental hazard areas listed below. For any lot or parcel that does not have sufficient buildable area outside of such hazard areas, we require adequate mitigation, including designs that allow occupants to shelter in place and to have sufficient time to evacuate during times of extreme weather and natural disasters. **Flood**: 100-year flood zone, dam/basin inundation area **Geologic**: Alquist-Priolo earthquake fault zone; County-identified fault zone; rockfall/debris-flow hazard area, medium or high liquefaction area (low to high and localized), existing and County-identified landslide area, moderate to high landslide susceptibility area) **Fire**: high or very high fire hazard severity zone
Policy HZ-1.5	**Existing properties in environmental hazard areas.** We encourage owners of existing properties in hazard areas to add design features that allow occupants to shelter in place and to have sufficient time to evacuate during times of extreme weather and natural disasters.
Policy HZ-1.6	**Critical and essential facility location.** We require new critical and essential facilities to be located outside of hazard areas, whenever feasible.
Policy HZ-1.7	**Underground utilities.** We require that underground utilities be designed to withstand seismic forces, accommodate ground settlement, and hardened to fire risk.
Policy HZ-1.8	**Wind erosion hazards.** We require new development in medium-high or high wind erosion hazard areas to minimize the effects of wind-blown soil through building and site design features such as fencing, surface treatment or pavement, attenuation or wind barriers, architectural features, building materials, and drought resistant landscaping.
Policy HZ-1.9	**Hazard areas maintained as open space.** We minimize risk associated with flood, geologic, and fire hazard zones or areas by encouraging such areas to be preserved and maintained as open space.
Policy HZ-1.12	**Local hazard mitigation plan implementation**. We require adherence to the goals, objectives and actions in the Multi-jurisdictional Hazard Mitigation Plan and subsequent amendments to reduce and mitigate damages from hazards in the county.
Policy HZ-1.14	**Long-term fire hazard reduction and abatement.** We require proactive vegetation management/hazard abatement to reduce fire hazards on existing private properties, along roadsides of evacuation routes out of wildfire prone areas, and other private/public land where applicable, and we require new development to enter into a long-term maintenance agreement for vegetation management in defensible space, fuel modification, and roadside fuel reduction in the Fire Safety Overlay and/or Very High Fire Hazard Severity Zones.
Goal HZ-2	**Human-Generated Hazards.** People and the natural environment protected from exposure to hazardous materials, excessive noise, and other human-generated hazards.
Policy HZ-2.3	**Safer alternatives.** We minimize the use of hazardous materials by choosing and by encouraging others to use non-toxic alternatives that do not pose a threat to the environment.

Policy HZ-2.4	**Truck routes for hazardous materials.** We designate truck routes for the transportation of hazardous materials through unincorporated areas and prohibit routes that pass through residential neighborhoods to the maximum extent feasible.
Policy HZ-2.10	**Agricultural operations.** We require new development adjacent to existing conforming agricultural operations to provide adequate buffers to reduce the exposure of new development to operational noise, odor, and the storage or application of pesticides or other hazardous materials.

The CWP Policy Plan includes the following Policy Maps that address hazards, hazardous materials, and wildfire:

- Policy Map HZ-5 Fire Hazard Severity Zones: Depicts the County's fire safety overlay zones and fire hazard severity zones (2016).
- Policy Map HZ-6 Fire Responsibility Areas: Depicts the County's local, state, and federal fire responsibility areas.
- Policy Map HZ-9 Airport Safety and Planning: Depicts the County's Airport Runway Protection Zones, airport noise contours, airport safety review areas, and low-altitude high speed military airspace.
- Policy Map PP-2 Evacuation Routes: Depicts the County's evacuation routes.

See **Section 5.8** below for further discussion concerning the above conditions and their potential presence in the BIG footprint.

Codified Ordinances of the County of San Bernardino

The County Code regulations addressing hazards, hazardous materials and wildfire are provided below.

County Code Title 2 Division 3: Fire Protection and Explosives and Hazardous Materials. The County's Uniform Fire Code, which is based on the 2000 Uniform Fire Code and 2000 Uniform Fire Code Standards, as amended, is found in Chapter 1 of this division. Chapter 2 includes the County's fire regulations and Chapter 3 includes the County's regulations concerning abatement of fire hazards. County Code § 23.0301 requires every owner or person in control of any land or interest in the unincorporated area of the County to abate all fire hazards and hazardous trees from such land and from all sidewalks, parkways, road easements and all other easements on such land. County Code § 23.0301 also includes the firebreak and fuel break standards that every owner and person in control of any buildings or structures in, upon, or adjoining any mountainous area, forest-covered lands, brush-covered lands, grass-covered lands, or any land that is covered with flammable material within the unincorporated area of the County of San Bernardino are required to implement at all times. The San Bernardino County FHA Program enforces the fire hazard requirements outlined in County Code § 23.0301 to reduce the threat of wildfires.

Chapter 4 authorizes the Fire Chief and Investigative Officers of SBCFD, Division of Hazardous Materials to enforce and administer all federal, state, and local laws pertaining to HMW in San Bernardino County. Chapter 5 authorizes the Chief and Investigative Officers of the Hazardous Materials Division of the SBCFD to enforce the provisions of this Public Nuisance Abatement Chapter. These authorities include the right

to enter land, with consent or a warrant if required, for investigation, posting or serving notice or to cause abatement as herein provided. Chapter 6 outlines the permits, inspections, and hearing procedures for HMW and Chapter 7 outlines CUPA permit elements for HMW within San Bernardino County.

County Code Title 3 Division 3, Environmental Health. Pursuant to Health and Safety Code § 120125 et seq., § 101025 et seq., § 101375 et seq., § 101450 et seq., § 101275 et seq., Public Resources Code § 21050 et seq., and other relevant State authority, this jurisdiction has found that the public's interest will be best served by all Environmental Health Services and related Consumer Protection Programs within the borders of San Bernardino County being enforced and administered through the Department of Environmental Health Services of the County of San Bernardino.

County Code § 33.0643, Well Abandonment. If after 30 days of abandonment, the owner of an abandoned well has not declared to Department of Environmental Health Services the well for proposed reuse, then the well shall be destroyed per § 33.0631, Permits, of the County Code, which requires obtaining a permit from the Department of Environmental Health Services prior to reconstructing or removing the well.

County Code § 33.0879, Abandonment of Sewage Holding Tanks. If the Department of Environmental Health Services or any agency orders the abandonment of the sewage holding tank, or if the connection is made to sanitary sewers, the permittee operating the sewage holding tank shall abandon the sewage holding tank.

County Code Chapter 82.15: **Geologic Hazard (GH) Overlay**. This Chapter was created to provide greater public safety by establishing investigative requirements for areas that are subject to potential geologic problems, including active faulting and sliding, debris flow/mud flow, rockfall, liquefaction, seiche, and adverse soil conditions. County Code Title 8, Chapter 82.15.040 (a), seeks to prevent construction or major rehabilitation of structures used for human occupancy within 50 feet of an active fault. County Code Chapter 82.15.040(b) requires that structures used for critical facilities be at least 150 feet from any active fault trace.

County Code Title 8 Division 2: Land Use Zoning Districts and Allowed Land Uses. This division establishes the primary and overlay land use zoning districts applied to County property. The Fire Safety Overlay (County Code Chapter 82.13), which is mapped on the County General Plan Hazards Maps, corresponds to distinct geographic areas and the associated wildland fire hazard, and was created to provide greater public safety in areas prone to wildland brush fires, by establishing additional development standards for these areas. There are no Fire Safety Overlays within the BIG footprint (County of San Bernardino, 2020).

County Code Title 8 Division 4: Standards for Specific Land Uses and Activities. Chapter 84.11, Hazardous Waste Facilities, provides guidelines for the regulation of HMW for the protection of health, safety, and welfare of persons, resources, and property.

City of Barstow General Plan

The City adopted the City of Barstow 2015-2020 General Plan (2020 General Plan) in February 2015. The 2020 General Plan is the overarching guide for implementation of the Development Code, which defines

development regulations and establishes zoning districts throughout the City. **Table 5: 2020 General Plan Relevant Goals and Policies** includes the hazards, hazardous materials and wildfire-related goals and policies relevant to the Project:

Table 5: 2020 General Plan Relevant Goals and Policies	
Number	**Goal or Policy**
SAFETY ELEMENT	
Goal 1	Public Safety Goals, Policies and Strategies. Maintain optimal levels of service and quality for fire and police protection, thereby ensuring the preservation and protection of health, well-being, and property for all types of development and all residents of the community.
Policy 1A	Increase police and fire staffing levels at an equal or greater rate than the City's overall population, household, and employment growth.
Goal 2	Public Safety Goals, Policies and Strategies. Expand police and fire facilities as needed in conjunction with future planned development.
Policy 2A	Review all new development proposals, as well as significant remodeling projects to determine potential impacts to public safety and the provision of police and fire protection services.
Policy 2B	Ensure, through planning and assessment, the adequacy of police and fire staffing and facilities to accommodate planned residential, commercial, and industrial growth.
Goal 3	Public Safety Goals, Policies and Strategies. Expand police and fire facilities as needed in conjunction with future planned development.
Goal 3	Emergency Preparation Goals, Policies and Strategies. Ensure that all development occurring under the General Plan is designed and built in accordance with current standards for seismic safety, fire protection and defensible space.
Policy 3.1	Consider and assess vulnerability to natural and humanmade disasters or emergencies when reviewing proposals for the siting and development of public/quasi-public facilities such as schools, water towers and power and communication transmitters
Sources: City of Barstow. (2015). *2020 Barstow General Plan 2015-2020 Update.* Retrieved from https://www.barstowca.org/departments/community-development-department/planning/general-plan-and-master-environmental-impact-report.	

The 2020 General Plan includes the following Exhibits that address hazards, hazardous materials, and wildfire:

- Exhibit RC-1: Flood Insurance Rating Map
- Exhibit S-1: Seismic Hazards Map
- Exhibit S-2 Emergency Evacuation Routes Map: Depicts the City's evacuation routes.

See **Section 4.0: Environmental Setting** below for further discussion concerning the above conditions and their potential presence in the BIG footprint.

The Code of the City of Barstow

The Code of the City of Barstow (Barstow Code) regulations addressing hazards, hazardous materials and wildfire are provided below.

Barstow Code Chapter 6.22: **Underground Storage of Hazardous Substances**. This Chapter outlines the permits required, application procedure, fees, and authority for underground storage of hazardous substances within the City.

Barstow Code Chapter 6.24 Environmental Health Code. This Chapter designates the San Bernardino County department of environmental health services as the enforcement agency for the Environmental Health Code and all state law pertaining to environmental health. The Environmental Health Code also establishes remedies and penalties for violations.

Barstow Code Chapter 6.34 Hazardous Waste. This Chapter adopts the San Bernardino County hazardous waste management plan. Furthermore, this Chapter establishes that all zoning, subdivision, conditional use permits, and variances will be consistent with the hazardous waste management plan.

Barstow Code § 6.34.010: **Adoption of Hazardous Waste Management Plan**. This code adopted the Counties hazardous waste management plan in its entirety.

Barstow Code § 10.40.230: Vehicles Transporting Hazardous Waste and Materials. This code regulates the parking and supervision of vehicles transporting hazardous materials requiring placards under federal law.

Barstow Code Chapter 15.16: Floodplain Management. The City has adopted floodplain management regulations, consistent with federal and state law, to reduce flood risk, protect public safety, and preserve natural floodplain functions. The ordinance applies to all Special Flood Hazard Areas as identified by FEMA and mapped in the City's Flood Insurance Study and Flood Insurance Rate Maps.

Barstow Code Chapter 16.04 Fire Code. The City has adopted the CFC which incorporates and amends the International Fire Code and is adopted by reference as the fire code of the City for the purpose of prescribing regulations governing conditions to life and property from fire hazardous materials or explosion.

Barstow Fire Protection District Ordinance 29-19. This ordinance adopts fire prevention in accordance with the latest CFC 2022 Edition (CCR Title 24 Part 9) for the purpose of prescribing regulations governing conditions to life and property from fire, hazardous materials, or explosion.

City of Barstow Fire Protection District Hazardous Materials Response Team

The Barstow Fire Protection District (BFPD) is an "all-hazard" response agency for the City. BFPD members are trained, equipped, and dedicated to providing outstanding emergency medical, fire, HMW, technical rescue, natural, and manufactured disaster response. BFPD engages in activities intended to promote greater public awareness of fire and safety hazards and prevention techniques and to prevent the occurrence of crime. The Fire Chief and engine companies conduct routine fire prevention inspections on local businesses to educate the business owners and to ensure code compliance.

City of Barstow Emergency Operations Plan

The City's EOP, updated in April 2022, provides guidance for the City's response to extraordinary emergency situations associated with natural, human-made, and technological disasters. This plan is not intended to be used for normal day-to-day emergencies, or the established routine procedures used to cope with such incidents. Rather, this plan concentrates on operational concepts and response procedures relative to large-scale emergencies and disasters. The City's EOP has been developed in

accordance with the Standardized Emergency Management System and the National Incident Management System. City departments are responsible to assure the preparation and maintenance of the City's Standard Operating Procedures, resource lists and checklists that detail how assigned responsibilities are performed to support the implementation of the City's EOP. The Standard Operating Procedures include the specific emergency authorities that designated officials, and their successors can assume during emergency situations.

2018 Barstow Hazard Mitigation Plan

Adopted in 2018, the Barstow Hazard Mitigation Plan (BHMP) identifies existing and potential hazards, assesses the risks associated with them, and outlines strategies and actions the City will take to minimize effects associated with those hazards. Hazards identified in the BHMP include flooding, wildfire, earthquakes, and climate change. Jurisdictions are required to update their local hazard mitigation plans every 5 years to be eligible for the projects funded under the HMA and other FEMA programs. The City is currently updating their BHMP.

4.0 METHODOLOGY FOR EVALUATING IMPACTS

This section describes the study area (i.e., affected environment) and summarizes the methodology used to analyze potential impacts concerning hazards, hazardous materials, and wildfire.

4.1 Terminology and Concepts

Hazards, Hazardous Materials, and Wastes

Hazardous Materials. Hazards Materials that no longer have practical use, such as materials that have been discarded, discharged, spilled, or contaminated, or are being stored until they can be disposed of properly (CCR Title 22, Chapter 11, Article 2, § 66261.10). Soil that is excavated from a site containing hazardous materials is a hazardous waste if it exceeds specific CCR Title 22 criteria.

Past industrial, agricultural, illegal dumping, or commercial activities on a site could have resulted in spills or leaks of hazardous materials to the ground, resulting in soil and/or groundwater contamination. Hazardous materials may also be present in building materials of older structures and released during building demolition activities. If improperly handled, hazardous materials and wastes can cause public health hazards when release to the soil, groundwater, or air. The four basic exposure pathways through which an individual can be exposed to a chemical agent include inhalation, ingestion, bodily contact, and injection. Exposure can come from an accidental release during transportation, storage, or handling of hazardous materials. Disturbance of subsurface soil during construction can also lead to exposure of workers or the public from stockpiling, handling, or transportation of soils contaminated by hazardous materials or waste from previous spills or leaks.

Hazardous Materials and Wastes (HMW). For the purpose of the assessment in this assessment, hazardous materials and wastes (HMW) are defined herein as any materials, wastes, and substances that, because of quantity, concentration, or physical or chemical characteristics, pose a significant, present, or potential hazard to human health and safety, or to the environment, if released. HMW include, but are not limited to, hazardous substances, hazardous wastes, and any material that a handler or the administering regulatory agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment (CHSC § 25501[o]). Although often treated separately from HMW, petroleum products (including crude oil and refined products such as fuels and lubricants) and natural gas are considered HMW in this analysis because they might also pose a potential hazard to human health and safety if released into the environment. Hazardous wastes include residues, discards, byproducts, contaminated products, or similar substances that exceed regulatory thresholds for properties of toxicity, ignitibility, corrosivity, or reactivity. Federal and state regulations identify by name specific hazardous wastes that the EPA has determined are hazardous and has designated as “listed wastes.” A description of various HWM and relevant terms referred to in this analysis are defined below.

Hazardous Materials and Wastes Sites. HMW Sites are properties containing or generating HMW. These sites have had materials which has been discarded, discharged, spilled, caused contamination, or are being stored either improperly or properly HMW Sites can be defined by previous use, which could include previous industrial, agricultural, illegal dumping, or commercial activities, which could have resulted in

spills or leaks of HMW to the ground, resulting in soil and/or groundwater contamination. Hazardous materials may also be present in building materials of older structures and released during building demolition activities.

Hazardous Waste Management. Hazardous waste management includes the treatment, storage, or disposal of hazardous waste. Treatment is any process that changes the physical, chemical, or biological character of the waste to reduce its potential as an environmental threat. Treatment can include neutralizing the waste, recovering energy or material resources from the waste, rendering the waste less hazardous, or making the waste safer to transport, dispose of, or store. Storage involves temporarily holding hazardous wastes until they are treated or disposed of properly. Hazardous waste is commonly stored in containers, tanks, containment buildings, drip pads, waste piles, or surface impoundments that comply with RCRA regulations. Disposal serves as a permanent way to contain hazardous wastes. The most common disposal method is through landfills, where hazardous wastes are disposed of in carefully constructed units designed to protect groundwater and surface water resources.

Environmental Concerns. This is a situation or condition that could potentially pose a risk to the environment, human health, or property, through the presence of HMW on a property, indicating an existing, past, or material threat of future release into the environment.

Environmental Safety Levels (ESLs). ESLs are levels of chemicals that indicate a potential for harm to humans, water life, and animal life. Additionally, they are used to help identify and evaluate potential environmental concerns at a site based on evaluation of over 100 commonly detected constituents. They address a full range of concerns potentially encountered at a site and are protective of human health, water quality, and the environment. The ESLs do not constitute policy or regulation, and their use is optional. The SFRWQCB ESLs are guidelines used to evaluate the potential risk associated with chemicals found in soil or groundwater where a release of HMW has occurred. Although developed and maintained by the SFRWQCB, ESLs are used by regulatory agencies throughout California. Screening levels have been established for both residential and commercial/industrial land uses, and for construction workers. Residential screening levels are the most restrictive; soil with chemical concentrations below these levels generally would not require remediation and would be suitable for unrestricted uses if disposed of offsite. Commercial/industrial screening levels are generally less restrictive than residential screening levels because they are based on potential worker exposure to HMW in the soil (and these are generally less than residential exposures). Screening levels for construction workers are also less restrictive than for commercial/industrial workers because construction workers are only exposed to the chemical of concern during the duration of construction, while industrial workers are assumed to be exposed over a working lifetime. Chemical concentrations below these screening levels generally would not require remediation and would be suitable for unrestricted uses. In addition, there are other more specific but similar screening levels used more narrowly focused human health or ecological risk assessment considerations.

Creosote. Creosote is derived from the distillation of tar from wood or coal and is used as a wood preservative. Pesticide products containing creosote as the active ingredient are used to protect wood used outdoors (such as railroad ties and utility poles) against termites, fungi, mites, and other pests. (EPA, 2024a).

Inorganic Contaminants or Metals. Inorganic contaminants consist of salts and metals, which may be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming. Federal and state regulated inorganic contaminants which are discussed in this section include:

Arsenic. Arsenic is a naturally occurring element that is found in combination with either inorganic or organic substances to form many different compounds. Inorganic arsenic compounds are found in soils, sediments, and groundwater. These compounds occur either naturally or as a result of mining, ore smelting, and industrial use of arsenic. It can enter drinking water supplies from natural deposits in the earth or from agricultural and industrial practices. (CDC, 2009)

Asbestos. Asbestos is a mineral fiber that occurs in rock and soil. Because of its fiber strength and heat resistance, asbestos has been used in a variety of building construction materials for insulation (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), fire retardant, friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Exposure to asbestos occurs when fibers are released into the air by the disturbance of asbestos-containing material during product use, demolition work, building or home maintenance, repair, and remodeling. In general, exposure may occur only when the asbestos-containing material is disturbed or damaged in some way to release particles and fibers into the air. (EPA, 2025a)

Chromium. Chromium is an odorless and tasteless metallic element. Chromium is found naturally in rocks, plants, soil and volcanic dust, and animals. The most common forms of chromium that occur in the natural environment are trivalent chromium (chromium-3) and hexavalent chromium (chromium-6). Chromium-3 is an essential human dietary element found in many vegetables, fruits, meats, grains, and yeast. Chromium-6 (see *Hexavalent Chromium* below) is the most toxic form of the metal which occurs both naturally from the erosion of natural chromium deposits and artificially from the release into the environment from leakage, poor storage, or inadequate industrial waste disposal practices at steel and pulp mills. (EPA, 2023a)

Hexavalent Chromium. Hexavalent chromium is a known human carcinogen when inhaled and has been shown to cause tumors in mice and rats when ingested in drinking water, but there is little evidence indicating that ingesting trivalent chromium, a dietary supplement, poses any toxic or carcinogenic risk to humans. (EPA, 2025b).

Nitrate. Nitrate is a compound of nitrogen and oxygen naturally found in air, soil, water, and some food. Plants and animals require nitrates for their survival and growth, and the human body also produces this compound. Nitrates are also used as fertilizer for crops and lawns. Additionally, nitrates are used in food preservation, certain pharmaceutical medications, as well as the manufacture of munitions and explosives. (EPA, 2023b)

Heavy Metals. Heavy metal is a broad term used to describe a group of naturally occurring metallic elements such as arsenic, cadmium, lead, iron, zinc, copper, manganese, thallium, and mercury. Some heavy metals are essential for human nutrition and others serve no biological role. All metals can be toxic to the human body depending on the level of exposure. (EPA, 2024b)

Lead. Lead is a naturally occurring element found in small amounts in the earth's crust. While it has some beneficial uses, it can be toxic to humans and animals, causing health effects. Lead is often released into the environment from the use of fossil fuels (i.e., leaded gasoline, lead based paint, ceramics, pipes and plumbing materials, solders, batteries, ammunition, and cosmetics). (EPA, 2024c)

Herbicides. Herbicides are chemicals used to manipulate or control undesirable vegetation. Herbicide application occurs most frequently in row-crop farming, where they are applied before or during planting to maximize crop productivity by minimizing other vegetation. (EPA, 2022c) Federal and state regulated herbicides which are discussed in this section include:

2,4-D. 2,4-D is a widely used herbicide that controls broadleaf weeds that has been used as a pesticide since the 1940s. It is used in many places including turf, lawns, rights-of-way, aquatic sites, forestry sites, and a variety of field, fruit, and vegetable crops. It may also be used to regulate the growth of citrus plants. 2,4-D generally has low toxicity for humans, except certain acid and salt forms can cause eye irritation. 2,4-D generally has moderate toxicity to birds and mammals, is slightly toxic to fish and aquatic invertebrates, and is practically nontoxic to honeybees. 2,4-D is not Agent Orange, rather it was a component. Agent Orange was a mixture of two different herbicides: 2,4,5-T and 2,4-D (as well as kerosene and diesel fuel). 2,4,5-T contained high levels of dioxin, a contaminant, found to cause cancer and other health problems in people. (EPA, 2023c)

Maximum Containment Level (MCL). MCLs identify the highest level of a contaminant that is allowed in drinking water. MCLs are enforceable standards which are set as close to Maximum Containment Level Goals as feasible using the best available treatment technology and taking cost into consideration. Maximum Containment Level Goals allow for a margin of safety and are non-enforceable public health goals. Maximum Containment Level Goals outline the EPA's desired level of a contaminant in drinking water below which there is no known or expected risk to health.

Pesticides. Pesticides include any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest. Pesticides are also intended for use as a plant regulator, defoliant, desiccant, or as a nitrogen stabilizer. Federal and state regulated pesticides which are discussed in this section include:

Chlordane. Chlordane was used as a pesticide in the United States from 1948 to 1988. Until 1978, chlordane was also used as a pesticide on agricultural crops, lawns, and gardens and as a fumigating agent. From 1983 to 1988, chlordane's only approved use was to control termites in homes. The pesticide was applied underground around the foundation of homes. (EPA, 2000a)

4,4-DDE. DDE is a breakdown product of DDT, which was previously used as an insecticide. (EPA, 2000b)

DDT. DDT was developed as the first of the modern synthetic insecticides in the 1940s. It was initially used with great effect to combat malaria, typhus, and the other insect-borne human diseases among both military and civilian populations. It also was effective for insect control in crop and livestock production, institutions, homes, and gardens. DDT's quick success as a pesticide and broad use in the United States and other countries led to the development of resistance by many insect pest species. DDT was prohibited

from being used as an insecticide in 1972 after mounting evidence of the pesticide's adverse declining benefits, environmental effects, and potential human health risks. (EPA, 2023d)

Secondary Contaminant. A secondary contaminant refers to substances that may be present in drinking water at higher levels than primary contaminants but typically do not pose significant health risks. Secondary contaminants can affect the taste, odor, color, and aesthetic quality of the water. (EPA, 2024d)

Secondary Maximum Containment Level (SMCL). SMCLs are EPA-developed non-mandatory water quality standards for secondary contaminants. The EPA does not enforce SMCLs, but they are established as guidelines to assist public water systems in managing their drinking water for aesthetic considerations, such as taste, color, and odor. These contaminants are not considered to present a risk to human health at the SMCL. (EPA, 2024d)

Semi-Volatile Organic Compounds (SVOCs). SVOCs are not as volatile as VOCs and thus are more likely to be liquids or solids at lower temperatures. SVOCs include products such as pesticides, oil-based products, and fire retardants. SVOCs can deposit on outdoor surfaces and are more likely to be dispersed in the air (EPA, 2023e). Federal and state regulated SVOCs which are discussed in this section include:

Naphthalene. Naphthalene is used in the production of coal tar, wood preserving, tanning, or ink and dye production. Naphthalene can also be released to the air from the burning of coal and oil and from the use of mothballs. Short term exposure of humans to naphthalene by inhalation, ingestion, and dermal contact is associated with hemolytic anemia, damage to the liver, and neurological damage. Long term exposure of workers and rodents to naphthalene has been reported to cause cataracts and damage to the retina. The EPA has classified naphthalene as a possible human carcinogen. (EPA, 2000c)

2-Methylnaphthalene. 2-Methylnaphthalene is a natural component of crude oil and coal and is found as a byproduct from the combustion of tobacco, wood, petroleum-based fuels, and coal. (US Department of Health and Human Services, 2025)

Synthetic Organic Contaminants. Synthetic Organic Contaminants are carbon-based compounds of human-made origin that can get into water through runoff from croplands, discharge from factories, urban storm water runoff and septic systems. Federal and state regulated Synthetic Organic Contaminants which are discussed in this section include:

Polychlorinated Biphenyls (PCBs). PCBs are a group of manufactured organic chemicals consisting of carbon, hydrogen, and chlorine atoms. PCBs belong to a broad family of manufactured organic chemicals known as chlorinated hydrocarbons. PCBs were domestically manufactured from 1929 until manufacturing was banned in 1979. They have a range of toxicity and vary in consistency from thin, light-colored liquids to yellow or black waxy solids. Due to their non-flammability, chemical stability, high boiling point and electrical insulating properties, PCBs were used in hundreds of industrial and commercial applications including:

- Electrical, heat transfer and hydraulic equipment
- Plasticizers in paints, plastics, and rubber products
- Pigments, dyes, and carbonless copy paper

- Other industrial applications.

Although no longer commercially produced in the United States, PCBs may be present in products and materials produced before the 1979 PCB ban. (EPA, 2025c). Products that may contain PCBs include:

- Transformers and capacitors
- Electrical equipment including voltage regulators, switches, re-closers, bushings, and electromagnets.
- Oil used in motors and hydraulic systems.
- Old electrical devices or appliances containing PCB capacitors.
- Fluorescent light ballasts
- Cable insulation
- Thermal insulation material including fiberglass, felt, foam, and cork.
- Adhesives and tapes
- Oil-based paint
- Caulking
- Plastics
- Carbonless copy paper
- Floor finish

Total Dissolved Solids. Total dissolved solids mean the total dissolved (filterable) solids present in a fluid.

Total Petroleum Hydrocarbons (TPH). TPH is a term used to describe a wide range of chemicals composed of carbon and hydrogen that are found in crude oils, petroleum products (such as gasoline, diesel, and other fuels, lubricating and hydraulic oils, and solvents), wastes, and process streams from refineries and other petroleum-related facilities. TPH is usually present in the environment as a result of accidental spills, waste disposal, leaks from storage tanks, or other types of releases. It may also be found as a result of oil seepages from naturally occurring underground reservoirs of oil. (CDC, 2014a). TPH are grouped into three ranges according to the number of carbons, these ranges include:

- Total Petroleum Hydrocarbons – Gasoline Range Organics
- Total Petroleum Hydrocarbons – Diesel Range Organics
- Total Petroleum Hydrocarbons – Oil Range Organics

Volatile Organic Compounds (VOCs). VOCs are compounds that have a high vapor pressure[4] and low water solubility[16]. VOCs are common ground-water contaminants. Many VOCs are human-made chemicals that are used and produced in the manufacture of paints, pharmaceuticals, and refrigerants and are often components of petroleum fuels, hydraulic fluids, paint thinners, and dry-cleaning agents. VOCs are emitted by a wide array of products which include fuels, paints and lacquers, paint strippers, cleaning supplies, pesticides, building materials and furnishings, office equipment such as copiers and printers, correction fluids and carbonless copy paper, graphics and craft materials including glues and adhesives, permanent markers, and photographic solutions. (EPA, 2023f). Federal and state regulated VOCs which are discussed in this section include:

Benzene. Benzene or benzol, is a colorless liquid with a sweet odor which is categorized as a VOC contaminant. Since Benzene is categorized as a VOC, it has a high vapor pressure, medium water solubility,

[16] A property of a solute (substance) to dissolve in a solvent (a solution with another substance).

and is highly flammable. Benzene is found in air, water, and soil. Benzene comes from both industrial and natural sources. Benzene was first discovered and isolated from coal tar in the 1800s. Today, benzene is made mostly from petroleum. Various industries use benzene to make other chemicals, such as styrene (for Styrofoam® and other plastics), cumene (for various resins), and cyclohexane (for nylon and synthetic fibers). Benzene is also used in the manufacturing of some types of rubbers, lubricants, dyes, detergents, drugs, and pesticides. Natural sources of benzene, which include gas emissions from volcanoes and forest fires, also contribute to the presence of benzene in the environment. (EPA, 2012a)

Ethylbenzene. Ethylbenzene is mainly used in the manufacture of styrene, which is widely used to make plastics and rubber to manufacture a variety of products, such as insulation, pipes, automobile parts, printing cartridges, food containers, and carpet backing. Occupational exposure to ethylbenzene occurs in factories that use ethylbenzene to produce other chemicals; for gas and oil workers; and for varnish workers, spray painters, and persons involved in gluing operations. Exposure to ethylbenzene also occurs from the use of consumer products, gasoline, pesticides, solvents, carpet glues, varnishes, paints, and tobacco smoke. Short term exposure in humans results in respiratory effects, such as throat irritation and chest constriction, irritation of the eyes, and neurological effects such as dizziness. Long term exposure by inhalation in humans has shown conflicting results regarding its effects on the blood. (EPA, 2000d)

Ethylene Dichloride (1,2-Dichloroethane). Ethylene dichloride is primarily used in the production of vinyl chloride as well as other chemicals and is added to leaded gasoline as a lead scavenger. It is used in solvents as a dispersant in rubber and plastics, as a wetting and penetrating agent, and in closed systems for various extraction and cleaning purposes in organic synthesis. Ethylene dichloride has historically been used in ore flotation, as a grain fumigant, as a metal degreaser, and in textile and PVC cleaning. Exposure to low levels of ethylene dichloride can occur from breathing ambient or workplace air. Inhalation of concentrated ethylene dichloride vapor can induce effects on the human nervous system, liver, and kidneys, as well as respiratory distress, cardiac arrhythmia, nausea, and vomiting. Long-term inhalation exposure to ethylene dichloride can produce effects on the liver and kidneys in animals. The EPA has classified ethylene dichloride as a probable human carcinogen. (EPA, 2000d)

Toluene. Toluene is an organic liquid with a sweet, benzene-like odor which is categorized as a VOC contaminant. The largest chemical use for toluene is to make benzene and urethane. Toluene is most commonly released into the atmosphere from the volatilization of petroleum fuels and toluene-based solvents and thinners and from motor vehicle exhaust. It is also released in wastewaters or by spills on land during the storage, transport and disposal of fuels and oils. It is released into the atmosphere principally from the volatilization of petroleum fuels and toluene-based solvents and thinners and from motor vehicle exhaust. (EPA, 2012b)

Total Xylenes. The term 'total xylenes' refers to all three isomers of xylene (*m*-, *o*-, and *p*-xylene). Total xylenes are primarily used as a solvent (a liquid that can dissolve other substances) in the printing, rubber, and leather industries. Along with other solvents, xylene is also widely used as a cleaning agent, a thinner for paint, in varnishes, and from a variety of consumer products, including gasoline, paint, varnish, shellac, rust preventives, and cigarette smoke. Short-term exposure of people to high levels of xylene can cause irritation of the skin, eyes, nose, and throat; difficulty in breathing; impaired function of the lungs; delayed response to a visual stimulus; impaired memory; stomach discomfort; and possible changes in the liver

and kidneys. Both short- and long-term exposure to high concentrations of xylene can also cause a number of effects on the nervous system, such as headaches, lack of muscle coordination, dizziness, confusion, and changes in one's sense of balance. (CDC, 2014b) Wildfire

As used in this assessment, and as defined by CAL FIRE and PRC § 4103, a wildfire or wildland fire is a fire burning uncontrolled on lands covered wholly or in part by timber, brush, grass, grain, or other flammable vegetation. Wildfires have differing causes such as lightning strikes and wind-blown embers but are most commonly caused by human activities. The terms wildfire or wildland fire are used interchangeably in this document.

4.2 Definition of Study Areas

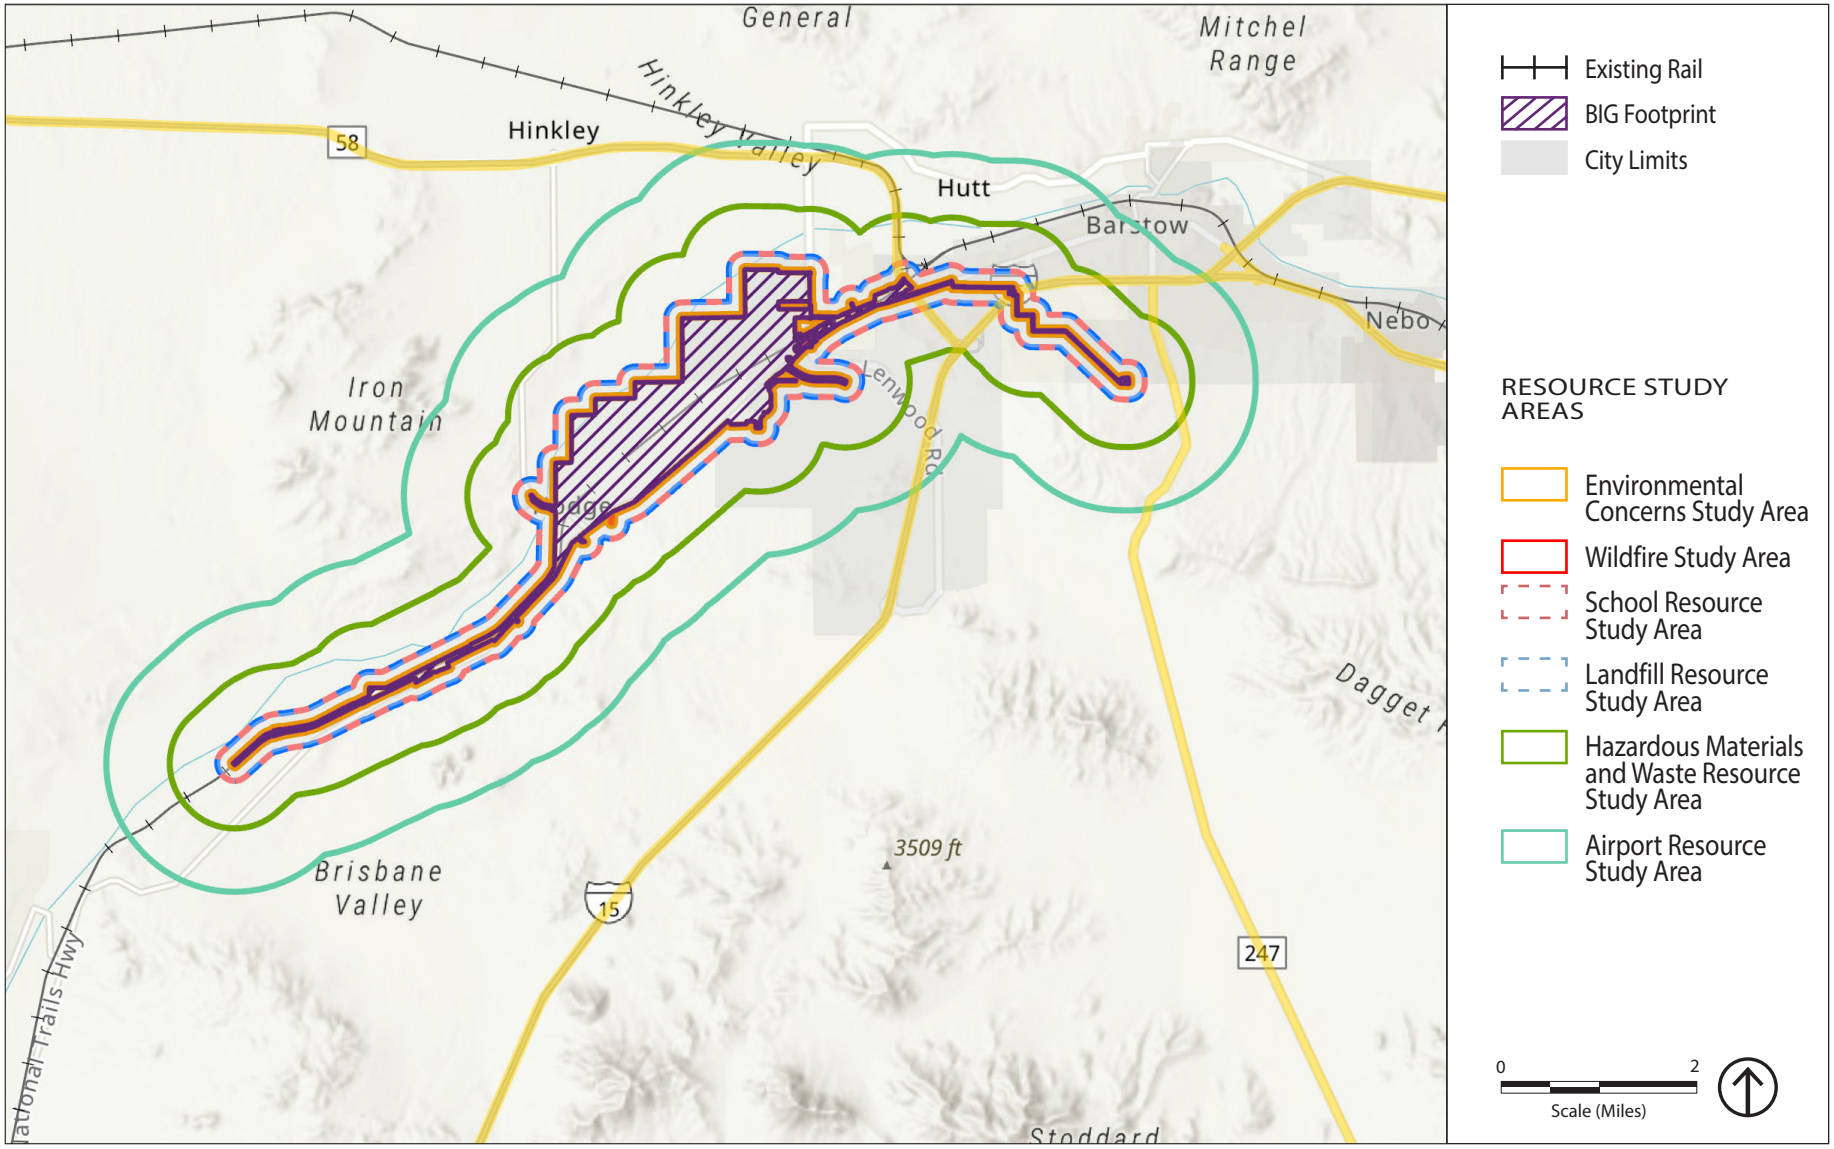

The study areas used in this report are measured from the BIG footprint (approximately 5,000 acres, including the rail yard with an intermodal facility and block swap yard, and a transload warehouse center, and offsite rail and non-rail improvements). As a general matter, the study area refers to the areas in which potential effects on environmental resources are described and quantified and is defined differently based on the affected resource. The study area is the area that would be physically affected by BIG construction, operation, and maintenance (including temporary disturbance) activities and the location of permanent infrastructure.

The analysis considers resources within the study areas defined in **Table 6: Study Areas** and depicted in **Figure 6: Study Areas** to determine impacts concerning hazards, hazardous materials, and wildfire.

Table 6: Study Areas

Topic	Study Area
Environmental Concern	BIG footprint
Wildfire	Big footprint
School[1]	BIG footprint plus 0.25-mile radius
Landfill[2]	BIG footprint plus 0.25-mile radius
HMW Sites[3]	BIG footprint plus up to 1.0-mile radius
Airport[4]	BIG footprint plus 2.0-mile radius
Evacuation	BIG footprint

Note:
[1] California Code of Regulations, Title 5, §14010(d), requires a safety study for new school sites within 1,500 feet (approximately 0.25 mile) of an existing railroad track. Also, schools study area includes 0.25-mile radius for consistency with State CEQA Guidelines Appendix G threshold.
[2] The Landfills study area allows for an analysis of the potential for a change in land use adjacent to landfills, pursuant to California Code of Regulations, Title 27, Subchapter 5, which requires assessment of landfill potential to release methane gas, which may present an explosion risk.
[3] HMW sites study area was evaluated to establish context in the vicinity of the BIG footprint. Any Environmental Concerns outside the BIG footprint are not evaluated, as discussed further in **Section 4.3.1: Historical Information Review**.
[4] Airport study area includes 2.0-mile radius for consistency with State CEQA Guidelines Appendix G threshold.

Hazardous Materials, Wastes, and Wildfire Study Areas - BIG

4.3 Methodology

Historical Information Review

General types of activity and land use can often be discerned from the type and layout of structures visible in an aerial photograph, although specific elements of site operations cannot readily be determined from photographs. Copies of historical aerial photographs are included in **Attachment C: Historical Aerial Photographs**. Summary of aerial photographs and findings relevant to the HMW study area is included in **Table 7: Historical Aerial Photographs Development Pattern Changes In HMW Sites Study Area.**

Analysts collected and reviewed historical information pertaining to HMW located in the HMW study area for evidence of activities that would suggest the potential presence of HMW within the HMW study area and to evaluate the potential for offsite contamination sources that could affect the HMW study area. The information reviewed is summarized in **Section 5.0: Environmental Setting.**

HMW Methodology

This technical report discusses the potential for BIG construction and operations to result in HMW-and hazards-related impacts, including concerning existing environmental concern sites (defined below), proximity to landfills, releases near a school, and/or airport-related safety hazards and noise. The analysis is based on a regulatory agency database search of the study area; applicable federal, state, and local regulations related to HMW; review of available Phase I Environmental Site Assessments (ESAs) (see **Attachment E: Phase I ESA Reports**) and Phase II ESAs (see **Attachment F: Phase II ESA Reports**), and a visual evaluation of site conditions (i.e., baseline conditions).

Due to the size of BIG's footprint, the methodology to identify sites as environmental concerns utilized a three-step process:

1. Classification of sites in the Environmental Concerns Study Area
2. Limited Environmental Due Diligence
3. Review of Phase I/II ESAs

These steps are described further below.

Step 1 – Classification of Sites in the Environmental Concerns Study Area

First, each of the 443 parcels within the BIG footprint were given a unique property reference number ("property number") beginning with "1" at the western portion of the footprint. The property numbers were used to clearly delineate each APN within the BIG footprint during evaluation while providing a clear labeling that is legible and consistent throughout reports, tables, and figures. **Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG** denotes the summary conclusions for Environmental Concerns Study Area, while **Attachment A: Parcel Evaluation Record and EDR Review** encompasses the record of individual parcel evaluation. **Figure 7: BIG Environmental Concern Sites Map 1** through **Figure 15: BIG Environmental Concerns Sites Map 9** are labeled with the reference number in a sequential order by acquisition across the BIG footprint.

Step 2 – Limited Environmental Due Diligence

Each parcel within the BIG footprint was assessed through an initial limited environmental due diligence transaction screen using the methodology provided in the ASTM Standard Practice E 1528-22 – Limited Environmental Due Diligence (ASTM, 2022). This methodology was selected based on the BIG footprint and known properties within rural, non-industrial or undeveloped location.

The objective of conducting a transaction screen was to determine if a particular parcel exhibited any *potential environmental concerns* as defined in 3.2.36 of the standard:

- **Potential Environmental Concern:** A PEC is the possible presence of any chemicals of concern on a subject property under conditions that indicate the possibility of an existing release, a past release, or a threat of a future release of any chemicals of concern into structures on the subject property or into the ground, groundwater, or surface water of the subject property as defined.

Under this methodology, a site reconnaissance within the BIG footprint and associated observations was completed for each reference number property (subject property) for environmental conditions and brief observation of adjoining properties. Additionally, governmental records and historical resource information were reviewed using EDR, which compiled current regulatory database information compiled by a variety of federal and state regulatory agencies as well as historical aerial photographs. Lastly, an online desktop review of state HMW agencies was completed. Data gaps from the evaluation primarily consist of completed questionnaires from current and prospective property owners due to ongoing acquisitions. These steps are discussed further below.

Based on the Limited Environmental Due Diligence within the BIG footprint, properties were screened as either PEC or no further evaluation warranted. Where a site was determined to possibly contain hazardous conditions but there was insufficient data to confirm presence or absence, the site was labeled a PEC. See **Attachment A: Parcel Evaluation Record and EDR Review** for a full list of parcels within the BIG footprint and their individual evaluations. See **Table 9** for properties with reported PECs.

The purpose of classifying sites as a PEC was to identify, to the extent feasible, properties within the BIG footprint to establish the environmental setting and baseline conditions described in **Section 5.0 Environmental Setting**.

Additional details pertaining to the methodology for site reconnaissance, Environmental Data Resources evaluation and agency review are detailed below.

Site Reconnaissance

An environmental assessor conducted site reconnaissance for properties within the Environmental Concern study area (i.e., the BIG footprint) from public rights-of-way on August 17, 2022, May 2, 2024, and June 2, 2025, to observe sites and learn the current conditions of the environmental concern study area properties for potential environmental concerns. Reconnaissance was limited to exterior views of the properties as access was not available within the interior of fence lines or structures. During the site reconnaissance, the assessor looked for the following conditions:

- Current uses within and near the BIG footprint

- Visual evidence of usage, treatment, storage, disposal, or generation of hazardous substances and petroleum products within and near the BIG footprint
- Presence of USTs and/or ASTs
- Presence of pools of liquid, standing surface water, or sumps
- Presence of unidentified containers suspected of containing hazardous substances, including petroleum products.
- Odors, noises, or discharges
- Releases of hazardous substances or petroleum products from containers or equipment
- Pits, ponds, or lagoons
- Stained soil or pavement
- Stressed vegetation (from other than insufficient water)

A summary of the site reconnaissance is included in **Section 5.1 Environmental Setting - Land Uses in the HMW** Study Area. The HMW study area generally contains the following existing uses within a 1-mile radius around the BIG footprint.

EDR Regulatory Database Review

EDR was contracted to conduct a review of federal, state, tribal, and EDR proprietary environmental databases of known and potentially hazardous waste sites; properties or facilities currently under investigation for potential environmental violations; and sites storing or using HMW. EDR compiled a list of these sites using a maximum 1.0-mile search distance from the BIG footprint (i.e., the HMW study area) (distances vary by database but are in accordance with ASTM E 1527-21). The EDR Report is provided in **Attachment B: EDR Report**.

The EDR Report identifies historically contaminated properties, businesses that use, generate, or dispose of HMW in their operations, and active contaminated sites that are currently under assessment or remediation (EDR, 2025).

Cortese Sites

The EDR Report also includes a list of Cortese Sites in accordance with CGC § 65962.5. CGC § 65962.5 requires CalEPA to compile and maintain lists of potentially contaminated sites, including those listed by the RWQCB and the DTSC, located throughout the state of California. Sites listed pursuant to CGC 65962.5 are considered a REC site because they are documented instances of contamination.

Screening Criteria

The EDR Report results were reviewed for sites that are suspected to affect BIG or are known, or likely, to be an environmental concern site (EDR 2025). To more fully evaluate sites identified as having the potential to negatively affect BIG, analysts applied screening criteria based on the nature and extent of a given release for each identified site, the reported release site's distance from the Environmental Concern

study area (i.e., footprint + 1.0-mile radius or the HMW study area), and the position of a reported release site concerning known or expected local or regional groundwater flow direction.

Sites that were listed in the EDR Report, but not identified as a release site (e.g., a site listed as a hazardous waste generator but not as having had a release), and sites that were listed as being "closed" are not considered to have potentially affected the BIG footprint and therefore are not identified as a REC, based on reasonably available information.

Agency Records Review

EnviroStor and GeoTracker Databases

Information was reviewed on the DTSC EnviroStor and RWQCB GeoTracker databases to supplement the EDR database records review. No additional sites of potential environmental concerns were discovered during the EnviroStor and GeoTracker database searches, which were not already identified in the EDR Report.

Step 3 – Review of Phase I / II ESA

Prior to and concurrently with Step 2, Phase I and II ESAs were completed for the BIG footprint as part of acquisition following both the ASTM E1527-13 and E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM, 2013 and 2021).

While parcels were evaluated on an individual basis within the BIG footprint for environmental concerns, Phase I ESAs were completed for parcels sharing common ownership (thus, a single Phase I ESA may cover multiple parcels).

The objective of the Phase I ESAs was to evaluate whether current or historical activities on or adjacent to the BIG footprint have potentially resulted in significant contamination by hazardous substances or petroleum products, which is subsequently referred to in this report as a "Recognized Environmental Condition" (REC), a "Historical Recognized Environmental Condition" (HREC) or a "Controlled Recognized Environmental Condition" (CREC) as defined below based on the ASTM standards:

Recognized Environmental Conditions (RECs): A REC is the presence or likely presence of any HMW on a property under conditions that indicate an existing release, past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. A site was determined to be a REC if it met at least one of the following criteria:

- The site has active cases on either EnviroStor or GeoTracker (consistent with ASTM E1527-21).
- Visual inspection indicates material risk of leaking oil tanks, improperly stored chemicals, illegal dumping, or other signs of potential HMW concerns.
- The use of the site is typically associated with HMW impacts.

- The nature of the environmental concern site's environmental history indicates a likelihood of subsurface release by an HMW.
- The groundwater flow direction in the site's vicinity indicates a likelihood that potential subsurface offsite HMW conditions could migrate toward the environmental concern or HMW study area.
- Review of the Phase I or Phase II ESA determines the site has HMW. Alternatively, if other criteria determine a property *may* contain HMW, the Phase I or Phase II ESA may confirm the property does not contain HMW.
- Other relevant information indicate a present potential risk from HMW to construction, operations, and maintenance personnel.

Controlled Recognized Environmental Conditions: A CREC is a recognized environmental condition resulting from a past release of HMW that has been addressed to the satisfaction of the applicable regulatory authority (e.g., as evidenced by the issuance of a no further action letter or equivalent or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (e.g., property use restrictions, activity and use limitations, institutional controls, or engineering controls).

Historical Recognized Environmental Conditions: an HREC is considered to be a past release of any HMW that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (e.g., property use restrictions, activities and use limitations, institutional controls, or engineering controls).

Orphan Sites: "Orphan sites" are those with potential HMW releases without financially viable responsible parties. Orphan site information is limited and often does not include enough information on location or the reason for its listing as an orphan site to analyze. Therefore, these sites cannot be evaluated to the same degree as non-orphan sites. However, the orphan information was reviewed and determined not to represent a REC (see **Attachment B: EDR Radius Map Report (EDR Report)**).

If a Phase I ESA reported a REC, additional Phase II ESA limited site investigations were completed where warranted within the BIG footprint. The objective of Phase II ESAs was to assist in determining any sources of environmental impacts through a subsurface investigation of soil, soil gas and/or groundwater.

Evaluation of the Phase I and II ESAs included the following:

1. If during review of a Phase I ESA, a REC, CREC, HREC was identified and a Phase II ESA was not completed, the reference number(s) parcel was deemed a REC, CREC or HREC, as appropriate.
2. If during review of a Phase I ESA a REC, CREC, or HREC was identified and Phase II ESA was completed with data quantifying that the RECs, CRECs or HRECs were satisfied based on state regulatory criteria, the reference number(s) parcel was screened out and not considered an REC, CREC or HREC, as appropriate.

3. If a Phase II ESA reported data above a state regulatory criterion, the reference number (s) parcel was deemed a REC.

The review of Phase I and II ESAs was conducted to confirm environmental concern areas within the BIG footprint. See **Attachment A: Parcel Evaluation Record and EDR Review** for a full list of parcels within the BIG footprint and a summary of their individual evaluations and **Table 9** for reference numbers with reported RECs, HRECs, or CRECs.

The purpose of classifying sites was to identify, to the extent feasible, parcels within the Environmental Concern study areas that were considered to contain an environmental concern site to establish the environmental setting and baseline conditions described in **Section 5.0: Environmental Setting**. Some parcels within the environmental concern study area were determined to have the potential for HMW releases or properties without financially viable responsible parties to be orphan sites.

Impact analysis considered the nature and severity of the potential effects as well as compliance with the regulatory framework and BNSF safety protocols. REC, HREC, CREC and PEC sites have a potentially greater potential for upset or accident conditions during construction, thus, are considered an indicator for upset or accident conditions in the impact analysis.

Emergency Response Plans/Emergency Evacuation Plans

To determine if BIG would impair implementation of or physically interfere with the County's EOP, CWP Policy Map PP-2: Evacuation Routes was reviewed. To determine if BIG would impair implementation of or physically interfere with the City's EOP and emergency evacuation plans, and the proposed General Plan Safety Element was reviewed.

Wildland Fires

BIG is evaluated against the significance criteria/thresholds, as the basis for determining the impact's level of significance concerning wildfire. This analysis considers the existing regulatory framework (i.e., laws, ordinances, regulations, and standards) that avoid or reduce the potentially significant environmental impact. Where significant impacts remain, despite compliance with the regulatory framework, feasible mitigation measures are recommended to avoid or reduce BIG's potentially significant environmental impacts.

This analysis of potential wildfire-related impacts considers BIG's temporary (i.e., construction) and permanent (i.e., operational) effects based on significance criteria/thresholds. For each criterion, the analyses are generally divided into two main categories: (1) construction impacts and (2) operational impacts. The impact conclusions consider the potential for changes in environmental conditions, as well as compliance with the regulatory framework enacted to protect the environment.

The environmental setting is based on review of aerial and ground-level photographs, and various public state and local data and relevant local planning documents, including CAL FIRE's Fire and Resource Assessment Program's publicly available FHSZ GIS map. The determination that a project would or would not result in potential significant impacts first considers if BIG is in or near an SRA or lands classified as very high FHSZs. If a project site is on such lands, then further analysis is warranted. In accordance with

State CEQA Guidelines Appendix G, because BIG is not within or near an SRA or lands classified as very high FHSZs, analysis of potential impacts concerning the following factors is not warranted, thus, was not conducted:

- An adopted emergency response or evacuation plan
- Potential exacerbation of wildfire risks due to slope, prevailing winds, and other factors.
- Potential exacerbation of wildfire risks due to required installation or maintenance of infrastructure associated with the Project.

Potential exposure of people or structures to significant risks as a result of runoff, post-fire slope instability, or drainage changes.

4.4 Determining Significance under California Environmental Quality Act

State CEQA Guidelines Appendix G contains the Environmental Checklist Form, which includes questions concerning HMW. The questions presented in the Environmental Checklist Form have been utilized as significance criteria in this technical report. Accordingly, BIG would have a significant effect on the environment if it would:

- Create a significant hazard to the public or the environment through routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area;
- Impair implementation of or physically interfere within an adopted emergency response plan or emergency evacuation plan;
- Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

5.0 ENVIRONMENTAL SETTING

This section discusses baseline conditions of the environmental concern sites in the environmental concerns study areas as defined in the investigation methods described in **Section 4.0: Methodology for Evaluating Impacts**; see **Table 9**.

5.1 Historical and Existing Land Uses

Land Uses in the HMW Study Area

The HMW study area generally contains the following existing uses within a 1-mile radius around the BIG footprint.

Agricultural and Dairy

Portions of the BIG footprint were used for agricultural and dairy purposes from at least the 1950s. Therefore, there is potential that agricultural-related chemicals such as pesticides, herbicides, and fertilizers were used and stored within the study area. Additionally, residual pesticides and herbicides may be persistent in soil elsewhere within the HMW study area due to migration of airborne pesticides and herbicides.

There are no current agricultural uses within the HMW study area outside the BIG footprint. No specific RECs such as structures or mixing areas were identified in the HMW study area in any available aerial historical record. Per the ASTM standard, the standard application of herbicides, pesticides, and fertilizers does not constitute a release or material threat of release. Historical dairy operations within Properties 2, 3, 5 and 6 (APN: 0466-101-06, 0466-101-07, 0466-111-02, and 0466-041-23) have ongoing Corrective Action Orders (CAO) with regulatory oversight. See **Table 9** for further description.

Commercial Uses

An assortment of small businesses, commercial retail, fast food establishments, automotive repair and vacant and abandoned service stations are scattered along Main Street. In Lenwood, several storage warehouses, automobile parts businesses, could be found among boarded-up buildings and overgrown lots. Multiple commercial uses located within the HMW study area use, store, or report use of HMW with the potential for improper storing and handling. No known commercial HMW storage and dumping sites are identified in available historical records with violations; however, based on historical aerial imagery and site reconnaissance, Properties 48, 49, 50, 217, 373, 380, 381, 382 include dumping of unknown material. See **Table 9** for further description.

Potential Material Dumping

Most of the HMW study area is vacant desert and abandoned structures with the potential for dumping of unknown materials or stockpiles of soil. One dumping site was listed within Properties 47, 48, 49, and 50 (APN: 0421-041-33, 0421-041-38, 0421-041-40, and 0421-041-41) is listed in EDR as an illegal drug lab. Additional minor dumping was reported; however, no other known dumping sites were identified in any available aerial historical record.

Railroad and Utility Corridors, and Roads

The HMW study area includes the existing BNSF railroad corridor and Main Street, as well as utility corridors. HMW potentially associated with railroad and utility corridors include heavy metals in ballast rock, lead (from wood preservatives), herbicides, PCBs, asbestos (from train disc brake pads), creosote (from railroad ties), arsenic (from railroad ties and some herbicides), and petroleum hydrocarbons. HMW potentially associated with roads include diesel, gasoline, motor oil, oil and grease, road base materials, ADL, HMW accidentally released during transport, and lead from the wood preservatives in utility poles and pre-1979 lead-based lane-striping paint. Road base materials can potentially contain HMW if they originate from the excavation of contaminated sites. Caltrans has found aerially deposited lead (ADL) is typically present along major roadways resulting from tailpipe emissions during the years in which lead was added as an additive in gasoline. Caltrans prepared a policy and guidance to evaluate the concentrations of lead adjacent to roadways prior to construction to protect workers and nearby residents (Caltrans, 2022a).

Rural Neighborhoods

The HMW study area includes rural neighborhoods in Barstow and unincorporated San Bernardino County, as well as the Lenwood community, a Census-designated place. The HMW study area has been sparsely populated by scattered residential uses for decades as shown by the historical records review. Some residential uses showed evidence of illegal dumping and HMW storage as determined through the site reconnaissance. Storage of HMW or poor housekeeping practices at these residential locations may have affected the HMW study area's soil and groundwater.

Many of the residential uses within the HMW study area use septic systems for sanitary disposal and water wells for potable water. Based on the historic and rural nature of the residential properties, burned structures, abandoned uses, unknown uses, and residential uses associated with agricultural operations, there is potential for HMW storage and dumping. No known HMW storage and dumping sites are identified in any historical record; however, based on historical aerial imagery and site reconnaissance, Property 31 (APN: 0421-051-15), Properties 47 - 51 (APNs: 0421-041-40, 0421-041-38, 0421-041-4150, 0421-041-33, 0421-041-43) and Property 291 (APN: 0421-171-33) include dumping of unknown material. See **Table 9** for further description.

Service Stations and Automotive Repair

West Main Street operated as a major byway prior to completion of Interstate 15 in 1973. Between the 1940s and 1970s, Main Street included multiple service stations with potential for HMW storage. Multiple UST or LUST sites were reviewed through EDR with regulatory cases closed in association with former service stations and automobile repair. See **Table 9** for further description.

Table 7: Historical Aerial Photographs Development Pattern Changes In HMW Sites Study Area						
Year	Development Pattern Changes					
	West Limit	Hodge	Oak Grove Road	Orleans Drive	Gazana Street	Barstow
1964	Photographs depict sparse agricultural and rural residential uses centered around Main Street and the railroad corridor.	Photographs depict sparse agricultural and rural residential uses centered around Main Street and the railroad corridor.	Photographs depict sparse agricultural uses centered around Main Street and the railroad corridor.	Photographs depict rural residences surrounding Main Street and the railroad corridor. No development is observed.	Photographs depict agricultural uses and scattered rural roads centered around Main Street and the railroad corridor. Riley Airport is south of Main Street with a single unpaved runway.	Photographs depict agricultural and rural low-density residential uses with rural unpaved and paved roads connecting to Main Street and Lenwood Road.
1973	Medium-sized structures of an unknown use appear north of the railroad corridor.	No significant changes from the 1964 photograph were observed in the 1973 photograph.	No significant changes from the 1964 photograph were observed in the 1973 photograph.	Some rural land uses appear to have been converted to agricultural and rural residential uses. New rural roads appear.	Rural roads and paved asphalt roads are visible. Rural land uses and Riley Airport appear to have been converted to a rural residential use, and a country club community appears south of Main Street.	Some low-density residential land uses appear to have been converted to medium-density residential, and a country club community appears south of Main Street.
1984	No significant changes from the 1973 photograph were observed in the 1984 photograph.	No significant changes from the 1964 and 1973 photographs were observed in the 1984 photograph.	Vacant lands appear to have been converted to agricultural uses northeast of Oak Grove Road and north of the rail corridor	No significant changes from the 1973 photograph were observed in the 1984 photograph.	Rural land appears to have been converted to agricultural use north of the railroad corridor. Residential uses are added to the country club community. Depue Airport appears south of Main Street with a single unpaved runway.	Land north of the railroad corridor appears to have been converted to agricultural use. Vacant land south of Main Street appears to have been converted to Medium-density residential. The

						Lenwood Road curved extension appears south of Main Street.
1995	No significant changes from the 1973 and 1984 photographs were observed in the 1995 photograph.	No significant changes from the 1964, 1973, and 1984 photographs were observed in the 1995 photograph.	No significant changes from the 1984 photograph were observed in the 1995 photograph.	Agricultural land north of the railroad corridor appears to expand, and land south of the railroad corridor appears to have been converted to rural residential uses.	Rural land north of the railroad corridor appears to have been converted to agricultural use. More houses are added to the country club community and along some rural roads.	Some land appears to have been converted to agricultural use. New development appears north of railroad corridor. Houses are built in existing medium-density residential.
2005	No significant changes from the 1973, 1984, and 1995 photographs were observed in the 2005 photograph.	No significant changes from the 1964, 1973, 1984, and 1995 photographs were observed in the 2005 photograph.	No significant changes from the 1984 and 1995 photographs were observed in the 2005 photograph.	Land along rural roads south of Main Street appears to have been converted to agricultural use.	Residences are built along rural roads and added to the existing country club community.	Houses are built north of the railroad corridor, and a rural residential plot is developed south of Main Street.
2009	No significant changes from the 1973, 1984, 1995, and 2005 photographs were observed in the 2009 photograph.	No significant changes from the 1964, 1973, 1984, 1995, and 2005 photographs were observed in the 2009 photograph.	No significant changes from the 1984, 1995, and 2005 photograph were observed in the 2009 photograph.	No significant changes from the 2005 photograph were observed in the 2009 photograph.	No significant changes from the 2005 photograph were observed in the 2009 photograph.	Agricultural land north of the railroad corridor appears to have been converted to industrial use. Little agricultural use remains.
2012	No significant changes from the 1973, 1984, 1995, 2005, and 2009 photographs were observed in the 2012 photograph.	No significant changes from the 1964, 1973, 1984, 1995, 2005, and 2009 photographs were observed in the 2012 photograph. Land Uses in the Environmental Concern Study Area

The environmental concern study area (i.e., the BIG footprint) is primarily vacant undeveloped land, which is traversed by an existing BNSF railroad, and which contains scattered residential, commercial, and industrial land uses. As shown in **Table 8: Existing Land Uses**, there are approximately 108 dwelling units and approximately 93,724 square feet of non-residential land uses (i.e., commercial, industrial) within BIG footprint. Additionally, a private airstrip ("Depue Airport") is within BIG's proposed solar farm.

Table 8: Existing Land Uses

Description	Dwelling Units (DU[1])	Commercial (SF[2])	Industrial (SF[2])	TOTAL (DU[1])	TOTAL (SF[2])
Existing Land Use	108	85,887	7,837	108	93,724

Note:
[1] DU = Dwelling Unit
[2] SF = Square Feet

Site reconnaissance efforts observed more densely populated residential and commercial land uses near the railroad corridor's eastern portion east of Lenwood Road. Vacant and disturbed lots are also interspersed between the residential and commercial uses. Underground utility lines are likely present within these areas. Overhead power lines are present along various streets near and within the environmental concerns study area. Illegal dumping was observed at various locations along the railroad corridor and on properties within and near to the BIG footprint. Where this dumping was observed to contain heavy appliances, barrels, or similar types of potential HMW, the property was considered a REC site. This dumping activity could have contributed to potential soil and groundwater contamination within the environmental concerns study area. A copy of a site reconnaissance photos is included in **Attachment C: Site Photolog**.

General Environmental Concerns

General environmental concerns within the HMW study area include illegal dumping, improper storage of HMW, LBP, ACM, herbicides, pesticides, fertilizers, PCBs, ADL, naturally occurring asbestos (NOA), heavy metals, creosote, and petroleum hydrocarbons. Other environmental concerns related to HMW are landfills, pipelines, USTs, oil and gas wells, airports, airstrips, helicopters, and the location of schools.

Through the course of this HMW evaluation, analysts identified general areas of environmental concern within the HMW study area. These general environmental concern areas are rural neighborhoods, industrial and commercial uses, an existing railroad corridor, utility corridors, roads, building materials, past agricultural areas, and existing adjacent agricultural areas.

Illegal Dumping

Most of the HMW study area is vacant undeveloped desert land. Residents may have uses portions of the area to illegally dump HMW, leading to soil and groundwater contamination.

Lead-Based Paint

Historically, lead was used as a pigment and drying agent in oil-based paint. The risk of lead toxicity in LBP varies according to the paint's condition and the year of its application. In 1978, the federal government banned the consumer use of lead-containing paint (EPA, 2022a). As noted above, approximately 108 residential dwelling units and 93,724 square feet of non-residential land uses (i.e., commercial, industrial) exist within the BIG footprint. If built before 1978, these buildings may contain LBP on both interior and exterior architectural surfaces. Additionally, LBP may have been used in commercial/industrial buildings subsequent to 1978, as well as in residential structures (paint purchased prior to 1978 but stored and used in subsequent years). As detailed in **Section 2.0: Project Summary**, BIG proposes to demolish and replace or modify several structures within the BIG footprint which would contain LBP. Additionally, weathering and maintenance of paint (primarily exterior surfaces) at buildings within or near the BIG footprint may have contaminated the soils with lead. Some structures within the HMW study area were constructed prior to 1970 and, therefore, would likely contain LBP.

The baseline assessment conducted as part of this Hazardous Waste and Materials Technical Report did not include a survey for the potential presence of lead. However, industrial, commercial, and residential structures within the HMW study area were evaluated through historical aerial photographs and site visits to determine the potential for building material hazardous substances in the HMW study area. General types of activity and land use can often be discerned from the type and layout of structures visible in aerial photographs and site visits, although specific elements of a site operation sometimes cannot readily be determined from these sources. The HMW study area has varying types of land use, including existing transportation corridors, industrial uses, residential uses, and commercial uses. Because access to private property is limited, the assessors observed from public rights-of-way only.

LBP is recognized as a potential health risk because of the known toxic effects on the central nervous system, kidneys, and blood stream. Lead exposure occurs primarily through the ingestion of LBP. Concern for LBP is primarily related to residential structures, although the concern may also apply to commercial structures. The U.S. Department of Housing and Urban Development has defined LBP as any paint that contains more than 0.50 percent lead by weight, and has identified the following risk factors:

- Age of the paint on a residential structure
  - The maximum risk is from paint applied before 1950.
  - There is severe risk from paint applied before 1960.
  - There is moderate risk from deteriorated paint applied before 1970.
  - There is a slight risk from paint that is intact but applied before 1977.
  - Paint applied in 1977 or later is not expected to contain lead.
- The condition of the painted surfaces
- The presence of children and certain types of household goods in the building
- Previously reported cases of lead poisoning in the building or surrounding areas.

According to Caltrans Standard Special Provision 14-001 (Caltrans, 2022), residue from the removal of yellow thermoplastic and yellow-painted traffic stripes and pavement markings may contain lead chromate.

Structures requiring removal or modifications prior to construction include residential and commercial uses; see **Table 8** discussion above. Therefore, depending on the building's construction date, some of the structures proposed for removal may contain LBP.

Asbestos-Containing Materials

Asbestos is a mineral fiber that was most commonly used prior to 1980 in various building construction materials (e.g., floor tiles, roofing materials, thermal system insulation, mastics) for insulation, strength, and fire-retardant purposes. Prior to the 1980s, a variety of building construction materials commonly used asbestos for insulation and as a fire retardant. Some types of nonfriable building materials may still contain asbestos. These products include, but are not limited to, roofing felt, vinyl asbestos floor tile, ceiling tiles, transite[17] flat sheet, transite shingles, roofing coatings, and transite pipe.

There is no health threat if ACM remains undisturbed and does not become airborne. However, if ACM is damaged or disturbed by repair, remodeling, or demolition activities, microscopic fibers become airborne and can be inhaled. Asbestos is linked to cancers of the lung and the lining of internal organs, as well as to asbestosis and other diseases that inhibit lung function (EPA, 2022b). Federal and state regulations typically require preparation of, and compliance with, ACM abatement plans before disturbing ACM.

An asbestos survey of structures or building materials was not conducted as part of this baseline assessment, given the number of buildings and lack of access. However, industrial, commercial, and residential structures within the HMW study area were evaluated through historical aerial photographs and site visits to determine the potential for building material hazardous substances in the HMW study area. General types of activity and land use can often be discerned from the type and layout of structures visible in aerial photographs and site visits, although specific elements of a site operation sometimes cannot readily be determined from these sources. The HMW study area has varying types of land use, including existing transportation corridors, industrial uses, residential uses, and commercial uses. Because access to private property is limited, the assessors observed from public rights-of-way only. The EDR Report and available Phase I and Phase II ESAs did not indicate any historic asbestos violations within the HMW study area. Although the use of asbestos in the manufacturing of most building materials has not yet been fully prohibited by federal law, the use of asbestos in building materials has for the most part been discontinued since the late 1970s.

Structures requiring removal or modifications prior to construction include residential and commercial uses; see **Table 8** discussion above. Therefore, depending on the initial building's construction date, some of the structures proposed for removal may have been built with structural and building materials that contain asbestos.

[17] "Transite" is a hard, fireproof composite material typically used in building walls.

Pesticides

Agricultural activities are commonly associated with the storage, handling, and application of pesticides (and herbicides) on row crops or orchards. The routine application of such compounds may not accumulate to soil concentrations requiring regulatory oversight. A pesticide is any substance or mixture of substances that is intended to prevent the presence of, destroy, repel, or mitigate any pest (EPA, 2022c). The term pesticide applies to insecticides and various other substances used to control pests, including herbicides. Examples of the health risks posed by pesticides include cancer, nervous system damage, hormone or endocrine disruption, eye or skin irritation, and reproductive health hazards.

Any current or former agricultural lands or landscapes within or to the adjacent HMW study area may have been subject to regular applications of fertilizers, pesticides, or other chemicals for maintenance. The direct application of these chemicals was not observed during the site reconnaissance in adjacent agricultural uses. Pesticides may also be used along railroad and utility corridors and along roadways. Areas that might be of concern include pesticide-handling areas that lack concrete pads, berms, or cribs to contain spills or leaks during handling and storage, and rinse water from washout facilities for pesticide-application equipment that has not been properly collected and treated before discharge.

Historical aerial photographs document agricultural uses within the HMW study area dating back to at least 1932. Therefore, the use of agricultural chemicals, such as pesticides, is likely to have occurred within the HMW study area.

Polychlorinated Biphenyls

BIG's HMW study area includes public utilities (electric, natural gas, etc.) throughout and approximately 93,724 square feet of non-residential land uses (i.e., commercial, industrial). Hazardous substances common in utility corridors include PCBs, classified as chlorinated hydrocarbons, which were manufactured from 1929 until their production was banned in 1979. PCBs were also used in hundreds of industrial and commercial applications because of their non-flammability, chemical stability, high boiling point, and electrical insulating properties. Equipment that might contain PCBs includes electrical transformers, hydraulic equipment, capacitors, and similar equipment may contain PCBs in hydraulic or dielectric insulating fluids within the units (EPA, 2022d). Given the federal TSCA has generally prohibited the domestic manufacture of PCBs since 1976; only equipment manufactured before 1976 has the potential to contain PCBs.

The site assessor observed the presence of equipment (pole-mounted and ground-mounted electrical transformers) with potential to contain PCBs and likely manufactured before 1976 during site reconnaissance. Therefore, PCBs may be present within the HMW study area. However, there were no records of spills at these locations.

Aerially Deposited Lead

Historic emissions from locomotives indicate a potential presence of aerially deposited lead (ADL) due to the long-standing operation of the Mainline railroad tracks adjoining the Subject Property since at least 1908. The potential for ADL contamination exists throughout many urbanized areas, particularly those located adjacent to heavily used rail corridors. Over decades of rail activity, lead particles from exhaust

emissions, fuel combustion, and surface dust deposition may have accumulated in shallow soils closest to the tracks, resulting in localized areas of elevated lead concentrations associated with historic rail operations.

Additionally, areas around freeways, highways, and major thoroughfares could be affected by ADL from vehicular emissions. In California's more-urbanized highway corridors, exposed soils have been found to be contaminated with lead, primarily due to historical automobile exhaust emissions. Results of in-situ sampling and laboratory testing from other unrelated projects have shown that some of the soil contains concentrations of lead in excess of state regulatory thresholds; therefore, any waste generated from the disturbance of soil in these locations would be considered a hazardous waste.

Historical aerial photographs document the existence of multiple roadways that date back to at least 1932 in the HMW study area. The HMW study area is in a rural portion of the County. Most of the study area is vacant, undeveloped land. The nearest highway to the BIG footprint is SR 58, located 0.7 mile to the northeast. However, various roadways (e.g., Lenwood Road, Hinkley Road, and Main Street) traverse and/are located near the BIG footprint. Yellow paint and tape used for pavement marking before 1997 likely contain lead that could exceed the hazardous waste criteria for lead under CCR, Title 22. In addition, ACM may be found in roadway materials, such as materials used before the 1980s for expansion joints in pavement. Therefore, soil within and adjacent to the proposed improvements may be contaminated with ADL.

Naturally Occurring Asbestos

NOA is found in serpentine rock and is a potential contamination issue. NOA is a fibrous mineral that often takes the form of long, thin strands; however, NOA can degrade from weathering or excavation activities into microscopic fibers and become airborne. If NOA does not become airborne, it does not pose a threat, but when suspended in the air and inhaled, the thin fibers can irritate tissues and resist the body's natural defenses.

Maps obtained from the U.S. Forest Service show three County NOA areas (i.e., Angeles National Forest, Big Bear Lake, and San Bernardino National Forest) approximately 33 miles southwest of the BIG footprint (U.S. Forest Service 2008). Because these three NOA areas are outside of the HMW study area, NOA is not considered a substantial concern for BIG.

Naturally Occurring Arsenic

Arsenic occurs naturally in the soil and small amounts may enter the air, water and land from windblown dust, which may eventually settle out in the sediment and soil. Elementally, arsenic is widely distributed in the Earth's crust. The natural background concentration can vary substantially between sites based on soil type, and geochemical conditions. A study conducted of regional background concentrations of arsenic in undifferentiated urbanized flatland soils and proposed an upper estimate for background arsenic of 11 milligrams per kilogram (mg/kg) (Duvergé, 2011). This value can be used, as appropriate based on the study parameters as arsenic concentrations in California soils typically exceed risk-based screening levels by one or more orders of magnitude due to naturally occurring background

concentrations. However, based on soil data collected within the HMW study area, no exceedances of arsenic in soil were detected above 11 mg/kg and is not considered a substantial concern for BIG.

Landfills

Landfills have potential to release methane gas, which may present an explosion risk. Under current regulations, all active and most closed landfills are required to have landfill gas migration control systems and monitoring programs. Additionally, most active and many closed landfills have landfill gas capture and treatment and destruction systems. Therefore, the likelihood of methane landfill gas affecting an area beyond the landfill property is considered low.

There are no landfills within the landfill study area. The landfill nearest the BIG footprint is the Barstow Landfill, an active landfill located approximately 5.2 miles to the southeast, at 32553 Barstow Road, Barstow.

Oil and Gas Wells

The State of California Geologic Energy Management Division (CalGEM) (formerly, Division of Oil, Gas and Geothermal Resources) reports California's oil and gas industry information from the geographic perspective including location of oil and gas wells and other types of related facilities throughout the state. Reporting is included through an online mapping application Well Finder. There are no oil and gas wells reporting within the BIG footprint or within 10 miles. Based on the proximity to any oil and gas wells, the wells are not considered a concern for BIG.

Airports, Airstrips, and Helicopters

CWP Policy Map HZ-9 Airport Safety and Planning depicts the County's Airport Runway Protection Zones, airport noise contours, and airport safety review areas associated with airport land use plans. As shown in CWP Policy Map HZ-9, no portion of the BIG footprint is within an airport land use plan or low-altitude high speed military airspace. Additionally, there are no public airports or public use airports within BIG's airport study area (i.e., within two miles of the BIG footprint). The nearest public airport to the BIG footprint is Barstow-Daggett Airport, which is approximately 17 miles from the BIG footprint. However, a private airstrip ("Depue Airport") is located within BIG's proposed solar farm area. According to FAA accident reports and registration records, the airport has existed near the existing BNSF tracks without incident since it was first registered in 1979 (National Transportation Safety Board 2022). The landing strip is southwest of the Main Street at Delaney Road intersection. BNSF has acquired and will be closing the private Depue Airport as part of the development of the solar farm.

Educational Facilities

The only school within the school study area is Lenwood Elementary School, which is approximately 1,000 feet (0.19 miles) south of the BIG footprint's eastern extent. Hazards to Lenwood Elementary School were analyzed similar to hazards to residential uses, given both land uses are sensitive land uses which could be impacted by spills and contamination BIG's potential to emit hazardous emissions within one-quarter mile of a school is evaluated in **Appendix 5.3 BIG-1: Barstow International Gateway Air Quality Technical Report**.

Environmental Concern Sites

Listed below are the facility listings identified on federal and state/tribal databases within the ASTM-required search distances from the approximate HMW study area boundaries. Each parcel within the BIG footprint was assigned a property reference number ("property number") beginning with "1" at the eastern portion of the BIG footprint. Based on the evaluation of records from the EDR Report, the EnviroStor and GeoTracker databases, aerial photographs, and site reconnaissance, analysts determined 73 properties within the BIG footprint are determined to be a REC, four properties were identified as PECs, four properties were identified as an HREC, and no properties were identified as CRECs. Additionally, orphan site information was reviewed and determined not to represent a REC; see **Attachment A: EDR Radius Map Report (EDR Report)**. These properties, their reference number, locations, the rationale for designating them as environmental concern sites, and their environmental concern category are listed in **Table 9** and their locations are shown on **Figure 7: BIG Environmental Concern Sites Map 1** through **Figure 15: BIG Environmental Concerns Sites Map 9**.

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG

Reference number, Reference Name APN, and Photo Reference	Distance from Site	Rationale for Designation	Environmental Concern Category
Reference number 2, 3, 5, & 6): Reference names: De Vries, Neil, and Mary Family Trust (APN: 0466-101-06 & -07; 0466-111-02; 0466-041-23)	Partially within BIG footprint	N&M Dairy: These properties were listed in both the EDR Report and Geotracker database with a Clean-up and Abatement Order (CAO) No. R6V-2103-0103 for former N&M Dairy operations, which terminated in 2013. Former dairy and agricultural fields typically include storage and use of HMW. The BIG footprint encompasses former operations of corrals with possible monitoring wells. The current groundwater monitoring report (see **Attachment E.1**) dated April 2025, identified the following: All groundwater well samples are reported to contain nitrate below its mcl (10.0 mg/L); however, the CAO requires that when nitrates are detected above 7 mg/L, bottled water must be provided to neighboring residences. Additionally, based on the CAO extending to the neighboring properties, those properties are considered a REC at this time as depicted on **Figure 7, Figure 8,** and **Figure 9** pertaining to Reference Numbers 4, 7-29 & 60 and discussed below. MW-2, MW-3 and MW-4 have been below the mcl for over 9 years and MW-1 for the past 10 years. ▪ Maximum observed nitrate level = 9.4 mg/L ▪ Median observed nitrate level = 0.8 mg/L The report states that "Data indicate the dairy is currently not, and has not been for many years, a significant source of nitrate impacts to the site or downgradient	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
		groundwaters." Additionally, MW-1 was reinstalled outside of the BIG footprint on August 9, 2025. Based on dairy operations not in service and recent nitrate levels detected from 0.7 to 4.8 mg/L (i.e., below the regulatory threshold), there is a current request for termination of the CAO and permits to continue groundwater monitoring is under consideration. Given this property's historical use, and documented groundwater concentrations, the property is likely not an environmental concern; however, the open CAO in association with the property is an environmental concern and is considered a REC site. At which time the CAO is terminated, the property would be considered an HREC rather than a REC.	
Reference number: 4, 7-29, 60 Reference names: Devcal Corporation Study Area and Expanded Study Area associated with N&M Dairy	Partially within BIG footprint	A Phase I ESA completed for properties 4, 25 – 29 and 60 identified the N&M Dairy operations as a REC for additional properties outside of the N&M Dairies boundary as they are included within a Study Area and 2012 Expanded Study Area designated by the RWQCB (see **Attachment E.2**). Additionally, while not identified as a REC in Phase I ESAs completed for properties 7 through 29, they are included within the Study Area and Expanded Study and in turn share similar concerns with the CAO. N&M Dairy Farm facility is located approximately 1/2-mile south of these properties, and historical presented exceedances of nitrate and TDS in the groundwater dating back to the early 2000s. Based on the results of the 2024 sampling event within the Study Area and Expanded Study Area, nitrate levels are below the MCL of 10 mg/L; however, the CAO requires nitrate detections threshold to 7 ml/L. Sampling within this extended area is anticipated to continue and is considered a REC for the Study Area and Extended Study Area. When the CAO is terminated the property would be considered an HREC. As depicted in **Figure 16: Summary of BIG Footprint and Surrounding Area Groundwater Nitrate (NO3-) Levels** groundwater within reference area 25-47 ranges from 8 to 15 feet bgs. Groundwater is not anticipated to be encountered during grading and construction activities, and recent nitrates levels detected from 0.7 to 4.8 mg/L (i.e., below the regulatory threshold), is not likely to have an adverse risk to construction workers. Health risk for these secondary	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
		contaminants is based on ingestion not a dermal exposure, which is not likely to be encountered during grading activities. Additionally, groundwater extracted from construction or operational wells from these areas are not planned to be used as a potable source. Given these factors and N&M Dairy's current request for termination of the CAO, and that contaminants of concerns are below their respective MCL, the property is likely not an environmental concern requiring mitigation; however, the open CAO in association with N&M Dairy is an environmental concern and is considered a REC. At which time the CAO is terminated, these properties would not be considered a REC.	
Reference number: 11 Reference names: Landau (APN: 0420-161-34)	Partially within BIG footprint	While this property is not listed in the EDR Report, or the Envirostor or Geotracker databases, a Phase I ESA (see **Attachment E.3**) completed in 2024 identified that one partially buried, rusted, unlabeled, 55-gallon drum was observed containing concrete debris and scrap metal in an illegal dumping near the northwestern subject property boundary. The drum appeared to be empty and there was no evidence of spills, leaks, or staining in the surrounding surfaces; however, it should be noted that stressed vegetation was observed in the in the area adjacent to the buried drum. Based on the unknown content of the partially buried drum and stressed vegetation, this finding has been identified as a REC. Additionally, one REC was identified in connection with the N&M Dairy (listed as Reference numbers 2,3,5 and 6) for nitrates and TDS exceedances above their respective MCL within the groundwater. Groundwater within reference area 25-47 ranges from 8 to 15 feet bgs. Groundwater is not anticipated to be encountered during grading and construction activities, and the presence of nitrates and TDS below their respective MCL is not likely to have an adverse risk to construction workers. Health risk for these secondary contaminants is based on ingestion not a dermal exposure, which is not likely to be encountered during grading activities. Additionally, groundwater extracted from construction or operational well from these areas is not planned to be used for a potable source. Given these factors and N&M Dairy's current request for termination of the CAO, and that contaminants of concerns are below their respective	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
		MCL, the property is likely not an environmental concern requiring mitigation; however, the open CAO in association with N&M Dairy is an environmental concern and is considered a REC. Once the CAO is terminated the property would be considered a HREC.	
Reference number: 17,18 Reference names: Briggs; Baker (APN 0420-151-07, -08)	Partially within BIG footprint	These properties were not listed in the EDR Report, or the Envirostor or Geotracker databases. However, these properties have operated as a residence since at least 1953 and an agricultural field was observed since at least 2005 based on aerial imagery. During site reconnaissance, cattle, horses, and multiple ASTs were observed likely used for on-site farming operations. Although no Phase I ESA has been conducted, based on current operations, there is a potential for fertilizers, or pesticides in surface soil due to historical grazing and agricultural uses of this property, which represents a PEC. Additionally, these properties were identified in connection with the N&M Dairy (listed as Reference numbers 2, 3, 5, and 6) for nitrates and TDS exceedances above their respective MCL within the groundwater. Groundwater within reference area 25-47 ranges from 8 to 15 feet bgs. Groundwater is not anticipated to be encountered during grading and construction activities, and the presence of nitrates and TDS below their respective MCL is not likely to have an adverse risk to construction workers. Health risk for these secondary contaminants is based on ingestion not a dermal exposure, which is not likely to be encountered during grading activities. Additionally, groundwater extracted from construction or operational well from these areas is not planned to be used for a potable source. Given these factors and N&M Dairy's current request for termination of the CAO, and that contaminants of concerns are below their respective MCL, the property is likely not an environmental concern requiring mitigation; however, the open CAO in association with N&M Dairy is an environmental concern and is considered a REC. Once the CAO is terminated the property would be considered an HREC.	PEC, REC
Reference number: 31 Reference name: Ellis	Within BIG footprint	While this property is not listed in the EDR Report, or the Envirostor or Geotracker databases, a Phase I ESA (see **Attachment E.4**) completed in 2019 identified an open water well with 12-inch-diameter steel casing for residential water supply. The Phase I ESA sampled the	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
Reno APN: 0421-051-02		water in the well casing. Sample results indicated that pesticides and SVOCs were not detected, but dissolved arsenic was detected at 13.5 µg/L, slightly above the federal and state MCL of 10 µg/L. Other metals were not detected at levels above an MCL. The origin of the arsenic is likely due to natural background conditions for this area; however, the presence of dissolved arsenic in the groundwater at concentrations above the MCL is identified as a REC.	
Reference number: 47-50 Reference name: Rios (APN 0421-041-33, 0421-041-38, 0421-041-40, and 0421-041-41)	Within BIG footprint	A Phase I ESA (see **Attachment E.5**) completed in 2024 identified the following RECs: ▪ The property was previously used as an orchard from 1978 to 2005. Based on the potential historical pesticide use, this property has been identified as a REC. ▪ The database search identified the property has been listed in the Clandestine Drug Lab (CDL) database (Facility ID: 2001-01-155) as an illegal drug lab since 2001. According to CDL, the illegal drug lab operated onsite or had drug lab equipment and/or materials stored. In 2001, the San Bernardino Fire Department was notified of the drug lab. The San Bernardino Fire Department discovered four pounds of red phosphorous, 1 gallon of organic liquid, 1 gallon of acid, and lab trash and debris in the garage; a small pit containing chemicals with pH of 14 was also discovered behind the garage building. Consolidated Waste was subcontracted to remove soil contamination to visual levels. No analytical sampling appears to have been completed, and no further action was taken. Based on known hazardous materials improperly stored on the property with no confirmation sampling, this property has been identified as a REC. ▪ The extensive debris and general disrepair, charred remains of a former residence, and potential historical use of the property as a tire change/auto repair shop are a REC to the subject property. Based on the unknown content of the partially buried drum and stressed vegetation, this property has been identified as a REC. Additionally, although not identified as a REC, two water well installation permits were issued for the subject	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
		property in 1987 and 1989, respectively. There are no known records concerning the abandonment of these water wells, and the water wells may remain on the subject property. These properties are not listed on the EnviroStor or GeoTracker databases, but were listed within the EDR Report as an Illegal Drug Lab. This property's perimeter was viewed from Main Street with burned structures, heavy dumping, and dirt piles scattered throughout. No Phase I ESA has been conducted to document the extent of environmental concern. Given this property's condition, historic uses, and potential for dumping and HMW storage, this property is considered a REC site.	
Reference number: 66 Reference name: Rowe (APN 0421-032-42)	Within BIG footprint	While this property is not listed in the EDR Report, or the Envirostor or Geotracker databases, a Phase I ESA (see **Attachment E.6**) completed in 2022 identified that this property has been utilized for agricultural and residential purposes since the 1980s. Supporting structures included a livestock area and storage warehouse with two approximately 1,000-gallon ASTs containing diesel fuel. Oily surface stains were reported surrounding the diesel ASTs. Based on the above, a Phase II ESA (see **Attachment F.1**) was completed in 2022, which found: TPH-GRO, metals, VOCs, SVOCs/PAHs, and Pesticides, were detected in the soil samples, but concentrations of all contaminants detected did not exceed the SFRWQCB ESLs. PCBs were not detected in any samples. TPH-DRO concentrations ranged from 85.4 at 1-foot bgs to 2,150 mg/kg at 8-feet bgs. Therefore, TPH-DRO exceeds the SFRWQCB ESL for commercial/industrial at 8-feet bgs. The vertical limit below 8-ft bgs, of TPH-DRO impact, is not defined. ▪ TPH-DRO ESL = 1,200 mg/kg ▪ Observed TPH-DRO level = 2,150 mg/kg Given the property's current use and Phase II ESA results, the known TPH-DRO impacts within property are considered an REC site.	REC
Reference number: 67 Reference name: Mitchell	Within BIG footprint	Although this property is not listed in the EDR Report, or the Envirostor or Geotracker databases, a Phase I ESA (see **Attachment E.7**) completed in 2022 identified that this property has been utilized for agricultural and residential purposes since at least 1953. Supporting	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
(APN 0421-032-27)		structures included multiple residences, multiple water wells and septic systems, shipping containers and a recreational area. Surface stains were reported surrounding 55-gallon drums, and ASTs. Additionally, a water sample, which supply's drinking water to the existing residence was taken from the domestic supply water wells in 2009. The results reported exceedances in nitrate levels for domestic water supply. ▪ Nitrate MCL: 10.0 mg/L ▪ Maximum observed nitrate level: 53 mg/L Based on the above, a Phase II ESA (see **Attachment F.2**) was completed in 2022, which found: ▪ VOCs, SVOCs, Pesticides, and PCBs were not detected in two of the three soil samples. Trace levels of benzene and toluene were detected at location MB1-5 (0.005 mg/kg). However, the detected levels are below the SFRWQCB ESLs for commercial/industrial soil and for the protection of groundwater. ▪ All three samples detected arsenic concentrations which exceeded the SFRWQCB ESLs for commercial/industrial soil (Arsenic ESL: 0.31 mg/kg), however the concentrations detected are below the Southern California background level ESL: 11 mg/kg) per DTSC Hero. ▪ The TPH results indicated the surface staining observed by the 55-gallon drums and ASTs is below the commercial/industrial ESLs. Given the property's current use and Phase I / Phase II ESA results, the known nitrate exceedance is considered an REC. A summary of nitrate exceedances is included in **Figure 16**.	
Reference number: 79 Reference name: Getzlaff (APN 0421-032-20)	Within BIG footprint	This property is not listed on the EnviroStor or GeoTracker databases, nor within the EDR Report. A Phase I ESA (see **Attachment E.8**) completed in 2022 identified a record for one onsite water well with exceedances in specific conductance, TDS, and nitrates. Results of the domestic water supply sample of the well identified the following: ▪ Specific Conductance MCL: 1,600 umhos/cm; Detected concentration: 1,800 umhos/cm.	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
		▪ Filterable residue/ TDS MCL: 1,000 mg/L; Detected concentration: 1,100 mg/L. ▪ Nitrate MCL: 10.0 mg/L; Detected concentration 20 mg/L. A Phase II ESA was not recommended; however, due to the exceedances from the water well, this property is considered a REC site. A summary of nitrate exceedances is included in **Figure 16.**	
Reference number: 110 – 113; 115 – 116; 140 – 141; 143 – 144; 145; 147 Reference name: Van Leeuwen (APNs 0421-021-03, 0421-021-04, 0421-021-34, 0421-021-36, 0421-021-38, 0421-021-41, 0421-032-08, 0421-032-09, 0421-032-12, 0421-032-13, 0421-032-14, and 0421-032-38)	Within BIG footprint	While these properties are not listed in the EDR Report, or the Envirostor or Geotracker databases, these properties have operated and been utilized for agricultural purposes since the 1950s. Residences and supporting structures have been located on property 110 (APN 0421-032-38) along with a barn and fueling operations. A Phase I ESA (see **Attachment E.9**) completed in 2022 identified multiple ASTs on property 110 since the 1990s along with a drum storage area and topographic low area for stormwater runoff collection. Oily surface stains were reported surrounding two irrigation wells on properties 140 (APN 0421-021-03) and 144 (APN 0421-021-36). Department of Environmental Health records 12 onsite water wells. Based on the above, a Phase II ESA (see **Attachment F.3**) was completed in 2022, which found: ▪ A residential water well sample taken from the hose bib on property 110 (which is supplied water by a well located on property 110), detected levels of arsenic which exceed the MCL. Arsenic MCL in drinking water: 0.010 mg/L; Detected concentration: 0.0137 mg/L. As determined in the Phase II ESA, “this result indicates that, if the water supplied to the hose bib is sourced from the onsite domestic supply well, the groundwater may be impacted with levels of dissolved phase arsenic that exceeds the state MCL.” ▪ The TPH results indicate the oily surface staining observed in the drum storage areas on property 110, the AST/fueling area, and surrounding the irrigation wells is generally heavy non-volatile TPH-ORO and the soil borings in the AST/Fueling area indicate the staining is limited to less than 10 feet bgs. However, samples below the 2-foot depth were not obtained in the drum storage areas or from the stained area surrounding the irrigation well so the vertical limit of	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
		the TPH-ORO impacts/staining in those two areas is not defined. Additionally, soil samples taken in drum storage area 1 on property 110 detected concentrations of TPH-DRO which exceed the ESL for commercial/industrial. TPH-DRO commercial/industrial ESL: 1,200 mg/kg; detected concentration: 1,760 mg/kg. Given the property's current use and Phase II ESA results, the detected arsenic which exceed the MCL on property 110, the known TPH-DRO and TPH-ORO which exceed the ESL on property 140, and the known TPH-ORO which exceed the ESL on property 144 are considered a REC.	
Reference number: 146 Reference name: Otto (APN 0421-032-10)	Within BIG footprint	This property has been utilized for agricultural and residential purposes since the 1980s. While this property is not listed in the EDR Report, or the Envirostor or Geotracker databases, a Phase I ESA (see **Attachment E.10**) completed in 2022 identified one REC of "Three 55-gallon and at least one partially buried 55-gallon drums were located on the Site. These drums were not labeled, former contents unknown, and appeared to be empty. Very minor surface staining was observed beneath the three 55-gallon drums at top the surface." Remaining onsite drums and minor undefined staining within property is considered an REC site.	REC
Reference number: 211 Reference Name: Depue (APNs 0421-071-53 and 0421-071-54)	Within BIG footprint	This property is not listed on the Envirostor or Geotracker database; however, listed within the EDR database under multiple databases with USTs. Additionally a Phase I ESA was completed for the property (see **Attachment E.11**). The Depue Ranch was listed with three historical USTs: installed in 1968, 1974, and 1983, containing leaded and unleaded fuel with two 500-gallon and one 1,500-gallon UST onsite. Additionally, the Hazardous Materials Database reported that "on April 18, 1986, San Bernardino Environmental Public Works Agency received a letter from owner Bob G. Depue stating that they had registered three underground storage gas tanks on his ranch that they used for personal use but have removed all 3 USTs from the ground and they are not in use." Permits to operate or remove the USTs were not identified in the County files have not been reviewed to	REC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
		document proper abandonment. Based on the missing abandonment documentation this site is considered a REC at this time. These properties are also associated with the abovementioned site for the Depue Airport private airstrip.	
Reference number: 214 Reference Name: Kelley (APN 0421-232-01)	Within BIG footprint	This property is not listed on the Envirostor or Geotracker database or EDR. Based on aerial review, this property includes a portion of a private airstrip ("Depue Airport"). Airports can emit chemicals such as nitrogen oxides, volatile organic compounds, carbon monoxide, and particulate matter and airstrips adjacent to agricultural areas can commonly carry pesticides and herbicides. Therefore, this is considered a PEC site.	PEC
Reference Number: 219 Reference Name: Depue (APN: 0421-082-13)	Within BIG footprint	This property is not listed on the Envirostor or Geotracker database or EDR; however, a Phase I ESA (see **Attachment E.12**). and Phase II ESA (see **Attachment F.4**) were completed for the site. The Phase I ESA identified five RECs within the property based on the site operations and poor storage of materials including 55-gallon drums, batteries, and ASTs in poor condition. Arsenic was identified at 13.6 mg/kg within SB-3 at 2-feet bgs, which is slightly above the background concentration of 11 mg/kg. Additionally, one water sample identified arsenic at 10.9 µg/L, which is also slightly above the ESL of 10 µg/L. Given the property's use and Phase II ESA results, the potential for arsenic impacts within property are considered a REC site.	REC
Reference Number: 286 Reference Name: Yim Family Trust (APN: 0421-141-20)	Within BIG footprint	The site is listed within EDR and with a closed Geotracker Case as a LUST and CORTESE site for former fueling station operations. The Former Whiting Brothers underwent the RWQCB to address historical petroleum hydrocarbon impacts from former fueling operations. A soil vapor extraction (SVE) system was installed and operated between approximately 2001 and 2012. In 2013 soil vapor sampling was conducted and in September 2014, low threat closure was completed. Based on the closed case for the former fueling operations on the site, this parcel is considered a HREC.	HREC
Reference	Within Big	This property was listed within EDR and a Geotracker	HREC

Table 9: Summary of Environmental Concern Sites Identified Within the Environmental Concern Study Area – BIG			
Reference number, Reference Name APN, and Photo Reference	**Distance from Site**	**Rationale for Designation**	**Environmental Concern Category**
Number: 301 Reference Name: Budget Automotive (APN: 0421-181-08)	Footprint	Case incorrectly georeferenced. This site is listed as a closed LUST case and CORTESE site for the former fuel station operations. Based on available data, a release of gasoline from a UST, which was discovered on July, 1993. On site remediation occurred from 1993 until case closure, which was met in January, 1995. Based on the closed case for the former fueling operations on the site, this parcel is considered a HREC.	
Reference number: 338 Reference name: De La Rosa (APN: 0422-014-05)	Within BIG footprint	While this property is not listed in the EDR Report, or the Envirostor or Geotracker databases, a Phase I ESA (see **Attachment E.13**) completed in 2022 identified that this property has been utilized for residential and commercial uses as a services station since at least 1929. Records indicated USTs onsite were abandoned with sand in 1979, potential dumping within the septic system, staining within automotive repair facility. Based on the above, a Phase II ESA (see **Attachment F.5**) was completed in 2022, which found: ▪ Metals, VOCs, SVOCs, TPH, Pesticides, and PCBs were not detected in the soil samples above background levels. ▪ Samples were not analyzed in the upper 5-feet bgs and "some staining or contaminants may be present in the upper 5-feet of the Site, the results of this investigation indicate that contaminants, if present, do not extend to 5 feet or below in the areas that were investigated". Given the property's former use and Phase II ESA results, the potential for TPH impacts within property are considered a PEC site.	PEC
Reference number: 361 Reference name: Gómez (APN 0422-031-10) See Attachment C, Photo 7	Within BIG footprint	This property is not listed in the Envirostor or Geotracker databases; however, a Phase I ESA (see **Attachment E.14**) completed in 2022 identified an HREC associated with a former diesel spill. The records described within the Phase I ESA indicated this property was leased by Sullivan Petroleum Company in 1999 for storage of petroleum containers and the spill consisted of 100 gallons of diesel fuel. Review of historical documentation indicated the impacted soil was excavated and disposed of offsite; confirmation sampling associated with the excavation effort indicated remaining TPH-DRO and benzene, toluene, ethylbenzene, and xylene concentrations in the	HREC

Reference Number 373. Property 373 located at 25538 Main Street is listed as Harbor Distributing Company / Harbor Distributing LLC DBA High Desert Distributing and 25538 West Main Street listed as W A Thompson CO/ W A Thompson Distributing CO, which were georeferenced as the same property and jointly listed in 15 databases within EDR Report.

Harbor Distributing Company / Harbor Distributing LLC DBA High Desert Distributing records return within four databases including RCRA NonGen/NLR database under the NAICS description of beer, wine and liquor stores. Additionally, a record for Hazardous Waste Tracking System (HWTS) under EPA ID CAL000452099 which was created in 2020, and Facility Index System / Enforcement and Compliance History Online pertain to the Site's presence in the above-mentioned databases. The site is not a waste generator, and no improper activity or violations were reported.

W A Thompson CO/ W A Thompson Distributing CO is listed the LUST, Cortese, HIST Cortese, and California Environmental Reporting System databases under Global ID: T0607100878; however, this Global ID is georeferenced outside of the BIG footprint based on review with the RWQCB Geotracker database with a regulatory closed case dated January 30, 1997.

During site reconnaissance in both July 2022 and May 2024, multiple 55-gallon drums with improper storage and monitoring wells were observed. Due to the discrepancy in reporting and potential for an environmental concern with wells and drum storage, this property was identified as a PEC.

A Phase I ESA identified RECs and HRECs associated with the property (see **Attachment E.16**). The following HRECs were identified in connection with the subject property: Four USTs ranging in capacity from 1,000- to 6,000-gallons for gasoline and diesel fuel were removed from the subject property with a reported release and was issued closure in 1997 from San Bernardino County Fire Department. The following RECs were identified in connection with the subject property:

- At least five steel USTs ranging in capacity from 1,000- to 8,000-gallons for gasoline and/or diesel fuel were removed from the subject property in the late 1980s without closure documentation. All USTs were removed from the subject property except for one 1,000-gallon UST that was

abandoned in-place with a cement-sand slurry due the UST location underneath the current Central Warehouse.

- A limited Phase II ESA and Addendum was conducted in 2020 and 2022 by Ramboll that indicated that soil and groundwater concentrations at the subject property were indicative of a petroleum release (see **Attachment F.6**). Several data gaps were noted in the Phase II ESA. Typically (pursuant to regulatory guidance from DTSC), a second sub-slab soil vapor sampling event would be required for health risk screening purposes to account for seasonal variability and/or confirmation; however, only one sub-slab soil vapor sampling event was conducted. An immediately downgradient groundwater sample was not collected where the 1,000-gallon UST was abandoned in place. Additionally, laboratory analysis for metals were excluded from the second groundwater sampling event of the permanent groundwater monitoring wells.
- Handwritten notes dated December 27, 1985, documenting a conversation between a crane operator and County Inspector about a section of sewer line (approximately 8-10 inches wide and 100 feet long) located just north of the W.A. Thompson facility where potentially gasoline-impacted soil had been uncovered during the construction of the Barstow City Sewer Line.

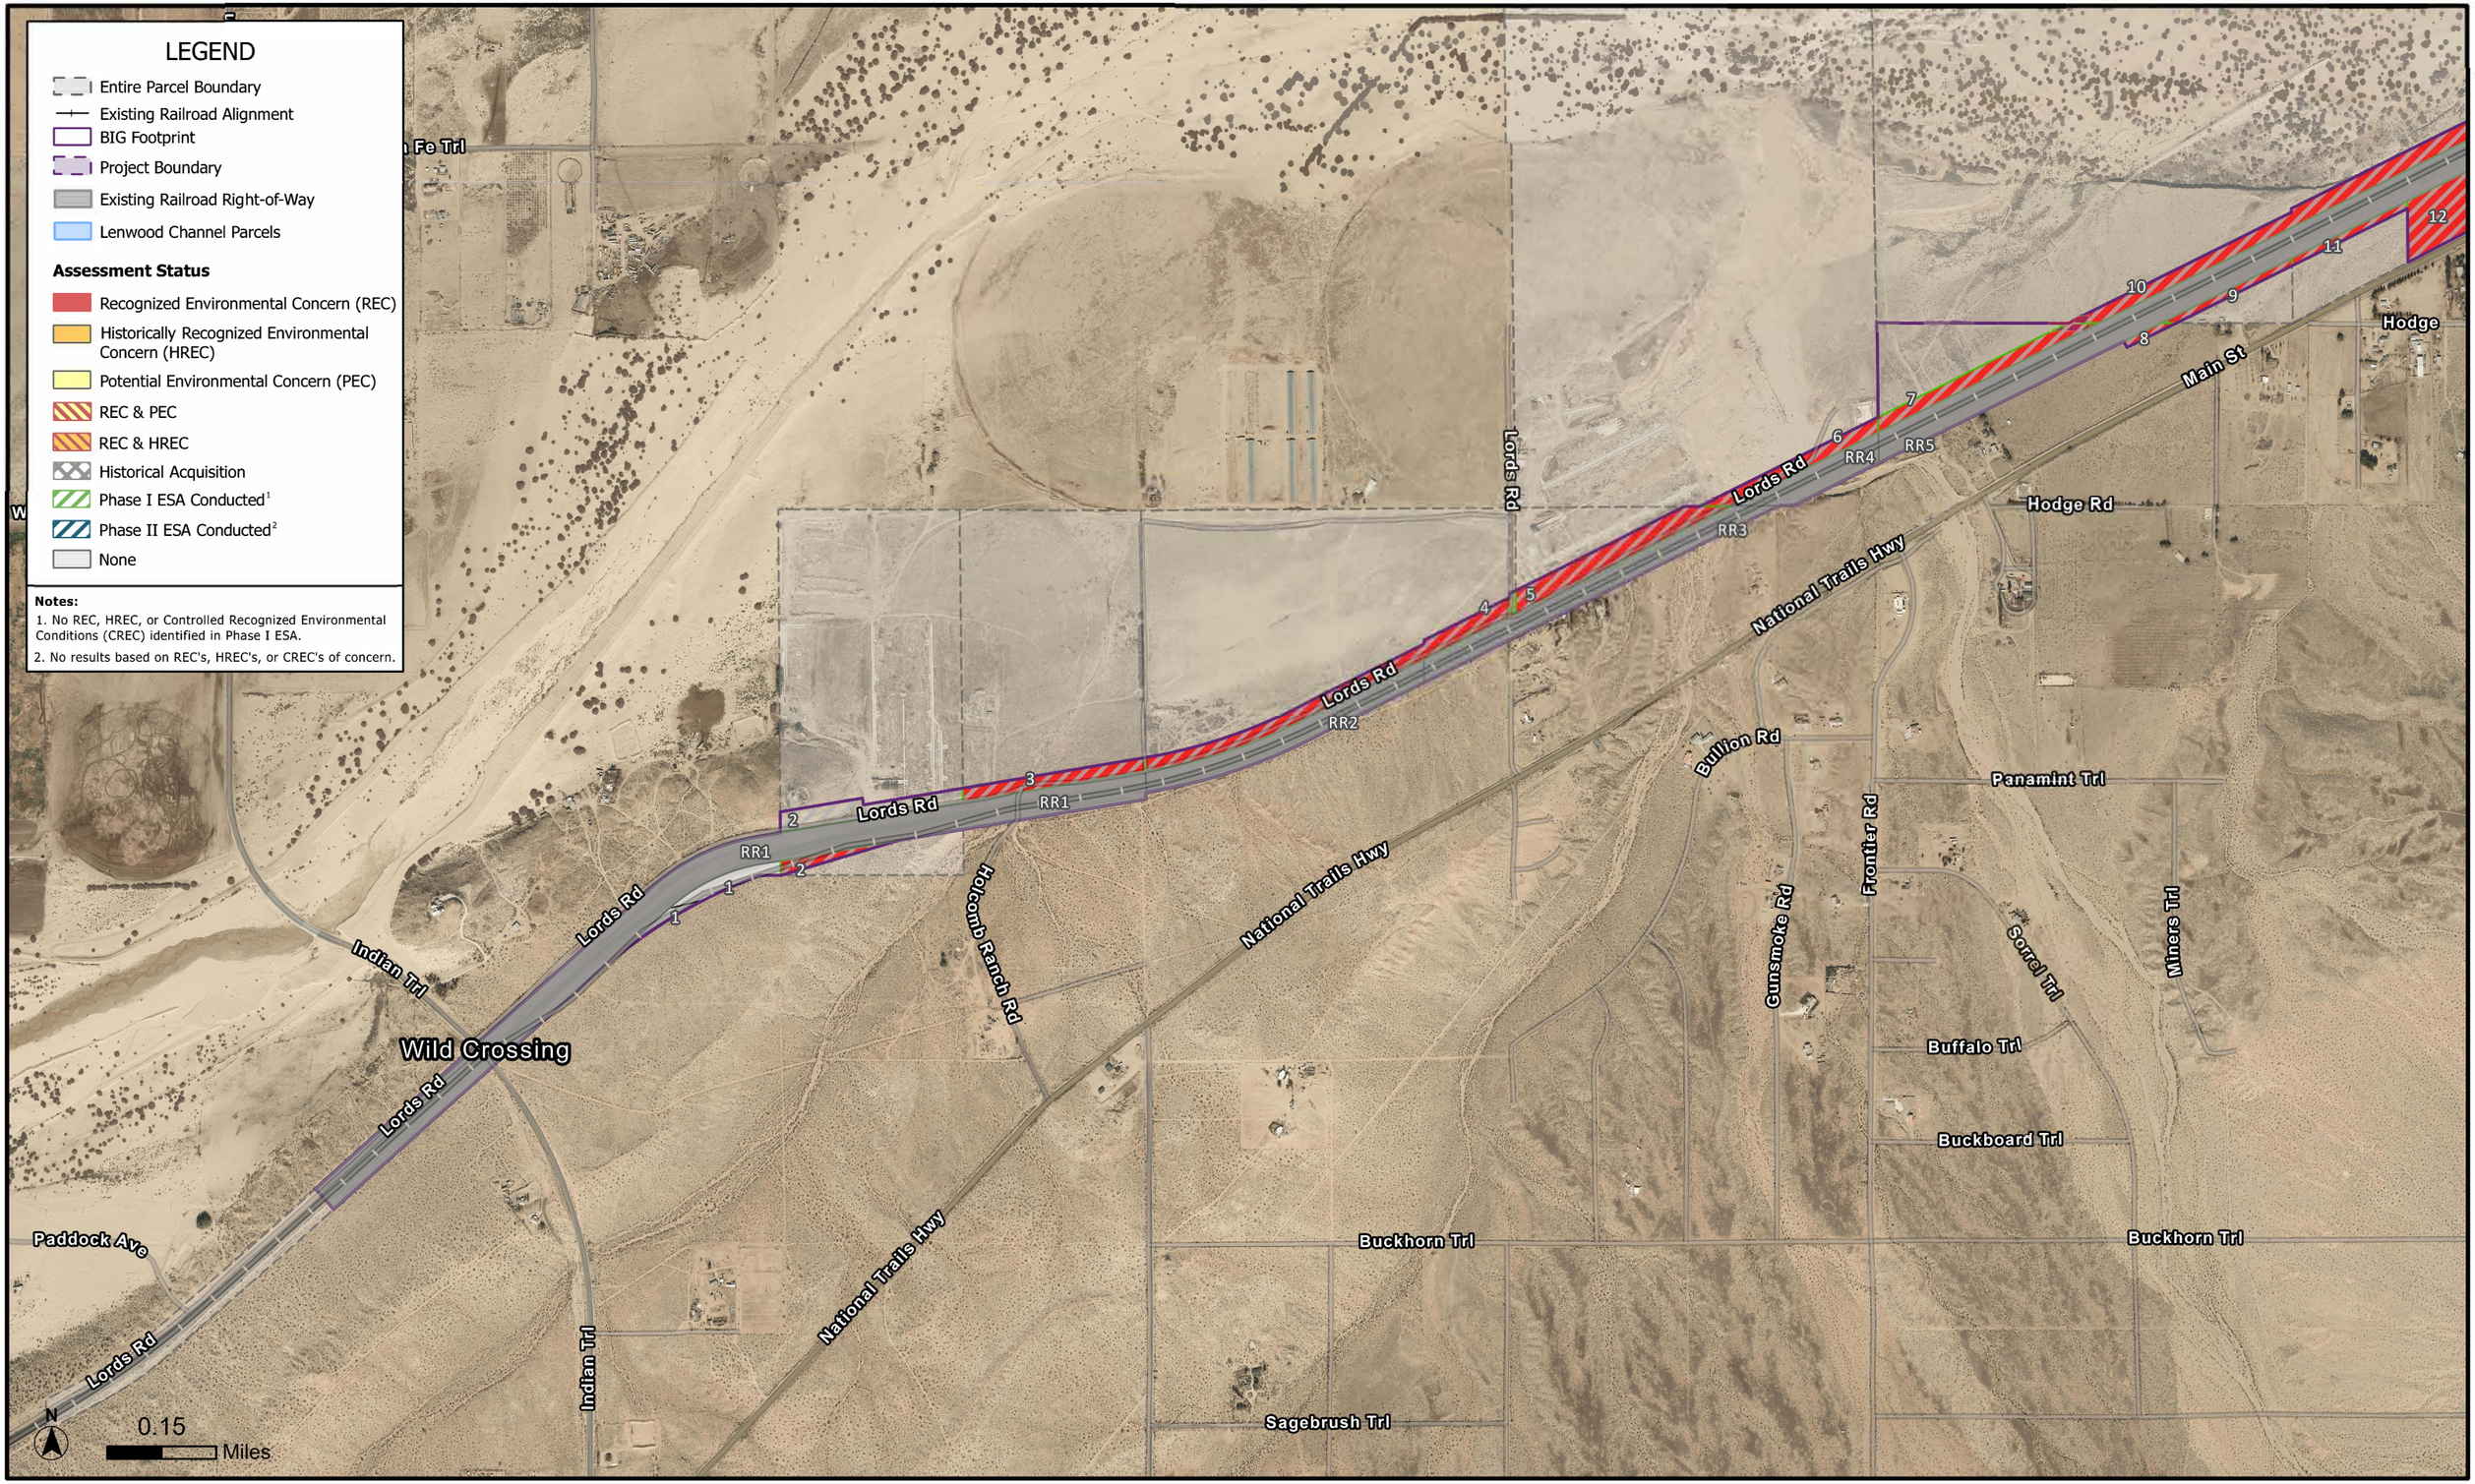

A supplemental Phase II ESA (see **Attachment F.6**) addressed the data gaps and concluded the following:

Regarding soil, the total petroleum fuel (GRO, DRO, and ORO) impacts were indicated in soil laboratory results, however concentrations were below the commercial/industrial shallow soil exposure and leaching to groundwater ESLs. Arsenic concentrations which exceeded the SFRWQCB arsenic ESL (0.31 mg/kg) but were below the typical Southern California background level of 11 mg/kg per DTSC HERO, were detected in soil samples. A study of regional background concentrations of arsenic in undifferentiated urbanized flatland soils was conducted and proposed an upper estimate for background arsenic (99th percentile) of 11 mg/kg (Duverge, 2011). This value can be used and is appropriate based on the study parameters, as arsenic concentrations in California soils typically exceed risk-based screening levels by one or more orders of magnitude due to naturally occurring background concentrations.

Regarding groundwater, total petroleum fuel impacts were indicated in groundwater laboratory results above the MCLs. Dissolved phase TPH-G (8.11 mg/L) in groundwater at soil boring SB-3 (northern sewer line location) was encountered above the MCL. Dissolved-phase benzene (0.0063 mg/L) was encountered above the MCL. The Phase II ESA notes this contamination may be attributed to the previously encountered potential gasoline-impacted soil documented by the County Inspector during the construction of the sewer line or may also be attributable to the former presence of operating USTs at the Site. An increased dissolved phase TPH-D (0.716 mg/L) in groundwater was encountered above the MCLs. The Phase II ESA notes that previous results in limited Phase II conducted in 2022 was 0.26 mg/L. Metal concentrations were generally consistent with concentrations reported in the Limited Phase II ESA.

Regarding soil vapor, chloroform concentrations at sub-slab soil vapor probes were above the commercial/industrial ESL. Additionally, bromodichloromethane concentrations in sub-slab soil vapor were above the ESL. The Phase II ESA concluded that concentrations encountered at the Site to date do not appear to require vapor mitigation.

Wildland Fires

Wildland Fires

Wildfires can potentially occur where developments are adjacent to open space or near wildland fuels such as grass, leaf litter, trees, or shrubs that can ignite when exposed to a natural occurrence (e.g., lighting) or by a human-caused activity. Wildfire hazards are also based on factors such as topography and climatic conditions (e.g., winds, humidity, droughts, and extreme temperatures). Wildfires can originate in undeveloped areas and spread to developed or urban areas where landscape and structures are not designed and maintained to be fire-resistant.

The potential for wildfires to affect an area is largely dependent on vegetation patterns within a given area and the density of the vegetative growth. The vegetation is typically defined as having low, moderate, or high fuel loads. Light fuels typically consist of flammable grasses and annual herbs; medium fuels are brush and shrubs less than six feet in height, and heavy fuels are heavier brush and timber over six feet high. Topography also influences fire risk by affecting fire spread rates. Steep terrain can result in faster fire spread upslope and terrain that create funneling effects, such as canyons. These landscapes can result in especially intense fire behavior. Conversely, flat terrain or those with slight elevation changes tend to have little effect on fire spread. In these instances, the fire spread is largely driven by vegetation and weather conditions such as humidity and wind.

The approximately 5,000-acre BIG footprint is in the County's western portion, at the eastern extent of the City of Barstow. The BIG footprint is bounded by the Mojave River to the north, Main Street to the south, Lenwood Road on the east, and Hinkley Road to the west. Except for approximately 108 dwelling units, approximately 93,724 square feet of non-residential land uses, and approximately 700 acres of

former farmland, the BIG footprint is vacant with little to no improvements. The BIG footprint can be characterized as scrub-like desert landscape (e.g., allscale scrub, creosote bush scrub, desert dunes, and disturbed habitat) with sparse rural residential development. The BIG footprint is mostly devoid of tall vegetation and trees, with structures and other elements of the built environment scattered throughout. The BIG footprint also includes BNSF's existing mainline corridor, which traverses the area in an east/west orientation. The BIG footprint is generally flat and gradually slopes north to the Mojave River. In the western half of the BIG footprint, the topography is relatively level between the existing main lines and Mojave River with low, uneven terrain at some locations, especially near the southwesterly end near Hinkley Road. There are no hillsides, ridgelines, or dominant landforms within the BIG footprint.

The area surrounding the BIG footprint is primarily vacant undeveloped land with sparse rural residential uses to the south, east, and west.

Wildland Urban Interface

As depicted in **Figure 17: Wildland-Urban Interface and Influence Zone – BIG**, small portions throughout the BIG footprint (approximately 45 acres in total) located near the Main Street at Lenwood Road intersection, along the Lenwood portion of the Mainline, southwestern portion of Barstow, and within the proposed solar area are designated Interface (i.e., WUI). As discussed above, a WUI is defined as an area where homes are built near or among lands prone to wildland fire. Because homes have been built within the BIG footprint, this area is considered WUI. Because the BIG footprint includes sparse desert vegetation and is relatively flat, it is considered as having light fuel with a topography that would have little effect on fire spread. However, most of the BIG footprint is designated either: Not-WUI or Influence Zone (approximately 976 acres and 3,819 acres, respectively); WUI Intermix areas (approximately 38 acres), where housing intermingles with wildland; Wildland/Non-Urban (approximately 1,092 acres); or Urban Unzoned (approximately 77 acres) (CAL FIRE, 2020).

Wildfire Responsibility Areas

As depicted in **Figure 18: California State Responsibility Zones – BIG,** CAL FIRE classifies most of the BIG footprint as a LRA (approximately 4,850 acres) with only a small portion on federally managed land; see **Figure 18** (CAL FIRE, 2025). The wildfire study area is located within an LRA, as designated by CAL FIRE, and is primarily classified as a moderate FHSZ. The SRA nearest the BIG footprint is approximately 21 miles to the south. The very high FHSZ nearest the BIG footprint is approximately 25 miles to the south (CAL FIRE, 2025).

The County's Multi-Jurisdictional Hazard Mitigation Plan includes a list of notable wildfires in the County from 2019 to 2022. None of the fires occurred in the wildfire study area (County 2022). However, as depicted in **Figure 20: Fire Hazard Severity Zones in LRA**, the CWP and BHMP identifies most of BIG's footprint is within a moderate fire hazard severity zone and Non-Wildland/Non-Urban areas (CWP, 2020). The City's BHMP also identifies the BIG Footprint is located near two key areas within or near the City which are considered fire hazard areas, these include:

- The Lenwood community, located near the BIG footprint's eastern boundary. This area is identified as a fire hazard area due to the abundance of brush and blow sand, which makes it difficult to gain access to fight fire.
- The Mojave Riverbed, located along BIG's northern boundary. This area is identified as a fire hazard area because of its significant slope to the bottom of the riverbed and the soft soil, which is difficult to gain access to when firefighting.

Neither Barstow's General Plan Safety Element nor the Barstow Fire Protection District Strategic Operations Plan 2019 address wildfire risk, mitigation, history, or areas of concern. Both are focused on the organizational structure and needs of the Barstow Fire Protection District and developing goals and policies rather than outlining areas of wildfire concern.

Fire Protection

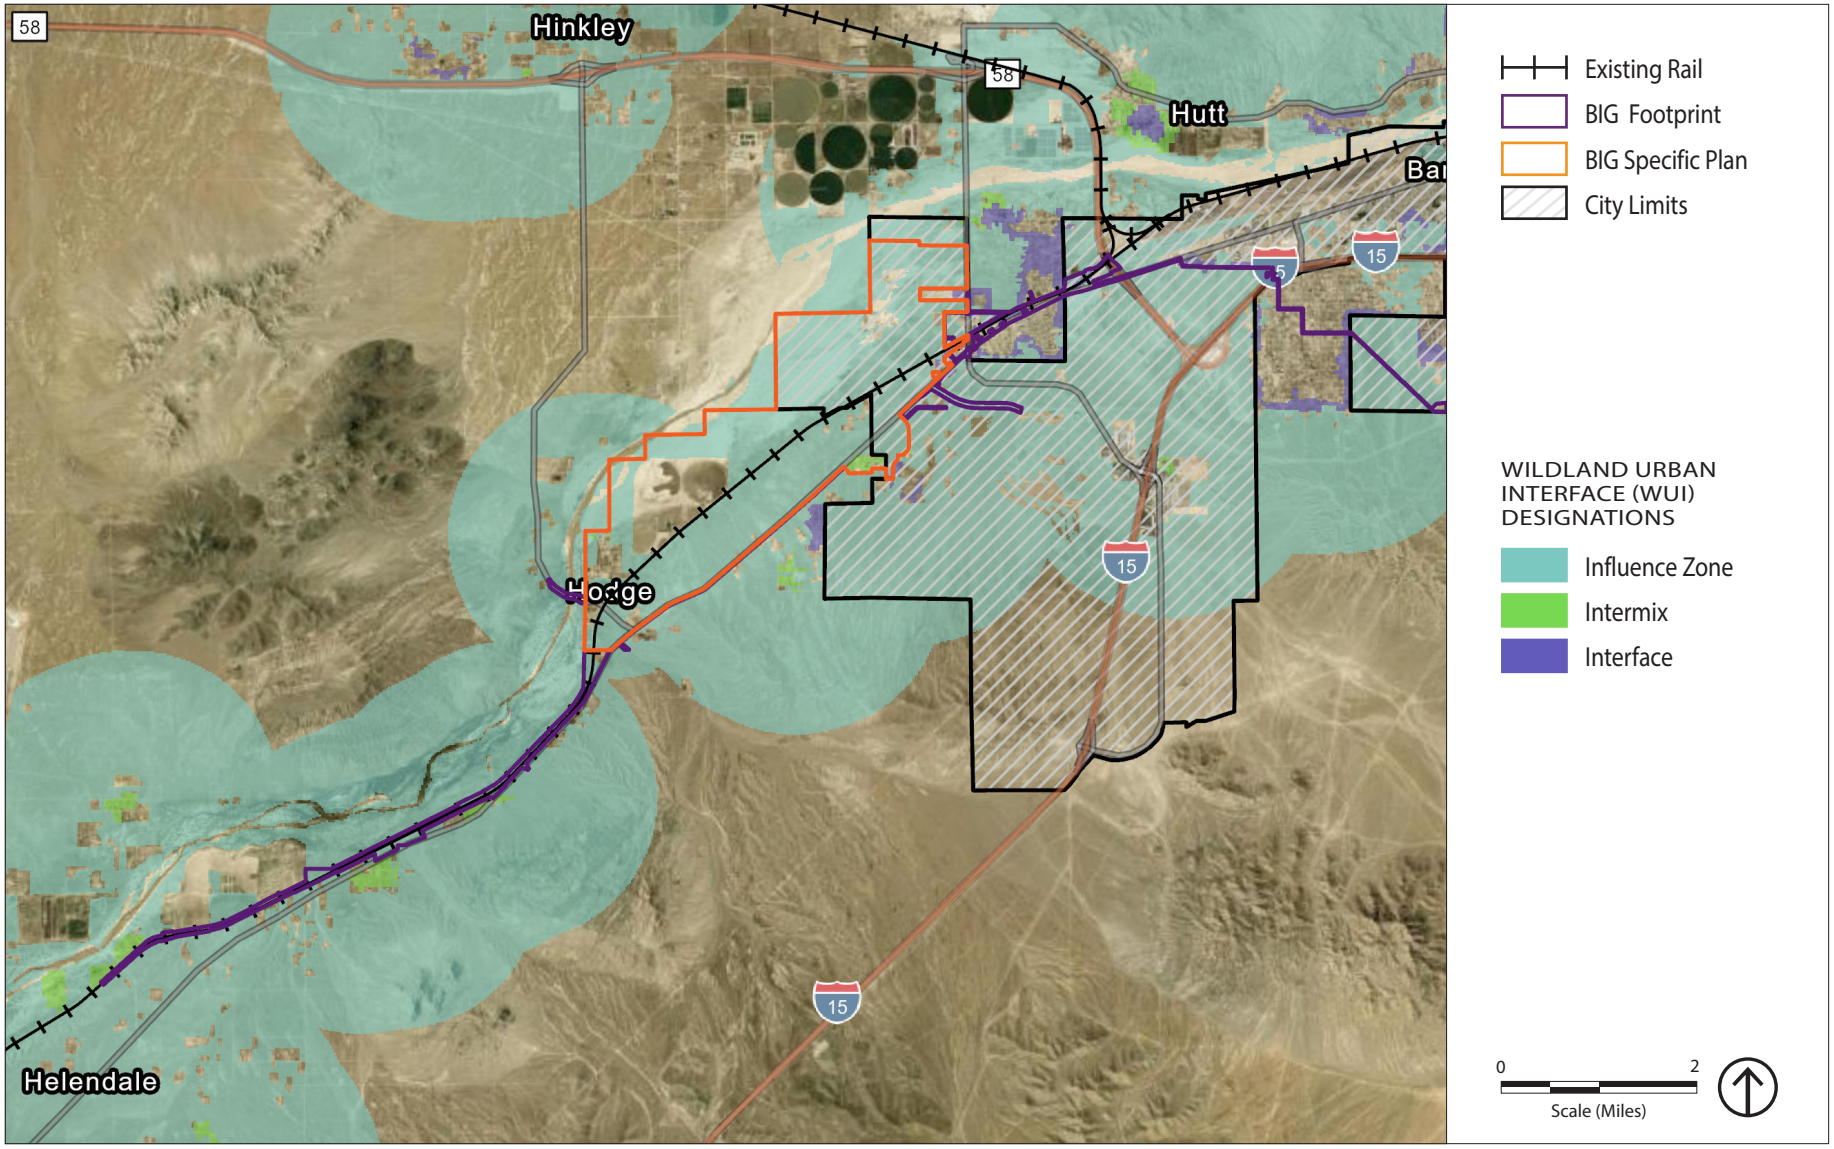

San Bernardino County Fire Protection District. Most of the BIG's footprint (approximately 63 percent or 3,070 acres) is within unincorporated County lands, while the remainder (approximately 37 percent or 1,808 acres) is within City limits; see **Figure 3-4: BIG Local Vicinity Map**. Thus, most of the BIG footprint is within SBCFPD jurisdiction as it is outside of the City's boundaries; see **Figure 5.14-1: Fire Protection Service Boundaries**. SBCFPD is a community-based, all hazard emergency services provider (County of San Bernardino, 2014). SBCFPD core services include the following: fire stations; Emergency Medical Services, special operations, and training; and CONFIRE Dispatch, which is a joint powers authority that serves as the communications and dispatch hub for numerous County fire agencies, including SBCFPD (CONFIRE, 2019).

SBCFPD Fire Station 4, located at 27089 Helendale Road, Helendale, approximately 3.4 miles southwest of BIG, currently serves the BIG footprint; see **Figure 5.14-1**. SBCFPD strives for a response time of less than five minutes once a call for service is received (Lester Kaita, personal communication, October 12, 2021). However, SBCFPD response times vary depending on the area served. SBCFPD's goal is to be enroute to an incident within one 1 minute 30 seconds, with an overall time of a few seconds near the stations to over 9 minutes to the most remote areas.

The SBCFPD Hazardous Materials Division is the Certified Unified Program Agency responsible for administering the County's HMW program. The Certified Unified Program Agency's responsibility includes controlling the use, disposal, and transport of flammable chemicals and liquids.

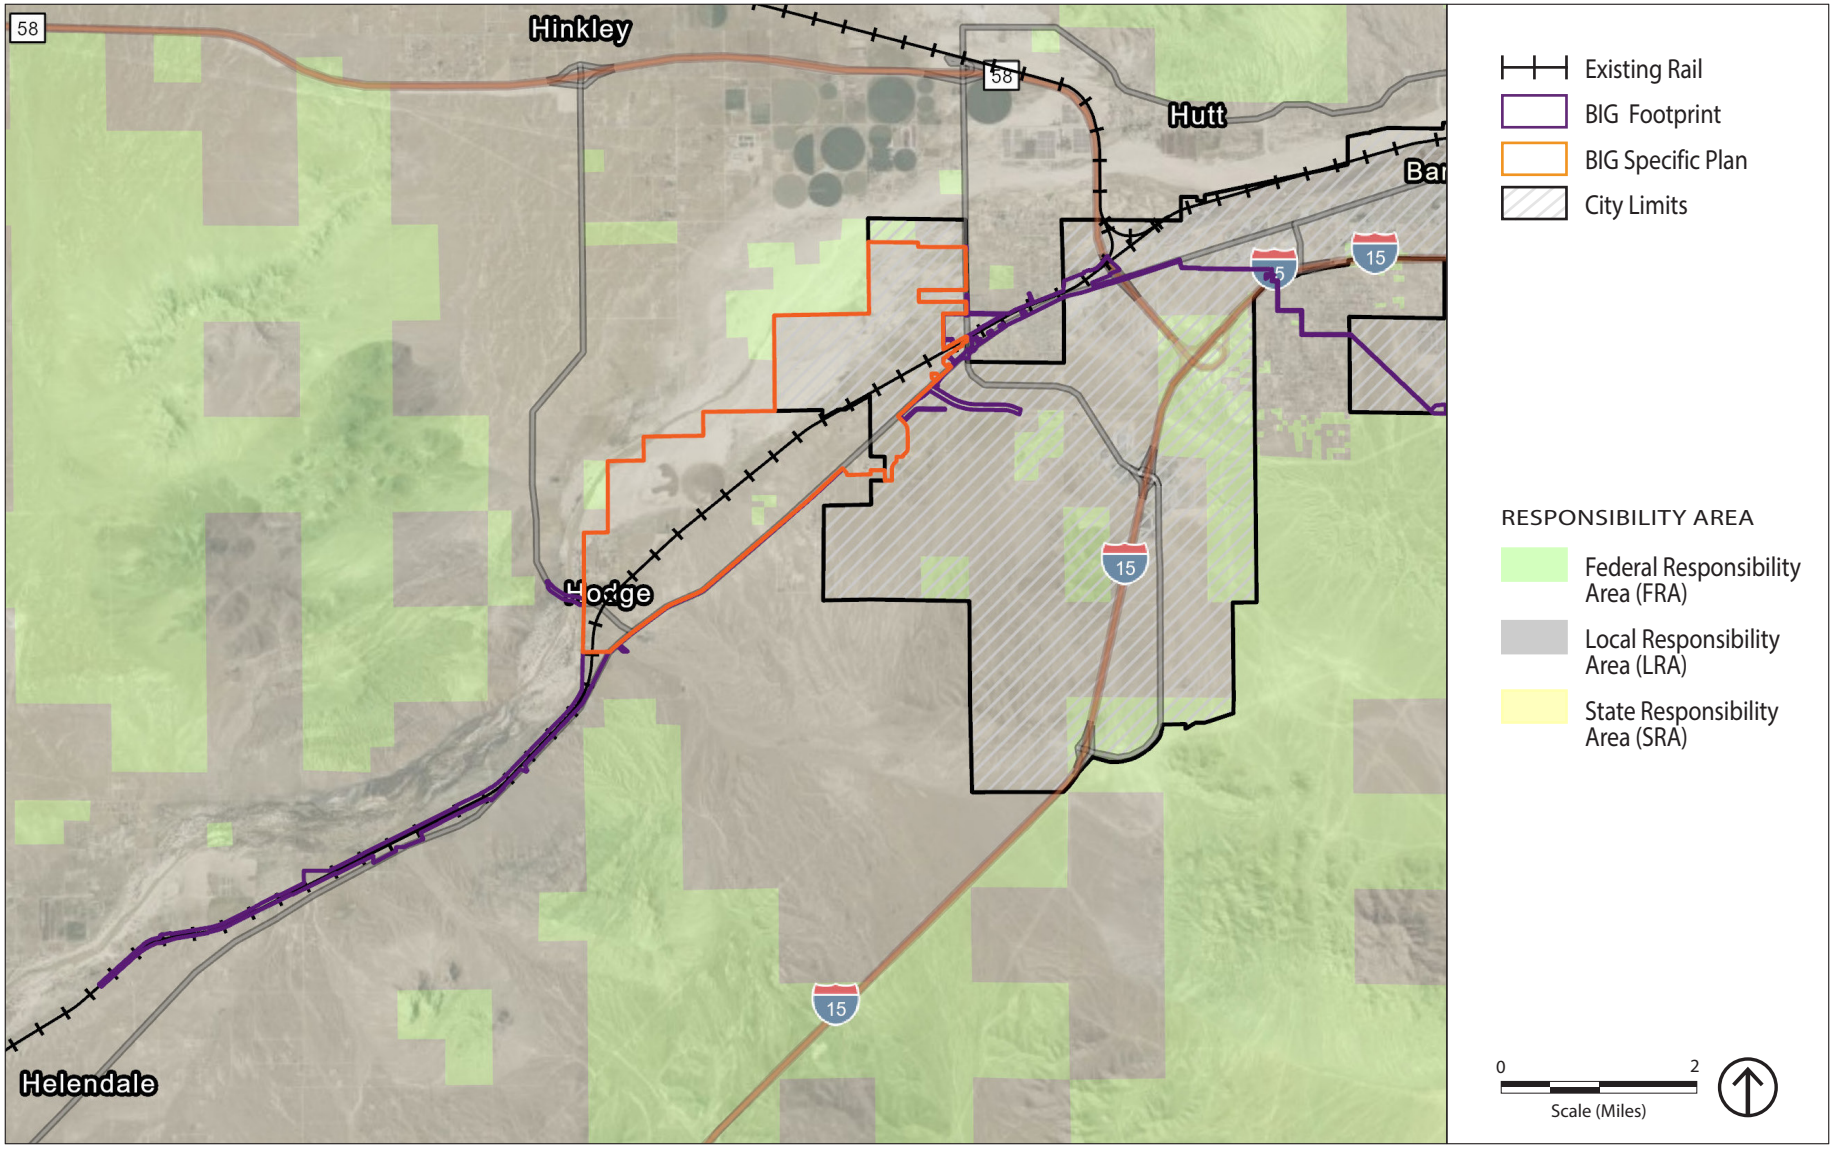

City of Barstow Fire Protection District. As noted above, approximately 37 percent (approximately 1,808 acres) of the BIG footprint is within Barstow City limits; see **Figure 3-4**. Thus, a portion of the BIG footprint is currently within BFPD jurisdiction; see **Figure 5.14-1**. The BFPD is an "all-hazard" response agency for the City. BFPD members are trained, equipped, and dedicated to providing emergency medical, fire, HMW, technical rescue, natural, and manufactured disaster response. BFPD engages in activities intended to promote greater public awareness of fire and safety hazards and prevention techniques. The Fire Chief and engine companies conduct routine fire prevention inspections on local businesses to educate the business owners and ensure code compliance.

The BIG footprint is within the BFPD service area and its SOI, and is primarily served by BFPD Station 366, located at 2600 Main Street approximately 0.68-mile east of the BIG footprint. The BFPD is a full-service department consisting of full-time firefighters and administrative staff. Currently, BFPD has 30 full time personnel: one Fire Chief, three Battalion Chiefs, six Captains, six Engineers, twelve Firefighters [of whom some also are paramedics or emergency medical technicians], and two administrative staff (non-sworn). BFPD operates two full-time paramedic engine companies and one paramedic squad.

Emergency Response

Emergency Response Plans/Emergency Evacuation Plan

As previously noted, CWP Policy Map PP-2: Evacuation Routes depicts the County's evacuation routes and indicates SR-58 to the northeast and I-15 to the southeast are emergency evacuation routes. County evacuation routes are shown in **Figure 21: Emergency Evacuation Routes**.

The Safety Element of the proposed General Plan establish the emergency evacuation routes for the City. Major routes within proximity to the BIG footprint include SR-58 to the north and east and I-15 to the east. Minor routes within proximity to the BIG footprint include Lenwood Road to the east and West Main Street to the south.

BNSF Emergency Response Plan

BNSF has prepared a System Emergency Response Plan (Response Plan) to respond to emergencies (BNSF, 2025b). The Response Plan describes procedures for responding to hazardous release emergencies, persons, and agencies to contact, locations for personnel to evacuate to, and prevention practices to limit the potential of these emergencies. BNSF has also established a website (www.BNSFhazmat.com) to communicate with first responders (BNSF, 2024).

BNSF integrates (by contract) additional Incident Management Team expertise in areas such as incident management, wildlife management, water and air dispersion modeling, toxicology, chemistry, firefighting, communications, and railroad and commodity salvage. Contracted incident management experts can support the BNSF Incident Management team to manage large-scale incidents. Additionally, BNSF provides free railroad hazmat response training to an average of 8,000 first responders per year in communities across their network. In 2020, BNSF provided hazmat response training to more than 9,000 first responders across its network (BNSF, 2025b).

BNSF has strategically deployed hazmat equipment across the national network of railways, including fire foam application trailers and wildland trailers. A BNSF-owned fire-fighting foam trailer is located at the existing BNSF rail yard in the City (BNSF, 2016). Fire-fighting foam trailers are mobile units designed to deliver large quantities of firefighting foam, primarily for flammable liquid fires. They are used to create a foam blanket that smothers the fire by depriving it of oxygen, suppresses flammable vapors, and cools the fuel source, preventing reignition. Trailers are mobilized to the location of an incident, such as oil fires resulting from train derailment, and contract industrial firefighters are deployed to operate the equipment (BNSF Hazmat, 2021). Additionally, these fire-fighting foam trailers are available as an asset to other railroads and local communities within an approximately 150-mile radius.

The BNSF Response Plan contains policy framework in the event of an unanticipated accident, collision, or train derailment that could release HMW into the environment (BNSF, 2025a). In the event of a rail derailment, appropriate BNSF hazmat personnel are mobilized along with hazardous materials contractors, environmental response contractors, and shippers are notified immediately.

Training Local Emergency Responders

BNSF coordinates and works closely with CAL FIRE for wildfire response in the State. The BNSF environmental team trains local responders on hazmat awareness and emergency response to ensure that BNSF can work effectively with communities and respond quickly in the unlikely event that a hazmat emergency occurs.

BNSF provides free railroad hazmat response training to an average of 8,000 local emergency responders per year in communities across our network. BNSF has provided training for more than 125,000 emergency responders since 1996. In 2020, BNSF provided hazmat response training to more than 9,000 first responders across its network (BNSF, 2024).

6.0 IMPACT ANALYSIS

6.1 Introduction

This section evaluates potential direct and indirect effects that would result from BIG construction and operations under CEQA. BIG is analyzed alongside the proposed General Plan. Thus, the 2015 General Plan goals and policies would be superseded by the proposed General Plans goals and policies.

6.2 Applicable Proposed General Plan Policies

The proposed General Plan goals and policies relevant to Hazards, Hazardous Materials, and Wildfire are listed below.

Safety Element

Policy S-1.1 Hazard planning. Regularly update and incorporate by reference into the General Plan a Local Hazard Mitigation Plan and participate in regional and statewide emergency preparation efforts.

Policy S-1.2 Mutual aid. Maintain mutual aid agreements with the County, MCLB, and Ft. Irwin fire departments to maximize the ability to respond to emergencies in Barstow and surrounding communities.

Policy S-1.3 Building design and location. Require new development to design and build in accordance with current standards for seismic, landslide, fire, and flood safety. Encourage building designs and locations that reduce exposure of structures and occupants to natural hazards, including windblown sand, and enable occupants to shelter in place during disasters.

Policy S-1.4 Utility hardening. Coordinate with service providers to ensure that new utilities are designed to accommodate ground settlement and to be resilient to risks associated with flood, high wind, blow sand, seismic, and fire events. Encourage retrofitting of existing utilities to improve resilience and ensure that utilities remain operational during emergencies.

Policy S-1.5 Water for fire protection. Coordinate with water suppliers and fire protection agencies to ensure adequate provision of water supplies for structural fire suppression.

Policy S-1.6 Critical facilities in flood and earthquake zones. Prohibit the construction of new public critical facilities and hazardous materials uses within mapped 100- or 200-year flood zones and Alquist-Priolo Fault Zones unless a proposed location is otherwise necessary and alternative locations are infeasible. If new critical facilities must be constructed in these areas, require that they be designed to include structural and site design elements that go beyond current building code requirements that further harden the facilities/uses against flooding and seismic events.

Policy S-1.7 New development in flood zones. Discourage new development in mapped 100- flood zones unless proposed development incorporates floodproofing construction materials, techniques, and/or site designs. Encourage new development to employ site designs that elevate buildings out of mapped 200-year flood zones.

Policy S-1.8 Existing development in flood zones. Encourage existing development in mapped 100-, 200-, and 500-year flood zones to implement retrofits that harden structures against flood damage through appropriate construction materials, techniques, and/or site designs.

Policy S-1.9. Flood zone mapping. Require new development projects that are within 500 feet of a mapped 100-year flood zone and involve the subdivision of land to confirm or map new 100-year and 200-year flood zones for the proposed project area and surrounding 500 feet. This requirement shall also apply to new development east of Higgins Road and south of Rimrock Road.

Policy S-1.10 New development in seismic and geologic hazard zones. Discourage new development in Alquist-Priolo Fault Zones, and liquefaction, subsidence, and landslide hazard zones to the extent feasible. For development that does occur in these areas, require submittal of a geotechnical report and ensure that measures are incorporated into the project design to reduce risks to an acceptable level. Prohibit the construction of new critical facilities in these areas.

Policy S-1.11 Seismic safety retrofits. Encourage efforts to seismically retrofit existing structures, prioritizing structures constructed prior to 1980, structures in the Alquist-Priolo Fault Zone, and homes of low-income households.

Policy S-1.12 Wind and blow sand. Require the incorporation of wind barriers, architectural features, and/or drought-resistant ground coverage in new development site designs to substantively reduce dust, erosion, and structural damage from windblown sand.

Policy S-2.1 Resilient public facilities. Require new critical and public facilities to be located and designed to operate during, minimize their exposure to, and susceptibility to damage from flooding, seismic and geological effects, and urban fires. Retrofit existing City facilities to be retrofitted to remain operational during an emergency.

Policy S-2.2 Emergency response operations plan. Maintain and implement a comprehensive Emergency Operations Plan to ensure quick and effective response to natural and human-caused disasters and hazards, disasters, and other emergency situations.

Policy S-2.3 Cooperative hazard management and recovery. Coordinate with community organizations and local, state, and federal agencies to reduce, manage, and respond to natural and human-generated hazards in order to reestablish and expedite public services, assist affected residents and businesses, and accelerate the short- and long-term recovery process after hazard events or emergency conditions.

Policy S-2.4 Community emergency preparation. Engage the community in emergency planning through working with local community-based organizations, health care providers, and contractors to expand education about natural hazard preparation, emergency response, and recovery resources. Provide educational materials that reflect Barstow's language diversity and in formats that are accessible to all community members.

Policy S-2.5 Emergency access and evacuation. Require that new development have at least two ingress and egress routes that are designed to provide unencumbered access for emergency vehicles and remain accessible and functional in the event of a natural hazard event or emergency.

Policy S-2.6 Hazards and evacuation planning. Incorporate information about flood, landslide, subsidence, and liquefaction hazard areas, and risks associated with cargo spills into local evacuation planning and identify potential alternative routes should key evacuation routes be blocked or damaged by these hazards.

Policy S-2.7 Community resilience centers. Partner with other public entities and new development to retrofit existing and design new public community facilities that can serve as resilience centers, especially during extreme heat and poor air quality conditions. Ensure such centers are equitably distributed throughout Barstow and have air-conditioned indoor space, clean indoor air, permanent shaded areas, proper hydration supplies, and resilient power supply. [EJ-AQ, PF]

Policy S-2.8 Healthy, resilient, and efficient buildings. Encourage and pursue funding for improvements to existing residential and nonresidential buildings consistent with the latest state building code requirements for indoor air quality; energy efficiency; energy storage; disaster and severe weather resilience; and solar power. As funding is obtained, prioritize improvements for buildings that are both within 500 feet of a freeway or railroad and intended for use by residents or employees for at least eight hours a day. [EJ-AQ, SH]

Policy S-2.9 Urban heat reduction. Encourage the use of shade-producing trees and structures that reduce ambient air temperatures and heat radiance from buildings, parking lots, and other impermeable surfaces.

Policy S-3.1 Hazardous materials siting. Prohibit the development of new hazardous waste facilities within the mapped 100-, 200-, and 500-year flood hazard areas and Alquist-Priolo Fault Zones. Require uses within mapped 100- and 200-year floodplains that produce, contain, or store hazardous materials to employ building and site design features that go beyond current building code requirements that further harden the facilities/uses against flooding and seismic events.

Policy S-3.2. Pipelines and electrical transmission lines. Require new development to incorporate appropriate site designs that are consistent with easements for major natural gas transmission or hazardous liquid pipelines. Prohibit the development of new hazardous waste facilities within such easements. For new development within 500 feet of such easements, require hazardous materials storage areas to be located as far from these pipelines and electrical transmission lines as possible.

Policy S-3.3 Community use of hazardous materials. Educate residents about how to reduce their personal hazardous materials use and exposure and how to safely dispose of hazardous materials.

Policy S-3.4 Hazardous material disposal. Work with local waste handlers to ensure the safe disposal of hazardous materials and limit the exposure of hazardous materials to the community.

Policy S-3.5 Hazardous materials transport. Encourage the transport of hazardous materials via the safest available method for each material, avoiding populated areas and areas subject to natural hazards whenever appropriate.

Policy S-4.1 Land use compatibility. Approve development in a manner that ensures existing and future land use compatibility, taking into consideration periodic, and impulsive noise and vibration impacts of business operations.

Policy S-4.2 New residential. When new residential development is proposed adjacent to land designated for industrial or commercial uses, require the proposed project to assess the potential noise and vibration impacts and implement feasible and appropriate measures.

Policy S-4.3 New nonresidential. When new nonresidential development is proposed adjacent to land designated for residential uses, require the proposed project to assess the potential noise and vibration impacts and implement feasible and appropriate measures.

Policy S-4.4 Control sound at the source. Prioritize feasible and appropriate noise measures that control sound and vibration at the source before buffers, soundwalls, and other perimeter measures.

Policy S-4.5 Transportation noise. Minimize potential transportation noise through proper roadway design, coordination of commercial vehicle routing, and other feasible and appropriate traffic control or abatement measures.

Policy S-4.6 Industrial proximity. Discourage new residential or other uses sensitive to noise and/or vibration within 200 feet of existing or planned railroad, mining, or industrial processing operations. Require new development of vibration-sensitive uses in areas within 200 feet of railroad operations to evaluate for indoor vibration levels and mitigate any exceedances of the Federal Transit Administration vibration-annoyance and damage criteria.

Airports

As the City nor its SOI are not situated within any airport land use plan, nor are there any public or public-use airports within the City or SOI boundaries, no airport policies are included in the proposed General Plan.

6.3 Impacts

Impact 1	*Would the Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?*

Construction

BIG construction activities would require temporary transport (e.g., waste oils), use (e.g., cleaning solvents), and disposal of HMW. The potentially HMW associated with BIG construction activities could include the following among others:

- Acids and caustics
- Compressed gases
- Caulking
- Adhesives and glues
- Degreasers
- Refrigerants
- Oils and lubricants
- Batteries and battery acid

- Fuels and additives
- Herbicides and pesticides
- Wood preservatives
- Paints, varnishes, and shellacs
- Paint strippers
- Solvents and thinners
- Mineral spirits

During BIG construction, potential HMW would be used and stored within the BIG footprint. Although BIG's use and storage of these materials would be temporary, construction would result in a temporary increase in the transport, use, and storage of HMW due to the scale of construction, which could in turn result in an incremental increase in hazardous waste disposal. As described in **Section 5.0: Environmental Setting**, the BIG footprint contains residential and commercial uses which could contain ACM (both friable and nonfriable), LBP, or PCBs based on their initial construction date. The EDR Report and available Phase I and Phase II ESAs did not indicate any historic asbestos violations or PCB spills within the HMW study area. However, it is assumed that some existing onsite structures (i.e., commercial, or residential structures built prior to the 1980s and electrical transformers, hydraulic equipment, capacitors, and similar equipment manufactured prior to 1976) could contain ACM, LBP, or PCBs. Therefore, demolition of these existing structures could result in the removal of ACM, LBP, or PCBs, which would likely require the transportation of these HWM from the construction site to appropriate disposal sites. Additionally, disposal of hazardous waste from potential implementation of **MM BIG HAZ-1: Limited Soil Management Plan,** which involves management and handling of impacted soil, would involve transporting hazardous waste to appropriate offsite disposal facilities; see below. Construction activities could also result in other hazardous wastes including soil or groundwater formerly contaminated by ADL, petroleum hydrocarbons, pesticides, herbicides, asbestos, heavy metals (i.e., lead and arsenic), PCBs, creosote, or VOCs, etc.

Additionally, there is potential for discovery and disturbance of undocumented HMW along with the few exceedances identified within the northwestern and eastern lead track portion of BIG. **MM BIG HAZ-1: Limited Soil Management Plan** would be created during the final construction design and would include provisions for responding to the completion of lateral and vertical delineation of known impacts and potential disturbance of undocumented contamination. Responsibility for responding to the discovery of undocumented contamination would be delegated to the CUPA, the Hazardous Materials Division of the County Fire Protection District. If soil, groundwater, or other environmental media with suspected contamination is encountered unexpectedly during construction (i.e., identified by odor or visual staining, or by unearthing any USTs, abandoned drums, etc.), work would immediately cease in the vicinity of the suspect materials. The area would then be secured as necessary, and appropriate measures would be taken to protect human health and the environment as defined in the SMP. Appropriate measures include notifying regulatory agencies and complying with the various agencies' laws, regulations, and policies. BNSF and its contractors would work with these agencies should undocumented HMW be encountered during construction. **MM BIG HAZ-1** would decrease the potential for significant hazard to the public or the environment through the routine transport, use, or disposal of HMW during construction.

Additionally, BIG construction would not require transporting, storing, or disposing of HMW in quantities greater than needed to support construction activities, thereby minimizing potential exposure of the public, workers, and the environment. However, inadvertent releases or spills could occur from the

improper storage HMW, improper handling of HMW, accidents, seismic activity, or inclement weather and have the potential to result in direct and temporary effects.

Off-site accidents during HMW transport to or from the construction site could expose individuals and the environment to risks at some distance from the construction site. Although transportation accidents are infrequent, accidents could occur during shipment of hazardous commodities (such as gasoline, diesel, or compressed gases) for construction. Accidents could also occur during cleanup of existing contaminated sites before the construction phase or during the transportation of HMW generated during construction.

Although BIG construction would involve the temporary handling of HMW, when HMW are properly used, transported, stored, and disposed of according to the manufacturers' guidelines and regulatory agency regulations, they present no substantial hazard to the community. Per § 402 of the CWA, BIG construction would be required to develop and implement a Storm Water Pollution Prevention Plan which would specify BMPs for proper transport, use, and disposal of any HMW and prevent all construction pollutants from contacting stormwater and erosion from moving offsite into receiving waters. Therefore, through compliance with guidelines and regulations regarding the transport, use, or disposal of HMW and implementation of construction BMPs (e.g., proper handling, transportation, and storage), BIG would not create a significant hazard to the public or the environment.

Following compliance with the regulatory framework and with implementation of **MM BIG HAZ-1,** BIG construction activities would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of HMW. A less than significant impact would occur with mitigation incorporated.

Operations

BIG operations would involve the routine transport, use, and disposal of HMW, and thus could create a significant hazard to the public or the environment through the routine transport, use, and disposal of HMW.

Transport of HMW via Rail. Within the lead tracks and rail yard, BIG operations would involve transport of HMW to/from BIG, almost entirely via rail. HMW could include explosives, gases, flammable liquids, flammable solids and reactive solids/liquids, oxidizers, and organic peroxides, poisonous (toxic) materials and infectious substances, radioactive materials, corrosive materials, and other miscellaneous HMW, as defined by the Association of American Railroads. However, BIG's routine transport of HMW via rail would be regulated at federal, state, and local regulations. HMW being transported to/from BIG via rail would be regulated by at the federal level by the PHMSA and FRA, who regulate transport of HMW via rail through Federal Hazmat Law and Federal Rail Safety Act (49 U.S.C. § 20101 et seq.). Federal Hazmat Law regulates HMW transport and the design of containers they are transported in and Federal Rail Safety Act regulates HMW transport by railroad and enforces safety regulations (49 CFR 200-268). Additionally, BIG operations would comply with the federal RCRA (42 USC § 6901 et seq.) requirements for HMW transport. At the state level, HMW transport to/from BIG via rail would be regulated through the Hazardous Waste Control Act (Proposition 65, CHSC § 25249.5 et seq.), which regulates the transport

of HMW deemed hazardous by the state, and CCR Title 22, Division 4.5 which regulates HMW transport and includes requirements for packaging, storage, labeling, reporting, and general management of HMW prior to shipment. Additionally, HMW transport to/from BIG via rail would be required to comply with CFC (CCR Title 24 Part 9), which contains regulations for safeguarding life and property from various hazards, including fire and explosion, among others. Locally, the CUPA administers the County's HMW program, which regulates the transport of flammable chemicals and liquids (San Bernardino County Fire Protection District, 2025). The transportation of HMW would comply with all federal, state, and local laws and regulations regarding the safe transport of HMW, which would be effective in preventing a hazard to the public. Further, BIG includes safe haven canopies, which are designated facilities where damaged, leaking, or shifted containers or trailers would be placed to contain spills until they are loaded into an alternative container or trailer, or resecured, as necessary. Through compliance with federal, state, and local laws and regulations regarding the safe transport of HMW and design elements, BIG would not create a significant hazard to the public or the environment through the routine transport, use, and disposal of hazardous materials.

Transport of HMW via Heavy-Duty Truck. BIG's operations could also include transport of HMW to/from BIG via traditional heavy-duty truck. HMW being transported to/from BIG via traditional heavy-duty trucks would be regulated federally by the PHMSA and Federal Motor Carrier Safety Administration through the Federal Hazmat Law and the Federal Motor Carrier Safety Regulations (49 CFR Parts 350-399), which regulates HMW transport by highway and enforces other various motor carrier safety acts codified at 49 U.S.C. § 501 et seq., § 30101 et seq., § 30301 et seq., and § 31501 et seq. At the state level, HMW transport to/from BIG via traditional heavy-duty truck would also be regulated through the Hazardous Waste Control Act (Proposition 65, CHSC § 25249.5 et seq.), CCR Title 22, Division 4.5, and CFC (CCR Title 24 Part 9). Additionally, HMW haulers would be required to comply with California Highway Patrol and Caltrans Federal Hazmat Law requirements, which include regulations for the safe transport, including security, of HMW in intrastate, interstate, and foreign commerce, and require a HMW vehicle hauler to be licensed to transport HMW on public roads. The transportation of HMW via heavy-duty truck would comply with all federal, state, and local laws and regulations regarding the safe transport of HMW, which would be effective in preventing a hazard to the public. Further, BIG includes safe haven canopies, which are designated facilities where damaged, leaking, or shifted containers or trailers would be placed to contain spills until they are loaded into an alternative container or trailer, or resecured, as necessary. Through compliance with federal and state laws and regulations regarding the safe transport of HMW and design elements, BIG would not create a significant hazard to the public or the environment through the routine transport, use, and disposal of hazardous materials.

Use/Generation of HMW During Maintenance. Additionally, occasional track maintenance would be required. Maintenance activities could involve the use or generation of HMW including the following among others:

- Cleaners
- Solvents
- Grease
- Oil
- Excavation and replacement of ballast
- Herbicides
- Rail ties

Maintenance activities would be temporary and intermittent. The use and handling of these materials would be regulated federally by OSHA's Hazardous Waste Operations and Emergency Response Standards, which sets safety and health standards for any employees who are exposed or potentially exposed to HMW and who are engaged in clean-up operations; corrective actions; voluntary clean-up operations; operations involving HMW at treatment, storage, and disposal facilities; and emergency response operations, and through Title 29, CFR § 1926.62, which includes requirements addressing exposure assessment, methods of compliance, respiratory protection, protective clothing and equipment, hygiene facilities and practices, medical surveillance, medical removal protection, employee information and training, signs, recordkeeping, and observation and monitoring. At the state level, HMW use, and handling is regulated by the USDOT through CCR Title 26, which establishes regulations for safe handling procedures (i.e., packaging, marking, labeling, and routing). Additionally, the Hazardous Substances Account Act (California Health & Safety Code § 25300, et seq.) establishes regulations and incentives which require that generators of HMW use technology and BMPs for the safe handling, treatment, recycling, and destruction of their hazardous waste prior to disposal. The use and handling of HMW would comply with federal and state laws regulating HMW, which would be effective in protecting workers and the public. BNSF also maintains and regularly updates policies regarding HMW transport, storage, and use during maintenance activities which would further minimize potential for hazard to the public and environment, as discussed below.

HMW Disposal. Proper hazardous waste disposal, regardless of the method selected, often affects the environment. Waste management strategies that seek to prevent pollution by reducing waste generation at its source are considered the most desirable approach. The Pollution Prevention Act of 1990 (42 U.S.C. § 13101 et seq.) established pollution prevention as a national objective. This priority would be reflected in rail operations through BNSF's Corporate Rule Environmental Operations protocols , which include procedures for handling and reporting certain types of HMW (BNSF, 2019), thereby reducing the quantity of hazardous wastes that needs to be transported.

Within the lead tracks, BIG operations could generate heavy metals in ballast rock, lead (from wood preservatives), asbestos (from train disc brake pads), and creosote and arsenic (from railroad ties). The potential for effects as a result of BIG rail operations at the lead tracks would be similar to potential contamination within the existing BNSF corridor. The BIG footprint slopes north and there are no immediate or adjoining residential uses to the north, thus, transload warehouse center, intermodal facility, and block swap yard operations would not create a significant hazard to the public through disposal of HMW within the BIG footprint. Dwelling units within the BIG footprint would be removed prior to construction, thus, none would be at risk from contamination as a result of HMW disposal from BIG rail yard or transload warehouse center operations.

Long-term HMW storage and use (e.g., routine use and disposal of HMW during BIG operations and maintenance) would be governed by above-mentioned federal, state, and local regulations that prescribe the proper use, storage, and disposal of such materials. BIG would be required to prepare a California HMW business plan, which would specify requirements for material inventory management, inspections, training, recordkeeping, and reporting. BNSF would also provide hazmat commodity flow reports to first responders and elected- or emergency-management officials and provide free training to emergency

service personnel regarding spills or accidents involving HMW (BNSF, 2022c). Priorities outlined in the Pollution Prevention Act of 1990 (42 U.S.C. § 13101 et seq.) would be reflected in rail operations through BNSF's Corporate Rile Environmental Operations protocols, which includes procedures for handling and reporting certain types of HMW (BNSF, 2019), thereby reducing the quantity of hazardous wastes that needs to be transported. Waste management strategies that seek to prevent pollution by reducing waste generation at its source are considered the most desirable approach.

BNSF Response. BNSF regularly inspects all the components of the network, including locomotives, track, rail, and bridges. These comprehensive inspections meet all federal requirements. Trained BNSF inspectors utilize advanced equipment such as instrument-equipped rail cars, bridge inspection vehicles and unmanned aerial vehicles and deploy technology such as Machine Vision Systems (MVS), autonomous track measurement systems, ultrasound, ground-penetrating radar and high-definition cameras and accelerometers. These efforts, coupled with the use of specialized rail cars to carry HMW, mobile apps to equip first responders with critical safety information, and a software system to determine the safest rail routes all help ensure that more than 99.99% of all HMW moved by all rail carriers reach its destination without a release caused by a train accident (AAR, 2023).

BNSF has prepared a System Emergency Response Plan (Response Plan) to respond to emergencies within their rail network. The Response Plan describes procedures for responding to hazardous release emergencies, persons, and agencies to contact, locations for personnel to evacuate to, and prevention practices to limit the potential of these emergencies. BNSF has also established a website (www.BNSFhazmat.com) to communicate with first responders (BNSF, 2025a). BNSF integrates (by contract) additional Incident Management Team experts in areas such as incident management, wildlife management, water and air dispersion modeling, toxicology, chemistry, firefighting, communications, and railroad and commodity salvage. Contracted incident management experts are capable of supporting the BNSF Incident Management team to manage large-scale incidents. BNSF would work with first responders in the unlikely event that an incident was to occur. BNSF has a network of over 150 hazardous materials responders and advisors who are trained to deal with HMW releases (BSNF, 2016). BNSF has also strategically positioned emergency response equipment, including fire foam application trailers and wildland trailers, at more than 100 locations across the BNSF network. A BNSF-owned fire-fighting foam trailer is located at the existing BNSF rail yard in the City (BNSF, 2016). Trailers are mobilized to the location of an incident, such as oil fires resulting from train derailment, and contract industrial firefighters are deployed to operate the equipment (BNSF, 2021). Additionally, these fire-fighting foam trailers are available as an asset to other railroads and local communities within an approximately 150-mile radius of the existing BNSF Barstow rail yard.

Additionally, BNSF provides free training to first responders through the Transportation Community Awareness and Emergency Response program. Additionally, BNSF provides information to first responders on commodities traveling through communities (BSNF, 2023).

Further, BNSF would be required to prepare a HMW business plan for BIG's rail yard, transload warehouse center, and solar farm pursuant to CHSC, § 25500 et seq., which would specify requirements for HMW inventory management, inspections, training, recordkeeping, and reporting. State agencies, including Caltrans, would also impose regulations on the identification, generation, transportation, storage, and

disposal of materials the state deems hazardous through the Hazardous Waste Control Act (CHSC, § 25100 et seq.). BNSF also provides hazmat commodity flow reports to local first responders and elected- or emergency-management officials upon request to assist with emergency response planning and provides free training to emergency service personnel regarding spills or accidents involving HMW (BNSF 2022c).

Further, the City's EOP would provide guidance and outlines operational concepts and response procedures for the City's response to extraordinary emergency situations associated with large-scale emergencies and disasters, including hazardous materials incidents and releases.

Solar Farm and Battery Energy Storage Systems. BIG's proposed solar farm would consist of solar modules, transformers, and battery storage in a BESS. Solar modules made with cadmium telluride and crystalline silicon and batteries do not result in emissions during their normal operations and accidental breakage is unlikely. All proposed mineral oil filled transformers would be equipped with spill containment areas to prevent HMW contamination as required by regulation. Battery storage in BESS would be in accordance with OSHA requirements, and would include ventilation, acid resistant materials, and spill response supplies. All hazardous materials associated with BIG's proposed solar farm would be disposed of in accordance with RCRA and State Hazardous Waste Management Program requirements. Although BIG's proposed renewable energy facility would result in an increased use of commercially available potentially HMW, the use of these substances would be subject to applicable federal, state, and local health and safety laws and regulations that are intended to minimize health risk to the public associated with HMW. Further, BIG's proposed solar farm operations would not use substantial quantities of HMW or generate substantial quantities of HMW requiring transport during operations. Solar farm operations would only be expected to use limited hazardous materials and substances such as herbicides and pesticides to control vegetation within the solar farm. Large quantities of these materials are not expected to be stored on-site. Storage of hazardous materials would be regulated by applicable federal, state, and local regulations. Compliance with these requirements would serve to minimize health and safety risks to people or structures associated with routine use, transport, and disposal as well as accidental release of or exposure to hazardous materials.

Therefore, following compliance with the established regulatory framework and existing BNSF policies and procedures, BIG operations (including maintenance activities) would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. A less than significant impact would occur, and no mitigation is required.

Impact 1 Level of Significance: Potentially Significant Impact.

Mitigation Measures:

MM BIG HAZ -1: Limited Soil Management Plan. Prior to grading permit issuance, the Applicant shall retain a qualified environmental consultant to prepare a Limited Soil Management Plan (SMP) for only areas considered as RECs within the BIG footprint. The SMP shall establish procedures for identification and management of impacted and clean soil, segregation, and management of impacted soil in accordance with regulatory requirements, transportation of impacted soil to an off-site disposal facility licensed to

accept such soil, and identification and management of construction debris during excavation, grading, and construction activities to be completed within the BIG footprint. The SMP shall be submitted to the City of Barstow Building and Safety Division for review and approval. The SMP shall include the following:

- Procedures for identification, handling, reporting, and removal of the known or unknown ASTs/USTs, piping, dispensers, or other storage tank components that may be encountered (see MM BIG HAZ-3).
- Health and safety measures for when performing demolition, grading, or other construction activities, which may include but are not limited to, personal protective equipment and periodic work breathing zone monitoring for volatile organic compounds using a handheld organic vapor analyzer in the event impacted soils are encountered during excavation activities. This will be documented through a health and safety plan as it pertains to onsite workers that may encounter contaminated soil.
- The limited SMP shall be prepared and executed for point source areas based on the Phase I and II ESA reports, which define soil, soil vapor, and groundwater impacts throughout the BIG footprint. The limited SMP shall require the timely testing and sampling of soils so that contaminated soils can be separated from inert soils for proper disposal versus reused onsite. The limited SMP shall specify the testing parameters and sampling frequency as well as transportation and disposal requirements. If groundwater is anticipated to be encountered within collocated areas of the limited SMP, then provisions for groundwater management shall be considered within the limited SMP.
- During the Project's excavation phase, the Project Applicant shall remove and properly dispose of impacted materials in accordance with the provisions of the limited SMP. If material is stockpiled prior to disposal, it will be managed in accordance with the SMP and BIG's Storm Water Pollution Prevention Plan, prior to its transfer for treatment and/or disposal.

Impact 1 Level of Significance After Mitigation: Less than Significant Impact.

Impact 2	***Would the Project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?***

Construction

Construction would involve the demolition, dismantling, and removal of all on-site existing land uses and associated structures and infrastructure which could expose workers to HMW, as discussed further below. Additionally, construction activities would include grading. With respect to the potential for groundwater contamination, groundwater is not expected to be encountered during construction because the

proposed grading cuts are not anticipated to reach the existing groundwater table levels, see **Section 5.10: Hydrology** for further discussion.

As described in **Table 9**, 73 properties within the environmental concerns study area were identified as RECs, four properties were identified as PECs, and four were identified as an HREC.

Railroad Properties 1 through 28. Of the 73 properties, 28 properties within the BIG footprint have historically been occupied by the BNSF railroad corridor and likely contain heavy metals, lead, herbicides, PCBs, asbestos, creosote, and arsenic which exceed their respective ESL's. However, this existing railroad right-of-way would remain in place. Therefore, because no disturbance which would result in the accidental release of these contaminants into the environment, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment associated with the 28 properties within the existing railroad corridor.

Table 9 indicates that an additional 45 properties (outside of the existing railroad corridor) with environmental concerns were identified within BIG's environmental concern study areas. These sites are included as environmental concern sites primarily due to land use (i.e., industrial), USTs, or historical or field observations without sufficient reporting to confirm absence of an environmental concern. A summary of all contaminants detected which exceed ESL's and MCL's within the BIG footprint are summarized in **Table 9** and below. These known RECs could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Impacts regarding the potential disturbance or release of hazardous materials into groundwater are analyzed in **Section 5.10: Hydrology**.

Arsenic in Soil. Arsenic concentrations which exceeded the commercial/industrial SFRWQCB arsenic ESL (0.31 mg/kg) but were below the typical Southern California background level of 11 mg/kg per DTSC HERO, were detected soil samples on properties 52, 59, 63, 64, 66, 80, 94, 110, 190, 350 and 373. A study of regional background concentrations of arsenic in undifferentiated urbanized flatland soils was conducted and proposed an upper estimate for background arsenic (99th percentile) of 11 mg/kg (Duverge, 2011). This value can be used and is appropriate based on the study parameters, as arsenic concentrations in California soils typically exceed risk-based screening levels by one or more orders of magnitude due to naturally occurring background concentrations.

BIG construction would include extensive earthwork which could result in reasonably foreseeable upset conditions resulting in a release of arsenic as fugitive dust. Although construction BMPs would be designed and implemented to prevent the release of hazardous materials into the environment, release of fugitive dust is still likely. Therefore, BIG would implement **MM BIG AQ-1: Fugitive Dust Emissions** which requires daily watering of exposed soil and roads to further prevent the release of fugitive dust containing arsenic during construction. Therefore, with incorporation of **MM BIG AQ-1**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including arsenic, into the environment.

TPH in Soil. TPH-DRO concentrations which exceeded the commercial/industrial SFRWQCB ESL were detected in soil samples on properties 66 and 140. TPH concentrations do not exceed the SFRWQCB ESL; however, elevated concentrations were detected in soil samples on properties 31, 110, 140, and 144. Additionally, on property 146, remaining onsite drums and minor undefined staining was identified within the property, which could potentially have residual impacts. A Phase I ESA for properties 380 – 382 also identified three RECs in association with the property including illegally dumped waste oil, history of automotive and machine repairs, and contaminated soil identified during sewer line excavation, which could potentially have residual impacts. Therefore, these properties are considered RECs. Although construction BMPs would be designed and implemented to prevent the release of hazardous materials into the environment, lateral and horizontal delineation and removal of the RECs would still be required. Therefore, BIG would implement **MM BIG HAZ-1** which requires implementation of a Soil Management Plan (SMP) to properly delineate any residual TPH or oil in soil prior to and during grading activities. With incorporation of **MM BIG HAZ-1**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including TPH or oil, into the environment.

Soil Vapor. A Phase I ESA for property 380 – 382 identified three RECs in association with the property including illegally dumped waste oil, history of automotive and machine repairs, and contaminated soil identified during sewer line excavation, which could potentially have residual impacts. On property 373, chloroform concentrations at sub-slab soil vapor probes were detected above the commercial/industrial ESL and bromodichloromethane concentrations in sub-slab soil vapor were above the ESL. The Phase II ESA conducted for the property concluded concentrations encountered do not appear to require vapor mitigation. However, to minimize potential impacts during construction, BIG would implement **MM BIG HAZ-1** which requires implementation of a limited SMP to properly delineate any soil vapor in soil prior to and during grading activities. With incorporation of **MM BIG HAZ-1**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Other Soil Impacts. Properties 47 through 50 are identified to have three RECs associated with historical uses including a former orchard operations from 1978 to 2005 with potential pesticide impacts, a listing from the Clandestine Drug Lab database due to hazardous chemicals and contaminated soil with no confirmation sampling, and extensive site deterioration with debris, burned structures, a buried drum, and stressed vegetation suggesting possible hazardous materials impacts. To minimize potential impacts during construction, BIG would implement **MM BIG HAZ-1** which requires implementation of a limited SMP to properly delineate any soil vapor in soil prior to and during grading activities. With incorporation of **MM BIG HAZ-1**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Arsenic in Groundwater. Arsenic concentrations which exceeded the SFRWQCB MCL were detected in water samples at properties 31, 110, and 219 and well water at property 31. Therefore, these properties are considered RECs. Construction within this property would include soil disturbance which could involve the release of hazardous materials into the environment. **MM BIG HAZ-2** requires adherence to State RWQCB and regional CUPA guidelines for well abandonment if not used for future development or

additional sampling and well head treatment prior to any reuse associated with BIG. Therefore, with compliance with established regulatory framework and incorporation of **MM BIG HAZ-2**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including arsenic, into the environment.

Nitrate in Groundwater. Nitrate concentrations which exceed the SFRWQCB ESL were detected in groundwater samples on properties 2 through 29, 60 67, and 79. Therefore, these properties are considered REC's. Properties 2, 3, 5, and 6 currently have an active Corrective Action Order (CAO) in place for an exceedance of Nitrate MCLs for drinking water. However, a recent groundwater monitoring report from 2022 identified that Nitrate levels no longer exceed the MCL and have not for the past nine years. Since dairy operations are no longer in service and nitrate levels are at or below their respective regulatory thresholds, there is a current request for termination of the order and permits to continue groundwater monitoring is under consideration. When the CAO is terminated, the property would be considered an HREC rather than a REC, and the potential for a release of hazardous materials into the environment which would create a significant hazard to the public or environment would be less than significant.

Properties 4, 7 through 29, and 60 are identified as RECs in connection with the N&M Dairy (listed as Reference numbers 2, 3, 5 and 6) for nitrates and Total Dissolved Solids (TDS) exceedances above their respective MCL within the groundwater. As depicted in **Appendix 5.9 BIG-1** Figure 12, groundwater within these areas ranges from 8 to 15 feet bgs. However, as described above, groundwater is not anticipated to be encountered during grading and construction activities for BIG, and the presence of nitrates and TDS below their respective MCL is not likely to have an adverse risk to construction workers. Health risk for these secondary contaminants is based on ingestion not a dermal exposure, which is not likely as groundwater is not expected to be encountered during grading activities. Additionally, groundwater extracted from construction or operational well from these areas is not planned to be used as a potable water source. Given these factors and N&M Dairy's current request for termination of CAO, and that contaminants of concerns are below their respective MCL, the property is likely not an environmental concern requiring mitigation; however, the open CAO in association with N&M Dairy is an environmental concern and is considered a REC. Once the CAO is terminated the property would not be considered a HREC.

Additionally, nitrate concentrations which exceeded the SFRWQCB MCL were detected in drinking water samples at properties 67 and 79. Sampling at property 73 was completed from the kitchen sink, which was provided from an onsite potable water well, while property 86 was collected from the nearest hose bib which provided water from onsite potable water wells. Therefore, this analysis assumed that these samples are representative of the potable water in the onsite well. Construction within this property would include soil disturbance which could involve the release of hazardous materials into the environment. However, based on evaluation of depth to groundwater and proposed grading, water is not anticipated. Additionally, nitrate is only a concern for ingestion. **MM BIG HAZ-2** requires adherence to State RWQCB and regional CUPA guidelines for well abandonment if not used for future development or additional sampling and treatment prior to any reuse associated with BIG. Therefore, with incorporation of **MM BIG HAZ-2,** BIG construction would not create a significant hazard to the public or the environment

through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including nitrate, into the environment.

Implementation of **MM BIG HAZ-2: Water Well Abandonment** requires adherence to State RWQCB and regional CUPA guidelines for well abandonment or additional sampling and well head treatment prior to any reuse associated with BIG. Additionally, based on evaluation of proposed grading to groundwater elevation, groundwater is not anticipated to be encountered during construction. Nitrate exceedance risk is through ingestion exposure pathway, not a dermal exposure pathway. Thus, for nitrates to cause adverse effects, it would need to be ingested. Therefore, with incorporation of **MM BIG HAZ-2,** BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including nitrate, into the environment.

Specific Conductance in Groundwater. Specific Conductance as a water quality measurement provides an understanding of the amount of dissolved material in water and is considered a secondary MCL (SMCL). Higher detections of Specific Conductance concentrations could indicate the suitability of the water for end users. Concentrations which exceeded the SFRWQCB MCL were detected in drinking water samples from a well source on property 79. **MM BIG HAZ-2** requires adherence to State RWQCB and regional CUPA guidelines for well abandonment if not used for future development or additional sampling and treatment prior to any reuse associated with BIG. Therefore, through compliance with the established regulatory framework and incorporation of **MM BIG HAZ-2**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including specific conductance, into the environment.

TDS in Groundwater. TDS concentrations which exceeded the SFRWQCB MCL were detected in drinking water samples on property 79. High levels of TDS are caused by the presence of potassium, chlorides, and sodium. As an SMCL, TDS measurements are considered guidelines to assist water systems in managing their drinking water for aesthetic considerations including taste, color, and odor. **MM BIG HAZ-2** requires adherence to State RWQCB and regional CUPA guidelines for well abandonment if not used for future development or additional sampling and treatment prior to any reuse associated with BIG. Therefore, through compliance with the established regulatory framework and incorporation of **MM BIG HAZ-2**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including TDS, into the environment.

TPH/Metals/VOCs in Groundwater. At property 373, a Phase II ESA identified total petroleum fuel impacts were indicated in groundwater laboratory results above the MCL; dissolved phase TPH-G in groundwater above the MCL; dissolved-phase benzene was encountered above the MCL; and an increased dissolved phase TPH-D exceeding the MCL in groundwater was encountered. The Phase II ESA conducted for the property identified depth to groundwater was 23 feet. Given the depth to groundwater, it is not anticipated that groundwater would be encountered during site grading. However, to minimize potential impacts during construction, BIG would implement **MM BIG HAZ-1** which requires implementation of a limited SMP to properly delineate any soil vapor in soil prior to and during grading activities. With incorporation of **MM BIG HAZ-1**, BIG construction would not create a significant hazard to

the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Groundwater Quality. Impacts to groundwater resources from construction watering are analyzed in **Section 5.10: Hydrology**. As discussed in **Section 5.10**, through compliance with established regulatory framework and permit conditions, BIG's impacts to groundwater quality would be less than significant.

USTs. EDR reported a historical UST(s) associated with property 211. **MM BIG HAZ-3: AST or UST Removal** includes sampling, cleaning, permitting, and handling of potential onsite hazardous materials storage if USTs are discovered during construction. Additionally, demolition permits include measures for the safe dismantling and removal of building components and debris, and prevents the accidental release of lead and asbestos, thereby protecting workers and the public from potential exposure to HMW during demolition. Further, construction BMPs would be designed and implemented for site specific conditions to further prevent the release of hazardous materials into the environment. Therefore, compliance with demolition permit procedures and BMPs would ensure BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Additionally, **MM BIG HAZ-3** would stop work within a 30-foot radius of the UST, and then proper permitting, cleaning, sampling as described above would be completed. Therefore, through compliance with the established regulatory framework and incorporation of **MM BIG HAZ-3**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including USTs, into the environment.

ASTs. Upon inspection of property 11, one partially buried, rusted, unlabeled, 55-gallon drum was observed in an illegal dumping containing concrete debris and scrap metal near the northwestern property 11 boundary. The drum appeared to be empty and there was no evidence of spills, leaks, or staining in the surrounding surfaces; however, it should be noted that stressed vegetation was observed in the area adjacent to the buried drum. Based on the unknown content of the partially buried drum and stressed vegetation, this finding has been identified as an REC. Additionally, upon inspection of properties 17 and 18, multiple ASTs of unknown size and sorted material were observed in association with farming operations. Based on the potential improper management of roofing materials and the de minimus surface staining, there is a potential of spills or releases within soil.

PECs. As discussed above in **Section 5.0 Environmental Setting – Environmental Concern Sites**, properties 17, 18, 214, and 338 were identified as PEC sites. **MM BIG HAZ-4: Data Gaps Requiring Further Environmental Site Assessment** requires the Applicant to conduct assessment of any PEC sites in accordance with ASTM standards to address PEC's. Through incorporation of **MM BIG HAZ-4**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. BNSF would obtain demolition permits for removing debris and structures within the footprint. Demolition permits include measures for the safe dismantling and removal of building components and debris, thereby protecting workers and the public from potential exposure to HMW during demolition. Further, construction BMPs would be designed and implemented for site specific conditions to further prevent the release of hazardous materials into the environment. Additionally, BIG

would include **MM BIG HAZ-3**, which includes sampling, cleaning, permitting, and handling of potential onsite hazardous materials storage if ASTs are discovered during construction. Additionally, **MM BIG HAZ 3** would stop work within a 30-foot radius of the AST, and then proper permitting, cleaning, sampling as described above would be completed. Therefore, through compliance with the established regulatory framework and incorporation of **MM BIG HAZ-3**, BIG construction would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials, including ASTs, into the environment.

The concentrations of contaminants summarized above exceeded their respective ESL's or MCL's; therefore, construction would present a risk to construction workers. BIG would require approximately 26 million total cubic yards of earthwork throughout the footprint, thus, BIG construction (i.e., earthwork) could result in reasonably foreseeable upset condition resulting in release of contaminants in soil. Although BNSF would obtain demolition permits, which require measures for the safe dismantling and removal of building components and debris, and implement site specific construction BMP's, BIG construction could still result in the release of hazardous materials which exist within the identified REC sites. Therefore, the most effective way to minimize these contaminants from being released as fugitive dust during construction activities is through enhanced construction watering. BNSF would implement **MM BIG AQ-1**, which is described below and requires daily watering of exposed soil and haul roads to be watered at least three times per day. **MM BIG AQ-1** would ensure exposed soil and haul roads remain saturated to minimize the amount of soil picked up and dispersed by construction activities or wind. BIG would reduce potential impacts from disturbing contaminated soil (i.e., soil contaminated by heavy metals, lead, herbicides, PCBs, asbestos, creosote, and arsenic) by reducing soil dispersed in the air during construction. Impacts concerning air quality during construction are analyzed in **Section 5.3: Air Quality**.

Building and rail construction would not require transporting, storing, or disposing of HMW in quantities greater than needed to support construction activities, thereby minimizing potential exposure of the public, workers, and the environment. However, inadvertent releases or spills could occur from the improper storage HMW, improper handling of HMW, accidents, seismic activity, or inclement weather and have the potential to result in direct and temporary effects.

Potential HMW releases along rail corridors can also include valve leakage or safety valve releases, which carry the potential of releasing HMW in the form of liquids or gases. The degree of effect from an HMW-related release or spill is dependent on the proximity of the release to population densities, concentrated development, and environmentally sensitive areas.

Offsite accidents during HMW transport to or from the construction site could expose individuals and the environment to risks at some distance from the construction site. Although transportation accidents are infrequent, accidents could occur during shipment of hazardous commodities (such as gasoline, diesel, or compressed gases) for construction. Accidents could also occur during cleanup of existing contaminated sites before the construction phase or during the transportation of HMW generated during construction.

An on-site or off-site accident, collision, or derailment may release HMW into the environment. For some chemicals, toxic fumes may be airborne and blown beyond the accident site. Fire and explosion are also a possibility. Although the state enforces standard accident and HMW recovery training and procedures,

which are followed by private state-licensed, certified, and bonded transportation companies and contractors, BIG's location along interstate rail and highway corridors creates a risk of exposure.

Direct and temporary effects from the inadvertent release of HMW could occur. The pathways through which the community or the environment (e.g., local air quality, biota) could be exposed to HMW include skin contact, ingestion from air emissions, and dust. Other exposures could result from release of HMW caused by improper containment or decontamination procedures and lack of containment during inclement weather, which could result in stormwater runoff and contamination percolation into the soil substrate.

Pursuant to OSHA regulations (29 CFR. Part 1910.120), standard accident training for cleaning up small spills would be provided to all individuals prior to their work with hazardous substances, and the appropriate types and amounts of spill cleanup materials and personal protective equipment would be immediately available. BNSF would prepare and implement a written hazard communication program that would require labeling all containers and provide employees with access to material safety data sheets. HMW users could consult the material safety data sheet for the specific material they plan to work with and consider response options beforehand in case of a spill or release.

BNSF would obtain demolition permits to remove structures within the footprint. Demolition permits include measures for the safe dismantling and removal of building components and debris, and prevents the accidental release of lead and asbestos, thereby protecting workers and the public from potential exposure to HMW during demolition.

Further, as discussed above, BNSF would implement **MM BIG HAZ-1**, which includes provisions for responding to the disturbance of undocumented contamination. If soil, groundwater, or other environmental media with suspected contamination is encountered unexpectedly during construction (i.e., identified by odor or visual staining, or by unearthing any USTs, or abandoned drums), work would immediately cease in the vicinity of the suspect materials. The area would then be secured as necessary, and all appropriate measures would be taken to protect human health and the environment. Appropriate measures include notifying regulatory agencies and complying with the various agencies' laws, regulations, and policies. Therefore, impacts would be less than significant with incorporation of mitigation.

Operations

BIG would modify the existing rail transportation system and develop a new transload warehouse center and rail yard that includes an intermodal facility and block swap yard which would transport containers, some of which could contain HMW. BIG also proposes a solar farm, which would consist of solar modules, transformers, and battery storage in a BESS.

Within BIG's proposed intermodal facility, some containers containing HMW would be transferred between trains and heavy-duty trucks, and these would depart by train or heavy-duty truck. Within BIG's proposed block swap yard, entire blocks of railcars, which could involve containers containing HMW, would be moved en masse to another train. The potential effects would vary according to the HMW's chemical and physical properties and potential hazard (e.g., fire, explosion, vapor cloud). No long-term

HMW storage would occur at the rail yard, as no structure for HMW storage (or other use) is proposed. Additionally, no long-term HMW storage would occur at the transload warehouse center because items would be repackaged and loaded into larger containers. BIG would also include elements that have a potential risk of explosion, fire, and other environmental hazards such as freight trains transporting HMW. These elements have electrical equipment and/or combustible materials and thus represent a fire and explosion risk. The use, storage, transport, and disposal of hazardous materials would be governed by existing regulations of several agencies, including the EPA, USDOT, California Division of Occupational Safety and Health, and the Barstow Fire Protection District, et al., as discussed in **Section 2.0 Regulatory Setting.** Additionally, BIG would be subject to the CUPA permits required in San Bernardino County which require a Business Emergency/Contingency Plan to be filed and would comply with the Business Emergency/Contingency Plan requirement prior to obtaining final certificate of occupancy and prior to bringing hazardous materials onto the property. Under current conditions, only HMW shipments that conform to DOT regulations would be accepted or transported by rail.

BIG would also remove existing at-grade crossings to reduce potential vehicular movement conflicts with within the proposed rail yard. The existing Hinkley Road at-grade crossing would be removed and vehicular traffic from Hinkley Road to Main Street would instead use the internal roadway that connects to Lenwood Road at the eastern extent of BIG. Thus, potential vehicular movement conflicts with trains transporting HMW would be avoided, minimizing the potential for upset and accident conditions involving the release of hazardous materials into the environment.

BNSF regularly inspects all the components of the network, including locomotives, track, rail, and bridges. These comprehensive inspections meet all federal requirements. Trained BNSF inspectors utilize advanced equipment such as instrument-equipped rail cars, bridge inspection vehicles and unmanned aerial vehicles and deploy technology such as MVS, autonomous track measurement systems, ultrasound, ground-penetrating radar and high-definition cameras and accelerometers. These efforts, coupled with the use of specialized rail cars to carry HMW, mobile apps to equip first responders with critical safety information, and a software system to determine the safest rail routes all help ensure that more than 99.99% of all HMW moved by rail reaches its destination without a release caused by a train accident (Association of American Railroads 2023).

Additionally, BNSF has prepared a System Emergency Response Plan (Response Plan) to respond to emergencies. The Response Plan describes procedures for responding to hazardous release emergencies, persons, and agencies to contact, locations for personnel to evacuate to, and prevention practices to limit the potential of these emergencies. BNSF integrates (by contract) additional Incident Management Team expertise in areas such as incident management, wildlife management, water and air dispersion modeling, toxicology, chemistry, firefighting, communications, and railroad and commodity salvage. Contracted incident management experts are capable of supporting the BNSF Incident Management team to manage large-scale incidents. BNSF has also established a website (www.BNSFhazmat.com) to communicate with first responders. Through the website, first responders can schedule and participate in online BNSF HMW training, obtain a summary of BNSF's Response Plan, and request a HMW traffic flow report. In the unlikely event that an incident was to occur, BNSF would coordinate with first responders. BNSF has a network of over 150 hazardous materials responders and advisors who are trained to deal with HMW releases (BNSF

2023). BNSF has also strategically positioned emergency response equipment at more than 100 locations across the BNSF network. Additionally, BNSF provides free training to first responders through the Transportation Community Awareness and Emergency Response program. Additionally, BNSF provides information to first responders on commodities traveling through communities (BNSF 2016). Regarding emergency evacuation, see discussion under Impact 5.9 BIG-6. Additionally, the City's EOP would provide guidance and outlines operational concepts and response procedures for the City's response to extraordinary emergency situations associated with large-scale emergencies and disasters, including hazardous materials incidents and releases.

It is noted that any amount of material that leaks from any container is counted as a release; therefore, a single train accident can result in a report of multiple releases. In 2020, BNSF handled over 1.4 million HMW shipments and only 0.0005 percent of these shipments were involved in an accident that resulted in a HMW release to the environment (BNSF, 2025b).

Despite compliance with the EPA, USDOT, California Division of Occupational Safety and Health, BFPD, and BNSF policies, there is risk of a passenger or freight train derailing on the trackway, releasing hazardous materials into the environment and creating a significant hazard to the public or the environment. Refer to **Section 5.15: Transportation** for a discussion concerning BIG's potential to increase hazards due to an incompatible use (i.e., trackway traversing communities). Train derailments in the U.S. occur for several reasons, although generally they occur because of track and special trackwork not being adequately maintained for the trains' operational speed, mechanical and equipment failures, train handling, and human error. One location where these causes often accumulate and the risk of derailment is often greatest is where there is special trackwork, such as turnouts and crossovers. As discussed in **Section 3: Project Description**, BIG would use turnouts and crossovers at the connections to the BNSF mainline, and while risk of derailments cannot be entirely eliminated, the use of robust railway signal system that includes power operated switches is one way to minimize those risks. The signal system and the power switches included on all BIG turnouts serves to enhance safety for railroad personnel and the general public by:

- Allowing for the remote operation of switches, enabling train crews to remain on the train without having to get on and off the locomotives or having to stop the train on the mainline to close switches behind them.
- Notifying the trainmen of switches not properly lined for their desired train movements.
- Warning train crews of broken rails or when switches are not properly closed, and in some systems, may even stop the trains if these events occur.
- Slowing down trains if they are operating too fast for the specific track or turnout if positive train control is included.
- Placing dragging equipment detectors at strategic locations to detect dragging equipment or lading (i.e., freight or cargo) before the trains occupy the mainline and increase speed.
- Warning the trainmen when rail cars are occupying the track ahead of them, helping to avoid potential collisions.

- Detecting trains' locations giving train dispatches a clear understanding of where trains are located.
- Keeping trains off specific tracks when track crews are performing maintenance.
- Warning the traveling public of approaching trains (although BIG does not propose at-grade crossings).

Although the railway signal systems alone would not entirely avoid derailments or address other safety concerns inherent to the railroad environment, they are essential components intended to make the rail corridor as safe as possible. Inclusion of a railway signal system that includes power operated switches would minimize potential hazards to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of HMW into the environment. A less than significant impact would occur, with mitigation incorporated.

BIG's proposed solar farm would consist of solar modules, transformers and battery storage in a BESS which would involve the use of limited hazardous materials during operation. As discussed in Impact 5.9-1 above, any routine transport, use, and disposal of these materials during BIG operations must adhere to federal, State, and local regulations for transport, handling, storage, and disposal of hazardous substances. Furthermore, hazardous materials/chemicals such as herbicides and pesticides in low quantities do not pose a significant threat related to the release of hazardous materials into the environment. Under normal operations, BESS facilities do not store or generate hazardous materials in quantities that would represent a risk to offsite receptors. Further, operations of BIG's solar farm would include preventative measures, such as energy management systems and building management systems to reduce the potential for accidents to occur. Nevertheless, because lithium-ion BESS facilities do store energy, a battery thermal runaway can occur if a cell, or area within a cell, achieves elevated temperatures due to thermal failure, mechanical failure, internal/external short circuiting, and electrochemical abuse. In this event, state-of-the-art fire, and safety systems, such as a sounding alarm and flashing strobes, would alert employees of the thermal runaway event. Components of an integrated fire and safety system within a BESS enclosure include module-level monitoring, control of the system 24/7, and an internal cooling/heating, ventilation, and air conditioning system. The fire and safety system may include, as required by the design, fire panels, aspirating hazard detection system, smoke/heat detectors, gas ventilation and deflagrations systems and suppression or thermal runaway systems. The BESS containers would have a fire rating in conformance with NFPA and County standards and specialized fire suppression systems. BIG would utilize pre-engineered battery storage systems listed under UL 9540 or BESS tested in compliance with UL 9540A. UL 9540 contains safety standards for the system's construction (e.g., frame and enclosure, including mounting, supporting materials, barriers and more); the insulation, wiring, switches, transformers, spacing and grounding; safety standards for performance of over twenty different elements, such as tests for temperature, volatility, impact, overload of switches, and an impact drop test; and standards for manufacturing, ratings, markings, and instruction manuals. In addition to the many individual standards referenced, CFC compliance requires a Failure Mode and Effects Analysis be performed and requires a test to ensure safe compatibility of the system's parts. This includes the UL 1973 standard, in which a battery manufacturer must prove that a failed cell inside will not cause a fire outside the system. BIG's compliance with the CFC, UL 9540/9540A requirements, and industry standards for

adequate separations, cascading protections, and suppression systems to limit failure to a single cell or module would minimize potential impacts from a lithium-ion fire. In the unlikely event of thermal runaway, BIG's preventative measures and fire and safety systems, as described above, are designed to limit the event to a single battery module as well as reduce the duration and intensity of an event, if it occurs. BIG would also be subject to the requirements of Chapter 12 of the CFC which requires that all BESS use an Energy Management System for monitoring and balancing cell voltages, currents, and temperatures. The system must transmit an alarm signal if potentially hazardous temperatures or other conditions such as short circuits, over voltage or under voltage, are detected. The CFC also requires the use of appropriate fire detection and suppression systems, which would be incorporated into each of BIG's BESS enclosures. As required by CFC Chapter 12, BNSF would prepare and implement preparation and submittal of a Fire Protection and Emergency Response Plan to the SBCFD for review and approval. The purpose of the Fire Protection and Emergency Response Plan would be to eliminate causes of fire, prevent loss of life and property by fire, to comply with County and SBCFD standards for solar facilities, and to comply with the OSHA standard of fire prevention, 29 CFR 1910.39. The Fire Protection and Emergency Response Plan would address fire hazards of the different BIG components, including the BESS.

As discussed above, BNSF would be required to prepare a hazardous material business plan for BIG's rail yard, transload warehouse center, and solar farm pursuant to CHSC, § 25500 et seq., which would be required to also include an emergency response plan designed to minimize hazards to humans and the environment from a sudden release of hazardous waste, fires, or explosions. The emergency response plan would require immediate action to take place if an event were to occur. The hazardous materials business plan would also include emergency response training for local first responders. Further, BNSF provides hazmat commodity flow reports to local first responders and elected- or emergency-management officials upon request to assist with emergency response planning and provides free training to emergency service personnel regarding spills or accidents involving HMW (BNSF, 2025c). Adherence to regulations and standard protocols during BIG's solar farm operation would minimize and reduce the potential for HMW impacts from the BESS.

In summary, BIG's operations would not create a potentially significant hazard to the public or the environment through reasonably foreseeable upset and accidental conditions involving the release of hazardous materials into the environment, and impacts would be less than significant with mitigation incorporated.

Impact 5.9 BIG-2 Level of Significance: Potentially Significant Impact

Mitigation Measures: **MM AQ-1, MM HAZ-1, MM HAZ-2,** and **MM HAZ-3.**

MM BIG HAZ-2: **Water Well Abandonment.** The intent for water well abandonment is to ensure that wells associated with the former residential operations within BIG are properly sealed and abandoned.

Well abandonment or reuse treatment will require adherence state RWQCB and regional CUPA guidelines for well abandonment if wells are not planned to be used for future development. If existing or new water wells are planned to support BIG, additional sampling will be required. Based upon the results of the sampling in

comparison to regulatory thresholds, water can be reused for BIG construction or need treatment prior to any reuse associated with BIG.

MM BIG HAZ-3: **AST or UST Removal.** AST and UST removal is intended to provide specific sampling and removal procedures for AST/USTs known or unknown at the start of construction. Prior to demolition permit issuance, the Applicant shall demonstrate to the Barstow Department of Building and Safety and San Bernardino County Fire Protection District Hazardous Materials Division (CUPA) that a licensed contractor authorized to remove the above ground/USTs has been retained. The above ground/USTs shall include the required permitting, soil sampling testing, and reporting the CUPA. If soil contamination exists, then impacted soils shall be removed and handled properly according to the Soil Management Plan (see MM HAZ-1). If previously unidentified USTs and/or ASTs are discovered during demolition or any ground disturbing activities, all construction within a 30-feet radius exclusion zone of the unidentified USTs and/or ASTs shall stop work. Implementation of proper permitting, cleaning, sampling, and reporting as described above shall be completed.

MM BIG HAZ-4: **Data Gaps Requiring Further Environmental Site Assessment.** Prior to the issuance of a grading permit, the Applicant shall conduct assessment in accordance with ASTM standards to address potential environmental concerns identified at PEC site's identified within the BIG footprint. Documentation shall include clearance or other forms of approval from responsible regulatory agencies, as warranted, confirming that the site conditions are suitable for the intended use and that any potential risks have been mitigated to a level that is safe for construction and future occupancy.

Impact 2 Level of Significance After Mitigation: Less than Significant Impact.

Impact 3	***Would the Project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?***

Construction

As noted in **Section 3.0: Project Description**, hazardous air pollutant emissions from BIG construction are analyzed in **Appendix 5.3 BIG-1** and thus are not analyzed here. Additionally, refer to Impact 5.9-1 and Impact 5.9-2 above.

Materials potentially containing HMW commonly used in construction (e.g., compressed gases, oils and lubricants, fuels and additives, paints and varnishes, adhesives, and glues) would be used during BIG construction activities. Additionally, demolition of existing structures and earthwork within the BIG footprint could result in the release of contaminants (i.e., soil contaminated by heavy metals, lead, herbicides, PCBs, asbestos, creosote, and arsenic). As such, construction activities may result in direct and temporary effects.

The only school within 0.25 miles of the BIG footprint is Lenwood Elementary School, which is approximately 0.15 miles from BIG the east lead track. East lead track construction would include clearing

and grubbing, bridge crossing construction, ballast placement, track laying, and connection to the mainline. Lead track construction would parallel the existing BNSF mainline and primarily be within BNSF right-of-way. As such, BIG construction activities could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 miles of an existing school. Any HMW use within the BIG footprint would comply with federal, state, and local regulations, including but not limited to the RCRA, Comprehensive Environmental Response, Compensation and Liability Act, Hazardous Materials Release Response Plans and Inventory Law, Hazardous Materials Transportation Uniform Safety Act of 1990, and the Hazardous Waste Control Act; see **Section 2.0.** These regulations would apply equally near school sites and require monitoring the generation, transportation, treatment, storage, and disposal of hazardous waste.

The effect of HMW released to the environment in the event of a leak or spill because of an accident or collision during construction would be minimal given the small quantities of materials transported or used at any given time and given the precautions required by regulations. Compliance with federal, state, and local regulations, as well as regular inspections in accordance with CUPA and BNSF protocols, would minimize potential effects.

Further, PRC § 21151.4 states that "an environmental impact report shall not be certified or a negative declaration shall not be approved for any project involving the construction or alteration of a facility within 0.25 mile of a school that might reasonably be anticipated to emit hazardous air emissions, or that would handle an extremely hazardous substance or a mixture containing extremely hazardous substances in a quantity equal to or greater than the state threshold quantity specified pursuant to CHSC § 25532 subdivision (j), that may pose a health or safety hazard to persons who would attend or would be employed at the school, unless both of the following occur: (1) The lead agency preparing the environmental impact report or negative declaration has consulted with the school district having jurisdiction regarding the potential impact of the project on the school, and (2) The school district has been given written notification of the project not less than 30 days prior to the proposed certification of the environmental impact report or approval of the negative declaration." On December 7, 2022, and April 15, 2024, and as part of the preparation of the proposed General Plan, the City consulted with the Barstow Unified School District concerning both the proposed General Plan and BIG, thus complying with Criterion (1); see proposed General Plan discussion above. Also, the Barstow Unified School District (School District) was included in the City's distribution list for this EIR's Notice of Preparation (NOP) (February 15, 2024); therefore, the District has been given written notification of BIG more than 30 days prior to BIG's EIR certification, thus complying with Criterion (2).

BIG construction activities would occur within 0.25-mile of a school and is reasonably anticipated to handle an extremely hazardous substance, or a mixture containing extremely hazardous substances in a quantity equal to or greater than the state threshold quantity specified pursuant to CHSC § 25532 subdivision (j), that may pose a health or safety hazard to persons who would attend or would be employed at the school. Accordingly, BNSF would consult with and give the affected school district opportunity to comment on BIG. A less than significant impact would occur, and no mitigation is required.

Operations

As noted in **Section 3: Project Description**, hazardous air emissions from BIG operations are analyzed in **Appendix 5.3 BIG-1**, thus, are not analyzed here.

BIG operations would not involve the storage or handling of acutely HMW within 0.25 miles of a school. BIG's proposed solar farm would not be located within 0.25-mile of Lenwood Elementary School. Freight trains carrying HMW would utilize BIG's tracks. These trains would travel immediately adjacent to the existing BNSF track position but would be 90 feet closer to Lenwood Elementary compared to the existing BNSF tracks, thus, would incrementally increase the risk of HMW transport and use.

BIG operations would involve rail transport approximately 900 feet from Lenwood Elementary School and would be buffered by a commercial use and Main Street. Any handling of hazardous substances would be conducted in compliance with existing regulations of several agencies, including the EPA, USDOT, Cal/OSHA, and the San Bernardino County Fire Protection District, as listed in **Section 2: Introduction**. As previously mentioned, existing BNSF rail safety precautions and requirements minimize potential derailments and spills of HMW. BNSF regularly inspects all the components of its network, ensuring locomotives, track, rail, and bridges meet all federal requirements. BNSF conducts timely maintenance, repair, and replacement whenever issues or potential issues are detected. Trained BNSF inspectors utilize advanced equipment such as instrument-equipped rail cars, bridge inspection vehicles and unmanned aerial vehicles and deploy technology such as MVS, autonomous track measurement systems, ultrasound, ground-penetrating radar and high-definition cameras and accelerometers. These efforts, coupled with the use of specialized rail cars to carry hazmat, mobile apps to equip first responders with critical safety information, and a software system to determine the safest rail routes, all help minimize potential hazardous emissions or substances within 0.25-mile of a school. Transportation would occur on tracks in nearly the same location as occurs under existing conditions. Thus, though BIG would handle hazardous or acutely hazardous materials, substances, or waste within 0.25-mile of an existing or proposed school, there would be no increase in risk over existing conditions. A less than significant impact would occur with incorporation of MM BIG HAZ-1, BIG HAZ-2, and BIG HAZ-3.

Impact 5.9-3 Level of Significance: Potentially significant.

Mitigation Measures: MM BIG HAZ-1, MM BIG HAZ-2, and MM BIG HAZ-3.

Impact 5.9-3 Level of Significance After Mitigation: Less than significant impact.

Impact 5.9-4	***Would the Project be located on a site which is included on a list of hazardous materials sites compiled pursuant to CGC § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?***

Table 11: Cortese List Information Requirements outlines the sections of the Cortese List provisions contain requirements for information to be compiled and submitted by DTSC to the Secretary for Environmental Protection. Sites listed pursuant to CGC 65962.5 are considered a REC site because they are documented instances of contamination.

Table 11: Cortese List Information Requirements	
Section	**Information Required**
65962.5(a)	Hazardous waste facilities subject to corrective action pursuant to Health and Safety Code § 25187.5.
65962.5(a)(3)	Information received by the California DTSC pursuant to Health and Safety Code § 25242 on hazardous waste disposals on public land.
65962.5(a)(4)	Sites listed pursuant to Health and Safety Code § 25356.
65962.5(a)(5)	Sites included in the Abandoned Site Assessment Program (formerly identified in the CalSites database, now part of the Envirostor database).

As outlined in **Table 9**, 1 open and 24 closed Cortese sites are georeferenced in the environmental concerns study area. Active Cortese sites are sites with known or potentially HMW releases that are not yet considered resolved or closed. Closed Cortese sites are sites with a prior HMW release which has been sufficiently remediated to the satisfaction of the relevant regulatory agencies. Closed Cortese sites are typically not considered an environmental issue given the HMW contamination has been removed. Of the 25 total Cortese sites identified, 21 closed Cortese sites are georeferenced within the environmental concerns study area but are associated with properties outside of the BIG footprint. Therefore, given these sites given these sites have been sufficiently remediated to the satisfaction of the relevant regulatory agencies and are not located within the BIG footprint, construction and operation of BIG in proximity to these sites would not create a significant hazard to the public or the environment.

Of the 25 total Cortese sites identified, 1 open and 3 closed sites are located within the BIG footprint. Construction and operation of BIG in proximity to the 3 closed Cortese sites would not create a significant hazard to the public or the environment given these sites have been sufficiently remediated to the satisfaction of the relevant regulatory agencies.

The open Cortese site located within the BIG footprint is listed as N&M Dairy, which is located north of BIG's west lead track improvements. As discussed above under Impact 5.9 BIG-2, properties 2 through 29 and 60 are identified as RECs in connection with N&M Dairy for nitrates and TDS exceedances above their respective MCL within the groundwater. As depicted in Appendix 5.9 BIG-1 Figure 12, groundwater within these areas ranges from 8 to 15 feet bgs. However, as described above, groundwater is not anticipated to be encountered during grading and construction activities for BIG, and the presence of nitrates and TDS below their respective MCL is not likely to have an adverse risk to construction workers. Health risk for these secondary contaminants is based on ingestion not a dermal exposure, which is not likely as groundwater is not expected to be encountered during grading activities. Additionally, groundwater extracted from construction or operational wells from these areas is not planned to be used as a potable water source during construction and operations. Given these factors and N&M Dairy's current request for termination of CAO, and that contaminants of concerns are below their respective MCL, the property is likely not an environmental concern requiring mitigation; however, the open CAO in association with N&M Dairy is an environmental concern and is considered a REC. Once the CAO is terminated and considered closed, the property would not be considered an HREC. Further, with incorporation of MM BIG HAZ-2, which requires adherence to State RWQCB and regional CUPA guidelines for well abandonment or additional sampling and well head treatment prior to any reuse associated with BIG, BIG construction and operations would not create a significant hazard to the public or the environment.

Impact 5.9-4 Level of Significance: Potentially significant impact.

Mitigation Measures: MM BIG HAZ-2.

Impact 5.9-3 Level of Significance After Mitigation: Less than significant impact.

Impact 5	***For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project result in a safety hazard or excessive noise for people residing or working in the project area?***

Construction and Operations

As shown in CWP Policy Map HZ-9, there are no airport land use plans for properties within the airport study area, therefore, BIG would not conflict with an airport land use plan. The nearest public airport to BIG is Barstow-Daggett Airport, which is approximately 17 miles from the BIG footprint. No aspect of BIG would be of sufficient height to interfere with Barstow-Daggett Airport airspace. A private airstrip ("Depue Airport") is currently located within the BIG footprint; however, BIG would remove the airstrip and replace it with the proposed solar farm. Therefore, given the private airstrip would be removed and BIG is located more than two miles from a public airport, BIG would not result in a safety hazard or excessive noise from proximity to a public airport for people working within BIG. Given this distance, BIG would not result in a safety hazard or excessive noise from proximity to a public airport for people working within BIG. No impact would occur, and no mitigation is required.

Impact 5 Level of Significance: No impact.

Mitigation Measures: No mitigation required.

Impact 6	***Would the Project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?***

Construction

BIG construction would result in temporary road closures, detours, and increased traffic in the BIG footprint. As shown in **Figure 21: Emergency Evacuation Routes – BIG,** the Barstow General Plan Safety Element depicts the City's and County's emergency evacuation routes and indicates the two major evacuation routes nearest the BIG footprint are SR-58 to the north and east and I-15 to the east. Minor routes within proximity to the BIG footprint include Lenwood Road to the east and West Main Street to the south. No major designated evacuation routes would be temporarily or permanently modified as part of BIG construction activities. One minor designated evacuation route, West Main Street, would be temporarily modified as part of BIG construction activities. BIG's proposed Lenwood Channel Bridge reconstruction along West Main Street would require closure of West Main Street for an approximately 18-month bridge reconstruction period, which would impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Further, although no

emergency evacuation routes are within the BIG footprint, detours and additional construction traffic could still impair implementation of or physically interfere with the adopted HMP and BHMP identified evacuation routes or County or City EOPs. Thus, prior to construction, BNSF would prepare a detailed Traffic Control Plan (TCP) pursuant to City of Barstow Standard Plan 138 requirements to minimize the impact of construction activities and construction traffic on adjoining and nearby roadways and land uses. A TCP is required for any work in the public right-of-way and would show how to safely manage vehicles, bicyclists, and pedestrians through or around construction zones.

The TCP would be prepared in close consultation with the City, local law enforcement, and fire department officials. The City would review and approve the TCP before commencement of any construction activities. The County would review and approve the TCP portions relevant to work within County right-of-way before commencement of construction activities within County right-of-way. The TCP must adhere to the California Manual on Uniform Traffic Control Devices (Caltrans 2025), which outline standards for temporary traffic control devices, equipment placement, and personnel, with specific requirements set by the City or County. Key elements of the TCP include maps of the work area, placement of signs, temporary traffic control devices (cones, barricades, channelizers), equipment, and personnel like flaggers. In instances of long-term lane closures, additional elements (e.g., temporary striping, contra-flow, or crash cushions) would be required. Therefore, a less than significant impact would occur.

Operations

As shown on **Figure 21,** major routes within proximate to the BIG footprint are SR-58 to the north and east and I-15 to the east. Minor routes within proximate to the BIG footprint include Lenwood Road to the east and West Main Street to the south. BIG operations and maintenance would not interfere with adopted emergency plans. Except for BIG's proposed Lenwood Channel Bridge reconstruction along West Main Street which would temporarily impair implementation of or physically interfere with an adopted emergency evacuation plan during construction, BIG does not proposed any permanent improvements which would involve or significantly alter evacuation routes. Rather, BIG proposes offsite improvements to improve traffic flow, emergency access, and flooding conditions of evacuation routes as compared to existing conditions.

To improve traffic flow and emergency access, BIG proposes removal of existing at-grade rail crossings and construction of a grade-separated crossing. To improve flooding conditions, BIG proposes to widen the Lenwood Channel by 60 to 100 feet for approximately 1.25 miles total to improve flooding compared to existing conditions. Through compliance with local laws and regulations requiring preparation of a TCP, no temporary or permanent street improvements associated with BIG would impact emergency evacuation routes, and no properties would experience reduced emergency access as a result of BIG operations or maintenance activities.

Therefore, BIG operations would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant, and no mitigation is required.

Impact 5.9 BIG-6 Level of Significance: Less than Significant Impact.

Mitigation Measures: No mitigation required.

Impact 7	*Would the Project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?*

There are no SRA Responsibility Areas or lands classified as Very High FHSZs within the wildfire study area.

As depicted in **Figure 19: Fire Hazard Severity Zones in Federal Responsibility Areas – BIG**, the CWP and BHMP identifies most of BIG's footprint is within a moderate fire hazard severity zone and Non-Wildland/Non-Urban areas (CWP 2020). The City's BHMP also identifies the BIG footprint is located near two key areas within or near the city which are considered fire hazard areas, which include:

- The Lenwood community, located near the BIG footprint's eastern boundary. This area is identified as a fire hazard area due to the abundance of brush and blow sand, which makes it difficult to gain access to fight fire.
- The Mojave Riverbed, located along BIG's northern boundary. This area is identified as a fire hazard area because of its significant slope to the bottom of the riverbed and the soft soil, which is difficult to gain access to when firefighting.

Construction

During typical construction, wildland fire hazards inherently associated with building operations are continuously being generated at construction sites. Clearing and grubbing would remove potential fuel for fires which could occur during construction. The potential for emergency response incidents related to hazardous construction operations would be minimized through compliance with the established regulatory framework, including CAL-OSHA, which ensures that employers provide their workers a place of employment free from recognized hazards to safety and health, included risk of fire. Additionally, the City's EOP would provide guidance and outlines operational concepts and response procedures for the City's response to extraordinary emergency situations associated with large-scale emergencies and disasters, including hazardous materials incidents and releases. Further, given brush and other potential for fuel within the BIG would be cleared during the clearing and grubbing of the site, the risk of wildland fires during construction would be less than significant, and no mitigation is required.

Operations

BIG includes a fuel facility and freight trains transporting fuel and other volatile materials. These elements have electrical equipment and combustible materials and thus represent a fire and explosion risk. Freight trains transporting fuel would adhere to federal and state regulations for the safe transport of combustible materials. The wildfire study area is primarily vacant, undeveloped land in the Mojave Desert. Transport of flammable and combustible materials on BIG tracks may pose a risk for wildland fires in the event of accidental release. However, according to accident reports obtained from the Federal Railroad Association (FRA) for rail accidents within the County, the existing BNSF track has not experienced a derailment causing a wildland fire or fire that would pose a risk to people or structures (FRA, 2022). See also **Impact 2**. Additionally, as discussed in **Impact 1**, train signals and power switches would minimize the

risk of derailment which could cause wildfires. BNSF safety protocols minimize the potential for a spill which could cause a fire. BNSF maintains fire suppression equipment in Barstow which would further minimize the risk of a wildfire as a result of spill (BNSF, 2016).

BIG's proposed solar farm would consist of solar modules, transformers, and battery storage in a BESS within the vicinity of the Lenwood community. Given continuing rapid technological change in the battery industry, the proposed BESS component manufacturer has not been determined at this time but could include any commercially available and proven large-scale battery technology, including but not limited to lithium ion, sodium sulfur, and sodium or nickel hydride. The batteries would be contained within enclosures or in individual containers, housed in open-air-style racking within its enclosed container. The containers would also have heating, ventilation, and air conditioning cooling to maintain energy efficiency and to protect the batteries. The CFC and associated standards require rigorous large-scale fire testing, such as UL 9540A requiring the systems to pass performance-based criteria. This means that enclosures of battery storage systems may not pose a fire or explosion risk to adjacent exposures. To achieve these results, some BESS employ various types of active thermal runaway mitigation systems within the integrated design of utility scale, lithium-ion based battery storage enclosures. Regardless of the design basis, these thermal runaway mitigation systems are required to be tested to UL 9540A large scale fire testing in order to manage fire and exposure risks. Some BESS comply with these performance-based requirements without the use of active fire suppression systems, rather, they use passive design features or thermal management features that prevent or limit thermal runaway. Either design-based or active thermal runaway mitigation approaches to achieve the UL 9540A criteria, again, all systems must demonstrate that they pose no explosion or fire risk to adjacent exposures. BIG's proposed BESS would be designed, constructed, operated, and maintained in accordance with applicable best practices and regulatory requirements, including fire safety standards. Batteries would be housed in an enclosure that contains an integrated fire safety system and controls. If smoke, heat, or flammable gas were detected, an alarm would sound, strobes would flash, and any thermal runaway mitigation systems present would be activated. The BESS containers would have a fire rating, if required based on large-scale fire test results. Final fire safety design would follow applicable codes and referenced standards and would be specific to the battery technology that is ultimately implemented. The BESS containers would have a fire rating in conformance with NFPA and County standards and specialized fire suppression systems. Final fire safety design would follow applicable standards and would be specific to the battery technology that is ultimately implemented.

Over the long term, BIG's solar farm operation and maintenance could introduce potential ignition sources such as maintenance vehicles used for solar farm maintenance activities, however maintenance vehicles would travel on roads that have been cleared of vegetation. BIG's proposed inverters and solar panels may represent a potential ignition source; however, the potential for fire risk for these components is considered low through compliance with SBCFD's vegetation clearance requirements. As such, vegetation-related fires would be unlikely to occur within the solar farm. As described above, all BESS battery components would include the integrated fire and safety systems within each enclosure and be installed within non-walk, outdoor enclosures on electrically grounded concrete pads or foundations to minimize the potential for sparks or ignition to occur. As discussed above, BNSF would prepare and implement preparation and submittal of a Fire Protection and Emergency Response Plan to the SBCFD for

review and approval in accordance with CFC Chapter 12. The Fire Protection and Emergency Response Plan would address fire hazards of the different BIG components, including the BESS. BIG's proposed solar farm area would be cleared during construction and would comply with the CFC and SBCFD vegetation clearance requirements during operations. Further, BIG's proposed solar farm design would be required to conform to conditions established by the SBCFD to ensure potential hazards relative to exposure of people or structures to significant risk of loss, injury, or death involving wildland fires would be reduced to the extent feasible. Following compliance with federal, State, and local worker safety and fire protection codes and regulations, fire occurrences during construction and for the life of BIG's solar farm would be minimized. Coupled with the implementation of fire suppression technology and adherence with applicable industry best practices and regulatory fire standards, BIG's proposed solar farm operations would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires and impacts would be less than significant.

Therefore, in summary, BIG construction and operations would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires. A less than significant impact would occur, and no mitigation is required.

Impact 7 Level of Significance: Less than significant Impact.

Mitigation Measures: No Mitigation Required.

Impact 8	***If located in or near state responsibility areas (SRAs) or lands classified as very high FHSZs, would the Project:*** ***a. substantially impair an adopted emergency response plan or emergency evacuation plan?*** ***b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?*** ***c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?*** ***d. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?***

Construction and Operation

CAL FIRE classifies most of the BIG footprint as a LRA and outside of a very high FHSZ; see **Figure 19.** The nearest SRA to the BIG footprint is approximately 21 miles to the south. The very high FHSZ nearest to the BIG footprint is approximately 25 miles to the south. Therefore, because the BIG footprint is not located in or near an SRA or lands classified as very high FHSZs, no impact would occur.

Impact 5.9 BIG-8 Level of Significance: No Impact.

Mitigation Measures: No mitigation required.

Figure Number	Reference Number	Parcel Number	Parcel Type	Historical Parcel Owner	Acres	EDR Listing	Phase I ESA	Phase II ESA	Site History/Previous Use	Environmental Concern?	Contaminant of Concern?
Figure 7	1	0466-101-09	Take Area	ATCHISON TOPEKA AND SANTA FE RR CO	2.28	--	--	--	Vacant land. No PECs identified.	No	
	2	0466-101-06	Take Area	DE VRIES, NEIL & MARY FAMILY TR 9-10	73.50	--	X	--	Former Dairy Operations with REC identified within Phase I ESA; however portion of parcel not included within CAO with the RWQCB.	No	--
	3	0466-101-07	Take Area	DE VRIES, NEIL & MARY FAMILY TR 9-10	73.75	X	X	--	Former Dairy Operations with REC identified within Phase I ESA. Currently under a CAO with the RWQCB.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	4	0466-111-01	Take Area	STS ROYBAL FAMILY TRUST	85.00	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	5	0466-111-02	Take Area	DE VRIES, NEIL & MARY FAMILY TR 9-10	14.30	X	X	--	Former Dairy Operations with REC identified within Phase I ESA. Currently under a CAO with the RWQCB.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	6	0466-041-23	Take Area	DE VRIES, NEIL & MARY FAMILY TR 9-10	233.08	X	X	--	Former Dairy Operations with REC identified within Phase I ESA. Currently under a CAO with the RWQCB.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	7/8	0420-161-01	Take Area	ALLY, CASSANDRA	66.90	--	--	--	Vacant land. No PECs; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	9	0420-161-10	Take Area	HIMMELRICK, JEFFREY C	6.04	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	10	0420-151-01	Take Area	19978 NATIONAL TRAILS LLC	323.09	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	11	0420-161-34	Take Area	LANDAU, STEPHEN J	10.00	--	X	--	Vacant land. One REC identified within Phase I ESA for buried material, drum, and stressed vegetation. Additionally, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
Figure 8	12	0420-161-33	Full Acquisition	ALEXANDER TRUST 11/7/96	15.00	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	13	0420-151-44	Full Acquisition	BNSF RAILWAY COMPANY	18.94	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	14	0420-151-03	Take Area	19978 NATIONAL TRAILS LLC	117.99	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	15	0420-151-04	Take Area	BOYCE, WILLIAM E	15.00	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	16	0420-151-06	Take Area	BOYCE, WILLIAM E	9.68	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	17	0420-151-07	Take Area	BRIGGS, JAMES D	13.50	--	--	--	Outside of take area, site reconnaissance observations included ASTs, cattle grazing, and agricultural operations.	Yes - REC/PEC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	18	0420-151-08	Take Area	BAKER, MATTHEW C	7.41	--	--	--	Outside of take area, site reconnaissance observations included ASTs, cattle grazing, and agricultural operations.	Yes - REC/PEC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	19	0420-142-75	Full Acquisition	BNSF RAILWAY COMPANY	0.06	--	--	--	Vacant Land. No PECs identified; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	20	0420-142-01	Full Acquisition	CISNEROS, JOSE J	7.60	--	--	--	Vacant Land. No PECs identified; however, within N&M Dairy 2012 Expanded Study Area, and consid	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	21	0420-111-04	Full Acquisition	BOLIN, CHRISTINA	0.60	--	X	--	Vacant land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	22	0420-111-09	BNSF Rail ROW	ATCHISON TOPEKA AND S F RAILWAY CO	0.00	--	--	--	Vacant Land. No PECs identified; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	23	0420-111-03	Take Area	19978 NATIONAL TRAILS LLC	157.81	--	X	--	Vacant Land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	24	0420-131-02	Full Acquisition	DEVCAL CORPORATION	135.06	--	X	--	Vacant Land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	25	0420-121-01	Take Area	DEVCAL CORPORATION	80.00	--	X	--	Vacant Land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	26	0420-121-11	Take Area	DEVCAL CORPORATION	17.50	--	--	--	Vacant Land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)
	27	0420-121-03	Take Area	DEVCAL CORPORATION	40.00	--	X	--	Vacant Land. No RECs, HRECs, CRECs identified within Phase I ESA; however, within N&M Dairy 2012 Expanded Study Area, and considers a REC.	Yes - REC	Nitrate and TDS in Groundwater (Alta Em Inc., 2025)

Notes:
AOC - Area of Concern
PEC- Potential Environmental Concern
REC - Recognized Environmental Concern
CREC- Controlled Environmental Concern
HREC - Historical Recognized Environmental Concern
TPH - Total Petroleum Hydrocarbon
VOC - Volatile Organic Carbon

ADL - Aerially Deposited Lead
BTEX - Benzene, Toluene, Ethylbenzene and Xylenes
RR - Railroad Parcel
C- Channel Parcel
Take Area - Only a portion of property was acquired.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 23), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY SEARCH RESULTS

The Target Property was identified in the following databases.

Page Numbers and Map Identifcations refer to the EDR Area/Corridor Report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal RCRA generators

RCRA-SQG: RCRA - Small Quantity Generators

A review of the RCRA-SQG list, as provided by EDR, and dated 06/02/2025 has revealed that there are 3 RCRA-SQG sites within the requested target property.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
Registry ID: 110070728871

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES

Environmental Interest/Information System:
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY

SERVICE ROCK PRODUCTS (Continued) **1016113556**

INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
ICIS-Air (AIR) AIR is the modernization of the Air Facility System (AFS) into the Integrated Compliance Information System (ICIS). AIR contains enforcement, compliance, and permit data for stationary sources of air pollution regulated by the EPA, State, and Local air pollution agencies.
The Air Facility System (AFS) contains compliance and permit data for stationary sources of air pollution regulated by the EPA, state, and local air pollution agencies.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

U.S. DOT Description: R.Q. Na2212, Asbestos, 9, Pgiii
Non-Hazardous Waste Description: Not reported
Number of Containers: 3
Container Type Code: BA
Container Type Description: Burlap, cloth, paper, or plastic bags
Waste Quantity: 1
Quantity Unit of Measure Code: Y
Quantity Unit of Measure Description: Cubic Yards
Waste Quantity, in Tons: 0.84
Acute Waste Quantity, in Tons: 0
Non-Acute Waste Quantity, in Tons: 0.84
Waste Quantity, in Kilograms: 761.9052
Acute Waste Quantity, in Kilograms: 0
Non-Acute Waste Quantity, in Kilorgrams: 761.9052
Management Method Code: H132
Management Method Description: LANDFILL (WITH PRIOR TREATMENT AND/OR STABILIZATION)
Waste Residue Indicator: N
Quantity Discrepancy Indicator: N
Waste Type Discrepancy Indicator: N
Waste Density: Not reported
Waste Density Unit of Measure Code: Not reported

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Environmental Interest/Information System:
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
