1.0 BARSTOW INTERNATIONAL GATEWAY SUMMARY

This Report has been prepared to analyze the proposed Barstow International Gateway ("BIG") and associated off-site improvements. BIG is located in the City of Barstow ("City") and in unincorporated territory in the County of San Bernardino ("County"), California (see **Figure 1: Regional Vicinity Map** and **Figure 2: Local Vicinity Map**

). BIG consists of a rail yard with an intermodal facility[1] and "block swap" facility[2], a transload warehouse center[3], and a solar farm.

Additionally, to serve the proposed rail yard and transload warehouse center, BNSF Railway Company (BNSF) proposes off-site rail improvements (including lead track extensions), and off-site non-rail improvements (including drainage, utilities, and roadways).

BIG's proposed components are depicted on **Figure 3: Barstow International Gateway Concept Diagram**,

Figure 4: Barstow International Gateway Conceptual Site Plan, and off-site improvements are depicted on

Figure 5: BIG Off-Site Improvements.

1.1 Project Location and Setting

BIG totals approximately 5,000 acres[4], and includes approximately 680 acres which would remain ungraded/undisturbed ("Mojave River buffer area"). BIG's Specific Plan area totals approximately 4,300 acres and is generally bounded by the Mojave River to the north, Main Street (also referred to as National Trails Highway or Route 66) to the south, Lenwood Road to the east, and Hinkley Road to the west.

Most of the BIG footprint is within unincorporated County lands, while the remainder is within Barstow City limits. The BIG footprint is generally flat and gradually slopes north to the Mojave River. Offsite improvements are generally within existing BNSF rail and City/County street rights-of-way. The BIG footprint is primarily vacant undeveloped land, which is traversed by an existing BNSF railroad, and which contains scattered residential, commercial, and industrial land uses. This area is mostly devoid of tall vegetation and trees, with structures and other elements of the built environment scattered throughout. Existing land uses within BIG's footprint are listed in **Table 1: Existing Land Uses**. There are approximately 108 dwelling units and approximately 94,000 square feet of non-residential land uses (i.e., commercial

[1] "Intermodal facility" refers to a rail yard where containerized goods are transferred between trains and trucks. Trucks arrive to either pick up containers from arriving trains or deliver containers for departing trains. However, unlike traditional intermodal facilities, at BIG the majority of containers would arrive by train and be transferred to and from electric hostlers.

[2] "Block Swap" refers to transferring a block of intermodal train cars between trains. In effect, the entire block of cars remains coupled together and is moved en masse to another train.

[3] "Transload" refers to the transfer of goods from one container to another. In this document, it specifically refers to the transfer of goods from 40-foot international containers to 53-foot domestic containers. The transload warehouse center at the BIG is designed to serve goods transported to and from the intermodal facility by rail.

[4] Although the BIG Specific Plan acreage is 4,335 acres, throughout this technical report, the BIG Specific Plan acreage is referred to as 4,300 acres. Note: all acreages in this report are preliminary and based on GIS data. Acreages will be refined with site survey.

and industrial) within the BIG footprint. Additionally, a private airstrip ("Depue Airport") is within BIG's proposed solar farm footprint. Under BIG, this private airstrip would be demolished and replaced with the proposed solar farm.

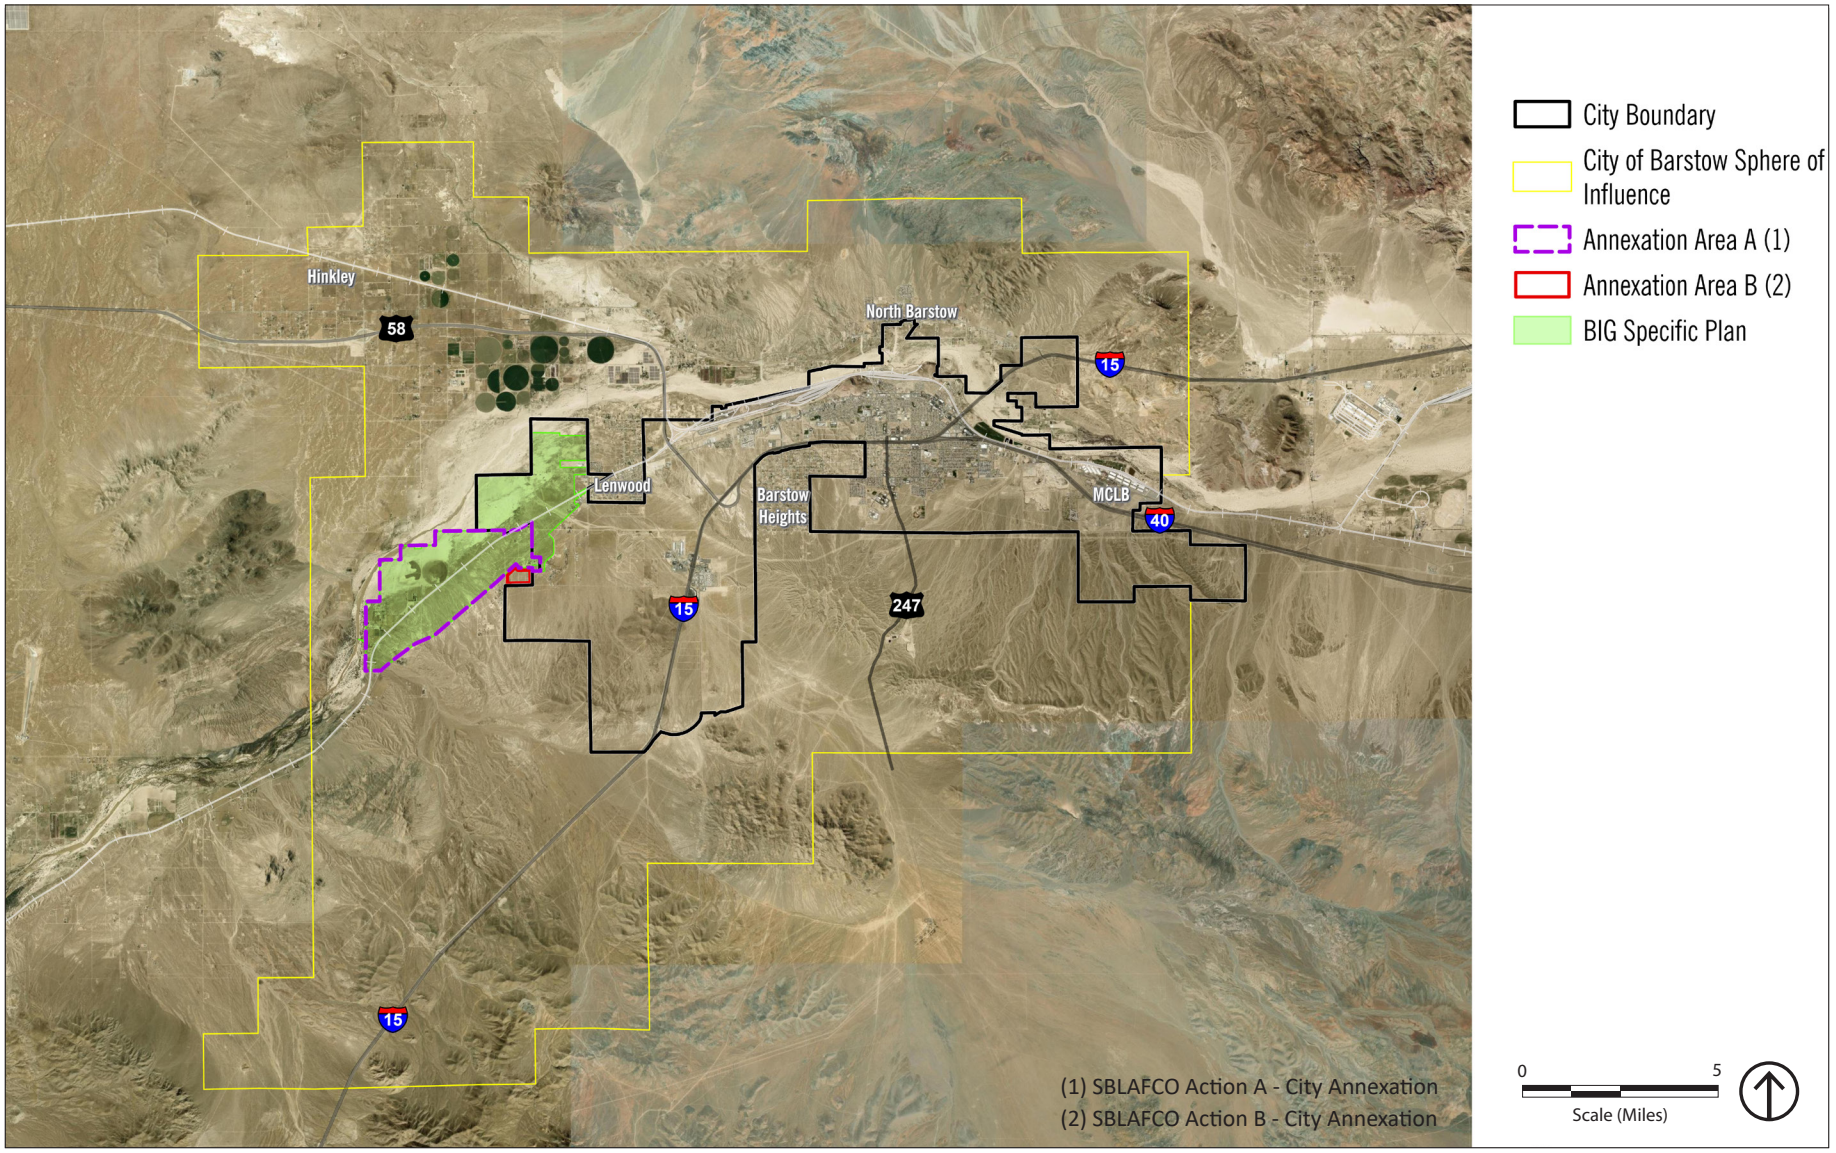

Table 1: Existing Land Uses					
Description	**Residential (DU)**	**Commercial (SF)**	**Industrial (SF)**	**TOTAL (DU)**	**TOTAL (SF)**
Existing Land Use	108	85,887	7,837	108	93,724

Regional vehicular access to BIG is provided by Main Street from the south, I-15 from the southeast, and SR-58 from the east. Local access to BIG is primarily provided by Lenwood Road and Hinkley Road from the east and west, respectively, in addition to various unpaved roads along Main Street. Regional rail access is provided from the north by BNSF's Mojave subdivision, from the west by BNSF's Cajon subdivision, and from the east by BNSF's Needles subdivision.

1.2 Project Components

Rail Yard

Overview

The rail yard would be generally bound by the existing mainline to the north, Main Street to the south, Lenwood Road to the east, and Hinkley Road to the west. The rail yard would consist of an intermodal facility (i.e., where cross-dock intermodal operations and other intermodal facility operations would occur and where support intermodal facility uses would be located), a block swap yard, and ancillary rail areas (i.e., container yard, chassis storage, and ancillary rail storage area), as described below.

BIG's proposed rail yard would operate 24 hours per day, 365 days per year. The rail yard would have approximately 860 employees during Opening Year (2028), 1,010 employees in Interim Year (2033), and 1,125 employees during Horizon Year (2048)[5], which would accommodate both the block swap yard and intermodal facility operations. Employees would be split evenly between three shifts.

While the block swap yard would change the number of trains that would arrive or depart BIG by optimizing for end destinations, it would not increase the number of containers. BIG's intermodal facility would, through the cross-dock intermodal operation, add a new volume to the BNSF network, totaling approximately 3.2 trains per day on average in 2028, approximately 4.3 trains per day on average in 2033, and approximately 4.9 trains per day on average in 2048. These train counts include eastbound and westbound trains, and as described elsewhere, trains between the Ports and the BIG intermodal facility would be comprised of dedicated Tier 4 locomotives.

Intermodal Facility

BIG's intermodal facility is proposed at the southern extent of the BIG Specific Plan area and its operations would consist of two types: cross-dock intermodal and "other" operations. BIG's intermodal facility would operate differently than typical intermodal facilities in that most of the containers processed at BIG intermodal facility would not arrive or leave externally by heavy-duty trucks. Instead, almost all of the containers would arrive or leave by train and be processed via BIG's unique "cross-dock intermodal" operation. The intermodal facility's primary purpose would be to transfer containers between railcars and electric hostlers[6] for cross-dock movements at the onsite proposed transload warehouse center, and vice versa, though a small portion would arrive by heavy-duty truck. The electric hostlers would be used to transport containers within the rail yard, and between the rail yard and transload warehouse center. The electric hostlers would be zero-emission and would not leave BIG. This differs from the operations at a traditional intermodal facility where the primary purpose is to transfer containers from heavy-duty trucks[7]

[5] A "Horizon Year" is the last year of analysis. BIG's Horizon Year is 20 years after opening.
[6] Electric hostlers are trucks used for moving trailers and containers short distances within freight terminals, rail yards, and warehouses. Electric holsters would not use public roadways outside of BIG footprint.
[7] "Heavy-duty" trucks are conventional highway trucks that travel on public roads and carry containers intra- and inter-state.

to railcars, and vice versa (defined as "other" operations). BIG also includes a dedicated fleet of Tier 4 linehaul locomotives[8] to move containers between the Ports and the BIG intermodal facility.

BIG's intermodal facility would be composed of various components including railroad tracks, cargo handling equipment, an automated gate system, circulation roadways, yard equipment parking, container parking, stormwater detention ponds, electric vehicle charging stations, and buildings and ancillary rail facilities. Containers would be stored in parking spaces and low stacks at the intermodal facility, along with the ancillary rail area, and transload warehouse center (each described further below). Although electric lift equipment would be utilized to the extent commercially feasible within BIG's intermodal facility, a small 5,000-square-foot fuel canopy would be constructed in the electric hostler maintenance area to accommodate fueling of hybrid equipment. Hybrid and diesel equipment would include rubber-tired gantry cranes (RTGs), seven air compressors, welders, railcar wheel change machines, and heavy-duty truck transport refrigeration units (TRUs). The fuel canopy would be served by a 10,000-gallon unleaded fuel aboveground storage tank and a 20,000-gallon diesel fuel aboveground storage tank, with both controlled by an electronic fuel control system. In addition, starting in BIG opening year 2028, BNSF would increase the renewable diesel composition within their existing southern California fueling sites, including the existing fueling sites at the Ports and Barstow classification yard from 1 percent to 10 percent, a 900 percentage point increase in renewable diesel. This would improve the emissions of all BNSF trains fueling at the Ports, including those BNSF trains that would not stop at BIG.

BIG's intermodal facility proposes approximately 134,000 square feet of support buildings and structures, as detailed in **Table 2: BIG Intermodal Facility Structures**. As described below, final building sizes may vary slightly, this EIR conservatively analyzes up to 150,000 SF of support buildings and structures.

Table 2: BIG Intermodal Facility Structures

Building/Canopy	Square Footage
Administration Building	23,000
Electric Hostler Employee and Maintenance Building	39,000
Drivers Assist Building	5,000
Crane Maintenance Employee and Storage Building	5,000
Crane Maintenance Canopies	22,500
Container Safe Haven Canopies	2,500
Quick Repair Canopy	10,000
AGS Kiosk Canopies	20,000
AGS Portals	2,000
Emergency Fuel Station Canopy for Hybrid Vehicles	5,000
Total	*134,000*
Assumed Building Total for Final Design	*150,000*

Note:
The square footage described is an estimate and may vary up to 10% depending on the final engineering, therefore, the total square footage for planning purposes is estimated at approximately 150,000 sf.

[8] "Tier" refers to emissions standards set by regulatory agencies for engine emissions, with Tier 0 referring to the oldest and having the highest emissions, while Tier 4 is the latest, more stringent standard with the fewest emissions.

Block Swap Yard

The block swap yard is proposed within the middle portion of the BIG Specific Plan area, on approximately 410 acres of the rail yard's total approximately 1,950 acres. The proposed block swap yard would allow for the transfer of multiple railcars, or "blocks" of intermodal rail cars between trains via Tier 4 switcher locomotives. A block is defined as rail cars of a similar type moving to a similar destination that are already connected and can be combined with other blocks intended for similar destinations to produce more efficient train movements. The entire block of rail cars would remain coupled together and be moved en masse, permitting the synchronizing of blocks to their destinations, so that each train would be compiled of rail car blocks travelling to similar destinations. Blocks could be assembled from inbound trains or trains processed at the intermodal facility carrying containers processed at the transload warehouse center. Certain train blocks may stage at the block swap yard until another train arrives with similar destination. The block swap yard would facilitate switching and transfer of lengthy rail car blocks between tracks for assembling departing trains. Thus, by synchronizing trains to their destinations, the block swap yard would improve train efficiency eastbound and westbound. The rail car blocks within the block swap yard would include containers from BIG's intermodal facility and containers processed at the transload warehouse center, combining as needed based on their destination.

The block swap yard's function is unique compared to a typical classification yard, such as the existing Barstow classification yard. Classification yards are where trains being processed are made up of non-intermodal railcars (i.e., individual boxcars, gondolas, open and closed hopper cars, automobile railcars, and tank cars), rather than intermodal railcars. BNSF designates these types of trains with a different train identification than those that would be processed at BIG. Further, BNSF uses different equipment to process these trains than would be used at BIG. While there is a small intermodal facility component adjacent to the existing Barstow classification yard, that intermodal facility is only used to process overflow from other BNSF intermodal facilities. By contrast, BIG's block swap yard would disassemble and assemble lengthy blocks of railcars with intermodal containers to similar destinations utilizing Tier 4 switcher locomotives. The existing Barstow classification yard also utilizes switcher locomotives as part of its operations, although they are currently Tier 0/0+/1+ switchers. Starting in BIG opening year 2028, BNSF will voluntarily retire all existing Tier 0/0+/1+ switcher locomotives at the unrelated existing Barstow classification yard, and in their place add six Tier 4 switcher locomotives.

Ancillary Rail Area

The ancillary rail storage area is an approximately 400-acre area north of the existing mainline and would be graded and covered with aggregate to be used for numerous purposes, including a container yard, truck chassis storage, and storage of maintenance equipment. A container yard would support the storage of empty containers awaiting loading while chassis storage would be used to provide parking for empty chassis awaiting use for loading, unloading, or draying of containers. The ancillary rail storage area would also be used for storage of spare parts and equipment for track maintenance, including rail, ties, turnouts, and other track material.

Mainline Improvements

BIG would retain the existing two rail mainlines ("north mainlines") within their current alignments, except at bridge crossings, which would be upgraded. BIG also proposes to construct two new mainlines ("south mainlines"), which would traverse the proposed rail yard in an east-west orientation, extending from Lenwood Road on the east to Hinkley Road on the west. During the construction phase, the south mainlines would be used to divert train traffic from the existing mainlines while they are upgraded. During BIG operations, half of the trains which would bypass BIG would use the north mainlines and half would use the south mainlines to balance train counts between the mainlines. BIG would also upgrade various bridge crossings including replacement of the crossing at Lenwood Channel to accommodate the proposed Lenwood Channel widening; removal of existing culverts[9] to accommodate proposed culverts for the overall rail yard; and replacement of two structures to meet BNSF standards regarding 50- and 100-year flood conditions.

Transload Warehouse Center

The transload warehouse center is proposed at the northern extent of the BIG Specific Plan area, on approximately 1,330 acres of BIG SP's total approximately 4,300 acres. The transload warehouses would be designed to process the contents of containers from cross-dock intermodal operations, with a small percentage dedicated to processing the contents of containers that have a portion destined for the Inland Empire (the remainder of the container's contents would be placed on trains destined eastward). A small percentage of containers processed at the transload warehouse center would arrive/leave by heavy-duty trucks, primarily from/to the Inland Empire. The transload warehouse center would process most of the containers within an on-site "closed loop" operation between BIG's intermodal facility and the transload warehouse center. The transload warehouse center would include approximately 9.0 million square feet of transload warehouses. The transload warehouse center would be fully built during construction, but operations would gradually increase as customers relocate to BIG. Transload warehouse center operations would include approximately 2,767 employees in Opening Year, approximately 3,660 employees in Interim Year, and 4,248 employees in Horizon Year.

The transload warehouse center would be composed of multiple buildings of various configurations and sizes, depending on tenant needs. As such,

Figure 4: Barstow International Gateway Conceptual Site **Plan**

Figure 4 provides a conceptual site plan for illustrative purposes showing potential transload warehouse buildings, locations, and sizes. Final transload warehouse buildings, locations, and sizes may differ from those proposed and would be processed with the City, as development occurs. Each transload warehouse would include container parking/storage areas, employee parking, stormwater/hydrology improvements, and landscaping. Finally, emergency generators are proposed throughout the transload warehouse center to provide electric power in the event of a power outage.

There would also be several areas distributed around the transload warehouse center, adding up to approximately 275 acres, for staging/overflow parking of containers accessing the transload warehouse

[9] Culverts are drainage features, typically a pipe or arch, used to convey water under a road or rail tracks.

center. These warehouse staging areas would be for truck containers only; truck "hoteling"[10] would not occur, as electric hostlers would transfer containers to/from these areas, thus, heavy-duty truck trailers would not enter or exit these areas.

Hydrology/Stormwater Drainage Improvements

BIG would construct various infiltration basins and drainage outlets to the Mojave River that would be designed for 100-year flood events. Preliminarily, BIG proposes detention ponds of various sizes throughout BIG footprint totaling approximately 165 acre-feet of storage volume, which would accommodate the 100-year flood conditions.

In addition to various ephemeral washes throughout BIG footprint, three other primary hydrologic features traverse BIG footprint, as detailed below.

Unnamed Stream (Milepost 10.9): This feature is a dry wash from Main Street to the Mojave River that includes a sharp western bend. This feature would be realigned to accommodate track mains, sidings, and support tracks and improved with a combination of bridges and box culverts spanning the channel (Bridge 10.9a and Bridge 11.2, respectively).

Hinkley Road Bridge at Mojave River (Milepost 10.5): The existing Hinkley Road Bridge, which the County owns and maintains, is at a narrowed section of the Mojave River and crosses via a concrete pier structure. Based on discussions with the County, the existing Hinkley Road Bridge over the Mojave River is experiencing structural issues and is at risk of being over-topped from seasonal flooding. Hydrology and hydraulic analyses have indicated the existing bridge is undersized. To maintain a roadway connection to Hinkley Road from the transload warehouse center, BIG proposes to replace the existing bridge with a longer structure to better match the channel width of the Mojave River at that location. The channel beneath, and immediately adjacent to, the existing bridge would be excavated and widened to match the natural channel width more closely. Portions of Hinkley Road immediately east and west of the bridge would be raised to reduce exposure to Mojave River flood events. These proposed improvements at Hinkley Road Bridge would reduce flooding compared to existing conditions. As part of the improvements, the existing at-grade crossing would be abandoned, and vehicles would instead utilize the proposed Hinkley Road extension through the transload warehouse center.

Lenwood Channel (Milepost 6.5): A portion of the BIG footprint along Lenwood Channel is currently within the FEMA 100-year flood zone due to existing flooding concerns. Lenwood Channel is a north-south earthen channel used to convey water from the southeast to the Mojave River and maintained by the San Bernardino County Flood District. Lenwood Channel would be widened by approximately 60 to 100 feet throughout the Specific Plan area for a length of 1.1 miles, continuing offsite south of Main Street, for an additional 1 mile. The widened channel would improve flooding compared to existing conditions. Preliminary BIG design requires the Lenwood Channel to be spanned at three locations for additional track east leads, mains, and sidings, as well as three roadway crossings: Main Street, Hinkley Road, and the private road between the intermodal facility and transload warehouse center.

[10] Truck "hoteling" refers to when a heavy-duty truck parks for the driver to rest within the cab.

Utility Improvements

To accommodate the proposed rail yard and transload warehouse center, BIG would require both relocations of existing facilities and construction of new/expanded facilities (i.e., water, wastewater, electric power, natural gas, and telecommunications). The utility improvements proposed within BIG's footprint are discussed below.

Water

BIG's construction phase water demand includes non-potable water for construction activities and potable water for on-site construction workers. To provide non-potable water during the construction phase, up to eight new private onsite temporary groundwater wells would be constructed within BIG's transload warehouse center portion.

Temporary aboveground connections from Golden State Water Company existing mains within Main Street to BIG would be constructed to supply potable water to the construction sites. Additionally, Mojave Water Agency owns and operates a 48-inch recharge water line that crosses the BIG Specific Plan area. BIG proposes to relocate this existing line to the north to avoid conflict with rail yard and transload warehouse center improvements.

Operational potable water and fire flow water would be provided by directly connecting to facilities owned and operated by the Golden State Water Company. Fire flow would be supplemented by on-site water tanks and fire pumps if necessary to meet the fire flow requirements. Power to water tanks and fire pumps would be supported by the transload warehouse diesel backup generators in the case of an emergency. Water tanks would be placed entirely within the BIG footprint. The transload warehouse center would connect to an existing water main in Jasper Road on the east end of the BIG Specific Plan area. The rail yard would connect to an existing water main on the east end of the BIG Specific Plan area near Lenwood Road on the south side of Main Street. A new public 12- to 16-inch looped water main would be constructed from the existing connection in Main Street, extending west to the edge of rail yard, north to Hinkley Rd, and then continue east in Hinkley Road to the existing connection point near Lenwood Road. A second connection from the looped water main would be provided at the northeast corner of the Specific Plan at Lenwood Road. The new on-site public water mains total approximately 10 miles in length.

Wastewater

BIG's construction-related wastewater generation would be from construction workers. Temporary portable facilities (i.e., portable restrooms and portable handwash stations) would be utilized during the construction phase.

BIG's operational wastewater generation would be from transload warehouse center and rail yard employees, and the rail yard wash bays and track pans. Wastewater generated by BIG would discharge to the City's existing wastewater system at three connection points. The transload warehouse center would discharge to the proposed new sewer main in Hinkley Road. A new 8-inch wastewater line is proposed within the Hinkley Road extension from the west end of the transload warehouse center to the northeast end of the transload warehouse center and would connect to the existing sewer main in Lenwood Road. Within the transload warehouse center, west of the Lenwood Channel, 8-inch lines would extend north

into C Street to serve the transload warehouses connecting to Lenwood Road via B Street. The rail yard would include new wastewater lines and force mains at the southern portion of the rail yard, conveying wastewater to the east and connecting to the existing sanitary sewer main in Main Street near Country Club Drive. BIG's wastewater would be conveyed by gravity flow to and treated at the Barstow Regional Wastewater Treatment Facility, which is owned and operated by the City. Wastewater conveyance and treatment would be coordinated with the City.

Electrical Power

BIG construction activities would generate temporary electric power demand from construction equipment, tools, lighting, and other necessary facilities (e.g., temporary offices). The electric power for construction activities would be supplied through connections to existing Southern California Edison (SCE) facilities.

BIG operations would generate permanent electric power demand from the transload warehouse center (lighting, electric vehicle charging for material handling, and forklifts) and rail yard (lighting, buildings, cranes, and electric hostlers (used to move containers between the rail yard and the transload warehouse center). BIG operational electric power demand would be met through connecting to the SCE Tortilla Substation and supplemented with onsite electrical generation (i.e., an approximately 140-acre, approximately 21 megawatts (MW) solar power generation facility (i.e., solar farm), which is described further below. BIG proposes to construct the following onsite electric power facilities to serve BIG:

- Three substations: two substations at the eastern and western extents of the rail yard; and one substation within the solar farm.
- Additional 33kV distribution lines connecting via underground duct banks in a loop around the west end of the intermodal facility and north end of the transload warehouse center. These proposed 33KV distribution lines would total 23 miles of ductbank within the BIG Specific Plan area.
- An approximately 140-acre solar farm is proposed south of BIG rail yard, at the southwest corner of the Main Street at Country Club Drive intersection. The solar farm is estimated to generate approximately 21 MW to serve BIG. The solar farm would include a battery electric storage system and a new substation at the northwest corner to route power from the solar farm to BIG rail yard. The solar farm would be fenced to prevent trespass and would include internal roadways for maintenance vehicles. The solar farm would require minimal grading to level the site as existing topography is utilized wherever possible and excavation limited primarily to stormwater detention to capture runoff. Additionally, BIG would comply with CalGreen regulations requiring that rooftop solar generation be installed on the industrial warehouse rooftops (Title 24, Section 140.10). Based on 9.0 MSF of transload warehouse, BIG would include approximately 6.4 MW of rooftop solar generation for Title 24 compliance.
- Emergency diesel generators are proposed at various locations across the rail yard and transload warehouse center to provide backup power in the event of Tortilla Substation service interruptions. Rail yard generators would only be used if a power outage were to occur at nighttime, as the proposed solar farm would provide sufficient power during daytime in the event of a power outage. The rail yard would include up to 10 generators at the far western extent, while the transload warehouse center would include up to 29 generators dispersed throughout. Generators would require up to 50 hours of testing and maintenance operations per year.

Solar farm maintenance would consist of cleaning, inspecting, and replacing solar panels, equipment, and other system components. Maintenance trips associated with these activities would be limited to trucks transporting materials, equipment, and supplies to and from the farm. To maintain uninterrupted power generation for BIG, maintenance activities would occur incrementally. The solar farm would also require vegetative maintenance (e.g., mowing and weeding, and other grass control measures). No grading would occur during solar farm maintenance.

Natural Gas

BIG construction activities would not require construction of new natural gas facilities, although protection in place or relocation of existing natural gas facilities would be required to accommodate BIG.

Stormwater

To collect stormwater runoff, BIG proposes stormwater basins that would detain any stormwater in excess of predevelopment flows then discharge to existing drainageways through stormwater best management practices. BIG would include various outlets to the Mojave River. Exact sizing and locations of transload warehouse center basins would be dependent on final transload warehouse location, layout, and sizing. In addition, Lenwood Channel would be modified as discussed above.

Solid Waste

BIG would result in solid waste generation from construction (demolition debris, broken or excess materials, packaging, and other construction waste), as well as during operations from the rail yard and transload warehouse center. BIG's solid waste would be collected within onsite trash bins and be disposed of at the Barstow Sanitary Landfill, with 65 percent being recycled (for instance, demolished concrete foundations can be crushed and re-used onsite as aggregate).

Telecommunications

Telecommunication lines cross BIG footprint along Lenwood Road and along the southern edge of the existing tracks. Underground utilities may also be present. All underground communication facilities are assumed to have shallow depths except those crossing under existing features such as underpasses and creeks. Lines within BIG footprint may be relocated adjacent to/within existing and proposed rights-of-way or abandoned. In addition, BNSF Telecommunications would install approximately 12 communication towers with heights generally between 100 - 120 feet, though two communication towers would be 160 feet tall. Additionally, various existing telecommunications lines owned by Frontier Communications and Lumen would be removed from within BIG footprint, and, in their place, new communications line would be run beginning at the Jasper Road at Lenwood Road intersection, running to the western extent of the BIG Specific Plan area, and then running eastward back to Lenwood Road in a "loop."

On-Site Circulation Improvements

BIG would include various on-site circulation improvements as discussed below.

Hinkley Road Realignment: BIG would vacate Hinkley Road between the south side of the Mojave River bridge crossing and Main Street, closing the existing at-grade rail crossing. Hinkley Road would be realigned beginning at the north side of the Mojave River bridge crossing to connect through the transload

warehouse center to the Jasper Road/Lenwood Road intersection. Transload warehouse center employees and heavy-duty trucks destined for the transload warehouse center would enter from the Lenwood Road/Hinkley Road/Jasper Road intersection.

Internal private roadways: In addition to the realigned public Hinkley Road (discussed above), BIG would include four dedicated internal private roadways for electric hostlers (private streets A, B, D, and E), and two internal private roadways for employee, visitor, and truck access (private streets C and F).

Country Club Drive: Country Club Drive would be widened along the solar farm frontage for approximately 400 feet to the proposed realignment of Sweeten Lane. A new stop-controlled intersection is proposed at the Country Club Drive at Sweeten Lane intersection.

Main Street: Rail yard employees and heavy-duty trucks destined for the intermodal facility would enter BIG's rail yard from a new driveway on Main Street across from Country Club Road. Main Street would be widened from two lanes to four lanes for approximately 0.5 miles east of Country Club, resulting in a consistent four-lane roadway width through Barstow. Additionally, the existing two-lane Main Street over Lenwood Channel low water crossing would be replaced with a new four-lane bridge that accommodates the 100-year flood condition, substantially reducing the existing flood conditions. Main Street would be raised over Lenwood channel, modifying the vertical alignment of Main Street for approximately 0.8 mile. The intent of this design is to keep flood waters contained in Lenwood Channel and convey the flow to the Mojave River under the bridge at MP 6.5, avoiding the overflow of the bank that can occur under existing conditions.

To accommodate BIG, various on-site public rights-of-way within the City and unincorporated San Bernardino County would also need to be vacated.

Off-Site Improvements

In addition to the on-site improvements described above, BIG also proposes off-site rail and non-rail improvements, as discussed below:

Off-Site Rail Improvements

BIG proposes lead track extensions to the east of approximately two miles and lead track extensions to the west of approximately seven miles ("east lead track" and "west lead track"). These off-site rail improvements would be primarily within existing BNSF right-of-way. These improvements would enable trains to safely enter and exit the mainline at mainline speeds, rather than slower "yard" speeds and risk fouling the track.[11] BIG east and west lead tracks would require modifications to existing culverts within the footprint; see also *Stormwater Drainage* discussion below.

[11] "Fouling the track" means the placement of an individual or an item of equipment in such proximity to a track that the individual or equipment could be struck by a moving train or on-track equipment, or in any case is within four feet of the field side of the near running rail (49 CFR Part 214). When a rail network becomes congested, trains can foul the track by moving slower than a train behind them.

Off-Site Non-Rail Improvements

BIG proposes ancillary and related stormwater drainage, utility (i.e., water, sewer, electric power, natural gas, and telecommunications), and circulation/roadway improvements and modifications, described below.

Water. North of transload warehouse center, an existing Mojave Water Agency 48-inch recharge line would be relocated. The relocated line would stretch along the north side of the transload warehouse center to the west end of the BIG Specific Plan area, then continue along the north side of the mainline and lead tracks for a total of 8.3 miles.

Wastewater. An existing approximately 27-inch sanitary sewer line is within existing BNSF ROW for approximately 1.6 miles between Lenwood Road and Pettit Road. This line includes multiple north/south lateral connections to serve the land uses between Main Street and the existing BNSF tracks. BIG would relocate this line at Phillips Street south to within Main Street. Additionally, the transload warehouse center will connect to City sewer via a new 27-inch sewer line within Jasper Road extending to north of Paris Avenue.

Electric Power. Electrical demand would be handled through connecting to the SCE Tortilla Substation, located approximately 0.4 miles south of the Veterans Parkway at Diamond Avenue intersection. Three underground duct banks with electrical conductors would connect BIG to the Tortilla Substation utilizing existing franchise agreements with the City and County on a route following Main Street, Sunrise Road, N Street, and Bonanza Road before utilizing existing easements between Bonanza Road and the substation. This proposed 33KV distribution route would extend approximately 7.1 miles underground from the Tortilla Substation to the intermodal facility's eastern extent at Country Club drive, then continue overhead approximately 3.5 miles from Country Club Drive to approximately Hinkley Road. For the 33kv line segment from Tortilla Substation to BIG, the 33kv circuits would be in underground utility lines resulting in an approximately 30-foot-wide disturbance to account for construction access and temporary spoils. From Tortilla substation to H Street (approximately 1.2 miles), the 33kv conduit could occur within a 450-foot-wide corridor, inclusive of the existing 150-foot wide SCE easement along Bonanza Road. However, the exact alignment is presently unknown and is being coordinated with SCE. Therefore, this EIR analyzes an approximately 30-foot wide disturbance within the 450-feet wide corridor ("33kv distribution corridor"). This EIR analyzes the "worst-case" environmental impacts within the 33kv distribution corridor. SCE would make modifications, which include constructing new feeders and new power distribution lines. Within the Tortilla Substation's existing fence line, SCE would also make modifications to supply the new feeders from their existing 115kV-33kV transformers. Various offsite existing electric power lines could be relocated, modified, or extended to accommodate BIG improvements.

Natural Gas. Various off-site existing natural gas lines could be relocated to accommodate BIG improvements.

Telecommunications. No off-site telecommunications improvements are proposed. Various minor existing telecommunications lines would be relocated toward the eastern end of the lead track improvements. Existing telecommunications lines passing through the intermodal facility and block swap yard would be relocated to the north side of the Main Street ROW.

Stormwater Drainage. As described above, the Lenwood Channel widening would continue offsite, south of Main Street. It would be widened by approximately 60 to 100 feet for a total of approximately 2.1 miles (of which 1 mile would be offsite) to improve flooding compared to existing conditions. At the Main Street crossing at Lenwood Channel, BIG would replace 0.8-mile of the existing Main Street low water crossing of Lenwood Channel with a bridge and raise and widen the road through this stretch west to the new intermodal facility entrance. These improvements accommodate the City/County master plan and improve flooding compared to existing conditions.

Other. To accommodate wildlife crossings from south of Main Street to the Mojave River without potential conflict with vehicular or train traffic, BIG proposes an underground wildlife crossing under Main Street west of the existing Hinkley Road.

Circulation/Roadway. Jiggs Road would be realigned generally from just east of Indian Trail to Hinkley Road to maintain emergency access from Indian Trails to Hinkley Road. In addition, a maintenance road would be constructed alongside the mainline to provide maintenance access to the tracks, generally from just east of Indian Trail to Hinkley Road. Various circulation and roadway improvements and modifications are proposed outside the BIG Specific Plan area. All circulation improvements would be permanent, except a temporary Main Street bypass. The temporary bypass would be constructed to maintain access along Main Street during Lenwood Channel Bridge reconstruction. To maintain access for adjacent residents, the temporary Main Street bypass would include private driveways for adjacent residential uses and would be open for the approximately 18-month bridge reconstruction period. Once the Lenwood Channel Bridge reconstruction is complete, the bypass would be removed and the site restored to its original condition. Additionally, construction of additional lead tracks over Pettit Road (approximately 1,100 feet west of SR-58) would require the road to be lowered by approximately 2.0 feet. BIG would also vacate various ROW within the City and County. Finally, Sweeten Lane would be vacated and realigned to eliminate the existing unimproved intersection with Main Street. A new paved access would extend from Country Club east approximately 1,000 feet and connect to the unimproved Sweeten Lane.

Maintenance Activities

While "light maintenance activities" [12] could occur at BIG, major maintenance activities[13] would still occur at the existing Barstow classification yard, thus, requiring short-distance trips via BNSF's existing mainline to and from the existing Barstow classification yard for heavy maintenance. Locomotive trips associated with maintenance activities would be based on the number of linehaul locomotives needed to move trains between the Ports and BIG intermodal facility, and the number of switcher locomotives needed to haul rail cars within BIG intermodal facility and block swap yard. All switcher locomotives at BIG would be Tier 4 locomotives, and BNSF would also retire all existing Tier 0/0+/1+ locomotives at the unrelated existing Barstow yard and, in their stead, add six Tier 4 switcher locomotives.

[12] "Light maintenance activities" means routine locomotive servicing (e.g., window washing, fueling, inspecting fluid levels and topping off fluids, stocking cabins with crew equipment such as water and trash bags, toilet servicing) and minor railcar servicing (e.g., wheel changes, brake and friction shoes, and loose or missing bolts).

[13] "Major maintenance activities" means repair of railing and platform, railcar suspension, hitches, engine, etc.

1.3 Project Construction Activities and Phasing

For analysis purposes, construction is assumed to occur over approximately 34 months beginning in the third quarter of 2025 and ending in the third quarter of 2028. The entirety of BIG's construction activities, including offsite improvements, are analyzed in this report and described below. The anticipated construction phase timing is shown in **Table 3: BIG Construction Schedule**. However, the current construction schedule anticipates that BIG construction would begin approximately August 2026, and end approximately July 2029, for an approximate 13-month shift from the schedule shown in **Table 3: BIG Construction Schedule** and analyzed in this technical report. However, construction duration (34 months) would remain unchanged. Further, given fleet turnover and compliance with increased regulatory requirements, construction and operational air quality emissions would improve over time as is reflected in CalEEMod, the California Air Resource Board's air quality emissions modeling platform.

During peak construction periods, work would be under way at several locations within BIG footprint simultaneously, with overlapping construction of various elements. Construction working hours and the number of workers present at any time would vary depending on the activities being performed. BIG construction would require approximately 8,177 construction workers per year.[14]

Table 3: BIG Construction Schedule

Phase	Start Date	End Date
South Mainlines	8/7/2025	10/2/2026
Intermodal Facility	8/7/2025	1/4/2027
Block Swap Yard	1/22/2026	6/8/2028
North Mainlines	5/27/2027	6/8/2028
Transload Warehouse	2/5/2026	12/6/2027
33 kV Distribution Undergrounding	9/13/2025	5/7/2027
Solar Site	3/20/2026	2/27/2027

Nighttime construction could occur throughout the BIG footprint except where within 300 feet of sensitive receptors (along the 33kv distribution line). To avoid potential noise and vibration impacts from pile driving, BIG proposes to establish a buffer of 1,800 feet for nighttime pile driving and 500 feet for daytime pile driving from sensitive receptors. Additionally, nighttime construction would be necessary for track work adjacent to the existing mainline where lead tracks would tie into the mainline. All construction activities would occur within BIG footprint.

BIG components would involve the following construction activities:

Demolition and Grading

The BIG footprint is primarily vacant, undeveloped land traversed by an existing BNSF railroad and containing scattered residential, commercial, and industrial land uses. Existing land uses within BIG's footprint are listed in **Table 1**: **Existing Land Uses**. All existing land uses not demolished during acquisition to avoid trespassing and safety concerns would be demolished prior to, or during, mass grading. In

[14] Based on 23,200 construction worker "job years"

addition, existing utilities (underground and aboveground) within BIG footprint would be removed or temporarily relocated as needed.

Six culverts/bridges would need to be demolished within the existing BIG footprint. Demolition would involve excavators to break apart bridge abutments and foundations.

Mass grading would occur in one phase across the BIG footprint and require approximately 26 million cubic yards of cut and fill. Mass grading would be typified by large construction equipment establishing the area's general grading contours. For locations supporting future buildings, roadways, or track, mass grading would include watering and compaction of soil to provide a stable subgrade. Earthwork onsite would be balanced, with excess cut from the rail yard being used as fill within the transload warehouse center.

Fine grading would include site-specific grading for the transload warehouse center, as well as finish grading around buildings, parking areas, curb and gutter, etc.

1.4 Construction of Rail Yard (Intermodal Facility and Block Swap Yard)

The likely sequence for BIG rail yard construction (intermodal facility and block swap yard) would include mass grading; compacting the rail bed and internal roadways/parking areas; installing underground improvements/utilities; fine grading; installing crushed rock subballast; laying track and ballast; and installing train signals and communications systems. To reduce construction trucking, BIG would bring rail ties, welded rail, and rail ballast in via train.

Rail yard construction elements would include surface and elevated track work where the track would cross a water feature, a grade-separated roadway crossing for electric hostlers to access (and return from) the transload warehouse center, and installation of an intermodal facility. Major construction activities would include grading and excavation support, underground utility installation, systems construction, bridge construction, and railway systems construction (including trackwork, signaling, and communications). High-mast lights (up to 120 feet in height) would be constructed throughout the rail yard, including foundation work, conduits, and security camera positions. Rail yard construction would also include foundations and tracks for gantry cranes.

Furthermore, the proposed rail yard area would be excavated to result in a nearly-level grade between the east and west ends. With the proposed grading, most of the rail yard would be approximately 30-45 feet below Main Street. Various key BIG elements are also shown below.

Rail materials such as rail ties, welded rails, and ballast would be delivered by train. As noted above, the two existing north mainlines would be protected in place except at the bridge crossings, and two new south mainlines constructed. The south mainlines would be constructed first, and, during the first year of construction, existing rail traffic would use the new south mainlines so that the existing mainlines can be rebuilt and their bridge crossings upgraded. Mainline, rail yard, and lead track construction would utilize a Track-Laying Machine for approximately 20 months to lay track.

Intermodal facility construction would include various administrative and support buildings and substantial paving for the container parking and storage.

1.5 Solar Farm Construction

Solar farm construction, which would occur in a single phase, would require minimal grading to level the site as existing topography is utilized wherever possible and excavation limited primarily to stormwater detention to capture runoff. Fencing would be installed around the solar farm's perimeter of the solar farm, internal drive-aisles would be graded and paved, and the proposed substation would be constructed per SCE standards.

1.6 Construction of Transload Warehouse Center

Construction elements for the transload warehouse center would include grading, over-excavation,[15] footing and foundation excavation and pouring, tilt-up panel concrete construction, parking lot grading and paving, utility installation and undergrounding, and hydrology/drainage improvements.

1.7 Construction of On-Site Bridges and Roadway Improvements

Railroad bridge and roadway construction may use various methods including segmented pre-cast, cast-in-place, box girder or pre-cast, and span-by-span techniques.

Pre-construction activities would occur during final design and would include geotechnical investigations, identification of staging areas, initiation of site preparation and demolition, relocation of utilities, and implementation of temporary, long-term, and permanent road closures. Two bridges would be constructed over Lenwood Channel (BR 6.5D, 6.5E, and BR 6.5F) to enable traffic to flow from either side of Lenwood Channel.

1.8 Construction of Off-Site Rail Improvements

Offsite rail improvements would include clearing and grubbing, bridge crossing construction, ballast placement, track laying, and connection to the mainline. Off-site rail improvements would parallel the existing mainline and primarily be within existing BNSF right-of-way. BIG's rail deliveries of rail ties and ballast would include materials for construction of off-site rail improvement.

1.9 Construction of Off-Site Non-Rail Improvements

Off-site non-rail improvements would include construction of drainage, utility, and roadway improvements.

Drainage. Lenwood Channel improvements would consist of scouring and widening the channel. Construction equipment would be within Lenwood Channel in order to accomplish the widening.

Utilities. Additionally, offsite construction would include utility improvements including the 33kv distribution/Tortilla Substation improvements. Construction processes are anticipated to include clearing and grubbing, saw cuts and demolition of existing pavement, excavation to approximately 10 feet below ground surface, installation of temporary shoring, placement of circuits and distribution lines, fill placement and removal of temporary shoring, and roadway repair.

[15] "Over-excavation" refers to removal and re-compaction of soil.

Roadways/Intersections. A bridge over Lenwood Channel for Main Street would be constructed to replace the existing low water crossing and accommodate widening of Main Street in that immediate area. Additionally, BIG proposes roadway/intersection improvements/modifications, including the installation of traffic signals at various intersections.

Typical construction processes for these offsite non-rail improvements would include clearing and grubbing, over-excavation, bridge construction, traffic signals with associated underground conduits and cabling, and restriping and asphalt or concrete pavement placement, where needed.

2.0 LAWS, REGULATIONS, ORDERS

2.1 Federal

United States Environmental Protection Agency

The United States Environmental Protection Agency (U.S. EPA) is responsible for establishing the National Ambient Air Quality Standards (NAAQS), enforcing the Federal Clean Air Act (FCAA, 42 United States Code [USC] § 7401), and regulating transportation-related emission sources under the exclusive authority of the federal government, such as aircraft, ships, and certain types of locomotives. The U.S. EPA also establishes vehicular emission standards, including those for vehicles sold in states other than California. Automobiles sold in California must meet stricter emission standards established by the California Air Resources Board (CARB).

Federal Clean Air Act

The FCAA, codified in Title 42, Chapter 85 of the USC, was initially established by the United States (U.S.) Congress in 1970 and substantially revised in 1977 and 1990 (U.S. EPA, 2025f). The FCAA requires the U.S. EPA to establish and periodically update the primary and secondary NAAQS for the following criteria air pollutants: ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter (PM) with diameters of 10 and 2.5 micrometers or less (PM_{10}, $PM_{2.5}$, respectively), and lead (Pb). Primary standards are designed to protect public health, including sensitive individuals, such as children and the elderly, whereas secondary standards are designed to protect public welfare, such as visibility and crop or material damage. Applicable NAAQS and California Ambient Air Quality Standards (CAAQS) (discussed further in **Section 2.2: State** below) are summarized in **Table 4: CAAQS and NAAQS .**

Table 4: CAAQS and NAAQS

Pollutant	Averaging Time	State Standards[1, 2]	National Standards[3, 4, 5]
Ozone (O_3) [6]	1 Hour	0.09 ppm (180 µg/m^3)	NA
	8 Hour	0.070 ppm (137 µg/m^3)	0.070 ppm (137 µg/m^3)
Particulate Matter (PM_{10}) [7]	24-Hour	50 µg/m^3	150 µg/m^3
	Annual Arithmetic Mean	20 µg/m^3	NA
Fine Particulate Matter ($PM_{2.5}$) [7]	24-Hour	NA	35 µg/m^3
	Annual Arithmetic Mean	12 µg/m^3	9.0 µg/m^3
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)
	8 Hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)
Nitrogen Dioxide (NO_2) [8]	1 Hour	0.18 ppm (339 µg/m^3)	0.100 ppm[10]
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)
Sulfur Dioxide (SO_2) [9]	1 Hour	0.25 ppm (655 µg/m^3)	0.075 ppm (196 µg/m^3)
	24 Hour	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)
	Annual Arithmetic Mean	NA	0.03 ppm (80 µg/m^3)
Lead (Pb) [10, 11]	30-Day Average	1.5 µg/m^3	NA
	Calendar Quarter	NA	1.5 µg/m^3
	Rolling 3-Month Average	NA	0.15 µg/m^3
Sulfate (SO_4^{-2})	24 Hour	25 µg/m^3	NA
Hydrogen Sulfide (H_2S)	1 Hour	0.03 ppm (42 µg/m^3)	NA

Table 4: CAAQS and NAAQS			
Pollutant	**Averaging Time**	**State Standards[1, 2]**	**National Standards[3, 4, 5]**
Vinyl Chloride (C_2H_3Cl) [10]	24 Hour	0.01 ppm (26 µg/m^3)	NA

ppm = parts per million; µg/m^3 = micrograms per cubic meter; mg/m^3 = milligrams per cubic meter; NA = not applicable

Notes:

1 California standards for O_3, carbon monoxide (except Lake Tahoe), sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, suspended particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2 Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25° C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25° C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

3 National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.

4 Any equivalent measurement method which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.

5 National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

6 On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

7 On February 7, 2024, the national annual $PM_{2.5}$ primary standard was lowered from 12.0 µg/m^3 to 9.0 µg/m^3. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standard of 15.0 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

8 To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

9 On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. Note that the 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

10 The ARB has identified lead and vinyl chloride as "toxic air contaminants" with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

11 The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m^3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

Sources: California Air Resources Board. 2024 (July). *Table of Ambient Air Quality Standards.*

Based on monitoring of ambient concentrations, areas where concentrations of regulated pollutants exceed the applicable NAAQS are designated as "nonattainment areas". The severity of nonattainment is classified as (ranging from least to worst air quality) "marginal", "moderate", "serious", "severe", or "extreme". Nonattainment areas that are classified as "serious" or worse are required to develop air quality management plans (AQMPs) which include specific emission reduction strategies to meet interim milestones in implementing emission controls and improving air quality. The U.S. EPA can withhold certain transportation funds from states that fail to comply with the planning requirements of the act.

Mobile Source Air Toxics

In addition to the criteria pollutants for which there are NAAQS, the U.S. EPA regulates mobile source air toxics. In February 2007, the U.S. EPA finalized a rule (Control of Hazardous Air Pollutants (HAPs) from Mobile Sources, February 9, 2007 [40 Code of Federal Regulations [CFR] Parts 59, 80, 85, and 86]) to

reduce HAPs from mobile sources (U.S. EPA, 2007, p. 4). The rule limits the benzene content of gasoline and reduces toxic emissions from passenger vehicles and gas cans. The U.S. EPA estimates that in 2030 this rule would reduce total emissions of mobile source air toxics by 330,000 tons and volatile organic compound (VOC) emissions (precursors to O_3 and $PM_{2.5}$) by more than 1 million tons. The latest revision to this rule occurred in October 2008. This revision added specific benzene control technologies that the previous rule did not include. There are no NAAQS or CAAQS for mobile source air toxics. Specifically, U.S. EPA has not established NAAQS for HAPs.

National Emission Standards for Hazardous Air Pollutants

Pursuant to the FCAA, the U.S. EPA established the National Emission Standards for Hazardous Air Pollutants (40 CFR Part 61), technology-based source-specific regulations limiting allowable emissions of HAPs (U.S. EPA, 2025d). Among these sources include asbestos-containing building materials. National Emission Standards for HAPs include requirements pertaining to the inspection, notification, handling, and disposal of asbestos-containing building materials associated with demolition and renovation of structures.

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines (40 CFR Part 89). Tier 1 standards were phased in from 1996 to 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in from 2001 to 2006. Tier 3 standards were phased in from 2006 to 2008. Tier 4 standards, which generally require add-on emission control equipment to attain them, were phased in from 2008 to 2015. These standards apply to construction and cargo-handling equipment, but not locomotives (U.S. EPA, 2008a).

Emission Standards for Locomotives

To reduce emissions from switcher and line-haul locomotives, the U.S. EPA established a series of increasingly stricter emission standards for new or remanufactured locomotive engines (40 CFR Parts 85, 89, and 92). The standards have been adopted by the U.S. EPA in two regulatory actions. On December 17, 1997, the U.S. EPA adopted the first emissions regulation for railroad locomotives, requiring locomotive engines manufactured or remanufactured from 1973 to 2001 to meet Tier 0 standards, 2002 to 2004 to meet Tier 1 standards, and 2005 and later to meet Tier 2 standards (U.S. EPA, 1998). Subsequently, on March 14, 2008, the U.S. EPA adopted more stringent emissions regulation for railroad locomotives (U.S. EPA, 2008b). The regulation sets new emissions standards for newly-built and remanufactured locomotive engines. The standards for newly-built locomotive engines are implemented in two tiers: Tier 3 standards took effect in 2011 and 2012, and Tier 4 standards took effect in 2015. The regulation also sets new emissions standards for remanufactured Tier 0, 1, and 2 locomotive engines, which was fully implemented by 2010.

Emission Standards for Heavy-Duty Trucks

To reduce emissions from heavy-duty diesel trucks, U.S. EPA established a series of increasingly stricter emission standards for new engines, starting in 1988 (40 CFR § 86.1811-04). The U.S. EPA promulgated

the final standards with the 2007 Heavy-Duty Highway Rule (U.S. EPA, 2001). Beginning with model year (MY) 2007, the PM emission standard of 0.01 gram per horsepower-hour is required for all new on-road, heavy-duty diesel engines. Since 2010, the nitrogen oxides (NO_X) and nonmethane hydrocarbon standards of 0.20 gram per horsepower-hour and 0.14 gram per horsepower-hour, respectively, have been fully applicable to new on-road, heavy-duty diesel engines. The U.S. EPA released the Greenhouse Gas (GHG) Emissions Standards for Heavy-Duty Vehicles – Phase 3 in March 2024. The final rule is effective as of June 21, 2024. The final rule promulgates new GHG emissions standards for MY 2032 and later heavy-duty highway vehicles, phasing in starting with MY 2027 for heavy-duty vehicles (40 CFR §§ 86, 1036, 1037, 1039, 1054, and 1065) (U.S. EPA, 2025c).

In response to President Trump's "Unleashing American Energy" Executive Order, published on January 20, 2025, the U.S. EPA announced its intention to reconsider regulations and actions that rely on the 2009 GHG Endangerment Finding (Endangerment Finding) on March 12, 2025, including the GHG Emissions Standards for Heavy-Duty Vehicles – Phase 3.

Non-road Diesel Fuel Rule

The U.S. EPA's Non-road Diesel Fuel Rule (40 CFR Title Part 89) sets sulfur limitations for non-road diesel fuel, including fuel used in locomotives and marine vessels (though not for the marine residual fuel used by very large engines on oceangoing vessels). This rule applies to line-haul locomotives; the California Diesel Fuel Regulations (described below) generally preempt this rule for other sources such as switcher locomotives, construction equipment, and cargo-handling equipment. Under this rule, the diesel fuel used by line-haul locomotives was limited to 500 ppm starting June 1, 2007; and was further limited to 15 ppm starting January 1, 2012 (U.S. EPA, 2004b).

Highway Diesel Fuel Rule

With this rule (40 CFR 80 Subpart 1), U.S. EPA set sulfur limitations for on-road diesel fuel to 15 ppm starting June 1, 2006 (U.S. EPA, 2001).

Corporate Average Fuel Economy Standards

The National Highway Traffic and Safety Administration (NHTSA) is responsible for establishing vehicle standards and for revising existing standards. Compliance with federal fuel economy standards is not determined by individual vehicle model. Rather, compliance is determined based on each manufacturer's average fuel economy for the portion of their vehicles produced for sale in the U.S. On June 7, 2024, the NHTSA finalized their Corporate Average Fuel Economy Standards (CAFE) standards for model years 2030 to 2035 (49 USC § 32902). The final rule requires an industry-wide fuel average of approximately 50.4 miles per gallon (mpg) for passenger cars and light-duty trucks and an industry fleet-wide average for heavy-duty pickup trucks and vans of roughly 2.851 gallons per 100 miles in model year 2035 (NHTSA, 2024).

In response to President Trump's "Unleashing American Energy" Executive Order, published on January 20, 2025, the U.S. EPA announced on March 12, 2025, of its intention to reconsider regulations and actions that rely on the 2009 Endangerment Finding. This includes the CAFE standards. On June 6, 2025, the

NHTSA published an interpretive rule that establishes the NHTSA's authority to revise the CAFE standards without consideration of EVs. Implementation of these standards remains uncertain.

2.2 State

CARB and California Clean Air Act

Approved in 1967, the Mulford-Carrell Air Resources Act[16] established CARB and the CAAQS; these standards are shown numerically in **Table 4** above. Like the U.S. EPA, CARB also designates areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the California Clean Air Act (CCAA), areas are designated as nonattainment for a pollutant if air quality data shows that a CAAQS for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events such as wildfires, volcanoes, etc. are not considered violations of a CAAQS, and are not used as a basis for designating areas as nonattainment. The CAAQS, included with the NAAQS in **Table 4**, are generally more stringent and apply to more pollutants than the NAAQS. In addition to the criteria pollutants, CAAQS have been established for visibility reducing particulates, hydrogen sulfide, and sulfates.

California is divided into 15 air basins. Responsibility for the management and control of air pollutant standards, emissions, and plans is delegated to thirty-five Air Pollution Control Districts (ZE) or Air Quality Management Districts (AQMD). The General Plan Area and BIG footprint are located in the Mojave Desert Air Basin (MDAB) under the jurisdiction of the Mojave Desert Air Quality Management District (MDAQMD).

The CCAA requires APCDs and AQMDs in the State to aim to achieve and maintain CAAQS by the earliest practical date and to develop AQMPs and regulations specifying how the districts will meet this goal. California law does not require that CAAQS be met by specified dates as is the case with NAAQS. Rather, according to CARB, it requires incremental progress toward attainment (CARB, NDb). California law continues to mandate CAAQS, although attainment of the NAAQS has precedence over attainment of the CAAQS due to federal penalties for failure to meet federal attainment deadlines (CARB, NDb). The AQMPs also serve as the basis for preparation of the State Implementation Plan (SIP) for meeting NAAQS.

The CAAQS are generally stricter than NAAQS for the same pollutants, refer to **Table 4** above. Similar to the federal process, the CAAQS are adopted after review by CARB staff of the scientific literature produced by agencies such as the Office of Environmental Health Hazard Assessment (OEHHA), the air monitoring methods, and atmospheric sciences appointed by the Office of the President of the University of California, and public review and comment. The CAAQS are set at levels determined to be protective of human health.

CARB is responsible for meeting requirements of the FCAA, administering the CCAA, and maintaining the CAAQS. CARB is also responsible for setting emission standards for vehicles sold in California and for other

[16] The Mulford-Carrell Air Resources Act was approved in 1967 and created the CARB, committing California to a unified, statewide approach to aggressively address the serious issue of air pollution in the State.

emission sources, such as consumer products and certain off-road equipment. CARB also establishes passenger vehicle fuel specifications.

State Implementation Plan

The FCAA requires all states to submit a SIP to the U.S. EPA. This Statewide SIP is often referred to as an "infrastructure" SIP. Infrastructure SIPs are administrative in nature and describe the authorities, resources, and programs a state has in place to implement, maintain, and enforce the federal standards. It does not contain any proposals for emission control measures.

In addition to infrastructure SIPs, the CCAA requires submissions of SIPs for areas that are out of compliance with the NAAQS. These area attainment SIPs are comprehensive plans that describe how an out-of-compliance area will attain and maintain the particular NAAQS standard(s) it does not conform to. Once an out-of-compliance area has attained the standard in question, a maintenance SIP is required for a period of time to ensure the area will continue to meet the standard.

SIPs are not single documents. They are a compilation of new and previously submitted plans, programs (such as monitoring, modeling, permitting, etc.), district rules, State regulations, and federal controls. Many of California's SIPs rely on the same core set of control strategies, including emission standards for cars and heavy trucks, fuel regulations, and limits on emissions from consumer products. State law makes CARB the lead agency for all purposes related to SIPs. Local air districts and other agencies prepare SIP elements and submit them to CARB for review and approval. CARB forwards those revisions to the U.S. EPA for approval and publication in the Federal Register. The latest SIPs for the MDAB are described below.

Toxic Air Contaminants

The California Air Toxics Program, administered by CARB, is an established two-step process of risk identification and risk management to address potential health effects from exposure to toxic substances in the air. In the risk identification step, CARB and OEHHA determine if a substance should be formally identified, or "listed" as a toxic air contaminant (TAC) in California. In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce risk. Based on results of that review, CARB has promulgated a number of Airborne Toxic Control Measures, both for stationary and mobile sources, including On-Road and Off-Road Vehicle Rules. These Airborne Toxic Control Measures include measures such as limits on heavy-duty diesel motor vehicle idling and emission standards for off-road diesel construction equipment to reduce public exposure to diesel particulate matter (DPM) and other TACs. These actions are also supplemented by the Assembly Bill (AB) 2588 Air Toxics "Hot Spots" program and Senate Bill (SB) 1731, which require facilities to report their air toxics emissions, assess health risks, notify nearby residents and workers of significant risks if present, and reduce their risk through implementation of a risk management plan.

Tanner Air Toxics Act and Air Toxics Hot Spot Information and Assessment Act

Public exposure to TACs is a significant environmental health issue in California. In 1983, the California legislature enacted a program to identify the health effects of TACs and reduce exposure to them. The California Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an

increase in mortality or in serious illness, or which may pose a present or potential hazard to human health" (17 California Code of Regulations [CCR] § 93000). A substance that is listed as a HAP pursuant to section 112(b) of the FCAA (42 USC § 7412[b]) is a TAC. Under State law, the California Environmental Protection Agency, acting through CARB, is authorized to identify a substance as a TAC if it is an air pollutant that may cause or contribute to an increase in mortality or serious illness, or may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) B 1807 (Tanner Air Toxics Act) and AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987). AB 1807 set up a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit that TAC. If there is a safe threshold for a substance (i.e., a point below which there is no toxic effect), the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate "toxics best available control technology" to minimize emissions. To date, CARB has established formal control measures for 11 TACs that are identified as having no safe threshold.

Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the AQMD or APCD. High-priority facilities are required to perform a health risk assessment (HRA), and if specific thresholds are exceeded, are required to communicate the results to the public through notices and public meetings.

CARB has promulgated the following specific rules to limit TAC emissions:

- **13 CCR Chapter 10 § 2485: Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling.** Regulation generally restricting on-road diesel-powered commercial motor vehicles with a gross vehicle weight rating of greater than 10,000 pounds from idling more than five minutes.
- **13 CCR Chapter 10 § 2480: Airborne Toxic Control Measure to Limit School Bus Idling and Idling at Schools.** Generally, restricts a school bus or transit bus from idling for more than five minutes when within 100 feet of a school.
- **13 CCR § 2477 and Article 8: Airborne Toxic Control Measure for In-Use Diesel-Fueled Transport Refrigeration Units (TRU) and TRU Generator Sets and Facilities Where TRUs Operate.** Regulations established to control emissions associated with diesel-powered TRUs.

1998 Fleet Average Emissions Memorandum of Mutual Understanding

California adopted the 1994 California State Implementation Plan (1994 SIP) to attain the federal O_3 air quality standard in the South Coast Nonattainment Area and certain other areas of California. The 1994 SIP control measure M14 assumes that cleaner locomotives will operate in California and the Ports of Los Angeles and Long Beach. CARB, Class I freight railroads operating in the South Coast Air Basin (SCAB) (BNSF Railway [BNSF] and Union Pacific Railroad), and the U.S. EPA signed a Memorandum of Mutual Understanding (MOMU) in July 1998 (CARB, 1998). The goal of the MOMU was a fleet average in the SCAB equivalent to U.S. EPA's Tier 2 locomotive standard for NO_X by 2010. The railroads demonstrated that they have not exceeded Fleet Average Target for the preceding year by operating locomotive fleets that on average meet a Tier 2 NO_X emissions standard by 2010 and through 2030. Under the MOMU, early

reductions were bankable, and the two railroads made use of this feature by building up emissions credits toward the 2010 fleet-wide average. BNSF is meeting fleet average agreement as of 2021 (CARB, 2022).

2005 CARB/Railroad Statewide Agreement

On June 30, 2005, CARB entered into a pollution reduction agreement with Union Pacific Railroad and BNSF (CARB, 2005b). The Agreement's key elements include a Statewide idling-reduction program, health risk assessments (HRAs) for all major rail yards, and community and air district involvement in the preparation of risk assessments, enforcement of Agreement provisions, and evaluation and development of measures to further reduce impacts on local communities. The Agreement is also intended to maximize the use of low sulfur diesel in locomotives fueled in California, establish a Statewide visible emissions reduction and repair program, provide a detailed evaluation of advanced control measures, and include an assessment of remote sensing technology to identify high-emitting locomotives. Railroads committed to implementing numerous actions to reduce pollutant emissions from rail operations throughout the state. In addition, the railroads prepared designated rail yard emissions inventories that CARB used for CARB rail yard-specific HRAs of exposure to DPM. When fully implemented, the agreement is expected to achieve a 20 percent reduction in locomotive DPM emissions near rail yards. To do this, BNSF has:

- Phased-out non-essential idling and installed idling reduction devices on California-based locomotives, resulting in a reduction in idling earlier than what is required by regulation.
- Maximized the use of ultra-low sulfur (15 ppm) diesel fuel by January 1, 2007, for locomotives fueled in California, six years before such fuel was required by regulation.
- Implemented a system-wide Opacity Management Plan which identifies black smoke from locomotives and schedules these locomotives for repairs.
- Identified and expeditiously repaired locomotives with excessive smoke and ensured that at least 99 percent of the locomotives operating in California passed smoke inspections.

The Southern California Major Class I rail yards covered in the agreement include BNSF's Hobart, Watson, San Bernardino, Commerce Eastern, and Sheila Street yards. As required by the Railroad Statewide Agreement, BNSF has submitted an *Idling, Visible Emission Reduction Plan, Review of Impacts of Air Emissions,* and *Assessment of TACs*, among other elements, for the designated yards. CARB inspects the rail yards yearly for compliance.

California Diesel Fuel Regulations

CARB's California Diesel Fuel Regulations (13 CCR §§ 2281 – 2285, 2299-2299.5) set sulfur limitations for diesel fuel sold in California for use in on-road and off-road motor vehicles. Although originally excluded from the rule, harbor craft and intrastate locomotives were later included by a 2004 rule amendment. Under this rule, diesel fuel used in motor vehicles was originally limited to 500 ppm sulfur and ultimately to 15 ppm beginning September 1, 2006. A federal diesel rule similarly limited sulfur content nationwide for on-road vehicles to 15 ppm beginning October 15, 2006. Diesel fuel used in intrastate locomotives (switch locomotives) was limited to 15 ppm sulfur starting January 1, 2007 (CARB, 2014).

Heavy Duty Diesel Truck Idling Regulation

This CARB rule (13 CCR § 2485) requires that heavy-duty trucks idle for no longer than five minutes at a time. However, truck idling for longer than five minutes while queuing is allowed if the queue is beyond 100 feet from any homes or schools (CARB, NDh).

Measures to Reduce Emissions from Goods Movement Activities

In April 2006, the CARB approved the *Emissions Reduction Plan for Ports and Goods Movement in California* (CARB, 2006). The *Emissions Reduction Plan for Ports and Goods Movement in California* proposes measures that would reduce emissions from the main sources associated with port cargo handling activities, including ships, harbor craft, terminal equipment, trucks, and locomotives. The *Goods Movement Plan* includes discussion of Hobart and intermodal container transfer facilities. In December 2006, CARB approved the *Regulation for Mobile Cargo Handling Equipment at Ports and Intermodal Rail Yards* (Title 13, CCR § 2479) as amended in 2009, which is designed to use best available control technology to reduce diesel PM and NO_X emissions from mobile cargo-handling equipment at ports and intermodal rail yards. Since January 1, 2007, the regulation has imposed emission standards on new and in-use terminal equipment that vary by equipment type. The regulation also includes recordkeeping and reporting requirements.

CARB Portable Diesel-Fueled Engines Air Toxic Control Measure

Effective September 12, 2007, all portable engines having a maximum rated horsepower of 50 brake horsepower and greater and fueled with diesel shall comply with this regulation and meet weighted fleet average PM emission standards (17 CCR § 93116.1). The first fleet standard compliance date was in 2013 with incremental compliance dates set through 2020.

Requirements for Intrastate Locomotive Fuel Use

CARB approved new requirements for intrastate locomotive fuel use on November 18, 2004 (17 CCR § 2299). Effective January 1, 2007, diesel fuel sold for diesel-electric locomotives operating in California is subject to all of the requirements of Title 13 CCR §§ 2281 (sulfur content), 2282 (aromatic hydrocarbons content), and 2284 (lubricity) applicable to vehicular diesel fuel and is treated under those sections as if it were vehicular diesel fuel. Intrastate locomotives are defined as locomotives that spend at least 90 percent of their time on an annual basis operating and refueling within California boundaries (CARB, 2004).

In-Use Off-Road Diesel Vehicle Regulation

On July 26, 2007, CARB adopted a regulation to reduce diesel PM and NO_X emissions from in-use (existing) off-road heavy-duty diesel vehicles in California (13 CCR § 2449). The regulation applies to self-propelled diesel-fueled vehicles that cannot be registered and licensed to drive on-road, as well as two-engine vehicles that drive on the road, with the limited exception of two-engine sweepers. Examples include loaders, crawler tractors, skid steers, backhoes, forklifts, airport ground support equipment, water well drilling rigs, and two-engine cranes. Such vehicles are used in construction, mining, and industrial operations. The regulation does not apply to stationary equipment or portable equipment such as

generators. The off-road vehicle regulation establishes emissions performance requirements, establishes reporting, disclosure, and labeling requirements for off-road vehicles, and limits unnecessary idling.

In-Use Locomotive Regulation

CARB adopted the In-Use Locomotive Regulation on April 27, 2023 (13 CCR § 2478). Implementation of the regulation would reduce emissions from locomotives operating in California by requiring locomotive operators to fund a spending account based on the public health costs to Californians from locomotive emissions and activity levels. Locomotive operators may use funds held in the spending account to purchase cleaner locomotive technologies. The regulation prohibits locomotives with engine build dates 23 years and older from operating in California starting in 2030. The In-Use Locomotive Regulation, starting in 2030, also requires that switch, industrial and passenger locomotives with original engine build dates of 2030 or later operate in a zero-emission (ZE) configuration in California. Additionally, in 2035, line haul locomotives with original engine build dates of 2035 or later must operate in a ZE configuration in California. The regulation will achieve emission reductions that will minimize health risk associated with exposure to toxic and criteria pollutants, help meet federal air quality standards, and support California's GHG reduction goals. The regulation also increases the use of ZE technology in the off-road sector and support the goals of Executive Order N-79-20 (Executive Department State of California, 2020).

As the In-Use Locomotive Regulation would be more stringent than federal standards, CARB needed to obtain approval from the U.S. EPA. On January 13, 2025, CARB withdrew their requests for FCAA waivers from the U.S. EPA needed to support four recently adopted vehicle emissions regulations: (1) the Advanced Clean Fleets (ACF) Regulations; (2) the In-Use Locomotive Regulations; (3) part of the Commercial Harbor Craft and Ocean-Going Vessels At-Berth Regulations; and (4) part of the TRU Engine Standards Regulations. Therefore, these regulations will not be implemented.

CARB Statewide Truck and Bus Regulation

In December 2008, CARB adopted the Statewide Truck and Bus Regulation that requires installation of PM retrofits on all on-road heavy-duty trucks and buses beginning January 1, 2012, and replacement of older trucks starting January 1, 2015 (13 CCR § 2025). By January 1, 2023, all vehicles need to have model year 2010 engines or equivalent.

California Drayage Truck Regulation

CARB adopted a drayage truck regulation (13 CCR § 2027) effective December 2009 to reduce emissions of diesel PM, NO_X, and other air contaminants from all on-road class 7 and class 8 diesel-fueled trucks that transport cargo to and from California's ports and intermodal rail yards. The regulation requires owners to register their trucks in the Drayage Truck Registry and to comply with emissions standards by a phase-in schedule. As of January 1, 2023, this regulation ended and all affected vehicles need to comply with the CARB Statewide Truck and Bus Rule, which requires all drayage trucks and other regulated vehicles in this category to have model year 2010 engines or equivalent (CARB, 2011).

CARB Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Trucks (ACT) Regulation (13 CCR § 1963) in June 2020 requiring manufacturers to transition from diesel trucks and vans to ZE trucks beginning in 2024. By 2045, every new truck sold in California is required to be ZE. The goal of the ACT regulation is to achieve NO_X and GHG emission reductions through advanced clean technology, and to increase the penetration of the first wave of ZE heavy-duty technology. The ACT Regulation accelerates the transition of ZE medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- ZE Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell ZE trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, ZE truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.
- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers, and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available ZE trucks and place them in service where suitable to meet their needs.

The ACT regulation was granted a separate waiver in 2023 by the Biden administration. On May 22, 2025, the U.S. Senate voted to revoke the waiver granted by the Biden administration for California's ACT rule (as well as the ACC II program and Heavy-Duty Omnibus regulation). On June 12, 2025, President Trump formally nullified California's ACT rule and ACC II program (Congressional Resolutions H.J. Res 87 and H.J. Res 88, respectively). California currently has no authority to implement ACT.

CARB Advanced Clean Fleets Regulation

CARB adopted the ACF Regulation (13 CCR § 2013, 2014, & 2015) in April 2023, requiring the use of ZEVs for targeted fleets and that manufacturers only produce ZEV trucks starting in 2036. The ACF regulation was adopted to complement the recently adopted ACT regulation to help advance the introduction of ZE technology into California's trucks and bus fleets. By 2050, the ACF regulation is expected to introduce 1,690,000 ZEVs into the California fleet and result in $26.5 billion in statewide health benefits from improved air quality. This regulation will help contribute to the goals set by Executive Order N-79-20 (described further below) and will help achieve emission reductions outlined in the State Implementation Plan, SB 350, AB 32, SB 32, and AB 32. The regulation has four components including a manufacturer sales mandate, drayage fleets requirements, high priority and federal fleets phase-in, and state and local agency procurement requirement.

On January 13, 2025, CARB withdrew their requests for FCAA waivers from the U.S. EPA needed to support four recently adopted vehicle emissions regulations: (1) the ACF Regulations; (2) the In-Use Locomotive Regulations; (3) part of the Commercial Harbor Craft and Ocean-Going Vessels At-Berth Regulations; and (4) part of the Transport Refrigeration Unit Engine Standards Regulations. In addition, on September 25, 2025, CARB repealed the ACF drayage truck requirements (13 CCR § 2014) and the high priority and

federal fleet requirements (13 CCR § 2015 through 2015.6). California currently has no authority to implement ACF.

California Surplus Off-Road Opt-In for NO_X

The Surplus Off-Road Opt-In for NO_X Program was originally adopted with the Statewide regulation for In-Use Off-Road Diesel Vehicles (Off-Road Rule) in 2008 and applies to any AQMD or APCD whose governing board elected to opt into the provision of the program. The Surplus Off-Road Opt-In for NO_X Program requires applicable fleets to meet a more stringent fleet average NO_X target than the statewide Off-Road Rule on a compliance schedule (CARB, NDf).

SB 535

SB 535 directs 25 percent of the proceeds from the GHG Reduction Fund (i.e., funds from the AB 32 cap-and-trade program) to go to projects that provide a benefit to disadvantaged communities (as identified by the OEHHA mapping). These funds must be used for programs that further reduce GHG emissions. Funding programs that reduce GHG emissions would also potentially reduce exposure to other emissions including criteria pollutants and TACs.

OEHHA has developed CalEnviroScreen 4.0, which is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects. CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the state. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores. It should be noted that the CalEnviroScreen scores are not an expression of health risk, and do not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment.

California Asbestos Control Measures

CARB has adopted two Airborne Toxic Control Measures for controlling naturally occurring asbestos (NOA)—the Asbestos Airborne Toxic Control Measure for Surfacing Applications (CCR, Title 17, § 93106) and the Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations (CCR, Title 17, § 93105). U.S. EPA is also responsible for enforcing regulations relating to asbestos renovations and demolitions; however, U.S. EPA can delegate this authority to state and local agencies. CARB and local air districts have been delegated authority to enforce the Federal National Emission Standards for HAPs regulations for asbestos.

2.3 Regional

The State is divided into APCDs/AQMDs. These agencies are county or regional governing authorities that have primary responsibility for controlling air pollution from stationary sources. CARB and local air districts are also responsible for developing clean air plans to demonstrate how and when California will attain AAQS established under both the FCAA and CCAA. For the areas within California that have not attained

air quality standards, CARB works with air districts to develop and implement State and local attainment plans. In general, attainment plans contain a discussion of ambient air quality data and trends; a baseline emissions inventory; future year projections of emissions, which account for growth projections and already adopted control measures; a comprehensive control strategy of additional measures needed to reach attainment; an attainment demonstration, which generally involves complex modeling; and contingency measures. Plans may also include interim milestones for progress toward attainment. The MDAB is managed by the MDAQMD. The MDAQMD is geographically the second largest of the State's 35 air districts. MDAQMD operates and maintains six monitoring stations (Barstow, Hesperia, Phelan, Trona, Twentynine Palms, and Victorville) in the District's 20,000-square-mile jurisdiction. In general, MDAQMD is the agency responsible for ensuring that the NAAQS and CAAQS are attained and maintained in the MDAB and is responsible for:

- Adopting and enforcing rules and regulations concerning air pollutant sources.
- Issuing permits for stationary sources of air pollutants.
- Inspecting stationary sources of air pollutants.
- Responding to citizen complaints.
- Monitoring ambient air quality and meteorological conditions.
- Awarding grants to reduce motor vehicle emissions.
- Conducting public education campaigns.

Mojave Desert Air Quality Management District

The MDAQMD has jurisdiction over the air quality in the vicinity of the BIG footprint. MDAQMD is the air pollution control agency for San Bernardino County's (County) High Desert and Riverside County's Palo Verde Valley. MDAQMD implements air quality programs required by federal and state mandates, enforces rules and regulations based on air pollution laws and educates businesses and residents about their role in protecting air quality and the risks of air pollution.

Table 5: Federal and State Ambient Air Quality Attainment Status of the MDAB lists the attainment status for various criteria air pollutants in the MDAB. Areas that meet the AAQS are classified as attainment areas, while areas that do not meet these standards are classified as nonattainment areas. Areas for which there are insufficient data available are designated unclassified. As shown in **Table 5**, the BIG footprint is a federal nonattainment area for O_3 and PM_{10} and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The BIG footprint is classified as attainment or unclassified for lead, visibility reducing particles, sulfates, hydrogen sulfide, and vinyl chloride.

Table 5: Federal and State Ambient Air Quality Attainment Status of the MDAB		
Pollutant	**State**	**Federal**
Ozone (O_3) (1 Hour Standard)	Nonattainment	No Federal Standard
Ozone (O_3) (8 Hour Standard)	Nonattainment	Severe Nonattainment
Particulate Matter ($PM_{2.5}$) (24 Hour Standard)	–	Unclassified/Attainment
Particulate Matter ($PM_{2.5}$) (Annual Standard)	Nonattainment	Unclassified/Attainment
Particulate Matter (PM_{10}) (24 Hour Standard)	Nonattainment	Nonattainment
Particulate Matter (PM_{10}) (Annual Standard)	Nonattainment	Nonattainment
Carbon Monoxide (CO) (1 Hour Standard)	Attainment	Unclassified/Attainment
Carbon Monoxide (CO) (8 Hour Standard)	Attainment	Unclassified/Attainment
Nitrogen Dioxide (NO_2) (1 Hour Standard)	Attainment	Unclassified/Attainment
Nitrogen Dioxide (NO_2) (Annual Standard)	Attainment	Unclassified/Attainment
Sulfur Dioxide (SO_2) (1 Hour Standard)	Attainment	Unclassified/Attainment
Sulfur Dioxide (SO_2) (24 Hour Standard)	Attainment	Unclassified/Attainment
Lead (Pb) (30 Day Standard)	Attainment	Unclassified/Attainment
Lead (Pb) (3 Month Standard)	Attainment	Unclassified/Attainment
Sulfates (SO_{4-2}) (24 Hour Standard)	Attainment	No Federal Standards
Hydrogen Sulfide (H_2S) (1 Hour Standard)	Nonattainment	No Federal Standards

MDAQMD Rules

The MDAQMD has adopted rules to limit air emissions. Many of these rules were put in place as required measures specified in the various SIPs and air quality plans. This evaluation considered seven MDAQMD rules for regulation of fugitive dust and emissions from fossil fuel combustion. Excerpts of these rules are presented below:

Rule 201: Permit to Construct, and Rule 203, Permit to Operate. This rule requires that new or replacement equipment (stationary sources) that generate air pollutant emissions obtain a permit from the MDAQMD prior to their installation (Rule 201) and operation (Rule 203).

Rule 401: Visible Emissions. A person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is:

- As dark or darker in shade as that designated No. 1 on the Ringelmann Chart, as published by the U.S. Bureau of Mines, or
- Of such opacity as to obscure an observer's view to a degree equal to or greater than does smoke described in subsection (a) of this rule.

Rule 402: Nuisance. A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, which cause, or have a natural tendency to cause, injury or damage to business or property.

Rule 403: Fugitive Dust Control.

- Any person shall not cause or allow the emissions of fugitive dust from any transport, handling, construction, or storage activity so that the presence of such dust remains visible in the atmosphere beyond the property line of the emission source. (Does not apply to emissions emanating from unpaved roadways open to public travel or farm roads. This exclusion shall not apply to industrial or commercial facilities).
- A person shall take every reasonable precaution to minimize fugitive dust emissions from wrecking, excavation, grading, clearing of land and solid waste disposal operations.
- A person shall not cause or allow PM to exceed 100 micrograms per cubic meter when determined as the difference between upwind and downwind samples collected on high volume samplers at the property line for a minimum of five hours.
- A person shall take every reasonable precaution to prevent visible PM from being deposited upon public roadways as a direct result of their operations. Reasonable precautions shall include, but are not limited to, the removal of PM from equipment prior to movement on paved streets or the prompt removal of any material from paved streets onto which such material has been deposited.
- Subsections (a) and (c) shall not be applicable when the wind speed instantaneously exceeds 40 kilometers (25 miles) per hour, or when the average wind speed is greater than 24 kilometers (15 miles) per hour. The average wind speed determination shall be on a 15-minute average at the nearest official air-monitoring station or by wind instrument located at the site being checked.
- The provisions of this rule shall not apply to agricultural operations.

Rule 404: PM Concentration.

- A person shall not discharge into the atmosphere from any source, PM except liquid sulfur compounds, in excess of the concentration at standard conditions, shown in Table 404(a). Where the volume discharged is between figures listed in the table, the exact concentration permitted to be discharged shall be determined by linear interpolation.
- The provisions of this rule shall not apply to emissions resulting from the combustion of liquid or gaseous fuels in steam generators or gas turbines.

- For the purposes of this rule, emissions shall be averaged over one complete cycle of operation or one hour, whichever is the lesser time period.

Rule 405: Solid PM Weight.

- A person shall not discharge into the atmosphere from any source, solid PM including Pb and Pb compounds, in excess of the rate shown in Table 405(a). Where the process weight per hour is between figures listed in the table, the exact weight of permitted discharge shall be determined by linear interpolation.
- For the purposes of this rule, emissions shall be averaged over one complete cycle of operation or one hour, whichever is the lesser time period.

Rule 409: Combustion Contaminants. A person shall not discharge into the atmosphere from the burning of fuel, combustion contaminants exceeding 0.23 gram per cubic meter (0.1 grain per cubic foot) of gas calculated to 12 percent of carbon dioxide (CO_2) at standard conditions averaged over a minimum of 25 consecutive minutes.

Rule 431: Sulfur Content of Liquid Fuels. This rule limits the sulfur content in diesel and other liquid fuels for the purpose of reducing the formation of sulfur oxides and particulates during combustion and of enabling the use of add-on control devices for diesel-fueled internal combustion engines. The rule applies to all refiners, importers, and other fuel suppliers such as distributors, marketers, and retailers, as well as to users of diesel, low-sulfur diesel, and other liquid fuels for stationary-source applications in the MDAQMD. The rule also affects diesel fuel supplied for mobile sources.

Rule 1113: Architectural Coatings. Rule 1113 limits the quantity of VOCs in architectural coatings. This rule is applicable to any person who supplies, sells, offers for sale, manufactures, blends or repackages any Architectural Coating for use within the MDAQMD as well as any person who applies or solicits the application of any architectural coating within the MDAQMD. The rule designates a maximum of 50 grams of VOC per liter for flat coatings.

Mojave Desert Air Quality Attainment Plans

O_3 Attainment Plans

- 2023: Federal 70 Parts Per Billion O_3 Attainment Plan (Western Mojave Desert (MD) Nonattainment Area MDAQMD Federal 70 PPB O_3 Attainment Plan (Western Mojave Desert Nonattainment Area). The MDAQMD Federal 70 PPB O_3 Attainment Plan for the 2008 8-hour O_3 NAAQS was adopted on January 23, 2023, and covers the BIG footprint, parts of the County and Antelope Valley within the Western Mojave Desert. The MDAQMD Federal 70 PPB O_3 Attainment Plan includes enforceable emission limits, a monitoring program, a permitting program, and contingency measures to attain the federal 2008 8-hour O_3 standard. The MDAQMD Federal 70 PPB O_3 Attainment Plan addresses several state and federal planning requirements and incorporates new scientific information, primarily in the form of updated emissions inventories, ambient measurements, and meteorological air quality models. The document also demonstrated conformity with the Southern California Association of Governments' (SCAG) 2024 - 2050 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) activity data, discussed further below. The document demonstrates that the MDAQMD will meet the 70 ppb 8-hour O_3 NAAQS by August 2033 (MDAQMD, 2023).

- 2018: Federal Negative Declaration (8-Hour O_3 Standard) for One Control Techniques Guideline Categories
- 2018: Federal Negative Declaration (8-Hour O_3 Standard) for Two Control Techniques Guidelines Categories
- 2015: 8-Hour O_3 Reasonably Available Control Technology SIP Analysis: MDAQMD
- 2015: Federal Negative Declaration (8-Hour O_3 Standard) for Nineteen Control Techniques Guidelines Categories
- 2008: Federal 8-Hour O_3 Attainment Plan (Western MD Nonattainment Area)
- 2006: MDAQMD 2006 8-hr O_3 Reasonably Available Control Technology SIP Analysis
- 2004: 2004 O_3 Attainment Plan (State and Federal)
- 1996: Triennial Revision to the 1991 Air Quality Attainment Plan
- 1994: Reasonable Further Progress Rate-of-Progress Plan
- 1994: Post 1996 Attainment Demonstration and Reasonable Further Progress Plan
- 1991: 1991 Air Quality Attainment Plan

PM Attainment Plans

- 2023: MDAQMD Federal 70 PPB O_3 Attainment Plan (Western Mojave Desert Nonattainment Area). The MDAQMD Federal 70 PPB O_3 Attainment Plan for the 2008 8-hour O_3 NAAQS was adopted on January 23, 2023, and covers the BIG footprint, parts of the County and Antelope Valley within the Western Mojave Desert. The MDAQMD Federal 70 PPB O_3 Attainment Plan includes enforceable emission limits, a monitoring program, a permitting program, and contingency measures to attain the federal 2008 8-hour O_3 standard. The MDAQMD Federal 70 PPB O_3 Attainment Plan addresses several state and federal planning requirements and incorporates new scientific information, primarily in the form of updated emissions inventories, ambient measurements, and meteorological air quality models. The document also demonstrated conformity with the Southern California Association of Governments' (SCAG) 2024 - 2050 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) activity data, discussed further below. The document demonstrates that the MDAQMD will meet the 70 ppb 8-hour O_3 NAAQS by August 2033 (MDAQMD, 2023).
- 2005: MDAQMD Schedule for District Measures to Reduce PM Pursuant to H&S Code 39614(d)1995: MD Planning Area Federal PM Attainment Plan.
- 1994: Final Mojave Desert Planning Area Federal Particulate Matter 10 (PM_{10}) Attainment Plan. On January 20, 1994, the U.S. EPA re-designated a portion of the Mojave Desert[17] as a nonattainment area with respect to the NAAQS for PM_{10} (MDAQMD, 1995, p. 6). This nonattainment area covers a vast geographical region, including the urban areas of Victor Valley and Barstow, the Morongo Basin, along with the rural desert environs reaching to the Nevada and Arizona state lines. The PM_{10} Attainment Plan was prepared in July 1995 to provide a complete description and submittal to U.S. EPA of the PM_{10} attainment planning elements which the MDAQMD will implement to bring the nonattainment area into compliance with federal law. Most

[17] The nonattainment area covers a vast geographical region, including areas of Victor Valley and Barstow, the Morongo Basin, along with the rural desert environs reaching to the Nevada and Arizona state lines.

importantly, the PM_{10} Attainment Plan serves as a planning tool for reducing PM_{10} pollution. The PM_{10} Attainment Plan sets forth an air quality improvement program for the region which will be implemented by both the public and private sector of the community (MDAQMD, 1995, p. 3).

Southern California Association of Governments

On April 4, 2024, SCAG's Regional Council adopted Connect SoCal 2024 (2024 – 2050 RTP/SCS). Connect SoCal 2024 charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The strategy was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The overarching accessibility vision of the SCAG RTP, Connect SoCal, includes innovative technologies and Intelligent Transportation Systems aimed at expanding accessibility, relieving congestion, and reducing emissions (SCAG, 2024b, p.8). Connect SoCal 2024 is a long-range vision plan that balances future mobility and housing needs with economic, environmental, and public health goals. Connect SoCal 2024 subgoals relevant to BIG include supporting investments that result in improved safety and air quality and minimized GHG emissions (Mobility); integrating the region's development pattern and transportation network to improve air quality, reduce GHG emissions, and enable more sustainable use of energy and water (Environment); conserving the region's resources (Environment); improve access to jobs (Economy); and advancing a resilient and efficient goods movement system that supports the economic vitality of the region, attainment of clean air, and quality of life for our communities (Economy) (SCAG, 2024b, p. 85). The SCAG region strives to implement sustainable planning through integrated land use and transportation planning.

South Coast Air Quality Management District

Although BIG is within the MDAQMD's jurisdiction, it would affect truck and train movements that also occur within the South Coast Air Quality Management District's (South Coast AQMD) jurisdiction. The South Coast AQMD is the air pollution control agency for Orange County and the non-desert/urban portions of Los Angeles, Riverside, and San Bernardino Counties. The agency's primary responsibility is ensuring that state and federal AAQS are attained and maintained in the SCAB. The South Coast AQMD developed the 2022 AQMP for the SCAB, with input from SCAG and CARB. The AQMP is a comprehensive plan that includes control strategies for stationary and area sources, as well as for on-road and off-road mobile sources. SCAG has the primary responsibility for providing future growth projections and the development and implementation of Transportation Control Measures[18].

CARB, in coordination with federal agencies, provides the control element for mobile sources. The 2022 AQMP, adopted by the South Coast AQMD Governing Board on December 2, 2022, was developed to address the requirements for meeting the 2015 8-hour O_3 standard. The 2022 AQMP builds upon measures already in place from previous AQMPs. It also includes a variety of additional strategies such as regulation, accelerated deployment of available cleaner technologies (e.g., ZEs technologies, when cost-effective and feasible, and low NO_X technologies in other applications), best management practices, co-

[18] A TCM is any measure that is specifically identified and committed to in the applicable implementation plan for the purpose of reducing emissions or concentrations of air pollutants from transportation sources by reducing vehicle use, changing traffic flow, or congestion conditions.

benefits from existing programs (e.g., climate and energy efficiency), incentives, and other FCAA measures to achieve the 2015 8-hour O_3 standard. The 2022 AQMP incorporates the latest scientific and technological information and planning assumptions, including Connect SoCal 2024 and updated emission inventory methodologies for various source categories.

The South Coast AQMD 2022 AQMP includes the following Transportation Control Measures and Reasonably Available Control Measures[19] that are relevant to BIG:

Measure 7.19, Programs to Encourage Goods Movement by Rail. This measure involves programs to encourage goods movement by rail and indicates that this is being implemented by CARB.

Measure 7.20, Divert Trucks from Nonattainment Areas. This measure aims to divert trucks from nonattainment areas by requiring pass-through trucks to choose routes away from the SCAG region.

2.4 Local

County of San Bernardino Countywide Plan

The County adopted the Countywide Plan (CWP) in October 2020. The CWP Policy Plan addresses the physical, social and economic issues facing the County's unincorporated portions. The CWP includes the following goals and policies relevant to air quality as shown in **Table 6: CWP Policy Plan Relevant Goals and Policies.**

Table 6: CWP Policy Plan Relevant Goals and Policies

Number	Goal or Policy
LAND USE ELEMENT	
Goal LU-2	**Land Use Mix and Compatibility**. An arrangement of land uses that balances the lifestyle of existing residents, the needs of future generations, opportunities for commercial and industrial development, and the value of the natural environment.
Policy LU-2.7	**Countywide jobs-housing balance**. We prioritize growth that furthers a countywide balance of jobs and housing to reduce vehicle miles traveled, increase job opportunities and household income, and improve quality of life. We also strive for growth that furthers a balance of jobs and housing in the North Desert region and the Valley region.
Policy LU-2.10	**Unincorporated commercial development**. We intend that new commercial development in the unincorporated areas serve unincorporated residential areas, tourists, and/or freeway travelers. We encourage new commercial development to be concentrated to enhance pedestrian circulation and reduce vehicular congestion and vehicle miles traveled, with new development directed into existing centralized areas when possible.
Policy LU-2.12	**Office and industrial development in the region**. We encourage office and industrial uses in the unincorporated Valley region in order to promote a countywide jobs-housing balance.
NATURAL RESOURCES ELEMENT	
Goal NR-1	**Air quality that promotes health and wellness of residents in San Bernardino County through improvements in locally-generated emissions.**
Policy NR-1.1	**Land use.** We promote compact and transit-oriented development countywide and regulate the types and locations of development in unincorporated areas to minimize vehicle miles traveled and greenhouse gas emissions.

[19] Reasonably Available Control Measures (RACMs) are measures which may be applicable to a wide range of sources including stationary sources and mobile sources.

Table 6: CWP Policy Plan Relevant Goals and Policies	
Number	**Goal or Policy**
Policy NR-1.2	**Indoor air quality.** We promote the improvement of indoor air quality through the California Building and Energy Codes and through the provision of public health programs and services.
Policy NR-1.3	**Coordination on air pollution.** We collaborate with air quality management districts and other local agencies to monitor and reduce major pollutants affecting the county at the emission source.
Policy NR-1.4	**Military coordination on air quality.** We collaborate with the military to avoid or minimize impacts on military training and operations from air pollution and haze.
Policy NR-1.5	**Sensitive land uses.** We consider recommendations from the California Air Resources Board on the siting of new sensitive land uses and exposure to specific source categories.
Policy NR-1.6	**Fugitive dust emissions.** We coordinate with air quality management districts on requirements for dust control plans, revegetation, and soil compaction to prevent fugitive dust emissions.
Policy NR-1.7	**Greenhouse gas reduction targets.** We strive to meet the 2040 and 2050 greenhouse gas emission reduction targets in accordance with state law.
Policy NR-1.8	**Construction and operations.** We invest in County facilities and fleet vehicles to improve energy efficiency and reduce emissions. We encourage County contractors and other builders and developers to use low-emission construction vehicles and equipment to improve air quality and reduce emissions.
Policy NR-1.9	**Building design and upgrades.** We use the CALGreen Code to meet energy efficiency standards for new buildings and encourage the upgrading of existing buildings to incorporate design elements, building materials, and fixtures that improve environmental sustainability and reduce emissions.
RENEWABLE ENERGY & CONSERVATION ELEMENT	
Goal RE-1	**Energy Conservation and Efficiency.** The County will pursue energy efficiency tools and conservation practices that optimize the benefits of renewable energy.
Policy RE-1.1	Continue implementing the energy conservation and efficiency measures identified in the County of San Bernardino Greenhouse Gas Emissions Reduction Plan.
Policy RE-1.2	Optimize energy efficiency in the built environment. RE 1.2.1: Support low- to no-cost retrofits to improve energy efficiency of existing homes through grant and loan programs. RE 1.1.2: Encourage property owners to participate in a PACE program for access to energy efficiency retrofit financing. RE 1.2.3: Encourage utilities to expand free to low-cost audit and retrofit programs in the built environments. RE 1.2.4: Work with utilities (Southern California Edison (SCE), Southern California Gas Company (SCG), etc.) to identify retrofit opportunities with short payback periods, such as variable-speed pool pumps, building air sealing, and attic insulation, for County use in conducting focused energy efficiency outreach. RE 1.2.5: Collaborate with community partners to promote the benefits of energy efficiency to County residents, businesses, and industries. RE 1.2.6: Encourage new development to comply with the optional energy efficiency measures of the CALGreen Code. RE 1.2.6: Encourage new development to comply with the optional energy efficiency measures of the CALGreen Code.
Policy RE-1.3	Promote the local economic benefits of energy efficiency retrofits. RE 1.3.1: Support workforce development and certification for green trades.

Table 6: CWP Policy Plan Relevant Goals and Policies	
Number	**Goal or Policy**
	RE 1.3.2: Provide networking opportunities to connect local contractors with energy efficiency retrofit programs such as the PACE program and Energy Upgrade California. RE 1.3.3: Encourage energy efficiency retrofit projects as components of adaptive re-use of historic structures.
Policy RE-1.4	Encourage residents and businesses to conserve energy. RE 1.4.1: Collaborate with utilities to support and learn from annual energy benchmarking reports that large energy users are conducting pursuant to AB 1103. RE 1.4.2: Collaborate with the CEC, utilities, and local partners to launch online energy tracking competitions.
Goal RE-2	**Renewable Energy Systems.** The County will be home to diverse and innovative renewable energy systems that provide reliable and affordable energy to our unique Valley, Mountain, and Desert regions.
Policy RE-2.1	Support solar energy generation, solar water heating, wind energy and bioenergy systems that are consistent with the orientation, siting and environmental compatibility policies of the General Plan. RE 2.1.1: Utilize renewable energy development standards in the Development Code to minimize impacts on surrounding properties.
Policy RE-2.2	Promote use of energy storage technologies that are appropriate for the character of the proposed location. RE 2.2.1: Encourage onsite energy storage with RE generation facilities, consistent with County Development Code requirements. RE 2.2.2: Encourage and allow energy storage facilities as an accessory component of RE generation facilities. RE 2.2.3: Establish thresholds for conditions under which energy storage facilities are a primary use and subject to separate permit processes. RE 2.2.4: Periodically review and encourage appropriate technology types for energy storage facilities. RE 2.2.5: Support state policies and efforts by utility companies to plan for and develop energy storage technologies through legislative advocacy and coordination with utility companies.
Policy RE-2.3	Encourage the use of feasible emerging and experimental renewable energy technologies that are compatible with County regulatory standards. RE 2.3.1: Monitor emerging renewable energy technologies and amend County development standards as needed to accommodate suitable new technology types. RE 2.3.2: Monitor improvements in existing renewable energy technologies, and consider allowing additional types of renewable energy facilities as they become compatible with County regulatory standards.
Policy RE-2.4	Identify and prioritize programs that support cost-effective and universal access to renewable energy. RE 2.4.1: Expand outreach and education efforts through the County's online Community Development Toolkit on programs such as the availability of federal and state tax credits, participation in the PACE program, and other mechanisms to reduce the cost of renewable energy facilities for onsite use on new and existing buildings. RE 2.4.2: Educate developers about the County's RE goals and policies, and encourage the inclusion of renewable energy facilities for onsite use in new developments. RE 2.4.3: Engage with residential developers to discuss and identify opportunities and incentives to expand onsite renewable energy facilities consistent with the goals and policies of this Element. RE 2.4.4: Encourage installation of renewable energy systems on rental properties, multi-family

Table 6: CWP Policy Plan Relevant Goals and Policies	
Number	**Goal or Policy**
	buildings, and buildings with multiple commercial tenants by working with property developers and owners, using tools such as green leases, split incentive programs, and the California Solar Initiative's MASH program. RE 2.4.5: Encourage the pursuit of community choice aggregation programs in collaboration with other interested jurisdictions in the region. RE 2.4.6: Proactively coordinate RE programs with other jurisdictions in the County to promote countywide collaboration and consistency.
Policy RE-2.5	Support renewable energy systems that accelerate zero net energy (ZNE) through innovative design, construction, and operations of residences, businesses, and institutions that are grid-neutral and independent of centralized energy infrastructure. RE 2.5.1: Allow and encourage construction of new buildings designed to ZNE standards consistent with state programs. RE 2.5.2: Incorporate ZNE into outreach and educational strategies about renewable energy and energy efficiency. RE 2.5.3: Allow and encourage construction of new buildings or developments in remote locations with stand-alone energy systems not connected to the grid. RE 2.5.4: Encourage energy independence and resiliency, including zero net energy and stand-alone systems not connected to the grid, in County economic development presentations and outreach efforts. RE 2.5.5: Collaborate with incorporated cities and other jurisdictions to create region-specific ZNE programs and Community Development toolkit tools tailored to the climates and characteristics of each region to provide consistency and leverage resources.
Policy RE-2.6	Encourage energy efficiency through appropriate renewable energy systems. RE 2.6.1: Pursue and consider development incentives such as density bonuses and streamlined permitting for projects that install accessory renewable energy facilities. RE 2.6.2: Allow developers of nonresidential properties to reduce required on-site parking spaces below minimum standards when space equivalent to the parking space reduction is devoted to renewable energy generation and storage facilities designed to serve onsite energy needs. RE 2.6.3: Encourage solar energy generation on rooftops and on covered parking as the first priority for on-site energy generation.
Goal RE-3.1	Community-Oriented Renewable Energy. Community-oriented renewable energy facilities will be prioritized to complement local values and support a high quality of life in unincorporated communities.
Policy RE-3.1	Prioritize, facilitate, and encourage onsite accessory RE generation to serve the unincorporated county, with a primary focus on rooftop and parking lot solar energy generation. RE 3.1.1: Permit rooftop, parking lot, and similar accessory RE generation facilities that primarily serve on-site energy needs in all zoning districts, including micro-grid systems, with minimal regulation and permitting requirements.
Policy RE-3.2	Encourage community-oriented renewable energy (CORE) generation that primarily serves local uses in the county. RE 3.2.1: Specific standards shall be established and maintained for community-oriented RE generation facilities appropriate to the Valley, Desert, and Mountain regions. RE 3.2.2: Encourage through the regulatory system the establishment of local and regional organizations to pursue community-oriented RE production and storage. RE 3.2.3: CORE facilities shall be designed primarily to meet the needs of the local users, with an adequate overage margin to meet peak demands and defray the cost of the systems.

Table 6: CWP Policy Plan Relevant Goals and Policies	
Number	**Goal or Policy**
	RE 3.2.3: Encourage utilities and developers to establish community-shared solar programs that allow residents and businesses to purchase shares of the output of RE generation facilities to offset their electricity bills. RE 3.2.4: Provide information and educational opportunities in the Countywide Plan Community Development Tool Kit for local organizations pursuing the acquisition of Community-Oriented Renewable Energy (CORE). RE 3.2.5: Encourage utilization of micro-grid technologies to support the principle of "local production primarily for local consumption," to enhance local energy security and to improve local costs of living and commerce. RE 3.2.6: Apply minimal discretion in the permit approval process for CORE facilities. RE 3.2.7: Encourage infrastructure, net metering and regulatory systems that support CORE facilities.
Policy RE-3.3	Promote an adaptive distributed energy infrastructure that sustains local communities and improves resiliency to grid failures and increasing energy prices. RE 3.3.1: Support research, planning and investment in accessory and community-oriented energy generation, distribution, and storage infrastructure by adapting regulatory tools to respond to rapidly evolving RE technologies. RE 3.3.2: Encourage new institutional campuses and large residential/commercial developments to include micro-grids with onsite renewable energy generation and energy storage systems.
Policy RE-3.4	Require renewable energy facilities developed in spheres of influence of incorporated cities to be compatible and consistent with standards of the sphere cities.
Policy RE-3.5	Incorporate resident, business owner, and stakeholder input into the development and implementation of County policies for renewable energy.
Policy RE-3.6	Encourage renewable energy facilities to meet community goals, including supporting community health, wellness, and recreational needs. RE 3.6.1: Include opportunities to incorporate public art and encourage design features that provide screening in renewable energy facilities on public spaces, nonresidential facilities, and multi-family buildings. RE 3.6.2: Encourage the use of renewable energy facilities as shade structures in parks and community centers, and over parking lots and parking structures.
Policy RE-3.7	Continue to foster local economic benefits of renewable energy facilities through community involvement. RE 3.7.1: Require CORE project development applications to be sponsored or co-sponsored by local users who will be the primary consumers of the energy generated by the projects. RE 3.7.2: Encourage RE generation facility developers to give preference to San Bernardino County residents in hiring for construction, operation, and decommissioning of the facility. RE 3.7.3: Encourage local community colleges, vocational schools, and workforce training centers to offer programs on renewable energy installation and maintenance. RE 3.7.4: Encourage innovation zones for manufacturers to locate and operate in the unincorporated county to research, construct, test, and distribute renewable energy technologies
TRANSPORTATION & MOBILITY ELEMENT	
Goal TM-3	**Vehicle Miles Traveled.** A pattern of development and transportation system that minimizes vehicle miles traveled.
Policy TM-3.1	**VMT reduction.** We promote new development that will reduce household and employment VMT relative to existing conditions.
Policy TM-3.2	**Trip reduction strategies.** We support the implementation of transportation demand

Table 6: CWP Policy Plan Relevant Goals and Policies	
Number	**Goal or Policy**
	management techniques, mixed use strategies, and the placement of development in proximity to job and activity centers to reduce the number and length of vehicular trips.
Goal TM-4	**Complete Streets, Transit, and Active Transportation.** On- and off-street improvements that provide functional alternatives to private car usage and promote active transportation in mobility focus areas
Policy TM-4.8	**Local bicycle and pedestrian networks**. We support local bike and pedestrian facilities that serve unincorporated areas, connect to facilities in adjacent incorporated areas, and connect to regional trails. We prioritize bicycle and pedestrian network improvements that provide safe and continuous pedestrian and bicycle access to mobility focus areas, schools, parks, and major transit stops.
Policy TM-4.9	**Bike and pedestrian safety.** We promote pedestrian and bicyclist safety by providing separated pedestrian and bike crossings when we construct or improve bridges over highways, freeways, rail facilities, and flood control areas. We monitor pedestrian and bicycle traffic accidents and promote safety improvements in unincorporated high-accident areas.

Codified Ordinances of the County of San Bernardino Municipal Code

The Codified Ordinances of the County of San Bernardino (County Code) regulations addressing air quality are provided below.

- **County Code § 63.0501: Adoption of California Energy Code.** Under this section, the 2022 California Energy Code contained in Part 6 of Title 24 of the CCR, is designated and adopted by reference as the Energy Code for the design and installation of energy systems for the unincorporated area of the County.
- **County Code § 63.1501: Adoption of California Green Building Standards (CALGreen) Code.** Under this section, the 2022 CALGreen Code, contained in Chapters 1-8 of Part 11 of Title 24 of the CCR, is designated and adopted by reference as the CALGreen Code for the unincorporated area of the County.
- **County Code § 83.01.040: Air Quality.** The purpose of the General Performance Standards chapter is to establish uniform performance standards for development within the County that promotes compatibility with surrounding areas and land uses. Performance standards are designed to mitigate the environmental impacts of existing and proposed land uses within a community. For air quality, these standards include those for equipment permit and inspection requirements, permits from AQMDs, and diesel exhaust emissions control measures.
- **County Code Chapter 83.14: Transportation Control Measures.** The purpose of this Chapter is to reduce vehicle trips thereby reducing air congestion and pollutants and improving air quality, to comply with State law, and to promote an improved quality of life. This Chapter is intended to satisfy the legal requirements of Chapter 6 of the San Bernardino County Congestion Management Program.

City of Barstow 2020 General Plan

The City adopted the City of Barstow 2015-2020 General Plan (2015 General Plan) in February 2015. The 2015 General Plan is the overarching guide for implementation of the Development Code, which defines development regulations and establishes zoning districts throughout the City. **Table 7: 2015 General Plan Relevant Goals and Policies** includes the air-quality related goals and policies relevant to BIG.

Table 7: 2015 General Plan Relevant Goals and Policies

Number	Goal or Policy
CIRCULATION ELEMENT	
Goal 3	Foster improved traffic flow and air quality by encouraging the use of non-motorized transportation, alternative fuel vehicles and multi-occupant vehicles.
Policy 3A	Encourage pedestrian travel by improving the means by which residents and visitors may walk throughout the community.
Policy 3B	Establish a network of bicycle routes as illustrated on Exhibit C-2.
Policy 3C	Encourage carpooling and the use of alternative fuel vehicles by city residents and employees.
Policy 3D	Implement incentives outlined in Municipal Code Chapter 19.49 – Design Guidelines such as relaxation of parking requirements, density bonuses and exceptions to building height and lot coverage requirements in exchange for on- or off-site provision of bicycle racks and/or storage facilities, bikeways, electric vehicle charging facilities, designated pedestrian pathways or other design features designed to foster alternatives to single-occupancy, internal combustion engine driven vehicle use.
RESOURCE CONSERVATION AND OPEN SPACE ELEMENT	
Goal 2	Ensure protection of air quality by reducing air pollution and emissions of pollutants.
Policy 2A	Work with the Mojave Desert Air Quality Management District, San Bernardino Association of Governments, San Bernardino County and neighboring jurisdictions to implement the federal ozone and PM_{10} & $PM_{2.5}$ nonattainment plans and meet federal state air quality standards and reduce overall emissions from mobile and stationary sources.
Goal 5	Adhere to the environmental assessment process required under CEQA to communicate with other agencies and the public on the air quality impacts of development within the community.
Policy 5A	Communication of the impact of development on environmental quality with the impacted state and federal agencies as well as the general public in a clear and concise manner.
Goal 6	Provide programs and incentives to encourage residents, businesses and developers to reduce consumption and efficiently use energy resources.
Policy 6A	Educate the development community with regard to green building principles and other strategies for conserving natural resources.

The Code of the City of Barstow

The Code of the City of Barstow (Barstow Code) regulations addressing air quality are provided below (Barstow, City of, 2015).

- Barstow Code § 10.09.030: Trip reduction. This section establishes objectives for trip reductions in the City of Barstow by identifying large employers to evaluate trip reduction strategies and supporting various transportation initiatives and land use regulations aimed at reducing vehicle emissions and promoting alternative modes of transportation.

- Barstow Code § 10.09.040: Travel demand management. This section identifies measures to implement strategies and programs which reduce traffic congestion, vehicle miles travelled (VMT), and/or vehicle trips, which result in reduction of mobile source emissions.
- Barstow Code Title 15: Buildings and Construction. This title includes various regulations concerning erection, construction, maintenance, etc. of all buildings and/or structures in the City.
- Barstow Code § 15.08.010: Building Codes. Codes adopted specify the various State Codes the City has adopted, including among others the 2019 California Energy Code (CCR, Title 24, Part 6) and the 2019 CALGreen Code (CCR, Title 24, Part 11).

3.0 AIR QUALITY THRESHOLDS

Based upon the criteria derived from State California Environmental Quality Act (CEQA) Guidelines Appendix G, a project would have a significant effect on the environment if it would:

- Conflict with or obstruct implementation of the applicable air quality plan.
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable state or federal AAQS.
- Expose sensitive receptors to substantial pollutant concentrations.
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The U.S. EPA and CARB have designated portions of the MDAQMD nonattainment for a variety of pollutants. Please refer to **Table 5** for these classifications. Under the FCAA, the MDAQMD has adopted federal attainment plans for O_3 and PM_{10}, as described above.

Under CEQA, the MDAQMD is an expert comment agency on air quality and related matters within its jurisdiction or impacting on its jurisdiction. MDAQMD serves as a responsible agency for projects that require air permits. According to the MDAQMD's *CEQA and Federal Conformity Guidelines*, a project is significant if it triggers or exceed the following evaluation criteria:

- Generates total emissions (direct and indirect) in excess of the thresholds given in Table 8: Mojave Desert Air Quality Management District Emissions Thresholds.
- Generates a violation of any AAQS when added to the local background.
- Does not conform with the applicable attainment or maintenance plan(s).
- Exposes sensitive receptors to substantial pollution concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a non-cancerous Hazard Index (HI) greater than or equal to 1.

Table 8: Mojave Desert Air Quality Management District Emissions Thresholds

Criteria Air Pollutants and Precursors	Annual (tons)	Daily (pounds)
Carbon Monoxide (CO)	100	548
Oxides of Nitrogen (NO_X)	25	137
Volatile Organic Compounds (VOC)	25	137
Oxides of Sulfur (SO_X)	25	137
Particulate Matter (PM_{10})	15	82
Particulate Patter ($PM_{2.5}$)	12	65
Hydrogen Sulfide (H_2S)	10	54
Lead (Pb)	0.6	3

Source: Mojave Desert Air Quality Management District. 2020 (February). *California Environmental Quality Act and Federal Conformity Guidelines.*

3.1 Cancer and Non-Cancerous Health Risks

As noted above, the MDAQMD considers a project that results in an incremental increase in individual lifetime cancer risk impact of 10 in a million or greater to be significant. "Incremental" in this context

means above existing conditions. With respect to non-cancerous health impacts, the MDAQMD considers a project that results in an HI greater than or equal to 1 to result in a significant impact. A discussion of what these thresholds mean in terms of potential real world effects is set forth below.

3.2 Cancer Burden

Whereas cancer risk represents the probability that an individual will develop cancer, cancer burden multiplies the cancer risk by the exposed population to estimate the number of individuals that would be expected to contract cancer from the project. A cancer burden greater than 0.5 excess cancer cases (in areas exposed to 1 in one million or greater risk, on a 70-year basis) is considered significant.

3.3 Odors

The MDAQMD does not have numerical thresholds for odors. Odors are qualitatively evaluated based on typical odor generating land uses, as well as potential for a project to create an odor nuisance pursuant to MDAQMD Rule 402.

3.4 Asbestos

There are no quantitative thresholds for asbestos. CARB regulates demolition of asbestos containing structures. As described above, significance of NOA impacts are determined based on a review of geologic formation mapping and BIG's potential to disturb potential asbestos containing rock formations.

3.5 Valley Fever

There are no quantitative thresholds for valley fever. Compliance with MDAQMD dust control rules and best management practices during construction would reduce the risk of contracting Valley Fever.

4.0 METHODOLOGY FOR IMPACT ANALYSIS

The study area for direct and indirect impacts concerning air quality is the BIG footprint and the MDAB and the SCAB as a whole. BIG construction and operational emissions sources were calculated based on BIG-specific activity levels. MDAQMD was consulted for the general analysis approach and methodology. See **Appendix A: Air Quality and Greenhouse Gas Emissions Modeling Data** for more information regarding the construction and operations assumptions used in this analysis, as well as the modeled emissions.

4.1 Construction

Construction emissions can vary substantially from day to day, depending on the level of activity, and the specific type of equipment used. Construction emissions result from on-site and off-site activities. Onsite construction emissions principally consist of fugitive dust from ground disturbing activities, exhaust emissions from heavy-duty construction equipment and motor vehicle operation, and off-gassing from architectural coatings (painting) and paving. Off-site construction emissions are caused by motor vehicle exhaust from vendor delivery vehicles and worker trips. Additionally, off-site emissions would occur from trains hauling construction materials (e.g., ballast, rails, railroad ties, etc.). Total construction emissions are modeled based on the below assumptions, then amortized over a 30-year period and added to operational emissions.

Models

Criteria pollutant emissions from BIG demolition and construction were calculated using emission factors from CARB's OFFROAD2021 model (v1.0.3). The use of emission rates from the OFFROAD model captures the latest off-road construction assumptions, including emission inventories as well as equipment population and activity data, collected by CARB. OFFROAD default load factors (the ratio of average equipment horsepower utilized to maximum equipment horsepower) and useful life parameters were used for emission estimates. Mobile-source emissions from worker vehicle trips and truck trips were calculated using Vehicle Miles Traveled (VMT) and Truck Miles Traveled (TMT) (heavy-duty truck miles traveled) estimates and appropriate emission factors from CARB's EMission FACtor 2021 (EMFAC) model (v1.0.2). EMFAC2021 emissions projections assumed implementation of the ACT Regulation and the Heavy-Duty Low NO_X Omnibus Regulation. These regulations were disapproved by Congressional Resolutions H.J. Res 87 and H.J. Res 89, respectively. The resolutions were signed by the President on June 12, 2025. These resolutions, along with H.J. Res. 88 (revoking federal light-duty vehicle GHG standards), limit the ability of CARB to enforce these California regulations that had been authorized by U.S. EPA waivers under the FCAA. CARB is currently evaluating the impact of the actions (H.J. Res 87, H.J. Res 88, and H.J. Res 89) under the Congressional Review Act, but has not yet provided emissions modeling guidance. Accordingly, emissions from trucks are overestimated in the EMFAC2021 model.

Fugitive dust emissions from dirt and aggregate handling were calculated using emission factors derived from equations from the U.S. EPA's AP-42 Compilation of Air Emissions Factors. Emissions from architectural coatings and paving were calculated using the methodology in the California Emissions Estimator Model (CalEEMod) User Guide Appendix C: Emission Calculation Details for CalEEMod and

emissions rates in the CalEEMod User Guide Appendix G: Default Data Tables (OEHHA, 2022). **Table 9: Regulations and Agreements Assumed in the Unmitigated Construction and Operational Emissions** summarizes the regulations that were assumed in the construction emissions unmitigated scenario.

Table 9: Regulations and Agreements Assumed in the Unmitigated Construction and Operational Emissions

Off-Road Construction Equipment	On-Road Trucks	Trains	Fugitive Dust
Emission Standards for Non-road Diesel Engines – Tier 1, 2, 3, and 4 standards gradually phased in over all years (accounted for in emissions factor projections) due to normal construction equipment fleet turnover. **California Diesel Fuel Regulations –** 15 ppm sulfur starting 9/1/06. **CARB In-Use Off-Road Diesel Vehicle Rule –** Off-road mobile equipment powered by diesel engines 25 hp or larger must meet the fleet average or best available control technology (BACT) requirements for NO_X and PM emissions by March 1 of each year. **CARB Portable Diesel-Fueled Engines Air Toxics Control Measure-** Effective September 12, 2007, all portable engines having a maximum rated horsepower of 50 bhp and greater and fueled with diesel shall meet weighted fleet average PM emission standards. **CARB Off-Road Large Spark Ignition Equipment Rule –** LSI engines greater than 25 hp, powered by gasoline, LPG, or other alternative fuels to meet HC + NO_X requirement beginning January 1, 2009.	**Emission Standards for On-road Trucks –** Engine emission standards gradually phased in due to normal truck fleet turnover and accounted for in emissions factor projections. **California Diesel Fuel Regulations –** 15 ppm sulfur starting September 1, 2006. **Airborne Toxic Control Measure to Limit Diesel Fueled Commercial Motor Vehicle Idling –** Diesel trucks are subject to idling limits starting 2/1/05. **Port of Los Angeles Clean Truck Program –** Heavy-duty diesel drayage trucks calling on port terminals shall meet the USEPA 2007 emission standards for on-road heavy-duty diesel engines (USPEA, 2001) by 2012. **CARB Statewide Truck and Bus Regulation –** Installation of PM retrofits on all heavy-duty trucks beginning January 1, 2012, and replacement of older trucks starting January 1, 2015. By January 1, 2023, all vehicles need to have 2010 model year engines or equivalent.	**Emission Standards for Locomotives –** Tiered engine emission standards gradually phased in due to normal locomotive fleet turnover and accounted for in emissions factor projections. **1998 Fleet Average Agreement –** Fleet average emission factors for NO_X for linehaul locomotives operating in the South Coast area. **2005 CARB/Railroad Statewide Agreement –** Reduced line haul locomotive idling times assumed to take effect starting in 2006. **Non-road Diesel Fuel Rule –** 500 ppm sulfur starting June 2007 and 15 ppm sulfur starting January 1, 2012. Applies to all line-haul locomotives. **California Diesel Fuel Regulations –** 15 ppm sulfur starting January 1, 2007. Applies to all switch locomotives.	**MDAQMD Rue 403 Compliance –** Properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; cover stockpiles with tarps; water all haul roads twice daily; and limit speeds on unpaved roads to 15 miles per hour.

Table 9: Regulations and Agreements Assumed in the Unmitigated Construction and Operational Emissions			
Off-Road Construction Equipment	**On-Road Trucks**	**Trains**	**Fugitive Dust**
Note: This table is not intended to be a comprehensive list of all potentially applicable regulations; rather, the table lists key regulations and agreements that quantifiably affect the emission calculations for BIG construction and assumed in the analysis. Emissions reductions are reflected in EMFAC emission factors for on-road vehicles and reflected in U.S. EPA locomotive emission factors.			

Construction Schedule

For analysis purposes, BIG construction is assumed to begin in third quarter 2025 and be completed by third quarter 2028, with an overall duration of approximately 34 months. Construction continuing into 2028 would include track and signal work, while equipment testing would occur at the intermodal facility. The anticipated construction phase timing is shown in **Table 10: Construction Schedule.** During peak construction periods, work would be under way at several locations within the Project Footprint simultaneously, with overlapping construction of various elements.

Construction Equipment

BIG construction would involve the use of off-road construction equipment for demolition, site preparation, grading, and construction, heavy-duty trucks and locomotives for delivery of bulk materials and hauling away demolished material, and personal automobiles for employee commuting. The combustion of fossil fuels (diesel and gasoline) generates emissions of criteria pollutants, VOC, CO, NO_X, SO_2, PM_{10}, $PM_{2.5}$, and MSATs. Vendor delivery vehicles and worker commute trips would generate PM emissions from tire wear, break wear, and re-entrainment of roadway dust. In addition, off-road and on-road construction equipment traveling over unpaved surfaces and performing earthmoving activities such as site clearing/grading would generate fugitive dust emissions in the form of PM_{10} and $PM_{2.5}$.

Construction emissions are estimated by assuming construction occurs at the earliest feasible date and applies to the entire period in **Table 10** (i.e., a conservative estimate of construction activities) and applying off-road, fugitive dust, and on-road emissions factors from CARB's OFFROAD model. The anticipated construction equipment is shown in **Table 11: Construction Equipment**. All equipment in **Table 11** is assumed to be Tier 4 except for track laying machines, articulated trucks, auger borers, tampers, and regulators**.**

Demolition and Earthwork

Emissions associated with demolition and earthwork would originate from equipment, trucks, concrete batch plants, and rail deliveries. Construction would require the demolition and removal of approximately 150,000 square feet of structures and 36,000 square feet of concrete slab. Although the California Green Building Standards (CALGreen) code requires 65 percent of construction and demolition materials to be diverted away from the landfill by either recycling or reusing materials, it is currently unknown how much of the demolished material can be recycled and re-used on-site. Therefore, as a conservative estimation of impacts, all demolished materials were assumed to be hauled off-site. Demolition was modeled to occur during the initial stages of the mass grading phase. Earthwork during mass grading would include approximately 26,000,000 cubic yards of balanced cut and fill as well as 2,000,000 cubic yards of balanced subcut.

Fugitive dust emissions would occur from demolition, earthwork, trenching, storage piles, and entrained road dust. Emissions of airborne PM are largely dependent on the amount of ground disturbance associated with site preparation activities as well as weather conditions and the application of water. Fugitive dust emissions may have a substantial, temporary impact on local air quality. In addition, fugitive dust may be a nuisance to those living and working in the vicinity of BIG. Dust from construction can become a nuisance and potential health hazard to those living and working nearby. MDAQMD Rules 402 and 403 (prohibition of nuisances, watering of inactive and perimeter areas, track out requirements, etc.), are applicable to BIG and were quantified in the modeling of fugitive dust emissions. In accordance with MDAQMD Rule 403, BNSF (or its contractors) will prepare a Dust Control Plan outlining steps to be taken to reduce PM_{10} during construction, including but not limited to periodically watering disturbed areas, using soil stabilizers on storage piles and unpaved roadways, avoiding track out or removing tracked out dirt from public roads within 24 hours, and reducing non-essential earth-moving activity under high wind conditions (see MDAQMD Rule 403 for definitions and other measures applicable to the BIG project).

Soils disturbed during earthwork could be impacted with TACs, including naturally occurring arsenic, aerially deposited heavy metals and polycyclic aromatic hydrocarbons from locomotive exhaust, pesticides and herbicides used along the ROW and parcels formerly used for agriculture, solvents and other chemicals leaked onto parcels formerly used for industrial/commercial uses, total petroleum hydrocarbons from fuel leaks, and creosotes that leached from the railroad ties. Materials potentially impacts with these contaminants would be segregated, characterized, and removed through hauling to the appropriate offsite receiver site (please see Section 5.9, *Hazards and Hazardous Materials* and 5.17, *Utilities and Service Systems* for details).

Concrete and Asphalt Batch Plants

Concrete would also be required for components such as the intermodal facility as well as the construction of bridges and retaining walls. Asphalt would be required for parking areas and roadways/drive aisles. BIG construction would require approximately 1.9 million cubic yards of concrete and 700,000 tons (approximately 345,379 cubic yards) of asphalt for warehouse parking areas. Due to the size of the BIG footprint, the analysis assumed three batch plants would operate during construction, three concrete batch plants and one asphalt batch plant. Batch plants can produce fugitive dust emissions from material handling and exhaust emissions from engine-powered equipment. Construction contractors using batch plants that remain onsite for more than 12 months must obtain an air quality permit from MDAQMD and comply with MDAQMD Rule 401 (Visible Emissions), Rule 402 (Nuisance), Rule 403 (Fugitive Dust Control) to minimize fugitive dust emissions and nuisances, and Rule 1103 (Cutback and Emulsified Asphalt). To obtain the permit, the batch plant must demonstrate to MDAQMD that localized impacts would be acceptable. The locations of the anticipated batch plants would be determined by the construction contractor and are currently unknown. Concrete and asphalt batching emissions were estimated based on the total amount of concrete and asphalt required (independent of the number of batch plants) and emission factors from U.S. EPA AP-42 Chapter 11.12, Concrete Batching, (U.S. EPA, 2006) and Chapter 11.1, Hot Mix Asphalt Plants (U.S. EPA, 2004a). Batch plants would be run with electricity and would not generate diesel exhaust. Emissions from heavy-duty truck trips associated with transporting material to

and from the concrete batch plants were included in the mobile source emissions as vendor trips, discussed below.

Construction Trips

Mobile source emissions from worker trips and heavy-duty truck trips were calculated using VMT and TMT estimates from **Appendix 5.15- BIG-1: CEQA Assessment – *VMT Analysis, Active Transportation, and Public Transit Analysis*** (**Appendix 5.15-1**) and appropriate EMFAC emission rates. Construction trips are summarized in **Table 12: Construction Trips**. MDAQMD rules (e.g., Rule 401 [Visible Emissions], Rule 402 [Nuisance], Rule 403 [Fugitive Dust Control] etc.) require dust control measures such as watering unpaved access roads and disturbed areas, and promptly replacing ground cover over disturbed areas, were incorporated into the modeling based on U.S. EPA AP-42. BIG-specific data, including construction schedule (see **Table 10**) and equipment lists (see **Table 11**), were also incorporated into the modeling.

Table 12: Construction Trips

Year	Peak Worker Trips per Day [1] (Passenger Cars)	Peak Truck Trips per Day [1] (Heavy-duty Trucks)
2025	2,048	714
2026	2,418	1,732
2027	1,435	1,065
2028	275	239

Notes:
[1] Based on **Appendix 5.15 BIG-1**, the maximum probable concurrent construction employment and truck activity is expected in month 9 of construction.
[2] Truck trips during intermodal infrastructure include concrete pavement, base course, and transload warehouse center construction material deliveries. Deliveries at various locations for intermodal infrastructure would occur concurrently.

Sources: Kimley-Horn. 2025. **Appendix 5.15 BIG-1 – CEQA Assessment – VMT Analysis, Active Transportation, and Public Transit Analysis.**

Rail Deliveries

Bulk materials needed for construction, including ballast, welded rails, and rail ties, could be hauled to the BIG site by rail within the MDAB. Rail emission factors from the U.S. EPA document *Emission Factors for Locomotives* (U.S. EPA, 2009) and the travel distance by rail within the MDAB were used to estimate construction rail delivery emissions (see **Appendix A** for modeling assumptions and details). Construction rail delivery emissions were calculated by assuming that locomotives meeting fleet average line-haul emission standards would be used for all rail deliveries.

Construction would require approximately 80 trains for rail tie delivery, 44 trains for welded rail delivery, and 315 trains for ballast delivery for a total of approximately 439 trains over a 10-month construction period (approximately two trains per day). Trains delivering rail ties, welded rails, and ballast were assumed to have one locomotive and 50 cars. Track ballast would be delivered in 100-ton rail ballast cars. Train hauling was conservatively assumed to occur over a round-trip distance of 300 miles to account for the potential emissions within Southern California (i.e., the one-way distance from Lenwood to the eastern edge of the MDAB is approximately 150 miles, and the one-way distance from Lenwood to the Port of Los Angeles/Port of Long Beach is approximately 130 miles). Additionally, trains were assumed to idle for eight hours per day (i.e., during the majority of the day to allow for unloading).

Temporary Mainline Relocation Train Trips

During construction, the existing mainline would be reconstructed (see **Section 1.0: Project Summary**). Prior to reconstruction, a new south mainline would be constructed immediately north of Main Street. Trains would then be diverted to this south mainline while the existing mainline is reconstructed. Upon reconstruction, trains would be evenly split between the two mainlines. Thus, construction air quality analysis assumes 100 percent of trains would use the south mainline from 2025 to2027, and beginning 2027, half of trains using BNSF's mainline would use the south mainline and half would use the reconstructed mainline. Train count projections are provided for 2026, 2027, and 2028, to consider potential changes in emissions as trains are diverted from the existing mainline to the proposed south mainline until 2027, then split between the two mainlines from 2027 to 2028. The location of the trains affects localized pollutant concentrations and health risk, but would not affect overall mass emissions.

Train count data is based on actual train data from the last quarter of 2022 and the first three quarters of 2023 as these were the most recent available data at the time environmental analysis commenced. Growth rates were applied to the existing train counts for future year data. Growth is based on a compounded annual growth rate derived from the historical change in container volumes and associated train trips (see Appendix B [BNSF CAGRs Used in BIG of Appendix B [BNSF Barstow International Gateway Corridor Emissions Analysis]). The changes in emissions associated with moving trains closer or farther from sensitive receptors was included in construction emissions dispersion modeling given these changes would occur during the construction period.

Summary of Construction Assumptions

Table 13: Construction Assumptions Summary summarizes the methodology, models used, and other construction assumptions described above. See **Appendix A** for more information regarding the construction assumptions used in this analysis, as well as the modeled emissions.

Table 13: Construction Assumptions Summary

Emissions Source	Assumptions	Methodology or Model Used
Off-Road Construction Equipment[1]	See **Table 11** for equipment assumptions	CARB OFFROAD
Earthwork (fugitive dust)	26,000,000 cubic yards of balanced cut and fill, truck loading, and storage piles 2,000,000 cubic yards of subcut and soil	U.S. EPA AP-42 §§ 11.9 and 13.2
On-Road Hauling and Worker Vehicle Trips	See **Table 12** for construction trip assumptions Peak worker trips would occur during building construction and peak truck trips would occur during demolition, site preparation, and mobilization.	CARB EMFAC2021
Demolition	150,000 square feet of structures 36,000 square feet of concrete slab removal	U.S. EPA AP-42 §§ 11.9 and 13.2
Rail Deliveries (Locomotive Hauling and Idling)	80 trains for rail tie delivery 44 trains for welded rail delivery 315 trains for ballast delivery Total of approximately 439 trains over a 10-month	U.S. EPA, Emission Factors for Locomotives, April 2009

Table 13: Construction Assumptions Summary		
Emissions Source	**Assumptions**	**Methodology or Model Used**
	construction period. Each train was assumed to idle 8 hours per day. Approximately 2 trains per day	
Concrete and Asphalt Batch Plants	2.3 million cubic yards total over a 21-month period Three electrically powered concrete batch plants (1.9 million cubic yards total, approximately 3,500 cubic yards per day) One electrically powered asphalt batch plant Approximately 345,379 cubic yards (approximately 633 cubic yards per day)	U.S. EPA AP-42 § 11.12

4.2 Operations

Operational emission sources include rail yard equipment, stationary sources, area sources[20], locomotives, and truck and employee commute trips associated with the block swap yard, the intermodal facility, and transload facility. The following approximate building area was assumed for modeling purposes:

- Intermodal Facility: 150,000 square feet of building area
- Transload Facility: 9,000,000 square feet of building area

Operational emission source assumptions were obtained from BNSF. Operational mobile source activity assumptions were based on traffic data within the BIG transportation analysis, (see **Appendix 5.15-1: CEQA Assessment – VMT Analysis, Active Transportation, and Public Transit Analysis**). Typically, intermodal transport grows by approximately two percent per year. However, as discussed above, BIG would introduce a unique cross-dock intermodal operation which would present competitive benefits to suppliers compared to long-distance transport via heavy-duty truck. As such, BNSF anticipates that during this "initial transition period" after opening year and while suppliers transition supply chains to use BIG (2028-2033), a higher growth percentage than typical would occur. Following this initial transition period and through horizon year, BIG's growth would continue at the normal approximately 2 percent per year (see Appendix B). Therefore, the analysis evaluates BIG's environmental impacts during Opening Year (2028), Interim Year (2033), and Horizon Year (2048) conditions.

Models

Criteria pollutant emissions from BIG operational line-haul locomotives were calculated using U.S. EPA emission factors (EPA-420-F-09-025). Since onsite switcher locomotives would only operate in California, these emissions were calculated with emissions factors from CARB's 2017 Carl Moyer Program Guidelines. On-road mobile-source emissions from worker vehicle trips and truck trips were calculated using VMT and

[20] Area sources occur from consumer products, architectural coatings, and landscaping that were previously not present on the site.

TMT estimates and appropriate emission factors from CARB's EMFAC model. EMFAC2021 emissions projections assumed implementation of the ACT Regulation and the Heavy-Duty Low NO_X Omnibus Regulation. These regulations were disapproved by Congressional Resolutions H.J. Res 87 and H.J. Res 89, respectively. The resolutions were signed by the President on June 12, 2025. These resolutions, along with H.J. Res. 88 (revoking federal light-duty vehicle GHG standards), limit the ability of CARB to implement and enforce these California regulations that had been authorized by U.S. EPA waivers under the FCAA. CARB is currently evaluating the impact of the actions (H.J. Res 87, H.J. Res 88, and H.J. Res 89) under the Congressional Review Act but has not yet provided emissions modeling guidance.

Fugitive dust emissions from road dust were calculated using emission factors derived from equations from the U.S. EPA's AP-42 Compilation of Air Emissions Factors. Off-road equipment emissions were calculated using emission factors from CARB's OFFROAD model. The use of emission rates from the OFFROAD model captures the latest off-road construction assumptions, including emission factors, established by CARB. OFFROAD default load factors (the ratio of average equipment horsepower utilized to maximum equipment horsepower) and useful life parameters were used for emission estimates. Emissions from area, energy, water use, solid waste, and refrigerant emissions were calculated using the methodology in the CalEEMod User Guide Appendix C: Emission Calculation Details for CalEEMod and emissions rates in the CalEEMod User Guide Appendix G: Default Data Tables (CAPCOA, 2022); see **Appendix A**. **Table 9: Regulations and Agreements Assumed in the Unmitigated Construction and Operational Emissions,** above, summarizes the regulations that were assumed and factored into emissions factor projections in the operational emissions unmitigated scenario.

BIG trains would travel along a Corridor defined as the rail line operated by BNSF between the San Pedro Ports and Needles Station at approximately the California/Arizona border. A Corridor Emissions Model (CEM) was developed to quantify corridor specific mass emissions (i.e., air emissions associated with the BNSF locomotives operating on the Corridor). The western portion of the Corridor is located within the jurisdiction of the South Coast AQMD (within the SCAB), and the eastern portion is within the jurisdiction of the MDAQMD (within the MDAB). The BNSF Summit rail station delineates the boundary between the South Coast AQMD and MDAQMD along the Corridor. The CEM specifically evaluates air emissions from rail movements along the entirety of the Corridor under both a "Proposed Project" condition (i.e., BIG obtains all necessary approvals and is built) and a "No Project" condition (i.e., BIG is not built).

Moving emissions (i.e., emissions associated with each train movement within the Corridor) are calculated by multiplying the gross tonnage of the train (freight plus locomotive weight) and the total miles the train traveled through the Corridor to produce the gross ton–mile (GTM). The gross ton–mile is combined with the fuel efficiency of the train, which accounts for the direction the train is traveling using a positive or negative grade slope of the Corridor. Lastly, the model calculates a composite emission factor using the U.S. EPA Locomotive Line-Haul Tier Emission Factors.

Idling emissions are emissions within the Corridor for all locomotives under minimum operating conditions (idling throttle position) while stationary. For this calculation, each line-haul locomotive is assumed to produce 25 horsepower during idling, with a brake-specific fuel consumption rate of 20.8 brake horsepower hour per gallon (U.S. EPA: Emission Factors for Locomotives, 2009).

Train count data is based on actual train data from the last quarter of 2022 and the first three quarters of 2023 as these were the most recent available data at the time environmental analysis commenced. Growth rates were applied to the existing train counts for future year data. Growth is based on a compounded annual growth rate (CAGR) derived from the historical change in container volumes associated with train trips (see the CAGR data prepared by EnSafe, which can be found in Appendix B [BNSF CAGRs used in BIG] of EnSafe's BNSF Barstow International Gateway Corridor Emissions Analysis. EnSafe's corridor emissions analysis is located within Appendix B of this report).

The changes in emissions associated with moving trains closer or farther from sensitive receptors near the BIG footprint was included in construction emissions dispersion modeling given these changes would occur during the construction period.

Equipment and Stationary Sources

The operational equipment that would be used within the intermodal facility is listed in **Table 14: Operational Electric Equipment** and **Table 15: Operational Diesel Equipment**. The operational equipment shown in **Table 14** would be electric powered, thus, would not increase localized air pollutant emissions of criteria pollutants.

Table 14: Operational Electric Equipment

Equipment	Quantity (2028)	Quantity (2033)	Quantity (2048)
Widespan Rail Mounted Gantry (RMG) Cranes	10	12	14
Chassis Stacking Forklifts	2	2	3
Intermodal Facility Forklifts	2	2	3
Top Pick/Side Loaders	2	2	3
Terminal Hostlers	47	62	73
Transload Hostlers	81	107	124
Warehouse Forklifts	540	540	540

Sources:
AECOM. (2023). *BNSF Barstow Simulation Analysis*.
South Coast Air Quality Management District (South Coast AQMD). 2014. *High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results.*

The operational equipment shown in **Table 15** would use diesel fuel and would generate criteria air pollutant and TAC emissions. Cargo handling equipment emissions factors were modeled using CARB's OFFROAD2021 model. Less than five percent of containers handled at BIG would have TRUs. Electrical plug-in facilities would be provided for TRUs, and TRU emissions were only estimated for the short time between arrival of transportation refrigeration units and plug-in. No cold storage would occur. Equipment, such as hostlers and forklifts, traveling within BIG would also generate PM from re-entrained road dust, tire wear, and brake wear. Re-entrained road dust emission rates are primarily affected by the silt loading on the road and amount of vehicle travel. Emission rates are lower per mile traveled on more trafficked roads. Re-entrained road dust was calculated using U.S. EPA AP-42 factors and brake/tire wear was calculated from CARB EMFAC2021 emissions rates.

[3] Truck TRUs are 5 percent of the total one-way trucks and hours per unit are from CARB OFFROAD.

Source: Compiled from discussions with BNSF engineers (2023).

Area Sources

Area source emissions would be generated due to maintenance products (such as solvents, disinfectants, sanitizers), architectural coatings, and landscaping that were previously not present on the site. Area source emissions were calculated based on generation and emissions factors from the CalEEMod version 2022 User Guide, Appendix C (Emissions Calculation Details) and Appendix G (Default Data Tables) (see **Appendix A** for modeling assumptions and details). Emissions are based on the railroad building and transload warehouse building area square footages above. The default area source VOC emission factor developed for CalEEMod is based on a statewide factor and is not directly applicable to BIG. BIG would not use consumer products as specified by CalEEMod User Guide. BIG may have small employee break areas and bathrooms that would use cleaning products; however, the majority of BIG acreage would be used for the block swap yard, intermodal facility and transload warehouse center. As the CalEEMod consumer product rates are based on a statewide average, reactive organic gas (ROG [VOC]) emissions are likely overestimated for the proposed transload warehouse center and therefore conservative.

Energy Sources

BIG will consume liquid fuels (gasoline and diesel) for vehicle and equipment use and consume electricity in buildings and lighting throughout. Emissions from the combustion of fossil fuels in mobile equipment and vehicles are discussed below. Electricity consumption would occur from building space heating and cooling, water heating, appliances, lighting, and EV charging (including automobiles, electric hostlers, and cargo handling equipment) (see **Appendix A** for modeling assumptions and details). Electricity use would contribute indirectly to criteria air pollutant emissions; however, criteria pollutant emissions from offsite electricity generation are generally excluded from the evaluation of significance. Because power plants are stationary sources permitted by air districts and/or the U.S. EPA, criteria pollutant emissions are generally associated with the power plants themselves, and not individual buildings or electricity users (CAPCOA, 2022, p. C-53).

Locomotive Emissions within BIG Footprint

As noted above, baseline train count data is based on actual train data from the last quarter of 2022 and the first three quarters of 2023 as these were the most recent available data at the time the environmental analysis commenced. Growth rates were developed based on historic growth rates for the various container and train types that would utilize BIG (see Appendix B), and were applied to the existing train counts for future year data. BIG would construct a new mainline immediately north of Main Street. The existing mainline would be reconstructed. Future train volumes would be evenly distributed between the new main lines.

Locomotive emissions associated with the intermodal facility are from two major categories: line-haul locomotive emissions during transport and idling (arriving and departing locomotives) and switcher locomotive emissions during yard activities (i.e., moving rail cars within the block swap yard or intermodal facility). Locomotive emissions are based on locomotive activity data from the BIG Corridor Emissions Model (EnSafe, 2025). These emission sources would use diesel fuel and are described below.

Line-haul refers to the movement of cargo over long distances (i.e., locomotives over 2,300 horsepower that haul freight cross-country) and occurs within the intermodal facility as the initiation or termination of a line-haul trip, as cargo is either picked up or dropped for transport to destinations across the region or country.[21] Line-haul locomotives would access the BIG intermodal facility and block swap yard.

Switching refers to the assembling and disassembling of trains at various locations in the rail yard, sorting of the cars of inbound cargo trains into contiguous “blocks” for subsequent delivery. Switching locomotives would stay within BIG. Each switching locomotive operates in consists[22] of two locomotives each. Switching would primarily occur at the block swap yard to transfer a block of train cars between trains without re-classification. Switching locomotives would not be needed for intermodal facility operations except for some block swap trains that are switched over to the intermodal facility. This

[21] CARB categorizes U.S. diesel-electric freight and passenger locomotives into three major groups, primarily based on horsepower and types of operations: (1) interstate line haul (>4,000 horsepower); (2) medium horsepower (MHP) (2,301 to 3,999 horsepower); and (3) Switch (yard) (1,006 to 2,300 horsepower). U.S. EPA defines the smaller switch (yard) locomotive, also called a switcher, to be between 1,006 and 2,300 horsepower. U.S. EPA also defines higher horsepower locomotives as line haul locomotives (i.e., >2,300 horsepower) (40 CFR Part 1033.901).

[22] In railroad terminology, a "consist" refers to the specific arrangement and composition of a train, including the locomotives and railcars.

switching activity has been attributed to the block swap yard for modeling purposes. Regular breakdown and build activities of arriving and departing trains at the intermodal facility would occur with line-haul locomotives under self-powered conditions (i.e., not conducted by switch engines).

All line-haul and switcher locomotives are assumed to be equipped with Automatic Engine Start Stop (AESS) technology, which limits idling time at any single location to 15 minutes per Program 1(b) of the Statewide Rail Agreement (CARB, 2005b). After 15 minutes, the AESS will cause all but one locomotive per train to shut down. All emissions analysis of movements of the line-haul locomotives in breaking down arriving trains and building departing trains assume that only one locomotive per train is operating. The remaining locomotives would be restarted prior to train departure.

Locomotive emissions were modeled using current BNSF fleet data and locomotive emissions factors from the U.S. EPA document Emissions Factors for Locomotives (EPA-420-F-09-025) (U.S. EPA, 2009) and updated with the CARB Carl Moyer Program Guidelines 2017 Revisions (CARB, 2017). Emissions from rail yard switcher and line-haul locomotives were modeled using a detailed layout of track segments and assumptions for the movement of locomotives along track segments based on the proposed track and facility layout, as well as detailed duty cycle data locomotive notch settings provided by BNSF. **Table 16: Train Operational Assumptions** shows the number of locomotives assumed and **Table 17: Locomotive Fleet Mix** shows the line-haul and switcher locomotive fleet mix.

Table 16: Train Operational Assumptions within the BIG Footprint										
Scenario	Existing		2026		2028		2033		2048	
	Average Trains per Day	Average Locomotives per Train	Average Trains per Day	Average Locomotives per Train	Average Trains per Day	Average Locomotives per Train	Average Trains per Day	Average Locomotives per Train	Average Trains per Day	Average Locomotives per Train
No BIG										
Mainline (All Trains)	45.3	3.5	47.3	3.5	48.7	3.5	52.4	3.6	66.6	3.6
With BIG										
N. and S. Mainline	-	-	47.3	3.5	32.0	3.3	34.3	3.4	43.3	3.4
BIG East Lead	-	-	-	-	24.4	3.1	27.6	3.1	35.4	3.1
BIG West Lead	-	-	-	-	19.4	3.9	21.7	3.9	27.3	3.8
Block Swap Yard and Through Trains[2]	-	-	-	-	20.3	3.4	22.6	3.4	28.9	3.3

Note:
[1] With BIG 2026 mainline trains would occur on the South Main only while the Existing Main is being reconstructed. After BIG opens, some mainline trains would be routed to the Intermodal Facility and Block Swap Yard.
[2] The number of trains include through trains that do not stop in the facility for processing. see **Appendix A** for modeling assumptions and details).

Table 17: Locomotive Fleet Mix Forecast							
U.S. EPA Tier Standard	Line-Haul Locomotives[1,2,3]				Switcher Locomotives[1,2]		
	Without BIG and With BIG			With BIG	With BIG		
	2028	2033	2048	Dedicated Fleet (All Years)[4]	2028	2033	2048
Uncontrolled (1973-1999)	0.0%	0.0%	0.0%	0.0%	18.0%	18.0%	13.0%
Tier 0 (2000-2001)	0.0%	0.0%	0.0%	0.0%	62.0%	62.0%	60.0%
Tier 0+	0.0%	0.0%	0.0%	0.0%	11.0%	11.0%	8.0%
Tier 1 (2002-2004)	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Tier 1+	26.48%	22.12%	8.62%	0.0%	3.8%	3.8%	7.6%
Tier 2 (2005-2011)	0.0%	0.0%	0.0%	0.0%	1.0%	1.0%	1.0%
Tier 2+	37.01%	37.27%	38.05%	0.0%	4.0%	4.0%	10.0%
Tier 3 (2012-2014)	27.91%	28.10%	28.69%	0.0%	0.0%	0.0%	0.0%
Tier 4 (2015)	8.60%	12.52%	24.64%	100%	0.2%	0.2%	0.4%

Note:
1 Line-haul locomotives are 4,000 horsepower or higher; switcher locomotives are less than 2,300 horsepower.
2 Line-haul locomotive life is assumed to be 40 years; switcher locomotive life is assumed to be 70 years.
3 Based on 2023 report for the 1998 MOU and adjusted for full conversion of Tier 0 and 1 to Tier 1+ and Tier 2 to Tier 2+. Annual Tier 4 purchases with associated Tier 1 replacements based on 5-year historical average purchase rates.
4 As a part of BIG, cross-dock intermodal containers (i.e., those taken by rail from the Ports to BIG's intermodal facility) would be transported using a dedicated fleet of Tier 4 linehaul locomotives.

Sources: *BNSF locomotive inventory data.*

Other Mobile Sources (Employee Transportation)

Employee vehicles (passenger cars) would generate vehicle exhaust and paved road dust (including break and tire wear) emissions. The emissions factors for on-road vehicles accessing BIG were modeled for future years (Opening Year [2028], Interim Year [2033], and Horizon Year [2048]) using EMFAC2021 for exhaust and brake wear/tire wear, and U.S. EPA AP-42 factors were used for road dust emissions (EMFAC does not include road dust emissions). **Table 18: BIG Passenger Vehicle** Trip Generation summarizes BIG's average daily employee vehicle trips.

Table 18: BIG Passenger Vehicle Trip Generation

Land Use	Vehicle Type	Average Daily Vehicle Trips		
		2028	2033	2048
Transload Facility	Passenger Cars	6,962	9,204	10,620
Intermodal Facility	Passenger Cars	1,765	2,085	2,325

Sources: Kimley-Horn. 2025. Appendix 5.15 BIG-1 – CEQA Assessment – VMT Analysis, Active Transportation, and Public Transit Analysis.

Additionally, although electric hostlers and various fleet vehicles and cargo handling equipment would be electrically powered and would not generate exhaust emissions, these vehicles and equipment would also generate PM from re-entrained road dust, tire wear, and brake wear.

Paved road dust is fugitive dust that is deposited on a paved roadway and then re-entrained into the air by passing vehicles. Dust is deposited on the roadway by being blown from disturbed areas, tracked from unpaved shoulders or vehicles traveling on connecting unpaved roads, stirred up by wind currents, and deposited by water runoff or erosion. Vehicles cause dust from paved and unpaved roads to be re-entrained or re-suspended in the atmosphere. The forces created by the rolling wheels of vehicles remove fine particles from the road and also pulverize aggregates lying on the surface. Emissions of paved road dust are generally proportional to vehicle miles traveled. Re-entrained road dust emission rates are primarily affected by the silt loading on the road and amount of vehicle travel. Emission rates are lower per mile traveled on more trafficked roads. Re-entrained road dust was calculated using U.S. EPA AP-42 factors and brake/tire wear was calculated from CARB EMFAC2021 emissions rates.

Corridor Emissions in California

Mass Emissions of Criteria Pollutants

BIG trains would travel along a Corridor defined as the rail line operated by BNSF between the San Pedro Ports and Needles Station at approximately the California/Arizona border. BNSF's ownership in the Corridor occurs between downtown Los Angeles and the Needles Station. The rail Corridor traverses both the SCAB and MDAB. The emissions modeling breaks the Corridor into four segments, including 1) San Pedro Ports to San Bernardino station, 2) San Bernardino station to Summit station, 3) Summit station to Barstow station/BIG, and 4) Barstow station/BIG to Needles station. The following data are used to calculate locomotive emissions on the rail Corridor between the Ports and Needles, California, for analysis years 2028, 2033, and 2048 (see Appendix B):

- Train Profiles: The number of locomotives, locomotive weight, freight weight, direction of travel, and distance traveled for an average train type along the Corridor.

- Train Trips: The number of trips for each train type.
- Fleet Mix: The blend of locomotive types used for each analysis year (locomotive types are classified by the engine tier, ranging from Tier 1 to Tier 4). The locomotive inventory is based on the 1998 Locomotive NO_X Fleet Average Emissions Agreement in the South Coast Air Basin (1998 MOMU), signed by CARB, Union Pacific Railroad and BNSF. As part of BIG, all cross-dock intermodal containers (i.e., those taken by rail from the Ports to BIG) would be transported using a dedicated fleet of Tier 4 linehaul locomotives.
- Fuel Blend: The mix of conventional and renewable fuels used for each scenario and analysis year. As part of BIG, starting in BIG opening year 2028, BNSF would increase the renewable diesel composition within Southern California's existing fueling sites from 1 percent to 10 percent, a 9 percent point increase in renewable diesel for eastbound movements. This is a region-wide average and not indicative of an increase at any specific site within Southern California. This would improve the emissions of all BNSF trains fueling in Southern California, including those BNSF trains that would not stop at BIG.
- Fuel Efficiency: To estimate the fuel efficiency for the various scenarios and operational years, the Corridor Emissions Model incorporates the BNSF Fuel Efficiency Model, a regression model based on actual 2023 fuel usage data.

Rail emission factors from the U.S. EPA document *Emission Factors for Locomotives* (2009) and the railroad miles along BNSF's Corridor. It is noted that BIG includes various features which reduce operational emissions, including a dedicated fleet of Tier 4 locomotives to transport cross-dock intermodal containers from the Ports to BIG's intermodal facility, Tier 4 switcher locomotives, the retirement of all existing switcher locomotives at the existing Barstow classification yard and the addition of six Tier 4 switcher locomotives, and increasing the renewable diesel composition within Southern California's existing fueling sites. These would reduce Corridor emissions and are incorporated into the With Project model analysis.

It is noted that train activity along the existing mainlines in the vicinity of BIG and along the corridor is anticipated to increase approximately 1.0-2.5 percent annually without BIG (EnSafe, 2025), and thus, future baseline train emissions would also increase. Future daily train volumes along the rail corridor would increase by the following percentages when compared to existing conditions:

- Year 2028 No BIG: 7.43 percent increase in daily train trips (which equates to an approximate 2.62 percent increase annually);
- Interim Year 2033 No BIG: 15.75 percent increase in daily train trips (which equates to an approximate 1.43 percent increase annually); and
- Horizon Year 2048 No BIG: 47.27 percent increase in daily train trips (which equates to an approximate 1.89 percent increase annually).

According to State CEQA Guidelines § 15125, where existing conditions change or fluctuate over time, and where it is necessary to provide the most accurate picture of a project's impacts, a lead agency may define existing conditions by referencing historic conditions, conditions expected when the project becomes operational, or both, supported with substantial evidence. Therefore, operational train emissions modeling was completed for future years without BIG (2028, 2033, and 2048) to establish future baseline train emissions and analyze incremental emissions increases directly attributable to BIG. Based on that

data, use of existing conditions alone would be misleading and without informative value to decision-makers and the public. (See State CEQA Guideline § 15125(a)(2)). See State CEQA Guideline § 15125(a)(2) ["[a] lead agency may use projected future conditions (beyond the date of project operations) as the sole baseline for analysis only if it demonstrates with substantial evidence that use of existing conditions would be either misleading or without informative value to decision-makers and the public. Use of projected future conditions as the only baseline must be supported by reliable projections based on substantial evidence in the record"; see also *Neighbors for Smart Rail v. Exposition Metro Line Constr. Auth.* (2013) 57 Cal.4th 439, 453; *POET, LLC v. State Air Resources Bd.*) (2017) 12 Cal.App.5th 52, 80; *San Franciscans for Livable Neighborhoods v. City & County of San Francisco* (2018) 26 Cal.App.5th 596, 616-617, 620 [upholding future baseline as supported by substantial evidence: "A determination that an existing conditions analysis would be misleading or without informational value is primarily factual and must be upheld if supported by substantial evidence."].)

Mass Emissions of DPM in the Corridor

Using the methodology above, operational emissions in the rail Corridor were modeled for analysis years 2028 (initial operational year), 2033 (interim operational year), and 2048 (full operational capacity) for both the No BIG and With BIG scenarios, so that the modeled emissions in those years can be compared. As a screening methodology, the comparison shows if BIG would increase DPM emissions in the Corridor. If BIG DPM emissions in the Corridor remain the same or decrease, then there would be no potential DPM impacts associated with BIG anywhere on the Corridor. DPM is a TAC and its health effects are described below in **Section 4.3: Air Pollutants of Concern**.

Localized Concentrations of Corridor Criteria Pollutant Emissions

Localized effects of BIG-related Corridor emissions and the associated increases in criteria pollutants were modeled for a worst-case segment in the SCAB and two study segments in the MDAB near BIG. The analyzed segments include one location in the SCAB (based on the SRA with the highest background concentration) and two locations in the MDAB (one west of BIG and one east of BIG). The SCAB worst-case segment is based on existing background ambient air quality concentrations as measured by the South Coast AQMD and CARB. There are fewer monitoring stations in the MDAB and the Barstow Monitoring Station measured by MDAQMD has the highest background concentrations and was conservatively used to evaluate impacts in the MDAB.

As noted above, the SCAB segment with the highest background concentrations was selected to provide a conservative analysis. The two locations in the MDAB include a segment west of BIG and a segment east of BIG. Segments east and west of BIG were selected because train volumes and associated emissions at these locations are different. Therefore, both of these segments were analyzed to disclose impacts from different emissions increases east and west of BIG.

BIG-related Corridor emissions at the selected SCAB and MDAB segments were modeled with the American Meteorological Society/U.S. EPA Regulatory Model (AERMOD). AERMOD is a dispersion model used to determine ground-level pollutant concentrations at individual receptors along the modeled Corridor segment. Refer to the dispersion modeling discussion below for a more detailed description of air dispersion modeling used in this analysis. All modeled segments used a uniform Cartesian receptor grid

with 50-meter spacing, and U.S. Geological Survey National Elevation Dataset terrain data. Train emissions were represented by line-volume sources in AERMOD. Specific modeling parameters used for each segment are shown below.

- South Central Los Angeles County Segment
  - Air Basin: SCAB
  - Source Type: Line Volume
  - Length: 1.9 miles
  - Meteorological Station: Northrop Field/Hawthorne Municipal Airport
- West of BIG Segment
  - Air Basin: MDAB
  - Source Type: Line Volume
  - Length: 2.3 miles
  - Meteorological Station: Barstow-Dagget Airport
- East of BIG Segment
  - Air Basin: MDAB
  - Source Type: Line Volume
  - Length: 10.4 miles
  - Meteorological Station: Barstow-Dagget Airport

Modeled NO_2 and CO concentrations are combined with the measured background concentrations and then compared to the NAAQS and CAAQS. Modeled PM_{10} and $PM_{2.5}$ concentrations are not combined with background concentrations as they are compared to incremental thresholds.

California and Regional TMT Improvements

BIG would transport more containers with trains instead of heavy-duty trucks, which would reduce truck trips and TMT; see **Appendix 5.15 BIG-1: CEQA Assessment – Transportation Analysis**. The daily and annual truck trips and TMT removed from the Nationwide, California, MDAQMD, and South Coast AQMD roadway network by BIG are shown in **Table 19: Net Truck Trips and Truck Miles Traveled Reductions by BIG**. Mobile source emissions reductions were modeled for future years (Opening Year 2028, Interim Year 2033, and Horizon Year 2048) using EMFAC2021.[23]

[23] As noted above, EMFAC2021 emissions projections assumed implementation of the ACT Regulation and the Heavy-Duty Low NO_X Omnibus Regulation. These regulations were disapproved by Congressional Resolutions H.J. Res 87 and H.J. Res 89, respectively. The resolutions were signed by the President on June 12, 2025. These resolutions, along with H.J. Res. 88 (revoking federal light-duty vehicle GHG standards), nullify California regulations that had been authorized by U.S. EPA waivers under the FCAA. CARB is currently evaluating the impact of the actions (H.J. Res 87, H.J. Res 88, and H.J. Res 89) under the Congressional Review Act, but has not yet provided emissions modeling guidance. Accordingly, emissions from trucks are overestimated in the EMFAC2021 model.

Table 19: Net Truck Trips and Truck Miles Traveled Reductions by BIG			
	Opening Year 2028	**Interim Year 2033**	**Horizon Year 2048**
Daily			
Daily BIG Truck Trips[1]	594	753	929
Daily BIG Peak TMT[2]	40,273	51,053	62,986
Daily Truck Trips Removed (Nationwide)[3]	-1,715	-2,270	-2,635
Daily Truck Trips Removed (California)[4]	-2,083	-2,754	-3,198
Daily Net TMT Reduction in MDAQMD Network[5]	-40,328	-49,500	-59,305
Daily Net TMT Reduction in South Coast AQMD Network[5]	-124,710	-163,607	-192,255
Daily Net TMT Reduction in California Network[5]	-159,263	-209,220	-244,880
Daily Net TMT Reduction in Nationwide Network[5]	-596,780	-784,417	-912,666
Annual			
Annual BIG Truck Trips[1]	192,000	243,600	300,370
Annual Truck Trips Removed (Nationwide)[3]	-627,000	-829,220	-962,700
Annual Truck Trips Removed (California)[4]	-760,270	-1,005,270	-1,167,090
Annual Net TMT Reduction in MDAQMD Network[5]	-14,719,796	-18,067,338	-21,646,477
Annual Net TMT Reduction in South Coast AQMD Network[5]	-45,519,012	-59,716,409	-70,173,104
Annual Net TMT Reduction in California Network[5]	-58,130,956	-76,365,405	-89,381,289
Annual Net TMT Reduction in Nationwide Network[5]	-217,824,523	-286,312,231	-333,123,035

Note:
[1] Heavy-duty truck trip generation to/from BIG. Includes heavy-duty trucks traveling to/from BIG's transload warehouse center and IMF. See trip generation discussion in Appendix 5.15 BIG-2: LOS Assessment.
[2] Consistent with the "Daily BIG Truck Trips", this includes a 13% surplus when converting from annual to daily values to account for potential seasonal surges (based on data from other southern California IMFs provided by BNSF on 12/02/2022). See trip generation discussion in the Appendix 5.15 BIG-2: LOS Assessment.
[3] "Truck Trips Removed" is the "Plus BIG Truck Trips" minus "No BIG Baseline Truck Trips" (average daily or annual values, as noted). Includes truck trips nationwide. See truck miles traveled discussion in Appendix 5.15 BIG-1: CEQA Assessment.
[4] "Truck Trips Removed (California)" is higher than "Truck Trips Removed (Nationwide)" because under No BIG Baseline conditions all trips related to the transload warehouse center originate in California, while Plus BIG conditions includes truck trips from hub cities to final nationwide destinations. See truck miles traveled discussion in Appendix 5.15 BIG-1: CEQA Assessment.
[5] "Net TMT Reduction" (also referred to as "Change in TMT due to BIG" or "TMT removed") is the "Plus BIG TMT" minus "No BIG Baseline TMT" for each relevant region (average daily or annual values, as noted). Due to distance rounding, the California TMT is slightly lower than the sum of the South Coast AQMD and MDAQMD TMT values. Additionally, a portion of the California Network TMT reductions occur within the San Joaquin Valley Air Basin in addition to the South Coast Air Basin and the Mojave Desert Air Basins. Therefore, combining TMT reductions within MDAQMD and South Coast AQMD jurisdictions will not match the total California Network TMT reduction.

Barstow Yard Switcher Elimination and Replacement

As a project feature with implementation of BIG, BNSF would remove all 15 existing Barstow Yard locomotives and replace them with Tier 4 locomotive engines by January 1, 2028, or before the first day of BIG operations, whichever date is later. In the event that BIG has not been approved or has not commenced construction for any reason, including, but not limited to, legal challenge or as a result of

business decision by BNSF, BNSF shall have no obligation to remove from service and/or replace any locomotives at the existing Barstow Yard.

Summary of Operational Assumptions

Table 20: Operational Assumptions Summary summarizes the methodology, models, and operational assumptions used in the operational analyses. See **Appendix A** for more information regarding the operational assumptions used in this analysis, as well as the modeled operational emissions.

Table 20: Operational Assumptions Summary		
Emissions Source	**Assumptions**	**Methodology or Model Used**
Equipment and Stationary Sources	See **Table 14** and **Table 15** for electric and diesel equipment assumptions	CARB OFFROAD
Area and Energy Sources	Based on 150,000 square feet of intermodal facility buildings and 9,000,000 square feet of warehouse building area	CalEEMod Consumption Rates
Locomotive Emissions	See **Table 16** and **Table 17** for locomotive assumptions	Line Haul Locomotives: U.S. EPA Emissions Factors for Locomotives (April 2009) Switcher Locomotives: CARB's Carl Moyer Program Guidelines, (2017)
Other Mobile Sources (Passenger Cars)	See **Table 18** for mobile source assumptions	CARB EMFAC2021
California Road Network TMT Improvements	See **Table 19**	CARB EMFAC2021
Rail Corridor Emissions	Based on 2023 report for the 1998 MOU and adjusted for full conversion of Tier 0 and 1 to Tier 1+ and Tier 2 to Tier 2+ and Compound Annual Growth Rates (CAGR) provided by BNSF. CAGR and emissions for With BIG and Without BIG are found in Appendix B of the Corridor Emissions Analysis, which is located within Appendix B of **Appendix 5.3 BIG-1**. 4.3 Dispersion Modeling

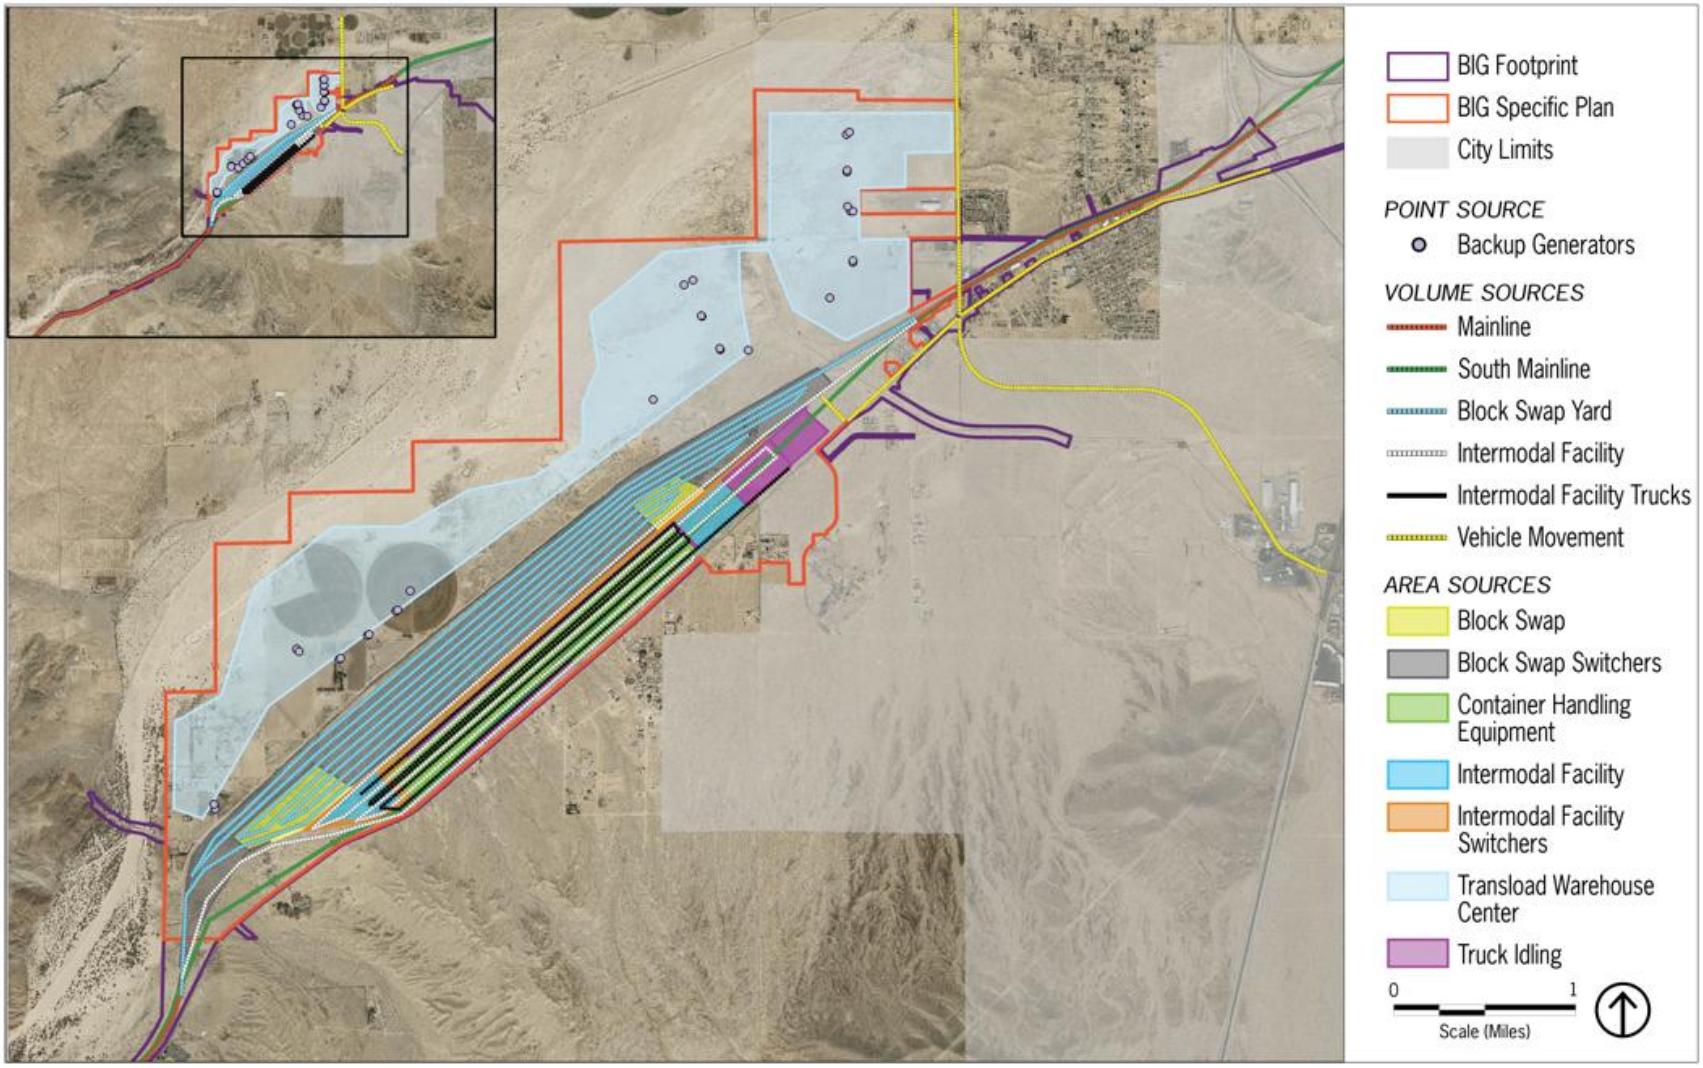
Dispersion modeling of CO, NO_X, PM_{10}, and $PM_{2.5}$ emissions was performed to estimate maximum offsite ground-level air pollutant concentrations and health risks from BIG construction and operations emissions using the AERMOD, version 24142. Dispersion modeling was performed for construction years 2025 through 2028, Opening Year (2028), Interim Year (2033), and Horizon Year (2048). The construction and operational sources used in AERMOD can be seen **in Figure 6: BIG Source Representation in AERMOD Construction Sources** and **Figure 7: BIG Source Representation in AERMOD Operational Sources**, and are summarized below in **Table 21: Dispersion Modeling Assumptions**. Corridor emissions improvements are not included in the BIG dispersion modeling as those emissions would primarily occur outside of the BIG footprint and were calculated separately.

Construction emission rates in grams per second were calculated from the total annual exhaust emissions reported in CalEEMod during construction. Annual operational emissions were converted to grams per second and these emissions rates were input into AERMOD. The predicted ambient concentrations from construction and operations were compared to the NAAQS and CAAQS. Dispersion modeling details and model outputs are provided in **Appendix A**. The modeling and analysis were prepared in accordance with Appendix W to Part 51, Title 40 (U.S. EPA, 2023), the User's Guide for the AERMOD (U.S. EPA, 2024), and the OEHHA *Air Toxics Hot Spots Program Risk Assessment Guidelines* (OEHHA, 2015).

The dispersion modeling used meteorological data from the Barstow-Daggett Airport Meteorological Station (data from 2015, 2016, 2018, 2019, 2020) located approximately 19 miles east of the BIG footprint (CARB, NDd). Data from the National Elevation Data set, available from the U.S. Geological Survey (USGS, 2018), were utilized to import the elevation information for sources and receptors. Construction and operations pollutant concentrations were estimated near the BIG footprint and surrounding area. AEROMOD regulatory default options and rural dispersion algorithm were used in the analysis.[24] The modeled concentrations were compared with the applicable NAAQS, CAAQS, and health-related guidelines to determine the level of impacts. The ambient concentrations obtained through dispersion modeling were subsequently used in the HRA.



[24] Per the U.S. EPA's AERMOD User's Guide, AERMOD implements the following default options: elevated terrain algorithms requiring input of terrain height data; stack-tip downwash (except for building downwash cases); the calms processing routines; the missing data processing routines.

Table 21: Dispersion Modeling Assumptions		
Emissions Source	**Geometric Configuration[1]**	**Assumptions/Methodology/Model**
CONSTRUCTION		
Construction (Off-Road Equipment, Concrete Batch Plants, Rail Deliveries)	Line-Volume Sources	Operating within onsite construction disturbance areas, Configured per U.S. EPA's AERMOD User's Guide
Rail Deliveries (Locomotive Idling)	Point Sources	Exhaust based on U.S. EPA Emissions Factors for Locomotives Point sources used for idling, AERMOD sources were configured based on CARB rail studies and AERMOD guidance
Pass-by Trains on North/South Mainlines	Line-Volume Sources	Modeled exhaust based on U.S. EPA Emissions Factors for Locomotives
Railway Excavation and Removal	Line-Volume Sources	The existing main line was modeled to calculate the metals released during the removal. A release height of 0 meters was modeled, with a plume width of 9 meters, or the width of the track corridor plus 50 feet on each side.
Construction (earthwork)	Area Sources	The model includes 17 area polygons, each representing a different parcel. The release height modeled was 1 meter (3.28 feet) to account for release of materials while construction equipment was relocating. Data was pulled from the Phase II ESA reports prepared.
OPERATIONS		
Line-Haul Locomotive Operations	Line-Volume Sources	Modeled exhaust based on U.S. EPA Emissions Factors for Locomotives
Stationary and Cargo Handling Equipment, Truck Emissions		OFFROAD and EMFAC
Switcher Operations and Idling Line-Haul Idling	Area Sources	Modeled exhaust based on U.S. EPA Emissions Factors for Locomotives
Transload Facility Operations		OFFROAD and EMFAC
Barstow Railyard Switcher Replacement		Modeled exhaust based on U.S. EPA Emissions Factors for Locomotives and CARB's Carl Moyer Program Guidelines, (2017)

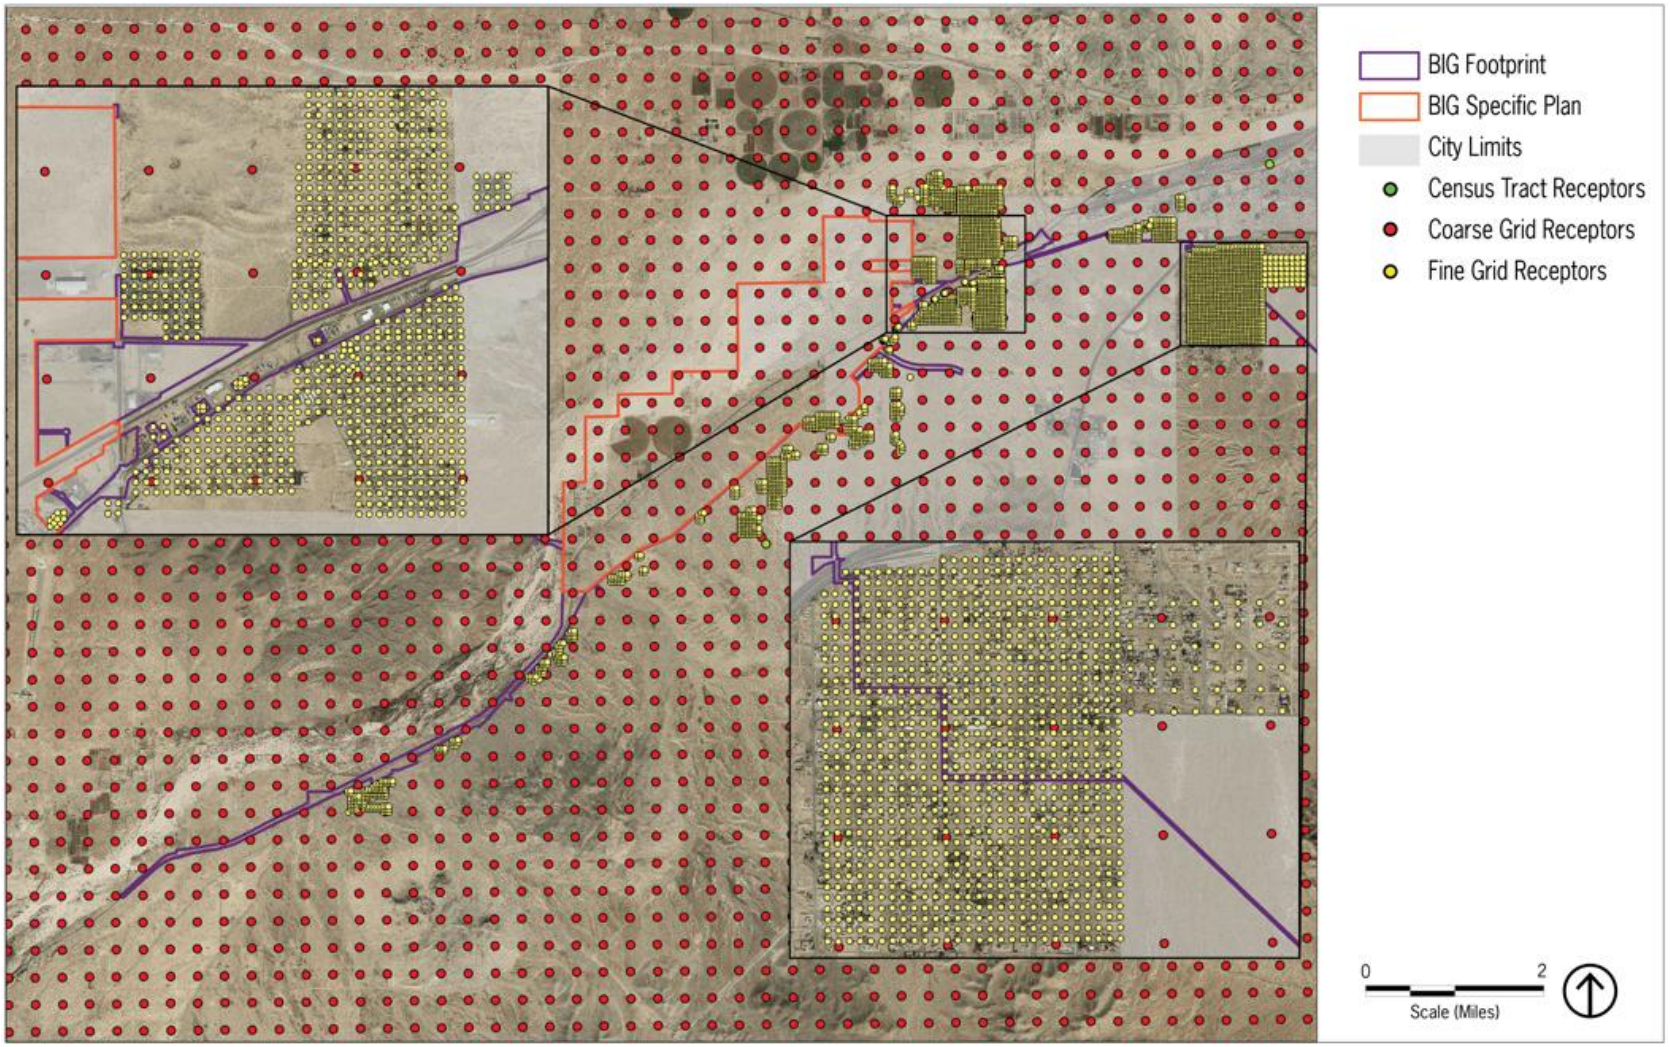
Notes:
[1] The emissions sources are defined as follows:
[2] Point source: a single identifiable local source of emissions; it is approximated in the AERMOD air dispersion model as a mathematical point in the modeling region with a location and emission characteristics such as height of release, temperature, etc. (example: a stack or vent).
[3] Line source: a series of volume sources (volume sources are a three-dimensional source of diffuse air pollutant emissions comprised of an area of emissions released at a height above ground) along a path (example: vehicular traffic along a roadway segment). Line sources (i.e., multiple volume sources) are also used to represent some construction activities.
[4] Area source: Area sources are used to model releases that occur over an area.

4.4 TACs and Health Risk Sources and Modeling

Human health risks associated with BIG TAC emissions from construction and operations were estimated following the *Air Toxics Hot Spots Program Risk Assessment Guidelines* developed by the OEHHA within the California Environmental Protection Agency (OEHHA, 2015). The methodology of the 2025 OEHHA guidance is described in detail below. In general, the assumptions used in the guidance are very conservative because in addition to assuming all receptors begin their exposure to project-related toxic contaminants prior to birth (i.e., third trimester in utero) when the individual receives a higher dose of contaminants due to higher breathing rates, the cancer risk assessment assumes that an individual would be located outdoors in the same location and continuously exposed to project-related toxic contaminants for a duration of 30 years, with no consideration of time spent indoors.

The objective of the HRA process is to analyze the potential health risks posed by a project which are expressed in a statistical measure in order to inform the public and decision makers of the potential health effects associated with a project's emissions of TACs. The HRA includes an evaluation of the following types of health effects: individual incremental cancer risk, population cancer burden, and chronic noncancer hazard index (HI).

- Individual incremental cancer risk (referred to hereafter simply as "individual cancer risk") is the additional probability for a person to develop cancer after long-term exposure to individual project-related toxic contaminants. The exposure duration is assumed to be 30 years for a resident or sensitive receptor, and 25 years for an off-site worker. "Incremental" in this context means the added probability that a project would result in an individual to develop cancer after long-term exposure to a toxic contaminant without consideration of background concentrations or cancer risk potential in an area. The project-level incremental individual cancer risk threshold is 10 in one million. The 10 in one million threshold means that no more than ten individuals out of one million people at the same location with the same exposure would develop cancer due to long-term exposure of a given toxic contaminant.
- The individual cancer risk should not be interpreted as the number of people that *will* develop cancer from long-term exposure. Rather, it quantifies the likelihood that annual toxic contaminant concentrations may, or may not, result in an individual's chance of developing cancer if a million people were exposed continuously for a specified duration.
- Population cancer burden is the expected number of additional cancer cases in a population assuming a 70-year exposure duration to a project-related individual cancer risk equal to or greater than one in a million. This assumes that the population would be exposed to BIG contaminants continuously for 70 years beginning in the third trimester in utero. This is a conservative assumption because the exposure duration does not consider members of the population beginning their exposure as adults or members of the population being exposed to less than 70 years of BIG operations (i.e., households moving out of the area).
- The chronic noncancer HI (referred to hereafter simply as "chronic HI") is the ratio of annual average TAC concentrations to established Reference Exposure Levels (RELs). The chronic HI quantifies the likelihood that chronic noncancer health effects (e.g., cardiovascular disease, diabetes, and respiratory health illnesses, etc.). A chronic HI below 1.0 indicates that adverse noncancer health effects from long-term exposure are not expected.



As described above, the on-road vehicle emission factors were derived using EMFAC2021, stationary sources and cargo handling equipment emission factors were derived using OFFROAD, and locomotive emission factors were derived using U.S. EPA *Emissions Factors for Locomotives* (U.S. EPA, 2009). **Table 22: Toxic Air Contaminant Sources** summarizes BIG's TAC sources from construction and operations.

Receptors

The HRA modeled TAC concentrations and health effects at 6,093 locations (receptors) surrounding BIG (i.e., a minimum distance of 3.5 miles from the BIG footprint), including the locations of potential exposure for residents, offsite workers, and sensitive members of the public. Sensitive receptor locations include schools, child-care centers, elder care facilities, hospitals, and recreational areas; see **Table 27.** A receptor grid with 50-meter spacing was used over sensitive receptor locations; see **Figure 8: BIG Centroid, Coarse, and Fine Receptor Grids** below. It should be noted that MDAQMD does not provide guidance for dispersion modeling; therefore, the South Coast AQMD's receptor grid spacing was used (South Coast AQMD, ND). South Coast AQMD-recommended grid spacing ensures that impacts to surrounding areas can be accurately identified (South Coast AQMD, ND).

Risk and Hazard Assessment

***Cancer Risk*.** Based on OEHHA methodology, residential inhalation cancer risk from annual average concentrations is calculated by multiplying the daily inhalation dose, cancer potency factor, age sensitivity factor (ASF), frequency of time spent at home, and exposure duration divided by averaging time, yielding the excess cancer risk. These factors are discussed in more detail below. Exposure through inhalation (Dose-air) is a function of breathing rate, exposure frequency, and concentration of substance in the air. To estimate cancer risk, the dose was estimated by applying the following formula to each ground-level concentration (OEHHA, 2015, equation 5.4.1.1, p. 5-24):

$$\text{Dose-air} = C_{air} * (BR/BW) * A * EF * 10^{-6}$$

Dose-air = dose through inhalation (mg/kg/day)

C_{air} = air concentration (µg/m^3) from air dispersion model

(BR/BW) = daily breathing rate normalized to body weight (L/kg bodyweight-day)

A = inhalation absorption factor (unitless)

EF = exposure frequency (approximately 350 days per year for residential)

10^{-6} = conversion factor (micrograms to milligrams, liters to cubic meters)

OEHHA developed ASFs to consider the increased sensitivity to carcinogens during early-life exposure. In the absence of chemical-specific data, OEHHA recommends default ASFs presented in **Table 23: Age Sensitivity Factors, Fraction of Time at Home, and Daily Breathing Rates**. Fraction of time at home (FAH) during the day is used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. OEHHA recommends the FAH values presented in **Table 23**.

Table 23: Age Sensitivity Factors, Fraction of Time at Home, and Daily Breathing Rates

Age	Exposure Frequency (days/year)	Exposure Duration (years)	Age Sensitivity Factor[1] (ASF)	Fraction of Time at Home (FAH)	Daily Breathing Rate (L/kg BW-day[2])
Residential					
Third trimester in utero	350	0.25	10	85%	361
0 to 2 years	350	2	10	85%	1,090
Ages 2 through 8 years	350	7	3	72%	631
Ages 9 through 15 years	350	7	3	72%	571
Ages 16 and greater	350	14	1	73%	261
Worker[3]	250	25	1	N/A	230
Student[3]	180	9	3	N/A	640

Notes:
[1] Accounts for potential increased sensitivity to carcinogens during childhood.
[2] Daily breathing rate normalized to body weight (L/kg body weight - day) (95th percentile for 3rd trimester to 2 years and 80th percentile for other age groups).
[3] Worker and Student breathing rates are 95th percentile 8-hour breathing rates based on moderate intensity activity.

Source: California Office of Environmental Health Hazard Assessment (OEHHA). 2015. Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments.

To estimate the cancer risk, the dose is multiplied by the cancer potency factor, the ASF, the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only) (OEHHA, 2015, equation 8.2.4 A, p. 8-7):

$$Risk_{inh\text{-}res} = (Dose_{air}*CPF*ASF*(ED/AT)*FAH)$$

$Risk_{inh\text{-}res}$ = residential inhalation cancer risk (potential chances per million)

$Dose_{air}$ = daily dose through inhalation (mg/kg-day)

CPF = inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)

ASF = age sensitivity factor for a specified age group (unitless)

ED = exposure duration (years)

AT = averaging time of lifetime cancer risk (years)

FAH = fraction of time spent at home (unitless)

It is important to note the following conservative modeling assumptions: exposure duration is based on continual heavy-duty truck operation along nearby roadways while the majority of heavy-duty truck activity along roadways would occur during daytime hours, exposure of residential receptors begin during the third trimester in utero while that may only represent a fraction of the population in the surrounding area, and receptors would be located outdoors in the same location and continuously exposed to toxic contaminants for a duration of 30-years without consideration of time spent indoors.

Pollutant emissions rates from contaminated soil were calculated by determining the daily amount of pollutant released, using the volume and density of contaminated soil, the dust release rate, and pollutant concentration, normalized by the total mass of disturbed soil. Emission rates for each of the pollutants by site was calculated using the following formula:

$$Emission\ rate_p = (cy_{is}*BD*DR_{ts}*C)/m_{ts}$$

Emission $Rate_p$ = milligrams of pollutant excavated per Phase II ESA site per day (mg_p/day)

Cy_{is} = cubic yards of impacted soil per Phase II ESA site (cy)

BD = Bulk Density of the soil (kg/cy)

DR_{ts} = Rate of total dust release by Phase II ESA site(kg/day)

C = Concentration of pollutant from Phase II ESA (mg/kg)

m_{ts} = mass of the total soil disturbed per Phase II ESA site (kg)

Calculation of the emission rates at each of the Phase II ESA sites and the Mainline Reconstruction required specific conservative assumptions including the total cubic yards disturbed on the BIG footprint, the size each Phase II ESA site was impacted by pollutants, the depth of excavation required in the BIG Footprint, the presence of naturally occurring metals on sites, and the width of excavation for rail track

removal. Further, the calculation conservatively assumes that 100 percent of the VOCs and SVOCs would volatilize into the air once exposed during excavation. A list of the assumptions are shown below.

- BIG construction would disturb approximately 26,000,000 cubic yards of soil over a 5,000-acre area. The average depth of excavation in the BIG footprint would be 6 feet.
- The acres impacted by detectable pollutants at each of the Phase II ESA sites was estimated based on the site history, site images, and boring locations. Any site less than two acres was conservatively assumed to be 100 percent impacted by the pollutants detectable in the Phase II ESA.
- The Phase II ESA sites were categorized into two project areas, the intermodal facility area and the transload warehouse area, based on their locations. PM release from each of the Phase II ESA sites was estimated by the weighting of each individual site within their respective categorized area and multiplying it by the construction fugitive dust PM emissions rates calculated for the intermodal facility or transload warehouse area. PM emissions for the intermodal facility and transload warehouse areas were taken from the grading, trenching, bulldozing, truck loading, debris loading, and paved-unpaved roads emission calculations. See Appendix A for more information regarding the construction assumptions and modeled emissions.
- Naturally occurring metals that were non-detectable in the Phase II ESA would innately be present in the excavated material. The naturally occurring metals (arsenic, beryllium, and cadmium) emission rates were conservatively calculated using the threshold for detection of the metal shown in the Phase II ESAs.25.
- The volume of impacted soil excavated for the Mainline Reconstruction was calculated using the line source modeled in AERMOD, which assumed a length of 106,285 feet, a 10-foot width on each side (total 20 feet), and a 6-foot depth as described above.
- PM emission rates for the Mainline Reconstruction were scaled proportionally from the grading, trenching, bulldozing, truck loading, debris loading, and paved-unpaved roads emission calculations for the block swap area of BIG. The PM emission rates are shown in **Appendix A.**
- Mainline Reconstruction concentrations for the metals, VOCs, and SVOCs during were derived from the threshold for detection listed in the Phase II ESAs. The pollutants metals, VOCs, and SVOCs included in Mainline Reconstruction are the same pollutants detected and analyzed in the Phase II ESAs.

Chronic Non-Cancer Hazard. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. The following equation was used to determine the non-cancer risk (OEHHA, 2015, p. 8-20):

$$\text{Hazard Quotient} = C_i/REL_i$$

C_i = concentration in the air of substance i (annual average concentration in $\mu g/m^3$)

REL_i = chronic noncancer REL for substance ($\mu g/m^3$)

[25] Using the threshold for detection as the baseline for the naturally occurring metal calculation is conservative as the metal concentrations must be below the threshold level of detection. In reality, concentrations of the metals would be lower than the threshold of detection.

Health Risk Computation. This analysis examines project impacts resulting from BIG construction and operations from the commencement of construction in 2025 for a 30-year exposure duration for sensitive/residential receptors, 25-year exposure duration for worker receptors, and 9-year exposure duration for school-site student receptors, consistent with current OEHHA guidance. Because cancerous health risks result from long exposure periods, construction health risk and operational health risk are analyzed both separately and combined. The separate construction health risk analysis uses an exposure duration of the construction period (i.e., 2.8-years) with a third trimester in utero start age. The construction only, operations only, and combined exposure durations are shown in **Table 24: Exposure Durations for Combined Risk Scenario**.

Table 24: Exposure Durations for Combined Risk Scenario

Risk Scenario		Exposure Duration (Years)		
		Construction Only Risk Scenario	Operational Only Risk Scenario	Combined Scenario (Construction followed by Operations)
Residential Receptors	Construction	2.8	-	2.8
	Operations	-	30	30
	Total	***2.8***	***27.2***	***30***
Worker Receptors	Construction	2.8	-	2.8
	Operations	-	25	25
	Total	***2.8***	***22.2***	***25***
Student Receptors	Construction	2.8	-	2.8
	Operations	-	9	9
	Total	***2.8***	***6.2***	***9***

Source: California Office of Environmental Health Hazard Assessment. (2015). Air Toxics Hot Spot Program, Risk Assessment Guidelines, Guidance Manual for the Preparation of Health Risk Assessments, p. 4-15.

The HRA was used to evaluate potential health impacts to offsite sensitive populations from TACs generated by construction and operations. Methodologies applicable to BIG's size, as specified in the Air Toxics Hot Spots Program Risk Assessment Guidelines, were used to perform health risk calculations based on output from the AERMOD dispersion model (OEHHA, 2015). The HRA was combined for both construction and operations. The cancer risk estimates are based on a 95th percentile breathing rate 3rd trimester to 2 years and 80th percentile for other age groups, which OEHHA and CARB identify as providing health-protective estimates of exposure and risk for residential receptors (OEHHA, 2015, p. 5-23 and CARB 2015, p. 35).

For health effects resulting from long-term exposure, CARB considers diesel PM as representative of the total health risks associated with the combustion of diesel fuel. The three principal health effect endpoints evaluated are individual lifetime cancer risk, chronic non-cancer effects, and acute non-cancer effects. Maximum predicted health risk values in the communities near BIG were compared to the maximum individual lifetime cancer risk threshold of 10 in one million.

Chronic and acute non-cancer effects are evaluated by calculating an HI. The HI is the sum of individual acute or chronic hazard quotients calculated for each substance. A hazard quotient is the estimated

ground level concentration of a TAC divided by the REL. RELs are developed by OEHHA and represent the concentration of a TAC at or below the ground level concentration at which no adverse health effects are expected. A chronic non-cancer HI below 1.0, or an acute HI below 1.0 indicates that adverse non-cancer health effects from long-term or short-term exposure, respectively, are not expected. For evaluation of acute non-cancer health effects, the one-hour maximum average air concentration of each TAC over the period of assumed exposure is used. Conservatively, the acute exposure concentration was selected as the maximum average concentration from any single hourly period during BIG construction and operation. For evaluation of chronic non-cancer health effects, this analysis used a similarly conservative approach in that the exposure level over the entire exposure duration for each exposure scenario is assumed to be the maximum annual average concentration of each TAC for any single year over the period of exposure.

***Population Cancer Burden*.** Population cancer burden is defined by OEHHA as an estimate of the number of cancer cases expected from a 70-year exposure to emissions (OEHHA, 2015, p. 8-1). Whereas individual cancer risk represents the probability of a single exposed person to develop cancer, population cancer burden estimates the number of individuals that would be expected to develop cancer by multiplying the cancer risk (calculated using the conservative assumptions discussed above) by the exposed population. OEHHA notes that an estimate of the number of people exposed at various cancer risk levels can provide perspective on the magnitude of the potential public health threat posed by a facility. This approach provides a much easier way for the general public to interpret results when compared to cancer burden estimates (Ibid, p. 8-16).

The exposed population is defined as the number of persons within a facility's zone of impact, which is typically the area exposed to an incremental cancer risk of one in a million from BIG. Consistent with this definition, cancer burden was calculated by first identifying all population census tracts[26] within BIG's zone of impact, multiplying the estimated incremental BIG cancer risk impact in the census tract by the population of the census tract and then summing all of products of population times estimated cancer risk in the zone of impact. Note that each census tract contributes to the cancer burden in proportion to its population and risk. For example, if a census tract has a relatively high estimated cancer risk, but no people living there, it will not contribute to the estimation of the cancer burden. The cancer burden was calculated assuming a 70-year exposure duration along with the appropriate exposure frequency, daily breathing rates, age sensitivity factors, and time at home factors appropriate to each age group (OEHHA, 2015). A cancer burden greater than 0.5 is considered a significant cancer impact.[27]

4.5 Odors

BIG's construction and operational odors are qualitatively evaluated based on the anticipated activity and distance to sensitive receptors. The MDAQMD regulates odors through Rule 402 (Nuisance). Rule 402 prohibits the discharge from any source of air contaminants or other material in such quantities which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public,

[26] A census tract is a geographic region defined for the purpose of taking a census. These regions typically coincide with the limits of cities, towns, or other administrative areas. Each tract has a unique numeric code. The census tract centroid is the geographic center of the tract based on a weighted distribution of the population within the tract using the census blocks that comprise the tract. A census block is the smallest geographic unit used to tabulate population and each tract can be comprised of several blocks.

[27] The cancer burden threshold in MDAQMD Rule 1520 (Control of Toxic Air Contaminants from Existing Sources) is used for this analysis as MDAQMD does not have a cancer burden CEQA threshold.

or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. Typical land uses that generate odors include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding.

4.6 Valley Fever

Coccidioidomycosis, more commonly known as Valley Fever, is primarily a disease of the lungs caused by the spores of the *Coccidioides immitis* fungus. The spores can occur naturally in some soils and there is the potential that spores could be stirred up during excavation, grading, and earth-moving activities and inhaled into the lungs.

Valley Fever is endemic to the southwestern U.S., so fugitive dust emissions from a project could cause exposure to the spores. Reduction of the potential for exposure to dust and the spores can be accomplished by providing dust control, training, job hazard assessments, and personal protective respiratory equipment when appropriate. The County is not considered a highly endemic region for Valley Fever. A report prepared by the California Department of Public Health identified that only 263 of the 9,280 suspect, probable, and confirmed annual cases of coccidioidomycosis recorded for California in 2023 (through December 2023) occurred in the County (CDPH, 2023).

The purpose of the Valley Fever analysis conducted for a project is to provide information regarding potential public health hazards related to exposure to Coccidioides spores and contracting Valley Fever. The analysis qualitatively evaluates how the project could complicate a possible environmental condition of the site that has the potential to affect people's health. State CEQA Guidelines Appendix G does not present significance thresholds for potential to contract reportable diseases such as Valley Fever, and neither has the MDAQMD developed such significance guidelines. The analysis presents relevant background information regarding Valley Fever, potential for the project to result in the exposure of onsite workers, nearby residents, and visitors to potential health hazards, and identifies measures to reduce potential exposure.

4.7 Asbestos

Asbestos minerals occur in rock and soil as the result of natural geologic processes, often in veins near earthquake faults in the coastal ranges and the foothills of the Sierra Nevada Mountains and other areas of California. NOA takes the form of long, thin, flexible, separable fibers. Natural weathering or human disturbance can break NOA down to microscopic fibers that are easily suspended in air. When inhaled, these thin fibers irritate tissues and resist the body's natural defenses. In addition, asbestos-containing materials may have been used in older buildings within BIG that would be demolished.

Asbestos is a known human carcinogen. It causes cancers of the lung and the lining of internal organs, as well as asbestosis and pleural disease that inhibit lung function. The U.S. EPA is working to address concerns about the potential impacts of NOA in several California areas. The California Geological Survey identifies ultramafic rocks in California to be the source of NOA. The California Geological Survey published *A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally*

Occurring Asbestos (California Department of Conservation, 2000). This study was used to determine if NOA would be within the BIG footprint.

4.8 Consistency with Air Quality Plans

A project would result in significant impacts if it conflicts with or delays implementation of any applicable attainment or maintenance plan. A project is conforming if it complies with all applicable MDAQMD rules and regulations, complies with all proposed control measures that are not yet adopted from the applicable plan(s), and is consistent with the growth forecasts in the applicable plan(s) (or is directly included in the applicable plan). Consistency with growth forecasts can be established by demonstrating that the project is consistent with the land use plan that was used to generate the growth forecast. An example of a project that is not consistent would be one that increases the gross number of dwelling units, increases the number of trips, or increases the overall VMT in an affected area (relative to the applicable land use plan).

4.9 Cumulative Effects

The MDAB is the study area for cumulative air quality effects. This represents the geographic limit for cumulative air quality since air emissions have a regional effect. Regionally, past, present, and foreseeable projects would contribute to increases in vehicle travel from long-term growth thereby worsening air quality. Cumulative growth in population, vehicle trips, and industrial activity could inhibit efforts to improve regional air quality and attain the NAAQS and CAAQS.

The MDAQMD's thresholds of significance analyze both direct and cumulative impacts. The MDAQMD *CEQA and Federal Conformity Guidelines* (CEQA Guidelines) state that cumulative impacts are similar to a project's direct and indirect impacts (MDAQMD, 2020, p. 8). A given project has a cumulative impact with all other related projects, from the standpoint of each type of impact (cumulative construction emissions, area sources, solvent use, transportation emissions, congestion, etc.). The MDAQMD does not have separate thresholds for cumulative impacts and uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or environmental impact report (EIR). The MDAQMD considers projects that exceed the project-specific significance thresholds to be cumulatively considerable, thus, project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed project-specific thresholds are generally not considered to be cumulatively considerable.

4.10 Laws, Ordinances, and Regulations

Laws, Ordinances, and Regulations (LORs) are existing requirements that are based on local, state, or federal regulations or laws that are frequently required independently of CEQA review. Typical LORs include compliance with the provisions of the Building Code, MDAQMD Rules, etc. The City may impose additional conditions during the approval process, as appropriate. Because LORs are neither BIG specific nor a result of development of BIG, they are not considered to be mitigation measures. These measures are considered part of the unmitigated project.

LOR AQ-1 Prior to the issuance of grading permits, the City Engineer shall confirm that the Grading Plan, Building Plans and Specifications require all construction contractors to comply with

MDAQMD's Rule 403 to minimize construction emissions of dust and particulates. The measures in the plans/specifications include, but are not limited to, the following:

- Minimize fugitive dust emissions from wrecking, excavation, grading, clearing of land and solid waste disposal operations.
- A person shall not cause or allow particulate matter to exceed 100 micrograms per cubic meter when determined as the difference between upwind and downwind samples collected on high volume samplers at the property line for a minimum of five hours.
- Prevent visible particulate matter from being deposited upon public roadways as a direct result of their operations. Reasonable precautions shall include, but are not limited to:
  - Remove particulate matter from offroad equipment prior to movement on paved streets or the prompt removal of any material from paved streets onto which such material has been deposited.
  - Use periodic watering for short-term stabilization of Disturbed Surface Area to minimize visible fugitive dust emissions. Use of a water truck to maintain moist disturbed surfaces and actively spread water during visible dusting episodes shall be considered sufficient to maintain compliance.
  - Take actions sufficient to prevent project-related track-outs onto paved surfaces.
  - Cover loaded haul vehicles while operating on publicly maintained paved surfaces.
  - Stabilize graded site surfaces upon completion of grading when subsequent development is delayed or expected to be delayed more than thirty days, except when such a delay is due to precipitation that dampens the disturbed surface sufficiently to eliminate Visible Fugitive Dust emissions.
  - Clean-up project-related Track-outs or spills on Publicly Maintained paved surfaces within twenty-four hours.
  - Reduce non-essential Earth-Moving Activity under High Wind conditions. For purposes of this Rule, a reduction in Earth-Moving Activity when visible dusting occurs from moist and dry surfaces due to wind erosion shall be considered sufficient to maintain compliance.
  - Prepare and submit to the MDAQMD, prior to commencing Earth-Moving Activity, a dust control plan that describes all applicable dust control measures that will be implemented at the project.
  - Provide Stabilized access route(s) to the project site as soon as is feasible.
  - Maintain natural topography to the extent possible.
  - Construct parking lots and paved roads first, where feasible; and
  - Construct upwind portions of project first, where feasible.
  - The Owner or Operator of a site undergoing weed abatement activity shall not disrupt the soil crust to the extent that Visible Fugitive Dust is created due to wind erosion.

LOR AQ-2 Pursuant to MDAQMD Rule 1113, the Applicant shall require by contract specifications that the interior and exterior architectural coatings products used have a volatile organic compound rating of 50 grams per liter or less.

LOR AQ-3 The Applicant shall ensure contractors post signs and train personnel on compliance with California Code of Regulations (CCR), Title 13, § 2449 requiring applicable diesel powered construction equipment idling to be limited to five minutes, except in circumstances when the limit does not apply (e.g., when queuing).

LOR AQ-4 BIG shall be designed in accordance with the applicable California Code of Regulations Title 24 (California Building Standards Code) Energy Efficiency Standards for Nonresidential Buildings (CCR, Title 24, Part 6). These standards are updated, nominally every three years, to incorporate improved energy efficiency technologies and methods. The City of Barstow Building Official, or designee shall ensure compliance prior to the issuance of each building permit. The Title 24 Energy Efficiency Standards (§ 110.10) require buildings to be designed to have 15 percent of the roof area "solar ready" that will structurally accommodate later installation of rooftop solar panels. If future building operators pursue providing rooftop solar panels, they will submit plans for solar panels prior to occupancy.

LOR AQ-5 BIG shall be designed in accordance with the applicable California Green Building Standards (CALGreen) Code (24 CCR, Part 11). The Building Official, or designee shall ensure compliance prior to the issuance of each building permit. These requirements include, but are not limited to:

- Design buildings to be water-efficient. Install water-efficient fixtures in accordance with California Green Building Standards Code Part 11, § 5.303.
- Recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste in accordance with California Green Building Standards Code Part 11, § 5.408.1.
- Provide storage areas for recyclables and green waste and adequate recycling containers located in readily accessible areas in accordance with California Green Building Standards Code Part 11, § 5.410.
- To facilitate future installation of electric vehicle supply equipment (EVSE), construction shall comply with California Green Building Standards Code Part 11, § 5.106.5.3 (nonresidential electric vehicle charging).

5.0 ENVIRONMENTAL SETTING

Air quality and dispersion of air pollution in an area is determined by such natural factors as topography, meteorology, climate, and atmospheric stability. In addition, man-made influences such as development patterns and lifestyles can affect the generation of and exposure to air borne pollutants. These factors are described in more detail below.

5.1 Topography

As described above, the BIG footprint is in the MDAB. The MDAB includes the desert portion of Los Angeles and San Bernardino Counties, the eastern desert portion of Kern County, and the northeastern desert portion of Riverside County. The MDAQMD has jurisdiction over stationary sources of air pollution within the County's High Desert and Riverside County's Palo Verde Valley, which includes the BIG footprint.

The MDAB is bound in the northwest by the Tehachapi Mountains, in the southwest by the San Gabriel Mountains, and in the south by the San Bernardino Mountains. To the north, the MDAB is defined by the San Bernardino-Inyo County boundary, to the northeast the California-Nevada state line, and to the east by the Colorado River (MDAQMD, ND). The San Gabriel and San Bernardino Mountains are high and rugged, with the highest peaks being 10,066 feet above sea level (Mt. San Antonio) and 11,503 feet (Mt. San Gorgonio), respectively. The MDAB generally lies at 3,000 to 6,000 feet elevation.

The Mojave Desert is situated in a transitional zone between the Great Basin Desert to the north and the Sonoran Desert to the south (mainly between 34 and 38°N latitudes) (Desert U.S.A., ND). The area is primarily a rain-shadow desert, meaning it experiences little rainfall because it is sheltered from prevailing rain-bearing winds (i.e., off the Pacific Ocean) by a range of mountains.

5.2 Climate and Meteorology

Air basins typically also share similar meteorological conditions. The MDAB's climatic conditions are very arid with moderate winters, with mean maximum temperatures in the 60s and lows in the 30s, and hot summers with mean maximum temperatures in July and August exceeding 100°F. The average rainfall in the BIG footprint is 4.1 inches annually.

The MDAB's weather patterns are generally influenced by moderately intense, anticyclonic circulation (associated with high pressure systems). In summer, a large subtropical high-pressure system off the coast of California keeps the MDAB sunny and dry; however, the presence of a thermal low-pressure area above the Mojave Desert causes atmospheric transport from the Los Angeles Basin. During the winter months, the strength of the Pacific high-pressure area decreases, and 20 to 30 frontal systems may pass through the area annually. Some of these frontal systems are sufficiently strong enough to produce rain in the area. The most substantial large-scale phenomena affecting the Basin's air quality are the transport winds from the south and the west. These winds are responsible for bringing O_3 and other pollutants through the mountain passes from the Los Angeles Basin and the San Joaquin Valley. Photochemical O_3 modeling conducted by the South Coast AQMD and CARB indicates that the MDAB would be in attainment of both standards without the influence of this transported air pollution from upwind regions (MDAQMD, 2023, p. 4). Additionally, the three stations closest to the MDAB, the source of the majority of transported O_3

and O_3 precursors, have the highest historical O_3 concentrations: Phelan, Hesperia and the Joshua Tree National Monument. The more distant or isolated stations (Barstow) have lower concentrations.

5.3 Air Pollutants of Concern

The air pollutants emitted into the ambient air by stationary and mobile sources are regulated by federal and state laws. These regulated air pollutants are known as "criteria air pollutants" and are categorized into primary and secondary pollutants.

Primary air pollutants are emitted directly from sources. CO, ROG, NO_X, SO_2, PM_{10}, $PM_{2.5}$, and Pb are primary air pollutants. ROG and NO_X are criteria pollutant precursors and form secondary criteria pollutants through chemical and photochemical reactions in the atmosphere. For example, the criteria pollutant O_3 is formed by a chemical reaction between ROG and NO_X in the presence of sunlight. O_3 and NO_2 are the principal secondary pollutants. Sources and health effects commonly associated with criteria pollutants are summarized in **Table 25: Air Contaminants and Associated Public Health Concerns**.

Table 25: Air Contaminants and Associated Public Health Concerns

Pollutant	Major Man-Made Sources	Human Health and Environmental Effects
Particulate Matter (PM_{10} and $PM_{2.5}$)	Power plants, steel mills, chemical plants, unpaved roads and parking lots, wood-burning stoves and fireplaces, automobiles and others.	Increased respiratory symptoms, such as irritation of the airways, coughing, or difficulty breathing; asthma; chronic bronchitis; irregular heartbeat; nonfatal heart attacks; and premature death in people with heart or lung disease. Impairs visibility.
Ozone (O_3)	Formed by a chemical reaction between reactive organic gases/volatile organic compounds (ROG or VOC)[1] and nitrogen oxides (NO_X) in the presence of sunlight. Motor vehicle exhaust industrial emissions, gasoline storage and transport, solvents, paints and landfills.	Irritates and causes inflammation of the mucous membranes and lung airways; causes wheezing, coughing, and pain when inhaling deeply; decreases lung capacity; aggravates lung and heart problems. Damages plants; reduces crop yield.
Sulfur Dioxide (SO_2)	A colorless gas formed when fuel containing sulfur is burned and when gasoline is extracted from oil. Examples are petroleum refineries, cement manufacturing, metal processing facilities, locomotives, and ships.	Respiratory irritant. Aggravates lung and heart problems. In the presence of moisture and oxygen, sulfur dioxide converts to sulfuric acid which can damage marble, iron and steel. Damages crops and natural vegetation. Impairs visibility. Precursor to acid rain.
Carbon Monoxide (CO)	An odorless, colorless gas formed when carbon in fuel is not burned completely; a component of motor vehicle exhaust.	Reduces the ability of blood to deliver oxygen to vital tissues, affecting the cardiovascular and nervous system. Impairs vision, causes dizziness, and can lead to unconsciousness or death.

Table 25: Air Contaminants and Associated Public Health Concerns		
Pollutant	**Major Man-Made Sources**	**Human Health and Environmental Effects**
Nitrogen Dioxide (NO_2)	A reddish-brown gas formed during fuel combustion for motor vehicles and industrial sources. Sources include motor vehicles, electric utilities, and other sources that burn fuel.	Respiratory irritant; aggravates heart and lung problems. Can aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms. Precursor to O_3. Contributes to global warming and nutrient overloading which deteriorates water quality. Causes brown discoloration of the atmosphere.
Lead (Pb)	Pb is a metal found naturally in the environment as well as in manufactured products. The major sources of Pb emissions have historically been motor vehicles (such as cars and heavy-duty trucks) and industrial sources. Due to the phase out of leaded gasoline, metals processing is the major source of Pb emissions to the air today. The highest levels of Pb in air are generally found near Pb smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers.	Exposure to Pb occurs mainly through inhalation of air and ingestion of Pb in food, water, soil, or dust. It accumulates in the blood, bones, and soft tissues and can adversely affect the kidneys, liver, nervous system, and other organs. Excessive exposure to Pb may cause neurological impairments such as seizures, mental retardation, and behavioral disorders. Even at low doses, Pb exposure is associated with damage to the nervous systems of fetuses and young children, resulting in learning deficits and lowered IQ.
Note: [1] Volatile Organic Compounds (VOCs or Reactive Organic Gases [ROG]) are hydrocarbons/organic gases that are formed solely of hydrogen and carbon. There are several subsets of organic gases including ROGs and VOCs. Both ROGs and VOCs are emitted from the incomplete combustion of hydrocarbons or other carbon-based fuels. The major sources of hydrocarbons are combustion engine exhaust, oil refineries, and oil-fueled power plants; other common sources are petroleum fuels, solvents, dry cleaning solutions, and paint (via evaporation).

Valley Fever

Coccidioidomycosis, more commonly known as “Valley Fever,” is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern U.S. The ecologic factors that appear to be most conducive to survival and replication of the spores are high summer temperatures, mild winters, sparse rainfall, and alkaline, sandy soils. The County is not considered a highly endemic region for Valley Fever as the latest report from the California Department of Public Health identified that 2.8 percent of the suspect, probable, and confirmed annual cases of coccidioidomycosis recorded for California in 2023 (through December 2023) occurred in the County (CDPH, 2023).

Toxic Air Contaminants

TACs are airborne substances that can cause short-term (acute) or long-term (i.e., chronic, carcinogenic, or cancer causing) adverse human health effects (i.e. injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California

list of TACs includes more than 200 compounds, including particulate emissions from diesel-fueled engines.

CARB identified DPM as a TAC. DPM differs from other TACs in that it is not a single substance but rather a complex mixture of particles and gases produced when an engine burns diesel fuel. DPM is a concern because it causes lung cancer; many compounds found in diesel exhaust are carcinogenic. DPM includes the particle-phase constituents in diesel exhaust. The chemical composition and particle sizes of DPM vary between different engine types (heavy-duty, light-duty), engine operating conditions (idle, accelerate, decelerate), fuel formulations (high/low sulfur fuel), and the year of the engine. Some short-term (acute) effects of diesel exhaust include eye, nose, throat, and lung irritation, and diesel exhaust can cause coughs, headaches, light-headedness, and nausea. DPM poses the greatest health risk among the TACs. Almost all diesel exhaust particle mass is 10 microns or less in diameter. Due to their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lung. DPM is the primary TAC of concern for the health risk impact analysis contained herein because it is the most potent TAC emitted from diesel exhaust and includes hundreds of chemicals. Therefore, although DPM is a subset of PM_{10} exhaust, this analysis conservatively assumes all PM_{10} exhaust emissions are DPM.[28]

Contaminated soil is an environmental and public health concern, particularly at sites undergoing cleanup or redevelopment. When soil contains hazardous substances (e.g., Pb, arsenic, petroleum hydrocarbons, or VOCs, it may pose human health risks through direct contact, ingestion of dust or vapors, or through leaching into groundwater. The primary pollutants of concern have cancer potency factors or chronic/ acute hazards and were derived from the results of the Phase II Environmental Site Assessments (ESAs) sites within the BIG footprint and OEHHA's 2009 Technical Support Document for Cancer Potency Factors.[29] These pollutants were present at detectable levels at one or more of the Phase II ESA sites and have a Cancer Potency Factor assigned to them by *Appendix A of OEHHA's 2009 Technical Support Document for Cancer Potency Factors*. These pollutants additionally have a REL assigned to them by *Appendix A, B, and C of OEHHA's 2015 Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments.* The REL is defined as the concentration at which no adverse non-cancer health

[28] More than 90 percent of DPM is less than 1 um in diameter and is a subset of PM2.5 and PM2.5 comprises a portion of PM10. Thus, assuming PM10 as the surrogate for DPM constitutes a conservative analysis. Source: CARB. [29] Review of the federal, state, and local records, including a proprietary records summary provided by Environmental Data Resources, Inc. (EDR), a third-party provider of environmental and land use records, showed more than 100 listed properties within the respective American Society for Testing and Materials (ASTM) standard search distances for each database which varied between 0.25 miles and 1.0 miles. Most of these listed properties were reviewed and removed as they did not have the potential to create a significant hazard to the public or the environment based on the type of listing, information provided for the listing, gradient, and/or the distance between the listed property and the BIG footprint. However, the PG&E Hinkley Chromium Cleanup (PG&E Hinkley) site, a well-known and high-profile site involving contamination of groundwater by hexavalent chromium is located approximately between two to seven miles north, northeast, or northwest of the site (i.e., north of the Mojave River). Generally, the hexavalent chromium contamination from the PG&E Hinkley site has impacted groundwater in the area and PG&E provides drinking water to residents in the area surrounding the PG&E Hinkley site. There are ongoing remediation and groundwater monitoring programs, and an extensive amount of information is publicly available online. Recent plume maps and information can be reviewed here: https://hinkleygroundwater.com/site-information/groundwater-monitoring-and-plume-maps/. Review of the latest plume maps indicates that the groundwater flow direction in the PG&E Hinkley site is northerly, i.e., away from BIG. As a result, it does not appear that the PG&E Hinkley site has or would impact BIG.

effects are anticipated with acute, 8-hour, or chronic exposure to the pollutant. Pollutants of concern include the following:

- Arsenic
- Beryllium
- Cadmium
- Cobalt
- Pb
- Nickel
- Benzene
- Chloroform
- Naphthalene
- Ethylbenzene
- Methylene Chloride
- Benzo(a)pyrene
- Benso(b)fluoranthene
- Bis(2-ethylexyl)phthalate

Existing Pollution Burden

According to CalEnviroScreen, the BIG footprint and the surrounding residences are in Census Tract 6071011800, which is within the 62nd percentile (OEHHA, 2023). CalEnviroScreen uses environmental, health, and socioeconomic information to produce percentile scores for every census tract in the State. Each census tract receives scores for as many as 21 indicators (such as air quality emissions, children's Pb risk from housing, drinking water contaminants, pesticide use, toxic releases from facilities, traffic impacts, among others). For each indicator, the scores are put in order from highest to lowest. An area with a high score is one that experiences a higher pollution burden than areas with low scores. As noted above, CalEnviroScreen scores are not an expression of health risk, and do not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment.

Senate Bill 535

Based on OEHHA mapping, the BIG footprint is adjacent to SB 535 designated disadvantaged communities in Census Tracts 6071009400, 6071009500, 6071011700, and 6071011900 (OEHHA, 2022). As noted above, SB 535 prioritizes AB 32 cap-and-trade program funds to projects that provide a benefit to disadvantaged communities as identified by the OEHHA mapping. SB 535 does not include project specific requirements or prohibit developments in proximity to a designated community.

Ambient Air Quality

CARB monitors ambient air quality at approximately 250 air monitoring stations across the State. These stations usually measure pollutant concentrations ten feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. The Barstow Monitoring Station is the closest to the BIG footprint. This station monitors O_3, CO, NO_2, and PM_{10}, but not $PM_{2.5}$. $PM_{2.5}$ data is collected at the Victorville Monitoring Station, which is the next closest monitoring station to the BIG footprint. Local air quality data from 2022 to 2024 are provided in **Table 26: Ambient Air Quality Data** which lists the monitored maximum concentrations and number of exceedances of state or federal air quality standards for each year.

Table 26: Ambient Air Quality Data			
Criteria Pollutant	**2022**	**2023**	**2024**
Ozone (O_3) [1, 2, 3]			
1-hour Maximum Concentration (ppm)	0.095	0.085	0.092
8-hour Maximum Concentration (ppm)	0.084	0.077	0.082
Number of Days Standard Exceeded			
CAAQS 1-hour (>0.09 ppm)	1	0	0
NAAQS 8-hour (>0.070 ppm)	13	16	24
Nitrogen Dioxide (NO_2) [1, 2, 3]			
1-hour Maximum Concentration (ppm)	0.060	0.060	0.062
Number of Days Standard Exceeded			
NAAQS 1-hour (>0.100 ppm)	0	0	0
CAAQS 1-hour (>0.18 ppm)	0	0	0
Particulate Matter Less Than 10 Microns (PM_{10}) [1, 2, 3]			
National 24-hour Maximum Concentration	225.1	318.7	102.8
State 24-hour Maximum Concentration	*	*	*
State Annual Average Concentration (CAAQS=20 µg/m^3)	*	*	*
Number of Days Standard Exceeded			
NAAQS 24-hour (>150 µg/m^3)	6	3	0
CAAQS 24-hour (>50 µg/m^3)	*	*	*
Particulate Matter Less Than 2.5 Microns ($PM_{2.5}$) [1, 2, 4]			
National 24-hour Maximum Concentration	24.6	25.6	40.7
State 24-hour Maximum Concentration	24.6	25.6	40.7
Number of Days Standard Exceeded			
NAAQS 24-hour (>35 µg/m^3)	0	0	1

Notes:
* Insufficient (or no) data available to determine the value.
[1] NAAQS = National Ambient Air Quality Standards; CAAQS = California Ambient Air Quality Standards; ppm = parts per million.
[2] µg/m^3 = micrograms per cubic meter; – = not measured, * = insufficient data available
[3] Measurements taken at the Barstow Monitoring Station at 301 E. Mountain View Street, Barstow, California 92311 (CARB# 36155)
[4] Measurements taken at the Victorville-Park Avenue Monitoring Station at 14306 Park Avenue, Victorville, California 92392 (CARB# 92392), which is the closet monitoring station that measures $PM_{2.5}$.

5.4 Sensitive Receptors

Sensitive populations are more susceptible to the effects of air pollution than the general population. Sensitive receptors that are in proximity to localized sources of toxics are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. The BIG footprint is mainly surrounded land zoned for Rural Living, Resource/Land Management, Public Facility, and Right-of-Way. The sensitive land uses that have been analyzed herein are nearest to BIG are shown in **Figure 9: Sensitive Receptor Locations** and described in **Table 27: Sensitive Receptors**. **Table 27** is a list of sensitive receptors that have been analyzed and not a list of sensitive receptors that necessarily would be impacted.

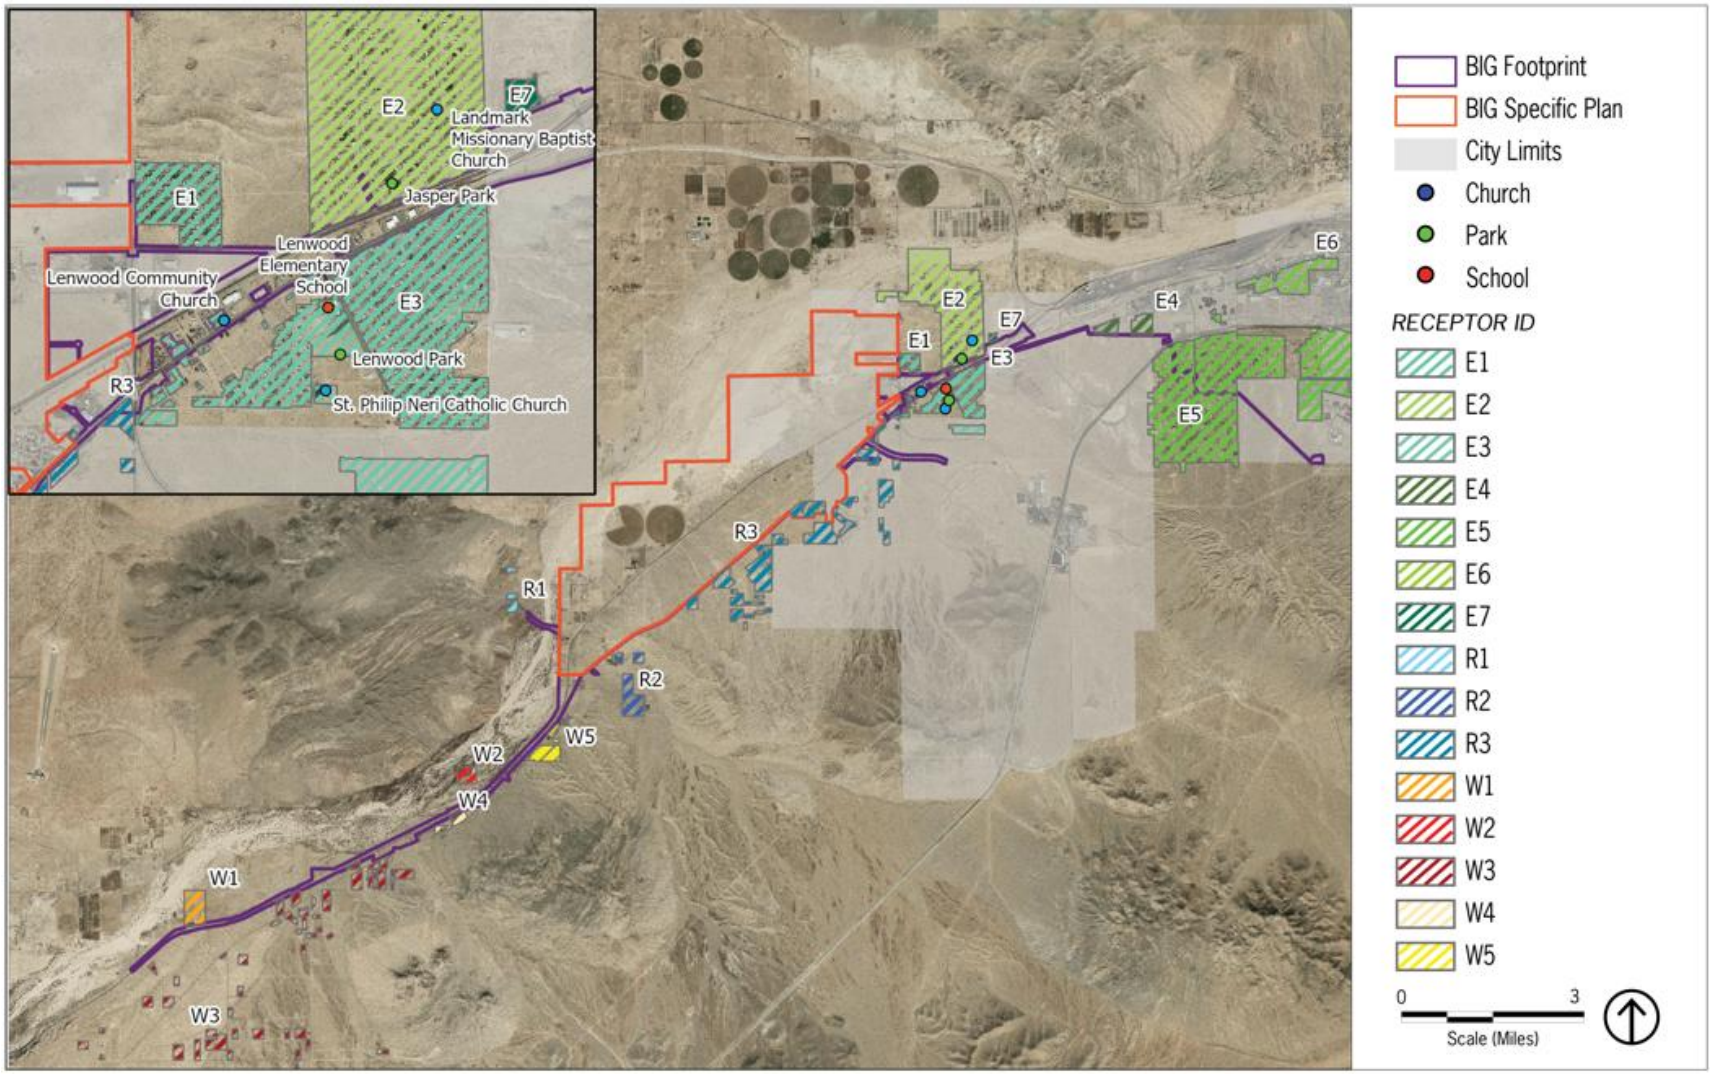

Table 27: Sensitive Receptors

Receptor ID	Receptor Description	Location	Distance and Direction from BIG[1]
RESIDENTIAL RECEPTORS – WEST LEAD RECEPTOR AREA			
W1	Single-Family Residences	Along Indian Trail, approximately 2,500 feet north of National Trails Highway	1,000 feet south
W2	Single-family Residences	Along Indian Trail, northeast of the Indian Trail and Lords Road Intersection	700 feet north
W3	Single-family Residences	Along Main Street, approximately 500 feet west of Hodge Road	240 feet south
W4	Single-family Residences	Along Main Street, approximately 400 feet east of Hodge Road	600 feet south
W5	Single-family Residences	Along Hodge Road, east of the Main Street and Hodge Road intersection	950 feet south
W6	Single-family Residences	Along Main Street, approximately 1,500 feet northeast of Hodge Road	350 feet south
W7	Single-family Residences	Along Main Street, approximately 5,680 feet southwest of Buckboard Road	360 feet southeast
W8	Single-family Residences	Along Main Street, approximately 4,400 feet southwest of Buckboard Road	340 feet southeast
RESIDENTIAL RECEPTORS – BLOCK SWAP/INTERMODAL RECEPTOR AREA			
R1	Single-family Residences	Along Main Street, approximately 1,500 feet north of Buckboard Road	720 feet southeast
R2	Single-family Residences	Along Main Street, approximately 3,000 feet northeast of Buckboard Road	530 feet southeast
R3	Single-family Residences	Along Main Street, approximately 2,400 feet west of Prairie Avenue	500 feet southeast
R4	Single-family Residences	Along Main Street, approximately 2,175 feet west of Prairie Avenue	330 feet southeast
R5	Single-Family Residences	At the intersection of Prairie Avenue and Spinet Street	2,850 feet southeast
R6	Single-family Residences	Along Gazana Street, Approximately 245 feet west of Sylvan Avenue	570 feet southeast
R7	Single-family Residences	Along Amarylis Avenue, approximately 480 feet south of Main Street	570 feet southeast

Table 27: Sensitive Receptors			
Receptor ID	**Receptor Description**	**Location**	**Distance and Direction from BIG[1]**
RESIDENTIAL RECEPTORS – EAST LEAD RECEPTOR AREA			
E1	Single-family Residences	Along Sweeten Lane, approximately 800 feet east of National Trails Highway	1,600 feet southeast
E2	Single-family Residences	Along Main St, approximately west of Sun Valley Drive	760 feet southeast
E3	Single-family Residences	Along Main Street, approximately 1,700 Sun Valley Drive	610 feet southeast
E4	Single-family Residences	Along Main St, approximately 910 feet west of Sun Valley Drive	580 feet southeast
E5	Single-family Residences	At the intersection of Main Street and Holland Street	640 feet southeast
E6	Single-family Residences	Intersection of Main Street and Holland Street	380 feet south
E7	Single-family Residences	Intersection of Jade Road and Walnut Street	4,200 feet north
E8	Single-family Residences	Along Jasper Road, approximately 380 feet west of Birch Road	300 feet north
E9	Single-family Residences	Along Main Street, approximately 200 feet north of Anderson Avenue	440 feet south
E10	Single-family Residences	Southeast of Main Street and Avenue H	9,000 feet southeast
ALONG 33 kV LINE			
T1	Single-family Residences	Surrey Court, North of Surrey Road and Surrey Court	100 feet south
T2	Single-family Residences	Along Rimrock Road, approximately 90 feet east of L Street	120 feet east
T3	Single-family Residences	Along J Street, approximately 80 feet south of Bonanza Road	100 feet south
SCHOOLS			
1	Lenwood Elementary School	Along Ash Road, approximately 500 feet south of Main Street	520 feet southeast
PLACES OF WORSHIP			
2	Landmark Missionary Baptist Church	Along Cedar Road, approximately 530 feet north of Jasper Road	1,080 northeast
3	St. Philip Neri Catholic Church	Along 3rd Street, approximately 400 feet east of Paris Avenue	1,670 feet southeast
4	Lenwood Community Church	Along Main Street, approximately 95 feet west of Woods Avenue	230 feet south
5	Veterans of Foreign Wars	Intersection of Main Street and Frank Street	140 feet south
6	Dollar General	Along Main St, west of Ash Road	125 feet south
PARKS			
7	Jasper Park	Along Jasper Road, approximately 290 feet east of Birch Road	Adjacent to the northeast
8	Lenwood Park	Along Ash Road, approximately 960 feet south of Main Street	960 feet to the southeast

5.5 BIG Footprint Baseline Emissions

The approximately 5,000-acre BIG footprint is in the western part of the City and southwestern part of the County. The BIG footprint is generally bordered by the Mojave River on the north, Historic Main Street (also referred to as National Trails Highway or Route 66) (hereinafter Main Street) on the south, Lenwood Road on the east, and Hinkley Road on the west. As a result of property acquisitions associated with BIG the majority of former residents within the BIG footprint have been relocated and many of the residences have been demolished. To provide a conservative impact analysis, the emissions baseline for BIG is considered to be zero.

However, as described above, the operational train emissions modeling was completed for future years without BIG (2028, 2033, and 2048) to establish future baseline train emissions and analyze incremental emissions increases directly attributable to BIG. Based on that data, use of existing conditions alone would be misleading and without informative value to decision-makers and the public. (See State CEQA Guideline § 15125(a)(2)).

6.0 IMPACT ANALYSIS

6.1 Introduction

This section presents the impact analysis to air quality for BIG. This analysis reviews both the temporary construction phase of BIG and the permanent operation of BIG and the potential for both to directly or indirectly cause potential adverse effects, including the potential to conflict with an air quality plan; result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state AAQS; expose sensitive receptors to substantial pollutant concentrations; and result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. The following are the impact criteria used in this analysis which are consistent with applicable guidance (see Section 3.1). BIG would result in significant impacts if it:

- Conflict with or obstruct implementation of the applicable air quality plan.
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable state or federal AAQS.
- Expose sensitive receptors to substantial pollutant concentrations.
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Consistency with AQMPs. MDAQMD requires a consistency evaluation with adopted federal and State AQMPs. Per the MDAQMD CEQA Guidelines, there are two general criteria to determine project consistency with the MDAQMD AQMPs (MDAQMD, 2020). Under the first criteria (Criterion 1), a project is non-conforming if it conflicts with or delays implementation of any applicable attainment or maintenance plan. For the second criteria (Criterion 2), a project is conforming if it complies with all applicable MDAQMD rules and regulations, complies with all proposed control measures that are not yet adopted from the applicable plan(s), and is consistent with the growth forecasts in the applicable plan(s) (or is directly included in the applicable plan). Conformity with growth forecasts can be established by demonstrating that the project is consistent with the land use plan that was used to generate the growth forecast.

If a project is deemed consistent with the existing land use plan, it is considered consistent with the AQMPs. Zoning changes, specific plans, general plan amendments, and similar land use plan changes that do not increase dwelling unit density, do not increase vehicle trips, and do not increase vehicle miles traveled are also deemed to not exceed this threshold (MDAQMD, 2020).

6.2 Impacts

Impact 5.3-1	*Would the project conflict with or obstruct implementation of the applicable air quality plan?*

Per the MDAQMD CEQA and Conformity Guidelines (2020), a project is nonconforming with an air quality plan If it conflicts with or delays implementation of any applicable attainment or maintenance plan (Criterion 1). A project is conforming if it complies with applicable air district rules and regulations,

complies with proposed control measures, and is consistent with the growth forecasts in the applicable plan (Criterion 2).

Criterion 1

As discussed in **Impact 5.3-2**, below, BIG would exceed MDAQMD's construction and operational emissions thresholds. Therefore, a delay in the timely attainment of air quality standards could occur, and BIG's impact is inconsistent with the first criterion.

Criterion 2

MDAQMD Western Mojave Desert AQMP

The BIG footprint is within the MDAB, which is under the jurisdiction of the MDAQMD. The MDAQMD Western Mojave Desert AQMP (2023) is the applicable air quality plan for the BIG footprint. The MDAQMD Western Mojave Desert AQMP contains air pollutant reduction strategies based on growth forecasts, which were defined in consultation with local governments and are based on local general plans; see **Section 2.0.** The BIG footprint's existing land use designations in the CWP consist of Rural Living, Resource/Land Management, Public Facility, and Right-of-Way. The BIG footprint's existing land use designations in the 2015 General Plan consist of General Commercial, General Industrial, Diverse Use, Public/Quasi-Public, and Right-of-Way. BIG includes implementation of a Specific Plan coordinated with the proposed General Plan, which would change the BIG footprint's existing land use designations to Specific Plan. Following the proposed General Plan, BIG would not conflict with any land use plan, policy, or regulation.

As previously mentioned in **Section 2.0**, the MDAQMD has adopted rules to limit air emissions. BIG would comply with the following MDAQMD Rules, as applicable, for regulation of fugitive dust and emissions from fossil fuel combustion:

- Visible Emissions Rule (Rule 401)
- Nuisance Rule (Rule 402)
- Fugitive Dust Rule (Rule 403)
- PM Concentration Rule (Rule 404)
- Solid PM Weight Rule (Rule 405)
- Combustion Contaminants Rule (Rule 409)
- Sulfur Content of Liquid Fuels Rule (Rule 431)
- Architectural Coating Rule (Rule 1113)

BIG implementation would not conflict with the MDAQMD Western Mojave Desert AQMP and would therefore not be inconsistent with the second criterion as a result.

South Coast CAQMD 2022 AQMP

BIG implementation would improve goods movement and supply chain efficiency by transporting more containers by train, thereby reducing truck trips in the SCAB, which is under the jurisdiction of the South

Coast AQMD. The South Coast AQMD identifies goods movement activities as a challenge for cleaning air for the 17 million residents in the SCAB (South Coast AQMD, 2022). The South Coast AQMD's 2022 AQMP includes TCMs and RACMs that BIG would help implement (Ibid, Appendix IV-C-72). Measure 7.19 involves programs (overseen by CARB) to encourage goods movement by rail. Additionally, Measure 7.20 aims to divert trucks from nonattainment areas (i.e., requiring pass-through trucks to choose routes away from the SCAG region). The AQMP notes that there is no authority to implement this measure and that it is not feasible because the whole South Coast region is nonattainment under one or more of the NAAQS. However, within the South Coast AQMD region, BIG would transport more containers with trains instead of heavy-duty trucks to reduce approximately 124,710 heavy-duty truck miles per year (compared to without BIG conditions) in 2028, approximately 158,437 heavy-duty truck miles per year (compared to without BIG conditions) in 2033, and approximately 192,255 heavy-duty truck miles per year (compared to without BIG conditions) in 2048 from regional roadways and associated emissions reductions within the South Coast AQMD. Additional reductions in truck miles and air pollutant emissions would occur throughout California and in other States with BIG implementation. The reduction in regional heavy-duty truck miles within the SCAB compared to without BIG conditions would achieve this measure (**Appendix 5.15 BIG-1**).

SCAG Regional Transportation Plan/Sustainable Communities Strategy (Connect SoCal)

The overarching vision of Connect SoCal includes encouraging implementation of innovative technologies and Intelligent Transportation Systems aimed at expanding accessibility, relieving congestion, and reducing emissions (SCAG, 2024b, p. 8). According to the *Goods Movement Technical Report* of Connect SoCal 2024, the efficient movement of goods is a critical component of a strong economy and improves quality of life in the SCAG region (SCAG, 2024a). By 2050, SCAG anticipates that the goods movement system will include new charging and fueling infrastructure, expanded rail yards, upgrades to the main line railroad tracks, improved port terminals, and heavy-duty truck and freight corridor bottleneck relief projects, including dedicated heavy-duty truck lanes. Per Connect SoCal 2024, as the region continues to grow, the goods movement system will also show significant progress in reducing emissions, including operational efficiencies and the introduction of near-zero and ZE vehicles.

Connect SoCal 2024 is supported by a combination of transportation and land use strategies that outline how the region can achieve California's GHG reduction goals and FCAA requirements. Connect SoCal 2024 also strives to achieve broader regional objectives, such as improved equity and resilience, preservation of natural lands, improvement of public health, increased transportation safety, support for the region's vital goods movement industries, and more efficient use of resources (SCAG, 2024a).

Connect SoCal 2024 subgoals relevant to BIG include supporting investments that result in improved safety and air quality and minimized GHG emissions (Mobility); integrating the region's development pattern and transportation network to improve air quality, reduce GHG emissions, and enable more sustainable use of energy and water (Environment); conserving the region's resources (Environment); improve access to jobs (Economy); and advancing a resilient and efficient goods movement system that supports the economic vitality of the region, attainment of clean air, and quality of life for our communities (Economy) (SCAG, 2024b, p. 85).

Connect SoCal 2024 explains that transportation, especially the goods movement sectors, contributes to the overwhelming majority of air pollutant emissions causing O_3 pollution. As part of the vision for the 2050 horizon year, Connect SoCal states that it is critical to integrate land use decisions and technological advancements to minimize environmental and health impacts while fostering continued growth in trade and commerce. (SCAG, 2024b, p. 112). Infrastructure improvements support greater system efficiency and may reduce emissions. Reducing air quality emissions is addressed through cleaner and more efficient operation of vehicles, largely by modifying or replacing the existing regional fleet of goods movement equipment (e.g., locomotives, cargo handling equipment, ocean going vessels and commercial harbor craft) with cleaner technologies or efficiency operation of vehicles (SCAG, 2024a, p.94).

BIG improves goods movement and supply chain efficiency by transporting more containers with trains within California to reduce heavy-duty truck miles by approximately (compared to without BIG conditions):

- 2028: 58,130,956 heavy-duty truck miles reduced per year in California and 217,824,523 heavy-duty truck miles reduced per year nationally
- 2033: 76,365,405 heavy-duty truck miles reduced per year in California and 286,312,231 heavy-duty truck miles reduced per year nationally (c
- 2048: 89,381,289 heavy-duty truck miles reduced per year in California and 333,123,035 heavy-duty truck miles reduced per year nationally

The reduction in heavy-duty truck miles would result in a GHG emission annual net reduction of approximately:

- 2028: 87,418 metric tons of CO_2 equivalent reduced in California and 325,665 metric tons of CO_2 equivalent reduced nationally
- 2033: 101,088 metric tons of CO_2 equivalent reduced in California and 376,762 metric tons of CO_2 equivalent reduced nationally
- 2048: 100,539 metric tons of CO_2 equivalent reduced in California and 372,416 metric tons of CO_2e reduced nationally

See **Appendix 5.8 BIG-1: Greenhouse Gas Emissions Assessment**) for additional detail on GHG emissions and truck miles traveled reductions. Connect SoCal notes that attaining the national ozone standards in the SCAB will require reductions in emissions of NO_X well beyond reductions resulting from current rules, programs and commercially available technologies. Previous regulations and incentive programs have improved vehicle emissions performance, but as the region grows, existing measures are not enough to realize attainment of the O_3 standards in the 2023- and 2031-time frames. With the projected changes in both heavy-duty truck and rail emissions, greater advancements in technology are needed to meet regional attainment objectives (SCAG, 2024a, p. 62). BIG's reduction in truck trips and improvement in goods movement with ZEs cargo handling equipment (compared to without BIG conditions) help address the regional attainment objectives identified by SCAG.

As discussed in ***Chapter 5.13: Population and Housing***, of the Draft EIR, BIG is estimated to generate approximately 16,0000 direct, indirect, and induced jobs by the year 2048, accounting for the 92 jobs associated with the existing commercial and industrial uses to be displaced. In 2021, the County's civilian

labor force had 937,085 employed persons (U.S. Census Bureau, ND). By the year 2050, SCAG estimates total employment for the County at 1,148,000, for an increase of 210,915 jobs by 2050. The estimated 16,000 new jobs attributable by BIG would be seven percent of the projected increase in jobs within the County by 2050. Thus, BIG would induce growth. However, job growth associated with BIG would be within the projections used to develop the AQMPs.

To accommodate the proposed improvements, BIG would remove approximately 108 dwelling units. Thus, BIG would not generate population growth or cause the population growth projections used in air quality management planning to be exceeded.

Regulatory Setting

The state has developed various regulations, and additional regulations are underway to achieve sustainable freight goals, accelerate the introduction of cleaner technology, and reduce localized emissions. Several of these regulations include:

- The Heavy Truck and Bus rule, passed in 2008, requires that by 2023 nearly all heavy-duty vehicles have engines that are MY 2010 or newer. Drayage trucks must also meet the requirement of having 2010 or newer MY engines under the Drayage Truck Regulation.
  - Trucks registered in California and accessing BIG are required to comply with CARB's Heavy Truck and Bus Rule.
- CARB created an optional low NO_X standard in 2013 to allow certification of lower NO_X engines for use in an incentive program. Additionally, various incentive programs have since funded the deployment of electric, hybrid-electric and near-ZE trucks, and an updated funding plan is under development.
  - The Low NO_X incentive program would also benefit trucks accessing BIG.
- The Clean Transportation Incentive Program invests up to $100 million annually in transportation and fuel transportation projects throughout the state.
  - Trucks accessing BIG would benefit from this incentive program to reduce emissions.
- The Low Carbon Transportation Investments and the Air Quality Improvement Program provide mobile source incentives to reduce GHG, criteria pollutant, and TAC emissions through the deployment of advanced technology and clean transportation in the light-duty and heavy-duty sectors. Low Carbon Transportation Investments are supported by Cap-and-Trade auction proceeds.
  - Low Carbon Transportation Investments would help to reduce truck emissions, including trucks accessing BIG.

Regulations are also being developed for forklifts and cargo handling equipment to transition to ZEs (CARB, NDc). BIG operations would benefit from the implementation of current and potential future regulations (e.g., improvements in vehicle emissions, low NO_X standard, Clean Transportation Incentive Program, Low Carbon Transportation Investments, the Air Quality Improvement Program, etc.) enacted to improve goods movement and reduce emissions.

For the reasons above, BIG would be inconsistent with Criterion 1 but consistent with Criterion 2.

Mitigation Measures: Refer to **Section 6.0: Mitigation Measures** for **MM BIG AQ-1** through **MM BIG AQ-14**.

Impact 5.3-2	***Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable state or federal ambient air quality standard?***

6.3 Construction

BIG construction would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern within BIG include O_3-precursor pollutants (i.e., ROG and NO_X) and PM_{10} and $PM_{2.5}$. Construction-generated emissions are short-term and of temporary duration, lasting only as long as construction activities occur, but would be considered a significant air quality impact if the amount of pollutants generated exceeds the MDAQMD's thresholds of significance.

Construction results in the temporary generation of emissions resulting from demolition, site grading, road paving, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Maximum daily construction-generated emissions for BIG are summarized in **Table 28: Unmitigated Construction Emissions (pounds per day)** and **Table 29: Unmitigated Construction Emissions (Tons per Year)** and can also be found in **Appendix A**.

Table 28: Unmitigated Construction Emissions (pounds per day)

Construction Year	Pollutant (Maximum Pounds per Day)[1]

VOC = Volatile Organic Compounds; NO_X = Nitrogen Oxides; CO = Carbon Monoxide; SO_2 = Sulfur Dioxide; PM_{10} = Particulate Matter 10 microns in diameter or less; $PM_{2.5}$ = Particulate Matter 2.5 microns in diameter or less.

Table 29: Unmitigated Construction Emissions (Tons per Year)						
Construction Year	Pollutant (Tons per Year)[1]					
	VOC	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
[1] MDAQMD Rule 403 Fugitive Dust applied. The Rule 403 reduction/credits include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; cover stockpiles with tarps; water all haul roads twice daily; and limit speeds on unpaved roads to 15 miles per hour. Reductions percentages from the South Coast Air Quality Management District CEQA Handbook (Tables XI-A through XI-E) were applied.						
Sources: *Refer to* ***Appendix A1***						

Table 28 and **Table 29** show that unmitigated construction emissions would exceed the MDAQMD VOC, NO_X, CO, PM_{10}, and $PM_{2.5}$ construction thresholds despite compliance with applicable laws, ordinances, and regulations (LORs) LOR AQ-1, LOR AQ-2, and LOR AQ-3; see **Laws, Regulations, and Orders** above. The majority of emissions occur from off-road equipment exhaust. Additionally, VOC emissions occur from architectural coating and paving activities. BIG would also be required to comply with the following mitigation measures to lower construction emissions. Mitigation Measure (**MM) BIG AQ-1** requires controls for fugitive dust emissions and **MM BIG AQ-2** requires all architectural coatings to be super-compliant low VOC paints, consisting of no more than 10 grams per liter of VOC. **MM BIG AQ-3** requires construction equipment to meet CARB Tier 4 Final emissions standards and **MM BIG AQ-4** requires the use of renewable diesel fuel during construction. Furthermore, **MM BIG AQ-5** requires on-road construction trucks to have an average fleet mix of MY 2010 or newer (no less than the average fleet mix for the current calendar year as set forth in the EMFAC2021 database) and **MM BIG AQ-6** requires emissions controls for concrete batch plants such as reduction of fugitive dust. The mitigation measures are described below in **Section 7.0**.

Mitigated Construction emissions are shown in **Table 30: Mitigated Construction Emissions (pounds per day)** and **Table 31: Mitigated Construction Emissions (Tons per Year)**. Despite the implementation of mitigation measures, due to the size of BIG, emissions would remain above MDAQMD's thresholds; refer to **Table 8**. Construction impacts would be significant and unavoidable despite the implementation of **MM BIG AQ-1** through **MM BIG AQ-6**.

6.4 Operations

Unmitigated Operations

BIG's operational emissions would be associated with area sources (e.g., landscape maintenance equipment, architectural coatings, off-road equipment, etc.), energy sources, mobile sources (i.e., motor vehicle use), and off-road equipment. The major contributors of operational emissions are heavy-duty trucks, line-haul locomotives, switcher locomotives, and non-electric cargo-handling equipment (e.g., chassis stackers, and maintenance equipment). BIG includes a dedicated fleet of Tier 4 locomotives to transport cross-dock intermodal containers from the Ports to BIG's intermodal facility, Tier 4 switcher locomotives, the retirement of all existing switcher locomotives at the existing Barstow classification yard and the addition of six Tier 4 switcher locomotives[30], increasing the renewable diesel composition within the Port's existing fueling site, the use of electric cargo handling equipment (i.e., electric RTG cranes, chassis stacking forklifts, forklifts, top pick/side loaders, and electric hostlers), and the use of all-electric appliances and end uses instead of natural gas.

In addition, future year operational emissions are influenced by various regulations and agreements that would reduce operational emissions from heavy-duty trucks, including continued implementation of CARB regulations such as the In-Use Off-Road Diesel Vehicle Rule, Emission Standard for On-road Trucks, and the CARB Statewide Truck and Bus Regulation. These regulations are factored into CARB's EMFAC 2021 projections used for the on-road mobile source analysis. Unmitigated BIG operational emissions within the MDAB are summarized in **Table 32: Unmitigated Net Operational Emissions within MDAQMD (Pounds per Day)** and **Table 33: Unmitigated Net Operational Emissions within MDAQMD (Tons per**

[30] Only six Tier 4 switcher locomotives are needed to fully replace the 15 existing Tier 0/0+/1+ switcher locomotives due to improved reliability, advanced traction control, and better power/improved torque with Tier 4 switchers.

Year). BIG operational emissions within the SCAB are summarized in **Table 34: Unmitigated Net Operational Emissions within SCAB (Tons per Year)**.

Table 34: Unmitigated Net Operational Emissions within SCAB (Tons per Year)						
Source	Pollutant (tons per year)[1]					
	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
[2] BIG would improve goods movement and supply chain efficiency by transporting more containers with trains to reduce approximately 124,710 TMT per day in 2028, approximately 163,607 TMT per day in 2033, and approximately 192,255 TMT per day in 2048; See Appendix 5.15 BIG-1: CEQA Assessment – Vehicle Miles Traveled, Active Transportation, and Public Transit Analysis. [3] SCAB only Corridor emissions per EnSafe, *BNSF Barstow International Gateway Corridor Emissions Analysis*, October 2025.						
Sources: Refer to ***Appendix A2*** and ***Appendix B***						

As shown in **Table 34,** emissions within SCAB would be below applicable thresholds. Therefore, no mitigation is required.

Regional Emissions Improvements and Pollutant Transport

As discussed above, BIG improves goods movement and supply chain efficiency by transporting more containers by train to eliminate approximately 1,715 daily truck trips in 2028, 2,270 daily truck trips in 2033, and 2,635 daily truck trips in 2048; see **Appendix 5.15 BIG-1, Table 19**. BIG is anticipated to reduce truck miles traveled by increasing the use of trains for cargo transportation and by providing an intermodal facility closer to unit origin than currently exists. Under existing conditions, cargo arrives at the Ports on container ships in 40-foot international containers, which are then placed onto heavy-duty trucks and transported to local warehouses. The cargo is then transferred from the 40-foot international containers to 53-foot domestic containers, which are trucked back to rail yards, transloaded onto trains, and transported generally easterly to their final destination. The transloading results in a significant number of truck trips and associated criteria pollutant and GHG emissions primarily within the MDAQMD region.

Prevailing winds transport O_3 and O_3 precursors from the SCAB and the San Joaquin Valley Air Basin into and through the MDAB. As noted in the MDAQMD 2023 O_3 Attainment Plan, due to meteorological and terrain effects, the air flow and transport of emissions from the SCAB is the major source of O_3 pollution in Western MD (MDAQMD, 2023, p. 4).

Furthermore, the MDAQMD 2023 O_3 Attainment Plan also notes that the current and new NO_X emission reduction commitments from CARB, South Coast AQMD, and the San Joaquin APCD will drive O_3 concentrations down even further for the future years within the MDAB. In 2020 NO_X emissions decreased by up to 20 percent due to the additional NO_x emission reductions caused by the pandemic, resulting in a 0-2 parts per billion decrease in O_3 (MDAQMD, 2023, p. D-23). This suggests that NO_x emission control strategies in upwind areas such as SCAB and the San Joaquin Valley are expected to be effective in reducing O_3 levels in future years. As such, emissions improvements from TMT reductions and train operations improvements compared to without BIG conditions in the SCAB would also improve emissions within the western portion of the MDAB by reducing the amount of pollutants transported into the MDAB.

Mitigated Operations

Table 32 and **Table 33: Unmitigated Net Operational Emissions within MDAQMD (Tons per Year)** shows the unmitigated operational emissions would exceed the MDAQMD VOC, NO_X, CO, PM_{10}, and $PM_{2.5}$ thresholds. The majority of emissions occur from locomotives, heavy-duty trucks, equipment exhaust, and fugitive dust. **MM BIG AQ-7** requires sweeping of paved areas to reduce fugitive dust. According to the

WRAP Fugitive Dust Handbook, an 86 percent sweeping efficiency and a 14-day frequency can result in a PM_{10} control efficiency of seven percent (Environmental, 2006).

To reduce exhaust emissions, **MM BIG AQ-8** requires RTG cranes to use renewable diesel. **MM BIG AQ-9** through **MM BIG AQ-14** require various measures to reduce BIG transload warehouse-related operational emissions. For example, **MM BIG AQ-9** includes truck idling limits, **MM BIG AQ-10** requires Tier 4 emergency backup generators, and **MM BIG AQ-11** and **MM BIG AQ-13** require truck efficiency measures such as compliance with CARB's Carl Moyer Efficiency Program and U.S. EPA's Smart Way Program. **MM AQ-13** would further reduce emissions by requiring electric landscaping equipment. To support future technologies, **MM BIG AQ-14** requires future EV charging infrastructure.

BIG's mitigated operational emissions are shown in **Table 35: Mitigated Operational Emissions within MDAB (Pounds per Day)** and **Table 36: Mitigated Operational Emissions within MDAB (Tons per Year)**. The mitigation measures are described below in **Section 7.0**.

Notes: [1] Totals may not add up due to rounding. [2] Mitigation measures include **MM BIG AQ-7** (sweeping paved areas), **MM BIG AQ-8** (renewable diesel RTG cranes). [3] Includes fugitive dust, break wear, and tire wear from fleet vehicles, on-site passenger cars, heavy-duty trucks, and cargo-handling equipment. [4] BIG would improve goods movement and supply chain efficiency by transporting more containers with trains to reduce approximately 14,719,796 annual TMT in 2028, approximately 18,067,338 annual TMT in 2033, and approximately 21,646,477 annual TMT in 2048; See Appendix 5.15 BIG-1: CEQA Assessment – Vehicle Miles Traveled, Active Transportation, and Public Transit Analysis. [5] MDAB only Corridor emissions per EnSafe, *BNSF Barstow International Gateway Corridor Emissions Analysis*, October 2025 (see Appendix B of this report).						
Source: *Refer to* ***Appendix A2*** and ***Appendix B.***						

Table 35 and Table 36 show that despite the implementation of **MM BIG AQ-7** through **MM BIG AQ-14**, operational emissions would remain above MDAQMD thresholds. Therefore, operational emissions would be significant and unavoidable for emissions within the MDAB (i.e., MDAQMD's jurisdiction). As shown in **Table 34**, unmitigated emissions within SCAB (i.e., South Coast AQMD's jurisdiction) would be below applicable thresholds and no mitigation is required. Additional mitigation measures considered but determined infeasible are discussed in **Section 7.0**.

Potential Criteria Pollutant Health Impacts

This section includes a discussion of the potential health effects of criteria air pollutant impacts due to the exceedance of mass emissions thresholds in accordance with the findings of the legal case *Sierra Club v. County of Fresno* (2018), commonly called "Friant Ranch". Health effects information was acquired through a review of available literature published by the MDAQMD, CARB, and U.S. EPA. This discussion provides supplemental information related to the air quality concentration impacts. This discussion is not itself an impact-significance determination under any CEQA threshold identified in this document.

This section discusses the relationship between BIG's regional criteria pollutant emissions and the potential for adverse health effects to occur for persons exposed to the emitted pollutants. BIG construction and operation would produce regional mass emissions of VOC, NO_X, CO, PM_{10}, and $PM_{2.5}$

above MDAQMD thresholds. NO_2, a criteria pollutant, is the primary component of NO_X. In addition, VOCs and NO_X are precursors of O_3, a criterial pollutant that is photochemically formed from the precursors in the atmosphere in the presence of sunlight (U.S. EPA, 2025a). Therefore, the criteria pollutants evaluated for regional health effects are NO_2, O_3, CO, and PM.

There is currently no methodology available that can accurately quantify regional health effects from NO_2, O_3, CO, or PM exposure associated with an individual project's emissions. The South Coast AQMD reached a similar conclusion in its *Amicus Curiae* brief filed with the California Supreme Court in the case of *Sierra Club v. County of Fresno*, when, concerning O_3, the South Coast AQMD stated that it does not know of a way to accurately quantify health impacts caused by emissions produced on a scale as small as individual projects (South Coast AQMD, 2015, p. 12). One existing tool, U.S. EPA's BenMAP, calculates the number and economic value of air pollution-related deaths and illnesses resulting from changes in O_3 and $PM_{2.5}$ concentrations (U.S. EPA, 2025b). However, the expected changes in regional O_3 concentrations associated with BIG would be so low that BenMAP would likely produce estimates of health effects that are near zero. Therefore, the extent to which regional adverse health effects can be identified in this section is limited to (a) discussing BIG's potential impact on regional pollutant levels; and (b) generally describing the types of adverse health effects associated with exposure to the pollutants of concern.

CO

The MDAB is currently designated attainment of the CAAQS and NAAQS for CO. The CAAQSs were established to protect public health, including the most sensitive groups (CARB, NDb). The NAAQS were established to protect public health with an adequate margin of safety (U.S. EPA, 2025e). The most stringent CO CAAQS or NAAQS are 20 ppm for a 1-hour average and 9.0 ppm for an 8-hour average.

The highest CO concentrations recorded anywhere in the MDAB over the last three available years (2019 through 2021) are 5.461ppm for a 1-hour average (CARB, NDa). This pollutant level is 27 percent of the 1-hour CAAQS and 16 percent of the 1-hour NAAQS.

According to the most recent U.S. EPA-approved MDAB emissions inventory, the MDAB's total CO emissions in 2020 were 337.3 tons per day (CARB, 2009). By comparison, BIG construction would result in a maximum of 3,846 pounds per day (1.92 tons per day) and BIG operations total CO emissions would be 2,697 pounds per day (1.35 tons per day), which would be 0.6 percent and 0.4 percent as large as the total MDAB emissions, respectively. Therefore, BIG's contribution to regional CO levels would be relatively small.

Potential Health Effects

In developing CO standards, the U.S. EPA has prepared a comprehensive report on the possible health effects associated with CO exposure (U.S. EPA, 2010). The South Coast AQMD summarizes the U.S. EPA's findings in its *Final 2016 AQMP* (South Coast AQMD, 2017). The main conclusions are:

Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of worsening oxygen supply delivery to the heart. Inhaled CO has no known direct toxic effect on the lungs, but exerts its effect on tissues by interfering with oxygen

transport, by competing with oxygen to combine with hemoglobin present in the blood to form carboxyhemoglobin. Hence, people with conditions requiring an increased oxygen supply can be adversely affected by exposure to CO. Individuals most at risk include patients with diseases involving heart and blood vessels, fetuses, and patients with chronic hypoxemia (oxygen deficiency), such as is seen at high altitudes. Reductions in birth weight and impaired neurobehavioral development have been observed in animals chronically exposed to CO resulting in carboxyhemoglobin levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels, including preterm births and heart abnormalities.

NO_2

The MDAB is currently designated attainment of the NO_2 CAAQS and NAAQS. The most stringent NO_2 standards are 0.18 ppm for a 1-hour average (state 1-hour standard), 0.100 ppm for a three-year average of the 98th percentile of the annual distributions of daily maximum 1-hour average concentrations (federal 1-hour standard), and 0.030 ppm for an annual average (CAAQS).

The highest NO_2 concentrations recorded anywhere in the MDAB over the last three available years (2021 through 2023) are 0.062 ppm (CARB, NDa). The pollutant level is 34 percent and 62 percent of the CAAQS and NAAQS 1-hour standards, respectively.

According to the most recent CARB emissions inventory, the total NO_X emissions within the MDAB in 2020 were 204.2 tons/day (CARB, 2009). By comparison, the highest NO_X emissions increment associated with BIG construction is 4,419 pounds per day (2.21 tons/day), which would be 0.7 percent of the total MDAB emissions. Operational emissions would exceed the MDAQMD threshold with 2,265 pounds per day (1.1 tons/day), which would be 0.3 percent as large as the total MDAB emissions. Therefore, BIG's contribution to regional NO_2 levels would be relatively small.

Potential Health Effects

In developing the NO_2 standards, the U.S. EPA and CARB have prepared comprehensive reports on the possible health effects associated with NO_2 exposure. The main conclusions of these agencies are:

The U.S. EPA concluded that a causal relationship exists between short-term NO_2 exposure and respiratory effects such as asthma attacks. There is likely to be a causal relationship between long-term NO_2 exposure and respiratory effects based on the evidence for development of asthma. For short-term and long-term NO_2 exposure, evidence is suggestive of, but not sufficient to imply, a causal relationship with cardiovascular effects, diabetes, mortality, birth outcomes, and cancer. People with asthma, children, and older adults are at increased risk for NO_2-related health effects (U.S. EPA, 2016).

The CARB concluded that, in controlled human exposure studies, asthmatics appear to be especially sensitive to NO_2. Asthmatic volunteers have experienced short-term effects at concentrations as low as 0.26 ppm. There is evidence that a subset of asthmatics may experience increased airway reactivity at concentrations of 0.2 to 0.3 ppm for 30 minutes to 2 hours. Generally, no clinical effects are reported in non-asthmatic volunteers in conditions below 1 ppm. Epidemiological studies have shown an association between NO_2 and both hospital admissions and emergency room visits for asthma at 24-hour average

concentrations ranging from 0.018 to 0.036 ppm. Less robust evidence suggests associations with mortality, hospitalization for cardiovascular disease, and low birth weight (CARB, 2007, p. A-30 – A-36).

O_3

The MDAB is currently designated nonattainment of the O_3 concentration standards. The most stringent state and federal O_3 standards are 0.09 ppm for 1-hour average, 0.07 ppm for the three-year average of the fourth-highest 8-hour concentration each year (known as the federal 8-hour standard), and 0.07 ppm for an 8-hour average (known as the state 8-hour standard).

The highest 1-hour O_3 concentration recorded in the MDAB over the last three available years (2021 through 2023) is 0.131 ppm, which is 1.45 times the standard. The highest 8-hour O_3 concentration recorded in the MDAB over the last three available years is 0.107 ppm, which is 1.5 times the standard (CARB, NDe).

According to the most recent CARB emissions inventory, the MDAB's total VOC (ROG) emissions in 2020 were 93.5 tons/day (CARB, 2009). By comparison, BIG's highest VOC (ROG) emissions increment was 924 pounds per day (0.46 tons/day) during construction and 596 pounds per day (0.3 tons/day) during operations, which would be 0.1 percent and 0.1 percent of the total MDAB emissions, respectively. As discussed above for NO_2, BIG's NO_X emissions increment would be 0.7 percent and 0.3 percent as large as the total MDAB emissions during construction and operations, respectively. Therefore, BIG's contribution to regional O_3 levels would be relatively small.

Potential Health Effects

In developing the O_3 standards, U.S. EPA and OEHHA have prepared comprehensive reports on the possible health effects associated with O_3 exposure. The agencies' main conclusions are:

U.S. EPA concluded that a causal relationship exists between short-term O_3 exposure and respiratory effects. A causal relationship is likely to exist between short-term O_3 exposure and cardiovascular effects and mortality. Evidence suggests a causal relationship between short-term O_3 exposure and central nervous system effects. A causal relationship is likely to exist between long-term O_3 exposure and respiratory effects. Evidence suggests a causal relationship between long-term O_3 exposure and 33 cardiovascular effects, reproductive and developmental effects, central nervous system effects, and mortality. There is little evidence for a relationship between long-term O_3 exposure and increased risk of lung cancer. The populations and life stages that have adequate evidence for increased O_3-related health effects are individuals with certain genotypes, individuals with asthma, younger and older age groups, individuals with reduced intake of Vitamins E and C, and outdoor workers (U.S. EPA, 2020).

OEHHA concluded that O_3 exposure can result in reduced lung function, increased respiratory symptoms, increased airway hyperreactivity and increased airway inflammation, increased mortality, hospitalization for cardiopulmonary causes, emergency room visits for asthma, and restrictions in activity. In controlled human exposure studies, exercising individuals exposed for one hour to an O_3 concentration as low as 0.12 ppm or for 6.6 hours to a concentration as low as 0.08 ppm experienced lung function decrements and symptoms of respiratory irritation such as cough or pain upon deep inhalation. The lowest O_3 concentrations at which airway hyperreactivity (an increase in the tendency of the airways to constrict in

reaction to exposure to irritants) has been reported are 0.18 ppm O_3 following 2-hour exposure in exercising subjects, 0.40 ppm following 2-hour exposure in resting subjects, and 0.08 ppm O_3 in subjects exercising for 6.6 hours. Airway inflammation has been reported following 2-hour exposures to 0.20 ppm O_3 and following 6.6-hour exposure to 0.08 ppm O_3. Children may be affected by O_3 more than the general population because of its effects on the developing lung and since children have relatively higher exposure than adults. Also, asthmatics may represent a sensitive sub-population for O_3 (OEHHA, 2004, p.6).

PM

The MDAB is currently designated nonattainment of the PM_{10} State 24-hour and annual CAAQS and NAAQS. The most stringent PM_{10} CAAQS or NAAQS are 50 μg/m^3 and 150 μg/m^3, respectively. The highest PM_{10} concentrations recorded in the BIG footprint over the last three available years (2021 through 2023) are 372.7 μg/m^3 (CARB, NDe). This pollutant level is seven times and two times the CAAQS and NAAQS, respectively. According to the most recent CARB emissions inventory, the total PM_{10} emissions within the MDAB in 2020 were 219.2 tons/day (CARB, 2009). By comparison, the PM_{10} emissions increment associated with BIG would average 61,120 pounds per day (31 tons/day) during construction and 914 pounds per day (0.5 tons/day) during operations, which would be 9.1 percent and 0.1 percent as large as the total MDAB emissions, respectively. Therefore, BIG's contribution to regional PM_{10} levels would be relatively small.

The MDAB is currently designated unclassified/attainment of the $PM_{2.5}$ federal 24-hour and NAAQS of 35 μg/m^3. The highest $PM_{2.5}$ concentrations recorded in BIG's footprint over the last three available years (2021 through 2023) are 87.1 μg/m^3 (CARB, NDe). This pollutant level is 2.5 times the NAAQS. According to the most recent CARB emissions inventory, the total $PM_{2.5}$ emissions within the MDAB in 2020 were 59.0 tons/day (CARB, 2009). By comparison, the highest $PM_{2.5}$ emissions increment associated with BIG are 56,291 pounds per day (28 tons/day) during construction and 268 pounds per day (0.13 tons/day) during operations, which would be 8.3 percent and 0.04 percent as large as the total MDAB emissions, respectively. Therefore, BIG's contribution to regional $PM_{2.5}$ levels would be relatively small.

Potential Health Effects

In developing the PM_{10} standards, the U.S. EPA and CARB have prepared comprehensive reports on the possible health effects associated with PM_{10} exposure. The South Coast AQMD also reviewed PM_{10}-related health effects in Appendix I of its *Final 2016 AQMP*. Most of the health effects findings made by these agencies focus on $PM_{2.5}$, which is the smaller, more easily inhalable subset of PM_{10}. The main conclusions of the agencies are:

U.S. EPA concluded that a causal relationship exists between $PM_{2.5}$ exposure (both short- and long-term) and cardiovascular effects sand mortality. A causal relationship is likely to exist between $PM_{2.5}$ exposure (both short- and long-term) and respiratory effects. Evidence is suggestive of a causal relationship between long-term $PM_{2.5}$ exposure and reproductive and developmental effects, cancer, mutagenicity, and genotoxicity. For the portion of PM_{10} greater than 2.5 microns ($PM_{10-2.5}$), U.S. EPA concluded that evidence is suggestive of a causal relationship between short-term $PM_{10-2.5}$ exposure and cardiovascular effects, respiratory effects, and mortality. Older adults have heightened responses for cardiovascular morbidity with PM exposure. Children are at an increased risk of PM-related respiratory effects.

Individuals with underlying cardiovascular disease or asthma may be at an increased risk for adverse effects (U.S. EPA, 2016).

CARB concluded that the potential health effects associated with PM exposure include mortality, increased hospital admissions for cardiopulmonary causes, acute and chronic bronchitis, asthma attacks and emergency room visits, respiratory symptoms, and days with some restriction in activity. These adverse health effects have been reported primarily in infants, children, the elderly, and those with preexisting cardiopulmonary disease. CARB also classifies the portion of PM_{10} produced by diesel engine exhaust (DPM) as a TAC exhibiting carcinogenic effects. A quantitative HRA of BIG's emission of DPM is included herein (CARB, 2008, p. 2-9).

South Coast AQMD concluded that there is a causal relationship between $PM_{2.5}$ exposure and cardiovascular effects and mortality. Specific cardiovascular effects include cardiovascular deaths, hospital admissions for ischemic heart disease and congestive heart failure, changes in heart rate variability and markers of oxidative stress, and markers of atherosclerosis. A causal relationship is likely to exist between $PM_{2.5}$ exposure and respiratory effects, such as hospital admissions for Chronic Obstructive Pulmonary Disease or respiratory infections, asthma development, asthma or allergy exacerbation, lung cancer, impacts on lung function, lung inflammation, oxidative stress, and airway hyperresponsiveness. Both short-term and long-term PM exposures are linked to health effects in humans. Young children, older adults, and people with pre-existing respiratory or cardiovascular health conditions are among those who may be more susceptible to the adverse effects of PM (South Coast AQMD, 2022, p. 2-30). The South Coast AQMD also found that the DPM portion of PM_{10} is a significant contributor to the cancer risk associated with TACs in the SCAB. For example, the average lifetime risk for excess cancer cases in the SCAB from all sources is estimated to be 424 per million for the inhalation pathway. South Coast AQMD's *Multiple Air Toxics Exposure Study V* determined that DPM is responsible for approximately 50 percent of the risk (South Coast AQMD, 2021, p. 2-63).

Summary

In summary, BIG would produce substantial CO, VOC (ROG), NO_X, and PM regional emissions. However, these would make relatively small contributions to regional levels. There is currently no agency-accepted methodology available that can accurately quantify regional health effects from CO, VOC, NO_2, O_3, or PM exposure associated with an individual project's emissions. Therefore, the above discussion is limited to identifying BIG's potential contribution to regional pollutant levels, and generally describing the types of adverse health effects associated with exposure to those pollutants.

Impact 5.3-3	***Would the project expose sensitive receptors to substantial pollutant concentrations?***

BIG implementation could result in localized emissions that would result in the exposure of sensitive receptors to localized criteria pollutant concentrations including potential CO hotspots, asbestos, Valley Fever, and toxic air contaminants. Impacts to sensitive receptors are discussed below.

6.5 Criteria Pollutant Concentrations

Localized Concentrations of Construction Emissions of Criteria Pollutants (BIG Footprint Only)

Dispersion modeling of on-site and off-site BIG construction emissions was performed to assess the impact of construction on ambient air concentrations in the vicinity of the BIG footprint. As described above in **Laws, Regulations, Orders**, BIG construction would comply with MDAQMD rules which include fugitive dust control (Rule 403) and use of low-VOC paints and coatings (Rule 1113).

The U.S. EPA dispersion model AERMOD was used to predict maximum ambient pollutant concentrations within the study area. Detailed dispersion modeling inputs and outputs are included in **Appendix A**. **Table 37: Maximum Off-Site Pollutant Concentrations from Construction (Unmitigated)** presents the maximum offsite ground level concentrations of criteria pollutants estimated for BIG construction.

Table 37 shows that emissions of PM_{10}, and $PM_{2.5}$ from BIG construction would result in ambient concentrations that exceed applicable PM_{10} and $PM_{2.5}$ NAAQSs. As discussed above, BIG would be required to implement **MM BIG AQ-1,** and **MM BIG AQ-3** through **MM BIG AQ-6**, which would reduce construction PM_{10} and $PM_{2.5}$ emissions. These mitigation measures require fugitive dust controls, Tier 4 equipment, use of renewable diesel, clean on-road construction vehicles, and concrete batch plant emissions controls. Mitigated construction pollutant concentrations are shown in **Table 38: Maximum Off-Site Pollutant Concentrations from Construction (Mitigated)**. As shown in **Table 38**, construction emissions would be reduced, but would still exceed the PM_{10} NAAQS (24-hour) despite the implementation of mitigation. Therefore, localized construction impacts would be significant and unavoidable. Additional mitigation measures considered but determined infeasible are discussed in **Section 7.0**.

Table 37: Maximum Off-Site Pollutant Concentrations from Construction (Unmitigated)

Pollutant	Averaging Time	Maximum Modeled Concentration	Background Concentration [1] ($\mu g/m^3$)[1]	Total Ground Level Concentration ($\mu g/m^3$)	Threshold		Threshold Exceeded? [3]
					($\mu g/m^3$)[2]	Federal or State	
NO_2 [4]	1-hour	179.65	117.42	297.08	339	State	No
	1-hour [4, 5]	80.83	102.24	183.07	188	Federal	No
	Annual	2.60	26.35	28.95	57	State	No
					100	Federal	No
CO	1-hour	262	6,256	6,518	23,000	State	No
					40,000	Federal	No
	8-hour	42	5,631	5,673	10,000	State/ Federal	No
PM_{10} [6]	24-hour	20.94	--	20.94	5	Federal	**Yes**
	Annual	3.17	--	3.17	1	Federal	**Yes**
$PM_{2.5}$ [6]	24-hour	4.74	--	4.74	1.2	Federal	**Yes**
	Annual	1.25	--	1.25	0.3	Federal	**Yes**

Notes:
[1] Background concentrations are from the Barstow Monitoring Station (2022 – 2024). Note that CO is no longer monitored and the above data is the latest available (2019 – 2021).

[2] Ambient air quality thresholds are the NAAQS and CAAQS provided in **Table 4**. All thresholds are shown in micrograms per cubic meter (µg/m³) for comparison to modeled concentrations.
[3] Exceedances of the NAAQS and CAAQS are indicated in **bold**.
[4] NO_2 concentrations were calculated per Tier 2 ARM2 ratios in U.S. EPA's 40 CFR Part 51 Appendix W, § 4.2.3.4. Conversion of NO_X to NO_2 use U.S. EPA minimum and maximum default values NO_2/NO_X of 0.5 and 0.9, respectively.
[5] This comparison is to the federal NAAQS, which is a 98th percentile threshold. The background concentration is the 3-year average of the 8th highest daily maximum 1-hour concentration, over the years 2022, 2023, and 2024.
[6] The thresholds for PM_{10} and $PM_{2.5}$ are incremental thresholds; therefore, the incremental concentration without background is compared to the threshold.

Figure 10: Construction Mitigated PM_{10} 24-Hour Concentration Isopleth

Localized Concentrations of Operations Emissions of Criteria Pollutants

BIG Footprint

Dispersion modeling of on-site and off-site BIG operational emissions was performed to assess impacts to air concentrations within BIG's vicinity (i.e., a minimum distance of 3.5 miles from the BIG footprint). These concentrations were modeled for BIG Opening Year 2028, Interim Year 2033, and Horizon Year 2048. The U.S. EPA dispersion model AERMOD, version 24142, was used to predict maximum ambient pollutant concentrations based on mass emissions modeled for each analysis year within BIG's vicinity. **Table 39: Maximum Off-Site Concentration from Operations (Unmitigated)** presents the maximum off-site ground level concentrations of criteria pollutants estimated for BIG. As shown in **Table 39,** unmitigated BIG operations would exceed the NAAQS for NO_2 (1-hour) in 2048.

BIG operations would include Tier 4 locomotives, renewable diesel fuels, and electric cargo handling equipment. Additionally, BIG operations would be required to implement **MM BIG AQ-7** through **MM BIG AQ-14 (**see **Section 7.0)**, which require onsite sweeping of paved areas, renewable diesel for RTG cranes, truck idling limits and truck route signage, Tier 4 emergency backup generators, and truck efficiency measures such as compliance with CARB's Carl Moyer Efficiency Program and U.S. EPA's Smart Way Program, electric landscaping equipment, electric truck charging stations, and future EV charging infrastructure. Implementation of mitigation would minimize operational emissions. Mitigated operational pollutant concentrations are shown in **Table 40: Maximum Off-Site Concentration from Operations (Mitigated)**. As shown in **Table 40**, operational concentrations would not exceed the NAAQS or CAAQS in any of the analysis years with implementation of **MM BIG AQ-7** through **MM BIG AQ-14**.

Table 39: Maximum Off-Site Concentration from Operations (Unmitigated)

Notes:

[1] Background concentrations are from the Barstow Monitoring Station (2022 – 2024). Note that CO is no longer monitored and the above data is the latest available (2019 – 2021).

[2] Ambient air quality thresholds are the NAAQS and CAAQS provided in **Table 4**. All thresholds are shown in micrograms per cubic meter (µg/m³) for comparison to modeled concentrations.

[3] Exceedances of the NAAQS and CAAQS are indicated in **bold**.

[4] NO_2 concentrations were calculated per Tier 2 ARM2 ratios in U.S. EPA's 40 CFR Part 51 Appendix W, § 4.2.3.4. Conversion of NO_X to NO_2 use U.S. EPA minimum and maximum default values NO_2/NO_X of 0.5 and 0.9, respectively.

[5] This comparison is to the federal NAAQS, which is a 98th percentile threshold. The background concentration is the 3-year average of the 8th highest daily maximum 1-hour concentration, over the years 2022, 2023, and 2024.

[6] The thresholds for PM_{10} and $PM_{2.5}$ are incremental thresholds; therefore, the incremental concentration without background is compared to the threshold.

[7] The Barstow Yard switcher replacement was conservatively not considered in the NAAQS and CAAQS modeling for the unmitigated project. Unlike the HRA, the NAAQS and CAAQS modeling is the max concentration at the fenceline and the switcher replacement would not substantially change the BIG concentrations.

	Annual	0.28	--	0.28	0.3	Federal	No

Table 40: Maximum Off-Site Concentration from Operations (Mitigated)							
Pollutant	Averaging Time	Maximum Modeled Concentration[7]	Background Concentration ($\mu g/m^3$)[1]	Total Ground Level Concentration ($\mu g/m^3$)	Threshold		Threshold Exceeded?[3]
					($\mu g/m^3$)[2]	Federal or Sate	
Notes: [1] Background concentrations are from the Barstow Monitoring Station (2022 – 2024). Note that CO is no longer monitored and the above data is the latest available (2019 – 2021). [2] Ambient air quality thresholds are the NAAQS and CAAQS provided in **Table 4.** All thresholds are shown in micrograms per cubic meter ($\mu g/m^3$) for comparison to modeled concentrations. [3] Exceedances of the NAAQS and CAAQS are indicated in bold. [4] NO_2 concentrations were calculated per Tier 2 ARM2 ratios in U.S. EPA's 40 CFR Part 51 Appendix W, § 4.2.3.4. Conversion of NO_X to NO_2 use U.S. EPA minimum and maximum default values NO_2/NO_X of 0.5 and 0.9, respectively. [5] This comparison is to the federal NAAQS, which is a 98th percentile threshold. The background concentration is the 3-year average of the 8th highest daily maximum 1-hour concentration, over the years 2022, 2023, and 2024. [6] The thresholds for PM_{10} and $PM_{2.5}$ are incremental thresholds; therefore, the incremental concentration without background is compared to the threshold. [7] The Barstow Yard switcher replacement was conservatively not considered in the NAAQS and CAAQS modeling for the unmitigated project. Unlike the HRA, the NAAQS and CAAQS modeling is the max concentration at the fenceline and the switcher replacement would not substantially change the BIG concentrations.

Rail Corridor Concentrations

Localized effects of BIG-related Corridor emissions and the associated increases in criteria pollutants were modeled for worst-case segment in the SCAB and two segments in the MDAB. The analyzed segments include one location in the SCAB (based on the SRA with the highest background concentration) and two locations in the MDAB (one west of BIG and one east of BIG). The SCAB worst-case segment is based on existing background ambient air quality concentrations as measured by the South Coast AQMD and CARB. There are fewer monitoring stations in the MDAB and the Barstow Monitoring Station measured by MDAQMD has the highest background concentrations and was conservatively used to evaluate impacts in the MDAB.

As noted above, the SCAB segment with the highest background concentrations was selected to provide a conservative analysis. The two locations in the MDAB include a segment west of BIG and a segment east of BIG. Segments east and west of BIG were selected because train volumes and associated emissions at these locations are different. Therefore, both of these segments were analyzed to disclose impacts from different emissions increases east and west of BIG.

South Coast AQMD Segment

Dispersion modeling of off-site BIG operational emissions was performed to assess impacts to air concentrations along the rail corridor within the SCAB. The segment modeled is located within SRA 12, which has been identified as the worst-case railroad segment because it has the highest background concentrations. These concentrations were modeled for BIG Opening Year (2028), Interim Year (2033), and Horizon Year (2048). **Table 41: Corridor – SCAQMD Segment Operations** presents the maximum off-site ground level concentrations of criteria pollutants estimated along the worst-case rail segment within SRA 12 of the SCAB. As shown in **Table 41**, unmitigated BIG operations would not exceed the NAAQS and CAAQS for NO_2 (1-hour), PM_{10} (24-hour and annual), and $PM_{2.5}$ (24-hour and annual) in 2028, 2033, and 2048.

MDAQMD West of BIG

Dispersion modeling of off-site BIG operational emissions was performed to assess impacts to air concentrations along the rail corridor west of the BIG Footprint to the Silver Lakes Community. This segment is located closest to sensitive receptors that are not adjacent to the BIG footprint. The concentrations were modeled for BIG Opening Year 2028, Interim Year 2033, and Horizon Year 2048. **Table 42: Corridor – MDAQMD West of BIG Segment Operations** presents the maximum off-site ground level concentrations of criteria pollutants estimated along the rail segment west of BIG to the Silver Lakes Community. As shown in **Table 42**, unmitigated BIG operations would not exceed the NAAQS or CAAQS in any of the analysis years.

[2] Ambient air quality thresholds are the NAAQS and CAAQS provided in **Table 4.** All thresholds are shown in micrograms per cubic meter (µg/m³) for comparison to modeled concentrations.

[3] Exceedances of the NAAQS and CAAQS are indicated in bold.

[4] NO_2 concentrations were calculated per Tier 2 ARM2 ratios in U.S. EPA's 40 CFR Part 51 Appendix W, § 4.2.3.4. Conversion of NO_X to NO_2 use U.S. EPA minimum and maximum default values NO_2/NO_X of 0.5 and 0.9, respectively.

Table 43: Corridor – MDAQMD East of BIG Segment Operations							
Pollutant	Averaging Time	Maximum Modeled Concentration[7]	Background Concentration (µg/m³)[1]	Total Ground Level Concentration (µg/m³)	Threshold		Threshold Exceeded?[3]
					(µg/m³)[2]	Federal or Sate	
[5] This comparison is to the federal NAAQS, which is a 98th percentile threshold. The background concentration is the 3-year average of the 8th highest daily maximum 1-hour concentration, over the years 2022, 2023, and 2024. [6] The thresholds for PM_{10} and $PM_{2.5}$ are incremental thresholds; therefore, the incremental concentration without background is compared to the threshold. [7] The Barstow Yard switcher replacement was conservatively not considered in the NAAQS and CAAQS modeling for the unmitigated project. Unlike the HRA, the NAAQS and CAAQS modeling is the max concentration at the fenceline and the switcher replacement would not substantially change the BIG concentrations.							
Sources: *Refer to* ***Appendix A3.5***							

6.6 CO Hot spots

An analysis of CO "hot spots" (CO exceedances are caused by vehicular emissions, primarily when vehicles are idling at intersections) is needed to determine whether the change in an intersection's level-of-service resulting from BIG would have the potential to exceed CAAQS or NAAQS.

BIG is in a rural area and as shown in the operational analysis, above, BIG CO concentrations would not exceed the 1-hour or 8-hour NAAQS or CAAQS when compared with background concentrations. Thus, BIG would not have the potential to cause an intersection to reach the volume of traffic required to generate a CO hot spot. Note that the Barstow Yard switcher replacements would not affect CO hotspots because Tier 4 emission standards primarily reduce NO_X and particulate matter, but CO emission rates are unchanged.

6.7 Asbestos

BIG would acquire various properties, many of which may contain structures which need to be removed. Many of the structures within BIG footprint may have been built with structural and building materials that contain asbestos.

The demolition of structures with asbestos-containing materials is subject to National Emission Standards for HAPs limitations and would require an asbestos inspection BIG would comply with the MDAQMD asbestos requirements, including submission of an asbestos survey and notification of demolition form. Strict compliance with existing asbestos regulations would prevent a substantial effect from asbestos. Additionally, The County is not designated by California Geological Survey as areas likely to contain NOA (California Department of Conservation, 2000). Therefore, NOA would not likely be disturbed during BIG construction.

6.8 Valley Fever

As discussed above, Valley Fever is not highly endemic to The County with an incident rate of 1.8 cases per 100,000 people (CDPH, 2017, p. 8). In contrast, in 2016 the statewide annual incident rate was 13.7 per 100,000 people. The California counties considered highly endemic for Valley Fever include Kern (251.7 per 100,000), Kings (157.3 per 100,000), San Luis Obispo (82.8 per 100,000), Fresno (60.8 per

100,000), Tulare (45.3 per 100,000), Madera (31.5 per 100,000), and San Joaquin (25.3 per 100,000), and accounted for 70 percent of the reported cases in 2016 (CDPH, 2017, p. 7-8).

Even if present at the site, construction activities may not result in increased incidence of Valley Fever. Propagation of Valley Fever is dependent on climatic conditions, with the potential for growth and surface exposure highest following early seasonal rains and long dry spells. Valley Fever spores can be released when filaments are disturbed by earthmoving activities, although receptors must be exposed to and inhale the spores to be at increased risk of developing Valley Fever. Moreover, exposure to Valley Fever does not guarantee that an individual will become ill—approximately 60 percent of people exposed to the fungal spores are asymptomatic and show no signs of an infection (USGS, 2000, p. 4).

To reduce fugitive dust from BIG and minimize adverse air quality impacts, BIG would employ dust control measures in accordance with the MDAQMD Rules 401 and 403.2, which limit the amount of fugitive dust generated during construction and would also be required to comply with **MM BIG AQ-1,** which requires controls for fugitive dust emissions. These requirements are consistent with California Department of Public Health recommendations for the implementation of dust control measures, including regular application of water during soil-disturbance activities, to minimize impacts related to Valley Fever (CDPH, 2013, p. 4-5). Further, regulations designed to minimize exposure to Valley Fever hazards are included in Title 8 of the CCR and would be complied with during BIG's construction phase (California Department of Industrial Relations, 2025).

BIG would not result in a significant impact attributable to Valley Fever exposure based on its geographic location and compliance with applicable regulatory standards and dust control measures, which will serve to minimize the release of and exposure to fungal spores. Therefore, impacts associated with Valley Fever exposure for sensitive receptors would be less than significant.

6.9 Potential Impacts of Toxic Air Contaminants

BIG Footprint

The health effects discussion is guided by the emissions analysis and HRA. The emissions analysis involves construction and operational activity data, and emission factors, which are used to estimate emissions for all BIG sources.

The HRA analyzes BIG TAC emissions and human exposure to the emissions during 9-, 20-, 30-, and 70-year periods, each starting the year after the baseline and reflecting OEHHA-recommended exposure durations for different receptor types. The impacts evaluated address three types of health effects (individual lifetime cancer risk, chronic non-cancer HI, and acute non-caner HI). A threshold exceedance indicates a substantial contribution to adverse health effects related to TAC exposure.

This analysis examines project impacts resulting from BIG construction and operations from the commencement of construction in 2025 for a 30-year exposure duration for sensitive/residential receptors, 25-year exposure duration for worker receptors, and 9-year exposure duration for school-site student receptors. Because cancerous health risks result from long exposure periods, construction health

risk and operational health risk are analyzed both separately and combined, based on the sources listed in **Table 22**.

Risk Uncertainty. HRAs such as the one presented in this analysis are not intended to quantify estimates of the absolute health risk or expected disease incidence for a population, Rather, HRAs such as this one are conducted to allow for comparisons of the potential health risks of different alternative to each other and the significance criteria (OEHHA, 2015, P.1-2). Consistent with agency guidelines and standard approaches to regulatory risk assessment, this risk assessment used health-protective (high-end/conservative) assumptions to provide a margin of safety with respect to human health (OEHHA, 2015, p.1-7).

What is a Carcinogenic Risk Assessment?

Individual cancer risk is the additional probability a person exposed to a toxic pollutant may have of developing cancer after long-term exposure to a project-related TAC. The individual cancer risk does not mean that a person *will* develop cancer from estimated exposures to toxic air pollutants, nor should it be interpreted as the number of people that will develop cancer at a specific location. The individual cancer risk is based on continual long-term exposure and estimated annual concentrations that may, or may not, vary in real time for the location or person under evaluation. Cancer risk is typically expressed as the chance of an individual developing cancer if a million people were exposed continuously for a specified duration (e.g. 30-years) to the same concentration of toxic emissions being evaluated.

Modeled pollutant concentrations will vary based on many factors. Some of the factors include how the pollutant is released (type of source [i.e., truck, locomotive, etc.]; height, speed, and temperature of release; terrain in the surrounding area; presence of buildings), wind direction and speed, and proximity of receptors.

As described above, this analysis uses a 10 in one million cancer (carcinogenic) risk threshold. Expressed as a probability, 10 in one million is 0.00001 or 0.001 percent. To provide context, the following is a list of risks associated with other known activities (risk of occurrence in an individual's lifetime):

Occurrence	**Lifetime Risk**
• Contracting cancer (from all sources)	• 250,000 in a million
• Dying of cancer	• 140,000 in a million
• Dying in a car accident	• 12,000 in a million
• Dying from a fall	• 4,600 in a million
• Dying from excessive heat	• 73 in a million
• Being struck by lighting	• 7.4 in a million

(Source: San Joaquin Valley Air Pollution Control District. 2015. *Guidance for Assessing and Mitigating Air Quality Impacts*, p. 100).

As shown above, the 10 in one million threshold is conservative in protecting public health. For instance, the chance of contracting cancer from a project with a risk of 10 in a million is, on the face of it, less than significant when compared to the 250,000 in a million overall chance of contracting cancer from all sources.[31]

It is important to note the following conservative modeling assumptions: exposure duration is based on continual heavy-duty truck operation along nearby roadways while the majority of heavy-duty truck activity along roadways would occur during daytime hours, exposure of residential receptors begin during the third trimester in utero while that may only represent a fraction of the population present in the surrounding area, and receptors would be located outdoors in the same location and continuously exposed to toxic contaminants for a specific duration without consideration of time spent indoors. Exposure would be reduced when factoring in that a majority of the heavy-duty truck trips along nearby roadways would occur during daytime hours, residential receptors may relocate to the project area later in life and begin exposure as an adult, and a majority of a receptor's time is spent indoors with windows closed and HVAC filtration that further reduces indoor pollutant concentrations.

While the level of significance for the purposes of this analysis is 10 in one million (0.001 percent), the MDAQMD considers a risk of 100 in one million (0.01 percent) to be a "significant risk". The MDAQMD's Air Toxics Program Public Notification Procedures identifies 10 in one million for lifetime Maximum Individual Cancer Risk (MICR) as the level for informing the public per the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (Air Toxics Act; Health and Safety Code [H&S Code] §§ 44300-44384). The Air Toxics Act does not require emissions or health risk reductions. The MDAQMD's Air Toxics "Hot Spots" Program Risk Reduction Audit And Plan Procedures identifies 100 in one million as the level of risk considered a "significant risk" and would require a risk reduction audit and plan.

Table 44: Carcinogenic Risk Assessment (Construction Only) shows the unmitigated health risk for BIG construction. The exposure duration for construction is approximately 2.8-years. The unmitigated construction risk assessment includes existing regulations summarized in **Table 9** above. **Table 9** also shows mitigated construction risk. Unmitigated and mitigated construction risk would exceed the 10 in one million incremental threshold at residential and worker receptors. See **Figure 11: Construction Health Risk Assessment (Unmitigated)** and **Figure 12: Construction Health Risk Assessment (Mitigated)**. As noted above, unmitigated risk would be minimized with **MM BIG AQ-3** through **MM BIG AQ-6**, which would reduce construction exhaust emissions (i.e., DPM) by requiring Tier 4 offroad equipment, renewable diesel, newer model year on-road construction trucks, and the minimization of batch plant emissions. Construction carcinogenic risk would remain above the 10 in one million threshold despite the implementation of mitigation measures.

[31] The 250,000 in a million overall chance of contracting cancer from all sources may also be a conservative. The South Coast AQMD's Multiple Air Toxics Exposure Study V (August 2021) notes that in the U.S. population, the chances of developing cancer over a lifetime is 38.4 percent. This translates into a risk of about 384,000 in a million over a lifetime.

Table 44: Carcinogenic Risk Assessment (Construction Only)				
Receptor Location[1,2]	Risk per Million			Threshold Exceeded?
	Unmitigated Cancer Risk	Mitigated Cancer Risk	Significance Threshold	
Maximally Exposed Individual Resident (MEIR)	45.84	24.52	10	Yes
Maximally Exposed Individual Worker (MEIW)	21.98	13.11	10	Yes
Maximally Exposed Student Receptor	10.47	5.96	10	No
Maximally Exposed Park Receptor	2.57	1.64	10	No
Notes: 1. Receptors described here reflect the receptor shown in **Table 27** with the highest carcinogenic risk 2. Sensitive receptor locations can be seen in **Figure 9.**				
Source: *Refer to* ***Appendix A4.1***				

Table 45: Carcinogenic Risk Assessment (Operations Only) shows the unmitigated and mitigated health risk for BIG operations. Based on OEHHA Risk Assessment Guidelines, the exposure duration for a resident is 30 years, beginning with the third trimester; the exposure duration for workers is 25-years, and the exposure duration for students is 9-years. The unmitigated operational risk assessment includes existing regulations summarized in **Table 9** above.

Table 45: Carcinogenic Risk Assessment (Operations Only)					
Receptor Location[1,2]	Risk per Million			Significance Threshold	Threshold Exceeded?
	Unmitigated Cancer Risk		Mitigated Cancer Risk		
	Without Barstow Switcher Replacement	With Barstow Switcher Replacement			
Maximally Exposed Individual Resident (MEIR)	42.63	40.17	39.97	10	Yes
Maximally Exposed Individual Worker (MEIW)	5.33	5.09	4.04	10	No
Maximally Exposed Student Receptor	6.38	6.26	3.90	10	No
Maximally Exposed Park Receptor	5.88	5.69	3.68	10	No
Notes: 1. Receptors described here reflect the receptor shown in Table 27 with the highest carcinogenic risk 2. Sensitive receptor locations can be seen in Figure 9.					
Sources: *Refer to* ***Appendix A4.2***					

As shown in **Table 45**, unmitigated operations would exceed the MDAQMD threshold of 10 in one million. See **Figure 13: Operations Health Risk Assessment – West Leads (Unmitigated)**, **Figure 14: Operations Health Risk Assessment – BIG and East Leads (Unmitigated)**, **Figure 15: Operations Health Risk Assessment – East of BIG (Unmitigated)**, **Figure 16: Operations Health Risk Assessment – East of BIG (Unmitigated with Switcher Replacement), Figure 17: Operations Health Risk Assessment – West Leads (Mitigated), Figure 18: Operations Health Risk Assessment – BIG and East Leads (Mitigated),** and **Figure 19: Operations Health Risk Assessment – East of BIG (Mitigated)**. These impacts would be reduced with implementation of **LOR AQ-3**, which minimizes construction idling. **MM BIG AQ-3** through **MM BIG AQ-6** would reduce cancer causing emissions from BIG construction and **MM BIG AQ-8** through **MM BIG AQ-14** would reduce cancer causing emissions from BIG operations. Impacts would remain above MDAQMD's thresholds after mitigation is applied. Unmitigated and mitigated risk would exceed the 10 in one million

incremental threshold at residential receptors during operations. However, the risk for student, worker, and park receptors would be less than significant.

Table 46: Carcinogenic Risk Assessment (Construction and Operations) shows the unmitigated and mitigated health risk associated with a continued exposure starting from the beginning of BIG construction for 2.8-years and the operational exposure continuing for the remaining time (e.g., 27.2-years for residential exposure). See **Figure 20: Combined Construction and Operational Health Risk Assessment – West Leads (Unmitigated)**, **Figure 21: Combined Construction and Operational Health Risk Assessment – BIG and East Leads (Unmitigated)**, **Figure 22: Combined Construction and Operational Health Risk Assessment – East of BIG (Unmitigated)**, **Figure 24: Combined Construction and Operational Health Risk Assessment – West Leads (Mitigated)**, **Figure 23: Combined Construction and Operational Health Risk Assessment – East of BIG (Unmitigated with Switcher Replacement)**, **Figure 25: Combined Construction and Operational Health Risk Assessment – BIG and East Leads (Mitigated)**, and **Figure 26: Combined Construction and Operational Health Risk Assessment – East of BIG (Mitigated)**.

Unmitigated and mitigated risk would exceed the 10 in one million incremental threshold at residential receptors. As noted above, unmitigated risk would be minimized with **LOR AQ-3**. The risk for student, worker, and park receptors would be less than significant.

As discussed above, individual residential cancer risk is calculated assuming that an individual would be exposed to the same concentration of a pollutant for a duration of 30 years without consideration of time spent indoors. Exposure would be reduced when factoring in time spent indoors with windows closed. With high summer temperatures in the City of Barstow, the use of air conditioning is likely to reduce indoor temperatures. With consideration of time spent indoors and the likelihood that windows would be closed and air conditioning would be used during the summer months, risk would be lower than what is shown in **Table 46.**

Table 46: Carcinogenic Risk Assessment (Construction and Operations)

Receptor Location	Risk per Million[1]			Significance Threshold	Threshold Exceeded?
	Unmitigated Cancer Risk		Mitigated Cancer Risk		
	Without Barstow Switcher Replacement	With Barstow Switcher Replacement			
Maximally Exposed Individual Resident (MEIR)	64.58	64.04	40.03	10	**Yes**
Maximally Exposed Individual Worker (MEIW)	26.47	26.28	16.36	10	**Yes**
Maximally Exposed Student Receptor	15.20	15.09	8.50	10	No
Maximally Exposed Park Receptor	6.46	6.27	3.96	10	No

Notes:

[1] The combined construction and operational risk is not the sum of the individual risk for each because the combined scenario assumes continuous exposure with different start ages, exposure durations, breathing rates, and age sensitivity factors. For example, the operations only scenario assumes 30 years of operational exposure whereas the combined risk is 2.8 years of construction + 27.2 years of operations.

Sources: Refer to ***Appendix A4.3***

The cancer risk isopleths are shown below**.** In addition, the estimated point of maximum impact and maximum individual lifetime cancer risk may not be replicated by air monitoring.

Population Cancer Burden

What is Population Cancer Burden?

Population cancer burden represents the number of excess cancer cases that could occur in the population assuming a worst-case 70-year exposure duration, beginning from the third trimester in utero. Population cancer burden quantifies the estimated increase in the number of cancer cases by multiplying the individual cancer risk (calculated using the conservative assumptions discussed above) by the exposed population. This assumes that the population would be exposed to BIG contaminants continuously for 70-years beginning in the third trimester in utero. This is a conservative assumption because the calculation does not consider members of the population beginning their exposure as adults, resulting in members of the population being exposed to less than 70-years of BIG construction and operations (i.e., households moving out of the area).

Table 47: Population Cancer Burden at 70 Year Exposure summarizes population cancer unmitigated and mitigated (refer to **Section 7.0**) burden by census tract. The cancer burden calculation provides an estimate of the increased number of cancer cases as a result of exposures to TAC emissions. The total cancer burden is the product of the number of persons in a population area (such as a census tract) and the estimated individual risk from TACs in that population area and then summed over all of the population areas. The unmitigated cancer burden includes the LORs noted above, as well as the existing regulations summarized in **Table 9** above.

Table 47: Population Cancer Burden at 70 Year Exposure

Census Tract ID	2048 Population	Unmitigated Risk at the Centroid	Unmitigated Burden	Mitigated Risk at the Centroid	Mitigated Burden
11801	4,787	1.16E-05	0.06	7.54E-06	0.04

*Refer to **Appendix A4.4***

Chronic Hazard Index

What is Chronic Hazard Index?

Chronic HI measures the likelihood that chronic noncancer health effects including cardiovascular disease, diabetes, and respiratory health illnesses would occur. A chronic HI below 1.0 indicates that exposure to a TAC is not expected to cause adverse noncancer health effects. Chronic HI is calculated by dividing the pollutant concentration by the chronic REL. RELs are published by OEHHA for various TACs. For respiratory

risk, the chronic REL is the airborne concentration of a substance that is not expected to cause adverse health effects in the general population, even with continuous exposure over a lifetime.

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a HI. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. RELs are designed to protect sensitive individuals within the population.

Unmitigated and mitigated (refer to **Section 7.0**) chronic non-carcinogenic impacts are shown in **Table 48: Chronic Hazard Assessment Results** for the worst-case peak receptor. A chronic HI of 1.0 is considered individually significant. The HI is calculated by dividing the chronic exposure by the REL. The chronic hazard was calculated based on the highest annual average concentration at the maximally exposed individual receptor. The highest worst-case chronic HI associated with unmitigated DPM emissions from BIG in year 2028 would be 0.08. Therefore, even without mitigation, non-carcinogenic hazards are calculated to be less than the MDAQMD significance threshold of 1.0 at all receptors a less than significant impact would occur. With mitigation the chronic hazard would be reduced to 0.06. Impacts would be less than significant.

Table 48: Chronic Hazard Assessment Results at Peak Receptor

Emissions Sources	Concentration ($\mu g/m^3$)[1,2]	Chronic Hazard
2028 Unmitigated	0.38	0.08
2028 Mitigated[2]	0.29	0.06
2033 Unmitigated	0.20	0.04
2033 Mitigated[2]	0.19	0.04
2048 Unmitigated	0.63	0.13
2048 Mitigated[2]	0.63	0.13
Threshold	N/A	1
Threshold Exceeded?	**N/A**	**No**

Note:
[1] The reported pollutant concentration (annual period) is at the closest receptor (maximally exposed individual receptor).
[2] Impacts would not exceed applicable thresholds and mitigation is not required. However, mitigation is required to reduce criteria pollutant emissions impacts and mitigated results are included for disclosure purposes. The mitigated exposure scenario shows the risk with **MM BIG AQ-1** through **MM BIG AQ-10**.
Refer to Appendix A4.5

Risk Uncertainty. As discussed above, HRAs such as the one presented in this analysis are not intended to provide estimates of the absolute health risk or expected incidence of disease in a population. Rather, HRAs are conducted to allow comparisons of the potential health impacts of different alternatives to each other and to significance criteria (OEHHA, 2015, p. 1-2). Consistent with agency guidelines and standard approaches to regulatory risk assessment, this risk assessment used health-protective (conservative) assumptions to provide a margin of safety with respect to human health (OEHHA, 2015, p. 1-7).

Improvements in the Corridor

As previously discussed, **Table 41** shows that BIG would not increase PM pollutant emissions in the Corridor within the SCAB (i.e., the South Coast AQMD's jurisdiction). DPM is the primary TAC of concern because it is the most potent TAC emitted from diesel exhaust and includes hundreds of chemicals. DPM is a subset of PM_{10}; however, locomotive emission factors are only available for PM_{10} and not DPM. Therefore, although DPM is a subset of PM_{10} exhaust, this analysis conservatively assumes all PM_{10} exhaust emissions are DPM.[32] **Table 49: Unmitigated Net Operational DPM Emissions Along Corridor (Tons per Year)** shows that BIG would reduce PM_{10} (DPM) emissions in the Corridor. BIG's DPM emission reduction occur from the Tier 4 dedicated fleet from the Ports to BIG's intermodal facility, and increasing the renewable diesel blend from one percent to nine percent. Therefore, BIG would improve DPM emissions in the Corridor and would result in a beneficial impact. Thus, there is no potential cancer risk, hazard index, or cancer burden impacts in the Corridor west of BIG.

Table 49: Unmitigated Net Operational DPM Emissions Along Corridor (Tons per Year)

Source	DPM (as Tons per Year of PM_{10} Exhaust)		
	2028	2033	2048
West of BIG (Within Mojave Desert Air Basin)[1]			
Operations – Corridor Emissions Without BIG	17.85	17.71	16.86
Operations – Corridor Emissions With BIG	17.74	17.66	16.76
Change	-0.11	-0.05	-0.10
Within South Coast Air Basin			
Operations – Corridor Emissions Without BIG	37.16	37.04	35.47
Operations – Corridor Emissions With BIG	36.77	36.74	35.47
Change	-0.39	-0.29	0.00

Notes:
1. As shown in Figure 14 ,impacts above 10 in a million cease along the rail Corridor approximately two miles east of BIG. As there are no other emissions associated with BIG other than the Corridor, and because there are few sensitive receptors along the Corridor east of BIG, there are no potential additional significant impacts east of BIG.

Source: SCAB only Corridor emissions per EnSafe. 2025. *BNSF Barstow International Gateway Corridor Emissions Analysis;* refer to **Appendix B**

Impact 5.3-4 Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

6.10 Construction

The sensitive receptors nearest BIG are approximately 120 feet southeast of the BIG footprint; see **Table 27**. Odors would only be a potential concern within the BIG footprint. During construction-related activities, some odors (not substantial pollutant concentrations) that may be detected are those typical of construction vehicles (e.g., diesel exhaust from grading and construction equipment). These odors are

[32] More than 90 percent of DPM is less than 1 um in diameter and is a subset of PM2.5 and PM2.5 comprises a portion of PM10. Thus, assuming PM10 as the surrogate for DPM constitutes a conservative analysis. Source: CARB. ND. *Inhalable Particulate Matter and Health (PM2.5 and PM10)*. https://ww2.arb.ca.gov/resources/inhalable-particulate-matter-and-health#:~:text=Fine%20particulate%20matter%20is%20defined,comprises%20a%20portion%20of%20PM10. CAPCOA and CARB. 2024 (July). *Non-Vehicular Diesel Engine Risk Assessment Guidance*. https://ww2.arb.ca.gov/sites/default/files/classic/ab2588/2024%20DICE%20Screening%20Risk%20Guidelines.pdf.

a temporary short-term impact that is typical of construction projects and would disperse rapidly. Therefore, BIG would not result in emissions leading to odors that would adversely affect a substantial number of people.

6.11 Operations

CARB's *Air Quality and Land Use Handbook* identifies the sources of the most common odor complaints received by local air districts (CARB, 2005a, p. 34). Typical sources include sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations. BIG does not contain any of the land uses identified as typically associated with emissions of objectionable odors.

BIG operations would generate air pollutants because of the exhaust from diesel fuel combustion. The maintenance activities and locomotive idling would generate the most diesel emissions. The chemical species found in diesel exhaust include some that are known to produce odors and that can result in the characteristic diesel exhaust odor with which most people are familiar.

As show in **Table 27**, the sensitive receptors nearest BIG are approximately 120 feet southeast of the BIG footprint. Receptors next to the east lead tracks are currently adjacent to the existing BNSF tracks. Thus, these receptors would experience the incremental increase from being closer to the proposed tracks. The grading proposed for BIG involves lowering the existing grade by up to approximately 37 feet from Main Street. Therefore, receptors near the intermodal facility would be substantially buffered from idling train exhaust odors by terrain differences, the proposed slope, and the proposed storage areas.

The mobile nature of most BIG emission sources would help to disperse odors. All line-haul locomotives entering the BIG footprint would be equipped with AESS technology, which would limit idling time for any single location to 15 minutes, after which the AESS will cause all but one locomotive to shut down. Thus, with AESS technology, idling and odors from diesel emissions would be minimized.

Although offensive odors rarely cause physical harm, they can be unpleasant and generate citizen complaints. MDAQMD Rule 402 (nuisance) places general limitations on nuisances including odors. Specifically, Rule 402 prohibits the discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. These limitations are based on complaints and enforced by the local air pollution control officer. Moreover, the distance between BIG emission sources and the nearest sensitive receptor is expected to be enough to allow for adequate dispersion of these emissions to below objectionable odor levels.

Given the rural nature of the BIG footprint and that BIG would not generate substantial odors, BIG would be likely to result in minor changes in the overall odor environment in the vicinity above baseline conditions. As such, the potential is low for BIG to produce objectionable odors that would substantially affect a sensitive receptor and impacts would be less than significant.

Mitigation Measures: No mitigation is required.

7.0 MITIGATION MEASURES

MM BIG AQ-1 **Fugitive Dust Emissions**. During construction, the contractor shall employ the following measures to minimize and control fugitive dust emissions. The contractor shall prepare a fugitive dust control plan that complies with MDAQMD Rule 403, which, at a minimum, shall describe how each measure would be employed, identify the individual responsible for ensuring implementation, and address the following components unless alternative measures are approved by the MDAQMD.

- Water unpaved road surface shall be maintained with adequate moisture.
- Limit vehicle travel speed on unpaved roads to 25 miles per hour for loaded haul trucks which may be exceeded if visible fugitive dust is not generated.
- Reduce non-essential dust-generating activities when average wind speed exceeds 25 mph.
- Stabilize disturbed surface areas, including storage piles, that are not being used for over two weeks, by using water, a chemical stabilizer/suppressant, hydro mulch, or by covering with a tarp or other suitable cover or vegetative ground cover, to control fugitive dust emissions effectively. In areas adjacent to organic farms, the Contractor would use non-chemical means of dust suppression. Use of a water truck during visible dusting episodes is considered sufficient for compliance with this measure. For disturbed surface areas, project-related dust generating activities should be based on the difference between upwind and downwind dust (i.e., the metric should be no more dust than currently exiting the site).
- For buildings up to 6 stories in height, wet all exterior surfaces of buildings during demolition.

MM BIG AQ-2 **Low VOC Paint (Construction and Operations).** During construction and operations, BIG shall utilize “Super-Compliant” low VOC paints. Super-Compliant low VOC paints shall be no more than 10g/L of VOC. Prior to issuance of building permits, the City of Barstow Building and Safety Department shall confirm that plans include the following specifications:

- All architectural coatings will be super-compliant low VOC paints.
- Recycle leftover paint. Take any leftover paint to a hazardous waste center; do not mix leftover water-based and oil-based paints.
- Keep lids closed on all paint containers when not in use to prevent VOC emissions and excessive odors.
- For water-based paints, clean up with water only. Whenever possible, do not rinse the cleanup water down the drain or pour it directly into the ground or the storm drain. Set aside the can of cleanup water and take it to the hazardous waste center (www.cleanup.org).
- Use compliant low-VOC cleaning solvents to clean paint application equipment.

- Keep all paint- and solvent-laden rags in sealed containers to prevent VOC emissions.
- Contractors shall construct/build with materials that do not require painting and use pre-painted construction materials to the extent practicable.
- Use high-pressure/low volume paint applicators with a minimum transfer efficiency of at least 50 percent or other application techniques with equivalent or higher transfer efficiency.

MM BIG AQ-3 **Reduce Exhaust Emissions from Off-Road Construction Equipment.** Prior to issuance of construction contracts, BNSF or its designee shall incorporate the following off-riad construction equipment exhaust emissions requirements into the contract specifications:

- All heavy-duty diesel off-road construction equipment used during the construction phase shall meet Tier 4 Final engine requirements, except for specialized equipment, such as Caterpillar 657 Scrapers, Caterpillar 777 Articulated Off-Highway Trucks, track laying machines, ballast regulators, and other specialized rail equipment that are not available as Tier 4. In the event that non-specialized construction equipment cannot meet to Tier 4 Final engine certification, the Project representative or contractor must demonstrate through future documentation with written findings that no Tier 4 equipment of that type are reasonably available. Alternative strategies may include, but would not be limited to, construction equipment with Tier 4 Interim or reduction in the number and/or horsepower rating of construction equipment and/or limiting the number of construction equipment operating at the same time.
- A copy of each unit's certified tier specification and shall be made available to the City in quarterly reports.

MM BIG AQ-4 **Renewable Diesel (Construction).** During construction, the Contractor shall use renewable diesel fuel to minimize and control exhaust emissions from heavy-duty diesel-fueled construction equipment and off-road heavy diesel trucks, except that traditional diesel can be used where renewable diesel is not available from suppliers within 200 miles of the BIG footprint. Renewable diesel shall meet the most recent ASTM D975 specification for Ultra Low Sulfur Diesel and have a carbon intensity no greater than 50 percent of diesel with the lowest carbon intensity among petroleum fuels sold in California. The Contractor shall provide the City with quarterly reports of renewable diesel purchase records and equipment and vehicle fuel consumption. The construction contract shall identify the quantity of traditional diesel purchased and fully document the availability and price of renewable diesel to meet BIG demand.

MM BIG AQ-5 **Reduce Exhaust Emissions from On-Road Construction Equipment.** Prior to issuance of construction contracts, the general contractor shall incorporate the following material-hauling heavy truck fleet mix requirements into the contract specifications:

- All on-road trucks used to haul construction materials shall consist of an average fleet mix of equipment model year 2010 or newer, but no less than the average fleet mix for the current calendar year as set forth in the CARB's EMFAC2021 database.

- The contractor shall provide documentation to BNSF of efforts to secure such a fleet mix.
- The contractor shall keep a written record of the fleet mix for on-road construction equipment during BIG construction and provide the City with annual reports documenting compliance.

MM BIG AQ-6 **Reduce the Potential Impact of Concrete and Asphalt Batch Plants.** Prior to the construction or arrival of a batch plant on site, the contractor shall provide the City with documentation demonstrating that batch plants are sited at least 1,000 feet from sensitive receptors, including places such as daycare centers, hospitals, senior care facilities, residences, parks, and other areas where people may congregate. Batch plants shall implement control measures required by MDAQMD as part of the Permit to Construct in order to reduce fugitive dust such as water sprays, enclosures, hoods, curtains, shrouds, movable and telescoping chutes, central dust collection systems, and other suitable technology, to reduce emissions to be equivalent to the U.S. EPA AP-42 controlled emission factors for batch plants. The contractor shall provide a copy of the MDAQMD permit application to the City that each batch plant meets this standard during operation.

MM BIG AQ-7 **Sweep Paved Areas.** During operations, accessible paved areas such as parking lots, internal roadways, the container yard, chassis storage area, and cargo handling areas shall be swept.

MM BIG AQ-8 **Renewable Diesel RTG Cranes.** Rubber Tired Gantry (RTG) cranes shall be powered with renewable diesel. BNSF shall provide the City of Barstow with evidence demonstrating use of renewable diesel for RTG cranes prior to the issuance of certificate of occupancy.

MM BIG AQ-9 **Truck Idling Limits and Truck Route Signage.** Prior to the issuance of a tenant occupancy permit, the Planning Division shall confirm that all truck access gates and loading docks within the project site shall have posted signage posted that states:

- Truck drivers shall turn off engines when not in use.
- Truck drivers shall shut down the engine after two minutes of continuous idling operation. Once the vehicle is stopped, the transmission is set to “neutral” or “park”, and the parking brake is engaged.
- Telephone numbers of the building facilities manager, the Mojave Desert AQMD, and CARB to report violations.
- Signs shall also inform truck drivers about the health effects of diesel particulates, the California Air Resources Board diesel idling regulations, and the importance of being a good neighbor by not parking in residential areas.
- Clearly mark truck routes with trailblazer signs, so that trucks will not travel next to or near sensitive land uses (e.g., residences, schools, day care centers, etc.).
- Reduce overnight truck parking near off-site sensitive land uses by providing overnight truck parking inside the proposed Project site.

- The Operator shall designate an officer to monitor trucks on-site for compliance. Signs and drive aisle pavement markings shall clearly identify the on-site circulation pattern to minimize unnecessary on-site vehicular travel.
- Additionally, signs shall be provided at every truck exit driveway showing directional information to the off-site truck route. To the extent feasible, the Project shall direct trucks away from sensitive receptors. All signage installed as part of the Project shall be legible, durable, and weather-proof.

This mitigation measure applies only to tenant improvements and not the building shell approvals.

MM BIG AQ-10 Tier 4 Emergency Back-Up Generators. Prior to the issuance of a tenant occupancy permit, the Planning Division shall confirm that the Project plans and specifications require all standard emergency generators to meet California Air Resources Board Tier 4 Final emissions standards. A copy of each unit's Best Available Control Technology (BACT) documentation (certified tier specification) and CARB or Mojave Desert AQMD operating permit (if applicable) shall be provided to the City. This mitigation measure applies only to tenant improvements and not the building shell approvals.

MM BIG AQ-11 Carl Moyer Truck Efficiency Improvements. Prior to the issuance of a tenant occupancy permit, the Planning Division shall confirm that tenant lease agreements include specifications that require vendor trucks for the industrial buildings include energy efficiency improvement features through the Carl Moyer Program—including truck modernization, retrofits, and/or aerodynamic kits and low rolling resistance tires— to reduce fuel consumption. This mitigation measure applies only to tenant improvements and not the building shell approvals.

MM BIG AQ-12 U.S. EPA Smart Way Program. Prior to the issuance of a tenant occupancy permit, the Planning Division shall confirm that tenant lease agreements include specifications that require tenants to enroll in the United States Environmental Protection Agency's SmartWay program, and tenants shall be required to use carriers that are SmartWay carriers. This mitigation measure applies only to tenant improvements and not the building shell approvals.

MM BIG AQ-13 Electric Landscape Equipment. Prior to the issuance of occupancy permits, the implementing entity shall confirm that agreements for landscaping services include contractual language that all handheld landscaping equipment used onsite shall be 100 percent electrically powered. This mitigation measure applies only to tenant permits and not the building shell approvals.

MM BIG AQ-14 Future EV Charging Infrastructure. Prior to the issuance of a building permit for transload warehouse facility tenant improvements, the implementing entity shall confirm that the BIG transload facility is designed to include the following:

- Prior to issuance of a Building Permit for the Shell Design, the buildings' electrical room shall be sufficiently sized to hold additional panels that may be needed to supply power for the future installation of EV truck charging stations on the site. Conduit should be installed from the electrical room to tractor trailer parking spaces in a logical location(s) on the site determined by the Project Applicant during

construction document plan check, for the purpose of accommodating the future installation of EV truck charging stations at such time this technology becomes commercially available and the buildings are being served by trucks with electric-powered engines.

7.1 Mitigation Measures Considered but Determined Infeasible

No additional feasible mitigation measures were identified that could reduce emissions below those shown above. Mitigation measure feasibility for each major source category is discussed below.

Construction

Additional mitigation measures for BIG were considered for addressing impacts related to construction. These measures were evaluated in terms of whether they were capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. The measures below were evaluated and determined to be infeasible for consideration as enforceable mitigations:

1. Extend the construction schedule and limit construction equipment and usage

   Extending the construction schedule or limiting construction equipment and/or usage could reduce on-site emissions, however, it was determined that this would not be a feasible measure, as increasing the length of the construction schedule would delay the opening year of BIG and thus delay BIG's benefits. Furthermore, extending construction activities would extend the duration of impacts that affect other operations, access, and improvements of the beneficial effects of BIG (nationally reducing truck miles travelled, reducing greenhouse gas emissions, improving existing flooding conditions, etc.). Finally, other environmental impacts could increase as a result of extending the construction schedule, including visual impacts from construction lighting, biological impacts due to longer potential to affect sensitive species, noise impacts due to extended duration of noise-generating activities, and transportation due to longer road closures.

2. Require electric construction equipment and vehicles

Electric equipment would eliminate on-site emissions associated with diesel equipment exhaust (other emissions, such as particulate matter from fugitive dust, would still occur). However, commercialization of this technology for construction equipment is in its earliest stages. Alternative fuel and electric construction equipment (including excavators, wheel loaders, and soil compactors) that are commercially available are compact, light- to medium-duty, and have limited capacity and capabilities when viewed in the context of a major construction project like BIG. The vast majority of earth moving activities at BIG would require heavy-duty capabilities beyond those of the zero-emissions equipment recommended by the MDAQMD and the South Coast AQMD. Based on an understanding of the current marketplace, there are currently no zero emissions or near zero emissions equipment available for the earthwork operations necessary to construct BIG based on the general capabilities of the available zero emissions and near zero emissions equipment. Other considerations such as operational demands and the need for charging infrastructure also would limit the feasibility of electrified equipment. The types of heavy-duty on-road trucks for the activities required for the BIG construction (e.g., soil import/export, transport of steel and pre-cast concrete structure elements and materials) are typically larger trucks (Class 8 trucks with a

displacement greater than 10 liters) than those currently available with zero emission or near-zero emission technology. However, renewable diesel fuel shall be used to minimize and control exhaust emissions from heavy -duty diesel-fueled construction equipment and heavy diesel trucks, except where renewable diesel is not available from suppliers (within 200 miles of BIG).

Because small equipment types account for only a minor fraction of total BIG construction emissions, a requirement for their use would provide little emissions reduction benefit. Technological innovations likely will be slowly adapted for larger equipment and vehicles based on market demand and economic considerations. Development of larger electrified equipment and vehicles is unlikely to occur during the construction duration of BIG, as concepts of heavy-duty equipment and vehicles have only recently been announced by manufacturers, and widespread commercial availability is unlikely before the 2030s (construction to be completed by 2028), long after BIG construction is complete. Therefore, a requirement that all equipment and vehicles be electric as a potential mitigation measure would not be feasible for the BIG construction period.

Operations

Additional mitigation measures for BIG were considered for addressing impacts related to operations. These measures were evaluated in terms of whether they were capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. The measures below were evaluated and determined to be infeasible based on these factors:

1. Battery Electric Locomotives (BELs) – Linehaul from Ports to IMF -

The majority of freight locomotives in the United States are diesel-fueled. Alternatives to diesel fueled locomotives are in production or being tested. Zero-emissions (ZE) linehaul locomotives can be accomplished using one of three potential processes (catenary lines, hydrogen fuel cells, or battery electric), with the battery electric locomotive (BEL) technology currently being the most technologically advanced way of implementing a ZE locomotive. Catenary lines are impractical since this would involve laying thousands of miles of electrifies lines the distance of the rail and hydrogen fuel cells, although promising, is not feasible based on technological progress (decades from being a feasible fuel source). BELs use batteries instead of diesel to provide power to the locomotive's traction motors. Linehaul locomotives have a fuel capacity of 5,000 US gallons and converting the fuel to energy represents approximately 200 megawatt-hours (MWh) of available energy capacity on board the locomotive. Diesel engines are about 40% efficient in converting the fuel to energy, which means diesel locomotives have an effective or "useable" energy capacity of 75-80 MWh. By contrast, batteries are approximately 90% efficient at converting energy to work, however, they have a much smaller energy capacity, as discussed below.

In order to meet the demands of BIG, based on the analysis and route modeling, a BEL with a battery of a minimum of 15MWh capacity would be required to replace each diesel fueled locomotive in order to complete the portion of an eastbound trip from the Long Beach port through the Cajon Pass to BIG.

Currently, the largest BEL built for a North American rail operator was 2.4MWh. There is nothing higher than the 2.4MWh that has been deployed in North America. The largest locomotive built for international operations that could operate on the North American rail network contains approximately 7MWh of energy. To provide more energy to a locomotive would require multiple battery tenders (additional railcars included solely to carry batteries to extend the overall power of the locomotives) to reach the desired range. Therefore, the largest BEL currently available would have less than one-tenth of the energy capacity of the diesel locomotive linehaul units. Furthermore, battery tenders are extremely heavy, presenting ongoing maintenance concerns to mainline track segments, and inclusion of three to four battery tenders means three to four fewer railcars with goods being transported, which reduces the economic viability of every train trip that the train would make.

There is no supply chain for either a BEL of this size or for battery tenders to increase their power, and there is no established maintenance process or safety protocol that has yet been adopted by the North American rail industry. Introduction of new locomotive propulsion systems is governed by the Federal Railroad Administration. The safety case for battery-electric locomotives is still pending and will need to be approved by the agency for operation by a North American operator. That process is expected to take several years.

Furthermore, the power needed for recharging and the time necessary to recharge creates additional challenges for BIG. Assuming manufacturers can develop a BEL of sufficient energy capacity and it was market ready, the power draw needed to support these units would struggle to meet the demand. BELs traveling from the Ports would arrive at BIG with empty or nearly-empty batteries. Charging the 15MWh batteries could take over 12 hours, using expected-to-be-available 1MW charging solutions currently under development. A train equipped with four locomotives would require a power capacity of 4MW per train. If higher-power chargers become available (e.g. 6MW systems utilized in European ferry systems), the charging time would be shortened to approximately two hours, but the power need would be a staggering 24MW, or more than one-third of the entire facility power allotment – simply to charge one train of four locomotives. This would require transmission-level electrical delivery service to accomplish BIG required charging demands. Additionally, this calculation is only for the power demand to charge a single train's worth of BELs; for the dedicated fleet from the Ports to BIG's intermodal facility, BIG is anticipated to receive approximately three trains per day in 2028, increasing to approximately five trains per day in 2048. Each train would require between four to five BELs, and there would be overlap between multiple trains charging their BELs at a given time. In 2048, this would mean approximately 18 BELs charging per day and a corresponding approximately 18MW in additional energy demand.

BIG is allotted a "power budget" of 66MW peak energy demand for the facility by SCE, which has been allocated to support the current proposed electrical demand for the site, including electric wide span cranes, electric hostlers, and other electric cargo handling equipment. Through incorporation of electric hostlers, electric RMG cranes, electric forklifts, charging for employee electric vehicles, hybrid electric RTGs, and lighting, heating, air conditioning, and other typical electrical demands, BIG has already maximized the allocated power budget. SCE has indicated that BIG would be required to move to transmission-level service in order to supply additional power to the site. This process would take approximately 7-10 years from the time that the linehaul BEL and charging technology is approved and

available. Given the power budget is for peak energy demand, additional solar generation would not enable BNSF to go beyond this power budget, as solar does not generate energy during nighttime, and cloud cover or other weather conditions could also reduce the energy generation during daytime. Because BIG would operate 24 hours per day, BIG must consider only power from the grid as the power budget, and would supplement this power with energy from solar during daytime.

In order to support operations and prevent delays, a significant support fleet of BEL locomotives would be required beyond just the replacements to each diesel fueled locomotives. This support fleet would be needed to prevent train delays and be powered and ready to add to a train for departure. Factors that contribute to a large support fleet are charging times, undefined train schedules that can lead to departure bunching, and labor agreements that have scheduled on-duty times effecting the ability to transfer power from recharge pads to trains efficiently.

In order to support operations and prevent delays a significant support fleet of BEL locomotives would be required beyond just the replacements to each diesel fueled locomotives. This support fleet would be needed to prevent train delays and be powered and ready to add to a train for departure. Factors that contribute to a large support fleet are charging times, undefined train schedules that can lead to departure bunching, and labor agreements that have scheduled on-duty times effecting the ability to transfer power from recharge pads to trains efficiently.

Finally, this mitigation is not legally feasible due to federal preemption. See *Friends of Eel River v. North Coast Railroad Authority* (2017) 3 Cal.5th 677, *Association of Irritated Residents v Kern County Bd. of Supervisors* (2017) 17 Cal.App.5th 708; *American Railroads v. South Coast Air Quality Management District* (2010) 622 F.3d 1094.

No Class I Railroads are currently using BEL linehaul locomotives as part of their active fleet. In fact, BNSF is the only Class I Railroad that has tested a BEL linehaul locomotive. Therefore, with the lack of availability, the demand on the electrical system/long lead time for power delivery and the inefficiency of the current system, this measure is infeasible.

2. Battery Electric Locomotives (BELs) – Switchers at the Block Swap Yard

While not yet commercially viable or operationally proven for the type of switching operation at BIG, battery-electric locomotives (BELs) would require a capacity of at least 2 MWh to provide the power necessary to perform locomotive switching tasks for at least a full shift. Switchers at BIG would need to operate around the clock in order to support the needs of the facility. In order to provide adequate time to charge the locomotives, high-speed chargers would be required to be utilized to charge the locomotive batteries between operating shifts. To recharge a 2MWh battery, it would require 2MW of constant power per locomotive (anticipated as a 1 hour charge time). Assuming the expected-to-be available 1 MW charging solutions currently under development, the chargers will have a constant draw of 1MW and can temporarily reach 4.5MW. This means that charging just three locomotives at one time could equate to 20% of the entire facility's power budget (13.5/66 MW) and would be roughly equivalent to the entire power capacity of one of the three circuits providing power to BIG. It is anticipated that BIG would utilize approximately eight switchers to support the facility in 2028, potentially peaking at 36MW of power if all locomotives are charged at the same time. In 2048, the number of switchers to support the facility

increases to twelve. Therefore, adding BEL switchers would significantly impact the power demand for the BIG facility.

If BIG adopted lower-power chargers (e.g. commercially-available 400kw chargers) it would take approximately six hours to charge a single locomotive. To maintain operational fluidity and flexibility, BIG would require three times as many battery-electric switchers to operate the facility. One third of the fleet would operate each shift while a third would be actively charging with a reserve third in support for power outages, periods of high volume, locomotive maintenance, and crew availability during shift changes. In 2048, this would require commissioning 24 electric switcher locomotives. Positioning twelve fully-charged locomotives across the yard while moving twelve depleted locomotives to the charger and supporting a reserve fleet of 12 locomotives could cause significant congestion and hamper fluidity within the rail yard. Furthermore, simultaneously charging twelve locomotives at 400kw each would increase BIG power demand by almost 5MW. As electrical costs vary widely in California, based on time of use and rates, electricity cost could result in cost that would exceed the costs of diesel. Further, given the limited use of switcher locomotes, reduced fuel costs would be offset by the additional cost of the electric locomotives.

Furthermore, to date, only one switcher of this size (2.4 MWh) has been built for US operations as a prototype. No 2.4 MWh or higher switcher has been built. There is no supply chain for this equipment and there is no established maintenance process or safety protocol that has been adopted by the North American rail industry. Introduction of new locomotive propulsion systems is governed by the Federal Railroad Administration. The safety case for battery-electric locomotives is still pending and will need to be approved by the agency for operation by a North American operator. That process would take several years.

BNSF has been working with SCE on BIG power supply since 2022 to analyze the capacity of Barstow's electrical infrastructure. Because charging an electric vehicle fleet and cargo handling equipment that operates 24/7 creates significant demands on the electrical grid, SCE conducted an extensive internal review to confirm that the system could reliably serve the load, even when portions of the distribution system were being maintained. After several iterations, SCE confirmed that BIG could be supplied using new feeders from the existing Tortilla Substation. These new feeders will be able to cross-connect to existing feeders within Barstow to meet SCE's reliability requirements. This avoided the need for a new substation in Barstow.

BIG is allotted a "power budget" of 66 MW for the facility by SCE, which has been allocated to support the current proposed electrical demand for the site, including electric wide span cranes, electric hostlers, and other electric cargo handling equipment. SCE has indicated that BIG would be required to move to transmission-level service in order to supply additional power to the site. This process would take approximately 7-10 years from the time that the switcher BEL and charging technology is approved and available. Therefore, with the lack of availability, the demand on the electrical system/long lead time for power delivery and the inefficiency of the current system, this measure is infeasible.

3. Zero/Near Zero Emission Trucks

BIG would use electric hostlers for the movements between the intermodal facility and the transload warehouses, however a small percentage of diesel trucks are assumed to transport containers directly to the intermodal facility as the use of zero/near-zero emission trucks have been determined to be infeasible.

As an initial matter, given the actions of Congress and the Trump administration, California has no legal ability to mandate zero/near zero emission truck technology under the former Advanced Clean Truck Rule or any other regulation. Given this revocation, as deliveries are made to BIG's intermodal facility from a variety of customers or independent trucking contractors throughout Southern California, the Central Valley, Arizona and Nevada. It is entirely speculative that zero emission/near zero emission trucks will be widely in use with customers or independent trucking contractors within a reasonable period of time. Further, given the multitude of origins of these trucks, the necessary charging infrastructure does not exist along the many anticipated trucking routes in California or elsewhere in the region. Moreover, because of the revocation of the Advanced Clean Truck Rule, there is no basis to find that such critical infrastructure will exist in a reasonable period of time. As noted above, there are also concerns about power availability; BIG is allotted a "power budget" of 66MW for the facility by SCE, which has been allocated to support the current proposed electrical demand for the site, including electric wide span cranes, electric hostlers, and other electric cargo handling equipment. Should BIG require all trucks accessing the site to be electric, this could only be accommodated by either removing or converting an electric component in order to reduce electric demand, or supplying additional power to the site. SCE has indicated that BIG would be required to move to transmission-level service in order to supply additional power to the site. This process would take approximately 7-10 years from the time that the eRTG and charging technology is approved and available.

Additionally, the rail yard lacks space for the necessary infrastructure for truck charging due to spatial constraints from the grade-separated crossing, slope, and rail tracks. All available space is dedicated to stacking containers, employee parking, or buildings. In addition to the power constraints identified above, BIG would need to locate the truck charging within the container yard north of the mainline tracks in order to accommodate electric truck charging. This would require electric trucks to enter the rail yard, drop off their container, and then go north to the container yard to charge. The grade-separated crossing is designed to be dedicated to electric hostlers draying containers between the rail yard and transload warehouse center, and adding electric trucks cause congestion and operational inefficiencies.

Finally, BNSF has no ability to mandate the make-up of the trucking fleets used by its existing customers or independent trucking companies used by its customers and a mandate that access to BIG be limited to only zero/near zero emission trucks would significantly impede BNSF's ability to attract future customers and thus render the entirety of BIG impractical.

Therefore, for all the above reasons. the potential zero/near zero truck mitigation measure would not be feasible for the BIG.

4. Hybrid Electric Rubber Tire Gantry Cranes (RTGs) vs. Electric RTG Cranes (eRTGs)

BIG would use hybrid electric Rubber Tire Gantry Cranes (RTGs) as well as Electric Rail Mounted Cranes (RMGs). RTGs provide the operational flexibility needed on-site in conjunction with the electric RMGs. The RTGs are not fixed to a track or to any charging infrastructure, for instance conductor bars (fixed infrastructure where the crane collects power) or cable reeling drums/power cables (cable connection to the power source) that would limit movement. RTGs can move the entire length of a track, be repositioned to other tracks, or move around the site as necessary providing significant operational benefits. Additionally, RTGs can be relocated for service and don't affect the efficiency of operations if equipment or the track is out of service. The RTGs would be used in conjunction with fully electric RMGs, which are fixed to the track and have limited mobility. Any breakdown of an RMG or maintenance of rail/track, would stop all operation on that track and take all equipment out of service until the crane or the electrical supply was repaired. RTGs have the flexibility to be moved around the site, even where track is out of service.

BIG would utilize a hybrid electric RTG vs the battery or electric RTGs (eRTGs) as the battery capacity of eRTGs do not have the capacity for the operational needs of the BIG. Currently, the only eRTG is new (introduced in April 2025) that has not been tested or is currently in use. This RTG has 2 battery types available: liquid cooled with 4 hr = 222kWh capacity or liquid-cooled with 8-hr = 296kWh capacity. The stated battery charging time is 1 hour at the full rated charging power with a charging rate of 1C. If the batteries and charging operate at full capacity as specified, each crane would require a minimum of 3 to 6 hours of downtime per day for charging under optimal charging conditions. BIG is not considered to be within the optimal conditions for battery electric equipment as battery charging efficiency would be susceptible to degradation in hot conditions.

Additionally, BIG would use approximately 11 RTGs. The facility would operate 24 hours a day and 7 days a week with minimal down time for charging RTGs. It is expected that BIG would utilize 1MW chargers for each crane, resulting in a minimum of 11 MW draw if all cranes are charged simultaneously. RTGs would all be moved to a centralized charging location at the beginning/end of each shift. Relocating the RTGs would reduce operational time for each crane and could take a considerable amount of time if a crane has to move several miles to a charger, given the intermodal tracks are approximately three miles long. The alternative would include utilizing trackside charging stations which would eliminate the need to relocate the cranes for charging, but would create fixed infrastructure choke points, rendering parts of the track unusable while the cranes are charging, reducing the effective capacity of the facility.

Moreover, BIG is allotted a "power budget" of 66MW for the facility by SCE, which has been allocated to support the current proposed electrical demand for the site, including electric wide span cranes, electric hostlers, and other electric cargo handling equipment. SCE has indicated that BIG would be required to move to transmission-level service in order to supply additional power to the site. This process would take approximately 7-10 years from the time that the eRTG and charging technology is approved and available.

For all of these reasons, the potential mitigation measure was determined infeasible.

APPENDIX A

Criteria Pollutant and GHG Emissions Calculations

APPENDIX A1

Construction Emissions Calculations

Appendix A Contents

Appendix A1 - Construction Emissions Calculations

A1.1 Summary
A1.2 Equipment Exhaust
A1.3 Fugitive Dust
A1.4 On-Road Mobile Sources
A1.5 Paving and Architectural Coatings
A1.6 Asphalt Batch Plant
A1.7 Locomotive Delivery Emissions

Appendix A2 - Operational Emissions Calculations

A2.1 Locomotive Emissions
A2.2 Mobile Source Emissions
A2.3 Equipment
A2.4 Area-Energy

Appendix A3 - Ambient Air Quality Standards

A3.1 Construction
A3.2 Operations - BIG Footprint
A3.3 Operations - Corridor (SCAQMD Segment)
A3.4 Operations - Corridor (MDAQMD West oF BIG)
A3.5 Operations - Corridor (MDAQMD East of BIG)

Appendix A4 - Health Risk

A4.1 Construction
A4.2 Operations
A4.3 Combined Scenario
A4.4 Burden
A4.5 Chronic Hazard

Appendix A1.1: Summary

Daily Construction Emissions Summary

Construction Year 2025

	Unmitigated Maximum Daily Emissions (pounds per day)						Mitigated Maximum Daily Emissions (pounds per day)

Construction GHG Emissions Summary

Construction Year 2025

	GHG Emissions ($MTCO_2e$ per year)	
Source	**Unmitigated**	**Mitigated**
Off-Road Equipment Exhaust	31,438.81	11,946.75
On-Road Mobile Sources	7,288.04	7,288.04
Total	**38,726.85**	**19,234.79**

Construction Year 2026

	GHG Emissions ($MTCO_2e$ per year)	
Source	**Unmitigated**	**Mitigated**
Off-Road Equipment Exhaust	100,956.18	38,363.35
On-Road Mobile Sources	43,980.75	43,980.75
Train Material Deliveries	5,494.99	5,494.99
Asphalt Batching	11,811.99	11,811.99
Total	**162,243.91**	**99,651.08**

Construction Year 2027

	GHG Emissions ($MTCO_2e$ per year)	
Source	**Unmitigated**	**Mitigated**
Off-Road Equipment Exhaust	22,611.80	8,592.48
On-Road Mobile Sources	23,697.39	23,697.39
Total	**46,309.19**	**32,289.88**

Construction Year 2028

	GHG Emissions ($MTCO_2e$ per year)	
Source	**Unmitigated**	**Mitigated**
Off-Road Equipment Exhaust	1,973.41	749.90
On-Road Mobile Sources	2,286.13	2,286.13
Total	**4,259.54**	**3,036.03**

Total Emissions

	GHG Emissions ($MTCO_2e$ per year)	
Construction Year	**Unmitigated**	**Mitigated**
2025	38,726.85	19,234.79
2026	162,243.91	99,651.08
2027	46,309.19	32,289.88
2028	4,259.54	3,036.03
Total	**251,539.49**	**154,211.78**
Amortized	**8,384.65**	**5,140.39**

GHG Emissions

Construction Year 2025

	GHG Emissions ($MTCO_2e$ per year)	
Equipment	**Unmitigated**	**Mitigated**
Auger Boring Machine	1.56	0.59
Crane	7.31	2.78
Excavator	174.91	66.47
Generators	2.27	0.86
Light Carts	15.62	5.94
Dump Trucks	5.04	1.92
Grapple/Pump Truck	151.23	57.47
Water Trucks	151.23	57.47
Other	14.96	5.68
Paving Equipment	37.55	14.27
Skid Steer	1.54	0.59
Tractor/Loaders/Backhoes	24.42	9.28
Total	**587.64**	**223.30**

Construction Year 2026

	GHG Emissions ($MTCO_2e$ per year)	
Equipment	**Unmitigated**	**Mitigated**
Generators	7.55	2.87
Grader	382.11	145.20
Light Carts	52.02	19.77
Dump Trucks	11,582.32	4,401.28
Grapple/Pump Truck	671.44	255.15
Water Trucks	134.29	51.03
Rollers	55.24	20.99
Dozer	542.95	206.32
Total	**13,427.91**	**5,102.61**

Construction Year 2027

	GHG Emissions ($MTCO_2e$ per year)	
Equipment	**Unmitigated**	**Mitigated**
Generators	2.63	1.00
Grader	133.07	50.57
Light Carts	18.11	6.88
Dump Trucks	4,033.46	1,532.71
Grapple/Pump Truck	233.82	88.85
Water Trucks	46.76	17.77
Rollers	19.24	7.31
Dozer	189.08	71.85
Total	**4,676.17**	**1,776.95**

Daily Construction Emissions Summary - Solar

Construction Year 2026

	Unmitigated Maximum Daily Emissions (pounds per day)						Mitigated Maximum Daily Emissions (pounds per day)					
Construction Phase	**ROG**	**NO_X**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**	**ROG**	**NO_X**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
Warehouse Construction	1.52	11.31	15.98	0.04	0.45	0.41	1.47	4.72	15.92	0.04	0.18	0.11
Total	**1.52**	**11.31**	**15.98**	**0.04**	**0.45**	**0.41**	**1.47**	**4.72**	**15.92**	**0.04**	**0.18**	**0.11**

Construction Year 2027

	Unmitigated Maximum Daily Emissions (pounds per day)						Mitigated Maximum Daily Emissions (pounds per day)					
Construction Phase	**ROG**	**NO_X**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**	**ROG**	**NO_X**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**

Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Sub-Area
Region: San Bernardino (MD)
Calendar Year: 2025
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Construction Emissions Equation

CARB OFFROAD Methodology

Daily Emissions

E = EF * Pop * Avg HP * Load * Activity / CF
E = Emissions (pounds/day)
EF = Emission Factor (grams/hp*h)
Pop = population (number of same equipment)
Avg Hp = maximum rated average horsepower
Load = load factor
Activity = hours of operation (hours/day)
CF = conversation factor = 453.6 grams/pound

Annual Emissions

E = Daily E * Activity / CF
E = Emissions (tons/year)
Daily E = Daily Emissions (pounds/day)
Activity = annual days of operation (days/year)
CF for pollutants = 2000 pounds/ton
CF for GHG emissions = 2204.62 pounds/MT

				Unmitigated EF (g/hph)							Mitigated EF (g/hph)

Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Sub-Area
Region: San Bernardino (MD)
Calendar Year: 2025
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Vehicle Category	**Horsepower Bin**	**Fuel Consumption**	**Total_Activity_hpy**	**Total_Population**	**Horsepower_Hours_hhpy**	**ROG**	**NOX**	**CO**	**SO2**	**PM10 exhaust**	**PM2.5 exhaust**	**CO2**

PM Emissions from Grading Equipment Passes

Source: U.S EPA, AP-42, Chapter 11.9

E = EF x VMT

VMT = As / Wb x 43,560 (sf/ac) / 5,280 (ft/mi)

Where:

E =		emissions (lb)
PM_{10} EF =	1.542546	emission factor (lb/VMT)
$PM_{2.5}$ EF =	0.16655879	emission factor (lb/VMT)
VMT =	3162.5	vehicle miles traveled
As =	4600	acreage of the grading site (acre)
Wb =	12	blade width of the grading equipment (CalEEMod default is 12 ft based on Caterpillar's 140 motor grader)

PM Emissions from Trenching

AP-42, 13.2

EF = emission factor (lb/ton)
EF = K*(0.0032)*((U/5)^1.3)/((M/2)^1.4)

K_{PM10} = 0.35 PM_{10} particle size multiplier (AP-42 default)
$K_{PM2.5}$ = 0.053 $PM_{2.5}$ particle size multiplier (AP-42 default)
U = 2.6 mean wind speed (meters/second) *San Bernardino-Mojave Desert
M = 12 material moisture content (%) (The moisture contents of different materials are listed in AP-42 Table 13.2.4-1. CalEEMod uses the moisture content of cover (12%) as default).

EF_{PM10} = 3.89593E-05
$EF_{PM2.5}$ = 5.89954E-06

Notes:
Assumes 1.2641662 tons/CY based on a bulk density of 1.5 grams/cubic centimeter (per CalEEMod).

E = EF x TP

EF = emissions factor (lb/ton)
TP = throughput of loaded and unloaded materials (ton)

Grading+Trenching

	Pounds/Day		**Tons/Year**	
	PM_{10}	**$PM_{2.5}$**	**PM_{10}**	**$PM_{2.5}$**

PM emissions from Bulldozing

AP-42, 11.9

EF_{PM10} = 0.47495993 lb/hour

$EF_{PM2.5}$ = 0.655794613 lb/hour

$EF_{PM10} = ((C_{PM15} \times S^{1.5})/M^{1.4}) \times F_{PM10}$

$EF_{PM2.5} = ((CTSP \times S^{1.2})/M^{1.3}) \times F_{PM2.5}$

Emissions (lb) = EF (lb/hour) X Hour

Where:

C_{TSP} =	5.7	emission factor
C_{PM15} =	1	emission factor
M =	7.9%	emission factor
S =	6.9%	emission factor
F_{PM10} =	0.75	emission factor
$F_{PM2.5}$ =	0.105	emission factor

PM Emissions from Truck Loading and Storage Piles

AP-42, 13.2

$EF_{PM10} = K_{PM10} \times 0.0032 \times ((U/5)^{1.3} / (M/2)^{1.4}))$

$EF_{PM2.5} = K_{PM2.5} \times 0.0032 \times ((U/5)^{1.3} / (M/2)^{1.4}))$

Where:

EF_{PM10} =	3.89593E-05 lb/ton	K_{PM10}	0.35 particle size multiplier
$EF_{PM2.5}$ =	5.89954E-06 lb/ton	$K_{PM2.5}$ =	0.053 particle size multiplier
		U =	2.6 mean wind speed (m/s) *San Bernardino-Mojave Desert
		M =	12 material moisture content
		TP =	1.2641662 tons per cubic yard

Emissions (lb)= EF (lb/ton) x throughput of loaded and unloaded materials (ton)

E = EF x TP

	Work Days								cubic yards of soil				tons of soil

Construction Mobile Source Emissions Factors

Source: EMFAC2021 (v1.0.2) Emission Rates
Region Type: MPO
Region: SCAG
Calendar Year: 2024
Season: Summer, Winter, Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HOTSOAK and RUNLOSS, g/vehicle/day for IDLEX and DIURN. PHEV calculated based on total VMT.

Appendix A1.5: Paving and Architectural Coatings

Asphalt Paving (2026)

		Acres	VOC (lbs/day)
Block Swap Yard			
North Repair and Loco Charging Area		3.7	9.80
South Loco Charging Area		5.0	13.11
IMF		1.7	4.49
Transload Warehouses and Roadway		51.7	135.33
	Total	*62.1*	*162.74*

$E = EF \times A \times P$

E =		paving emissions (lb VOC/day).
EF =	2.62	paving emission factor (lb VOC/acre). The default emission factor is 2.62 lb/acre (Sacramento Metropolitan Air Quality Management District 1994).
A =		area paved (acre)
P =	100%	percent of area that is paved with asphalt (%)

Source: CalEEMod 2022 User Guide Appendix C , page C-23, April 2022.

Paving Acerage

	SY	SF	Acres
Block Swap			
North Repair and Loco Charging Area			
8” Asphalt	18,100	162,900	3.7
South Loco Charging Area			
8” Asphalt	24,225	218,025	5.0
IMF			
5" Asphalt	8,300	74,700	1.7
Logistics Park (9M SF of Buildings)			
8" Asphalt Roadway	250,000	2,250,000	51.7

Construction Architectural Coatings

$E_{AC} = EF_{AC} \times F \times A_{paint}$

Where:	E_{AC}=		emissions (lb VOC)
	EF =	0.01158958	emissions factor (lb/sf) (unmitigated)
	EF =	0.00231792	emissions factor (lb/sf) (mitigated)
	A =		building surface area (sf) (assumes 2 times the floor square footage for nonresidential)
	F =	0.25	exterior (fraction of surface area, 25% for exterior)
		0.75	interior (fraction of surface area, 75% for interior)
		0.06	parking Default parking lot area)

Unmitigated		**Painted**	**Emissions (VOC) (2027)**					
	Total SF	**Area SF**	**Exterior**	**Interior**	**Total (lbs)**	**Total (tons)**	**Pounds/Day**	**Days**
IMF Building SF	51,700	103,400	299.5906	898.7718	1,198.36	0.60	4.61	260

					Mitigated Total:	**20.98**	**161.39**	

Emissions Factor

$EF_{AC} = C_{VOC} / 454$ (g/lb) x 3.785 (L/gal)/180 (sf)

Where:	EF =		emissions factor (lb/sf)
	C =	250	VOC content (g/L) (unmitigated)
		50	VOC content (g/L) (mitigated)
	EF_{AC} =	0.01158958	Umitigated
		0.00231792	Mitigated

VOC Content

	Unmitigated
Nonresidential Interior:	250 g/L
Nonresidential Exterior:	250 g/L
Parking:	250 g/L

Unmitigated VOC content per CalEEMod defaults (CalEEMod User Guide, Appendix G, Table G-17)

VOC from Parking Lot Striping

$A_{paint} = A_{PL} \times P\%$

Where:	A_{PL} =		Parking lot area
	P% =	0.06	Default percent of parking lot area that is painted (6%)

Source: Architectural Coatings calculated per California Air Pollution Control Officers Association, *CalEEMod User Guide, Appendix C: Calculation Details, pages C-22 - C-23* , April 2022.

Appendix A1.6: Asphalt Batch Plant

Asphalt Batch Plant Uncontrolled Emissions

Annual Throughput (Tons per Year)

700,000

(Average Annual Throughput for Asphalt Batch Plant Facility is 100,000 tons per year)

Dryer, Hot Screens, and Mixer

Natural Gas

(70-90% of Asphalt Batch Plants use Natural Gas)

Reference: Table 1: Estimated Annual Emissions for a Typical Batch Mix HMA Facility (pg. 18)
Hot Mix Asphalt Plants - Emission Assessment Report (epa.gov)

Year **2026**
Batching Days: 234

Table 11.1-5 Emission Factors

Emission Factors for Locomotives (EPA-420-F-09-025), Table 2

Conversion Factors (bhp-hr/gal)	
Locomotive Application	**Conversion Factor (bhp-hr/gal)**
Large Line-Haul	20.8
Passenger	20.8
Small Line-Haul	18.2
Switching	15.2

Source: Emission Factors for Locomotives (EPA-420-F-09-025), Table 3

Locomotive Fuel Consumption by Service Category	
National & Regional Freight Line-Haul	88%
National Freight Switching	7%
Local Freight	<2%
Passenger	3%

Source: Emission Factors for Locomotives (EPA-420-F-09-025), Table 4

GHG Emission Factors (g/gal)		
CO_2	**N_2O**	**CH_4**
10,210	0.26	0.8

GHG emission factors obtained from The Climate Registry, 2021 Emission Factors, Tables 2.1 and 2.7.

SO2 Emission Rate

SO2 (g/gal) = (fuel density) x (conversion factor) x (64g SO2/32g S) x (S content of fuel)

Density of Diesel Fuel	3,200	g/gal	(Source: U.S. EPA Emission Factors for Locomotives, U.S. EPA-420-F-09-025, April 2009)
Sulfur Conversion in Fuel	0.978	unitless	(the fraction of fuel sulfur converted to SO2)
Conversion Factor	2		(64g SO2/32g S) (grams of SO2 formed from a gram of sulfur)
Sulfur Content of Fuel	15	ppm	S content of fuel = 15 g S / 1,000,000 g fuel
SO2 (g/gal):	0.09389

SO2 (g/gal) = (fuel density) x (conversion factor) x (64g SO2/32g S) x (S content of fuel)

Density of Diesel Fuel	3,200	g/gal	(Source: U.S. EPA Emission Factors for Locomotives, U.S. EPA-420-F-09-025, April 2009)
Sulfur Conversion in Fuel	0.978	unitless	(the fraction of fuel sulfur converted to SO2)
Conversion Factor	2	(64g SO2/32g S)	(grams of SO2 formed from a gram of sulfur)
Sulfur Content of Fuel	15	ppm	S content of fuel = 15 g S / 1,000,000 g fuel
SO2 (g/gal):	0.093888		

1 pound =	453.59	grams
1 ton =	907184.7	grams
1 ton =	0.9071847	metric tons
1 mile =	1609.344	meters
Fuel Consumption =	20.8	bhp-hr/ga (Large Line-Haul and Passenger) (Source: Emission Factors for Locomotives (EPA-420-F-09-025), Table 3)

Paved Road Dust Calculations (EPA AP-42 13.2.1, equation 2)

E = (k*(sL)^0.91*(W)^1.02)*(1-P/4N)

	PM_{10}	$PM_{2.5}$	
E =			emission factor
k =	0.0022	0.00054	particle size multiplier (lb/vmt)
sL =	0.03	0.03	surface silt loading (CARB Miscellaneous Process Methodology 7.9, Entrained Road Travel, Paved Road Dust, November 2016)
W HHD =	16	16	average vehicle weight (tons) (based on EMFAC2021 User's Guide Appendix 4: Vehicle Categories)
W worker =	2.7	2.7	average vehicle weight (tons) (based on EMFAC2021 User's Guide Appendix 4: Vehicle Categories)
P =	0	0	Number of days per year with >0.01 inches of rain (Source: WRCC data for Barstow,https://wrcc.dri.edu/cgi-bin/cliMAIN.pl?cabars+sca)
N =	365	365	Days per period

Architectural Coatings - Operations

$E_{AC} = EF_{AC} \times F\ A_{paint} \times Reapplication$

Where:	E_{AC}=		emissions (lb VOC)
	EF =	0.011589578	emissions factor (lb/sf) (unmitigated)
	EF =	0.002317916	emissions factor (lb/sf) (mitigated)
	A =		building surface area (sf) (assumes 2 times the floor square footage for nonresidential)
	F =	0.25	exterior (fraction of surface area, 25% for exterior)
		0.75	interior (fraction of surface area, 75% for interior)
		0.06	parking (Default parking lot area)
	Reapplication =	0.1	Rate at which surfaces are repainted (10% of area per year)

Unmitigated		**Reapplication**	**Emissions (VOC)**				
	Total SF	**Area SF**	**Exterior**	**Interior**	**Total (lbs)**	**Total (tons)**	**Pounds/Day**
IMF Building SF	150,000	30,000	86.9218341	260.765502	347.69	0.17	0.95

IMF Paved Area SF	800,000	4,800	-	-	3.34	0.00	0.01
Transload Parking SF	4,500,000	27,000	-	-	18.78	0.01	0.05
					Unmitigated Total:	**10.62**	**58.17**

Mitigated		**Reapplication**	**Emissions (VOC)**				
	Total SF	**Area SF**	**Exterior**	**Interior**	**Total (lbs)**	**Total (tons)**	**Pounds/Day**
IMF Building SF	150,000	30,000	17.3843668	52.1531004	69.54	0.03	0.19
Transload Building SF	9,000,000	1,800,000	1043.06201	3129.18603	4,172.25	2.09	11.43
IMF Paved Area SF	800,000	4,800	-	-	0.00	0.00	0.00
Transload Parking SF	4,500,000	27,000	-	-	0.00	0.00	0.00
					Mitigated Total:	**2.12**	**11.62**

Emissions Factor

$EF_{AC} = C_{VOC} / 454$ (g/lb) x 3.785 (L/gal)/180 (sf)

Where:	EF =		emissions factor (lb/sf)
	C =	250	VOC content (g/L) (unmitigated)
		50	VOC content (g/L) (mitigated)
	EF_{AC} =	0.011589578	Umitigated
		0.002317916	Mitigated

VOC Content

	Unmitigated
Nonresidential Interior:	250 g/L
Nonresidential Exterior:	250 g/L
Parking:	250 g/L

Unmitigated VOC content per CalEEMod defaults (CalEEMod User's Guide, Appendix D, Table 6.1)

VOC from Parking Lot Striping

$A_{paint} = A_{PL} \times P\%$

Where:	A_{PL} =		Parking lot area
	P% =	0.06	Default percent of parking lot area that is painted (6%)

Source: Architectural Coatings calculated per California Air Pollution Control Officers Association, *CalEEMod User's Guide, AppendixA: Calculation Details, pages 32-33* , May 2021.

Consumer Products

Emissions = EF x Building Area

Where:

EF = 2.14E-05 pounds of VOC per building square foot per day (non-SCAQMD)
2.04E-05 pounds of VOC per building square foot per day (SCAQMD)

	SF	VOC (lbs/day)
IMF Buildings:	150,000	3.21
Transload Buildings:	9,000,000	192.60
Total:	9,150,000	195.81

Source: Architectural Coatings calculated per California Air Pollution Control Officers Association, *CalEEMod User's Guide, Appendix D3: Consumer Products Summary, page D-8* , April 2022.

Landscape Equipment

Days/Year: 180

	Landscaped Area (SF)	
IMF Buildings	4,500	(at admin building and entrance sign)
Parking	1,000	
Transload	900,000	
Total Landscaped Area:	905,500	

Note: Facility landscaping will be held to a minimum and that would only be around the admin buildings.
Landscaping may consist of decorative stone and an occasional local low maintenance trees, cactus, or shrubs.

Nonresidential Landscape Equipment	Fuel	Usage hrs/day/sf	HP	LF
Leaf Blowers/Vacuums	Gasoline 4-Stroke	1.98E-06	10	0.94

$ECH4 = T \times G \times [C \times (1 - D) + (1 - C) \times (1 - Ox)] \times R \times UC$

$ECO2 = T \times G \times [C \times D + (1 - C) \times Ox + 1] \times R \times UC$

T=		short tons of waste generated by the project
G=	0.02637	generation mass of carbon (short ton carbon per short ton of waste) (Table G-37)
	0.03516	(mass CH4)
	0.09669	(mass CO2)
C=	0.75	collection efficiency of landfill gas (75%)
D=	0.98	destruction efficiency of landfill gas (98%)
Ox=	0.1	oxidation efficiency (10%)
R =		ratio of molecular weights for CO2 and carbon (44 g CO2 / 12 g carbon) and CH4 to carbon (16 g CH4 / 12 g carbon).
	16	(CH4)
	12	(CO2)
UC=	0.907185	unit conversion from short tons to MT (0.907185 MT/short ton).

Refrigerants

	Total SF	KSF	Unmitiated $MTCO_2e$/year	Mitigated $MTCO_2e$/year
IMF	150,000	150	662	79
Transload (Unrefrigerated)	8,550,000	8550	37,725	4,482
Transload (Refrigerated)	450,000	450	1,986	236
Total	*9,150,000*	*9,150*	*40,372*	*4,797*

Mitigation requires the use of a low GWP refrigerant (such as R-454B or better).

$$E = \sum(((CS \times OLR) + (CS \times SLR \times (TS \div L))) \times GWP)_r \times KSF \times UC_1$$

Where:

E=		average annual refrigerant emissions (MT CO_2e/yr).
CS=	7.5	equipment charge size (kg refrigerant/KSF). The equipment charge size is the total quantity of refrigerant installed in the refrigeration or A/C equipment. Default equipment charge sizes are based on industry data published by USEPA (2016b) (Table G-38).
OLR=	0.075	annual operational leak rate (%) (USEPA 2016b) (Table G-38).
SLR=	0.075	service leak rate (%) (USEPA 2016b) (Table G-38).
TS=	25	times serviced (number of times serviced over equipment lifetime) (USEPA 2016b) (Table G-38).
L=	25	average equipment operational lifetime (years) (USEPA 2016b) (Table G-38).
GWP=	3922	global warming potential (unitless) (IPCC 2007; CARB 2020d; World Meteorological Organization 2018) (Table G-39).
KSF=		land use size (1,000 sqft). Emissions are quantified by land use subtype, with the input for the land use size.
UC_1=	0.001	unit conversion from kg to MT (0.001 MT/kg)
r=		refrigerant.
I=		equipment type.

Table G-38. Refrigerant Equipment Inventory and Operational Defaults by Land Use Subtype
