INTRODUCTION

This Air Quality, Greenhouse Gas (GHG), and Energy Impact Report has been prepared to evaluate the potential air quality, GHG emissions, and energy impacts associated with the IPT Enterprise Business Center LLC Project (project) in Lake Forest, Orange County, California. This report follows the guidelines identified by the South Coast Air Quality Management District (SCAQMD) in its *California Environmental Quality Act (CEQA) Air Quality Handbook*[1] and associated updates. In keeping with these guidelines, this analysis describes existing air quality, including air quality and GHG emissions generated from project-related sources, regional air pollution, and global climate change. In addition, this analysis discusses energy use resulting from implementation of the proposed project and evaluates whether the proposed project would result in the wasteful, inefficient, or unnecessary consumption of energy resources or conflict with any applicable plans for renewable energy and energy efficiency. Furthermore, this analysis discusses cumulative impacts associated with the proposed project along with the Western Realco Projects.

PROJECT LOCATION AND DESCRIPTION

The 8.83-acre project site is located at 26200 Enterprise Way in the north-central portion of Lake Forest in Orange County, California. The project site is currently developed with an existing 144,906-square-foot (sq ft) building. Regional access to the project site is provided by State Route 241 (SR-241), which is located approximately 0.7 mile north of the project site, and Interstate 5 (I-5), which is located approximately 3.75 miles southwest of the project site. Local access to the project site is provided by Enterprise Way, which is accessed from Dimension Drive. See Figure 1, Regional Project Location, and Figure 2, Site Plan, below.

The proposed project involves the demolition of the existing 144,906 sq ft building and redevelopment of the property with a new 165,803 sq ft industrial building. The proposed project would include a mix of office, manufacturing, and warehouse space. Approximately 10,000 sq ft would serve as office space, with up to 65,000 sq ft proposed for manufacturing use, and the remainder would be utilized for warehouse use. A maximum of 23 usable dock-high doors, a gated truck loading area, a 16-foot-(ft) high, 65 ft long wall located at the eastern end of the loading docks, west of the proposed trash enclosure, and up to 262 parking spaces for passenger vehicles would be provided. Landscaping would total approximately 17.29 percent of the gross project site (66,559 sq ft). Additionally, the proposed project includes the following off-site improvements which would be constructed by the project developer prior to occupancy of the proposed industrial building to enhance public safety and address concerns related to large truck turning movements:

- **Intersection of Bake Parkway and Commercentre Drive:** Modifications would be made to the traffic signal to accommodate protected eastbound and westbound left-turn phasing (from split phasing). Lane geometrics would be modified for the westbound approach to accommodate dual left-turn lanes and a shared through right-turn lane. Additionally, modifications would be made to the traffic signal equipment.

Site Plan

- **Intersection of Bake Parkway and Dimension Drive:** Modifications would be made to the median to accommodate a 430-foot westbound left-turn lane. Additionally, modifications would be made to the traffic signal equipment.

- **Intersection of Dimension Drive/Commercentre Drive – Enterprise Way:** Modifications would be made to the traffic signal to accommodate protected eastbound and westbound left-turn phasing (from permissive phasing). The radius of the southeast corner at this intersection would be modified to accommodate wheelbase-67 (WB-67) truck turns (northbound right turn). Additionally, modifications would be made to the traffic signal equipment.

- **Intersection of Lake Forest Drive and Dimension Drive:** Modifications would be made to accommodate a 250-foot northbound left-turn lane and a 205-foot eastbound left-turn lane. Additionally, modifications would be made to the traffic signal equipment.

- **Intersection of Lake Forest Drive and Rancho Parkway:** Modifications would be made to accommodate a new 225-foot northbound right-turn lane, a 470-foot northbound left-turn lane, and a 440-foot southbound left-turn lane. Additionally, modifications would be made to the traffic signal equipment.

The proposed project would be consistent with the California Green Building Standards Code (CALGreen Code) and Assembly Bill (AB) 1881 water-efficient landscape requirements. Additionally, the proposed project will be seeking Leadership in Energy and Environmental Design (LEED) certification through the Applicant's LEED Volume program. Some of the features in the design include, but are not limited to, drought tolerant landscaping, low-flow fixtures, high-efficiency lighting, solar, and infrastructure for electric vehicle (EV) charging.

This analysis assumes the proposed uses could operate up to 24 hours per day, 7 days per week. Once operational, the proposed project would generate approximately 573 average daily trips (ADT), including 458 passenger car trips, 38 two-axle truck trips, 21 three-axle truck trips, and 58 four-axle truck trips.[2] In addition, the proposed project would not utilize natural gas during construction and operation. The proposed project would also include two 200-horsepower (hp), diesel-powered, cargo-handling equipment units for operation of the project and a 300 hp, diesel-powered fire pump, which is estimated to operate for up to 50 hours per year.

Construction activities associated with the proposed project would include demolition of the existing structure, site preparation, grading, building construction, paving, and architectural coating activities. Construction of the proposed project would tentatively commence in January 2026 and is expected to be completed in about 1 year. Construction of the proposed project would require a net export of approximately 900 cy of material. Based on information from the project Applicant, the proposed project is anticipated to require the use of concrete industrial saws, excavators, impactors, stackers, jaw crushers, bull dozers, tractors, loaders, backhoes, graders, scrapers, forklifts, cranes, generator sets, welders, concrete ride on trowel machine, cement and mortar mixers, paving

equipment, and air compressors. Equipment tier engine and number of equipment pieces was provided by the project Applicant.

EXISTING LAND USES IN THE PROJECT AREA

For the purposes of this analysis, sensitive receptors are areas of population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses which are sensitive to air quality. Impacts on sensitive receptors are of particular concern because they are the population most vulnerable to the effects of air pollution. The project site is surrounded primarily by light industrial uses and residential uses. The adjacent land uses to the project site are light industrial uses to the north, west, and south and residential uses to the east.

The closest sensitive receptors to the project site are residential uses, such as single-family homes located adjacent to the east property line at approximately 82 feet from the project site's eastern boundary limit as measured to the residential building facade. Other residential uses are located north of the project site, at approximately 900 ft from the project's northern boundary limit as measured to the residential building façade. In addition, a nature park is located to the south of the proposed project site, within 450 ft from the proposed project site southern boundary as measured to the center of the park.

BACKGROUND

This section provides current background information on air pollutants and GHG and their health effects. It also provides current regulatory background information, including information from the California Air Resources Board's (CARB); a description of the general health risks of toxics, and the significance criteria for project evaluation. In addition, this section provides background information on energy usage in the project area.

AIR POLLUTANTS AND HEALTH EFFECTS

Both State and federal governments have established health-based ambient air quality standards (California Ambient Air Quality Standards [CAAQS] and National Ambient Air Quality Standards [NAAQS], respectively) for six criteria air pollutants:[3] carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead (Pb), and suspended particulate matter (PM). In addition, the State has set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. These standards are designed to protect the health and welfare of the populace with a reasonable margin of safety. Long-term exposure to elevated levels of criteria pollutants may result in adverse health effects. However, emission thresholds established by an air district are used to manage total regional emissions within an air basin based on the air basin's attainment status for criteria pollutants. These emission thresholds were established for individual projects that would contribute to regional emissions and pollutant concentrations and could adversely affect or delay the projected attainment target year for certain criteria pollutants.

Because of the conservative nature of the thresholds and the basin-wide context of individual project emissions, there is no known direct correlation between a single project and localized air quality-related health effects. One individual project that generates emissions exceeding a threshold does not necessarily result in adverse health effects for residents in the project vicinity. This condition is especially true when the criteria pollutants exceeding thresholds are those with regional effects, such as ozone precursors like nitrogen oxides (NO_X) and volatile organic compounds (VOCs).

Occupants of facilities such as schools, daycare centers, parks and playgrounds, hospitals, and nursing and convalescent homes are considered to be more sensitive than the general public to air pollutants because these population groups have increased susceptibility to respiratory disease. Persons engaged in strenuous outdoor work or exercise also have increased sensitivity to poor air quality. Residential areas are considered more sensitive to air quality conditions, compared to commercial and industrial areas, because people generally spend longer periods of time at their residences, with greater associated exposure to ambient air quality conditions. Recreational uses are also considered sensitive compared to commercial and industrial uses due to greater exposure to ambient air quality conditions associated with exercise.

[3] Criteria pollutants are defined as those pollutants for which the federal and State governments have established ambient air quality standards, or criteria, for outdoor concentrations in order to protect public health.

Ozone

Rather than being directly emitted, ozone (O_3 or smog) is formed by photochemical reactions between NO_X and VOCs. Ozone is a pungent, colorless gas. Elevated ozone concentrations result in reduced lung function, particularly during vigorous physical activity. This health problem is particularly acute in sensitive receptors such as the sick, the elderly, and young children. Ozone levels peak during the summer and early fall months.

Carbon Monoxide

Carbon monoxide (CO) is formed by the incomplete combustion of fossil fuels, almost entirely from automobiles. It is a colorless, odorless gas that can cause dizziness, fatigue, and impairments to central nervous system functions. CO passes through the lungs into the bloodstream, where it interferes with the transfer of oxygen to body tissues.

Particulate Matter

Particulate matter (PM) is the term used for a mixture of solid particles and liquid droplets found in the air. Coarse particles are those that are 10 microns or less in diameter (PM_{10}). Fine, suspended particulate matter with an aerodynamic diameter of 2.5 microns or less ($PM_{2.5}$), is not readily filtered out by the lungs. Nitrates, sulfates, dust, and combustion particulates are major components of PM_{10} and $PM_{2.5}$. These small particles can be directly emitted into the atmosphere as byproducts of fuel combustion; through abrasion, such as tire or brake lining wear; or through fugitive dust (wind or mechanical erosion of soil). They can also be formed in the atmosphere through chemical reactions. Particulates may transport carcinogens and other toxic compounds that adhere to the particle surfaces and can enter the human body through the lungs.

Nitrogen Dioxide

Nitrogen dioxide (NO_2) is a reddish-brown gas that is a byproduct of combustion processes. Automobiles and industrial operations are the main sources of NO_2. Aside from its contribution to ozone formation, NO_2 also contributes to other pollution problems, including a high concentration of fine particulate matter, poor visibility, and acid deposition. NO_2 may be visible as a coloring component on high pollution days, especially in conjunction with high ozone levels. NO_2 decreases lung function and may reduce resistance to infection.

Sulfur Dioxide

Sulfur dioxide (SO_2) is a colorless, irritating gas formed primarily from incomplete combustion of fuels containing sulfur. Industrial facilities also contribute to gaseous SO_2 levels in the region. SO_2 irritates the respiratory tract, can injure lung tissue when combined with fine particulate matter, and reduces visibility and the level of sunlight.

Lead

Leaded gasoline (phased out in the United States beginning in 1973), paint (on older houses and cars), smelters (metal refineries), and the manufacture of lead storage batteries have been the primary sources of lead (Pb) released into the atmosphere. Lead has multiple adverse neurotoxic health effects, and children are at special risk. Some lead-containing chemicals cause cancer in

animals. Lead levels in the air have decreased substantially since leaded gasoline was eliminated. Ambient lead concentrations are only monitored on an as-warranted, site-specific basis in California. On October 15, 2008, the United States Environmental Protection Agency (USEPA) strengthened the NAAQS for lead by lowering it from 1.5 to 0.15 micrograms per cubic meter (µg/m^3). The USEPA revised the monitoring requirements for lead in December 2010. These requirements focus on airports and large urban areas, resulting in an increase in 76 monitors nationally.

Volatile Organic Compounds

VOCs (also known as reactive organic gases [ROGs] and reactive organic compounds [ROCs]) are formed from the combustion of fuels and the evaporation of organic solvents. VOCs are not defined as criteria pollutants; however, because VOCs accumulate in the atmosphere more quickly during the winter, when sunlight is limited and photochemical reactions are slower, they are a prime component of the photochemical smog reaction. There are no attainment designations for VOCs.

Toxic Air Contaminants

In addition to the criteria pollutants discussed above, toxic air contaminants (TACs) are another group of pollutants of concern. TACs are injurious in small quantities and are regulated by the USEPA and the CARB. Some examples of TACs include benzene, butadiene, formaldehyde, and hydrogen sulfide. The identification, regulation, and monitoring of TACs is relatively recent compared to that for criteria pollutants.

TACs do not have ambient air quality standards, but are regulated by the USEPA, CARB, and the SCAQMD. In 1998, the CARB identified particulate matter from diesel-fueled engines as a TAC. The CARB has completed a risk management process that identified potential cancer risks for a range of activities using diesel-fueled engines.[4] High-volume freeways, stationary diesel engines, and facilities attracting heavy and constant diesel vehicle traffic (e.g., distribution centers and truck stops) were identified as posing the highest risk to adjacent receptors. Other facilities associated with increased risk include warehouse distribution centers, large retail or industrial facilities, high-volume transit centers, and schools with a high volume of bus traffic. Health risks from TACs are a function of both concentration and duration of exposure.

Unlike TACs emitted from industrial and other stationary sources noted above, most diesel particulate matter is emitted from mobile sources—primarily "off-road" sources such as construction and mining equipment, agricultural equipment, and truck-mounted refrigeration units, as well as "on-road" sources such as trucks and buses traveling on freeways and local roadways.

Although not specifically monitored, recent studies indicate that exposure to diesel particulate matter may contribute significantly to a cancer risk (a risk of approximately 500 to 700 in 1,000,000) that is greater than all other measured TACs combined.[5] The technology for reducing diesel particulate matter emissions from heavy-duty trucks is well established, and both State and federal agencies are moving aggressively to regulate engines and emission control systems to reduce and remediate diesel

[4] CARB. 2000. Stationary Source Division and Mobile Source Control Division. *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles.* October.

[5] Ibid.

emissions. The CARB anticipated that by 2020, average statewide diesel particulate matter concentrations will decrease by 85 percent from levels in 2000 with full implementation of the CARB's Diesel Risk Reduction Plan,[6] meaning that the statewide health risk from diesel particulate matter is expected to decrease from 540 cancer cases in 1,000,000 to 21.5 cancer cases in 1,000,000. The CARB 2000 Diesel Risk Reduction Plan is still the most recent version and has not been updated.

Table A summarizes the sources and health effects of air pollutants discussed in this section. Table B presents a summary of CAAQS and NAAQS.

Table A: Sources and Health Effects of Air Pollutants

Pollutants	Sources	Primary Effects
Carbon Monoxide (CO)	• Incomplete combustion of fuels and other carbon-containing substances, such as motor exhaust • Natural events, such as decomposition of organic matter	• Reduced tolerance for exercise • Impairment of mental function • Impairment of fetal development • Death at high levels of exposure • Aggravation of some heart diseases (angina)
Nitrogen Dioxide (NO_2)	• Motor vehicle exhaust • High temperature stationary combustion • Atmospheric reactions	• Aggravation of respiratory illness • Reduced visibility • Reduced plant growth • Formation of acid rain
Ozone (O_3)	• Atmospheric reaction of organic gases with nitrogen oxides in sunlight	• Aggravation of respiratory and cardiovascular diseases • Irritation of eyes • Impairment of cardiopulmonary function • Plant leaf injury
Lead (Pb)	• Contaminated soil	• Impairment of blood functions and nerve construction • Behavioral and hearing problems in children
Suspended Particulate Matter ($PM_{2.5}$ and PM_{10})	• Stationary combustion of solid fuels • Construction activities • Industrial processes • Atmospheric chemical reactions	• Reduced lung function • Aggravation of the effects of gaseous pollutants • Aggravation of respiratory and cardiorespiratory diseases • Increased cough and chest discomfort • Soiling • Reduced visibility
Sulfur Dioxide (SO_2)	• Combustion of sulfur-containing fossil fuels • Smelting of sulfur-bearing metal ores Industrial processes	• Aggravation of respiratory diseases (asthma, emphysema) • Reduced lung function • Irritation of eyes • Reduced visibility • Plant injury • Deterioration of metals, textiles, leather, finishes, coatings, etc.

Table notes are provided on the following page.

[a] California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California Ambient Air Quality Standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact USEPA for further clarification and current national policies.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] Any equivalent measurement method which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.

[e] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

[f] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[g] Reference method as described by the USEPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the USEPA.

[h] On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. In February 2024, the national annual $PM_{2.5}$ primary standard was lowered from 12 µg/m³ to 9.0 µg/m³; the secondary annual standard remained at 15 µg/m³.The existing national 24- hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of 15 µg/m³. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m³ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

[j] To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[k] On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

[l] The CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[m] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

[n] In 1989, the CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

ENERGY

Electricity

Electricity is a manmade resource. The production of electricity requires the consumption or conversion of energy resources (including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources) into energy. Electricity is used for a variety of purposes (e.g., lighting, heating, cooling, and refrigeration, and for operating appliances, computers, electronics, machinery, and public transportation systems).

According to the most recent data available, in 2023, California's electricity was generated primarily by natural gas (43.7 percent), renewable sources (56.1 percent), nuclear (8.2 percent), large hydroelectric (12.6 percent), coal (<1.0 percent), and other and unspecified sources. Total electric generation in California in 2023 was 281,140 gigawatt-hours (GWh), down 2.1 percent from the 2022 total generation of 287,220 GWh.[7]

The project site is within the service territory of Southern California Edison (SCE). SCE provides electricity to more than 15 million people in a 50,000-square-mile (sq mi) area of Central, Coastal, and Southern California.[8] According to the California Energy Commission (CEC), total electricity consumption in the SCE service area in 2022 was 85,870 GWh (31,604 GWh for the residential sector and 54,266 GWh for the non-residential sector). Total electricity consumption in Orange County in 2022 was 20,243.7 GWh (20,243,721,856 kilowatt-hours [kWh]).[9]

Natural Gas

Natural gas is a non-renewable fossil fuel. Fossil fuels are formed when layers of decomposing plant and animal matter are exposed to intense heat and pressure under the surface of the Earth over millions of years. Natural gas is a combustible mixture of hydrocarbon compounds (primarily methane) that is used as a fuel source. Natural gas is found in naturally occurring reservoirs in deep underground rock formations. Natural gas is used for a variety of uses (e.g., heating buildings, generating electricity, and powering appliances such as stoves, washing machines and dryers, gas fireplaces, and gas grills).

Natural gas consumed in California is used for electricity generation (45 percent), residential uses (21 percent), industrial uses (25 percent), and commercial uses (9 percent). California continues to depend on out-of-state imports for nearly 90 percent of its natural gas supply.[10]

The Southern California Gas Company (SoCalGas) is the natural gas service provider for the project site. SoCalGas provides natural gas to approximately 21.8 million people in a 24,000 sq mi service area throughout Central and Southern California, from Visalia to the Mexican border.[11] According to the CEC, total natural gas consumption in the SoCalGas service area in 2022 was 5,026 million therms (2,230 million therms for the residential sector). Total natural gas consumption in Orange County in 2022 was 572.4 million therms (572,454,744 therms).[12]

Fuel

Petroleum is also a non-renewable fossil fuel. Petroleum is a thick, flammable, yellow-to-black mixture of gaseous, liquid, and solid hydrocarbons that occurs naturally beneath the earth's surface. Petroleum is primarily recovered by oil drilling. It is refined into a large number of consumer products, primarily fuel oil, gasoline, and diesel.

The average fuel economy for light-duty vehicles (autos, pickups, vans, and sport utility vehicles [SUVs]) in the United States has steadily increased from about 14.9 miles per gallon (mpg) in 1980 to 22.8 mpg in 2022.[13] Federal fuel economy standards have changed substantially since the Energy Independence and Security Act was passed in 2007. The act, which originally mandated a national fuel economy standard of 35 mpg by year 2020,[14] applies to cars and light trucks of Model Years 2011 through 2020. In March 2020, the USEPA and National Highway Traffic Safety Administration (NHTSA) finalized the Corporate Average Fuel Economy (CAFE) standards for Model Years 2024–2026 Passenger Cars and Light Trucks, further detailed below.

Gasoline is the most used transportation fuel in California, with 97 percent of all gasoline being consumed by light-duty cars, pickup trucks, and SUVs. According to the most recent data available, total gasoline consumption in California was 316,425 thousand barrels or 1,597.6 trillion British Thermal Units (BTU) in 2022.[15] Of the total gasoline consumption, 299,304 thousand barrels or 1,511.2 trillion BTU were consumed for transportation.[16] Based on fuel consumption obtained from CARB's California Emissions Factor Model, Version 2021 (EMFAC2021), approximately 157.5 million gallons of diesel and approximately 1,176.8 million gallons of gasoline will be consumed from vehicle trips in Orange County in 2025.

GREENHOUSE GASES

Global climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans in recent decades. The Earth's average near-surface atmospheric temperature rose 0.6 ± 0.2° Celsius (°C) or 1.1 ± 0.4° Fahrenheit (°F) in the 20th century. The prevailing scientific opinion on climate change is that most of the warming observed over the last 50 years is attributable to human activities. The increased amounts of carbon dioxide (CO_2) and other GHGs are the primary causes of the human-induced component of warming. GHGs are released by the burning of fossil fuels, land clearing, agriculture, and other activities, and lead to an increase in the greenhouse effect.[17]

GHGs are present in the atmosphere naturally, are released by natural sources, or are formed from secondary reactions taking place in the atmosphere. The gases that are widely seen as the principal contributors to human-induced global climate change are:

- CO_2
- Methane (CH_4)
- Nitrous oxide (N_2O)
- Hydrofluorocarbons (HFCs)
- Perfluorocarbons (PFCs)
- Sulfur hexafluoride (SF_6)

Over the last 200 years, humans have caused substantial quantities of GHGs to be released into the atmosphere. These extra emissions are increasing GHG concentrations in the atmosphere, and enhancing the natural greenhouse effect, which is believed to be causing global warming. While manmade GHGs include naturally occurring GHGs (e.g., CO_2, methane, and N_2O), some gases (e.g., HFCs, PFCs, and SF_6) are completely new to the atmosphere.

Certain gases (e.g., water vapor) are short-lived in the atmosphere. Others remain in the atmosphere for significant periods of time, contributing to climate change in the long term. Water vapor is excluded from the list of GHGs above because it is short-lived in the atmosphere and its atmospheric concentrations are largely determined by natural processes, such as oceanic evaporation. For the purposes of this air quality analysis, the term "GHGs" will refer collectively to the six gases listed above.

These gases vary considerably in terms of Global Warming Potential (GWP), which is a concept developed to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The global warming potential is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and length of time that the gas remains in the atmosphere ("atmospheric lifetime"). The GWP of each gas is measured relative to carbon dioxide, the most

[17] The temperature on Earth is regulated by a system commonly known as the "greenhouse effect." Just as the glass in a greenhouse lets heat from sunlight in and reduces the heat escaping, greenhouse gases like carbon dioxide, methane, and nitrous oxide in the atmosphere keep the Earth at a relatively even temperature. Without the greenhouse effect, the Earth would be a frozen globe; thus, although an excess of greenhouse gas results in global warming, the naturally occurring greenhouse effect is necessary to keep our planet at a comfortable temperature.

abundant GHG; the definition of GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to the ratio of heat trapped by one unit mass of CO_2 over a specified time period. GHG emissions are typically measured in terms of pounds or tons of CO_2 equivalents (CO_2e). Table C shows the GWP for each type of GHG. For example, SF_6 is 23,900 times more potent at contributing to global warming than CO_2.

Table C: Global Warming Potential of Greenhouse Gases

Gas	Atmospheric Lifetime (Years)	Global Warming Potential (100-Year Time Horizon)
Carbon Dioxide	50-200	1
Methane	12	25
Nitrous Oxide	114	310
HFC-23	270	11,700
HFC-134a	14	140
HFC-152a	1.4	140
PFC: Tetrafluoromethane (CF_4)	50,000	6,500
PFC: Hexafluoromethane (C_2F_6)	10,000	9,200

The following discussion summarizes the characteristics of the six GHGs and black carbon.

Carbon Dioxide

In the atmosphere, carbon generally exists in its oxidized form, as CO_2. Natural sources of CO_2 include the respiration (i.e., breathing) of humans, animals and plants, volcanic out gassing, decomposition of organic matter, and evaporation from the oceans. Human-caused sources of CO_2 include the combustion of fossil fuels and wood, waste incineration, mineral production, and deforestation. Natural sources release approximately 150 billion tons of CO_2 each year, far outweighing the 7 billion tons of man-made emissions of CO_2 each year. Nevertheless, natural removal processes (e.g., photosynthesis by land- and ocean-dwelling plant species) cannot keep pace with this extra input of man-made CO_2, and consequently, the gas is building up in the atmosphere.

In 2021, total annual CO_2 accounted for approximately 81.2 percent of California's overall GHG emissions.[18] Transportation is the single largest source of CO_2 in California, which is primarily comprised of on-road travel. Electricity production, industrial, and residential sources also make important contributions to CO_2 emissions in California.

Methane

Methane (CH_4) is produced when organic matter decomposes in environments lacking sufficient oxygen. Natural sources include wetlands, termites, and oceans. Decomposition occurring in landfills accounts for the majority of human-generated CH_4 emissions in California and in the United States

[18] CARB. 2022c. GHGs Descriptions & Sources in California. Website: ww2.arb.ca.gov/ghg-descriptions-sources (accessed June 2025).

as a whole. Agricultural processes such as intestinal fermentation, manure management, and rice cultivation are also significant sources of CH_4 in California. Total annual emissions of CH_4 accounted for approximately 9.8 percent of GHG emissions in California in 2021.[19]

Nitrous Oxide

Nitrous oxide (N_2O) is produced naturally by a wide variety of biological sources, particularly microbial action in soils and water. Tropical soils and oceans account for the majority of natural source emissions. Nitrous oxide is a product of the reaction that occurs between nitrogen and oxygen during fuel combustion. Both mobile and stationary combustion emit N_2O, and the quantity emitted varies according to the type of fuel, technology, and pollution control device used, as well as maintenance and operating practices. Agricultural soil management and fossil fuel combustion are the primary sources of human-generated N_2O emissions in California. N_2O emissions accounted for approximately 3.4 percent of GHG emissions in California in 2021.[20]

Hydrofluorocarbons, Perfluorocarbons, and Sulfur Hexafluoride

HFCs are primarily used as substitutes for ozone-depleting substances regulated under the Montreal Protocol.[21] PFCs and SF_6 are emitted from various industrial processes, including aluminum smelting, semiconductor manufacturing, electric power transmission and distribution, and magnesium casting. There is no aluminum or magnesium production in California; however, the rapid growth in the semiconductor industry leads to greater use of PFCs. HFCs, PFCs, and SF_6 accounted for about 5.6 percent of GHG emissions in California in 2021.[22]

Black Carbon

Black carbon is the most strongly light-absorbing component of PM formed by burning fossil fuels such as coal, diesel, and biomass. Black carbon is emitted directly into the atmosphere in the form of $PM_{2.5}$ and is the most effective form of PM, by mass, at absorbing solar energy. Per unit of mass in the atmosphere, black carbon can absorb one million times more energy than CO_2.[23] Black carbon contributes to climate change both directly, such as absorbing sunlight, and indirectly, such as affecting cloud formation. However, because black carbon is short-lived in the atmosphere, it can be difficult to quantify its effect on global warming.

Most United States emissions of black carbon come from mobile sources (52 percent), particularly from diesel-fueled vehicles. The other major source of black carbon is open biomass burning, including wildfires, although residential heating and industry also contribute. CARB estimates that the annual black carbon emissions in California will be reduced approximately 50 percent below 2013 levels by 2030.[24]

REGULATORY SETTING

AIR QUALITY REGULATIONS

The USEPA and the CARB regulate direct emissions from motor vehicles. The SCAQMD is the regional agency primarily responsible for regulating air pollution emissions from stationary sources (e.g., factories) and indirect sources (e.g., traffic associated with new development), as well as monitoring ambient pollutant concentrations.

Federal Regulations

Federal Clean Air Act

The 1970 federal Clean Air Act (CAA) authorized the establishment of national health-based air quality standards and also set deadlines for their attainment. The federal Clean Air Act Amendments of 1990 changed deadlines for attaining national standards as well as the remedial actions required of areas of the nation that exceed the standards. Under the CAA, State and local agencies in areas that exceed the national standards are required to develop State Implementation Plans to demonstrate how they will achieve the national standards by specified dates.

State Regulations

California Clean Air Act

In 1988, the California Clean Air Act (CCAA) required that all air districts in the State endeavor to achieve and maintain CAAQS for CO, O_3, SO_2, and NO_2 by the earliest practical date. The CCAA provides districts with authority to regulate indirect sources and mandates that air quality districts focus particular attention on reducing emissions from transportation and area-wide emission sources. Each nonattainment district is required to adopt a plan to achieve a 5 percent annual reduction, averaged over consecutive 3-year periods, in district-wide emissions of each nonattainment pollutant or its precursors. A Clean Air Plan shows how a district would reduce emissions to achieve air quality standards. Generally, the State standards for these pollutants are more stringent than the national standards.

California Air Resources Board

The CARB is the State's "clean air agency." The CARB's goals are to attain and maintain healthy air quality, protect the public from exposure to toxic air contaminants, and oversee compliance with air pollution rules and regulations.

Assembly Bill 2588 Air Toxics "Hot Spots" Information and Assessment Act. Under Assembly Bill (AB) 2588, stationary sources of air pollutants are required to report the types and quantities of certain substances their facilities routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, determine health risks, and notify nearby residents of significant risks.

Regional Regulations

South Coast Air Quality Management District

The SCAQMD has jurisdiction over most air quality matters in the South Coast Air Basin (Basin). This area includes all of Orange County, Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The SCAQMD is the agency principally responsible for comprehensive air pollution control in the Basin and is tasked with implementing certain programs and regulations required by the CAA and the CCAA. The SCAQMD prepares plans to attain CAAQS and NAAQS. SCAQMD is directly responsible for reducing emissions from stationary (area and point) sources. The SCAQMD develops rules and regulations, establishes permitting requirements, inspects emissions sources, and enforces such measures though educational programs or fines, when necessary.

The proposed project would be subject to the following SCAQMD rules and regulations:

- **Regulation IV – Prohibitions:** This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air pollutant emissions, fuel contaminants, start-up/ shutdown exemptions, and breakdown events.
    - **Rule 402 – Nuisance:** This rule restricts the discharge of any contaminant in quantities that cause or have a natural ability to cause injury, damage, nuisance, or annoyance to businesses, property, or the public.
    - **Rule 403 – Fugitive Dust:** This rule requires the prevention, reduction, or mitigation of fugitive dust emissions from a project site. Rule 403 restricts visible fugitive dust to a project property line, restricts the net PM_{10} emissions to less than 50 µg/m^3 and restricts the tracking out of bulk materials onto public roads. Additionally, Rule 403 requires an Applicant to utilize one or more of the best available control measures (identified in the tables within the rule). Control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers, and/or ceasing all activities. Finally, Rule 403 requires that a contingency plan be prepared if so determined by the USEPA. In addition, SCAQMD Rule 403(e), Additional Requirements for Large Operations, includes requirements to provide Large Operation Notification Form 403 N, appropriate signage, additional dust control measures, and employment of a dust control supervisor that has successfully completed the Dust Control training class in the South Coast Air Basin.
- **Regulation XI – Source Specific Standards:** Regulation XI sets emissions standards for different sources.
    - **Rule 1113 – Architectural Coatings:** This rule limits the amount of VOCs from architectural coatings and solvents, which lowers the emissions of odorous compounds.
- **Rule 2305 – Warehouse Indirect Source Rule (ISR).** The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and

fine particulate matter. This rule applies to owners and operators of warehouses with at least 100,000 square feet of indoor floor space in a single building. The warehouse rule is a menu-based points system requiring warehouse operators to annually earn a specified number of points. These points can be earned by completing actions from a menu that can include acquiring and using natural gas, Near-Zero Emissions and/or Zero- Emissions on-road trucks, zero-emission cargo handling equipment, solar panels or zero-emission charging and fueling infrastructure, or other options. SCAQMD expects this rule to reduce emissions from warehouse uses by 10–15 percent. On September 11, 2024, the USEPA approved Rule 2305 to reduce pollution from warehouses, as a State implementation plan (SIP) revision.

The SCAQMD is responsible for demonstrating regional compliance with ambient air quality standards but has limited indirect involvement in reducing emissions from fugitive, mobile, and natural sources. To that end, the SCAQMD works cooperatively with the CARB, the Southern California Association of Governments (SCAG), county transportation commissions, local governments, and other federal and State government agencies. It has responded to this requirement by preparing a series of Air Quality Management Plans (AQMPs) to meet CAAQS and NAAQS. SCAQMD and the SCAG are responsible for formulating and implementing the AQMP for the Basin. The main purpose of an AQMP is to bring the area into compliance with federal and State air quality standards. Every 3 years, SCAQMD prepares a new AQMP, updating the previous plan and 20-year horizon.[25]

The Final 2022 AQMP is the currently adopted AQMP. Key elements of the Final 2022 AQMP include the following:

- Calculating and taking credit for co-benefits from other planning efforts (e.g., climate, energy, and transportation);
- A strategy with fair-share emission reductions at the federal, State, and local levels;
- Investment in strategies and technologies meeting multiple air quality objectives;
- Seeking new partnerships and significant funding for incentives to accelerate deployment of zero-emission and near-zero emission technologies;
- Enhanced socioeconomic assessment, including an expanded environmental justice analysis;
- Attainment of the 24-hour $PM_{2.5}$ standard in 2019 with no additional measures;
- Attainment of the annual $PM_{2.5}$ standard by 2025 with implementation of a portion of the O_3 strategy; and
- Attainment of the 1-hour O_3 standard by 2022 with no reliance on “black box” future technology (CAA Section 182(e)(5) measures).

[25] SCAQMD. 2022. *Final 2022 Air Quality Management Plan*. December 2.

The 2022 AQMP builds upon measures already in place from previous AQMPs. It also includes a variety of additional strategies such as regulation, accelerated deployment of available cleaner technologies (e.g., zero emissions technologies, when cost-effective and feasible, and low NO_x technologies in other applications), best management practices, co-benefits from existing programs (e.g., climate and energy efficiency), incentives, and other CAA measures to achieve the 2015 8-hour ozone standard.

Southern California Association of Governments

SCAG is a council of governments for Los Angeles, Orange, Riverside, San Bernardino, Imperial, and Ventura Counties. It is a regional planning agency and serves as a forum for regional issues relating to transportation, the economy and community development, and the environment. SCAG is the federally designated Metropolitan Planning Organization (MPO) for the majority of the southern California region and is the largest MPO in the nation. With regard to air quality planning, SCAG prepares the Regional Transportation Plan (RTP) and Regional Transportation Improvement Program (RTIP), which address regional development and growth forecasts and form the basis for the land use and transportation control portions of the AQMP and are utilized in the preparation of the air quality forecasts and consistency analysis included in the AQMP. The RTP, RTIP, and AQMP are based on projections originating within local jurisdictions.

Although SCAG is not an air quality management agency, it is responsible for developing transportation, land use, and energy conservation measures that affect air quality. SCAG's Regional Comprehensive Plan (RCP) provides growth forecasts that are used in the development of air quality-related land use and transportation control strategies by the SCAQMD. The RCP is a framework for decision-making for local governments, assisting them in meeting federal and State mandates for growth management, mobility, and environmental standards, while maintaining consistency with regional goals regarding growth and changes. Policies within the RCP include consideration of air quality, land use, transportation, and economic relationships by all levels of government.

SCAG adopted the 2024–2050 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (Connect SoCal) on April 4, 2024. However, the CARB has not officially approved the 2024-2050 RTP/SCS. Therefore, the 2020–2045 RTP/SCS is the approved version by the CARB. The 2024–2050 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The 2024–2050 RTP/SCS is an important planning document for the region, allowing project sponsors to qualify for federal funding and takes into account operations and maintenance costs, to ensure reliability, longevity, and cost effectiveness. The forecasted development pattern, when integrated with the financially constrained transportation investments identified in the 2024–2050 RTP/SCS, would reach the regional target of reducing GHG emissions from autos and light-duty trucks by 19 percent by 2035 (compared to 2005 levels).

Local Regulations

City of Lake Forest General Plan

The City of Lake Forest addresses air quality in the Recreation and Resources Element of its General Plan.[26] The Recreation and Resources Element includes goals and policies that work to create a community with optimal air quality for its residents. The following policies from the Recreation and Resources Element are applicable to the proposed project:

- **Policy RR-4.2, Land Use Planning.** Utilize land-use planning techniques to reduce traffic congestion and promote alternative modes of transportation for the community.

- **Policy RR-4.6, Sensitive Receptors.** Insulate sensitive receptors from areas of heightened air quality pollution, including highways, by utilizing land use planning to buffer and protect residential areas.

- **Policy RR-4.7, Mitigation.** Require the implementation of relevant mitigation measures for all future development upon identification of potential air quality impacts.

ENERGY REGULATORY SETTING

Federal and State agencies regulate energy use and consumption through various means and programs. On the federal level, the United States Department of Transportation (USDOT), the United States Department of Energy, and the USEPA are three federal agencies with substantial influence over energy policies and programs. Generally, federal agencies influence and regulate transportation energy consumption through establishment and enforcement of fuel economy standards for automobiles and light trucks, through funding of energy-related research and development projects, and through funding for transportation infrastructure improvements. On the State level, the California Public Utilities Commission (CPUC) and the CEC are two agencies with authority over different aspects of energy.

The CPUC regulates privately owned electric, natural gas, telecommunications, water, railroad, rail transit, and passenger transportation companies and serves the public interest by protecting consumers and ensuring the provision of safe, reliable utility service and infrastructure at reasonable rates, with a commitment to environmental enhancement and a healthy California economy.

The CEC is the State's primary energy policy and planning agency. The CEC forecasts future energy needs, promotes energy efficiency, supports energy research, develops renewable energy resources, and plans for/directs state response to energy emergencies. The applicable federal, State, regional, and local regulatory framework is discussed below.

Federal Regulations

Energy Policy Act of 2005

The Energy Policy Act of 2005 seeks to reduce reliance on non-renewable energy resources and provide incentives to reduce current demand on these resources. For example, under this act, consumers and businesses can obtain federal tax credits for purchasing fuel-efficient appliances and products (including hybrid vehicles), building energy-efficient buildings, and improving the energy efficiency of commercial buildings. Additionally, tax credits are available for the installation of qualified fuel cells, stationary microturbine power plants, and solar power equipment.

Corporate Average Fuel Economy (CAFE) Standards

On March 31, 2022, the National Highway Traffic Safety Administration (NHTSA) finalized the Corporate Average Fuel Economy (CAFE) standards for Model Years 2024–2026 Passenger Cars and Light Trucks. The amended CAFE standards would require an industry wide fleet average of approximately 49 mpg for passenger cars and light trucks in model year 2026, by increasing fuel efficiency by 8 percent annually for model years 2024–2025, and 10 percent annually for model year 2026. The final standards are estimated to save about 234 billion gallons of gas between model years 2030 to 2050.

State Regulations

Assembly Bill 1575, Warren-Alquist Act

In 1975, largely in response to the oil crisis of the 1970s, the State Legislature adopted AB 1575 (also known as the Warren-Alquist Act), which created the CEC. The statutory mission of the CEC is to forecast future energy needs; license power plants of 50 megawatts (MW) or larger; develop energy technologies and renewable energy resources; plan for and direct State responses to energy emergencies; and, perhaps most importantly, promote energy efficiency through the adoption and enforcement of appliance and building energy efficiency standards. AB 1575 also amended Public Resources Code (PRC) Section 21100(b)(3) and *State CEQA Guidelines* Section 15126.4 to require Environmental Impact Reports (EIRs) to include, where relevant, mitigation measures (MMs) proposed to minimize the wasteful, inefficient, and unnecessary consumption of energy caused by a project. Thereafter, the State Resources Agency created Appendix F to the *State CEQA Guidelines*. Appendix F assists EIR preparers in determining whether a project will result in the inefficient, wasteful, and unnecessary consumption of energy. Appendix F of the *State CEQA Guidelines* also states that the goal of conserving energy implies the wise and efficient use of energy and the means of achieving this goal, including (1) decreasing overall per capita energy consumption; (2) decreasing reliance on fossil fuels such as coal, natural gas, and oil; and (3) increasing reliance on renewable energy sources.

Senate Bill 1389, Energy: Planning and Forecasting

In 2002, the State Legislature passed Senate Bill (SB) 1389, which required the CEC to develop an integrated energy plan every 2 years for electricity, natural gas, and transportation fuels for the California Energy Policy Report. The plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies

a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for zero emission vehicles (ZEVs) and their infrastructure needs, and encouragement of urban designs that reduce vehicle miles traveled (VMT) and accommodate pedestrian and bicycle access.

In compliance with the requirements of SB 1389, the CEC adopts an Integrated Energy Policy Report every 2 years and an update every other year. The most recently adopted report includes the *2023 Integrated Energy Policy Report.*[27] The *Integrated Energy Policy Report* covers a broad range of topics, including decarbonizing buildings, integrating renewables, energy efficiency, energy equity, integrating renewable energy, updates on Southern California electricity reliability, climate adaptation activities for the energy sector, natural gas assessment, transportation energy demand forecast, and the California Energy Demand Forecast. The *Integrated Energy Policy Report* provides the results of the CEC's assessments of a variety of energy issues facing California. Many of these issues will require action if the State is to meet its climate, energy, air quality, and other environmental goals while maintaining energy reliability and controlling costs.

Renewable Portfolio Standard

SB 1078 established the California Renewable Portfolio Standards program in 2002. SB 1078 initially required that 20 percent of electricity retail sales be served by renewable resources by 2017; however, this standard has become more stringent over time. In 2006, SB 107 accelerated the standard by requiring that the 20 percent mandate be met by 2010. In April 2011, SB 2 required that 33 percent of electricity retail sales be served by renewable resources by 2020. In 2015, SB 350 established tiered increases to the Renewable Portfolio Standards of 40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. In 2018, SB 100 increased the requirement to 60 percent by 2030 and required that all the State's electricity come from carbon-free resources by 2045. SB 100 took effect on January 1, 2019.[28]

California Energy Code

Energy consumption by new buildings in California is regulated by the Building Energy Efficiency Standards in Part 6 of Title 24 of the California Code of Regulations (CCR), known as the Energy Code. The CEC first adopted the Building Energy Efficiency Standards for Residential and Non-residential Buildings in 1978 in response to a legislative mandate to reduce energy consumption in the State. The Energy Code is updated every 3 years, with the most recent update consisting of the 2022 Energy Code that became effective January 1, 2023. Mid-cycle supplements to the 2022 Energy Code will become effective on July 1, 2024. The efficiency standards apply to both new construction and rehabilitation of both residential and nonresidential buildings, and regulate energy consumed for heating, cooling, ventilation, water heating, and lighting. The building efficiency standards are enforced through the local building permit process. Local government agencies may adopt and enforce energy standards for new buildings, provided these standards meet or exceed those provided in the Energy Code.

California Green Building Standards Code

In 2010, the California Building Standards Commission (CBSC) adopted Part 11 of the Title 24 Building Energy Efficiency Standards, referred to as the CALGreen Code. The CALGreen Code took effect on January 1, 2011. The CALGreen Code is updated on a regular basis, with the most recent update consisting of the 2022 CALGreen Code standards that became effective January 1, 2023. The CALGreen Code established mandatory measures for residential and nonresidential building construction and encouraged sustainable construction practices in the following five categories: (1) planning and design, (2) energy efficiency, (3) water efficiency and conservation, (4) material conservation and resource efficiency, and (5) indoor environmental quality. Although the CALGreen Code was adopted as part of the State's efforts to reduce GHG emissions, the CALGreen Code standards have co-benefits of reducing energy consumption from residential and nonresidential buildings subject to the standard.

California Energy Efficiency Strategic Plan

On September 18, 2008, the CPUC adopted California's first Long-Term Energy Efficiency Strategic Plan, presenting a roadmap for energy efficiency in California. The Plan articulates a long-term vision and goals for each economic sector and identifies specific near-term, mid-term, and long-term strategies to assist in achieving those goals. The Plan also reiterates the following four specific programmatic goals known as the "Big Bold Energy Efficiency Strategies" that were established by the CPUC in Decisions D.07-10-032 and D.07-12-051:

- All new residential construction will be zero net energy (ZNE) by 2020.
- All new commercial construction will be ZNE by 2030.
- 50 percent of commercial buildings will be retrofitted to ZNE by 2030.
- 50 percent of new major renovations of State buildings will be ZNE by 2025.

Regional Regulations

There are no regional regulations that apply to the proposed project.

Local Regulations

City of Lake Forest General Plan

The City of Lake Forest addresses energy in the Public Facilities Element of the General Plan.[29] The Public Facilities Element includes goals and policies that work to provide a community with adequate power, provided through economically and environmentally sustainable means. The following policies are applicable to the proposed project:

- **Policy PF-6.1, Compliance with State Legislation.** Comply with all state requirements regarding the generation of power and encourage energy providers to investigate the use or expansion of renewable sources of energy.

[29] City of Lake Forest. 2020. *General Plan, Lake Forest 2040*. June. Website: https://www.lakeforestca.gov/sites/default/files/lake-forest/departments/Lake%20Forest%20General%20Plan%20(excluding%20Housing%20Element)_202110051212558852.pdf (accessed June 2025).

- **Policy PF-6.2, New Development.** Continue to require new development and redevelopment to provide verification from energy utilities that states they are able to accommodate the additional demand for service.

- **Policy PF-6.4, Business Community.** Support the decisions of the Lake Forest business community as they select and implement the most appropriate, financially feasible, and responsible energy source for their individual operations.

- **Policy PF-6.5, Conservation.** Promote conservation strategies during design, construction, and maintenance of facilities.

- **Policy PF-6.8, Innovation.** Encourage innovative energy management solutions in new developments.

GREENHOUSE GAS REGULATORY SETTING

This section describes regulations related to global climate change at the federal, State, and local level.

Federal Regulations

The United States has historically had a voluntary approach to reducing GHG emissions. However, on April 2, 2007, the United States Supreme Court ruled that the USEPA has the authority to regulate CO_2 emissions under the CAA.

Although there currently are no adopted federal regulations for the control or reduction of GHG emissions, the USEPA commenced several actions in 2009 to implement a regulatory approach to global climate change, including the 2009 USEPA final rule for mandatory reporting of GHGs from large GHG emission sources in the United States. Additionally, the USEPA Administrator signed an endangerment finding action in 2009 under the CAA, finding that seven GHGs (CO_2, CH_4, N_2O, HFCs, NF_3, PFCs, and SF_6) constitute a threat to public health and welfare, and that the combined emissions from motor vehicles cause and contribute to global climate change, leading to national GHG emission standards.

State Regulations

The CARB is the lead agency for implementing climate change regulations in the State. Since its formation, the CARB has worked with the public, the business sector, and local governments to find solutions to California's air pollution problems. Key efforts by the State are described below.

Assembly Bill 1493 (2002)

In a response to the transportation sector's significant contribution to California's CO_2 emissions, AB 1493 was enacted on July 22, 2002. AB 1493 requires the CARB to set GHG emission standards for passenger vehicles and light duty trucks (and other vehicles whose primary use is noncommercial personal transportation in the State) manufactured in 2009 and all subsequent model years. These standards (starting in model years 2009 to 2016) were approved by the CARB in 2004, but the needed waiver of CCAA Preemption was not granted by the USEPA until June 30, 2009. The CARB

responded by amending its original regulation, now referred to as Low Emission Vehicle III, to take effect for model years starting in 2017 to 2025. The Trump administration revoked California's waiver in 2019; however, the Biden administration restored California's waiver in 2021.

Executive Order S-3-05 (2005)

Governor Arnold Schwarzenegger signed Executive Order (EO) S-3-05 on June 1, 2005, which proclaimed that California is vulnerable to the impacts of climate change. To combat those concerns, the executive order established California's GHG emissions reduction targets, which established the following goals:

- GHG emissions should be reduced to 2000 levels by 2010;
- GHG emissions should be reduced to 1990 levels by 2020; and
- GHG emissions should be reduced to 80 percent below 1990 levels by 2050.

The Secretary of the California Environmental Protection Agency (CalEPA) is required to coordinate efforts of various State agencies in order to collectively and efficiently reduce GHGs. A biannual progress report must be submitted to the Governor and State Legislature disclosing the progress made toward GHG emission reduction targets. In addition, another biannual report must be submitted illustrating the impacts of global warming on California's water supply, public health, agriculture, the coastline, and forestry, and report possible mitigation and adaptation plans to address these impacts.

The Secretary of CalEPA leads this climate action team (CAT) made up of representatives from State agencies as well as numerous other boards and departments. The CAT members work to coordinate statewide efforts to implement global warming emission reduction programs and the State's Climate Adaptation Strategy. The CAT is also responsible for reporting on the progress made toward meeting the statewide GHG targets that were established in the executive order and further defined under AB 32, the "Global Warming Solutions Act of 2006." The first CAT Report to the Governor and the Legislature was released in March 2006, which it laid out 46 specific emission reduction strategies for reducing GHG emissions and reaching the targets established in the executive order. The most recent report was released in December 2020.

Assembly Bill 32 (2006), California Global Warming Solutions Act

California's major initiative for reducing GHG emissions is AB 32, passed by the State legislature on August 31, 2006. This effort aims at reducing GHG emissions to 1990 levels by 2020. The CARB has established the level of GHG emissions in 1990 at 427 million metric tons (MMT) of CO_2e (MMT CO_2e). The emissions target of 427 MMT CO_2e requires the reduction of 169 MMT CO_2e from the State's projected business-as-usual (BAU) 2020 emissions of 596 MMT CO_2e. AB 32 requires the CARB to prepare a Scoping Plan that outlines the main State strategies for meeting the 2020 deadline and to reduce GHGs that contribute to global climate change. The Scoping Plan was approved by the CARB on December 11, 2008, and contains the main strategies California will implement to achieve the reduction of approximately 169 MMT CO_2e, or approximately 30 percent, from the State's projected 2020 emissions level of 596 MMT CO_2e under a BAU scenario (this is a reduction of 42 MMT CO_2e, or almost 10 percent from 2002–2004 average emissions). The Scoping Plan also includes CARB-recommended GHG reductions for each emissions sector of the State's GHG

inventory. The Scoping Plan calls for the largest reductions in GHG emissions to be achieved by implementing the following measures and standards:

- Improved emissions standards for light-duty vehicles (estimated reductions of 31.7 MMT CO_2e);
- The Low-Carbon Fuel Standard (15.0 MMT CO_2e);
- Energy efficiency measures in buildings and appliances and the widespread development of combined heat and power systems (26.3 MMT CO_2e); and
- A renewable portfolio standard for electricity production (21.3 MMT CO_2e).

The CARB approved the *First Update to the Climate Change Scoping Plan* on May 22, 2014. The First Update identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. The First Update defines CARB climate change priorities until 2020, and also sets the groundwork to reach long-term goals set forth in EOs S-3-05 and B-16-2012. The update highlights California's progress toward meeting the "near-term" 2020 GHG emission reduction goals as defined in the initial Scoping Plan. It also evaluates how to align the State's "longer-term" GHG reduction strategies with other State policy priorities for water, waste, natural resources, clean energy, transportation, and land use. CARB released a second update to the Scoping Plan, the 2017 Scoping Plan,[30] to reflect the 2030 target set by EO B-30-15 and codified by SB 32.

The 2022 Scoping Plan[31] was approved in December 2022 and assesses progress towards achieving the SB 32 2030 target and lays out a path to achieve carbon neutrality no later than 2045. The 2022 Scoping Plan focuses on outcomes needed to achieve carbon neutrality by assessing paths for clean technology, energy deployment, natural and working lands, and others and is designed to meet the State's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities.

The 2022 Scoping Plan focuses on building clean energy production and distribution infrastructure for a carbon-neutral future, including transitioning existing energy production and transmission infrastructure to produce zero-carbon electricity and hydrogen and utilizing biogas resulting from wildfire management or landfill and dairy operations, among other substitutes. The 2022 Scoping Plan states that in almost all sectors, electrification will play an important role. The 2022 Scoping Plan evaluates clean energy and technology options and the transition away from fossil fuels, including adding four times the solar and wind capacity by 2045 and about 1,700 times the amount of current hydrogen supply. As discussed in the 2022 Scoping Plan, EO N-79-20 requires that all new passenger vehicles sold in California will be zero-emission by 2035, and all other fleets will have transitioned to zero-emission as fully possible by 2045, which will reduce the percentage of fossil fuel combustion vehicles.

Senate Bill 97 (2007)

SB 97, signed by the Governor in August 2007 (Chapter 185, Statutes of 2007; PRC Sections 21083.05 and 21097), acknowledges climate change is a prominent environmental issue that requires analysis under CEQA. This bill directed the Governor's Office of Planning and Research (OPR) to prepare, develop, and transmit to the California Resources Agency guidelines for mitigating GHG emissions or the effects of GHG emissions, as required by CEQA.

The California Natural Resources Agency adopted the amendments to the *State CEQA Guidelines* in November 2018, which went into effect in December 2018. The amendments do not identify a threshold of significance for GHG emissions, nor do they prescribe assessment methodologies or specific MMs. The amendments encourage lead agencies to consider many factors in performing a CEQA analysis, but preserve the discretion granted by CEQA to lead agencies in making their own determinations based on substantial evidence. The amendments also encourage public agencies to make use of programmatic mitigation plans and programs when they perform individual project analyses.

Senate Bill 375 (2008)

Signed into law on October 1, 2008, SB 375 supplements GHG reductions from new vehicle technology and fuel standards with reductions from more efficient land use patterns and improved transportation. Under the law, CARB-approved GHG reduction targets in February 2011 for California's 18 federally designated regional planning bodies, known as MPOs. CARB may update the targets every 4 years and must update them every 8 years. MPOs, in turn, must demonstrate how their plans, policies, and transportation investments meet the targets set by CARB through Sustainable Community Strategies (SCSs). The SCSs are included with the Regional Transportation Plan (RTP), a report required by State law. However, if an MPO finds that its SCS will not meet the GHG reduction targets, it may prepare an Alternative Planning Strategy. The Alternative Planning Strategy identifies the impediments to achieving the targets.

Executive Order B-30-15 (2015)

Governor Jerry Brown signed EO B-30-15 on April 29, 2015, which added the immediate target of:

- GHG emissions should be reduced to 40 percent below 1990 levels by 2030.

All State agencies with jurisdiction over sources of GHG emissions were directed to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 targets. CARB was directed to update the AB 32 Scoping Plan to reflect the 2030 target and, therefore, is moving forward with the update process. The mid-term target is critical to help frame the suite of policy measures, regulations, planning efforts, and investments in clean technologies and infrastructure needed to continue reducing emissions.

Senate Bill 350 (2015) Clean Energy and Pollution Reduction Act

SB 350, signed by Governor Jerry Brown on October 7, 2015, updates and enhances AB 32 by introducing the following set of objectives in clean energy, clean air, and pollution reduction for 2030:

- Raise California's renewable portfolio standard from 33 percent to 50 percent; and
- Increasing energy efficiency in buildings by 50 percent by the year 2030.

The 50 percent renewable energy standard will be implemented by the CPUC for the private utilities and by the CEC for municipal utilities. Each utility must submit a procurement plan showing it will purchase clean energy to displace other non-renewable resources. The 50 percent increase in energy efficiency in buildings must be achieved through the use of existing energy efficiency retrofit funding and regulatory tools already available to state energy agencies under existing law. The addition made by this legislation requires state energy agencies to plan for and implement those programs in a manner that achieves the energy efficiency target.

Senate Bill 32, California Global Warming Solutions Act of 2016, and Assembly Bill 197

In summer 2016 the Legislature passed, and the Governor signed, SB 32, and AB 197. SB 32 affirms the importance of addressing climate change by codifying into statute the GHG emissions reductions target of at least 40 percent below 1990 levels by 2030 contained in Governor Brown's April 2015 EO B-30-15. SB 32 builds on AB 32 and keeps us on the path toward achieving the State's 2050 objective of reducing emissions to 80 percent below 1990 levels, consistent with an Intergovernmental Panel on Climate Change (IPCC) analysis of the emissions trajectory that would stabilize atmospheric GHG concentrations at 450 parts per million CO_2e and reduce the likelihood of catastrophic impacts from climate change.

The companion bill to SB 32, AB 197, provides additional direction to CARB related to the adoption of strategies to reduce GHG emissions. Additional direction in AB 197 meant to provide easier public access to air emissions data that are collected by CARB was posted in December 2016.

Senate Bill 100

On September 10, 2018, Governor Brown signed SB 100, which raises California's Renewables Portfolio Standard (RPS) requirements to 60 percent by 2030, with interim targets, and 100 percent by 2045. The bill also establishes a state policy that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all State agencies by December 31, 2045. Under the bill, the State cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

Executive Order B-55-18

EO B-55-18, signed September 10, 2018, sets a goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." EO B-55-18 directs CARB to work with relevant state agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. The goal of carbon neutrality by 2045 is in addition to other statewide goals, meaning not only should emissions be reduced to 80 percent below 1990 levels by 2050, but that, by no later than 2045, the remaining emissions be offset by equivalent net removals of CO_2e from the atmosphere, including through sequestration in forests, soils, and other natural landscapes.

Title 24, Part 11, Building Standards Code and CALGreen Code

In November 2008, the CBSC established the CALGreen Code, which sets performance standards for residential and non-residential development to reduce environmental impacts and encourage sustainable construction practices. The CALGreen Code addresses energy efficiency, water conservation, material conservation, planning and design, and overall environmental quality. The CALGreen Code is updated every 3 years and was most recently updated in 2022 to include new mandatory measures for residential as well as non-residential uses; the new measures took effect on January 1, 2023. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions.

California Building Efficiency Standards (Title 24, Part 6)

The CBSC, or Title 24 of the CCR contains the regulations that govern the construction of buildings in California. Within the California Building Standards Code, two parts pertain to the incorporation of both energy efficient and green building elements into land use development. Part 6 is California's Energy Efficiency Standards for Residential and Non-Residential Buildings. These standards were first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption and are updated on an approximately 3-year cycle to allow consideration and possible incorporation of new energy efficient technologies and methods. All buildings for which an application for a building permit is submitted on or after January 1, 2023, must follow the 2022 standards. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions.

Executive Order N-79-20, Executive Order B-48-18, Low Carbon Fuel Standard and the Advanced Clean Cars Program

EO N-79-20, which was signed by the Governor on September 23, 2020, sets the following goals for the State: 100 percent of in-state sales of new passenger cars and trucks shall be zero-emission by 2035; 100 percent of medium- and heavy-duty vehicles in the State shall be zero-emission by 2045 for all operations where feasible and by 2035 for drayage trucks; and 100 percent of off-road vehicles and equipment in the State shall be zero-emission by 2035, where feasible. EO B-48-18 requires all State entities to work with the private sector to have at least 5 million ZEVs on the road by 2030, as well as install 200 hydrogen fueling stations and 250,000 EV charging stations by 2025. This order also requires all State entities to continue to partner with local and regional governments to streamline the installation of ZEV infrastructure. EO S-01-07 calls for a statewide goal to be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020, and that a Low Carbon Fuel Standard (LCFS) for transportation fuels be established for California. In 2018, CARB approved amendments to the LCFS regulation to readjust carbon intensity benchmarks to meet California's 2030 GHG reductions targets under SB 32. These amendments include opportunities to promote zero emission vehicle (ZEV) adoption, carbon capture and sequestration, and advanced technologies for decarbonization of the transportation sector. Furthermore, CARB adopted the Advanced Clean Cars program, which combines the control of GHG emissions and criteria air pollutants, as well as requirements for greater numbers of ZEVs, into a single package of regulatory standards for vehicle model years 2017 through 2025. The program's ZEVs regulation requires battery, fuel cell, and/or plug-in hybrid electric vehicles to account for up to 15 percent of California's new vehicle sales by 2025.

California Integrated Waste Management Act

To minimize the amount of solid waste that must be disposed of in landfills, the State Legislature passed the California Integrated Waste Management Act of 1989 (AB 939), effective January 1990.According to AB 939, all cities and counties were required to divert 25 percent of all solid waste from landfill facilities by January 1, 1995, and 50 percent by January 1, 2000. In 2011, AB 341 modified the California Integrated Waste Management Act and directed the California Department of Resources Recycling and Recovery (CalRecycle) to develop and adopt regulations for mandatory commercial recycling. AB 341 also established a statewide recycling goal of 75 percent; the 50 percent disposal reduction mandate still applies for cities and counties under AB 939. In April 2016, AB 1826 further modified the California Integrated Waste Management Act, requiring businesses that generate a specified amount of organic waste per week to arrange for recycling services for that organic waste in a specified manner.

Regional Regulations

South Coast Air Quality Management District

In 2008, the SCAQMD formed a Working Group to identify GHG emissions thresholds for land use projects that could be used by local lead agencies in the Basin. The Working Group developed several different options that are contained in the SCAQMD 2008 draft guidance document titled *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans*[32] that could be applied by lead agencies. On September 28, 2010, SCAQMD Working Group Meeting No. 15 provided further guidance, including a tiered approach for evaluating GHG emissions for development projects where the SCAQMD is not the lead agency. The SCAQMD has not presented a finalized version of these thresholds to the governing board.

The SCAQMD identifies the emissions level for which a project would not be expected to substantially conflict with any State legislation adopted to reduce statewide GHG emissions. As such, the utilization of a service population represents the rates of emissions needed to achieve a fair share of the State's mandated emissions reductions. Overall, the SCAQMD identifies a GHG efficiency level that, when applied statewide or to a defined geographic area, would meet the year 2020 and post-2020 emissions targets as required by AB 32 and SB 32. If projects are able to achieve targeted rates of emissions per the service population, the State will be able to accommodate expected population growth and achieve economic development objectives, while also abiding by AB 32's emissions target and future post-2020 targets.

Southern California Association of Governments

On April 4, 2024, SCAG adopted the 2024–2050 RTP/SCS.[33] In general, the SCS outlines a development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, would reduce VMT from automobiles and light-duty trucks and thereby reduce GHG emissions from these sources. For the SCAG region, CARB has set GHG reduction targets at 8 percent below 2005 per capita emissions levels by 2020, and 19 percent

below 2005 per capita emissions levels by 2035. The RTP/SCS lays out a strategy for the region to meet these targets. Overall, the SCS is meant to provide growth strategies that will achieve the regional GHG emissions reduction targets. Land use strategies to achieve the region's targets include planning for new growth around high-quality transit areas and livable corridors and creating neighborhood mobility areas to integrate land use and transportation and plan for more active lifestyles.[34] However, the SCS does not require that local General Plans, Specific Plans, or zoning be consistent with the SCS; SCAG is required to consider local land use controls when drafting the SCS.

Local Regulations

City of Lake Forest General Plan.

The City of Lake Forest addresses GHGs in the Recreation and Resources Element of its General Plan.[35] The Recreation and Resources Element includes goals and policies that work to create a community with optimal air quality for its residents. The following policies from the Recreation and Resources Element are applicable to the proposed project:

- **Policy RR-4.8, Local Reduction Targets.** The City of Lake Forest establishes the following per capita GHG reduction targets, in order to meet the requirements established by the State under AB 32 and SB 32, consistent with the CARB's 2017 Scoping Plan:
    - 3.99 metric tons (MT) of CO_2e (MT CO_2e) per capita by 2030;
    - 2.66 MT CO_2e per capita by 2040; and
    - 1.33 MT CO_2e per capita by 2050.
- **Policy RR-4.9, GHG Reduction.** Consider and adopt new policies and programs that will help to provide energy efficient alternatives to fossil fuel use and reduce consumption in order to reduce greenhouse gas emissions.
- **Policy RR-4.10, Carbon Reduction.** Expand the number of parks and trees in Lake Forest to provide a larger carbon sink or area containing natural sources that retain more carbon than what those sources emit.

SETTING

This section provides the current SCAQMD attainment status, climate and air quality, ambient air quality monitoring results, and GHG emissions inventory.

ATTAINMENT STATUS

The CARB is required to designate areas of the state as attainment, nonattainment, or unclassified for all State standards. An *attainment* designation for an area signifies that pollutant concentrations did not violate the standard for that pollutant in that area. A *nonattainment* designation indicates that a pollutant concentration violated the standard at least once, excluding those occasions when a violation was caused by an exceptional event, as defined in the criteria. An *unclassified* designation signifies that data do not support either an attainment or nonattainment status. The CCAA divides districts into moderate, serious, and severe air pollution categories, with increasingly stringent control requirements mandated for each category.

The USEPA designates areas for O_3, CO, and NO_2 as either does not meet the primary standards, or cannot be classified, or better than national standards. For SO_2, areas are designated as does not meet the primary standards, does not meet the secondary standards, cannot be classified, or better than national standards. On February 2024, the USEPA issued a final revised standard for $PM_{2.5}$ to lower the primary standard from 12 µg/m^3 to 9 µg/m^3. The USEPA will issue final area designations in February 2026.

Table D provides a summary of the attainment status for the Basin with respect to NAAQS and CAAQS.

EXISTING CLIMATE AND AIR QUALITY

Air quality in the planning area is not only affected by various emission sources (e.g., mobile and industry), but also by atmospheric conditions (e.g., wind speed, wind direction, temperature, and rainfall). The combination of topography, low mixing height, abundant sunshine, and emissions from the second-largest urban area in the United States gives the Basin some of the worst air pollution in the nation.

The annual average temperature varies little throughout the Basin, ranging from the low to middle 60s°F. With a more pronounced oceanic influence, coastal areas show less variability in annual minimum and maximum temperatures than inland areas. The climatological station closest to the site is the Laguna Beach Station.[36] The monthly average maximum temperature recorded at this station ranged from 65.1°F in January to 78.1°F in August, with an annual average maximum of 71.2°F. The monthly average minimum temperature recorded at this station ranged from 43.0°F in January to 59.6°F in August, with an annual average minimum of 51.0°F. These levels are representative of the project area.

The majority of annual rainfall in the Basin occurs between November and March. Summer rainfall is minimal and is generally limited to scattered thundershowers in coastal regions and slightly heavier showers in the eastern portion of the Basin and along the coastal side of the mountains. Average monthly rainfall at the Laguna Beach station varied from 0.03 inch in July to 2.77 inches in February, with an annual total of 12.52 inches. Patterns in monthly and yearly rainfall totals are unpredictable due to fluctuations in the weather.

The Basin experiences a persistent temperature inversion (increasing temperature with increasing altitude) as a result of the Pacific high. This inversion limits the vertical dispersion of air contaminants, holding them relatively near the ground. As the sun warms the ground and the lower air layer, the temperature of the lower air layer approaches the temperature of the base of the inversion (upper) layer until the inversion layer finally breaks, allowing vertical mixing with the lower layer. This phenomenon is observed in mid-afternoon to late afternoon on hot summer days when the air appears to clear up suddenly. Winter inversions frequently break by midmorning.

Winds in the project area blow predominantly from the south-southwest, with relatively low velocities. Wind speeds in the project area average about 5 miles per hour (mph). Summer wind speeds average slightly higher than winter wind speeds. Low average wind speeds, together with a persistent temperature inversion, limit the vertical dispersion of air pollutants throughout the Basin. Strong, dry, north or northeasterly winds, known as Santa Ana winds, occur during the fall and winter months, dispersing air contaminants. The Santa Ana conditions tend to last for several days at a time.

The combination of stagnant wind conditions and low inversions produces the greatest pollutant concentrations. On days of no inversion or high wind speeds, ambient air pollutant concentrations are the lowest. During periods of low inversions and low wind speeds, air pollutants generated in urbanized areas are transported predominantly on shore into Riverside and San Bernardino Counties. In the winter, the greatest pollution problems are CO and NO_X because of extremely low

[36] Western Regional Climate Center. Recent Climate in the West. Website: http://www.wrcc.dri.edu, (accessed June 2025).

inversions and air stagnation during the night and early morning hours. In the summer, the longer daylight hours and brighter sunshine combine to cause a reaction between hydrocarbons and NO_x to form photochemical smog. Smog is a general term that is naturally occurring fog that has become mixed with smoke or pollution. In this context it is better described as a form of air pollution produced by the photochemical reaction of sunlight with pollutants that have been released into the atmosphere, especially by automotive emissions.

AIR QUALITY MONITORING RESULTS

Air quality monitoring stations are located throughout the nation and are maintained by the local air pollution control district and State air quality regulating agencies. The SCAQMD, together with the CARB, maintains ambient air quality monitoring stations in the Basin. The air quality monitoring stations closest to the project site are located at 26081 Via Pera in Mission Viejo and 1630 West Pampas Lane in Anaheim.

Pollutant monitoring results for years 2021 to 2023 at the Mission Viejo and Anaheim ambient air quality monitoring stations, shown in Table E, indicate that air quality in the area has generally been good. As indicated in the monitoring results, the federal PM_{10} standard had no exceedances in the 3-year period. The State PM_{10} standard had no exceedances in 2021 and 2022 and an unknown number of exceedances in 2023. Similarly, the $PM_{2.5}$ federal standard had no exceedances in 2021 and 2022 and an unknown number of exceedances in 2023. The 1-hour ozone State standard was exceeded two times in 2021, one time in 2022, and an unknown number of times in 2023. The 8-hour ozone State standard was exceeded eight times in 2021, six times in 2022, and an unknown number of times in 2023. The 8-hour ozone federal standard was exceeded eight times in 2021, five times in 2022, and two times in 2023. In addition, the CO and NO_2 standards were not exceeded in this area during the 3-year period. SO_2 is not monitored in the project area.

GREENHOUSE GAS EMISSIONS INVENTORY

An emissions inventory that identifies and quantifies the primary human-generated sources and sinks of GHGs is a well-recognized and useful tool for addressing climate change. This section summarizes the latest information on global, United States, and California GHG emissions inventories.

Global Emissions

Worldwide emissions of GHGs in 2020 totaled 22.9 billion MT CO_2e. Global estimates are based on country inventories developed as part of the programs of the United Nations Framework Convention on Climate Change (UNFCCC).[37]

United States Emissions

In 2022, the year for which the most recent data are available, the United States emitted about 6,343 MMT CO_2e. Overall, emissions in 2022 increased by 1 percent relative to the 2021 total GHG emissions. This increase in total GHG emissions was driven by fossil fuel combustion due primarily to increased energy use, due inpart to the continued rebound in economic activity after the height of the COVID-19 pandemic. However, GHG emissions in 2022 were 17 percent below those of 2005 levels. Of the five major sectors—residential and commercial, agricultural, industry, transportation, and electricity generation—transportation accounted for the highest amount of GHG emissions in 2022 (approximately 28 percent), with electricity generation second at 25 percent and emissions from industry third at 23 percent.[38]

State of California Emissions

The State emitted 381.3 MMT CO_2e emissions in 2021, 12.6 MMT CO_2e higher than 2020 levels but 23.1 MMT CO_2e below the 2019 levels.[39] CARB estimates that transportation was the source of 38 percent of the State's GHG emissions in 2021, which is 7.4 percent higher than the 2020 emissions. This increase was most likely from passenger vehicles whose activity and emissions rebounded after the COVID-19 pandemic. The next largest sources included industrial sources at approximately 19 percent and electricity generation at 16 percent. The remaining sources of GHG emissions were commercial and residential activities at 10 percent, agriculture at 8 percent, high GWP at 6 percent, and waste at 2 percent.[40]

METHODOLOGY

The methodology used to estimate air quality, GHG, and energy impacts is described below.

AIR QUALITY

Construction Emissions

Construction activities can generate a substantial amount of air pollution. Construction activities are considered temporary; however, short-term impacts can contribute to exceedances of air quality standards. Construction activities include demolition, site preparation, earthmoving, and general construction. The emissions generated from these common construction activities include fugitive dust from soil disturbance, fuel combustion from mobile heavy-duty diesel and gasoline powered equipment, portable auxiliary equipment, and worker commute trips.

The California Emissions Estimator Model version 2022.1 (CalEEMod) computer program was used to calculate emissions from on-site construction equipment and emissions from worker and vehicle trips to the site. As discussed previously in the Project Location and Description section, construction of the proposed project would tentatively commence in January 2026 and is expected to be completed in about 1 year, which was included in CalEEMod. Construction of the proposed project would require a net export of approximately 900 cy of material, which was included in CalEEMod. The proposed project would require the use of concrete industrial saws, excavators, impactors, stackers, jaw crushers, bull dozers, tractors, loaders, backhoes, graders, scrapers, forklifts, cranes, generator sets, welders, concrete ride on trowel machine, cement and mortar mixers, paving equipment, and air compressors, which was included in CalEEMod. Equipment tier engine and number of equipment pieces was provided by the project Applicant, which was included in CalEEMod. In addition, this analysis assumes that the proposed project would comply with SCAQMD Rule 403 measures. Number of worker trips, vendor, and hauling trips during construction were also provided by the project Applicant and included in CalEEMod. All other construction details are not yet known; therefore, default assumptions (e.g., off-road emission factors and construction trip lengths) from CalEEMod were used.

Operational Emissions

The air quality analysis includes estimating emissions associated with long-term operation of the proposed project. Consistent with the SCAQMD guidance for estimating emissions associated with land use development projects, the CalEEMod computer program was used to calculate the long-term operational emissions associated with the project. The proposed project would construct a 165,803 sq ft industrial building. Therefore, the proposed project analysis was conducted using land use codes *Unrefrigerated Warehouse- No Rail*, *Other Asphalt Surfaces,* and *Parking Lot*. The *Other Asphalt Surfaces* land use was used to represent the off-site improvements for the proposed project. Trip generation rates used in CalEEMod for the project were based on the project's Traffic Impact Analysis (TIA),[41] which identifies that the proposed project would generate approximately 573 average daily trips, 458 passenger car trips, 38 two-axle truck trips, 21 three-axle truck trips, and

[41] LSA. 2025. *Traffic Impact Analysis for the IPT Enterprise Business Center LLC Project, Table E: Project Trip Generation Summary.* May.

58 four-axle truck trips. As noted in the TIA, the trip generation rates are from the Institute of Transportation Engineers Trip Generation Manual, 11th Edition and the Warehouse Truck Trip Study Data Results and Usage from the SCAQMD. This analysis assumes that the four-axle truck trips would travel approximately 40 miles. To be conservative, separate CalEEMod analyses were prepared for the operational analysis for the proposed project. One CalEEMod run evaluated operational and vehicle trip emissions and another CalEEMod run evaluated four-axle truck trip emissions for the proposed project. In addition, consistent with the project design plans, this CalEEMod analysis incorporates selections to reflect no natural gas usage during construction and operation of the proposed project. This analysis includes the use of a 300 hp diesel fire pump, which is estimated to run for approximately 50 hours per year and the use of two 200 hp diesel powered cargo handling equipment units, which were also included in CalEEMod. In addition, this analysis assumes that the proposed project would be operational in 2027, which is included in CalEEMod.

ENERGY USE

The analysis of electricity usage is based on the CalEEMod modeling conducted by LSA, which quantifies energy use for project operations. Fuel consumption (diesel fuel and gasoline) from vehicle trips during operation was estimated for the opening year (2027) of the proposed project based on trip estimates from the CalEEMod model and fuel efficiencies from the CARB Emission Factor Model (EMFAC2021) model. Estimates of fuel consumption (diesel fuel and gasoline) from construction trucks and construction worker vehicles were based on trip estimates from the CalEEMod model and fuel efficiencies from the CARB EMFAC2021 model.

The analysis focuses on the three sources of energy that are relevant to the proposed project: electricity, the equipment fuel necessary for project construction, and vehicle fuel necessary for project operations. For the purposes of this analysis, the amount of electricity, construction fuel, and fuel use from operations are quantified and compared to that consumed in Orange County. The electricity use of the proposed project is analyzed as a whole on an annual basis. Electricity use was estimated for the project using default energy intensities by land use type in CalEEMod.

GREENHOUSE GAS ANALYSIS

Recognizing that the field of global climate change analysis is rapidly evolving, the approaches advocated most recently indicate that for determining a project's contribution to GHG emissions, lead agencies should calculate, or estimate, emissions from vehicular traffic, energy consumption, water conveyance and treatment, waste generation, construction activities, and any other significant source of emissions within the project area. The CalEEMod results, using the input assumptions described above, were used to quantify GHG emissions generated by the project.

THRESHOLDS OF SIGNIFICANCE

The *State CEQA Guidelines* indicate that a project would normally have a significant adverse air quality impact if project-generated pollutant emissions would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project is nonattainment under applicable federal or state ambient air quality standards;
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in other emissions (such as those leading to odors) affecting a substantial number of people.

The *State CEQA Guidelines* indicate that a project would normally have a significant adverse energy impact if the project would:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

The *State CEQA Guidelines* indicate that a project would normally have a significant adverse greenhouse gas emission impact if the project would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Certain air districts (e.g., SCAQMD) have created guidelines and requirements to conduct air quality analyses. The SCAQMD's current guidelines, its *CEQA Air Quality Handbook* with associated updates, were followed in this assessment of air quality and GHG impacts for the proposed project.

CRITERIA POLLUTANT THRESHOLDS

SCAQMD has established daily emissions thresholds for construction and operation of a proposed project in the South Coast Air Basin. The emissions thresholds were established based on the attainment status of the Basin with regard to air quality standards for specific criteria pollutants. Because the concentration standards were set at a level that protects public health with an adequate margin of safety, these emissions thresholds are regarded as conservative and would overstate an individual project's contribution to health risks.

Table F lists the CEQA significance thresholds for construction and operational emissions established for the Basin. Projects in the Basin with construction- or operation-related emissions that exceed any of their respective emission thresholds would be considered significant under SCAQMD guidelines. These thresholds, which SCAQMD developed and that apply throughout the Basin, apply as both project and cumulative thresholds. If a project exceeds these standards, it is considered to have a project-specific and cumulative impact.

LOCALIZED IMPACTS ANALYSIS

The SCAQMD published its *Final Localized Significance Threshold Methodology* in July 2008, recommending that all air quality analyses include an assessment of air quality impacts to nearby sensitive receptors.[42] This guidance was used to analyze potential localized air quality impacts associated with construction of the proposed project. Localized significance thresholds (LSTs) are developed based on the size or total area of the emission source, the ambient air quality in the source receptor area, and the distance to the project. Sensitive receptors include residences, schools, hospitals, and similar uses that are sensitive to adverse air quality.

LSTs are based on the ambient concentrations of that pollutant within the project Source Receptor Area (SRA) and the distance to the nearest sensitive receptor. For the proposed project, the appropriate SRA for the LST is the nearby Saddleback Valley (SRA 19). SCAQMD provides LST screening tables for 25-, 50-, 100-, 200-, and 500-meter source-receptor distances for projects that are 5 acres in size or less. If the project exceeds the 5 acre LST threshold, then additional dispersion modeling analysis would be required. As identified above, the closest sensitive receptors to the project site are residential uses, including single-family homes, which are located adjacent to the east property line at approximately 82 feet from the project site's eastern boundary. Based on the anticipated construction equipment and based on the grading and ground-disturbing activities assumed in CalEEMod, it is assumed that the maximum daily disturbed acreage during construction of the proposed project would be 4.0 acres.[43] For the operational threshold, the maximum daily LST, which is based on a 5 acre project site, would be used. Table G lists the emissions thresholds that apply during project construction and operation.

LOCAL MICROSCALE CONCENTRATION STANDARDS

The significance of localized project impacts under CEQA depends on whether ambient CO levels in the vicinity of the project are above or below State and federal CO standards. Because ambient CO levels are below the standards throughout the Basin, a project would be considered to have a significant CO impact if project emissions result in an exceedance of one or more of the 1-hour or 8-hour standards. The following are applicable local emission concentration standards for CO:

- California State 1-hour CO standard of 20 parts per million (ppm)
- California State 8-hour CO standard of 9 ppm

GREENHOUSE GAS THRESHOLDS

State CEQA Guidelines Section 15064(b) provides that the "determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data," and further states that an "ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting."

Appendix G of the *State CEQA Guidelines* includes significance thresholds for GHG emissions. A project would normally have a significant effect on the environment if it would do either of the following:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment

- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs

To provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents, SCAQMD has convened a GHG CEQA Significance Threshold Working Group (Working Group). Based on the last Working Group meeting held in September 2010 (Meeting No. 15), SCAQMD proposed to adopt a tiered approach for evaluating GHG emissions for development projects where SCAQMD is not the lead agency:

- **Tier 1—Exemptions:** If a project is exempt from CEQA, project-level and cumulative GHG emissions are less than significant.

- **Tier 2—Consistency with a Locally Adopted GHG Reduction Plan:** If the project complies with a GHG emissions reduction plan or mitigation program that avoids or substantially reduces GHG emissions in the project's geographic area (i.e., city or county), project-level and cumulative GHG emissions are less than significant.

- **Tier 3—Numerical Screening Threshold:** If GHG emissions are less than the numerical screening-level threshold, project-level and cumulative GHG emissions are less than significant.

  For projects that are not exempt or where no qualifying GHG reduction plans are directly applicable, SCAQMD requires an assessment of GHG emissions. For the analysis of stationary/ industrial projects, the SCAQMD adopted a threshold of 10,000 MT of CO_2e per year (MT CO_2e/yr). The proposed project is not a stationary source project and therefore, the 10,000 MT CO_2e/year threshold is not applicable. For all other land use types, the SCAQMD recommends utilizing one of two options to analyze the impact of a project's GHG emissions. Under Option 1, the SCAQMD applies a "bright-line" screening-level threshold of 3,000 metric tons (MT) of CO_2e (or MT CO_2e) per year (MT CO_2e/year) for all land use types. Under Option 2, the SCAQMD applies the a "bright-line" screening level threshold based on specific land use types as follows: 1,400 MT CO_2e for commercial projects; 3,500 MT CO_2e for residential projects; or 3,000 MT CO_2e for mixed-use projects. This "bright-line" threshold is based on a review of the Office of Planning and Research (OPR) database of CEQA projects. Based on their review of 711 CEQA projects, 90 percent of CEQA projects would exceed the "bright-line" thresholds identified above. Therefore, projects that do not exceed the bright-line threshold would have a nominal and therefore less than cumulatively considerable impact on GHG emissions.

- **Tier 4—Performance Standards:** If emissions exceed the numerical screening threshold, a more detailed review of the project's GHG emissions is warranted. The SCAQMD has proposed an efficiency target for projects that exceed the bright-line threshold. The current recommended approach is per-capita efficiency targets. The SCAQMD is not recommending use of a percentage emissions reduction target. Instead, the SCAQMD proposed a 2020 efficiency target of 4.8 MT CO_2e per year per service population for project-level analyses and 6.6 MT CO_2e per yr per service population for plan-level projects (e.g., program-level projects such as General Plans).

For the purpose of this analysis, the proposed project will be compared to the threshold of 3,000 MT CO_2e per year for all land use types. The project is also evaluated for compliance with the 2022 Scoping Plan and SCAG's RTP/SCS.

IMPACTS ANALYSIS

This section identifies the air quality, energy, and GHG emissions impacts associated with implementation of the proposed project.

AIR QUALITY IMPACTS

Air pollutant emissions associated with the proposed project would occur over the short term from construction activities and over the long term from operational activities associated with the proposed land uses.

Consistency with Applicable Air Quality Plans

A consistency determination plays an essential role in local agency project review by linking local planning and unique individual projects to the air quality plans. A consistency determination fulfills the CEQA goal of fully informing local agency decision-makers of the environmental costs of the project under consideration at a stage early enough to ensure that air quality concerns are addressed. Only new or amended General Plan elements, Specific Plans, and significantly unique projects need to undergo a consistency review due to the air quality plan strategy being based on projections from local General Plans.

The AQMP is based on regional growth projections developed by SCAG. The proposed project would include 165,803 sq ft of industrial uses. The proposed project would not house more than 1,000 persons, occupy more than 40 acres of land, or encompass more than 650,000 sq ft of floor area. Thus, the proposed project would not be defined as a regionally significant project under CEQA, and therefore, it does not meet SCAG's Intergovernmental Review criteria.

The City's General Plan is consistent with the SCAG Regional Comprehensive Plan Guidelines and the SCAQMD AQMP. Pursuant to the methodology provided in the SCAQMD *CEQA Air Quality Handbook*, consistency with the Basin 2022 AQMP is affirmed when a project (1) would not increase the frequency or severity of an air quality standard violation or cause a new violation, and (2) is consistent with the growth assumptions in the AQMP. Consistency review is presented as follows:

1. The proposed project would result in short-term construction and long-term operational pollutant emissions that are all less than the CEQA significance emissions thresholds established by SCAQMD, as demonstrated below; therefore, the proposed project would not result in an increase in the frequency or severity of an air quality standards violation or cause a new air quality standards violation.

2. The *CEQA Air Quality Handbook* indicates that consistency with AQMP growth assumptions must be analyzed for new or amended General Plan elements, Specific Plans, and significant projects. Significant projects include airports, electrical generating facilities, petroleum and gas refineries, designation of oil drilling districts, water ports, solid waste disposal sites, and offshore drilling facilities; therefore, the proposed project is not defined as significant. In addition, the proposed project would not require a change to the General Plan land use designation or the current zoning and would be consistent with the City's General Plan and Zoning Ordinance.

Based on the consistency analysis presented above, the proposed project would be consistent with the regional AQMP.

Criteria Pollutant Analysis

The Basin is designated as nonattainment for O_3 and $PM_{2.5}$ for federal standards and nonattainment for O_3, PM_{10}, and $PM_{2.5}$ for State standards. The SCAQMD's nonattainment status is attributed to the region's development history. Past, present, and future development projects contribute to the region's adverse air quality impacts on a cumulative basis. By its very nature, air pollution is largely a cumulative impact. No single project is sufficient in size to, by itself, result in nonattainment of AAQS. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. If a project's contribution to the cumulative impact is considerable, then the project's impact on air quality would be considered significant.

In developing thresholds of significance for air pollutants, the SCAQMD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. Therefore, additional analysis to assess cumulative impacts is unnecessary. The following analysis assesses the potential project-level construction- and operation-related air quality impacts.

Construction Emissions

During construction, short-term degradation of air quality may occur due to the release of particulate emissions generated by grading, paving, building, and other activities. Emissions from construction equipment are also anticipated and would include CO, NO_x, ROG, directly emitted particulate matter ($PM_{2.5}$ and PM_{10}), and TACs such as diesel exhaust particulate matter.

Project construction activities would include demolition, grading, site preparation, building construction, paving, and architectural coating activities. Construction-related effects on air quality from the proposed project would be greatest during the site preparation phase due to the disturbance of soils. If not properly controlled, these activities would temporarily generate particulate emissions. Sources of fugitive dust would include disturbed soils at the construction site. Unless properly controlled, vehicles leaving the site would deposit dirt and mud on local streets, which could be an additional source of airborne dust after it dries. PM_{10} emissions would vary from day to day, depending on the nature and magnitude of construction activity and local weather conditions. PM_{10} emissions would depend on soil moisture, silt content of soil, wind speed, and the amount of operating equipment. Larger dust particles would settle near the source, while fine particles would be dispersed over greater distances from the construction site.

Water or other soil stabilizers can be used to control dust, resulting in emission reductions of 50 percent or more. The SCAQMD has established Rule 403: Fugitive Dust, which would require the Applicant to implement measures that would reduce the amount of particulate matter generated during the construction period.

In addition to dust-related PM_{10} emissions, heavy trucks and construction equipment powered by gasoline and diesel engines would generate CO, SO_2, NO_x, VOCs and some soot particulate ($PM_{2.5}$

and PM_{10}) in exhaust emissions. If construction activities were to increase traffic congestion in the area, CO and other emissions from traffic would increase slightly while those vehicles idle in traffic. These emissions would be temporary in nature and limited to the immediate area surrounding the construction site.

Construction emissions were estimated for the project using CalEEMod. Table H lists the tentative project construction schedule based on a 13-month construction duration. Table I lists the potential construction equipment to be used during project construction under each phase of construction. Construction-related emissions are presented in Table J. CalEEMod output sheets are included in Appendix A.

As shown in Table J, construction emissions associated with the project would not exceed the SCAQMD thresholds for VOCs, CO, sulfur oxides (SO_X), $PM_{2.5}$, or PM_{10} emissions. However, maximum daily NO_X emissions during the overlapping grading and site preparation phases would exceed the significance criteria. Therefore, the proposed project would result in a potentially significant impact for criteria pollutants during construction. As such, implementation of MM AQ-1 would be required to reduce NO_X emissions to the extent feasible.

MM AQ-1 **Tier 4 Interim Construction Equipment.** Prior to issuance of a building permit, the project Applicant shall submit construction plans to the City of Lake Forest verifying that all construction equipment used during construction of the project shall be equipped with Tier 4 Interim engines or the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type (Tier 4 engines automatically meet this requirement) as certified by the California Air Resources Board. During construction activities, the equipment shall be properly maintained and tuned in accordance with manufacturer specifications.

Table K identifies the results of the analysis with implementation of MM AQ-1.

As shown in Table K, with implementation of MM AQ-1, NO_X emissions associated with the proposed project would be below the SCAQMD significance thresholds. Therefore, with implementation of MM AQ-1, construction of the proposed project would not result in emissions that would result in a cumulatively considerable net increase of any criteria pollutant for which the project is in nonattainment under an applicable federal or State ambient air quality standard.

Operational Air Quality Impacts

Long-term air pollutant emission impacts are those typically associated with mobile sources (e.g., vehicle trips and truck trips), energy sources (e.g., electricity), area sources (e.g., architectural coatings and the use of landscape maintenance equipment), and stationary sources (e.g., use of fire pump).

Mobile source emissions include VOC and NO_X emissions that contribute to the formation of ozone. Additionally, PM_{10} emissions result from running exhaust, tire and brake wear, and the entrainment of dust into the atmosphere from vehicles traveling on paved roadways.

Energy source emissions result from activities in buildings for which natural gas is used. However, the proposed building would be all electric and no natural gas use would be associated with the operation of the proposed building.

Typically, area source emissions consist of direct sources of air emissions located at the project site, including architectural coatings and the use of landscape maintenance equipment. Stationary source emissions are associated with the use of the fire pump.

Long-term operation emissions associated with the proposed project were calculated using CalEEMod. Model results are shown in Table L below. CalEEMod output sheets are included in Appendix A.

As shown in Table L, the proposed project would not exceed the significance criteria for VOCs, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$ emissions; thus, the proposed project would not have a significant effect on regional air quality. Therefore, operation of the proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project is nonattainment under an applicable federal or State ambient air quality standard.

Long-Term Microscale (CO Hot Spot) Analysis

Vehicular trips associated with the proposed project would contribute to congestion at intersections and along roadway segments in the project vicinity. Localized air quality impacts would occur when emissions from vehicular traffic increase as a result of the proposed project. The primary mobile-source pollutant of local concern is CO, a direct function of vehicle idling time and, thus, of traffic flow conditions. CO transport is extremely limited; under normal meteorological conditions, CO disperses rapidly with distance from the source. However, under certain extreme meteorological conditions, CO concentrations near a congested roadway or intersection may reach unhealthful levels, affecting local sensitive receptors (e.g., residents, schoolchildren, the elderly, and hospital patients). Typically, high CO concentrations are associated with roadways or intersections operating at unacceptable levels of service or with extremely high traffic volumes. In areas with high ambient background CO concentrations, modeling is recommended to determine a project's effect on local CO levels.

An assessment of project-related impacts on localized ambient air quality requires that future ambient air quality levels be projected. Existing CO concentrations in the immediate project vicinity are not available. Ambient CO levels monitored at the Mission Viejo station, the closest station to the project site, showed a highest recorded 1-hour concentration of 2.5 ppm (the State standard is 20 ppm) and a highest 8-hour concentration of 1.6 ppm (the State standard is 9 ppm) during the past 3 years (Table F). The highest CO concentrations would normally occur during peak traffic hours; hence, CO impacts calculated under peak traffic conditions represent a worst-case analysis.

As described in the Traffic Impact Analysis,[44] the proposed project would generate 74 AM peak hour trips and 78 PM peak-hour trips. As the proposed project would not generate 100 or more AM or

[44] LSA. 2025. *Traffic Impact Analysis for the IPT Enterprise Business Center LLC Project, Table E: Project Trip Generation Summary.* March.

PM peak hour trips, the proposed project did not meet the criteria for an evaluation of study area intersection or roadway segment level of service (LOS). Therefore, it is assumed that the addition of the proposed project traffic would not create any significant adverse impacts to nearby intersections.

Therefore, given the extremely low level of CO concentrations in the project area, and lack of traffic impacts at any intersections, project-related vehicles are not expected to contribute significantly to result in the CO concentrations exceeding the State or federal CO standards. No CO hot spots would occur, and the project would not result in any project-related impacts on CO concentrations.

Localized Significance Analysis

Project construction and operation emissions were compared to the LST screening tables in SRA 19, based on an 82-feet (25 meters) source-receptor distance and a disturbed acreage of 4.0 acres for construction and 5.0 acres for operation.

Table M indicates the estimated on-site construction emissions. As shown in Table M, on-site construction emissions would not exceed the LST thresholds for the closest receptor. Therefore, construction of the proposed project would not result in a locally significant air quality impact.

Operational emissions shown in Table N are based on CalEEMod operational emission results using the assumptions detailed in the Methodology section for Operational Emissions. By design, the localized impacts analysis only includes on-site sources; however, the CalEEMod outputs do not separate on-site and off-site emissions for mobile sources. For a worst-case scenario assessment, the emissions detailed in Table N assume all area, off-road, stationary, and energy source emissions would occur on site, and 5 percent of the project-related new mobile sources, which is an estimate of the amount of project-related on-site vehicle and truck travel, would occur on site. Considering the total trip length included in CalEEMod, the 5 percent assumption is conservative. Table N indicates the localized operational emissions would not exceed the LSTs at the closest receptor. Therefore, the proposed operational activity would not result in a locally significant air quality impact.

The results of the LST analysis indicate that the proposed project would not result in an exceedance of the SCAQMD LST thresholds during project construction or operation.

Odors

During project construction, some odors may be present due to diesel exhaust. However, these odors would be temporary and limited to the construction period. The proposed project would not include any activities or operations that would generate objectionable odors, and once operational, the project would not be a source of odors. Therefore, the proposed project would not result in other emissions (such as those leading to odors) affecting a substantial number of people.

ENERGY IMPACTS

The following describes the potential impacts regarding energy resources that could result from implementation of the proposed project.

Energy Consumption

The proposed project would increase the demand for energy through day-to-day operations and fuel consumption associated with project construction. This section discusses energy use resulting from implementation of the proposed project and evaluates whether the proposed project would result in the wasteful, inefficient, or unnecessary consumption of energy resources or conflict with any applicable plans for renewable energy and energy efficiency.

Construction Energy Use

Construction of the proposed project is anticipated to be completed in 13 months. The project would require energy for activities such as the manufacture and transportation of building materials, grading activities, and building construction. Construction of the proposed project would require electricity to power construction-related equipment. Construction of the proposed project would not involve the consumption of natural gas. The construction-related equipment would not be powered by natural gas, and no natural gas demand is anticipated during construction.

Transportation energy represents the largest energy use during construction and would occur from the transport and use of construction equipment, delivery vehicles and haul trucks, and construction worker vehicles that would use petroleum fuels (e.g., diesel fuel and/or gasoline). Therefore, the analysis of energy use during construction focuses on fuel consumption. Construction trucks and vendor trucks hauling materials to and from the project site would be anticipated to use diesel fuel, whereas construction workers traveling to and from the project site would be anticipated to use gasoline-powered vehicles. Fuel consumption from transportation uses depends on the type and number of trips, VMT, the fuel efficiency of the vehicles, and the travel mode.

Estimates of fuel consumption (diesel fuel and gasoline) from construction equipment, construction trucks, and construction worker vehicles were based on default construction equipment assumptions and trip estimates from CalEEMod and fuel efficiencies from EMFAC2021. Fuel consumption estimates are presented in Table O. CalEEMod output sheets are included in Appendix A, and detailed energy calculations are included in Appendix B.

Table O: Energy Consumption Estimates during Construction

Energy Type	Total Energy Consumption	Percentage Increase Countywide
Diesel Fuel (total gallons)	129,024.5	0.1
Gasoline (total gallons)	14,731.3	<0.01

Source: Compiled by LSA (June 2025).

As indicated in Table O, the proposed project would consume approximately 129,024.5 gallons of diesel fuel and approximately 14,731.3 gallons of gasoline during construction. Based on fuel consumption obtained from EMFAC2021, approximately 1,150.0 million gallons of gasoline and approximately 157.8 million gallons of diesel will be consumed from vehicle trips in Orange County in 2026. Therefore, construction of the proposed project would increase the annual construction generated fuel use in Orange County by approximately 0.1 percent for diesel fuel usage and by less than 0.01 percent for gasoline fuel usage. As such, project construction would have a negligible effect on local and regional energy supplies. Furthermore, impacts related to energy use during construction would be temporary and relatively small in comparison to Orange County's overall use of the State's available energy resources. No unusual project characteristics would necessitate the use of construction equipment that would be less energy efficient than at comparable construction sites in the region or the State. In addition, construction activities are not anticipated to result in an inefficient use of energy as gasoline and diesel fuel would be supplied by construction contractors who would conserve the use of their supplies to minimize their costs on the project. The proposed project would not cause or result in the need for additional energy facilities or an additional or expanded delivery system. For these reasons, fuel consumption during construction would not be inefficient, wasteful, or unnecessary.

Operational Energy Use

Operational energy use is typically associated with natural gas use, electricity consumption, and fuel used for vehicle trips associated with a project. Energy consumption was estimated for the proposed project using default energy intensities by land use type in CalEEMod. As described in the Methodology section, this analysis was conducted using land use codes *Unrefrigerated Warehouse-No Rail*, *Other Asphalt Surfaces,* and *Parking Lot.* The proposed project would result in diesel usage associated with the fire pump; however, the fire pump is only expected to run approximately 50 hours per year. Therefore, use of the fire pump is not expected to substantially increase diesel fuel usage and is not evaluated further.

The proposed project would also result in energy usage associated with gasoline and diesel fuel consumed by project-related vehicle and truck trips. Fuel use associated with vehicle and truck trips

generated by the proposed project was calculated based on the project's Traffic Impact Analysis,[45] which identifies that the proposed project would generate approximately 573 average daily trips, including 458 passenger car trips, 38 two-axle truck trips, 21 three-axle truck trips, and 58 four-axle truck trips. The amount of operational fuel use was estimated using CARB's EMFAC2021 model, which provided projections for typical daily fuel usage in Orange County.

Electricity and fuel usage estimates associated with the proposed project are shown in Table P.

Table P: Proposed Project Energy Consumption Estimates during Operation

Energy Type	Annual Energy Consumption
Electricity Consumption (kWh/year)	865,996.0
Gasoline (gallons/year)	85,947.6
Diesel Fuel (gallons/year)	142,126.4

Source: Compiled by LSA (June 2025).
kWh = kilowatt-hours

As shown in Table P, the estimated potential increase in electricity demand associated with the operation of the proposed project is 865,996.0 kilowatt-hours (kWh) per year. Total electricity consumption in Orange County in 2022 was 20,243.7 GWh (20,243,721,856 kWh). Therefore, operation of the proposed project would increase the annual electricity consumption in Orange County by less than 0.01 percent.

Electrical demand associated with project operations would not be considered inefficient, wasteful, or unnecessary in comparison to other similar developments in the region. Furthermore, the proposed project would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. The proposed project would be required to adhere to all federal, State, and local requirements for energy efficiency, including the Title 24 standards. Title 24 building energy efficiency standards establish minimum efficiency standards related to various building features, including appliances, water and space heating and cooling equipment, building insulation and roofing, and lighting, which would reduce energy usage. In addition, the proposed project will be seeking LEED certification through the Applicant's LEED Volume program. Some of the features included in the design include, but are not limited to, drought tolerant landscaping, low flow fixtures, high efficiency lighting, and infrastructure for EV charging.

As shown in Table P, the net increase in fuel use associated with the vehicle trips generated by the proposed project is estimated at 85,947.6 gallons of gasoline and 142,126.4 gallons of diesel fuel per year. This analysis conservatively assumes that all vehicle trips generated as a result of project operation would be new to Orange County. Based on fuel consumption obtained from EMFAC2021, approximately 1,128.9 million gallons of gasoline and approximately 157.6 million gallons of diesel will be consumed from vehicle trips in Orange County in 2027. Therefore, vehicle and truck trips associated with the proposed project would increase the annual fuel use in Orange County by less than 0.01 percent for gasoline fuel usage and by approximately 0.1 percent for diesel fuel usage.

[45] LSA. 2025. *Traffic Impact Analysis for the IPT Enterprise Business Center LLC Project, Table E: Project Trip Generation Summary.* March.

Therefore, fuel consumption associated with vehicle trips generated by project operations would not be considered inefficient, wasteful, or unnecessary in comparison to other similar developments in the region.

Conflict with Renewable Energy or Energy Efficiency Plans

In 2002, the Legislature passed SB 1389, which required the CEC to develop an integrated energy plan every 2 years for electricity, natural gas, and transportation fuels for the Integrated Energy Policy Report. The plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for ZEVs and their infrastructure needs, and encouragement of urban designs that reduce VMT and accommodate pedestrian and bicycle access.

The CEC's *2023 Integrated Energy Policy Report* provide the results of the CEC's assessments of a variety of energy issues facing California. As indicated above, energy usage on the project site during construction would be temporary in nature and would be relatively small in comparison to the overall use in the County. In addition, energy usage associated with operation of the proposed project would be relatively small in comparison to the overall use in Orange County, and the State's available energy resources. Therefore, energy impacts at the regional level would be negligible. Because California's energy conservation planning actions are conducted at a regional level, and because the proposed project's total impact on regional energy supplies would be minor, the proposed project would not conflict with or obstruct California's energy conservation plans as described in the CEC's Integrated Energy Policy Report. Additionally, as demonstrated above, the proposed project would not result in the inefficient, wasteful, and unnecessary consumption of energy. Potential impacts related to conflict with or obstruction of a State or local plan for renewable energy or energy efficiency would be less than significant, and no mitigation is required.

GREENHOUSE GAS IMPACTS

This section describes the potential GHG impacts associated with implementation of the proposed project.

Generation of Greenhouse Gas Emissions

This section describes the proposed project's construction- and operational-related GHG emissions and contribution to global climate change. The SCAQMD has not addressed emission thresholds for construction in its *CEQA Air Quality Handbook*; however, the SCAQMD requires quantification and disclosure. Thus, an evaluation of the proposed project's impacts related to the release of GHG emissions for both construction and operational phases of the project is described below.

Short-Term Greenhouse Gas Emissions

Construction activities associated with the proposed project would produce combustion emissions from various sources. During construction, GHGs would be emitted through the operation of construction equipment and from worker and builder supply vendor vehicles, each of which typically use fossil-based fuels to operate. The combustion of fossil-based fuels creates GHGs such as CO_2,

CH_4, and N_2O. Furthermore, CH_4 is emitted during the fueling of heavy equipment. Exhaust emissions from on-site construction activities would vary daily as construction activity levels change.

As indicated above, the SCAQMD does not have an adopted threshold of significance for construction-related GHG emissions. However, lead agencies are required to quantify and disclose GHG emissions that would occur during construction. The SCAQMD then requires the construction GHG emissions to be amortized over the life of the project, defined by the SCAQMD as 30 years,[46] added to the operational emissions, and compared to the applicable interim GHG significance threshold tier.

Using CalEEMod, it is estimated that the proposed project would generate approximately 1,315.9 MT CO_2e during construction of the project. When annualized over the 30-year life of the project, annual emissions would be 43.9 MT CO_2e.

Long-Term Greenhouse Gas Emissions

Long-term GHG emissions are typically generated from mobile sources (e.g., vehicle and truck trips), area sources (e.g., maintenance activities and landscaping), stationary sources (e.g., fire pump) indirect emissions from sources associated with energy consumption, waste sources (land filling and waste disposal), and water sources (water supply and conveyance, treatment, and distribution). Mobile-source GHG emissions would include project-generated vehicle trips to and from the project. Area-source emissions would be associated with activities such as landscaping and maintenance on the project site. Energy source emissions would be generated at off-site utility providers because of increased electricity demand generated by the project. Waste source emissions generated by the proposed project include energy generated by land filling and other methods of disposal related to transporting and managing project-generated waste. In addition, water source emissions associated with the proposed project are generated by water supply and conveyance, water treatment, water distribution, and wastewater treatment.

Following guidance from the SCAQMD, GHG emissions were estimated using CalEEMod. Table Q shows the calculated GHG emissions for the proposed project.

As discussed above, a project would have less than significant GHG emissions if it would result in operational-related GHG emissions of less than 3,000 MT CO_2e/yr. Based on the analysis results, the proposed project would result in approximately 2,884.8 MT CO_2e/yr, which would not exceed the SCAQMD Threshold of 3,000 MT CO_2e/yr. Therefore, operation of the proposed project would not generate significant GHG emissions that would have a significant effect on the environment.

Consistency with Greenhouse Gas Emissions Reduction Plans

An evaluation of the proposed project's consistency with the 2022 Scoping Plan, and SCAG's RTP/SCS is provided below.

2022 Scoping Plan

The following discussion evaluates the proposed project according to the goals of the 2022 Scoping Plan, including EO B-30-15, SB 32, AB 197, and AB 1279.

EO B-30-15 added the immediate target of reducing GHG emissions to 40 percent below 1990 levels by 2030. CARB released a second update to the Scoping Plan, the 2017 Scoping Plan,[47] to reflect the 2030 target set by EO B-30-15 and codified by SB 32. SB 32 affirms the importance of addressing climate change by codifying into statute the GHG emissions reductions target of at least 40 percent below 1990 levels by 2030 contained in EO B-30-15. SB 32 builds on AB 32 and keeps us on the path toward achieving the State's 2050 objective of reducing emissions to 80 percent below 1990 levels. The companion bill to SB 32, AB 197, provides additional direction to the CARB related to the adoption of strategies to reduce GHG emissions. Additional direction in AB 197 intended to provide easier public access to air emissions data that are collected by CARB was posted in December 2016. AB 1279 codifies the State goals of achieving net carbon neutrality by 2045 and maintaining net negative GHG emissions thereafter.

In addition, the 2022 Scoping Plan assesses progress toward the statutory 2030 target, while laying out a path to achieving carbon neutrality no later than 2045. The 2022 Scoping Plan focuses on outcomes needed to achieve carbon neutrality by assessing paths for clean technology, energy deployment, natural and working lands, and others, and is designed to meet the State's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities. The 2022 Scoping Plan contains the GHG reduction targets embedded in EO B-30-15, SB 32, AB 197, and AB 1279. Thus, compliance with the Scoping Plan would also result in compliance with EO B-30-15, SB 32, AB 197, and AB 1279.

47 CARB. 2017a. *California's 2017 Climate Change Scoping Plan*. November.

The Bay Area Air Quality Management District (BAAQMD) adopted the *Justification Report: CEQA Thresholds for Evaluating the Significance of Climate Impacts from Land Use Projects and Plans* (Justification Report) in April 2022.[48] The Justification Report established guidance on how individual projects would be consistent with California's long-term climate goals and provides substantial evidence in supporting the use of their thresholds for projects throughout California because the thresholds are designed to meet the State's established GHG reduction goals, including the 2022 Scoping Plan goals. Therefore, the BAAQMD's Justification Report is being used to analyze the proposed project's consistency with the 2022 Scoping Plan. According to the BAAQMD Justification Report[49], a project would have a less than significant impact related to consistency with the 2022 Scoping Plan if the proposed project achieves a reduction in project-generated VMT below the regional average consistent with the current version of the 2022 Scoping Plan (currently 15 percent) or meets a locally adopted Senate Bill 743 VMT target, reflecting the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA. Additionally, a project must not include natural gas appliances or natural gas plumbing and should not result in any wasteful, inefficient, or unnecessary electrical usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the State CEQA Guidelines. Lastly, a project must achieve compliance with off-street electric vehicle requirements in the most recently adopted version of CALGreen Tier 2. If a project is designed and built to incorporate these design elements related to VMT, natural gas, energy, and EVs, then it would contribute its portion of what is necessary to achieve California's long-term climate goals and an agency reviewing the project under CEQA can conclude that the project would be consistent with the State's 2022 Scoping Plan.

Vehicles Miles Traveled. Based on the project's Traffic Impact Analysis,[50] the proposed project VMT would exceed the City's VMT threshold (Target VMT Rate) by 20 percent, resulting in a significant VMT impact. The proposed project would be required to implement Traffic Demand Management (TDM) measures including the installation of bike lanes along Commercentre Drive between Alton Parkway and Dimension Drive to promote alternative transportation within the intent of reducing VMT. According to the California Air Pollution Control Officers Association (CAPCOA) Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (December 2021) (CAPCOA Handbook), the addition of bike lanes (T-20 Expand Bikeway Network) can provide a maximum VMT reduction of 0.5 percent. Assuming that this TDM measure could achieve the maximum 0.5 percent VMT reduction, the reduction achieved would not reduce the project's VMT impact to below the City's VMT threshold. Therefore, even with implementation of the TDM measure (addition of bike lanes), the project's VMT impact would be significant and unavoidable. As such, the proposed project would conflict with the goals and policies of the 2022 Scoping Plan related to VMT and would result in a significant and unavoidable impact.

Natural Gas Usage. The proposed project would not be powered by natural gas, and no natural gas demand is anticipated during construction or operation of the proposed project. As described in the BAAQMD Justification Report, eliminating natural gas in new development supports that projects are implementing their "fair share" of emission reductions and supporting achievement of the State's 2045 carbon neutrality goals. As such, if a project does not utilize natural gas, a lead agency can conclude that it would be consistent with achieving the 2045 neutrality goal and the 2022 Scoping Plan and would not have a cumulative considerable impact on climate change.[51] Therefore, because the proposed project would not be powered by natural gas, the proposed project would be consistent with this design element.

Energy Usage. As described in the Energy Impacts Section, fuel consumption during construction would not be inefficient, wasteful, or unnecessary. As shown in Table Q, the estimated potential increase in electricity demand associated with the operation of the proposed project is 865,996.0 kWh per year. Total electricity consumption in Orange County in 2022 was 20,243,721,856 kWh. Therefore, operation of the proposed project would increase the annual electricity consumption in Orange County by less than 0.01 percent. In addition, the proposed project would be constructed to current Title 24 standards, which would require energy-saving building features. As such, based on this analysis, as required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the *State CEQA Guidelines*, the proposed project would not result in the wasteful, inefficient, or unnecessary consumption of fuel or energy and would incorporate renewable energy and energy efficiency measures into the building design, equipment use, and transportation. As such, the proposed project would be consistent with 2022 Scoping Plan. Therefore, the proposed project would be consistent with this design element.

Electric Vehicle Requirements. The final project design element that the proposed project should include to ensure that it is achieving its "fair share" of GHG emission reductions is compliance with off-street EV requirements in the most recently adopted version of the CALGreen Code Tier 2 measures. The proposed project would include 53 EV capable spaces, 14 electric vehicle supply equipment (EVSE) designated spaces, 1 EVSE van accessible space, and 1 EVSE standard accessible space. Additionally, as specified in **MM GHG-1**, the proposed project would be required to install EV truck charging stations on the project site pursuant to the CALGreen Code.[52]

MM GHG-1 **Electric Vehicle Charging.** Provisions shall be made at the project site for emerging electric truck technology. Prior to the issuance of a shell building permit, the City shall verify that the site plan identifies an on-site location for future electric truck charging stations, with space available for a minimum of four (4) trucks to simultaneously charge when charging stations are installed in the future. The conduit trenching shall be installed to that location for future conduit pull as a requirement of the shell building permit. In conjunction with the approval of tenant

improvement plans and permits, the applicant shall install electric truck charging stations on the site for a minimum of four (4) electric trucks to simultaneously charge.

With implementation of **MM GHG-1**, the proposed project would support the operation of zero-emissions trucks at the project site as such technology is commercially deployed and available. Electric chargers are an effective measure to support the reduction of GHG emissions related to mobile source operational activities, because they would enable drivers of trucks associated with the proposed projects to operate a larger share of miles in electric mode, as opposed to diesel powered mode, thereby displacing GHG emissions from diesel consumption with a lesser amount of indirect emissions from electricity. Therefore, with implementation of **MM GHG-1**, the proposed project would have the potential to further lower mobile source emissions associated with operation of the proposed project. Based on the above, the proposed project would be consistent with this design element.

While the proposed project would be consistent with the project design elements related to natural gas, energy, and EVs, as described above, the proposed project would result in a significant and unavoidable impact related to VMT even with implementation of TDM measures. Therefore, the proposed project would conflict with the plans and policies adopted for the purpose of reducing the emissions of GHGs, including the 2022 Scoping Plan. This would result in a significant and unavoidable project level impact.

Regional Transportation Plan/Sustainable Communities Strategy

SCAG adopted the 2024-2050 RTP/SCS on April 4, 2024. However, the CARB has not yet approved the 2024-2050 RTP/SCS. Therefore, this analysis evaluates the proposed project consistency with both the 2020-2045 RTP/SCS and the more recent 2024-2050 RTP/SCS.

SCAG's RTP/SCS identifies that land use strategies that focus on new housing and job growth in areas served by high quality transit and other opportunity areas would be consistent with a land use development pattern that supports and complements the proposed transportation network. The core vision of the 2020-2045 RTP/SCS and the 2024–2050 RTP/SCS is to better manage the existing transportation system through design management strategies, integrate land use decisions and technological advancements, create complete streets that are safe to all roadway users, preserve the transportation system, and expand transit and foster development in transit-oriented communities. Both the 2020-2045 RTP/SCS and 2024–2050 RTP/SCS contain transportation projects to help more efficiently distribute population, housing, and employment growth, as well as forecast development that is generally consistent with regional-level general plan data. The forecasted development pattern, when integrated with the financially constrained transportation investments identified in the 2020-2045 RTP/SCS and the 2024–2050 RTP/SCS, would reach the regional target of reducing GHG emissions from autos and light-duty trucks by 19 percent by 2035 (compared to 2005 levels). Neither the 2020-2045 RTP/SCS nor the 2024–2050 RTP/SCS require that local general plans, specific plans, or zoning be consistent with the RTP/SCS but both plans provide incentives for consistency for governments and developers.

Implementing SCAG's RTP/SCS will greatly reduce the regional GHG emissions from transportation, helping to achieve statewide emissions reduction targets. As demonstrated in the Air Quality Impact

Section, the proposed project does not meet the criteria identified in *State CEQA Guidelines* Section 15205.b.2 for projects of statewide, regional, or areawide significance. In addition, the proposed project would not require a change to the General Plan land use designation or the current zoning, and would be consistent with the City's General Plan and Zoning Ordinance. As such, the proposed project would not increase population growth forecasts and is not expected to alter SCAG's demographic projections; therefore, the proposed project is already reflected in SCAG's RTP/SCS and would not interfere with SCAG's ability to achieve the region's GHG reduction target of 19 percent below 2005 per capita emissions levels by 2035. Furthermore, the proposed project is not regionally significant per *State CEQA Guidelines* Section 15206 and as such, it would not conflict with the SCAG RTP/SCS targets since those targets were established and are applicable on a regional level. Impacts related to consistency with the SCAG RTP/SCS would be less than significant, and no mitigation is required.

As described above, although the proposed project would be consistent with the SCAG RTP/SCS, the proposed project would not be consistent with the policies or goals of the 2022 Scoping Plan related to VMT. Therefore, the proposed project would conflict with a plan or policy adopted for the purpose of reducing GHG emissions. This impact is significant and unavoidable.

CUMULATIVE IMPACTS

As defined in Section 15355 of the State CEQA Guidelines, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area.

As stated previously, the SCAQMD air quality significance thresholds considers the emission levels for which a project's individual emissions would be cumulatively considerable. Therefore, if a project falls below the SCAQMD significance threshold, its contribution would not be cumulatively considerable. Nevertheless, because the Western Realco Projects are reasonably foreseeable projects that would be located in the immediate vicinity of the project site and for the purposes of this analysis are assumed to have construction schedules that overlap with the proposed project, the City of Lake Forest, as the lead agency for the environmental review of the proposed project, has requested a quantitative cumulative impact analysis of the proposed project in combination with the immediately adjacent proposed Western Realco Projects. The Western Realco Projects are comprised of two separate projects (Western Realco Project 1 and Western Realco Project 2). Western Realco Project 1 (26110 Enterprise, 26140 Enterprise, and 26160 Enterprise Way) consists of an 8.42-acre project site located north of the IPT Enterprise Business Center LLC Project site along Bake Parkway. Western Realco Project 1 includes the demolition of three existing office buildings (a total of 150,000 sq ft) and the reconstruction of two new industrial buildings with a total of 156,800 sq ft (one 54,000 sq ft building and one 102,800 sq ft building). The two buildings would have a total of 59,800 sq ft of warehouse use, 79,000 sq ft of manufacturing use, and 18,000 sq ft of office space. Western Realco Project 2 (26250 Enterprise Way) consists of a 4.54-acre project site located immediately west of the IPT Enterprise Business Center LLC Project site in the intersection between Enterprise Way and Dimension Drive. Western Realco Project 2 includes the demolition of a 76,978 sq ft two-story office building and construction of a 77,000 sq ft single-story building. The building would have 69,000 sq ft of warehouse use and 8,000 sq ft of office space. The Western Realco Projects 1 and 2 analysis is based on the project-specific *Air Quality, Greenhouse Gas, and*

Energy Impact Report: Western Realco Enterprise Way Industrial Project, prepared by LSA in June 2025.[53] A quantitative evaluation of the combined air quality and health risk impacts of constructing and operating the proposed project and the Western Realco Projects at the same time has been prepared and is presented under the Cumulative Impacts section below.

Cumulative Air Quality Impacts

The cumulative impact area for air quality related to the proposed project is the South Coast Air Basin. Each project in the Basin is required to comply with SCAQMD rules and regulations and is subject to independent review. Future development that may take place with implementation of the Western Realco Project would contribute criteria pollutants to the area during project construction and operation.

The Basin is currently designated as a nonattainment area for the federal O_3 standard and $PM_{2.5}$ standard and as a nonattainment area for the State O_3, PM_{10}, and $PM_{2.5}$ standard. Thus, the Basin has not met the federal and State standards for these air pollutants. As identified above, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. If a project's contribution to the cumulative impact is considerable, then the project's impact on air quality would be considered significant. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. The regional thresholds developed by the SCAQMD are based on individual projects. In the absence of cumulative thresholds and to be conservative, this analysis would compare the combined cumulative emissions (emissions from the Western Realco Projects 1 and 2 and the proposed project) against the project-based SCAQMD significance criteria to determine impacts.

Cumulative Construction Emissions

During construction, short-term degradation of air quality may occur due to the release of particulate matter emissions (i.e., fugitive dust) generated by grading, building construction, paving, and other activities. Emissions from construction equipment are also anticipated and would include carbon monoxide (CO), nitrogen oxides (NO_X), reactive organic gases (ROG), particulate matter less than 2.5 microns ($PM_{2.5}$) and particulate matter less than 10 microns (PM_{10}), and toxic air contaminants such as diesel exhaust particulate matter.

Construction emissions were estimated using CalEEMod. As describe above, the potential development associated with the Western Realco Project would be comprised of two separate projects. Therefore, two separate model runs were conducted to evaluate the potential impacts under Western Realco Project 1 and Western Realco Project 2.

Construction activities under Western Realco Project 1 would consist of demolition, site preparation, grading, building construction, paving, architectural coating, and utility trenching activities. The Western Realco Project 1 would require the demolition approximately 150,000 sq ft of existing buildings, which was included in CalEEMod. Construction of Western Realco Project 1

[53] LSA. 2025. *Air Quality, Greenhouse Gas, and Energy Impact Report for the Western Realco Enterprise Way Industrial Project*. June.

would tentatively commence in the first quarter of 2026 and is expected to be completed in about 1 year, which was included in CalEEMod. Construction phase durations and schedule were provided by the project Applicant and included in CalEEMod. Western Realco Project 1 would not require the export or import of soil, which was also included in CalEEMod. In addition, Western Realco Project 1 would require the use of concrete industrial saws, excavators, impactors, bull dozers, tractors, loaders, backhoes, graders, scrapers, forklifts, cranes, generator sets, welders, cement and mortar mixers, paving equipment, and air compressors, which was included in CalEEMod. The number of equipment pieces was provided by the project Applicant, which was included in CalEEMod. This analysis assumes that Western Realco Project 1 would comply with SCAQMD Rule 403 and Rule 1113 measures. All other construction details are not yet known; therefore, default assumptions (e.g., worker and construction trips, off-road emission factors and construction trip lengths) from CalEEMod were used.

Construction activities under Western Realco Project 2 would consist of demolition, site preparation, grading, building construction, paving, architectural coating, and utility trenching activities. Western Realco Project 2 would require the demolition of approximately 76,978 sq ft of existing building, which was included in CalEEMod. Construction of Western Realco Project 2 would tentatively commence in the third quarter of 2026 and is expected to be completed in about 9 months, which was included in CalEEMod. Western Realco Project 2 would require the net import of approximately 1,167 cubic yards of material, which was also included in CalEEMod. Based on information from the project Applicant, the proposed project is anticipated to require the use of concrete industrial saws, excavators, impactors, jaw crushers, bull dozers, tractors, loaders, backhoes, graders, scrapers, forklifts, cranes, generator sets, welders, cement and mortar mixers, paving equipment, and air compressors, which was included in CalEEMod. The number of equipment pieces was provided by the project Applicant, which was included in CalEEMod. This analysis assumes that Western Realco Project 2 would comply with SCAQMD Rule 403 and Rule 1113 measures. All other construction details are not yet known; therefore, default assumptions (e.g., worker and construction trips, off-road emission factors and construction trip lengths) from CalEEMod were used.

The total peak emissions from Western Realco Projects 1 and 2, along with the peak emissions from the proposed project were summed and compared to the SCAQMD regional thresholds. Cumulative construction emissions are summarized in Table R below. Table R identifies the estimated emissions with implementation of MM AQ-1 for the proposed project along with the mitigated construction emissions for the Western Realco Projects 1 and 2 as identified in the *Air Quality, Greenhouse Gas, and Energy Impact Report: Western Realco Enterprise Way Industrial Project.*[54] Appendix C provides CalEEMod output sheets.

The results shown in Table R, indicate the cumulative emissions would not exceed the significance criteria for daily PM_{10} or $PM_{2.5}$. However, the maximum emissions for NO_X and VOC would exceed the significance criteria. As such, the cumulative impact of Western Realco Projects 1 and 2 and the proposed project would be potentially significant for criteria pollutants during construction.

Note: The South Coast Air Basin is classified as non-attainment for Ozone under both the State and federal standards. Ozone is not directly emitted by any one source but rather forms in the atmosphere through reactions with other pollutants including NOx and VOCs.

CO = carbon monoxide

NOx = nitrogen oxides
PM_{10} = particulate matter less than 10 microns in size
$PM_{2.5}$ = particulate matter less than 2.5 microns in size
SCAQMD = South Coast Air Quality Management District
SOx = sulfur oxides
VOC = volatile organic compounds

The VOC emissions during construction are primarily a result of architectural coating emissions. All cumulative projects would be required to comply with SCAQMD Rule 1113, which requires that VOC emissions be reduced during painting by placing limits on the VOC content in various coating categories. Compliance with Rule 1113 architectural coatings would minimize VOC emissions during construction. However, implementation of MM AQ-2 would be required to further reduce VOC emissions to the extent feasible for the proposed project and Western Realco Projects 1 and 2.

MM AQ-2 **Volatile Organic Compounds.** Prior to issuance of a grading permit, the Project Applicant shall submit construction plans to the City of Lake Forest that state that the project shall utilize "Super-Compliant" low volatile organic compounds (VOC) paints for nonresidential interior and exterior surfaces and low VOC paint for parking lot surfaces. Super-Compliant low VOC paints have been reformulated to exceed the regulatory VOC limits put forth by SCAQMD Rule 1113. Super-Compliant low VOC paints shall be no more than 10 grams per liter (g/L) of VOC.

In addition, as shown in Table R, cumulative NO_X emissions would exceed the significance criteria. As described above, this cumulative analysis provides an evaluation of the combined air quality impacts of constructing the proposed project and Western Realco Projects 1 and 2 at the same time. The

likelihood of all three projects being constructed at the same time represents a conservative assumption. In the event that the construction phases of the proposed project and Western Realco Projects 1 and 2 overlap, the proposed project would be required to implement MM AQ-3 to further reduce the cumulative NO_X emissions to the extent feasible.

MM AQ-3 **Tier 4 Final Construction Equipment.** Prior to issuance of a building permit, the project Applicant shall consult with the City on the status of Western Realco Projects 1 and 2. If in this consultation, the City identifies that the construction schedule of the Western Realco Projects 1 and 2, and the IPT Enterprise Business Center LLC Project (proposed project) will be under construction at the same time, the proposed project shall equip all construction equipment during the overlapping period with Tier 4 Final engines or the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type (Tier 4 engines automatically meet this requirement) as certified by the California Air Resources Board. The equipment shall be properly maintained and tuned in accordance with manufacturer specifications. The project Applicant shall submit construction plans to the City of Lake Forest denoting the projected equipment Tier rating that will be used during the construction period.

Based on the project-specific *Air Quality, Greenhouse Gas, and Energy Impact Report: Western Realco Enterprise Way Industrial Project*,[55] the cumulative analysis for Western Realco Projects 1 and 2 along with the IPT Enterprise Business Center LLC Project would have the potential to result in cumulative pollutant emissions of NO_x and VOC during construction. Therefore, Western Realco Projects 1 and 2 would also be required to implement mitigation requiring the use of super compliant low VOC paints with no more than 10 grams per liter of VOC content to reduce cumulative VOC emissions to the extent feasible. In addition, in the event that the construction of the proposed project and phases of Western Realco Projects 1 and 2 overlap, Western Realco Projects 1 and 2 would also be required to implement mitigation requiring all construction equipment be equipped with Tier 4 Final engines or the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type as certified by the CARB to reduce cumulative NO_X emissions. With implementation of these mitigation measures, the cumulative NO_X and VOC emissions would be reduced to a less than significant impact for Western Realco Projects 1 and 2, as identified in the *Air Quality, Greenhouse Gas, and Energy Impact Report: Western Realco Enterprise Way Industrial Project*.[56] Table S identifies the estimated cumulative emissions with implementation of MM AQ-2 and MM AQ-3 for the proposed project, as identified above, and the mitigated emissions identified for Western Realco Projects 1 and 2 which require implementation of super compliant low VOC paints and Tier 4 Final Engines.

Note: The South Coast Air Basin is classified as non-attainment for Ozone under both the State and federal standards. Ozone is not directly emitted by any one source but rather forms in the atmosphere through reactions with other pollutants including NOx and VOCs.

CO = carbon monoxide
lbs/day = pounds per day
NOx = nitrogen oxides
PM_{10} = particulate matter less than 10 microns in size
$PM_{2.5}$ = particulate matter less than 2.5 microns in size
SCAQMD = South Coast Air Quality Management District
SOx = sulfur oxides
VOC = volatile organic compound

As shown in Table S, with implementation of MM AQ-2 and MM AQ-3, estimated cumulative NO_x and VOC emissions associated with the proposed project along with Western Realco Projects 1 and 2 (if constructed at the same time) would be below the SCAQMD significance threshold. Therefore, with implementation of MM AQ-2 and MM AQ-3, cumulative construction emissions resulting from the implementation of the proposed project along with Western Realco projects 1 and 2 would not result in a cumulatively considerable net increase of any criteria pollutant for which the project is in nonattainment under an applicable federal or State ambient air quality standard.

Cumulative Operational Emissions

Long-term air pollutant emissions associated with operation of Western Realco Projects 1 and 2 include emissions from area, energy, and mobile sources, and are discussed below. The quantity of emissions is the product of usage intensity (i.e., the amount of natural gas) and the emission factor of the fuel source. Emission estimates for Western Realco Projects 1 and 2 operations were calculated using CalEEMod.

Western Realco Project 1 would construct two industrial buildings totaling 156,800 sq ft, which would include a mix of office, manufacturing, and warehouse space. Therefore, the Western Realco Project 1 analysis was conducted using land use codes *Unrefrigerated Warehouse-No Rail*,

Manufacturing, General Office Building, Parking Lot, and *Other Asphalt Surfaces*. Trip generation rates used in CalEEMod for Western Realco Project 1 were based on the project's Traffic Impact Analysis (TIA),[57] which identifies that Project 1 would generate approximately 670 ADT, including 104 ADT for warehouse uses, 371 ADT for manufacturing uses, and 195 ADT for office uses. As noted in the TIA, the trip generation rates are from the Institute of Transportation Engineers Trip Generation Manual, 11th Edition, and the Warehouse Truck Trip Study Data Results and Usage from the SCAQMD. This analysis assumes that the four-axle truck trips associated with the warehouse and manufacturing uses would travel approximately 40 miles. To be conservative, separate CalEEMod analyses were prepared for the operational analysis for Western Realco Project 1. One CalEEMod run evaluated operational and vehicle trip emissions and another CalEEMod run evaluated four-axle truck trip emissions for Western Realco Project 1. In addition, consistent with the project design plans, this CalEEMod analysis incorporates selections to reflect no natural gas usage during construction and operation. In addition, this analysis assumes that Western Realco Project 1 would be operational in 2027, which is included in CalEEMod.

Western Realco Project 2 would construct a 77,000 sq ft industrial building. Therefore, the Western Realco Project 2 analysis was conducted using land use codes *Unrefrigerated Warehouse-No Rail* and *Parking Lot*. Trip generation rates used in CalEEMod for Western Realco Project 2 were based on the project's TIA,[58] which identifies that Western Realco Project 2 would generate approximately 204 ADT, including 87 ADT for office uses. As noted in the TIA, the trip generation rates are from the Institute of Transportation Engineers Trip Generation Manual, 11th Edition, and the Warehouse Truck Trip Study Data Results and Usage from the SCAQMD. This analysis assumes that the four-axle truck trips associated with the warehouse uses would travel approximately 40 miles. To be conservative, separate CalEEMod analyses were prepared for the operational analysis for Western Realco Project 2. One CalEEMod run evaluated operational and vehicle trip emissions and another CalEEMod run evaluated four-axle truck trip emissions for Western Realco Project 2. In addition, consistent with the project design plans, this CalEEMod analysis incorporates selections to reflect no natural gas usage during construction and operation of Western Realco Project 2. In addition, this analysis assumes that Western Realco Project 2 would be operational in 2027, which is included in CalEEMod. Detailed input assumptions are included in the CalEEMod output sheets attached in Appendix C.

Operational Cumulative emissions are shown in Table T.

The results shown in Table T indicate the cumulative emissions associated with the proposed project and Western Realco Projects 1 and 2 would not exceed the project-level significance criteria for daily VOC, NO_x, PM_{10} or $PM_{2.5}$ emissions. Therefore, cumulative operational emissions would not result in a cumulatively considerable net increase of criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standards.

Moreover, future development under Western Realco Projects 1 and 2 would be required to adhere to the General Plan policies, growth assumptions in the 2024–2050 RTP/SCS, and SCAQMD air quality plans. Construction and operational emissions associated with future individual projects would be further analyzed in a project-specific environmental analysis consistent with environmental review requirements under CEQA, as applicable.

Cumulative Energy Impacts

The geographic area for cumulative analysis of electricity is that of the SCE service area, while the geographic area for cumulative analysis of natural gas service is that of the SoCalGas service area. Although the proposed project and any future development for Western Realco Projects 1 and 2 would result in an increase in demand for electricity, this increase would not require SCE to expand or construct infrastructure that could cause substantial environmental impacts. As discussed previously, total electricity consumption in the SCE service area in 2022 was 85,870 GWh. By 2030, consumption is anticipated to increase by 12,000 GWh for the low-demand scenario and by

22,000 GWh for the high-demand scenario.[59] While this forecast represents a large increase in electricity consumption, the proposed project's share of cumulative consumption would be negligible. The proposed project, in combination with cumulative development, is well within SCE's system-wide net annual increase in electricity supplies over the 2018 to 2030 period, and there are sufficient planned electricity supplies in the region for estimated net increases in energy demands.

Similarly, additional natural gas infrastructure is not anticipated due to cumulative development. Total natural gas consumption in the SoCalGas service area in 2022 was 5,026 million therms. Between 2018 and 2030, total natural gas consumption in the SoCalGas service area is forecast to remain steady for the low- and mid-demand scenarios and to increase by approximately 650 million therms in the high-demand scenario due to intense energy efficiency efforts.[60] As mentioned in the preceding sections, the proposed project would not utilize natural gas during project construction and operation. Similarly, Western Realco Projects 1 and 2 would also not utilize natural gas during construction and operation. Therefore, the proposed project along with Western Realco Projects 1 and 2's share of cumulative consumption of natural gas in the SoCalGas service area would be zero. In addition, both SCE and SoCalGas demand forecasts include the growth contemplated by the proposed project and the other cumulative development within their respective service areas. Increased energy efficiency to comply with building energy efficiency standards would reduce energy consumption on a per-square-foot basis. Furthermore, utility companies are required to increase their renewable energy sources to meet the Renewable Portfolio Standards mandate of 60 percent renewable supplies by 2030. SCE and SoCalGas plan to continue to provide reliable service to their customers and upgrade their distribution systems as necessary to meet future demand.

Transportation energy use would also increase; however, this transportation energy use would not represent a major amount of energy use compared to the amount of existing development and to the total number of vehicle trips and VMT throughout Orange County and the region. The proposed project and cumulative development are required to comply with various federal and State government legislation to improve energy efficiency in buildings, equipment, and appliances, and reduce VMT.

As such, cumulative impacts from proposed project along with Western Realco Projects 1 and 2 would not result in an inefficient, wasteful, and unnecessary consumption of energy. Therefore, the proposed project and Western Realco Projects 1 and 2's contribution to the inefficient, wasteful, and unnecessary consumption of energy would not be cumulatively considerable.

Cumulative Greenhouse Gas Impacts

GHG impacts are by their nature cumulative impacts. Localized impacts of climate change are the result of the cumulative impact of global emissions. The combined benefits of reductions achieved by all levels of government help to slow or reverse the growth in GHG emissions. In the absence of comprehensive international agreements on appropriate levels of reductions achieved by each

59 CEC. 2018. *California Energy Demand, 2018–2030 Revised Forecast*. Publication Number: CEC-200-2018-002-CMF. February. Website: https://efiling.energy.ca.gov/getdocument.aspx?tn=223244 (accessed June 2025).

60 Ibid.

country, another measure of cumulative contribution is required. This serves to define the State's share of the reductions regardless of the activities or lack of activities of other areas of the U.S. or the world. Therefore, a cumulative threshold based on consistency with State targets and actions to reduce GHGs is an appropriate standard of comparison for significance determinations. The thresholds developed by the SCAQMD are based on individual projects. Since climate change is a global issue, it is unlikely that individual projects would generate enough GHG emissions to influence climate change on their own. Consequently, it is speculative to determine how an individual project's GHG emissions would impact climate change in California. As such, impacts identified under the Greenhouse Gas Impacts Section, are not project-specific impacts to global climate change but are the proposed project's contribution to this cumulative impact. The proposed project's emissions are less than the SCAQMD threshold of 3,000 MT CO_2e per year; therefore, environmental impacts related to GHG emissions and global climate change would not be cumulatively considerable under CEQA. The proposed project, in conjunction with other cumulative projects, would be subject to all applicable regulatory requirements, which would further reduce GHG emissions.

However, the proposed project would conflict with the goals of the 2022 Scoping Plan related to VMT. As identified under the Greenhouse Gas Impacts Section, the proposed project would not contribute to its "fair share" of emission reductions required to support SB 743 and the goals of the 2022 Scoping Plan. While implementation of the TDM measure (addition of bike lanes) would promote alternative transportation with the intent of reducing VMT, the project's VMT impact would not be reduced to below the City's VMT threshold, and therefore, would result in a significant and unavoidable transportation impact related to VMT. Therefore, the proposed project would conflict with the plans and policies adopted for the purpose of reducing the emissions of GHGs, including the 2022 Scoping Plan. As such, the proposed project would result in a significant and unavoidable cumulative impact.

CONCLUSIONS

Based on the analysis presented above, with implementation of MM AQ-1 construction and operation of the proposed project would not result in the generation of criteria air pollutants that would exceed SCAQMD thresholds of significance. Compliance with SCAQMD Rule 403: Fugitive Dust would further reduce construction dust impacts. With implementation of MM AQ-1, the proposed project is not expected to produce significant emissions that would affect nearby sensitive receptors. The proposed project would also not result in other emissions (e.g., those leading to odors) that affect a substantial number of people. The proposed project would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation and would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. In addition, GHG emissions released during construction and operation of the proposed project would be less than significant. However, the project would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHG and therefore, would result in a significant and unavoidable project-related GHG impact.

Based on the analysis presented above, with implementation of MM AQ-2 and MM AQ-3, the proposed project would not result in a cumulatively considerable net increase of any criteria pollutant. The proposed project would neither result in a cumulatively considerable increase of any air emissions affecting nearby sensitive receptors, nor would it result in other emissions (e.g., those leading to odors) that result in a cumulatively considerable effect on a substantial number of people. The proposed project would not result in a cumulatively considerable impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation and would not result in a cumulatively considerable impact due to conflict with or obstruction of a State or local plan for renewable energy or energy efficiency. In addition, GHG cumulative emissions impacts would not result in a potentially significant contribution to global climate change. However, the proposed project would conflict with the plans and policies adopted for the purpose of reducing the emissions of GHGs, including the 2022 Scoping Plan. As such, the proposed project would result in a significant and unavoidable cumulatively considerable impact related to GHG.

8. User Changes to Default Data

Screen	Justification
Land Use	Project is proposing a 165,803-sf industrial building, including 66,559-sf of landscape area, 262 parking spaces, and 9,875-sf of paved area on an 8.83-acre project site
Construction: Construction Phases	Construction schedule based is on a tentative commence date of January 2026 and a duration of 12 months. Based on Appliant's construction data provided in the data spreadsheet.
Construction: Off-Road Equipment	Construction equipment is based on the Appliant's construction data provided in the data spreadsheet.
Construction: Trips and VMT	number of worker trips, vendor trips, and hauling trips was based on the Appliant's construction data provided in the data spreadsheet.
Construction: Architectural Coatings	project would comply with SCAQMD Rule 1113 for architectural coating
Operations: Vehicle Data	Based on a total trip generation of 515 ADT for cars and light duty trucks only trip generation = 515 ADT /165.803 tsf = 3.11
Operations: Fleet Mix	Based on 515 ADT, including 494 vehicle trips and 21 MHDT
Operations: Energy Use	project would be designed to be all electric
Operations: Off-Road Equipment	project would include two 200-hp diesel powered cargo handling equipment pieces

1.1. Basic Project Information

Data Field	Value
Project Name	IPT Enterprise Business Center LLC Project - HHDT
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	4.20
Location	26200 Enterprise Way, Lake Forest, CA 92630, USA
County	Orange
City	Lake Forest
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	6046
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description

8. User Changes to Default Data

Screen	Justification
Land Use	Project is proposing a 165,803-sf industrial building, including 66,559-sf of landscape area, 262 parking spaces, and 9,875-sf of paved area on an 8.83-acre project site
Construction: Construction Phases	Construction schedule based on Appliant's construction data provided in the data spreadsheet.
Construction: Off-Road Equipment	Construction equipment is based on the Appliant's construction data provided in the data spreadsheet.
Construction: Trips and VMT	number of worker trips, vendor trips, and hauling trips was based on the Appliant's construction data provided in the data spreadsheet.
Construction: Architectural Coatings	project would comply with SCAQMD Rule 1113 for architectural coating

Operations: Vehicle Data	Based on a total trip generation of 58 ADT for heavy heavy duty trucks trip generation = 58ADT /165.803 tsf = 3.11
Operations: Fleet Mix	HHDT trips only
Operations: Energy Use	project would be designed to be all electric
Operations: Off-Road Equipment	project would include two 200-hp diesel powered cargo handling equipment pieces

Notes:

[1] For construction trucks assumes 50 percent HHDT and 50 percent MHDT vehicles, consistent with assumptions in CalEEMod for hauling trucks. For construction worker vehicles assumes 50 percent LDA, 25 percent LDT1, and 25 percent LDT2 vehicles, consistent with assumptions in CalEEMod for worker vehicles.

[2] EMFAC2021 was run for Orange County for the construction year 2026. Data was aggregated over all vehicle model years and speed bins.

[3] The fuel efficiency was calculated by dividing the VMT (miles/day) by the fuel consumption (gallons/day).

Notes:

[1] EMFAC2021 was run for Orange County for the operational year 2027. Data was aggregated over all vehicle model years and speed bins.

[2] Fleet mix is based on assumptions made in CalEEMod for the proposed project.

[3] The fuel efficiency was calculated by dividing the VMT (miles/day) by the fuel consumption (gallons/day).

					Total Diesel/year	**142,126.35**

Notes:

[1] Calculated for operational year 2027 only. Future years will likely use less fuel due to more efficient cars.

[2] Total VMT is based on project's trip generation and trip lengths.

[3] Fleet distribution is based on EMFAC2021 output and CalEEMod assumptions.

[4] Fuel efficiency is based on fuel consumption and VMT data from EMFAC2021 for Riverside County and total VMT.

INTRODUCTION

LSA has prepared a construction and operational Health Risk Assessment (HRA) for the proposed IPT Enterprise Business Center LLC Project (proposed project) in Lake Forest, California.

An HRA is a process used to estimate the increased health risk levels for people living and/or working near a project that emits toxic air contaminants (TACs). An HRA combines results of studies on the health effects of various animal and human exposure to TACs with results of studies that estimate the exposure levels at different distances from the source of pollutants. The purpose of the HRA is to document the increased cancer and noncancer health risk levels from project-related emissions of TACs on existing nearby sensitive receptors, including residents and/or workers.

The City of Lake Forest (City) recommends the preparation of an HRA in accordance with policies and procedures of the State Office of Environmental Health Hazard Assessment (OEHHA) and the South Coast Air Quality Management District (SCAQMD). This HRA evaluates all these criteria in compliance with applicable requirements.

PROJECT LOCATION AND DESCRIPTION

The 8.83-acre project site is located at 26200 Enterprise Way in the north-central portion of Lake Forest in Orange County, California. The project site is currently developed with an existing 144,906-square-foot (sq ft) vacant building. Regional access to the project site is provided by State Route 241 (SR-241), which is located approximately 0.7 mile north of the project site, and Interstate 5 (I-5), which is located approximately 3.75 miles southwest of the project site. Local access to the project site is provided by Enterprise Way, which is accessed from Dimension Drive. See Figure 1, Regional Project Location, and Figure 2, Site Plan, below.

The proposed project involves the demolition of the existing 144,906 sq ft building and redevelopment of the property with a new 165,803 sq ft industrial building. The proposed project would include a mix of office, manufacturing, and warehouse space. Approximately 10,000 sq ft would serve as office space, with up to 65,000 sq ft proposed for manufacturing use, and the remainder would be utilized for warehouse use. A maximum of 23 usable dock-high doors, a gated truck loading area, a 16-foot-(ft) high, 65 ft long wall located at the eastern end of the loading docks, west of the proposed trash enclosure, and up to 262 parking spaces for passenger vehicles would be provided. Landscaping would total approximately 17.29 percent of the gross project site (66,559 sq ft). Additionally, the proposed project includes the following off-site improvements which would be constructed by the project developer prior to occupancy of the proposed industrial building to enhance public safety and address concerns related to large truck turning movements:

- **Intersection of Bake Parkway and Commercentre Drive:** Modifications would be made to the traffic signal to accommodate protected eastbound and westbound left-turn phasing (from split phasing). Lane geometrics would be modified for the westbound approach to accommodate dual left-turn lanes and a shared through right-turn lane. Additionally, modifications would be made to the traffic signal equipment.

Site Plan

- **Intersection of Bake Parkway and Dimension Drive:** Modifications would be made to the median to accommodate a 430-foot westbound left-turn lane. Additionally, modifications would be made to the traffic signal equipment.

- **Intersection of Dimension Drive/Commercentre Drive – Enterprise Way:** Modifications would be made to the traffic signal to accommodate protected eastbound and westbound left-turn phasing (from permissive phasing). The radius of the southeast corner at this intersection would be modified to accommodate wheelbase-67 (WB-67) truck turns (northbound right turn). Additionally, modifications would be made to the traffic signal equipment.

- **Intersection of Lake Forest Drive and Dimension Drive:** Modifications would be made to accommodate a 250-foot northbound left-turn lane and a 205-foot eastbound left-turn lane. Additionally, modifications would be made to the traffic signal equipment.

- **Intersection of Lake Forest Drive and Rancho Parkway:** Modifications would be made to accommodate a new 225-foot northbound right-turn lane, a 470-foot northbound left-turn lane, and a 440-foot southbound left-turn lane. Additionally, modifications would be made to the traffic signal equipment.

The proposed project would be consistent with the California Green Building Standards Code (CALGreen Code) and Assembly Bill (AB) 1881 water-efficient landscape requirements. Additionally, the proposed project will be seeking Leadership in Energy and Environmental Design (LEED) certification through the applicant's LEED Volume program. Some of the features in the design include, but not be limited to, drought-tolerant landscaping, low-flow fixtures, high-efficiency lighting, solar, and infrastructure for electric vehicle (EV) charging.

This analysis assumes the proposed uses could operate up to 24 hours per day, 7 days per week. Once operational, the proposed project would generate approximately 573 average daily trips (ADT), including 458 passenger car trips, 38 two-axle truck trips, 21 three-axle truck trips, and 58 four-axle truck trips.[1] In addition, the proposed project would not utilize natural gas during construction and operation. The proposed project would also include two 200-horsepower (hp), diesel-powered, cargo-handling equipment pieces for operation of the project and a 300 hp, diesel-powered fire pump, which is estimated to operate for up to 50 hours per year.

Construction activities associated with the proposed project would include demolition of the existing structure, site preparation, grading, building construction, paving, and architectural coating activities. Construction of the proposed project would tentatively commence in January 2026 and is expected to be completed in about 1 year. Construction of the proposed project would require a net export of approximately 900 cy of material. Based on information from the project Applicant, the proposed project is anticipated to require the use of concrete industrial saws, excavators, impactors, stackers, jaw crushers, bull dozers, tractors, loaders, backhoes, graders, scrapers, forklifts, cranes, generator sets, welders, concrete ride on trowel machine, cement and mortar mixers, paving

equipment, and air compressors. Equipment tier engine and number of equipment pieces was provided by the project Applicant.

EXISTING LAND USES IN THE PROJECT AREA

For the purposes of this analysis, sensitive receptors are areas of the population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses that are sensitive to air quality. Impacts on sensitive receptors are of particular concern because they are the population most vulnerable to the effects of air pollution. The project site is surrounded primarily by light industrial uses and residential uses. The adjacent land uses to the project site are light industrial uses to the north, west, and south, and residential uses to the east.

The closest sensitive receptors to the proposed project site are residential uses, such as single-family homes located adjacent to the east property line at approximately 82 feet from the project site's eastern boundary limit to the residential building facade. Other residential uses are located north of the project site, at approximately 900 ft from the project's northern boundary limit as measured to the residential building façade. In addition, a nature park is located to the south of the proposed project site, within 450 ft as measured from the proposed project site southern boundary to the center of the park.

BACKGROUND

This section provides a discussion of regulatory guidance from the California Air Resources Board (CARB), the OEHHA, the California Air Pollution Control Officers Association (CAPCOA), and the SCAQMD.

OFFICE OF ENVIRONMENTAL HEALTH AND HAZARD ASSESSMENT GUIDELINES

The OEHHA developed the *Air Toxics Hot Spots Program Guidance Manual*[2] in conjunction with the CARB for use in implementing the Air Toxics Hot Spots Program (Health and Safety Code Section 44360). The manual describes health effect values, exposure pathway variates (e.g., breathing rates), and a tiered approach for performing HRAs based on current science and policy assessment. The intent of the guidance manual is to incorporate children's health concerns, update risk assessment practices, and provide consistent risk assessment procedures.

CALIFORNIA AIR POLLUTION CONTROL OFFICERS ASSOCIATION

In 2009, the CAPCOA published guidance[3] on assessing the health risk impacts from and to proposed land use projects, focusing on the acute, chronic, and cancer impacts of sources affected by CEQA. The document recommends procedures to identify when a project should undergo further risk evaluation, procedures for conducting an HRA, guidelines to engage the public, presentation guidelines for results from the HRA, and mitigation measures that may be appropriate for various land use projects.

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

The SCAQMD has risk assessment guidelines, *AB 2588 and Rule 1402 Supplemental Guidelines*[4]. These guidelines incorporate the OEHHA guidance and the options to be used when using the CARB's Hotspots Analysis and Reporting Program Version 2 (HARP2) program for risk assessment calculations.[5]

SETTING

REGIONAL AIR QUALITY

The project site is in Lake Forest, California, which is part of the South Coast Air Basin (Basin) and is under the jurisdiction of the SCAQMD.

Climate/Meteorology

Air quality in the planning area is not only affected by various emission sources (e.g., mobile and industry), but also by atmospheric conditions (e.g., wind speed, wind direction, temperature, and rainfall). The nearest representative meteorological station that provides the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) ready meteorological data is the Mission Viejo Meteorological Station. Figure 3, Project Area Wind Patterns, shows the windrose[6] from data measured at this station and the wind patterns for the project area.

Figure 3: Project Area Wind Patterns

[6] A windrose provides a succinct view of how wind speed and direction are typically distributed at a particular location. Presented in a circular format, the windrose shows the frequency of winds blowing from particular directions.

Toxic Air Contaminants

The public's exposure to TACs is a significant environmental health issue in the State of California. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health. The Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the Federal Clean Air Act (42 United States Code Section 7412) is a TAC. Under State law, the California Environmental Protection Agency, acting through CARB, is authorized to identify a substance as a TAC if it determines the substance is an air pollutant that may cause or contribute to an increase in mortality or an increase in serious illness, or which may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act), AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987), and Senate Bill (SB) 25, the Children's Environmental Health Protection Act. The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions.

Air toxics from stationary sources are also regulated in California under AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the designated air quality management district or air pollution control district. High-priority facilities are those that have stationary source emissions of TACs with the potential to result in a significant risk to public health or safety. Considerations include the potency, toxicity, quantity, and volume of hazardous materials released from the facility, the proximity of the facility to potential receptors, including, but not limited to, hospitals, schools, day care centers, worksites, and residences, and any other factors that the district finds and determines may indicate that the facility may pose a significant risk to receptors. Pursuant to subdivision (a) to Section 44360 of OEHHA[7], high priority facilities are required to perform an HRA and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings. Land use projects are not subject to the requirements of AB 2588; however, the health risk assessment methodology developed for this program can be applied to emission sources associated with land use projects (i.e., trucks).

To date, CARB has designated nearly 200 compounds as TACs. Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines (diesel particulate matter [DPM]).

THRESHOLDS OF SIGNIFICANCE

Both the State and federal governments have established health-based ambient air quality standards for seven air pollutants. For other air pollutants without defined significance standards, the definition of substantial pollutant concentrations varies. For TACs, "substantial" is taken to mean that the individual health risk exceeds a threshold considered to be a prudent risk management level.

The following limits for maximum individual cancer risk (MICR) and noncancer acute and chronic Hazard Index (HI) from project emissions of TACs are considered appropriate for use in determining the health risk for projects in the Basin:

- **MICR:** MICR is the estimated probability of a maximally exposed individual (MEI) contracting cancer as a result of exposure to TACs over a period of 30 years for adults and 9 years for children in residential locations and over a period of 25 years for workers. The MICR calculations include multipathway consideration, when applicable.

  The cumulative increase in MICR that is the sum of the calculated MICR values for all TACs would be considered significant if it would result in an increased MICR greater than 10 in 1 million (1×10^{-5}) at any receptor location.

- **Chronic HI:** Chronic HI is the ratio of the estimated long-term level of exposure to a TAC for a potential MEI to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.

  The proposed project would be considered significant if the cumulative increase in total chronic HI for any target organ system would exceed 1.0 at any receptor location.

- **Acute HI:** Acute HI is the ratio of the estimated maximum 1-hour concentration of a TAC for a potential MEI to its acute reference exposure level.

  The proposed project would be considered significant if the cumulative increase in total acute HI for any target organ system would exceed 1.0 at any receptor location.

The SCAQMD *CEQA Air Quality Handbook*[8] states that emissions of TACs are considered significant if an HRA shows an increased risk of greater than 10 in 1 million. Based on guidance from SCAQMD in the document *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis,*[9] for the purposes of this analysis, the threshold of 10 in 1 million was used as the cancer risk threshold for the proposed project.

METHODOLOGY

The methodology used to estimate health risk impacts is described below.

GENERAL INFORMATION

For the purposes of an HRA, emissions are analyzed for acute health impacts, chronic, and carcinogenic health impacts. A multipathway assessment has been conducted to evaluate the project's emissions during construction and operation following the modeling techniques recommended in the OEHHA *Air Toxic Hot Spots Program Risk Assessment Guidelines*.[10] The analysis herein has been conducted in accordance with SCAQMD requirements for HRAs.

This HRA has been conducted using three models: (1) the CARB's California Emissions Factor Model, Version 2021 (EMFAC2021) for vehicle emissions factors and percentages of fuel type within the overall vehicle fleet; (2) the United States Environmental Protection Agency's (USEPA) AERMOD dispersion model to determine how the TACs would move through the atmosphere after release from sources both on site and along the truck routes; and (3) the CARB's HARP2 model to translate the pollutant concentrations from AERMOD into individual health risks at the nearby sensitive receptor locations.

The OEHHA has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated. Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles (also known as DPM) made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to DPM also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM. The HRA analyses used particulate matter less than 10 microns in diameter (PM_{10}) emissions to represent DPM emissions, consistent with OEHHA guidance.

The conservative nature of this analysis is due primarily to the following three factors:

- The CARB-adopted diesel exhaust unit risk factor (URF) of 300 in 1 million per microgram per cubic meter is based on the upper 95th percentile of estimated risk for each of the epidemiological studies used to develop the URF. Therefore, the risk factor is already representative of the conservative risk posed by DPM.

- The risk estimates assume sensitive residence receptors would be subject to DPM for 24 hours per day, 350 days per year and worker receptors for 8 hours per day, 350 days per year. As a conservative measure, SCAQMD does not recognize indoor adjustments for residents or workers. However, people typically spend the majority of their time indoors versus remaining

outdoors for 24 hours per day, 350 days per year.[11] Therefore, the actual exposure any person would experience would be less than considered in this analysis. This results in much lower actual health risk levels than presented in this analysis.

- For the operational HRA, the exposure to DPM is assumed to be constant for the given period analyzed (i.e., 30 years for the residential receptors and 25 years for the worker receptors). However, emissions from DPM are expected to substantially decrease in the future with the implementation of standard regulatory requirements and technological advancements to reduce DPM. Therefore, the health risk levels from these future trucks would be less than presented in this analysis.

Improvements over the last 40 years to diesel fuel and diesel engines have resulted in lower emissions of some of these TACs.[12] These improvements resulted in a 75 percent reduction in particle emissions from diesel-powered trucks and other equipment in 2010 and an 85 percent reduction in 2020 compared to 2000 levels.[13] These improvements are anticipated to continue into the foreseeable future. Electric trucks are also being phased in and, once in use, would eliminate the emissions of DPM associated with truck travel.

American Meteorological Society/Environmental Protection Agency Regulatory Model Dispersion Modeling

In order to assess the dispersion of emissions associated with the proposed project, air dispersion modeling was performed using AERMOD. The model is approved by the USEPA when estimating the air quality impacts associated with point and fugitive sources in simple and complex terrain. The model was used to calculate the annual average pollutant concentrations associated with each emitting source. Inputs for each emitting source were based on the characterizations described above.

For the volume sources used to represent on-road mobile source activity, vertical (sigma z) dispersion parameters were developed as described in the SCAQMD's modeling guidance for trucks. For the truck unloading locations, individual point sources represent the trucks idling at each loading dock. For all the idling sources, the release parameters were set to the SCAQMD default parameters. Receptors were placed at the nearest sensitive receptor locations.

The model requires additional input parameters, including local meteorology. Due to the model's sensitivity to individual parameters (e.g., wind speed, temperature, and direction), the USEPA

11 In May 1991, the CARB Research Division, in association with the University of California, Berkeley, published research findings titled *Activity Patterns of California Residents*. The findings of that study indicate that, on average, adults and adolescents in California spent almost 15 hours per day inside their homes and 6 hours in other indoor locations, for a total of 21 hours (87 percent of the day). About 2 hours per day were spent in transit, and just over 1 hour per day was spent in outdoor locations.

recommends meteorological data used as input into dispersion models be selected on the basis of relative spatial and temporal conditions that exist in the area of concern. As such, 5 years of meteorological data from SCAQMD's Mission Viejo Meteorological Station (the nearest available station) was used to represent local weather conditions and prevailing winds. Figure 3 shows the graphical representation of the wind patterns. Receptors were placed at the nearest sensitive receptor locations, as shown in Figure 4, Sensitive Receptor Grid.

Figure 4: Sensitive Receptor Grid

Hotspots Analysis and Reporting Program Modeling

CARB's HARP2 model is a tool that assists with the programmatic requirements of the Air Toxics "Hot Spots" Program (AB 2588). HARP2 was used to translate the TAC concentrations from AERMOD into long-term carcinogenic and chronic, and short-term acute health risk levels following the guidance in the SCAQMD and OEHHA risk assessment guidelines. These guidelines specify a minimum set of TAC pathways and HARP2 modeling options for the carcinogenic assessment. To estimate chronic noncancer risks at residential receptors, the "Risk Management Plan (RMP)-Derived Method" risk-calculation option was used. Following the OEHHA guidance, an 8-hour chronic noncancer risk was calculated for residential receptors because the proposed project would operate more than 8 hours per day and 5 days per week.

The dose-response relationship for a specific pollutant describes the association between exposure and the observed response (health effect). In other words, the relationship estimates how different levels of exposure to a pollutant change the likelihood and severity of health effects. The dose-response relationship (the response occurring with increasing doses) varies with each pollutant, individual sensitivity, and type of health effect. Combining the results of the emission

characterization and dispersion modeling described above with the dose-response assessment gives an estimate of the increased health risk for an individual exposed to the maximum predicted long-term concentrations of TACs.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were default rates as presented in the OEHHA guidance document entitled *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[14] and guidance from SCAQMD.

CONSTRUCTION HEALTH RISK ASSESSMENT

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. As discussed above, to estimate the potential cancer risk associated with construction of the proposed project from equipment exhaust (including DPM), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using the CARB exposure methodology with the air dispersion modeling performed using the USEPA AERMOD air dispersion model. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data.

Emission Sources

The California Emissions Estimator Model version 2022.1 (CalEEMod) computer program was used to calculate emissions from on-site construction equipment and emissions from worker and vehicle trips to the site, which was included in AERMOD. Construction of the proposed project is anticipated to begin in January of 2026 and occur for approximately 1 year. Construction of the proposed project would require a net export of approximately 900 cy of material, which was also included in CalEEMod. Based on information from the project Applicant, the proposed project is anticipated to require the use of concrete industrial saws, excavators, impactors, stackers, jaw crushers, bull dozers, tractors, loaders, backhoes, graders, scrapers, forklifts, cranes, generator sets, welders, concrete ride on trowel machine, cement and mortar mixers, paving equipment, and air compressors, which was included in CalEEMod. Equipment tier engine and number of equipment pieces was provided by the Applicant, which was included in CalEEMod. In addition, this analysis assumes that the proposed project would comply with SCAQMD Rule 403 measures. The number of worker trips, vendor, and hauling trips during construction were also provided by the project Applicant and included in CalEEMod. All other construction details are not yet known; therefore, default assumptions (e.g., off-road emission factors and construction trip lengths) from CalEEMod were used.

OPERATIONAL HEALTH RISK ASSESSMENT

To determine the potential health risk to people living and working near the proposed project associated with the exhaust of diesel-powered trucks and equipment, an operational HRA was conducted for the proposed project.

Emission Sources

The first step of an HRA is to characterize the project-related emissions of TACs. The proposed project would generate approximately 573 average daily trips, including 458 passenger vehicle trips, 38 two-axle truck trips, 21 three-axle truck trips, and 58 four-axle truck trips.[15] It is assumed that the truck trips would travel approximately 40 miles per trip. The trucks would access the site by Enterprise Way. The proposed project would provide a maximum of 23 dock doors; as the project would contain multiple loading docks, off-site queuing of trucks is not anticipated. While the TAC emissions from gasoline-powered vehicles have a small health effect compared to DPM, this HRA includes all the traffic information described and both gasoline- and diesel-powered vehicle emissions. For the diesel exhaust emissions, it is sufficient to only consider the DPM (PM_{10}) portion of the exhaust; all the TACs for the gasoline exhaust emissions are contained in the reactive organic gas (ROG) emissions. Using speciation data from CARB, the emission rates of the TAC components are derived from the total ROG emissions.

Project trucks would operate in two modes: stationary idling and moving on and off the site. The emissions from trucks while idling result in a much higher concentration of TACs at nearby sensitive receptors compared to the emissions from moving trucks. This is due to the dispersion of emissions that occurs with distance and with travel of the vehicle. For this HRA, the truck travel emissions were modeled as a series of volume sources along the on-site driveways, along Enterprise Way going east and west. LSA assumed vehicles traveling on site would maneuver slowly, averaging approximately 5–15 miles per hour (mph), and that vehicles traveling on roadways would average 5–55 mph. This analysis also assumes that on-site truck idling would occur for approximately 15 minutes.

EMFAC2021 was used to determine the emissions factors of idling and operating diesel trucks to determine the total emissions of PM_{10}. Although the TAC of concern from diesel trucks is DPM, EMFAC2021 does not include emissions factors for this TAC. DPM is a component of the overall exhaust from the project-related trucks. This HRA conservatively assumes the DPM emissions to be equal to the PM_{10} emissions when actually the DPM is only a portion of the overall PM_{10} in the truck exhaust. While it is expected that the truck emissions rate will continue to reduce over time, an HRA only allows for a single emission rate to represent the entire 25- or 30-year exposure period. The use of emissions factors for the earliest year the proposed project could start operations (2027) was selected for this HRA to be conservative. For instance, based on operations starting in 2027, using emissions factors for a 2031 vehicle fleet (the midpoint of the 9-year exposure period) or using emissions for a 2042 vehicle fleet (the midpoint of the 30-year exposure period) could be used; however, either of these would be less conservative.

HEALTH RISK IMPACTS

The following section describes the potential impacts on sensitive and worker receptors from construction and operation of the proposed project. As identified above, the closest sensitive receptor includes single-family homes located adjacent to the east property line at approximately 82 feet from the project site's eastern boundary limit to the residential building facade. The nearest worker receptor to the project site is located immediately north of the project site. The HRA analysis and results are presented below; construction and operational data outputs are included in Appendix A and Appendix B, respectively.

CONSTRUCTION HEALTH RISK ASSESSMENT

A construction HRA, which evaluates construction-period health risk to off-site receptors, was performed for the proposed project. Table A, below, identifies the results of the analysis at the MEI. Model snap shots of the sources are included in Appendix A.

Table A: Health Risks from Project Construction to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Residential MEI	41.14	0.054	0.000
Worker MEI	0.70	0.054	0.000
SCAQMD Significance Threshold	**10 in 1 million**	**1.0**	**1.0**
Significant?	**Yes**	**No**	**No**

Source: Compiled by LSA (June 2025).
MEI = maximally exposed individual
SCAQMD = South Coast Air Quality Management District

As shown in Table A, the maximum cancer risk for the residential MEI would be 41.14 in 1 million, which would exceed the SCAQMD cancer risk threshold of 10 in 1 million. The worker MEI would be 0.70 in 1 million, which would not exceed the SCAQMD cancer risk threshold of 10 in 1 million. The total chronic hazard index would be 0.054 for the residential MEI and for the worker MEI, which is below the threshold of 1.0. In addition, the total acute hazard index would be nominal (0.000), which would also not exceed the threshold of 1.0. Therefore, implementation of Mitigation Measure 1 (MM-1) would be required to reduce construction cancer risk.

MM-1 All construction equipment used during construction of the project shall be equipped with Tier 4 Interim engines or the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type (Tier 4 engines automatically meet this requirement) as certified by the California Air Resources Board. The equipment shall be properly maintained and tuned in accordance with manufacturer specifications. Prior to issuance of building permits, the project Applicant shall submit construction plans to the City of Lake Forest denoting the projected equipment Tier rating that will be used during the construction period.

As shown in Table B, with the implementation of MM-1 the maximum cancer risk for the residential receptor MEI would be 5.12 in 1 million, which would not exceed the SCAQMD cancer risk threshold of 10 in 1 million. Therefore, with implementation of MM-1, construction of the proposed project would not exceed SCAQMD thresholds and would not expose nearby sensitive receptors to a significant health risk.

OPERATIONAL HEALTH RISK ASSESSMENT

To determine the potential health risk to people living and working near the project site associated with the exhaust of diesel-powered trucks and equipment associated with the proposed project, an operational HRA was conducted. The carcinogenic and chronic health risks from the proposed project are shown in Table C. The residential risk conservatively incorporates both the risk for a child living in a nearby residence for 9 years (the standard period of time for child risk) and an adult living in a nearby residence for 30 years (considered a conservative period of time for an individual to live in any one residence). An exposure period of 25 years was assumed for worker receptors.

Table C: Health Risks from Project Operation to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in 1 Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Residential MEI	3.06	0.001	<0.001
Worker MEI	0.85	0.003	<0.001
SCAQMD Significance Threshold	**10.0 in 1 million**	**1.0**	**1.0**
Significant?	**No**	**No**	**No**

Source: Compiled by LSA (June 2025).
MEI = maximally exposed individual
SCAQMD = South Coast Air Quality Management District

As shown in Table C, the maximum cancer risk for the residential MEI would be 3.06 in 1 million, which would not exceed the SCAQMD cancer risk threshold of 10 in 1 million. The worker MEI would be 0.85 in 1 million, which would also not exceed the threshold. The total chronic hazard index would be 0.001 for the residential MEI and 0.003 for the worker MEI, which is below the threshold of 1.0. In addition, the total acute hazard index would be less than 0.001, which would also not

exceed the threshold of 1.0. As these results show, all health risk levels to nearby receptors from operation-related emissions of TACs would be well below the SCAQMD's HRA thresholds. No significant health risk would occur from project operation emissions and no mitigation is required.

CUMULATIVE IMPACTS

As defined in Section 15355 of the *State CEQA Guidelines*, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area. The SCAQMD significance health risk thresholds consider the emission levels for which a project's individual emissions would be considerable. Each project's individual emissions would contribute to the total ambient air concentration. Therefore, if a project falls below the SCAQMD significance health risk thresholds, its contribution would not be cumulatively considerable. Nevertheless, the Western Realco Projects are reasonably foreseeable projects that would be located in the immediate vicinity of the project site and for the purposes of this analysis are assumed to have construction schedules that overlap with the proposed project. Therefore, the City of Lake Forest, as the lead agency for the environmental review of the proposed project, has requested a quantitative evaluation of the combined cumulative impacts associated with development of the proposed project and immediately adjacent proposed Western Realco Projects.

The Western Realco Projects are comprised of two separate projects (Western Realco Project 1 and Western Realco Project 2). Western Realco Project 1 (26110 Enterprise, 26140 Enterprise, and 26160 Enterprise Way) consists of an 8.42-acre project site located north of the IPT Enterprise Business Center LLC Project site along Bake Parkway. Western Realco Project 1 includes the demolition of three existing office buildings (a total of 150,000 sq ft) and the reconstruction of two new industrial buildings with a total of 156,800 sq ft (one 54,000 sq ft building and one 102,800 sq ft building). The two buildings would have a total of 59,800 sq ft of warehouse use, 79,000 sq ft of manufacturing use, and 18,000 sq ft of office space. Western Realco Project 2 (26250 Enterprise Way) consists of a 4.54-acre project site located immediately west of the IPT Enterprise Business Center Project site in the intersection between Enterprise Way and Dimension Drive. Western Realco Project 2 includes the demolition of a 76,978 sq ft two-story office building and construction of a 77,000 sq ft single-story building. The building would have 69,000 sq ft of warehouse use and 8,000 sq ft of office space.

The regional thresholds developed by the SCAQMD are based on individual projects. In the absence of cumulative thresholds and to be conservative, this analysis would compare the combined cumulative emissions (emissions from the proposed project and the Western Realco Projects) against the project-based SCAQMD significance criteria to determine impacts. Cumulative impacts associated with implementation of the proposed project along with development of Western Realco Projects 1 and 2 are further analyzed below.

Cumulative Construction Health Risk

The following section describes the potential cumulative impacts on sensitive and worker receptors resulting from construction activities associated with the development of the proposed project combined with Western Realco Projects 1 and 2. The residential MEI for the cumulative analysis is

an apartment building reserved for seniors located to the east of Project Site 1, within 125 feet from the project site's eastern boundary, as measured to the building façade. The nearest cumulative worker MEI is located immediately south of Western Realco Project Site 1. Table D, below, identifies the results of the analysis at the MEI, and the risk level of proposed project combined with Western Realco Projects 1 and 2 at the cumulative MEI. Model snap shots of the sources are included in Appendix C.

This analysis assumes buildout of the proposed project and Western Realco Projects 1 and 2. Therefore, a model run was conducted to evaluate the potential cumulative impacts of the buildout of the proposed project along with Western Realco Projects 1 and 2.

A construction HRA was performed to estimate the potential cancer risk associated with construction of Western Realco Projects 1 and 2 from equipment exhaust (including DPM), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). This assessment was conducted using the AERMOD air dispersion model, which provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data from the Mission Viejo Station.

LSA used estimated emissions from on-site construction equipment and emissions from worker and vehicle trips to the site,[16] which was included in AERMOD. The results of the risk assessment, based on the modeled construction emissions from Western Realco Projects 1 and 2, along with the

[16] LSA. 2025. Air Quality, Greenhouse Gas, and Energy Impact Report for the IPT Enterprise Business Center LLC Project. June.

construction emissions from the proposed project, were summed for the proposed project's MEI and compared to the SCAQMD health risk thresholds. Cumulative construction emissions are summarized in Table D above. Appendix C provides HRA model output sheets.

As shown in Table D, the construction related maximum cumulative cancer risk for the residential MEI would be 78.6 in 1 million, which would exceed the SCAQMD cancer risk threshold of 10 in 1 million. The worker MEI would be 1.98 in 1 million, which would not exceed the SCAQMD cancer risk threshold of 10 in 1 million. The total chronic HI would be 0.102 for the residential MEI and 0.139 for the worker MEI, which is below the threshold of 1.0. In addition, the total acute HI would be nominal (0.000), which would also not exceed the threshold of 1.0. As compared to the project-level emission thresholds recommended by SCAQMD, cumulative construction emissions resulting from the implementation of the proposed project along with the emissions from Western Realco Projects 1 and 2, would exceed the SCAQMD cancer risk threshold of 10 in one million. Therefore, implementation of MM-1 would be required to reduce construction cancer risk.

Furthermore, as identified on the project-specific *Health Risk Assessment: Western Realco Enterprise Way Industrial Project*,[17] the cumulative analysis for Western Realco Projects 1 and 2, in combination with the IPT Enterprise Business Center LLC Project, would exceed the SCAQMD cumulative cancer risk threshold of 10 in 1 million during construction. Therefore, Western Realco Project 1 would be required to implement mitigation requiring all construction equipment be equipped with Tier 4 Final engines or the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type as certified by the CARB to reduce cumulative cancer risks. Western Realco Project 2 would be required to implement mitigation requiring all construction equipment be equipped with Tier 4 Interim engines or the most effective VDECS available for the engine type as certified by the CARB to reduce cumulative cancer risks. With implementation of these mitigation measure, the cumulative cancer risk would be reduced a less than significant impact for Western Realco Projects 1 and 2, as identified in the *Health Risk Assessment: Western Realco Enterprise Way Industrial Project*.[18]

Table E identifies the estimated cumulative health risks with implementation of MM-1 for the proposed project and the mitigated emissions identified for Western Realco Projects 1 and 2.

As shown in Table E, with the project's implementation of MM-1, the construction related maximum cumulative cancer risk for the residential MEI would be 5.47 in 1 million, which would not exceed the SCAQMD cancer risk threshold of 10 in 1 million. As compared to the project-level emission thresholds recommended by SCAQMD, cumulative construction emissions resulting from the implementation of the proposed project with MM-1 along with the emissions from Western Realco Projects 1 and 2, would not exceed SCAQMD thresholds. Therefore, no significant health risk would occur from cumulative construction emissions with the project's implementation of MM-1.

Cumulative Operational Health Risk

To determine the potential health risk associated with the exhaust of diesel-powered trucks and equipment to people living and working near the proposed project and Western Realco Projects 1 and 2, an operational HRA was conducted.

Trip generation rates used for CalEEMod for Western Realco Project 1 were based on the project's Traffic Impact Analysis (TIA),[19] which identifies that Western Realco Project 1 would generate approximately 670 ADT, including 104 ADT for warehouse uses, 371 ADT for manufacturing uses, and 195 ADT for office uses. Trip generation rates used in CalEEMod for Western Realco Project 2 were based on the project's TIA,[20] which identifies that Western Realco Project 2 would generate approximately 204 ADT, including 87 ADT for office uses. This cumulative HRA assumed vehicles traveling on site would maneuver slowly, averaging approximately 5–15 mph, and that vehicles traveling on roadways would average 5–55 mph. This analysis also assumes that on-site truck idling would occur for approximately 15 minutes. In addition, to be conservative, this analysis assumes the use of emissions factors for the operational year of 2027.

The cumulative carcinogenic and chronic health risks from the proposed project along with Western Realco Projects 1 and 2 are shown in Table F. The residential risk conservatively incorporates both the risk for a child living in a nearby residence for 9 years (the standard period of time for child risk) and an adult living in a nearby residence for 30 years (considered a conservative period of time for an individual to live in any one residence). An exposure period of 25 years was assumed for worker receptors. Appendix D provides HRA model output sheets.

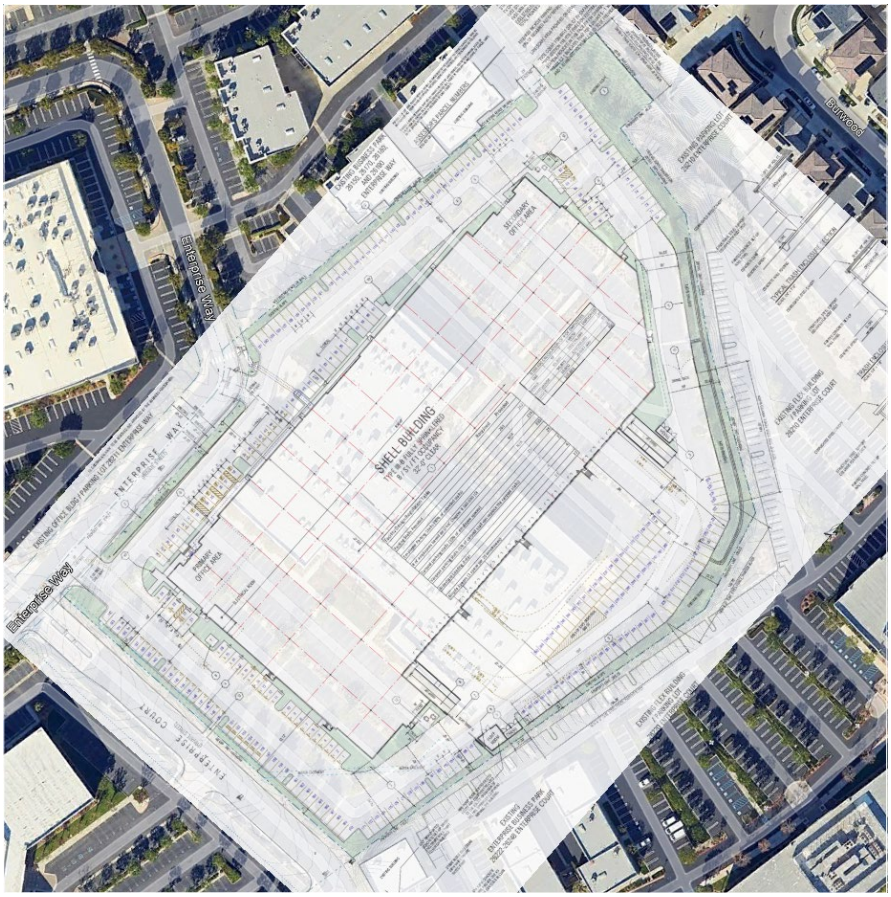
SCAQMD Significance Threshold	**10 in 1 million**	**1.0**	**1.0**
Significant?	**No**	**No**	**No**

Source: Compiled by LSA (June 2025).
MEI = maximally exposed individual
SCAQMD = South Coast Air Quality Management District

As shown in Table F, the maximum cumulative cancer risk for the residential MEI would be 4.43 in 1 million, which would not exceed the SCAQMD cancer risk threshold of 10 in 1 million. The worker MEI would be 2.16 in 1 million, which would also not exceed the threshold. The total chronic hazard index would be 0.002 for the residential MEI and 0.007 for the worker MEI, which is below the threshold of 1.0. In addition, the total acute hazard index would be less than 0.001, which would also not exceed the threshold of 1.0. As these results show, all health risk levels to nearby receptors from cumulative operation-related emissions of TACs would be well below the SCAQMD's HRA thresholds. No significant health risk would occur from cumulative operation emissions and no mitigation is required.



CONCLUSION

Based on the results of the analysis, including implementation of MM-1, health risk levels to nearby sensitive receptors from project-related emissions of TACs would be well below the SCAQMD's HRA thresholds. As compared to the project-level thresholds of significance promulgated by SCAQMD, the cumulative emissions associated with the proposed project with implementation of MM-1 combined with the mitigated emissions from Western Realco Projects 1 and 2 would not result in a significant impact on sensitive receptors during construction. In addition, cumulative operational emissions would be below the SCAQMD's HRA thresholds, and no mitigation is required.
