Longitude:	-118.227262
Case Type:	Cleanup Program Site
Case Worker:	JYL
Local Agency:	Not reported
RB Case Number:	0045
File Location:	Regional Board
Potential Media Affected:	Aquifer used for drinking water supply, Soil
Potential Contaminants of Concern:	MTBE / TBA / Other Fuel Oxygenates, Gasoline
Site History:	The tank storage facility at the site was constructed in 1921 for petroleum storage and is bordered by petroleum processing facilities operated by Tesoro Los Angeles Refinery, ConocoPhillips Los Angeles Plant, and BP Arco Refinery. Site assessment and remediation under Regional Board Cleanup and Abatement Order (CAO) No. 90-152. Responsible Party also participates Carson Regional Groundwater Group's (CRGG) regional groundwater contamination investigation. US EPA and RWQCB established MOU to regulate groundwater contamination matter under RCRA Corrective Action and CAO Order No. 90-152.

Quarterly Update: QUARTERLY UPDATE Quarterly Update Period: July - September 2019

SGS INDUSTRIAL (Continued) **S113094054**

Current Activity: Permit Maintenance The new permit was signed and made effective on August 15, 2019 after the response to comments and the appeals period. ----------
Quarterly Update Period: April - June 2019 Current Activity: Permit Renewal Application The public notice of Draft Permit Decision began on April 4 and continued through May 2019. A public meeting and hearing were held on May 8, 2019 in Carson; no one from the public attended the hearing and meeting. One comment was received. A response to comments was prepared, minor modifications to the permit were made, and the final permit was signed on June 24, 2019 with an August 15, 2019 effective date allowing time for appeals.
---------- Quarterly Update Period: January-March 2019 Current Activity: Permit Renewal Application DTSC issued the Application Technical Completeness letter on March 29, 2019. The public notice of Draft Permit Decision will begin on April 4 and continue through May 2019. A public meeting and hearing will be held on May 8, 2019 in Carson to discuss the Draft Permit Decision.
---------- Quarterly Update Period: October- December 2018 Current Activity: Permit Renewal Application Phillips 66 submitted the response to the second Notice of Deficiency in December. DTSC continues to review the application. ----------
Quarterly Update Period: July - September 2018 Current Activity: Permit Renewal The final response to the first NOD was received in August. The technical review of the application is continuing.
---------- Quarterly Update Period: April - June 2018 Current Activity: Permit Renewal Additional response to the first NOD was supplied on June 29, 2018, and the final application revisions are due on August 15. ---------- Quarterly Update Period: January - March 2018 Current Activity: Permit Renewal The technical review of the permit application continued and t

Hazardous Waste Summary:
Waste Code: D001
Waste Description: IGNITABLE WASTE

Waste Code: D002
Waste Description: CORROSIVE WASTE

Waste Code: D003
Waste Description: REACTIVE WASTE

Waste Code: D004
Waste Description: ARSENIC

Waste Code: D006
Waste Description: CADMIUM

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: D008
Waste Description: LEAD

Waste Code: D009
Waste Description: MERCURY

Waste Code: D010
Waste Description: SELENIUM

Waste Code: D018
Waste Description: BENZENE

Waste Code: D035
Waste Description: METHYL ETHYL KETONE

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF

PHILLIPS 66 LOS ANGELES REFINERY CARSON PLANT (Continued) **1000904828**

ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F037
Waste Description: PETROLEUM REFINERY PRIMARY OIL/WATER/SOLIDS SEPARATION SLUDGE - ANY SLUDGE GENERATED FROM THE GRAVITATIONAL SEPARATION OF OIL/WATER/SOLIDS DURING THE STORAGE OR TREATMENT OF PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH SLUDGES INCLUDE, BUT ARE NOT LIMITED TO, THOSE GENERATED IN OIL/WATER/SOLIDS SEPARATORS; TANKS AND IMPOUNDMENTS; DITCHES AND OTHER CONVEYANCES; SUMPS; AND STORM WATER UNITS RECEIVING DRY WEATHER FLOW. SLUDGES GENERATED IN STORM WATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS), AND K051 WASTES ARE EXEMPTED FROM THIS LISTING.

Waste Code: F038
Waste Description: PETROLEUM REFINERY SECONDARY (EMULSIFIED) OIL/WATER/SOLIDS SEPARATION SLUDGE - ANY SLUDGE AND/OR FLOAT GENERATED FROM THE PHYSICAL AND/OR CHEMICAL SEPARATION OF OIL/WATER/SOLIDS IN PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH WASTES INCLUDE, BUT ARE NOT LIMITED TO, ALL SLUDGES AND FLOATS GENERATED IN INDUCED AIR FLOTATION (IAF) UNITS, TANKS AND IMPOUNDMENTS, AND ALL SLUDGES GENERATED IN DAF UNITS. SLUDGES GENERATED IN STORMWATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS), AND F037, K048, AND K051 WASTES ARE EXEMPTED FROM THIS LISTING.

Waste Code: K048
Waste Description: DISSOLVED AIR FLOTATION (DAF) FLOAT FROM THE PETROLEUM REFINING INDUSTRY.

Waste Code: K049
Waste Description: SLOP OIL EMULSION SOLIDS FROM THE PETROLEUM REFINING INDUSTRY.

Waste Code: K050
Waste Description: HEAT EXCHANGER BUNDLE CLEANING SLUDGE FROM THE PETROLEUM REFINING INDUSTRY.

Waste Code: K051
Waste Description: API SEPARATOR SLUDGE FROM THE PETROLEUM REFINING INDUSTRY.

Waste Code: K169
Waste Description: K169

Waste Code: K170
Waste Description: K170

Waste Code: K171
Waste Description: K171

Waste Description:	CHROMIUM
Waste Code:	D008
Waste Description:	LEAD
Waste Code:	D009
Waste Description:	MERCURY
Waste Code:	D010
Waste Description:	SELENIUM
Waste Code:	D018
Waste Description:	BENZENE
Waste Code:	D035
Waste Description:	METHYL ETHYL KETONE
Waste Code:	F003
Waste Description:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste Code:	F005
Waste Description:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

PHILLIPS 66 LOS ANGELES REFINERY CARSON PLANT (Continued) **1000904828**

Waste Code:	F037
Waste Description:	PETROLEUM REFINERY PRIMARY OIL/WATER/SOLIDS SEPARATION SLUDGE - ANY SLUDGE GENERATED FROM THE GRAVITATIONAL SEPARATION OF OIL/WATER/SOLIDS DURING THE STORAGE OR TREATMENT OF PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH SLUDGES INCLUDE, BUT ARE NOT LIMITED TO, THOSE GENERATED IN OIL/WATER/SOLIDS SEPARATORS; TANKS AND IMPOUNDMENTS; DITCHES AND OTHER CONVEYANCES; SUMPS; AND STORM WATER UNITS RECEIVING DRY WEATHER FLOW. SLUDGES GENERATED IN STORM WATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS), AND K051 WASTES ARE EXEMPTED FROM THIS LISTING.
Waste Code:	F038
Waste Description:	PETROLEUM REFINERY SECONDARY (EMULSIFIED) OIL/WATER/SOLIDS SEPARATION SLUDGE - ANY SLUDGE AND/OR FLOAT GENERATED FROM THE PHYSICAL AND/OR CHEMICAL SEPARATION OF OIL/WATER/SOLIDS IN PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH WASTES INCLUDE, BUT ARE NOT LIMITED TO, ALL SLUDGES AND FLOATS GENERATED IN INDUCED AIR FLOTATION (IAF) UNITS, TANKS AND IMPOUNDMENTS, AND ALL SLUDGES GENERATED IN DAF UNITS. SLUDGES GENERATED IN STORMWATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS), AND F037, K048, AND K051 WASTES ARE EXEMPTED FROM THIS LISTING.
Waste Code:	K048
Waste Description:	DISSOLVED AIR FLOTATION (DAF) FLOAT FROM THE PETROLEUM REFINING INDUSTRY.
Waste Code:	K049
Waste Description:	SLOP OIL EMULSION SOLIDS FROM THE PETROLEUM REFINING INDUSTRY.
Waste Code:	K050
Waste Description:	HEAT EXCHANGER BUNDLE CLEANING SLUDGE FROM THE PETROLEUM REFINING INDUSTRY.
Waste Code:	K051
Waste Description:	API SEPARATOR SLUDGE FROM THE PETROLEUM REFINING INDUSTRY.
Waste Code:	K169
Waste Description:	K169
Waste Code:	K170
Waste Description:	K170
Waste Code:	K171
Waste Description:	K171
Waste Code:	K172
Waste Description:	K172

Lead Agency:	LOS ANGELES RWQCB (REGION 4)
Lead Agency Case Number:	Not reported
Latitude:	33.8044499633375
Longitude:	-118.247727468292
Case Type:	Cleanup Program Site
Case Worker:	JYL
Local Agency:	Not reported
RB Case Number:	0232
File Location:	Regional Board
Potential Media Affected:	Aquifer used for drinking water supply, Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern:	Benzene, Crude Oil, Diesel, Ethylbenzene, Gasoline, MTBE / TBA / Other Fuel Oxygenates, Naphthalene, Other Petroleum, Toluene, Total Petroleum Hydrocarbons (TPH), Xylene
Site History:	ConocoPhillips Company operates the ConocoPhillips Los Angeles Refinery (LAR) which consists of two plants located in Carson and Wilmington, California. The Carson Plant is a 245-acre site located at 1520 E. Sepulveda Boulevard, Carson, California. These two plants have been connected by pipelines since December 1991 and together provide complete refinery facilities. The Carson Plant is a crude-oil refining, processing, and storage facility. The Carson Plant was constructed in 1923 by Shell Oil Company. It was modernized and expanded in 1980s. Currently the Plant has a processing capacity of 132,000 barrels of crude oil per day. The facility performs crude oil fractionation and heavy-end refining. The unfinished intermediate petroleum products are then piped to the Wilmington Plant for conversion to finished products. The Discharger has released wastes, among which petroleum hydrocarbons are the principal contaminants of concern, to underlying soil and groundwater. On-site evidence of these wastes includes vapor phase contaminants in soil, solid phase contaminants in soil, non-aqueous phase liquids (NAPL) above and below the water table, and dissolved phase contaminants in groundwater. Since 1985, the refinery has been under numerous directives, issued by the Water Board under authority in sections 13304 and 13267 of the California Water Code, to investigate and cleanup releases of wastes. On September 3, 2003, representatives of refineries in Carson area met with USEPA staff to dicuss the presence of chemicals of concern (di-isopropyl ether [DIPE], methyl tert-butyl ether [MTBE] and tert-butyl alcohol [TBA] in groundwater underlying these facilities. Since 2003, COP has been working with RWQCB on phased program for oxygenates assessment. COP completed LNAPL Investigation in 2008, installed cluster Gage Aquifer groundwater monitoring wells in 2009. Phase 3 data package was submitted in March 2009. COP is in progress to finalize a site conceptual model for LARC in the first quarter of 2011. The 245-acre Phillips 66 Los Angeles Refinery (LAR) has been in operation since 1923. The LAR is a crude oil refining, processing, and storage facility. There are other facilities with similar operations located in Carson, California. The LAR is bordered by Tesoro Los Angeles Refinery, Carson (Tesoro Carson), Tesoro Los Angeles Refinery, Wilmington (Tesoro Wilmington), and Kinder Morgan Carson Terminal (Kinder Morgan). The LAR is located in the West Coast Basin of the Los Angeles County Coastal Plain. The uppermost groundwater occurs in the Water Table Aquifer of the Bellflower Aquiclude at depths ranging from 35 feet to 59 feet below ground surface (bgs). Other aquifers beneath the Bellflower Aquiclude in descending order are the Gage Aquifer, Lynwood Aquifer and Silverado Aquifer. The LAR is located near the Dominguez Gap Barrier

PHILLIPS 66 COMPANY, CARSON PLANT (Continued) **S103963019**

Project (DGBP) and the groundwater flow direction in the Water Table Aquifer, Gage Aquifer, and Lynwood Aquifer beneath the LAR is influenced by the operation of the DGBP. The groundwater flow is towards the west away from the DGBP. In the Silverado Aquifer groundwater flow is towards the east. There is light non-aqueous phase liquid (LNAPL) present in the Water Table Aquifer beneath most of the LAR. The groundwater beneath the LAR is also impacted with contaminants of concern (COCs) in the dissolved phase, primarily total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs) particularly benzene and oxygenates such as methyl tert-butyl ether (MTBE), tert-butyl alcohol (TBA), and disipropyl ether (DIPE). The highest concentrations of COCs are detected in the Water Table Aquifer. Benzene and oxygenates are also detected in the Gage Aquifer, Lynwood Aquifer, and Silverado Aquifer. Phillips 66 has been operating extraction wells in the Water Table Aquifer for hydraulic control and LNAPL removal at the LAR.

Citation: 19 CCR 4.5 2762.3(a) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2762.3(a)
Violation Description: Failure to develop and implement effective written operating procedures with clear instructions for safely conducting activities involved in each process with the process safety information.
Violation Notes: Returned to compliance on 10/15/2020. OBSERVATION: The owner or operator failed to develop and implement an operating procedure for and starting and switching PCK-14 and PCK-10 pumps. A review of the LAR P & P, Operating Information, Procedures, and Training Manual, 5-1-5, revealed the process supervisor or a shift supervisor performs the following steps: determines a use category for an operating procedure according to Attachment 3, Risk-Based Use Categories; writes the operating procedure; assigns a subject matter expert to review the new operating procedure; and certifies that the new operating procedure is ready for use. A review of the East Operations master operating and emergency procedures index, however, revealed there was no operating procedure for switching light coker gas oil (LCGO) service between the PCK-10 and PCK-14 pumps. During an interview on July 16, 2019 at 1:45 p.m., David Prieto (Prieto), Operator, stated that there were no operating procedures on how to start or switch pumps. [Truncated]

Citation: 19 CCR 4.5 2762.6(a) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2762.6(a)
Violation Description: Failure to develop, implement and maintain effective written Management of Change (MOC) procedures to manage changes in process chemicals, technology, procedures, process equipment, and facilities. Failure to also develop, implement and maintain written Management of Organizational Change (MOOC) procedures to manage changes in personnel or organizational issues. The MOC procedure shall include provisions for temporary repairs, including temporary piping or equipment

PHILLIPS 66 COMPANY, CARSON PLANT (Continued) **S103963019**

repairs.

Violation Notes: Returned to compliance on 07/21/2020. OBSERVATION: On 01/05/2019, SAP notification 16228225 was created for DU-23, for G no cooling water through seal cooler.G The corresponding order number 61797696 was never started or completed to repair the DU-23 seal cooler issue. A second SAP notification,16245570, was created on 02/07/2019 to replace DU-23 seal flush cooler. The corresponding order number 61833282 was created on 02/14/2019; however, the actual work was not started or completed. The DU-5 Crude Board Operator, Anthony Concha, created a third SAP notification, 16262587, on 03/14/2019 to repair the seal flush leak on the DU-23 pump. Additionally, he documented in the DU-5 Crude Board Operator Log Book comments, G DU-23 UCR pump is leaking from the tube fitting on the seal flush cooler, UCR was spraying out around the tube fitting but was able to reduce the leak by wiring the tubing creating a pinch pointG G A metal wire was wrapped around a hose to secure it in place at the DU-23 seal flush cooler as an [Truncated]

Violation Date: 09-17-2019
Citation: 19 CCR 4.5 2765.2(a) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2765.2(a)

Violation Description: Failure to develop, implement, and maintain at the stationary source an emergency response program that includes the following elements: 1. Procedures for informing and interfacing with the public and local emergency response agencies about accidental releases, emergency planning, and emergency response. 2. Documentation of proper first-aid and emergency medical treatment necessary to treat accidental human exposures. 3. Procedures and measures for emergency response after an accidental release of a regulated substance. 4. Procedures for the use of emergency response equipment and for its inspection, testing, and maintenance are developed by the stationary source. 5. Training for all employees in relevant procedures and relevant aspects of the Incident Command System. 6. Procedures to review and update the emergency response plan to reflect changes at the stationary source are developed and employees are informed of these changes.

Violation Notes: Returned to compliance on 07/21/2020. OBSERVATION: The owner or operator failed to train employees in relevant procedures and relevant aspects of the Incident Command System (ICS) for the emergency response program. On March 15, 2019, Leo Thompson, Utility Operator at the Crude Unit, operated a fire hose during the DU-22 Pump Fire Incident without having the required ICS training. On March 26, 2019, during an interview, Leo Thompson said that the fire at the DU-22 pump started at approximately 7:15 pm on March 15, 2019. Mr. Thompson described the sound of the fireball as a loud G huff.G As he walked around accumulator, Victor 3430, he felt the blast wave and heat of the fire ball and explosion and saw the smoke. After he used his radio to inform the control room of the fire, he activated the air power to the deluge system and turned on a fire monitor. Then he proceeded to use a fire hose next to pump 8098. He said that while he was using the fire hose, he was standing in oily water above his mid-calf. [Truncated]

Citation:	HSC 6.95 25510(a) - California Health and Safety Code, Chapter 6.95, Section(s) 25510(a)
Violation Description:	Failure to report a release or threatened release of a hazardous material to the unified program agency and to OES.
Violation Notes:	Returned to compliance on 10/22/2020. OBSERVATION: Upon discovery of the Coker fire on May 2, 2019, the owner or operator failed to immediately report a release or threatened release of a hazardous material, or an actual release of a hazardous substance to the UPA, and to the California Office of Emergency Services (CalOES). The owner or operator failed to provide a CalOES Spill report to demonstrate the incident was reported. A review of Impact Report #327900 revealed that a process safety and environmental incident occurred at 4:45 p.m., on May 2, 2019, when a fire was reported at the Coker unit in the area of the LCGO pumps. According to the Phillips 66 submitted letter dated July 15, 2019, approximately 85 barrels (3,570 lbs.) of LCGO was released. During an interview on June 27, 2019, Ed Becker, Health and Safety Manager, stated there had been a miscommunication when Shelly Micuzzi had called CalOES, G the representative told her she did not need to make the notificationG to the UPA and CalOES [Truncated]

Citation:	19 CCR 4.5 2762.4(a) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2762.4(a)
Violation Description:	(1) Failure to train each employee involved in operating a process, and each operating employee prior to working in a newly assigned process, in an overview of the process and in the operating procedures as specified in section 2762.3. Failure to include material on the specific safety and health hazards applicable to the employee's job tasks, procedures, including emergency operations and shutdown, and safe work practices applicable to the employee's job tasks. (2) Failure to train each employee involved in maintaining the on-going integrity of process equipment in an overview of that process and its hazards and in the procedures applicable to the employee's job tasks to assure that the employee can perform the job tasks in a safe manner.
Violation Notes:	Returned to compliance on 10/22/2020. OBSERVATION: the owner or operator failed to train each operator of the Coker unit involved in maintaining the on-going integrity of LCGO pumps after a process change was made to the seal flush cooler to assure the operator can perform the job tasks in a safe manner. During an interview on July 16, 2019 at 1:45 p.m., Prieto stated that on May 2, 2019, the operators and the Reliability Group mechanics started up PCK-10 and there had been a change to the seal flush cooling system. Prieto explained there had been a problem with the seal flush cooler and the impeller was not spinning which indicated there was no water flow through the seal flush cooler. Richard Barton (Barton), Mechanical

PHILLIPS 66 COMPANY, CARSON PLANT (Continued) **S103963019**

Supervisor, opened a valve at the bottom of the seal flush cooler and water drained on the ground. The impeller began moving which indicated water flow had resumed. During an interview on November 13, 2019, at 11:45 a.m., Barton described the purpose of the seal flush cooler: it receives [Truncated]

Citation: 19 CCR 4.5 2762.6(f) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2762.6(f)
Violation Description: Failure to ensure employees involved in the process as well as maintenance workers whose job tasks will be affected by a change, are informed of, and effectively trained in the change in a timely manner, prior to implementation of the change. Failure to make the MOC documentation available to and require effective training in the change prior to implementation of the change, pursuant to section 2762.12, for contractors and employees of contractors who are operating the process and whose job tasks are affected by a change.
Violation Notes: Returned to compliance on 10/22/2020. OBSERVATION: The owner or operator failed to ensure that operators whose job tasks would be affected by a change, were informed of, and effectively trained in the change in a timely manner, prior to implementation of the change. Prieto and Fears were not trained on permanent MOCs, M20192273 and M20135455. M20192273 was regarding the following changes: removal of corrosion probes, flanges, and reducing tees from the discharge pipe downstream of the LCGO pumps, PCK-10 and PCK-14; provision of a straight pipe connected by a different welding material; removal of an alarm/instrumentation device, and an update to the PSI. M20135455 was in regard to a major capital project involving the following changes: replacement of the multistage pumps with single stage overhung pumps; process modification of piping, valves, and flanges to fit the single stage overhung pumps; changes in seal plans; and changes to standard operating procedures (SOP). The change involved the need for [Truncated]

Site Name:	PHILLIPS 66 COMPANY, CARSON PLANT
Violation Date:	09-17-2019
Citation:	19 CCR 4.5 2762.5(a) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2762.5(a)
Violation Description:	Failure to develop, implement, and maintain effective written procedures to ensure the ongoing integrity of process equipment. (1) Failure to ensure the procedures provide clear instructions for safely conducting maintenance activities on process equipment, consistent with the Process Safety Information. (2) Failure to ensure the procedures and inspection documents developed under subsection 2762.5 are readily accessible to employees and employee representatives pursuant to section 2762.10.
Violation Notes:	Returned to compliance on 07/21/2020. OBSERVATION: The owner or operator failed to develop and implement written procedures for maintenance of the DU-21, DU-22, and DU-23 centrifugal reflux pumps. The Phillips 66 Refining Recommended Best Practice (BP), Rotating Equipment Routine Pump Care, M-45 BP-4, is a corporate guide for maintaining the ongoing integrity of the rotary equipment; however, there was no evidence to demonstrate any site specific written maintenance procedures were developed or implemented for the Los Angeles Refinery. During interview on April 2, 2019, Leah Moore, Rotating Equipment and Reliability Engineer, provided the following statements: Pumps like DU-22 require the following maintenance: motor gets greased, oil mist is inspected, and vibration values are recorded as a part of the reliability rounds if the pump is in operation. Written notification is created in SAP when there is an equipment issue which would require maintenance and the shop supervisor is notified. The shop [Truncated]

Citation:	19 CCR 4.5 2762.5(b) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2762.5(b)
Violation Description:	(1) Failure to ensure inspections and tests are performed on process equipment, using procedures that meet or exceed recognized and generally accepted good engineering practices (RAGAGEP). (2) Failure to ensure the frequency of inspections and tests of process equipment are consistent with (1) the applicable manufacturers' recommendations, (2) RAGAGEP, or (3) internal practices that are more protective than (1) or (2). Failure to ensure inspections and tests are conducted more frequently if necessary, based on the operating experience with the process equipment. (3) Failure to retain a certification record to document that each inspection and test has been performed in accordance with subsection 2762.5. Failure to ensure the certification record identifies the date of the inspection; the name of the person who performed the inspection or test; a description of the inspection or test performed; the results of the inspection or test; and the serial number or other identifier of the equipment on which the

PHILLIPS 66 COMPANY, CARSON PLANT (Continued) **S103963019**

inspection or test was performed.

Violation Notes: Returned to compliance on 07/21/2020. OBSERVATION: The owner or operator failed to perform inspection and tests on the DU-21, DU-22, and DU-23 centrifugal reflux pumps using procedures that meet or exceed RAGAGEP. The inspection and testing frequencies were inconsistent with RAGAGEP, such as API 610, API 682 or the Phillips 66 Refining Recommended Best Practice (BP), Rotating Equipment Routine Pump Care, M-45 BP-4. The owner or operator failed to document that the required inspection and test was performed. During interview on April 2, 2019, Leah Moore, Rotating Equipment and Reliability Engineer, provided the following statements: on or about December 2017, she created the Reliability Rounds Routine Pump Care form for recording and documenting the inspection results. She stated reliability rounds are made every three months, and vibration analysis is currently conducted monthly. Prior to that time, maintenance for pumps or reliability rounds had only been visual inspections, and there had been no [Truncated]

Citation: 19 CCR 4.5 2762.8(a) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2762.8(a)

Violation Description: Failure to conduct an effective compliance audit and certify every three (3) years that the procedures and practices developed under Article 6.5 have been evaluated to verify they are in compliance with the provisions of Article 6.5, and are being followed.

Violation Notes: Returned to compliance on 10/15/2020. OBSERVATION: The owner or operator failed to conduct and certify a compliance audit based on an evaluation of procedures and practices developed under Article 6.5 (Program 4) of the CalARP regulations. A review of the compliance audit report, dated October 9, 2018, Attachment A, exhibited non-conformances of the following California Accidental Release Prevention (CalARP) regulations: 19 CCR 2760.1, 19 CCR 2760.2, 19 CCR 2760.5, 19 CCR 2760.6, 19 CCR 2760.7; these were based on Program 3 (Article 6) requirements, and not on Program 4 requirements. CORRECTIVE ACTION: Conduct an effective compliance audit and certify that the owner or operator has evaluated the procedures and practices developed under Article 6.5. Provide a copy of the compliance audit to the UPA.

Violation Description: Failure to submit an RMP which includes all requirements described in section 2745.3 through 2745.9.

Violation Notes: Returned to compliance on 10/22/2020. OBSERVATION: The owner or operator failed to submit a risk management plan (RMP) which includes the Program 4 requirements as provided in Section 2745.7.5. The five

PHILLIPS 66 COMPANY, CARSON PLANT (Continued) **S103963019**

year RMP update submitted to the United States Environmental Protection Agency (US EPA) on June 17, 2019 included data on prevention program elements for Program 3. A copy of this RMP was submitted with a cover letter from the Senior Process Safety Consultant to the Unified Program Agency (UPA). The cover letter specified that the UPA would receive the Program 4 update before October 2019; however, the Program 4 data elements were not submitted. CORRECTIVE ACTION: Submit the Program 4 prevention program elements and information as required by Section 2745.7.5 to the UPA.

Violation Description: Failure to correct equipment deficiencies to ensure safe operation of process equipment. Failure to ensure repair methodologies are consistent with RAGAGEP or more protective internal practices.
Violation Notes: Returned to compliance on 10/15/2020. OBSERVATION: The owner/operator failed to repair or replace a blocked seal flush cooler at the PCK-10 pump and a non-functional check valve at the PCK-14 pump discharge pipe before further use and ensure safe operation of the pumps until the seal flush cooler and check valve could be corrected. A review of the May 2, 2019 shift relief report by Lopez revealed the operational condition of PCK-10: G Ran PCK-10, all looks good but need to fix seal water cooler. Water cooler outlet open to grade, ok to run overnight Per Liah and Richard.G The shift notes did not reference a work order for repairing or replacing the seal flush cooler and the check valve, or specify any means to assure safe operation of the PCK-10 and PCK-14 pumps. A review of SAP work order request, #61884480, for the leaking seal flush cooler at the PCK-10 pump revealed G PCK-10 seal oil water cooler is in bad shape and leaking.G On April 2, 2019, a machinist initiated work order #116268338 for routine [Truncated]

Citation: 19 CCR 4.5 2762.5(d) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2762.5(d)
Violation Description: (1) Failure to ensure that all process equipment at a minimum complies with the criteria established in subsection 2762.1(d). Failure to ensure that all process equipment is: (1) suitable for the process application for which it is or will be used; (2) fabricated from the proper materials of construction; (3) designed, constructed, installed, maintained, inspected, tested, operated and replaced in compliance with the manufacturer's and any other design specifications and all applicable codes and standards. (2) Failure to ensure and document newly installed process equipment or existing process equipment for which no RAGAGEP exists, are designed, built, installed, maintained, inspected, tested and operated in a safe manner. (3) Failure to conduct regularly scheduled checks and inspections as

PHILLIPS 66 COMPANY, CARSON PLANT (Continued) **S103963019**

necessary to ensure that the requirements of paragraph (1) are met. (4) Failure to ensure that maintenance materials, spare parts and equipment meet design specifications and applicable codes. (5)Failure to establish a process for evaluating new or updated equipment codes and standards and implementing changes as appropriate to ensure safe operation.

Violation Notes: Returned to compliance on 10/22/2020. OBSERVATION: The owner or operator failed to ensure that the PCK-10 Ladish valve and the CK-4 chain operated valve were designed, constructed, installed, maintained, inspected, tested, operated and replaced in compliance with the manufacturerG s specifications and applicable codes and standards. A review of the Los Angeles Refinery Coker Fire, Incident Investigation Report IMPACT #327900 revealed the G -+-inch block valve was missing 2 bonnet bolts, the bonnet gasket was missing, the bonnet bolts were cap screws rather than a stud with 2 nutsG G The Incident Corrective Actions addressed the need to improve valve rebuild quality with checklists, bolt torqueing requirements, and gasket verification. During an interview on June 27, 2019, at 10:40 a.m., Barton stated Emergency Response Team (ERT) members had to climb a ladder to the CK-4 Stripper and manually close a vent line from CK-4 to CK-1 Fractionator and a suction line of PCK-10 from CK-4. Violation Description: Failure to develop and implement effective written operating procedures with clear instructions for safely conducting activities involved in each process with the process safety information.

Violation Notes: Returned to compliance on 07/21/2020. OBSERVATION: The owner or operator failed to develop and implement specific operating procedures for centrifugal reflux pumps, DU-21, DU-22, and DU-23, such as for removing pumps from service, returning pumps to service, and switching to a spare (standby) pump. Furthermore, operators stated they did not have or use any written operating procedures for returning DU-22 to service during or prior to the DU-22 Pump Fire Incident on March 15, 2019. On March 15, 2019, the crude unit operating employees removed DU-23 from service due to a mechanical issue and placed the spare pump, DU-22, into service without implementing any specific operating procedures or steps to ensure a safe operation. DU-22 had been removed from service for repairs and had not been in operation since January 18, 2018. During interview on April 2, 2019, Daniel Viveros, Operator, provided the following statements: On March 15, 2019, DU-22 was placed back into service because DU-23 had a leak of [Truncated]

Chapter 4.5, Section(s) 2762.5(c)
Violation Description: Failure to correct equipment deficiencies to ensure safe operation of process equipment. Failure to ensure repair methodologies are consistent with RAGAGEP or more protective internal practices.
Violation Notes: Returned to compliance on 07/21/2020. OBSERVATION: The owner or operator failed to correct deficiencies of the DU-22 pump and suction valve and the DU-23 seal flush cooler to ensure safe operation of the pumps. A review of the refineryG s maintenance and mechanical integrity database, SAP, revealed the following: Leah Moore, Rotating Equipment and Reliability Engineer created SAP Notification, 16042281, on 12/29/2017 and stated G DU-22 pump has very high vibration. Seems like unbalance in the horizontal axis.G On 12/29/2017, she stated DU-22 coupling shims are cracked. Please replace and re-align.G DU-22 pump was repaired on 01/22/2018; however, no post repair test was conducted to confirm the observed and documented mechanical integrity issues had been properly addressed and resolved. On 01/05/2019, SAP notification 16228225 was created for DU-23, for G no cooling water through seal cooler.G The corresponding order number 61797696 was never started or completed to repair the DU-23 seal cooler issue. Completed Document Type: CEQA - Initial Study/ Neg. Declaration
Completed Date: 04/14/1995
Comments: The CEQA documents (Negative Declaration) and the Remedial Action Plan are approved following a 30-day public comment period. The recommended alternative includes the following elements: institutional controls; monitoring; excavation, in-situ and ex-situ bio-treatment, soil vapor extraction and bioventing of deep soils and shallow soils; thermal/catalytic oxidation of soil vapor; vacuum enhanced LNAPL recovery with total fluids pumps; recovered LNAPL disposal by a certified waste recycler or a permitted hazardous waste TSDF; groundwater remediation by air sparging within the SVE capture radius and plume of groundwater contamination; if necessary groundwater extraction and treatment with air stripping followed by GAC; and treated groundwater discharge to the sanitary sewer. Sparging would not be implemented until the LNAPL had been removed.

Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Initial Study/ Neg. Declaration
Completed Date: 04/14/1995
Comments: The CEQA documents (Negative Declaration) and the Remedial Action Plan are approved following a 30-day public comment period. The recommended alternative includes the following elements: institutional controls; monitoring; excavation, in-situ and ex-situ bio-treatment, soil vapor extraction and bioventing of deep soils and shallow soils; thermal/catalytic oxidation of soil vapor; vacuum enhanced LNAPL recovery with total fluids pumps; recovered LNAPL disposal by a certified waste recycler or a permitted hazardous waste TSDF; groundwater remediation by air sparging within the SVE capture radius and plume of groundwater contamination; if necessary groundwater extraction and treatment with air stripping followed by GAC; and treated groundwater discharge to the sanitary sewer. Sparging would not be implemented until the LNAPL had been removed.

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	The responsible party has paid for all remediation activities to date and is expected to continue. The RP provided DHS with $50,000 advance funding for DHS' oversight and monitoring costs under the terms of the enforceable agreement signed in November, 1987. The $50,000 in advance funds have been spent. DHS has budgeted $50,000 for contractor assistance to DHS oversight/monitoring staff. DHS will recover 100 percent of direct costs plus staff costs related to the project.
Site Description:	This 65-acre site was used from 1937 to 1982 to manufacture asbestos insulation products, cement and polyvinyl chloride pipe. The site is currently vacant but contains spilled and buried asbestos waste.
Hazardous Waste Desc:	Numerous buried settling ponds and disposal pits which contain asbestos wastes exist throughout the site.
Threat To Public Health & Env:	The primary threat is human exposure to a release of asbestos fibers. To preclude direct contact with the substances, the site is fenced and secured 24 hours a day.
Site Activity Status:	Manville Corporation entered into an enforceable agreement with the Department in November, 1987 to conduct remedial investigation activities. A remedial investigation was conducted to define the nature and extent of contamination and to determine the type and extent of remedial measures necessary. A feasibility study was approved July, 1988. A draft RAP is under review by DHS and is expected to be final by January, 1989.

Alternate Address:	2112 EAST 223RD STREET
Alternate City,St,Zip:	CARSON, CA 90745
Background Info:	The Stauffer Chemical site is located at 2112 East 223rd Street in the City of Carson, Los Angeles County. The site occupies an area of approximately 25 acres. The site is an inactive polyvinyl chloride plant. The plant was deactivated in 1982 and the majority of buildings, chemical storage, and process facility have been removed and there is no active storage of hazardous waste materials at the site. 1,2 DCA or 1,2 dichloroethane and vinyl chloride are the primary constituents of concern. Soil and groundwater investigations have indicated the presence of chlorinated hydrocarbons.

Quarterly Update:	This facility is also known as Stauffer Chemical Co. This facility manufactured ethylene chloride/dichloride, vinyl chloride, and polyvinyl chloride resins. This facility Received an ISD on 4/6/81. After obtaining the ISD, Stauffer requested amendments to their ISD to add an incinerator to the ISD. The incinerator was needed as Stauffer was no longer able to dispose distillation heavy ends. DTSC amended the ISD on 9/18/81. Stauffer did not pursue a Part B permit but rather shut down the operation and closed the facility. Facility operation ceased in May 1982 and Stauffer sent a notification letter to EPA on 10/22/82 stating facility shut down and closure was completed. Although Stauffer had already conducted closure activity, they did not notify EPA/DHS of their closure and did not go through the formal closure process. Therefore, they were required to submit Closure Plans after the fact of facility closure. Stauffer submitted closure plans to DHS on 6/17/83 and 5/4/83. Facility structures were demolished in 1985. File records do not show the closure of the facility being approved and closure being certified/verified. Instead, closure/cleanup of the facility was undertaken by site mitigation. On 7/7/94 a consent agreement & Imminent and substantial endangerment order was issued by Site Mit to require remediation of the site. Refer to site mitigation database for site cleanup details. It looks like site clean up is still active at this facility. 4/25/2018- Consent order dated 06/27/1994 was uploaded from cleanup to refer facility to CERCLA for cleanup. PM, Isaac Hirbawi, confirmed that this site is still open and undergoing cleanup.

Background Info:	Monsanto Chemical Company has manufactured bio and nonbio-degradable detergents for over three decades. The site is

MONSANTO CHEMICAL COMPANY/ C/O LARRY ADAMS SUPERINTENDANT (Continued) **1000376908**

located in a heavily industrialized area. Raw materials used in the process include benzene, paraffin, olefin, chlorine, anhydrous ammonia, and aluminum chloride. Volatile organic solvents, chlorinated as well as non-chlorinated, have been found in the groundwater. A layer of benzene is floating on top the groundwater table. Contaminants identified in the soil include benzene and assorted petroleum hydrocarbons. Soil vapor tests have detected the presence of chlorinated solvents. Direct contact with contaminated soil, inhalation of volatile organics, surface runoff, and groundwater contamination are a threat to public health and the environment. Contaminated water is used for industrial and agricultural purposes. A Consent Order with Monsanto, to investigate the extent of contamination and cleanup the site, was signed in December 1990.
Not reported
Sampling analyses indicate high levels of benzene in shallow aquifer. A seven-inch non-aqueous benzen layer has been identified. 1,2-dichloroethane exists in shallow and deep aquifer.
Not reported
A revised amendment to the Consent Order was finalized and signed on November 15, 1993 to include Remediation Capital Corporation of Reno, Nevada, as a party to the Agreement. RCC purchased the property from Monsanto in September 1993.
Not reported
RCC subsequently filed for bankruptcy and the site reverted back to Monsanto (now Solutia).

Comments: Not reported

Completed Area Name: Groundwater Operable Unit
Completed Sub Area Name: Not reported
Completed Document Type: Feasibility Study Report
Completed Date: 03/05/2008
Comments: DTSC approval letter was sent to Stauffer on 3/5/08

Completed Area Name: Soil Operable Unit
Completed Sub Area Name: Not reported
Completed Document Type: Design/Implementation Workplan
Completed Date: 12/31/1997
Comments: Soil remedial Design and Implementation Plans were approved by DTSC.

Completed Area Name: Soil Operable Unit
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Plan
Completed Date: 06/25/1997
Comments: DTSC approved soil RAP and Negative Declaration. The selected alternative addresses the soil operable unit as an interim measure. The project includes vapor and liquid extraction with vapor and liquid treatment for soils. The interim cleanup number for 1,2, DCA is 20 ppm.

Completed Area Name: Soil Operable Unit
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Investigation / Feasibility Study
Completed Date: 01/30/1997
Comments: DTSC reviewed and approved the revised Feasibility Study report. This completes the approval of the RI/FS for the soil operable unit.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/29/2021
Date Data Arrived at EDR: 08/04/2021
Date Made Active in Reports: 08/31/2021
Number of Days to Update: 27

Source: EPA
Telephone: N/A
Last EDR Contact: 09/01/2021
Next Scheduled EDR Contact: 10/11/2021
Data Release Frequency: Quarterly

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 07/29/2021
Date Data Arrived at EDR: 08/04/2021
Date Made Active in Reports: 08/31/2021

Next Scheduled EDR Contact: 10/11/2021
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

Next Scheduled EDR Contact: 11/28/2011
Data Release Frequency: No Update Planned

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/29/2021

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 02/22/2021

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

CERS: CalEPA Regulated Site Portal Data

The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 03/24/2021
Date Data Arrived at EDR: 05/11/2021

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Version Date:	2012

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

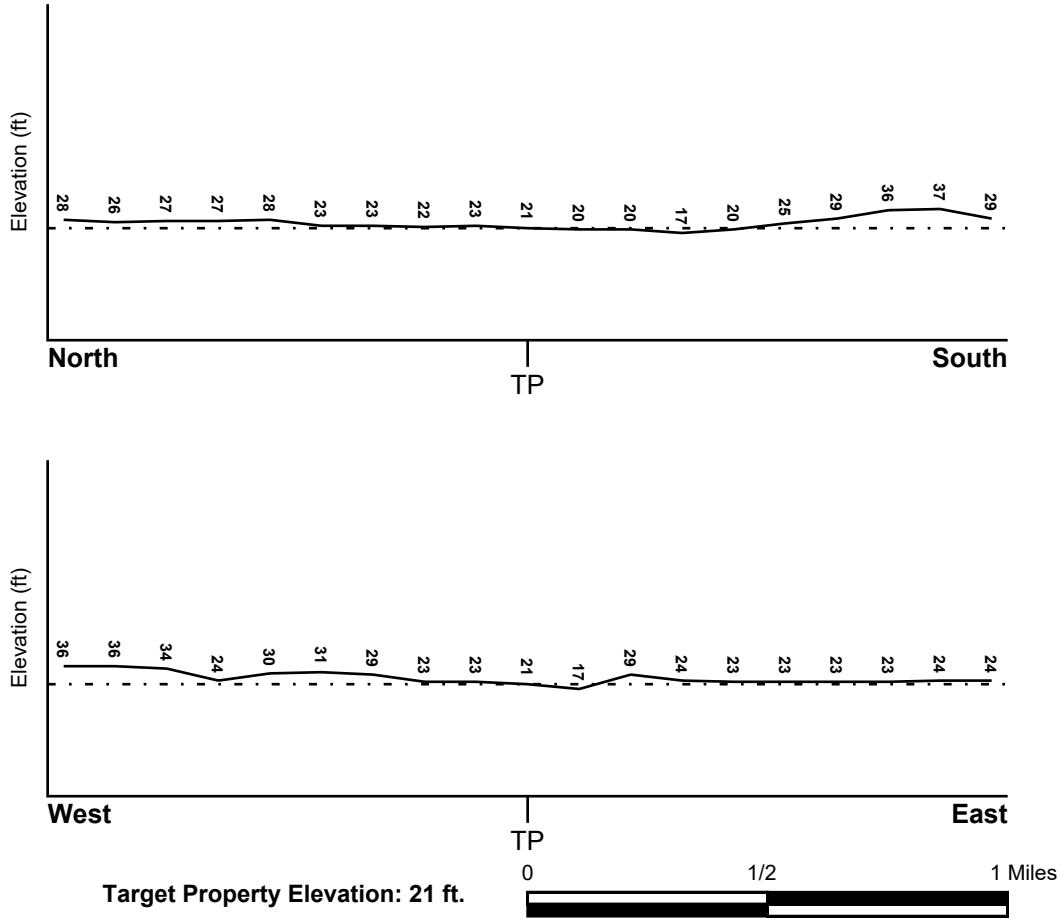
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 21 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1965F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06037C1955F	FEMA FIRM Flood data
06037C1962F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NORTH LONG BEACH (OE)	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/8 - 1/4 Mile NW
Site Name:	AIR PRODUCTS & CHEM INC
Site EPA ID Number:	CAT080010655
Groundwater Flow Direction:	West
Measured Depth to Water:	30 to 40 feet in the semi-perched Gaspur aquifer.
Hydraulic Connection:	The Gaspur aquifer is hydraulically connected to the underlying Gage aquifer, which in turn, is interconnected with the underlying Lynwood aquifer.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information based on site-specific subsurface investigations is documented in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
BI376	1/2 - 1 Mile NNW	NE
1G	1/2 - 1 Mile NNW	NE

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
loam
clay
silt loam
loamy sand
sandy loam
fine sand
clay loam
gravelly - sandy loam
coarse sand
gravelly - sand
sand

Surficial Soil Types:
loam
clay
silt loam
loamy sand
sandy loam
fine sand
clay loam
gravelly - sandy loam
coarse sand
gravelly - sand
sand

Shallow Soil Types:
fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types:
stratified
clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

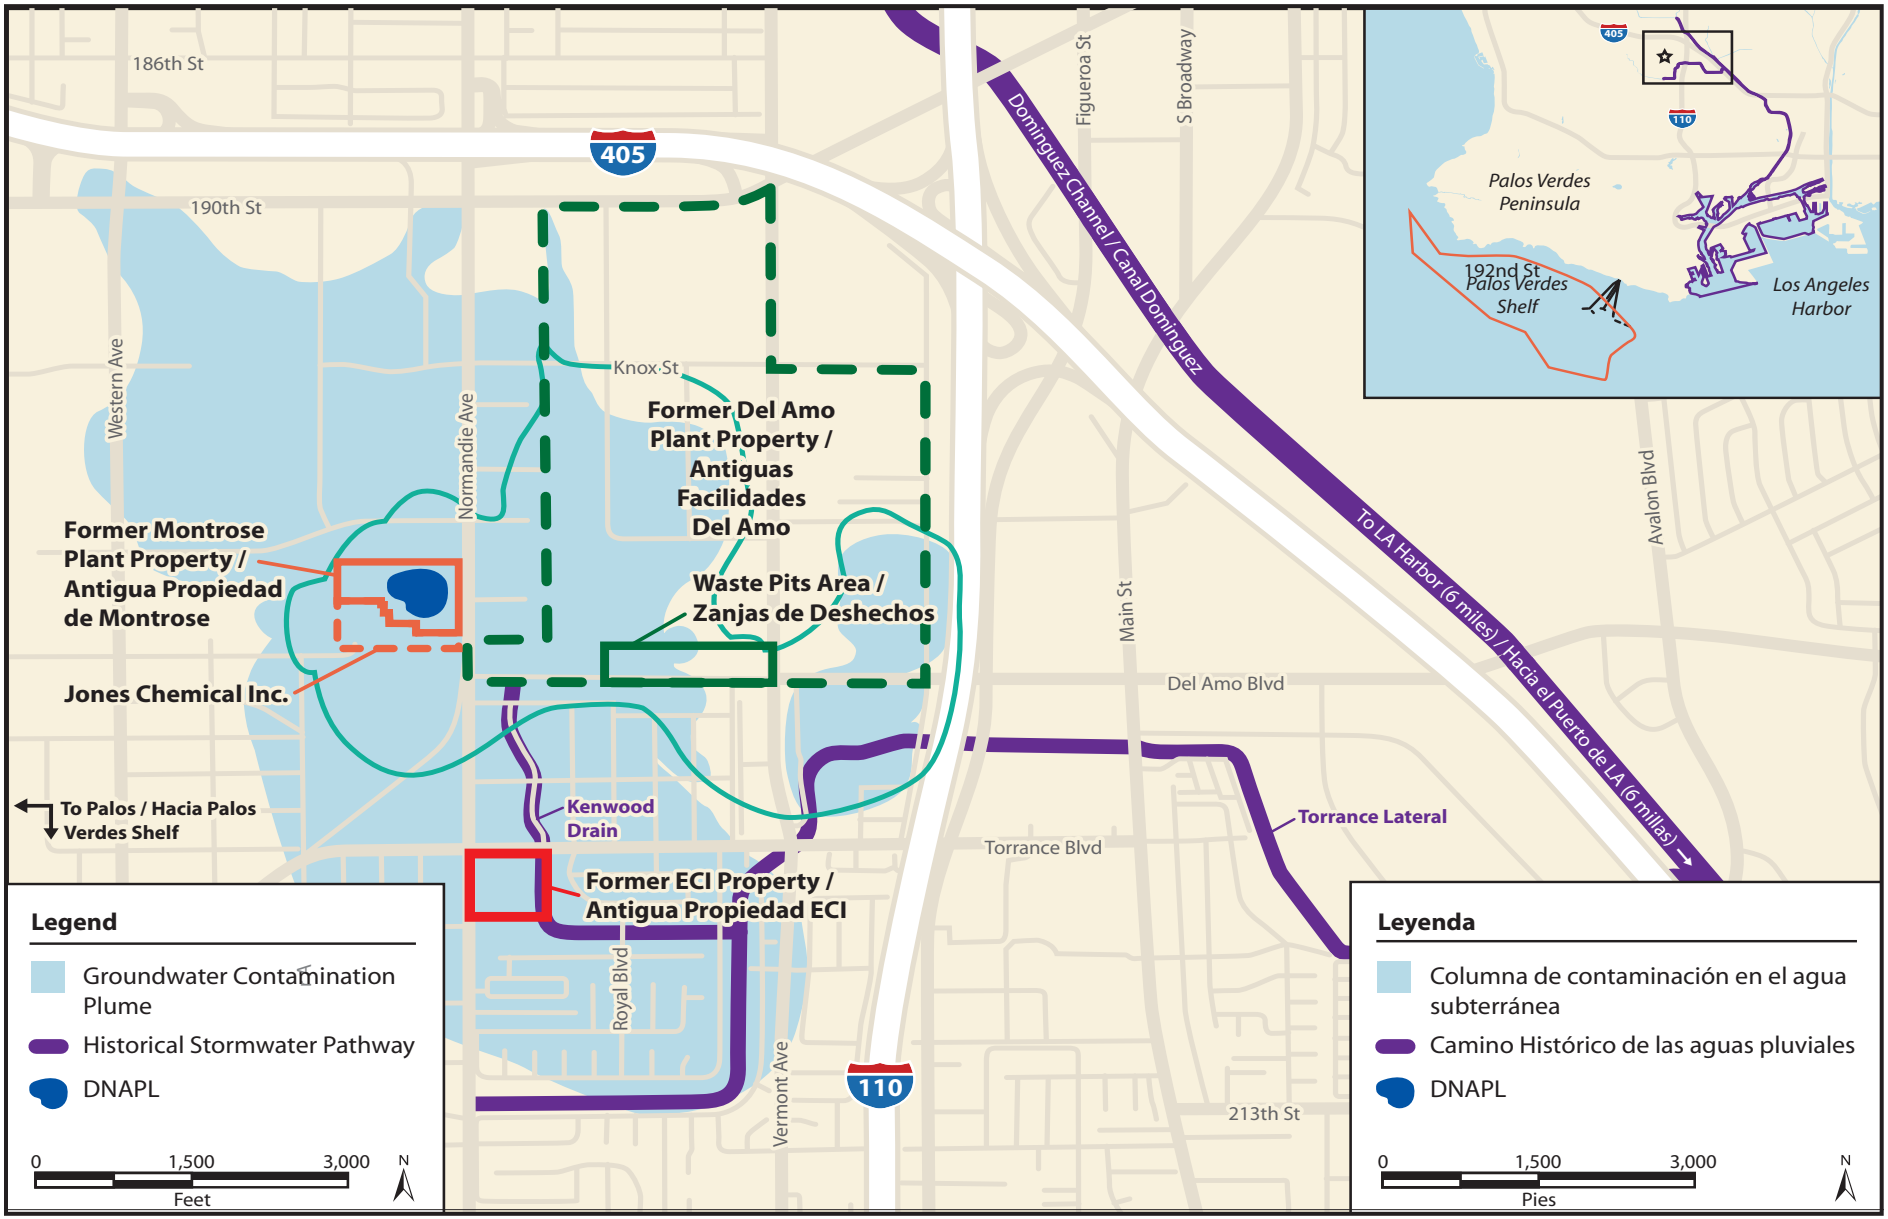
Soil Gas Investigation at the JCI Jones Portion of the Montrose Site 6

Community Involvement Plan Update 7

Montrose and Del Amo Superfund Site History

The Montrose Chemical Corporation Superfund site ("Montrose site") includes the location of a former dichloro-diphenyltrichloroethane (DDT) manufacturing plant. The plant made the chemical from 1947 to 1982. In 1989, EPA included the Montrose site as part of its Superfund cleanup program. DDT manufacturing work had severely contaminated (polluted) the soil and groundwater beneath and nearby the former plant property.

The Del Amo Superfund site ("Del Amo site") is made up of three former manufacturing plants built to support World War II efforts. The former Del Amo facility is east of the former Montrose plant property. In 2002, EPA included the Del Amo site as part of its Superfund cleanup program. The Del Amo site, like the Montrose site, also had contaminated soil and groundwater beneath and nearby the former facility. Groundwater contamination from both sites has mixed. As such, EPA is managing the cleanup of the groundwater contamination at both sites as one project.



What is a Superfund Site?

In 1980, Congress passed the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), commonly called the "Superfund law." This law was passed in response to public concern about health and environmental risks from hazardous waste sites. This law allows EPA to clean up certain hazardous waste sites and requires companies responsible for the contamination to pay for or do the cleanup. Other types of pollution are handled by other environmental laws.

This fact sheet gives the latest information on EPA's work to clean up both Superfund sites and opportunities for you to learn more about the cleanup and engage with EPA.

Site Map: Montrose and Del Amo Superfund Sites

Harbor Gateway, Los Angeles County, CA / Harbor Gateway, condado de Los Angeles, CA

Commercial Building Indoor Air Investigation at the Del Amo Site

Background

Vapor intrusion is the process where certain chemicals underground volatilize (evaporate) and move into the indoor air of overlying buildings. The chemicals can enter a building by moving through cracks and/or other openings in the building's foundation. (See Figure 1 for more information on vapor intrusion.) As a follow-up to the Del Amo site's 2015 Five-Year Review—a report done every five years to ensure EPA's cleanup plan continues to protect public health—EPA evaluated historic soil vapor data to see if vapor intrusion should be investigated. EPA found vapor intrusion investigations were needed at nine commercial buildings.

In September 2017 and March 2018, Shell Oil Company (Shell), under EPA oversight, sampled soil-gas, indoor and/or outdoor air at two buildings on the Del Amo site—the Coca-Cola building and the LSC Communications (formerly, RR Donnelly) building. (Sampling is done over multiple seasons to ensure results are accurate under all indoor conditions.)

The sampling showed there were no health risks from vapor intrusion at the Coca-Cola or LSC buildings.

The other responsible companies for cleaning up contamination at Del Amo site developed a sampling plan for nine additional buildings. Following EPA's approval, the companies sampled air beneath the buildings in October 2019. EPA is currently evaluating the results and a second sampling event is being scheduled.

Sampling will be scheduled for the additional buildings.

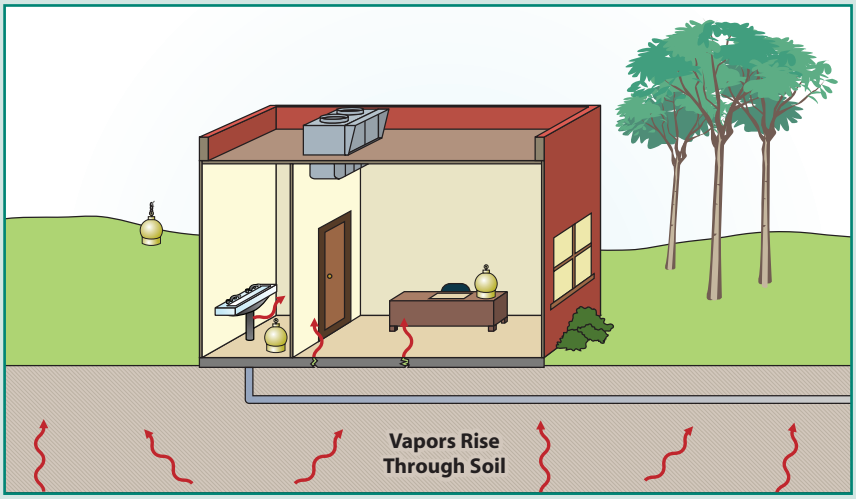


Figure 1: This figure shows how certain chemicals can volatilize (evaporate) and move into indoor air of overlying buildings through cracks and other openings in the building's foundation. The arrows show how these chemicals move into buildings above ground.

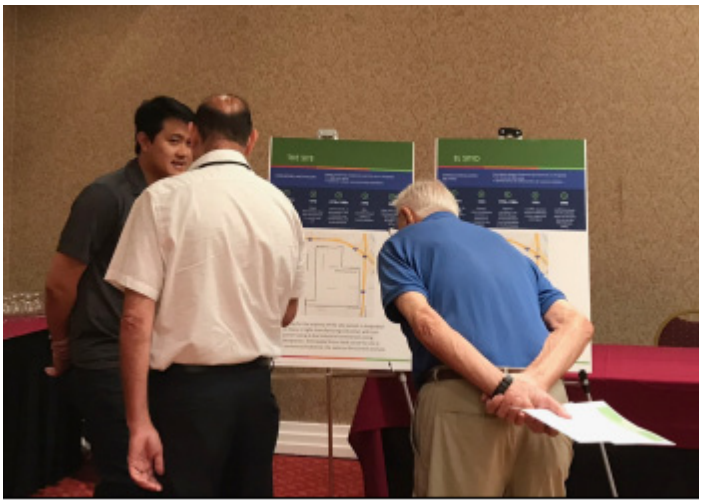

Figure 2: The location of the Coca-Cola and LSC Communications buildings.

Soil Cleanup Work at the Del Amo Site

In late 2018, Shell completed a soil cleanup pilot study at the Coca-Cola property, under EPA oversight. The goal of the pilot study was to see if a soil vapor extraction (SVE) system would effectively clean up the soil. This pilot study was important because its results would help EPA create a final cleanup plan for this portion of the site.

SVE works by heating up the chemicals underground. This heating causes the chemicals to volatilize (evaporate). The SVE system then captures all chemical vapors and treats them. Results from the pilot study showed an SVE system would effectively remove contaminants while protecting property workers and nearby residents.

EPA hosted the SVE pilot study community open house in September 2019.

EPA Remedial Project Manager, Tu Nguyen, speaking with community members at the September 2019 SVE meeting.

Five-Year Review

EPA is doing a Five-Year Review for cleanup work at the Montrose and Del Amo sites, respectively. According to the Superfund law, EPA is required to review its cleanup plan, or "remedy," every five years if either the cleanup takes more than five years to complete or if hazardous waste remains on site.

The last Five-Year Review for the Del Amo site, done in 2015, found there was insufficient information to say the soil and NAPL cleanup plans (or "remedies") were protective of human health and the environment. EPA could not say they were protective due to the potential for vapor intrusion at the Del Amo site. As described above, EPA has since done studies on vapor intrusion, which showed there are no health risks from vapor intrusion at the Coca-Cola or LSC buildings, and it has plans to study the remaining buildings. The last Five-Year Review also found the remedy at the "Waste Pits" portion of the Del Amo site was protective of human health and the environment.

The first Five-Year Review for the Montrose and Del Amo groundwater remedy, also done in 2015, found the remedy protected human health and the environment in the short-term. However, to ensure the remedy is protective for the long-term, the Five-Year Review identified numerous issues for EPA to evaluate.

What Is Included in a Five-Year Review?

Five-Year Reviews include:

- an inspection of the site and cleanup technologies;
- review of monitoring data, operating data, and maintenance records; and
- a check for any new relevant regulatory requirements (such as new state or local laws) that have been established since EPA made its original cleanup decision.

EPA Wants to Hear from You!

EPA is doing interviews with community members as part of the Five-Year Review. We want to hear your thoughts on the site cleanup and better understand your concerns and needs. All responses are confidential to EPA, and if you would like to be interviewed, please contact Yarissa Martinez, Remedial Project Manager, to share your thoughts on the groundwater remedy, or Tu Nguyen, Remedial Project Manager, to share your thoughts on the Del Amo remedy. (*Contact information at the end of this fact sheet.*)

A report on Five-Year Review will be completed no later than September 30, 2021. EPA will post a copy of the report on the sites' webpages.

Using Electrical Resistance Heating (ERH) to Clean Up Dense Non-Aqueous Phase Liquid (DNAPL) at the Montrose Site

Electric Resistance Heating pilot study system on the Former Montrose property.

The DNAPL Electrical Resistance Heating (ERH) pilot study—done by Montrose under EPA oversight—ran from January to April 2019. EPA reviewed and provided comments on the final report on the results of this study. Once final, the report will be posted to the sites' webpages in the next few months.

As mentioned, EPA will be working on a final cleanup plan (called a "Record of Decision" [ROD]) for the DNAPL, which is expected to be complete in Fall 2020.

Cleaning Up Groundwater at the Montrose and Del Amo Sites

Site-Wide Groundwater Sampling Event

On September 4, 2019, the sixth-annual dual-site groundwater sampling event was held at more than 500 wells in the area. On this day, the companies responsible for cleaning up groundwater contaminated by the Montrose and Del Amo Superfund sites measured groundwater levels and analyzed groundwater. Results from this sampling event are being analyzed. Once the analysis is complete, results will be included in a report that will be posted on the sites' webpages.

How does the ERH technology work?

The technology uses electricity through long metallic rods, called "electrodes," installed underground throughout the property. The rods heat the underground soil and vaporize the contaminants. The system collects the vapor through an underground network of vacuum wells and moves it to an above-ground treatment system. Air sampling instruments monitored air quality during the pilot study near the former Montrose property to ensure the system was working properly. No air quality issues were found during the pilot study.

What is Non-Aqueous Phase Liquid (NAPL) and Dense Non-Aqueous Phase Liquid (DNAPL)?

A mixture of concentrated chemicals that does not easily dissolve in water is called NAPL by scientists. In general, NAPL and water do not mix (i.e., like oil and water), making it difficult to remove NAPL. Sometimes, NAPL is made of chemicals heavier than water (and, therefore, would sink in water). This variety of NAPL is referred to as Dense Non-Aqueous Phase Liquid (DNAPL).

Ground Water Fact Sheet Update

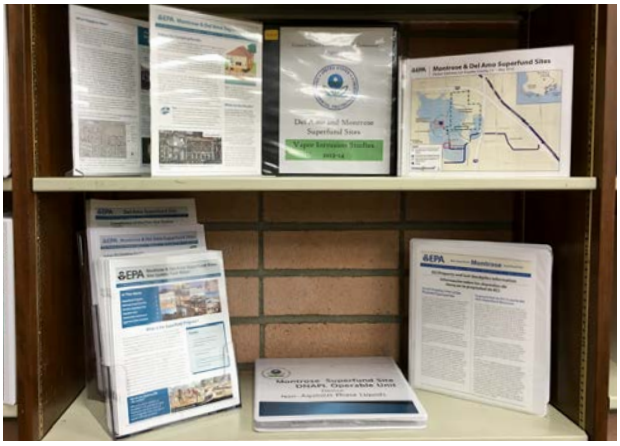
The latest groundwater cleanup factsheet is posted on the homepage for both websites This factsheet includes a complete description of the treatment system, information on how we will continue treating groundwater.

Soil Gas Investigation at the JCI Jones Portion of the Montrose Site

Under EPA oversight, Jones Chemical Company (Jones) developed a soil-gas monitoring plan to: (1) understand how VOCs are behaving underground; and (2) to see where the chemicals are traveling and at what concentrations. Work under the plan started in December 2018 and should be completed by Summer 2020, with a final report by Fall 2020. Preliminary data shows concentrations are not above EPA's screening levels and is moving to the west.

Onsite crew doing soil gas sampling.

Get Involved!



EPA commits to sending email updates on cleanup work every quarter to interested stakeholders. You can sign-up for the Del Amo & Montrose Superfund sites email distribution by clicking on the link in the *bottom-right corner of both websites.*

Community Involvement Plan

EPA representative speaks with community members at a public meeting.

Informational material on Sites at the Carson Public Library in Carson.

EPA is close to finishing its revision of the Montrose and Del Amo Community Involvement Plan (CIP). Because the Montrose and Del Amo Superfund sites impact the same community, EPA is preparing one CIP for community involvement and outreach. The CIP is a strategy unique to the sites and is intended to allow for meaningful community involvement throughout the Superfund cleanup process.

EPA plans to issue the final CIP online and in the local information repositories in early 2020.

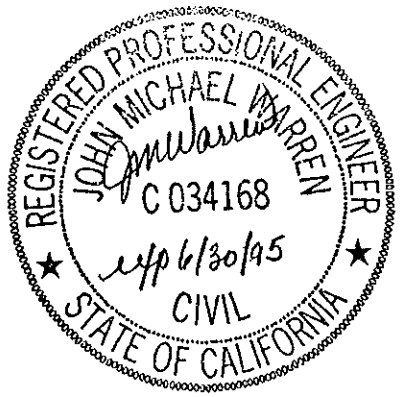
CERTIFICATION PAGE



The attached site investigation report has been prepared under my direction and with my knowledge. I am aware of the contents of the site investigation report and am familiar with the site in question. I believe all data presented to be true and accurate and the approach to be technically sound.

Geology, groundwater hydrology, and geochemistry are inexact sciences, and investigative data commonly contain large uncertainties. The behavior of petroleum products and other contaminants in soil and groundwater are complex phenomena. Our judgements and conclusions are based on the analytical data presented herein and our experiences on other similar projects. The available data do not preclude the presence of materials at other locations on the subject site which presently, or in the future, may be considered hazardous.

Opinion and judgements expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions. This document and the information contained in it have been prepared solely for the use of Air Products and Chemicals, Inc. Any reliance on this information by third parties shall be at such party's sole risk.

1.0 INTRODUCTION

This Remedial Investigation/Feasibility Study Report (report) is prepared on behalf of Air Products and Chemicals, Inc., (APCI), for APCI's plant (site) located at 23320 South Alameda in Carson, California (Figure 1, Site Location Map). This report is compiled using information obtained by IT through site investigations and review of existing site data.

1.1 Site Description

The site is located at 23320 South Alameda in Carson, California, in an industrial area mainly composed of oil refineries and chemical manufacturers. The property is bordered by a railway spur and a Texaco Sulfur Recovery Plant to the north, the Dominguez Water Channel to the east, an ARCO Coke Product Plant to the south, and Alameda Street and the ARCO refinery to the west.

The site was a hydrogen manufacturing plant, consisting of three main areas:

1. The hydrogen production plant, which has been demolished.
2. The specialty gases operation in the southwest part of the site, which is currently in operation.
3. A vessel repair shop which temporarily operated for the past three years in the northwest part of the site and has been demolished.

The specialty gases operation fills cylinders with various gases, which are received in containers or tube trailers. The building which houses the specialty gases operation, consists of a warehouse and a distribution office. The vessel repair shop in the northwest part of the plant, repaired and reconditioned APCI oxygen, nitrogen, and argon vessels and equipment. This operation was housed in a single story structure, approximately 12,000 square feet in area. The hydrogen production plant which has not been operational since 1986, occupied approximately two-thirds of the facility. It was demolished in 1993.

The surface area of the site still has the concrete slabs remaining from the hydrogen plant, the control room building and the vessel repair shop. The rest of the area is paved or has a road base gravel spread over the surface.

1.2 Site Contamination

The portion of the facility included in this study is the former hydrogen plant purification area. This area is bordered on the east by the control building slab, on the west by Alameda Street, on the south by the former compressor building slab, and on the north by the fence and railroad spur (Figure 2, Site Map).

The site previously contained a 2,500 gallon underground diesel storage tank, which was removed in 1987. Upon removal of the tank, soil contamination and suspected free product were encountered in the excavation. The contaminated soil was removed from the excavation and bio-remediated. A 6,000 gallon spent caustic solution underground tank was also located in the hydrogen plant purification area. This tank was removed on May 18, 1993, by IT. The caustic tank did not appear to have released any contaminants on site. IT has prepared and submitted a closure report to the County of Los Angeles Department of Public Works.

A truck scale located north of the control building was removed in late 1992. Visible soil contamination was observed to the north and west portions of the excavation during the removal operations. Soil contaminated with Total Petroleum Hydrocarbon (TPH) measured as Gasoline (3,516 ppm) and Diesel (780 ppm) was discovered during the removal and excavation operations. The soil beneath the adjacent hydrogen plant purification area was found to contain 180-785 ppm TPH as gasoline.

The site previously contained two aboveground hydrocarbon tanks, located in the hydrogen plant purification area. One tank was used to collect a hydrocarbon condensate, similar to gasoline, from the hydrogen feed stream. The other tank contained diesel fuel, which was used to scrub the hydrocarbon condensate from the feed gas. There was a gravel area below the tanks.

1.3 Remedial Investigation Limitations

This report was prepared by compiling information and data from an Underground Diesel Storage Tank Removal and Site Assessment Report (IT Corporation, 1988), from the recent Soil Gas Survey (Target Environmental Services, Inc, 1993), and Site Assessment (IT Corporation, 1993). IT used the following approach to evaluate the presence of contaminants and the horizontal and vertical extent of contamination.

- review available soil and groundwater analytical data
- determine the types of soil
- evaluate the soil physical properties (size, permeability, etc.)
- determine the former locations of the aboveground and underground storage tanks
- evaluate constituents fate and transport in the environment

The results of the Soil Gas Survey completed in February 1993, provided the guidance for the location of five boreholes in the areas of highest detected contamination. Soil samples collected from these boreholes were to be used to evaluate the approximate vertical extent of contamination.

Based on the analytical results of the assessment performed in March 1993 by IT, eight boreholes were proposed to evaluate the horizontal extent of contamination. Once the drilling and sampling process commenced, IT determined that more boreholes were needed to adequately define the horizontal extent of contamination. A total of 14 more boreholes were drilled in the purification area.

Given the many local sources of hydrocarbon contamination of soil and groundwater from other industries, IT's goal was to differentiate the Air Products hydrocarbon condensate contamination from other outside sources of contamination.

2.0 STUDY OBJECTIVES

The main objective of this study is to evaluate the vertical and lateral extent of hydrocarbon contamination emanating from past APCI activities at the site, and to develop remedial alternatives for contamination present. This report is based on the information from the following:

- Underground Diesel Tank Removal and Site Investigation, IT Corporation, March 1988.
- Soil Gas Survey of the Hydrogen Plant Purification Area, Target Environmental Services, Inc., prepared for IT, February 1993.
- Site Investigation Study of the Hydrogen Plant Purification Area, IT Corporation, March 1993.
- Additional Soil Sampling of the Hydrogen Plant Purification Area, IT Corporation, May 1993.

3.0 *PREVIOUS INVESTIGATIONS*

3.1 March 1988, Underground Diesel Tank Removal and Site Investigation

A Site Investigation was completed by IT in March 1988, after the removal of a 2,500 gallon underground diesel storage tank. Hydrocarbon soil contamination and free floating hydrocarbon product were observed in the tank excavation.

This Site Investigation involved the drilling of four boreholes (B-1 to B-4) and collecting soil samples to determine the vertical and horizontal extent of the hydrocarbon contamination. Selected soil samples from the boreholes were collected for laboratory analysis. Four samples, each, were analyzed for Organic Lead by gas chromatograph/PID and for Benzene, Toluene, Ethylbenzene and Xylenes (BTEX) by EPA Method 8020. Ten samples were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) by EPA Method 418.1, one sample for flash-point by EPA Method 1010, and six samples for pH by EPA Method 9040.

Analytical results for TRPH, BTEX and Organic Lead are detailed in the report. Sample B-1-2 was selected for the flash-point which was 65 degrees Fahrenheit. The samples collected from Borehole B-4 were used for the pH analyses. The pH ranged from 7.6 to 8.3 in the six samples.

In order to determine the depth to groundwater, one borehole (B-5) was drilled into the groundwater table in an area near, but outside of, the soil contamination area. Groundwater was encountered at a depth of 58 feet, with the total depth of the borehole at 60.5 feet below surface grade. No soil sampling was performed in this borehole. A sample was collected of the aquifer material (brown silty fine sand) for grain size analysis to aid in proper well design for groundwater monitoring wells, if necessary. No groundwater monitor wells were necessary, since the contamination was at a maximum of 25 feet below the surface and groundwater was at a depth of 58 feet below the surface.

3.2 February 1993, Soil Gas Survey of the Hydrogen Plant Purification Area

Under contract to IT, a Soil Gas Survey of the Hydrogen Plant Purification Area was performed by Target Environmental Services, Inc., (Target) in February 1993. The report prepared by Target is included in its entirety in IT's Site Assessment Report, dated March 1993. This survey revealed three areas where elevated levels of volatile hydrocarbons were detected. These are the northeast area near the former truck scale, the northwest area near the former aboveground

storage tanks and the southwest area where the hydrogen feed gas pipeline entered the facility.

The soil gas survey indicated that different types of hydrocarbon contamination were present at the site. The chromatogram signatures of the samples collected in the central portion of the site are suggestive of the gasoline like condensate which was handled in this area. The signatures of the samples collected west of the aboveground tank storage area and at the southwestern corner of the site reveal a complex petroleum hydrocarbon mixture which is not typical of gasoline or diesel fuel, or any other known hydrocarbons handled by Air Products in this area.

The different chromatogram signatures suggest of different sources of contamination. The samples collected from the central part of the site indicate that the hydrocarbon contamination may have come from the aboveground storage tanks. The complex hydrocarbon contamination along the west and southwestern portion of the site may be the result of contamination from the nearby pipe lines owned by others which run along Alameda Street.

3.3 March 1993 Borehole Sampling of the Hydrogen Plant Purification Area

Based on the results of the soil gas survey performed (Target Environmental Services, Inc., 1993) five borehole locations (1-5) were selected based on the highest concentrations of volatile organics observed. The boreholes were drilled to help establish the vertical limits of the hydrocarbon contamination in these areas and to determine the types and concentrations of contaminants. Samples were collected every five feet down to a depth of 40 feet. See Figure 3, Borehole Locations, and Appendix A for Borehole Logs.

All samples collected from the boreholes were analyzed by EPA Method 418.1 for TRPH, by EPA Method 8015 (modified) for Total Petroleum Hydrocarbons (TPH) as Diesel and Gasoline, and by EPA Method 8020 for BTEX. The Analytical Results are summarized in Table 3.1.

Analytical Results for Borehole 1 indicated concentrations of TRPH, TPH and BTEX contamination in the samples collected from depths of 5 and 10 feet. All of the other samples were non-detect (ND) at the indicated detection limits.

Analytical Results for the samples collected in Borehole 2 indicated concentrations of TRPH, TPH and BTEX contamination at depths of 5, 10 and 15 feet. Samples collected at 20 and 25 feet depth were ND except for 17 mg/kg TPH as diesel at a depth of 20 feet. BTEX contamination was again encountered at depth of 30, 35 and 40 feet.

TABLE 3.1

5G	35	ND	ND	ND	ND	ND	ND	ND

ND = Non Detect
mg/kg = Milligrams per Kilogram
µg/kg = Micrograms per Kilogram

(A) - The chromatographic pattern of the sample resembles that of low boiling fuel hydrocarbon, but does not match the pattern of the gasoline calibration standard. The result reported is quantitated as gasoline.

(J) - Value reported below the detection limit.

(Z) - The chromatographic pattern of the sample resembles that of high boiling fuel hydrocarbon but does not match the pattern of the diesel calibration standard. The result reported is quantitated as diesel.

Analytical Results for Borehole 3 indicated concentrations of TRPH, TPH and BTEX contamination at depths of 5 and 10 feet. TPH as diesel of 18 mg/kg was detected at a depth of 15 feet. All of the other samples were ND at the indicated detection limits.

Analytical Results for Borehole 4 indicated concentrations of TRPH, TPH and BTX contamination at depths of 5, 10 and 15 feet. Concentrations of 75 mg/kg TRPH and 33 mg/kg TPH as diesel were detected at a depth of 20 feet. A concentration of 33 mg/kg TRPH was detected at a depth of 35 feet. All samples collected at the depths of 25 and 30 feet were ND at the indicated detection limits.

Analytical Results for Borehole 5 indicated concentrations of TRPH and TPH contamination at depths of 5 and 10 feet. Benzene of 5 μg/kg was also detected at a depth of 10 feet. All of the other samples were ND at the indicated detection limits.

The chromatographic patterns for the TPH contamination reported as gasoline and diesel at depths of 5, 10 and 15 feet did not match those of the gasoline or diesel calibration standards. This contamination is believed indicative of the hydrocarbon condensate which is similar to gasoline from the aboveground storage tank .

The conclusion of this report (IT, Corporation, 1993) indicated that the vertical and lateral extent needed to be further defined in the hydrogen plant purification area.

3.4 May 1993, Investigation of the Hydrogen Plant Purification Area

The focus of the May 1993 investigation was to further define the horizontal and vertical limits of contamination around the hydrogen plant purification area (See Figure 2, Site Map).

Based on the results of the previous sampling performed in March 1993, IT proposed to drill additional boreholes to further define the horizontal and vertical limits of contamination. A total of 14 more boreholes were drilled in the hydrogen plant purification area (Figure 3 - Borehole Locations).

On May 5, 1993, IT proceeded to drill six boreholes, numbered 6, 7, 8, 9, 10 and 11, each to a depth of 30 feet. On May 6, 1993, boreholes, numbered 12, 13, 14, 15 and 16 were drilled. These boreholes were also drilled to a depth of 30 feet except Borehole 16 which reached only 25 feet because of equipment failure. Boreholes 17, 18 and 19 were drilled on May 7, 1993,

to a depth of 30 feet or first encountered groundwater. This groundwater zone is believed to be perched.

3.4.1 Sampling Procedures

The boreholes were drilled using a B-53 mobile drill rig, equipped with 3.75 inch hollow stem augers. The soil samples were collected using a California Modified Split Spoon Sampler containing three brass rings. Soil samples were collected at the 5, 10, 15, 20, 25 and 30 foot depths (see Borehole Logs in Appendix A).

The Split Spoon Sampler was deployed down the hollow stem augers and driven 18 inches into the soil using a 140 pound drive hammer. Upon sample retrieval, the soil samples were screened in the field by an Organic Vapor Analyzer (OVA) to determine the presence of any possible vapors. From this field test any soil samples that had a recorded reading were sent to the analytical laboratory for analysis. One brass ring was then selected, capped, sealed with duct tape, labeled and entered into IT Chain-of-Custody documentation. All of the soil samples were preserved on ice for delivery to the analytical laboratory. The samples were transported to IT Analytical Services in Cerritos, California, a State of California certified analytical laboratory (see Chain-of-Custody documentation in Appendix B).

Between sampling events, the Split Spoon Sampler and brass rings were steam cleaned or were cleaned by washing in Tri-sodium Phosphate and triple-rinsed, using de-ionized water to prevent cross-contamination. The augers were also steam cleaned between the drilling of each borehole to prevent the possibility of any cross-contamination. The soil cuttings from the boreholes and the decontamination water from the steam cleaning, were placed in 55 gallon drums for later disposal.

The soils in each of the boreholes was characterized according to the United States Soil Classification System and logged on Borehole logs located in Appendix A. All of the boreholes were backfilled with a concrete/bentonite mix.

3.4.2 Analytical Procedures

All soil samples sent to the analytical laboratory, were analyzed by EPA Method 418.1 for TRPH. The samples collected from the 15 foot depth (with the exception of the samples 12B and 17D) were analyzed by EPA Method 8240 for Volatile Organic Compounds and by EPA Method 9045 for pH. Several Analytical Results for Acetone and Methylene Chloride have the

letter "B" after the numeric value. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected. Analytical Results are summarized in Table 3.2 and located in Appendix B.

3.4.3 Discussion of Analytical Results

Borehole 6

Three soil samples (6A, 6B and 6C) were collected from Borehole 6, which is located northeast of the truck scale area (Figure 3 - Borehole Locations). The Analytical Results indicated 41 mg/kg TRPH in sample 6A and ND at the indicated detection limits for samples 6B and 6C. The pH analysis for 6C was 8.1. Methylene Chloride was detected in 6C at 6(B) μg/kg. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected. The other constituents that were analyzed under EPA Method 8240 were ND at the indicated detection limits in sample 6C.

The soil in Borehole 6 ranged from a fine-grained, grey, silty sand at 5 feet, to a brown, silty sand at the 30 foot depth. A coarse grained, gravelly sand was encountered at the 25 foot depth. The soil was damp to wet. A perched groundwater zone was encountered at a depth of 30 feet. OVA readings were 0 ppm for all three samples, but the samples were analyzed to evaluate the horizontal limits of contamination.

Borehole 7

Four soil samples (7A, 7B, 7C and 7D) were collected from Borehole 7, which is located north of the truck scale area (Figure 3 - Borehole Locations). These samples registered field OVA readings ranging from 0 to 18 ppm.

Analytical Results indicated TRPH concentrations of 3,520 mg/kg in sample 7A and 2,610 mg/kg in sample 7B. Samples 7C and 7D were ND for TRPH. The pH analysis for sample 7C was 8.0. Analytical Results for EPA Method 8240 in sample 7C, indicated 27 μg/kg Acetone and 5(B) μg/kg Methylene Chloride. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected. The other constituents that were analyzed under EPA Method 8240 were ND at the indicated detection limits for sample 7C.

NA = Not Analyzed
ND = Non Detect
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram
ppm = parts per million
TRPH = Total Recoverable Petroleum Hydrocarbons
B = indicates analyte found in the associated blank as well as in the sample, value reported is not blank corrected

The soil in Borehole 7 ranged from a brown, silty sand to a grey-black, silty sand. A gravelly sand was encountered at a depth of 20 feet. The soil was damp to wet at a depth of 5 feet. The perched groundwater zone was not encountered in this borehole.

Borehole 8

Six soil samples (8A, 8B, 8C, 8D, 8E and 8F) were collected from Borehole 8, which is located near the southeast corner of the hydrogen plant purification area (Figure 3 - Borehole Locations). These samples registered field OVA readings ranging from 0 to 101 ppm.

Analytical Results indicated TRPH concentrations of 7,660 mg/kg in sample 8A and 7,890 mg/kg in sample 8B. Samples 8C, 8D, 8E and 8F were ND for TRPH at the indicated detection limits. The pH analysis for sample 8C was 7.2. Analytical Results for EPA Method 8240 in sample 8C indicated 15 μg/kg Acetone and 6(B) μg/kg Methylene Chloride. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected. The other constituents that were analyzed under EPA Method 8240 were ND at the indicated detection limits for sample 8C.

The soil in Borehole 8 ranged from a black, oily, silty sand at the 5 foot depth to a tan gravelly sand at the 30 foot depth. The soil was damp to wet with a perched groundwater zone encountered at 30 feet.

Borehole 9

Borehole 9 was drilled within 1 foot of the underground caustic tank prior to its removal (Figure 3 - Borehole Locations). Six soil samples (9A, 9B, 9C, 9D, 9E and 9F) were collected. These samples registered field OVA readings ranging from 297 to 588 ppm.

Analytical Results indicated TRPH concentrations of 6,510 mg/kg in sample 9A, 1,780 mg/kg in sample 9B, 180 mg/kg in sample 9C, 2,640 mg/kg in sample 9D, 1,340 mg/kg in sample 9E and 1,290 mg/kg in sample 9F. The pH analysis for sample 9C was 9.0. Analytical Results for EPA Method 8240 in sample 9C indicated 8,300 μg/kg Benzene, 20,000 μg/kg Toluene, 1,600 μg/kg Ethylbenzene and 9,300 μg/kg Xylenes. The other constituents that were analyzed under EPA Method 8240 were ND at the indicated detection limits for sample 9C.

The soil in Borehole 9 ranged from a black, wet, "gooey", silty sand near the surface to a wet, silty clayey sand at the 30 foot depth. A watery liquid containing petroleum product was encountered from the 5 to 10 foot depth. A perched groundwater zone was encountered at the 30 foot depth.

Borehole 10

Five soil samples (10A, 10B, 10C, 10D and 10E) were collected from Borehole 10, which is located in the roadway south of the hydrogen plant purification area (Figure 3 - Borehole Locations). These samples registered field OVA readings ranging from 2 to 109 ppm.

Analytical Results indicated TRPH concentrations of 6,180 mg/kg in sample 10A, 4,760 mg/kg in sample 10B and ND at the indicated detection limits in the rest of the samples (10C, 10D and 10E). The pH analysis for sample 10C was 8.4. Analytical Results for EPA Method 8240 on sample 10C indicated 50 μg/kg Acetone, 5(B) μg/kg Methylene Chloride, 5 μg/kg Benzene, and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 10 was mostly a fine-grained, silty sand with a gravelly sand at the 15 foot depth. The soil was damp and the perched groundwater zone was not encountered in the borehole.

Borehole 11

Borehole 11 was drilled in the roadway, southwest of the hydrogen plant purification area (Figure 3 - Borehole Locations). Six soil samples (11A, 11B, 11C, 11D, 11E and 11F) were collected. These samples registered field OVA readings ranging from 2 to 214 ppm.

Analytical Results indicated TRPH concentrations of 5,970 mg/kg in sample 11A, 71,500 mg/kg in sample 11B and ND at the indicated detection limits in the rest of the samples. The pH analysis for sample 11C was 8.7. Analytical Results for EPA Method 8240 in sample 11C indicated 100 μg/kg Acetone, 5(B) μg/kg Methylene Chloride, 5 μg/kg Benzene, and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 11 was a fine-grained, silty sand with a gravelly sand at the 20 to 30 foot depths. A wet zone was encountered between the 5 and 10 foot depth. A perched groundwater zone was encountered at 30 feet.

Borehole 12

Borehole 12 was drilled in the northern part of the connected parking area outside of the fence. Prior to drilling the borehole, a geophysical survey was conducted to prevent the possibility of drilling into buried underground utilities or pipes (Figure 3 - Borehole Locations). Three soil samples (12A, 12B and 12C) were collected. These samples registered field OVA readings ranging from 0 to 15 ppm.

Analytical Results indicated TRPH concentrations of 59,500 mg/kg in sample 12A, 36 mg/kg in sample 12B, and ND at the indicated detection limits in sample 12C. The pH analysis for sample 12B was 9.1. Analytical Results for EPA Method 8240 in sample 12B indicated 22(B) μg/kg Acetone, and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 12 was a fine-grained, silty sand with a gravelly sand at the 20 foot depth. The soil was damp and the perched groundwater zone was not encountered.

Borehole 13

Borehole 13 was drilled in the parking area outside of the fence and west of the hydrogen plant purification area (Figure 3 - Borehole Locations). Prior to drilling the borehole, a geophysical survey was conducted to prevent the possibility of drilling into buried underground utilities or pipes. Five soil samples (13A, 13B, 13C, 13D and 13E) were collected. These samples registered field OVA readings ranging from 0 to 80 ppm.

Analytical Results indicated TRPH concentrations of 9,460 mg/kg in sample 13A, 30 mg/kg in sample 13E, and ND at the indicated detection limits in samples 13B, 13C and 13D. The pH analysis for sample 13C was 8.6. Analytical Results for EPA Method 8240 in sample 13C indicated 39(B) μg/kg Acetone and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 13 ranged from a fine-grained sand to a gravelly sand. The soil was damp and a perched groundwater zone was encountered at the 30 foot depth. An oily layer was encountered at the 5 foot depth.

Borehole 14

Borehole 14 was drilled in the parking area outside of the fence, and near where the ARCO pipeline entered the facility (Figure 3 - Borehole Locations). Prior to drilling the borehole, a geophysical survey was conducted to prevent the possibility of drilling into buried underground utilities or pipes. Five soil samples (14A, 14B, 14C, 14D and 14E) were collected. These samples registered field OVA readings ranging from 0 to 48 ppm.

Analytical Results indicated TRPH concentrations of 8,070 mg/kg in sample 14A and ND at the indicated detection limits in the rest of the samples. The pH analysis for sample 14C was 7.5. Analytical Results for EPA Method 8240 in sample 14C indicated 28(B) μg/kg Acetone, and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 14 ranged from a silty sand, to a gravelly sand at the 20 foot depth. A wet "gooey", oily layer was encountered at the 5 foot depth. The soil was damp and a perched groundwater zone was encountered at the 30 foot depth.

Borehole 15

Borehole 15 was also drilled in the parking area outside of the fence and west of the compressor shelter (Figure 3 - Borehole Locations). Prior to drilling the borehole, a geophysical survey was run to prevent the possibility of drilling into buried underground utilities or pipes. Five soil samples (15A, 15B, 15C, 15D and 15E) were collected. These samples registered field OVA readings ranging from 0 to 215 ppm.

Analytical Results indicated TRPH concentrations of 2,790 mg/kg in sample 15A, 11,400 mg/kg in sample 15B, 580 mg/kg in sample 15D, and ND at the indicated detection limits for samples 15C and 15E. The pH analysis for sample 15C was 6.2. Analytical Results for EPA Method 8240 in sample 15C indicated 19(B) μg/kg Acetone, and ND at the indicated detection limits for the rest of the constituents analyzed. The B indicates that the analyte was found in the

associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 15 ranged from a silty sand to a gravelly sand at the 20 foot depth. The soil was damp with a perched groundwater zone encountered at the 30 foot depth.

A borehole was drilled south of Borehole 15. A concrete obstruction was encountered at the 4 foot depth and drilling was halted. No further drilling was performed in the parking area due to the underground utilities and pipes.

The soil that was encountered in the abandoned borehole was a black, silty sand with a strong hydrocarbon odor. No borehole log was recorded for this hole.

Borehole 16

Borehole 16 was drilled just south of the concrete slab of the former maintenance building (Figure 3 -Borehole Locations). Due to an equipment failure, the borehole was only drilled to a depth of 25 feet. Five soil samples (16A, 16B, 16C, 16D and 16E) were collected. These samples registered field OVA readings ranging from 0 to 165 ppm.

Analytical Results indicated TRPH concentrations of 310 mg/kg in sample 16A, 5,590 mg/kg in sample 16B, 1,150 mg/kg in sample 16C, and ND at the indicated detection limits in samples 16D and 16E. The pH analysis for 16C was 8.2. Analytical Results for EPA Method 8240 in sample 16C indicated 64 μg/kg Acetone, 18(B) μg/kg Methylene Chloride, 5 μg/kg Benzene, 9 μg/kg Ethylbenzene, 19 μg/kg Xylenes, and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 16 ranged from a fine-grained, silty sand to gravelly sand at the 20 foot depth. A wet black "gooey" layer was encountered at the 10 foot depth. The soil was damp to wet. The perched groundwater zone was not encountered in this borehole.

Borehole 17

Borehole 17 was drilled just north of the concrete slab of the former maintenance building (Figure 3 -Borehole Locations). Four soil samples (17B, 17C, 17D and 17E) were collected. These samples registered field OVA readings ranging from 0 to 46 ppm.

Analytical Results indicated TRPH concentrations of 1,970 mg/kg in sample 17B and ND at the indicated detection limits in samples 17C, 17D and 17E. The pH analysis for sample 17D was 7.2. Analytical Results for EPA Method 8240 in sample 17D indicated 14 μg/kg Acetone, 5(B) μg/kg Methylene Chloride, and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 17 ranged from a fine-grained, silty sand to a gravelly sand at the 20 foot depth. The soil was damp to moist. The perched groundwater zone was not encountered in the borehole.

Borehole 18

Borehole 18 was drilled just north of the compressor shelter concrete slab (Figure 3 - Borehole Locations). Four soil samples (18C, 18D, 18E and 18F) were collected. These samples registered field OVA readings ranging from 0 to 82 ppm.

Analytical Results indicated TRPH concentrations of 48 mg/kg in sample 18D, 74 mg/kg in sample 18E and ND at the indicated detection limits in samples 18C and 18F. The pH analysis for sample 18C was 7.3. Analytical Results for EPA Method 8240 in sample 18C indicated 13 μg/kg Acetone, 7(B) μg/kg Methylene Chloride, and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 18 ranged from a fine-grained silty sand to a gravelly sand at the 25 foot depth. The soil was damp and a perched groundwater zone was encountered at the 30 foot depth.

Borehole 19

Borehole 19 was drilled in the southeast corner of the former control building concrete slab (Figure 3 - Borehole Locations). Five soil samples (19A, 19B, 19C, 19D and 19E) were collected. These samples registered field OVA readings ranging from 0 to 161 ppm.

Analytical Results indicated TRPH concentrations were ND at the indicated detection limits for all of the samples. The pH analysis for sample 19C was 8.3. Analytical Results for EPA

Method 8240 in sample 19C indicated 12 μg/kg Acetone, 6(B) μg/kg Methylene Chloride, and ND at the indicated detection limits for the other constituents analyzed. The B indicates that the analyte was found in the associated blank as well as the sample, but the value was not blank corrected.

The soil in Borehole 19 ranged from a fine-grained, silty sand to a gravelly sand at the 25 foot depth. The soil was damp and a perched groundwater zone was encountered at the 30 foot depth.

4.0 ENVIRONMENTAL CONDITIONS

This section will describe the environmental conditions at the APCI site. Environmental conditions include site geology, hydrology, hydrogeology and meteorology.

4.1 Site Geology

The site is located in the southern portion of the Central Section of the Los Angeles Basin. Soils in this portion of the Basin are mainly comprised of recent soil formations made up of clays, silts and sands that extend into the groundwater formation. The State of California, Department of Water Resources classifies these formations as "Younger Alluvium".

The site consists of a relatively flat grade, covered with concrete and asphalt in the contaminated area. The site is approximately 18 to 25 feet above mean sea level. According to the information collected during the present and past subsurface investigations, the following is a summary of the site subsurface soil conditions:

- 0 to 5 feet — Damp brown to grey, silty sand
- 5 to 10 feet — Damp to wet fine-grained, grey, silty sand
- 10 to 15 feet — Damp grey to black, fine-grained, silty sand
- 15 to 20 feet — Damp brown or grey, silty sand, maybe some gravel
- 20 to 25 feet — Damp grey or brown sand, maybe some gravel
- 25 to 30 feet — Damp to wet, gravelly sand
- over 30 feet — Moist to wet, brown, silty sand

Borehole logs from the February and May investigations are included in Appendix A. Soil conditions at the site were observed to a depth of 40 feet.

4.2 Site Surface Hydrology

The site is topographically even with the properties located to the north and south. The site is approximately 2 to 3 feet above Alameda Street on the west and approximately 20 feet above the Dominguez Channel water level. During periods of heavy rains, runoff water is channeled to area storm drains located throughout the site. The surface around the hydrogen plant purification area is mainly covered by asphalt and concrete. Some road base gravel has been spread on the roadway between the purification area and the former compressor shed.

The northeast and east portions of the site are bare soil. Any runoff would pond and eventually evaporate and/or percolate into the subsurface. The potential of water runoff from the site is minimal. The site did not experience any uncontrolled rain water runoff release during the uncharacteristically heavy rain period of 1993.

4.3 Site Hydrogeology

A perched groundwater zone was encountered at approximately 30 feet below the surface. This perched groundwater may be caused by the result of heavy rains during the 1992\1993 rain season in the Los Angeles area. The next groundwater formation is estimated to be 60 to 100 feet below the surface. This deeper groundwater formation would correspond to the Gage Aquifer, a major hydro-stratigraphic unit in the basin. Groundwater flow in the Gage Aquifer in the vicinity of the site, trends generally in a westerly direction. No known municipal use exists for the groundwater beneath the APCI site.

4.4 Site Meteorology

The climate of the Carson area, like most of Southern California, is controlled by the strength and position of a semi-permanent high pressure center over the Pacific Ocean. The high pressure ridge over the west coast of Southern California creates a repetitive pattern of frequent early morning cloudiness, hazy afternoon sunshine, daytime on-shore breezes and little temperature changes throughout the year. Limited rainfall occurs in the winter when the fringes of mid-latitude storms move through the area and the high pressure center is weakest and furthest south. On the average 12 to 15 inches of rain fall annually from November through early April. Summers are often completely dry.

Local meteorological conditions conform to the pattern of strong on-shore winds by day, especially in the summer, and weak off-shore winds by night, especially in the winter. Winds blow on-shore from the west/southwest by day and off-shore from the east/northeast by night, with the on-shore component much stronger and more persistent than the weak off-shore component.

5.0 CONCLUSION

Based on the information obtained from the March 1988 Underground Diesel Tank Removal, the March 1993 Site Investigation Report, the February 1993 Soil Gas Survey and the site investigation performed in May 1993, IT has completed the evaluation of the types, the sources and the extent of contamination at the APCI hydrogen production plant purification area.

5.1 Types and Source of Contamination

There are several local industrial sources of hydrocarbons at this site that may have contributed to the contamination of the soil. The task at hand was to differentiate the Air Products soil contamination, related to past surface spills of hydrocarbon condensate, from any other outside sources of contamination that were not attributable to past Air Products activities. Existing underground pipelines, which run along Alameda Street adjacent to the site, appear to be another source of hydrocarbon contamination. In addition, there is known hydrocarbon contamination of regional groundwater in the area.

The information obtained from the diesel tank removal and (IT Corporation, 1988) site assessment indicated that petroleum hydrocarbons and Benzene, Toluene, Ethylbenzene and Xylenes were present in the soil. At the time of the removal of the diesel tank, it was thought that the tank was the source of contamination. We know now that this tank was not the source of contamination, since the petroleum hydrocarbons and BTEX were not characteristic of diesel fuel; the flash point was well below that expected for diesel; the integrity of the tank and piping appeared to be intact; and the contamination extended, in a wide fashion, from the surface down to a depth of 20 feet, which would indicate a surface spill rather than an underground storage tank release.

The Soil Gas Survey (Target Environmental Services, Inc., 1993) indicated that the chromatogram signatures of the samples collected in the central portion of the purification area were indicative of the gasoline-like hydrocarbon condensate handled by Air Products in this area. The signatures of the samples collected in the western and southwestern portions of the purification area revealed a complex petroleum hydrocarbon mixture which was not typical of gasoline or diesel fuel. The highest concentrations of TPH and BTEX were west of the aboveground storage tank area and in the southwestern portion of the hydrogen plant purification area. The Air Products tanks, given their location and contents, do not appear to be the source

of this contamination. Investigation of other potential sources of the petroleum hydrocarbon mixture, such as the underground pipelines which run along Alameda Street, would be prudent; however, such an investigation is beyond the scope of this work plan.

The five boreholes drilled in March 1993 were positioned, using the soil gas survey results as a guide. The Analytical Results indicated that high concentrations of TRPH and BTEX were detected in the samples collected from the 5 and 10 foot depths in all of the five boreholes. TPH and BTEX were also detected in Boreholes 2 and 4. The surface to the 15 foot depth extent, and the nature of the contamination suggests that surface spills from the aboveground tanks were the source of this contamination. The reappearance of BTEX in Borehole 2 at the 30, 35 and 40 foot depths, and in Borehole 4 at the 35 foot depth, however, cloud this issue. Given that the 15 foot to the 35 foot depth appears to be clean, this reappearance of BTEX suggests that another source may be present for the contamination. See Table 3.1 for a Summary of the Analytical Results.

The latest borehole sampling performed in May 1993, further defined the lateral and vertical extent of contamination. It also quantified the hydrocarbon concentrations. In addition, select soil samples were analyzed by EPA Method 8240 for Halogenated Volatile Organic Compounds (HVOC). While very low levels of Methylene Chloride and Acetone were detected in some of the samples, Methylene Chloride, when detected, was also detected in the method blanks and these values were not blank corrected. Acetone was also detected in several of the method blanks and these values were also not blank corrected. Given the low levels of these substances and their presence in the laboratory blanks, Methylene Chloride and Acetone are not considered to be contaminants of concern.

IT believes that the gasoline-like contamination found in the hydrogen purification area at the depths of 5, 10 and 15 feet are the result of surface spills from the aboveground storage tanks. In the central portion of the site this contamination extends to a depth of approximately 30 feet. The complex hydrocarbon substance discovered on the western and southwest area of the site appears to emanate from other sources. The contamination discovered in some of the deepest soil samples also appears to emanate from a source other than Air Products since the Air Products surface spill evidence is not continuous from the surface to that depth. Since the 15 foot to the 35 foot depth at these locations is essentially clean, the source may have been past activities at the site prior to APCI presence or the effects of the known regional groundwater contamination from below.

5.2 Areal Extent of Contamination

The areal extent of contamination in an east-west direction is approximately 200 feet. This is measured from Borehole 13 to Borehole 19. In a north-south direction the extent is approximately 300 feet measured from Borehole 17 to Borehole 15. The depth of contamination was approximately 5 feet deep on the extremes and progressively deeper toward the center of the purification area. Borehole 9 showed the deepest extent of contamination with concentrations of TRPH at the 30 foot depth. Figure 4 shows cross sections of the TRPH contamination across the site in a north-south, and west-east direction. Figure 5 indicates the boreholes that were used for the cross sections.

It is known that the regional groundwater is contaminated with hydrocarbons from other sources. IT is aware of a regional groundwater study presently underway. This study is jointly sponsored by ARCO, Shell, Texaco, and GATX Terminals Corp. The results of the study may provide information regarding groundwater conditions at the Air Products site. Since the contamination attributable to Air Products appears to occur in the top 30 feet of soil, and that the groundwater is 60 feet down, we are not recommending the installation of groundwater wells at this time.

5.3 Cleanup Guidelines

The following section discusses soil and groundwater cleanup requirements by various regulatory agencies as understood by IT. Action levels for soil and groundwater have been based on the strictest interpretation of agency guidelines concerning action levels.

5.3.1 Soil

The California Regional Water Quality Control Board "Water Quality Objectives of 1985" established soil and groundwater action levels in their guidelines. The action levels for the contaminants detected on-site based on these guidelines, are: TPH at 2,000 mg/kg, Benzene at 700 μg/kg, Toluene at 100 mg/kg, Ethylbenzene at 1.4 mg/kg, Xylene at 620 mg/kg and Methylene Chloride (Dichloromethane) at 190 μg/kg. The action levels for the TPH and BTEX are developed for soil, in order to protect groundwater. Acetone is not a regulated substance and does not have an action level. The Methylene Chloride and Acetone detected at the site are not considered to be a hazardous waste problem since they were detected at low levels and were present in the method blanks, will not be further discussed.

In addition, the Leaking Underground Fuel Tank (LUFT) Manual suggests action levels for petroleum hydrocarbon contaminated soil resulting from underground fuel storage tanks.

According to the LUFT Manual, Table 2-1, page 29 Leaching Potential Analysis for Gasoline, using TPH; the leaching potential score for Gasoline contamination at the site is calculated as follows:

CONDITION	SCORE
Depth to groundwater less than 100 feet	9 points
No fractures in subsurface	10 points
Average rainfall is 14 to 17 inches/year	9 points
No man made conduits	10 points
Site-coarse soil	5 points
Total Site Score	43 points

The scores above are assigned to the listed scenarios in order to achieve a score to be used in selecting maximum allowable levels of contaminants that can be present at the site. If existing contaminants exceed the prescribed levels, remediation activities will be required. Based on the 43 score obtained, maximum allowable levels of TPH as Gasoline and BTEX contamination are 100, 1.0, 1.0, 1.0 and 1.0 mg/kg, respectively. These levels are strictly developed based on the presence of gasoline fuel in the soil as a result of a release from an underground tank leak. Remediation of the overlying soils should lessen the degree of contamination and restore normal site conditions to prevent any degradation of the groundwater.

5.3.2 Groundwater

Given that the APCI contamination does not extend deeper than 30 feet, contaminants from the site are not believed to have impacted regional groundwater. The shallow, perched groundwater encountered at the site appears to be transitory. Contamination of this perched groundwater zone will be, in effect, remediated after completion of the soil remedial efforts.

6.0 RECOMMENDATIONS

IT recommends implementation of the remedial alternatives for soil contamination discussed in sections 7.0 and 8.0 of this report, which evaluate site contaminant behavior as well as remedial alternatives of the soil.

Based on the discussion in section 8.0, the recommended remedial alternatives are Soil Vapor Extraction (SVE) followed by Recycling.

7.0 CONTAMINANT FATE AND TRANSPORT, HYDROGEN PLANT PURIFICATION AREA

7.1 Contaminants Description

The purpose of this section is to identify the contaminants of concern, and to discuss the physical and chemical properties of these contaminants in relation to their ultimate fate and transport in the environment. These contaminants of concern were selected based on results obtained from the field investigations.

The guidance by the USEPA (United States Environmental Protection Agency, Risk Assessment for Superfund, Volume I, Human Health Evaluation Manual EPA 540-1-89/002) for the selection of contaminants of concern was followed. This guidance document suggests that in selecting contaminants of concern, the focus should be on those contaminants that constitute the bulk of the potential risk. There are two major classes into which contaminants of concern fall; organics and metals. Metal constituents were not analyzed for in the soil samples. Table 7.1 summarizes the Constituents of Concern at the APCI site.

TABLE 7.1
Contaminants of Concern

Petroleum Hydrocarbons
Volatile Organics
Benzene
Toluene
Ethylbenzene
Xylenes

7.1.1 Volatile Organics

In general, the fate of organics in the environment is determined, to a large degree, by the contaminants' water solubility and high propensity for binding to particulate or other organic matter. Organics will strongly sorb to surface material. Organics in the atmosphere are associated almost exclusively with particulate matter. Although organics are very persistent, bio-degradation by bacteria and photo oxidation of particle bound compounds do occur. Also, the rate of decay may be influenced by the chemical properties of the binding substrate.

The majority of the organic compounds in the soil are slightly soluble, to nearly insoluble in water. Of the detected compounds, Benzene, Toluene, Ethylbenzene and Xylenes are the most soluble. The general rule of solubility is that it decreases with an increasing number of aromatic rings. Therefore, the most likely organic compounds to be leached from the soil by water would be the low molecular weight aliphatic hydrocarbons (C5 through C8).

Benzene, Toluene, Ethylbenzene and Xylenes are constituents with volatility properties that at sufficient concentrations, could be expected to volatilize and be detected through the soil.

7.2 Potential Routes of Migration

The environmental factors that influence the mobility of a contaminant include climatology, surface hydrology, geology, and hydrogeology.

7.2.1 Climatology

The APCI site is located in Southern California where the climate is classified as Coastal Mediterranean type, with a rainy winter season and dry summers. Precipitation in the area averages 12 to 15 inches each year. With the exception of the 1992/1993 season, the region had experienced a drought over the last six years. In winter the average daily temperatures range from the low 40 degrees to the high 70 degrees Fahrenheit. In summer, average daily temperatures range from the low 60 degrees to the high 80 degrees Fahrenheit.

7.2.2 Surface Hydrology

The site is in an area surrounded by oil refineries and chemical manufacturers. The surface area of the site is mostly covered by asphalt or concrete slabs.

7.2.3 Geology

The soil at the site, based on the borehole logs, is a grey to dark brown, silty sand with interbedded gravel zones. The soil is fairly porous and was damp to wet.

7.2.4 Hydrogeology

The site has at least two known groundwater zones. A perched groundwater zone is located at approximately 30 feet below the surface. This zone may be the result of the recent rainfall in the Los Angeles area. The other groundwater zone is located at an approximate depth of 60 to 100 feet. This zone would be equivalent to the Gage aquifer.

7.3 Factors Affecting Waste Migration

The transport of contaminants of concern is largely a function of their physical properties, the physical properties of their surrounding matrix, the physical conditions to which they are subjected, and to the chemical factors. Highly volatile wastes are more prone to be transported through the atmosphere and the more soluble ones to be carried by water.

Wastes will move farther and faster in porous sandy formations than in denser soil. Volatile wastes are mobile under hot windy conditions, and soluble during periods of heavy rainfall. The transport and fate of each contaminant is highly dependent upon its characteristic physio-chemical properties. The properties of greatest importance in this regard are:

- Molecular Weight
- Vapor Pressure
- Water Solubility
- Volatility (Henry's Law Constant K_h or H_c)
- Octanol Partition Coefficient (Kow)
- Organic Carbon Water Coefficient (Koc)
- Bio-concentration Factor

All of these influence a contaminant's environmental persistence. The physical and chemical properties of the contaminants of concern are presented in Table 7.2.

Water solubility is the maximum concentration of a chemical that dissolves in pure water at a specific temperature and pH. It is a critical property affecting environmental fate and transport.

Vapor pressure is a relative measure of the volatility of a chemical in its pure state and is a important determinant of the rate of vaporization from soil and surface waters.

Henry's Law Constant is another parameter, important in evaluating volatilization from waste exposed to air.

The Organic Carbon Water Coefficient (Koc) is a measure of the tendency for organics to be absorbed by the soil and sediments. The Koc is chemical specific and is largely independent of soil properties, and is a prime determinant of phase transport in moist soil.

The Octanol Partition Coefficient (Kow) is a measure of how a chemical is distributed at equilibrium between Octanol and water. It is an important parameter and is often used in the assessment of environmental fate and transport for organic compounds.

The bio-concentration factor provides a measure of the extent of chemical partitioning at equilibrium between a biological medium, such as a fish tissue and/or plant tissue and an external medium, such as water. The larger the factor becomes, the greater the likelihood of accumulation in living tissue.

TABLE 7.2
PHYSICAL AND CHEMICAL PROPERTIES FOR POTENTIAL CONTAMINANTS OF CONCERN AT THE APCI SITE

CONSTITUENT	BENZENE	TOLUENE	ETHYL-BENZENE	XYLENES
Molecular Weight (amu)	58	92	106	106
Vapor Pressure (mmHg)	95.2	28.1	7	10
Water Solubility (25 Celsius/mg/L)	1750	535	152	198
Volatility Henry's Constant (atm m3 lig/moles)	$5.59X10^{-3}$	$6.37X10^{-3}$	$6.43X10^{-3}$	$7.04X10^{-3}$
Log Kow	2.12	2.73	3.15	3.26
Koc (mg/g)	83	300	1100	248
Persistence/ Bio-degradation	1	NA	NA	1

NA - Not Applicable
amu - atomic molecular unit
mmHg - millimeters of Mercury
mg/l - milligrams per Liter
mg/g - milligrams per Gram

8.0 SITE REMEDIATION FEASIBILITY STUDY

This section summarizes the site remediation alternatives that may be used to remediate the contamination that is present at the APCI site.

8.1 Site Remediation Objectives

Soil contamination at the site appears to originate from the former aboveground hydrocarbon condensate and diesel storage tanks.

Based on this, IT will evaluate remedial alternatives that will achieve compliance with remediation guidelines that have been established by the State of California LUFT Manual, the Regional Water Quality Control Board and the County of Los Angeles Department of Public Works Guidance. Based on interaction with the appropriate regulatory agency, and considering the area background, the cleanup objective may be re-established at higher levels. The following is a tabular form of applicable remediation goals.

TABLE 8.1
ESTABLISHED CLEANUP GOALS
NON-SITE SPECIFIC

CONTAMINANT	LUFT GOAL*	COUNTY GUIDANCE *	RWQCB ACTION LEVELS
TRPH	1000 ppm	Background	NA
EPA 8015 TPH Gasoline Diesel	 100 ppm 1000 ppm	"	NA
BENZENE	1.0 ppm	"	700 μg/kg
TOLUENE	1.0 ppm	"	100 mg/kg
ETHYLBENZENE	1.0 ppm	"	1.4 g/kg
XYLENES	1.0 ppm	"	620 mg/kg

* Based on total contaminants present **Based on soil levels to protect groundwater

NA - Not Applicable

In addition, any systems, equipment, and/or construction to be conducted on-site to achieve these goals will be in compliance with all federal, state and local laws and regulations.

8.2 Feasibility Study Objectives

Remediation alternatives selected were evaluated, based on the following criteria which are, listed in terms of importance in the decision making process.

- Effectiveness and protection of public health and the environment
- Cost of alternative
- Technology availability and ease of application
- Ease of permitting and agency acceptance
- Time to apply
- Potential future liabilities associated with executing the alternative

APCI requested that in addition to this criteria, special consideration be given on a remedial technology's cost, time frame to implement, regulatory acceptance, technical feasibility, and future potential liability. Table 8.2, below, summarizes these criteria for each remedial alternative.

TABLE 8.2
REMEDIAL ALTERNATIVE CRITERIA

REMEDIAL ALTERNATIVE	COST 1,000,000's	TIME* FRAME	REGULATORY ACCEPTANCE	FEASIBILITY	LIABILITY POTENTIAL
No Action	.05	NA	Not Accepted	Not Feasible	Deed Restriction
Land Disposal	21.5	3-4 Month(s)	Acceptable	Feasible	Future Liability
Thermal Destruction	27.3	10-12 Month(s)	Not Likely	Not Feasible	Air Discharge
Soil Washing	9.0	10-12 Month(s)	Acceptable	Acceptable	Water Treatment
Bio-remediation	3.7	2-3 Year(s)	Acceptable	Not Feasible	Air Discharge
In-Situ Vapor Extraction	1.8	1-2 Year(s)	Acceptable	Feasible	NA
Recycling	5.4	3-4 Month(s)	Acceptable	Feasible	NA

* - Time frame approximated for implementation including permitting

NA - Not Applicable

8.3 Remedial Alternatives

The following is a list of remedial alternatives and associated approximate costs as evaluated for the APCI site. These remedial alternatives are based on the worst case scenario for the site. They may be substantially lessened after regulatory review. Prices listed in each of the options are estimated and/or average prices per ton, assuming 35,000 cubic yards (52,500 tons) of contaminated soil are present at the site. Total prices quoted include over-run contingencies and administrative costs. Some of the prices listed are based on current disposal and/or recycling facility fees. Other prices are based on the Hazardous Materials Treatment Technologies Manual (HMTT) prepared by the Federal EPA and dated February 9, 1989.

8.3.1 No Action

No Action involves leaving contaminated soil in place and is the least costly. No Action can achieve compliance with the guidelines listed, if a risk assessment is performed and shows that by leaving the material in place there is no endangerment to public health and the environment. The associated costs are administrative costs estimated at $50,000. This option will involve future deed restrictions for the property, if accepted by the appropriate regulatory agency.

8.3.2 Land Disposal

This alternative was widely used in the past to remediate contaminated soil similar to those present at the APCI site. However, lack of suitable, properly designed landfill space for this waste makes this alternative less attractive. In addition, this alternative is merely a storage alternative and not a final destruction of the waste. The alternative will involve excavating and off-site disposal of all contaminated soil. Cost for land disposal of the contaminated soil, including all site activities, excavation and disposal taxes will be approximately $21.5 million.

This cost includes segregating the contaminated soil, backfilling and restoration. This cost is based on tons of actual contaminated soil above goal levels listed in Table 9-1. Cost is based on approximately $100 per ton for disposal at the Chem Waste Class I facility, plus a $10 per ton Kings County Tax, and approximately $33 per ton for transportation, excavation and restoration is based on $20 per ton. In addition, a state tax, currently $102 per ton, is included in the estimate. Permitting for this alternative is relatively easier than other alternatives.

8.3.3 Thermal Destruction

This is a very effective solution that completely destroys contaminants by burning them.

Incineration can either be high temperature, which completely burns the media, including the contamination present, or low temperature that burns waste contaminants with low burning temperature and preserves the media.

The permitting requirements for this alternative are very extensive and include conducting burn tests to determine the applicability and effectiveness of the alternative for the site specific waste. The solution is time extensive, mainly due to the permitting process. The incineration is also equipment intensive. In addition, fly ash as well as off-gas emissions, will require further treatment prior to final disposal. This alternative involves excavation of the contaminated soil for either on-site or off-site incineration.

Costs including excavation, segregation of contaminated soil and backfilling, and site restoration will be in the excess of $27.3 million. This estimate is based on $20 per ton to excavate and restore the site, plus an estimated cost of $500 per ton to permit and thermally destruct of waste. These costs are based on USEPA Hazardous Material Treatment Technologies, issued February 9, 1989 (HMTT).

8.3.4 Soil Washing

Soil washing is also a very effective alternative. However, soil washing transmits contaminants from soil to water and chemical solution mix. This mix requires further treatment prior to final disposal. Soil washing is both time and equipment intensive, requires extensive testing to produce optimum water-chemical mix, and requires extensive permitting. The alternative involves excavation and removal of contaminated soil for on-site washing.

The cost of soil washing, including excavation segregation, washing, backfilling and site restoration is approximately $9.0 million. This is based on a cost estimate of $150 per ton and $20 per ton to excavate and restore. In addition, soil washing costs $.50 per gallon to treat generated waste water.

8.3.5 Bio-remediation

Bio-remediation is a very effective alternative when dealing with petroleum hydrocarbon related contaminants. The alternative is effective, environmentally safe, readily available and easily applied. However, bio-remediation is a time extensive solution and may take weeks, and sometimes months to apply. In addition, bio-remediation requires optimum environmental conditions to be highly effective.
This alternative will involve the excavation of the contaminated soil for on-site treatment.

Bio-remediation involves excavating and spreading the contaminated soil in lifts up to 18 inches deep. Because of the presence of highly volatile organic compounds, this alternative will require extensive permitting from the South Coast Air Quality Management District (SCAQMD) and will require extensive monitoring and sampling program implementation.

Costs for this alternative are approximately $3.7 million. This is based on $50 per ton, plus $20 per ton for excavation and restoration.

8.3.6 Soil Vapor Extraction

The application of Soil Vapor Extraction (SVE) technology to the remediation of soils contaminated with petroleum hydrocarbons and volatile organic compounds is gaining wide acceptance. The alternative involves installing a series of vapor extraction wells, and applying vacuum pressure to them. The contaminant vapor is drawn off and either burned in a portable incinerator (oxidizer) or passed through a carbon absorption system.

This alternative is effective, environmentally safe, readily available, and easily applied. However, SVE is a time extensive solution and may take weeks, and sometimes months to be effective.

The incineration will be high temperature, which completely burns the vapors. Carbon absorption causes the vapors to be passed through a filter media. However, incineration is the preferred alternative over carbon absorption because of the replacement costs of the filter media. The incinerator may be used at another site after all of the contaminants have been removed from the soil. The permitting requirements for this alternative are easily obtainable. The incineration is also equipment intensive and requires weekly maintenance and monthly air sampling.

Soil Vapor Extraction is the least costly of the remedial alternative. No excavation of the soil is required. The cost for Soil Vapor Extraction and site restoration is approximately $1.8 million. This cost is based on purchasing a system for approximately $200,000 (including oxidizer). System installation, vapor extraction well installation, monthly sampling, operation and maintenance, and utilities is approximated at $30 per ton.

8.3.7 Recycling

This alternative is a very effective solution that reuses the contaminated soil by making the soil into asphalt. There are no permitting requirements for this alternative. Acceptance by the recycling facility is a prerequisite. There is no long term liability with recycling. This alternative involves excavation of the contaminated soil, and transportation to the recycling facility.

Costs including excavation, transportation, recycling costs, backfilling, and site restoration are estimated to be $5.4 million. This alternative can be used only after the highly volatile organic vapors have been removed from the soil.

8.4 Recommended Remedial Methods

IT recommends that in-situ soil vapor extraction and recycling be the remedial method utilized at the site. The following are reasons for selecting these remedial methods:

8.4.1 Soil Vapor Extraction

- As a result of the highly volatile components at the site, SCAQMD will not allow removal of the soil without removing or preventing the escape of the volatiles to the atmosphere, soil vapor extraction (SVE) can remove the most volatile contaminants.
- SVE is a proven technology in remediation of Petroleum Hydrocarbon contamination.
- SVE is very effective on the type of waste present, can be applied safely, and will provide maximum protection to public health and environment.
- SVE is the least costly alternative for the removal of the volatile organic compounds.
- The technology is simple, and the equipment is readily available.

Soil Vapor Extraction is the least costly of the remedial alternative. No excavation of the soil is required. The cost for Soil Vapor Extraction and site restoration is approximately $1.8 million. This cost is based on purchasing a system for approximately $200,000 (including oxidizer). System installation, vapor extraction well installation, monthly sampling, operation and maintenance, and utilities is approximated at $30 per ton.

8.3.7 Recycling

This alternative is a very effective solution that reuses the contaminated soil by making the soil into asphalt. There are no permitting requirements for this alternative. Acceptance by the recycling facility is a prerequisite. There is no long term liability with recycling. This alternative involves excavation of the contaminated soil, and transportation to the recycling facility.

Costs including excavation, transportation, recycling costs, backfilling, and site restoration are estimated to be $5.4 million. This alternative can be used only after the highly volatile organic vapors have been removed from the soil.

8.4 Recommended Remedial Methods

IT recommends that in-situ soil vapor extraction and recycling be the remedial method utilized at the site. The following are reasons for selecting these remedial methods:

8.4.1 Soil Vapor Extraction

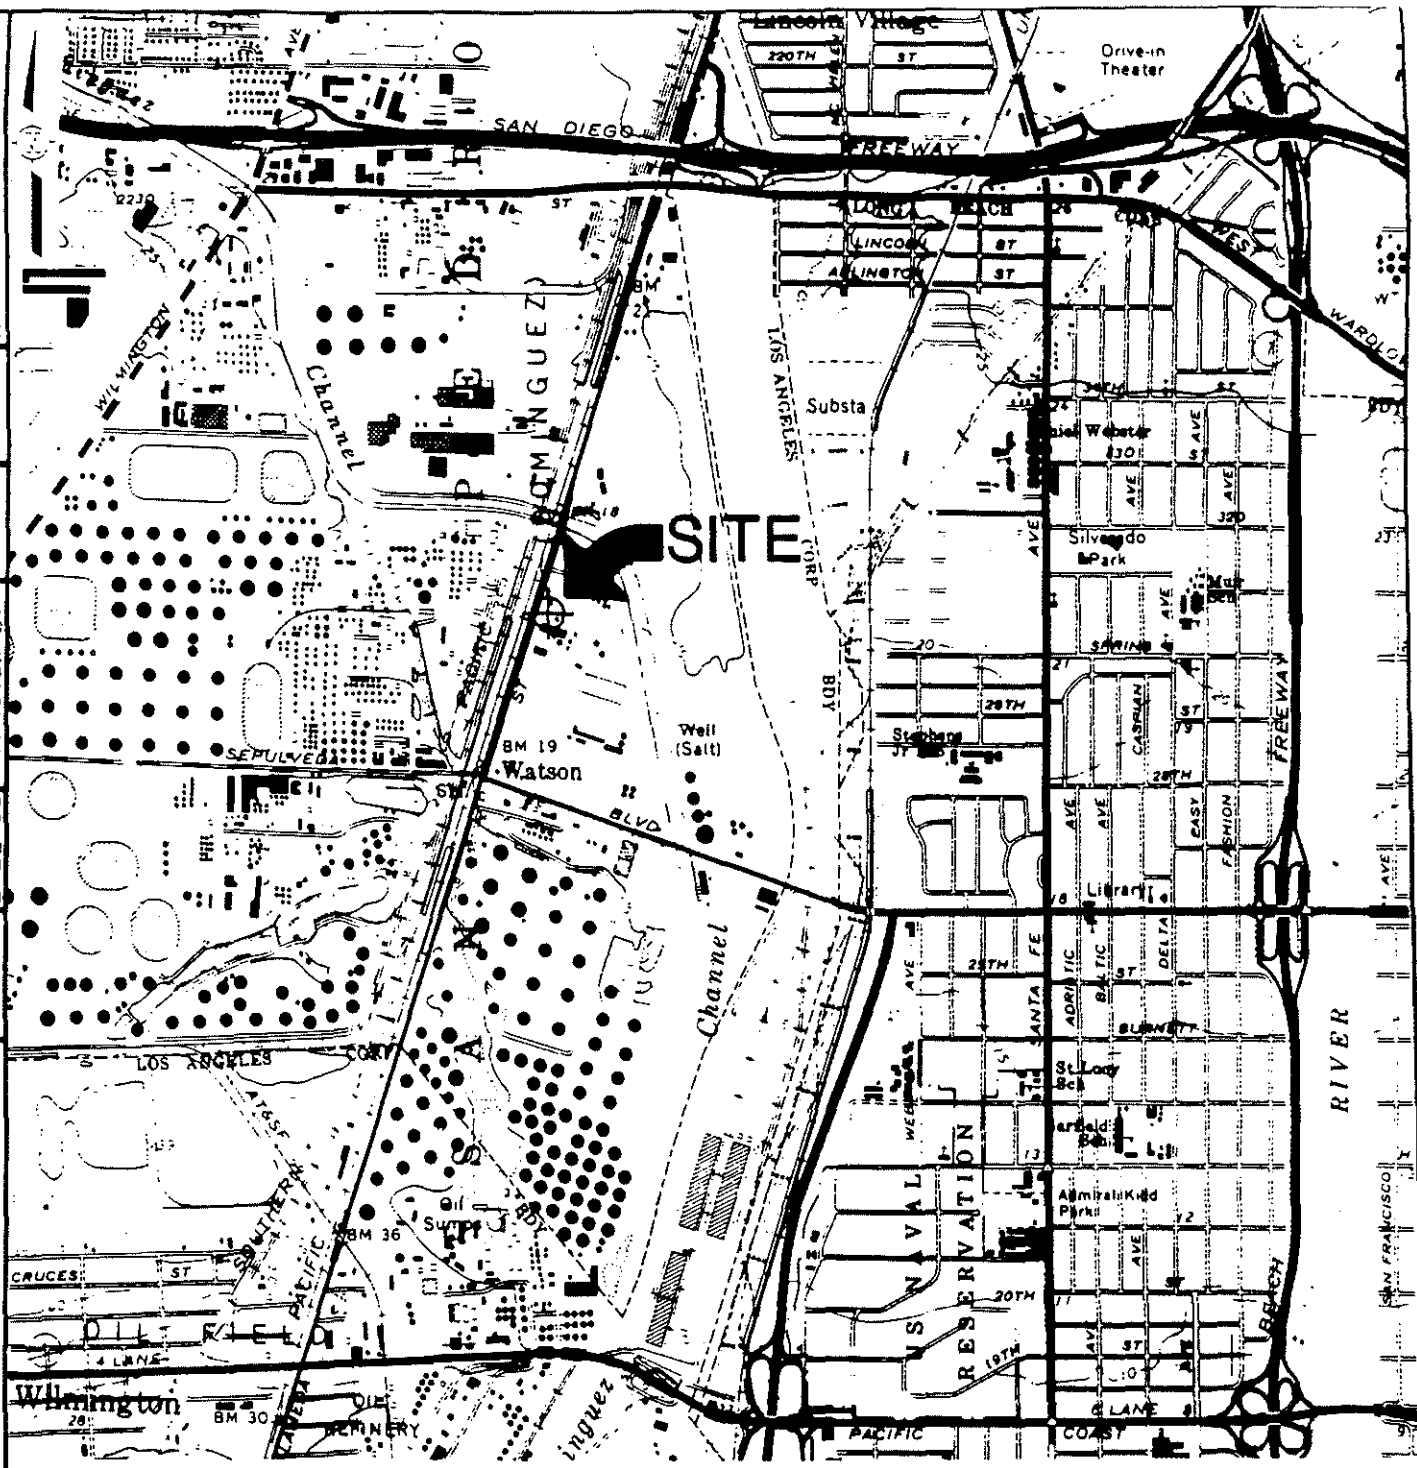
- As a result of the highly volatile components at the site, SCAQMD will not allow removal of the soil without removing or preventing the escape of the volatiles to the atmosphere, soil vapor extraction (SVE) can remove the most volatile contaminants.
- SVE is a proven technology in remediation of Petroleum Hydrocarbon contamination.
- SVE is very effective on the type of waste present, can be applied safely, and will provide maximum protection to public health and environment.
- SVE is the least costly alternative for the removal of the volatile organic compounds.
- The technology is simple, and the equipment is readily available.

- SVE is widely used and easily permitted.
- Minimum potential for future liability.
- Site lithology (i.e., soil permeability) will facilitate the use of SVE.
- Regulatory cleanup guidelines for the volatile organics can be achieved through SVE.
- The extent of contamination can be feasibly remediated by SVE.
- Time of cleanup remediation can be accomplished between 6 to 18 months.

8.4.2 Recycling

- This alternative is very effective on the type of waste present, can be applied safely, and will provide maximum protection to public health and environment.
- There is no long term liability associated with recycling.
- Time of removal can be accomplished in approximately two months after removal of volatile organics.
- Vertical and horizontal extent of contamination can be feasibly remediated.
- Permitting is minimal, versus the other alternatives.

8.5 Applicable Requirements



This section identifies applicable regulatory requirements as they relate to the selected alternatives. The final chosen contractor will contact the listed appropriate agencies to obtain any necessary permits and/or variances to implement this alternative.

TABLE 8.3
AGENCIES AND REQUIREMENTS

AGENCY	POSSIBLE REQUIREMENT
County of Los Angeles Department of Public Works	Overall Necessary Project Approval
Los Angeles Regional Water Quality Control Board	Waste Discharge Requirement Cleanup Goal Acceptance
South Coast Air Quality Management District	Air Emissions Permit/Equipment Permits
California Department of Toxic Substance Control	Compliance with Permit by Rule Requirements
City of Carson	Local and Building Permits

8.6 Application of Alternative/Site Control

A Remedial Action Work Plan will have to be submitted prior to remediation, describing the application of the selected alternatives to the Air Products site.

INTRODUCTION

Air Products Manufacturing Corporation formerly operated a hydrogen manufacturing facility located at 23320 South Alameda Street, in the City of Carson, California. An in-situ soil vapor extraction system has been in operation at this site for approximately 18 months. A site location map is included as Figure 1.

On December 9 and 10, 1996, Terra Vac drilled five closure soil borings (CB-1, CB-2, CB-3, CB-4, and CB-5), in locations as shown on Figure 2, according to the Regional Water Quality Control Board (RWQCB) approved Work Plan (Terra Vac, October, 1996). The soil borings were initiated with a hand auger and widened with a post hole digger for the first five feet to avoid hitting underground utilities with the hollow stem auger. Soil samples were obtained with a split spoon sampler every five feet to a maximum depth of 35.5 feet; a total of six samples were collected from each soil boring. A total of 15 representative samples (three from each boring) were analyzed.

Samples were analyzed to determine concentrations of diesel, gasoline, and benzene, toluene, ethylbenzene, and xylenes (BTEX). Modified EPA Method 8015 (total petroleum hydrocarbons [TPH] diesel) detects long chain hydrocarbons between C8 and C30 and EPA Method 8015 (TPH gasoline) detects shorter chain hydrocarbons between C6 and C12. Samples were analyzed by EPA Method 8020 for benzene, toluene, ethylbenzene and xylenes (BTEX).

SITE GEOLOGY

The site is located in the Dominguez Gap within the southern portion of the Central Section of the Los Angeles Basin. Soils in this portion of the Basin are mainly comprised of recent soil formations made up of clays, silts and sands that extend to the groundwater formation (IT Corporation, 1988). The site currently has a relatively flat grade covered with asphalt and concrete.

SITE HYDROGEOLOGY

Perched groundwater zones were encountered at approximately 5 to 10 feet and at 25 to 30 feet below grade at borings located within the areas of former tank excavations (CB-1, CB-3, CB-4, and CB-5). These borings revealed backfill consisting of clayey material in the upper zones, which thereby retained groundwater due to surface infiltration from recent rains. Perched groundwater was encountered at the transition from sand to clay at 15 to 16 feet below grade in CB-2. The permanent groundwater table is estimated to be 60 to 65 feet below the surface and would correspond to the Gage Aquifer, a major hydro-stratigraphic unit in the basin. Groundwater flow in the Gage Aquifer in the vicinity of the site flows generally in a westerly direction. No known municipal use exists for the groundwater below this site (IT Corporation, 1988).

SOIL BORING LOCATIONS

The closure soil boring locations were chosen to be representative of the remediated area and the locations of former aboveground and underground hydrocarbon storage tanks. As requested by the Regional Water Quality Control Board (RWQCB), soil borings were placed near the location of the former underground diesel tank (CB-4) and former underground spent caustic solution tank (CB-5). The locations of the five closure borings are shown on Figure 2.

DRILLING ACTIVITES

The drilling and sampling procedures used at this site followed Terra Vac Standard Operating Procedures and current industry practices to ensure quality control and quality assurance. The five soil borings were drilled using a drill hollow stem auger drill rig equipped with 4 inch outside diameter, continuous flight hollow stem augers. Decontamination buckets and brushes were used for decontamination of the split spoon sampler and sampling sleeves in between sampling depths.

The soil and decontamination water generated during the sampling have been containerized in 55 gallon drums and will be properly disposed.

Upon completion of drilling and sampling, the soil borings were backfilled to grade surface with bentonite/cement grout and capped with asphalt. A copy of the soil boring logs has been included in Appendix A.

Sample Collection

Soil samples were collected with a California modified split spoon sampler at five foot intervals beginning at the five (5) foot depth in each boring. The drilling subcontractor provided brass sample liners for collection of soil samples from the split spoon sampler. Each split spoon sample was lined with three (3) sample liners which were used as follows:

- The bottom most soil sample sleeve from each split spoon sampler was collected for chemical analysis. The ends of each sleeve was covered with a plastic end cap and placed in a cooler with blue ice for transportation the laboratory.
- The middle soil sample sleeve was intended to be used for field screening with the OVM by Terra Vac. However, heavy rains during closure boring drilling prevented OVM readings to be taken from most of the borings. Sample screening for subsequent lab analysis was based on soil appearance (i.e. discoloration, apparent hydrocarbon odor).
- The top sample sleeve was used for characterization and logged on a boring log form by Terra Vac's Geologist.

Chemical Analysis

A total of 15 soil samples were submitted to a California certified laboratory. The samples were selected for analyses based on the OVM readings, visual appearance and location. Samples were selected to asses the vertical and lateral distribution of hydrocarbon contamination across the project area.

The soil samples were analyzed by Modified EPA Method 8015 for TPH diesel and TPH gasoline, and by EPA Method 8020 for BTEX. A copy of the analytical reports have been included in Appendix B.

EPA Method 8015 TPH Diesel Fuel Results

In closure boring CB-1, the TPH diesel fuel concentrations were 1,000 mg/Kg at 11 feet below grade, not detected at 21 feet below grade, and 53 mg/Kg at 30 feet below grade.

TPH diesel was not detected in CB-2 at all depths (5.5, 15.5, and 25.5 feet below grade).

The soil sample from CB-3 had TPH diesel concentrations of 2,300 mg/Kg at 6 feet below grade, not detected at 16 feet below grade, and 110 mg/Kg at 20.5 below grade.

TPH diesel was not detected in CB-4 at all depths (10.5, 20.5, and 30.5 feet below grade).

The soil samples from CB-5 had TPH-diesel fuel concentrations of 490 mg/Kg at 15.5 feet below grade, 110 mg/Kg at 20.5 feet below grade, and 2,100 mg/Kg at 35.5 feet below grade.

EPA Method 8015 TPH Gasoline Results

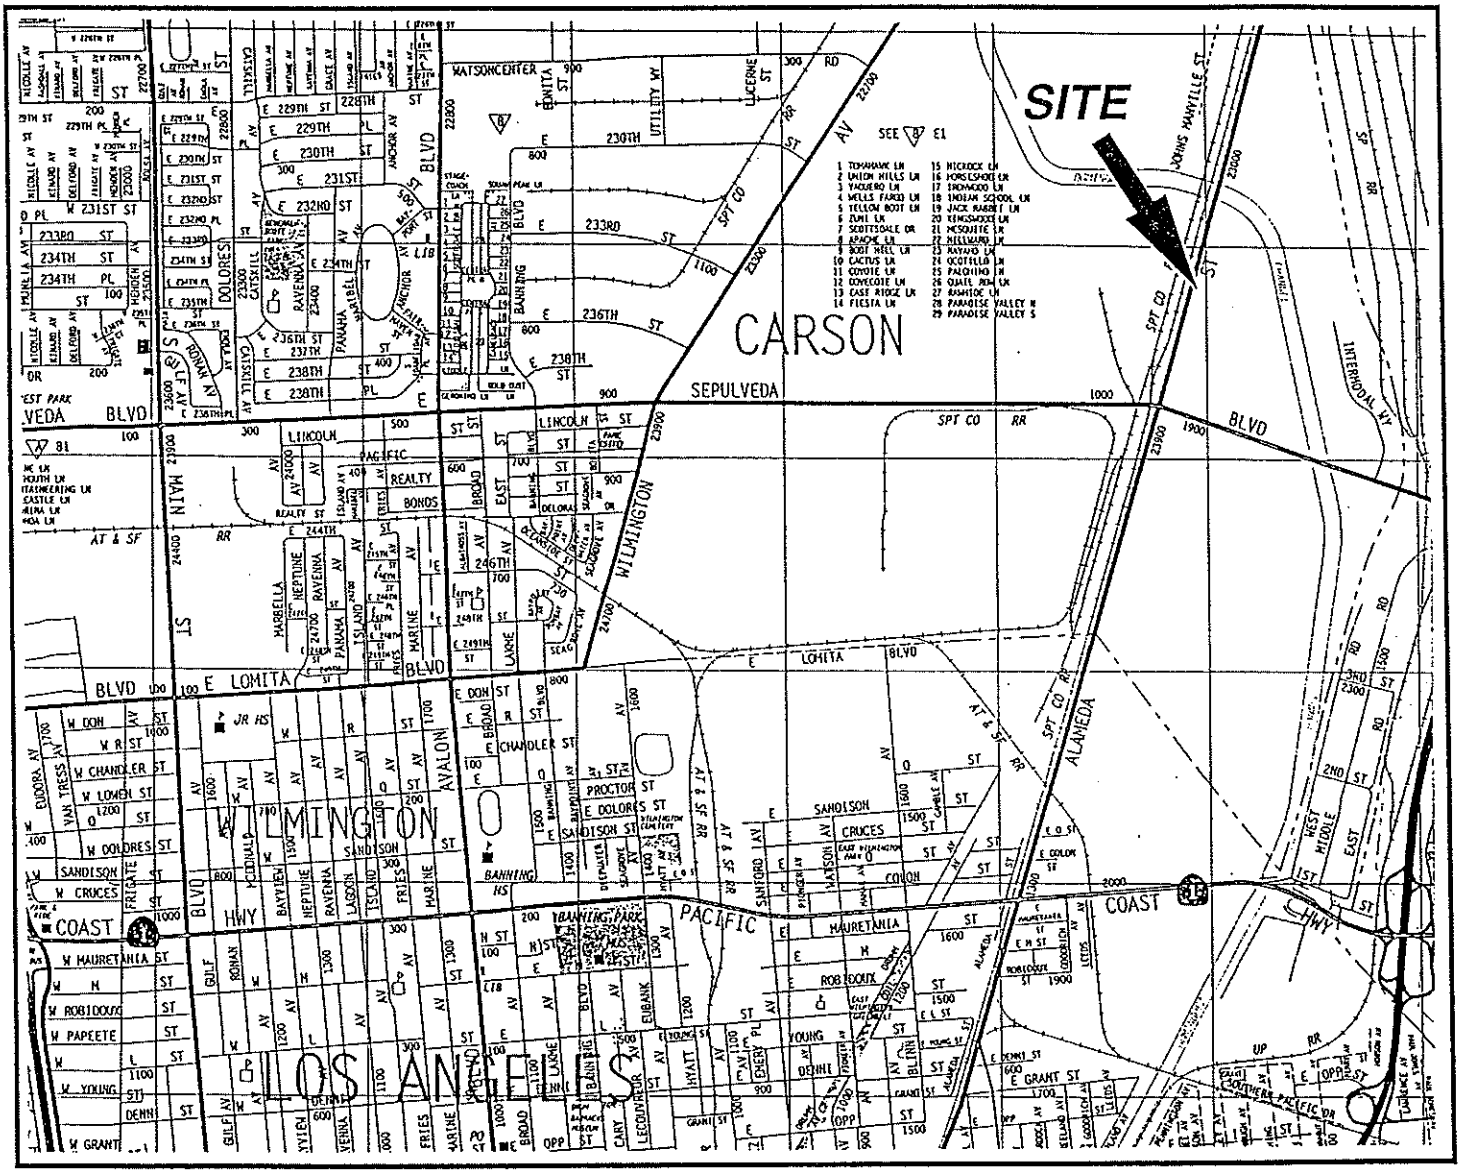
In closure boring CB-1, the TPH gasoline concentrations were 2.5 mg/Kg at 11 feet below grade, not detected at 21 feet below grade, and 0.79 mg/Kg at 30 feet below grade.

TPH gasoline was not detected in CB-2 at all depths (5.5, 15.5, and 25.5 feet below grade).

Soil samples from CB-3 had a TPH gasoline concentration of 1.7 mg/Kg at 6 feet below grade, and not detected at 16 and 20.5 feet below grade.

TPH gasoline was not detected in CB-4 at all depths (5.5, 15.5, and 25.5 feet below grade).

Soil samples from CB-5 had a TPH gasoline concentration of 1,700 mg/Kg at 15.5 feet below grade, not detected at 20.5 feet below grade, and 8,600 mg/Kg at 35.5 feet below grade



EPA Method 8020 (BTEX) Results

The soil samples from CB-1 had concentrations of 43 µg/Kg benzene, 120 µg/Kg toluene, 29 µg/Kg ethylbenzene, and 130 µg/Kg total xylenes at 11 feet below grade; not detected at 21

RECOMENDATIONS

The site should be considered for closure. All of the soil samples analyzed had non detect or low concentrations of contamination. In the area of CB-5 at 15.5 and 35.5 feet below grade, the dense clay zones less affected by the soil vapor extraction system as the rest on the site. This is caused by the characteristic low permeability of clay materials and a plastic liner installed in the excavation after the former caustic tank was removed.

The tightness of the clay and this plastic liner will reduce or eliminate the migration of the remaining BTEX and TPH compounds. The remaining contamination will also continue to degrade through natural biodegradation.

Tank Closure Report
Air Products and Chemicals, Inc.
Carson, California

Dear Mr. Burgess:

The following letter report describes activities conducted by IT Corporation (IT) during the removal of four underground storage tanks. The tanks formerly were located at the Air Products and Chemicals, Inc. (APCI) facility located at 23320 South Alameda Street in Carson, Los Angeles County, California.

BACKGROUND

The APCI Carson facility had four underground storage tanks to be removed. They are as follows:

Tank #	Identification	Volume (Gal.)	Contents
LD-IGD-2	8807	12,000	Diesel Fuel
LB-IGD-1	E-67364	3,000	Gasoline
28.5	E-36350	2,000	Waste Oil
28.91	26076	2,500	Diesel Fuel

The tanks' former locations are illustrated in Figure 1.

FIELD INVESTIGATION

Tank Cleaning

On August 4, 1987, IT triple-rinsed the interior of the four tanks with a pressure washer to remove any hydrocarbon residues. Using a vacuum truck, approximately 1300 gallons of wash water were removed from the tanks and transported under hazardous waste manifest #87086134 to Petroleum Recycling, Inc. located in Signal Hill, California. Mr. Daniel F. O'Connell of APCI signed the manifest and retained the generator's copies.

Inspector Ray Williams of the Los Angeles County Fire Prevention Division supervised the testing of all the tanks with a GX-3 meter prior to the removal operation. All tanks were properly inerted with 15 pounds of dry ice per 1000 gallons.

Tank Removal

IT excavated and removed the four underground storage tanks on August 4, 1987. No visible indication of leakage nor obvious holes in the steel tanks were noted with tanks LD-IGD-1, LB-IGD-2, and 28.5. What appeared to be petroleum contamination was observed below and on all four sides of the excavation for Tank 28.91. The tanks were transported as a non hazardous waste to American Metal Recycling, Inc. in Ontario, California. The certificate of destruction is attached.

Soil Sampling

Under the direction of Ms. Bonnie M. Keolian, Industrial Waste Engineering Inspector for Los Angeles County Department of Public Works, and per Closure Permit No. 3036 B File No. I-5385-22, a total of eight soil samples were obtained from a depth of two feet below the invert of the tanks. The samples were designated #1 through #8. The locations of the samples are detailed in Figures 2 and 3.

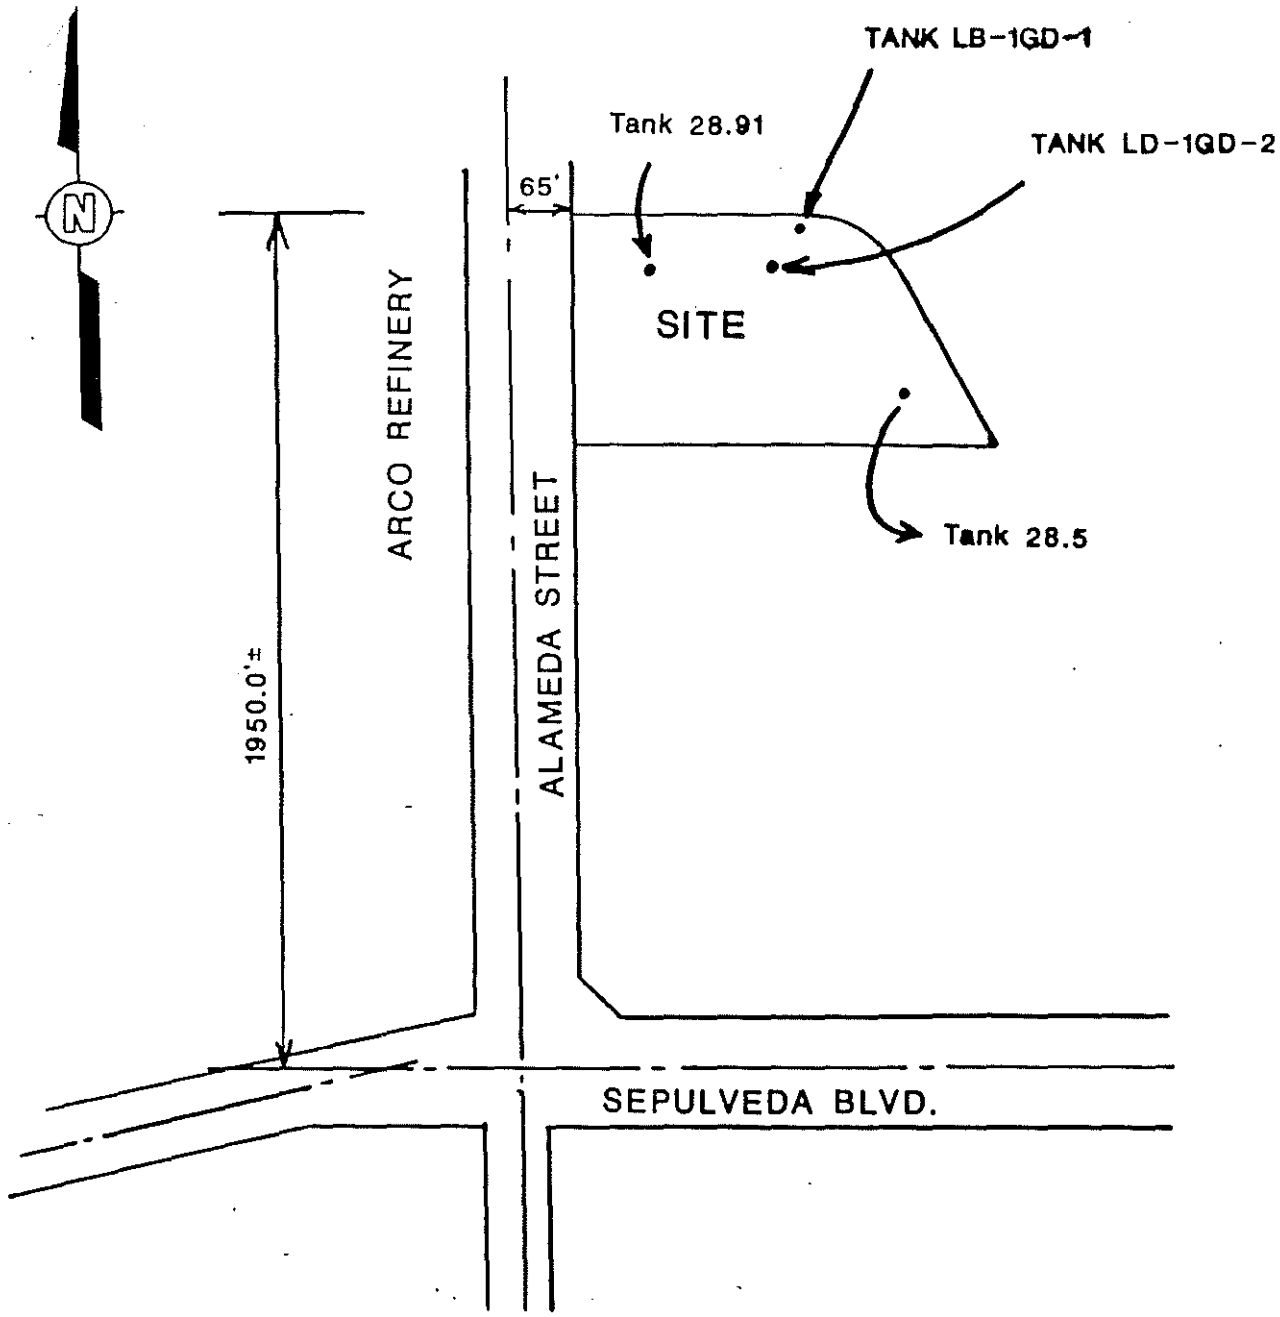
Soil from the designated areas was removed using a backhoe bucket. Grab samples were collected from the backhoe bucket using a hand trowel and placed in 16 ounce jars with Teflon septums. The jars were sealed, labeled, entered into the IT Chain-of-Custody, and immediately placed on ice to prevent volatilization until delivery to the laboratory.

LABORATORY TESTING

Soil samples were analyzed by IT Analytical Services Laboratory of Cerritos, California, for total petroleum hydrocarbons (TPH) according to U.S. EPA Test Method 418.1 and 8015. The results of the sampling are summarized in Table 1. Copies of the Certificate of Analysis and the Chain-of-Custody records are enclosed.

CONCLUSIONS AND RECOMMENDATIONS

Summary



Based on the analytical results, IT concludes that TPH concentrations in soil samples collected from beneath gasoline tank LB-IGD-1 are below 100 ppm. Soil samples obtained from below tanks 28.5 and LD-IGD-2 contain concentrations of between 58 and 270 ppm. Although soil samples taken below the latter two tanks indicate minor soil contamination, no visible signs of contamination were noted in the field and the two tanks were intact. We believe the elevated TPH concentrations were due to over-spillage.

We acknowledge the fact that fairly high levels of petroleum contamination were found below Tank 28.91 and further investigation needs to be done to establish the limits of the plume.

Recommendations

It is our professional opinion that the following steps should be taken at the APCI facility:

- Backfill and compact the excavation for Tank LB-IGD-1
- Spread out and aerate the soil removed from the excavations of Tanks 28.5 and LD-IGD-2. In approximately two weeks, obtain composite samples of the previously contaminated material. If levels are below 100 ppm TPH, use the excavated material as backfill and compact. If analysis shows that levels are above 100 ppm, repeat the aeration process.
- Focus attention on the area surrounding the former location of Tank 28.91. (From a conversation with the Los Angeles Flood Control District, it is our understanding that the static water level in the vicinity of the site is approximately 45 feet). With a drill rig obtain soil samples at five foot intervals to establish the vertical extent of the contamination. The borings should be drilled to a depth of 40 feet or first encountered ground water.
- Using a series of borings, field instrumentation, and observation, establish the extent of the contaminated soil both horizontally and vertically.
- Although the area is congested with machinery and adjacent a working driveway, a few selected test pits may be dug to supplement the drilling operation.
- Evaluate and recommend the most prudent means of site remediation.

Re: File No. 100.315
Air Products Manufacturing Corp., 23320 South Alameda St., Carson, CA

Dear Keith:

As requested in your 20 November 1996 letter, Air Products hereby provides the Regional Water Quality Control Board (the Board) with our closure investigation report for the above referenced former hydrogen manufacturing site. As you recall, Air Products operated a soil vapor extraction system (SVE) at this site from May 1995 to November 1996. Following a series of rebound tests, which showed no significant benefit to the continued operation of the SVE system, the Board granted Air Products permission to shut down the SVE system. Subsequently, Air Products' contractor, Terra Vac Inc., prepared a site closure investigation workplan which was approved by the RWQCB. According to the workplan, Air Products drilled five closure borings (CB-1 through CB-5) to an approximate depth of 30 feet below grade and conducted field organic vapor analyses (OVA) during each boring in order to identify any soils with remaining hydrocarbons. Described below is a summary of the five boring locations. Three soil samples from each boring were selected for laboratory analysis, based on the OVA screening, and each sample was analyzed for TPH Diesel, TPH Gasoline, and BTEX.

Closure boring CB-1 was situated where the former 10,000 gallon aboveground diesel and 10,000 gallon aboveground hydrocarbon condensate tanks were located. Closure boring CB-2 and closure boring CB-3 were situated in order to assess the effectiveness of the SVE system in a northerly and southerly direction respectively. Closure boring CB-4 was situated where the former 2,500 gallon underground diesel tank #28.91 was located and closure boring CB-5 was situated where the former 6,000 gallon underground spent caustic solution tank #28.70 was located.

To summarize the results of our closure boring investigation, two borings (CB-2 and CB-4) showed total elimination of hydrocarbons, two other borings (CB-1 and CB-3) showed a nearly total elimination of hydrocarbons, and one boring (CB-5) showed some hydrocarbons remaining. It appears that the overall effectiveness of the SVE system in removing hydrocarbons was good; however, this effectiveness varied somewhat within a closure boring and among closure boring areas. Air Products believes that the site conditions explained below are responsible for these variations in hydrocarbon removal effectiveness.

Based on the "none detected" readings at all levels in CB-2 and CB-4, it appears that the SVE system was completely effective in the northern area of the site where these borings were located. CB-4 was situated where the former underground tank #28.91 was located. The soil in the area surrounding these two closure boring locations appears to be uniformly sandy and porous to the extent that it was well suited to influence from the nearby vapor extraction wells. The SVE system was also very effective in the area where CB-1 and CB-3 were located; however, it was not quite as effective as the CB-2/CB-4 northern area. Air Products attributes this difference in effectiveness to clay layers present at two depths. Clay is less porous than other soil components and serves as a barrier for the downward movement of water from surface infiltration. The clay layers and perched water discovered in CB-1, CB-3, and CB-5 at approximately 5-10 feet and 25-35 feet below grade apparently prevented the SVE system from achieving a "none detected" level of hydrocarbon removal. The existence of the two clay/perched water layers also explains the clean, "none detected" layer of soil found between the two clay layers in CB-1, CB-3, and CB-5.

At 15 and 35 feet below grade, the CB-5 (former underground tank #28.70) location appears to have been less affected by the SVE system. This was quite puzzling at first, given that three vapor extraction wells had operated in close proximity of the CB-5 area. This may be related to two conditions. One is that our past consultant, IT Corp., upon removing underground tank #28.70, had placed a plastic liner in the excavation pit prior to placing the contaminated soil back in the hole. This plastic liner probably acted as a vapor barrier and isolated the 0-10 or 0-15 foot below grade section of the CB-5 area from the beneficial effects of the SVE system. The second condition, and probably the major cause for the reduced treatment efficiency at CB-5, must be the existence of the clay/perched water condition. For some reason, though, the lower treatment efficiency was more dramatic than at CB-1 or CB-3. This may have been due to more clay and/or perched water at CB-5, or SVE well construction.

Given the recent regulatory changes in site clean-up criteria, where the old system of assigning a single numerical target for all sites has shifted to a risk based system where closure targets are more site specific, Air Products is not sure what the Board's position would be regarding the CB-5 area. This is an industrial site that is leased from a refinery and which is bordered by a refinery, a sulfur recovery plant, and a coke storage operation. Although some hydrocarbons remain at the CB-5 area, Air Products believes they present a very low risk. The site is flat and the clay layers and concrete/asphalt covering serve to prevent the downward migration of contamination. The hydrocarbons at the 35 foot depth are 25 to 30 feet above the permanent groundwater level. This permanent groundwater, the Gage Aquifer trends in a westerly direction. No known municipal use exists for the groundwater beneath the site and the nearest known down gradient well is approximately 2.5 miles to the west. Given these facts, Air Products proposes no further action and requests Board closure for the site.

Air Products hereby requests that the Board provide comments to Air Products regarding this closure investigation and our interpretations of the results. Air Products also asks that the Board now grant closure for former underground diesel tank # 28.91 based on the CB-4 analytical results of "none detected" for TPH diesel, TPH gasoline, and BTEX; and for former underground caustic solution tank # 28.70. In addition, given the low risk associated with the hydrocarbons remaining in the CB-5 area, Air Products proposes no further action be required and that the Board grant closure approval for the SVE system area. We would appreciate your prompt response in this regard. If you have any questions please call me at (610) 481-8867.

Sincerely,

Robert J. Swigart

UNDERGROUND STORAGE TANK CASE REVIEW FORM

Los Angeles Regional
Water Quality Control Board

Date: September 23, 1997	LUSTIS file no.: # I-05385	Case reviewer: KEITH ELLIOTT	
Site Name/Address: **Air Products & Chemicals Inc.** **23320 Alameda Street, South** **Carson, CA**	Responsible parties: Robert J. Swigart	Address: Air Products & Chemicals Inc. 7201 Hamilton Boulevard Allentown, PA 18195-1501	Phone no.: (610) 481-8867

I. CASE INFORMATION (N/A = Not Applicable)

Tank No.	Size in Gallons	Contents	Closed in-place/Removed?	Date
LD-IGD-1	3,000	Gasoline	Removed	08/04/87
LD-IGD-2	12,000	Diesel Fuel	Removed	08/04/87
3 (28.5)	2,000	Waste Oil	Removed	08/04/87
4(28.91)	2,500	Diesel Fuel	Removed	08/04/87
5	6,000	Caustic	Removed	05/18/93

II. SITE CHARACTERIZATION INFORMATION (GW=groundwater, -- =Not Reported)

GW Basin: West Coast HSA - Coastal Plain	Beneficial uses: MUN	Depth to drinking water aquifer: About 400 feet bgs	
Distance to nearest municipal supply well: 0.85 miles		Distance between known shallow GW contamination and aquifer: 350 feet	
GW highest depth:5 ft bgs	GW lowest depth:65 ft bgs	Well screen interval: No GW monitoring wells installed on-site	Flow direction: West/Southwest
Soil types: Silty sand, sand, and gravel.		Maximum soil depth sampled: 58 feet	

III. MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS -- Initial and Latest (ND=Non-detect; NRQ=Not required)

Contaminant	Soil (mg/kg)		Water (µg/L)		Contaminant	Soil (mg/kg)		Water (µg/L)	
	Initial (1993)	Latest (1996)	Initial (Year)	Latest (Year)		Initial (1993)	Latest (1996)	Initial (Year)	Latest (Year)
TPH (Gas)	7,170	8,600			Ethylbenzene	57	63		
TPH (Diesel)	50,400	2,300			Xylenes	320	280		
Benzene	91	180			MTBE	NA	ND(5/1/97)		
Toluene	450	350			Other				

IV. SOIL REMEDIATION

Method:Excavation with on-site bioremediation of about 410 cubic yards of soil from Tank 28.91 In addition, SVE for the process area.	Duration of remediation: 1 year SVE.

V. GROUNDWATER REMEDIATION

Method: N/A	Duration of remediation: N/A

VI. FREE PRODUCT:

Was free product encountered? The report indicates Yes, in excavation for caustic tank (BH-9) also in BH-16 however, this is believed to be an elevated perched ground water with petroleum hydrocarbon upon this water.	Has free product been totally recovered? yes
When was free product recovery project completed? 8/96 when SVE system shut down.	

VII. RECOMMENDED ACTION:

Soil Closure only: Yes	Case Closure: Yes	Solvent Case? NO
Additional Action Required (i.e.: additional site assessment, remediation, monitoring): NONE		

VIII. COMMENTS AND JUSTIFICATION FOR RECOMMENDED ACTION:

This site is adjacent to the Carson Reg[illegible]l Ground Water Group which has extensive [illegible]phase hydrocarbons upon the ground water. In addition, there are numerous pipelines along the adjacent Alameda Street. Also, there were releases from above ground storage tanks at the subject site.

A crossgradient gauge aquifer monitoring well M-2 identified 0.9 mg/kg TPH & ND for BTEX and crossgradient monitoring well 33-D was ND for TPH & BTEX in 4/97. There were no downgradient monitoring wells analyzed before reaching the downgradient free-phase hydrocarbon "Pool 1" plume at the Arco refinery which had 14.84 feet of free product in the closest well AMR/554-D.

The SVE system operated for one year and developed asymptotic conditions. Tested for rebound conditions which were minimal.

Elevated contaminant concentrations noted above are in area of caustic tank where a plastic liner was placed into excavation prior to backfilling. This liner inhibited SVE treatment of soils. The remaining site appears to have been remediated to more acceptable levels.

Close site based upon Level 2 MTBE and "Common Sense" closure criteria with limitation for industrial use at site.

1.0 Introduction

The Air Products and Chemicals, Incorporated (APCI) Carson Hydrogen Facility (site), is located in Carson, Los Angeles County, California, at 23300 South Alameda Street (Figure 1). The site is fenced and occupied by one temporary building on an unpaved lot. The surrounding area consists of industrial properties with the Texaco Sulfur Recovery Facility to the north, and the APCI Specialty Gas Facility and the ARCO Coke Storage Facility to the south.

The site is owned by ARCO, and has been leased by APCI since 1962. In 1962, APCI built a hydrogen purification and liquefaction facility which manufactured liquid and gaseous hydrogen. This manufacturing facility was in operation from 1962 until 1986. The facility was decommissioned and was demolished in 1992 and 1993. All underground storage tanks (USTs) and aboveground storage tanks (ASTs) were removed between the years of 1987 and 1993. Under the direction of the Los Angeles Regional Water Quality Control Board (RWQCB), an in-situ soil vapor extraction system was in operation at the west end of the site between May of 1995 and November of 1996 to remediate past hydrocarbons releases. The RWQCB granted closure of the site in 1997.

The site is located in the Dominguez Gap within the southern portion of the Central Section of the Los Angeles Basin. Shallow soils in this portion of the Basin are mainly recent clays, silts and sands that extend to the Gage Aquifer at approximately 60 feet below surface.

APCI intends to construct a new hydrogen facility on the site. In preparation for this construction, APCI has conducted demolition of some remaining foundations and associated footers from the previous hydrogen facility, as well as other pre-construction activities. These activities included the excavation of soil in several areas of the site.

1.1 Objectives

IT Corporation (IT) was contracted by APCI to perform air monitoring, environmental engineering oversight, soil sampling, and South Coast Air Quality Management District (SCAQMD) Rule 1166 report preparation for activities conducted during the demolition of

certain concrete foundations and associated footers near the west end of the site, and subsequent excavation in preparation for new foundations and footers to be located in this area. Because of the location of the site in the refinery area of Carson and its history of hydrocarbon contamination, APCI anticipated that soils affected by hydrocarbons might be encountered during the demolition and excavation. This report summarizes the field operations, soil excavation and stockpiling activities, field and laboratory analyses, soil removal from the site for disposal, and backfilling operations. All operations were completed in accordance with the conditions stipulated by the SCAQMD Rule 1166 Contaminated Soil Mitigation Plan No. 342375 (Appendix A).

2.0 Field Activities

This section summarizes field activities, including air monitoring, excavation, soil sampling, soil analysis, and backfilling.

2.1 Air Monitoring

On August 25, 1998, air monitoring began, in accordance with SCAQMD Rule 1166 Mitigation Plan No. 342375. Both soils and airspace were monitored using an Hnu® P1-101 Model photo-ionization detector (PID) calibrated to hexane gas (Photo 1). The calibration of the PID was confirmed using manufacturer's recommended procedures and hexane gas standardized to 100 parts per million (ppm) at the beginning and end of each day in which excavation activities were conducted.

PID measurements were taken throughout the excavation activities at time intervals not exceeding 15 minutes. All measurements were entered into SCAQMD Rule 1166 Soil Monitoring Records. Whenever applicable, notations as to sample location, depth, and details of excavation activities were also noted on the Monitoring Records. Monitoring Records are presented in Appendix B.

In accordance with Section III, Condition 14 of the Mitigation Plan, SCAQMD was notified of PID measurements exceeding 50 ppm. On August 27, 1998, reference number EH-98-0336 was provided by the SCAQMD. On August 31, 1998, the SCAQMD provided reference number EH-98-0338 for all remaining soils removed from August 27, 1998 to the end of the excavation activities.

2.2 Vapor Suppression Activities

Throughout the excavation activities, particular care was taken to maintain proper vapor suppression (Photo 2). The excavation area was frequently sprayed with water and all areas of the excavation not within the immediate work area were covered with plastic sheeting (Photo 3). Excavated soils were stockpiled on the site according to the conditions of the Mitigation Plan. All stockpiles of potentially contaminated soil were placed on plastic sheeting, sprayed with water and covered with plastic sheeting (Photo 4). All sheeting was secured and anchored to prevent exposure of potentially contaminated soils to the atmosphere.

2.3 Excavation

Demolition and excavation activities began August 25, 1998 and were completed September 1, 1998. Excavation was conducted by Howard Contracting Incorporated (HCI) of Los Alamitos, California. An estimated total of 1200 cubic yards of soil was removed and placed into one of two stockpile areas, one containing soils with PID measurements less than 50 ppm ("< 50 ppm stockpile") and the other with PID measurements equal to or higher than 50 ppm ("> 50 ppm stockpile"). The excavation was approximately 93 feet long north to south and 75 feet wide east to west, with depths varying from 3 feet to 7 feet below ground surface (bgs) (Figure 2).

2.4 Soil Sampling

Ten soil samples were taken of stockpiled soils on September 2, 1998, entered into chain of custody records, and delivered in ice-chilled coolers to Enviro-Chem, Inc. (Enviro-Chem) in Pomona, California. Nine samples were taken from the > 50 ppm stockpiles and one from the < 50 ppm stockpile. The nine samples from the > 50 ppm stockpiles were composited into three composite samples by the laboratory. All four samples were analyzed for total petroleum hydrocarbons (TPH) by United States Environmental Protection Agency (EPA) Method 8015M, volatile organic compounds (VOCs) by EPA Method 8260A, and Title 22 metals by EPA Methods 6010A, 7196A, and 7471A. Based upon elevated lead and mercury concentrations, the samples were further analyzed for soluble lead and mercury using the California Waste Extraction Test (WET) and by EPA Method 1311 Toxicity Characteristic Leaching Procedure (TCLP). Laboratory Reports are presented in Appendix C.

No VOCs were detected in the samples. All samples contained elevated levels of hydrocarbons in the diesel (C10-C22) and oil (C22-C35) ranges, but no gasoline or kerosene range hydrocarbons were detected in any of the samples. Barium, chromium, cobalt, copper, nickel, selenium, vanadium, and zinc were detected in one or more of the samples at relatively low concentrations. Analytical results are presented in Table 1. Soluble lead concentrations in all samples exceeded the California soluble threshold limit concentration (STLC) of 5 milligrams per liter (mg/L), which resulted in the soil being classified as a California hazardous waste. Lead TCLPs for all four samples were less than the 5.0 mg/L threshold limit. Mercury TCLP for one sample measures less than the 0.2 mg/L threshold limit. Thus, soil was not a RCRA hazardous waste.

Because APCI anticipated transporting the contaminated soil to a disposal facility in Arizona, the nine samples from the >50 ppm stockpiles were transferred to Del Mar Analytical Services (Del Mar), an Arizona certified laboratory, for analysis of BTEX and polynuclear aromatic hydrocarbons (PAHs). Some PAHs were detected in all three composite samples at relatively low concentrations. Benzene and toluene were detected in low concentrations in the composite sample STK1-7,8,9. Analytical results are presented in Table 2.

2.5 Removal of Contaminated Soil

A total of approximately 1782 tons or 1200 cubic yards of stockpiled, contaminated soil was removed from the site (US EPA ID No. CAC002102136). All soils were loaded and hauled by Ecology Control Industries (ECI) to Browning-Ferris Industries, Inc.'s (BFI) La Paz County Landfill in Parker, Arizona (US EPA ID No. AZC950823111). Removal operations took place between September 17, 1998 and September 22, 1998. Copies of hazardous waste manifests are included in Appendix D.

2.6 Backfilling and Compaction

Backfilling and compaction operations were conducted between September 10, 1998 and September 13, 1998 by HCI. Backfilling oversight and compaction testing was conducted by Globus Engineering Incorporated (Globus) of San Pedro, California. The excavation was backfilled with soils from the <50 ppm stockpile and other uncontaminated soils stockpiled on the site.

3.0 Certifications and Limitations

The statements, opinions and conclusions contained in this report are based solely upon the services performed by IT Corporation as described in this document and the contracted scope of work established by APCI and the terms and conditions of the contract agreement with APCI. In performing these services and completing this document, IT Corporation utilized and relied upon the work and information provided by others, including public agencies, whose information cannot be guaranteed by IT Corporation.

This document is intended for the sole and exclusive use of APCI. The findings of this document are limited to those specifically expressed in the document and no other representations or warranties are given by IT Corporation and no additional conclusions should be reached or representations relied on other than those expressly stated in the report and as limited by contracted IT Corporation Terms and Conditions.

IT Corporation performed the field operations, investigations and analyses described in this document in accordance with currently accepted professional standards of environmental investigation, analysis and engineering. The results presented in this document are considered representative of conditions at the time the work was performed. If there are any questions about the information presented in this report, please call the undersigned at (714) 261-6441.

Respectfully submitted,

ECOVA

1. INTRODUCTION

This report summarizes the final phase of work completed by ECOVA Corporation (ECOVA) on behalf of Air Products and Chemicals, Inc. (APCI), at the APCI facility located at 23320 South Alemeda Street in Carson, California. ECOVA designed and operated a solid-phase biological treatment system at the site to remediate diesel contaminated soil. (Figure 1-1).

In this report we present:

- project background information
- project objectives
- excavation activities
- design and construction of the treatment bed
- baseline, process and final sampling methodologies
- results of analyses
- changes to the work plan resulting from discoveries in the field during the initial field work
- a review of the bioremediation methods
- treatment unit decommissioning

1.1 BACKGROUND

In January, 1989 ECOVA Corporation (ECOVA) of Redmond, Washington was retained by APCI to degrade the diesel contamination in the soil surrounding former UST 28.91. Development of a work plan and attainment of authorization to proceed from the South Coast Air Management District (SCAQMD) and the Los Angeles County Department of Public Works (LACDPW) resulted in a May 1989 startup of the project.

In August, 1987 in response to the State of California underground Fuel Storage Tank Law, APCI retained a contractor to remove four underground storage tanks (USTs) from their Carson, California facility. Upon excavation and removal of a 2,500-gallon diesel underground storage tank (UST 28.91), stained soil was observed in the tank pit (IT Corporation, 1988). At the time of removal, UST 28.91 had been empty and out of service for a period of 10 years. A subsequent environmental investigation was designed and implemented to determine the severity and extent of diesel contamination beneath and near the former UST 28.91. The results of the environmental investigation results showed that:

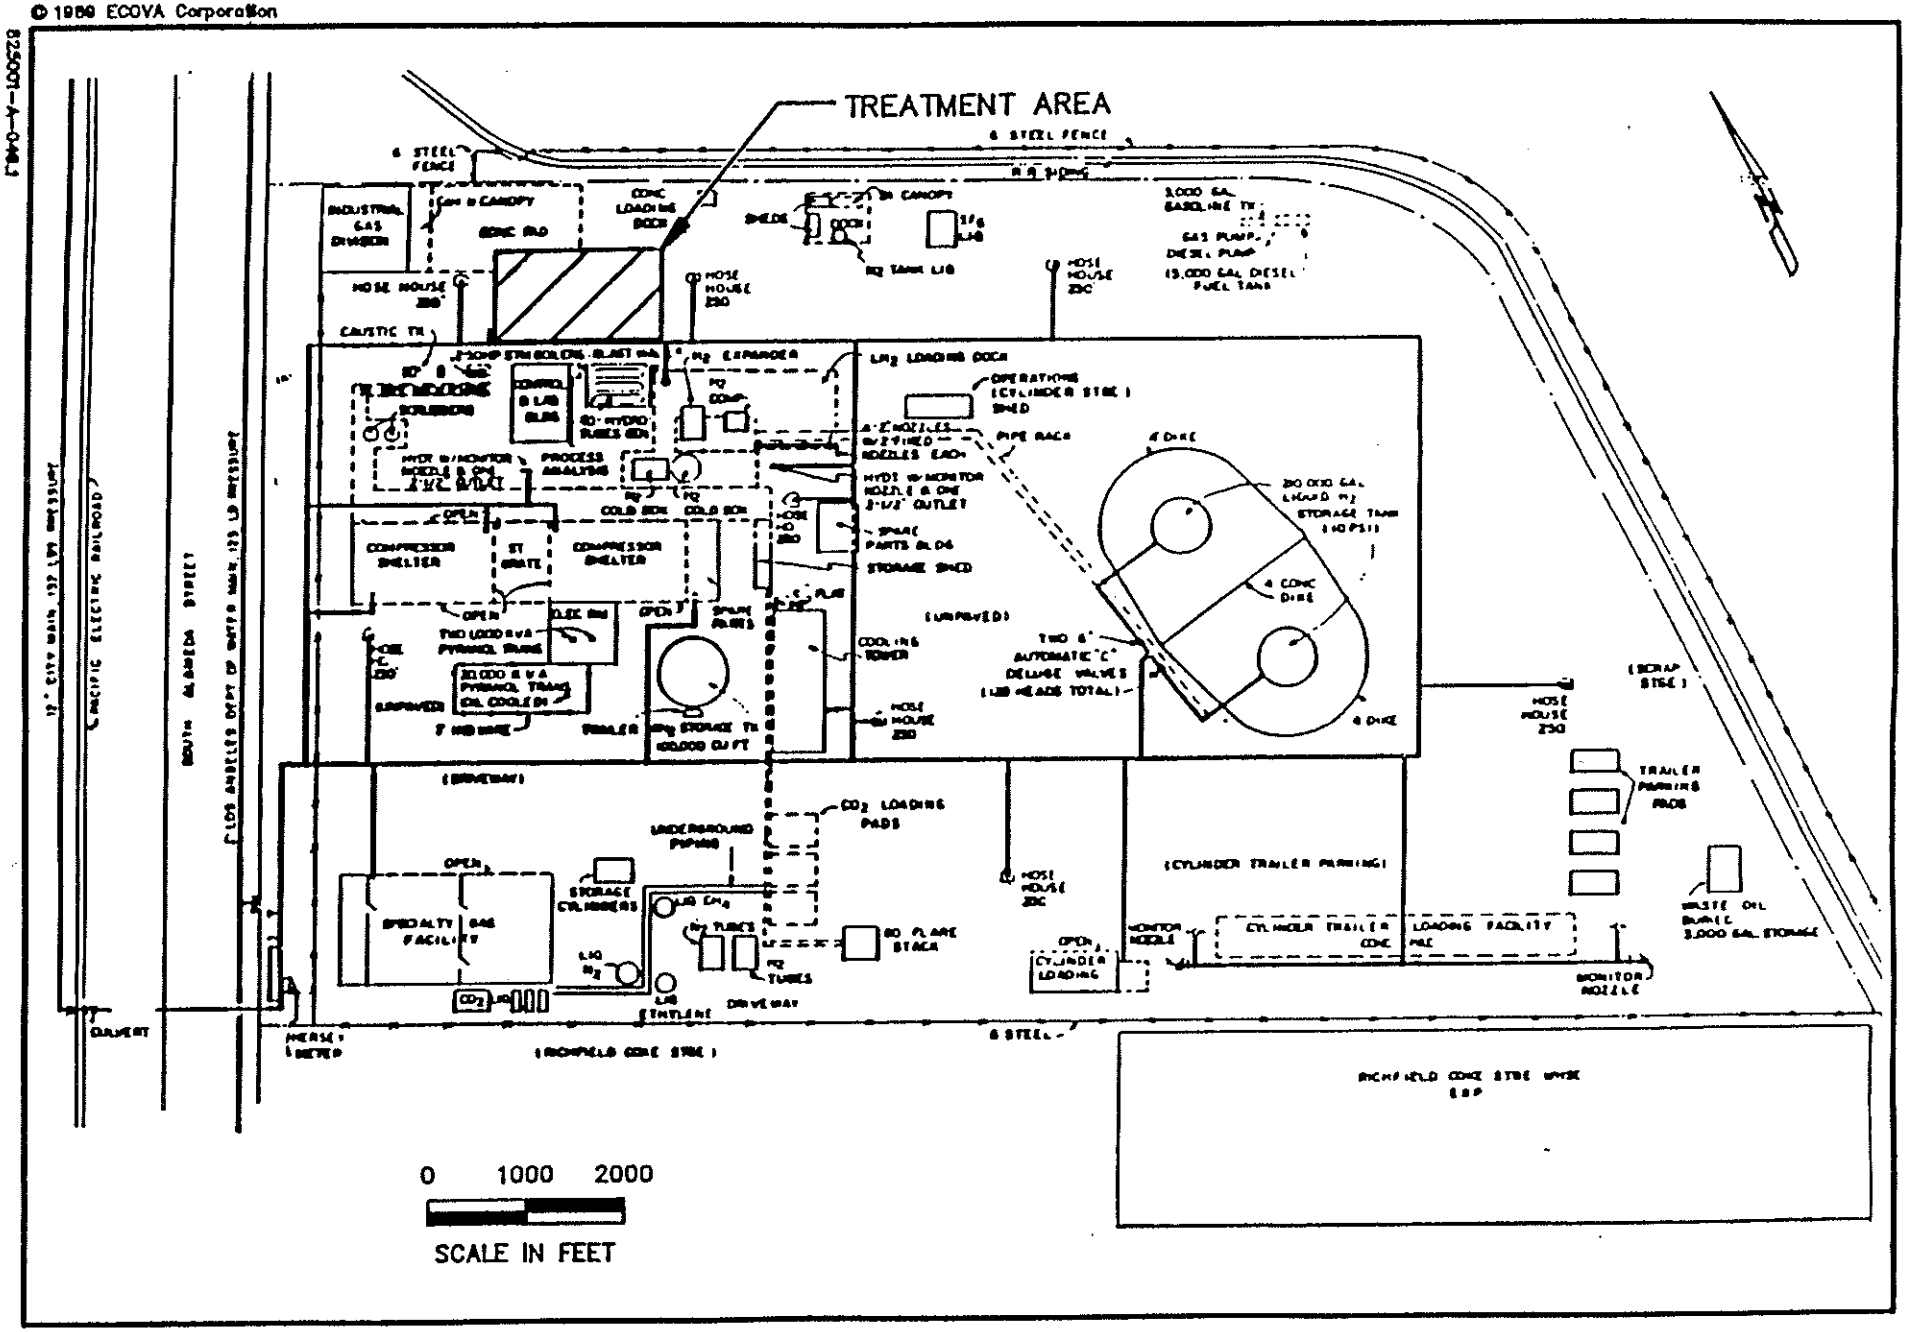

FIGURE 1-1. Site Map

- Leakage associated with the former UST 28.91 had contaminated a localized area beneath and around the tank
- The depth of contamination reached to 15 feet below surface
- Soil contaminants include petroleum hydrocarbons and the volatile diesel fuel constituents of benzene, toluene, ethylbenzene, and xylene isomers
- The horizontal limits of contamination was an area 50-feet on the North-South to 35-feet on the East-West around former UST 28.91
- Based on groundwater data from a boring, approximately 43-feet of unsaturated soil separate the plume from possible ground water contamination (IT Corporation, 1988)

1.2 PROJECT OBJECTIVES

The primary project objective is to achieve biodegradation of the diesel contaminated soil to a concentration allowing off-site disposal to a Class III landfill. The Total Petroleum Hydrocarbon (TPH) concentrations as measured by EPA method 418.1, must be reduced to concentrations below 100 mg/kg (ppm) and any remaining volatile organic compounds must be reduced to below the target cleanup levels accepted by the LACDPW and the California Regional Water Quality Control Board, Los Angeles Region (CRWQCB). Table 1-1 lists specific contaminant cleanup concentrations.

2. SUMMARY OF WORK

2.1 SOIL EXCAVATION

On March 8, 9, and 10, 1989, volume 410 cubic yards (yd^3) of petroleum hydrocarbon contaminated soil was excavated from the area immediately below and adjacent to the former diesel UST 28.91. Two backhoes and a trackhoe were utilized to excavate the contaminated soil. The ECOVA field geologist utilized the cross sections and boring logs provided in the site environmental investigation (IT Corporation, 1988) to confirm geologic indicators, such as a distinctive gray sand layer, which previous investigators noted as the bottom boundary of the contamination. The documented field data was used to supplement on-site air monitoring and visual inspection, as the soil removal process progressed, to determine the extent of contamination. The excavation resulting from the removal of contaminated soil measured 24 by 23 feet by 20 feet deep. Following excavation, the pit was backfilled with clean imported sand fill and compacted to 90 percent compaction.

To confirm that all the contaminated soil was removed from the excavation, ECOVA sampled the bottom and side walls of the excavation (Figure 2-1). A total of six samples were analyzed: one sample each from the north and south ends of the excavation bottom and two samples from each sidewall, composited into one sample. These samples were analyzed for Total Petroleum Hydrocarbons using EPA Method 418.1. The analytical results for the samples collected from the excavation bottom and walls are provided in Table 2-1. Analytical confirmation and visual inspection of the walls of the excavation indicated these areas are not contaminated.

2.1.1. TREATMENT AREA

The treatment bed was constructed on March 8, 1989, prior to the initiation of excavation activities. By building the treatment bed prior to excavating the soil, the field crew was able to place and spread the contaminated soil within the treatment bed as the excavation activities progressed. The contaminated soil was transported to the treatment area, located adjacent to the former truck scales area (Figure 2-2). The treatment area consists of a 1,020 square yard bermed treatment bed measuring 17 yards by 60 yards. The soil in the treatment bed was divided into a grid pattern of 11 individual cells measuring approximately 10 by 10 yards each. Since the area underlying the designated treatment area was covered with asphalt cement, the treatment bed was constructed by bringing in fill material to construct earth berms on top of the asphalt cement. The existing sewer drains were covered with visqueen as was a truck scale pad which made up a portion of the treatment bed floor (Figure 2-2).

2. SUMMARY OF WORK

2.1 SOIL EXCAVATION

On March 8, 9, and 10, 1989, volume 410 cubic yards (yd^3) of petroleum hydrocarbon contaminated soil was excavated from the area immediately below and adjacent to the former diesel UST 28.91. Two backhoes and a trackhoe were utilized to excavate the contaminated soil. The ECOVA field geologist utilized the cross sections and boring logs provided in the site environmental investigation (IT Corporation, 1988) to confirm geologic indicators, such as a distinctive gray sand layer, which previous investigators noted as the bottom boundary of the contamination. The documented field data was used to supplement on-site air monitoring and visual inspection, as the soil removal process progressed, to determine the extent of contamination. The excavation resulting from the removal of contaminated soil measured 24 by 23 feet by 20 feet deep. Following excavation, the pit was backfilled with clean imported sand fill and compacted to 90 percent compaction.

To confirm that all the contaminated soil was removed from the excavation, ECOVA sampled the bottom and side walls of the excavation (Figure 2-1). A total of six samples were analyzed: one sample each from the north and south ends of the excavation bottom and two samples from each sidewall, composited into one sample. These samples were analyzed for Total Petroleum Hydrocarbons using EPA Method 418.1. The analytical results for the samples collected from the excavation bottom and walls are provided in Table 2-1. Analytical confirmation and visual inspection of the walls of the excavation indicated these areas are not contaminated.

2.1.1. TREATMENT AREA

The treatment bed was constructed on March 8, 1989, prior to the initiation of excavation activities. By building the treatment bed prior to excavating the soil, the field crew was able to place and spread the contaminated soil within the treatment bed as the excavation activities progressed. The contaminated soil was transported to the treatment area, located adjacent to the former truck scales area (Figure 2-2). The treatment area consists of a 1,020 square yard bermed treatment bed measuring 17 yards by 60 yards. The soil in the treatment bed was divided into a grid pattern of 11 individual cells measuring approximately 10 by 10 yards each. Since the area underlying the designated treatment area was covered with asphalt cement, the treatment bed was constructed by bringing in fill material to construct earth berms on top of the asphalt cement. The existing sewer drains were covered with visqueen as was a truck scale pad which made up a portion of the treatment bed floor (Figure 2-2).

2.2 AIR MONITORING

In order to meet the SCAQMD emission monitoring requirements, ambient air volatiles were measured throughout the excavation and soil spreading operations. Volatile air emissions were measured using a photoionization detection meter (HNU MODEL ISPI 101) with a 11.7 eV probe. The HNU was calibrated on a daily basis using an Isobuthylene gas standard. Table 2-2 presents air emissions data for March 9, 1989 as an example of the measured emissions from the excavation operations. At no time during excavation or soil treatment operations did the measured emissions exceed 7.5 ppm based on a 99.6 ppm (span 3.30) Isobutylene gas standard.

2.3 TREATMENT OPERATIONS

Treatment operations began on March 10, 1989 and consisted of removing and stockpiling construction rubble from the treatment bed, watering, and cultivating the contaminated soil. A backhoe was used to remove and stockpile blocks of asphalt and concrete from the soil in the treatment bed. The clearing of the treatment bed was necessary to prevent damaging the disk that was used to cultivate the soil. Following the removal of rubble, a 150-horsepower tractor was mobilized to the site to pull a disk (12-inch diameter disks) over the contaminated soil in the treatment bed. The soil was disked for a period of four hours in order to maximize the circulation of air and water within the soil. The soil was initially disked two times per week for the first two weeks of treatment. Subsequently the soil was disked on a weekly basis until the monitoring sampling during the 9th week of treatment. Based on our experience with the solid phase biodegredation of diesel fuel in soil we did not feel that fertilizer or microbial inoculum needed to be added to the soil in the treatment bed.

2.4 SAMPLING

2.4.1 BASELINE SAMPLING

The treatment bed has been sampled two times during the project. The initial sampling (March 11, 1989) was conducted one day after the initial tilling of the soil to gather soil baseline chemical data. The second sampling (May 15, 1989) was conducted to determine the extent of TPH degradationn and to define the nature of the TPH found in the soil being treated (process monitoring).

To define the baseline chemistry of the contaminated soil composite soil samples were collected and analyzed from each of the 11 treatment bed cells. Each cell sample was a composite made up of five individual soil samples: a sample from the center of the cell, and four samples on the cell boundaries, north, south, east, and west of the midpoint of the cell (See Figure 2-2). These five samples were composited into one sample in the

field. At each sample location, a 12-inch long stainless steel core with two 6-inch inserts were was advanced into the soil. The inserts were then emptied into a stainless steel bowl and composited. The composite was then added to composites from the other sampling points within the cell and placed in individual airtight glass jars, and the caps wrapped in parafilm. The cell composites samples were placed in a cooler with ice, then cooled to 4 °C and shipped on the same day under full chain-of-custody procedures to ECOVA Analytical Services in Redmond, Washington.

The samples collected during the March 11, 1989 sampling were analyzed for TPH by EPA Method 418.1 Infrared Spectrophotometry (IR). In addition, the sample with the highest measured concentration of TPH was also analyzed using Gas Chromatograph (GC) methods, EPA modified 8020 (GC-FID), to determine the benzene, ethylbenzene, toluene, and xylenes content and EPA method 8015 to define the types of petroleum hydrocarbons that were being detected by the IR analyses.

2.4.2 PROCESS MONITORING

Following a nine week treatment period the soil in the APCI treatment bed was sampled for a second time on May 15, 1989. For reasons explained in Section 2.7.2 of this report, during this sampling (Process Monitoring) discrete samples were collected from each cell in the treatment bed, from a depth of 6 inches below surface to the base of the treatment bed (18 inches below surface). During the second soil sampling a total of 43 soil samples were collected from the treatment bed. Cell #1 was not completely filled with soil, therefore only three samples were collected from that particular cell.

Following labeling and preparation for shipping, the individual soil samples were placed in a cooler, iced down to 4 °C and shipped via overnight carrier to ECOVA for analysis on May 16, 1989.

2.5 DECONTAMINATION OF SAMPLING EQUIPMENT

To prevent cross-contamination of samples, all equipment used in the collection of samples was decontaminated at specific points designated in the sampling routine. Soil sampling equipment was decontaminated in accordance with the following procedures:

1. Brush or wipe any soil off the sampler, being sure that the inner surface is free of soil.
2. Scrub the sampler in TSP solution with a wire brush.
3. Rinse with potable water and then distilled water.
4. Repeat above procedure for stainless steel bowl used to composite samples and all sampling apparatus.

2.6 HEALTH AND SAFETY

A comprehensive Health and Safety Plan for the APCI site was developed for the protection of all onsite employees and subcontractors. Training on the specific hazards of this site was conducted prior to work, and monitoring of employee exposure is being conducted to ensure reduced risk as a cleanup operations continue. ECOVA has maintained adherence to the OSHA requirements for hazard waste site works and EPA study guidelines as appropriate.

2.7 ANALYTICAL RESULTS

2.7.1 BASELINE ANALYTICAL RESULTS

The results of the baseline sampling are summarized in Table 2-3. The measured TPH ranged from 399 to 866 mg/kg (parts per million-ppm) with an average concentration of 610 ppm. The cell with the highest measured TPH was Cell 1 and the measured TPH concentration of 2148 ppm was anomalously high. The results of EPA method 8015 analysis (GC-FID) on the composite sample from Cell 1 (APCI-C1) indicated that heavy end (long chain hydrocarbons) made up a considerable portion of the sample, with light end petroleum hydrocarbons and diesel making up the minor constituents of the petroleum hydrocarbons in sample APCI-C1 (see Table 2-4). The EPA method modified 8020 analysis indicated low concentrations of BTXs (see Table 2-5), thus confirming that the lighter petroleum hydrocarbons make up the minor fraction of the measured petroleum hydrocarbons in Cell 1.

2.7.2 CHANGES IN SAMPLING AND ANALYTICAL PROTOCOL

Based on the analytical results from the Baseline Analytical showing that the contaminant in the APCI soil consisted of a heterogenous mixture of several types of petroleum hydrocarbons (see Table 2-3 and Table 2-4). ECOVA elected to revamp the sampling/analytical protocol for the Process Monitoring. As was presented in Section 2.3.2 of this report the new sampling protocol for the Process Monitoring called for a greater number of samples to be collected. By collecting four discrete samples from each cell and sampling the lower 12-inches of the treatment bed, ECOVA could get a better understanding of the distribution of the different kinds of petroleum hydrocarbons within the treatment bed. By having better sample control, the soil within the cells could be better characterized.

An extra analytical procedure was also added to the TPH by IR analyses of the Process Monitoring suite of samples (May 15, 1989). The IR method is a straightforward and inexpensive way to measure the TPH content in the soil and it is routinely used to monitor petroleum hydrocarbon degradation when the contaminant is a

known petroleum distallate such as diesel. After analyzing Cell 1 in the baseline sampling it became apparent that the petroleum hydrocarbons in the APCI contaminated soil was not solely diesel but a heterogenous mix of petroleum hydrocarbons with some prominent long chain (greater than carbon -30) petroleum hydrocarbons. For the Baseline Analytical work, the soil samples were analyzed for TPH by the IR method which included the Oil and Grease fraction. During the Process Monitoring ECOVA modified the analytical procedures to eliminate the Oil and Grease fraction by treating the analytical extract with silica gel. The silica gel filtering screens any non-petroleum hydrocarbons, such as Oil and Grease, which the IR analysis picks up as petroleum hydrocarbons.

2.7.3 PROCESS MONITORING RESULTS

As can be observed in the analytical results from the Process Monitoring (Table 2-6) the TPH by IR (Oil & Grease) figures are approximately 1500 ppm higher in concentration than the silica gel filtered TPH by IR analyses. The difference can be attributed to bio residue and humic acids that are not petroleum hydrocarbons but are picked up by the IR analysis (EPA method 418.1) as petroleum hydrocarbons.

Following review of the Process Monitoring analytical data, ECOVA selected and analyzed composite soil samples from the cells which contained the highest concentrations of TPH (Cells 4, 6 and 9,see Table 2-7). The composite samples were then analyzed for TPH utilizing EPA Method modified 8015 (GC-FID) to characterize the petroleum hydrocarbons. Based on interpretation of the gas chromatographs by ECOVA analytical personnel it was determined that the majority of the TPH measured by IR is made up of an atmospheric residual of crude oil or a heavy bunker oil (see Figures 2-3, 2-4, 2-5, and 2-6).

3. BIOREMEDIATION CONSIDERATIONS

This section of the interim report summarizes the assumptions that were used to design the soil biological treatment program for the APCI site. The effectiveness of biological treatment processes at the facility will ultimately be limited by the nature of petroleum biodegradation and the specific petroleum hydrocarbons encountered. An analysis of these two factors suggests that the biodegradability of the APCI material is limited and that concentrations could "plateau" at approximately 30-40 percent of starting concentrations.

3.1 OVERVIEW OF PETROLEUM BIODEGRADATION

The biological degradation of petroleum hydrocarbons is a naturally occurring reaction. Complete biodegradation of petroleum ultimately results in carbon dioxide, water, and microbial biomass. The rate of this reaction, however, is highly dependent on a variety of factors including the specific structure of the compound; the availability of nutrients, oxygen and water for the microorganisms; and the nature of soil or other matrix in which the compound resides. Certain compounds can be biologically degraded over a very short time (hours), while other compounds such as asphaltics, are virtually totally non-degradable.

The susceptibility of petroleum to biodegradation varies with the types and sizes of its component molecules. There are several hundred individual component molecules in any given crude oil, and the overall degradability of a specific petroleum product will depend on the proportion of degradable compounds of which it is composed. For example, alkanes of intermediate chain length (C_{10}-C_{24}) are degraded most rapidly. However, very long chain alkanes become increasingly resistant to biodegradation, and after exceeding a molecular weight of 500-600 they cease to serve as carbon sources to microorganisms. Branching structures typical of asphaltics also reduce the rate of biodegradation, and aromatic compounds are degraded more slowly than alkanes. Condensed polycyclic aromatics and cycloparaffins, as well as high-molecular-weight alkanes, are degraded only very slowly.

The availability of nutrients and oxygen also has significant effects on petroleum degradation. In particular, nitrogen and phosphorus fertilizers, as well as oxygen, accelerate biodegradation. Additionally, proper pH and temperature help to produce favorable effects.

Solid-phase biological treatment processes are designed to remove constraints which slow degradation rates, such as limited nutrients and oxygen, and bring about rapid rates of degradation. Because of the variability in the source of petroleum hydrocarbon contamination, the chemical nature of contaminated soil, and other site-specific concerns, treatability studies are the most appropriate way of establishing proper treatment conditions. However,

in cases were the petroleum hydrocarbon is a known, such as diesel fuel, we can carry out the bioremediation utilizing parameters established during previous projects.

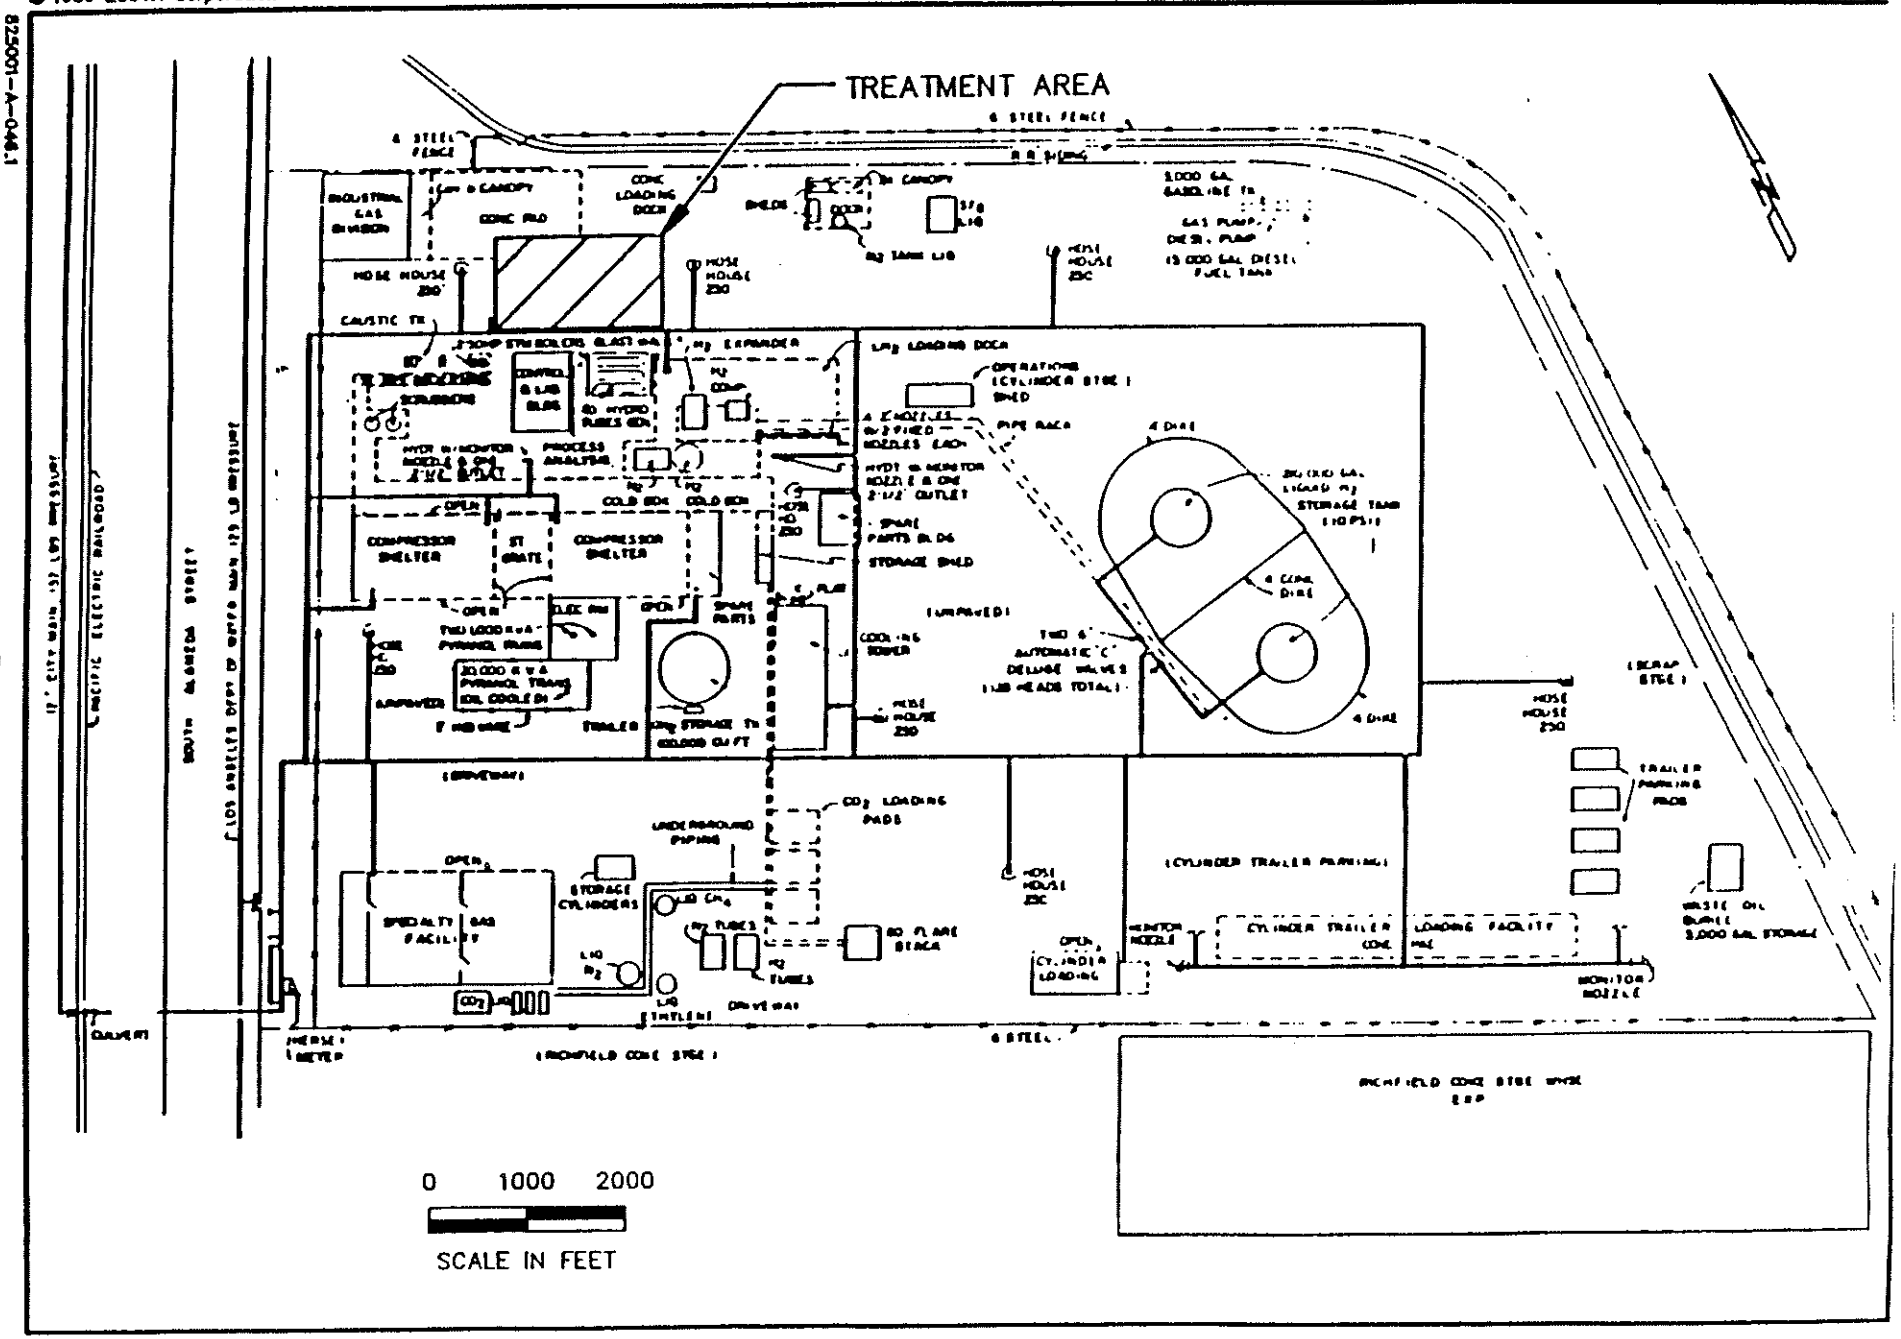
Based on review of the IT environmental study chemical data, it appeared that rapid and complete biodegradation of contaminants at the APCI facility was possible. As a result, it was assumed by ECOVA and APCI that the source contaminant was diesel and therefore the biodegradation would continue at this rate until degradation of the petroleum hydrocarbons reached the target concentration levels.

A subsequent evaluation of the Baseline and Process Monitoring analytical data by ECOVA, however, indicates that this assumption may not be valid, since a portion of the contaminant material is recalcitrant and a linear rate of degradation may not be possible. Specifically, there appears to be little further reduction in TPH concentration after the initial rapid drop. This suggests that in addition to the relatively easily degraded lower molecular fraction, the site material contains a larger molecular weight fraction that degrades at a much slower rate.

The analytical results clearly showed that although there remains a fraction of hydrocarbons (C-25 to C-30) amenable to biodegradation, a second tier of recalcitrant hydrocarbons exists that may not be amenable to biodegradation. Gas chromatographic evidence supports the probability that this recalcitrant fraction is composed of C-40 and longer-chain hydrocarbons. This fraction may average from about 30 to 40 per cent of the amount of TPH present in the contaminated soil.

3.2. SUMMARY

There is a major fraction of the hydrocarbons at the APCI site that are amenable to biodegradation. However, data also indicate a second group of recalcitrant hydrocarbons exist that will probably not biodegrade to any great extent. The overall degradability of the TPH at the APCI site may be 60-70 percent, leaving approximately 30-40 percent of the material as non-degradable to target TPH levels as measured by EPA method 418.1.



4. RECOMMENDATIONS

Analytical results from treatment bed samples collected on May 16, 1989 indicate: (a) that diesel fuel components have been eliminated or reduced to low (less than 280 ppm) concentrations from the treated soil and (b) that a significant portion of the hydrocarbons present in the treatment bed are heavy bunker oil or an atmospheric residual of a crude oil. The latter two substances are not amenable to rapid biodegradation.

Because crude oil is naturally present in background soil, ECOVA proposes that it is not necessary to dispose of the treated soil in a Class III landfill. Instead, soil in the treatment bed should be treated until all diesel fuel has been degraded and then kept on site and used as fill material as needed.

Dear Bina:

SUBJECT: Public Records Request- 23320 S. Alameda St, Carson, CA 90810

I, the undersigned, being the Custodian of Records, certify that a thorough search of our files, carried out under my direction and control, revealed no records as named in your request for records.

It is to be understood that this does not mean that records do not exist under another spelling, another name, or under another classification, but that with the information furnished to our office, and to the best of our knowledge, no such records exist in our files. Also, note that the DPH reserves the right to assert all applicable privileges/doctrines and exemptions.

If you have any questions, please email me at ycurtis@ph.lacounty.gov.

Yvonne Curtis

Sincerely,

Yvonne Curtis, Deputy Health Officer

BUSINESS ACTIVITIES

PAGE ___ OF ___

I. FACILITY IDENTIFICATION

FACILITY ID # 019-999-005031 (1)	EPA ID # (Hazardous Waste only) CAR000056135 (2)
BUSINESS NAME (Facility Name or DBA) Air Products Carson Hydrogen Plant (3)	

II. ACTIVITIES DECLARATION

If your facility does any of the following activities. ▸ Submit Business Owner/Operator Identification page and any of the following applicable form(s)

Does Your Facility...		If Yes, Please Complete...
A. HAZARDOUS MATERIALS Have hazardous materials stored on site (for any purpose) at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids stored in ASTs and USTs) ?	☒YES ☐NO 4	▸ HAZARDOUS MATERIALS INVENTORY - CHEMICAL DESCRIPTION FORM (OES Form 2731) ▸ CONSOLIDATED CONTINGENCY PLAN (format not included) ▸ TRAINING PLAN (format not included)
B. UNDERGROUND STORAGE TANKS (UST) 1. Own or operate underground storage tanks (UST) ?	☐YES ☒NO 5	▸ UST FACILITY ▸ UST TANK (one page per tank)
2. Intend to upgrade existing or install new USTs ?	☐YES ☒NO 6	▸ UST INSTALLATION - CERTIFICATE OF COMPLIANCE (one page per tank)
3. Need to report closing a UST ?	☐YES ☒NO 7	▸ UST TANK (closure portion - one page per tank)
C. ABOVE GROUND PETROLEUM STORAGE TANKS (APST or ASTs) Own or operate APSTs above these thresholds: 1. the tank capacity is greater than 660 gallons, or, 2. the total capacity for the facility is greater than 1,320 gallons?	☒YES ☐NO 8	▸ No form is required at this time. However, if you answered yes, prepare and maintain a Spill Prevention Control and Countermeasure (SPCC) plan to address oil spills and releases from the APST(s) at your facility.
D. HAZARDOUS WASTE 1. Generate hazardous waste?	☒YES ☐NO 9	▸ EPA ID number - provide at the top of this page ▸ As a Hazardous Waste Generator, answer yes to item E.2. and complete applicable forms.
2. Recycle more than 100 kilograms/month (or 220 pounds/month) of excluded or exempted recyclable materials (per Health and Safety Code Section 25143.2) ?	☐YES ☒NO 10	▸ RECYCLABLE MATERIALS REPORT (For claiming exclusions or exemptions under Health and Safety Code Section 25143.2)
3. Treat Hazardous Waste on site?	☐YES ☒NO 11	▸ ONSITE HAZARDOUS WASTE TREATMENT - FACILITY
4. Treatment subject to Financial assurance requirement (for Permit by Rule and Conditional Authorization) ?	☐YES ☒NO 12	▸ ONSITE HAZARDOUS WASTE TREATMENT - UNIT (one page per unit) ▸ CERTIFICATION OF FINANCIAL ASSURANCE
5. Consolidate Hazardous Waste generated at a remote site?	☐YES ☒NO 13	▸ REMOTE WASTE / CONSOLIDATION SITE ANNUAL NOTIFICATION
6. Need to report the closure/removal of a tank that was classified as hazardous waste and cleaned onsite?	☐YES ☒NO 14	▸ HAZARDOUS WASTE TANK CLOSURE CERTIFICATION
E. REGULATED SUBSTANCES (RS) 1. Have Regulated Substances (RS) including extremely hazardous substances (EHS) stored on site at greater than the threshold planning quantities established by the California Accidental Release Prevention Program (Cal ARP) ?	☒YES ☐NO 15a	▸ HAZARDOUS MATERIALS INVENTORY - CHEMICAL DESCRIPTION FORM (OES Form 2731) ▸ REGULATED SUBSTANCE REGISTRATION FORM (OES Form 2735.6) ▸ RISK MANAGEMENT PLAN (when required)
F. LOCAL REQUIREMENTS 2. Have hazardous materials stored on site at or above a threshold amount established by the local agency ?	☒YES ☐NO 15b	▸ CONSULT LOCAL AGENCY OR CUPA FOR REPORTING REQUIREMENTS
3. Required by CUPA to provide other information ?	☒YES ☐NO 15c	▸ WASTE GENERATOR FORM (LA County)

Air Products Carson Hydrogen Plant
Los Angeles County Certified Unified Program Agency (CUPA)
Submittal of Consolidated Permit Application Package

Dear Madam or Sir:

Enclosed is the Consolidated Permit Application Package for the new Air Products Carson Hydrogen Plant. This facility is located at 23300 South Alameda Street, Carson, California. The facility is owned and operated by Air Products and Chemicals, Inc. (Air Products). Construction of the facility is nearing completion. We are in the process of commissioning and starting up the facility. Based on our current schedule, we plan to have the facility ready for commercial operation on 22 November 1999.

The enclosed package consists of the following completed items:

- Business Activities Page
- Business Owner/Operator Identification Page
- Hazardous Materials Inventory - Chemical Description Forms
- Regulated Substance Registration Forms
- Business Plan Form
- Site Map
- Hazardous Waste Generator Form

As per the instructions for the Consolidated Permit Application Package, we have not enclosed any payments. It is our understanding we will be billed later by the LA County Fire Department Financial Management Division.

CERTIFIED MAIL RETURN RECEIPT

12 November, 1999

Los Angeles County CUPA
Health Hazardous Materials Division
Attn.: Kenneth Smith, Supervisor HMM
24300-A Narbonie Ave.
Lomita, CA 90717

RE: Air Products and Chemicals, Inc. (Air Products)
23320 S. Alameda Street, Carson CA
Facility ID# 067220
EPA ID No. CAT 0800 10655

Dear Mr. Smith:

This letter is in response to the 9-29-99 Notice of Violation and Order To Comply (NOV) issued to the above referenced facility. As per our 9 Nov 1999 telephone conversation you extended the NOV Correction Date from 10/29/99 to 3 December 1999 because the postmark on the NOV envelope was 2 Nov 1999.

NOV Item No. 581 - *Submit generator manifest copies to CAL-EPA Dept. of Toxic Substances Control (DTSC) within 30 days of each shipment of hazardous waste [22CCR 66262.23(b)].*

Enclosed please find a copy of the 8 September 1999 dated cover letter for the "blue" manifest copies submitted to DTSC for the hazardous wastes generated from/by the facility closure. The manifest shipment date was 8/24/99; therefore, the manifest submittal was within the required 30 day time frame.

NOV Item No. 587 - *Receipts for used oil [H&S 25250.8(b(3))].*

Used oil generated from/by the facility closure activities is listed on the enclosed Manifest number 98521481 Section 11 D (4 drums, 1628 lbs).

Manifest System Document Review Comment - *Provide manifests for all hazardous wastes generated on premises.*

Because facility was/is closed, all facility records have been shipped to Air Products Corporate office in Allentown PA. Hazardous waste manifests associated with the facility closure are enclosed. However it is unclear if comment applies to manifests generated throughout history of facility or only for 1999 closure activities. Please specify the years and or dates of facility manifests of interest.

NOV Item No. 645 - *Owner or operator shall close the facility in a manner that: (a) minimizes the need for further maintenance, and (b) controls or eliminates all contaminated equipment, structures, and soil; or decontaminate by removing all hazardous waste residues [22CCR 66265.11, 66265.114, H&S 25187].*

22 CCR 66265.111 through 66265.115 applies to owners and operators of hazardous waste management facilities. As per the 22 CCR 66260.10 definition listed below, 22 CCR 66265.111 through 66265.115 **is not applicable** to the Air Products 23320 South Alameda facility because it was not a hazardous waste management facility only a hazardous waste generator. .

> *Hazardous waste facility," "hazardous waste management facility," "HW facility," or "facility" means: (a) all contiguous land and structures, other appurtenances, and improvements on the land used for the treatment, transfer, storage, resource recovery, disposal or recycling of hazardous waste. A hazardous waste facility may consist of one or more treatment, transfer, storage, resource recovery, disposal or recycling operational units or combinations of these units. (b) For the purpose of implementing corrective action under this division, hazardous waste facility includes all contiguous property under the control of the owner or operator that is required to implement corrective action.*
> *"Hazardous waste management facility" see "Hazardous waste facility".*

Air Products is requesting a written response or confirmation of the adequacy of the NOV items addressed and corrected by this submittal. If you have any questions or require additional information, please contact me at 610/481-3354, between 7:00 am and 4:30 p.m. east coast time.

Sincerely,

Ginger Patrick

Dear Mr. Smith:

This letter is in response to the 9-29-99 Notice of Violation and Order To Comply (NOV) issued to the above referenced facility. As per our 9 Nov 1999 telephone conversation you extended the NOV Correction Date from 10/29/99 to 3 December 1999 because the postmark on the NOV envelope was 2 Nov 1999.

NOV Item No. 581 - *Submit generator manifest copies to CAL-EPA Dept. of Toxic Substances Control (DTSC) within 30 days of each shipment of hazardous waste [22CCR 66262.23(b)].*

Enclosed please find a copy of the 8 September 1999 dated cover letter for the "blue" manifest copies submitted to DTSC for the hazardous wastes generated from/by the facility closure. The manifest shipment date was 8/24/99; therefore, the manifest submittal was within the required 30 day time frame.

NOV Item No. 587 - *Receipts for used oil [H&S 25250.8(b(3))].*

Used oil generated from/by the facility closure activities is listed on the enclosed Manifest number 98521481 Section 11 D (4 drums, 1628 lbs).

Manifest System Document Review Comment - *Provide manifests for all hazardous wastes generated on premises.*

Because facility was/is closed, all facility records have been shipped to Air Products Corporate office in Allentown PA. Hazardous waste manifests associated with the facility closure are enclosed. However it is unclear if comment applies to manifests generated throughout history of facility or only for 1999 closure activities. Please specify the years and or dates of facility manifests of interest.

NOV Item No. 645 - *Owner or operator shall close the facility in a manner that: (a) minimizes the need for further maintenance, and (b) controls or eliminates all contaminated equipment, structures, and soil; or decontaminate by removing all hazardous waste residues [22CCR 66265.11, 66265.114, H&S 25187].*

22 CCR 66265.111 through 66265.115 applies to owners and operators of hazardous waste management facilities. As per the 22 CCR 66260.10 definition listed below, 22 CCR 66265.111 through 66265.115 **is not applicable** to the Air Products 23320 South Alameda facility because it was not a hazardous waste management facility only a hazardous waste generator. .

Hazardous waste facility," "hazardous waste management facility," "HW facility," or "facility" means: (a) all contiguous land and structures, other appurtenances, and improvements on the land used for the treatment, transfer, storage, resource recovery, disposal or recycling of hazardous waste. A hazardous waste facility may consist of one or more treatment, transfer, storage, resource recovery, disposal or recycling operational units or combinations of these units. (b) For the purpose of implementing corrective action under this division, hazardous waste facility includes all contiguous property under the control of the owner or operator that is required to implement corrective action.
"Hazardous waste management facility" see "Hazardous waste facility".

Air Products is requesting a written response or confirmation of the adequacy of the NOV items addressed and corrected by this submittal. If you have any questions or require additional information, please contact me at 610/481-3354, between 7:00 am and 4:30 p.m. east coast time.

PERMIT REQUIREMENT

Correction Date ___/___/___

101 ☐ Obtain a Unified Program Facility Permit by submitting a completed consolidated permit application package (CPP) (LA Co Ord. Sec. 12.50.075, 12.50.115).

HAZARDOUS WASTE GENERATOR REQUIREMENTS

HAZARDOUS WASTE DETERMINATION

Correction Date ___/___/___

501 ☐ Provide a hazardous waste determination for the following waste:

502 ☐ If using knowledge of the hazard characteristic and/or exclusion from regulation, provide supporting documentation (22CCR 66262.11).

IDENTIFICATION NUMBER

Correction Date ___/___/___

503 ☐ Obtain an EPA Identification number prior to treating, storing, disposal or transportation of hazardous waste (contact Cal-EPA at 916-324-1781, Fed EPA at 415-495-8895 for ID number).

504 ☐ Use a transporter or TSDF that has a valid Identification Number for transportation, treatment, storage, or disposal of hazardous waste [22CCR 66262.12(c)].

DISPOSAL, TREATMENT & TRANSPORTATION

Correction Date ___/___/___

505 ☐ Discontinue disposal of hazardous waste to an unauthorized location or to a facility which does not have a permit [H&S 25189.5(a)]

506 ☐ Obtain a permit/authorization for disposal of hazardous waste or legally dispose of such waste [H&S 25201(a), 22CCR 66270.1].

507 ☐ Discontinue transportation of hazardous waste or obtain a valid registration issued by DTSC prior to transportation or transfer of hazardous waste [H&S 25163(a)(1)].

508 ☐ Discontinue treatment of hazardous waste or obtain a valid permit or authorization for treatment of hazardous waste [H&S 25201(a)].

STORAGE

Correction Date ___/___/___

■ Discontinue storage or obtain a valid permit/authorization for storage of:

509 ☐ On-site hazardous waste in tanks or containers for more than 90 days [H&S 25201(a), 25123.3(b)(1), 22CCR 66262.34(c)].

510 ☐ On-site hazardous waste in tanks or containers in quantities exceeding 6,000 kilograms, or for more than the applicable accumulation period (180/270 days for generators of less than 1000 kg in any calendar month) [H&S 25201(a), 25123.3(h), 22CCR 66262.34(d)].

511 ☐ On-site hazardous waste for longer than one year or longer than the applicable accumulation time after 55 gallons has been reached at the point of generation (satellite storage) [22CCR 66262.34(e)].

512 ☐ Off-site hazardous waste in tanks/containers for any time period [H&S 25201(a), 25123.3(b)(2)].

513 ☐ Hazardous waste in other than containers, tanks, drip pads, or containment buildings [H&S 25201(a), 25123.3(b)(4)].

514 ☐ Hazardous waste at a transfer facility longer that 6 days or longer than 10 days for transfer facilities in industrially zoned areas [H&S 25201(a), 25123.3(b)(2),22CCR 66263.18].

515 ☐ Obtain an extension from DTSC for storage of hazardous waste at the staging site for remediation longer than one year [H&S 25201(a), 25123.3(e)].

DBA/Name	Air Products, Inc.	Owner	Air Products, Inc.

USE AND MANAGEMENT OF CONTAINERS

Correction Date ____/____/____

■ Immediately transfer hazardous waste from containers that are:

516 ☐ Leaking or in poor condition (22CCR 66265.171).

517 ☐ Incompatible with contents (22CCR 66265.172).

518 ☐ Keep containers of hazardous waste closed, except when adding or removing contents [22CCR 66265.173(a)].

519 ☐ Handle containers of hazardous waste in a manner which will avoid causing ruptures/leaks [22CCR 66265.173(b)].

520 ☐ Discontinue placing incompatible wastes which may adversely react in the same container [22CCR 66265.177 (a)(b)].

521 ☐ Inspect areas at least weekly, where containers are stored, for leaking or deteriorating containers and containment systems (22CCR 66265.174).

■ If greater than 1000 kg of hazardous waste is accumulated within any calendar month, comply with the following:

522 ☐ Locate ignitable/reactive waste at least 15 meters (50 feet) from the site property line (22CCR 66265.176).

523 ☐ Separate, or protect by a berm or other device, containers of hazardous waste which are incompatible with other wastes or materials stored nearby. [22CCR 66265.177(c)].

524 ☐ Store hazardous materials in undamaged containers within 96 hours or manage as a hazardous waste [22CCR 66261.2(f)(2)].

CONTAMINATED CONTAINERS

Correction Date ____/____/____

525 ☐ Mark containers or inner liners greater than 5 gallons with the date emptied. Legally manage containers within one year of that date [22CCR 66261.7(e)(f)].

526 ☐ Manage as hazardous waste all containers, or inner liners of containers that contained hazardous waste and which are not legally empty, per CCR 66261.7(b) or (d) [22CCR 66261.7(p)].

LABELING AND MARKING REQUIREMENTS

Correction Date ____/____/____

527 ☐ Package, label and mark each container of hazardous waste per DOT(49CFR Parts 173, 178, 179) requirements before offering for transportation off site [22CCR 66262.31].

528 ☐ Ensure the transport vehicle is correctly placarded per DOT (49 CFR Part 172, Subpart F) for hazardous materials before offering hazardous waste for transportation off-site (22CCR 66262.33).

530 ☐ Mark containers of hazardous waste at the satellite accumulation area, with the date 55 gallons was reached within 3 days of reaching the limit [22CCR 66262.34(e)(3)].

531 ☐ Mark the accumulation start date on each container and portable tank [22CCR 66262.34(f)(1)].

532 ☐ Mark the date that the applicable accumulation period begins for each container and tank [22CCR 66262.34 (f)(2)].

533 ☐ Label each container and tank of hazardous waste with the words "Hazardous Waste" [22CCR 66262.34(f)(3)].

534 ☐ Label each hazardous waste container and tank with the composition, physical state, hazardous properties of the waste contained therein and the name and address of the generator [22CCR 66262.34(f)(3)].

535 ☐ Label hazardous materials container properly within 10 days or handle as a hazardous waste [22CCR 66261.2(f)(1)].

TANKS

Correction Date ____/____/____

536 ☐ Determine whether a tank is leaking or unfit for tank systems without secondary containment. Maintain a written integrity assessment certified by a registered professional civil engineer (22CCR 66265 et seq).

537 ☐ Ensure that a tank system is designed adequately of sufficient structural strength, and compatible with its contents [22CCR 66265.191(b)].

538 ☐ For tank systems installed after 07/14/86, retain on site the required written assessment certified by a registered professional engineer for tank testing that the system has sufficient structural integrity [22CCR 66265.192(a)].

539 ☐ Provide secondary containment capable of collecting and detecting within 24 hours any leaked hazardous waste [22CCR 66265.193(c)(4)].

540 ☐ Discontinue placing hazardous waste, or treatment reagents, in a tank system which will cause the tanks, containment system or ancillary equipment to leak, ignite or react [22CCR 66265.194(a)].

541 ☐ Store or treat ignitable or reactive hazardous waste in tanks in a manner that will prevent the possibility of the waste to ignite or react [22CCR 66265.198(a)].

542 ☐ Utilize control practices which prevent spillage and overflow [22CCR 66265.194(b)].

543 ☐ Maintain sufficient freeboard of at least 60 centimeters (2 ft) in uncovered tanks [22CCR 66265.194(b)(3)].

■ Conduct daily inspections of tanks for the following:

544 ☐ Discharge control equipment.

545 ☐ Corrosion.

546 ☐ Releases.

547 ☐ Monitoring and leak detection data.

548 ☐ Construction materials.

549 ☐ Secondary containment areas.

550 ☐ Level of waste in uncovered tanks [CCR 66265.195(a)].

551 ☐ Inspect cathodic protection systems (if present) and sources of impressed current [22CCR 66265.195(b)].

552 ☐ Immediately remove from service a tank system or secondary containment system that has leaked (22CCR 66265.196).

DBA/Name Air Products & Chemicals | Owner Air Products & Chem, Inc.

553 ☐ Remove/decontaminate all waste residues, contaminated tank systems and soils during closure of a tank system. Manage them as hazardous waste [22CCR 66265.197(a)].

554 ☐ Comply with buffer zone requirements for tanks containing ignitable or reactive hazardous waste per NFPA'S Flammable and Combustible Liquids Fire Code [22CCR 66265.198(b)].

RECYCLABLE MATERIALS

Correction Date ___/___/___

560 ☐ Store damaged batteries in closed containers which are capable of preventing release of acid and are labeled with the initial accumulation date [22CCR 66266.81(b)].

USED OIL/FILTERS

Correction Date ___/___/___

561 ☐ Discontinue contaminating used oil with hazardous waste (H&S Code section 25250.7).

562 ☐ Manage used oil to prevent discharge to sewer, drainage system, surface water, ground water, watercourses, or deposit on land. " Prevent" incineration of used oil or burning as fuel. [H&S 25250.05(a)].

563 ☐ Discontinue the use of used oil or recycled oil as a dust suppressant, insect or weed control agent [H&S 25250.5(b)].

■ Comply with the following requirements for handling used oil filters:

564 ☐ Manage used oil filters as hazardous waste, or . . . [22CCR 66266.130(a)].

565 ☐ Drain and recycle used oil filters as scrap metal within one year [22CCR 66266.130(b)].

566 ☐ Store filters in closed containers labeled with the words "Drained Used Oil Filters" and the accumulation start date [22CCR 66266.130 (c)(C)(3)].

567 ☐ Manage used oil that has been drained from used oil filters as hazardous waste [22CCR 66266.130(c)(6)].

PREPAREDNESS AND PREVENTION

Correction Date ___/___/___

568 ☐ Maintain site to minimize possibility of fire, explosion, or unplanned release of hazardous waste constituents to air, soil, or surface water, which could threaten human health or environment (22CCR 66265.31).

■ Equip the site with the following:

569 ☐ Internal communication alarm system [22CCR 66265.32(a)].

570 ☐ A device (i.e., telephone or two way radio) for calling outside emergency help [22CCR 66265.32(b)].

571 ☐ Fire, spill control and or decontamination equipment [22CCR 66265.32(c)].

572 ☐ Water at an adequate volume and pressure to supply water hose streams and foam-producing equipment, or automatic sprinkler [22CCR 66265.32(d)].

573 ☐ Test/maintain all communication and alarm systems, fire protection, spill control, or decontamination equipment (22CCR 66265.34)

574 ☐ Provide for immediate access to emergency communication and/or alarm systems during hazardous waste handling (22CCR 66265.34).

575 ☐ Maintain adequate aisle space for personnel and emergency equipment (22CCR 66265.35).

576 ☐ Make arrangements to familiarize police and fire emergency response, local hospitals, office of emergency services and or emergency response contractors, with potential hazards at the facility [22CCR 66265.37(a)].

577 ☐ Document in the operating records when state and local authorities refuse to enter into arrangement for emergency response [22CCR 66265.37(b)].

DOCUMENT REVIEW

MANIFEST SYSTEM

Correction Date 10/29/99

578 ☐ Prepare a complete Uniform Hazardous Waste Manifest for hazardous waste transported or sent offsite [22CCR 66262.20(a)].

579 ☐ Designate a facility on the manifest which is authorized to handle the hazardous waste [22CCR 66262.20 (b)].

580 ☐ Properly complete, sign, and date, applicable manifest sections [22CCR 66262.23(a)(1),(2)].

581 ☒ Submit generator manifest copies to CAL-EPA/Dept of Toxic Substances Control within 30 days of each shipment of hazardous waste [22CCR 66262.23(a)(4)].

582 ☐ Provide the appropriate manifest copies to the transporters [22CCR 66262.23(b)].

583 ☐ Submit the TSDF manifest copy that has been signed by all transporters (except rail transporters) and out-of-state facility operators to DTSC within 30 days for out-of-state shipments [H&S 25160(b)(3)].

■ Retain for a minimum of 3 years:

584 ☐ Signed copies of manifests [22CCR 66262.40(a)].

585 ☐ Shipping papers or receipts for milkrun operations for generators less than 100 kg/month [22CCR 66263.42(e)].

586 ☐ Copies of manifests/bills of lading for spent lead-acid batteries [22CCR 66266.81(a)(4), (B)].

DBA/Name	Owner
Air Products	Air Products

587 ☒ Receipts for used oil [H&S 25250.8(b)(3)].
588 ☐ Bills of lading for used oil filters [22CCR 66266.42(a), 66266.130(c)(5)].
589 ☐ Determine the status of a hazardous waste shipment when the facility manifest copy is not received within 35 days [22CCR 66262.42(a)].
590 ☐ Send an Exception Report to DTSC within 45 days when the facility manifest copy is not received [22CCR66262.42 (a)].

Provide manifests for all haz. waste generated on the premises

LAND DISPOSAL RESTRICTIONS (LDR)

Correction Date ____/____/____

591 ☐ Provide written notification to the receiving facility with each shipment stating whether the hazardous waste meets treatment standards [22CCR 66268.7(a)].

■ Notification must include the following:

592 ☐ EPA hazardous waste number or California Hazardous Waste Codes for non-RCRA hazardous waste listed in section 66268.29.
593 ☐ Corresponding treatment standards or technology set forth in Article 4 and 11 [22CCR 66268.7(a)(2)].
594 ☐ Manifest number associated with the waste shipment.
595 ☐ Waste analysis data, where available [22CCR 66268.7(a)(1)].
596 ☐ Submit a signed notice and certification for LDR waste which does not require further treatment [22CCR 66268.7(a)(2)].
597 ☐ Submit notification to the receiving facility that a waste is subject to an exemption [22CCR 66268.7(a)(3)].

599 ☐ Retain on site a copy of all notices, certifications, demonstrations, waste analysis data and other documentation, for at least five years [22CCR 66268.7(a)(7)].

EXPORTS OF HAZARDOUS WASTE

Correction Date ____/____/____

600 ☐ Exports of hazardous waste to a foreign country from the State are prohibited unless notification of intent to export is provided to US EPA/DTSC and consent of the receiving country is obtained (22CCR 66262.53 et seq).
601 ☐ Notify DTSC of intended export of hazardous waste 4 weeks prior to shipment [22CCR 66262.53(b)].
602 ☐ Replace the TSDF with the consignee on the manifest and identify the point of departure from the United States (22CCR 66262.54).

RECORDKEEPING AND REPORTING

Correction Date ____/____/____

603 ☐ Discontinue submission of manifests, records, applications or other documents containing false or erroneous information or statements [H&S 25189.5(a)].
604 ☐ Retain waste analysis test records for at least 3 years [22CCR 66262.40(b)].
605 ☐ Retain a copy of the Biennial Report/Exception Report for 3 years [22CCR 66262.40(b)].
606 ☐ Submit a Biennial Report with required information to DTSC by March 1 of even-numbered years [22CCR 66262.41(a)].
607 ☐ Submit a written report on a reportable release incident to the CUPA within 15 days of the event [H&S 25504(b), 22CCR 66265.56(j), 66265.77(a)].
608 ☐ Report to the local CUPA, every two years using the format established under section (d), the required information regarding the recycling of more that 100 kilograms per month of recyclable materials [H&S 25143.10(a)].

CONTINGENCY PLAN AND EMERGENCY PROCEDURES

Correction Date ____/____/____

610 ☐ For small quantity generators, post emergency numbers and location of emergency equipment next to the telephone [40 CFR 262.34(d)(5)].
611 ☐ Maintain a contingency plan onsite [22CCR 66265.51(a)]. *(A California Hazardous Materials Consolidated Contingency Plan that complies with the regulatory compliance matrix may be used to comply with the business plan and contingency plan requirement under H&S Code Section 25504 and 22CCR 66265.51(a)).*
612 ☐ Implement the portion of the business plan, contingency plan or consolidated contingency plan, relating to emergency procedures, for any occurrence of fire, explosion, or releases of hazardous materials/waste which could threaten human health or the environment [22CCR 66265.51(b), 66265.56].
613 ☐ Describe the actions needed to respond to an emergency [22CCR 66265.52(a)].
614 ☐ Describe arrangements agreed upon by emergency teams [22CCR 66265.52(c)].
615 ☐ Identify the emergency coordinators [22CCR66265.52(d)].

■ Contingency plan lacks the following:

616 ☐ Complete evacuation plan [22CCR 66265.52(f)].
617 ☐ Current telephone number of the State OES [22CCR 66265.52(g)].
619 ☐ A list of emergency equipment, the location, physical description, or the capabilities of the equipment [22CCR 66265.52(e)].

620 ☐ Submit a contingency plan to local emergency authorities [22CCR 66265.53(b)].

DBA/Name	Air Products & Chem	Owner	Air Products

621 ☐ Amend contingency plan as necessary (22CCR 66265.54).
622 ☐ Maintain an emergency coordinator either on the premises or on call at all times (22CCR 66265.55).
625 ☐ Note the required information regarding the incident in the operating log [2CCR 66265.56(j)].

PERSONNEL TRAINING

Correction Date ___/___/___

626 ☐ For small quantity generators, ensure that the appropriate staff are adequately trained to manage waste and respond to emergencies [22CCR 66262.34 (d)(2)].
627 ☐ Ensure that training program is directed by a person trained in hazardous waste procedures [22CCR 66265.16(a)(2)].
628 ☐ Provide a training program directed by a representative trained in hazardous waste procedures [22CCR 66265.16(a)(2)].
629 ☐ Ensure that personnel complete the required training program within 6 months of employment, or work supervised positions prior to completing the training, to comply with the hazardous waste requirements [22CCR 66265.16(b), 66265.16(a)(1)].
630 ☐ Provide personnel an annual review of their initial training (on hazardous waste procedures) [22CCR 66265.16(c)].
631 ☐ Maintain onsite all required training documentation. [22CCR 66265.16(d)].
632 ☐ Maintain onsite training records on current and former employees within the last 3 years [22CCR 66265.16(e)].

SOURCE REDUCTION

Correction Date ___/___/___

634 ☐ Prepare and retain onsite current source reduction documents as applicable, and make them available to the inspector within five days of a request [H&S 25244.15(d), 25244.19, 25244.20, 25244.21].

■ Include the following required elements in the Source Reduction Evaluation Review and Plan (also known as a Source Reduction Plan):

635 ☐ Certification.
636 ☐ Amounts of wastes generated.
637 ☐ Process description.
638 ☐ Block diagrams.
639 ☐ Implementation schedule of selected source reduction measures (22CCR 67100.5).

CONSOLIDATION/REMOTE SITE COMPLIANCE

Correction Date ___/___/___

640 ☐ Submit the required notification to the CUPA before operating a consolidation site [H&S 25110.10(d)(1)].
641 ☐ Comply with the consolidation site operating requirements [H&S 25110.10(b)].
642 ☐ Submit the required notification before operating a remote site [H&S 25121.3(b)].
643 ☐ For non-RCRA waste at a remote site, comply with container and labeling requirements, notify the CUPA of the remote site exemption annually, and hold the waste at the site no longer than 10 days [H&S 25121.3(b)].

SITE MITIGATION/SITE CLOSURE

Correction Date 10/29/99

644 ☐ Provide a corrective action plan for unauthorized releases of hazardous waste or constituents to the ground (H&S 25187).
645 ☒ Owner or operator shall close the facility in a manner that:
a) minimizes the need for further maintenance, and
b) controls or eliminates all contaminated equipment, structures, and soil; or decontaminate by removing all hazardous waste residues (22CCR 66265.111, 66265.114, H&S 25187].

Provide a facility closure plan prior to vacating the premises by dates indicated above.

RE: Submittal of DTSC Waste Manifest Copies
Air Products and Chemicals, Inc.
23320 S. Alameda Street, Long Beach CA
Facility EPA ID No. CAT 080010655

Dear Sir or Madame:

Enclosed please find the DTSC waste manifest copies for State Manifest Document Numbers 98521482 and 98521481. The manifested wastes were generated from/by facility closure activities.

If you have any questions or require additional information, please contact me at 610/481-3354, between 7:00 am and 4:30 p.m. east coast time.

Sincerely,

Ginger Patrick

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

ADDITIONAL CODES (Enter all codes not identified above which are associated with waste)

5. USEPA HAZARDOUS WASTE CODE(S)	6. TREATMENT STANDARDS FOR NON-PHASE II STATES (INDICATE THE APPLICABLE TREATMENT STANDARD 268.41, 268.43 OR SPECIFIED TECHNOLOGY BELOW)	7. HOW MUST THE WASTE BE MANAGED? ENTER THE LETTER FROM BELOW

To identify F039, or UHCs managed in non-CWA, us the "F039/Underlying Hazardous Constituents Form" provided (CWM-2004) and check here: ☐
If no UHCs are present upon generation check here: ☒ Check here if disposal facility will check for all UHCs ☐ (i.e. no UHC form required)
To list additional EPA waste code(s), use the supplemental sheet and check here: ☐ In lieu of supplemental sheet you may use multiple copies of this form.

8. SOLVENT CONSTITUENTS (F001 - F005) Check here if disposal facility will check for all spent solvents ___

___ Acetone	___ Benzene	___ n-Butyl alcohol	___ Carbon disulfide
___ Carbon Tetrachloride	___ Chlorobenzene	___ O-Cresol	___ Cresols (m&p)
___ Cyclohexanone	___ o-Dichlorobenzene	___ 2-Ethoxyethanol	___ Ethyl acetate
___ Ethyl benzene	___ Ethyl ether	___ Isobutanol	___ Methanol
___ Methylene chloride	___ Methyl ethyl ketone	___ Methyl isobutyl ketone	___ Nitrobenzene
___ 2-Nitropropane	___ Pyridine	___ Tetrachloroethylene	___ Toluene
___ 1,1,1 Trichloroethane	___ 1, 1, 2-Trichloroethane	___ 1, 1, 2-Trichloro, 1, 2, 2-trifluoroethane	___ Trichloroethylene
___ Trichloromonofluoromethane	___ Xylenes		

9. (States authorized by EPA to manage the LDR program may have regulatory citations different from the 40 CFR citations listed below. Where these regulatory citations differ, your certification will be deemed to refer to those state citations instead of the 40 CFR citations.)

A. Or ✓ RESTRICTED WASTE REQUIRES TREATMENT
This waste must be treated to the applicable treatment standards set forth in 40 CFR Part 268 Subpart D, 268.32, or RCRA Section 3004(d)
☐ For Hazardous Debris: "This hazardous debris is subject to the alternative treatment standards of 40 CFR Part 268.45."

B.1 RESTRICTED WASTE TREATMENT TO PERFORMANCE STANDARDS
"I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the treatment process has been operated and maintained properly so as to comply with the performance levels specified in 40 CFR Part 268, Subpart D, and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d) without impermissible dilution of the prohibited waste. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

B.2 RESTRICTED WASTES FOR WHICH THE TREATMENT STANDARD IS EXPRESSED AS A SPECIFIED TECHNOLOGY (AND THE WASTE HAS BEEN TREATED BY THAT TECHNOLOGY)
"I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.42. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

B.3 GOOD FAITH AND ANALYTICAL CERTIFICATION - FOR INCINERATED ORGANICS
"I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the nonwastewater organic constituents have been treated by incineration in units operated in accordance with 40 CFR Part 264, Subpart O, or 40 CFR Part 265, Subpart O, or by combustion in fuel substitution units operating in accordance with applicable technical requirements, and I have been unable to detect the nonwastewater organic constituents despite having used best good faith efforts to analyze for such constituents. I am aware that there are a significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

B.4 DECHARACTERIZED WASTE REQUIRES TREATMENT FOR UNDERLYING HAZARDOUS CONSTITUENTS
"I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the hazardous characteristic. This decharacterized waste contains underlying hazardous constituents that require further treatment to meet universal treatment standards. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

C. RESTRICTED WASTE SUBJECT TO A VARIANCE
This waste is subject to a national capacity variance, a treatability variance, or a case-by-case extension. Enter the effective date of prohibition in column 7 above.
☐ For hazardous debris: "This hazardous debris is subject to the alternative treatment standards of 40 CFR Part 268.45."

D. RESTRICTED WASTE CAN BE LAND DISPOSED WITHOUT FURTHER TREATMENT
"I have determined that this waste meets all applicable treatment standards set forth in 40 CFR Part 268 Subpart D, and all applicable prohibition levels set forth in Section 268.32 or RCRA Section 3004(d), and therefore, can be land disposed without further treatment. A copy of all applicable treatment standards and specified treatment methods is maintained at the treatment, storage and disposal facility named above." "I certify under penalty of law that I have personally examined and am familiar with the waste through analysis and testing or thorough knowledge of the waste to support this certification that the waste complies with the treatment standards specified in 40 CFR Part 268 Subpart D and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA Section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification, including the possibility of a fine and imprisonment."

E. WASTE IS NOT CURRENTLY SUBJECT TO PART 268 RESTRICTIONS
This waste is a newly identified waste that is not currently subject to any 40 CFR Part 268 restrictions.

I hereby certify that all information in this and all associated documents is complete and accurate, to the best of my knowledge and information.

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

ADDITIONAL CODES (Enter all codes not identified above which are associated with waste)

5. USEPA HAZARDOUS WASTE CODE(S)	6. TREATMENT STANDARDS FOR NON-PHASE II STATES (INDICATE THE APPLICABLE TREATMENT STANDARD 268.41, 268.43 OR SPECIFIED TECHNOLOGY BELOW)	7. HOW MUST THE WASTE BE MANAGED? ENTER THE LETTER FROM BELOW

To identify F039, or UHCs managed in non-CWA, us the "F039/Underlying Hazardous Constituents Form" provided (CWM-2004) and check here: ☐
If no UHCs are present upon generation check here: ☒ Check here if disposal facility will check for all UHCs ☐ (i.e. no UHC form required)
To list additional EPA waste code(s), use the supplemental sheet and check here: ☐ In lieu of supplemental sheet you may use multiple copies of this form.

8. SOLVENT CONSTITUENTS (F001 - F005) Check here if disposal facility will check for all spent solvents ___

___ Acetone	___ Benzene	___ n-Butyl alcohol	___ Carbon disulfide
___ Carbon Tetrachloride	___ Chlorobenzene	___ O-Cresol	___ Cresols (m&p)
___ Cyclohexanone	___ o-Dichlorobenzene	___ 2-Ethoxyethanol	___ Ethyl acetate
___ Ethyl benzene	___ Ethyl ether	___ Isobutanol	___ Methanol
___ Methylene chloride	___ Methyl ethyl ketone	___ Methyl isobutyl ketone	___ Nitrobenzene
___ 2-Nitropropane	___ Pyridine	___ Tetrachloroethylene	___ Toluene
___ 1,1,1 Trichloroethane	___ 1, 1, 2-Trichloroethane	___ 1, 1, 2-Trichloro, 1, 2, 2-trifluoroethane	___ Trichloroethylene
___ Trichloromonofluoromethane	___ Xylenes		

9. (States authorized by EPA to manage the LDR program may have regulatory citations different from the 40 CFR citations listed below. Where these regulatory citations differ, your certification will be deemed to refer to those state citations instead of the 40 CFR citations.)

A. Or ✓ RESTRICTED WASTE REQUIRES TREATMENT
This waste must be treated to the applicable treatment standards set forth in 40 CFR Part 268 Subpart D, 268.32, or RCRA Section 3004(d)
☐ For Hazardous Debris: "This hazardous debris is subject to the alternative treatment standards of 40 CFR Part 268.45."

B.1 RESTRICTED WASTE TREATMENT TO PERFORMANCE STANDARDS
"I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the treatment process has been operated and maintained properly so as to comply with the performance levels specified in 40 CFR Part 268, Subpart D, and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d) without impermissible dilution of the prohibited waste. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

B.2 RESTRICTED WASTES FOR WHICH THE TREATMENT STANDARD IS EXPRESSED AS A SPECIFIED TECHNOLOGY (AND THE WASTE HAS BEEN TREATED BY THAT TECHNOLOGY)
"I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.42. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

B.3 GOOD FAITH AND ANALYTICAL CERTIFICATION - FOR INCINERATED ORGANICS
"I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the nonwastewater organic constituents have been treated by incineration in units operated in accordance with 40 CFR Part 264, Subpart O, or 40 CFR Part 265, Subpart O, or by combustion in fuel substitution units operating in accordance with applicable technical requirements, and I have been unable to detect the nonwastewater organic constituents despite having used best good faith efforts to analyze for such constituents. I am aware that there are a significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

B.4 DECHARACTERIZED WASTE REQUIRES TREATMENT FOR UNDERLYING HAZARDOUS CONSTITUENTS
"I certify under penalty of law that the waste has been treated in accordance with the requirements of 40 CFR 268.40 to remove the hazardous characteristic. This decharacterized waste contains underlying hazardous constituents that require further treatment to meet universal treatment standards. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment."

C. RESTRICTED WASTE SUBJECT TO A VARIANCE
This waste is subject to a national capacity variance, a treatability variance, or a case-by-case extension. Enter the effective date of prohibition in column 7 above.
☐ For hazardous debris: "This hazardous debris is subject to the alternative treatment standards of 40 CFR Part 268.45."

D. RESTRICTED WASTE CAN BE LAND DISPOSED WITHOUT FURTHER TREATMENT
"I have determined that this waste meets all applicable treatment standards set forth in 40 CFR Part 268 Subpart D, and all applicable prohibition levels set forth in Section 268.32 or RCRA Section 3004(d), and therefore, can be land disposed without further treatment. A copy of all applicable treatment standards and specified treatment methods is maintained at the treatment storage and disposal facility named above." "I certify under penalty of law that I have personally examined and am familiar with the waste through analysis and testing or thorough knowledge of the waste to support this certification that the waste complies with the treatment standards specified in 40 CFR Part 268 Subpart D and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA Section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification, including the possibility of a fine and imprisonment."

E. WASTE IS NOT CURRENTLY SUBJECT TO PART 268 RESTRICTIONS
This waste is a newly identified waste that is not currently subject to any 40 CFR Part 268 restrictions.

I hereby certify that all information in this and all associated documents is complete and accurate, to the best of my knowledge and information.

AETS/CWM

Phase IV Certification
Exempt Lab Pack LDR Certification Form

This notice is being sent to you in accordance with 40 CFR 268.7(a) to inform you that this shipment contains wastes restricted from land disposal by the USEPA under the land disposal restriction program.

1. Generator name AIR PRODUCTS EPA ID # CMD980101155 Manifest # 9852 H82 / 99003

2. This shipment contains lab-packs that do not carry waste codes listed in 40 CFR 268 Appendix IV. The EPA hazardous waste codes are listed on the appropriate packing slips. The method of treatment for these wastes is incineration. The numbers listed below represent the container numbers being shipped on this manifest to be disposed of under this alternate treatment standard.

AD 010871400 #002, 006, 011, 009, 005, 004, 007,

3. Subcategory Codes (check all that apply) (See 40 CFR 268 for details)

- ✓ D001 Hi > 10% TOC
- ✓ D001 Except Hi-TOC
- __ D003 Reactive Cyanide
- __ D003 Reactive Sulfide
- __ D003 Explosive
- __ D003 Water Reactives
- __ D003 Unexp Ord. Emg
- __ D003 Other Reactive
- __ D006 Batteries
- __ D008 Lead acid batteries
- __ F025 Light ends
- __ F025 Spent Filters
- __ K069 Calcium sulfate
- __ K069 Non-Calcium Sulfate
- __ P047 Salts
- __ P047 Non-Salts
- __ P065 Lo Incin. Res.
- __ P065 Lo RMERC Res.
- __ P065 not incin/rmerc res.
- __ P065 Hi incin/rmerc res.
- __ P092 Lo Incin res.
- __ P092 Lo rmerc res.
- __ P092 not inc./rmerc res.
- __ P092 Hi inc/rmerc res.
- __ U240 __ U240 salts/est.

4. All Lab packs contain non-wastewater material unless "ww" is present on the container packing slip. Note: Phase IV Certifications do not require identification of WW or NWW.
If F001-F005 codes apply and disposal facility does not monitor for all spent solvent constituents, check box and attach list of applicable constituents. ☐
(You may use the list in section 7 of the AETS waste stream LDR form)

5. Phase II Certification "I certify under penalty of law that I personally have examined and am familiar with the waste and that the lab pack does not contain any of the waste identified under 40 CFR 268 Appendix IV. I am aware that there are significant penalties for submitting false certifications, including the possibility of fine or imprisonment."
(States authorized by EPA to manage the LDR program may have regulatory citations different from the 40 CFR citations listed. Where these regulatory citations differ, your certification will be deemed to refer to those state citations instead of the 40 CFR citations.)

6. Phase IV Certification for Lab Packs "I certify under penalty of law that I personally have examined and am familiar with the waste and that the lab pack contains only wastes that have not been excluded under appendix IV to 40 CFR part 268 and that this lab pack will be sent to a combustion facility in compliance with the alternative treatment standards for lab packs at 40 CFR 268.42(c). I am aware that there are significant penalties for submitting a false certification, including the possibility of fine or imprisonment." (States authorized by EPA to manage the LDR program may have regulatory citations different from the 40 CFR citations listed. Where these regulatory citations differ, your certification will be deemed to refer to those state citations instead of the 40 CFR citations.)

16. **GENERATOR'S CERTIFICATION:** I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.
I hereby certify that the above-named material is not hazardous waste as defined by 40 CFR Part 261 or any applicable state law.

Printed/Typed Name: ROBERT WAGNER — Signature — Month Day Year: 10 8 24 99

TRANSPORTER

17. Transporter 1 Acknowledgement of Receipt of Materials
Printed/Typed Name: DOUGLAS TATE — Signature — Month Day Year: 10 8 24 99

18. Transporter 2 Acknowledgement of Receipt of Materials
Printed/Typed Name — Signature — Month Day Year

FACILITY

19. Discrepancy Indication Space

20. Facility Owner or Operator: Certification of receipt of non-hazardous materials covered by this manifest except as noted in Item 19.
Printed/Typed Name — Signature — Month Day Year

In case of an emergency or spill, immediately call AETS (800) 426-2382

	HAZARDOUS WASTE FACILITY REQUIREMENTS			
25123.3	Does not store onsite hazardous waste for more than 90 days	X		
(H&Scode)	Does not store hazardous waste offsite for more than 96 hours			X
25201	Does not operate onsite hazardous waste treatment facility			X
	Does not operate onsite hazardous waste transfer station			X
	Does not operate onsite haz. wst. resource recovery facility			X
	Does not operate onsite hazardous waste disposal site			X
	UNDERGROUND TANKS			
	Does generator have underground tanks containing:			
	Hazardous materials?	X		
	Hazardous wastes?	X		
	Does generator have leak detection system for underground tanks?			

INFORMATION ONLY

Number of underground storage tanks? 4* (2) - Diesel, gasoline (1) - waste oil (1) waste caustic

Is there a sewer connection on premises? Yes ~~XX~~ NO

NPDES permit # CA 0003085 — Is there acess to storm drain inlet on premises? Yes X NO → Drainage channel

Is there a private liquid disposal system on premises? Yes X → Septic Tank/leach fields

NO ~~XX~~

* – Expl – explanation attached

PLANT SURVEY

DESCRIPTION OF OPERATIONS/PRODUCTS

Arco Crude Stock (85% H_2 & impurities) → → →
(feed stock) NaOH, Diesel fuel
remove CO_2 remove CH_4
(-420°)
Cooling tower is used to cool compressors Can produce 15 tons/day

RAW MATERIALS	PROCESS	WASTE		
		CHEMICAL TYPE	VOL. LBS. OR GAL.	DISPOSAL METHOD
H_2 (g)	purifying w/ Diesel, NaOH			
		Caustic NaOH	6,000 gal/4 mths	→ landfill - Bkk (Crosby - Overy
Solvents (cleaners)				
Stoddard Solvent →	Parts wash →	(Possibly goes in w/ waste oil)		
Oil →	Used in compressors →	Sump (2500 gal capacity) (pumped every 3-4 mths)	~100-150 gal/mth.	→ Asbury Pumped V.
Cooling water Treatment Corrosion inhibitors, Caustic flocculant, Cl_2 (g)				

ACTION: REFERRAL:

COMMENTS:

Arco Crude Stock (85% H_2) → Have 2 (120,000 gallon) spheres on premise for storage

1) Diesel scrubs — Diesel, CH_4 → Back to Arco across the street
2) NaOH scrubs — waste NaOH → Bkk
3) Oxygen
4) 1500 psi
5) refrigerate — further contaminants are removed by adsorpers
6) chip (CH_4) → Back to Arco (fuel gas)

Use ~110 gal. of solvent per yr.
Advised to account for waste

NOTICE OF VIOLATION AND ORDER TO COMPLY

OWNER: Shelley Stuatt (Mgr)	FACILITY ID#: 067220	DATE: 9-29-99	
BUSINESS: Air Products & Chemicals, Inc.		REFER REPLY TO: SI AKIB HTMD 24309 A Narbonne Ave. Lomita, CA 90717 310, 534, 6270	
ADDRESS: 23320 S. Alameda St.			
CITY: Carson	ZIP: 90810		

Attention: The items marked on this notice and issued to you represent violations of the California Code of Regulations (CCR) or the California Health and Safety Code (H&S) and/or the Los Angeles County Code. These violations may result in non compliance fees, permit revocation, and/or civil/criminal penalties. Any time granted for correction of the violation(s) does not preclude any enforcement action by this Department or other agencies. *You are hereby directed to correct the violations within the time specified.* Failure to do so will be considered an additional violation. (Referenced titles & chapters: Titles 19, 22, 23, 27 of the CCR, Chapters 6.5, 6.7, 6.95 of the H&S Code and Title 12 of the Los Angeles County Ordinance).

PERMIT REQUIREMENT

Correction Date ___/___/___

101 ☐ Obtain a Unified Program Facility Permit by submitting a completed consolidated permit application package (CPP) (LA Co Ord. Sec. 12.50.075, 12.50.115).

HAZARDOUS WASTE GENERATOR REQUIREMENTS

HAZARDOUS WASTE DETERMINATION

Correction Date ___/___/___

501 ☐ Provide a hazardous waste determination for the following waste:

502 ☐ If using knowledge of the hazard characteristic and/or exclusion from regulation, provide supporting documentation (22CCR 66262.11).

IDENTIFICATION NUMBER

Correction Date ___/___/___

503 ☐ Obtain an EPA Identification number prior to treating, storing, disposal or transportation of hazardous waste (contact Cal-EPA at 916-324-1781, Fed EPA at 415-495-8895 for ID number).

504 ☐ Use a transporter or TSDF that has a valid Identification Number for transportation, treatment, storage, or disposal of hazardous waste [22CCR 66262.12(c)].

DISPOSAL, TREATMENT & TRANSPORTATION

Correction Date ___/___/___

505 ☐ Discontinue disposal of hazardous waste to an unauthorized location or to a facility which does not have a permit [H&S 25189.5(a)]

506 ☐ Obtain a permit/authorization for disposal of hazardous waste or legally dispose of such waste [H&S 25201(a), 22CCR 66270.1].

507 ☐ Discontinue transportation of hazardous waste or obtain a valid registration issued by DTSC prior to transportation or transfer of hazardous waste [H&S 25163(a)(1)].

508 ☐ Discontinue treatment of hazardous waste or obtain a valid permit or authorization for treatment of hazardous waste [H&S 25201(a)].

STORAGE

Correction Date ___/___/___

■ Discontinue storage or obtain a valid permit/authorization for storage of:

509 ☐ On-site hazardous waste in tanks or containers for more than 90 days [H&S 25201(a), 25123.3(b)(1), 22CCR 66262.34(c)].

510 ☐ On-site hazardous waste in tanks or containers in quantities exceeding 6,000 kilograms, or for more than the applicable accumulation period (180/270 days for generators of less than 1000 kg in any calendar month) [H&S 25201(a), 25123.3(h), 22CCR 66262.34(d)].

511 ☐ On-site hazardous waste for longer than one year or longer than the applicable accumulation time after 55 gallons has been reached at the point of generation (satellite storage) [22CCR 66262.34(e)].

512 ☐ Off-site hazardous waste in tanks/containers for any time period [H&S 25201(a), 25123.3(b)(2)].

513 ☐ Hazardous waste in other than containers, tanks, drip pads, or containment buildings [H&S 25201(a), 25123.3(b)(4)].

514 ☐ Hazardous waste at a transfer facility longer that 6 days or longer than 10 days for transfer facilities in industrially zoned areas [H&S 25201(a), 25123.3(b)(2),22CCR 66263.18].

515 ☐ Obtain an extension from DTSC for storage of hazardous waste at the staging site for remediation longer than one year [H&S 25201(a), 25123.3(e)].

DBA/Name Air Products, Inc. Owner Air Products, Inc.

USE AND MANAGEMENT OF CONTAINERS

Correction Date ___/___/___

■ Immediately transfer hazardous waste from containers that are:

516 ☐ Leaking or in poor condition (22CCR 66265.171).

517 ☐ Incompatible with contents (22CCR 66265.172).

518 ☐ Keep containers of hazardous waste closed, except when adding or removing contents [22CCR 66265.173(a)].

519 ☐ Handle containers of hazardous waste in a manner which will avoid causing ruptures/leaks [22CCR 66265.173(b)].

520 ☐ Discontinue placing incompatible wastes which may adversely react in the same container [22CCR 66265.177 (a)(b)].

521 ☐ Inspect areas at least weekly, where containers are stored, for leaking or deteriorating containers and containment systems (22CCR 66265.174).

■ If greater than 1000 kg of hazardous waste is accumulated within any calendar month, comply with the following:

522 ☐ Locate ignitable/reactive waste at least 15 meters (50 feet) from the site property line (22CCR 66265.176).

523 ☐ Separate, or protect by a berm or other device, containers of hazardous waste which are incompatible with other wastes or materials stored nearby. [22CCR 66265.177(c)].

524 ☐ Store hazardous materials in undamaged containers within 96 hours or manage as a hazardous waste [22CCR 66261.2(f)(2)].

CONTAMINATED CONTAINERS

Correction Date ___/___/___

525 ☐ Mark containers or inner liners greater than 5 gallons with the date emptied. Legally manage containers within one year of that date [22CCR 66261.7(e)(f)].

526 ☐ Manage as hazardous waste all containers, or inner liners of containers that contained hazardous waste and which are not legally empty, per CCR 66261.7(b) or (d) [22CCR 66261.7(p)].

LABELING AND MARKING REQUIREMENTS

Correction Date ___/___/___

527 ☐ Package, label and mark each container of hazardous waste per DOT(49CFR Parts 173, 178, 179) requirements before offering for transportation off site [22CCR 66262.31].

528 ☐ Ensure the transport vehicle is correctly placarded per DOT (49 CFR Part 172, Subpart F) for hazardous materials before offering hazardous waste for transportation off-site (22CCR 66262.33).

530 ☐ Mark containers of hazardous waste at the satellite accumulation area, with the date 55 gallons was reached within 3 days of reaching the limit [22CCR 66262.34(e)(3)].

531 ☐ Mark the accumulation start date on each container and portable tank [22CCR 66262.34(f)(1)].

532 ☐ Mark the date that the applicable accumulation period begins for each container and tank [22CCR 66262.34 (f)(2)].

533 ☐ Label each container and tank of hazardous waste with the words "Hazardous Waste" [22CCR 66262.34(f)(3)].

534 ☐ Label each hazardous waste container and tank with the composition, physical state, hazardous properties of the waste contained therein and the name and address of the generator [22CCR 66262.34(f)(3)].

535 ☐ Label hazardous materials container properly within 10 days or handle as a hazardous waste [22CCR 66261.2(f)(1)].

TANKS

Correction Date ___/___/___

536 ☐ Determine whether a tank is leaking or unfit for tank systems without secondary containment. Maintain a written integrity assessment certified by a registered professional civil engineer (22CCR 66265 et seq).

537 ☐ Ensure that a tank system is designed adequately of sufficient structural strength, and compatible with its contents [22CCR 66265.191(b)].

538 ☐ For tank systems installed after 07/14/86, retain on site the required written assessment certified by a registered professional engineer for tank testing that the system has sufficient structural integrity [22CCR 66265.192(a)].

539 ☐ Provide secondary containment capable of collecting and detecting within 24 hours any leaked hazardous waste [22CCR 66265.193(c)(4)].

540 ☐ Discontinue placing hazardous waste, or treatment reagents, in a tank system which will cause the tanks, containment system or ancillary equipment to leak, ignite or react [22CCR 66265.194(a)].

541 ☐ Store or treat ignitable or reactive hazardous waste in tanks in a manner that will prevent the possibility of the waste to ignite or react [22CCR 66265.198(a)].

542 ☐ Utilize control practices which prevent spillage and overflow [22CCR 66265.194(b)].

543 ☐ Maintain sufficient freeboard of at least 60 centimeters (2 ft) in uncovered tanks [22CCR 66265.194(b)(3)].

■ Conduct daily inspections of tanks for the following:

544 ☐ Discharge control equipment.

545 ☐ Corrosion.

546 ☐ Releases.

547 ☐ Monitoring and leak detection data.

548 ☐ Construction materials.

549 ☐ Secondary containment areas.

550 ☐ Level of waste in uncovered tanks [CCR 66265.195(a)].

551 ☐ Inspect cathodic protection systems (if present) and sources of impressed current [22CCR 66265.195(b)].

552 ☐ Immediately remove from service a tank system or secondary containment system that has leaked (22CCR 66265.196).

DBA/Name Air Products & Chemicals | Owner Air Products & Chem, Inc.

553 ☐ Remove/decontaminate all waste residues, contaminated tank systems and soils during closure of a tank system. Manage them as hazardous waste [22CCR 66265.197(a)].

554 ☐ Comply with buffer zone requirements for tanks containing ignitable or reactive hazardous waste per NFPA'S Flammable and Combustible Liquids Fire Code [22CCR 66265.198(b)].

RECYCLABLE MATERIALS

Correction Date ___/___/___

560 ☐ Store damaged batteries in closed containers which are capable of preventing release of acid and are labeled with the initial accumulation date [22CCR 66266.81(b)].

USED OIL/FILTERS

Correction Date ___/___/___

561 ☐ Discontinue contaminating used oil with hazardous waste (H&S Code section 25250.7).

562 ☐ Manage used oil to prevent discharge to sewer, drainage system, surface water, ground water, watercourses, or deposit on land. " Prevent" incineration of used oil or burning as fuel. [H&S 25250.05(a)].

563 ☐ Discontinue the use of used oil or recycled oil as a dust suppressant, insect or weed control agent [H&S 25250.5(b)].

■ Comply with the following requirements for handling used oil filters:

564 ☐ Manage used oil filters as hazardous waste, or . . . [22CCR 66266.130(a)].

565 ☐ Drain and recycle used oil filters as scrap metal within one year [22CCR 66266.130(b)].

566 ☐ Store filters in closed containers labeled with the words "Drained Used Oil Filters" and the accumulation start date [22CCR 66266.130 (c)(C)(3)].

567 ☐ Manage used oil that has been drained from used oil filters as hazardous waste [22CCR 66266.130(c)(6)].

PREPAREDNESS AND PREVENTION

Correction Date ___/___/___

568 ☐ Maintain site to minimize possibility of fire, explosion, or unplanned release of hazardous waste constituents to air, soil, or surface water, which could threaten human health or environment (22CCR 66265.31).

■ Equip the site with the following:

569 ☐ Internal communication alarm system [22CCR 66265.32(a)].

570 ☐ A device (i.e., telephone or two way radio) for calling outside emergency help [22CCR 66265.32(b)].

571 ☐ Fire, spill control and or decontamination equipment [22CCR 66265.32(c)].

572 ☐ Water at an adequate volume and pressure to supply water hose streams and foam-producing equipment, or automatic sprinkler [22CCR 66265.32(d)].

573 ☐ Test/maintain all communication and alarm systems, fire protection, spill control, or decontamination equipment (22CCR 66265.34)

574 ☐ Provide for immediate access to emergency communication and/or alarm systems during hazardous waste handling (22CCR 66265.34).

575 ☐ Maintain adequate aisle space for personnel and emergency equipment (22CCR 66265.35).

576 ☐ Make arrangements to familiarize police and fire emergency response, local hospitals, office of emergency services and or emergency response contractors, with potential hazards at the facility [22CCR 66265.37(a)].

577 ☐ Document in the operating records when state and local authorities refuse to enter into arrangement for emergency response [22CCR 66265.37(b)].

DOCUMENT REVIEW

MANIFEST SYSTEM

Correction Date 10/29/99

578 ☐ Prepare a complete Uniform Hazardous Waste Manifest for hazardous waste transported or sent offsite [22CCR 66262.20(a)].

579 ☐ Designate a facility on the manifest which is authorized to handle the hazardous waste [22CCR 66262.20 (b)].

580 ☐ Properly complete, sign, and date, applicable manifest sections [22CCR 66262.23(a)(1),(2)].

581 ☒ Submit generator manifest copies to CAL-EPA/Dept of Toxic Substances Control within 30 days of each shipment of hazardous waste [22CCR 66262.23(a)(4)].

582 ☐ Provide the appropriate manifest copies to the transporters [22CCR 66262.23(b)].

583 ☐ Submit the TSDF manifest copy that has been signed by all transporters (except rail transporters) and out-of-state facility operators to DTSC within 30 days for out-of-state shipments [H&S 25160(b)(3)].

■ Retain for a minimum of 3 years:

584 ☐ Signed copies of manifests [22CCR 66262.40(a)].

585 ☐ Shipping papers or receipts for milkrun operations for generators less than 100 kg/month [22CCR 66263.42(e)].

586 ☐ Copies of manifests/bills of lading for spent lead-acid batteries [22CCR 66266.81(a)(4), (B)].

DBA/Name	Owner
Air Products	Air Products

587 ☒ Receipts for used oil [H&S 25250.8(b)(3)].
588 ☐ Bills of lading for used oil filters [22CCR 66266.42(a), 66266.130(c)(5)].
589 ☐ Determine the status of a hazardous waste shipment when the facility manifest copy is not received within 35 days [22CCR 66262.42(a)].
590 ☐ Send an Exception Report to DTSC within 45 days when the facility manifest copy is not received [22CCR66262.42 (a)].

Provide manifests for all haz. waste generated on the premises

LAND DISPOSAL RESTRICTIONS (LDR)

Correction Date ____/____/____

591 ☐ Provide written notification to the receiving facility with each shipment stating whether the hazardous waste meets treatment standards [22CCR 66268.7(a)].

■ Notification must include the following:

592 ☐ EPA hazardous waste number or California Hazardous Waste Codes for non-RCRA hazardous waste listed in section 66268.29.
593 ☐ Corresponding treatment standards or technology set forth in Article 4 and 11 [22CCR 66268.7(a)(2)].
594 ☐ Manifest number associated with the waste shipment.
595 ☐ Waste analysis data, where available [22CCR 66268.7(a)(1)].
596 ☐ Submit a signed notice and certification for LDR waste which does not require further treatment [22CCR 66268.7(a)(2)].
597 ☐ Submit notification to the receiving facility that a waste is subject to an exemption [22CCR 66268.7(a)(3)].

599 ☐ Retain on site a copy of all notices, certifications, demonstrations, waste analysis data and other documentation, for at least five years [22CCR 66268.7(a)(7)].

EXPORTS OF HAZARDOUS WASTE

Correction Date ____/____/____

600 ☐ Exports of hazardous waste to a foreign country from the State are prohibited unless notification of intent to export is provided to US EPA/DTSC and consent of the receiving country is obtained (22CCR 66262.53 et seq).
601 ☐ Notify DTSC of intended export of hazardous waste 4 weeks prior to shipment [22CCR 66262.53(b)].
602 ☐ Replace the TSDF with the consignee on the manifest and identify the point of departure from the United States (22CCR 66262.54).

RECORDKEEPING AND REPORTING

Correction Date ____/____/____

603 ☐ Discontinue submission of manifests, records, applications or other documents containing false or erroneous information or statements [H&S 25189.5(a)].
604 ☐ Retain waste analysis test records for at least 3 years [22CCR 66262.40(b)].
605 ☐ Retain a copy of the Biennial Report/Exception Report for 3 years [22CCR 66262.40(b)].
606 ☐ Submit a Biennial Report with required information to DTSC by March 1 of even-numbered years [22CCR 66262.41(a)].
607 ☐ Submit a written report on a reportable release incident to the CUPA within 15 days of the event [H&S 25504(b), 22CCR 66265.56(j), 66265.77(a)].
608 ☐ Report to the local CUPA, every two years using the format established under section (d), the required information regarding the recycling of more that 100 kilograms per month of recyclable materials [H&S 25143.10(a)].

CONTINGENCY PLAN AND EMERGENCY PROCEDURES

Correction Date ____/____/____

610 ☐ For small quantity generators, post emergency numbers and location of emergency equipment next to the telephone [40 CFR 262.34(d)(5)].
611 ☐ Maintain a contingency plan onsite [22CCR 66265.51(a)]. *(A California Hazardous Materials Consolidated Contingency Plan that complies with the regulatory compliance matrix may be used to comply with the business plan and contingency plan requirement under H&S Code Section 25504 and 22CCR 66265.51(a)).*
612 ☐ Implement the portion of the business plan, contingency plan or consolidated contingency plan, relating to emergency procedures, for any occurrence of fire, explosion, or releases of hazardous materials/waste which could threaten human health or the environment [22CCR 66265.51(b), 66265.56].
613 ☐ Describe the actions needed to respond to an emergency [22CCR 66265.52(a)].
614 ☐ Describe arrangements agreed upon by emergency teams [22CCR 66265.52(c)].
615 ☐ Identify the emergency coordinators [22CCR66265.52(d)].

■ Contingency plan lacks the following:

616 ☐ Complete evacuation plan [22CCR 66265.52(f)].
617 ☐ Current telephone number of the State OES [22CCR 66265.52(g)].
619 ☐ A list of emergency equipment, the location, physical description, or the capabilities of the equipment [22CCR 66265.52(e)].

620 ☐ Submit a contingency plan to local emergency authorities [22CCR 66265.53(b)].

DBA/Name	Air Products & Chem.	Owner	Air Products

621 ☐ Amend contingency plan as necessary (22CCR 66265.54).
622 ☐ Maintain an emergency coordinator either on the premises or on call at all times (22CCR 66265.55).
625 ☐ Note the required information regarding the incident in the operating log [2CCR 66265.56(j)].

PERSONNEL TRAINING

Correction Date ___/___/___

626 ☐ For small quantity generators, ensure that the appropriate staff are adequately trained to manage waste and respond to emergencies [22CCR 66262.34 (d)(2)].
627 ☐ Ensure that training program is directed by a person trained in hazardous waste procedures [22CCR 66265.16(a)(2)].
628 ☐ Provide a training program directed by a representative trained in hazardous waste procedures [22CCR 66265.16(a)(2)].
629 ☐ Ensure that personnel complete the required training program within 6 months of employment, or work supervised positions prior to completing the training, to comply with the hazardous waste requirements [22CCR 66265.16(b), 66265.16(a)(1)].
630 ☐ Provide personnel an annual review of their initial training (on hazardous waste procedures) [22CCR 66265.16(c)].
631 ☐ Maintain onsite all required training documentation. [22CCR 66265.16(d)].
632 ☐ Maintain onsite training records on current and former employees within the last 3 years [22CCR 66265.16(e)].

SOURCE REDUCTION

Correction Date ___/___/___

634 ☐ Prepare and retain onsite current source reduction documents as applicable, and make them available to the inspector within five days of a request [H&S 25244.15(d), 25244.19, 25244.20, 25244.21].

■ Include the following required elements in the Source Reduction Evaluation Review and Plan (also known as a Source Reduction Plan):

635 ☐ Certification.
636 ☐ Amounts of wastes generated.
637 ☐ Process description.
638 ☐ Block diagrams.
639 ☐ Implementation schedule of selected source reduction measures (22CCR 67100.5).

CONSOLIDATION/REMOTE SITE COMPLIANCE

Correction Date ___/___/___

640 ☐ Submit the required notification to the CUPA before operating a consolidation site [H&S 25110.10(d)(1)].
641 ☐ Comply with the consolidation site operating requirements [H&S 25110.10(b)].
642 ☐ Submit the required notification before operating a remote site [H&S 25121.3(b)].
643 ☐ For non-RCRA waste at a remote site, comply with container and labeling requirements, notify the CUPA of the remote site exemption annually, and hold the waste at the site no longer than 10 days [H&S 25121.3(b)].

SITE MITIGATION/SITE CLOSURE

Correction Date 10/29/99

644 ☐ Provide a corrective action plan for unauthorized releases of hazardous waste or constituents to the ground (H&S 25187).
645 ☒ Owner or operator shall close the facility in a manner that:
a) minimizes the need for further maintenance, and
b) controls or eliminates all contaminated equipment, structures, and soil; or decontaminate by removing all hazardous waste residues (22CCR 66265.111, 66265.114, H&S 25187].

Provide a facility closure plan prior to vacating the premises by dates indicated above.

Violations: The conditions or practices checked below represent a violation of the referenced section of Title 22, California Code of Regulations (22 CCR, Div 4.5, Ch 10, Sec 66260.1 et seq), and/or Health & Safety Code Chapter 6.5 (H&S, Div 20, Ch 6.5, Sec 25100 et seq) for which there are civil and criminal penalties. Time granted for correction of violations does not preclude any enforcement action by this Department or other agencies. **You are directed to correct the violations within the times specified. Failure to do so will be considered an additional violation.**

HAZARDOUS WASTE DETERMINATION

Correction Date ___/___/___

01 ☐ Provide a hazardous waste determination for (CCR 66262.11)

DISPOSAL

Correction Date ___/___/___

Discontinue the illegal disposal of hazardous waste and/or extremely hazardous waste to an unauthorized location (H&S 25189.5):

02 ☐ trash/dumpster/ground;
03 ☐ storm drain;
04 ☐ sewer/septic system with a permit;
05 ☐ unpermitted facility.
06 ☐ Discontinue the disposal of hazardous materials containers which are not legally empty (CCR 66261.7)

EPA NUMBER/PERMITS

Correction Date ___/___/___

Obtain the following from the Cal-EPA:

07 ☐ EPA Identification Number (contact Cal-EPA, 916-324-1781, for ID number) (CCR 66262.12);
08 ☐ on-site waste treatment/disposal permit for (CCR 66270.1)

09 ☐ extremely hazardous waste permit for handling and disposal of (CCR 67430.1)

STORAGE AND MANAGEMENT OF CONTAINERS

Correction Date 10/15/97

Discontinue the on-site accumulation of hazardous waste:

10 ☐ longer than 90 days without an extension from DTSC (CCR 66262.34(c));
11 ☐ longer than 90 days after 100 kg has been accumulated (CCR 66262.34(b));
12 ☐ longer than 1 year or 90 days after 55 gallons has been accumulated at satellite storage.

Label the waste container with the following:

22 ☒ the words, "HAZARDOUS WASTE" (CCR 66262.34(f));
14 ☒ description of contents / hazardous property of waste / generator name and address (CCR 66262.34(f));
13 ☐ accumulation start date (CCR 66262.34(f)).

Provide hazardous waste containers which are:

15 ☐ in good condition (CCR 66265.171);
16 ☐ compatible with waste contents (CCR 66265.172);
17 ☐ closed/sealed during storage (CCR 66265.173);
18 ☐ handled/stored/segregated to minimize waste release/reaction (CCR 66265.177(c));
19 ☐ inspected at least weekly (CCR 66265.174).
25 ☐ Label hazardous materials properly within 10 days or handle as hazardous waste (CCR 66261.2(f)(1)).
26 ☐ Store hazardous materials properly within 96 hours or handle as hazardous waste (CCR 66261.2(f)(2)).
20 ☐ Properly manage used oil filters (CCR 66266.130).
21 ☐ Properly manage spent lead-acid storage batteries (CCR 66266.81).

NO LABEL ON WASTE OIL STORAGE

TANK REGULATIONS

Correction Date ___/___/___

23 ☐ Discontinue storing incompatibles in the same tank (CCR 66265.199).
24 ☐ Inspect tank and tank equipment daily and document in the operating record of the facility (CCR 66265.195).

16. GENERATOR'S CERTIFICATION. I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment. OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

RE: Submittal of DTSC Waste Manifest Copies
Air Products and Chemicals, Inc.
23320 S. Alameda Street, Long Beach CA
Facility EPA ID No. CAT 080010655

Dear Sir or Madame:

Enclosed please find the DTSC waste manifest copies for State Manifest Document Numbers 98521482 and 98521481. The manifested wastes were generated from/by facility closure activities.

If you have any questions or require additional information, please contact me at 610/481-3354, between 7:00 am and 4:30 p.m. east coast time.

Sincerely,

Ginger Patrick

Preliminary Assessment Summary

Air Products & Chemicals, Inc.
23320 South Alameda Street
Carson, California 90810

March 1985

Preparer: Rich Brausch
Toxic Substances Control Division
Southern California Section
(213) 620-2380

PROBLEM AND HISTORY:

From 1942 through 1962, this site was used as an equipment storage area for the ARCO Refinery located across the street.

In 1962, Air Products & Chemicals, Inc. leased the property for their cryogenic gas processing operation where they manufactured liquid hydrogen. This operation has continued through to the present date.

The plant's wastewater effluent has been monitored closely by the Regional Water Quality Control Board because they discharge into the Dominguez Channel. Their domestic and laboratory wastes are disposed of to a septic system on site rather than to sanitary sewers. Septic system disposal poses a problem since lab wastes have been analyzed and shown to contain phenols, oils and grease.

In an early inspection report, mention was made of practice early in the plant's history of disposing of their wastes by dumping them on the ground near the channel. No information was available to determine the quantity of wastes disposed of in this manner.

RECOMMENDATION:

Because of the past and present practices of disposing laboratory wastes into the septic system and because of the initial waste disposal techniques, staff recommends active status, medium priority. As an active generator of hazardous waste, this facility will be referred to the Los Angeles County Department of Health Services.

Department of the County Engineer
County of Los Angeles
Industrial Waste Division
108 W. Second Street
Los Angeles, California

Attention: J. L. Parton
Division Engineer

Dear Mr. Parton:

I would like to express my personal appreciation of the assistance and guidance given to our representatives last week at your office. The expeditious design and construction of our liquid hydrogen plant has been measurably expedited by the assistance that we received.

A matter of concept regarding the disposition of industrial wastes must be resolved prior to continuing with our program. Your approval is solicited for the wasting of spent caustic from our system to the Dominguez Channel near the corner of Sepulveda Boulevard and Alameda Streets. The caustic quantities and amounts to be wasted are as follows:

Quantities - 6 Gallons per hour

H_2O - 88%
NaOH - 2%
Na_2CO_3 - 10%

These concentrations may be further reduced by dilution with cooling tower blowdowns which will amount to 75 gallons per minute.

These data are supplied in confirmation of a discussion between your Mr. Lorenzo Quintana and the writer. If there is any further information required, please let me know.

Very truly yours,

F. B. Eastman
Chief Project Manager

Control Building
Plan Check No. 3836

Gentlemen:

This letter will confirm conversation between Mr. Lorenzo Quintiana of the Building and Safety Division and Mr. James A. Goring of Daniel, Mann, Johnson and Mendenhall, wherein it was stated that industrial wastes emanating from the Control Building Laboratory would be limited to 1000 cc per week of 10% caustic and 500 cc per week of 5% acid. These wastes will be disposed of in the facility sanitary system.

Yours very truly,

AIR PRODUCTS and CHEMICALS, INC.

Dept. of County Engineer, Bldg. & Safety Depts.
108 W. Second Street
Los Angeles, California

Dear Sir:

This is to certify that the Richfield Oil Corporation has reviewed drawing number 1-6100-57-252, dated March 17, 1962, prepared by the Air Products and Chemicals, Incorporated, for drainage for the property having an address of 23320 South Alameda Street which is adjacent on the north, east, and south to property owned by the Richfield Oil Corporation.

There is and will be no objections on the part of the Richfield Oil Corporation for work performed by Air Products and Chemicals, Incorporated in connection with the traverse of the drain line, marked 21" V.C., through 50 feet of Richfield Oil Corporation property en route to the Flood Control Channel.

Richfield Oil Corporation holds the county free of liability and responsibility for the work on this property.

Yours truly,

RICHFIELD OIL CORPORATION

Gentlemen:

At the request of Mr. L. Quintiana, we are transmitting herewith one copy of Air Products and Chemicals, Inc.'s brochure for their Hydrogen Facility at 23320 South Alameda Street.

We trust the information contained in the brochure will be of help in explaining the functions of the different structures which you have had under review.

In answer to the question raised by Mr. Quintiana as to the function of the Perlite Silo, it is our understanding that this structure houses "Perlite" insulation which is used to insulate certain equipment, such as the cold boxes, etc. At the time of equipment servicing it may be necessary to temporarily return the insulation to the silo.

Very truly yours,

MEMORANDUM

TO: Tom Otteson
FROM: Bernard Valasky
DATE: July 13, 1962
FILE: AIR PRODUCTS AND CHEMICALS INC. I-5385-20
23320 S. Alameda Street

Attached are approved plans showing facilities to be constructed at the hydrogen liquefying plant to be located at the above address.

The process includes using waste gas from the reforming process at the Richfield Refinery. This waste gas contains about 80 to 90 percent of elemental hydrogen together with other gases. Previously, the Richfield Company had been using this product for firing their boilers. These gases will now be pumped to the proposed new Air Products plant and the end product at this new plant will be pure hydrogen.

The gases pumped from the Richfield Refinery are passed through a light oil, stripping benzene and other aromatics. There will be no waste from this stripper. Carbon dioxide is removed in a caustic stripper and the spent solution from this stripping operation, sodium carbonate, will be discharged to Dominguez Channel. Other discharges to Dominguez Channel include 75 gallons per minute of cooling tower bleedoff and storm runoff. Included also is a small control laboratory which discharges into the domestic sanitary system. The discharge of these small amounts of laboratory wastes has been discussed and approved by the Health Department. Other facilities include floor drains in a Maintenance Building for washdown which will discharge also to the sanitary system. Included also are plans showing details of the connection to Dominguez Channel. A Permit for this connection has been issued by the Los Angeles County Flood Control District.

If the above facilities are installed, an Industrial Waste Permit will be required.

Gentlemen:

AIR PRODUCTS & CHEMICAL INC. (I-5385-20)

Enclosed is Industrial Waste Disposal Permit No. 3113 which sets requirements on the disposal of your industrial wastes to the Dominguez Channel, and to the sanitary sewer available to the site.

Improvements to Dominguez Channel are now under construction. The California State Regional Water Pollution Control Board No. 4 has adopted long range waste disposal and water quality objectives for the Dominguez Flood Control Channel. While the objectives do not specifically so state, we believe that it was the intent of the Regional Board that they be effective for the waters in the improved Channel rather than the present Channel. The principal difference between their objective from the conditions and limitations in outstanding waste disposal permits for discharge to Dominguez Channel is the requirement that at least 0.5 parts per million of dissolved oxygen be maintained in channel waters at all times.

It is probable that the conditions and limitations of outstanding waste disposal permits, issued by the County Engineer for discharges into Dominguez Channel, will have to be modified to insure conformance with these objectives. The principal

change would be a limitation on the amount of dissolved organic materials that may be discharged into the Channel. In this event, all permittees will be so notified and will be given the opportunity to review specific proposed revisions before such revisions are made effective.

Yours very truly,

John A. Lambie
COUNTY ENGINEER

1-17-63

SPECIAL CONDITIONS AND LIMITATIONS
INDUSTRIAL WASTE DISPOSAL PERMIT NO. 3113
AIR PRODUCTS & CHEMICALS INC. (I-5385-20)

1. This permit is issued to Air Products & Chemicals Inc., for the disposal of wastes from the gas processing facilities located at 23320 South Alameda Street, Long Beach.

2. The cooling tower bleedoff shall be discharged into the Dominguez Channel.

3. The laboratory wastes shall be discharged into the sanitary sewer available to this site.

4. Waste water discharged into the Dominguez Channel shall not cause formation of objectionable deposits of sludge. In general, settleable solids shall not exceed 1.0 cubic centimeters per liter.

5. Waste water discharged into the Dominguez Channel shall not contain oil in excess of 75 ppm.

6. Waste water discharged into the Dominguez Channel shall not cause damage to private or public structures or property.

7. The pH of waste water discharged to the Dominguez Channel shall be maintained at not less than 6.5.

8. Waste water discharged into the Dominguez Channel shall not contain toxic wastes in concentration sufficient to endanger public health. The dissolved sulfides in the discharge shall not exceed 1.0 ppm.

9. Waste water discharged into the Dominguez Channel shall not cause or create odors to the extent that they are a public nuisance.

10. All liquid industrial waste and water soluble solid wastes produced at the above location and not acceptable for disposal to the Dominguez Channel or to the sanitary sewer as provided above, shall be stored in impervious containers pending transportation to a legal point of disposal. The permittee shall certify by signing waste hauler's reports the source, quantity and point of disposal for all such wastes removed from the premises for disposal at any other location. The signed original of this report shall be forwarded to the County Engineer as indicated thereon. A copy of the waste hauler's report form is attached.

11. Representatives of interested governmental agencies concerned with the disposal of industrial wastes shall be permitted access at any reasonable time to take samples and to inspect operations.

12. The County Engineer shall be notified and his written approval secured before making any additions or modifications which may affect the quantity, quality, or method of disposal of waste materials.

13. The County Engineer may modify this permit by addition, revision, or elimination of conditions and limitations as may be necessary to accomplish the purposes of ordinances covering the disposal of waste materials.

14. Violation of any of the conditions of this permit shall be cause for suspension or revocation.

LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD I-5385

RESOLUTION NO. 68-4

PRESCRIBING REQUIREMENTS FOR DISPOSAL OF INDUSTRIAL WASTES
AIR PRODUCTS AND CHEMICALS INC.
23320 South Alameda Street, vicinity of Dominguez,
Los Angeles County, California
(File 63-63)

WHEREAS, AIR PRODUCTS AND CHEMICALS INC. is discharging industrial wastes to Dominguez Channel under terms of an industrial waste permit issued by the County of Los Angeles; and

WHEREAS, such permit therefor has been submitted to this Board in accordance with established administrative procedures; and

WHEREAS, this material is accepted as a report on waste discharge; and

WHEREAS, this Board has caused the following investigations to be made:

1. Field investigations were conducted by the staff of this Board.

2. Review was made of this Regional Board's Water Quality Control Policy for Harbors, Marinas, and Tidal Prisms in Los Angeles and Ventura Counties, adopted on April 10, 1967.

3. Review was made of this Regional Board's Water Quality Control Policy for Pacific Ocean Coastal Waters, Rincon Point to San Gabriel River, adopted on April 10, 1967.

4. Review was made of the following publications dealing with Dominguez Channel:

   a. "Report on Biochemical Study of Dominguez Channel", A Report to the Los Angeles County Flood Control District by Kennedy Engineers, January 1960.

   b. "Report on Waste Assimilation Study of Dominguez Channel", A Report for the State Water Pollution Control Board, State of California, by James M. Montgomery, Consulting Engineers, Inc., December 1962.

   c. "Report on Hydrogen Sulfide Study of Dominguez Channel", A Report to Dominguez Channel Users' Group, by Montgomery Research Inc., December, 1965.

   d. "Dominguez Channel Study--A Chemical, Physical, and Biochemical Evaluation of the Wastes in a Man-Made Tidal Channel Used for Flood Control and Industrial Waste Disposal, June-December 1965", by Sanitation Districts of Los Angeles County, May 1966.

5. Meetings were held with governmental agencies and those industries discharging wastes into the channel; and

1. This existing waste discharge is from a cryogenic gas processing plant located at 23320 South Alameda Street in the Dominguez area of unincorporated Los Angeles County. Wastes consist of about 40,000 gallons per day of cooling tower bleedoff. The point of discharge to Dominguez Channel is about 2,200 feet easterly of Alameda Street in Section 22, T4S, R13W, S.B.B.&M.

2. Dominguez Channel, in the reach between 116th Street (in Hawthorne) and its end at Henry Ford Avenue (in Los Angeles), is an open, lined channel which was improved by the Los Angeles County Flood Control District for the purpose of flood control.

3. This improvement, which was completed in November 1966, created a tidal prism which extends from the Los Angeles Inner Harbor to Vermont Avenue--a distance of some eight miles.

4. Dry weather flow in the channel above Vermont Avenue amounts to about 1.6 million gallons per day (mgd); this dry weather flow is constituted of street drainage and industrial wastes (principally cooling waters). This flow does not have a significant effect upon the waters of the tidal prism.

5. Below Vermont Avenue, Dominguez Channel traverses a heavily industrialized area; in this reach, there are numerous discharges of treated industrial wastes to the channel.

6. Dominguez Channel empties into Consolidated Slip at Henry Ford Avenue; Consolidated Slip is the extreme upper end of the East Basin of Los Angeles Inner Harbor.

7. Dry weather flow in Dominguez Channel at Henry Ford Avenue is on the order of 13 mgd (excluding tidal flow).

8. In its Resolution No. 67-4 entitled: "Adopting Water Quality Control Policy for Harbors, Marinas, and Tidal Prisms of Los Angeles and Ventura Counties," adopted April 10, 1967, this Board states in part that the quality of the waters of Dominguez Channel must be such that a nuisance will not be caused and that the quality of the waters of the Los Angeles-Long Beach Inner Harbor will not be made lower than as set forth in the policy statement.

9. The Board enunciated no beneficial uses of the waters of Dominguez Channel; however the following beneficial uses of the Inner Harbor waters were enunciated for protection: a) Harborage purposes; b) Shipping, navigation, and anchoring; c) Small boat mooring;

d) Industrial water for cooling and fish handling; and e) Aesthetic enjoyment.

Waters of the Outer Harbor of Los Angeles-Long Beach Harbor are included in the Nearshore Zone of Pacific Ocean coastal waters which are protected for: a) Aesthetic enjoyment; b) Ocean water contact sport (swimming, surfing, skindiving); c) Propagation and sustenance of marine life, including kelp and shorebirds; d) Shellfish harvesting; e) Scientific research and training; f) Sport fishing; g) Bait fishing; h) Commercial fishing; i) Pleasure boating; j) Shipping and navigation; and k) Industrial water supply.

10. Outflow from Dominguez Channel has an effect upon the quality of water in the Inner Harbor which in turn has an effect upon the quality of water in the Outer Harbor.
