								TOTAL	49998.828

Note: F150 Pickup Trucks are assumed to be gasoline fueled and utilize EMFAC2021's MDV vehicle category with aggregate model years and speeds for emission factors. For every hour on-site, each F150 is assumed to travel 0.1 mile at 15 miles per hour and start once and idle for 5 minutes.

1. Fuel Consumption for Pickup Trucks reflect gallons of fuel consumed per hour rather than per horsepower-hour.

Phase 1 Proposed Conditions

Operation - 2026

Vehicle type	Fleet percent[1]	VMT[2]	
	Adjusted Percent	Adjusted	Total
LDA	55.25%	-6,599,668	-6,599,668
LDT1	4.03%	-481,457	-481,457
LDT2	25.45%	-3,040,389	-3,040,389
MDV	14.30%	-1,708,635	-1,708,635
LHD1	0.00%	0	0
LHD2	0.00%	0	0
MHD	0.00%	0	0
HHD	0.00%	0	0
OBUS	0.21%	-24,967	-24,967
UBUS	0.21%	-25,235	-25,235
MCY	0.41%	-48,774	-48,774
SBUS	0.06%	-7,190	-7,190
MH	0.07%	-8,885	-8,885
TOTAL	100.00%	-11,945,200	-11,945,200

[1] Fleet mix assumes 100% passenger vehicles for foregone VMT for ferry terminal and 97% passenger vehicles and 3% trucks for future visitor serving uses.

[2] Net Annual VMT.

Source: EMFAC2021 (v1.0.2) Emissions Inventory
Region Type: Air Basin
Region: San Francisco Bay Area
Calendar Year: 2025, 2026, 2027, 2028
Season: Annual
Vehicle Classification: EMFAC202x Categories
Units: miles/day for Combustion VMT and Electric VMT, trips/day for Trips, tons/day for Emissions, 1000 gallons/day for Fuel Consumption, kg/day for Hydrogen Consumption

Model Output: OFFROAD2021 (v1.0.5) Emissions Inventory
Region Type: Air Basin
Region: San Francisco Bay Area
Calendar Year: 2025, 2026, 2027, 2028
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Model Output: OFFROAD2021 (v1.0.5) Emissions Inventory
Region Type: Air Basin
Region: San Francisco Bay Area
Calendar Year: 2025, 2026, 2027, 2028
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Region	Calendar Year	Vehicle Category	Model Year	Horsepower Bi	Fuel	HC_tpd	ROG_tpd	TOG_tpd	CO_tpd	NOx_tpd	CO2_tpd	PM10_tpd	PM2.5_tpd	SOx_tpd	NH3_tpd	Fuel Consumptior	Total_Activity_	Total_Population	Horsepower_Hours_hhpy

Source: EMFAC2021 (v1.0.2) Emissions Inventory
Region Type: Air Basin
Region: San Francisco Bay Area
Calendar Year: 2025, 2026, 2027, 2028
Season: Annual
Vehicle Classification: EMFAC202X Categories
Units: miles/day for Combustion VMT and Electric VMT, trips/day for Trips, tons/day for Emissions, 1000 gallons/day for Fuel Consumption, kg/day for Hydrogen Consumption

Region	Calendar Year	Vehicle Category	Model Year	Speed	Fuel	Population	Total VMT	CVMT	EVMT	Trips	Fuel Consumptio	Energy Consumption

Model Output: OFFROAD2021 (v1.0.5) Emissions Inventory
Region Type: Air Basin
Region: San Francisco Bay Area
Calendar Year: 2025, 2026, 2027, 2028
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Model Output: OFFROAD2021 (v1.0.5) Emissions Inventory
Region Type: Air Basin
Region: San Francisco Bay Area
Calendar Year: 2025, 2026, 2027, 2028
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Region	Calendar Year	Vehicle Category	Model Year	Horsepower Bi	Fuel	HC_tpd	ROG_tpd	TOG_tpd	CO_tpd	NOx_tpd	CO2_tpd	PM10_tpd	PM2.5_tpd	SOx_tpd	NH3_tpd	Fuel Consumption	Total Activity	Total_Population	Horsepower_Hours_hhpy

Model Output: OFFROAD2021 (v1.0.5) Emissions Inventory
Region Type: Air Basin
Region: San Francisco Bay Area
Calendar Year: 2025, 2026, 2027, 2028
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

B.5 – Health Risk Assessment

1. Health Risk Assessment

1.1 INTRODUCTION

This Health Risk Assessment (HRA) analyzes the potential health risk impacts experienced by off-site receptors from exposure to toxic air contaminants (TAC) during project construction and operation. The proposed project would provide San Francisco Bay Ferry-operated passenger ferry service at Redwood City with origin and destination points of San Francisco and Oakland. Ferry service would be provided by San Francisco Bay Ferry with initial service during weekday morning and afternoon commute periods between the hours of approximately 6 am to 9 pm, utilizing ferry vessels capable of carrying up to 300 passengers. As the ferry service matures, midday, evening, weekend, and special event service may be added. The service would be passenger only and would not transport vehicles. Transport of bicycles and small non-gas powered mobility devices, such as skateboards and scooters, would be allowed pursuant to WETA/San Francisco Bay Ferry operating rules and U.S. Coast Guard (USCG) regulations. The ferry terminal would consist of waterside and landside components required to establish the proposed ferry service as well as site access improvements. Given the nature of the proposed improvements and activities, the TAC of concern for this analysis is diesel particulate matter (DPM). The project components are described in greater detail below.

Ferry Terminal

The ferry terminal would have waterside components consisting of berths for two ferry vessels at a pile-supported floating dock with ramps and a gangway to a pile-supported access pier with a landside security gate, electric utilities for boarding ramps, shore power, and lighting. The landside components would consist of a 250-stall parking lot with transit stops, roadway improvements to Seaport Boulevard, bicycle/pedestrian network connections to the Bay Trail, secure on-site bicycle parking, and utilities serving the ferry terminal site. A portable restroom facility would be provided by the Port as part of the ferry terminal development. The landside ferry terminal structure would largely consist of a covered pedestrian waiting area and is assumed to be approximately 6,000 square feet. The surface parking lot is assumed to be approximately 101,000 square feet. The Bay Trail extension is assumed to be approximately 13,300 square feet.

Frontage Road and Relocated Railroad Tracks

Frontage Road currently terminates at the entrance to the project site; however, a controlled access gate approximately 1,300 feet south of the project site prevents it from being used to access the project site. This gated section of Frontage Road is not currently used and would be abandoned.

Approximately 300 feet of the existing railroad east of the project site would also be abandoned. The track to be removed would be replaced by a similar length of track constructed south of the project site within the abandoned portion of Frontage Road. The relocated tracks would connect to the existing tracks via a new switch approximately 1,300 feet south of the project site.

Relocated Maintenance Building

A similarly sized and constructed maintenance building would be installed to replace the existing maintenance building located adjacent to the western public parking lot for the waterfront park that would be removed to accommodate the new access road. Consistent with the existing structure, the building is assumed to be cinderblock and approximately 1,000 square feet in size and 15 feet in height. The relocated maintenance building would be within the Pacific Shores Center property at a site selected by Pacific Shores Center management based on their operational and site planning needs.

Future Visitor-Serving Uses

Consistent with the Port's 2020 Vision Plan, the Port is proposing a zone change to allow for future uses at the project site to expand waterfront access to the community and increase visitor-serving amenities. The proposed zone change would include the entire 9.2-acre project site and would allow a hotel and associated restaurant and retail and meeting/event facilities, and a standalone restaurant and small office that are separate from the hotel. The proposed zone change would change the project site zoning from the existing GI classification to CG (General Commercial). The CG classification would permit a hotel, an administrative or professional office of less than 10,000 square feet, sales of merchandise, and commercial passenger terminal facilities. Restaurants and bars would be permitted as a conditional use. The GI designation would limit lot coverage to 60 percent and while it would allow a building height of up to 75 feet (e.g., five to seven stories), the building height at the project site would be limited to three stories (e.g., approximately 45 feet) in compliance with the project site's General Plan designation of M (Marina) which is not proposed to be amended. For purposes of this analysis, the assumed square footage of future improvements include the hotel at 180,000 square feet, the permanent restroom at 350 square feet, the restaurant at 20,000 square feet, and the office at 10,000 square feet, which reflects the maximum allowed buildout under the proposed zone change from GI to CG.

Construction

Construction of all the project elements would be a duration of approximately four years commencing in late 2025, although the construction schedule may move further into the future as necessary; emissions from construction in future years is assumed to be lower than present due to increasing emission control standards for off-road equipment. Construction would begin with the raising of the site elevation of the 9.2-acre project site from approximately 10-feet NAVD to 17-feet NAVD. This would take approximately seven to nine months. The construction of the ferry terminal and parking lot, Bay Trail extension, the widening of the Seaport Boulevard corridor with a bicycle trail and sidewalk, other access improvements (including constructing the project site entrance, construction of the relocated railroad track, and abandonment of the Frontage Road segment), and demolition and relocation of the existing maintenance building would follow the raising of the site elevation. Construction of these elements are expected to last for approximately 15 months. Construction of the ferry terminal, which is estimated to take four months, is expected to overlap with construction of the access and site improvements associated with the ferry terminal. Demolition and reconstruction of the maintenance building and railroad track may also occur simultaneously with construction of the ferry terminal and improvements. The timing and duration for construction of the visitor-serving uses would be determined when the specific development is proposed; however, this analysis conservatively assumes that the construction of the visitor-serving uses would begin immediately following completion of the ferry terminal and site improvement construction and last for a period of approximately 24 months.

Operation

San Francisco Bay Ferry's ferry fleet is composed primarily of diesel-powered catamaran-style ships that accommodate between 225 and 445 passengers. The Water Emergency Transportation Authority (WETA), which is the agency that would manage the operation of the ferries, uses renewable diesel fuel for its ferry fleet, and its ferries are compliant with U.S. Environmental Protection Agency's (USEPA) Tier 4 emission standards. The vessel type proposed for the Redwood City service connecting to San Francisco and/or connecting to Oakland is a 300-passenger capacity vessel. The commute time (excluding passenger loading/unloading time) would be 65 minutes for the Oakland to Redwood City route and 55 minutes for the San Francisco to Redwood City route. The initial service is proposed as a commute-period service, providing three to four trips during both am and pm peak periods on weekdays. This service would operate approximately 6 am to 10:30 am in the mornings and approximately 4 pm to 9:30 pm in the evenings. Depending on demand, midday service to either San Francisco or Oakland, and weekend service to San Francisco may be added. Future plans might also involve extending the service to include special event services to San Francisco on the weekends, similar to what San Francisco Bay Ferry offers on existing services.

This analysis assumes that full buildout service would be implemented upon initial operation in 2027 and would include all day service to San Francisco and to Oakland that has a higher frequency of service during morning and evening peak periods on weekdays, and weekend day and special event service for the San Francisco route, than what is expected upon initial operation. Actual service would depend on demand and would be subject to San Francisco Bay Ferry's standard operating practices. The ferry service would require eight crews with a minimum of four people per crew per weekday to operate each route. These crews would work eight-hour shifts. The weekend San Francisco route would require four crews, working ten-hour shifts. The ferry terminal would not be staffed. Ferries would idle at the berth during 10-minute embarking/disembarking. Vessels would dock overnight and on weekends at the WETA Central Bay Operations and Maintenance Facility (CBOMF) in Alameda and may occasionally be berthed overnight or on weekends at the Redwood City terminal. WETA's responsibility for managing waterside infrastructure would be negotiated through future project operating agreements.

For purposes of this analysis, the following ferry operations are assumed:

- All vessels would start each day by traveling from the WETA Central Bay Operations and Maintenance Facility (CBOMF) in Alameda to the Redwood City Terminal.

- The Oakland-Redwood City weekday route would consist of 2 vessels traveling to and from the Oakland Terminal and Redwood City Terminal, each providing 3 roundtrip services during the AM peak hour and 3 during the PM peak hour, resulting in 12 daily vessel roundtrips.

- The San Francisco-Redwood City weekday route would consist of 2 vessels traveling to and from the San Francisco Terminal and Redwood City Terminal, each providing 4 roundtrip services during the AM peak hour and 4 during the PM peak hour, resulting in 16 daily vessel roundtrips.

- The San Francisco-Redwood City weekend route would consist of 5 vessels traveling to and from the San Francisco Terminal and Redwood City Terminal, each providing 5 roundtrip services throughout the day—assumed to be the same AM and PM peak hour timeframes as weekday services, but on Saturdays and Sundays—resulting in 10 daily vessel roundtrips.

- The San Francisco-Redwood City special event route would consist of 1 vessel traveling to and from the San Francisco Terminal and Redwood City Terminal, providing 1 roundtrip service, resulting in 1 daily vessel roundtrip per special event. Special events would occur on weekends only and are assumed to take place 15 days per year. The special event service is assumed to take place during the same AM and PM peak hour timeframes as weekday services, but on the weekend as special events are scheduled (e.g., large sporting events).

- Commute time for the Oakland-Redwood City route is assumed to be 65 minutes for each vessel roundtrip, not accounting for idle time during passenger loading/unloading. Commute time for the San Francisco-Redwood City route is assumed to be 55 minutes for each vessel roundtrip, not accounting for idle time during passenger loading/unloading.

- Each vessel is assumed to idle for 10 minutes to accommodate passenger loading/unloading, resulting in a 20-minute idle time for each vessel roundtrip. Each weekday vessel roundtrip is assumed to idle for 30 minutes during crew lunchbreaks, and each weekend—including special event—vessel roundtrip is assumed to idle for 45 minutes during crew lunchbreaks.

- All vessels would end each day by traveling from the Redwood City Terminal to the WETA CBOMF in Alameda to be domiciled overnight.

- To account for potential expansion of ferry services in the future in the emissions estimates utilized in this HRA, a 20-percent contingency was added to all idle and travel durations expressed above. For example, while each vessel roundtrip would include 20 minutes of idle time for passenger loading/unloading, the emission estimates assume 24-minute idle times. The 20-percent contingency was applied to proposed vessel activity durations because the route destination, route frequencies, and idle and travel times and durations associated with expanded services is currently unknown.

Agency Guidance

The latest version of the Bay Area Air District's (Air District; formerly Bay Area Air Quality Management District [BAAQMD]) CEQA Air Quality Guidelines recommends projects to evaluate the impacts of construction and operational activities on nearby receptors (Air District 2022). The nearest receptors to the project site include workers adjacent to the site to the south and southeast and potential residents located at the Redwood City Marina and the Westpoint Harbor, approximately 1 mile to the southwest and 2,000 feet to the east, respectively.

Because receptors, including sensitive receptors such as residents, are present in land uses near the project site and the project would entail intensive construction activities and long-term diesel equipment operation, a site-specific HRA has been prepared for the proposed project. This HRA considers the health impact to nearby receptors (e.g., residents, workers) from construction and operational emissions generated by the project, including diesel equipment exhaust (diesel particulate matter or DPM) and particulate matter with an aerodynamic diameter equal to or less than 2.5 microns ($PM_{2.5}$).

It should be noted that the quantitative health impacts identified in this HRA are based on conservative (i.e., health protective) assumptions. The United States Environmental Protection Agency (USEPA 2005) and the Office of Environmental Health Hazard Assessment (OEHHA 2015) note that conservative assumptions used

in a risk assessment are intended to ensure that the estimated risks do not underestimate the actual risks. Therefore, the estimated risks may not necessarily represent actual risks experienced by populations at or near a site. Using conservative assumptions tends to produce upper-bound estimates of exposure and thus risk.

For analyzed receptors, it was assumed that maximum exposed residential and worker receptors stood outdoors and are subject to DPM at their identified location for the entire day. In reality, California residents typically will spend on average 2 hours per day outdoors at their residences (USEPA 2011). This would result in lower exposures to construction related DPM emissions and lower estimated risk values.

1.2 METHODOLOGY AND SIGNIFICANCE THRESHOLDS

For this HRA, the BAAD significance thresholds were deemed to be appropriate and the thresholds that were used for this project are shown below:

Project-Level

- Excess cancer risk of more than 10 in a million
- Non-cancer hazard index (chronic or acute) greater than 1.0
- Incremental increase in average annual $PM_{2.5}$ concentration of greater than 0.3 $\mu g/m^3$

Cumulative

- Excess cancer risk of more than 100 in a million
- Non-cancer hazard index (chronic or acute) greater than 10.0
- Incremental increase in average annual $PM_{2.5}$ concentration of greater than 0.8 $\mu g/m^3$

The methodology used in this HRA is consistent with the following Air District and the OEHHA guidance documents:

- Air District. 2022. *California Environmental Quality Act (CEQA) Air Quality Guidelines*. April 2023.
- Air District. 2016. *Planning Healthy Places*. May 2016.
- OEHHA. 2015. *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments*. February 2015.

Potential exposures to DPM and $PM_{2.5}$ from proposed project construction and operation were evaluated for off-site receptors near the project site and receptors surrounding the Oakland and San Francisco Terminals. Pollutant concentrations were estimated using an air dispersion model, and excess lifetime cancer risks and chronic non-cancer hazard indexes were calculated using the California Air Resources Board (CARB) Hotspots Analysis and Reporting Program (HARP). These risks were then compared to the significance thresholds used for this HRA.

1.3 CONSTRUCTION EMISSIONS

To format the emission estimates to be used in HARP, construction emissions for all landside improvements were calculated for total pounds of emissions per year to occur during Phase 1 (ferry terminal and

improvements) and Phase 2 (future visitor uses) and normalized for pounds per hour for working hours across the respective phase. The hourly estimate was identified because HARP requires that an hourly emissions estimate be entered to estimate pollutant concentration and risk, and the hourly estimates were normalized across working hours because DPM does not have associated acute toxicity factors or reference exposure limit. Construction emissions were estimated consistent with the Air Quality analysis for the proposed project, using the proposed construction schedule and the latest version of California Emissions Estimation Model, known as CalEEMod Version 2022.1. DPM emissions were based on the CalEEMod construction results, using average daily exhaust PM_{10} emissions. The $PM_{2.5}$ emissions were taken from the CalEEMod output for $PM_{2.5}$ exhaust and fugitive dust. All waterborne construction activity emissions were calculated using CARB's OFFROAD2021, version 1.0.7 and the proposed construction schedule.

The project-related construction emissions are based on information provided by the project applicant and CalEEMod defaults. Initial soil import to raise the site prior to construction was modeled from October 2025 through May 2026, construction of the ferry terminal and associated improvements were modeled from June 2026 through September 2026, and construction of the visitor-serving uses was modeled from October 2026 to October 2028. The construction equipment mix used in the emission calculations for the ferry terminal reflects information provided by the project applicant and supplemented with CalEEMod defaults for missing values, such as equipment load factor. CalEEMod default equipment mix values were used for all landside improvements as that information is currently unknown. It should be noted that the modeled construction duration is shorter than the 15-month estimate identified in the project description above because this analysis assumes that construction of the ferry terminal, relocation and reconstruction of the maintenance building, roadway improvements to Seaport Boulevard, and the relocation and abandonment of the railroad along Frontage Road would occur simultaneously for a conservative assessment of potential air quality and health risk impacts. The CalEEMod construction emissions output, off-model construction emissions calculations, and emission rate calculations are provided in Attachment A.

1.4 OPERATIONAL EMISSIONS

Operational emissions for all landside improvements were calculated consistent with construction emissions; total pounds of emissions per year and normalized for an hourly rate, both to be entered into HARP. Operational emissions for landside improvements were calculated assuming a 0.2 mile mobile source travel distance on-site, using the latest version of CalEEMod, Version 2022.1. DPM emissions were based on the CalEEMod results, using exhaust PM_{10} emissions. The $PM_{2.5}$ emissions were taken from the CalEEMod output for $PM_{2.5}$ exhaust and fugitive dust. All waterborne activity (e.g., ferry) emissions were calculated using CARB's OFFROAD2021, version 1.0.7 and the proposed ferry operations schedule described in the project description above. The CalEEMod operational emissions output, off-model operational emissions calculations, and emission rate calculations are provided in Attachment A.

1.5 DISPERSION MODELING

Pollutant concentration modeling was performed using the AERMOD atmospheric dispersion model to assess the impact of emitted compounds on sensitive receptors near the project. The model is a steady state Gaussian plume model and is an approved model by the Air District for estimating pollutant concentrations at specific locations from point and fugitive sources in simple and complex terrain. The on-site construction and operational emissions for the project were modeled as area sources. The off-site mobile sources were modeled

as line sources. The model requires additional input parameters, including chemical emission data and local meteorology. Meteorological data obtained from the Air District for the nearest representative meteorological station's (San Carlos Airport) the latest available years with complete data (2013-2015, 2017) were used to represent local weather conditions and prevailing wind patterns.

Release Heights

The modeling analysis also considered the spatial distribution and elevation of each emitting source in relation to the analyzed receptors. To accommodate the model's Cartesian grid format, direction-dependent calculations were obtained by identifying the Universal Transverse Mercator (UTM) coordinates for each source location. In addition, digital elevation model (DEM) data for the area were obtained and included in the model runs to account for complex terrain. An emission release height of 4.15 m was used as representative of the stack exhaust height for off-road landside construction equipment and diesel truck traffic, and an initial vertical dispersion parameter of 1.93 m was used, per CARB guidance (CARB 2000). For landside fugitive dust sources, an emission release height of 0 m was used to represent dust generated by ground disturbing activities and roadway dust re-entrainment. For waterborne equipment exhaust, an emission release of 1 m was assumed and used to represent typical waterborne vessel and equipment exhaust locations.

Variable Emissions Factor

To determine contaminant impacts during construction hours, the model's Hour-Day scalar option was invoked to predict flagpole-level concentrations (1.5 m) for construction emissions generated Monday through Friday. Landside construction would occur between the hours of 7:00 AM and 4:00 PM with a 1-hour lunch break, and waterside construction would occur between the hours of 6:00 AM and 5:00 PM with a 1-hour lunch break. Operation of the landside improvements, particularly that of the hotel use, was assumed to occur 24 hours a day, 7 days a week. Ferry operations were modeled to occur during the AM and PM peak hour periods described above (6:00 to 10:30 AM and 4:00 to 9:30 PM), Monday through Sunday.

Unit Emission Rates

A unit emission rate of 1 gram per second (g/s) was used for all modeled sources for construction except for the Seaport Boulevard improvements and relocation of the railroad line. Because the Seaport Boulevard improvements and relocation of the railroad line emissions were quantified in total, the unit emission rate of 1 g/s was divided between the modeled sources for the Seaport Boulevard improvements and relocation of the railroad line proportional to their areas of disturbance. A unit emission rate of 1 g/s was used for all modeled sources for operation except for the ferry routes. Because ferry route emissions were quantified in total, the unit emission rate of 1 g/s was divided between the modeled sources for the two ferry routes proportional to their distance of travel.

Maximum Impacted Receptors

Receptors surrounding the project site include workers adjacent to the site to the south and southeast and potential residents located at the Redwood City Marina and Westpoint Harbor, approximately 1 mile to the southwest and 2,000 feet to the east, respectively. Worker receptors are also present surrounding the San Francisco and Oakland terminals. These receptors were included in AERMOD as discrete cartesian receptors and labeled consistently across all project scenarios: phase 1 construction (ferry terminal and improvements),

phase 2 construction (visitor serving uses), phase 1 operation, and full operation. The HARP calculations showed that the maximum impacted receptor (MIR) included: Risk MIR-Resident R_004, Risk MIR-Worker W_376, and Maximum $PM_{2.5}$ Concentration MIR W_376. Receptor R_004 is located on the eastern edge of Westpoint Harbor, and Receptor W_376 is located adjacent to the project site to the southwest.

The air dispersion model output for DPM and $PM_{2.5}$ concentrations from the AERMOD 1 g/s modeling are provided in Attachment B and the HARP results are provided in Attachment C.

1.6 RISK CHARACTERIZATION

1.6.1 Carcinogenic Chemical Risk

A threshold of ten in one million ($10x10^{-6}$) has been established by OEHHA and recommended by the Air District and other air districts as a level posing no significant risk for exposures to carcinogens. Health risks associated with exposure to carcinogenic compounds can be defined in terms of the probability of developing cancer as a result of exposure to a chemical at a given concentration. The cancer risk probability is determined by multiplying the chemical's annual concentration by its cancer potency factor (CPF), a measure of the carcinogenic potential of a chemical when a dose is received through the inhalation pathway. It is an upper-limit estimate of the probability of contracting cancer as a result of exposure to an ambient concentration of one microgram per cubic meter ($\mu g/m^3$) over a lifetime of 70 years. The averaging time recommended by the Air District for duration of total exposure of 30 years for residents and 25 years for workers was used in this analysis.

HARP has several available risk scenario selections for various receptor types for use in health risk and concentration calculations. The selections used for each receptor type affected by the proposed project are shown in Table 1, *HARP Input Selections.*

TABLE 1. HARP INPUT SELECTIONS

Input Parameter	Residential Receptors	Worker Receptors

TABLE 1. HARP INPUT SELECTIONS

Analysis Type	Cancer Risk	Cancer Risk
Receptor Type	Individual Resident	Worker
Exposure Duration – Phase 1 Construction	0.9 Years	0.9 Years

Pathways to Evaluate	Inhalation Only	Inhalation Only
Fraction of Time at Home	Yes	No
8-Hour Breathing Rates	No	Moderate Intensity

1.6.2 Non-Carcinogenic Hazards

An evaluation was also conducted of the potential non-cancer effects of chronic chemical exposures. Adverse health effects are evaluated by comparing the annual receptor level (flagpole) concentration of each chemical compound with the appropriate reference exposure limit (REL). Available RELs promulgated by OEHHA were considered in the assessment.

The hazard index approach was used to quantify non-carcinogenic impacts. The hazard index assumes that chronic sub-threshold exposures adversely affect a specific organ or organ system (toxicological endpoint). Target organs presented in regulatory guidance were used for each discrete chemical exposure. To calculate the hazard index, each chemical concentration or dose is divided by the appropriate toxicity value. This ratio is summed for compounds affecting the same toxicological endpoint. A health hazard is presumed to exist where the total equals or exceeds one. Because $PM_{2.5}$ dust could carry other chemicals that are inhaled by receptors, the maximum annual average $PM_{2.5}$ concentration was conservatively used for the hazard index calculations, accounting for both fugitive dust and exhaust emissions.

The chronic hazard analysis for DPM is provided in Attachment C along with the cancer risk calculation results from HARP. The calculations contain the relevant exposure concentrations and corresponding reference dose values used in the evaluation of non-carcinogenic exposures.

1.7 CONSTRUCTION HRA RESULTS

The calculated results are provided in Attachment C and are summarized in Table 2.

TABLE 2. PROJECT RISK SUMMARY - UNMITIGATED

Receptor	Cancer Risk (per million)	Chronic Hazards	$PM_{2.5}$ ($\mu g/m^3$)
Phase 1 Construction (0.9 Year)			
MIR – Resident	3	0.1	0.05
MIR – Worker	1	0.7	**0.37**
Phase 1 Operation (2 Years)			
MIR – Resident	<1	<0.1	<0.01
MIR – Worker	<1	<0.1	<0.01
Phase 2 Construction (2 Years)			
MIR – Resident	<1	<0.1	0.01
MIR – Worker	<1	0.1	0.05
Full Operation			
MIR – Resident (27 Years)	1	<0.1	0.01
MIR – Worker (22 Years)	1	0.2	0.10
Total Risk			
MIR – Resident	4	0.1	0.05
MIR – Worker	2	<0.1	**0.37**
BAAQMD Threshold	*10*	*1.0*	*0.30*
Exceeds Threshold?	**No**	**No**	**Yes**

Note: MIR = Maximum Impacted Receptor. Totals may not add up due to rounding. Calculations utilize averaging times of 30 years for residents and 25 years for workers. Incorporates Mitigation Measure AQ-1, which requires implementation of Air District-recommend dust control BMPs during construction.
Source: Attachment C

As shown in Table 2, cancer risk for the residential and worker MIRs during project construction and operation was calculated to be approximately four in one million and two in one million, respectively, which would not exceed the 10 in one million significance threshold. However, the annual average $PM_{2.5}$ concentration at the worker MIR would reach 0.37 $\mu g/m^3$ during construction of the ferry terminal, which would exceed the BAAQMD's significance threshold of 0.3 $\mu g/m^3$. Hazard index was calculated to be less than one for all receptors and project scenarios.

Because the annual average $PM_{2.5}$ concentration for the worker MIR would exceed the Air District significance threshold during construction of the ferry terminal, the following measure is proposed:

Mitigation Measure AQ-1: The project construction contractor(s) and subcontractor(s) must comply with the following requirements for all land-based off-road equipment used over the entire duration of the ferry terminal construction activities occurring at the ferry terminal project site:

- Use engines that meet either USEPA or CARB Tier 4 Final emission standards for engines that are greater than 50 horsepower. Ensure that all construction plans submitted to the City of Redwood City

Planning Division clearly show the selected emission reduction strategy for construction equipment over 50 horsepower.

- If Tier 4 Final equipment is not available for use for the project for a specific piece of off-road construction equipment, documentation shall be provided to the Port demonstrating that such equipment is not available for the project. If Tier 4 Final equipment is not available, the construction contractor(s) and subcontractor(s) affected shall use Tier 4 Interim equipment instead. If Tier 4 Interim equipment is not available for use for the project for a specific piece of off-road construction equipment, documentation shall be provided to the Port demonstrating that such equipment is not available for the project. If Tier 4 Interim equipment is not available, the construction contractor(s) and subcontractor(s) affected shall use Tier 3 equipment outfitted with a level 3 diesel particulate filter instead.

- Maintain a list of all operating equipment in use on the project site for verification by the Port or their designee. The construction equipment list shall state the makes, models, fuel type, and number of construction equipment on-site. All equipment shall be properly serviced and maintained in accordance with the manufacturer's recommendations.

- All non-essential idling of construction equipment is restricted to 5 minutes or less in compliance with CARB Rule 2449. The Port must communicate with all sub-contractors in contracts and construction documents that they are responsible for ensuring that this requirement is met.

- The Port of Redwood City shall ensure construction bids specify these requirements.

Mitigation Measure AQ-1 would reduce the proposed project's localized construction emission concentrations at the worker MIR location, as shown in Table 3. The results indicate that, with mitigation, annual average $PM_{2.5}$ concentration would be less than the Air District's significance threshold at the worker MIR, and all other receptors would be less than the Air District's significance thresholds during unmitigated project construction. Therefore, the proposed project would not expose nearby receptors to substantial concentrations of air pollutant emissions during construction, and this impact would be *less than significant* with mitigation.

TABLE 3. CONSTRUCTION RISK SUMMARY - MITIGATED

Receptor	Cancer Risk (per million)	Chronic Hazards	$PM_{2.5}$ ($\mu g/m^3$)

TABLE 3. CONSTRUCTION RISK SUMMARY - MITIGATED

Total Risk			
MIR – Worker	2	0.1	0.29
BAAQMD Threshold	*10*	*1.0*	*0.30*
Exceeds Threshold?	**No**	**No**	**No**

Note: Risks incorporate Mitigation Measure AQ-1, which requires the use of construction equipment which meets USEPA Tier 4 Final engine requirements for equipment over 50 horsepower and prohibits fossil fuel powered pumps for dewatering activities. Modeling conservatively assumes use of Tier 4 Interim equipment. Mitigation Measure AQ-1 was only applied to Phase 1 Construction. Total estimates reflect total risk across all phases after implementation of MM AQ-1 during Phase 1 Construction.

1.8 CUMULATIVE COMMUNITY HEALTH RISK

In addition to a project-level HRA, the Air District recommends assessing the potential cumulative impacts from sources of TACs within 1,000 feet of the MIR. For the cumulative analysis, the Air District maintains several tools and databases for identifying risks at a particular location. The existing TACs that the Air District recommends a cumulative analysis include permitted stationary sources, marine sources, roadway sources, rail sources, and highway sources. Risks from permitted stationary sources within 1,000 feet of the MIR can be identified using the Air District's *Stationary Source Screening Map* (Air District 2024). Risks from roadway sources are released periodically from the Air District in the form of risk assessment screening tools (RAST), which were utilized in determining associated risks at the residential MIR during mitigated project construction. The residential MIR was utilized in the cumulative community risk assessment as it represents the greatest health risk impact to nearby receptors during project construction and operation. No marine or rail risks are shown in the cumulative HRA as no ocean-going vessels or rail activities occur within 1,000 feet of the residential MIR. Harbor craft use within 1,000 feet of the residential MIR would be limited to smaller vessels entering and exiting Westpoint Harbor. Because no information is available on these harbor craft, they are assumed to be a *de minimis* contributor to cumulative health risk.

Table 4 summarizes the existing TAC source risks at the residential MIR from unmitigated project construction and operational emissions in combination with existing TAC sources within 1,000 feet of the receptor. As shown therein, the proposed project's mitigated emissions combined with existing TAC emissions within 1,000 feet do not exceed the Air District's cumulative community health risk significance thresholds at the residential MIR location, and this impact would be *less than significant*.

TABLE 4. CUMULATIVE COMMUNITY RISK SUMMARY

Source	Source Type	Distance to MIR	Cancer Risk (per million)	Chronic Hazards	$PM_{2.5}$ ($\mu g/m^3$)

						Total Construction Duration:	**3.45**

Assumptions: Exposure Duration (ED) is derived by dividing project workdays by total annual workdays (261), assuming 5 workdays a week, except where noted. Total duration shown to the right does not reflect absolute duration of construction. Instead, it adds up each activity's duration, even those that overlap in the same year, to be compared against that of the individual exposure durations below as an accuracy check.

Unmitigated Project Emission Rates

Assumptions: DPM Emissions utilize PM10 Exhaust. While travel distances may vary between off-site vehicle trips for landside activities (e.g., worker trips, vendor trips, hauling trips), hauling trips with a model default distance of 20 miles constitute the majority of off-site emissions. Therefore, the adjusted off-site emissions account for a weighted distance within 1,000 feet of the project site assuming a constant 20-mile travel distance across all modes. See Offsite Distance Adjustment table below.

Note 1: Off-site emissions associated with waterborne construction vessels traveling to and from the project site upon initial commencements and after construction completion, and one-time float and gangway deliveries towed by tug boats, are conservatively included in on-site emission totals in their entirety.

Note 2: All off-site dredging hauling emissions (crew and tug transport) that are part of "2026_pt 2" are conservatively assigned to an emission source representing travel between the Central Bay Operations and Maintenance Facility and the RWC Port in the dispersion modeling.

Note 3: Offsite landside operational emissions match the onsite mobile source emissions as they reflect a 0.2 mile travel distance, or approximately 1,000 feet.

Offsite Distance Adjustment - Construction

Assumptions: DPM Emissions utilize PM10 Exhaust. While travel distances may vary between off-site vehicle trips for landside activities (e.g., worker trips, vendor trips, hauling trips), hauling trips with a model default distance of 20 miles constitute the majority of off-site emissions. Therefore, the adjusted off-site emissions account for a weighted distance within 1,000 feet of the project site assuming a constant 20-mile travel distance across all modes.

Note 1: Off-site emissions associated with waterborne construction vessels traveling to and from the project site upon initial commencements and after construction completion, and one-time float and gangway deliveries towed by tug boats, are conservatively included in on-site emission totals in their entirety.

Note 2: All off-site dredging hauling emissions (crew and tug transport) that are part of "2026_pt 2" are conservatively assigned to an emission source representing travel between the Central Bay Operations and Maintenance Facility and the RWC Port in the dispersion modeling.

Note 3: Offsite landside operational emissions match the onsite mobile source emissions as they reflect a 0.2 mile travel distance, or approximately 1,000 feet.

						Total Construction Duration:	**3.45**

Assumptions: Exposure Duration (ED) is derived by dividing project workdays by total annual workdays (261), assuming 5 workdays a week, except where noted. Total duration shown to the right does not reflect absolute duration of construction. Instead, it adds up each activity's duration, even those that overlap in the same year, to be compared against that of the individual exposure durations below as an accuracy check.

Mitigated Project Emission Rates

Assumptions: DPM Emissions utilize PM10 Exhaust. While travel distances may vary between off-site vehicle trips for landside activities (e.g., worker trips, vendor trips, hauling trips), hauling trips with a model default distance of 20 miles constitute the majority of off-site emissions. Therefore, the adjusted off-site emissions account for a weighted distance within 1,000 feet of the project site assuming a constant 20-mile travel distance across all modes. See Offsite Distance Adjustment table below.

Note 1: Off-site emissions associated with waterborne construction vessels traveling to and from the project site upon initial commencements and after construction completion, and one-time float and gangway deliveries towed by tug boats, are conservatively included in on-site emission totals in their entirety.

Note 2: All off-site dredging hauling emissions (crew and tug transport) that are part of "2026_pt 2" are conservatively assigned to an emission source representing travel between the Central Bay Operations and Maintenance Facility and the RWC Port in the dispersion modeling.

Note 3: Offsite landside operational emissions match the onsite mobile source emissions as they reflect a 0.2 mile travel distance, or approximately 1,000 feet.

Note 4: Includes MM AQ-1.

Offsite Distance Adjustment - Construction		
Default Model Distance (miles)	Distance within 1,000 feet of Project	Adjustment Factor
20.00	0.20	0.01

HARP Scenario: Full Operation	Age 18	22 Years

Assumptions: DPM Emissions utilize PM10 Exhaust. While travel distances may vary between off-site vehicle trips for landside activities (e.g., worker trips, vendor trips, hauling trips), hauling trips with a model default distance of 20 miles constitute the majority of off-site emissions. Therefore, the adjusted off-site emissions account for a weighted distance within 1,000 feet of the project site assuming a constant 20-mile travel distance across all modes.

Note 1: Off-site emissions associated with waterborne construction vessels traveling to and from the project site upon initial commencements and after construction completion, and one-time float and gangway deliveries towed by tug boats, are conservatively included in on-site emission totals in their entirety.

Note 2: All off-site dredging hauling emissions (crew and tug transport) that are part of "2026_pt 2" are conservatively assigned to an emission source representing travel between the Central Bay Operations and Maintenance Facility and the RWC Port in the dispersion modeling.

Note 3: Offsite landside operational emissions match the onsite mobile source emissions as they reflect a 0.2 mile travel distance, or approximately 1,000 feet.

Note 4: Includes MM AQ-1.

HEALTH RISK ASSESSMENT DISPERSION MODELING RESULTS

Control Pathway

Dispersion Options

Titles

RWC Ferry Terminal Project
Phase 1 Construction Health Risk Assessment

Dispersion Options

☐ Regulatory Default ☒ Non-Default Options

☒ Flat & Elevated Terrain
☐ No Stack-Tip Downwash (NOSTD)
☐ Run in Screening Mode
☐ Conversion of NOx to NO2 (OLM or PVMRM)
☐ No Checks for Non-Sequential Met Data
☒ Fast All Sources (FASTALL)
☐ Fast Area Sources (FASTAREA)
☐ Optimized Area Source Plume Depletion
☐ Gas Deposition

BETA Options:

☐ Capped and Horizontal Stack Releases
☐ Adjusted Friction Velocity (u*) in AERMET (ADJ_U*)
☐ Low Wind Options

☐ SCIM (Sampled Chronological Input Model)
☐ Ignore Urban Night / Daytime Transition (NOURBTRAN)

Dispersion Coefficient

Urban
Population:
Name (Optional):
Roughness Length:

Output Type

☒ Concentration
☐ Total Deposition (Dry & Wet)
☐ Dry Deposition
☐ Wet Deposition

Plume Depletion

☐ Dry Removal
☐ Wet Removal

Output Warnings

☐ No Output Warnings
☐ Non-fatal Warnings for Non-sequential Met Data

Pollutant / Averaging Time / Terrain Options

Pollutant Type

PM2.5

Averaging Time Options

Hours ☒ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 6 ☐ 8 ☐ 12 ☐ 24

☐ Month ☐ Period ☒ Annual

Exponential Decay

☐ Yes ☒ No

Terrain Height Options

☐ Flat ☒ Elevated
SO: Meters
RE: Meters
TG: Meters

Flagpole Receptors

☒ Yes ☐ No

Default Height = 1.50 m

Wind Speed

☐ Wind Speeds are Vector Mean (Not Scalar Means)

Wind Direction

Rotation Adjustment [deg]:

Potential Temperature Profile

Base Elevation above MSL (for Primary Met Tower): 2.00 [m]

Meteorological Station Data

Stations	Station No.	Year	X Coordinate [m]	Y Coordinate [m]	Station Name
Surface		2013			San Carlos Met Station
Upper Air		2013			San Carlos Met Station

Data Period

Data Period to Process

Start Date: 1/1/2013 Start Hour: 1 End Date: 1/1/2018 End Hour: 24

Wind Speed Categories

Stability Category	Wind Speed [m/s]	Stability Category	Wind Speed [m/s]
A	1.54	D	8.23
B	3.09	E	10.8
C	5.14	F	No Upper Bound

Sensitive Receptor Summary

RWC Ferry Terminal Project
Phase 1 Construction Health Risk Assessment

PM2.5 - Concentration - Source Group: DREDGE
