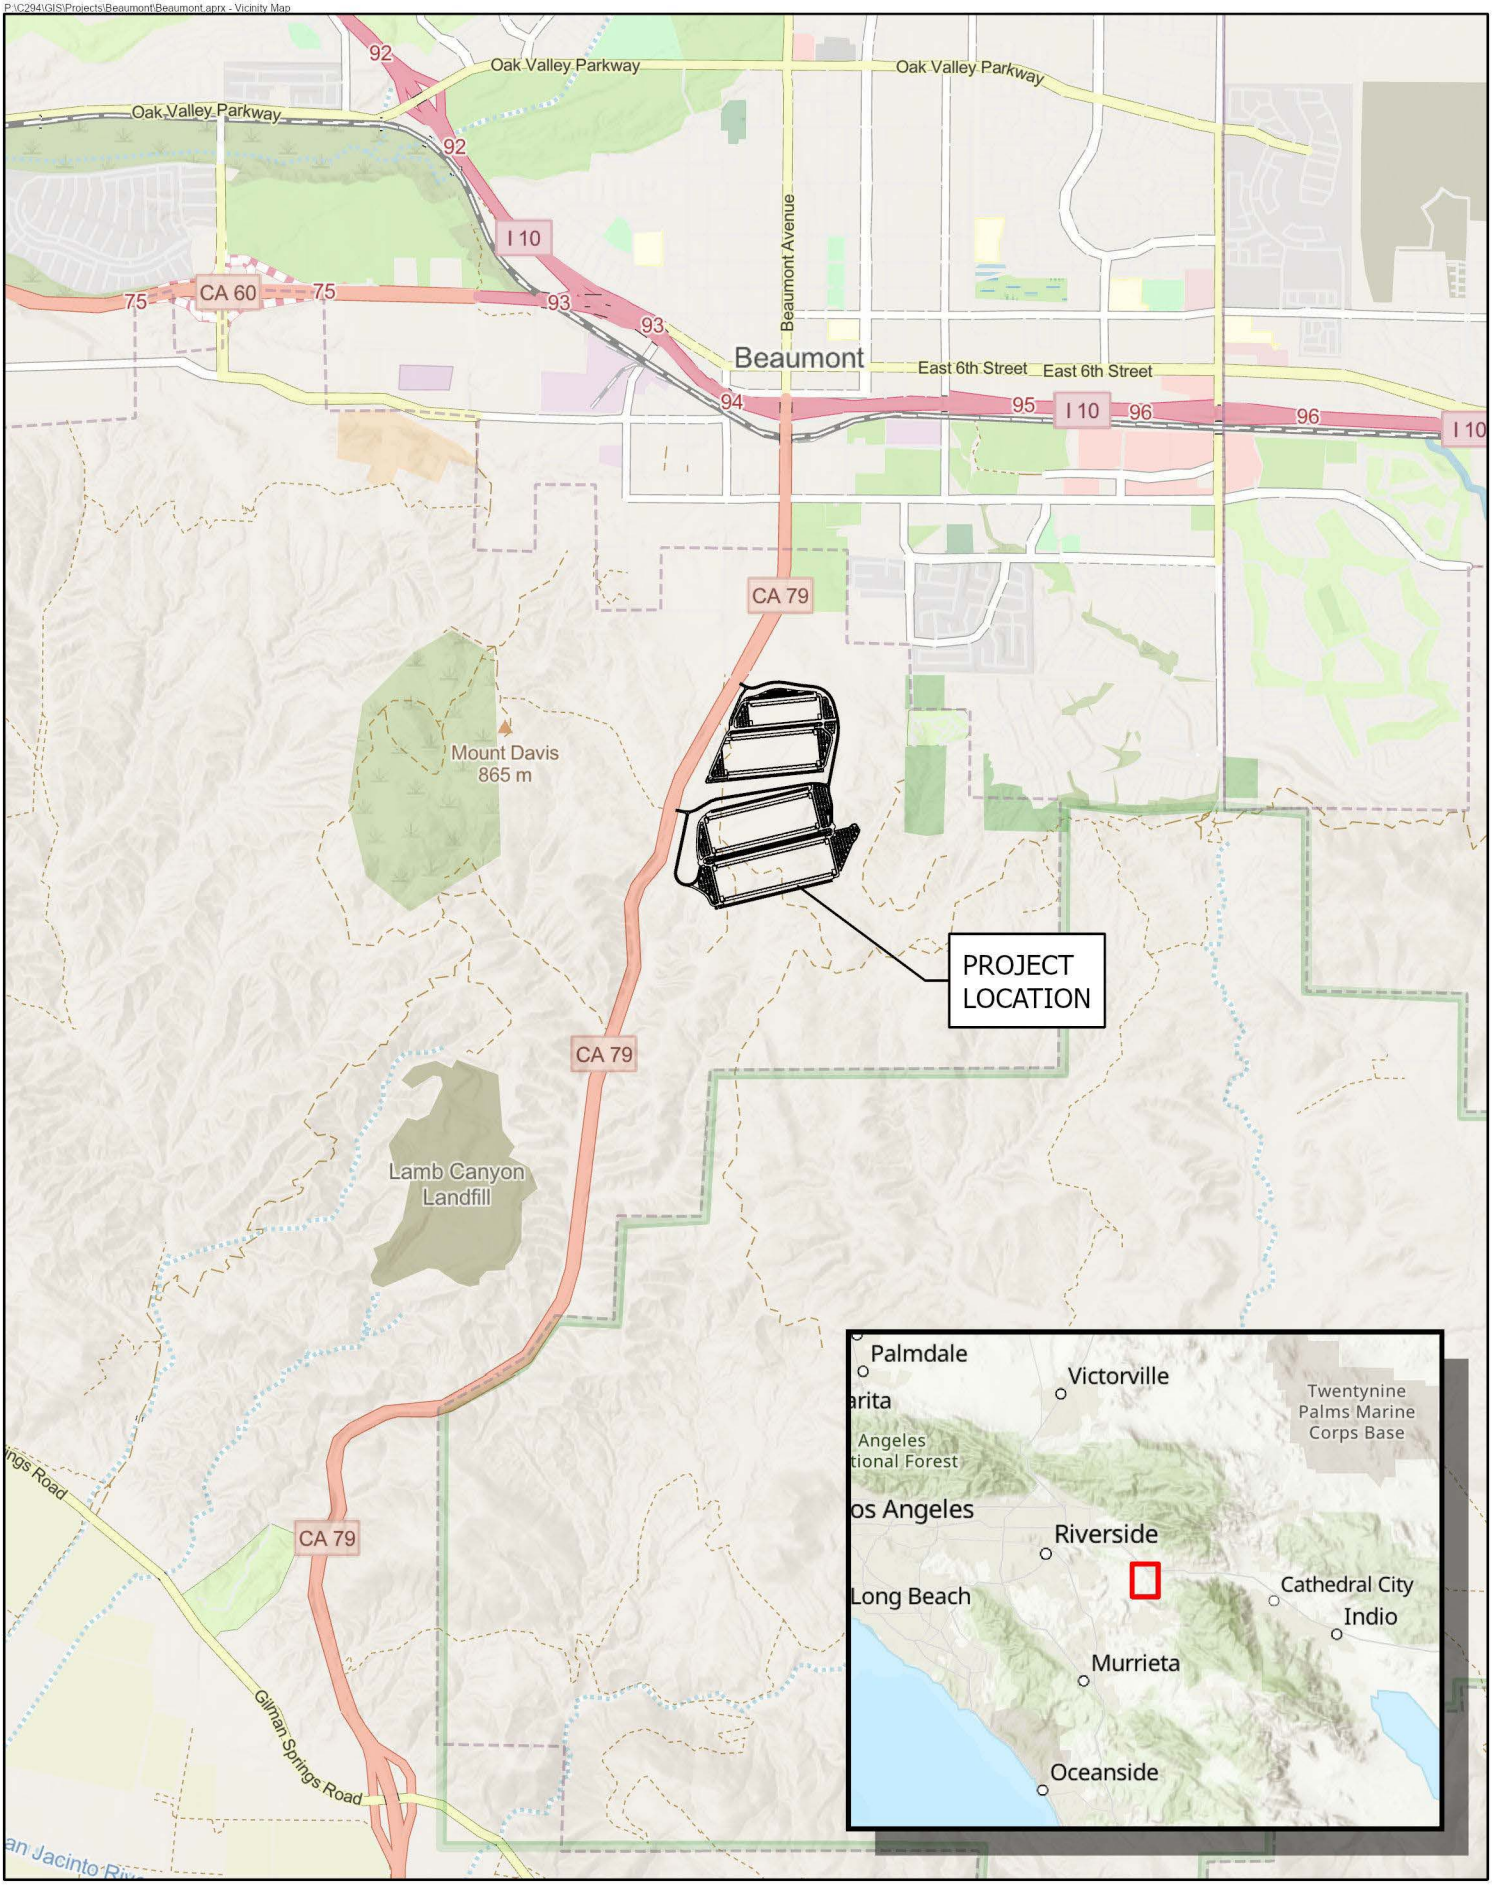
Executive Summary

Beaumont Heights TTM, henceforth referred to as “The Project”, is a proposed industrial development located east of State Route 79 in unincorporated Riverside County. It will include 4 new industrial buildings, parking lots, and drive isles. The Project is also intersected by Lamb’s Canyon, a blue line stream, along the west border. To compensate for the new impervious areas implemented in this project, flood control basins and structural Best Management Practices (BMPs) will be installed. This report provides information intended to describe the sizing and function of the basins and prove that the development does not cause increases to peak flow from the existing condition.



1 Project Description

1.1 Project Description

Beaumont Heights is a 384-acre industrial/commercial development located in unincorporated Riverside County just outside of the City of Beaumont border. The project area is bordered by State Route 79 on its western end, Laird Road on its north. The project as proposed will create 245 acres of impervious surfaces, mainly comprised of asphalt concrete streets, parking lots, and impervious rooftops.

The purpose of this report is to provide engineering calculations in support of the Beaumont Heights development, which will:

1. Analyze the onsite and regional existing and proposed condition hydrology.
2. Provide basin routing analysis for flow mitigation.
3. Ensure the cumulative project flow rate does not affect the existing blue line stream, Lamb's Canyon.

2 Local Hydrologic Characteristics

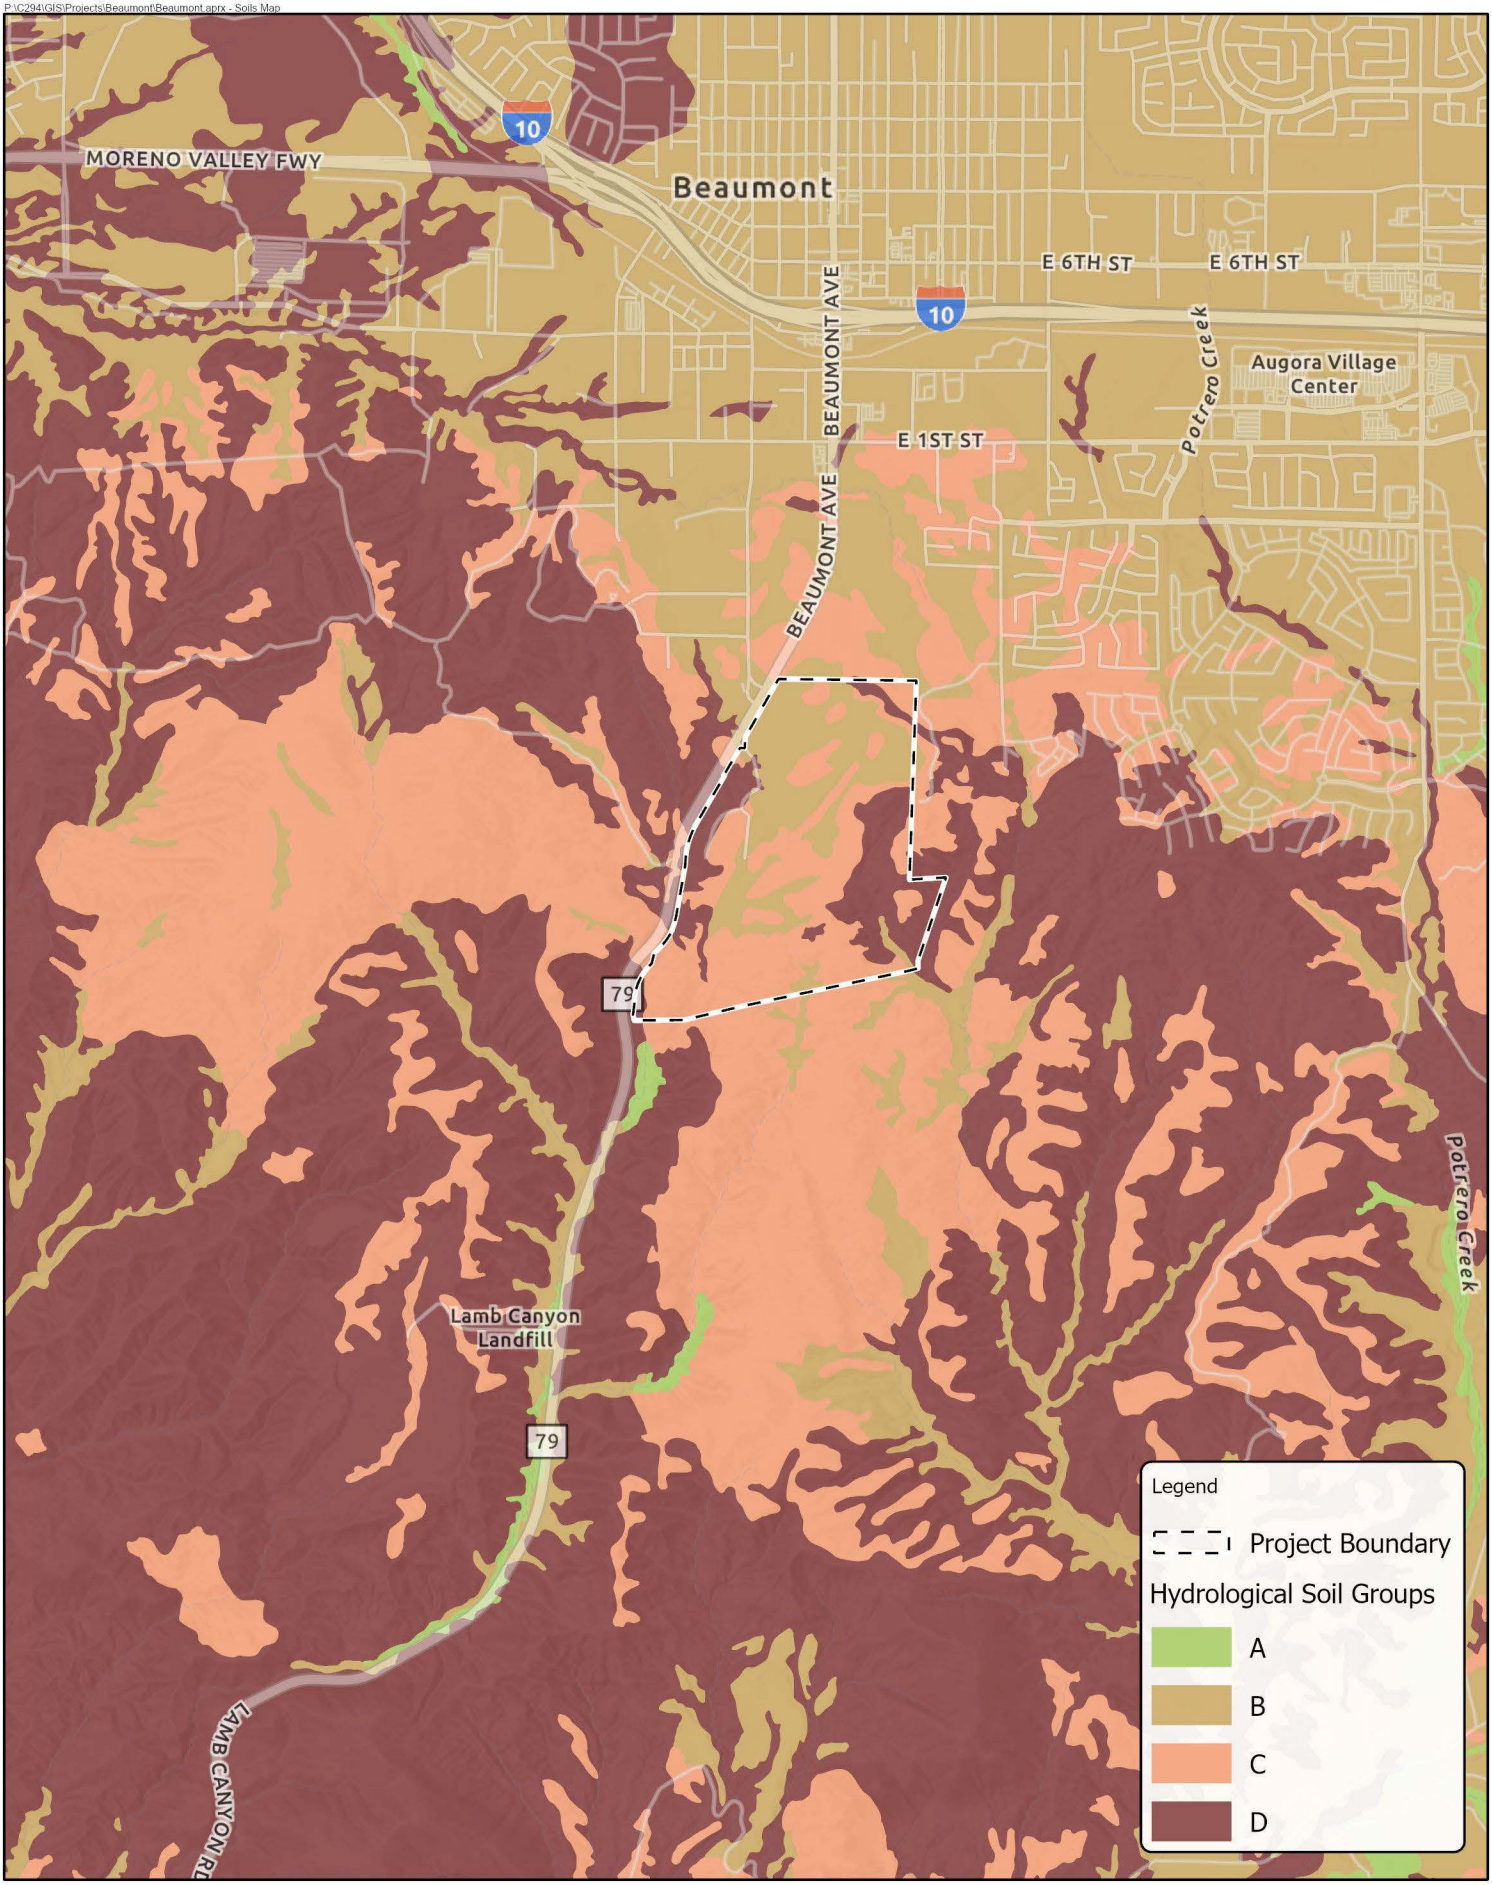
2.1 Existing Hydrologic Characteristics

The western portion of the site contains hills that descend towards the adjacent State Route 79 (Beaumont Ave) and towards the center of the site. The eastern portion has sharper slopes that would direct flow east and eventually offsite. The terrain contains tall dry grasses and chapparal that cover the entirety of the site. Flows on the east side of Beaumont Ave travel alongside the road, no culverts were identified during the preliminary assessment.

The existing hydrology is broken down to 2 major drainage areas. Area 2A includes drainage through the center of the site, from the north east to the south west corners, and eventually drains to Lamb's Canyon. Area 2C includes drainage from the projects northeast to the southeast side boundary, with storm water draining towards the southernly border of the site in the formation of sheet flow, see Figure 2-3.

The project area is designated as Zone X, an area of minimal flood hazard by FEMA, refer to Appendix C for a copy of the FIRMette.

2.2 Proposed Hydrologic Characteristics



The proposed development will flatten the site for the proposed buildings but generally follows the existing condition drainage pattern carrying runoff to the west side of the project. Four industrial buildings are proposed which include parking lots and truck bays, see Figure 2-4.

Onsite drainage areas2A and 2C are conveyed through the storm drain system and into the proposed detention basins, water quality flows are diverted from the basin outlet pipe into a biofiltration basin for stormwater treatment. Hydromodification management is also provided through these basins. Mitigated and treated flows area discharged to existing channels near the project boundaries, see Figure 2-5.

3 Regional Hydrologic Characteristics

A blue line stream crosses the project boundary but improvements will not have any grading or flow impacts. A regional analysis was conducted to ensure the project does not cause an increase in peak flow to the stream.

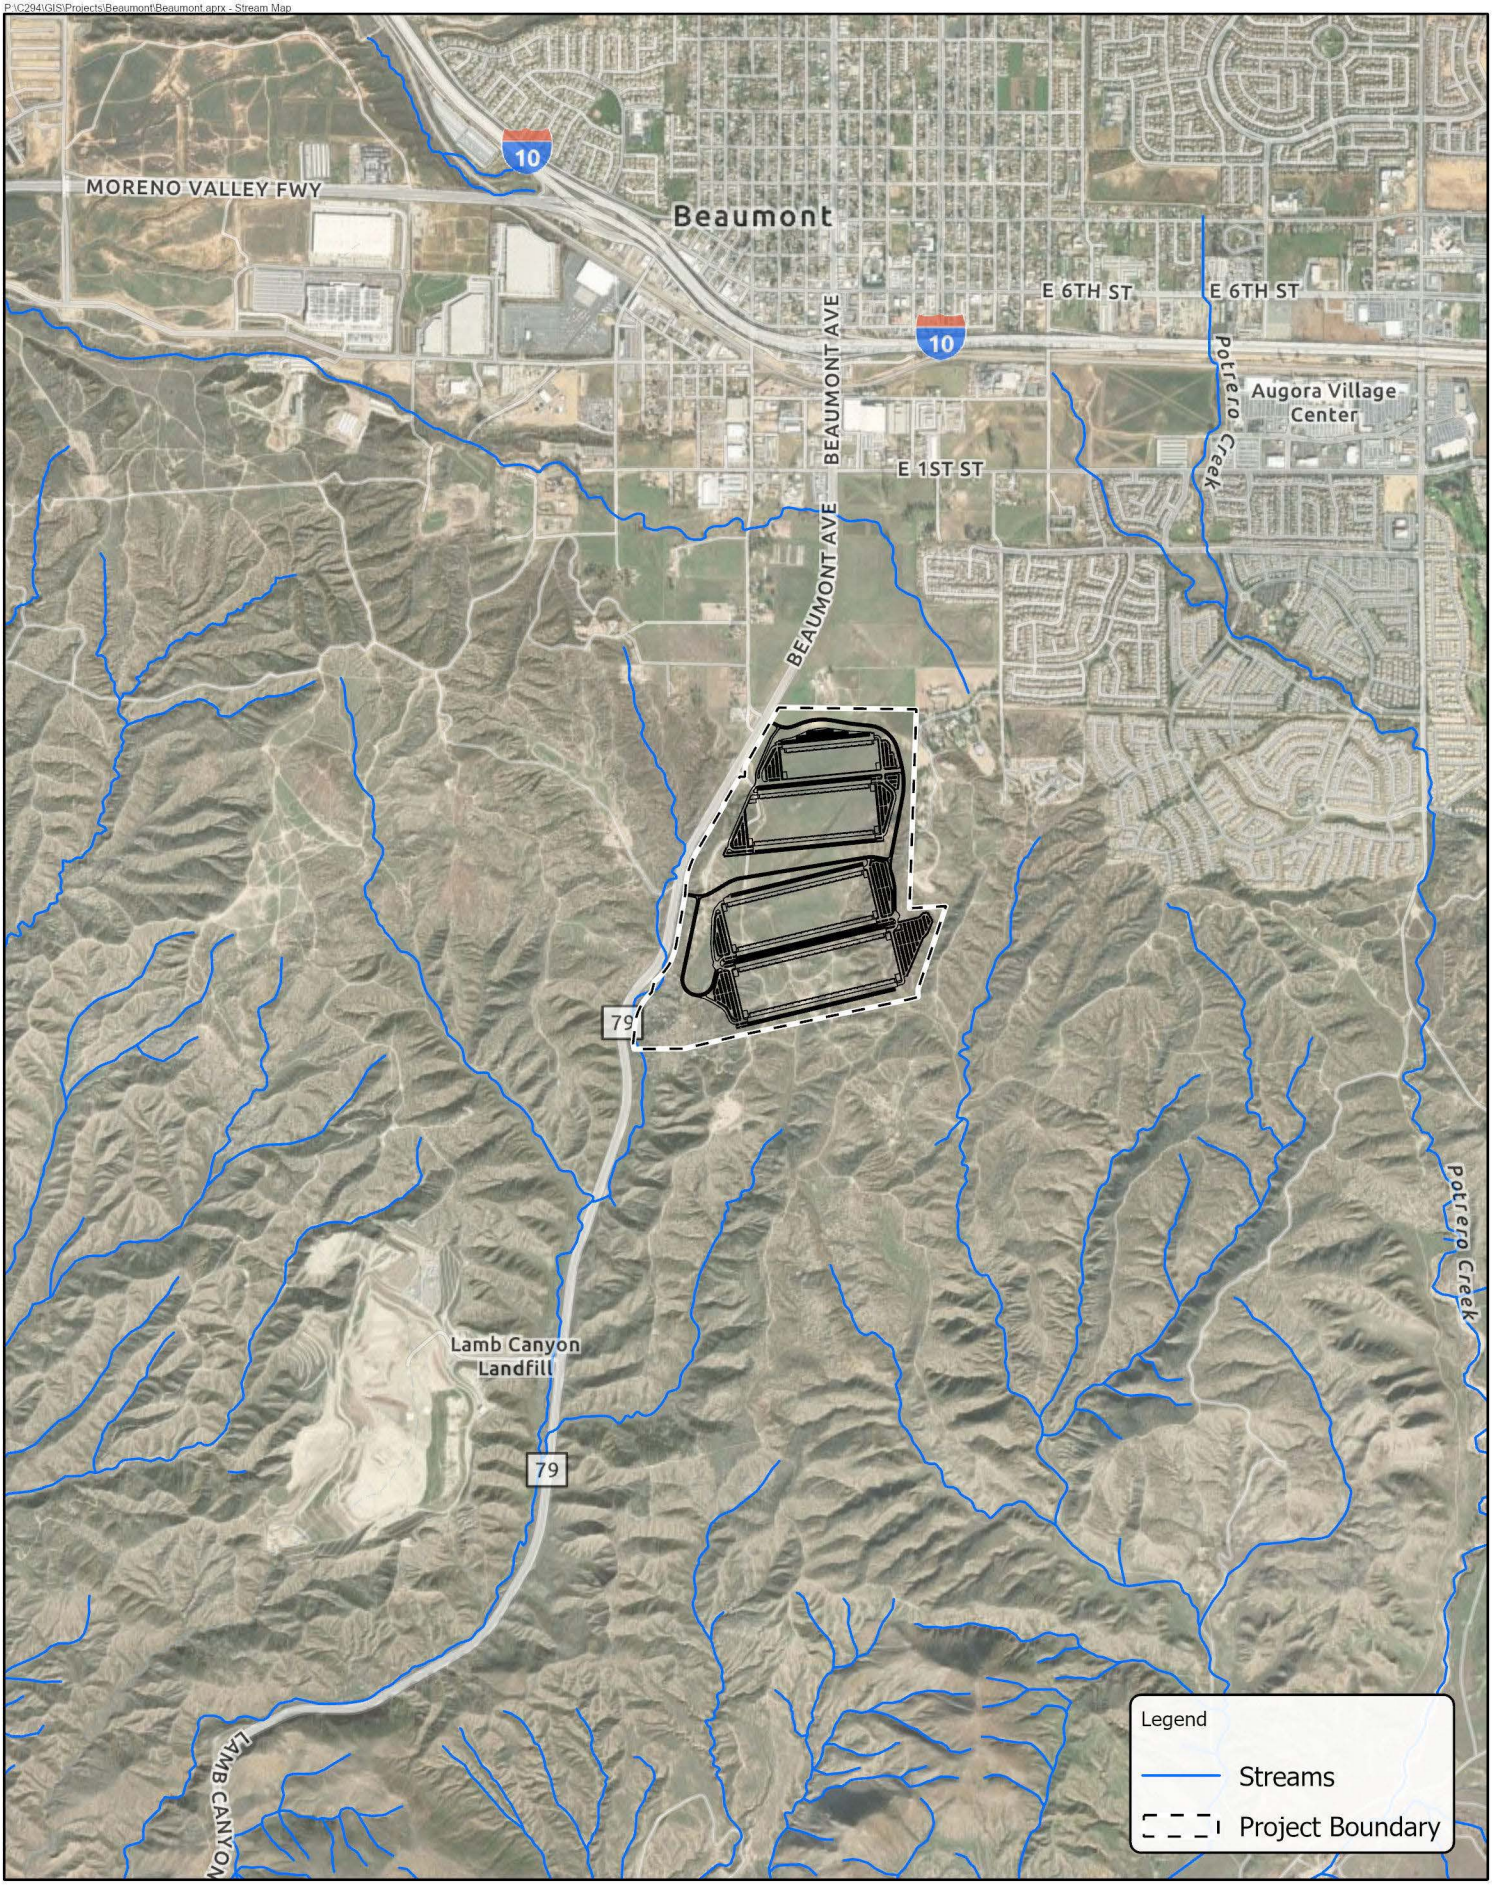
3.1 Existing Hydrologic Characteristics

The watershed was delineated to a point downstream of the blue line stream project boundary crossing to assess the flow impacts to the main channel. The regional watershed consists of 917 acres of predominately natural land use. Several rural houses are scattered along the northern boundary of the watershed. The watershed is mixed foothills and valley terrain.

Although there is only 1 blue line stream crossing, two watersheds were delineated to capture a second tributary impacted by the proposed improvements, see Figure 3-2.

3.2 Proposed Hydrologic Characteristics

The proposed regional watershed creates a watershed of 965 acres and includes the proposed industrial building, parking lots, and truck bays. The watershed boundaries vary from the existing because the site brings slightly more area towards watershed A.



See Figure 3-3 for the proposed watershed delineations which split the existing two watersheds into 4 to account for the proposed site.

4 Methodology

4.1 Hydrology

Hydrologic calculations for the project were performed using CIVILCADD/ CIVILDESIGN Engineering Software, Version 7. The 'Unit Hydrograph Analysis' was performed to allow for basin routing for the local analysis and because the watershed is larger than a square mile for the regional analysis. Parameters for the hydrograph calculations following guidance from the Riverside County Flood Control and Water Conservation Manual. The point Precipitations used for the analysis are from NOAA Atlas 14 which is found in Appendix A. For the existing conditions a Manning's value of 0.04 was used because the drainage area is composed of steep upper canyons and moderate slopes in the lower canons. For proposed 0.015 was used because a large percentage of area is impervious.

For the regional proposed models, a link node model was created to confluence the hydrographs at the point of confluence for the natural and developed subwatersheds.

4.1.1 Detention Basins

One detention basin is proposed for watershed 2A to mitigate flows from the site to meet the existing flowrate of Lamb's Canyon and follow the Riverside County basin guidelines. Detention will be underground and provide 30 ac-ft of storage. Approximately 13 ac-ft will be for Water quality volume capture and will be metered to the proposed biofiltration basin. The remaining volume will be for peak flow attenuation.

Basin routing was performed in XP Storm Water Management Model (XPSWMM) using the hydrographs from CIVILDESIGN. Due to the diversion for the water quality and peak flow bypasses, a hydraulic model was necessary to more accurately determine if the peak flows for the various storms and durations were met. The routing analysis was utilized to demonstrate that post development condition is designed to release runoff at the rate similar to the pre-development condition for the different storm events and the bio-retention basins/ detention system is adequately sized for its storage capacity.

5 Results

Preliminary Basin routing sizing demonstrates that adequate storage is allotted to meet the drainage needs of the proposed site. For 2C the tributary area was reduced to where the peak flow was less than the existing condition so storage is proposed for only water quality volume detention as shown in Table 5-1. Hydromodification management is also provided through these basin or reduction in tributary area. The regional analysis shows that the increased time of concentration from the proposed site and storm drain system provides a reduction in peak flow without accounting for the basin routing as shown in Table 5-2. For this reason, the basin analysis was only provided for the local condition. Watershed 1A is left as is and confluences with Watershed 2A. Watershed 2A will include underground storage for both water quality and flood mitigation results of this analysis are provided in Table 5-3. Upon preliminary approval from the County of Riverside, calculations will be further refined, and additional calculations will be provided for all project facilities and all other project requirements the County of Riverside Conditions for final design.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Flood volume = 611450.5 Cubic Feet
Total soil loss = 607544.5 Cubic Feet

Storm Event 1 Effective Rainfall = 5.042(In)

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

|        HYDRAULICS TABLES IN THE OUTPUT FILE                |
|  These are the more important tables in the output file.   |
|  You can use your editor to find the table numbers,        |
|  for example: search for Table E20 to check continuity.    |
|  This output file can be imported into a Word Processor    |
|  and printed on US letter or A4 paper using portrait       |
|  mode, courier font, a size of 8 pt. and margins of 0.75   |

261   | If there are messages about (sqrt(g*d)*dt/dx), or |
262   | the sqrt(wave celerity)*time step/conduit length  |
263   | in the output file all it means is that the       |
264   | program will lower the internal time step to      |
265   | satisfy this condition (explicit condition).      |
266   | You control the actual internal time step by      |
267   | using the minimum courant time step factor in the |
268   | HYDRAULICS job control.  The message put in words |
269   | states that the smallest conduit with the fastest |
270   | velocity will control the time step selection.    |
271   | You have further control by using the modify      |
272   | conduit option in the HYDRAULICS Job Control.     |
