# Section 1 Introduction

---

This report contains the findings of ELMT Consulting's (ELMT) Habitat Assessment and Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) consistency analysis for the proposed Harvest Landing Retail Center & Business Park project in the City of Perris, Riverside County, California. The report was prepared to document baseline conditions and assess the potential for special-status<sup>1</sup> plant and wildlife species to occur within the proposed project site that could pose a constraint to implementation of the proposed project. Special attention was given to the suitability of the on-site habitat to support special-status species identified by the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDDB) and other electronic databases as potentially occurring in the general vicinity of the project site. Additionally, this report also addresses resources protected under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (FGC), federal Clean Water Act (CWA) regulated by the United States Army Corps of Engineers (Corps) and Regional Water Quality Control Board (Regional Board) respectively, and Section 1602 of the FGC administered by CDFW.

The City of Perris is a signatory to the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). Since the City of Perris will be the lead agency for the proposed project, the project will need to be consistent with the rules and regulations set forth in the MSHCP. The Western Riverside County Regional Conservation Authority (RCA) MSHCP Information Map was queried to determine if the project site is subject to any potential MSHCP survey requirements. Further, the project site was reviewed against the MSHCP to determine if the site is located within any MSHCP areas including Criteria Cells (core habitat and wildlife movement corridors) or areas proposed for conservation. Based on the RCA MSHCP Information Map query and review of the MSHCP, it was determined that the project site is located within the Mead Valley Area Plan of the MSHCP but is not located within any Criteria Cells or MSHCP Conservation Areas. In addition, the project site is located within the designated survey area for burrowing owl (*Athene cunicularia*) and portions of the site are located within the designated survey area for Narrow Endemic Plant Species San Diego ambrosia (*Ambrosia pumila*), spreading navarretia (*Navarretia fossalis*), California Orcutt grass (*Orcuttia californica*), and Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*), and Criteria Area Species San Jacinto Valley crownscale (*Atriplex coronata* var. *notator*), Parish's crownscale (*Atriplex parishii*), Davidson's saltscale (*Atriplex serenana* var. *davidsonii*), thread-leaved brodiaea (*Brodiaea filifolia*), round-leaved filaree (*California macrophylla*), smooth tarplant (*Centromadia pungens* ssp. *laevis*), Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*), little mouseltail (*Myosurus minimus* ssp. *apus*), and mud nama (*Nama stenocarpa*).

## 1.1 PROJECT LOCATION

The project site is generally located north and east of Interstate 215, west of State Route 79, and south of State Route 60 in the City of Perris, Riverside County, California (Exhibit 1, *Regional Vicinity*). The project site is depicted on the Perris quadrangle of the United States Geological Survey's (USGS) 7.5-minute

---

<sup>1</sup> As used in this report, "special-status" refers to plant and wildlife species that are federally, State, and MSHCP listed, proposed, or candidates; plant species that have been designated with a California Native Plant Society Rare Plant Rank; wildlife species that are designated by the CDFW as fully protected, species of special concern, or watch list species; and specially protected natural vegetation communities as designated by the CDFW.

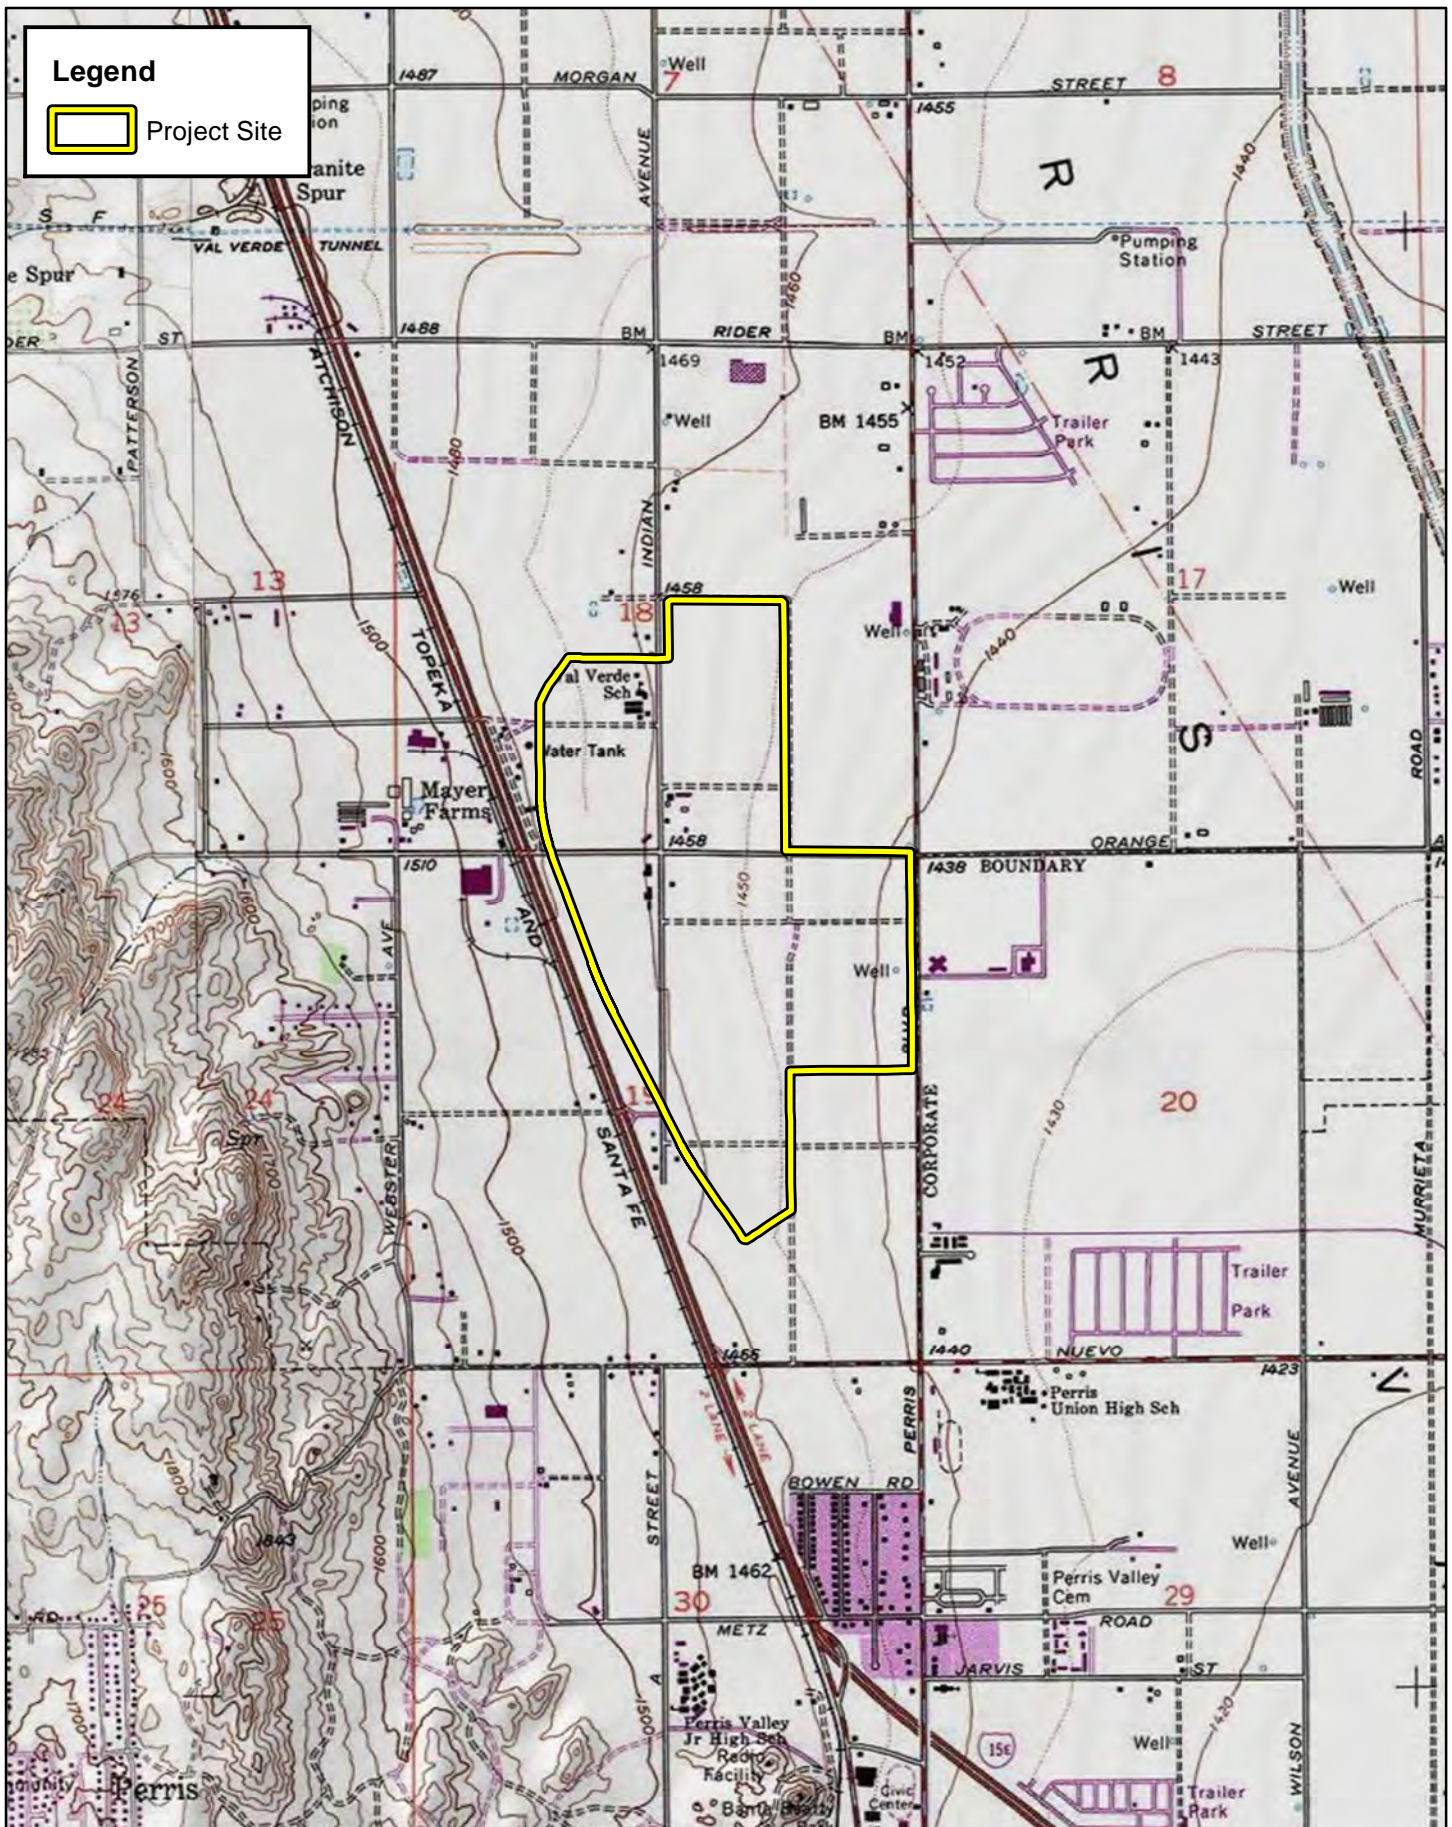

topographic map within Sections 18 and 19 of Township 4 South, Range 3 West (Exhibit 2, *Site Vicinity*). Specifically, the project site is bounded to the west by Interstate 215 East Frontage Road and to the east by North Perris Boulevard and is located north of East Nuevo Road and south of Placentia Avenue (Exhibit 3, *Project Site*).

## **1.1 PROJECT DESCRIPTION**

The project involves the proposed construction and operation of a commercial and business park specific plan over 358.28 acres which will be developed in two phases. The first phase of the project consists of construction of seven (7) industrial buildings, a commercial shopping center, a big box retail building, and a Water Quality Management Plan (WQMP) drainage and detention area. The total area of development for Phase I encompasses approximately 187.43 acres. In addition, the project would include the construction of approximately 35.09 acres of roadways and a 13.08-acre WQMP basin. Phase II will consist of future business park uses north of Orange Avenue. Phase II area totals 122.68 acres. Refer to Attachment A, *Site Plan*.

## Section 2 Methodology

---

A literature review and records search were conducted to determine which special-status biological resources have the potential to occur within or within the general vicinity of the project site. In addition to the literature review, a general habitat assessment or field investigation was conducted. The field investigation was conducted to document existing conditions within the project site to assess the potential for special-status biological resources to occur.

### 2.1 LITERATURE REVIEW

Prior to conducting the field investigation, species and habitat information was gathered from the reports related to the specific project and relevant databases for the *Steele Peak and Perris* USGS quadrangles to determine which species and/or habitats would be expected to occur on-site. These sources include:

- California Native Plant Society Electronic Inventory (CNPSEI) database;
- California Natural Diversity Database (CNDDDB) *Rarefind 5*;
- CNDDDB Biogeographic Information and Observation System (BIOS);
- Environmental Protection Agency (EPA) Water Program “My Waters” data layers
- Google Earth Pro historic aerial imagery (1985-2023);
- Stephen’s Kangaroo Rat Habitat Conservation Plan
- United States Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS), Soil Survey <sup>2</sup>;
- United States Fish and Wildlife Service (USFWS) Critical Habitat designations for Threatened and Endangered Species;
- USFWS National Wetlands Inventory (NWI);
- Western Riverside County Regional Conservation Authority (RCA) MSHCP Information Map;
- 2006 Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area; and
- CDFW’s listing of Crotch’s bumble bee.

The literature review provided a baseline from which to inventory the biological resources potentially occurring on the project site. The CNDDDB database was used, in conjunction with ArcGIS software, to locate the nearest recorded occurrences of special-status species and determine the distance from the project site.

### 2.2 FIELD INVESTIGATION

Following the literature review, biologists Jacob H. Lloyd Davies and Megan E. Peukert inventoried and evaluated the condition of the habitat within the project site on August 18, 2023. Plant communities

---

<sup>2</sup> A soil series is defined as a group of soils with similar profiles developed from similar parent materials under comparable climatic and vegetation conditions. These profiles include major horizons with similar thickness, arrangement, and other important characteristics, which may promote favorable conditions for certain biological resources.

identified on aerial photographs during the literature review were verified by walking meandering transects through the plant communities and along boundaries between plant communities.

All plant and wildlife species observed, as well as dominant plant species within each plant community, were recorded. Plant species observed during the field survey were identified by visual characteristics and morphology in the field. Unusual and less familiar plant species were photographed during the field survey and identified in the laboratory using taxonomical guides. Wildlife detections were made through observation of scat, trails, tracks, burrows, nests, and/or visual and aural observation. In addition, site characteristics such as soil condition, topography, hydrology, anthropogenic disturbances, indicator species, condition of on-site plant communities, and presence of potential jurisdictional drainage and/or wetland features were noted.

Special attention was given to special-status habitats and/or undeveloped areas, which have higher potential to support special-status plant and wildlife species. Areas providing suitable habitat for burrowing owl were closely surveyed for signs of presence during the field survey. Methods to detect the presence of burrowing owls included direct observation, aural detection, and signs of presence including pellets, whitewash, feathers, or prey remains.

No limitations significantly affected the results and conclusions given herein. The survey was conducted during the appropriate season to observe the target species, in good weather conditions, by qualified biologists who followed all pertinent protocols.

## **2.3 SOILS SERIES ASSESSMENT**

On-site and adjoining soils were researched prior to the field survey using the USDA NRCS Soil Survey for Western Riverside Area, California. In addition, a review of the local geological conditions and historical aerial photographs was conducted to assess the ecological changes that the project site has undergone.

## **2.4 PLANT COMMUNITIES**

Plant communities were mapped using 7.5-minute USGS topographic base maps and aerial photography. The plant communities were delineated on an aerial photograph, classified in accordance with those described in the MSHCP, and then digitized into GIS Arcview. The Arcview application was used to compute the area of each plant community in acres.

## **2.5 PLANTS**

Common plant species observed during the field survey were identified by visual characteristics and morphology in the field and recorded in a field notebook. Unusual and less-familiar plants were photographed in the field and identified in the laboratory using taxonomic guides. Taxonomic nomenclature used in this study follows the 2012 Jepson Manual (Hickman 2012). In this report, scientific names are provided immediately following common names of plant species (first reference only).

## **2.6 WILDLIFE**

Wildlife species detected by sight, calls, tracks, scat, or other sign were recorded during the survey in a field notebook. Field guides were used to assist with identification of wildlife species during the survey included The Sibley Field Guide to the Birds of Western North America (Sibley 2003), A Field Guide to Western Reptiles and Amphibians (Stebbins 2003), and A Field Guide to Mammals of North America (Reid 2006). Although common names of wildlife species are well-standardized, scientific names are provided immediately following common names in this report (first reference only).

## **2.7 JURISDICTIONAL DRAINAGES AND WETLANDS**

Aerial photography was reviewed prior to conducting the field investigation in order to locate and inspect any potential natural drainage features, ponded areas, or water bodies that may fall under the jurisdiction of the Corps, Regional Water Quality Control Board (Regional Board), or CDFW. In general, surface drainage features indicated as blue-line streams on USGS maps that are observed or expected to exhibit evidence of flow are considered potential riparian/riverine habitat and are also subject to state and federal regulatory jurisdiction. In addition, ELMT reviewed jurisdictional waters information through examining historical aerial photographs to gain an understanding of the impact of land-use on natural drainage patterns in the area. The USFWS National Wetland Inventory (NWI) and Environmental Protection Agency (EPA) Water Program “My Waters” data layers were also reviewed to determine whether any hydrologic features and wetland areas have been documented the project site or local vicinity.

## **Section 3      Existing Conditions**

---

### **3.1      LOCAL CLIMATE**

The City of Perris features a somewhat cooler version of a Mediterranean climate, or semi-arid climate, with warm, sunny, dry summers and cool, rainy, mild winters. Relative to other areas in Southern California, winters are colder with chilly to cold morning temperatures with frost common. Climatological data obtained for the City of Perris indicates the annual precipitation averages 11.11 inches per year. Almost all of the precipitation in the form of rain occurs in the months between December and April, with hardly any occurring between the months of May and September. The wettest months are January and February, with monthly average totals precipitation of 2.24 and 3.29 inches, respectively, and the driest months are June and July, both with monthly average total precipitation of 0.04 inch. The average maximum and minimum temperatures are 86 and 46 degrees Fahrenheit (°F), respectively, with July and August (monthly average high 100°F) being the hottest months and December and January (monthly average lows 34 and 35°F) being the coldest. The temperature during the site visit was in the high-80s°F with clear skies and calm winds.

### **3.2      TOPOGRAPHY AND SOILS**

On-site topography of the project site is relatively flat, sloping marginally from southwest to northeast at an approximate elevation of 1,435 to 1,480 feet above mean sea level. Limited topographic relief is present in the form of water detention basins, flood control channels, and spoils piles. Based on the NRCS USDA Web Soil Survey, the project site is underlain entirely by Domino silt loam (saline-alkali), Exeter sandy loam (deep, 0 to 2 percent slopes), Exeter sandy loam (deep, 2 to 8 percent slopes, eroded), Ramona sandy loam (0 to 2 percent slopes), Exeter very fine sandy loam (deep, 0 to 5 percent slopes), Greenfield sandy loam (0 to 2 percent slopes), Greenfield sandy loam (2 to 8 percent slopes, eroded), and Pachappa fine sandy loam (0 to 2 percent slopes). Refer to Exhibit 4, *Soils*. Soils on-site have been mechanically disturbed and heavily compacted from historic land uses (i.e., agricultural activities, grading activities, and weed abatement).

### **3.3      SURROUNDING LAND USES**

The project site occurs in an area formerly dominated by agricultural land uses that has been becoming urbanized in recent decades. Present land uses in the vicinity include tract neighborhoods, anchor retail centers, and assorted commercial, industrial, and institutional developments, with scattered undeveloped parcels supporting former agricultural land. The site is bounded to the north by existing development; to the northeast, east, and south by commercial and industrial developments with tract neighborhoods beyond; and to the west by Interstate 215.

## Section 4 Discussion

---

### 4.1 SITE CONDITIONS

The project site primarily consists of vacant, undeveloped land that has been subject to a variety of anthropogenic disturbances associated with historic agricultural activities, surrounding development, and routine weed abatement/disking activities. Val Verde Elementary School is located near the northwest corner of the site. Historic aerials show these activities have been ongoing since at least 1959. Prior to conducting the field investigation, aerial photography was reviewed to document existing site conditions and document the changes to the project site and surrounding area. Below is a summary of the aerial review.

- 1959: The project site and surrounding areas support active agricultural fields with associated structures near the intersection of Indian Avenue and Orange Avenue. Construction is present in the north portion of the site at what will become the existing location of Val Verde Elementary School. Interstate 215, Placentia Avenue and North Perris Boulevard are present to the west, north, and east, respectively.
- 1959 – 1966: Residential developments are present along Indian Avenue.
- 1966 – 1978: Agricultural operations have ceased in the western limits of the project site.
- 1978 – 1997: Large anchor retail centers are present off-site to the northeast and southeast.
- 1997 – 2002: A trailer stockyard is present in the northern portion of the project site.
- 2002 – 2005: Agricultural operations have ceased in the southern limits of the project site.
- 2005 – 2009: Agricultural operations have ceased in all but the eastern limits of the project site.
- 2009 – 2010: All agricultural operations supported by the project site have ceased.
- 2010 – 2020: No changes have occurred. The project site is subjected to routine weed abatement regimes.
- 2020 – present: A water detention basin is present off-site to the north, beyond Val Verde Elementary School. Additional commercial development is present to the southeast.

The disturbances outlined above have eliminated the natural plant communities that historically occurred on the project site and surrounding area. As a result, no native plant communities occur on-site, nor will any native plant communities be impacted from implementation of the proposed project. Refer to Appendix B, *Site Photographs*, for representative site photographs of the project site.

### 4.2 VEGETATION

No native plant communities occur within the boundary of the project site. The project site supports one (1) plant community: non-native grassland. In addition, the site supports two (2) land cover types that would

be classified as disturbed and developed. Refer to Exhibit 5, *Vegetation*. The vegetation community and land cover type are described in further detail below.

#### 4.2.1 Non-Native Grassland

The majority of the project site supports a non-native grassland that occurs in varying densities throughout the site, except the southwest and southeast corners and portions of the site perimeter. This plant community is dominated by non-native grasses such as oats (*Avena* spp.) and bromes (*Bromus* spp.) and supports primarily weedy/early successional species. Common plant species observed in the non-native grassland plant community include red-stemmed filaree (*Erodium cicutarium*), common mustard (*Brassica rapa*), Mediterranean mustard (*Hirschfeldia incana*), stinknet (*Oncosiphon pilulifer*), wild radish (*Raphanus sativa*), fiddleneck (*Amsinckia* sp.), annual lupine (*Lupinus bicolor*), and Mexican palo verde (*Parkinsonia aculeata*). Non-native grasses occur in the highest densities in the southern portion of the site, where they are nearly exclusive along a swale.

#### 4.2.2 Disturbed

The majority of the project site supports disturbed land that previously supported agricultural land uses. Vegetative cover ranges from dense/complete to barren based on frequency and nature of routine anthropogenic disturbance such as vehicle access and weed abatement regimes. Common plant species observed on-site include stinknet (*Oncosiphon piluliferum*), Russian thistle (*Salsola tragus*), common sunflower (*Helianthus annuus*), tumbleweed (*Amaranthus albus*), telegraph weed (*Heterotheca grandiflora*), horseweed (*Erigeron canadensis*), totalote (*Centaurea melitensis*), Spanish clover (*Acmispon americanus*), prickly lettuce (*Lactuca serriola*), mustard (*Hirschfeldia incana*), ripgut brome (*Bromus diandrus*), Peruvian pepper tree (*Schinus molle*), tree of heaven (*Ailanthus altissima*), knotweed (*Polygonum aviculare*), jimsonweed (*Datura wrightii*), and slim oat (*Avena barbata*). In addition, a swathe of mulefat (*Baccharis salicifolia*) was observed in a roadside ditch along Orange Avenue, a swathe of desiccated cattails (*Typha* sp.) was observed near a water detention basin near the southwest intersection of North Perris Boulevard and Orange Avenue, and pockets of non-native ornamental trees such as Mexican palo verde (*Parkinsonia aculeata*) and gum tree (*Eucalyptus* sp.) are present near existing and former residential developments.

#### 4.2.3 Developed

Developed areas primarily include paved site-adjacent roadways, and existing residential land uses. Developed areas include paved, impervious surfaces.

### 4.3 WILDLIFE

Plant communities provide foraging habitat, nesting and denning sites for wildlife species, and shelter from adverse weather or predation. This section provides a discussion of wildlife species that were observed during the field survey or that are expected to occur within the project site. The discussion is to be used as a general reference and is limited by the season, time of day, and weather condition during which the field survey was conducted. Wildlife detections were based on calls, songs, scat, tracks, burrows, and direct observation.

#### 4.3.1 Fish

The MSHCP does not identify any covered or special-status fish species as potentially occurring within the project site. No fish or hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for fish were observed within the project site. Therefore, no fish are expected to occur and are presumed absent from the project site.

#### 4.3.2 Amphibians

The MSHCP does not identify any covered or special-status amphibian species as potentially occurring within the project site. No amphibians were observed within the project site or local vicinity. While highly disturbed, the roadside ditches that parallel Orange Avenue and artificially irrigated areas near on-site residential developments provide limited habitat for local amphibians adapted to degraded conditions and routine anthropogenic disturbance. Common amphibian species that could be expected to occur in these areas include Baja California treefrog (*Pseudacris hypochondriaca hypochondriaca*) and garden slender salamander (*Batrachoseps major major*). No special-status amphibian species are expected to occur.

#### 4.3.3 Reptiles

The MSHCP does not identify any covered or special-status reptilian species as potentially occurring within the project site. The project site provides limited habitat for a few reptile species adapted to a high degree of human disturbance associated with the on-site weed abatement activities. The only reptilian species observed during the field investigation was Great Basin fence lizard (*Sceloporus occidentalis longipes*). Other common reptilian species that could be expected to occur include western side-blotched lizard (*Uta stansburiana elegans*), southern alligator lizard (*Elgaria multicarinata webbiai*), and San Diego gophersnake (*Pituophis catenifer annectens*).

#### 4.3.4 Birds

In accordance with the MSHCP, the project site is located within the designated survey area for burrowing owl. The project site provides suitable foraging nesting habitat for bird species adapted to a high degree of human disturbance. Avian species detected during the field survey include burrowing owl (*Athene cunicularia*), rock pigeon (*Columba livia*), common raven (*Corvus corax*), white-tailed kite (*Elanus leucurus*), prairie falcon (*Falco mexicanus*), house finch (*Haemorhous mexicanus*), song sparrow (*Melospiza melodia*), house sparrow (*Passer domesticus*), say's phoebe (*Sayornis saya*), european collared dove (*Streptopelia decaocto*), western meadowlark (*Sturnella neglecta*), cassin's kingbird (*Tyrannus vociferans*), and mourning dove (*Zenaida macroura*).

#### 4.3.5 Mammals

The MSHCP does not identify any covered or special-status mammalian species as potentially occurring within the project site. The project site provides limited foraging and denning habitat for mammalian species adapted to degraded conditions and routine anthropogenic disturbance. Mammalian species observed/detected during the field investigation include coyote (*Canis latrans*), California ground squirrel (*Otospermophilus beecheyi*), and desert cottontail (*Sylvilagus audubonii*). Other common mammalian

species that could be expected to occur include common raccoon (*Procyon lotor*), opossum (*Didelphis virginiana*), gray fox (*Urocyon cinereoargenteus*), striped skunk (*Mephitis mephitis*), and deer mouse species (*Peromyscus* sp.).

#### 4.4 NESTING BIRDS

No active nests were directly observed on-site during the field survey, which was conducted in the final weeks of the breeding season. Although heavily disturbed, the project site has the potential to provide nesting habitat for year-round and seasonal avian residents, as well as migrating songbirds that could occur in the area that area adapted to a high degree of disturbance. Additionally, the barren areas have the potential to support birds that nest on the open ground such as killdeer (*Charadrius vociferans*).

Nesting birds are protected pursuant to the federal MBTA and California Fish and Game Code (Sections 3503, 3503.5, 3511, and 3513 prohibit the take, possession, or destruction of birds, their nests or eggs). The nesting bird season generally occurs between February 1<sup>st</sup> and August 31<sup>st</sup> but may be extended due to weather and drought conditions. If construction occurs during the nesting season, a pre-construction clearance survey for nesting birds should be conducted prior to the start of any vegetation removal or ground disturbing activities to ensure that no nesting birds will be disturbed during construction.

#### 4.5 WILDLIFE CORRIDORS AND LINKAGES

Habitat linkages provide links between larger undeveloped habitat areas that are separated by development. Wildlife corridors are similar to linkages but provide specific opportunities for animals to disperse or migrate between areas. A corridor can be defined as a linear landscape feature of sufficient width to allow animal movement between two comparatively undisturbed habitat fragments. Adequate cover is essential for a corridor to function as a wildlife movement area. It is possible for a habitat corridor to be adequate for one species yet inadequate for others. Wildlife corridors are significant features for dispersal, seasonal migration, breeding, and foraging. Additionally, open space can provide a buffer against both human disturbance and natural fluctuations in resources.

The project site has not been identified as occurring in a wildlife corridor or linkage. The nearest linkage to the project site, as identified by the MSHCP, occurs approximately 0.65 mile to the west of the project site in association with the Motte/Rimrock Reserve. The proposed project will be confined to existing areas that have been heavily disturbed and are isolated from regional wildlife corridors and linkages as there are no riparian corridors, creeks, or useful patches of steppingstone habitat (natural areas) within or connecting the site to any recognized wildlife corridor or linkage. As such, implementation of the proposed project is not expected to impact wildlife movement opportunities and no impacts to wildlife corridors or linkages are expected to occur.

#### 4.6 STATE AND FEDERAL JURISDICTIONAL AREAS

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates discharge of dredge and/or fill materials into “waters of the United States” pursuant to Section 404 of the Federal CWA and Section 10 of the Rivers and Harbors Act. Of the State agencies, the Regional Board regulates discharges into surface waters pursuant to Section

401 of the CWA and the California Porter-Cologne Water Quality Control Act and the CDFW regulates alterations to streambed and associated plant communities pursuant to Section 1602 of the California Fish and Game Code.

Two ephemeral drainage features (Drainage 1 and Drainage 2) were observed onsite. Drainage 1 enters the site at the northeast corner of Orange Avenue and the Interstate 215 Frontage Road from a 48-inch box culvert which originates from the west under Interstate 215 and beyond. Flows from Drainage 1 are conveyed east along the northern shoulder of Orange Avenue through a concrete channel for approximately 165 feet before the channel yields to an earthen basin. Flows are consolidated through a 36-inch culvert and conveyed further east under Indian Avenue before exiting the project site through an 18-inch culvert at the northwest corner of Barrett Avenue and Orange Avenue. From here, flows are directed further east beyond the project site. Drainage 2 enters the site from the lower western boundary of the project site, through a 60-inch box culvert which originates from underneath the Interstate 215 Frontage Road and beyond Interstate 215 to the west. The drainage runs from west to east within the project site, extending from the Interstate 215 Frontage Road at the western boundary, and terminating within the project site before reaching Indian Avenue

The onsite ephemeral drainage features are not relatively permanent, standing, or continuously flowing bodies of water and, therefore, will not qualify as waters of the United States under the regulatory authority of the Corps (*Sackett v. EPA* (2022) 143 S. Ct. 1322, 1336). However, the onsite drainage features will likely qualify as waters of the State and fall under the regulatory authority of the Regional Board and CDFW. A delineation of state and federal jurisdictional waters report was prepared under separate cover.

Approximately 0.23 acre (2,978 linear feet) of non-wetland waters of the State and approximately 0.25 acre (2,978 linear feet) of CDFW jurisdictional streambed occur onsite.

## 4.7 SPECIAL-STATUS BIOLOGICAL RESOURCES

A records search was conducted for reported locations of special-status plant and wildlife species as well as natural communities of special concern in the *Steele Peak* and *Perris* USGS 7.5-minute quadrangles. Two quadrangles were used due to the proximity of the site to quadrangle boundaries and regional topography. Special-status plant and wildlife species were evaluated for their potential to occur within the project site based on habitat requirements, availability, and quality of suitable habitat, and known distributions. Twenty-four (24) special status plant species, eighty (80) special-status wildlife species, and three (3) special-status plant communities have been recorded in the *Steele Peak* and *Perris* USGS 7.5-minute quadrangles. Species determined to have the potential to occur within the general vicinity are provided in Appendix C, *Potentially Occurring Special-Status Biological Resources*.

### 4.7.1 Special-Status Plants

According to the CNDDDB and CNPS, twenty-four (24) special-status plant species have been recorded in the *Steele Peak* and *Perris* quadrangles (refer to Appendix C). No special-status plant species were observed on the project site during the field investigation. The project site and surrounding area have been subject to decades of anthropogenic disturbances which have removed native plant communities that historically occurred. Based on habitat requirements for specific species and the availability and quality of on-site

habitats, it was determined that the site has a low potential to support smooth tarplant (*Centromadia pungens ssp. laevis*) and paniculate tarplant (*Deinandra paniculata*). It was further determined that the site does not have potential to support any of the other special-status plant species known to occur in the vicinity of the site and all are presumed to be absent.

Smooth tarplant and paniculate tarplant are neither federally nor state listed as threatened or endangered. They are designated as CNPS Rare Plant Rank species. They are not listed as a covered species under the MSHCP. While the historic land uses supported by the project site have removed the natural plant communities that once occurred in the area, smooth tarplant and paniculate tarplant are known for tolerating disturbed conditions and is commonly seen colonizing similar areas in western Riverside County. Further, local records indicate that this species is known to occur in the vicinity of the site. Therefore, smooth tarplant and paniculate tarplant were determined to have a low potential to occur within the project site, even though they were not observed onsite. The project site is isolated from known occupied areas and aforementioned observations are scant and widespread. As such, if any smooth tarplant or paniculate tarplant are present on-site, they are not expected to contribute to the long-term conservation of the value for the species. No further surveys related to this species are recommended.

#### 4.7.2 Special-Status Wildlife

According to the CNDDDB, eighty (80) special-status wildlife species have been reported in the *Steele Peak* and *Perris* quadrangles (refer to Appendix C). Three (3) special-status wildlife species were observed during the field investigation: burrowing owl, white-tailed kite, prairie falcon. Based on habitat requirements for specific species and the availability and quality of on-site habitats, it was determined that the project site has a high potential to support Cooper's hawk (*Accipiter cooperii*), sharp-shinned hawk (*Accipiter striatus*), Costa's hummingbird (*Calypte costae*), northern harrier (*Circus hudsonius*), and California horned lark (*Eremophila alpestris actia*); and a low potential to support great egret (*Ardea alba*), great blue heron (*Ardea herodias*), snowy egret (*Egretta thula*); loggerhead shrike (*Lanius ludovicianus*). It was further determined that the project site does not have the potential to support any of the other special-status wildlife species known to occur in the vicinity of the site and all are presumed to be absent.

None of the other aforementioned species are federally or state listed as endangered or threatened. In addition, burrowing owl, white-tailed kite, prairie falcon, Cooper's hawk, sharp-shinned hawk, northern harrier, California horned lark, great blue heron, and loggerhead shrike are covered species under the MSHCP. Of the species, only burrowing owl, Costa's hummingbird, and California horned lark have a higher potential to nest onsite; burrowing owl were observed nesting onsite.

#### 4.7.3 Special-Status Plant Communities

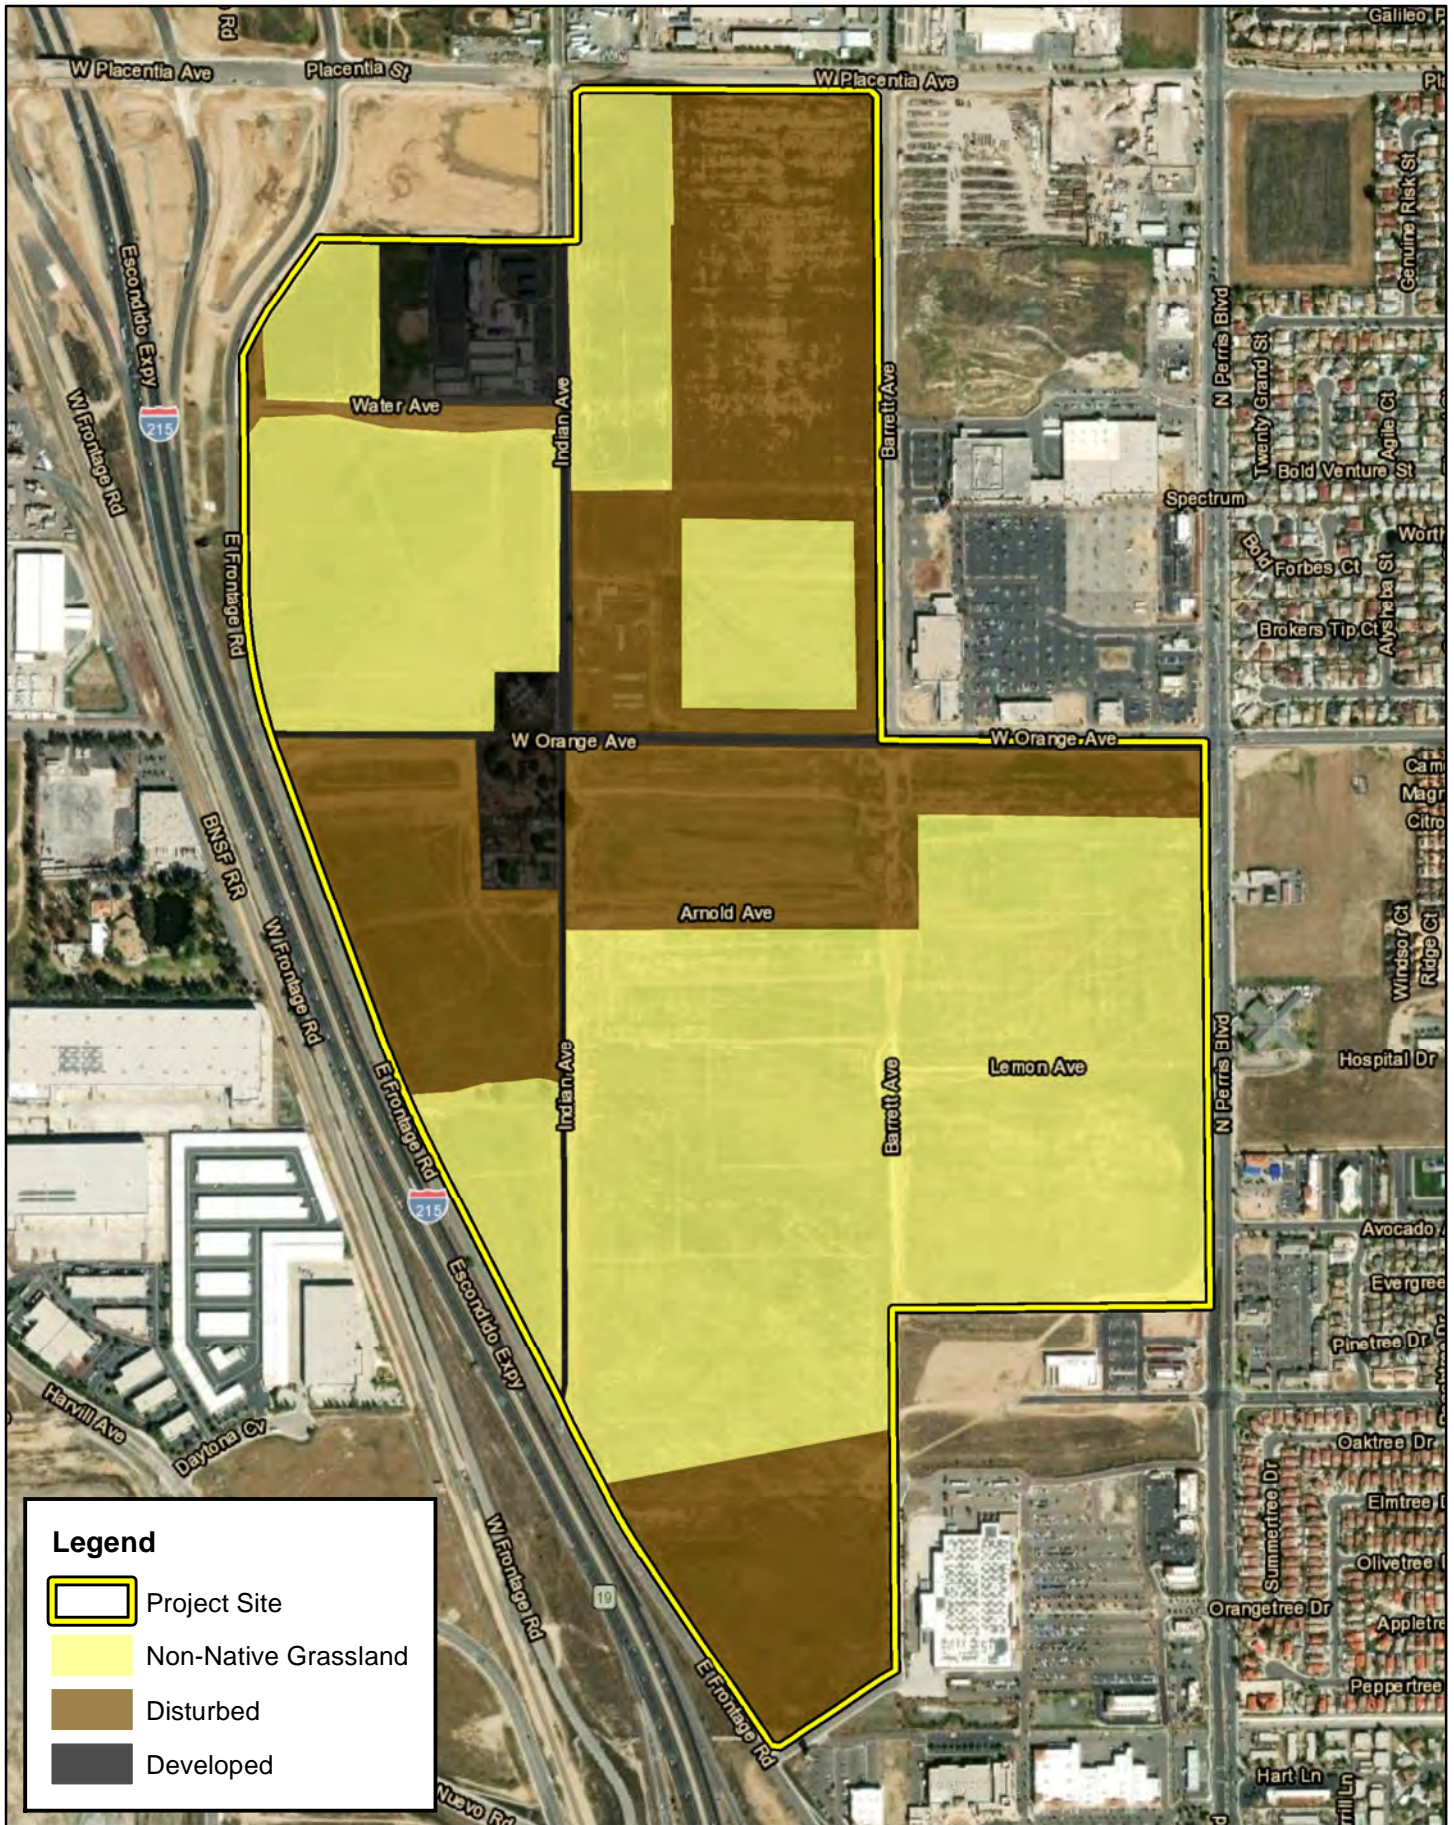

The CNDDDB lists three (3) special-status habitats as being identified within the *Steele Peak* and *Perris* quadrangles: Southern Coast Live Oak Riparian Forest, Southern Cottonwood Willow Riparian Forest, and Southern Sycamore Alder Riparian Woodland, which do not occur within the project site. No CDFW special-status plant communities occur within the boundaries of the project site.

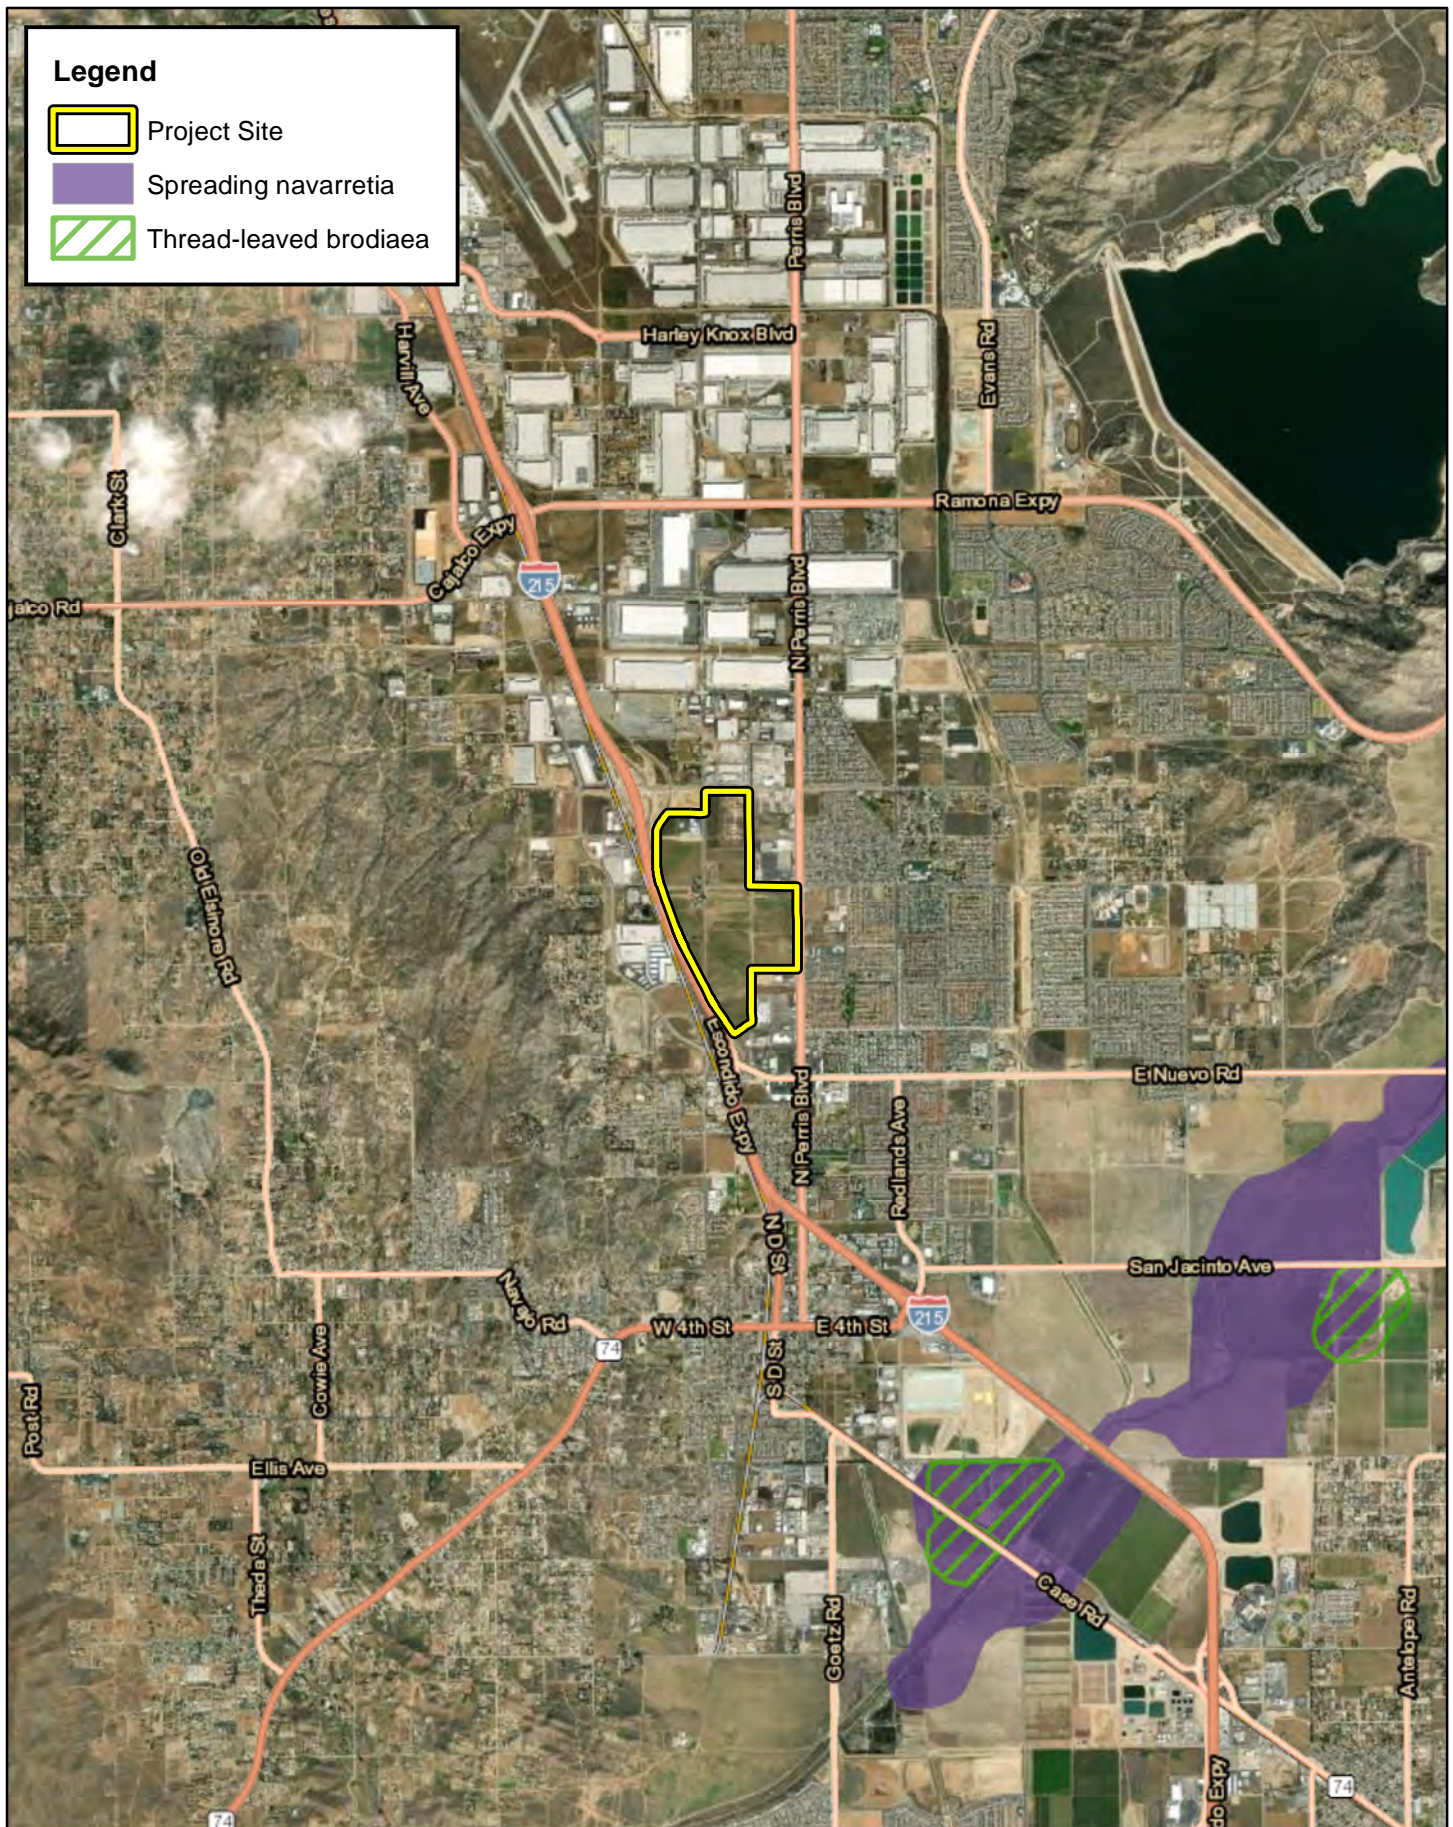

## 4.8 CRITICAL HABITAT

Under the federal Endangered Species Act, “Critical Habitat” is designated at the time of listing of a species or within one year of listing. Critical Habitat refers to specific areas within the geographical range of a species at the time it is listed that include the physical or biological features that are essential to the survival and eventual recovery of that species. Maintenance of these physical and biological features requires special management considerations or protection, regardless of whether individuals or the species are present or not. All federal agencies are required to consult with the USFWS regarding activities they authorize, fund, or permit which may affect a federally listed species or its designated Critical Habitat. The purpose of the consultation is to ensure that projects will not jeopardize the continued existence of the listed species or adversely modify or destroy its designated Critical Habitat. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing is on federal lands, uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highways Administration or a CWA Permit from the Corps). If there is a federal nexus, then the federal agency that is responsible for providing the funding or permit would consult with the USFWS.

The project site is not located with federally designated Critical Habitat. The nearest designated Critical Habitat is located approximately 2.46 miles to the southeast for spreading navarretia (*Navarretia fossalis*) and thread-leaved brodiaea (*Brodiaea filifolia*) (Exhibit 6, *Critical Habitat*). No impacts to federally designated Critical Habitat will occur from project implementation.

## Section 5 MSHCP Consistency Analysis

---

The project site is located in the Mead Valley Area Plan of the MSHCP but is not located within any Criteria Cells or designated conservation areas (Exhibit 7, *MSHCP Conservation Areas*). Additionally, the project site is located within the MSHCP designated survey areas for burrowing owl and Narrow Endemic Plant Species San Diego ambrosia (*Ambrosia pumila*), spreading navarretia (*Navarretia fossalis*), California Orcutt grass (*Orcuttia californica*), and Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*), and Criteria Area Species San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*), Parish's crownscale (*Atriplex parishii*), Davidson's saltscale (*Atriplex serenana* var. *davidsonii*), thread-leaved brodiaea (*Brodiaea filifolia*), round-leaved filaree (*California macrophylla*), smooth tarplant (*Centromadia pungens* ssp. *laevis*), Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*), little mousetail (*Myosurus minimus* ssp. *apus*), and mud nama (*Nama stenocarpa*).

The City of Perris is a permittee under the MSHCP and, while the project is not specifically identified as a Covered Activity under Section 7.1, *Covered Activities Outside Criteria Area and PQP Lands*, of the MSHCP, public and private development that are outside of Criteria Areas and Public/Quasi-Public (PQP)<sup>3</sup> Lands are permitted under the MSHCP, subject to consistency with MSHCP policies that apply to area outside of Criteria Areas. As such, to achieve coverage, the project must be consistent with the following policies of the MSHCP:

- The policies for the protection of species associated with Riparian/Riverine areas and vernal pools as set forth in Section 6.1.2 of the MSHCP;
- The policies for the protection of Narrow Endemic Plant Species as set forth in Section 6.1.3;
- The Urban/Wildlands Interface Guidelines as set forth in Section 6.1.4; and
- The requirements for conducting additional surveys as set forth in Section 6.3.2

### 5.1 RIPARIAN/RIVERINE AREAS AND VERNAL POOLS

#### 5.1.1 Riparian/Riverine Areas

As defined under Section 6.1.2 of the MSHCP, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools*, riparian/riverine areas are areas dominated by trees, shrubs, persistent emergent plants, or emergent mosses and lichens which occur close to or are dependent upon nearby freshwater, or areas with freshwater flowing during all or a portion of the year. Conservation of these areas is intended to protect habitat that is essential to a number of listed or special-status water-dependent fish, amphibian, avian, and plant species. Any alteration or loss of riparian/riverine habitat from development of a project will require the preparation of a Determination of Biologically Equivalent or Superior Preservation (DBESP) analysis to ensure the replacement of any lost functions and values of habitats in regard to the listed species. This assessment is independent from considerations given to waters of the United States and

---

<sup>3</sup> PQP Lands are a subset of MSHCP Conservation Area lands totaling approximately 347,000 acres of lands known to be in public/private ownership and expected to be managed for open space value and/or in a manner that contributes to the Conservation of Covered Species (including lands contained in existing reserves). The acreage of PQP Lands has been accounted for in the MSHCP tracking process for assembling the Conservation Area.

waters of the State under the CWA, the California Porter-Cologne Water Quality Control Act, and CDFW jurisdictional streambed under the California Fish and Game Code.

Approximately 0.25 acre of riparian/riverine habitat was mapped within the project boundaries. The 0.25 acre of mapped MSHCP Riparian/Riverine habitat, consists of 0.02 acre of disturbed riparian scrub (riparian), and 0.23 acre of riverine habitat.

Project activities are expected to permanently impact approximately 0.25 acre of mapped riparian/riverine habitat. The applicant proposes to mitigate impacts to riparian/riverine habitat through the following:

- The applicant proposes to mitigate the impacts to 0.25 acre of riverine habitat off-site through the purchase of re-establishment and/or establishment mitigation credits through the Riverpark Mitigation Bank. Permanent impacts to 0.25 acre of riparian/riverine habitat will be mitigated at a 1:1 ratio consisting of re-establishment and/or establishment mitigation credits. The applicant will be responsible for the purchase of mitigation credits to compensate for impacts to riverine habitat.
- If off-site mitigation credits are not available from Riverpark Mitigation Bank, the applicant will mitigate impacts to 0.25 acre of riparian/riverine habitat through on-site applicant sponsored mitigation through the creation of 0.5 acre of riparian/riverine habitat onsite. A conservation easement will be placed over the created riparian/riverine resource to ensure this area is protected in perpetuity.

A Habitat Mitigation Monitoring and Reporting Program will be prepared and will also be reviewed and approved by the County of Riverside Environmental Programs Division, Western Riverside County Regional Conservation Authority, and regulatory agencies.

### **5.1.2 Vernal Pools**

Vernal pools are seasonally inundated, ponded areas that only form in regions where specialized soil and climatic conditions exist. During fall and winter rains typical of Mediterranean climates, water collects in shallow depressions where downward percolation of water is prevented by the presence of a hard pan or clay pan layer (duripan) below the soil surface. Later in the spring when rains decrease and the weather warms, the water evaporates and the pools generally disappear by May. The shallow depressions remain relatively dry until late fall and early winter with the advent of greater precipitation and cooler temperatures. Vernal pools provide unusual "flood and drought" habitat conditions to which certain plant and wildlife species have specifically adapted as well as invertebrate species such as fairy shrimp.

One of the factors for determining the suitability of the habitat for fairy shrimp would be demonstrable evidence of seasonal ponding in an area of topographic depression that is not subject to flowing waters. These astatic pools are typically characterized as vernal pools. More specifically, vernal pools are seasonal wetlands that occur in depression areas without a continual source of water. They have wetland indicators of all 3 parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indicators of hydrology and/or vegetation during the drier portion of the growing season. Obligate hydrophytes and facultative wetlands plant species are normally dominant during the wetter portion of the growing season. The determination that an area exhibits vernal pool characteristics

and the definition of the watershed supporting vernal pool hydrology is made on a case-by-case basis. Such determinations should consider the length of time the area exhibits upland and wetland characteristics and the manner in which the area fits into the overall ecological system as a wetland. The seasonal hydrology of vernal pools provides for a unique environment, which supports plants and invertebrates specifically adapted to a regime of winter inundation, followed by an extended period when the pool soils are dry.

The MSHCP lists two general classes of soils known to be associated with special-status plant species: clay soils and Traver-Domino Willow association soils. The specific clay soils known to be associated with special-status species within the MSHCP plan area include Bosanko, Auld, Altamont, and Porterville series soils, whereas Traver-Domino Willows association includes saline-alkali soils largely located along floodplain areas of the San Jacinto River and Salt Creek. Without the appropriate soils to create the impermeable restrictive layer, none of the special-status species associated with vernal pools can occur within the project site. Domino silt loam (saline-alkali) is mapped as occurring in a narrow swathe in the eastern limits of the site along North Perris Boulevard. However, agricultural land uses spanning much of the past century have thoroughly mixed and compacted on-site soils, such that conditions suitable for the formation of vernal pools are no longer present.

A review of recent and historic aerial photographs (1966-2023) of the project site during wet and dry seasons did not provide visual evidence of an astatic or vernal pool conditions within the project site. The site supported agricultural land uses for several decades and has been heavily degraded by recent installation of flood control infrastructure and staging and storage activities associated with nearby construction activities, which have resulted in heavy compaction of on-site soils. While surface water was observed in the southeast portion of the site, this was due to a series of storm events that concluded the day prior to the field investigation, and ponding was only observed where recent disturbance had compacted on-site soils. From this review of historic aerial photographs and observations during the field investigations, it can be concluded that there is no indication of vernal pools or suitable fairy shrimp habitat occurring within the proposed project site.

Below is a summary of the fairy shrimp known to occur in Western Riverside County and their potential to occur on-site.

#### Riverside fairy shrimp (*Streptocephalus woottoni*)

Riverside fairy shrimp are restricted to deep seasonal vernal pools, vernal pool like ephemeral ponds, and stock ponds and other human modified depressions. They prefer warm-water pools that have low to moderate dissolved solids, are less predictable, and remained filled for extended periods of time. Basins that support Riverside fairy shrimp are typically dry a portion of the year, but usually are filled by late fall, winter or spring rains, and may persist through May. Known habitat occurs within annual grasslands, which may be interspersed through chaparral or coastal sage scrub vegetation. In Riverside County, Riverside fairy shrimp have been found in pools formed over the following soils: Murrieta stony clay loams, Las Posas series, Wyman clay loam, and Willows soils.

No soils that are known to support Riverside fairy shrimp occur within the project site. Further, no indicators of astatic water conditions were observed during the field investigation, and no ponding was observed on

historic aerials during the wet season due to existing activities on-site. Therefore, the site was determined not to provide suitable habitat for Riverside fairy shrimp.

**Santa Rosa Plateau fairy shrimp (*Linderiella santarosae*)**

Santa Rosa Plateau fairy shrimp are restricted to seasonal southern basalt flow vernal pools with cool clear to milky waters that are moderately predictable and remain filled for extended periods of time and are known only from vernal pool on the Santa Rosa Plateau. Since the project site is not located within the known area where Santa Rosa Plateau fairy shrimp have been documented, and no indicators of historic water ponding or astatic water conditions were observed on site, Santa Rosa Plateau fairy shrimp are not expected to occur on-site. Therefore, the site was determined not to provide suitable habitat for Santa Rosa Plateau fairy shrimp.

**Vernal pool fairy shrimp (*Branchinecta lynchi*)**

Vernal pool fairy shrimp are restricted to seasonal vernal pools (vernal pools and alkali vernal pools) and prefer cool-water pools that have low to moderate dissolved solids, are unpredictable, and often short lived. The vernal pool fairy shrimp is known from four locations in Western Riverside County MSHCP Plan Area: Skunk Hollow, the Santa Rosa Plateau, Salt Creek, and the vicinity of the Pechanga Indian Reservation. Since the project site is not located within or adjacent to the four known populations, and no indicators of historic water ponding or astatic water conditions were observed on site, the site was determined not to provide suitable habitat for vernal pool fairy shrimp.

## **5.2 NARROW ENDEMIC PLANT SPECIES**

Section 6.1.3 of the MSHCP, *Protection of Narrow Endemic Plant Species*, states that the MSHCP database does not provide sufficient detail to determine the extent of the presence/distribution of Narrow Endemic Plant Species within the MSHCP Plan Area. Additional surveys may be needed to gather information to determine the presence/absence of these species to ensure that appropriate conservation of these species occurs. Based on the RCA MSHCP Information Map query and review of the MSHCP, it was determined that the project site is located within the designated survey area for Narrow Endemic Plant Species San Diego ambrosia, spreading navarretia, California Orcutt grass, and Wright's trichocoronis as depicted in Figure 6-1 within Section 6.1.3 of the MSHCP. Based on the results of the literature review, the project site has not supported natural plant communities since at least 1959. Based on the results of the field investigation, the project site does not provide suitable habitat for these MSHCP listed Narrow Endemic Plant Species.

**San Diego Ambrosia (*Ambrosia pumila*)**

San Diego ambrosia is federally listed as endangered and is a CNPS Rare Plant Rank 1B.1 species. It occurs in open habitats in coarse substrates near drainages, and in upland areas on clay slopes or on the dry margins of vernal pools. This species occurs in a variety of associations that are dominated by sparse grasslands or marginal wetland habitats such as river terraces, pools, and alkali playas. In Riverside County, San Diego ambrosia is associated with open, gently sloped grasslands and is generally associated with alkaline soils. Three populations of San Diego ambrosia have been mapped in Riverside County. The project site is not located within any of the known occurrences of San Diego ambrosia. In addition, historical agricultural

activities and routine anthropogenic disturbances spanning much of the past century have contaminated and heavily mixed and compacted the soils within the site, such that they no longer have the potential to provide suitable habitat for San Diego ambrosia. As a result, the project site was determined not to have potential to support San Diego ambrosia and no further surveys are recommended.

Spreading Navarretia (*Navarretia fossallis*)

Spreading navarretia is federally listed as threatened and is a CNPS 1B.1 species. It is associated with vernal pools and depressions and basins in areas that once supported vernal pools. In western Riverside County, spreading navarretia has been found within vernal floodplains dominated by annual alkali grassland or alkali playa. The vernal pool habitat found in the Hemet area is based primarily on silty clay soils in the Willows and Travers series. Spreading navarretia is an annual herb that blooms from April to June. The project site is not located within any of the known occurrences of spreading navarretia. In addition, historical agricultural activities and routine anthropogenic disturbances spanning much of the past century have contaminated and heavily mixed and compacted the soils within the project site, such that they no longer have the potential to provide suitable habitat for spreading navarretia. As a result, the project site was determined not to have potential to support spreading navarretia and no further surveys are recommended.

California Orcutt Grass (*Orcuttia californica*)

California Orcutt grass is both federally and State listed as endangered and is a CNPS Rare Plant Rank 1B.1 species. It is associated with vernal pools. In Riverside County, this species is found in southern basaltic claypan vernal pools and alkaline vernal pools. It is an annual herb that blooms from April to August. In Riverside County it is known to occur in Upper Salt Creek, Skunk Hollow, and the Santa Rosa Plateau. The project site is not located within any of the known occurrences of California Orcutt grass. In addition, historical agricultural activities and routine anthropogenic disturbances spanning much of the past century have contaminated and heavily mixed and compacted the soils within the project site, such that they no longer have the potential to provide suitable habitat for California Orcutt grass. As a result, the project site was determined not to have potential to support California Orcutt grass and no further surveys are recommended.

Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*)

Wright's trichocoronis is a CNPS Rare Plant Rank 2.1 species. It is an annual herb that blooms from May to September and occurs in marshes, riparian forest, meadows, seeps, and vernal pools. In western Riverside County, Wright's trichocoronis is found in the alkali vernal plains and associated with alkali playa, alkali annual grassland, and alkali vernal pool habitats. This species occupies the more mesic portions of these habitats. Wright's trichocoronis is known from four locations along the San Jacinto River in the vicinity of the Ramona and Expressway and San Jacinto Wildlife Area. The project site is not located within any of the known occurrences of Wright's trichocoronis. In addition, historical agricultural activities and routine anthropogenic disturbances spanning much of the past century have contaminated and heavily mixed and compacted the soils within the project site, such that they no longer have the potential to provide suitable habitat for Wright's trichocoronis. As a result, the project site was determined not to have potential to support Wright's trichocoronis and no further surveys are recommended.

### 5.3 URBAN/WILDLANDS INTERFACE GUIDELINES

Section 6.1.4 of the MSHCP, *Guidelines Pertaining to Urban/Wildlands Interface*, is intended to address indirect effects associated with development in proximity to MSHCP Conservation Areas. The Urban/Wildlife Interface Guidelines are intended to ensure that indirect project-related impacts to the MSHCP Conservation Area, including drainage, toxics, lighting, noise, invasive plant species, barriers, and grading/land development, are avoided or minimized. The project site is not located within or in close proximity of any Criteria Cells or designated conservation areas. Therefore, the proposed project will not need to comply with the Urban/Wildlands Interface Guidelines.

### 5.4 ADDITIONAL MSHCP CONSIDERATIONS

In accordance with Section 6.3.2 of the MSHCP, *Additional Survey Needs and Procedures*, additional surveys may be needed for certain species in order to achieve coverage for these species. The query of the RCA MSHCP Information Map and review of the MSHCP determined that the project site is located within the designated survey area for burrowing owl and portions of the site are located within the designated survey area for Criteria Area Species San Jacinto Valley crownscale, Parish's brittlescale, Davidson's saltscale, Thread-leaved brodiaea, Round-leaved filaree, Smooth tarplant, Coulter's goldfields, Little mousetail, and Mud nama, as depicted in Figure 6-4 within Section 6.3.2 of the MSHCP. No other special-status wildlife species surveys were identified.

#### Burrowing Owl

Burrowing owl is currently designated as a California Species of Special Concern. The burrowing owl is a grassland specialist distributed throughout western North America where it occupies open areas with short vegetation and bare ground within shrub, desert, and grassland environments. Burrowing owls use a wide variety of arid and semi-arid environments with level to gently-sloping areas characterized by open vegetation and bare ground. The western burrowing owl (*A.c. hypugaea*), which occurs throughout the western United States including California, rarely digs its own burrows and is instead dependent upon the presence of burrowing mammals (i.e., California ground squirrels, coyotes, and badgers) whose burrows are often used for roosting and nesting. The presence or absence of colonial mammal burrows is often a major factor that limits the presence or absence of burrowing owls. Where mammal burrows are scarce, burrowing owls have been found occupying man-made cavities, such as buried and non-functioning drain pipes, stand-pipes, and dry culverts. They also require low growth or open vegetation allowing line-of-sight observation of the surrounding habitat to forage and watch for predators. In California, the burrowing owl breeding season generally extends from the beginning of February through the end of August.

Under the MSHCP, burrowing owl is considered an adequately conserved covered species that may still require focused surveys in certain areas as designated in Figure 6-4 of the MSHCP. The project site occurs within the MSHCP burrowing owl survey area and a habitat assessment was conducted for the species to ensure compliance with MSHCP guidelines for the species. In accordance with the MSHCP Burrowing Owl Survey Instructions (2006), survey protocol consists of two steps, Step I – Habitat Assessment and Step II – Locating Burrows and Burrowing Owls. The following section describes the methodology followed during the burrowing owl habitat assessment conducted for this project.

- Step I – Habitat Assessment: Step 1 of the MSHCP habitat assessment for burrowing owl consists of a walking survey to determine if suitable habitat is present on-site. The habitat assessment was conducted on August 18, 2023. Upon arrival at the project site, and prior to initiating the assessment survey, binoculars were used to scan all suitable habitats on and adjacent to the property, including perch locations, to establish owl presence.

All suitable areas of the project site were surveyed on foot by walking slowly and methodically while recording/mapping areas that may represent suitable owl habitat on-site. Primary indicators of suitable burrowing owl habitat in western Riverside County include, but are not limited to, native and non-native grassland, interstitial grassland within shrub lands, shrub lands with low density shrub cover, golf courses, drainage ditches, earthen berms, unpaved airfields, pastureland, dairies, fallow fields, and agricultural use areas. Burrowing owls typically use burrows made by fossorial mammals, but they often utilize man-made structures, such as earthen berms, cement culverts, cement, asphalt, rock, wood debris piles, openings beneath cement or asphalt pavement. Burrowing owls are often found within, under, or in close proximity to man-made structures.

According to the MSHCP guidelines, if suitable habitat is present, the biologist should also walk the perimeter of the property, which consists of a 150-meter (approximately 500 feet) buffer zone around the project site boundary. If permission to access the buffer area cannot be obtained, the biologist shall not trespass, but visually inspect adjacent habitats with binoculars. In addition to surveying the entire project site all bordering natural habitats located immediately adjacent to the project site were assessed. Seven (7) burrowing owls were observed during the habitat assessment. Further results from the habitat assessment indicate that suitable resources for burrowing owl are present throughout the project site. Accordingly, if suitable habitat is documented on-site or within adjacent habitats, both Step II, focused surveys and the 30-day preconstruction surveys are required in order to comply with the MSHCP guidelines.

- Step II – Locating Burrows and Burrowing Owls: Concurrent with the initial habitat assessment, a detailed focused burrow survey was conducted and included documentation of appropriately sized natural burrows or suitable man-made structures that may be utilized by burrowing owl - as part of the MSHCP protocol, which is described below under Part A, Focused Burrow Survey. The MSHCP protocol indicates that no more than 100 acres should be surveyed per day/per biologist.
  - Part A – Focused Burrow Survey: A systematic survey for burrows, including burrowing owl sign, was conducted concurrently with the August 18, 2023, habitat assessment by walking across all suitable habitats within the project site. Pedestrian survey transects were spaced to allow 100% visual coverage of the ground surface. The distances between transect centerlines were no more than 30 meters (approximately 100 feet) apart, and owing to the terrain, often much smaller. Transect routes were also adjusted to account for topography and in general ground surface visibility. Areas providing potential habitat for burrowing owls were surveyed for suitable burrows, consisting of natural and non-natural substrates in areas with low, open vegetation. All burrows encountered were examined for shape, scat, pellets, white-wash, feathers, tracks, and prey remains. Suitable burrows/sites, including rock piles and non-natural substrates, were thoroughly examined for signs of presence.

- **Part B – Focused Burrow Survey:** Focused burrowing owl surveys were conducted during the recognized timeframe (the breeding season is typically March through August) in the morning one hour before sunrise to two hours after sunrise.

Suitable burrows/sites, including rock piles and non-natural substrates, were thoroughly examined for signs of presence. All burrows encountered were examined for shape, scat, pellets, white-wash, feathers, tracks, and prey remains. The location of all suitable burrowing owl habitat, potential owl burrows, burrowing owl sign, and any owls observed were recorded and mapped, with a hand-held GPS unit, if observed. Methods to detect presence of burrowing owls included direct observation, aural detection, and signs of presence. Binoculars were used to observe distant birds and their activity around potential nesting habitat. During the focused surveys, the survey area was assessed on foot by qualified biologists Travis J. McGill, Jacob H. Lloyd Davies, Rachael A. Lyons, and Megan E. Peukert who are knowledgeable in the habitats and behavior of burrowing owls.

Four focused burrowing owl surveys were conducted on August 21, 23, 26, and 30, 2023. All surveys were completed between 0600 and 1100. The surveys were conducted to document the presence/absence of burrowing owl within the project site. Refer to Table 1, *Burrowing Owl Survey Data*, for a summary of the survey dates and times, personnel, weather conditions, and general findings.

**Table 1: Burrowing Owl Survey Data**

Survey No.	Survey Date	Surveyor	Time	Temperature (°F)	Cloud Cover	Wind Speed (mph)	Burrowing Owl Detected On-Site
1	8/21/23	Jacob H. Lloyd Davids and Rachael A. Lyons	0600-1000	72-80	0%	1-5	Yes
2	8/23/23	Jacob H. Lloyd Davies and Megan E. Peukert	0800-1100	75-86	0%	1-5	Yes
3	8/26/23	Rachael A. Lyons and Megan E. Peukert	0600-1000	74-82	0%	1-5	No
4	8/30/23	Jacob H. Lloyd Davids and Rachael A. Lyons	0700-1000	72-78	0%	1-5	No

A total of seven (7) burrowing owls, including four (4) adults and three (3) juveniles, were observed during the 2023 focused surveys approximately 450 feet south of the intersection of Orange Avenue and Barrett Avenue in the northern of two water detention basins.

#### Criteria Area Species

No criteria area species were observed on the project site. However, the site supported agricultural operations for much of the past century and continued to be impacted by surrounding development and weed abatement activities, eliminating natural plant communities.

*San Jacinto Valley Crownscale (Atriplex coronata var. notatior)*

San Jacinto Valley crownscale is federally endangered and designated as a CNPS 1B.1 species. It is an annual herb that blooms from April to August and is restricted to highly alkaline, silty-clay soils in association with Traver-Domino-Willows soil associations. San Jacinto Valley crownscale primarily occurs in floodplains dominated by alkali scrub, alkali playas, vernal pools, and alkali grasslands. This species is endemic to Riverside County and is restricted to the San Jacinto, Perris, Menifee and Elsinore Valleys. The project site is not located within any of the known occurrences of San Jacinto Valley crownscale. In addition, the heavily mixed and compacted soils and lack of natural vegetation communities on the site do not provide suitable habitat for this species. As a result, the project site was determined to not have potential to provide suitable habitat for San Jacinto Valley crownscale and this species is presumed absent.

*Parish's Brittlescale (Atriplex parishii)*

Parish's brittlescale is designated as a CNPS 1B.1 species. It is an annual herb that blooms from June to October and is found in alkaline habitats. In western Riverside County it is found primarily along the San Jacinto River and at Salt Creek within the Domino-Willows-Traver Soils series in association with the alkali vernal pools, alkali annual grassland, alkali playa, and alkali scrub components of alkali vernal plains. Salt Creek west of Hemet and the Winchester Valley support the only known populations of this plant. The project site is not located within any of the known occurrences of Parish's brittlescale. In addition, the heavily mixed and compacted soils and lack of natural vegetation communities within the site do not provide suitable habitat for this species. As a result, the project site was determined not to have potential to provide suitable habitat for Parish's brittlescale and this species is presumed absent.

*Davidson's Saltscale (Atriplex serenana var. davidsonii)*

Davidson's saltscale is designated as a CNPS 1B.2 species. It is an annual herb that blooms from April to October and occurs in coastal bluff scrub and coastal scrub in alkaline soils. In Riverside County, Davidson's saltscale is found in the Domino-Willows-Traver Soils series in association with the alkali vernal pools, alkali annual grassland, alkali playa, and alkali scrub components of alkali vernal plains. Currently known key populations of Davidson's saltscale include Salt Creek west of Hemet, the middle segment of San Jacinto River, and the San Jacinto Wildlife Area. The project site is not located within any of the known occurrences of Davidson's saltscale. In addition, the heavily mixed and compacted soils and lack of natural vegetation communities on the site do not provide suitable habitat for this species. As a result, the project site was determined not to have potential to provide suitable habitat for Davidson's saltscale and this species is presumed absent.

*Thread-leaved Brodiaea (Brodiaea filifolia)*

Thread-leaved brodiaea is federally listed as threatened, is State listed as a candidate for endangered status, and is a CNPS Rare Plant Rank 1B.1 species. It is a perennial bulbiferous herb that blooms from March to June and it typically occurs on gentle hillsides, valleys, and floodplains in semi-alkaline mudflats, vernal pools, mesic southern needlegrass grassland, mixed native-nonnative grassland and alkali grassland plant communities in association with clay, loamy sand, or alkaline silty-clay soils. Localities occupied by this species are frequently intermixed with, or near, vernal pool complexes, such as at the Santa Rosa Plateau and in the Upper Salt Creek drainage southwest of Hemet in Riverside County. The project site is not located within any of the known occurrences of thread-leaved brodiaea. In addition, the heavily mixed and

compacted soils and lack of natural vegetation communities within the site do not provide suitable habitat for this species. As a result, the project site was determined not to have potential to provide suitable habitat for thread-leaved brodiaea and this species is presumed absent.

Round-leaved Filaree (*California macrophylla*)

Round-leaved filaree typically occurs in cismontane woodland, valley grassland, and chaparral within the Riverside lowlands and Santa Ana Mountains bioregions. It is thought to prefer clay soils. Round-leaved filaree is an annual herb with a blooming period from March to May. The project site is not located within any of the known occurrences of round-leaved filaree. In addition, the heavily mixed and compacted soils and lack of natural vegetation communities within the site do not provide suitable habitat for this species. As a result, the project site was determined not to have potential to provide suitable habitat for round-leaved filaree and this species is presumed absent.

Smooth Tarplant (*Centromadia pungens ssp. laevis*)

Smooth tarplant is designated as a CNPS 1B.1 species. It is an annual herb that blooms from April to September. Smooth tarplant is an annual member of the sunflower family (Asteraceae) that often occurs in vernal pools, alkali playas and scrub, alkali grasslands, riparian areas, and disturbed sites in alkaline soils. However, smooth tarplant is also tolerant of disturbance, and is often found in agricultural lands or other disturbed mesic alkaline habitats. The majority of the populations in western Riverside County are associated with alkali vernal plains. Smooth tarplant is found at scattered low elevation locations throughout much of western Riverside County. In addition, the heavily mixed and compacted soils and lack of natural vegetation communities within the site do not provide suitable habitat for this species. In addition, the site is entirely surrounded by likewise disturbed land or development, further precluding this species from the site. As a result, the project site was determined to have a low potential to provide suitable habitat for smooth tarplant and this species is presumed absent due to historic anthropogenic activities.

Coulter's Goldfield (*Lasthenia glabrata ssp. coulteri*)

Coulter's goldfields are designated as a CNPS 1B.1 species. It is an annual herb that blooms from February to June and has been found to occur in marshes and swamps, playas, and vernal pools. In Riverside County, Coulter's goldfields occur primarily in highly alkaline, silty-clay soils in association with the Traver-Domino-Willows soil association. Coulter's goldfields occur primarily in the alkali vernal plains community. These are floodplains dominated by alkali scrub, alkali playas, vernal pools, and alkali grasslands. The project site is not located within any of the known occurrences of Coulter's goldfield. In addition, the heavily mixed and compacted soils and lack of natural vegetation communities within the site do not provide suitable habitat for this species. As a result, the project site was determined not to have potential to provide suitable habitat for Coulter's goldfield and this species is presumed absent.

Little Mousetail (*Myosurus minimus*)

Little mousetail is a CNPS 3.1. This plant species is an annual herb that blooms from March to June and occurs in association with vernal pools and within the alkali vernal pools and alkali annual grassland components of alkali vernal plains. Little mousetail is found in areas that have semi-regular inundation. Little mousetail is known from at least nine locations in western Riverside County. The largest population complex of this plant known is found within an alkali vernal pool complex at Salt Creek west of Hemet.

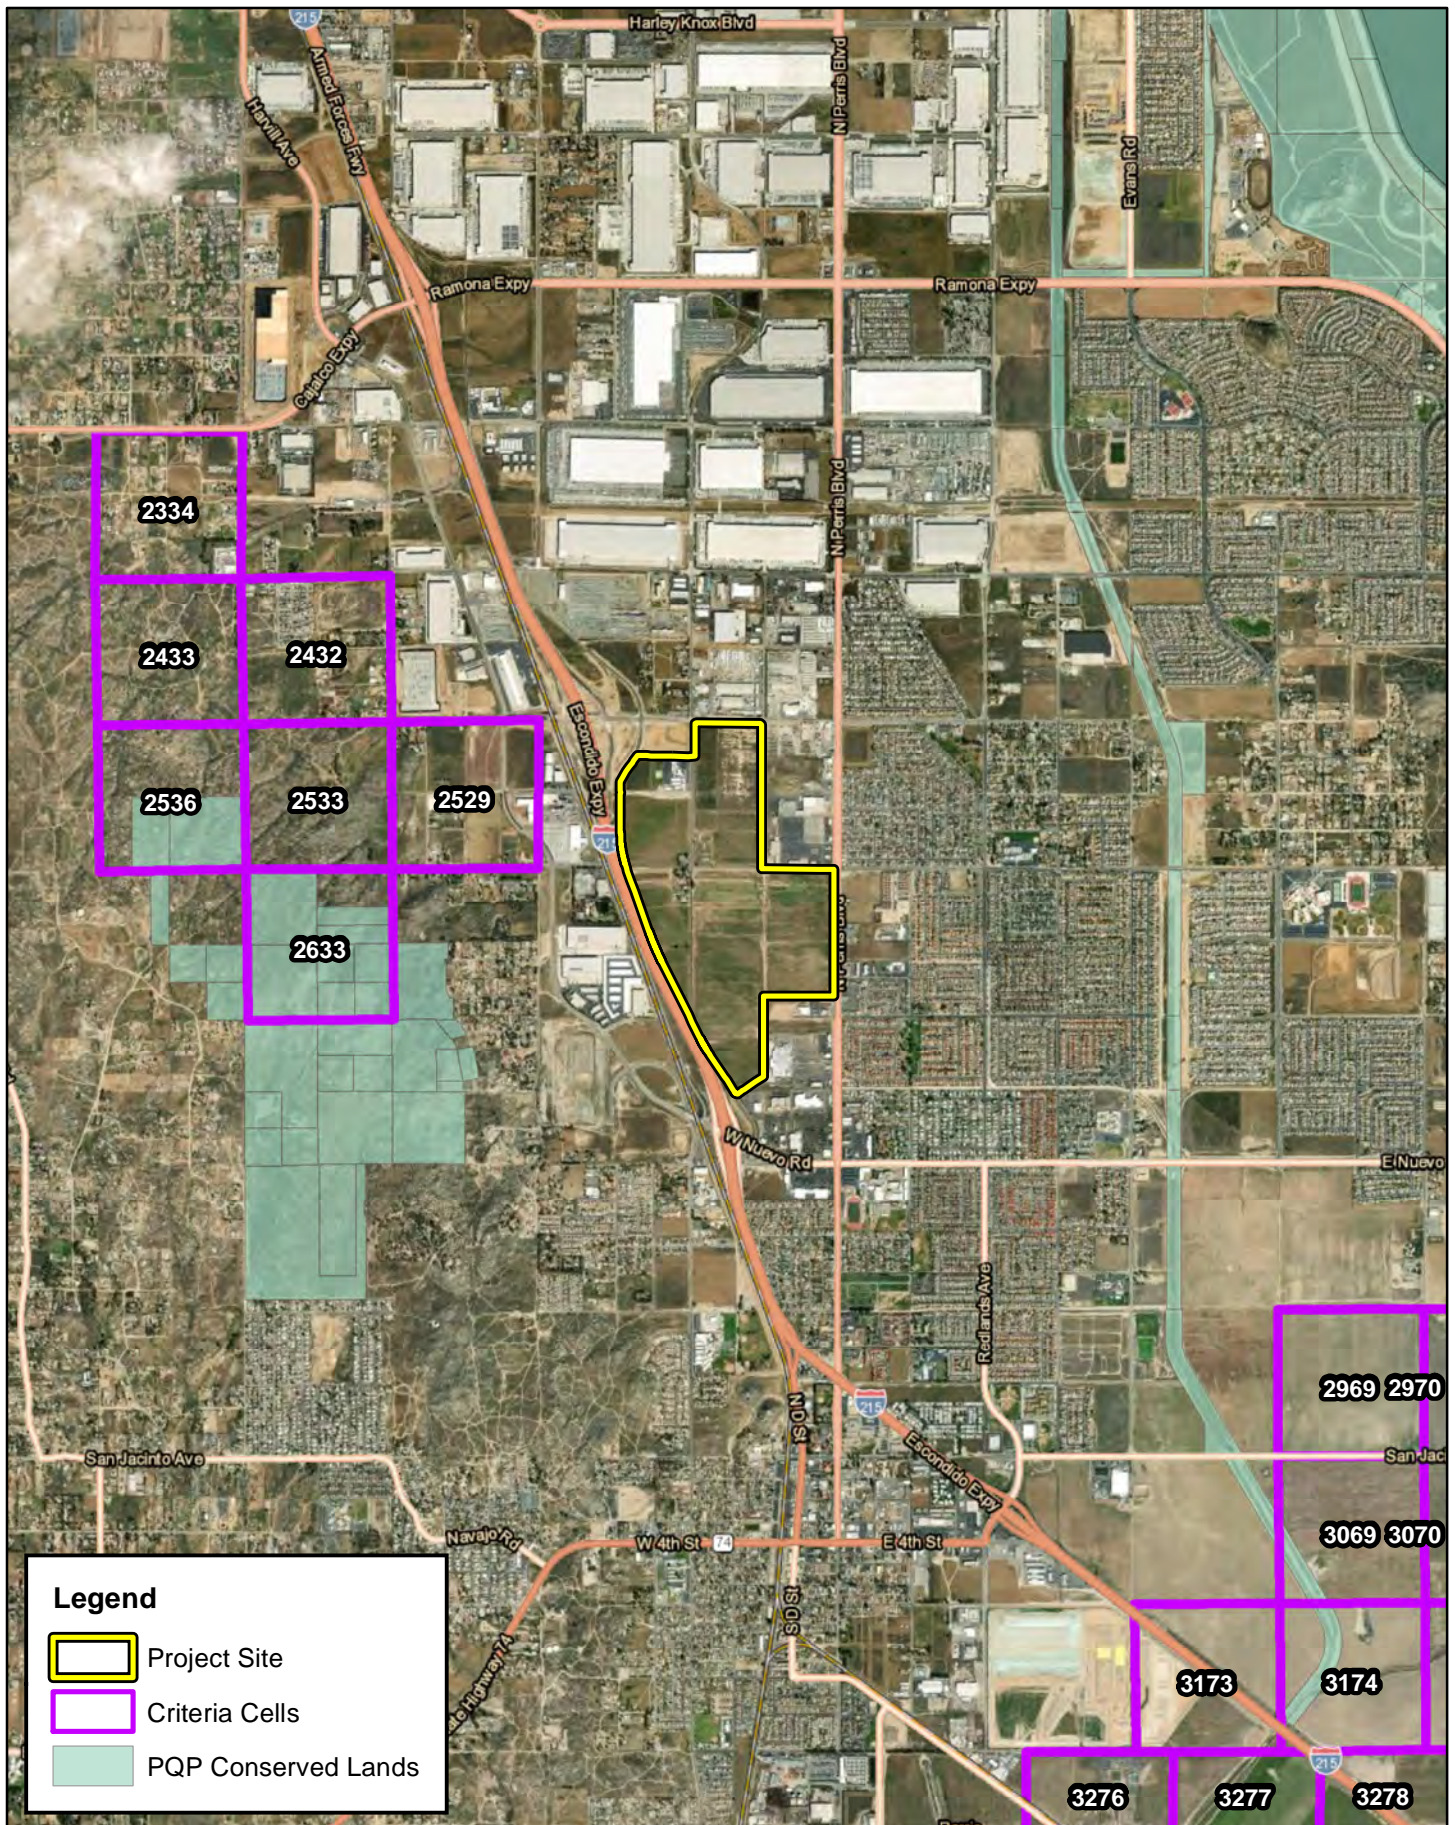

Two populations are on the Santa Rosa Plateau within the Santa Rosa Plateau Preserve. The project site is not located within any of the known occurrences of little mousetail. In addition, the heavily mixed and compacted soils and lack of natural vegetation communities within the site do not provide suitable habitat for this species. As a result, the project site was determined not to have potential to provide suitable habitat for little mousetail and this species is presumed absent.

Mud Nama (*Nama stenocarpa*)

Mud nama is an annual herb that blooms from January to July and is listed as a CNPS 2B.2 species. Mud nama is typically found within muddy embankments of marshes and swamps, and within lake margins and riverbanks between 16 and 1,640 feet above mean sea level. Within Riverside County, this species is known from along the San Jacinto River near Gilman Springs Road and from the El Casco quadrangle. The project site is not located within any of the known occurrences of mud nama. In addition, the heavily mixed and compacted soils and lack of natural vegetation communities within the site do not provide suitable habitat for this species. As a result, the project site was determined not to have potential to provide suitable habitat for mud nama and this species is presumed absent.

# HARVEST LANDING RETAIL CENTER AND BUSINESS PARK MSHCP Criteria Area

## Section 6      Stephen's Kangaroo Rat Habitat Conservation Plan

---

Separate from the consistency review against the policies of the MSHCP, Riverside County established a boundary in 1996 for protecting the Stephens' kangaroo rat (*Dipodomys stephensi*), a federally endangered and state threatened species. The Stephens' kangaroo rat is protected under the Stephens' Kangaroo Rat Habitat Conservation Plan (County Ordinance No. 663.10; SKR HCP). As described in the MSHCP Implementation Agreement, a Section 10(a) Permit, and California Fish and Game Code Section 2081 Management Authorization were issued to the Riverside County Habitat Conservation Agency (RCHCA) for the Long-Term SKR HCP and was approved by the USFWS and CDFW in August 1990 (RCHCA 1996). Relevant terms of the SKR HCP have been incorporated into the MSHCP and its Implementation Agreement. The SKR HCP will continue to be implemented as a separate habitat conservation plan; however, to provide the greatest conservation for the largest number of Covered Species, the Core Reserves established by the SKR HCP are managed as part of the MSHCP Conservation Area consistent with the SKR HCP. Actions shall not be taken as part of the implementation of the SKR HCP that will significantly affect other Covered Species. Take of Stephens' kangaroo rat outside of the boundaries but within the MSHCP area is authorized under the MSHCP and the associated permits.

The project site is located within the Mitigation Fee Area of the SKR HCP but is not located within or adjacent to any of the Core Reserve Areas. Since the project site is not located within or adjacent to any of the Core Reserve Areas, no focused SKR surveys or on-site mitigation would be required. On-site mitigation is only recommended in County Ordinance 663.10 when a site is located within or adjacent to a Core Reserve Area. As a result, the project applicant will only be required to pay the SKR HCP Mitigation Fee prior to development of the project site.

## Section 7 Conclusion and Recommendations

---

The discussion below provides a summary of survey results; avoidance and minimization efforts; direct, indirect, and cumulative project impacts; and compensatory mitigation measures for each biological resource area required to be analyzed according to the California Environmental Quality Act (CEQA), based on Appendix G (Environmental Checklist Form) of the CEQA Guidelines:

***CEQA Threshold:*** *Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service?*

### *Special-Status Plant Species*

No special-status plant species were observed during the field investigation. Based on habitat requirements for the identified special-status species, known species distributions, and the quality and availability of habitats present, it was determined that the project site has a low potential to support smooth tarplant and paniculate tarplant. The proposed project will be confined to existing heavily disturbed and developed areas that were subject to agricultural land uses and continue to be impacted by routine weed abatement regimes and other disturbances associated with on-site and surrounding development. Further, the site is isolated from known occupied areas and if any smooth tarplant and paniculate tarplant supported were found onsite, their present would not have a meaningful contribution to the conservation of the species. No additional surveys are recommended.

### *Special-Status Wildlife Species*

Recommendations for avoidance and minimization:

1. Prior to grading or construction activities, including vegetation removal, occurring during the nesting bird season (generally February 1st and August 31<sup>st</sup> but may be extended due to weather and drought conditions), a pre-construction clearance survey for nesting birds should be conducted within three (3) days of the start of any vegetation removal or ground disturbing activities to ensure that no nesting birds will be disturbed during construction. The project Applicant shall ensure that impacts to nesting bird species at the project site are avoided through the implementation of preconstruction surveys, ongoing monitoring, and if necessary, establishment of minimization measures. The project Applicant shall adhere to the following:
  - a. Applicant shall retain a qualified biologist (Designated Biologist) experienced in: identifying local and migratory bird species of special concern; conducting bird surveys using appropriate survey methodology; nesting surveying techniques, recognizing breeding and nesting behaviors, locating nests and breeding territories, and identifying nesting stages and nest success; determining/establishing appropriate avoidance and minimization measures; and monitoring the efficacy of implemented avoidance and minimization measures.

- b. Surveys shall be conducted by the Designated Biologist at the appropriate time of day/night, during appropriate weather conditions, no more than 3 days prior to the initiation of project activities. Surveys shall encompass all suitable areas including trees, shrubs, bare ground, burrows, cavities, and structures. Survey duration shall take into consideration the size of the project site; density, and complexity of the habitat; number of survey participants; survey techniques employed; and shall be sufficient to ensure the data collected is complete and accurate. If a nest is suspected, but not confirmed, the Designated Biologist shall establish a disturbance-free buffer until additional surveys can be completed, or until the location can be inferred based on observations. If a nest is observed, but thought to be inactive, the Designated Biologist shall monitor the nest for one hour (four hours for raptors during the non-breeding season) prior to approaching the nest to determine status. The Designated Biologist shall use their best professional judgement regarding the monitoring period and whether approaching the nest is appropriate.

If an active avian nest is confirmed, the Designated Biologist shall immediately establish a conservative avoidance buffer surrounding the nest based on their best professional judgement and experience. The Designated Biologist shall monitor the nest at the onset of project activities, and at the onset of any changes in such project activities (e.g., increase in number or type of equipment, change in equipment usage, etc.) to determine the efficacy of the buffer. If the Designated Biologist determines that such project activities may be causing an adverse reaction, the Designated Biologist shall adjust the buffer accordingly or implement alternative avoidance and minimization measures, such as redirecting or rescheduling construction or erecting sound barriers. All work within these buffers will be halted until the nesting effort is finished (i.e., the juveniles are surviving independent from the nest). The on-site qualified biologist will review and verify compliance with these nesting avoidance buffers and will verify the nesting effort has finished. Work can resume within these avoidance areas when no other active nests are found. Upon completion of the survey and nesting bird monitoring, a report shall be prepared and submitted to the City of Perris for mitigation monitoring compliance record keeping.

2. The project proponent shall retain a qualified biologist to conduct a pre-construction survey for resident burrowing owls within 30 days prior to commencement of grading and construction activities within the project site. The survey shall include the project site and all suitable burrowing owl habitat within a 500-foot buffer. The results of the survey shall be submitted to the City of Perris Planning Division prior to obtaining a grading permit. In addition, if burrowing owls are observed during the required nesting bird survey, to be conducted within three days prior to ground disturbance or vegetation clearance, the observation shall be reported to the Wildlife Agencies. If ground disturbing activities in these areas are delayed or suspended for more than 30 days after the pre-construction survey, the area shall be resurveyed for owls. The pre-construction survey and any relocation activity shall be conducted in accordance with the current Burrowing Owl Survey Instructions for the Western Riverside MSHCP.

If burrowing owl are detected, the CDFW shall be sent written notification by the City, within three days of detection of burrowing owls. If active nests are identified during the pre-construction survey, the nests shall be avoided and the qualified biologist and project proponent shall coordinate with the City of Perris Planning Division, the US Fish and Wildlife Service, and the CDFW to develop a Burrowing Owl Plan to be approved by the CDFW and the US Fish and Wildlife Service prior to commencing project activities. The Burrowing Owl Plan shall be prepared in accordance with guidelines in the CDFW Staff Report on Burrowing Owl (March 2012) and MSHCP. The Burrowing Owl Plan shall describe proposed avoidance, minimization, relocation, and monitoring as applicable. The Burrowing Owl Plan shall include the number and location of occupied burrow sites and details on proposed buffers if avoiding the burrowing owls and/or information on the adjacent or nearby suitable habitat available to owls for relocation. If no suitable habitat is available nearby for relocation, details regarding the creation and funding of artificial burrows (numbers, location, and type of burrows) and management activities for relocated owls may also be required in the Burrowing Owl Plan. The project proponent shall implement the Burrowing Owl Plan following CDFW and US Fish and Wildlife Service review and concurrence. A final letter report shall be prepared by the qualified biologist documenting the results of the Burrowing Owl Plan. The letter shall be submitted to the CDFW prior to the start of project activities. When a qualified biologist determines that burrowing owls are no longer occupying the project site per the criteria in the Burrowing Owl Plan, project activities may begin.

If burrowing owls occupy the project site after project activities have started, then construction activities shall be halted immediately. The project proponent shall notify the City and the City shall notify the CDFW and the US Fish and Wildlife Service within 48 hours of detection. A Burrowing Owl Plan, as detailed above, shall be implemented.

***CEQA Threshold:*** *Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?*

*Riparian Habitat and Special-Status Natural Communities*

Two (0) unnamed ephemeral drainage feature was observed within the project site during the field survey (Drainage 1 and 2). The onsite ephemeral drainage features are not a relatively permanent, standing, or continuously flowing body of water and, therefore, will not qualify as waters of the United States under the regulatory authority of the Corps (*Sackett v. EPA* (2022) 143 S. Ct. 1322, 1336). However, the onsite drainage features will likely qualify as waters of the State and fall under the regulatory authority of the Regional Board and CDFW.

Impacts to the on-site jurisdictional area will require a Corps Approved Jurisdictional Determination or Waiver, Regional Board CWA Section Report of Waste Discharge, and a CDFW Section 1602 Lake and Streambed Alteration Agreement prior to project implementation.

Additionally, no sensitive habitats were identified within the project site. Thus, no sensitive natural communities will be impacted from project implementation.

***CEQA Threshold:*** *Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?*

#### Federally Protected Wetlands

No inundated areas, wetland features, or wetland plant species that would be considered wetlands as defined by Section 404 of the Clean Water Act occur within the proposed project footprint. As a result, implementation of the proposed project would not result in any impacts or have substantial adverse effects on federally protected wetlands.

***CEQA Threshold:*** *Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?*

#### Wildlife Corridors

The project site has not been identified as occurring in a wildlife corridor or linkage. The nearest linkage, as identified by the MSHCP, occurs approximately 0.65 mile to the west of the project site in association with the Motte/Rimrock Reserve. The proposed project will be confined to existing areas that have been heavily disturbed and are isolated from regional wildlife corridors. Therefore, the project site does not function as a major wildlife movement corridor or linkage. As such, implementation of the proposed project is not expected to have a significant impact to wildlife movement opportunities or prevent local wildlife movement through the area. Due to the lack of any identified impacts to wildlife movement, migratory corridors or linkages or native wildlife nurseries, no mitigation is required. Therefore, impacts to wildlife corridors or linkages are not expected to occur.

Additionally, the project site does not provide any native wildlife nursery site (e.g., bat maternity site).

***CEQA Threshold:*** *Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?*

#### Local Policies or Ordinances

As outlined by the City of Perris Urban Forestry Establishment and Care Ordinance (Municipal Code Section 19.71.050) trees on private property may be protected and regulated under the provisions of the municipal code. To ensure that the proposed project is compliant with the City's municipal code, site plans shall identify the location of all existing trees with a diameter at breast-height (DBH) of six inches or larger and indicate whether these trees will be preserved or removed. For trees which are justified to be preserved, a tree protection plan will need to be prepared which identifies the location of these trees and sets forth protection instructions based on the recommendations of a qualified arborist.

***CEQA Threshold:*** *Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state Habitat Conservation Plan?*

*Local, Regional, and State Plans*

The project site is located within the Western Riverside County MSHCP. Specifically, the project site is located in the within the Mead Valley Area Plan of the MSHCP but is not located within any designated Criteria Cells or conservation areas. Based on the analysis provided in this report and with completion of recommendations provided above and payment of the MSHCP Local Development Mitigation Fee, development of the project site will be fully consistent with the MSHCP. Additionally, the project site is also located within the fee area for the SKR HCP. With payment of the Stephen's kangaroo rat mitigation fee, development of the project will be consistent with the SKR HCP.

## **Appendix C      Potentially Occurring Special-Status Biological Resources**

---

Table C-1: Potentially Occurring Special-Status Biological Resources

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<b>WILDLIFE SPECIES</b>					
<i>Accipiter cooperii</i> Cooper's hawk	Fed: None CA: WL	Generally found in forested areas up to 3,000 feet in elevation, especially near edges and rivers. Prefers hardwood stands and mature forests but can be found in urban and suburban areas where there are tall trees for nesting. Common in open areas during nesting season.	Yes	No	<b>High</b> Suitable foraging and nesting habitat are present within and surrounding the project site. This species is adapted to urban environments and occurs commonly.
<i>Accipiter striatus</i> sharp-shinned hawk	Fed: None CA: WL	Found in pine, fir and aspen forests. They can be found hunting in forest interior and edges from sea level to near alpine areas. Can also be found in rural, suburban and agricultural areas, where they often hunt at bird feeders. Typically found in southern California in the winter months.	Yes	No	<b>High</b> Suitable foraging habitat is present within and surrounding the project site. This species does not nest in this region. This species is adapted to urban environments and occurs commonly.
<i>Agelaius tricolor</i> tricolored blackbird	Fed: None CA: <b>THR/SSC</b>	Range is limited to the coastal areas of the Pacific coast of North America, from Northern California to upper Baja California. Can be found in a wide variety of habitat including annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields, cattle feedlots, and dairies. Occasionally forage in riparian scrub habitats along marsh borders. Basic habitat requirements for breeding include open accessible water, protected nesting substrate (freshwater marsh dominated by cattails, willows, and bulrushes), and either flooded or thorny or spiny vegetation and suitable foraging space providing adequate insect prey.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Aimophila ruficeps canescens</i> southern California rufous-crowned sparrow	Fed: None CA: WL	Typically found between 3,000 and 6,000 feet in elevation. Breed in sparsely vegetated scrubland on hillsides and canyons. Prefers coastal sage scrub dominated by California sagebrush ( <i>Artemisia californica</i> ), but they can also be found breeding in coastal bluff scrub, low-growing serpentine chaparral, and along the edges of tall chaparral habitats.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Ammodramus savannarum</i> grasshopper sparrow	Fed: None CA: SSC	Occurs in grassland, upland meadow, pasture, hayfield, and old field habitats. Optimal habitat contains short- to medium-height bunch grasses interspersed with patches of bare ground, a shallow litter layer, scattered forbs, and few shrubs. May inhabit thickets, weedy lawns, vegetated landfills, fence rows, open fields, or grasslands.	Yes (e)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Anniella stebbinsi</i> southern California legless lizard	Fed: None CA: SSC	Occurs in sparsely vegetated habitat types including coastal sand dunes, chaparral, pine-oak woodland, desert scrub, open grassland, and riparian areas. Requires sandy or loose loamy substrates conducive to burrowing.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Aquila chrysaetos</i> golden eagle	Fed: None CA: FP; WL	Occupies nearly all terrestrial habitats of the western states except densely forested areas. Favors secluded cliffs with overhanging ledges and large trees for nesting and cover. Hilly or mountainous country where takeoff and soaring are supported by updrafts is generally preferred to flat habitats. Deeply cut canyons rising to open mountain slopes and crags are ideal habitat.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Ardea alba</i> great egret	Fed: None CA: None	Yearlong resident throughout California, except for the high mountains and deserts. Feeds and rests in fresh, and saline emergent wetlands, along the margins of estuaries, lakes, and slow-moving streams, on mudflats and salt ponds, and in irrigated croplands and pastures.	No	No	<b>Low</b> Limited foraging habitat is present within the project site. No suitable nesting opportunities are present.
<i>Ardea herodias</i> great blue heron	Fed: None CA: None	Forages along streams, marshes, lakes, and meadows. Nests colonially in tall trees (typically <i>Eucalyptus</i> sp.), on cliffsides, or in isolated spots in marshes.	Yes	No	<b>Low</b> Limited foraging habitat is present within the project site. No suitable nesting opportunities are present.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Arizona elegans occidentalis</i> California glossy snake	Fed: None CA: SSC	Inhabits arid scrub, rocky washes, grasslands, and chaparral habitats.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Artemisiospiza belli belli</i> Bell's sparrow	Fed: None CA: WL	Generally prefers semi-open habitats with evenly spaced shrubs 1 – 2 meters in height. Dry chaparral and coastal sage scrub. Less common in tall dense, old chaparral.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Asio otus</i> long-eared owl	Fed: None CA: SSC	Hunts mostly at night over grasslands and other open habitats. Nesting occurs in dense trees such as oaks and willows where it occupies stick nests of other species, particularly raptors or corvids.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Aspidoscelis hyperythra</i> orangethroat whiptail	Fed: None CA: WL	Semi-arid brushy areas typically with loose soil and rocks, including washes, streamsides, rocky hillsides, and coastal chaparral.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Aspidoscelis tigris stejnegeri</i> coastal whiptail	Fed: None CA: SCC	Found in a variety of ecosystems, primarily hot and dry open areas with sparse foliage - chaparral, woodland, and riparian areas.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Athene cunicularia</i> burrowing owl	Fed: None CA: SSC	Occurs in open, annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Dependent upon fossorial mammals for burrows, most notable ground squirrels.	Yes (c)	Yes	<b>Present</b> The project site provides line-of-sight opportunities favored by burrowing owls. Was observed in an onsite water detention basin.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Aythya americana</i> redhead	Fed: None CA: SSC	Typically found in shallow freshwater lakes, ponds, and marshes.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Bombus crotchii</i> Crotch bumblebee	Fed: None CA: CE	Exclusive to coastal California east towards the Sierra-Cascade Crest; less common in western Nevada.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Bombus pensylvanicus</i> American bumblebee	Fed: None CA: None	Found in desert habitats and adjacent areas. Prefers farmlands, grasslands, and open fields. Nests embedded in grass or belowground.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Branchinecta lynchi</i> vernal pool fairy shrimp	Fed: <b>THR</b> CA: None	Associated with vernal pools. Can be found in association with other ephemeral habits including alkali pools, seasonal drainages, stock ponds, vernal swales, and rock outcrops.	Yes (a)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Branchinecta sandiegonensis</i> San Diego fairy shrimp	Fed: <b>END</b> CA: None	Habitat is restricted to vernal pools along coastal southern California and northwestern Baja California, Mexico. Usually observed from January to March during seasonal rainfall events.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Buteo regalis</i> ferruginous hawk	Fed: None CA: WL	Occurs primarily in open grasslands and fields, but may be found in sagebrush flats, desert scrub, low foothills, or along the edges of pinyon-juniper woodland. Feeds primarily on small mammals and typically found in agricultural or open fields.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Buteo swainsoni</i> Swainson's hawk	Fed: None CA: <b>THR</b>	Typical habitat is open desert, grassland, or cropland containing scattered, large trees or small groves. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grassland or suitable grain or alfalfa fields or livestock pastures.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Calypte costae</i> Costa's hummingbird	Fed: None CA: None	Desert and semi-desert, arid brushy foothills and chaparral. A desert hummingbird that breeds in the Sonoran and Mojave Deserts. Departs desert heat moving into chaparral, scrub, and woodland habitats.	No	No	<b>High</b> Suitable foraging and nesting habitat are present within and surrounding the project site. This species is adapted to urban environments and occurs commonly.
<i>Chaetodipus californicus femoralis</i> Dulzura pocket mouse	Fed: None CA: SSC	Occurs in desert and coastal habitats in southern California, Mexico, and northern Baja California, from sea level to at least 1,400 meters. Found in a variety of temperate habitats ranging from chaparral and grasslands to scrub forests and deserts. Requires low growing vegetation or rocky outcroppings, as well as sandy soils for burrowing.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Chaetodipus fallax fallax</i> northwestern San Diego pocket mouse	Fed: None CA: SSC	Occurs in desert and coastal habitats in southern California, Mexico, and northern Baja California, from sea level to at least 1,400 meters. Found in a variety of temperate habitats ranging from chaparral and grasslands to scrub forests and deserts. Requires low growing vegetation or rocky outcroppings, as well as sandy soils for burrowing.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Chaetura vauxi</i> Vaux's swift	Fed: None CA: SSC	Prefers redwood and Douglas-fir habitats with nest-sites in large hollow trees and snags, especially tall, burned-out snags. Fairly common migrant throughout most of the state in April and May, and August and September.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Charadrius montanus</i> mountain plover	Fed: None CA: SSC	Found in short grasslands, freshly plowed fields, newly-sprouting grain fields, and sometimes in sod farms. Prefers short vegetation or bare ground with flat topography, particularly grazed areas or areas with fossorial rodents.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Circus hudsonius</i> northern harrier	Fed: None CA: SSC	Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas. Mostly found in flat, or hummocky, open areas of tall, dense grasses moist or dry shrubs, and edges for nesting, cover, and feeding.	Yes	No	<b>High</b> Suitable foraging habitat is present for raptors migrating along the San Jacinto River. No suitable nesting opportunities are present.
<i>Coleonyx variegatus abbotti</i> San Diego banded gecko	Fed: None CA: SCC	Occurs in coastal and cismontane southern California from interior Ventura County south, although it is absent from the extreme outer coast. It is uncommon in coastal scrub and chaparral, most often occurring in granite or rocky outcrops in these habitats.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Crotalus ruber</i> red-diamond rattlesnake	Fed: None CA: SSC	It can be found from the desert, through dense chaparral in the foothills (it avoids the mountains above around 4,000 feet), to warm inland mesas and valleys, all the way to the cool ocean shore. It is most commonly associated with heavy brush with large rocks or boulders. Dense chaparral in the foothills, cactus or boulder associated coastal sage scrub, oak and pine woodlands, and desert slope scrub associations are known to carry populations of the northern red-diamond rattlesnake; however, chamise and red shank associations may offer better structural habitat for refuges and food resources for this species than other habitats.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Diadophis punctatus modestus</i> San Bernardino ringneck snake	Fed: None CA: None	Common in open, relatively rocky areas within valley-foothill, mixed chaparral, and annual grass habitats.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Diadophis punctatus similis</i> San Diego ringneck snake	Fed: None CA: None	Prefers moist habitats, including wet meadows, rocky hillsides, gardens, farmland, grassland, chaparral, mixed coniferous forests, and woodlands.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Dipodomys merriami parvus</i> San Bernardino kangaroo rat	Fed: <b>END</b> CA: CE; SSC	Primarily found in Riversidian alluvial fan sage scrub and sandy loam soils, alluvial fans and flood plains, and along washes with nearby sage scrub. May occur at lower densities in Riversidian upland sage scrub, chaparral and grassland in uplands and tributaries in proximity to Riversidian alluvial fan sage scrub habitats. Tend to avoid rocky substrates and prefer sandy loam substrates for digging of shallow burrows.	Yes (c)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Dipodomys simulans</i> Dulzura kangaroo rat	Fed: None CA: None	Typical habitat is open desert, grassland, or cropland containing scattered, large trees or small groves. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grassland or suitable grain or alfalfa fields or livestock pastures.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Dipodomys stephensi</i> Stephens' kangaroo rat	Fed: <b>THR</b> CA: <b>THR</b>	Occur in arid and semi-arid habitats with some grass or brush. Prefer open habitats with less than 50% protective cover. Require soft, well-drained substrate for building burrows and are typically found in areas with sandy soil.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Egretta thula</i> snowy egret	Fed: None CA: None	Widespread in California along shores of coastal estuaries, fresh and saline emergent wetlands, ponds, slow-moving rivers, irrigation ditches, and wet fields. In southern California, common yearlong in the Imperial Valley and along the Colorado River.	No	No	<b>Low</b> Limited foraging habitat is present within and surrounding the project site. No suitable nesting opportunities are present.
<i>Elanus leucurus</i> white-tailed kite	Fed: None CA: FP	Occurs in low elevation, open grasslands, savannah-like habitats, agricultural areas, wetlands, and oak woodlands. Uses trees with dense canopies for cover.	Yes	Yes	<b>Moderate</b> Limited foraging and nesting habitat are present within and near the project site. One (1) adult was observed foraging near the northwest corner of the intersection of Orange Avenue and Indian Avenue.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Empidonax traillii</i> willow flycatcher	Fed: None CA: <b>END</b>	A rare to locally uncommon, summer resident in wet meadow and montane riparian habitats (2,000 to 8,000 ft) in the Sierra Nevada and Cascade Range. Most often occurs in broad, open river valleys or large mountain meadows with lush growth of shrubby willows.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Empidonax traillii extimus</i> southwestern willow flycatcher	Fed: <b>END</b> CA: <b>END</b>	Occurs in riparian woodlands in southern California. Typically requires large areas of willow thickets in broad valleys, canyon bottoms, or around ponds and lakes. These areas typically have standing or running water or are at least moist.	Yes (a)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Emys marmorata</i> western pond turtle	Fed: None CA: SSC	Found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches, with abundant vegetation, either rocky or muddy bottoms, in woodland, forest, and grassland. In streams, prefers pools to shallower areas. Logs, rocks, cattail mats, and exposed banks are required for basking. May enter brackish water and even seawater. Found at elevations from sea level to over 5,900 feet (1,800 m).	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Eremophila alpestris actia</i> California horned lark	Fed: None CA: WL	Generally found in shortgrass prairies, grasslands, disturbed fields, or similar habitat types along the coast or in deserts. Trees and shrubs are usually scarce or absent. Generally rare in montane, coniferous, or chaparral habitats. Forms large flocks outside of the breeding season.	Yes	No	<b>High</b> Suitable foraging and nesting habitat are present within and near the project site.
<i>Eumops perotis californicus</i> western mastiff bat	Fed: None CA: SSC	Primarily a cliff-dwelling species, roost generally under exfoliating rock slabs. Roosts are generally high above the ground, usually allowing a clear vertical drop of at least 3 meters below the entrance for flight. In California, it is most frequently encountered in broad open areas. Its foraging habitat includes dry desert washes, flood plains, chaparral, oak woodland, open ponderosa pine forest, grassland, and agricultural areas.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Euphydryas editha quino</i> Quino checkerspot butterfly	Fed: <b>END</b> CA: None	Range is now limited to a few populations in Riverside and San Diego counties. Common in meadows and upland sage scrub/chaparral habitat.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Falco columbarius</i> merlin	Fed: None CA: WL	Nest in forested openings, edges, and along rivers across northern North America. Found in open forests, grasslands, and especially coastal areas with flocks of small songbirds or shorebirds.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Falco mexicanus</i> prairie falcon	Fed: None CA: WL	Commonly occur in arid and semiarid shrubland and grassland community types. Also occasionally found in open parklands within coniferous forests. During the breeding season, they are found commonly in foothills and mountains which provide cliffs and escarpments suitable for nest sites.	Yes	Yes	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Falco peregrinus anatum</i> American peregrine falcon	Fed: DL CA: DL; FP	Uncommon winter resident of the inland region of southern California. Active nesting sites are known along the coast north of Santa Barbara, in the Sierra Nevada, and in other mountains of northern California. Breeds mostly in woodland, forest, and coastal habitats. Riparian areas and coastal and inland wetlands are important habitats yearlong, especially in nonbreeding seasons.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Haliaeetus leucocephalus</i> bald eagle	Fed: DL CA: <b>END</b> ; FP	Occur primarily at or near seacoasts, rivers, swamps, and large lakes. Need ample foraging opportunities, typically near a large water source.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Hydroprogne caspia</i> Caspian tern	Fed: None CA: None	Occurs near large lakes, coastal waters, beaches, and bays. Found on both fresh and salt water, favoring protected waters such as bays and lagoons, rivers, not usually foraging over open sea. Nests on open ground on islands, coasts.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Icteria virens</i> yellow-breasted chat	Fed: None CA: SSC	Primarily found in tall, dense, relatively wide riparian woodlands and thickets of willows, vine tangles, and dense brush with well-developed understories. Nesting areas are associated with streams, swampy ground, and the borders of small ponds. Breeding habitat must be dense to provide shade and concealment. It winters south the Central America.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Lanius ludovicianus</i> loggerhead shrike	Fed: None CA: SSC	Often found in broken woodlands, shrublands, and other habitats. Prefers open country with scattered perches for hunting and fairly dense brush for nesting.	Yes	No	<b>Low</b> Limited foraging habitat is present within and surrounding the project site. No suitable nesting opportunities are present.
<i>Larus californicus</i> California gull	Fed: None CA: WL	Require isolated islands in rivers, reservoirs and natural lakes for nesting, where predations pressures from terrestrial mammals are diminished. Uses both fresh and saline aquatic habitats at variable elevations and degrees of aridity for nesting and for opportunistic foraging.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Lasiurus xanthinus</i> western yellow bat	Fed: None CA: SSC	Roosts in palm trees in foothill riparian, desert wash, and palm oasis habitats with access to water for foraging.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Lepus californicus bennettii</i> San Diego black-tailed jackrabbit	Fed: None CA: None	Occurs in diverse habitats, but primarily is found in arid regions supporting shortgrass habitats. Openness of open scrub habitat is preferred over dense chaparral.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Lynx rufus pallescens</i> pallid bobcat	Fed: None CA: None	Found on the western edge of the great basin habitat in extreme northeast California. Live in a variety of habitats including forests, deserts, mountains, swamps and farmland.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Myotis yumanensis</i> Yuma myotis	Fed: None CA: None	Found in forests and woodlands near water. Roosts in caves, buildings, mines, and crevices.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Nannopterum auritum</i> double-crested cormorant	Fed: None CA: WL	Common yearlong resident in southern California. Occurs widely in freshwater and marine habitats along coastlines. Require open water where they can forage for schooling fish.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Neolarra alba</i> white cuckoo bee	Fed: None CA: None	Found in dry, sandy areas (particularly deserts) in the American southwest near the host plants for <i>Perdita</i> bee species, of which it is a nest parasite.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Neotoma lepida intermedia</i> San Diego desert woodrat	Fed: None CA: SSC	Occurs in coastal scrub communities between San Luis Obispo and San Diego Counties. Prefers moderate to dense canopies, and especially rocky outcrops.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Numenius americanus</i> long-billed curlew	Fed: None CA: WL	Preferred winter habitats include large coastal estuaries, upland herbaceous areas, and croplands. On estuaries, feeding occurs mostly on intertidal mudflats.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Nycticorax nycticorax</i> black-crowned night heron	Fed: None CA: None	Fairly common, yearlong resident in lowlands and foothills throughout most of California, including the Salton Sea and Colorado River areas, and very common locally in large nesting colonies. Feeds along the margins of lacustrine, large riverine, and fresh and saline emergent habitats and rarely, on kelp beds in marine sub tidal habitats. Nests and roosts in dense-foliaged trees and dense emergent wetlands.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Nyctinomops femorosaccus</i> pocketed free-tailed bat	Fed: None CA: SSC	Prefers open lowland areas near water in arid or semi-arid habitats including deserts and scrublands including pinyon-juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oasis. Colonial roosting sites include caves, mines, and rock crevices, and to a lesser extent, buildings, bridges, and trees.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Onychomys torridus ramona</i> southern grasshopper mouse	Fed: None CA: SSC	Inhabits alkali desert scrub and other desert scrub habitats, and to a lesser extent succulent shrubs, desert washes, desert riparian, coastal scrub, mixed chaparral, and sagebrush habitats. Generally rare in valley foothill and montane riparian habitats. Prefers low to moderate shrub cover and requires friable soils.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Pandion haliaetus</i> osprey	Fed: None CA: WL	Remain close to still or slow-moving bodies of water including oceans, rivers, lakes, mangroves, coastal wetlands, lagoons, reefs, estuaries and marshes. Generally nest in high places, such as trees, power poles, or cliffs.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Pelecanus erythrorhynchos</i> American white pelican	Fed: None CA: SSC	Locally common winter resident of southern California. Typically forage in shallow inland waters, such as open areas in marshes and along lake or river edges. Also occur in shallow coastal marine habitats.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Pelecanus occidentalis californicus</i> California brown pelican	Fed: DL CA: DL; FP	Coastal areas, with nesting occurring on islands. Species found occasionally along Arizona's lakes and rivers. This species inhabits shallow inshore waters, estuaries and bays, avoiding the open sea. Its diet is comprised mostly of fish, causing great congregations in areas with abundant prey. Prey species include sardines and anchovies, but has been seen to take shrimps and carrion, and even nestling egrets. It regularly feeds by plunge-diving and is often the victim of kleptoparasites.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Perognathus longimembris brevinasus</i> Los Angeles pocket mouse	Fed: None CA: SSC	Occurs in lower elevation grasslands and coastal sage scrub communities in and around the Los Angeles Basin. Prefers open ground with fine sandy soils. May not dig extensive burrows, but instead will seek refuge under weeds and dead leaves instead.	Yes (c)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Phrynosoma blainvillii</i> coast horned lizard	Fed: None CA: SSC	Occurs in a wide variety of vegetation types including coastal sage scrub, annual grassland, chaparral, oak woodland, riparian woodland and coniferous forest. In inland areas, this species is restricted to areas with pockets of open microhabitat, created by disturbance (i.e. fire, floods, roads, grazing, fire breaks). The key elements of such habitats are loose, fine soils with a high sand fraction; an abundance of native ants or other insects; and open areas with limited overstory for basking and low, but relatively dense shrubs for refuge.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Plegadis chihi</i> white-faced ibis	Fed: None CA: WL	Prefers to feed in fresh emergent wetland, shallow lacustrine waters, muddy ground of wet meadows, and irrigated or flooded pastures and croplands. Nests in dense, fresh emergent wetland.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Poliophtila californica californica</i> coastal California gnatcatcher	Fed: THR CA: SSC	Obligate resident of sage scrub habitats that are dominated by California sagebrush ( <i>Artemisia californica</i> ). This species generally occurs below 750 feet elevation in coastal regions and below 1,500 feet inland. Ranges from the Ventura County, south to San Diego County and northern Baja California and it is less common in sage scrub with a high percentage of tall shrubs. Prefers habitat with more low-growing vegetation.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Poliophtila melanura</i> black-tailed gnatcatcher	Fed: None CA: WL	In Mojave, Great Basin, Colorado and Sonoran Desert communities, prefers nesting and foraging in densely lined arroyos and washes dominated by creosote bush and salt bush with scattered bursage, burrowed, ocotillo, saguaro, barrel cactus, nipple cactus, and prickly pear and cholla.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Pyrocephalus rubinus</i> vermillion flycatcher	Fed: None CA: SSC	Can be found in any open country in the American Southwest, including arid scrublands, farmlands, deserts, parks, and canyon mouths. In more arid areas, species prefers areas near streams or other sources of water. Nests in trees usually 6 to 20 feet aboveground along stream corridors.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Salvadora hexalepis virgulata</i> coast patch-nosed snake	Fed: None CA: SSC	Found in brushy or shrubby vegetation along the coast and requires small mammal burrows for refuge and overwintering.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Setophaga petechia</i> yellow warbler	Fed: None CA: SSC	Nests over all of California except the Central Valley, the Mojave Desert region, and high altitudes and the eastern side of the Sierra Nevada. Winters along the Colorado River and in parts of Imperial and Riverside Counties. Nests in riparian areas dominated by willows, cottonwoods, sycamores, or alders or in mature chaparral. May also use oaks, conifers, and urban areas near stream courses.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Spea hammondi</i> western spadefoot	Fed: None CA: SSC	Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washed, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Rainpools which do not contain bullfrogs, fish, or crayfish are necessary for breeding.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Spinus lawrencei</i> Lawrence's goldfinch	Fed: None CA: None	Open woodlands, chaparral, and weedy fields. Closely associated with oaks. Nests in open oak or other arid woodland and chaparral near water.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Spizella breweri</i> Brewer's sparrow	Fed: None CA: None	Lives in arid sagebrush steppe habitat. Prefers to nest, feed, and roost in sagebrush. Can also be found along foothill tree lines, brushy plains, and weedy fields.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Streptocephalus woottoni</i> Riverside fairy shrimp	Fed: <b>END</b> CA: None	Freshwater crustacean that is found in vernal pools in the coastal California area.	Yes (a)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Taxidea taxus</i> American badger	Fed: None CA: SSC	Primarily occupy grasslands, parklands, farms, tallgrass and shortgrass prairies, meadows, shrub-steppe communities and other treeless areas with sandy loam soils where it can dig more easily for its prey. Occasionally found in open chaparral (with less than 50% plant cover) and riparian zones.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Vireo bellii pusillus</i> least Bell's vireo	Fed: <b>END</b> CA: <b>END</b>	Primarily occupy Riverine riparian habitat that typically feature dense cover within 1 -2 meters of the ground and a dense, stratified canopy. Typically it is associated with southern willow scrub, cottonwood-willow forest, mule fat scrub, sycamore alluvial woodlands, coast live oak riparian forest, arroyo willow riparian forest, or mesquite in desert localities. It uses habitat which is limited to the immediate vicinity of water courses, 2,000 feet elevation in the interior.	Yes (a)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Xanthocephalus xanthocephalus</i> yellow-headed blackbird	Fed: None CA: SSC	Summers in the west-central United States and Canada and winters throughout the western United States. Nests primarily in large wetlands, but also in mountain meadows and along pond and river edges. Forages in fields and open country. Breeds in freshwater sloughs, marshy lake borders, and tall cattails.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<b>PLANT SPECIES</b>					
<i>Abronia villosa</i> var. <i>aurita</i> chaparral sand-verbena	Fed: None CA: None CNPS: 1B.1	Grows in sandy soils in coastal sage scrub and in chaparral habitats. Grows in elevation from 262 to 5,249 feet. Blooming period is from January to September.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Allium munzii</i> Munz's onion	Fed: <b>END</b> CA: <b>THR</b> CNPS: 1B.1	Found in chaparral, cismontane woodland, coastal scrub, pinyon and juniper woodland, valley and foothill grassland. Found at elevations ranging from 974 to 3,510 feet. Blooming period is from March to May.	Yes (b)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Arctostaphylos rainbowensis</i> rainbow manzanita	Fed: None CA: None CNPS: 1B.1	Grows within chaparral habitats. Found at elevations ranging from 675 to 2,200 feet. Blooming period is from December to March.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Atriplex coronata</i> var. <i>notatior</i> San Jacinto Valley crownscale	Fed: <b>END</b> CA: None CNPS: 1B.1	Grows in alkaline conditions within playas, mesic valley and foothill grasslands, and vernal pools. Found at elevations ranging from 456 to 1,640 feet. Blooming period is from April to August.	Yes (d)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Atriplex parishii</i> Parish's brittle scale	Fed: None CA: None CNPS: 1B.1	Habitat types include chenopod scrub, playas, and vernal pools. Found at elevations ranging from 82 to 6,234 feet. Blooming period is from June to October.	Yes (d)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Atriplex serenana</i> var. <i>davidsonii</i> Davidson's salt scale	Fed: None CA: None CNPS: 1B.2	Grows in alkaline soils within coastal bluff scrub and coastal scrub. Found at elevations ranging from 33 to 656 feet. Blooming period is from April to October.	Yes (d)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site. The project site occurs outside of the known elevation range for this species.
<i>Brodiaea filifolia</i> thread-leaved brodiaea	Fed: <b>THR</b> CA: <b>END</b> CNPS: 1B.1	Grows in chaparral openings, cismontane woodland, coastal scrub, playas, valley and foothill grassland, and vernal pools, often in clay soils. Found at elevations ranging from 82 to 3,675 feet. Blooming period is from March to June.	Yes (d)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Caulanthus simulans</i> Payson's jewelflower	Fed: None CA: None CNPS: 4.2	Occurs on granitic sandy soils in chaparral and coastal scrub habitats. Found at elevations ranging from 295 to 7,218 feet. Blooming period is from February to June.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Centromadia pungens</i> ssp. <i>laevis</i> smooth tarplant	Fed: None CA: None CNPS: 1B.1	Found in alkaline soils within chenopod scrub, meadows and seeps, playas, riparian woodland, valley, and foothill grassland habitats. Found at elevations ranging from 0 to 2,100 feet. Blooming period is from April to September.	Yes (d)	No	<b>Low</b> Limited habitat is present within the project site. This species is adapted to highly disturbed areas.
<i>Chorizanthe leptotheca</i> Peninsular spineflower	Fed: None CA: None CNPS: 4.2	Found in granitic soils within chaparral, coast scrub, and lower montane coniferous forest habitats. Found at elevations ranging from 984 to 6,234 feet. Blooming period is from May to August.	Yes (e)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Chorizanthe parryi</i> var. <i>parryi</i> Parry's spineflower	Fed: None CA: None CNPS: 1B.1	Occurs on sandy and/or rocky soils in chaparral, coastal sage scrub, and sandy openings within alluvial washes and margins. Found at elevations ranging from 951 to 3,773 feet. Blooming period is from April to June.	Yes (e)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Chorizanthe polygonoides</i> var. <i>longispina</i> long-spined spineflower	Fed: None CA: None CNPS: 1B.2	Typically found on clay lenses which are largely devoid of shrubs. Can be found on the periphery of vernal pool habitat and even on the periphery of montane meadows near vernal seeps. Found at elevations ranging from 98 to 5,020 feet. Blooming period is from April to July.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Convolvulus simulans</i> small-flowered morning-glory	Fed: None CA: None CNPS: 4.2	Grows in clay soils within serpentinite seeps, chaparral, coastal scrub, valley and foothill grassland habitats. Found at elevations ranging from 98 to 2,297 feet. Blooming period is from March to July.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Deinandra paniculata</i> paniculate tarplant	Fed: None CA: None CNPS: 4.2	Typically found in vernal mesic, sometimes sandy soils in coastal scrub, valley and foothill grasslands, and vernal pools. Found at elevations ranging from 82 to 3,084 feet. Blooming period is from April to November.	No	No	<b>Low</b> Limited habitat is present within the project site. This species is adapted to highly disturbed areas.
<i>Harpagonella palmeri</i> Palmer's grapplinghook	Fed: None CA: None CNPS: 4.2	Occurs on clay soils in chaparral, coastal scrub, and valley and foothill grasslands. Found at elevations ranging from 66 to 3,133 feet. Blooming period is from March to May.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Hordeum intercedens</i> vernal barley	Fed: None CA: None CNPS: 3.2	Found in coastal dunes, coastal scrub, vernal pools, and valley and foothill grassland habitats. Found at elevations ranging from 16 to 3,281 feet. Blooming period is from March to June.	Yes	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Lasthenia glabrata</i> ssp. <i>coulteri</i> Coulter's goldfields	Fed: None CA: None CNPS: 1B.1	Prefers playas, vernal pools, and coastal salt marshes and swamps. Found at elevations ranging from 3 to 4,003 feet. Blooming period is from February to June.	Yes (d)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	Status	Habitat	Covered by MSHCP	Observed On-site	Potential to Occur
<i>Lepidium virginicum</i> var. <i>robinsonii</i> Robinson's pepper-grass	Fed: None CA: None CNPS: 4.3	Dry soils on chaparral and coastal sage scrub. Found at elevations ranging from 3 to 2,904 feet. Blooming period is from January to July.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Myosurus minimus</i> ssp. <i>apus</i> little mouse-tail	Fed: None CA: None CNPS: 3.1	Occurs in alkaline soils in valley and foothill grassland and vernal pools. Found at elevations ranging from 66 to 2,100 feet. Blooming period is from March to June.	Yes (d)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Navarretia fossalis</i> spreading navarretia	Fed: <b>THR</b> CA: None CNPS: 1B.1	Grows in chenopod scrub, assorted shallow freshwater marshes and swamps, playas, and vernal pools. Found at elevations ranging from 98 to 2,149 feet. Blooming period is from April to June.	Yes (b)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Romneya coulteri</i> Coulter's matilija poppy	Fed: None CA: None CNPS: 4.2	Found in recently burned areas within chaparral and coastal scrub habitats. Found at elevations ranging from 66 to 3,937 feet. Blooming period is from March to July.	Yes (e)	No	<b>Presumed Absent</b> There is no suitable habitat present within the project site.
<i>Texosporium sancti-jacobi</i> woven-spored lichen	Fed: None CA: None CNPS: 3	Found on soil, small mammal pellets, dead twigs, and on <i>Selaginella</i> sp. within openings in chaparral habitat. Found at elevations ranging from 951 to 2,165 feet.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within the project site.
<i>Tortula californica</i> California screw moss	Fed: None CA: None CNPS: 1B.2	Found in chenopod scrub and valley and foothill grassland. Grows on sandy soil. Found at elevations ranging from 33 to 4,790 feet.	No	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.
<i>Trichocoronis wrightii</i> var. <i>wrightii</i> Wright's trichocoronis	Fed: None CA: None CNPS: 2B.1	Grows in alkaline soils in meadows and seeps, marshes and swamps, riparian forest, and vernal pools. Found at elevations ranging from 16 to 1,427 feet. Blooming period is from May to September.	Yes (b)	No	<b>Presumed Absent</b> There is no suitable habitat present within or adjacent to the project site.

CDFW SENSITIVE HABITATS					
Southern Coast Live Oak Riparian Forest	CDFW Sensitive Habitat	Open to locally dense evergreen riparian woodlands dominated by <i>Quercus agrifolia</i> . This type appears to be richer in herbs and poorer in understory shrubs than other riparian communities. Bottomlands and outer floodplains along larger streams, on fine-grained, rich alluvium. Canyons and valleys of coastal southern California.	NA	No	<b>Absent</b>
Southern Cottonwood Willow Riparian Forest	CDFW Sensitive Habitat	Dominated by cottonwood ( <i>Populus</i> sp.) and willow ( <i>Salix</i> sp.) trees and shrubs. Considered to be an early successional stage as both species are known to germinate almost exclusively on recently deposited or exposed alluvial soils.	NA	No	<b>Absent</b>
Southern Sycamore Alder Riparian Woodland	CDFW Sensitive Habitat	Occurs below 2,000 meters in elevation, sycamore and alder often occur along seasonally-flooded banks; cottonwoods and willows are also often present. Poison oak, mugwort, elderberry and wild raspberry may be present in understory.	NA	No	<b>Absent</b>

 Yes (d)- May require surveys under MSHCP Section 6.3.2  
 Yes (e)- Conditionally covered pending the achievement of species-specific conservation measures

## **Appendix D      Regulations**

---

*Special status species are native species that have been afforded special legal or management protection because of concern for their continued existence. There are several categories of protection at both federal and state levels, depending on the magnitude of threat to continued existence and existing knowledge of population levels.*

## **Federal Regulations**

### ***Endangered Species Act of 1973***

Federally listed threatened and endangered species and their habitats are protected under provisions of the Federal Endangered Species Act (ESA). Section 9 of the ESA prohibits “take” of threatened or endangered species. “Take” under the ESA is defined as to “harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any of the specifically enumerated conduct.” The presence of any federally threatened or endangered species that are in a project area generally imposes severe constraints on development, particularly if development would result in “take” of the species or its habitat. Under the regulations of the ESA, the United States Fish and Wildlife Service (USFWS) may authorize “take” when it is incidental to, but not the purpose of, an otherwise lawful act.

Critical Habitat is designated for the survival and recovery of species listed as threatened or endangered under the ESA. Critical Habitat includes those areas occupied by the species, in which are found physical and biological features that are essential to the conservation of an ESA listed species and which may require special management considerations or protection. Critical Habitat may also include unoccupied habitat if it is determined that the unoccupied habitat is essential for the conservation of the species.

Whenever federal agencies authorize, fund, or carry out actions that may adversely modify or destroy Critical Habitat, they must consult with USFWS under Section 7 of the ESA. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highway Administration or a permit from the U.S. Army Corps of Engineers (Corps)).

If USFWS determines that Critical Habitat will be adversely modified or destroyed from a proposed action, the USFWS will develop reasonable and prudent alternatives in cooperation with the federal institution to ensure the purpose of the proposed action can be achieved without loss of Critical Habitat. If the action is not likely to adversely modify or destroy Critical Habitat, USFWS will include a statement in its biological opinion concerning any incidental take that may be authorized and specify terms and conditions to ensure the agency is in compliance with the opinion.

### ***Migratory Bird Treaty Act***

The Migratory Bird Treaty Act (MBTA) (16 U.S. Government Code [USC] 703) makes it unlawful to pursue, capture, kill, possess, or attempt to do the same to any migratory bird or part, nest, or egg of any such bird listed in wildlife protection treaties between the United States, Great Britain, Mexico, Japan, and the countries of the former Soviet Union, and authorizes the U.S. Secretary of the Interior to protect and regulate the taking of migratory birds. It establishes seasons and bag limits for hunted species and protects migratory birds, their occupied nests, and their eggs (16 USC 703; 50 CFR 10, 21).

The MBTA covers the taking of any nests or eggs of migratory birds, except as allowed by permit pursuant to 50 CFR, Part 21. Disturbances causing nest abandonment and/or loss of reproductive effort (i.e., killing or abandonment of eggs or young) may also be considered “take.” This regulation seeks to protect migratory birds and active nests.

In 1972, the MBTA was amended to include protection for migratory birds of prey (e.g., raptors). Six families of raptors occurring in North America were included in the amendment: Accipitridae (kites, hawks, and eagles); Cathartidae (New World vultures); Falconidae (falcons and caracaras); Pandionidae (ospreys); Strigidae (typical owls); and Tytonidae (barn owls). The provisions of the 1972 amendment to the MBTA protects all species and subspecies of the families listed above. The MBTA protects over 800 species including geese, ducks, shorebirds, raptors, songbirds and many relatively common species.

### **State Regulations**

#### ***California Environmental Quality Act (CEQA)***

The California Environmental Quality Act (CEQA) provides for the protection of the environment within the State of California by establishing State policy to prevent significant, avoidable damage to the environment through the use of alternatives or mitigation measures for projects. It applies to actions directly undertaken, financed, or permitted by State lead agencies. If a project is determined to be subject to CEQA, the lead agency will be required to conduct an Initial Study (IS); if the IS determines that the project may have significant impacts on the environment, the lead agency will subsequently be required to write an Environmental Impact Report (EIR). A finding of non-significant effects will require either a Negative Declaration or a Mitigated Negative Declaration instead of an EIR. Section 15380 of the CEQA Guidelines independently defines “endangered” and “rare” species separately from the definitions of the California Endangered Species Act (CESA). Under CEQA, “endangered” species of plants or animals are defined as those whose survival and reproduction in the wild are in immediate jeopardy, while “rare” species are defined as those who are in such low numbers that they could become endangered if their environment worsens.

#### ***California Endangered Species Act (CESA)***

In addition to federal laws, the state of California implements the CESA which is enforced by CDFW. The CESA program maintains a separate listing of species beyond the FESA, although the provisions of each act are similar.

State-listed threatened and endangered species are protected under provisions of the CESA. Activities that may result in “take” of individuals (defined in CESA as; “hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill”) are regulated by CDFW. Habitat degradation or modification is not included in the definition of “take” under CESA. Nonetheless, CDFW has interpreted “take” to include the destruction of nesting, denning, or foraging habitat necessary to maintain a viable breeding population of protected species.

The State of California considers an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy. A threatened species is considered as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the

absence of special protection or management. A rare species is one that is considered present in such small numbers throughout its range that it may become endangered if its present environment worsens. State threatened and endangered species are fully protected against take, as defined above.

The CDFW has also produced a species of special concern list to serve as a species watch list. Species on this list are either of limited distribution or their habitats have been reduced substantially, such that a threat to their populations may be imminent. Species of special concern may receive special attention during environmental review, but they do not have formal statutory protection. At the federal level, USFWS also uses the label species of concern, as an informal term that refers to species which might be in need of concentrated conservation actions. As the Species of Concern designated by USFWS do not receive formal legal protection, the use of the term does not necessarily ensure that the species will be proposed for listing as a threatened or endangered species.

### ***Fish and Game Code***

Fish and Game Code Sections 3503, 3503.5, 3511, and 3513 are applicable to natural resource management. For example, Section 3503 of the Code makes it unlawful to destroy any birds' nest or any birds' eggs that are protected under the MBTA. Further, any birds in the orders Falconiformes or Strigiformes (Birds of Prey, such as hawks, eagles, and owls) are protected under Section 3503.5 of the Fish and Game Code which makes it unlawful to take, possess, or destroy their nest or eggs. A consultation with CDFW may be required prior to the removal of any bird of prey nest that may occur on a project site. Section 3511 of the Fish and Game Code lists fully protected bird species, where the CDFW is unable to authorize the issuance of permits or licenses to take these species. Pertinent species that are State fully protected by the State include golden eagle (*Aquila chrysaetos*) and white-tailed kite (*Elanus leucurus*). Section 3513 of the Fish and Game Code makes it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

### ***Native Plant Protection Act***

Sections 1900–1913 of the Fish and Game Code were developed to preserve, protect, and enhance Rare and Endangered plants in the state of California. The act requires all state agencies to use their authority to carry out programs to conserve Endangered and Rare native plants. Provisions of the Native Plant Protection Act prohibit the taking of listed plants from the wild and require notification of the CDFW at least ten days in advance of any change in land use which would adversely impact listed plants. This allows the CDFW to salvage listed plant species that would otherwise be destroyed.

### ***California Native Plant Society Rare and Endangered Plant Species***

Vascular plants listed as rare or endangered by the CNPS, but which have no designated status under FESA or CESA are defined as follows:

#### **California Rare Plant Rank**

1A- Plants Presumed Extirpated in California and either Rare or Extinct Elsewhere

1B- Plants Rare, Threatened, or Endangered in California and Elsewhere

- 2A- Plants Presumed Extirpated in California, But More Common Elsewhere
- 2B- Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere
- 3- Plants about Which More Information is Needed - A Review List
- 4- Plants of Limited Distribution - A Watch List

#### Threat Ranks

- .1- Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
- .2- Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
- .3- Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known).

#### **Local Policies**

##### ***Western Riverside County MSHCP***

The MSHCP is a comprehensive, multi-jurisdictional HCP focusing on conservation of species and their associated habitats in western Riverside County. The goal of the MSHCP is to maintain biological and ecological diversity within a rapidly urbanizing region.

The approval of the MSHCP and execution of the Implementing Agreement (IA) by the wildlife agencies allows signatories of the IA to issue “take” authorizations for all species covered by the MSHCP, including state- and federal-listed species as well as other identified sensitive species and/or their habitats. Each city or local jurisdiction will impose a Development Mitigation Fee for projects within their jurisdiction. With payment of the mitigation fee to the County and compliance with the survey requirements of the MSHCP where required, full mitigation in compliance with the California Environmental Quality Act (CEQA), National Environmental Policy Act (NEPA), CESA, and FESA will be granted. The Development Mitigation Fee varies according to project size and project description. The fee for industrial development is \$7,382 per acre (County Ordinance 810.2). Payment of the mitigation fee and compliance with the requirements of Section 6.0 of the MSHCP are intended to provide full mitigation under CEQA, NEPA, CESA, and FESA for impacts to the species and habitats covered by the MSHCP pursuant to agreements with the USFWS, the CDFW, and/or any other appropriate participating regulatory agencies and as set forth in the IA for the MSHCP.

*There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates activities pursuant to Section 404 of the Federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFG regulates activities under the Fish and Game Code Section 1600-1616, and the Regional Board regulates activities pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.*

## **Federal Regulations**

### ***Section 404 of the Clean Water Act***

In accordance with the Revised Definition of “Waters of the United States”; Conforming (September 8, 2023), “waters of the United States” are defined as follows:

(a) *Waters of the United States* means:

(1) Waters which are:

- (i) Currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
- (ii) The territorial seas; or
- (iii) Interstate waters;

(2) Impoundments of waters otherwise defined as waters of the United States under this definition, other than impoundments of waters identified under [paragraph \(a\)\(5\)](#) of this section;

(3) Tributaries of waters identified in paragraph (a)(1) or (2) of this section that are relatively permanent, standing or continuously flowing bodies of water;

(4) Wetlands adjacent to the following waters:

- (i) Waters identified in [paragraph \(a\)\(1\)](#) of this section; or
- (ii) Relatively permanent, standing or continuously flowing bodies of water identified in paragraph (a)(2) or (a)(3) of this section and with a continuous surface connection to those waters;

(5) Intrastate lakes and ponds not identified in paragraphs (a)(1) through (4) of this section that are relatively permanent, standing or continuously flowing bodies of water with a continuous surface connection to the waters identified in paragraph (a)(1) or (a)(3) of this section

(b) The following are not “waters of the United States” even where they otherwise meet the terms of [paragraphs \(a\)\(2\)](#) through [\(5\)](#) of this section:

(1) Waste treatment systems, including treatment ponds or lagoons, designed to meet the requirements of the Clean Water Act;

(2) Prior converted cropland designated by the Secretary of Agriculture. The exclusion would cease upon a change of use, which means that the area is no longer available for the production of agricultural commodities. Notwithstanding the determination of an area's status as prior converted

cropland by any other Federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with EPA;

(3) Ditches (including roadside ditches) excavated wholly in and draining only dry land and that do not carry a relatively permanent flow of water;

(4) Artificially irrigated areas that would revert to dry land if the irrigation ceased;

(5) Artificial lakes or ponds created by excavating or diking dry land to collect and retain water and which are used exclusively for such purposes as stock watering, irrigation, settling basins, or rice growing;

(6) Artificial reflecting or swimming pools or other small ornamental bodies of water created by excavating or diking dry land to retain water for primarily aesthetic reasons;

(7) Waterfilled depressions created in dry land incidental to construction activity and pits excavated in dry land for the purpose of obtaining fill, sand, or gravel unless and until the construction or excavation operation is abandoned and the resulting body of water meets the definition of waters of the United States; and

(8) Swales and erosional features (*e.g.*, gullies, small washes) characterized by low volume, infrequent, or short duration flow.

(c) In this section, the following definitions apply:

(1) *Wetlands* means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

(2) *Adjacent* means having a continuous surface connection

(3) *High tide line* means the line of intersection of the land with the water's surface at the maximum height reached by a rising tide. The high tide line may be determined, in the absence of actual data, by a line of oil or scum along shore objects, a more or less continuous deposit of fine shell or debris on the foreshore or berm, other physical markings or characteristics, vegetation lines, tidal gages, or other suitable means that delineate the general height reached by a rising tide. The line encompasses spring high tides and other high tides that occur with periodic frequency but does not include storm surges in which there is a departure from the normal or predicted reach of the tide due to the piling up of water against a coast by strong winds such as those accompanying a hurricane or other intense storm.

(4) *Ordinary high water mark* means that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.

(5) *Tidal waters* means those waters that rise and fall in a predictable and measurable rhythm or cycle due to the gravitational pulls of the moon and sun. Tidal waters end where the rise and fall of the water surface can no longer be practically measured in a predictable rhythm due to masking by hydrologic, wind, or other effects.

### ***Section 401 of the Clean Water Act***

Pursuant to Section 401 of the CWA, any applicant for a federal license or permit to conduct any activity which may result in any discharge to waters of the United States must provide certification from the State or Indian tribe in which the discharge originates. This certification provides for the protection of the physical, chemical, and biological integrity of waters, addresses impacts to water quality that may result from issuance of federal permits, and helps insure that federal actions will not violate water quality standards of the State or Indian tribe. In California, there are nine Regional Water Quality Control Boards (Regional Board) that issue or deny certification for discharges to waters of the United States and waters of the State, including wetlands, within their geographical jurisdiction. The State Water Resources Control Board assumed this responsibility when a project has the potential to result in the discharge to waters within multiple Regional Boards.

### **State Regulations**

#### ***Fish and Game Code***

Fish and Game Code Sections 1600 et. seq. establishes a fee-based process to ensure that projects conducted in and around lakes, rivers, or streams do not adversely impact fish and wildlife resources, or, when adverse impacts cannot be avoided, ensures that adequate mitigation and/or compensation is provided.

Fish and Game Code Section 1602 requires any person, state, or local governmental agency or public utility to notify the CDFW before beginning any activity that will do one or more of the following:

- (1) substantially obstruct or divert the natural flow of a river, stream, or lake;
- (2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake;  
or
- (3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake.

Fish and Game Code Section 1602 applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the State. CDFW's regulatory authority extends to include riparian habitat (including wetlands) supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. Generally, the CDFW takes jurisdiction to the top of bank of the stream or to the outer limit of the adjacent riparian vegetation (outer drip line), whichever is greater. Notification is generally required for any project that will take place in or in the vicinity of a river, stream, lake, or their tributaries. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish or other aquatic life and watercourses having a surface or subsurface flow that support or have supported riparian vegetation. A Section 1602 Streambed Alteration Agreement would be required if impacts to identified CDFW jurisdictional areas occur.

### ***Porter Cologne Act***

The California *Porter-Cologne Water Quality Control Act* gives the State very broad authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. The Porter-Cologne Act has become an important tool in the post SWANCC and Rapanos regulatory environment, with respect to the state’s authority over isolated and insignificant waters. Generally, any person proposing to discharge waste into a water body that could affect its water quality must file a Report of Waste Discharge in the event that there is no Section 404/401 nexus. Although “waste” is partially defined as any waste substance associated with human habitation, the Regional Board also interprets this to include fill discharged into water bodies.
