QUARTERLY UPDATE
Quarterly Update Period: January to March 2022

COVID-19 VIRUS PANDEMIC:

Pursuant to the State and Federal guidelines, DTSC staff continued regular oversight of the hazardous waste industry, including the Rho-Chem LLC Inglewood facility (the Facility) through the fourth quarter. DTSC permitted Hazardous Waste Treatment, Storage and Disposal Facilities (TSDFs), including the Facility, are designated as essential facilities and will continue to operate during the crisis. DTSC provided new guidelines and communications protocols to all the permitted HW TSDF facilities for their operations and continued compliance with regulations during this emergency period. DTSC has polled all active TSDFs, including Rho-Chem LLC regarding their operations during the crisis.

Rho-Chem LLC stated that the Facility is open for business and operating close to normal. They are coordinating closely with customers, suppliers and their own personnel to ensure that operations remain open so that waste can be received and treated in compliance with our permit requirements. They are operating and accepting waste as authorized and required by their permit. There are no current staffing-reduction plans. They anticipate that they will be able to maintain compliance with the permit conditions, required inspections, environmental monitoring, and other activities.

VSP SCORES:

On November 17, 2021 DTSC held a public meeting to present the rationale for the Facility's 2020 VSP Score and Compliance Tier Assignment. The Permittee presented details regarding their challenge of the DTSC determinations.

On December 1, 2021 Rho-Chem LLC/CleanEarth challenged DTSC's 2021 VSP Score and Compliance Tier Assignment determinations.

PERMIT RENEWAL:

DTSC review of the 2019 permit renewal application and 2020 supplemental information submittals is in progress.

FACILITY DESCRIPTION/HISTORY

The company now known as Rho-Chem was founded in 1951 by Richard O'Meara and was originally known as American Better Chemicals (American).

American initially functioned from an office as a brokerage for distribution of oils, lubricants, and various solvents. In early 1952, the company rented a warehouse on Hindry Street in Inglewood to store products before being delivered to customers. In June 1953, the company moved to the current location at 425 Isis Avenue. In mid-1961, American purchased a 75-foot-wide strip along the northern portion of the original parcel and built additional office and warehouse space. American expanded in 1967 when it began leasing an additional 41-foot-wide strip of land from Edward and Veda Bennett that was located directly north of the Site. Veda Bennett remained the owner of this northernmost parcel (231 feet long by 41 feet wide) until October 1989, when it was purchased by Rho-Chem Corporation.

Waste solvent recycling began at the Facility in approximately 1964. Richard O'Meara formed F&C Waste Chemical, which was essentially a "paper company". In 1970, Bonnie O'Meara created ABCO Industries and assumed ownership of the solvent recovery systems from American. F&C Waste Chemical discontinued the distribution of oils and lubricants in 1972. In February 1974, Bonnie O'Meara purchased both F&C and Richard O'Meara's stock in American. In July 1974, ABCO Industries merged with American, and in August 1974, the merged company was renamed Rho-Chem Corporation.

In late 1989, shortly after Rho-Chem acquired the northern 41-foot-wide parcel from Veda Bennett, Browning Ferris Industries, Inc. purchased Rho-Chem. In 1990, Southdown, Inc. (now CEMEX) acquired Rho-Chem. In May 1995, Philip Services Corporation acquired Rho-Chem from Southdown and leased the non-RCRA portion of the facility located to the west of the Facility at 8722 Aviation Boulevard. Southdown Inc. continued to own the land and continued to implement the Corrective Action (subsurface cleanup/remediation) under DTSC oversight through a Corrective Action Consent Agreement signed in 2002. The name of the (aboveground) permitted Facility remains Rho-Chem LLC. Ownership of Rho-Chem LLC was transferred to Stericycle Inc. in 2016 and later in April 2020 to Harsco/Clean Earth.

Rho-Chem is a hazardous waste management facility located at 425 Isis Avenue, Inglewood, Los Angeles County, California 90301 (Facility). The Facility is located west of Isis Avenue, south of Manchester Boulevard, east of Aviation Boulevard, and north of Hillcrest Boulevard. The Facility is situated on approximately 1.1 acres of land in an urban, industrial and commercial area, one mile north-northeast of Los Angeles International Airport and four miles east of the Santa Monica Bay. The Los Angeles County assessor's parcel numbers that describe the Facility location are 4126-003-020 and 4216-003-017.

The main structure at the Facility is a one-story, approximately 3,300-square-foot building that houses the administrative offices, a laboratory, drum storage areas, boiler and electrical rooms, an employee locker room, and restrooms. A driveway encircling the main office building to the north, west, and south is used for incoming and outgoing traffic. Other features outside the main office building include an employee and visitor parking area, aboveground storage tanks (ASTs), a drum storage area, and associated support facilities. The Facility is enclosed by a 6- to 8-foot-high chain-link security fence topped with barbed wire and by the exterior walls of structures located on adjacent properties.

The current operations and services include laboratory packing/de-packing liquid fuel blending, solvent recycling (fractionation column, batch distillation, and thin film evaporation), and solvent distribution. The facility also provides hazardous waste transfer, storage, and consolidation services. Residues from the solvent recycling operation and flammable hazardous wastes are incorporated into the fuel blending process. These materials are later shipped to other facilities as fuels for burning or incineration. In addition, Rho-Chem receives corrosives and wastewater material for consolidation and off-site treatment. The Permittee is also a registered hazardous waste transporter. Rho-Chem operates a 0.8-acre parcel leased as a 10-day hazardous waste transfer facility at 8722 Aviation Boulevard. The transfer facility is not within the boundary of the Facility and is not part of this permit.

Rho-Chem operations are pursuant to a Hazardous Waste Facility Permit, issued by the Department of Health Services, on September 28, 1990. On March 29, 1995, Rho-Chem submitted a permit renewal application and DTSC determined that they could continue to operate under existing permit conditions until a new permit was issued. The current Permit was issued on July 25, 2008 with an effective date of August 28, 2008. The current permit authorizes nine hazardous waste management units.

Releases from the facility continue to exist in the vadose zone and have migrated to ground water which is at 100 to 110 feet below ground surface (bgs). Many of the contaminants identified during the sampling are mobile in gas-phase, primarily aromatic and halogenated volatile organic compounds such as benzene, ethyl benzene, perchloroethene (PCE), and trichloroethylene (TCE). Other constituents of concern include metals such as lead, cadmium, arsenic, mercury, barium, selenium and silver; semi-volatile organic compounds; and a variety of pesticides. DTSC also provides oversight for the current Corrective Action Program for the Site.

PERMITTING REGULATORY DESCRIPTION/HISTORY

On November 14, 1980, the owner/operator filed a Part A Permit Application and was granted an Interim Status Document (ISD) by the California Department of Health Services (DHS), predecessor to DTSC, on April 6, 1981.

On December 30, 1983, DHS issued a hazardous waste facility permit, permit number CAD 008364432, to Rho-Chem.

On September 28, 1990, DTSC issued a RCRA-equivalent Hazardous Waste Facility Permit, number 90-3-TS-002, to Rho-Chem.

In 1992, Southdown Environmental Systems, Inc. acquired the Rho-Chem Facility.

In 1995, Phillip Services acquired the Rho-Chem Facility. On September 27, 1995 the Hazardous Waste Facility Permit (that was issued in 1990) expired. On March 29, 1995, Rho-Chem submitted a permit renewal application..

On March 12, 2001, the company name for Southdown Environmental Systems was changed to CEMEX, Inc. CEMEX, Inc. has assumed responsibility for the corrective action program. Both Rho-Chem Corporation and CEMEX, Inc. have signed, as responsible parties, a corrective action consent agreement with DTSC on November 22, 2002.

On January 7, 2008, Rho-Chem notified DTSC that its name would be changed from Rho-Chem Corporation to Rho-Chem, LLC, effective April 2008. After a series of revisions to the 1995 Permit Renewal Applications in 1997, 2004 and 2008, DTSC issued the current Permit on July 25, 2008 with an effective date of August 28, 2008.

On August 10, 2011 PSC submitted a Class 2 Permit Modification request to add use of Totes type of containers and capability to store propane cylinders at the Facility to DTSC and the permit modification was approved by DTSC on March 8, 2012 and became effective on March 8, 2012.

HEALTH RISK ASSESMENT

Rho-Chem submitted a draft Human Health Risk Assessment (HHRA) Report to DTSC on November 30, 2016 in support of their corrective measures study addressing the sub-surface contamination. DTSC reviewed the HHRA and provided comments on May 8, 2017. Response from Rho-Chem is awaited. Given below are the results from the draft assessment:

Receptor Theoretical excess lifetime cancer risk Non-cancer Hazard Index
Current Indoor Commercial/Industrial Worker (Office Location; SS-1) 1E-05 1
Current Indoor Commercial/Industrial Worker (Locker Room Location; SS-2) 2E-05 1
Future Indoor Commercial/Industrial Worker 3E-05 1
Future Outdoor Commercial/Industrial Worker 1E-04 0.5
Construction Worker 1E-05 2

PERMIT RENEWAL ACTIVITIES

Rho-Chem's operating permit expired on August 27, 2018. A reminder letter for permit renewal was issued on August 27, 2016 reminding the facility operator of the requirement to submit an application for permit renewal at least 180 days prior to the expiration date and recommending that the permit application be submitted 18 months prior to the current permit expiration date. A pre-application meeting for the permit renewal was held on April 20, 2017. On February 22, 2018 Stericycle, Inc. submitted an application for the permit renewal Permittee to DTSC.

On March 21, 2018 DTSC notified the Permittee that their permit renewal application was administratively incomplete and requested another meeting on April 10, 2018 to further explain the changes in the regulatory process for processing permit renewals (that became effective from April 1, 2016). These changes include the need for a signed Cost Reimbursement Agreement with a Cost Estimate, and an advance payment of 25% of the total estimated cost, for DTSC to begin technical review of the permit renewal application. On June 5, 2018, Stericycle Inc. submitted a revised Permit Application. On June 15, 2018 DTSC informed Stericycle Inc. that their permit renewal application is administratively complete and commenced technical review of the application. When an administratively complete renewal application is received prior to the expiration date, California regulations allow continued operation of permitted facilities under the terms of the expired permit until DTSC issues a decision to renew (or deny) the permit. DTSC completed the Technical Review and issued a First Notice of Deficiency (NOD #1) on May 10, 2019. Rho-Chem submitted a Response to NOD #1 and a revised permit application on August 30, 2019.

On April 6, 2020, Stericycle Inc. submitted supplemental information in response to the NOD#1, consisting of partial closure certification reports for some equipment at the Inglewood Facility including Fractionation Column, Thin Film Evaporator, Tank 30 (part of the Thin Film Evaporator system), Tank 31 (part of the Thin Film Evaporator system), Tank 67 (part of the Fractionation Column system) and Tank 68 (part of the Fractionation Column system).

OWNERSHIP CHANGE:

On May 13, 2020 DTSC received a notification that the ownership of the Rho-Chem LLC Inglewood Facility has been transferred from Stericycle Inc. to Harsco/Clean Earth Inc.

VIOLATION SCORING PROCEDURE ACTIVITIES

On September 27, 2019, DTSC issued 2019 Facility Violation Scoring Procedure Score (42.18) and the 2019 Compliance Tier Assignment (Unacceptable) to the Facility.

On December 4, 2019, in response to the 2019 VSP score and Compliance Tier Assignment, Rho-Chem submitted a dispute document challenging the DTSC scores and assessment.

On September 24, 2020, DTSC issued an Amended 2019 VSP score (43.16). The 2019 Compliance Tier Assignment (unacceptable) remained unchanged.

On September 30, 2020 DTSC issued 2020 Facility Violation Scoring Procedure Score (49.32) and the 2020 Compliance Tier Assignment (Unacceptable) to the Facility.

On November 23, 2020, CleanEarth submitted another dispute document challenging the 2019 VSP Score and the 2019 Compliance Tier Assignment.

On November 24, 2020, CleanEarth submitted a document disputing the 2020 Provisional Inspection Violation Scores.

On March 9, 2021, DTSC issued a provisional Inspection Violation Dispute Document Decision responding to the November 23, 2020 dispute document submitted by the Permittee's owner CleanEarth for the 2019 VSP Score. VSP scores for three out of the nine violations were revised/reduced by the DTSC Dispute Resolution Official.

On April 27, 2021, DTSC sent the Final 2019 VSP Score (35.34) and Compliance Tier Assignment Letter (Conditionally Acceptable) to the Permittee.

On April 27, 2021, DTSC sent the Final 2020 VSP Score (40.39) and Compliance Tier Assignment (Unacceptable) to the Permittee.

On May 14, 2021, DTSC sent a letter back to the Permittee in response to the May 26, 2020 dispute document submitted by the Permittee regarding the 2020 Inspection Violation Score, determining that no adjustment to the inspection violation score is appropriate.

On June 30, 2021 DTSC received a letter from CleanEarth challenging the 2020 VSP Compliance Tier Assignment.

On August 17, 2021 DTSC sent a letter for the final 2020 Inspection Violation Score of 20.

On September 30, 2021, DTSC updated the 2021 Violation Scoring Procedure (VSP) Score to 43.25, the 2021 Compliance Tier for the Facility to "unacceptable" and notified RhoChem LLC.

Site History:

The Charles Caine Company, Inc. site is approximately one-third of an acre located at 8325 Hindry Avenue, Los Angeles, California 90045 (the Site).

The Site encompasses a single parcel of land in the County of Los Angeles, referred to as Assessor's Parcel Number 4127 025-011.

Surface structures at the Site included:
• A building on the eastern side of the Site used for an office and masking and engraving (Eastern Building or Front Building);
• A large building on the western side used for painting (paint waterfall booths) and liquid and dry storage (Western Building); and
• A building in the middle of the Site on the south side used for storing PCE and TCE, degreasing, and wastewater treatment (Southern Building), which is where the degreaser and clarifier were located.

As a result of industrial operations, releases and disposals of hazardous substances occurred at the Site. Although the date of the first release or disposal of hazardous substances is unknown, the property was an active painting facility beginning in the late 1940s, and solvents, paint thinners, and various paints were used and stored at the Site. Charles Caine Company, Inc. owned and operated a spray painting facility at the site from approximately 1950 to 1999, when the company ceased its operations after filing for bankruptcy. Prior to becoming a spray painting facility, the site was utilized by the Charles Caine Company as a machine shop and a die-casting facility. In May 2000, the Chapter 7 Trustee of the bankruptcy estate of Charles Caine Company filed for motion with the United States Bankruptcy Court to: (1) acquire the services of a hazardous waste hauler to remove and transport wastes left at the site; (2) abandon the property after the hazardous wastes have been removed and; (3) have no further liability for costs of cleanup and remediation of the property, if any for the Trustee and professionals involved. In August 2000, the removal of the remaining hazardous waste was completed and the property was abandoned. The hazardous wastes removed from the site included: Eighteen (18) 55-gallon drums of solvents, sludges and solidified resins/ paint; 192 five-gallon cans of paint, stripper and solvent; 1,350 one-gallon cans of paint and paint residues; and 45 one and five gallon packages of aerosols, acids, methylene chloride, thinners, resins and isocyanates. A Phase II Site Assessment Report was prepared by Miller Brooks Environmental, Inc. in March 1998. A total of 17 soil borings were drilled and sampled to a maximum depth of 30 feet below ground surface. The substances detected along with their maximum concentrations are as follows: Tetrachlorethylene (PCE) at 8,000 parts per million (ppm), Trichlorethylene (TCE) at 5.6 ppm, methylene chloride at 0.010 ppm, cis-1,2-dichloroethene at 0.51 ppm, 1,1-dichloroethane at 0.074 ppm, 1,1,1-trichloro- ethane at 0.080 ppm and carbon tetrachloride at 0.017 ppm. California Code of Regulations (CCR) Title 22 Metals were also tested, but were found to exist in concentrations below the CCR Title 22 total threshold limit concentration, or ten times the soluble threshold limit concentration. The report concluded that the soil has been impacted by volatile organic compounds (VOCs) and total recoverable petroleum hydrocarbons (TRPH) but the vertical and lateral extent of the contamination was not delineated. On November 3, 2001, DTSC signed a Remedial Action Order. The Responsible Parties (RPs) submitted Remedial Investigation (RI) Workplan on May 8, 2002. On May 20, 2004, DTSC approved the RI Workplan. On June 21, 2004, the RPs submitted a draft RI report. On August 27, 2004 the RPs submitted a Health Risk Assessment (HRA) report.

In 2001, DTSC issued an Imminent and Substantial Endangerment Determination and Remedial Action Order. In 2009, DTSC obtained Site Remediation Account funds to pay for and complete the remedial work at the Site. DTSC performed the following response actions:

In November 2009, DTSC approved a Removal Action Workplan (RAW) prepared by its consultant, Engineering/Remediation Resources Group,Inc. (ERRG). The RAW evaluated four removal action alternatives based on the BHRA, which set cleanup goals to residential standards: (1) no further action; (2) containment through capping and institutional controls; (3) soil excavation and offsite disposal; and (4) soil excavation and offsite disposal and soil vapor extraction (SVE). Alternative four was recommended by ERRG and approved by DTSC in a letter dated December 1, 2009.

In July 2010, ERRG completed excavation and offsite disposal of contaminated soil, and installed the SVE system pursuant to the selected removal action in the RAW. All the buildings were demolished, and the clarifier and degreaser were removed. Soil was also removed at various depths between six and fifteen feet bgs, and then backfilled with clean fill material.

In January 2013, DTSC approved a final Feasibility Study and Remedial Action Plan (FS/RAP). The FS/RAP recommended remedial action for soil and groundwater at the Site: institutional controls, SVE for treatment of VOCs in soil and groundwater, in-situ chemical oxidation (ISCO) and hydraulic containment for treatment of VOCs in shallow groundwater, and monitored attenuation (MA) of VOCs in groundwater. Implementation of the remedial design was initiated in 2013.

Currently, DTSC is monitoring groundwater beneath and around the Site to ensure the remedy is operating as designed. According to the FS/RAP, DTSC specified that drinking water standards or other risk-based values will be one of the remedial action objectives (RAOs) for the Site. It is likely that DTSC will incur additional, possibly significant, response costs in the future.

Site History:

The Charles Caine Company, Inc. site is approximately one-third of an acre located at 8325 Hindry Avenue, Los Angeles, California 90045 (the Site). The Site encompasses a single parcel of land in the County of Los Angeles, referred to as Assessor's Parcel Number 4127 025-011.

Surface structures at the Site included:
• A building on the eastern side of the Site used for an office and masking and engraving (Eastern Building or Front Building);
• A large building on the western side used for painting (paint waterfall booths) and liquid and dry storage (Western Building); and
• A building in the middle of the Site on the south side used for storing PCE and TCE, degreasing, and wastewater treatment (Southern Building), which is where the degreaser and clarifier were located.

As a result of industrial operations, releases and disposals of hazardous substances occurred at the Site. Although the date of the first release or disposal of hazardous substances is unknown, the property was an active painting facility beginning in the late 1940s, and solvents, paint thinners, and various paints were used and stored at the Site. Charles Caine Company, Inc. owned and operated a spray painting facility at the site from approximately 1950 to 1999, when the company ceased its operations after filing for bankruptcy. Prior to becoming a spray painting facility, the site was utilized by the Charles Caine Company as a machine shop and a die-casting facility. In May 2000, the Chapter 7 Trustee of the bankruptcy estate of Charles Caine Company filed for motion with the United States Bankruptcy Court to: (1) acquire the services of a hazardous waste hauler to remove and transport wastes left at the site; (2) abandon the property after the hazardous wastes have been removed and; (3) have no further liability for costs of cleanup and remediation of the property, if any for the Trustee and professionals involved. In August 2000, the removal of the remaining hazardous waste was completed and the property was abandoned. The hazardous wastes removed from the site included: Eighteen (18) 55-gallon drums of solvents, sludges and solidified resins/ paint; 192 five-gallon cans of paint, stripper and solvent; 1,350 one-gallon cans of paint and paint residues; and 45 one and five gallon packages of aerosols, acids, methylene chloride, thinners, resins and isocyanates. A Phase II Site Assessment Report was prepared by Miller Brooks Environmental, Inc. in March 1998. A total of 17 soil borings were drilled and sampled to a maximum depth of 30 feet below ground surface. The substances detected along with their maximum concentrations are as follows: Tetrachlorethylene (PCE) at 8,000 parts per million (ppm), Trichlorethylene (TCE) at 5.6 ppm, methylene chloride at 0.010 ppm, cis-1,2-dichloroethene at 0.51 ppm, 1,1-dichloroethane at 0.074 ppm, 1,1,1-trichloro- ethane at 0.080 ppm and carbon tetrachloride at 0.017 ppm. California Code of Regulations (CCR) Title 22 Metals were also tested, but were found to exist in concentrations below the CCR Title 22 total threshold limit concentration, or ten times the soluble threshold limit concentration. The report concluded that the soil has been impacted by volatile organic compounds (VOCs) and total recoverable petroleum hydrocarbons (TRPH) but the vertical and lateral extent of the contamination was not delineated. On November 3, 2001, DTSC signed a Remedial Action Order. The Responsible Parties (RPs) submitted Remedial Investigation (RI) Workplan on May 8, 2002. On May 20, 2004, DTSC approved the RI Workplan. On June 21, 2004, the RPs submitted a draft RI report. On August 27, 2004 the RPs submitted a Health Risk Assessment (HRA) report.

In 2001, DTSC issued an Imminent and Substantial Endangerment Determination and Remedial Action Order. In 2009, DTSC obtained Site Remediation Account funds to pay for and complete the remedial work at the Site. DTSC performed the following response actions:

In November 2009, DTSC approved a Removal Action Workplan (RAW) prepared by its consultant, Engineering/Remediation Resources Group,Inc. (ERRG). The RAW evaluated four removal action alternatives based on the BHRA, which set cleanup goals to residential standards: (1) no further action; (2) containment through capping and institutional controls; (3) soil excavation and offsite disposal; and (4) soil excavation and offsite disposal and soil vapor extraction (SVE). Alternative four was recommended by ERRG and approved by DTSC in a letter dated December 1, 2009.

In July 2010, ERRG completed excavation and offsite disposal of contaminated soil, and installed the SVE system pursuant to the selected removal action in the RAW. All the buildings were demolished, and the clarifier and degreaser were removed. Soil was also removed at various depths between six and fifteen feet bgs, and then backfilled with clean fill material.

In January 2013, DTSC approved a final Feasibility Study and Remedial Action Plan (FS/RAP). The FS/RAP recommended remedial action for soil and groundwater at the Site: institutional controls, SVE for treatment of VOCs in soil and groundwater, in-situ chemical oxidation (ISCO) and hydraulic containment for treatment of VOCs in shallow groundwater, and monitored attenuation (MA) of VOCs in groundwater. Implementation of the remedial design was initiated in 2013.

Currently, DTSC is monitoring groundwater beneath and around the Site to ensure the remedy is operating as designed. According to the FS/RAP, DTSC specified that drinking water standards or other risk-based values will be one of the remedial action objectives (RAOs) for the Site. It is likely that DTSC will incur additional, possibly significant, response costs in the future.

Site History:

July, 15, 2013: DTSC sent letter to Los Angeles County Fire Dept. Site Mitigation Unit transferring regulatory oversight of project activities.

The Tetra Graphics site is located at 10310 Glasgow Place and 10311 South La Cienega Boulevard, Los Angeles, California 90045. Land use is zoned as light industrial on the 0.34 acre, 14,985 square foot lot. An elementary school is located within 0.25 mile to the east. The immediate area surrounding the site is industrial and commercial. In 1989, prior owner, Virginia Phillips, sold the property to Michael Wratschko. The property was then refinanced in 1993 under the name John S. Wratschko. In 1995, the property was sold under a trustee type sale to Phillips Trust. Phillips Trust then sold the property to 10311 La Cienega Property LLC in 1998. Past operators at the site since 1951 include: Tetra Graphics, Printmaster (printing), Troy Furniture Co. (woodworking) and other unknown operators who preformed activities such as aircraft parts manufacturing, welding, warehousing, processing, and laboratory quality control testing. Contaminants at the site include DCB-1,2, DCB-1,4, PCE and tCE approximately 10' to 40' bgs. A closure request document was submitted to the County of Los Angeles Fire Department Hazmat Section in March 1997. During the initial closure investigation, eight soil borings were advanced into the soil, a total of 15 samples were taken. The highest concentration of both TCE and PCE was detected at the deepest depth sample taken (40" bgs). The County reviewed the document and requested that the facility perform more investigation with the condition that this future investigation be performed under a cost recovery cleanup agreement with the County. The site owner refused to enter into a cleanup agreement with the County. The County then referred the site to DTSC in a letter dated November 26, 1997. Hazardous substances were stored and/or treated in an above ground storage tank (removed) and a three stage clarifier. Both the AST and clarifier were located in the west section of the facility. No records for permits were found to exist with the County Department of Public Works, LA County Fire Department, LA County Sanitation District, or Bureau of Sanitation (city) during present or past investigations. Therefore, it appears that these units were not permitted. Contaminants may migrate through the soil in either the liquid or gas phase to groundwater. Contaminants may migrate in the groundwater to drinking water wells or through the soil in either the liquid or gaseous phase. Currently, WorldWide Security Associates, Inc occupies the approximately 9,340 square foot, single story office building on the site which was built in 1951. There is also a paved parking lot on the property.

Site History:

The former Los Angeles Municipal Airport, originally known as Mines Field, is currently part of the Los Angeles International Airport, located 12 miles southwest of the city of Los Angeles, California. The former site consisted of 570-acres of land acquired by the U. S. Army through a 1940 lease. The airport facilities were used by the Army Air Forces and the Navy for military flights, training exercises, and for its tactical position. The U.S. military surrendered its leasehold interest on the property in 1948. Archival documents state that spent machine gun slugs were encountered during a 1990 removal and replacement of some concrete paving in the vicinity of Hangar No. 1 (National Register of Historic Places Site), which is on a portion of the site that was not under a Department of Defense lease. Since 1990 all of the original structures with the exception of Hangar No. 1 are gone and have been replaced with parking areas, aircraft taxiways, air cargo businesses, and related airport structures. Currently the former Los Angeles Municipal Airport/Los Angeles International Airport are owned by the Los Angeles Department of Airports. An Archives Search was conducted by Parsons in 2010.

UNDER INVESTIGATION

Site History:

Department of Toxic Substances Control (DTSC) will conduct a Targeted Site Investigation (TSI) at the Oak Street Elementary School, City of Inglewood, California (the site). The project is being implemented on behalf of the Inglewood Unified School District (District). The 4.49 acre site (APN 4022-002-900) consists of an existing school located east of Interstate 405 (I-405) and surrounded on three sides by single family residential homes. The site is 1.5 miles from the end of the approach runway for the Los Angeles International Airport.

The school was constructed in the 1940's on previous agricultural property. Recent air quality health studies at the site show a potentially significant health risk due to carcinogens and particulate matter. Additionally, sound studies show sever excessive noise at the school site. The District needs to decide either to remodel/rebuild the school or move it to another location. Thus, the purpose of the TSI is to assist the District in making a determination as to the acceptable use for the site after the environmental studies are done.

PROPOSED SCOPE of WORK:

2. Preliminary Endangerment Assessment (PEA) Work Plan.
3. Implementation of PEA Work Plan.

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13 and E1527-21, Section 8.1.8 Sources of Standard Source Information:

"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."

Formerly Utilized Sites Remedial Action Program: DOE FUSRAP

The U.S. Department of Energy (DOE) established the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1974 to remediate sites where radioactive contamination remained from the Manhattan Project and early U.S. Atomic Energy Commission (AEC) operations. The DOE Office of Legacy Management (LM) established long-term surveillance and maintenance (LTS&M) requirements for remediated FUSRAP sites. DOE evaluates the final site conditions of a remediated site on the basis of risk for different future uses. DOE then confirms that LTS&M requirements will maintain protectiveness.

Government Publication Date: Mar 4, 2017

National Priority List: NPL

Sites on the United States Environmental Protection Agency (EPA)'s National Priorities List of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. The NPL, which EPA is required to update at least once a year, is based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action. Sites are represented by boundaries where available in the EPA Superfund Site Boundaries maintained by the Shared Enterprise Geodata and Services (SEGS). Site boundaries represent the footprint of a whole site, the sum of all of the Operable Units and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Nov 3, 2022

National Priority List - Proposed: PROPOSED NPL

Sites proposed by the United States Environmental Protection Agency (EPA), the state agency, or concerned citizens for addition to the National Priorities List (NPL) due to contamination by hazardous waste and identified by the EPA as a candidate for cleanup because it poses a risk to human health and/or the environment. Sites are represented by boundaries where available in the EPA Superfund Site Boundaries maintained by the Shared Enterprise Geodata and Services (SEGS). Site boundaries represent the footprint of a whole site, the sum of all of the Operable Units and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Nov 3, 2022

Deleted NPL: DELETED NPL

Sites deleted from the United States Environmental Protection Agency (EPA)'s National Priorities List. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate. Sites are represented by boundaries where available in the EPA Superfund Site Boundaries maintained by the Shared Enterprise Geodata and Services (SEGS). Site boundaries represent the footprint of a whole site, the sum of all of the Operable Units and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Where there is no polygon boundary data available for a given site, the site is represented as a point.

SEMS List 8R Active Site Inventory: SEMS

The U.S. Environmental Protection Agency's (EPA) Superfund Program has deployed the Superfund Enterprise Management System (SEMS), which integrates multiple legacy systems into a comprehensive tracking and reporting tool. This inventory contains active sites evaluated by the Superfund program that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Active Site Inventory Report displays site and location information at active SEMS sites. An active site is one at which site assessment, removal, remedial, enforcement, cost recovery, or oversight activities are being planned or conducted. This data includes SEMS sites from the List 8R Active file as well as applicable sites from the SEMS GIS/REST file layer obtained from EPA's Facility Registry Service.

EPA Report on the Status of Open Dumps on Indian Lands: IODI

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified congressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

The ERIS ***Physical Setting Report - PSR*** provides comprehensive information about the physical setting around a site and includes a complete overview of topography and surface topology, in addition to hydrologic, geologic and soil characteristics. The location and detailed attributes of oil and gas wells, water wells, public water systems and radon are also included for review.

The compilation of both physical characteristics of a site and additional attribute data is useful in assessing the impact of migration of contaminants and subsequent impact on soils and groundwater.

Disclaimer

This Report does not provide a full environmental evaluation for the site or adjacent properties. Please see the terms and disclaimer at the end of the Report for greater detail.

Appendix

Federal Sources

FEMA National Flood Hazard Layer — **FEMA FLOOD**

The National Flood Hazard Layer (NFHL) data incorporates Flood Insurance Rate Map (FIRM) databases published by the Federal Emergency Management Agency (FEMA), and any Letters Of Map Revision (LOMRs) that have been issued against those databases since their publication date. The FIRM Database is the digital, geospatial version of the flood hazard information shown on the published paper FIRMs. The FIRM Database depicts flood risk information and supporting data used to develop the risk data. The FIRM Database is derived from Flood Insurance Studies (FISs), previously published FIRMs, flood hazard analyses performed in support of the FISs and FIRMs, and new mapping data, where available.

Indoor Radon Data — **INDOOR RADON**

Indoor radon measurements tracked by the Environmental Protection Agency(EPA) and the State Residential Radon Survey.

Public Water Systems Violations and Enforcement Data — **PWSV**

List of drinking water violations and enforcement actions from the Safe Drinking Water Information System (SDWIS) made available by the Drinking Water Protection Division of the US EPA's Office of Groundwater and Drinking Water. Enforcement sensitive actions are not included in the data released by the EPA. Address information provided in SWDIS may correspond either with the physical location of the water system, or with a contact address.

Radon Zone Level — **RADON ZONE**

Areas showing the level of Radon Zones (level 1, 2 or 3) by county. This data is maintained by the Environmental Protection Agency (EPA).

Safe Drinking Water Information System (SDWIS) — **SDWIS**

The Safe Drinking Water Information System (SDWIS) contains information about public water systems as reported to US Environmental Protection Agency (EPA) by the states. Addresses may correspond with the location of the water system, or with a contact address.

Soil Survey Geographic database — **SSURGO**

1.0 INTRODUCTION

1.1 Executive Summary

Partner conducted a Phase II Subsurface Investigation at the subject property to evaluate the potential impact of petroleum hydrocarbons and/or volatile organic compounds (VOCs) to soil gas, soil, and/or groundwater as a consequence of the historical nd on-going uses of underground storage tanks (USTs), clarifiers, and/or underground hydraulic lifts. The site is improved with two fueling stations, comprised of four USTs servicing 21 fuel dispensers beneath two canopies, herein referred to as Northern and Western Canopies. One 20,000-gallon gasoline UST and one compartmentalized 20,000-gallon gasoline/diesel UST are located at the northwest junction of the two canopies, herein referred to as Western USTs. Two 12,000-gallon gasoline USTs are located south of the Northern Canopy, herein referred to as Eastern USTs. The Western USTs were installed in 2005 and the Eastern USTs were installed in 1993. No known releases were reported in the documents available to Partner (on-line or provided by the Client) in connection with the current UST systems. Five groundwater monitoring wells (MW-1 through MW-5) were observed on-site during Phase I and Phase II activities. Based on the location of the wells, they appear to be associated with the on-site leaking underground storage tank (LUST) incident that was reported in 2003 and received closure in 2013.

The following recognized environmental conditions (RECs) were identified in the Phase I:

- The environmental risk associated with USTs increases over time, as these systems age. Furthermore, no subsurface investigations have been conducted in connection with the USTs at the subject property since 2012 (~11 years). Therefore, based on the age of the current UST systems and lack of recent subsurface investigations, the onsite UST systems represent a REC.
- Partner observed the presence of fifteen (15) below-grade hydraulic lifts and one potential former underground hydraulic lift within the automotive service/office building located in the central portion of the subject property. Based on the subgrade nature and long-term duration of use, Partner cannot rule out potential releases of hydraulic fluid to the subsurface beneath the current and former lifts. As such, the current and former below-ground hydraulic lifts at the subject property represent a REC.
- Three clarifiers, herein referred to as Clarifiers 1 through 3, were installed in 1982 at the subject property. Based on the age of the clarifier and trench/floor drain systems (41 years) and hazardous nature of the waste streams, Partner cannot rule out the potential for a release of hazardous substances to the subsurface in connection with these features. As such, the clarifiers and associated floor/trench drain system represent a REC.

The following historical recognized environmental condition (HREC) was identified in the Phase I:

- Based on review of documentation provided by the Regional Water Quality Control Board (RWQCB), the subject property was identified as a LUST site for a release occurring on or before September 10, 2003. The release was identified in the areas of the current Western USTs and is associated with a previous generation of USTs at the subject property, which included four 10,000-gallon gasoline USTs and one 7,000-gallon diesel UST. The five USTs were removed in 2005. Approximately 1,000

tons of hydrocarbon impacted soil was excavated and transported offsite, and groundwater monitoring was conducted from July 2008 through July 2012. The most recent groundwater monitoring data was collected in July 2012, which indicated that total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX), methyl tert-butyl ether (MTBE) and tert-butyl alcohol (TBA) were non-detectable in all five wells. Subsequently, a no further action (NFA) letter was issued to Hertz Corporation on September 24, 2013, as groundwater concentrations met criteria components of the Low Threat UST Closure Policy. Therefore, based on review of the analytical data indicating residual soil impacts were left in place at 45 to 60 feet bgs, removal of the prior generation of UST systems and associated impacted soil, and regulatory oversight and closure, the closed LUST case and prior generation of USTs represents a HREC and no further investigation is recommended.

The five monitoring wells installed at the Site during the LUST investigation were observed to still be present during Partner's Phase II work.

Additionally, two 2,000-gallon waste oil USTs and two 8,000-gallon waste/new oil USTs were reportedly removed under Los Angeles Fire Department (LAFD) oversight in 2005. Confirmation soil samples did not detect TPHg or volatile organic compounds (VOCs), and therefore these former USTs were not identified as a REC.

The scope of the first round of Phase II Subsurface Investigation consisted of the collection and analysis of 15 soil/soil gas borings, as well as the collection and analysis of groundwater samples from three existing groundwater monitoring wells. Fourteen soil samples were analyzed for carbon-chain total petroleum hydrocarbons (TPH-cc) and VOCs, and 10 soil gas samples were analyzed for VOCs. It should be noted that three of the planned soil gas locations in the area of the Eastern USTs and one soil gas location adjacent to Clarifier C3 could not be sampled due to flooded conditions and as a result, soil gas conditions in these areas have not been assessed.

Subsurface lithology encountered in the upper 20 feet consisted of a mixture sandy silt and silty clay to approximately 10 feet below ground surface (bgs), followed by sand and silty sand to terminal depths of 20 feet bgs.

During Partner's investigation, very low estimated concentrations of gasoline range organics (GRO) were detected in 11 of the 14 analyzed soil samples and motor oil range organics (MORO) were detected in two of the 14 soil samples at concentrations below the reporting limit (RL). It should be noted the GRO was detected in each corresponding method blank and MORO was detected in one of the two corresponding method blanks for the soil samples. Based on the detection of GRO and MORO in the method blanks, these analytes probably originated at the laboratory and are not indicative on on-site soil conditions. Additionally, the estimated GRO and MORO concentrations did not exceed the respective screening levels. Diesel range organics (DRO) was not detected in any of the 14 soil samples.

Low estimated concentrations of TBA were detected in seven of the 14 analyzed soil samples and a low estimated concentration of chloromethane was detected in one sample all at a concentrations below the RLs. The estimated concentrations did not exceed their respective screening levels. No other VOCs were

detected in the soil samples. The lateral and vertical extent of these impacts were not defined during this investigation.

Various VOCs were detected in the 10 soil gas samples collected from 10 borings advanced in the vicinity of the USTs, dispenser islands, clarifiers and hydraulic lifts. However, only benzene was detected at concentrations exceeding applicable regulatory guidelines for commercial/industrial use in four locations

Based on the results of this investigation, subsurface impacts by VOCs above commercial screening levels were identified in the area of the automotive service/office building, Clarifier C2, and the western UST dispenser islands beneath the Northern Canopy. The vertical and lateral extent of the impacts was not defined by Partner's sampling.

To evaluate the potential for releases at the Site to have impacted groundwater, during a second round of field work, four groundwater samples were collected from 3 of 5 identified historical monitoring wells (MW-3, MW-4, and MW-5). Monitoring well MW-3 is screened from approximately 55 to 85 feet bgs, and MW-4 and MW-5 are screened from approximately 75 to 95 feet bgs. Depth to groundwater ranged from 73.52 feet bgs to 87.54 feet bgs in wells MW-3, MW-4 and MW-5. Two of the existing wells, MW-1 and MW-2, couldn't be sampled because less than two inches of water was found in these monitoring wells. The groundwater samples were analyzed for total petroleum hydrocarbons as gasoline (TPH-g), total petroleum hydrocarbons as diesel (TPH-d), and VOCs.

No VOCs and TPH were detected above laboratory detection limits in any of the four groundwater samples collected from the three on-Site groundwater monitoring wells installed by others at the northern portion of the Site. The groundwater samples were collected in the area of the current and known past USTs at the Site. Therefore, it does not appear that any releases from onsite operations have impacted groundwater at the Site. During the Phase I Site investigation, off-Site groundwater impacts were not identified as an REC. Based on this information, no impacts to groundwater were identified at this Site.

Water was noted in the groundwater monitoring well boxes at MW-3 and MW-5. It is recommended that the well box seals and/or screws be replaced on all the monitoring wells at the Site to ensure that no fluids leak into the monitoring well and the groundwater beneath.

Based on the concentrations of benzene detected in soil gas, Partner is unable to rule out potential vapor intrusion from benzene to the automotive service/office building. Therefore, a vapor intrusion assessment may be necessary to determine if subsurface vapors are intruding into on-site buildings.

Since demolition of the current buildings and construction of new building(s) is planned after the termination of the current lease period, Partner recommends that all subsurface features of concern (including USTs systems, underground hydraulic lifts, and clarifiers) be removed under regulatory agency oversight at the time of demolition and redevelopment, and that confirmation sampling be conducted at the time of removal. If impacts are identified, Partner recommends that appropriate remediation be completed under regulatory agency oversight, as appropriate. Due to the historical and on-going uses of the Site and known concentrations of VOCs in soil vapor and residual hydrocarbons remaining in-place, it is recommended that a Soils Management Plan be developed and implemented during demolition and construction activities to address any impacted soils or unknown USTs that may be encountered at the Site.

Further, it is recommended that soil gas conditions be assessed following the removal of the on-Site USTs, dispensers, lifts and clarifiers. If elevated levels of VOCs remain at the Site following these removal activities, then the installation of a soil vapor barrier is recommended.

1.2 Limitations

This report presents a summary of work conducted by Partner. The work includes observations of site conditions encountered and the analytical results provided by an independent third-party laboratory of samples collected during the course of the project. The number and location of samples were selected to provide the required information. It cannot be assumed that the limited available data are representative of subsurface conditions in areas not sampled.

2.0 SITE BACKGROUND

2.1 Site Description

The subject property consists of one parcel of land comprising 18.28 acres located on the northeast corner of West Arbor Vita Street and Airport Boulevard within a mixed residential, commercial, and industrial area of Los Angeles, Los Angeles County, California. The subject property consists of a one-story automotive service/office building located on the central portion of the subject property and an additional one-story automotive service building located on the northern portion of the subject property. The buildings total approximately 38,680 square feet. In addition to the current structures, the subject property is also improved with concrete-paved parking areas, two fueling station canopies, a car wash, various carport canopies located throughout the property, and associated landscaping. Five groundwater monitoring wells (MW-1 through MW-5) were observed on-site during Phase I and Phase II activities. Based on the location of the wells, they appear to be associated with the on-site LUST incident that was reported in 2003 and received closure in 2013.

The subject property is bound by residential properties to the north beyond Interceptor Street; residential and a light industrial property to the east; an industrial warehouse, an area undergoing redevelopment, and a car wash and motel to the south beyond West Arbor Vitae Street; a car rental facility to the southwest beyond the intersection of West Arbor Vitae Street and Airport Boulevard; and residential properties and a parking lot and car detailing service to the west beyond Airport Boulevard. Refer to Figure 1 for a site vicinity map showing site features and surrounding properties.

2.2 Site History

Partner completed a *Phase I Environmental Site Assessment Report* (Phase I) for the subject property, dated March 9, 2023, on behalf of Rexford Industrial Realty, LP. According to available historical sources, the subject property was formerly undeveloped as early as 1896; consisted of vacant graded land between 1947 and circa 1952; developed with Airport Junior High School from 1955 to 1981; and redeveloped with the current structures in 1981. Tenants on the subject property have included Airport Junior High School (1955-until at least 1966) and Hertz Rent-A-Car (1981-Present). City directories were not available for 9000 Airport Boulevard from 1966 through 1990.

The following recognized environmental conditions (RECs) were identified in the Phase I:

- The site is improved with two fueling stations, comprised of four USTs servicing 21 fuel dispensers beneath two canopies, herein referred to as Northern and Western Canopies. One 20,000-gallon gasoline UST and one compartmentalized 20,000-gallon gasoline/diesel UST are located at the northwest junction of the two canopies, herein referred to as Western USTs. Two 12,000-gallon gasoline USTs are located south of the Northern Canopy, herein referred to as Eastern USTs. The Western USTs were installed in 2005 and the Eastern USTs were installed in 1993. The USTs and associated piping are of double-walled fiberglass reinforced plastic (FRP) construction and are continuously monitored for leak detection via a Veeder Root system. No known releases were reported in the documents available to Partner (on-line or provided by the Client) in connection with the current UST systems. A release was reported for the prior generation of USTs that received regulatory closure in 2013. During the site inspection, Partner observed two groundwater

monitoring wells on the northwestern portion of the subject property, near the active fueling dispenser canopies, which appear to be associated with investigation conducted for the closed leaking underground storage tank (LUST) case. Partner reviewed the most recent tank integrity tests which included the monitoring system certification and Vapor Recovery Equipment Test. The Monitoring System Certification Forms, dated September 2022, indicated the monitoring system is operational and showed passing results for all criteria (i.e., sensor testing results, line leak detector testing, and in-tank gauge testing). As such, the USTs appear to be tight and in compliance with current regulations as of September 2022. The environmental risk associated with USTs increases over time, as these systems age. Furthermore, no subsurface investigations have been conducted in connection with the USTs at the subject property since 2012 (~11 years). Therefore, based on the age of the USTs and lack of recent subsurface investigations, the on-site UST systems represent a REC.

- Partner observed the presence of fifteen (15) below-grade hydraulic lifts within the automotive service/office building located in the central portion of the subject property. Additionally, Partner observed concrete patching in the northern portion of the building potentially indicative of former below-grade lifts. The dates of installation for the lifts (current and former) are unknown; however, these features were presumably installed in the 1980s or early-1990s in connection with on-site automotive repair operations for the Hertz fleet of vehicles. As such, it is unlikely polychlorinated biphenyls (PCBs) are present in the hydraulic oil. However, based on the subgrade nature and long-term duration of use, Partner cannot rule out potential releases of hydraulic fluid to the subsurface beneath the current and former lifts. As such, the current and former below-ground hydraulic lifts at the subject property represent a REC.
- Three clarifiers, also referred to as oil/water separators, herein referred to as Clarifiers 1 through 3, were installed in 1982 at the subject property. Clarifiers 1 and 2 are connected to floor/trench drains within the northern automotive repair building and the central automotive service/office building, respectively, and are utilized to treat wastewater streams consisting of floor wash water, new/used oil, solvents, and various automotive fluids (e.g., brake fluid, antifreeze etc.) generated from the automotive repair operations. Clarifier 3 was installed and connected to drains within the on-site car wash and is utilized to treat wastewater streams consisting of detergents, wash water, and residual oils generated from car washing operations. Furthermore, based on review of historical permits, historical on-site operations included the use of spray booths and solvents from 1982 to 2008. The clarifiers and associated floor/trench drain systems have the potential to impact the subsurface of the subject property should the systems become compromised. Based on the age of the clarifier and trench/floor drain systems (41 years) and hazardous nature of the waste streams, Partner cannot rule out the potential for a release of hazardous substances to the subsurface in connection with these features. As such, the clarifiers and associated floor/trench drain system represent a REC.

The following historical recognized environmental condition (HREC) was identified in the Phase I:

- Based on review of documentation provided by the Regional Water Quality Control Board (RWQCB), the subject property was identified as a LUST site for a release occurring on or before September 10, 2003, that reportedly impacted soil and groundwater with petroleum hydrocarbons. The release

was identified in the area of the current Western USTs, and is associated with a previous generation of USTs, which included four 10,000-gallon gasoline USTs and one 7,000-gallon diesel UST. Twenty-one soil borings were advanced in a 2003 in preparation for UST upgrades and removals associated with Senate Bill SB 989. Minor soil impacts were detected in the vicinity of the eastern dispenser islands. Petroleum hydrocarbons were also detected in soil associated with the western fueling system. The hydrocarbon contaminated soil around the western system was reportedly confined to the UST area and around the dispenser island closest to those USTs. TPHg and MTBE were detected up to 0.036 mg/kg and 2.0 mg/kg, respectively, while aromatic hydrocarbons, namely, BTEX were not detected above laboratory reporting limits; however, at the completion of the initial soil characterization, the vertical extent was unknown. The deepest area of impacted soil was anticipated to be located along the western portion of the UST pit (between B-11 and B-14), and additional boring and monitoring well were advanced to evaluate vertical extent of impacts in this area.

In September 2003, ATC, the environmental consultant for Hertz Corporation, directed the advancement of a soil boring and installation of one groundwater monitoring well (MW-1) at a location to the west of the western fueling system. Soil samples collected between 45 and 55 feet bgs contained the highest levels of MTBE (ranging between 1.3 to 48 micrograms per kilogram (µg/kg). MTBE and TBA were detected up to 8,700 micrograms per liter (µg/L) and 2,500 µg/L in MW-1, respectively, while BTEX were not detected above laboratory reporting limits. Between March 24 and April 4, 2005, ATC oversaw the excavation of impacted soil during the removal of the four gasoline USTs and one diesel UST, and the associated dispenser islands at the western fueling area. During this work approximately 1,000 tons of hydrocarbon impacted soil was excavated and transported offsite.

In June 2008 and July 2009, additional groundwater monitoring wells (MW-2 through MW-5) were installed. Confirmation soil sampling conducted in 2009 indicated concentrations of TPHg, TPHd and BTEX were below laboratory detection limits in the soil samples. Soil samples collected in well MW-4 detected elevated concentrations of MTBE and TBA up to 28,000 mg/kg and 61,000 mg/kg, respectively, which are above established applicable screening levels. The high concentrations of MTBE and TBA were reportedly detected in a clay layer between 45 bgs and 60 bgs, and appear to have been left in place. Groundwater monitoring reportedly began in July 2008 and the latest groundwater monitoring data collected in July 2012 indicated that TPHg, BTEX, MTBE and TBA were non-detectable in all five wells. Subsequently, the Los Angeles Regional Water Quality Control Board (RWQCB) issued a no further action (NFA) letter to Hertz Corporation on September 24, 2013, as groundwater concentrations met criteria components of the Low Threat UST Closure Policy. Therefore, based on review of the analytical data indicating residual soil impacts were left in place at 45 to 60 feet bgs, removal of the prior generation of UST systems and associated impacted soil, and regulatory oversight and closure, the closed LUST case and prior generation of USTs represent a HREC and no further investigation is recommended.

The five groundwater monitoring wells installed during the LUST investigation were observed still to be present at the Site during the Phase II investigation activities.

2.3 Geology and Hydrogeology

Review of the United States Geological Survey (USGS) *Venice/Inglewood, California* Quadrangle topographic map indicates the subject property is situated approximately 105 feet above mean sea level, and the local topography is sloping gently to the northeast. Refer to Figure 2 for a topographic map of the site vicinity.

The subject property is located within the Los Angeles Basin in a physiographic unit called the El Segundo Sand Hills. The El Segundo Sand Hills extend from the Ballona Gap south to Torrance and the Palo Verdes Hills, and approximately three to four miles inland from the Pacific Ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The Sand Hills consist of a narrow strip of active or recent dunes along the coast an older stabilized sand dune inland. The subject property is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Sand Dunes have been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands, and which now form a portion of the Torrance Plain. Weathering and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area

Based on borings advanced during this investigation, the underlying subsurface consists predominantly of dark brown sandy silt (ML) and silty clay (CL) from the ground surface to approximately 10 feet bgs, underlain by brown, loose sand (SP) to approximately 20 feet bgs. During the first day of fieldwork, saturated soil and water were not encountered in any of the eight soil borings advanced up to terminal depths of 20 feet bgs. Shallow water was encountered in several borings at a depth of approximately 2 to 5 feet bgs on the second day of fieldwork and after overnight rainfall and is likely due to recent rain events. Refer to Appendix A for boring logs from this investigation.

Based on previous groundwater monitoring events conducted on site, groundwater is anticipated to be first encountered at approximately 73 to 84 feet below ground surface (bgs) with flow direction to the northeast. This gradient is consistent with those measured at other nearby groundwater cases. Those include that the Rho Chem facility which is located at 425 South Isis Avenue and approximately 2,500 feet to the northeast and up-gradient of the subject property with planned or existing groundwater monitoring wells located within 1,500 feet of the Site. The former National Car Rental facility located at the corner of Airport Boulevard and West Arbor Vitae Street and upgradient of the Site has a groundwater UST case that was closed in 2019 with levels of benzene above the drinking water maximum contaminant left in-place. Based upon the closure status of this release, it is not considered to be a potential source of impacts to the Site.

3.0 FIELD ACTIVITIES

The Phase II Subsurface Investigation scope included the advancement of 15 borings (B1 through B15) to collect representative soil and/or soil gas samples, and collection and analysis of groundwater samples from three of the five groundwater monitoring wells that were installed as a part of the LUST investigation and were observed to still be present at the Site during these Phase II investigation activities. No samples were collected from the other two groundwater monitoring wells that were still observed be present at the Site because less than two inches of water were measured in each of these wells. Refer to Table 1 for a summary of the boring locations, sampling schedule, and laboratory analyses for this investigation.

3.1 Preparatory Activities

Prior to the initiation of fieldwork, Partner completed the following activities.

3.1.1 Utility Clearance

Partner delineated the work area with white spray paint and notified Underground Service Alert (USA) to clear public utility lines as required by law at least two business days prior to drilling activities. USA issued ticket number A230651099 for the project.

In addition, Partner subcontracted with Safescann, LLC (Safescann) on March 9, 2023, to clear boring locations of utilities. Safescann systematically free-traversed each proposed boring location with a Geonics EM-61 and a Fischer M-Scope electromagnetic induction (EM) equipment, a Sensors and Software Noggin ground penetrating radar (GPR) unit, and a Metrotech 9890 utility locator with line-tracing capabilities. The data was interpreted in real time for evidence of utility lines and/or other subsurface features of potential concern. Based on the findings of the geophysical survey, boring B8 was moved northward to avoid subsurface utilities. No other subsurface utilities were identified within the proposed boring locations.

3.1.2 Health and Safety Plan

Partner prepared a site-specific Health and Safety Plan, which was reviewed with on-site personnel involved in the project prior to the commencement of drilling activities.

3.2 Drilling Equipment

On March 9 and 10, 2023, Partner subcontracted with Minute Man Drilling (MMD) to provide and operate drilling equipment. MMD, under the direction of Partner, advanced borings B1 through B15 with a truck-mounted Geoprobe Model 5410 direct-push drill rig. Sampling equipment was decontaminated between sample intervals and boring locations to prevent cross-contamination.

3.3 Sample Locations

Borings B1 was advanced to the south of Clarifier 1. Borings B2 and B3 were advanced to the northeast and northwest of the Northern Canopy, respectively. Borings B4 through B6 were advanced to the west, south and east of the two 12,000-gallon USTs, respectively. Several attempts were made to advance boring B7 to the east and northeast of the 20,000-gallon USTs; however, drilling refusal was encountered in each boring at depths less than 2 feet bgs. Borings B8 through B10 were advanced to the north, west, and southeast of the two 20,000-gallon USTs, respectively. Boring B11 was advanced to the east of the Western Canopy and

. Boring B12 was advanced to the north of Clarifier 2. Boring B13 was advanced within the northern portion of the automotive repair and office building in the vicinity of the possible former hydraulic lift. Boring B14 was advanced in the current hydraulic lift area within the central portion of the automotive service/office building. Boring B15 was advanced to the north of Clarifier 3.

Refer to Figure 3 for a map indicating sample locations.

3.4 Soil Sampling

Borings B1 through B12, and B15 were overlain by asphalt, which was penetrated using a punch bit attachment advanced by the direct-push drill rig. Borings B13 and B14 were overlain by concrete, which was penetrated using a concrete coring attachment advanced by the direct-push drill rig. Borings B1, B3, B11 through B13, and B15 were advanced to a terminal depth of 10 feet bgs. Borings B4 through B6, and B8 through B10 were advanced to a terminal depth of 20 feet bgs. Borings B2, B7, and B14 were advanced to drilling refusal at 7, 2, and 6 feet bgs, respectively.

Soil samples were collected using a 2-foot long by 1.5-inch diameter sampler with a 2-foot long acetate liner and sampling point. The sampler was advanced by the direct-push drill rig using 4-foot long by 1.25-inch diameter hollow rods with the inner rods in place. At approximately 1 foot above the desired sampling depth, an inner rod was removed and the sampler was advanced to the desired sampling depth to allow undisturbed soil to enter the sampling liner. The sampler was retrieved from the subsurface and the soil-filled liner was removed.

Each acetate liner was cut using a pipe-cutter. Samples were collected from the lower half of the liner using a disposable plastic syringe and retained in two sodium bisulfate-preserved and one methanol-preserved volatile organics analysis (VOA) vials in accordance with United States Environmental Protection Agency (EPA) Method 5035 sampling protocol. The remainder of the lower half of the liner was capped on either end with Teflon tape and plastic caps. The capped liners and VOA vials were labeled for identification and stored in an iced cooler. The soil in the upper half of the liner was visually inspected for discoloration, monitored for odors, classified in accordance with the Unified Soil Classification System (USCS), placed in a sealable plastic bag, and field-screened with a photoionization detector (PID). None of the samples exhibited discoloration or an odor and none of the PID readings suggested the presence of elevated volatile organics concentrations.

Soil samples were collected from borings B1, B3, B11 through B13, and B15 at 2, 5, and 10 feet bgs; from borings B2 and B14 at 2 and 5 feet bgs; and from borings B4 through B6, and B8 through B10 at 5, 10, 15, and 20 feet bgs. As mentioned previously, no soil samples were collected from B7 due to boring refusal at a depth of 2 feet.

3.5 Soil Gas Sampling

3.5.1 Soil Gas Probe Construction

Soil gas probes were constructed within the borings B1 through B3, and B8 through B14 upon completion of soil sampling. Due to shallow refusal encountered within boring B7 and flooded surface conditions at borings B4 through B6, and B15, soil gas probes were not installed within these borings.

Soil gas probes were constructed with new ¼-inch diameter Nylaflow tubing with a new ¼-inch diameter polypropylene filter at the terminal end which was inserted into the borehole to the desired sampling depth. One-inch diameter polyvinyl chloride (PVC) casing was used as a guide for the tubing to ensure that the desired sampling depth was achieved. Sand was poured into the boring annulus to form an approximately 1-foot long sand pack around the polypropylene filter, at which time the PVC piping was withdrawn. Approximately 1 foot of dry, granular bentonite was placed atop the sand pack and the remainder of the borehole was backfilled with hydrated bentonite to the ground surface to form a seal. The sampling end of the tubing was fitted with a valve and the probe was labeled for identification.

3.5.2 Soil Gas Sampling Methodology

Soil gas samples were collected in accordance with the July 2015 Department of Toxic Substances Control (DTSC) and Los Angeles Regional Water Quality Control Board (LARWQCB) "Advisory – Active Soil Gas Investigations."

Soil gas samples were collected using 1-liter, stainless-steel, cylindrical SUMMA canisters provided by Enthalpy Analytical (Enthalpy), a state-certified laboratory (California Department of Public Health Environmental Laboratory Accreditation Program certificate number 1338) in Orange, California, which subjected each canister to a rigorous cleaning process using a combination of dilution, heat, and high vacuum. After cleaning, the canisters were batch-certified to be free of target contaminants to a specified reporting limit (RL) via gas chromatography/mass spectroscopy (GC/MS) prior to delivery.

Partner received the SUMMA canisters evacuated to approximately -30 inches of mercury. The SUMMA canisters were fitted with stainless-steel flow controllers, which Enthalpy calibrated to maintain constant flow (approximately 0.1 liter per minute) for approximately 5 to 10 minutes of sampling time.

Each probe was allowed to equilibrate for a minimum of two hours after installation prior to sampling. After equilibration, the sample tubing and sampler screen were purged of ambient air using a plastic syringe. A Tracer gas [1,1-diflouroethane (1,1-DFA)] was placed around each probe at the ground surface while sampling to detect ambient air intrusion. Once the sampling tubing was purged of ambient air, the sampling end of the tubing was fitted to the sampling canister and the port valve was opened, causing air to enter the sample container due to the pressure differential. Partner closed the valves after the canister was evacuated to approximately -1 to -2 inches of mercury, with pertinent data (e.g., time, canister vacuum) recorded at the start and end of sampling. The SUMMA canisters were disconnected from the sampling ports and canister identifications were noted for the corresponding sample.

Soil gas samples were collected from borings B1, B3, and B11 through B13 at 10 feet bgs; from boring B2 at 7 feet bgs; from borings B8 through B10 at 20 feet bgs; and from boring B14 at 6 feet bgs.

3.6 Post Soil and Soil Gas Sampling Activities

Probes/temporary well points were removed from the subsurface and the boreholes were backfilled with hydrated bentonite chips following sampling activities. Boreholes advanced in improved areas were capped with concrete or asphalt patch to match existing ground cover after being backfilled.

No significant amounts of derived wastes were generated during this investigation.

3.7 Groundwater Sampling Activities

Partner performed an evaluation of the five existing monitoring wells prior to collection of groundwater samples. The well boxes all appeared intact, and the monitoring well caps were noted on all the wells. Standing water was noted in the well boxes of MW-3 and MW-5. The seals between the monitoring well lids and/or the screws which hold to lids to the well boxes should be replaced to ensure that no surface water enters the monitoring well and impacts groundwater.

According to reports describing the LUST investigation, , monitoring well MW-1 and MW-2 are screened from 45 to 75 feet bgs, MW-3 is screened from 55 to 85 feet bgs and MW-4 and MW-5 are screened from 75 to 95 feet bgs. Less than 2 inches of water was observed in MW-1 and MW-2, and this amount of represents residual water trapped in the wells' end-caps, not surrounding groundwater. Therefore, these wells were not sampled. In the remaining monitoring wells, he measured depth to groundwater ranged from 73.52 ft to 87.54 feet bgs (MW-5). Partner oversaw the sampling of groundwater conducted by Blaine Tech Services, Inc. (Blaine Tech) which included low flow purging and sampling with a bladder pump and new polyethylene tubing. Purge water parameters were measured with a Sper Scientific turbidity meter and a YSI Pro Plus multi-parameter meter. All field instruments were calibrated by Blaine Tech prior to use.

Groundwater Sampling Methodology

Each well box was opened, and the well box integrity and monitoring well cap seal and casing condition were observed. No standing water was observed in the well boxes at MW-1, MW-2, and MW-4, although based on the condition of the seal and the presence of silt inside the well boxes, it is likely that water has previously been found in these well boxes. In MW-3 and MW-5, standing water was noted in the well boxes, but the well caps and casing were noted to be intact. The rainwater noted in these well boxes was removed prior to removing the well cap and recording groundwater elevation measurements using a water level indicator. The water level meter was decontaminated after each well measurement. Purging commenced after the water level in each well was gauged.

The pump was set at the desired extraction point, near the midpoint of the measured water column within the well prior to purging. At least one system volume (i.e., pump tubing volume) was removed prior to recording groundwater parameters. The groundwater parameters temperature, pH, conductivity, turbidity, dissolved oxygen, and oxidation reduction potential (ORP) were periodically recorded at a rate of one reading every 3 minutes. Purging ceased once the groundwater parameters stabilized. Groundwater parameter stabilization is considered to be a fluctuation of less than 3% in temperature; 10% in conductivity, turbidity, and dissolved oxygen; 0.1 units in pH; and 10 millivolts in ORP over three consecutive readings.

The depth to water (DTW) was recorded with a water level meter during purging to monitor the water column drawdown. The pump purged groundwater from the well at a flow rate of 200 milliliters per minute. Sampling began once groundwater parameters and well column drawdown stabilized.

Groundwater was conveyed directly from the pump discharge tubing into laboratory-supplied containers. The pump flow rate was maintained or reduced slightly during sampling. The pump was shut off and downhole sampling equipment was retrieved from the well after sampling, and equipment was decontaminated prior to sampling of the next monitoring well.

Containers for analysis of volatile organic compounds were filled to the top of the container with no observable headspace or air bubbles to minimize the potential for volatilization. Sample containers were sealed, labeled for identification, placed into a plastic bag, and stored in an iced cooler. The samples were

transported in the iced cooler under chain-of-custody protocol to the laboratory for analysis. Following sampling, each well cap and well box lid was securely replaced prior to demobilizing from the site.

Partner collected samples from four groundwater samples from three of the existing groundwater wells (MW-3, MW-4, and MW-5) including a duplicate collected from MW-4. Partner did not sample water from monitoring wells MW-1 and MW-2 since less than two inches of water was measured in each of these wells and this amount of water does not represent surrounding groundwater. The groundwater samples collected from MW-3, MW-4 and MW-5 were transferred in an iced cooler under chain-of-custody protocol to Jones Environmental, Inc. (JEI) for analysis for total petroleum hydrocarbons as gasoline (TPH-g) and volatile organic compounds (VOCs) in accordance with EPA Method 8260B, as well as total petroleum hydrocarbons as diesel (TPH-d) in accordance with EPA Method 8015.

4.0 DATA ANALYSIS

4.1 Laboratory Analysis

Partner collected 46 soil samples and 10 soil gas samples on March 9 and 10, 2023, which were transported in an iced cooler (soil samples) or at ambient temperature (soil gas samples) under chain-of-custody protocol to Enthalpy for analysis. Based on field-screening results, visual observations, and/or olfactory observations, one soil sample per boring (14 soil samples total) was analyzed for TPH-cc via EPA Method 8015B and VOCs via EPA Method 8260B. A soil gas sample was collected from each of 10 borings and analyzed for VOCs via EPA Method TO15. The remaining soil samples were placed on hold at the laboratory.

On March 22, 2023, Partner collected four groundwater samples from MW-3, MW-4 and MW-5 (one duplicate) which were previously installed by others as a part of the closed LUST investigation at the Site.

Laboratory analytical results are included in Appendix B and discussed below.

4.2 Regulatory Agency Comparison Criteria

Department of Toxic Substances Control Attenuation Factor and Regional Screening Levels

Regional Screening Levels (RSLs) are generic, risk-based chemical concentrations developed by the EPA for use in initial screening-level evaluations. RSLs combine human health toxicity values with standard exposure factors to estimate contaminant concentrations that are considered to be health protective of human exposures over a lifetime through direct-contact exposure pathways (e.g., via inhalation and/or ingestion of and/or dermal contact with impacted soil and/or indoor air). RSLs are not legally enforceable standards, but rather are considered guidelines to evaluate if potential risks associated with encountered chemical impacts may warrant further evaluation.

The DTSC Office of Human and Ecological Risk (HERO) developed California-Modified RSLs based on a review of 1) RSL concentrations, and 2) recent toxicity values.

While soil gas detections are not immediately comparable to the indoor air quality guidelines within the RSLs, the DTSC issued recommended a default attenuation factor of 0.03 in their guidance document *Screening and Evaluating Vapor Intrusion, Final Draft,* issued in February 2023. With the indoor air RSLs and default attenuation factors, the associated Residential and Commercial/Industrial Soil Gas Screening Levels (SGSLs) can be calculated and are presented in Table 4.

Environmental Screening Levels

The San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) were utilized as an initial screening level evaluation for total petroleum hydrocarbons. ESLs aid in assessing the potential threats to human health, terrestrial/aquatic habitats, and/or drinking water resources due to contaminants in soil, soil gas, and/or groundwater. Under most circumstances, the presence of contamination below applicable ESLs can be assumed to not pose a significant, chronic (i.e., long-term) adverse risk to the applicable receptor of concern. Conversely, sites that exceed ESLs generally require further evaluation and/or remediation. Please note that the ESLs were developed using default assumptions (e.g., standard exposure factors) and, consequently, are only meant for screening level assessments. The

ESLs should not be considered enforceable regulatory standards. Cleanup levels ultimately dependent on site-specific factors and are established by the regulatory agencies on a case-by-case basis.

4.3 Soil Sample Data Analysis

Low concentrations of GRO were detected in 11 of the 14 analyzed soil samples and MORO was detected in two of the 14 soil samples at concentrations between the method detection limit (MDL) and the reporting limit (RL).. It should be noted the GRO was detected in each corresponding method blank and MORO was detected in one of the two corresponding method blanks for the soil samples. Based on the detection of GRO and MORO in the method blanks, these analytes probably originated at the laboratory and are not indicative on on-site soil conditions. Additionally, the estimated GRO and MORO concentrations did not exceed the respective screening levels. DRO was not detected in any of the 14 soil samples.

Low concentrations of TBA were detected in seven of the 14 analyzed soil samples and chloromethane was detected in one sample at a concentrations above the MDL but below the RL. The estimated concentrations did not exceed their respective screening levels. No other VOCs were detected in the soil samples. The lateral and vertical extent of these impacts were not defined during this investigation.

Based on the findings, the soil samples placed on hold at the laboratory were not analyzed.

Refer to Tables 2 and 3 for a summary of the soil sample TPH-cc and VOCs laboratory analysis results, respectively.

4.4 Soil Gas Sample Data Analysis

No VOCs other than benzene were detected in soil gas at concentrations that exceed the commercial/industrial SGSLs. Four soil vapor samples had concentrations of benzene in excess of SGSLs calculated using the DTSC's 2023 default attenuation factor of 0.03. Low concentrations of various VOCs, including Freon 12; chloromethane; trichlorofluoromethane; TBA; 1carbon disulfide; methylene chloride; methyl tert-butyl ether (MTBE); n-hexane; 2-butanone; chloroform; benzene; trichloroethene (TCE); 4-methyl-2-pentanone; toluene; tetrachloroethene (PCE); 2-hexanone; ethylbenzene; m,p-xylenes; o-xylene; styrene; and 1,2,4-trimethylbenzene (TMB), were detected in the analyzed soil gas samples. Of these, four of the benzene concentrations exceeded the commercial/industrial SGSL.

The tracer gas was not detected In any sample, indicating that the integrity of the bentonite seal was maintained.

Refer to Table 4 for a summary of the soil gas sample VOCs laboratory analysis results.

4.5 Groundwater Data Analysis

In the four samples collected from the three previously installed monitoring wells at the northern portion of the Site, no VOCs, GRO, or DRO were detected above laboratory reporting limits and these RLs were below drinking water MCLs and/or screening levels. A summary of groundwater analytical results is presented in Table 5.

5.0 CONCLUSIONS AND RECOMENDATIONS

Partner conducted a Phase II Subsurface Investigation at the subject property to evaluate the potential impact of petroleum hydrocarbons and/or volatile organic compounds (VOCs) to soil gas, soil, and/or groundwater as a consequence of the historical and on-going uses of underground storage tanks (USTs), clarifiers, and/or underground hydraulic lifts. The site is currently improved with two fueling stations and a total of 8 USTs including 21 fuel dispensers beneath two canopies, herein referred to as Northern and Western Canopies; One 20,000-gallon gasoline UST; and one compartmentalized 20,000-gallon gasoline/diesel UST located at the northwest junction of the two canopies, herein referred to as Western USTs; two 12,000-gallon gasoline USTs located south of the Northern Canopy, herein referred to as Eastern USTs. The Western USTs were installed in 2005 and the Eastern USTs were installed in 1993. No known releases were reported in the documents available to Partner (on-line or provided by the Client) in connection with the current UST systems. Five groundwater monitoring wells (MW-1 through MW-5) were observed on-site during Phase I and Phase II activities. Based on the location of the wells, they appear to be associated with the on-site leaking underground storage tank (LUST) incident that was reported in 2003 and received closure in 2013.

The following recognized environmental conditions (RECs) were identified in the Phase I:

- The environmental risk associated with USTs increases over time, as these systems age. Furthermore, no subsurface investigations have been conducted in connection with the USTs at the subject property since 2012 (~11 years). Therefore, based on the age of the current UST systems and lack of recent subsurface investigations, the onsite UST systems represent a REC.
- Partner observed the presence of fifteen (15) below-grade hydraulic lifts and one potential former underground hydraulic lift within the automotive service/office building located in the central portion of the subject property. Based on the subgrade nature and long-term duration of use, Partner cannot rule out potential releases of hydraulic fluid to the subsurface beneath the current and former lifts. As such, the current and former below-ground hydraulic lifts at the subject property represent a REC.
- Three clarifiers, herein referred to as Clarifiers 1 through 3, were installed in 1982 at the subject property. Based on the age of the clarifier and trench/floor drain systems (41 years) and hazardous nature of the waste streams, Partner cannot rule out the potential for a release of hazardous substances to the subsurface in connection with these features. As such, the clarifiers and associated floor/trench drain system represent a REC.

The following historical recognized environmental condition (HREC) was identified in the Phase I:

- Based on review of documentation provided by the Regional Water Quality Control Board (RWQCB), the subject property was identified as a LUST site for a release occurring on or before September 10, 2003. The release was identified in the areas of the current Western USTs and is associated with a previous generation of USTs at the subject property, which included four 10,000-gallon gasoline USTs and one 7,000-gallon diesel UST. The five USTs were removed in 2005. Approximately 1,000 tons of hydrocarbon impacted soil was excavated and transported offsite, and groundwater monitoring was conducted from July 2008 through July 2012. The most recent groundwater

monitoring data was collected in July 2012, which indicated that TPHg, BTEX, MTBE and TBA were non-detectable in all five wells. Subsequently, a no further action (NFA) letter was issued to Hertz Corporation on September 24, 2013, as groundwater concentrations met criteria components of the Low Threat UST Closure Policy. Therefore, based on review of the analytical data indicating residual soil impacts were left in place at 45 to 60 feet bgs, removal of the prior generation of UST systems and associated impacted soil, and regulatory oversight and closure, the closed LUST case and prior generation of USTs represents a HREC and no further investigation is recommended.

The five monitoring wells installed by others as a part of this LUST investigation were observed to still be present by Partner during these Phase II investigation activities.

Additionally, two 2,000-gallon waste oil USTs and two 8,000-gallon waste/new oil USTs were reportedly removed under Los Angeles Fire Department (LAFD) oversight in 2005. Confirmation soil samples did not detect TPH-g or VOCs and therefore these former USTS were not identified as a REC.

The scope of the Phase II Subsurface Investigation consisted of the collection and analysis of 15 soil/soil gas borings, as well as the collection and analysis of groundwater samples from three existing groundwater monitoring wells. Fourteen soil samples were analyzed for carbon-chain total petroleum hydrocarbons (TPH-cc) and VOCs, and 10 soil gas samples were analyzed for VOCs. It should be noted that three of the planned soil gas locations in the area of the Eastern USTs and one soil gas location adjacent to Clarifier C3 could not be sampled due to flooded conditions and as a result, soil gas conditions in these areas have not been assessed.

Subsurface lithology encountered in the upper 20 feet consisted of a mixture sandy silt and silty clay to approximately 10 feet below ground surface (bgs), followed by sand and silty sand to terminal depths of 20 feet bgs.

During Partner's investigation, very low estimated concentrations of GRO were detected in 11 of the 14 analyzed soil samples and MORO were detected in two of the 14 soil samples at concentrations below the reporting limit (RL). It should be noted the GRO was detected in each corresponding method blank and MORO was detected in one of the two corresponding method blanks for the soil samples. Based on the detection of GRO and MORO in the method blanks, these analytes probably originated at the laboratory and are not indicative on on-site soil conditions. Additionally, the estimated GRO and MORO concentrations did not exceed the respective screening levels. DRO was not detected in any of the 14 soil samples.

Low estimated concentrations of TBA were detected in seven of the 14 analyzed soil samples and chloromethane was detected in one sample at a concentration below the RLs. The estimated concentrations did not exceed their respective screening levels. No other VOCs were detected in the soil samples. The lateral and vertical extent of these impacts were not defined during this investigation.

Various VOCs were detected in the 10 soil gas samples collected from 10 borings advanced in the vicinity of the USTs, dispenser islands, clarifiers and hydraulic lifts. However, only benzene was detected at concentrations exceeding applicable regulatory guidelines for commercial/industrial use in four locations.

Based on the results of this investigation, subsurface impacts by VOCs above commercial screening levels have been identified in the area of the automotive service/office building, Clarifier C2, and the western UST

dispenser islands beneath the Northern Canopy. The vertical and lateral extent of the impacts has not been defined.

VOCs and TPH were not detected above laboratory detection limits in any of the four groundwater samples collected from the three on-Site groundwater monitoring wells installed by others at the northern portion of the Site. The groundwater samples were collected in the area of the current and known past USTs at the Site. Therefore, it does not appear that any releases from onsite operations have impacted groundwater at the Site. During the Phase I Site investigation, off-Site groundwater impacts were not identified as an REC. Based on this information, no impacts to groundwater were identified at this Site.

Water was noted in groundwater monitoring well boxes at MW-3 and MW-5. It is recommended that the well box seals and/or screws be replaced on all the moniitoring wells to ensure that no fluids leak into the monitoring well and the groundwater beneath.

Partner understands from the client, that Hertz will continue to operate onsite until 2026 and continue their use of the USTs, clarifiers and lifts during that time. Current onsite operations, which include the use of petroleum products, cleaners, and auto servicing fluids, may also contribute concentrations of VOCs in indoor air.

Based on the concentrations of benzene detected in soil gas, Partner is unable to rule out potential vapor intrusion from benzene to the automotive service/office building. Therefore, a vapor intrusion assessment may be necessary to determine if subsurface vapors are intruding into on-site buildings.

Since demolition of the current buildings and construction of new building(s) is planned after the termination of the current lease period, Partner recommends that all subsurface features of concern (including USTs systems, underground hydraulic lifts, and clarifiers) be removed under regulatory agency oversight at the time of demolition and redevelopment, and that confirmation sampling be conducted at the time of removal. If impacts are identified, Partner recommends that remediation be completed under regulatory agency oversight, as appropriate. Due to the historical and on-going uses of the Site and known concentration of VOCs in soil vapor and residual hydrocarbons remaining in-place, it is recommended that a Soils Management Plan be developed and implemented during demolition and construction activities to address any impacted soils or unknown USTs that may be encountered at the Site. Further, it is recommended that soil gas conditions be assessed following the removal of the on-Site USTs, dispensers, lifts and clarifiers. If elevated levels of VOCs remain at the Site following these removal activities, then the installation of a soil vapor barrier is recommended.

This data package contains sample and QC results for eight air samples and eight soil samples, requested for the above referenced project on 03/10/23. The samples were received cold and intact.

TPH-Extractables by GC (EPA 8015B):

- High surrogate recoveries were observed for n-triacontane in B1-10 (lab # 481248-011) and B8-20 (lab # 481248-019); no target analytes were detected at or above RL in these samples.
- TPH (C6-C12) was detected between the MDL and the RL in the method blank for batch 309500; this analyte was not detected in samples at or above the RL.
- TPH (C23-C44) was detected between the MDL and the RL in the method blank for batch 309641; this analyte was not detected in the sample at or above the RL.
- No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):

No analytical problems were encountered.

Volatile Organics in Air by MS (EPA TO-15):

- B10-SG (lab # 481248-004) and B12-SG (lab # 481248-006) were diluted due to high hydrocarbons.
- No other analytical problems were encountered.

1.0 EXECUTIVE SUMMARY

1.1 Executive Summary

Partner completed a *Phase I Environmental Site Assessment Report* (Phase I) for the Site in March 2023 at the request of Rexford to document the environmental history of the Site prior to their acquisition of the property.

The following recognized environmental conditions (RECs) were identified in the Phase I:

- The on-site UST systems consisting of four USTs that were installed in 1993 and 2005, represent a REC. The environmental risk associated with USTs increases over time, as these systems age. Furthermore, no subsurface investigations have been conducted in connection with the USTs at the Site since 2012 (~11 years). Therefore, based on the age of the current UST systems and lack of recent subsurface investigations, the onsite UST systems represent a REC.
- Partner observed the presence of fifteen (15) below-grade hydraulic lifts and one potential former underground hydraulic lift within the automotive service/office building located in the central portion of the Site. Based on the subgrade nature and long-term duration of use, Partner cannot rule out potential releases of hydraulic fluid to the subsurface beneath the current and former lifts. As such, the current and former below-ground hydraulic lifts at the Site represent a REC.
- Three clarifiers, herein referred to as Clarifiers 1 through 3, were installed in 1982 at the Site. Based on the age of the clarifier and trench/floor drain systems (41 years) and hazardous nature of the waste streams, Partner cannot rule out the potential for a release of hazardous substances to the subsurface in connection with these features. As such, the clarifiers and associated floor/trench drain system represent a REC.

The following historical recognized environmental condition (HREC) was identified in the Phase I:

- Based on review of documentation provided by the Regional Water Quality Control Board (RWQCB), the Site was identified as a LUST site for a release occurring on or before September 10, 2003. The release was identified in the areas of the current Western USTs and is associated with a previous generation of USTs at the Site, which included four 10,000-gallon gasoline USTs and one 7,000-gallon diesel UST. The five USTs were removed in 2005. Approximately 1,000 tons of hydrocarbon impacted soil was excavated and transported offsite, and groundwater monitoring was conducted from July 2008 through July 2012. The most recent groundwater monitoring data was collected in July 2012, which indicated that total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX), methyl tert-butyl ether (MTBE) and tert-butyl alcohol (TBA) were non-detectable in all five wells. Subsequently, a no further action (NFA) letter was issued to Hertz Corporation on September 24, 2013, as groundwater concentrations met criteria components of the Low Threat UST Closure Policy. Therefore, based on review of the analytical data indicating residual soil impacts were left in place at 45 to 60 feet bgs, removal of the prior generation of UST systems and associated impacted soil, and regulatory oversight and closure, the closed LUST case and prior generation of USTs represents a HREC and no further investigation is recommended. The

five monitoring wells installed at the Site during the LUST investigation were observed to still be present during Partner's Phase II work.

Additionally, two 2,000-gallon waste oil USTs and two 8,000-gallon waste/new oil USTs were reportedly removed under Los Angeles Fire Department (LAFD) oversight in 2005. Confirmation soil samples did not detect TPHg or volatile organic compounds (VOCs), and therefore these former USTs were not identified as a REC.

A Phase II Subsurface Investigation was performed in March 2023 consisting of the collection and analysis of 15 soil/soil vapor borings, as well as the collection and analysis of groundwater samples from three existing groundwater monitoring wells. Fourteen soil samples were analyzed for carbon-chain total petroleum hydrocarbons (TPH-cc) and VOCs, and 10 soil vapor samples were analyzed for VOCs.

Subsurface lithology encountered in the upper 20 feet consisted of a mixture sandy silt and silty clay to approximately 10 feet below ground surface (bgs), followed by sand and silty sand to terminal depths of 20 feet bgs.

Based on the results of the investigation, subsurface impacts to soil vapor by VOCs, specifically benzene, above commercial screening levels were identified in the following areas:

- automotive service/office building,
- clarifier C2.
- western UST dispenser islands.
- beneath the northern dispenser island canopy.

The vertical and lateral extent of benzene impacts to soil vapor above conservative screening levels was not defined by Partner's March 2023 sampling.

To evaluate the potential for past releases at the Site to have impacted groundwater, during a second round of field work, in March 2023, groundwater samples were collected from monitoring wells MW-3, MW-4, and MW-5. Depth to groundwater ranged from 73.52 feet bgs to 87.54 feet bgs in wells MW-3, MW-4 and MW-5. The groundwater samples were analyzed for total petroleum hydrocarbons as gasoline (TPH-g), total petroleum hydrocarbons as diesel (TPH-d), and VOCs, which were not detected. Therefore, it does not appear that potential past releases from onsite operations have impacted groundwater at the Site.

To further define the benzene soil vapor plumes previously identified, in July 2023, following Rexford's acquisition of the Site, Partner conducted a Soil Vapor Assessment consisting of 15 additional soil vapor borings surrounding B3 and B12 through B14. A sixteenth boring that was proposed for the project, however, could not be advanced due to utility conflicts in the area. A total of 32 soil vapor samples (including two duplicate samples) were collected and analyzed for VOCs.

Low concentrations of various VOCs, including Freon 12; chloromethane; trichlorofluoromethane; TBA; carbon disulfide; methylene chloride; MTBE; n-hexane; 2-butanone; chloroform; trichloroethene (TCE); 4-methyl-2-pentanone; toluene; tetrachloroethene (PCE); 2-hexanone; ethylbenzene; m,p-xylenes; o-xylene; styrene; and 1,2,4-trimethylbenzene (TMB), were detected in the analyzed soil vapor samples; however, these VOCs were detected at concentrations below their respective soil gas screening levels (SGSLs). No other VOCs were detected in soil vapor. The tracer gas was not detected in any sample, indicating that the integrity of the bentonite seal was maintained.

Twenty-seven of the soil gas samples contained concentrations of benzene above the most conservative commercial/industrial SGSLs calculated using the DTSC's 2023 default attenuation factor (AF) of 0.03. The concentrations did not exceed the AF 0.001 or 0.0005 SGSLs (which are generally more in line with actual conditions for commercial/industrial sites) as based on the 2011 DTSC guidelines, indicating that vapor intrusion is unlikely to be a concern.

Benzene was not detected in the shallow (5 foot bgs) interval of the thee borings advanced to the north of the northern canopy (P1, P2, and P3) nor in the deep (14 foot and 15 foot bgs, respectively) intervals of P1 and P3. Based on this data set, the lateral extent of benzene in shallow soil vapor has been defined to the north of the north dispenser islands, and benzene in shallow soil vapor does not extend off-Site to the north. A soil vapor sample collected from P2 at 12 foot bgs, however, contained a concentration of benzene above the most conservative SGSL at 84 ug/m3, which may indicate minor deeper benzene impacts in soil vapor in the vicinity of P2, north of the northern canopy. As this concentration only slightly exceeds the SGSL of 67 µg/m^3, additional vertical delineation is not recommended.

In the remaining vapor probes (P4-P16), low-levels of benzene were found at concentrations ranging from 40 micrograms per cubic meter (µg/m^3) in the 5-foot interval of P6 to 180 µg/m^3 in the 5-foot interval of P13. In the deeper vapor probes collected from 10-12 ft bgs, benzene was detected at concentrations from 67 ug/m3 (in P13) to 134 µg/m^3 (in P15), exceeding the commercial SGSL. Concentrations in the deeper samples were generally equivalent to or less than those found at 5 ft bgs. This, combined with the lack of benzene in soil and groundwater, indicate that there are no significant deeper soil vapor impacts at P4 through P16.

The highest concentrations of benzene in both the shallow intervals and the deep intervals were found in borings south of the fuel dispenser islands and the western USTs, but close to the central USTs, Clarifier 2 , Clarifier 3 and the auto repair building's chemical storage area (along the east central edge of the building). The highest detections of benzene were found outside of enclosed office spaces, either in parking lots or in open automotive repair bays. The widespread nature indicates that the vapor plume is associated with multiple sources at concentrations that do not represent a significant exposure risk to workers in the building nor to visitors to the Site.

Based on the cumulative results of the investigation, there appears to be diffuse low-level benzene impacts primarily south and east of the north and west dispenser islands and western UST area, with no benzene detected in shallow soil vapor to the north of this area. The Site is currently utilized for automotive repair and fueling operations, primarily in open or outdoor spaces, and therefore, vapor intrusion is not expected to be a concern at the Site at this time. Additionally, based on the current use of petroleum products on-Site, given the VOC concentrations detected in soil gas, VOC vapor migration into the building from the documented subsurface impacts, if any, is expected to have a minimal effect on the overall quality of indoor air within the subject property building. Accordingly, no further investigation with respect to the soil gas impacts is recommended at this time.

Since demolition of the current buildings and construction of new building(s) is planned after the termination of the current lease period, Partner recommends that the tenant remove all subsurface features of concern (including clarifiers, USTs, dispenser islands, piping and below grade hydraulic lift) under regulatory agency oversight. Further, we recommend that confirmation soil sampling be conducted at the

time of removal, even in areas where the regulatory agency may not require sampling, such as piping runs between clarifiers, and below hydraulic lifts. If impacts are identified, Partner recommends that appropriate soil removal be completed under regulatory agency oversight. Further, a soil gas assessment is recommended following vacancy and removal of the subsurface features to confirm that no unacceptable vapor plume remains. If elevated levels of VOCs remain at the Site following these removal activities, then the installation of a soil vapor barrier is recommended.

Finally, due to the historical and on-going uses of the Site and known concentrations of VOCs in soil vapor and residual hydrocarbons, it is recommended that a Soils Management Plan be developed and implemented during demolition and construction activities to address any newly encountered soils of potential impact and unknown USTs that may be encountered at the Site.

2.0 SITE BACKGROUND

2.1 Site Description

The subject property consists of one parcel of land comprising 18.28 acres located on the northeast corner of West Arbor Vita Street and Airport Boulevard within a mixed residential, commercial, and industrial area of Los Angeles, Los Angeles County, California (Site – see **Figure 1**). The Site consists of a one-story automotive service/office building located on the central portion of the Site and an additional one-story automotive service building located on the northern portion of the Site. The buildings total approximately 38,680 square feet. In addition to the current structures, the Site is also improved with concrete-paved parking areas, two fueling station canopies, a car wash, various carport canopies located throughout the property, and associated landscaping. Five groundwater monitoring wells (MW-1 through MW-5) were observed on-site during Phase I and Phase II activities. Based on the location of the wells, they appear to be associated with the on-site leaking underground storage tank (LUST) incident that was reported in 2003 and received closure in 2013 (see **Figure 2**).

The Site is bound by residential properties to the north beyond Interceptor Street; residential and a light industrial property to the east; an industrial warehouse, an area undergoing redevelopment, and a car wash and motel to the south beyond West Arbor Vitae Street; a car rental facility to the southwest beyond the intersection of West Arbor Vitae Street and Airport Boulevard; and residential properties and a parking lot and car detailing service to the west beyond Airport Boulevard. Refer to **Figure 1** for a site vicinity map showing site features and surrounding properties.

2.2 Site History

Partner completed a *Phase I Environmental Site Assessment Report* (Phase I) for the Site, dated March 9, 2023, on behalf of Rexford Industrial Realty, LP. According to available historical sources, the Site was formerly undeveloped as early as 1896; consisted of vacant graded land between 1947 and circa 1952; developed with Airport Junior High School from 1955 to 1981; and redeveloped with the current structures in 1981. Tenants on the Site have included Airport Junior High School (1955- until at least 1966) and Hertz Rent-A-Car (1981-Present). City directories were not available for 9000 Airport Boulevard from 1966 through 1990.

Partner conducted the site reconnaissance on February 23, 2023. The following recognized environmental conditions (RECs) were identified in the Phase I:

- The on-site UST systems consist of four USTs that were installed in 1993 and 2005, represent a REC .The environmental risk associated with underground storage tank (USTs) increases over time, as these systems age. Furthermore, no subsurface investigations have been conducted in connection with the USTs at the Site since 2012 (~11 years). Therefore, based on the age of the current UST systems and lack of recent subsurface investigations, the onsite UST systems represent a REC.
- Partner observed the presence of fifteen (15) below-grade hydraulic lifts and one potential former underground hydraulic lift within the automotive service/office building located in the central portion of the Site. Based on the subgrade nature and long-term duration of use, Partner cannot rule out

potential releases of hydraulic fluid to the subsurface beneath the current and former lifts. As such, the current and former below-ground hydraulic lifts at the Site represent a REC.

- Three clarifiers, herein referred to as Clarifiers 1 through 3, were installed in 1982 at the Site. Based on the age of the clarifiers and trench/floor drain systems (41 years) and hazardous nature of the waste streams, Partner cannot rule out the potential for a release of hazardous substances to the subsurface in connection with these features. As such, the clarifiers and associated floor/trench drain system represent a REC.

The following historical recognized environmental condition (HREC) was identified in the Phase I:

- Based on review of documentation provided by the Regional Water Quality Control Board (RWQCB), the Site was identified as a LUST site for a past release occurring on or before September 10, 2003. The past release was identified in the areas of the current Western USTs and is associated with a previous generation of USTs at the Site, which included four 10,000-gallon gasoline USTs and one 7,000-gallon diesel UST. The five USTs were removed in 2005. Approximately 1,000 tons of hydrocarbon impacted soil was excavated and transported offsite, and groundwater monitoring was conducted from July 2008 through July 2012. The most recent groundwater monitoring data was collected in July 2012, which indicated that gasoline constituent compounds including total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX), MTBE and tert-butyl alcohol (TBA) were not detected in all five wells. Subsequently, a no further action (NFA) letter was issued to Hertz Corporation on September 24, 2013, as groundwater concentrations met criteria components of the Low Threat UST Closure Policy. Therefore, based on review of the analytical data indicating residual soil impacts were left in place at 45 to 60 feet bgs, removal of the prior generation of UST systems and associated impacted soil, and regulatory oversight and closure, the closed LUST case and prior generation of USTs represents a HREC and no further investigation is recommended.

Phase II Soil and Soil Vapor Assessment – March 2023

A Phase II Subsurface Investigation performed in March 2023 consisted of the collection and analysis of 15 soil/soil vapor borings (B1 through B15 - see grey symbols on **Figure 3**), as well as the collection and analysis of groundwater samples from three existing groundwater monitoring wells. Fourteen soil samples were analyzed for carbon-chain total petroleum hydrocarbons (TPH-cc) and VOCs, and 10 soil vapor samples were analyzed for VOCs. Due to ponding water in the vicinity of the northern and western canopy dispenser islands, soil vapor samples in that area were unable to be collected. Partner recommends collection of soil vapor samples in this area to close this data gap.

A total of 14 soil samples were collected from 14 borings and analyzed for TPH-g, TPH-d and total petroleum hydrocarbons as motor oil (TPH-mo) in accordance with EPA Method 8015M and for VOCs in accordance with EPA Method 8260. In these samples the following was found (see **Table 2**):

- No TPH-g, TPH-d or TPH-mo were detected above laboratory reporting limits in any of the 14 soil samples analyzed and the laboratory reporting limits were well below each of their commercial/industrial use screening levels;

- No VOCs were reported above laboratory reporting limits in any of the 14 soil samples analyzed and the laboratory reporting limits were well below each of their commercial/industrial use screening levels.

- Trace estimated levels of tert-butyl alcohol (TBA) and chloromethane were detected at concentrations below the laboratory reporting limit (RL) but above the equipment's detection limit (DL) in the following samples:
    - In 7 of the 14 samples TBA had estimated (J-flag) concentrations ranging from 3.2J to 7.3J micrograms per kilogram (ug/kg), and these estimated concentrations are well below the commercial/industrial use screening level of 6,540,000 ug/kg,
    - In one of the 14 samples, methylene chloride had estimated concentration of 1.1 J ug/kg and this estimated concentration is well below the commercial/industrial use screening level of 460,000 ug/kg,

The results of the soil sampling conducted in March 2023 are summarized on **Figure 4**.

A total of 10 soil vapor samples were collected from 10 borings and analyzed for VOCs using EPA Method TO-15. VOCs were detected from these samples collected in the vicinity of the USTs, dispenser islands, clarifiers and hydraulic lifts.

In these samples, the following VOCs were found (see **Table 4**):

- Benzene was detected in 8 of the 10 soil vapor samples at concentrations ranging from 18 to 112 micrograms per cubic meter (ug/m3). The most conservative screening level for commercial/industrial use, calculated using a default attenuation factor (AF) of 0.03 to estimate indoor air concentrations from soil vapor levels, is 14 ug/m3. Four of the soil vapor samples had measured benzene concentrations greater than the 0.03 AF screening level, but all detected concentrations were less than the commercial/industrial screening level using the 0.001 AF which is appropriate for use for existing commercial/industrial buildings. The samples with conservative screening level exceedances were B3 and B12 through B14 at 5 feet bgs, which are located northwest of the northern canopy, east of the western canopy, and near hydraulic lifts inside the maintenance building (see **Figure 5**);
- Ethylbenzene was detected in 6 soil vapor samples at concentrations ranging from 3.2 µg/m3 to 86 µg/m3;
- Toluene was detected in 10 soil vapor samples at concentrations ranging from 3.8 µg/m3 to 150 µg/m3;
- Xylenes were detected in 5 soil vapor samples at concentrations ranging from 8.2 µg/m3 to 191 µg/m3;
- Freon 12, chloromethane, trichloro-difluoroethane, MTBE, 2-hexanone and 1,2,4 TMB were detected in four or less samples at concentrations more than 50 times less than their most conservative commercial/industrial-use screening levels;
- Acetone was found in all 10 samples at concentrations ranging from 100 ug/m3 to 720 ug/m3 and is a common laboratory cross-contaminant with not health based screening criteria;
- Carbon disulfide was detected in 9 samples at concentrations ranging from 1.6 to 78 ug/m3 and the most conservative commercial/industrial screening level is 10,000 ug/m3;

- Chloroform was detected in one sample at a concentration of 8.3 ug/m3 and is a common drinking water disinfection byproduct often found near water lines in shallow soil vapor samples. The most conservative commercial/industrial screening level for chloroform is 18 ug/m3.
- TCE was detected in 1 sample located east of the western canopy at a concentration of 2.7 µg/m3;
- PCE was detected in5 soil vapor samples at concentrations ranging from 5.1 µg/m3 to 33 µg/m3;
- Methylene chloride was detected in 4 samples at concentrations ranging from 1.5 µg/m3 to 4.9 µg/m3;
- n-hexane was detected in 8 samples at concentrations ranging from 5 µg/m3 to 450 µg/m3;
- 2- butanone was detected in 9 samples at concentrations ranging from 12 µg/m3 to 160 µg/m3;
- 4-methy-2-pentanone was detected in 8 samples at concentrations ranging from 1.8 µg/m3 to 74 µg/m3;
- Styrene was detected in 6 samples at concentrations ranging from1.5 to 7.9 µg/m3.
- No other VOCs were detected above laboratory reporting limits in any of the 10 soil vapor samples analyzed and the laboratory reporting limits were well below each of their most conservative commercial/industrial-use screening levels.

Based on the results of this investigation, subsurface impacts to soil vapor by the VOC benzene at concentrations above the conservative commercial/industrial 0.03 AF screening level were identified in several portions of the Site:

- the area of the automotive service/office building,
- near Clarifier C2,
- near the western UST dispenser islands in the vicinity of the norther dispenser island canopy.

The vertical and lateral extent of the impacts in these areas was not defined by Partner's sampling, and therefore Partner recommended additional investigation.

Groundwater Assessment -March 2023

To evaluate the potential for past releases at the Site to have impacted groundwater, during a second round of field work conducted in March 2023, three groundwater samples were collected from existing monitoring wells MW-3, MW-4, and MW-5 (see red symbols on **Figure 3**). Depth to first groundwater was measured at 73.52 feet bgs to 87.54 feet bgs in wells MW-3, MW-4 and MW-5. Groundwater samples were collected using low-low protocol and samples were collected once chemical parameters stabilized within 10% over three consecutive 3-minute screening intervals.. The groundwater samples were analyzed for total petroleum hydrocarbons as gasoline (TPH-g), total petroleum hydrocarbons as diesel (TPH-d), and VOCs (See **Table 3**).

No VOCs and TPH were detected above laboratory detection limits in any of the groundwater samples collected from the three on-Site groundwater monitoring wells. The groundwater samples were collected in the area of

the current and known former USTs at the Site. Therefore, Partner identified no evidence that releases from onsite operations have impacted groundwater at the Site.

Based on the concentrations of benzene detected, soil vapor impacts are found at the Site at levels above the most conservative screening levels in the areas of existing subsurface features including USTs, dispenser islands, clarifiers and automobile lifts/service areas. Therefore, Partner recommended performance of a supplemental soil vapor assessment to define the extent of the identified benzene soil vapor plumes to establish current Site conditions.

2.3 Geology and Hydrogeology

Review of the United States Geological Survey (USGS) *Venice/Inglewood, California* Quadrangle topographic map indicates the Site is situated approximately 105 feet above mean sea level, and the local topography is sloping gently to the northeast.

The Site is located within the Los Angeles Basin in a physiographic unit called the El Segundo Sand Hills. The El Segundo Sand Hills extend from the Ballona Gap south to Torrance and the Palo Verdes Hills, and approximately three to four miles inland from the Pacific Ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The Sand Hills consist of a narrow strip of active or recent dunes along the coast an older stabilized sand dune inland. The Site is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Sand Dunes have been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands, and which now form a portion of the Torrance Plain. Weathering and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area

Based on borings advanced during this investigation, the underlying subsurface consists predominantly of dark brown sandy silt (ML) and silty clay (CL) from the ground surface to approximately 10 feet bgs, underlain by brown, loose sand (SP) to approximately 20 feet bgs. During the first day of fieldwork, saturated soil and water were not encountered in any of the eight soil borings advanced up to terminal depths of 20 feet bgs. Shallow water was encountered in several borings at a depth of approximately 2 to 5 feet bgs on the second day of fieldwork and after overnight rainfall and is likely due to recent rain events.

During the previous Phase II investigation, three groundwater samples were collected from 3 of 5 identified historical monitoring wells (MW-3, MW-4, and MW-5). Monitoring well MW-3 is screened from approximately 55 to 85 feet bgs, and MW-4 and MW-5 are screened from approximately 75 to 95 feet bgs. Depth to first groundwater measured in March 2023 ranged from 73.52 feet bgs to 87.54 feet bgs in wells MW-3, MW-4, and MW-5.

3.0 FIELD ACTIVITIES

The Soil Vapor Assessment scope included the advancement of 15 borings (P1 through P6 and P8 through P16) to collect representative soil vapor samples. Refer to **Table 1** for a summary of the probe locations, sampling schedule, and laboratory analyses for this investigation.

3.1 Preparatory Activities

Prior to the initiation of fieldwork, Partner completed the following activities.

3.1.1 Utility Clearance

Partner delineated the work area with white spray paint and notified Underground Service Alert (USA) to clear public utility lines as required by law at least two business days prior to drilling activities. USA issued ticket number B231640163-00B for the project.

In addition, Partner subcontracted with Ground Penetrating Radar Systems (GPRS) on June 15, 2023, to clear boring locations of utilities. GPRS systematically free-traversed each proposed boring location with a Radiodetection model RD7000 electromagnetic induction (EM) equipment unit with line-tracing capabilities, and a GSSI model SIR-3000 ground penetrating radar (GPR) unit. The data was interpreted in real time for evidence of utility lines and/or other subsurface features of potential concern. Based on the findings of the utility survey, subsurface utilities were identified in the vicinity of proposed boring locations P7, P8, and P15. Based on the identified utilities in these areas, borings B8 and B15 were adjusted accordingly and P7 was not completed due to the number and locations of utilities identified in the vicinity of that proposed boring.

3.1.2 Health and Safety Plan

Partner prepared a site-specific Health and Safety Plan, which was reviewed with on-site personnel involved in the project prior to the commencement of drilling activities.

3.2 Drilling Equipment

On June 15 and 16, 2023, Partner subcontracted with Optimal Technology (Optimal) to provide and operate drilling equipment. Optimal, under the direction of Partner, advanced 15 borings with a mobile laboratory equipped with a hydraulic direct-push rod. Sampling equipment was decontaminated between sample intervals and boring locations to prevent cross-contamination.

3.3 Sample Locations

The borings were advanced at locations intended to delineate the previous detections of benzene at in soil vapor collected borings B3, B2, B13, and B14 which were sampled in March 2023. As such, soil vapor borings P1 through P4 were advanced approximately 88 feet east-northeast, 106 feet northeast, 53 feet north-northwest, and 78 feet south of previous boring B3, respectively. Soil vapor boring P4 is also approximately 42 feet northeast of previous boring B12. Soil vapor borings P5 through P6 were advanced approximately 72 feet east, 73 feet west, and 124 feet south of previous boring B12, respectively. Soil vapor borings P8, P9, P12, P13, and P15 were advanced approximately 29 feet southwest, 88 feet south-southwest, 66 feet east-southeast, 99 feet east-northeast, and 28 feet north of previous boring B13, respectively. Soil vapor

boring P9 is also approximately 35 feet northwest of previous boring B14. Soil vapor borings P10, P11, P16, and P14 were advanced approximately 68 feet southwest, 63 feet south-southwest, 60 feet east-southeast, and 136 feet east of previous boring B14, respectively.

Refer to Figure 3 for a map indicating sample locations.

3.4 Soil Vapor Sampling

3.4.1 Soil vapor Probe Construction

Soil vapor probes were constructed within each boring at 5 feet bgs and at the terminal depth or drilling refusal. Soil vapor boring P1 was advanced to 15 feet bgs. Soil vapor borings P2 through P6, and P8 through P16 were advanced to drilling refusal at depths ranging from 9 to 14 feet bgs. The terminal depth of each boring is presented on Table 1. Due to utility congestion, soil vapor boring P7 could not be advanced, and no soil vapor probes were not installed within this boring.

An electric rotary hammer drill was used to drill a 1-inch diameter hole through the overlying surface to allow probe placement when required. The same electric hammer drill was used to push probes in areas of resistance during placement. Optimal constructed temporary soil vapor probes within soil vapor probe borings by inserting new ¼-inch diameter Nylaflow® tubing with an inert vapor implant at the terminal end or drilling refusal to the desired sampling depth. Approximately one foot of sand was then poured into the boring annulus to form a sand pack around the vapor implant to minimize disruption of vapor flow to the implant, followed by approximately one foot of dry, granular bentonite placed atop the sand pack to prevent migration of clay and/or water. The remainder of the borehole was backfilled with hydrated bentonite to the ground surface to form a seal. The sampling end of the tubing was fitted with a valve and the probe was labeled for identification.

3.4.2 Soil vapor Sampling Methodology

Soil vapor samples were collected in accordance with the July 2015 Department of Toxic Substances Control (DTSC) and Los Angeles Regional Water Quality Control Board (LARWQCB) "Advisory – Active Soil Gas Investigations."

At each sampling location an electric vacuum pump set to draw 0.2 liters per minute (L/min) of soil gas was attached to the probe and purged prior to sample collection. Soil gas samples were obtained in SGE gas-tight syringes by drawing the sample through a luer-lock connection which connects the sampling probe and the vacuum pump. Samples were immediately injected into the gas chromatograph (GC)/purge and trap after collection. New tubing was used at each sampling point to prevent cross contamination.

Analyses were performed on a laboratory grade Hewlett Packard model 5890 Series II gas chromatograph equipped with a Hewlett Packard model 5971 Mass Spectra Detector and Tekmar LSC 2000 Purge and Trap. An SGE capillary column using helium as the carrier gas was used to perform the analysis. The results were collected on a personal computer utilizing Hewlett Packard's 5971 MS and chromatographic data collection and handling system.

A replicate analysis (duplicate) was run to evaluate the reproducibility of the sampling system and instrument. The difference between samples did not vary more than 20%. Blanks were run at the beginning of each workday and after calibrations. The blanks were collected using an ambient air sample. These blanks

checked the septum, syringe, GC column, GC detector, and the ambient air. Impacts were not found in any of the blanks analyzed during this investigation. Blank results are given along with the sample results.

A tracer gas was applied to the soil gas probes at each point of connection in which ambient air could enter the sampling system. These points include the top of the sampling probe where the tubing meets the probe connection and the surface bentonite seals. Isobutane was used as the tracer gas. No isobutane was found in any of the samples collected. The standard purge volume of three volumes was purged in accordance with the advisory. A shut-in test was conducted prior to purging or sampling each location to check for leaks in the above-ground sampling system. The system was evaluated to a minimum measured vacuum of 100 inches of water. The vacuum gauge was calibrated and sensitive enough to indicate a water pressure change of at least 0.5 inches.

Soil vapor samples were collected from each soil vapor boring at 5 feet bgs and from soil vapor borings P2 through P6, and P8 through P16 from their respective terminal depths.

3.5 Post Soil and Soil vapor Sampling Activities

Probes/temporary well points were removed from the subsurface and the boreholes were backfilled with hydrated bentonite chips following sampling activities. Boreholes advanced in improved areas were capped with concrete after being backfilled. No significant amounts of derived wastes were generated during this investigation.

4.0 DATA ANALYSIS

4.1 Laboratory Analysis

Optimal Technologies, a state-certified mobile laboratory [SWRCB Environmental Laboratory Accreditation Program (ELAP) certificate number 2779] that was present on site, collected 30 soil gas samples, and two duplicate samples on June 15 and 16, 2023, which were immediately loaded into the gas chromatograph/mass spectrometer (GC/MS) for analysis. Each sample was analyzed for VOCs via EPA Method 8260B.

Laboratory analytical results are included in Appendix A and discussed below.

4.2 Regulatory Agency Comparison Criteria

Department of Toxic Substances Control Attenuation Factor and Regional Screening Levels

Regional Screening Levels (RSLs) are generic, risk-based chemical concentrations developed by the EPA for use in initial screening-level evaluations. RSLs combine human health toxicity values with standard exposure factors to estimate contaminant concentrations that are considered to be health protective of human exposures over a lifetime through direct-contact exposure pathways (e.g., via inhalation and/or ingestion of and/or dermal contact with impacted soil and/or indoor air). RSLs are not legally enforceable standards, but rather are considered guidelines to evaluate if potential risks associated with encountered chemical impacts may warrant further evaluation.

The DTSC Office of Human and Ecological Risk (HERO) developed California-Modified RSLs based on a review of 1) RSL concentrations, and 2) recent toxicity values.

While soil gas detections are not immediately comparable to the indoor air quality guidelines within the RSLs, a default attenuation factor can be applied to sites where a site-specific attenuation factor for the building slab is unknown or cannot be assessed as stated in the October 2011 document *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)*. With the subsurface soil vapor contaminant concentrations, the associated contaminant concentrations in indoor air can be estimated as calculated commercial/industrial Soil Gas Screening Levels (SGSLs) using a variety of Attenuation Factors (AFs).

The *Vapor Intrusion Guidance* recommended the following default attenuation factors:

Building Scenario	Building Type	Sample Location	Attenuation Factor
Existing	Residential	Contaminant Source	0.002
		Crawl Space	1.0
		Sub-Slab	0.05
	Commercial/Industrial	Contaminant Source	0.001

		Sub-Slab	0.05
Future	Residential	Contaminant Source	0.001
	Commercial/Industrial	Contaminant Source	0.0005

In June 2015, the United States EPA and Office of Solid Waste and Emergency Response (OSWER) published a document titled *OSWER Technical Guidance for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Vapor Sources to Indoor Air*. This document presented data collected from sites throughout the United States to develop an EPA default AF of 0.03 for residential and commercial/industrial settings which predicts the attenuation of sub-slab and soil vapors into indoor air at contaminant source areas. The data evaluated by USEPA to develop this AF included only a handful of properties from California, and no data collected in Southern California. Many of the properties included in the USEPA/OSWER study had below ground basements, which are not common in California construction (USEPA, 2015).

In February 2020, the DTSC and California Water Resources Control Board issued a *Draft for Public Comment Supplemental Guidance: Screening and Evaluating Vapor* which recommended the use of a 0.03 AF for both soil vapor and sub-slab data. In the 2020 Draft Supplement it is stated that "Data collected during site investigations and report to Geotracker will be compiled in a California data base to support development of California-specific AFs…" (DTSC, 2020)

On August 22, 2022, the DTSC issued a Vapor Intrusion Update states that "An AF of 0.03 can be used for the initial evaluation of the potential for vapors to enter a building, especially to support a decision to move directly to an indoor-air evaluation. An alternate AF may also be proposed using multiple lines of evidence…" Further the Update states that "the use of a 0.03 AF is not a default requirement for developing clean-up goas or determining whether mitigation or remediation is required, and site-specific conditions should be used to for developing site specific AFs and mitigation/remediation goals" (DTSC, 2022).
In November 2022, the staff of the DTSC published a study of California-specific that data sets collected from both residential and commercial/industrial properties (Abbasi et, al, 2022). This study calculated an AF of 0.0009 (with a 95th percentile confidence) for 39 sites across California. This supports the use of an AF of 0.0005 for new commercial industrial structures as presented herein.

The primary screening levels for ambient air were referenced from Office of Environmental Health Hazard Assessment (OEHHA) and DTSC, HERO Note 3 Tables – June 2020 and revised May 2022 (DTSC, 2022). Where screening levels were not yet established for a specified VOC by the DTSC or OEHHA, the federal screening levels for ambient air were referenced from the EPA Region 9 RSLs (May 2022) in calculating the SGSL for that VOC (USEPEA, 2022).

With the established air RSLs listed in HERO Notes 3 and 4 and EPA RSLs, Partner calculated soil gas screening levels (SGSLs) using 0.0005, 0.001 and 0.03 as the AFs. The SGSLs were used for comparison to the VOC concentrations detected at the Site.

4.3 Soil Vapor Sample Data Analysis

The cumulative results of this investigation and Partner's previous investigation indicate that no VOCs other than benzene were detected in soil vapor at concentrations that exceed even the most conservative commercial/industrial SGSLs. Thirty-one soil vapor samples contained concentrations of benzene in excess of the most conservative AF 0.03 commercial/industrial SGSLs calculated using the DTSC's 2023 default attenuation factor of 0.03. The concentrations did not exceed the AF 0.001 or 0.0005 SGSLs as based on the 2011 DTSC guidelines. Low concentrations of various other VOCs, including Freon 12; chloromethane; trichlorofluoromethane; TBA; carbon disulfide; methylene chloride; methyl tert-butyl ether (MTBE); n-hexane; 2-butanone; chloroform; benzene; trichloroethene (TCE); 4-methyl-2-pentanone; toluene; tetrachloroethene (PCE); 2-hexanone; ethylbenzene; m,p-xylenes; o-xylene; styrene; and 1,2,4-trimethylbenzene (TMB), were detected in the analyzed soil vapor samples; however, these VOCs were detected at concentrations below their respective SGSLs. Refer to **Table 4** for a summary of the soil vapor sample VOCs laboratory analysis results and to **Figure 5** for a map of the benzene concentrations detected in soil gas. Isocontours of benzene concentrations at the 5-foot interval and 10-foot interval bgs are provided as **Figures 6.1 and 6.2**.

No benzene was detected in above the 0.03 AF SGSL in 7 of the 42 vapor samples analyzed from Partner's March and June 2023 investigations while, in 35 .concentrations The highest concentrations were generally found within the central portion of the Site near, and just north of the automotive repair building.

  No other VOCs were detected above laboratory reporting limits in any of the 42 total soil vapor samples analyzed and the laboratory reporting limits were generally below each of their most conservative commercial/industrial-use screening levels.

The tracer gas was not detected in any sample, indicating that the integrity of the bentonite seal was maintained.

5.0 CONCLUSIONS AND RECOMENDATIONS

Partner completed a *Phase I Environmental Site Assessment Report* (Phase I) for the Site in March 2023, which identified RECs associated with a former UST system, hydraulic lifts, and three clarifiers. Additionally, Partner noted a HREC associated with a former LUST case related to past releases from five former on-site USTs.

A Phase II Subsurface Investigation performed in March 2023 consisted of the collection and analysis of 15 soil/soil vapor borings (B1 through B15), as well as the collection and analysis of groundwater samples from three existing groundwater monitoring wells. Fourteen soil samples were analyzed for carbon-chain total petroleum hydrocarbons (TPH-cc) and VOCs, and 10 soil vapor samples were analyzed for VOCs.

Subsurface lithology encountered in the upper 20 feet consisted of a mixture sandy silt and silty clay to approximately 10 feet below ground surface (bgs), followed by sand and silty sand to terminal depths of 20 feet bgs.

Based on the results of the investigation, subsurface impacts to soil vapor by benzene, above commercial screening levels were identified in the following areas:

- automotive service/office building,
- clarifier C2.
- western UST dispenser islands.
- beneath the northern dispenser island canopy.

The vertical and lateral extent of benzene impacts to soil vapor above conservative screening levels was not defined by Partner's March 2023 sampling.

To evaluate the potential for past releases at the Site to have impacted groundwater, during a second round of field work, in March 2023, groundwater samples were collected from monitoring wells MW-3, MW-4, and MW-5. Depth to groundwater ranged from 73.52 feet bgs to 87.54 feet bgs in wells MW-3, MW-4 and MW-5. The groundwater samples were analyzed for total petroleum hydrocarbons as gasoline (TPH-g), total petroleum hydrocarbons as diesel (TPH-d), and VOCs, which were not detected. Therefore, it does not appear that potential past releases from onsite operations have impacted groundwater at the Site.

To further define the benzene soil vapor plumes previously identified, in July 2023, following Rexford's acquisition of the Site, Partner conducted a Soil Vapor Assessment consisting of 15 additional soil vapor borings surrounding B3 and B12 through B14. A sixteenth boring that was proposed for the project, however, could not be advanced due to utility conflicts in the area. A total of 32 soil vapor samples (including two duplicate samples) were collected and analyzed for VOCs.

Low concentrations of various VOCs, including Freon 12; chloromethane; trichlorofluoromethane; TBA; carbon disulfide; methylene chloride; MTBE; n-hexane; 2-butanone; chloroform; trichloroethene (TCE); 4-methyl-2-pentanone; toluene; tetrachloroethene (PCE); 2-hexanone; ethylbenzene; m,p-xylenes; o-xylene; styrene; and 1,2,4-trimethylbenzene (TMB), were detected in the analyzed soil vapor samples; however, these VOCs were detected at concentrations below their respective soil gas screening levels (SGSLs). No other VOCs were detected in soil vapor. The tracer gas was not detected in any sample, indicating that the integrity of the bentonite seal was maintained.

Twenty-seven of the soil gas samples contained concentrations of benzene above the most conservative commercial/industrial SGSLs calculated using the DTSC's 2023 default attenuation factor (AF) of 0.03. The concentrations did not exceed the AF 0.001 or 0.0005 SGSLs (which are generally more in line with actual conditions for commercial/industrial sites) as based on the 2011 DTSC guidelines, indicating that vapor intrusion is unlikely to be a concern.

Benzene was not detected in the shallow (5 foot bgs) interval of the thee borings advanced to the north of the northern canopy (P1, P2, and P3) nor in the deep (14 foot and 15 foot bgs, respectively) intervals of P1 and P3. Based on this data set, the lateral extent of benzene in shallow soil vapor has been defined to the north of the north dispenser islands, and benzene in shallow soil vapor does not extend off-Site to the north. A soil vapor sample collected from P2 at 12 foot bgs, however, contained a concentration of benzene above the most conservative SGSL at 84 ug/m3, which may indicate minor deeper benzene impacts in soil vapor in the vicinity of P2, north of the northern canopy. As this concentration only slightly exceeds the SGSL of 67 µg/m^3, additional vertical delineation is not recommended.

In the remaining vapor probes (P4-P16), low-levels of benzene were found at concentrations ranging from 40 micrograms per cubic meter (µg/m^3) in the 5-foot interval of P6 to 180 µg/m^3 in the 5-foot interval of P13. In the deeper vapor probes collected from 10-12 ft bgs, benzene was detected at concentrations from 67 ug/m3 (in P13) to 134 µg/m^3 (in P15), exceeding the commercial SGSL. Concentrations in the deeper samples were generally equivalent to or less than those found at 5 ft bgs. This, combined with the lack of benzene in soil and groundwater, indicate that there are no significant deeper soil vapor impacts at P4 through P16.

The highest concentrations of benzene in both the shallow intervals and the deep intervals were found in borings south of the fuel dispenser islands and the western USTs, but close to the central USTs, Clarifier 2 , Clarifier 3 and the auto repair building's chemical storage area (along the east central edge of the building). The highest detections of benzene were found outside of enclosed office spaces, either in parking lots or in open automotive repair bays. The widespread nature indicates that the vapor plume is associated with multiple sources at concentrations that do not represent a significant exposure risk to workers in the building nor to visitors to the Site.

Based on the cumulative results of the investigation, there appears to be diffuse low-level benzene impacts primarily south and east of the north and west dispenser islands and western UST area, with no benzene detected in shallow soil vapor to the north of this area. The Site is currently utilized for automotive repair and fueling operations, primarily in open or outdoor spaces, and therefore, vapor intrusion is not expected to be a concern at the Site at this time. Additionally, based on the current use of petroleum products on-Site, given the VOC concentrations detected in soil gas, VOC vapor migration into the building from the documented subsurface impacts, if any, is expected to have a minimal effect on the overall quality of indoor air within the subject property building. Accordingly, no further investigation with respect to the soil gas impacts is recommended at this time.

Since demolition of the current buildings and construction of new building(s) is planned after the termination of the current lease period, Partner recommends that the tenant remove all subsurface features of concern (including clarifiers, USTs, dispenser islands, piping and below grade hydraulic lift) under regulatory agency oversight. Further, we recommend that confirmation soil sampling be conducted at the

time of removal, even in areas where the regulatory agency may not require sampling, such as piping runs between clarifiers, and below hydraulic lifts. If impacts are identified, Partner recommends that appropriate soil removal be completed under regulatory agency oversight. Further, a soil gas assessment is recommended following vacancy and removal of the subsurface features to confirm that no unacceptable vapor plume remains. If elevated levels of VOCs remain at the Site following these removal activities, then the installation of a soil vapor barrier is recommended.

Finally, due to the historical and on-going uses of the Site and known concentrations of VOCs in soil vapor and residual hydrocarbons, it is recommended that a Soils Management Plan be developed and implemented during demolition and construction activities to address any newly encountered soils of potential impact and unknown USTs that may be encountered at the Site.

Dear David:

This letter presents the results of the soil vapor investigation conducted by Optimal Technology (Optimal), for Partner Engineering & Science, Inc. on June 15-16, 2023. The study was performed at 9000 Airport Rd., Los Angeles, California.

Optimal was contracted to perform a soil vapor survey at this site to screen for possible chlorinated solvents and aromatic hydrocarbons. The primary objective of this soil vapor investigation was to determine if soil vapor contamination is present in the subsurface soil.

Gas Sampling Method

Gas sampling was performed by hydraulically pushing soil gas probes to a depth of 5.0-15.0 feet below ground surface (bgs). When necessary, one-quarter inch Nylaflow tubing was installed at depth in a one-foot sand pack covered by one foot of dry bentonite. Hydrated bentonite filled the hole from the top of the dry bentonite to the surface. An electric rotary hammer drill was used to drill a 1.0-inch diameter hole through the overlying surface to allow probe placement when required. The same electric hammer drill was used to push probes in areas of resistance during placement.

At each sampling location, an electric vacuum pump set to draw 0.2 liters per minute (L/min) of soil vapor was attached to the probe and purged prior to sample collection. Vapor samples were obtained in gas-tight syringes by drawing the sample through a luer-lock connection which connects the sampling probe and the vacuum pump. Samples were immediately injected into the gas chromatograph/purge and trap after collection. New tubing was used at each sampling point to prevent cross contamination.

All analyses were performed on a laboratory grade Agilent model 6890N gas chromatograph equipped with an Agilent model 5973N Mass Spectra Detector and Tekmar LSC 3100 Purge and Trap. A Restek column using helium as the carrier gas was used to perform all analysis. All results were collected on a personal computer utilizing Agilent's MS and chromatographic data collection and handling system.

Quality Assurance

5-Point Calibration
The initial five-point calibration consisted of 20, 50, 100, 200 and 500 ul injections of the calibration standard. A calibration factor on each analyte was generated using a best fit line method using the Agilent data system. If the r^2 factor generated from this line was not greater than 0.990, an additional five-point calibration would have been performed. Method reporting limits were calculated to be 1-1000 micrograms per cubic meter (ug/m^3) for the individual compounds.

A daily calibration check was performed using a pre-mixed standard supplied by Scotty Analyzed Gases. The standard contained common halogenated solvents and aromatic hydrocarbons (see Table 1). The individual compound concentrations in the standards ranged between 0.025 nanograms per microliter (ng/ul) and 0.25 ng/ul.

Sample Replicates
A replicate analysis (duplicate) was run to evaluate the reproducibility of the sampling system and instrument. The difference between samples did not vary more than 20%.

Equipment Blanks
Blanks were run at the beginning of each workday and after calibrations. The blanks were collected using an ambient air sample. These blanks checked the septum, syringe, GC column, GC detector and the ambient air. Contamination was not found in any of the blanks analyzed during this investigation. Blank results are given along with the sample results.

Purge Volume
The standard purge volume of three volumes was purged in accordance with the July 2015 DTSC/RWQCB Advisory for Active Soil Gas Investigations.

Tracer Gas Leak Test
A tracer gas was applied to the soil gas probes at each point of connection in which ambient air could enter the sampling system. These points include the top of the sampling probe where the tubing meets the probe connection and the surface bentonite seals. Isobutane was used as the tracer gas. No Isobutane was found in any of the samples collected.

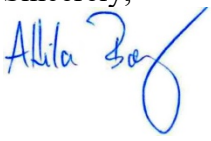
Shut-in Test
A shut-in test was conducted prior to purging or sampling each location to check for leaks in the above-ground sampling system. The system was evaluated to a minimum measured vacuum of 100 inches of water. The vacuum gauge was calibrated and sensitive enough to indicate a water pressure change of at least 0.5 inches.

Scope of Work

To achieve the objective of this investigation a total of 32 vapor samples were collected from 15 locations at the site. Sampling depths, vacuum readings, purge volume and sampling volumes are given on the analytical results page. All the collected vapor samples were analyzed on-site using Optimal's mobile laboratory.

Subsurface Conditions

Subsurface soil conditions at this site offered sampling flows at 0-20" water vacuum.



Results

During this vapor investigation, analytes were detected in multiple samples collected above the listed reporting limit. Please see the complete table of analytical results included with this report.

Disclaimer

All conclusions presented in this letter are based solely on the information collected by the soil vapor survey conducted by Optimal Technology. Soil vapor testing is only a subsurface screening tool and does not represent actual contaminant concentrations in either the soil and/or groundwater. We enjoyed working with you on this project and look forward to future projects. If you have any questions, please contact me at (877) 764-5427.

Subject: Technical Memorandum – Former Air Force Annex Property
9000 Airport Boulevard
Los Angeles, California 90045
Partner Project No. ES23-399900

Dear Mr. Gomez:

Partner Engineering and Science, Inc. (Partner) has prepared this Technical Memorandum for the above-referenced address (the "subject property") in response to a letter received from the Department of Toxic Substances Control (DTSC). In DTSC's letter dated September 19, 2024, DTSC states that the subject property overlays the location of the former Los Angeles Air Force Station No. 1, Westchester, California (Site No. J09CA045300). Based on such statement, DTSC recommended obtaining additional information about the subject property history and site remediation efforts. This Technical Memorandum evaluates the location of the subject property and clarifies that the referenced Formerly Used Defense Site (FUDS) was actually located outside of the boundaries of the subject property.

Below is a summary of our findings:

BACKGROUND – PRIOR PHASE I ENVIRONMENTAL SITE ASSESSMENT

Partner completed a *Phase I Environmental Site Assessment* (2023 Phase I) *Report* on the subject property, dated March 9, 2023, prepared on behalf of Rexford Industrial Realty. The 2023 Phase I found that the subject property consisted of one parcel of land encompassing approximately 18.28-acres located on the east side of Airport Boulevard and the north side of West Arbor Vitae Street within a residential, commercial, retail, and industrial area of Los Angeles County. At the time of the 2023 Phase I, the site was improved with two single-story commercial buildings that were constructed in 1981, with additional improvements added in 1996. In addition to the two structures, the subject property is also improved with concrete-paved parking areas, two fueling station canopies, a car wash, various carport canopies located throughout the property, and associated landscaping. The subject property is occupied by Hertz Rental Car for commercial use as a car rental facility. Onsite operations consist of car rental services, automotive service operations, fueling stations, and administrative office use.

The following was identified in the Phase I Report with respect to the former Los Angeles Air Force Station No. 1, Westchester, California (Site No. J09CA045300):

- According to records reviewed, a Military Evaluation/ (FUDS) appeared to have been identified within the boundaries of the subject property. Further examination indicates that the FUDS site, "Los Angeles AFD Annex No. 1," is linked to the southeast adjacent property at 5760 Arbor Vitae Street. The EnviroStor database system seems to have incorrectly plotted the FUDS location.

HISTORICAL INFORMATION REVIEWED

Below is a summation of regulatory and historical documents reviewed during the performance of the 2023 Phase I. These documents support the conclusion in the 2023 Phase I that **the former Los Angeles Air Force Station No. 1, Westchester, California (Site No. J09CA045300) was not located within the boundaries of the subject property but was located at 5760 Arbor Vitae Street and offsite to the southeast of the subject property.** Please refer to **Attachment A** for a figure depicting the relative locations of the subject property and the USACE-plotted location for former Los Angeles Air Force Annex No. 1.

Los Angeles AFS Annex No. 1, Formerly Used Defense Sites Program Management Action Plan, Published by the U.S. Army Corps of Engineers, Environmental Programs, Data as of 2021 Annual Reports to Congress (Unclassified)

The document is the official, unclassified report on the former Los Angeles Air Force Annex No. 1 published by the U.S. Army Corps of Engineers (USACE) and was reviewed by Partner for the 2023 Phase I. It is included as **Attachment B** to this document.

According to the official USACE document (page 6) the coordinates provided for the former Los Angeles Air Force Annex No. 1 are as follows: 33.951801; -118.383003. Partner utilized these coordinates in Google Earth, which plots the former Los Angeles Air Force Annex No. 1 as being located at 5760 Arbor Vitae Street and not within the boundaries of the subject property.

The USACE document also indicates the former Los Angeles Air Force Annex No. 1 totaled approximately 4.27-acres in size, which generally matches the parcel size of the 5760 Arbor Vitae Street parcel. As previously discussed, the subject property totals 18.28-acres in size which does not match the USACE provided acreage for the former Los Angeles Air Force Annex No. 1. The USACE document also notes Northrop University acquired 3.12-acres of the former Los Angeles Air Force Annex No. 1 in 1977, with the additional 1.15-acres purchased by Northrup University in 1984 via government auction. As discussed below in the historical review, the subject property was already developed with the existing car rental facility in 1981. Therefore, it does not appear the prior sales and/or ownership of Northrup University apply to the subject property. The USACE document indicates the former Los Angeles Air Force Annex No. 1 was utilized by the Air Force between 1955 and 1975 as a printing plant and as headquarters for the Space and Missile Systems Organization. However, as discussed below in the historical review, the subject property was developed with a junior high school during this period of time (see **Attachment C).** The USACE document

further states that two underground storage tanks (USTs), including one 2,000-gallon UST and one 4,000-gallon UST, were removed in 2002 by the owner, Neutrogena Corporation, from the former Los Angeles Air Force Annex No. 1. Partner notes Neutrogena was not the owner of the subject property in 2002, and the USTs listed were not identified as being located on the subject property. The USACE reports notes the status is listed as "complete."

These multiple lines of evidence provided by the USACE report, including the described location, size, and historical uses, provide clear documentation that the Air Force Annex No. 1 was located offsite at 5760 Arbor Vitae Street, not on the subject property.

HISTORICAL REVIEW

As part of the 2023 Phase I, Partner reviewed various historical documents, including aerial photographs (see **Attachment C**), Sanborn Fire Insurance Maps (see **Attachment D**), City Directories (see **Attachment E**), and Topographic Maps (see **Attachment F**), to evaluate the historical usage of the subject property and surrounding properties. Below is a summation of historical uses identified for the subject property and the offsite property at 5760 Arbor Vitae, the former location of Los Angeles Air Force Annex No. 1:

9000 Airport Boulevard - According to available historical sources, the subject property was formerly undeveloped as early as 1896; consisted of vacant graded land between 1947 and circa 1952; developed with Airport Junior High School from 1955 to 1981; and redeveloped with the current structures and car rental facility in 1981. Tenants on the subject property have included Airport Junior High School (1955-1966) and Hertz Rent-A-Car (1981-Present). A 1969 Sanborn Fire Insurance map depicted the subject property as being developed with several classroom buildings comprising Airport Junior High School on the eastern portion of the property (no historical/previous addresses depicted). Topographic maps dated 1964, 1972, and 1981 also depict the subject property as developed with a junior high school (Airport Jr. High). No evidence of a former industrial-type building was identified on the subject property during the historical review between 1955 and 1975.

5760 Arbor Vitae – According to available historical sources, this property was formerly undeveloped prior to 1950 and was developed with a large commercial warehouse-type structure by 1955. Based on review of the USACE document, the Air Force operated at this site from 1955 to 1975. According to historical city directories, historical tenants at this address include U.S. Air Force Dept C/Building (1960-1966); U.S. Air Force Civilian Empl 6 (1971); U.S. Air Force Contract Management 6 (1971); American Hall Aviation; and Northrup University (1981). These city directories further confirm the former Los Angeles Air Force Annex No. 1 was located at 5760 Arbor Vitae. Additionally, the 1981 topographic map revealed this property as developed with the Los Angeles Air Force Station.

CONCLUSIONS

Partner's review of the official, unclassified USACE document and historical documentation has concluded the former Los Angeles Air Force Annex No. 1 was located at 5760 Arbor Vitae and not within the boundaries of the subject property.

I. Statement of Purpose

A. Management Action Plan

The Management Action Plan (MAP) is to outline the total multi-year environmental cleanup program for a Formerly Used Defense Site (FUDS) property. The plan will define the cleanup program requirements and propose a comprehensive approach and associated costs to conduct future investigations and response action at each cleanup site.

B. Formerly Used Defense Sites Program

During the past two centuries, the Department of Defense (DOD) has used land throughout the United States to both train Soldiers, Airmen, Sailors and Marines, and test new weapons to ensure the nation's military readiness. As training and testing needs changed, DOD obtained property or returned it to private or public uses. When no longer needed, many of these properties were cleaned up according to the best practices available at the time and then transferred to other owners such as private individuals or federal, state, tribal, or local government entities.

Today, DOD is responsible for the environmental restoration (cleanup) of properties that were formerly owned by, leased to or otherwise possessed by the United States and under the jurisdiction of the Secretary of Defense prior to October 1986.Such properties are known as Formerly Used Defense Sites or FUDS. The U.S. Army is DOD's lead agent for the FUDS Program. The U.S. Army Corps of Engineers executes the FUDS Program on behalf of the U.S. Army and DOD. The U.S. Army and DOD are dedicated to protecting human health and the environment by investigating and, if required, cleaning up potential contamination or munitions that may remain on these properties from past DOD activities.

The scope and magnitude of the FUDS Program are significant, with more than 10, 000 properties identified for potential inclusion in the program. Information about the origin and extent of contamination or munitions, land transfer issues, past and present property ownership, applicable laws and DOD policies must be evaluated before DOD considers a property eligible for Defense Environment Restoration Account funding under the FUDS Program. Environmental cleanup at FUDS properties is conducted under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA).

C. Installation Restoration Program (IRP)

Installation Restoration Program (IRP) category projects include sites that require response actions to address releases of: (a) Hazardous substances and pollutants or contaminants; (b) Petroleum, Oil, and Lubricants (POLs); (c) Hazardous wastes or hazardous waste constituents; and (d) Explosive compounds released to soil, surface water, sediment, or groundwater as a result of ammunition or explosives production or manufacturing at ammunition plants.

The relative risk site evaluation (RRSE) framework is a methodology used by all DoD Components to evaluate the relative risk posed by a site in relation to other sites. It is a tool used across all of DoD to group sites into high, medium, and low categories based on an evaluation of site information using three factors: the contaminant hazard factor (CHF), the migration pathway factor (MPF), and the receptor factor (RF).Factors are based on a quantitative evaluation of Comprehensive Environmental Response, Compensation and Liability Act(CERCLA) hazardous substances, pollutants, or contaminants and a qualitative evaluation of pathways and human and ecological receptors in the four media most likely to result in significant exposure groundwater, surface water, sediment, and surface soils.

D. Military Munitions Response Program (MMRP)

In 2001, DoD established the Military Munitions Response Program (MMRP). The MMRP addresses munitions response sites (MRSs) at Formerly Used Defense Site locations. MRSs are sites that are known or suspected to contain unexploded ordnance, discarded military munitions, or munitions constituents (MC). Through the MMRP, DoD complies with environmental cleanup laws, such as the Comprehensive Environmental Response, Compensation, and Liability Act, also known as Superfund.

To prioritize funding and cleanup of MRSs that pose the greatest threat to safety, human health, and the environment, DoD uses the Munitions Response Site Prioritization Protocol (MRSPP). The MRSPP consists of three separate modules to evaluate hazards associated with explosives, chemical warfare materiel, MC, and other incidental environmental contaminants. The MRSPP scores affect how DoD sequences MRSs for cleanup. In addition to relative risk, DoD considers other factors such as economic, programmatic, and stakeholder concerns, as well as reuse and redevelopment plans, when prioritizing sites for cleanup.

Name: LOS ANGELES AFS ANNEX NO.1

A. Property Description

The site was located on 5.27 acres 10 miles southwest of downtown Los Angeles, in the proximity of the Los Angeles International Airport. A report dated 18 December 1975 indicated that 3.12 acres of the 4.27 acre parcel were disposed to the General Services Administration (GSA) and then assigned to the Health, Education, and Welfare Department who transferred it to Northrop University by quit claim deed dated 1 August 1977. The remaining 1.15 acres of the 4.27 acres were purchased by Northrop University in 1984 through a government auction. The 1-acre parcel lease was terminated 25 October 1966 and the site is currently under private ownership.

VII. Community Involvement

Since 1993, the Department of Defense (DOD) has supported the development, implementation, and maintenance of the Restoration Advisory Board (RAB) program. Through the RAB program, communities provide input into the decision - making process of DOD's environmental cleanup program. A RAB is a group, equally co - chaired by a DOD representative and a community member, that serves as a forum for exchange of information between government officials and members of the local community on property cleanup issues. In addition to regular RAB meetings, a combination of activities may be conducted to enhance this process. Such activities may include coordinating installation site tours or providing interactive presentations with the use of cleanup technology models. Members of a RAB may include local citizens and representatives of the U.S. Environmental Protection Agency (EPA) and state, local, and tribal governments. The RAB team should reflect the diverse interests of the community and help identify possible issues associated with an installation's environmental cleanup program. RABs provide a link between the community and cleanup decision makers, and should complement other community involvement activities, such as holding public meetings, distributing informative mailings to the public on installation cleanup activities, and establishing local information repositories.

In fiscal year 1998 (FY98), DOD continued to build trust with local communities surrounding military installations by strengthening the RAB program and making new resources available; including the implementation of the Technical Assistance for Public Participation (TAPP) program. The TAPP program was designed to help community members of RABs and TRCs better understand the scientific and engineering issues underlying their properties' environmental cleanup activities. Under TAPP, the installation may contract for an independent technical consultant to advise the RAB on a specific project, which must be identified in the TAPP application. Typical projects may involve reviewing proposed remedial technologies, interpreting health and environmental effects data, or reviewing cleanup documents.

RE: CITY DIRECTORY RESEARCH
9000 Airport Boulevard
LOS ANGELES,CA 90045

Thank you for contacting ERIS for an City Directory Search for the site described above. Our staff has conducted a reverse listing City Directory search to determine prior occupants of the subject site and adjacent properties. We have provided the nearest addresses(s) when adjacent addresses are not listed. If we have searched a range of addresses, all addresses in that range found in the Directory are included.

Note: Reverse Listing Directories generally are focused on more highly developed areas. Newly developed areas may be covered in the more recent years, but the older directories will tend to cover only the "central" parts of the city. To complete the search, we have either utilized the ACPL, Library of Congress, State Archives, and/or a regional library or history center as well as multiple digitized directories. These do not claim to be a complete collection of all reverse listing city directories produced.

ERIS has made every effort to provide accurate and complete information but shall not be held liable for missing, incomplete or inaccurate information. To complete this search we used the general range(s) below to search for relevant findings. If you believe there are additional addresses or streets that require searching please contact us at 866-517-5204.

1.0 INTRODUCTION

Partner Engineering & Science, Inc. (Partner) has been engaged by Rexford Industrial Realty, L.P. (the "Client"), to prepare the following Soil Management Plan (SMP) for the property located at 9000 Airport Boulevard in Los Angeles, California (hereafter referred to as "the Site").

1.1 Proposed Development and Impacts to Site Soil

Partner understands that the Site is planned to be redeveloped with a commercial/industrial structure. Previous investigations performed at this Site indicated evidence of minor impacts of petroleum hydrocarbons to subsurface soil and soil vapor. Minor concentrations (below regulatory guidelines) of volatile organic compounds (VOCs) were detected in soil samples collected at the Site.

Any soil potentially impacted by VOCs and other chemicals of potential concern presented herein that may be encountered during earthmoving activities, including ground cover demolition, excavation, and/or grading, will be managed pursuant to this SMP.

1.2 Purpose

The purpose of this SMP is to outline proper protocol and management for the following activities during Site redevelopment:

- Screening, handling, and managing soil during excavation activities;
- Application of South Coast Air Quality Management District (SCAQMD) Rule 1166 related to potential VOC-impacted soils;
- Identification of suspected impacted soil;
- Managing and stockpiling excavated and graded soil (*e.g.*, dust control, stockpile maintenance);
- Collecting and analyzing samples from stockpiled soil as necessary for waste characterization;
- Specifying threshold levels to evaluate whether excavated soil is suitable for on-site reuse;
- Handling/disposal of soil with confirmed impacts;
- Handling and transportation of Site soils with respect to sensitive receptors in the vicinity of the Site (*e.g.*, schools, nursing centers, residences);
- In the event they are encountered, addressing subsurface features of potential environmental concern (*e.g.*, previously unknown and not already removed abandoned underground storage tanks (USTs), oil wells, sumps, clarifiers, buried drums, septic systems, drains) in the event they are encountered during excavation at the Site; and
- Protocol for contractors for keeping potentially impacted soils from contacting stormwater at and/or the groundwater beneath the Site.

Additionally, this SMP includes a history of the Site and description of constituents of potential concern (COPC) that have been or may be encountered at the Site. This SMP does not include groundwater handling as groundwater is not anticipated to be encountered during excavation and grading activities associated with redevelopment.

1.3 Limitations

The recommendations and/or conclusions provided in this SMP are based on observations, the governing regulations, and/or available information from regulatory agencies; previous field investigations; and/or laboratory testing of soil, soil gas, and/or groundwater samples. Recommendations and/or conclusions beyond those stated and reported herein should not be inferred from this document.

Partner warrants that the environmental consulting services contained herein were performed in accordance with generally accepted practices in the environmental engineering and sciences, geology, and hydrogeology fields that existed at the time and location of work. No other warranties are implied or expressed.

2.0 SITE HISTORY AND BACKGROUND

Site Description

The Site consists of one parcel of land comprising 18.28 acres located on the northeast corner of West Arbor Vitae Street and Airport Boulevard within a mixed residential, commercial, and industrial area of Los Angeles, Los Angeles County, California (see **Figure 1**). The Site consists of a one-story automotive service/office building located on the central portion of the Site and an additional one-story automotive service building located on the northern portion of the Site. The buildings total approximately 38,680 square feet. In addition to the current structures, the Site is also improved with concrete-paved parking areas, two fueling station canopies, a car wash, various carport canopies located throughout the property, and associated landscaping. Five groundwater monitoring wells (MW-1 through MW-5) were observed on-site during Phase I and Phase II activities. Based on the location of the wells, they appear to be associated with the on-site leaking underground storage tank (LUST) incident that was reported in 2003 and received closure in 2013.

The Site is bound by residential properties to the north beyond Interceptor Street; residential and a light industrial property to the east; an industrial warehouse, an area undergoing redevelopment, and a car wash and motel to the south beyond West Arbor Vitae Street; a car rental facility to the southwest beyond the intersection of West Arbor Vitae Street and Airport Boulevard; and residential properties and a parking lot and car detailing service to the west beyond Airport Boulevard. Refer to **Figure 1** for a site vicinity map and **Figure 2** for a map showing site features.

Site History

Partner completed a *Phase I Environmental Site Assessment Report* (Phase I) for the Site in March 2023 at the request of Rexford to document the environmental history of the Site prior to their acquisition of the property.

The following recognized environmental conditions (RECs) were identified in the Phase I:

- The on-site UST systems consisting of four USTs that were installed in 1993 and 2005, represent a REC. The environmental risk associated with USTs increases over time as these systems age. Furthermore, no subsurface investigations have been conducted in connection with the USTs at the Site since 2012 (~11 years). Therefore, based on the age of the current UST systems and lack of recent subsurface investigations, the onsite UST systems represent a REC.
- Partner observed the presence of fifteen (15) below-grade hydraulic lifts and one potential former underground hydraulic lift within the automotive service/office building located in the central portion of the Site. Based on the subgrade nature and long-term duration of use, Partner cannot rule out potential releases of hydraulic fluid to the subsurface beneath the current and former lifts. As such, the current and former below-ground hydraulic lifts at the Site represent a REC.
- Three clarifiers, herein referred to as Clarifiers 1 through 3, were installed in 1982 at the Site. Based on the age of the clarifier and trench/floor drain systems (41 years) and hazardous nature of the waste streams, Partner cannot rule out the potential for a release of hazardous substances to the

subsurface in connection with these features. As such, the clarifiers and associated floor/trench drain system represent a REC.

The following historical recognized environmental condition (HREC) was identified in the Phase I:

- Based on review of documentation provided by the Regional Water Quality Control Board (RWQCB), the Site was identified as a LUST site for a release occurring on or before September 10, 2003. The release was identified in the areas of the current Western USTs and is associated with a previous generation of USTs at the Site, which included four 10,000-gallon gasoline USTs and one 7,000-gallon diesel UST. The five USTs were removed in 2005. Approximately 1,000 tons of hydrocarbon impacted soil was excavated and transported offsite, and groundwater monitoring was conducted from July 2008 through July 2012. The most recent groundwater monitoring data was collected in July 2012, which indicated that total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX), methyl tert-butyl ether (MTBE) and tert-butyl alcohol (TBA) were non-detectable in all five wells. Subsequently, a no further action (NFA) letter was issued to Hertz Corporation on September 24, 2013, as groundwater concentrations met criteria components of the Low Threat UST Closure Policy. Therefore, based on review of the analytical data indicating residual soil impacts were left in place at 45 to 60 feet bgs, removal of the prior generation of UST systems and associated impacted soil, and regulatory oversight and closure, the closed LUST case and prior generation of USTs represents a HREC and no further investigation was recommended. The five monitoring wells installed at the Site during the LUST investigation were observed to still be present during Partner's Phase II work.

Additionally, two 2,000-gallon waste oil USTs and two 8,000-gallon waste/new oil USTs were reportedly removed under Los Angeles Fire Department (LAFD) oversight in 2005. Confirmation soil samples did not detect TPHg or VOCs, and therefore these former USTs were not identified as a REC.

A Phase II Subsurface Investigation was performed in March 2023 consisting of the collection and analysis of 15 soil/soil vapor borings, as well as the collection and analysis of groundwater samples from three existing groundwater monitoring wells. Fourteen soil samples were analyzed for carbon-chain total petroleum hydrocarbons (TPH-cc) and VOCs, and 10 soil vapor samples were analyzed for VOCs.

Subsurface lithology encountered in the upper 20 feet consisted of a mixture sandy silt and silty clay to approximately 10 feet below ground surface (bgs), followed by sand and silty sand to terminal depths of 20 feet bgs.

Based on the results of the investigation, subsurface impacts to soil vapor by VOCs, specifically benzene, above commercial screening levels were identified in the following areas:

- automotive service/office building,
- clarifier C2,
- western UST dispenser islands, and
- beneath the northern dispenser island canopy.

The vertical and lateral extent of benzene impacts to soil vapor above conservative screening levels was not defined by Partner's March 2023 sampling.

To evaluate the potential for past releases at the Site to have impacted groundwater, during a second round of field work, in March 2023, groundwater samples were collected from monitoring wells MW3, MW4, and MW5. Depth to groundwater ranged from 73.52 feet bgs to 87.54 feet bgs in wells MW-3, MW-4 and MW-5. The groundwater samples were analyzed for gasoline range total petroleum hydrocarbons (TPH-g), diesel range total petroleum hydrocarbons (TPH-d), and VOCs, which were not detected. Therefore, it does not appear that potential past releases from onsite operations have impacted groundwater at the Site.

To further define the benzene soil vapor plumes previously identified, in July 2023, following Rexford's acquisition of the Site, Partner conducted a Soil Vapor Assessment consisting of 15 additional soil vapor borings surrounding B3 and B12 through B14. A total of 32 soil vapor samples (including two duplicate samples) were collected and analyzed for VOCs. Low concentrations of various VOCs, including Freon 12; chloromethane; trichlorofluoromethane; TBA; carbon disulfide; methylene chloride; MTBE; n-hexane; 2-butanone; chloroform; trichloroethene (TCE); 4-methyl-2-pentanone; toluene; tetrachloroethene (PCE); 2-hexanone; ethylbenzene; m,p-xylenes; o-xylene; styrene; and 1,2,4-trimethylbenzene (TMB), were detected in the analyzed soil vapor samples; however, these VOCs were detected at concentrations below their respective soil gas screening levels (SGSLs). No other VOCs were detected in soil vapor. The tracer gas was not detected in any sample, indicating that the integrity of the bentonite seal was maintained.

Twenty-seven of the soil gas samples contained concentrations of benzene above the most conservative commercial/industrial SGSLs calculated using the Department of Toxic Substances Control (DTSC) 2023 default attenuation factor (AF) of 0.03. The concentrations did not exceed the AF 0.001 or 0.0005 SGSLs (which are generally more in line with actual conditions for commercial/industrial sites) as based on the 2011 DTSC guidelines, indicating that vapor intrusion is unlikely to be a concern. Benzene was not detected in the shallow (5 foot bgs) interval of the three borings advanced to the north of the northern canopy (P1, P2, and P3) nor in the deep (14 foot and 15 foot bgs, respectively) intervals of P1 and P3. Based on this data set, the lateral extent of benzene in shallow soil vapor has been defined to the north of the north dispenser islands, and benzene in shallow soil vapor does not extend off-Site to the north. A soil vapor sample collected from P2 at 12 foot bgs, however, contained a concentration of benzene above the most conservative SGSL at 84 micrograms per cubic meter (ug/m^3), which may indicate minor deeper benzene impacts in soil vapor in the vicinity of P2, north of the northern canopy. As this concentration was less than an order of magnitude above the SGSL of 14 µg/m^3, additional vertical delineation was not recommended. In the remaining vapor probes (P4-P16), low-levels of benzene were found at concentrations ranging from 40 micrograms per cubic meter (µg/m^3) in the 5-foot interval of P6 to 180 µg/m^3 in the 5-foot interval of P13. In the deeper vapor probes collected from 10-12 ft bgs, benzene was detected at concentrations from 67 ug/m^3 (in P13) to 134 µg/m^3 (in P15), exceeding the commercial SGSL. Concentrations in the deeper samples were generally equivalent to or less than those found at 5 ft bgs. This, combined with the lack of benzene in soil and groundwater, indicate that there are no significant deeper soil vapor impacts at P4 through P16. Refer to **Figure 3** for a map depicting soil boring and monitoring well locations.

The highest concentrations of benzene in both the shallow intervals and the deep intervals were found in borings south of the fuel dispenser islands and the western USTs, but close to the central USTs, Clarifier 2, Clarifier 3 and the auto repair building's chemical storage area (along the east central edge of the building). The highest detections of benzene were found outside of enclosed office spaces, either in parking lots or in open automotive repair bays. The widespread nature indicates that the vapor plume is associated with

multiple sources at concentrations that do not represent a significant exposure risk to workers in the building nor to visitors to the Site.

Based on the cumulative results of the investigations, there appears to be diffuse low-level benzene impacts primarily south and east of the north and west dispenser islands and western UST area, with no benzene detected in shallow soil vapor to the north of this area. Refer to **Figure 4** for a map depicting the detected benzene concentrations throughout the Site. The Site is currently utilized for automotive repair and fueling operations, primarily in open or outdoor spaces, and therefore, vapor intrusion is not a concern at the Site at this time. Additionally, based on the current use of petroleum products on-Site, given the VOC concentrations detected in soil gas, VOC vapor migration into the building from the documented subsurface impacts, if any, is expected to have a minimal effect on the overall quality of indoor air within the subject property building. Accordingly, no further investigation with respect to the soil gas impacts was recommended by Partner for current Site use by the tenant.

Partner understands that after the termination of the lease period, the current tenant (Hertz) will be responsible for the demolition of the current buildings and removal of all subsurface improvements such as active and previously installed USTs, clarifiers, dispenser islands, piping and below grade hydraulic lifts under regulatory agency oversight.

Further, Partner understands that Rexford will construct new building(s) on Site.

Partner recommended that confirmation soil sampling be conducted at the time of removal, even in areas where the regulatory agency may not require sampling, such as piping runs between clarifiers, and below hydraulic lifts. If impacts are identified, Partner recommended that appropriate soil removal be completed under regulatory agency oversight. Further, a soil gas assessment is recommended following vacancy and removal of the subsurface features to confirm that no unacceptable vapor plume remains. If elevated levels of VOCs remain at the Site following these removal activities, then the installation of a soil vapor barrier was recommended. Additionally, based on the proposed redevelopment of the Site, Partner recommended that a SMP be developed and implemented during demolition and construction activities to address any impacted soils or unknown USTs or other subsurface structures that may be encountered at the Site. This SMP addresses that recommendation in advance of the Tenant's required removal and closure related activities and will be amended following the collection of post-removal sampling after the Tenant removes the USTs, clarifier, lifts, piping and other structures mentioned above. Hertz's responsibility is to perform closure activities in accordance with the *Facility Closure Memorandum* provided under separate cover.

3.0 CHEMICALS OF POTENTIAL CONCERN

Based on the cumulative results of the Phase I ESA, Phase II ESA, Groundwater Investigation, and Soil Vapor Assessment, impacts by petroleum hydrocarbons to subsurface soils and soil vapor have been identified, primarily to the south and east of the north and west dispenser islands and western UST area. The primary COPC is benzene and other gasoline related compounds with low detections above the respective laboratory reporting limits in soil gas samples. Based on the presence of these compounds in soil samples and the historical use of the Site, the potential exists that these compounds may be encountered in soil during earthmoving activities at the Site, which must be managed pursuant to this SMP.

Tables 1 and 2 presents the soil and groundwater analytical results of the Phase II Subsurface Investigation, respectively. Chemicals of concern were not detected in the analyzed groundwater samples. This limited data set indicated no apparent impacts to groundwater as a result of historic Site operations.

Partner understands that after the termination of the lease period, the current tenant (Hertz) will be responsible for the demolition of the current buildings and removal of all subsurface improvements such as active and previously installed USTs, clarifiers, dispenser islands, piping and below grade hydraulic lifts under regulatory agency oversight. During these subsurface structure removal activities, it is likely that impacts to shallow soil and soil vapor will also be removed under regulatory agency oversight. As a result, it is anticipated that a final round of soil/soil vapor sampling will be conducted following the Tenant's removal of subsurface improvements under the oversight of the appropriate regulatory agencies. The results discussed below indicate the conditions prior to subsurface improvement removal and are considered a "worst-case" set of conditions that may be encountered. The SMP will be updated with new data following subsurface structure removal and regulatory agency closure of open cases.

Table 3 presents the cumulative soil vapor analytical results of the Phase II Subsurface Investigation and Soil Vapor Assessment. Based on the proposed redevelopment, soil gas detected concentrations were compared to screening levels appropriate for the industrial uses (both current and future) of the Site.

In soils, the following compounds were detected at concentrations above the laboratory method detection limit (MDL) but less than the industrial use soil screening level:

- TPH-g was detected in 11 of the 14 analyzed soil samples at concentrations between 1.2 and 3.1 milligrams per kilogram (mg/kg), which are below the commercial/industrial screening level of 2,000 mg/kg and the groundwater protection screening level of 1,100 mg/kg.
- Motor oil range total petroleum hydrocarbons (TPH-mo) was detected in two of the 14 analyzed soil samples at concentrations of 1.2 mg/kg, which are below the commercial/industrial screening level of 180,000 mg/kg. A groundwater protection screening level does not exist for TPH-mo.
- TBA was detected in seven of the 14 analyzed soil samples at concentrations ranging between 3.2 and 7.3 micrograms per kilogram (µg/kg), which are below the commercial/industrial screening level of 6,540,000 µg/kg and the groundwater protection screening level of 920 mg/kg.

- Chloromethane was detected in one of the 14 analyzed soil samples at a concentration of 1.2 µg/kg, which are below the commercial/industrial screening level of 460,000 µg/kg and the groundwater protection screening level of 11,000 µg/kg.

In soil vapor, a total of 22 analytes were detected in the analyzed soil gas samples, as further discussed below:

- Benzene was detected in 36 of the 42 analyzed soil gas samples at concentrations ranging from 1.4 to 180 µg/m^3. Thirty-one of the concentrations exceeded the most conservative commercial/industrial screening level of 14 µg/m^3; however, the concentrations did not exceed the 0.001 or 0.0005 AF commercial/industrial screening levels.
- The VOCs Freon 12; chloromethane; trichlorofluoromethane; acetone; carbon disulfide; methylene chloride; MTBE; n-hexane; 2-butanone chloroform; benzene; trichloroethene; 4-methyl-2-pentanone; toluene; tetrachloroethene; 2-hexanone; ethylbenzene; m,p-xylenes; o-xylene styrene; 1,2,4-trimethylbenzene; and xylene (total) were detected in one or more of the analyzed soil gas samples, however, the concentrations did not exceed the respective commercial/industrial screening levels.

Additional chemicals may be added to the list of COPCs on a case-by-case basis should field observations indicate the potential presence of chemical soil impacts unrelated to the listed COPCs.

4.0 SOIL MANAGEMENT

Earthmoving activities associated with the Site redevelopment includes ground cover demolition, excavation, and grading. The following sections outline the protocols for identifying, handling, and/or disposing of COPC-impacted soil that may be encountered during earthmoving activities associated with the Site.

4.1 Applicability

The SMP applies to earthmoving activities associated with the Site redevelopment, including excavation, grading, trenching, utility installation, and/or other activities that could potentially generate COPC-impacted soil and to excavation activities that will encounter groundwater. Field personnel directly involved with earthmoving activities should be familiar with the contents of the SMP.

4.2 Duration

Implementation of the SMP is intended to coincide with Site redevelopment and shall remain in effect for the duration of the activities involving earthmoving.

4.3 Key Roles and Responsibilities

The following is a list of key roles involved with the SMP and the respective general responsibilities:

- Client (or Assigned Successor) – Responsible for selecting and engaging the main contractor(s) involved with redeveloping the Site and implementing the SMP;
- General Contractor (GC) – Responsible for overseeing the Site grading/redevelopment/construction activities and managing the associated subcontractors. They will be responsible for notifying the Environmental Professional as soon as odorous or discolored soils are encountered in their team's demolition and grading work; and
- Environmental Professional – As engaged on behalf of the Client, responsible for implementing the SMP. Environmental Professional staff shall be HAZWOPER 40-hour trained/certified, and be under the direction of a registered Professional Engineer or registered Professional Geologist with the State of California and qualified by education, training, and/or experience to implement the SMP.
- When odorous or discolored soils are identified by the GC, the Environmental Professional will mobilize to the Site to conduct SCAQMD Rule 1166 VOC Monitoring will with a PID.

4.4 Health and Safety Plan

The Environmental Professional has prepared a site-specific health and safety plan (HASP), included in Appendix A, to be implemented by the Environmental Professional in conjunction with the SMP when handling soil with suspected or confirmed COPC impacts. The GC will prepare and implement a similar HASP and joint safety meetings may be held during field work.

The HASP identifies the COPCs and/or other hazards of concern and establishes guidelines and/or procedures for controlling/minimizing exposures to COPCs/hazards, including the appropriate level(s) of personal protective equipment (PPE). The HASP also addresses COVID-19 precautionary measures, including personal protection and social distancing. Although it is not anticipated at this Site, if hazardous waste materials are identified during the course of the removal activities through sampling of discolored,

odorous or high vapor readings, the GC must use properly trained personnel, with Hazardous Waste Operations and Emergency Response (HAZWOPER) certification, for the handling of any such identified materials.

The GC will be responsible for producing their own HASP and all their own employees and subcontractors' health and safety concerns associated with excavation, grading, and/or other earthmoving activities (e.g., excavation stability, stockpile placement, heavy equipment operation, job hazard analyses [JHAs]).

4.5 Pre-Earthmoving Meeting

A schedule diagram for the SMP implementation tasks is presented in **Figure 5.**

Prior to earthmoving activities, a kickoff meeting will be held with representatives of the Client, the GC, and the Environmental Professional team present. During this meeting the Environmental Professional Project Manager will review and discuss the contents of the SMP, roles and responsibilities, and the schedule.

As shown on **Figure 6,** the Environmental Professional Project Manager will:

- Review the SMP contents with applicable on-Site grading and construction personnel to ensure their familiarity with the procedures outlined in this SMP.
- Provide and distribute contact information for the Client, the GC, and the Environmental Professional team to facilitate communication during earth moving activities and the implementation of this SMP.
- Review maps of potential areas of concern and chemicals that may be encountered.
- Review maps presenting areas where wastewater treatment structures are found including the clarifier that must be removed under the oversight of the Los Angeles County Department of Public Works, sewer connections and other known subsurface structures such as holding tanks
- Conduct a Site Walk with the GC, Demolition Contractor and Client identifying areas of concern or required Environmental Professional observations/action.

After the pre-construction meeting, the Environmental Professional will be on call and mobilize to the Site on an as-needed basis as outlined in this SMP. In addition, the Environmental Professional should visit the Site regularly (weekly) during the subsurface demolition work and at key times during the duration of the earthmoving activities to confirm that field activities are adhering to the SMP.

4.6 First Day of Demolition Meeting

The Environmental Professional will be on Site during the first day of demolition activities to review the schedule and plan for all subsurface demolition activities.

4.7 Environmental Professional Site Visits

After the pre-construction meeting, and first day of demolition meeting, the Environmental Professional will be on call and mobilize to the Site on an as-needed basis, when odorous or discolored soils are found or unknown subsurface structures are identified as outlined in this SMP.

In addition, the Environmental Professional will visit the Site weekly during the subsurface demolition work, and at key times during the duration of the earthmoving activities to confirm that field activities are adhering to the provisions discussed in the SMP.

4.8 SCAQMD 1166 Permitting

SCAQMD Rule 1166 sets requirements to control the emission of VOCs from excavation, grading, and or handling of VOC contaminated soil. SCAQMD Rule 1166 requires a mitigation plan that falls under site-specific or various locations for any excavation of an underground storage tank and/or transfer piping storing or previously storing VOC materials or excavating or grading soil containing VOC materials.

Typical activities conducted under a Site-Specific Plan include:

- Excavations (including grading) involving more than 2,000 cubic yards of VOC-contaminated soil; projects involving lesser quantities can be conducted under a Various Locations Plan;
- Storage and/or handling of VOC-contaminated soil at approved treatment facilities; or,
- Situations where the standard conditions contained within the Various Locations Plan are not appropriate.

A Various Locations Plan is designed for contractors that conduct, on a regular basis, smaller scale excavations at facilities that have stored, dispensed, or handled materials that contain VOCs. Typical activities and limitations conducted under a Various Locations Plan include:

- Removal, replacement or repair of USTs or related piping used to store or transfer VOCs (i.e., gasoline, methanol, xylene, toluene, or similar compounds);
- Excavations involving less than 2,000 cubic yards of VOC-contaminated soil; and,
- Excavations not located within 1,000 feet of a school.

If VOC impacted soil is encountered or suspected during excavation and/or grading, the Environmental Professional will evaluate the suspected VOC impacted soil and excavation activities for applicability of a Site Specific or Various Locations Permit. Evaluation will be based on the 1166 field screening methods described in subsequent sections.

4.9 General Contractor Responsibilities

The GC will be responsible for the following non-inclusive list of tasks associated with planned excavation and earthmoving activities:

- Health and safety planning and implementation for all on-Site excavation (e.g., excavation stability, stockpile placement, heavy equipment operation) and demolition activities;
- Preparation of a Health and Safety Plan for their workers, conducting regular tail-gate meetings and preparation of any required Job Hazard Analyses (JHAs).
- Maintenance of dust control measures
- Work area access control and Site security (e.g., perimeter fencing); and
- Preparation of, and compliance with, a local stormwater pollution prevention plan (SWPPP).

With respect to the SWPPP, the GC should ensure that the SWPPP is in conformity with the soil-handling protocol outlined in this SMP.

4.10 Undocumented Subsurface Features

The GC will cordon off and halt construction activities in the immediate area(s) of undocumented subsurface features of potential environmental concern (e.g., underground tanks, abandoned wells, sumps, hydraulic lifts, clarifiers, buried drums) if encountered during the course of ground cover demolition, excavation, site grading, and/or other earthmoving activities. The following general approach will be applied to address such subsurface features:

1) Secure the area and notify Site owner and the Environmental Professional;
2) The Environmental Professional will assist in notifying the relevant regulatory oversight agency or agencies involved with the subsurface feature decommissioning and file the necessary permit(s), when applicable;
3) Decontaminate and decommission the subsurface feature(s) via removal (if feasible) in accordance with generally accepted industry practices and the requirements of the filed permit(s), when applicable;
4) Coordinate with the Environmental Professional for collection and analysis of soil samples to evaluate potential chemical impacts to the subsurface due to a historical release or releases from the decommissioned subsurface feature(s); and
5) Coordinate with the Environmental Professional to document the decommissioning activities and findings in a summary report.

The Environmental Professional will provide specific procedures to address encountered subsurface features on a case-by-case basis based on the Site conditions and the nature of the subsurface feature(s).

4.11 Field Identification of Potentially Impacted Soils

The primary initial criterion for segregating soil generated during soil-disturbing activities will be the field observations of the GC excavation personnel. Soil devoid of evident observed impacts such as odors, stained materials and other discoloration is deemed suitable for unrestricted use and may be reused on-site as backfill. During the course of construction activities, the GC may identify soils require export for mass balance/grading, site construction excavations (such as utility installation), or for geotechnical reasons (such as expansive soils). If required by the receiving facility, such export soils may be sampled by the Environmental Professional, as requested by the GC.

Any potentially impacted soils identified by the GC for further evaluation will be assessed by the Environmental Professional as described in section 4.12 below. Soils to be exported from the Site will require disposal profiling which involves sampling and laboratory analysis to be conducted by Environmental Professional as described in section 4.13 through 4.17 and in the attached **Figure 6**.

Stained, odorous and/or discolored soil is defined as follows:

- Stained or discolored soil: Soil that is discolored (may be darker or lighter or a different odd color, such as blue, green or orange, when compared to surrounding soil)
- Odorous soil: Soil that has a noticeable odor of anything other than a typical soil musty odor (i.e., gasoline/oil/sweet or sharp solvent/rotten egg) may be indicative of potential chemical impacts and are particularly useful in identifying petroleum hydrocarbon and/or solvent releases to the subsurface.

Protocol for on-site handling and management of unrestricted soil is the sole responsibility of the GC. However, during subsurface demolition and deconstruction activities, the GC should limit soil-disturbing activities to the minimum required for the removal of such features and limit the on-site relocation/redistribution of disturbed soils to the extent feasible until the subsurface structures are entirely removed. Additional conditions not under consideration in this SMP (e.g., physical soil/geotechnical properties) may limit the on-site reuse of soil deemed suitable for unrestricted use under this SMP.

If soil exhibiting discoloration, odor, and/or other characteristic indicative of potential chemical of concern impacts is identified during soil-disturbing activities, a "stop work" directive will be given, handling of soil in the potential area of concern must cease, and the immediate location of the potentially impacted soils will be cordoned off by the GC with caution tape and access to the area restricted. The GC should give immediate notice to the Environmental Professional of the encountered conditions so that trained environmental staff can be mobilized to the Site. Soil disturbing activities in the potential area of soils impact may resume when the Environmental Professional representative is on-Site and indicates that a specific area is clear for continued of activity.

The Environmental Professional will give direction to the GC on the proper handling of soil exhibiting evident impacts. Including keeping such materials segregated in separate covered stockpiles from soils deemed suitable for unrestricted use.

4.12 Field Monitoring of Potentially Impacted Soil and Rule 1166 Field-Screening

As the soil removal progresses, or if discolored or odorous soil is identified by the GC, disturbed soil will be monitored for evidence of potential impacts (e.g., staining, odor) and regularly field-screened for VOCs by the Environmental Professional using an Photo Ionization Detector (PID). Soil will be field-screened with the PID at a frequency coinciding with the 1166 Permit Requirements.

Decisions regarding the applicable soil handling and/or disposal protocol will initially be based on PID field readings. The Environmental Professional will provide an PID for the project that has been calibrated by the manufacturer within three months of the date of fieldwork, and that has been field-calibrated prior to the start of each day of field use with hexane calibration gas (or the PID readings will be correlated and expressed as hexane using equivalency factors provided by the manufacturer if a calibration gas other than hexane is used). Calibration will be documented and retained as needed.

The PID monitoring shall be performed at a distance no more than three inches above the soil surface.

Soil with elevated PID readings (i.e., concentration of 50 parts per million [ppm]) and/or exhibiting evidence of potential COPC-impacts (i.e., stained or odorous) will be cordoned off for further evaluation as discussed in Section 4.13. The remaining soil will be subject to further screening if disturbed during earthmoving activities.

If PID measurements are greater than 50 ppm but less than 1,000 ppm, the affected work area and load of soil shall be sprayed with water and/or SCAQMD approved vapor suppressant to keep vapor levels down.

If PID measurements are equal to or greater than 1,000 ppm, the SCAQMD must be notified immediately by the Environmental Professional, the affected soil and working area shall be immediately sprayed with water or a SCAQMD approved vapor suppressant, and any impacted soil that has been excavated will be

immediately placed in SCAQMD approved sealed containers, equipped with vapor tight lids, or the soil excavated will be directly loaded into trucks, moistened with additional water, covered, and transported immediately off-Site to an approved treatment facility.

4.13 Stockpiling of VOC-Impacted Soil

VOC-impacted soil identified with PID measurements greater than 50 ppm measured no more than three inches from the soil surface shall be stockpiled and segregated from non-impacted soils. Stockpiles shall be covered with plastic sheeting or immediately loaded into trucks for transportation to a treatment/disposal facility with the appropriate disposal documentation.

VOC impacted stockpiles shall not contain more than 500 cubic yards of soil. If PID measurements are greater than 50 ppm but less than 1,000 ppm, VOC impacted soil stockpiles shall be covered with plastic sheeting which overlap a minimum of 24 inches and are secured so that no portion of the impacted soil is exposed to the atmosphere. In the course of handling the stockpile, only the working face of the stockpile may be uncovered. During the excavation, the exposed VOC impacted soil shall be restricted to the immediate working area of the stockpile only. The other portions of the stockpile shall be covered with plastic sheeting, with seams overlapping a minimum of 24 inches and secured with duct tape. Exposed VOC impacted soil surfaces shall be kept moist with water or other approved suppressants and shall be re-covered during periods of inactivity longer than one hour. At the end of each working day, the stockpiles shall be completely covered, and coverings securely anchored to prevent any exposure of soil to the atmosphere.

Once stockpiled and covered with plastic sheeting, VOC impacted soil shall remain covered and undisturbed until removed from the Site. Daily inspections shall be performed of the covered VOC impacted stockpiles to ensure the integrity of the plastic cover. Such inspections shall include a visual inspection of seams and plastic cover surfaces. Any holes or tears in coverings, or any other potential sources of fugitive VOC emissions shall be repaired immediately.

If the PID measurements are greater than 1,000 ppm, excavation of the immediate working area should cease and the SCAQMD must be notified by the Environmental Professional within one hour of detection. Impacted soil shall be immediately placed in SCAQMD approved sealed containers, equipped with vapor tight lids, or directly loaded into trucks, moistened with additional water, covered, and transported immediately off-Site to an approved treatment facility with appropriate documentation.

4.14 Sampling & Chemical Analysis of Impacted Soils Areas

The Environmental Professional will collect a minimum of one representative grab soil sample from each identified potential area of distinct impact for laboratory analysis to evaluate the presence of chemical of concern impacts, if any. Additional samples may be collected for laboratory analysis as necessary to delineate the approximate lateral extent of each potential AOC.

The laboratory analysis results will be compared to the latest promulgated editions of the EPA regional screening levels (RSLs) and the DTSC Human and Ecological Risk Office (HERO) Note 3 Screening Levels (SLs) for industrial Site uses. Soil with concentrations of one or more COPCs above RSLs or SLs and soil with elevated PID readings will be profiled for waste characterization and disposal at an appropriate off-Site disposal facility. Each confirmed area of soils impact will remain cordoned off and flagged for excavation,

special handling, and disposal protocol as discussed throughout Section 4 of this SMP. The remaining soil will be subject to further screening if disturbed during earthmoving activities.

4.15 Disposal of Impacted Soil

Laboratory analytical results from the stockpile sampling will be compared to regulatory screening levels and waste characterization profiling standards. If warranted, the stockpiled soil will be disposed of off-Site in accordance with applicable regulations. Soils requiring off-Site disposal will be designated as hazardous or non-hazardous based on the laboratory analytical results and hazardous waste criteria (both California and Federal (RCRA) Hazardous Waste standards).

Before off-site transport is initiated, any soils going to a landfill should have appropriate documentation including an accepted waste profile and transportation manifests including information on the generator, waste type, waste quantity and container, transporter information and landfill information. The stockpiled soil will be loaded onto covered trucks and transported under waste manifest documentation to an appropriately licensed/permitted receiving facility for treatment, recycling, and/or disposal. Records of waste manifests will be kept on file as required by law and made available on-Site on an as-needed basis.

4.16 On-Site Reuse of Disturbed Soil

Disturbed soil devoid of evident potential chemical impacts (e.g., odor, discoloration, elevated PID readings) will be deemed suitable for unrestricted use and may be reused on-site as backfill without further assessment or exported, the latter pending sampling and laboratory analysis as discussed in Sections 4.14 and 4.15.

The laboratory analysis results of non-VOC-contaminated soil will be compared to the SLs. Soil with concentrations of one or more chemicals of concern above SLs is unsuitable for on-site reuse as backfill and must be exported. Non-VOC-contaminated soil that does not exceed SLs may be reused on-site as backfill.

The SMP protocol for evaluating whether excavated soil is suitable for on-site reuse as backfill is based solely on the absence or presence and magnitude of chemical impacts. Other factors (e.g., geotechnical, geochemical, and/or structural considerations) are not accounted for in the SMP and will be the responsibility of the GC. In addition, the GC will be responsible for evaluating the suitability of imported fill material for use on-site. The GC must not import -soils without prior testing or impacted backfill materials to the Site.

4.17 Transportation of Impacted Soils

Impacted soil shall be removed from the Site within 30 days of its excavation. In accordance with SCAQMD Rule 1166 requirements, and to prevent exposure to sensitive receptors in the vicinity of the Site (i.e., schools, hospitals and residences), impacted soil removed from the Site shall comply with the following:

- Impacted soil shall be transported to an approved treatment/disposal facility.
- When loading into trucks is completed, and during transportation, no excavated material shall extend above the sides or rear of the truck or trailer,
- During loading and prior to covering/tarping, impacted soil shall be wetted by spraying with water or other dust inhibitors.

- The trucks or trailers shall be completely covered/tarped prior to leaving the Site to prevent particulate emissions to the atmosphere.
- The exterior of the trucks (including the tires) shall be cleaned off with brushes or brooms (dry decontaminated) prior to the trucks leaving the excavation location and shaker plates will be placed at the Site exit to prevent dust track-off. Each truckload of impacted soil will be inspected by the Environmental Professional before leaving the Site.

Records of treatment/disposal shall be maintained for impacted soil removed from the Site which shall include the identification and the location of the generator, the transporter, and the receiving facility. Such records shall be signed and dated by each of the above parties indicating receipt or relinquishment of the impacted soil at the time custody is transferred. For VOC impacted soils, such records shall be labeled "SCAQMD Rule 1166 VOC Contaminated Soil" and Records of disposal/treatment shall be maintained for a period of two years and made available to SCAQMD upon request.

4.18 Vapor Suppression and Dust Control

To suppress vapor emissions during soil disturbances of potential VOC-impacted soil, excavations will be kept moist by periodically spraying the work area with water. In addition, exposed soil surfaces of stockpiles of potential VOC-impacted soil will be kept moist with water.

Dust control during the site redevelopment following the completion of impacted soils will revert to the protocols established by the GC.

4.19 Surface Water Protection

Responsibility for surface water protection (e.g., prevention of sediment runoff into storm drains) and implementation of best management practices (BMPs), if required for the Site redevelopment, is the sole responsibility of the GC.

5.0 REPORTING

- If needed, results of the excavation, PID monitoring, and any soil disposal will be submitted to the SCAQMD in a report following completion of excavation impacted soil at the Site. The report will include a summary of field activities, Rule 1166 compliance documentation (e.g., soil monitoring records) if VOC contaminated soil was encountered; laboratory analysis reports; and off-Site disposal documentation (if soil was exported, excluding unrestricted soil). The Environmental Professional will also be responsible for complying with SCAQMD reporting requirements if VOC contaminated soil was encountered.
- A summary report of impacted soils, or previously unknown and encountered subsurface structures removed as a part of the implementation of this SMP will be prepared at Rexford's request.

APPENDIX A: PARTNER HEALTH AND SAFETY PLAN

Partner Site-Specific Health and Safety Plan

Introduction

Partner Engineering and Science, Inc. (Partner) has been retained by Rexford Industrial Realty, L.P. to conduct a Phase 2 at the subject property. This Health and Safety Plan (HASP) document identifies the Health and Safety procedures that are intended to guide the field activities at the site. The details of this plan apply to employees of Partner and its subcontractors. Regulatory agencies are expected to observe the safety rules and regulations established by their respective organizations in addition to the requirements of this document.

This plan must be reviewed and acknowledged by all personnel prior to entering the work area. In general, a "Tailgate Safety Meeting" is conducted at the initiation of on-site activities and at the beginning of each day thereafter until the completion of the project. However, the actual briefing may be conducted off-site (e.g., in the office) if conditions preclude or render impractical its completion on-site.

This HASP will be a living document in that it will be continually updated and/or revised as the site conditions and knowledge of the operations develop further. The development and preparation of the HASP has been based on past experiences and site specific information at the time of preparation. If actual site conditions or operations vary from the data used to prepare this HASP, amendments shall be made to reflect those changes.

This HASP has been developed with consideration to current safety standards, health effects, and standards for known contaminants and procedures designed to account for potential hazards from known and/or suspected substances. In preparing this document, Partner has specifically reviewed Occupational Safety & Health Administration (OSHA) Title 29 Code of Federal Regulations (CFR) 1910 & 1926, California Occupational Safety & Health Administration (Cal/OSHA) Title 8 California Code of Regulations (CCR) 5192, the National Institute of Occupational Safety & Health (NIOSH)/OSHA/United States Coast Guard (USCG)/Environmental Protection Agency (EPA) Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities, NIOSH Pocket Guide to Chemical Hazards, and the American Conference of Governmental Industrial Hygienists, Inc. (ACGIH) Threshold Limit Values for Chemical Substances and Chemical Agents.

Site Safety Officers

The Site Safety Officer (SSO) is the individual who is capable of identifying existing and predictable hazards in surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them. The SSO is designated on a site-by-site basis based on the site conditions, scope-of-work, and the individual's ability to recognize site-specific hazards and take appropriate corrective actions. It is the responsibility of all employees to work in a manner that will prevent injury and exposure to themselves and to other employees. Every employee is responsible for obeying safety rules and regulations, and reporting unsafe conditions or acts to their supervisors.

EMERGENCY CONTINGENCY INFORMATION

Evacuation Routes and Procedures

In case of evacuation, all vehicles/equipment should be turned off and personnel should immediately leave the work area. Personnel should relocate to the specified meeting area located upwind of the affected area, such as the building exterior, site field office, property boundary, or other pre-designated location, where all personnel will be accounted for.

IF AN EMERGENCY ARISES, THE DESIGNATED ASSEMBLY LOCATION FOR THIS PROJECT IS THE east parking lot OF THE SUBJECT PROPERTY, AT THE PARTNER FIELD OFFICE (VEHICLE).

This location is located up-wind of the subject property, but is subject to change if prevailing weather conditions alter typical wind direction. Personnel should not reenter the work area following evacuation until 1.) the condition causing the emergency has been corrected, 2.) all hazards have been assessed, 3.) the HASP has been reviewed, and 4.) personnel have been oriented on any changes in the HASP. All emergencies should be promptly reported to the SSO.

Air Monitoring

Air quality in the breathing zone will be monitored continuously with a photoionization detector (PID) calibrated to isobutylene. Work will proceed in Level D while PID readings are between 0 and 10 parts per million (ppm). In the event that breathing zone readings exceed 100 ppm, all personnel will discontinue work at the location and withdraw from the work area. The appropriate vapor control measures will be implemented (e.g., application of vapor suppression), the necessary emergency response authorities will be notified, and/or the work area will be re-sampled until vapor levels are within acceptable levels prior to reentering the work zone.

Refer to the table below for the Operational Action Levels.

Contaminants	Action Level	Action to Take
VOCs (PID)	**1 to 10 PPM** Above background at the breathing zone and sustained for 5 minutes **10 to 100 PPM** Above background at the breathing zone and sustained for 5 minutes **100 to 300 PPM** Above background at the breathing zone and sustained for 1 minute **>300 PPM** Above background at the breathing zone and sustained for 1 minute	Level D, continuous air monitoring Upgrade to Level C, continuous air monitoring and ventilate space Upgrade to Level B, continuous air monitoring and ventilate space, or stop work and ventilate Stop work, Evacuate work zones
Combustible Gas in Air (LEL meter)	Less than 10% lower explosive limit (LEL) Greater than 10% LEL	Continue with caution and air monitoring (combustible gas monitoring) Stop work, immediately withdrawal personnel, and ventilate space with manhole blower
Oxygen in Air (O2 Meter)	Less than 19.5% 19.5 to 21.5% Greater than 21.5%	Stop work and ventilate or upgrade to Level B Level D, continue work with air monitoring Stop work, immediately withdrawal personnel, and evaluate

The PID will be calibrated daily by Partner personnel prior to use. Calibration will be performed in accordance with the manufacturer specifications and recorded in a log book kept with the instrument. Ambient breathing space measurements should be collected every 15 minutes.

Personal Protection Equipment

Based on the preliminary site information including evaluation of the hazards at the site and Partner's experience, personal protective equipment (PPE) will be required for all personnel and visitors entering the controlled portion of the site. PPE for each potential level of protection is described below. Both Level C and D PPE should be available on-site during all phases of the project, as conditions may change and require additional PPE. Work should be conducted in Level D and no breathing protection will be required as long as monitored breathing zone vapor concentrations remain in the nominal operation action level.

If on-site personnel find that breathing zone concentrations remain above nominal operation action level for more than 5 minutes, then the SSO or PM will make a determination if breathing protection is needed. At this time, all work in the affected area should be suspended until a decision is made. Implementation of Level C PPE will be required if work continues during elevated breathing zone concentrations. Donning and use of respirators shall be performed in accordance with manufacturer specifications. Replacement of respirator cartridges shall be performed in accordance with manufacturer specifications. All respirators and cartridges shall be stored in air tight bags while not in use.

Refer to the PPE Levels of Protection for a detailed description of the equipment associated for each level of PPE.

PPE Levels of Protection

Level D (to be used at all times) is as follows:

- Full-length pants and shirt;
- Sturdy safety-toe work boots;
- Hard hat;
- Safety glasses.

Modified Level D (used as appropriate) is as follows:

- Regular Tyvek coveralls;
- Outer gloves: leather, cotton, or nitrile;
- Inner gloves: latex or nitrile;
- Sturdy safety-toe work boots;
- Hard hat;
- Safety glasses.

Level C (used as appropriate) is as follows:

- Half-face air purifying, canister equipped respirator (NIOSH-approved) equipped with Organic Vapor/HEPA cartridges/filters;
- Regular Tyvek coveralls;
- Outer gloves: leather, cotton, or nitrile;
- Inner gloves: latex or nitrile;
- Sturdy safety-toe work boots;
- Hard hat;
- Safety glasses.

Level B (used as appropriate) is as follows:

- Positive-pressure, full-face piece, self-contained breathing apparatus (SCBA) or positive-pressure supplied air respirator with escape SCBA (NIOSH-approved);
- Disposable chemical-resistant coveralls (Polycoated Tyvek);
- Outer gloves: neoprene or nitrile;
- Inner gloves: latex or nitrile;
- Sturdy safety-toe work boots;
- Petroleum-resistant covers over work boots;
- Hard hat.

Decontamination Procedures

Drilling and sampling equipment will arrive decontaminated and clean. All downhole soil and groundwater sampling equipment (e.g., sampling tubes, split spoons, hand augers, Hydropunch, etc.), tools, purge pumps, water level indicators, etc. will be decontaminated before, between, and after use with Alconox or an equivalent phosphate-free detergent solution to reduce the risk of cross-contamination. Decontamination of all sampling equipment will consist of submerging the equipment in a detergent solution bath and scrubbing it with dedicated brushes. The equipment will then be placed in a rinse bath and agitated. A second rinse bath should occur if needed. All drilling equipment such as augers and drilling rods should be thoroughly steam cleaned and rinsed.

Nitrile outer gloves will be worn whenever handling samples, equipment, or any other potentially contaminated items. Skin exposed to direct contact with contaminants of concern will be immediately flushed with water.

Work Zone Delineation

A 15-foot exclusion zone will be delineated with caution cones as necessary to denote the work zone and area restricted to authorized project personnel.

Traffic Control

Traffic control is not anticipated to be required for this project.

Adverse Weather

The work area will be secured and all personnel will discontinue work at the location and withdraw from the work area in the event that adverse weather is encountered (e.g., heavy rain, lightning).

Emergency Equipment

A first aid kit and fire extinguisher will be located in the work vehicle in a location that is easily accessible and highly visible. The SSO will be responsible for knowing the location of and accessing the emergency equipment as needed.

Workplace Injuries

Partner requires employees to notify a supervisor and the Human Resources Department when medical attention is required for any reason, accident, or illness. Employees requiring transportation to a medical facility mush be taken by trained medical personnel. For all non-work related injuries, transportation and medical costs will be the responsibility of the employee.

Injury Process Flow:

Assess severity and tend to injury immediately.

1) First Aid: Administration of bandage or ice pack, any over the counter medications

Hazard Assessment

(☒ = Applies, or required item(s) available. ☐ = Not Applicable.)

Hazard Assessment: Physical Hazards and Related Concerns

☐ **Confined Space Entry (CSE)**. Confined space entry means the potentially hazardous entry into any space which, by design, has limited openings for entry and exit and unfavorable natural ventilation that could contain or produce dangerous air contaminants and is not intended for continuous employee occupancy. Confined spaces include, but are not limited to, storage tanks, compartments of ships, process vessels, pits, silos, vats, degreasers, reaction vessels, boilers, ventilation and exhaust ducts, sewers, tunnels, underground utility vaults, and pipelines. Other environments which must be treated as confined spaces include test pits, basements, garages, warehouses, and other indoor areas where mechanical (i.e., diesel, propane, gasoline or similarly powered) equipment must be operated for drilling or excavation purposes. Confined space entry should be allowed only when absolutely necessary.

☒ **Construction Hazards, Drill Rigs, Backhoes, etc.** The use of drill rigs, backhoes, and other heavy equipment represent potentially serious construction hazards. Whenever such equipment is used, personnel in the vicinity should be limited to those who must be there to complete their assigned duties. All personnel must avoid standing within the turning radius of the equipment or below any suspended load. Job sites must be kept as clean, orderly, and sanitary as possible. When water is used, care must be taken to avoid creating muddy or slippery conditions. If slippery conditions are unavoidable, barriers and warning signs must be used to warn of these dangers.

Never turn your back to operating machinery. Never wear loose clothing jewelry, hair, or other personal items around rotating equipment or other equipment that could catch or ensnare personal items. Always stand far enough away from operating machinery to prevent accidental contact, which may result from mechanical or human error.

Additionally, the following basic personal protective measures must be observed: **Hardhats** must be worn to protect against bumps or falling objects. **Safety glasses** must be worn by all workers in the vicinity of drill rigs or other sources of flying objects. **Goggles,** face shields, or other forms of eye protection must be worn when necessary to protect against chemicals or other hazards. **Safety-toed shoes or boots** are also required. The shoes must be chemically resistant or protected with appropriately selected boots/coverings where necessary. Unless otherwise specified, normal **work clothes** must be worn. Long sleeves and gloves are also required whenever necessary to protect against hazardous contact, cuts, abrasions or other possible skin hazards.

☒ **Electrical**. OSHA regulations require that employees who may be exposed to electrical equipment be trained to recognize the associated hazards and the appropriate control methods. All **extension cords** used for portable tools or other equipment must be designed for hard or extra usage and be (three-wire) grounded. All 120-volt, single-phase 15- and 20-ampere receptacle outlets on construction sites and other locations where moisture/water contact may occur must be equipped with **ground-fault circuit interrupters (GFCI)** units. GFCI units must be attached directly to or as close as possible to the receptacle. GFCI located away from the receptacle will not protect any wiring between the receptacle and the GFCI unit. Only the wiring plugged into the GFCI and outward will be protected by the GFCI. All **(temporary lighting)** lamps for general illumination must be protected from accidental breakage. Metal case sockets must be grounded. Portable lighting in wet or conductive locations should be 12 volts or less.

☐ **Drums and Buried Drums**. As a precautionary measure, personnel must assume that labeled and unlabeled drums encountered during field activities contain hazardous materials until their contents can be confirmed and characterized. Personnel should recognize that drums are frequently mislabeled, particularly drums that are reused.

Only trained and authorized personnel should be allowed to perform drum handling. Prior to any handling, drums must be visually inspected to gain as much information as possible about their contents. Trained field personnel must look for signs of deterioration such as corrosion, rust or leaks, and for signs that the drum is under pressure such as swelling or bulging. Drum-type and drumhead configuration may provide the observer with information about the type of material inside (e.g., a removable lid is designed to contain solids, while the presence of a bung indicates liquid storage).

Although not usually anticipated, buried drums can be encountered when digging test pits. Therefore, the following provisions must be observed if drums are encountered: Machine excavation (e.g., backhoe) should cease immediately anytime a drum is encountered. The appropriate management personnel should be notified immediately. All personnel should be instructed to immediately leave the work area.

Even authorized personnel must not enter an excavation where drums have been uncovered, even for monitoring purposes, unless all provisions of OSHA's trenching and excavation standard have been met and the appropriate level of PPE is utilized. Sampling of unknown drums usually requires Level B protection. Buried drums must not be moved unless it can be accomplished in a safe manner and overpack drums are available.

☒ **Fire and Explosion**. The possibility of flammable materials being encountered during field activities must be recognized and the appropriate steps necessary to minimize fire and explosion must be observed. This includes situations where excessive organic vapors or free product are encountered. When this occurs, monitoring with a combustible gas indicator (CGI) is required.

Excessive organic vapors, for the purposes of initiating the use of a CGI, are defined as sustained readings (i.e., continuous for at least 5 minutes) at or above 250 units or as an instantaneous reading at or above 1,000 units on the PID or flame ionization detector (FID), in close proximity (within 1 foot or less) of the borehole, test pit, sampling location, or other area of potential exposure.

In situations where hexane and/or methanol are needed for field activities, the following precautions must be observed: Keep flammable and combustible materials away from heat, sparks and open flames; do not smoke around flammable or combustible materials; and keep all flammable and combustible liquids in approved and properly labeled safety containers.

☐ **Landfill/Methane Hazards**. Fire and explosion should be regarded as one of, if not the, most significant potential hazards associated with drilling operations and other intrusive work conducted at a landfill. Accordingly, all sources of ignition must be fully controlled. Failure to control ignition sources could result in fire, explosion, and pose a serious threat to life and health. Control methods may include forced ventilation and/or filling the borehole with enough water to inhibit the release of methane and other gases that would otherwise escape through the top of the borehole.

If forced (mechanical) ventilation is to be used, all such equipment must be approved for Class I, Division I hazardous atmospheres. The blower must be positioned to blow across the top of the borehole so that gases and vapors may be diluted as they exit the borehole. Do not attempt to suck out the gases or vapors. Blowers, all other mechanical equipment, and tools that could release sparks or static electricity must be bonded and grounded.

Regardless of the gas/vapor control method used, the atmosphere surrounding the borehole must be frequently monitored using direct reading instruments approved for Class I, Division I hazardous atmospheres. Monitoring should be conducted within 1 to 2 feet of the top of the borehole. Do not insert sampling devices into the borehole. Never approach the auger or drill shaft while it is in operation.

Regardless of actual instrument readings, if all sources of ignition cannot be controlled, operations should be immediately shut down and the area evacuated if readings equal or exceed 10% of LEL until ignition sources have been eliminated. Ignition sources include, but are not limited to, smoking, static electricity, lighting, open flames, spontaneously ignitable substances, frictional heat or sparks, hot surfaces, radiant heat, electrical sparks, stray currents, cutting and welding, ovens, furnaces, and heating equipment.

☐ **Heat and Cold Stress**. Overexposure to temperature extremes can represent significant risks to personnel if simple precautions are not observed. Typical control measures designed to prevent **heat stress** include dressing properly, drinking plenty of the right fluids, and establishing an appropriate work/break regimen. Typical control measures designed to prevent **cold stress** also include dressing properly, and establishing an appropriate work/break regimen.

☒ **Moving Vehicles, Traffic Safety**. All vehicular traffic routes that could impact worker safety must be identified and communicated. Whenever necessary, barriers or other methods must be established to prevent injury from moving vehicles. This is particularly important when field activities are conducted in parking lots, driveways, ramps or roadways. OSHA 1926.201 specifies that when signs, signals or barricades do not provide adequate protection from highway or street traffic, flagmen must be utilized. Flagmen must wear red or orange garments. Garments worn at night must be reflective.

☒ **Noise**. Noise exposure can be affected by many factors including the number and types of noise sources (continuous vs. intermittent or impact) and the proximity to noise intensifying structures (e.g., walls or buildings) that cause noise to bounce back or echo. The single most important factor effecting total noise exposure is distance from the source. The closer one is to the source, the louder the noise. The operation of a drill rig, backhoe, or other mechanical equipment can be sources of significant noise exposure. In order to reduce the exposure to this noise, personnel working in areas of excessive noise must use hearing protectors (e.g., ear plugs, ear muffs).

Rule-of-Thumb: Wherever actual data from sound level meters or noise dosimeters is unavailable and it is necessary to raise one's voice above a normal conversational level to communicate with others within 3 to 5 feet away, hearing protection should be worn.

☒ **Overhead Utilities and Hazards**. Overhead hazards can include low hanging structures that can cause injury due to bumping into them. Other overhead hazards include falling objects, suspended loads, swinging loads, and rotating equipment. Hardhats must be worn by personnel in areas were these types of physical hazards may be encountered. Barriers or other methods must also be used to exclude personnel from these areas where appropriate. Electrical wires are another significant overhead hazard. According to OSHA (29 CFR 1926.550), the minimum clearance that must be maintained from overhead electrical wires is 10 feet from an electrical source rated $\leq$ 50 kV. Sources rated > 50 kV require a minimum clearance of 10 feet plus 0.4 inch per kV above 50 kV.

☒ **Pedestrian Traffic**. The uncontrolled presence of pedestrians on a drilling or excavation site can be hazardous to both pedestrians and site workers. Prior to the initiation of site activities, the site should be surveyed to determine if, when, and where pedestrian may gain access. This includes walkways, parking lots, gates, and doorways. Barriers or caution tape should be used to exclude all pedestrian traffic. Exclusion of

pedestrian traffic is intended to prevent injury to the pedestrians and eliminate distractions that could cause injury to Partner personnel or other site workers.

☒ **Test Pit and/or other Excavations**. All provisions of the OSHA trenching and excavation standard (29 CFR 1926.650-652) must be followed during excavation activities. This includes all test pit excavation and sampling activities. The estimated location of utility installations such as sewer, telephone, electric, water lines, and other underground installations that may reasonably be expected to be encountered during excavation work, must be determined prior to opening an excavation.

Excavations in contaminated or potentially contaminated areas must be tested for confined spaces atmospheric hazards prior to entry. Excavations should not be entered if other means are available to perform the task requiring entry. If entry into an excavation is required, the atmosphere within the space must be monitored by a trained person to assure that oxygen concentrations are at greater than or equal to 19.5 percent, that combustible gas levels are less than 10 percent, and that vapor levels are within applicable safe exposure (PEL and TLV) limits.

A ladder or similar means of egress must be located in excavations greater than 4 feet in depth so as to require no more than 25 feet of lateral travel for employees. No person should be allowed to enter an excavation greater than 5 feet in depth unless the walls of the excavation have been protected using an approved shield (trench box), an approved shoring system, or the walls have been sloped back an appropriate angle, the excavation is free of accumulated water, and the excavation has been tested for hazardous atmospheres as noted previously. If personnel enter an excavation, the spoils pile and all materials must be placed at least 2 feet from the edge of the excavation to prevent the materials from rolling into the excavation. Personnel must remain at least 2 feet away from the edge of the excavation at all times. Upon completion of a test pit exploration, the excavation should be backfilled and graded. Excavations should never be left open unless absolutely necessary, and then only with proper barricading and controls to prevent accidental injury.

☒ **Underground Utilities and Hazards**. The identification of underground storage tanks (USTs), pipes, utilities, and other underground hazards is critically important prior to all drilling, excavating and other intrusive activities. In accordance with OSHA 29 CFR 1926.650, the estimated location of utility installations, such as sewer, telephone, electric, water lines and other underground installations that may reasonably be expected to be encountered during excavation work, must be determined prior to opening an excavation. The same requirements apply to drilling operations and the use of soil-gas probes. Where public utilities may exist, the utility agencies or operators must be contacted directly or through a utility-sponsored service such as Dig-Safe. Where other underground hazards may exist, reasonable attempts must be made to identify their locations as well. Failure to identify underground hazards can lead to fire, explosion, flooding, electrocution, or other life threatening accidents.

☐ **Water Hazards and Boat Sampling**. The collection of water or sediment samples on or immediately adjacent to a body of water can pose significant hazards. In addition to the slip, trip, and fall hazards associated with wet surfaces, the potential for drowning accidents must be recognized. These hazards can be intensified by the use of some PPE, particularly if respiratory protection is worn. OSHA 29 CFR 1926.106 requires that all employees working over or near water, where the danger of drowning exists, must wear a U.S. Coast Guard-approved life jacket or buoyant work vest. Ring buoys and emergency standby personnel must also be in place.

Hazard Assessment: Chemical Hazards and Related Concerns

☒ **Chemicals Subject to OSHA Hazard Communication**. All chemicals used in field activities such as solvents, reagents, decontamination solutions, or any other hazardous chemical must be accompanied by the required labels, Safety Data Sheets (SDS), and employee training documentation (OSHA 1910.1200).

☐ **Asbestos**. Disturbance of building materials in buildings built prior to 1980 must be evaluated for the presence of asbestos-containing materials by an accredited Partner inspector. The inspection and/or removal of asbestos-based or asbestos-containing building materials is regulated by some major cities and several states. Regulations require individuals who conduct building inspections for the presence of asbestos or collect samples of asbestos containing materials to be licensed or certified. Partner employees must determine the applicability of these regulations prior to any activities involving asbestos. The primary health effects of asbestos exposure include asbestosis (a scarring of the lungs), lung cancer, mesothelioma, and other forms of cancer. Exposure to asbestos is regulated by a comprehensive OSHA standard (29 CFR 1910.1001).

☒ **BTEX Compounds**. Exposure to the vapors of **benzene, ethyl benzene, toluene,** and **xylenes** above their respective permissible exposure limits (PELs), as defined by OSHA, may produce irritation of the mucous membranes of the upper respiratory tract, nose, and mouth. Overexposure may also result in the depression of the central nervous system. Symptoms of such exposure include drowsiness, headache, fatigue, and drunken-like behavior. Benzene has been determined to be carcinogenic, targeting blood-forming organs and bone marrow. The odor threshold for benzene is higher than the PEL and employees may be overexposed to benzene without sensing its presence; therefore, detector tubes must be utilized to evaluate airborne concentrations.

The vapor pressures of these compounds are high enough to generate significant quantities of airborne vapor. On sites where high concentrations of these compounds are present, a potential inhalation hazard to the field team during subsurface investigations can result. However, if the site is open and the anticipated quantities of BTEX contamination are small (e.g., part per million concentrations in the soil or groundwater), overexposure potential will also be small.

☐ **Carbon Monoxide**. Carbon monoxide (CO) is a gas usually formed by the incomplete combustion of various fuels. Welding, cutting, and the operation of internal combustion engines can produce significant quantities of CO. Amounts of CO can quickly rise to hazardous levels in poorly ventilated areas. CO is odorless and colorless. It cannot be detected without appropriate monitoring equipment. LEL/O_2 meters and H-Nu/PID are not appropriate for the detection of CO. A direct reading instrument, calibrated for CO, should be used. Common symptoms of overexposure include pounding of the heart, a dull headache, flashes before the eyes, dizziness, ringing in the ears, and nausea. These symptoms must not be relied upon in place of an appropriately calibrated monitoring instrument. Exposures should not exceed 15 ppm. Exposures above 15 ppm require the use of supplied air respirators. Air purifying respirators are not approved for protection against CO.

☐ **Chlorinated Organic Compounds**. Exposure to the vapors of many chlorinated organic compounds such as vinyl chloride; tetrachloroethene; 1,1,1-trichloroethane; trichloroethene; and 1,2-dichloroethene above their respective PELs will result in similar symptoms. The actual PELs as set by OSHA vary depending on the specific compound.

Overexposure to the vapor of these compounds can cause irritation of the eyes, nose, and throat. The liquid, if splashed in the eyes, may cause burning irritation and damage. Repeated or prolonged skin contact with the liquid may cause dermatitis. Acute overexposure to chlorinated hydrocarbons depresses the central nervous system exhibiting such symptoms as drowsiness, dizziness, headache, blurred vision, in-coordination, mental confusion, flushed skin, tremors, nausea, vomiting, fatigue, and cardiac arrhythmia. Alcohol may make symptoms of overexposure worse. If alcohol has been consumed, the overexposed worker may become flushed. Some of these compounds are considered to be potential human carcinogens. Exposure to vinyl chloride is regulated by a comprehensive OSHA standard (29 CFR 1910.1017).

☐ **Chromium Compounds**. Hexavalent chromium compounds, upon contact with the skin, can cause ulceration and possibly an allergic reaction. Inhalation of hexavalent chromium dusts is irritating and corrosive to the mucous membranes of the upper respiratory tract. Chrome ulcers and chrome dermatitis are common occupational health effects from prolonged and repeated exposure to hexavalent chromium compounds. Acute exposures to hexavalent chromium dusts may cause coughing or wheezing, pain on deep inspiration, tearing, inflammation of the conjunctiva, nasal itch, and soreness or ulceration of the nasal septum. Certain forms of hexavalent chromium have been found to cause increased respiratory cancer among workers.

Trivalent chromium compounds (chromic oxide) are generally considered to be of lower toxicity, although dermatitis may occur as a result of direct handling.

☐ **Cutting Oils**. Cutting oils may produce a condition known as "cutting oil acne," a specific dermatosis associated with prolonged and repeated direct contact. Other problems associated with continued occupational exposure to cutting fluids include allergic skin sensitization, folliculitis, and squamous cell carcinoma due to the presence of nitrosamines.

☒ **Fuel Oil**. See Petroleum Hydrocarbons (PHC)

☒ **Gasoline**. See BTEX Compounds, and Tetraethyl and Tetramethyl Lead.

☐ **Herbicides**. Some of the commonly used herbicides present a low toxicity to man. However, other herbicides pose more serious problems. Organophosphorus and carbamate herbicides, if inhaled or ingested, can interfere with the functioning of the central nervous system. Many herbicides can be readily absorbed through the skin to cause systemic effects. In addition to being absorbed through the skin, many herbicides, upon contact with the skin, may cause discoloring, skin irritation, or dermatitis. Contaminants of commercial preparations of chlorinated phenoxy herbicides such as 2,4,5-T include 2,3,7,8-tetrachlorodibenzo-p-dioxin (dioxin). Dioxin is a known mutagen and a suspect carcinogen.

☐ **Hydrogen Sulfide (H_2S)**. H_2S, characterized by its "rotten egg" odor, is produced by the decomposition of sulfur-containing organic matter. It is found in many of the same areas where methane is found such as landfills, swamps, sewers, and sewer treatment facilities. An important characteristic of H_2S is its ability to cause a decrease in one's ability to detect its presence by smell. So although one may no longer be able to smell it, it could still be present in harmful concentrations.

The symptoms of overexposure include headache, dizziness, staggering, and nausea. Severe overexposure can cause respiratory failure, coma, and death. The current OSHA PEL is 10 ppm as an 8-hour time-weighted average (TWA). The ACGIH TLV is the same.

☐ **Lead Paint**. The inspection and/or removal, sanding, grinding, etc. of lead-based or lead-containing paints is now strictly regulated by OSHA. States may require individuals who conduct lead paint inspections or collect samples of lead paint to be licensed or certified. Partner employees must determine the applicability of these regulations prior to any activities involving lead paint. For additional health information, see Metal Compounds.

☐ **Metal Compounds**. Overexposure to metal compounds has been associated with a variety of local and systemic health hazards, both acute and chronic in nature, with chronic effects being most significant. Direct contact with the dusts of some metal compounds can result in contact or allergic dermatitis. Repeated contact with arsenic compounds may result in hyperpigmentation. Cases of skin cancer due to the trivalent inorganic arsenic compounds have been documented. The moist mucous membranes, particularly the conjunctivae, are most sensitive to the irritating effects of arsenic. Copper particles embedded in the eye result in a pronounced foreign body reaction with a characteristic discoloration of eye tissue.

Inhalation of copper and zinc dusts and fumes above their established PELs may result in flu-like symptoms known as "metal fume fever." Prolonged and repeated inhalation of the dusts of inorganic arsenic compounds above the established PEL may result in weakness, loss of appetite, a sense of heaviness in the stomach, and vomiting. Respiratory problems such as cough, hoarseness, and chest pain usually precede the gastrointestinal problems. Chronic overexposure to the dusts of inorganic arsenic may result in lung cancer.

The early symptoms of lead poisoning are usually nonspecific. Symptoms include sleep disturbances, decreased physical fitness, headache, decreased appetite, and abdominal pains. Chronic overexposure may result in severe colic and severe abdominal cramping. The central nervous system (CNS) may also be adversely effected when lead is either inhaled or ingested in large quantities for extended periods of time. The peripheral nerve is usually affected. "Wrist drop" is peculiar to such CNS damage. Lead has also been characterized as a male and female reproductive toxin as well as a fetotoxin. Exposure to lead (Pb) is regulated by a comprehensive OSHA standard (29 CFR 1910.1025).

☐ **Methane**. Methane is an odorless, colorless, tasteless, gas that cannot be detected by an H-Nu/PID. When present in high concentrations in air, methane acts primarily as a simple asphyxiant without other significant physiologic effects. Simple asphyxiants dilute or displace oxygen below that required to maintain blood levels sufficient for normal tissue respiration.

Methane has a LEL of 5 percent and an upper explosive limit (UEL) of 15 percent. The LEL of a substance is the minimum concentration of gas or vapor in air below which the substance will not burn when exposed to a source of ignition. This concentration is expressed in percent by volume. Below this concentration, the mixture is "too lean" to burn or explode. The UEL of a substance is the maximum concentration of gas or vapor in air above which the substance will not burn when exposed to a source of ignition. Above this concentration, the mixture is "too rich" to burn or explode. The explosive range is the range of concentrations between the LEL and UEL where the gas-air mixture will support combustion. For methane this range is 5 to 15 percent.

☐ **Pesticides**. Pesticides can be grouped into three major categories: organophosphates, carbamate, and organochlorates. The actual PELs as set by the OSHA vary depending on the specific compound. Organophosphates, including diazinon, malathion and parathion, are quickly absorbed into the body by inhalation, ingestion, and direct skin contact. The symptoms of exposure include headache, fatigue, dizziness, blurred vision, sweating, cramps, nausea, and vomiting. More severe symptoms can include tightness of the chest, muscle spasms, seizures, and unconsciousness. It should also be noted that the malathion and parathion PELs both carry the Skin notation, indicating that these compounds adversely affect or penetrate the skin. OSHA specifies that skin exposure to substances carrying this designation should be prevented or reduced through the use of the appropriate PPE.

Organochlorates such as chlordane, DDT and heptachlor can cause dizziness, nausea, abdominal pain, and vomiting. The more severe symptoms include epileptic-like seizures, rapid heartbeat, coma, and death. These compounds also carry the OSHA Skin notation. The symptoms of exposure to carbamate such carbaryl (also known as sevin) is similar to those described for the organophosphates. However, the OSHA exposure limit for carbaryl does not carry the Skin notation.

☒ **Petroleum Hydrocarbons (PHCs)**. Petroleum hydrocarbons such as fuel oil are generally considered to be of low toxicity. Recommended airborne exposure limits have not been established for these vapors. However, inhalation of low concentrations of the vapor may cause mucous membrane irritation. Inhalation of high concentrations of the vapor may cause pulmonary edema. Repeated or prolonged direct skin contact with the oil may produce skin irritation as a result of defatting. Protective measures, such as the wearing of chemically resistant gloves, to minimize contact are addressed elsewhere in this plan. Because of the relatively low vapor pressures associated with PHCs, an inhalation hazard in the outdoor environment is not likely.

☒ **Polychlorinated Biphenyls (PCBs)**. Prolonged skin contact with PCBs may cause the formation of comedones, sebaceous cysts, and/or pustules (a condition known as chloracne). PCBs are considered to be suspect carcinogens and may also cause reproductive damage.

The OSHA PELs for PCBs are as follows:

Compound	*PEL (8-hour TWA)*
Chlorodiphenyl (42% Chlorine)	1 mg/m^3-Skin
Chlorodiphenyl (54% Chlorine)	0.5 mg/m^3 -Skin

It should be noted that PCBs have extremely low vapor pressures (0.001 millimeters of mercury (mm Hg) at 42% Chlorine and 0.00008 mm Hg at 54% Chlorine). This makes it unlikely that any significant vapor concentration (i.e., exposures above the OSHA PEL) will be created in the ambient environment. This minimizes the potential for any health hazards to arise due to inhalation unless the source is heated or generates an airborne mist. If generated, vapor or mists above the PEL may cause irritation of the eyes, nose, and throat. The exposure limits noted above are considered low enough to prevent systemic effects, but it is not known if these levels will prevent local effects. It should also be noted that both PELs carry the Skin notation, indicating that these compounds adversely affect or penetrate the skin. OSHA specifies that skin exposure to substances carrying this designation be prevented or reduced through the use of the appropriate PPE.

☐ **Polycyclic Aromatic Hydrocarbons (PAHs)**. Due to the relatively low vapor pressure of PAH compounds, vapor hazards at ambient temperatures are not expected to occur. However, if site conditions are dry, the generation of contaminated dusts may pose a potential inhalation hazard. Therefore, dust levels should be controlled with wetting, if necessary. Repeated contact with certain PAH compounds has been associated with the development of skin cancer. Contact of PAH compounds with the skin may cause photosensitization of the skin, producing skin burns after subsequent exposure to ultraviolet radiation. Protective measures, such as the wearing of chemically resistant gloves, are appropriate when handling PAH-contaminated materials.

☐ **Tetraethyl and Tetramethyl Lead**. Both compounds are used as anti-knock ingredients in gasoline. The inhalation of tetraethyl lead dusts may result in irritation of the respiratory tract. This dust, when in contact with moist skin or eye membranes, may cause itching, burning, and transient redness.

The direct absorption of a sufficient quantity of tetraethyl lead, whether briefly at a high rate, or for prolonged periods at a low rate, may cause acute intoxication of the central nervous system. Mild degrees of intoxication may cause headache, anxiety, insomnia, nervous excitation, and minor gastrointestinal disturbances.

☒ **Volatile Organic Compounds (VOCs)**. See BTEX compounds and Chlorinated Organic Compounds.

☒ **Waste Oil**. See Petroleum Hydrocarbons (PHCs) and Cutting Oil.

Hazard Assessment: Biological Hazards and Related Concerns

☒ **Insects**. Insects represent significant sources (vectors) of disease transmission. Therefore, precautions to avoid or minimize potential contact should be considered prior to all field activities. Disease or harmful effects can be transmitted through bites, stings, direct contact with insects, or ingestion of foods contaminated by certain insects. Examples of diseases transmitted by insect bites include encephalitis and malaria from contaminated mosquitoes and Lyme disease and spotted fever from contaminated ticks. Stinging insects, such as bees and wasps, are prevalent throughout the country, particularly during the warmer months. The stings of these insects can be painful and cause serious allergic reactions to some individuals.

☐ **Lyme Disease**. Lyme disease is an infection caused by the bite of certain ticks, primarily deer, dog and wood ticks. The symptoms of Lyme disease usually start out as a skin rash then progress to more serious symptoms. The more serious symptoms can include lesions, headaches, arthritis, and permanent damage to the neurological system. If detected early, the disease can be treated successfully with antibiotics. The following steps are recommended for prevention of Lyme disease and other diseases transmitted by ticks: a) Beware of tall grass, bushes, woods, and other areas where ticks may live; b) Wear good shoes, long pants tucked into socks, a shirt with a snug collar, good cuffs around the wrists, and tails tucked into the pants. Insect/tick repellents may also be useful; c) Carefully monitor for the presence of ticks. Carefully inspect clothes and skin when undressing. If a tick is attached to the skin, it should be removed with fine-tipped tweezers. You should be alert for early symptoms over the next month or so. If you suspect that you have been bitten by a tick, you should contact a physician for medical advice.

☐ **Medical Wastes and Bloodborne Diseases**. Any field activity where exposure to medical wastes or other sources of bloodborne pathogens can be reasonably anticipated must be conducted in accordance with the OSHA (29 CFR 1910.1030) Bloodborne Pathogens standard. According to the OSHA definition, Bloodborne Pathogens mean pathogenic microorganisms that are present in human blood and can cause disease in humans. These pathogens include, but are not limited to, hepatitis B virus (HBV) and human immunodeficiency virus (HIV). Wherever there is a potential for employee skin, eye, mucous membrane, or parenteral (skin or membrane piercing) contact with blood or other potentially infectious sources, employers must develop a Written Exposure Control Plan.

☐ **Poisonous Plants**. The possible presence of poisonous plants should be anticipated for field activities in wooded or heavily vegetated areas. Poison ivy is a climbing plant with alternate green to red leaves (arranged in threes) and white berries. Poison oak is similar to poison ivy and sumac, but its leaves are oak-like in form. The leaves of these poisonous plants produce irritating oil that causes an intensely itching skin rash and characteristic blister-like lesions. Contact with these plants should be avoided.

☐ **Rats, Snakes and Other Vermin**. Certain animals, particularly those that feed on garbage and other wastes, can represent significant sources (vectors) of disease transmission. Therefore, precautions to avoid or minimize potential contact with (biting) animals (such as rats) or animal waste (such as pigeon droppings) should be considered prior to all field activities. Rats, snakes, and other wild animals can inflict painful bites. The bites can poisonous (as in the case of some snakes) or disease causing (as in the case of rabid animals). Avoidance of these animals is the best protection.

☐ **Waste Water and Sewage**. Sewage and waste water contaminated with raw, untreated sewage can represent significant sources of bacterial, viral, or fungal contamination. Adverse effects due to contact can range from mild skin reactions or rashes to life threatening diseases. Diseases are easily transmitted by accidental ingestion or through skin contact, particularly if the skin is broken. Avoidance of direct contact and good personal hygiene are the best protection from these hazards.

3. HAZARDS IDENTIFICATION

EYES
Moderate irritant. Contact with liquid or vapor may cause irritation.

SKIN
Practically non-toxic if absorbed following acute (single) exposure. May cause skin irritation with prolonged or repeated contact. Liquid may be absorbed through the skin in toxic amounts if large areas of skin are exposed repeatedly.

INGESTION
The major health threat of ingestion occurs from the danger of aspiration (breathing) of liquid drops into the lungs, particularly from vomiting. Aspiration may result in chemical pneumonia (fluid in the lungs), severe lung damage, respiratory failure and even death.

Ingestion may cause gastrointestinal disturbances, including irritation, nausea, vomiting and diarrhea, and central nervous system (brain) effects similar to alcohol intoxication. In severe cases, tremors, convulsions, loss of consciousness, coma, respiratory arrest, and death may occur.

INHALATION
Excessive exposure may cause irritations to the nose, throat, lungs and respiratory tract. Central nervous system (brain) effects may include headache, dizziness, loss of balance and coordination, unconsciousness, coma, respiratory failure, and death.

WARNING: the burning of any hydrocarbon as a fuel in an area without adequate ventilation may result in hazardous levels of combustion products, including carbon monoxide, and inadequate oxygen levels, which may cause unconsciousness, suffocation, and death.

CHRONIC EFFECTS and CARCINOGENICITY
Contains benzene, a regulated human carcinogen. Benzene has the potential to cause anemia and other blood diseases, including leukemia, after repeated and prolonged exposure. Exposure to light hydrocarbons in the same boiling range as this product has been associated in animal studies with systemic toxicity. See also Section 11 - Toxicological Information.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE
Irritation from skin exposure may aggravate existing open wounds, skin disorders, and dermatitis (rash). Chronic respiratory disease, liver or kidney dysfunction, or pre-existing central nervous system disorders may be aggravated by exposure.

4. FIRST AID MEASURES

EYES
In case of contact with eyes, immediately flush with clean, low-pressure water for at least 15 min. Hold eyelids open to ensure adequate flushing. Seek medical attention.

SKIN
Remove contaminated clothing. Wash contaminated areas thoroughly with soap and water or waterless hand cleanser. Obtain medical attention if irritation or redness develops.

INGESTION

DO NOT INDUCE VOMITING. Do not give liquids. Obtain immediate medical attention. If spontaneous vomiting occurs, lean victim forward to reduce the risk of aspiration. Small amounts of material which enter the mouth should be rinsed out until the taste is dissipated.

INHALATION
Remove person to fresh air. If person is not breathing, ensure an open airway and provide artificial respiration. If necessary, provide additional oxygen once breathing is restored if trained to do so. Seek medical attention immediately.

5. FIRE FIGHTING MEASURES

FLAMMABLE PROPERTIES:

FLASH POINT:	-45 ^{o}F (-43°C)
AUTOIGNITION TEMPERATURE:	highly variable; > 530 ^{o}F (>280 ^{o}C)
OSHA/NFPA FLAMMABILITY CLASS:	1A (flammable liquid)
LOWER EXPLOSIVE LIMIT (%):	1.4%
UPPER EXPLOSIVE LIMIT (%):	7.6%

FIRE AND EXPLOSION HAZARDS
Vapors may be ignited rapidly when exposed to heat, spark, open flame or other source of ignition. Flowing product may be ignited by self-generated static electricity. When mixed with air and exposed to an ignition source, flammable vapors can burn in the open or explode in confined spaces. Being heavier than air, vapors may travel long distances to an ignition source and flash back. Runoff to sewer may cause fire or explosion hazard.

EXTINGUISHING MEDIA
SMALL FIRES: Any extinguisher suitable for Class B fires, dry chemical, CO2, water spray, fire fighting foam, or Halon.

LARGE FIRES: Water spray, fog or fire fighting foam. Water may be ineffective for fighting the fire, but may be used to cool fire-exposed containers.

During certain times of the year and/or in certain geographical locations, gasoline may contain MTBE and/or TAME. Firefighting foam suitable for polar solvents is recommended for fuel with greater than 10% oxygenate concentration - refer to NFPA 11 “Low Expansion Foam - 1994 Edition.”

FIRE FIGHTING INSTRUCTIONS
Small fires in the incipient (beginning) stage may typically be extinguished using handheld portable fire extinguishers and other fire fighting equipment.

Firefighting activities that may result in potential exposure to high heat, smoke or toxic by-products of combustion should require NIOSH/MSHA- approved pressure-demand self-contained breathing apparatus with full facepiece and full protective clothing.

Isolate area around container involved in fire. Cool tanks, shells, and containers exposed to fire and excessive heat with water. For massive fires the use of unmanned hose holders or monitor nozzles may be advantageous to further minimize personnel exposure. Major fires may require withdrawal, allowing the tank to burn. Large storage tank fires typically require specially trained personnel and equipment to extinguish the fire, often including the need for properly applied fire fighting foam.

See Section 16 for the NFPA 704 Hazard Rating.

6. ACCIDENTAL RELEASE MEASURES

ACTIVATE FACILITY SPILL CONTINGENCY or EMERGENCY PLAN.

Evacuate nonessential personnel and remove or secure all ignition sources. Consider wind direction; stay upwind and uphill, if possible. Evaluate the direction of product travel, diking, sewers, etc. to confirm spill areas. Spills may infiltrate subsurface soil and groundwater; professional assistance may be necessary to determine the extent of subsurface impact.

Carefully contain and stop the source of the spill, if safe to do so. Protect bodies of water by diking, absorbents, or absorbent boom, if possible. Do not flush down sewer or drainage systems, unless system is designed and permitted to handle such material. The use of fire fighting foam may be useful in certain situations to reduce vapors. The proper use of water spray may effectively disperse product vapors or the liquid itself, preventing contact with ignition sources or areas/equipment that require protection.

Take up with sand or other oil absorbing materials. Carefully shovel, scoop or sweep up into a waste container for reclamation or disposal - caution, flammable vapors may accumulate in closed containers. Response and clean-up crews must be properly trained and must utilize proper protective equipment (see Section 8).

7. HANDLING and STORAGE

HANDLING PRECAUTIONS

******USE ONLY AS A MOTOR FUEL******
******DO NOT SIPHON BY MOUTH******

Handle as a flammable liquid. Keep away from heat, sparks, and open flame! Electrical equipment should be approved for classified area. Bond and ground containers during product transfer to reduce the possibility of static-initiated fire or explosion.

Special slow load procedures for "switch loading" must be followed to avoid the static ignition hazard that can exist when higher flash point material (such as fuel oil) is loaded into tanks previously containing low flash point products (such as this product) - see API Publication 2003, "Protection Against Ignitions Arising Out Of Static, Lightning and Stray Currents.

STORAGE PRECAUTIONS

Keep away from flame, sparks, excessive temperatures and open flame. Use approved vented containers. Keep containers closed and clearly labeled. Empty product containers or vessels may contain explosive vapors. Do not pressurize, cut, heat, weld or expose such containers to sources of ignition.

Store in a well-ventilated area. This storage area should comply with NFPA 30 "Flammable and Combustible Liquid Code". Avoid storage near incompatible materials. The cleaning of tanks previously containing this product should follow API Recommended Practice (RP) 2013 "Cleaning Mobile Tanks In Flammable and Combustible Liquid Service" and API RP 2015 "Cleaning Petroleum Storage Tanks".

WORK/HYGIENIC PRACTICES

Emergency eye wash capability should be available in the near proximity to operations presenting a potential splash exposure. Use good personal hygiene practices. Avoid repeated and/or prolonged skin exposure. Wash hands before eating, drinking, smoking, or using toilet facilities. Do not use as a cleaning solvent on the skin. Do not use solvents or harsh abrasive skin cleaners for washing this product from exposed skin areas. Waterless hand cleaners are effective. Promptly remove contaminated clothing and launder before reuse. Use care when laundering to prevent the formation of flammable vapors which could ignite via washer or dryer. Consider the need to discard contaminated leather shoes and gloves.

ENGINEERING CONTROLS

Use adequate ventilation to keep vapor concentrations of this product below occupational exposure and flammability limits, particularly in confined spaces.

EYE/FACE PROTECTION

Safety glasses or goggles are recommended where there is a possibility of splashing or spraying.

SKIN PROTECTION

Gloves constructed of nitrile or neoprene are recommended. Chemical protective clothing such as that made of of E.I. DuPont Tychem ®, products or equivalent is recommended based on degree of exposure.

Note: The resistance of specific material may vary from product to product as well as with degree of exposure. Consult manufacturer specifications for further information.

RESPIRATORY PROTECTION

A NIOSH-approved air-purifying respirator with organic vapor cartridges or canister may be permissible under certain circumstances where airborne concentrations are or may be expected to exceed exposure limits or for odor or irritation. Protection provided by air-purifying respirators is limited. Refer to OSHA 29 CFR 1910.134, NIOSH Respirator Decision Logic, and the manufacturer for additional guidance on respiratory protection selection and limitations.

Use a positive pressure, air-supplied respirator if there is a potential for uncontrolled release, exposure levels are not known, in oxygen-deficient atmospheres, or any other circumstance where an air-purifying respirator may not provide adequate protection.

INCOMPATIBLE MATERIALS
Keep away from strong oxidizers.

HAZARDOUS DECOMPOSITION PRODUCTS
Carbon monoxide, carbon dioxide and non-combusted hydrocarbons (smoke). Contact with nitric and sulfuric acids will form nitrocresols that can decompose violently.

11. TOXICOLOGICAL PROPERTIES

ACUTE TOXICITY
Acute Dermal LD50 (rabbits): > 5 ml/kg
Acute Oral LD50 (rat): 18.75 ml/kg
Primary dermal irritation (rabbits): slightly irritating
Draize eye irritation (rabbits): non-irritating
Guinea pig sensitization: negative

CHRONIC EFFECTS AND CARCINOGENICITY
Carcinogenicity: OSHA: NO IARC: YES - 2B NTP: NO ACGIH: YES (A3)

IARC has determined that gasoline and gasoline exhaust are possibly carcinogenic in humans. Inhalation exposure to completely vaporized unleaded gasoline caused kidney cancers in male rats and liver tumors in female mice. The U.S. EPA has determined that the male kidney tumors are species-specific and are irrelevant for human health risk assessment. The significance of the tumors seen in female mice is not known. Exposure to light hydrocarbons in the same boiling range as this product has been associated in animal studies with effects to the central and peripheral nervous systems, liver, and kidneys. The significance of these animal models to predict similar human response to gasoline is uncertain.

This product contains benzene. Human health studies indicate that prolonged and/or repeated overexposure to benzene may cause damage to the blood-forming system (particularly bone marrow), and serious blood disorders such as aplastic anemia and leukemia. Benzene is listed as a human carcinogen by the NTP, IARC, OSHA and ACGIH.

This product may contain methyl tertiary butyl ether (MTBE): animal and human health effects studies indicate that MTBE may cause eye, skin, and respiratory tract irritation, central nervous system depression and neurotoxicity. MTBE is classified as an animal carcinogen (A3) by the ACGIH.

12. ECOLOGICAL INFORMATION

Keep out of sewers, drainage areas and waterways. Report spills and releases, as applicable, under Federal and State regulations. If released, oxygenates such as ethers and alcohols will be expected to exhibit fairly high mobility in soil, and therefore may leach into groundwater. The API (www.api.org) provides a number of useful references addressing petroleum and oxygenate contamination of groundwater.

13. DISPOSAL CONSIDERATIONS

Consult federal, state and local waste regulations to determine appropriate disposal options.

**** DETERMINATION OF NO HAZARD TO AIR NAVIGATION ****

The Federal Aviation Administration has conducted an aeronautical study under the provisions of 49 U.S.C., Section 44718 and if applicable Title 14 of the Code of Federal Regulations, part 77, concerning:

Structure:	Commercial Building
Location:	Los Angeles, CA
Latitude:	33-57-20.59N NAD 83
Longitude:	118-23-06.49W
Heights:	113 feet site elevation (SE)
	44 feet above ground level (AGL)
	157 feet above mean sea level (AMSL)

This aeronautical study revealed that the structure does not exceed obstruction standards and would not be a hazard to air navigation provided the following condition(s), if any, is(are) met:

It is required that FAA Form 7460-2, Notice of Actual Construction or Alteration, be e-filed any time the project is abandoned or:

_____ At least 10 days prior to start of construction (7460-2, Part 1)
__X__ Within 5 days after the construction reaches its greatest height (7460-2, Part 2)

Based on this evaluation, marking and lighting are not necessary for aviation safety. However, if marking/ lighting are accomplished on a voluntary basis, we recommend it be installed in accordance with FAA Advisory circular 70/7460-1 M.

The structure considered under this study lies in proximity to an airport and occupants may be subjected to noise from aircraft operating to and from the airport.

This determination expires on 03/16/2026 unless:

(a) the construction is started (not necessarily completed) and FAA Form 7460-2, Notice of Actual Construction or Alteration, is received by this office.
(b) extended, revised, or terminated by the issuing office.

(c) the construction is subject to the licensing authority of the Federal Communications Commission (FCC) and an application for a construction permit has been filed, as required by the FCC, within 6 months of the date of this determination. In such case, the determination expires on the date prescribed by the FCC for completion of construction, or the date the FCC denies the application.

NOTE: REQUEST FOR EXTENSION OF THE EFFECTIVE PERIOD OF THIS DETERMINATION MUST BE E-FILED AT LEAST 15 DAYS PRIOR TO THE EXPIRATION DATE. AFTER RE-EVALUATION OF CURRENT OPERATIONS IN THE AREA OF THE STRUCTURE TO DETERMINE THAT NO SIGNIFICANT AERONAUTICAL CHANGES HAVE OCCURRED, YOUR DETERMINATION MAY BE ELIGIBLE FOR ONE EXTENSION OF THE EFFECTIVE PERIOD.

This determination is based, in part, on the foregoing description which includes specific coordinates, heights, frequency(ies) and power. Any changes in coordinates, heights, and frequencies or use of greater power, except those frequencies specified in the Colo Void Clause Coalition; Antenna System Co-Location; Voluntary Best Practices, will void this determination. Any future construction or alteration, including increase to heights, power, or the addition of other transmitters, requires separate notice to the FAA.This determination includes all previously filed frequencies and power for this structure.

If construction or alteration is dismantled or destroyed, you must submit notice to the FAA within 5 days after the construction or alteration is dismantled or destroyed.

This determination does include temporary construction equipment such as cranes, derricks, etc., which may be used during actual construction of the structure. However, this equipment shall not exceed the overall heights as indicated above. Equipment which has a height greater than the studied structure requires separate notice to the FAA.

This determination concerns the effect of this structure on the safe and efficient use of navigable airspace by aircraft and does not relieve the sponsor of compliance responsibilities relating to any law, ordinance, or regulation of any Federal, State, or local government body.

If we can be of further assistance, please contact our office at (847) 294-7575, or vivian.vilaro@faa.gov. On any future correspondence concerning this matter, please refer to Aeronautical Study Number 2024-AWP-10025-OE.

This determination is based, in part, on the foregoing description which includes specific coordinates, heights, frequency(ies) and power. Any changes in coordinates, heights, and frequencies or use of greater power, except those frequencies specified in the Colo Void Clause Coalition; Antenna System Co-Location; Voluntary Best Practices, will void this determination. Any future construction or alteration, including increase to heights, power, or the addition of other transmitters, requires separate notice to the FAA.This determination includes all previously filed frequencies and power for this structure.

If construction or alteration is dismantled or destroyed, you must submit notice to the FAA within 5 days after the construction or alteration is dismantled or destroyed.

This determination does include temporary construction equipment such as cranes, derricks, etc., which may be used during actual construction of the structure. However, this equipment shall not exceed the overall heights as indicated above. Equipment which has a height greater than the studied structure requires separate notice to the FAA.

This determination concerns the effect of this structure on the safe and efficient use of navigable airspace by aircraft and does not relieve the sponsor of compliance responsibilities relating to any law, ordinance, or regulation of any Federal, State, or local government body.

**** DETERMINATION OF NO HAZARD TO AIR NAVIGATION ****

The Federal Aviation Administration has conducted an aeronautical study under the provisions of 49 U.S.C., Section 44718 and if applicable Title 14 of the Code of Federal Regulations, part 77, concerning:

Structure:	Commercial Building
Location:	Los Angeles, CA
Latitude:	33-57-18.11N NAD 83
Longitude:	118-23-01.83W
Heights:	113 feet site elevation (SE)
	44 feet above ground level (AGL)
	157 feet above mean sea level (AMSL)

This aeronautical study revealed that the structure does not exceed obstruction standards and would not be a hazard to air navigation provided the following condition(s), if any, is(are) met:

It is required that FAA Form 7460-2, Notice of Actual Construction or Alteration, be e-filed any time the project is abandoned or:

_____ At least 10 days prior to start of construction (7460-2, Part 1)
__X__ Within 5 days after the construction reaches its greatest height (7460-2, Part 2)

Based on this evaluation, marking and lighting are not necessary for aviation safety. However, if marking/ lighting are accomplished on a voluntary basis, we recommend it be installed in accordance with FAA Advisory circular 70/7460-1 M.

The structure considered under this study lies in proximity to an airport and occupants may be subjected to noise from aircraft operating to and from the airport.

This determination expires on 03/16/2026 unless:

(a) the construction is started (not necessarily completed) and FAA Form 7460-2, Notice of Actual Construction or Alteration, is received by this office.
(b) extended, revised, or terminated by the issuing office.

(c) the construction is subject to the licensing authority of the Federal Communications Commission (FCC) and an application for a construction permit has been filed, as required by the FCC, within 6 months of the date of this determination. In such case, the determination expires on the date prescribed by the FCC for completion of construction, or the date the FCC denies the application.

NOTE: REQUEST FOR EXTENSION OF THE EFFECTIVE PERIOD OF THIS DETERMINATION MUST BE E-FILED AT LEAST 15 DAYS PRIOR TO THE EXPIRATION DATE. AFTER RE-EVALUATION OF CURRENT OPERATIONS IN THE AREA OF THE STRUCTURE TO DETERMINE THAT NO SIGNIFICANT AERONAUTICAL CHANGES HAVE OCCURRED, YOUR DETERMINATION MAY BE ELIGIBLE FOR ONE EXTENSION OF THE EFFECTIVE PERIOD.

It is required that FAA Form 7460-2, Notice of Actual Construction or Alteration, be e-filed any time the project is abandoned or:

_____ At least 10 days prior to start of construction (7460-2, Part 1)
__X__ Within 5 days after the construction reaches its greatest height (7460-2, Part 2)

Based on this evaluation, marking and lighting are not necessary for aviation safety. However, if marking/ lighting are accomplished on a voluntary basis, we recommend it be installed in accordance with FAA Advisory circular 70/7460-1 M.

The structure considered under this study lies in proximity to an airport and occupants may be subjected to noise from aircraft operating to and from the airport.

This determination expires on 03/16/2026 unless:

(a) the construction is started (not necessarily completed) and FAA Form 7460-2, Notice of Actual Construction or Alteration, is received by this office.
(b) extended, revised, or terminated by the issuing office.

(c) the construction is subject to the licensing authority of the Federal Communications Commission (FCC) and an application for a construction permit has been filed, as required by the FCC, within 6 months of the date of this determination. In such case, the determination expires on the date prescribed by the FCC for completion of construction, or the date the FCC denies the application.

NOTE: REQUEST FOR EXTENSION OF THE EFFECTIVE PERIOD OF THIS DETERMINATION MUST BE E-FILED AT LEAST 15 DAYS PRIOR TO THE EXPIRATION DATE. AFTER RE-EVALUATION OF CURRENT OPERATIONS IN THE AREA OF THE STRUCTURE TO DETERMINE THAT NO SIGNIFICANT AERONAUTICAL CHANGES HAVE OCCURRED, YOUR DETERMINATION MAY BE ELIGIBLE FOR ONE EXTENSION OF THE EFFECTIVE PERIOD.

This determination is based, in part, on the foregoing description which includes specific coordinates, heights, frequency(ies) and power. Any changes in coordinates, heights, and frequencies or use of greater power, except those frequencies specified in the Colo Void Clause Coalition; Antenna System Co-Location; Voluntary Best Practices, will void this determination. Any future construction or alteration, including increase to heights, power, or the addition of other transmitters, requires separate notice to the FAA.This determination includes all previously filed frequencies and power for this structure.

If construction or alteration is dismantled or destroyed, you must submit notice to the FAA within 5 days after the construction or alteration is dismantled or destroyed.

This determination does include temporary construction equipment such as cranes, derricks, etc., which may be used during actual construction of the structure. However, this equipment shall not exceed the overall heights as indicated above. Equipment which has a height greater than the studied structure requires separate notice to the FAA.

This determination concerns the effect of this structure on the safe and efficient use of navigable airspace by aircraft and does not relieve the sponsor of compliance responsibilities relating to any law, ordinance, or regulation of any Federal, State, or local government body.

	154 feet above mean sea level (AMSL)

This aeronautical study revealed that the structure does not exceed obstruction standards and would not be a hazard to air navigation provided the following condition(s), if any, is(are) met:

It is required that FAA Form 7460-2, Notice of Actual Construction or Alteration, be e-filed any time the project is abandoned or:

_____ At least 10 days prior to start of construction (7460-2, Part 1)
__X__ Within 5 days after the construction reaches its greatest height (7460-2, Part 2)

Based on this evaluation, marking and lighting are not necessary for aviation safety. However, if marking/ lighting are accomplished on a voluntary basis, we recommend it be installed in accordance with FAA Advisory circular 70/7460-1 M.

The structure considered under this study lies in proximity to an airport and occupants may be subjected to noise from aircraft operating to and from the airport.

This determination expires on 03/16/2026 unless:

(a) the construction is started (not necessarily completed) and FAA Form 7460-2, Notice of Actual Construction or Alteration, is received by this office.
(b) extended, revised, or terminated by the issuing office.

(c) the construction is subject to the licensing authority of the Federal Communications Commission (FCC) and an application for a construction permit has been filed, as required by the FCC, within 6 months of the date of this determination. In such case, the determination expires on the date prescribed by the FCC for completion of construction, or the date the FCC denies the application.

NOTE: REQUEST FOR EXTENSION OF THE EFFECTIVE PERIOD OF THIS DETERMINATION MUST BE E-FILED AT LEAST 15 DAYS PRIOR TO THE EXPIRATION DATE. AFTER RE-EVALUATION OF CURRENT OPERATIONS IN THE AREA OF THE STRUCTURE TO DETERMINE THAT NO SIGNIFICANT AERONAUTICAL CHANGES HAVE OCCURRED, YOUR DETERMINATION MAY BE ELIGIBLE FOR ONE EXTENSION OF THE EFFECTIVE PERIOD.

This determination is based, in part, on the foregoing description which includes specific coordinates, heights, frequency(ies) and power. Any changes in coordinates, heights, and frequencies or use of greater power, except those frequencies specified in the Colo Void Clause Coalition; Antenna System Co-Location; Voluntary Best Practices, will void this determination. Any future construction or alteration, including increase to heights, power, or the addition of other transmitters, requires separate notice to the FAA.This determination includes all previously filed frequencies and power for this structure.

If construction or alteration is dismantled or destroyed, you must submit notice to the FAA within 5 days after the construction or alteration is dismantled or destroyed.

This determination does include temporary construction equipment such as cranes, derricks, etc., which may be used during actual construction of the structure. However, this equipment shall not exceed the overall heights as indicated above. Equipment which has a height greater than the studied structure requires separate notice to the FAA.

This determination concerns the effect of this structure on the safe and efficient use of navigable airspace by aircraft and does not relieve the sponsor of compliance responsibilities relating to any law, ordinance, or regulation of any Federal, State, or local government body.
