Hi Jim,

I got your email below. I was told that we only have 1 set of encore to use for the analyses you requested.

Here's what we can do 1) analyze 8015 TPHg using one encore 2) analyze 8260B+Oxygenates with 2nd encore 3) for dilutions, we can prioritize 8260B and use the 3rd encore 4) we will use the sample tube for any other reruns.

As for Ethanol, we are not set-up by method 8260B. We can analyze it by 8015B. Let me know if this will be a problem.

Enclosed is a copy of the coc for your reference.

Thanks,
Rachelle

Subject: Hertz - LAX project

All samples are to be ran as follows:

A State-certified laboratory will perform analyses of all collected soil and groundwater samples. Soil and

groundwater samples will be analyzed for TPH gasoline by EPA Method 8015/5035. In addition, the soil samples will be

analyzed for benzene, toluene, ethylbenzene, total xylenes (BTEX), fuel oxygenates including MTBE and

ethanol by EPA Method 8260B/5035. As requested by the RWQCB, groundwater samples will be analyzed by

Volatile Organic Compounds (full suite) including common aromatic and chlorinated volatile organic

compounds by EPA method 8260B/5035 for this sampling event.

Please let me know if there is a problem.

Best Regards,

RE: Hertz LAX, 52.75015.0006

Attention: Jim Madden

Enclosed are the results for sample(s) received on July 08, 2009 by Advanced Technology Laboratories . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

Eddie F. Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and cannot be reproduced in part or in its entirety without written permission from the client and Advanced Technology Laboratories.

CLIENT: ATC Associates Inc
Project: Hertz LAX, 52.75015.0006
Lab Order: 106302

CASE NARRATIVE

Results were J-Flag. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" Flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

All volatile analyses were performed using 5035 preservation requirements except sample MW-5/70'. Any high level dilutions were performed on a preserved methanol sample unless otherwise noted.

Hi Jim,

Please confirm if you want us to run all the samples collected on 7/8/09. The analyses requested on Page 1 of 2 do not have the lines drawn down to the last sample. Attached is the copy of the COCs for your reference.

Please advise.

Hi Jim,

I got your email below. I was told that we only have 1 set of encore to use for the analyses you requested.

Here's what we can do 1) analyze 8015 TPHg using one encore 2) analyze 8260B+Oxygenates with 2nd encore 3) for dilutions, we can prioritize 8260B and use the 3rd encore 4) we will use the sample tube for any other reruns.

As for Ethanol, we are not set-up by method 8260B. We can analyze it by 8015B. Let me know if this will be a problem.

Enclosed is a copy of the coc for your reference.

Thanks,
Rachelle

Subject: Hertz - LAX project

All samples are to be ran as follows:

A State-certified laboratory will perform analyses of all collected soil and groundwater samples. Soil and

groundwater samples will be analyzed for TPH gasoline by EPA Method 8015/5035. In addition, the soil samples will be

analyzed for benzene, toluene, ethylbenzene, total xylenes (BTEX), fuel oxygenates including MTBE and

ethanol by EPA Method 8260B/5035. As requested by the RWQCB, groundwater samples will be analyzed by

Volatile Organic Compounds (full suite) including common aromatic and chlorinated volatile organic

compounds by EPA method 8260B/5035 for this sampling event.

Please let me know if there is a problem.

August 17, 2009

Mr. Jim Madden
A.T.C. Associates Inc. [Monterey Park]
25 Cupania Circle
Monterey Park, CA 91755

Report No.: 9080044
Project Name: Hertz-LAX, P.O. No. 52.75015.0006

Dear Mr. Jim Madden,

This report contains the analytical results for the sample(s) received under chain of custody(s) by Positive Lab Service on August 06, 2009.

The test results in this report are performed in compliance with ELAP accreditation requirements for the certified parameters. The laboratory report may not be produced, except in full, without the written approval of the laboratory.

The issuance of the final Certificate of Analysis takes precedence over any previous Preliminary Report. Preliminary data should not be used for regulatory purposes. Authorized signature(s) is provided on final report only.

If you have any questions in reference to this report, please contact your Positive Lab Service coordinator.

SEMIANNUAL GROUNDWATER MONITORING REPORT – JULY 2012

Facility: **Hertz Facility**	Site Address: **9000 Airport Boulevard, Los Angeles California**
Responsible Party / Contact Person:	Hertz Corporation / Mr. Timothy Egan
Consulting Co. / Contact Person:	**ATC Associates Inc. /Jim Madden, Project Manager (323) 517-9780**
ATC Project No.:	52.75015.0006
Regulatory Agency/File No.:	Los Angeles Regional Water Quality Control Board / Release #900450670 (D-1)

WORK PERFORMED THIS QUARTER (July 1, 2012 to September 30, 2012]:

1. Performed second semi-annual groundwater monitoring and sampling.
2. Submit second semi-annual 2012 groundwater monitoring report

WORK PROPOSED FOR NEXT SEMI-ANNUAL EVENT [January 1, 2013 to March 30, 2013]:

1. Perform first semi-annual groundwater monitoring and sampling.
2. Prepare and submit first semi-annual 2013 groundwater monitoring report.

Current Phase of Project:	Assessment	(Assessment, Remediation, etc.)
Frequency of Sampling:	Semi-annual	(Semi-annual, etc.)
Frequency of Monitoring:	Semi-annual	(Semi-annual, etc.)
Liquid Phase Hydrocarbons Present On Site:	No	(Yes/No)
Cumulative PSH Recovered to Date:	None	(gallons)
PSH Recovered This Quarter:	None	(gallons)
Purge Water Removed This Quarter:	40	(gallons)
Permits for Discharge:	None	(NDPES, POTW, etc)
Current Remediation Techniques:	Natural attenuation	(SVES, PSH Recovery, Natural attenuation)
Approximate Depth to Groundwater:	73.47 to 84.92	(Measured Feet)
Groundwater Gradient:	0.06 ft/ft	(Magnitude)
Groundwater Flow Direction:	Northeast	(Direction)

Discussion: On July 12, 2012, ATC Associates, Incorporated (ATC) personnel visited the site to perform the second of two groundwater monitoring and sampling events **(Figure 1)**. Well construction details and survey data are in **Table 1**. ATC gauged five monitoring wells (**Figure 2**). Depth to groundwater during this gauging event ranged between 73.47 (MW-1) and 84.92 (MW-5) feet below ground surface (bgs). Groundwater monitoring wells MW-1 and MW-2 were observed to contain less than 1 foot of water during this sampling event, and the water was turbid, even after being purged. Due to the low water levels in groundwater monitoring well MW-2, a sample was not collected. Groundwater flow direction was northeast with a hydraulic gradient of approximately 0.06 ft/ft. No measurable phase-separated hydrocarbons (PSH) were recorded during this monitoring event. A groundwater elevation contour map is presented on **Figure 3**. The groundwater measurements in monitoring wells MW-1 and MW-2 are suspect based on the historical groundwater gradient and limited water column in the wells. Monitoring wells MW-1 and MW-2 were disregarded for groundwater elevation mapping purposes as shown in **Figure 3**. Groundwater monitoring and sampling procedures are provided in **Appendix A**.

ATC purged and collected groundwater samples from MW-1, MW-3, MW-4, and MW-5; field logs are in **Appendix B**. The samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg); benzene, toluene, ethylbenzene, and total xylenes (BTEX); fuel oxygenates methyl tert-butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl tert-butyl ether (ETBE), tert-amyl methyl ether (TAME), and tert-butyl alcohol (TBA), by EPA Test Method 8260 and gas chromatograph/mass spectrometer (GC/MS) combination.

TPHg was not present in concentrations above the laboratory practical quantitation limit (PQL= 100 µg/L) in groundwater samples collected from MW-1 and MW-3 through MW-5. BTEX were not detected at concentrations above the laboratory PQL of 1.0 µg/L in any of the groundwater samples collected during the current monitoring event. MTBE, TAME, DIPE, and ETBE were not present at concentrations above their respective laboratory PQLs.

However, it is ATC's opinion that the analytical results for monitoring wells MW-1 and MW-2 are not likely representative of

actual site conditions due to insufficient recharge of the wells. Dissolved oxygen readings were not available during this sampling event. Groundwater analytical results are presented in **Table 2**. The laboratory analytical report is in **Appendix C**.
Recommendations: Continue semi-annual groundwater monitoring
Summary of Unusual Activity: MTBE was not detected in any of the sampled groundwater monitoring wells during this sampling event.
Agency Directive Requirements: Continue semi-annual groundwater monitoring and sampling

APPENDIX A

GROUNDWATER MONITORING AND SAMPLING PROCEDURES

GROUNDWATER MONITORING AND SAMPLING PROCEDURES

Groundwater Monitoring and Decontamination Method

Prior to monitoring, a decontamination area is established. Decontamination procedures consist of scrubbing down-well equipment in a Liquidnox® solution wash (or equivalent degreasing compound), and rinsing in potable water and a final rinse of de-ionized (or distilled) water before and after each well. Any non-dedicated down-well equipment is decontaminated prior to use on site.

Prior to purging and sampling a well, the static water level is measured to the nearest 0.01 feet with an electronic interface probe and/or water level meter. Depth to bottom is typically measured every semi-annual event. The water level meter and tape will be decontaminated between each well. If floating phase-separated hydrocarbons (PSH) are suspected or previously confirmed, an electronic interface probe is used to measure the well fluids to the nearest 0.01 feet. PSH may alternatively be measured using a clear, open-ended product bailer, and the thickness is measured to the nearest 0.01 feet in the bailer. Any monitoring well containing a measurable thickness of PSH before or during purging is not additionally purged and no sample is collected from that well. Wells containing hydrocarbon sheen are sampled unless otherwise specified by the project manager. Field observations such as well integrity as well as water level measurements and PSH thickness are recorded in the field.

Well Purging

When well purging is required, each monitoring well to be sampled is purged using, a truck-mounted vacuum pump, a polyvinyl chloride (PVC) bailer or a submersible pump. Physical parameters (pH, temperature, and conductivity) of the purge groundwater are monitored during purging activities to assess if the water sample collected is representative of the aquifer. If required, parameters such as dissolved oxygen, turbidity, salinity etc. are also measured. Samples are considered representative if parameter stability is achieved. Stability is defined as a change of less than 0.25 pH units, less than 10% change in conductivity in micro mhos, and less than 1.0 degree centigrade (1.8 degrees Fahrenheit) change in temperature. Parameters are measured in a discreet sample decanted from the bailer separately from the rest of the purge groundwater. Parameters are measured during purging; initially, and at volume intervals of one well or borehole volume (dependent on local regulations). Purging continues until the required well or borehole volumes have been removed, until the well completely dewaters, or until measured parameters stabilize as indicated above. When wells dewater or demonstrate a slow recharge, wells may be sampled although fewer than required volumes have been removed. Well purging information is recorded on the Purge Data sheet. All meters used to measure parameters are calibrated daily. Purge water is sealed, labeled, and stored on site in D.O.T.-approved 55-gallon drums. After being chemically profiled, the water is transported to an appropriate disposal facility by a licensed waste hauler.

Groundwater Sample Collection

After purging, groundwater samples are collected after at least 80% of its static water level is recovered in the well. If recharge is extremely slow, the well is allowed to recharge until sufficient volume has accumulated for sample collection. **No-purge groundwater samples are collected when prior approval by the lead regulatory agency has been permitted**. **When no-purge samples are collected the same procedures are followed excluding well purging.** All groundwater samples are collected using polyethylene disposable bailers attached with new, clean string or rope. Groundwater samples being analyzed for compounds most sensitive to volatilization are collected first. Groundwater samples are placed in appropriate laboratory-supplied containers, labeled, place in zip-lock® plastic bags, documented on a chain of custody form and preserved on ice in a cooler for transport to a state-certified analytical laboratory. After collection, all samples are stored in a chilled cooler and refrigerated to approximately four degrees Celsius while a laboratory representative transports the samples to their facility. Analytical detection limits match or surpass standards required by local or regional guidelines.

QUALITY ASSURANCE / QUALITY CONTROL (QA/QC) PROCEDURES

Field Procedures

To prevent contamination of the samples and/or cross-contamination of monitoring wells ATC personnel adhere to the following procedures in the field:

- New, clean pair of appropriate disposable gloves is dawned prior to sampling each well.
- Wells are gauged and purged in the expected order of increasing degree of contamination based on historical analytical results.
- All purging equipment will be thoroughly decontaminated between each well using the procedures previously described at the beginning of this section.
- During sample collection for volatile organic analysis, the amount of air passing through the sample is minimized. This helps prevent the air from stripping the volatiles from the groundwater. Sample bottles are filled by slowly running the sample down the side of the bottle until there is a convex meniscus over the mouth of the bottle. The lid is carefully screwed onto the bottle such that no air bubbles are present within the bottle. If a bubble is present, the cap is removed and additional water is added to the sample container. After resealing the sample container, if bubbles still are present inside, the sample container is discarded and the procedure is repeated with a new container.

Sample Control

Laboratory and field handling procedures may be monitored, if required by the client or local regulatory agency, by including quality control (QC) samples for analysis with the groundwater samples. Examples of different types of QC samples are as follows:

- Trip blanks are prepared at the analytical laboratory, by laboratory personnel to check handling procedures while in the field, as required by site conditions and local regulations. Trip blanks are transported to the project site in the same manner as the laboratory-supplied sample containers to be filled. They are not opened, and are returned to the laboratory with the samples collected. Trip blanks are analyzed for purgable organic compounds.
- Equipment blanks are prepared in the field to determine if decontamination of field sampling equipment has been effective, as required by site conditions and local regulations. The sampling equipment used to collect the groundwater samples is rinsed with distilled water that is then decanted into laboratory-supplied containers. The equipment blanks are transported to the laboratory, and are analyzed for the same chemical constituents as the samples collected at the site.
- Duplicates (split samples) are collected at the same time that the standard groundwater samples are being collected and are analyzed for the same compounds in order to check the reproducibility of laboratory data. They are typically only collected from one well per sampling event, as required by site conditions and local regulations. The duplicate is assigned an identification number that will not associate it with the source well.

Generally, trip blanks and field blanks check field handling and transportation procedures. Duplicates check laboratory procedures. The configuration of QC samples is determined by ATC depending on site conditions and regulatory requirements.

July 18, 2012

Mr. Jim Madden
A.T.C. Associates Inc. [Monterey Park]
25 Cupania Circle
Monterey Park, CA 91755

Report No.: 1207079
Project Name: 043.75015.0016

Dear Mr. Jim Madden,

This report contains the analytical results for the sample(s) received under chain of custody(s) by Positive Lab Service on July 12, 2012.

The test results in this report are performed in compliance with ELAP accreditation requirements for the certified parameters. The laboratory report may not be produced, except in full, without the written approval of the laboratory.

The issuance of the final Certificate of Analysis takes precedence over any previous Preliminary Report. Preliminary data should not be used for regulatory purposes. Authorized signature(s) is provided on final report only.

If you have any questions in reference to this report, please contact your Positive Lab Service coordinator.

Re: Workplan for Additional Groundwater Investigation
Hertz Facility
9000 Airport Boulevard
Los Angeles, California
ATC Project No. 52.75015.0006
I.D. # 900450670

Dear Mr. Huang:

ATC Associates Inc. (ATC) is pleased to provide you, on behalf of Hertz Corporation, with the following workplan to install groundwater monitoring wells to further evaluate the extent of petroleum hydrocarbons as gasoline and/or methyl tertiary butyl ether (MTBE) impacted groundwater associated with the subject site. This Work Plan was prepared in response to the Los Angeles Regional Water Quality Control Board (RWQCB) letter dated March 9, 2009, which is included in Appendix A. Based on the results of the Additional Site Assessment Report prepared by ATC and dated October 9, 2008, the RWQCB has requested that additional groundwater monitoring wells be installed to determine the extent of MTBE. This workplan outlines the assessment activities, sampling protocols, laboratory analysis, and management of wastes to be generated during the work. In addition, ATC will prepare a report that documents the findings of the assessment and presents recommendations for future action as appropriate.

SITE DESCRIPTION

The site is located at 9000 Airport Boulevard in Los Angeles California as shown in Figure 1 and is used for rental car operations. The site consists of five buildings, a car wash system, and refueling systems. The refueling system consists of four gasoline underground storage tanks (USTs), one split gasoline/diesel UST, fourteen fuel dispenser islands, and underground distribution lines. The UST system is generally located in the west central portion of the facility and is bordered to the west by Airport Boulevard and to the north by the main vehicle entryway into and out of the facility (Figure 2).

The site is composed of the two main fueling areas, the “eastern” fueling system and the “western” fueling system. The eastern system consists of the following:

- Two 12,000 gallon gasoline USTs, and
- Ten 10 dispenser islands.

Each island has one fuel dispenser, and the ten islands are covered by an overhead canopy. The USTs are located just south of the dispenser islands and are aligned north-south in a common excavation.

The western system consists of the following:

- One 20,000-gallon gasoline UST,
- One split UST consisting of an 8,000-gallon gasoline portion and a 12,000-gallon diesel portion, and
- Twenty dispensers.

The dispensers are covered by a metal canopy structure. The two USTs are located to the north of the dispenser islands and are aligned east west in a common excavation. The two 20,000-gallon USTs were installed in 2005 when the previous USTs were removed as discussed below.

Directly north of both the eastern and western systems is an eight foot cinderblock wall immediately adjacent, followed by a landscaped planter area immediately to the north, then the paved main entry into and out of the facility. To the west of the western system is an asphalt paved drive/parking area, followed by a traffic guard rail and an eight foot chain link fence, then a landscaped parkway with Airport Boulevard to the west. It should be noted that immediately to the west, and overhead of the canopy for the four dispenser islands related to the western system, exists a large commercial billboard placed for viewing from Airport Boulevard. Toward the east and south of the systems are asphalt paved parking area and maintenance areas for the Hertz facility, including car wash structures to the south and the main office/locker building for the facility to the southeast.

SITE HISTORY

In July 2003, ATC directed the advancement of 21 soil borings (B-1 through B-21) to depths ranging from 15 feet to 30 feet below ground surface (bgs). The purpose of the assessment was to evaluate soil quality prior to pending UST upgrades associated with Senate Bill SB 989. Soil impact was detected in the vicinity of the eastern dispenser islands.

The hydrocarbon contaminated soil around the western system was confined to the UST nest and around the dispenser island closest to those USTs. The horizontal extent of the hydrocarbon contamination in the western system was estimated to be 40 feet by 60 feet. At the completion of the initial soil characterization, the vertical extent was not known. The deepest area of impacted soil would be located along the western portion of the UST pit (between B-11 and B-14). It was in this area that an additional boring and monitoring well was recommended. The details of the soil assessment are found in ATC's "Site Assessment Report", dated August 25, 2003.

In September 2003, ATC directed and supervised the advancement of a soil boring and installation of one groundwater monitoring well (MW-1) at a location to the west of the western fueling system as shown on **Figure 2 – Site Plan**. The boring was advanced to a depth of 75 feet bgs, and soil samples were collected at five foot intervals. ATC selected five soil samples between 45 and 63 feet bgs for laboratory analysis. Soil samples collected between 45 and 55 feet bgs contained the highest levels of MTBE (ranging between 1,300 to 48,000 micrograms per kilogram (µg/kg)). The MTBE concentrations decreased between one to two orders of magnitude (to 8 and 18 µg/L) between 55 feet and 63 feet bgs. The remaining analytes were at trace levels. Monitoring well MW-1 was constructed using 45 feet (surface to 45 feet bgs) of blank 4-inch diameter Schedule 40 PVC casing, and 30 feet of slotted (0.020-inch slots) 4-inch diameter Schedule 40 PVC well screen. Subsequent to its installation, the well was purged and developed.

A groundwater sample was collected during a September 2003 investigation from MW-1 and the results indicated a total petroleum hydrocarbons as gasoline (TPHg) concentration of 61 µg/L. Tertiary butyl alcohol (TBA) and MTBE were reported at concentrations of 2,500 g/L, and 8,700 µg/L, respectively. All other analytes were below their respective detection limits.

Between March 24 and April 4, 2005, ATC oversaw the removal of impacted soil during the removal of four gasoline USTs and one diesel UST and associated dispenser islands at the western fueling area. Transportation manifests indicated that 1,000 tons of petroleum hydrocarbon-impacted soil was excavated, transported and disposed during the performance of excavation activities. Laboratory analytical results indicated that TPHg, total petroleum hydrocarbons as diesel (TPHd), benzene and MTBE concentrations of up to 150, 720, 0.006, and 0.67 mg/kg, respectively, were present in the remaining soil. The TPHg, TPHd, and benzene concentrations were below maximum soil screening levels established by the Los Angeles Regional Water Quality Control Board in the Interim Site Assessment and Cleanup Guidebook, May 1996, based on a depth to groundwater of approximately 53 feet as measured in well MW-1. Additionally, the benzene and MTBE concentrations were below the EPAs Preliminary Remediation Goals (PRGs) for industrial and residential soils. The remediation activities were presented in the Remedial Excavation Report prepared by ATC and dated May 8, 2006.

Between June 19 and 20, 2008, ATC installed two groundwater monitoring wells (MW-2 and MW-3) at the site using a hollow-stem auger drilling method. Groundwater monitoring well MW-2 was installed north of the eastern dispenser islands and MW-3 was installed east of the western dispenser islands. The borings were advanced to between 77 and 89 feet bgs and the monitoring wells were installed to total depths of 75 and 85 feet bgs with a 30 ft screen interval used for both wells. Well locations are shown on **Figure 2**. Results of the additional well installations are presented as **Figure 3 – Groundwater Summary Map**.

SCOPE OF WORK

This workplan to install groundwater wells involves the following scope of work:

1. Updating the existing Site Health & Safety Plan (H&SP);
2. Obtaining necessary drilling permits from the County of Los Angeles;
3. Construct two groundwater wells at the locations shown on Figure 2;
4. Collect soil samples from the boreholes, and then convert the borings into 4-inch diameter groundwater monitoring wells. Develop the monitoring wells. Collect groundwater samples from the completed monitoring wells;
5. Survey all well elevations to allow for accurate groundwater elevation measurements and to further evaluate groundwater flow direction;
6. Prepare a “Soil and Groundwater Investigation Report”

Prepare Site Health & Safety Plan

A H&SP has been prepared for the proposed activities to ensure the personal health and safety of all ATC employees (see attached). The H&SP defines safety practices and procedures to be instituted in all ATC work places, as applicable. The program meets, and often exceeds, the requirements promulgated by the Occupational Safety and Health Administration (OSHA). As part of the H&SP, all ATC personnel are appropriately trained and under a Medical Surveillance Program in accordance with OSHA 40 CFR 1910.120.

Permitting

ATC will obtain the proper permits and any necessary agreements. ATC anticipates that permitting activities will require approximately two to three weeks.

Proposed Locations

The proposed well locations are to the north of MW-1 and southeast of MW-2 as shown on Figure 2. These locations were selected to attempt to further characterize the observed MTBE at the site. The groundwater flow direction is anticipated to be to the south or southeast based on the Additional Site Assessment Report prepared by ATC and dated October 9, 2008.

Drilling and Sampling
Prior to drilling, ATC will contact Underground Service Alert (USA) and a private utility locator service to identify possible subsurface utilities in the vicinity of the proposed boring locations. Following utility clearance, drilling will be scheduled. ATC plans to utilize a hollow stem auger drill rig to install the two wells.

The borings will be advanced, and undisturbed soil samples will be collected at approximate five foot intervals. The boring will be advanced approximately 15 feet below the anticipated groundwater table and completed as a groundwater monitoring well. The existing onsite wells will be measured prior to placement and the screened interval adjusted to attempt to be 15 feet above and below the groundwater table. Each well is anticipated to be constructed using 60 feet (surface to 60 feet bgs) of blank 4-inch, Schedule 40 PVC casing, and 30 feet of slotted (0.020-inch slots) 4-inch Schedule 40 PVC well screen. The well heads will be completed within traffic rated well vaults and surveyed by a state licensed land surveyor.

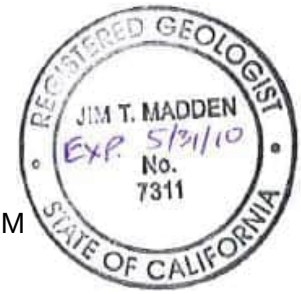
Following installation, the wells will be developed and sampled per RWQCB regulations. The groundwater samples will be collected from each of the wells using a disposable bailer and transferred to the appropriate laboratory-supplied containers. All samples will be labeled, logged onto a chain-of-custody form and placed into a chilled cooler for subsequent transport to a State-certified laboratory for analysis.

All soil and/or groundwater wastes generated during the advancement of the soil borings will be placed into Department of Transportation (DOT)-approved 55-gallon drums and will remain onsite pending proper disposition.

Organic Vapor Monitoring
To obtain data regarding the petroleum hydrocarbon-impact to soil and for health and safety concerns, samples will be field screened for volatile organic vapors utilizing a hand held photo-ionization detector (PID). PID readings will be recorded on the boring logs.

Well Survey
Following the completion of groundwater monitoring well installation, the wells will be surveyed by a State-licensed surveyor. The well head elevations will be tied into the existing well (MW-1) and an existing benchmark elevation. The surveyed well elevations will allow for the accurate determination of groundwater flow direction.

Analytical Testing
A State-certified laboratory will perform analyses of all collected soil and groundwater samples. Soil and groundwater samples will be analyzed for TPHg by EPA Method 8015. In addition, the soil samples will be analyzed for benzene, toluene, ethylbenzene, total xylenes (BTEX), fuel oxygenates including MTBE and ethanol by EPA Method 8260B. As requested by the RWQCB, groundwater samples will be analyzed by Volatile Organic Compounds (full suite) including common aromatic and chlorinated volatile organic compounds by EPA method 8260B for this sampling event.



Soil and Groundwater Investigation Report
A summary report documenting the procedures and findings of the investigation activities will be prepared and submitted to the RWQCB. The report will contain tabulated analytical results, figures showing the locations of the groundwater monitoring wells, non-hazardous waste manifests for soil and groundwater, and will be reviewed and signed by State of California registered Geologist. The report will be written and compiled in accordance with the most recent guidelines set by the RWQCB. The report will be submitted to the State Geotracker Internet Database.

Work Schedule

Upon receipt of approval of this Work Plan from the RWQCB, ATC can initiate the project immediately. ATC will coordinate well permitting and any necessary private property access. Monitoring well installation fieldwork is anticipated to be completed within approximately 10-15 working days, following approved permitting. Groundwater monitoring well installation, development and sampling will require approximately 3-4 working days to complete. Laboratory analytical test results should be received within 5-7 working days of sample receipt. Data interpretation and report preparation are expected to take 20 to 30 working days. The estimated project schedule does not include allowances for delays due to inclement weather, site access problems or other factors beyond the control of ATC.

Thank you for your time and consideration of this workplan. Our client would like to initiate this work as soon as possible. If you have any questions, or if you need any additional information or clarification, please contact either of the undersigned at (323) 517-9780.

Sincerely,
ATC Associates Inc.

UNDERGROUND STORAGE TANK PROGRAM -- DIRECTIVE TO TAKE CORRECTIVE ACTION IN RESPONSE TO UNAUTHORIZED UNDERGROUND STORAGE TANK RELEASE PURSUANT TO HEALTH AND SAFETY CODE SECTION 25296.10 AND TITLE 23, CALIFORNIA CODE OF REGULATIONS, SECTIONS 2720-2727
ADDITIONAL SITE ASSESSMENT
HERTZ FACILITY, 9000 AIRPORT BOULEVARD, LOS ANGELES (I.D. # 900450670) (D-1)

Dear Mr. Egan:

Pursuant to Health and Safety Code section 25296.10, Hertz Corporation (Hertz) is required to take corrective action (i.e., Preliminary Site Assessment, Soil and Water Investigation, Corrective Action Plan Implementation, and Verification Monitoring) to ensure protection of human health, safety and the environment. Corrective action requirements are set forth in California Code of Regulations (CCR), title 23, Chapter 16, sections 2720 through 2727.

We have reviewed the document entitled "Additional Site Assessment Report (Report)," dated October 9, 2008, prepared by ATC Associates Inc. (ATC) on behalf of Hertz Corporation (Hertz), for the above-referenced site.

Workplan for Additional Groundwater Investigation (Per CCR, title 23, §2722(d) and §2725)

In June and July 2008, ATC installed two groundwater monitoring wells (MW-2 and MW-3) to determine the direction of groundwater flow and investigate the extent of groundwater contamination at the site. In reference to the Report, we have the following comments:

1. Groundwater was encountered at approximately 73 to 76 feet below ground surface (bgs). Methyl tertiary butyl ether (MTBE) was detected up to 2,740 ug/L in well MW-2. All other constituents were not detected in groundwater samples. The extent of MTBE contmaination in soil and groundwater has not been delineated. Hertz is required to submit a Workplan for additional soil and groundwater investigation. At a minimum, two additional groundwater monitoring wells, one upgradient and one downgradient to well MW-2 must be installed. The Workplan is due by **May 15, 2009**.

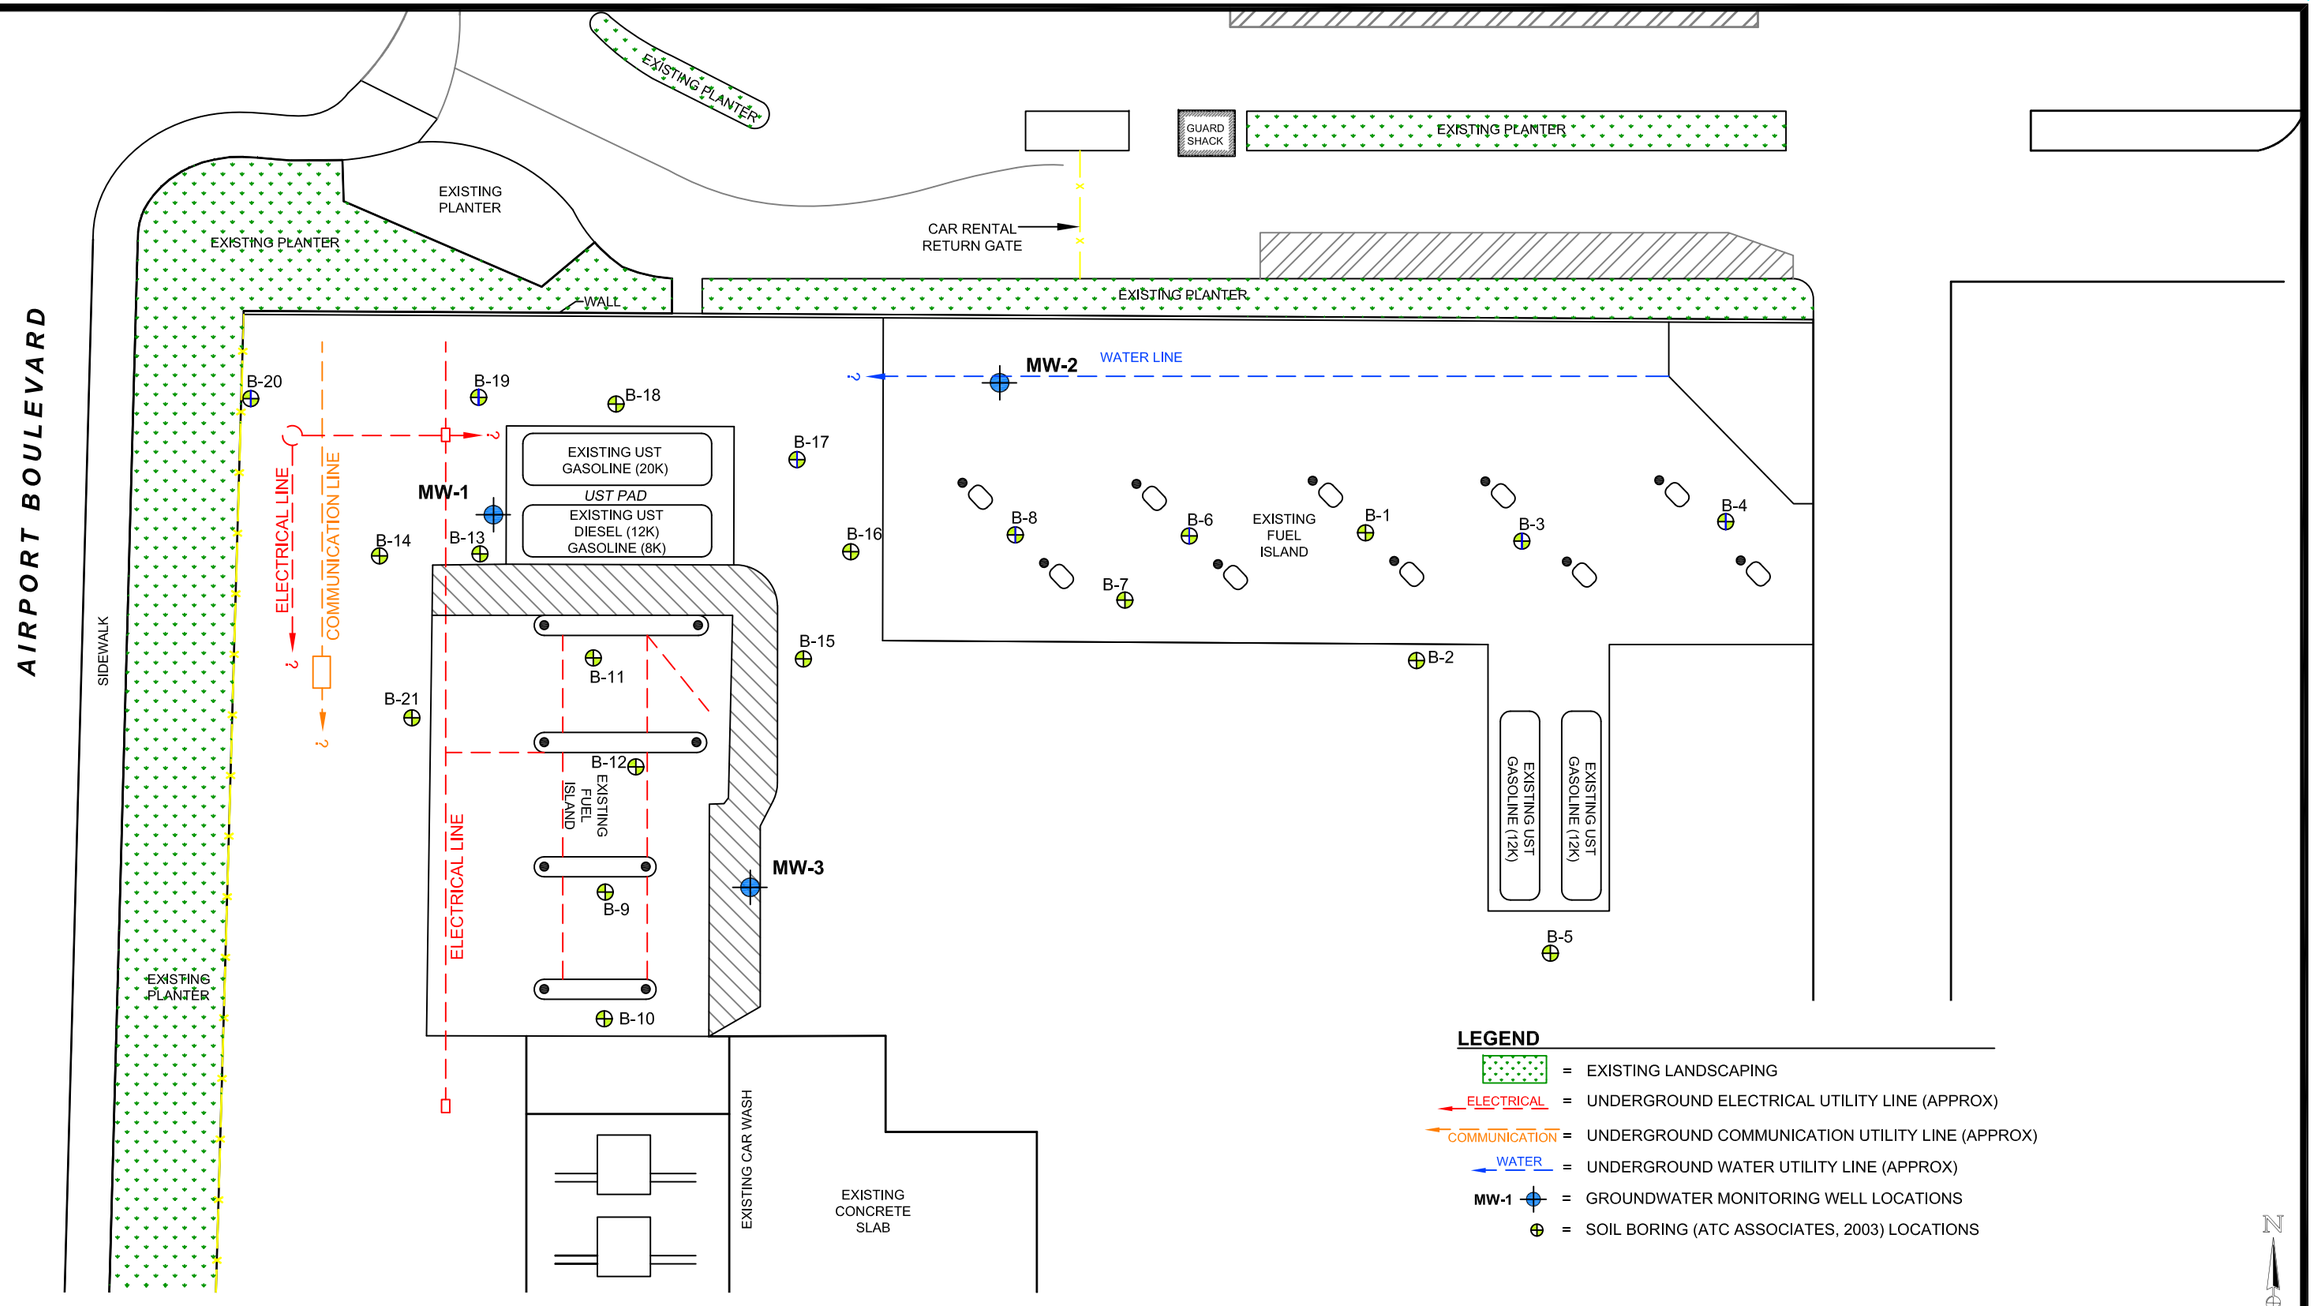
2. All reports submitted to this office must conform to the "Guidelines for Report Submittals," (June 1993) published by the Los Angeles County Department of Public Works.

3. Pursuant to State Water Resources Control Board Resolution No. 92-49, under Water Code Section 13304, all fieldwork related to subsurface investigation including well installation must be conducted by, or under the direct responsible supervision of, a licensed California Professional Geologist (PG) or Civil Engineer (PE). All technical documents submitted to this Regional Board must be reviewed and signed and/or stamped by a licensed California PG or PE with preferably five years subsurface hydrogeologic experience.

4. Soil and groundwater samples must be analyzed by Cal-LUFT GC/FID or Cal-LUFT GC/MS Method for total petroleum hydrocarbons as gasoline (TPH_G), and by EPA Method 8260B for BTEX, and fuel oxygenate compounds including methyl tertiary butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME), and tertiary butyl alcohol (TBA). Ethanol is also required and shall be analyzed by either method above. The analytical detection limits must conform to the Regional Board General Laboratory Testing Requirements (9/06) (http://www.waterboards.ca.gov/losangeles/publications_forms/forms/ust/lab_forms/labreq9-06.pdf). All respective analytical methods must be certified by the California Environmental Laboratory Accreditation Program (ELAP). All analytical data must be reported by a California-certified laboratory. Prior to consideration of case closure, responsible party must analyze at least one round of groundwater samples including all common aromatic and chlorinated volatile organic compounds per EPA Method 8260B. If the site has a waste oil tank, the full suite of aromatic and chlorinated analytes must also be tested and reported per EPA Method 8260B.

5. The existing groundwater monitoring well must be sampled quarterly and incorporated into the groundwater monitoring program. You are required to implement a quarterly groundwater monitoring program. All the groundwater monitoring wells must be sampled quarterly according to the following groundwater monitoring schedule:

Reporting Period	Report Due Date
January-March	April 15
April-June	July 15
July-September	October 15
October-December	January 15



The First Quarter 2009 Groundwater Monitoring Report is due by **April 15, 2009**. The Workplan for additional groundwater investigation is due by **May 15, 2009**.

If you have any questions, please contact me at (213) 576-6711 or send me an email at jhuang@waterboards.ca.gov.

Sincerely,

Jay C. Huang, P.G., C.E.G.

MANAGEMENT APPROVAL

This SPCC-HWCP will be implemented as described herein. Full implementation includes:

- Performing and documenting training for personnel who handle oil;
- Performing and documenting inspections of oil containers, piping and secondary containment systems; and
- Completion of corrective measures identified in the Recommendations Table 16-1 of this SPCC Plan.
- Provide a copy of this document to your local fire department.

Spill Prevention, Control and Countermeasure
5-year Review Checklist

Facility #: 1101-15

Complete the following checklist and return to Maureen Logan (maureen.logan@atcgs.com) in order to ensure the facility Spill Prevention, Control and Countermeasure (SPCC) plan remains valid and up-to-date.

1. Administrative

Facility Address: 9000 Airport Blvd, Los Angeles, CA 90045 Phone: (310) 568 5199
Facility Operating Hours: Mon. to Fri: 00:00 to 23:59 Sat. to Sun.: 00:00 to 23:59
Facility Manager: Jason Rodgers Facility Manager Phone: (201) 618 1437
Alternate On Site Contact:
Name: Karen Karapetyan Title: General Manager
Phone: (310) 568 5157

2. Is there a current SPCC Plan on-site? (If no, request a copy be forwarded) Yes ☑ No ☐

3. Storage

Complete the Inventory Table on Page 2 and answer the following questions. In the past 5 years (refer to current SPCC if needed):

a. Have tanks been added? Yes ☐ No ☑
b. Have tanks been removed or taken out of service? Yes ☐ No ☑
c. Have tanks been relocated Yes ☐ No ☑
d. Have dispensing lines been changed or altered? Yes ☐ No ☑

4. Containment

a. Are containments dikes or berms present? Yes ☐ No ☑
b. If so, describe type and location. _____
c. Is a drain valve present on the containment system? Yes ☐ No ☑

5. Spill Monitoring and Prevention

a. Are Spill Kits located near containers (tanks and drums) and dispensers? (Provide 1 photo of each area) Yes ☑ No ☐
b. Are they adequate and in good condition? Yes ☑ No ☐
c. Are visual and audible overfill alarms present on or near the tanks? Yes ☑ No ☐

6. Spill Reporting

a. Has there been a reportable spill at the facility in the last 5 years? Yes ☐ No ☑

7. Drainage

a. Is there an oil water separator present? Yes ☑ No ☐
b. Are floor drain present inside of buildings? Yes ☐ No ☑
Briefly describe location: _____
c. Are curbed gutters and/or stormwater catch basins present? Yes ☐ No ☑
Briefly describe location: _____

8. Security

a. Is adequate lighting provided in the tank storage areas? Yes ☑ No ☐
b. Is the facility secured during non-operating hours? Yes ☑ No ☐
c. Are buildings locked and secured during non-operating hours? Yes ☑ No ☐
d. Are ASTs protected from vehicular traffic by bollards or other barriers? Yes ☑ No ☐
e. Are there security cameras showing tank storage areas? Yes ☑ No ☐

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA CHECKLIST

FACILITY NAME: Hertz at LAX
FACILITY ADDRESS: 9000 Airport Boulevard, Los Angeles, California

1) Does the facility transfer oil over water to or from vessels and does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?

Yes _____ No X

2) Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?

Yes _____ No X

3) Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the formula in Attachment C-III, Appendix C, 40 CFR 112 or a comparable formula[1]) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Environments" (Section 10, Appendix E, 40 CFR 112 for availability) and the applicable Area Contingency Plan.

Yes _____ No X

4) Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the appropriate formula (Attachment C-III, 40 CFR 112 or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?

Yes _____ No X

5) Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?

Yes _____ No X

CERTIFICATION

I certify that under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.

Oil Storage Inventory (See Sample on Page 3)

Complete the following table for fixed Tanks. Take **three (3)** photos of each AST from different angles. Include additional photos of dispensers, fuel lines and tank labels (size, manufacture date) if visible. Name photos by tank number and angle (i.e. AST3 Looking South).

Tank #	Type	Tank Size (gal.)	Contents	Double- or Single-Walled	Material	Location	Install Date (Year)
1	AST	2,000	Motor Oil	Double	Steel	Maintenance	2005
2	AST	2,000	Used Oil	Double	Steel	Maintenance	2005
3	AST	500	Used Oil	Double	Steel	Behind Bus Building	2004

Complete the following table for other containers (drums and portable tanks). Take a photo of drums, plastic tanks, portable tanks, de-fuelers and generators. Only include drums/tanks that are 55 gal. and larger that contain petroleum products. Exclude windshield washer fluid, antifreeze, DEF and detergents.

Quantity of Cont.	Type	Drum Size (gal.)	Contents	Spill Pallet (Y/N)	Material	Location
8	Drum	55	Used Oil/Used Anti-Freeze	Yes	Steel	Maintenance
10	Drum	55	Motor Oil, Used Oil, Antifreeze	Yes	Steel	Maintenance
4	Drum	55	Anti-Freeze, ATF	Yes	Steel	Maintenance

Type: AST (Above Ground); UST (Underground), DM (Drum), PT (Portable Tank), DF (defueler)
Tank/Drum Contents: Gasoline; Diesel, Motor Oil; Used Oil; Transmission/Hydraulic Fluid; Used Oil filters
Material: Steel; Fiberglass; Polyethylene

CERTIFICATION

Resolutions adopted by the Boards of Directors of FEDERAL INSURANCE COMPANY, VIGILANT INSURANCE COMPANY, and PACIFIC INDEMNITY COMPANY on August 30, 2016; WESTCHESTER FIRE INSURANCE COMPANY on December 11, 2006; and ACE AMERICAN INSURANCE COMPANY on March 20, 2009:

"RESOLVED, that the following authorizations relate to the execution, for and on behalf of the Company, of bonds, undertakings, recognizances, contracts and other written commitments of the Company entered into in the ordinary course of business (each a "Written Commitment"):

(1) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized to execute any Written Commitment for and on behalf of the Company, under the seal of the Company or otherwise.

(2) Each duly appointed attorney-in-fact of the Company is hereby authorized to execute any Written Commitment for and on behalf of the Company, under the seal of the Company or otherwise, to the extent that such action is authorized by the grant of powers provided for in such person's written appointment as such attorney-in-fact.

(3) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized, for and on behalf of the Company, to appoint in writing any person the attorney-in-fact of the Company with full power and authority to execute, for and on behalf of the Company, under the seal of the Company or otherwise, such Written Commitments of the Company as may be specified in such written appointment, which specification may be by general type or class of Written Commitments or by specification of one or more particular Written Commitments.

(4) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized, for and on behalf of the Company, to delegate in writing to any other officer of the Company the authority to execute, for and on behalf of the Company, under the Company's seal or otherwise, such Written Commitments of the Company as are specified in such written delegation, which specification may be by general type or class of Written Commitments or by specification of one or more particular Written Commitments.

(5) The signature of any officer or other person executing any Written Commitment or appointment or delegation pursuant to this Resolution, and the seal of the Company, may be affixed by facsimile on such Written Commitment or written appointment or delegation.

FURTHER RESOLVED, that the foregoing Resolution shall not be deemed to be an exclusive statement of the powers and authority of officers, employees and other persons to act for and on behalf of the Company, and such Resolution shall not limit or otherwise affect the exercise of any such power or authority otherwise validly granted or vested."

I, Dawn M. Chloros, Assistant Secretary of FEDERAL INSURANCE COMPANY, VIGILANT INSURANCE COMPANY, PACIFIC INDEMNITY COMPANY, WESTCHESTER FIRE INSURANCE COMPANY and ACE AMERICAN INSURANCE COMPANY (the "Companies") do hereby certify that

(i) the foregoing Resolutions adopted by the Board of Directors of the Companies are true, correct and in full force and effect,
(ii) the foregoing Power of Attorney is true, correct and in full force and effect.

Given under my hand and seals of said Companies at Whitehouse Station, NJ, this 24th day of March 2022

Dawn M. Chloros

Dawn M. Chloros, Assistant Secretary

THIS BOND REPLACES WESTCHESTER FIRE INSURANCE COMPANY BOND NO. K08306151 EFFECTIVE 04/05/2018

PERFORMANCE BOND

Bond No. K13560468

Date bond executed:	04/26/2018
Period of coverage:	04/05/2018 – 04/05/2019
Principal:	The Hertz Corporation and DTG Operations Inc. 8501 Williams Road Estero, FL 33928
Type of Organization:	Corporation
State of incorporation (if applicable):	Delaware

Surety(ies): Westchester Fire Insurance Company
436 Walnut Street
Philadelphia, PA 19106

Scope of Coverage: The tanks covered by the Bond are listed in Exhibit A, which is made part of this agreement. The coverage guaranteed by the Bond shall include: "taking corrective action" and/or "compensating third parties for bodily injury and property damage caused by" either "sudden accidental releases" or "nonsudden accidental releases" or "accidental releases" "arising from operating the underground storage tank".

Penal sums of bond:

Per occurrence $	$1,000,000
Annual aggregate $	$2,000,000
Surety's bond number:	**K13560468**

Know All Persons by These Presents, that we, the Principal and Surety(ies), hereto are firmly bound to the United States Environmental Protection Agency and the state agencies listed in Exhibit B, in the above penal sums for the payment of which we bind ourselves, our heirs, executors, administrators, successors, and assigns jointly and severally; provided that, where the Surety(ies) are corporations acting as co-sureties, we, the Sureties, bind ourselves in such sums jointly and severally only for the purpose of allowing a joint action or actions against any or all of us, and for all other purposes each Surety binds itself, jointly and severally with the Principal, for the payment of such sums only as is set forth opposite the name of such Surety, but if no limit of liability is indicated, the limit of liability shall be the full amount of the penal sums.

Whereas said Principal is required under Subtitle I of the Solid Waste Disposal Act, as amended, to provide financial assurance for "taking corrective action" and/or "compensating

third parties for bodily injury and property damage caused by" either "sudden accidental releases" or "nonsudden accidental releases" or "accidental releases"; arising from operating the underground storage tanks identified above, and

Whereas said Principal shall establish a standby trust fund as is required when a surety bond is used to provide such financial assurance;

Now, therefore, the conditions of the obligation are such that if the Principal shall faithfully "take corrective action, in accordance with 40 CFR part 280, subpart F and the Director of the state implementing agency's instructions for," and/or "compensate injured third parties for bodily injury and property damage caused by" either "sudden accidental releases" or "nonsudden accidental releases" or "accidental releases" arising from operating the tank(s) identified above, or if the Principal shall provide alternate financial assurance, as specified in 40 CFR part 280, subpart H, within 120 days after the date the notice of cancellation is received by the Principal from the Surety(ies), then this obligation shall be null and void; otherwise it is to remain in full force and effect.

Such obligation does not apply to any of the following:

(a) Any obligation of The Hertz Corporation and DTG Operations Inc. under a workers' compensation, disability benefits, or unemployment compensation law or other similar law;

(b) Bodily injury to an employee of The Hertz Corporation and DTG Operations Inc. arising from, and in the course of, employment by The Hertz Corporation and DTG Operations Inc.;

(c) Bodily injury or property damage arising from the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle, or watercraft;

(d) Property damage to any property owned, rented, loaned to, in the care, custody, or control of, or occupied by The Hertz Corporation and DTG Operations Inc. that is not the direct result of a release from a petroleum underground storage tank;

(e) Bodily injury or property damage for which The Hertz Corporation and DTG Operations Inc. is obligated to pay damages by reason of the assumption of liability in a contract or agreement other than a contract or agreement entered into to meet the requirements of 40 CFR 280.93.

The Surety(ies) shall become liable on this bond obligation only when the Principal has failed to fulfill the conditions described above.

Upon notification by the Directors of the United States Environmental Protection Agency and/or Director of those agencies listed in Exhibit B that the Principal has failed to "take corrective action, in accordance with 40 CFR part 280, subpart F and the Director's instructions," and/or "compensate injured third parties" as guaranteed by this bond, the Surety(ies) shall either perform "corrective action in accordance with 40 CFR part 280 and the Director's instructions," and/or "third-party liability compensation" or place funds in an amount up to the annual aggregate penal sum into the standby trust fund as directed by the Director under 40 CFR 280.112.

Upon notification by the Director that the Principal has failed to provide alternate financial assurance within 60 days after the date the notice of cancellation is received by the Principal

from the Surety(ies) and that the Director has determined or suspects that a release has occurred, the Surety(ies) shall place funds in an amount not exceeding the annual aggregate penal sum into the standby trust fund as directed by the Director under 40 CFR 280.112.

The Surety(ies) hereby waive(s) notification of amendments to applicable laws, statutes, rules, and regulations and agrees that no such amendment shall in any way alleviate its (their) obligation on this bond.

The liability of the Surety(ies) shall not be discharged by any payment or succession of payments hereunder, unless and until such payment or payments shall amount in the annual aggregate to the penal sum shown on the face of the bond, but in no event shall the obligation of the Surety(ies) hereunder exceed the amount of said annual aggregate penal sum.

The Surety(ies) may cancel the bond by sending notice of cancellation by certified mail to the Principal, provided, however, that cancellation shall not occur during the 120 days beginning on the date of receipt of the notice of cancellation by the Principal, as evidenced by the return receipt.

The Principal may terminate this bond by sending written notice to the Surety(ies).

In Witness Thereof, the Principal and Surety(ies) have executed this Bond and have affixed their seals on the date set forth above.

The persons whose signatures appear below hereby certify that they are authorized to execute this surety bond on behalf of the Principal and Surety(ies) and that the wording of this surety bond is identical to the wording specified in 40 CFR 280.98(b) as such regulations were constituted on the date this bond was executed.

The State of Vermont / Vermont Department of Environmental Conservation
The State of Washington / Washington Department of Ecology
The State of Wisconsin / Wisconsin Department of Natural Resources

Power of Attorney

WESTCHESTER FIRE INSURANCE COMPANY

Know all men by these presents: That WESTCHESTER FIRE INSURANCE COMPANY, a corporation of the Commonwealth of Pennsylvania pursuant to the following Resolution, adopted by the Board of Directors of the said Company on December 11, 2006, to wit:

"RESOLVED, that the following authorizations relate to the execution, for and on behalf of the Company, of bonds, undertakings, recognizances, contracts and other written commitments of the Company entered into the ordinary course of business (each a "Written Commitment"):

(1) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized to execute any Written Commitment for and on behalf of the Company, under the seal of the Company or otherwise.

(2) Each duly appointed attorney-in-fact of the Company is hereby authorized to execute any Written Commitment for and on behalf of the Company, under the seal of the Company or otherwise, to the extent that such action is authorized by the grant of powers provided for in such persons written appointment as such attorney-in-fact .

(3) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized, for and on behalf of the Company, to appoint in writing any person the attorney-in-fact of the Company with full power and authority to execute, for and on behalf of the Company, under the seal of the Company or otherwise, such Written Commitments of the Company as may be specified in such written appointment, which specification may be by general type or class of Written Commitments or by specification of one or more particular Written Commitments.

(4) Each of the Chairman, the President and Vice Presidents of the Company is hereby authorized, for and on behalf of the Company, to delegate in writing any other officer of the Company the authority to execute, for and on behalf of the Company, under the Company's seal or otherwise, such Written Commitments of the Company as are specified in such written delegation, which specification may be by general type or class of Written Commitments or by specification of one or more particular Written Commitments.

(5) The signature of any officer or other person executing any Written Commitment or appointment or delegation pursuant to this Resolution, and the seal of the Company, may be affixed by facsimile on such Written Commitment or written appointment or delegation.

FURTHER RESOLVED, that the foregoing Resolution shall not be deemed to be an exclusive statement of the powers and authority of officers, employees and other persons to act for and on behalf of the Company, and such Resolution shall not limit or otherwise affect the exercise of any such power or authority otherwise validly granted or vested.

Does hereby nominate, constitute and appoint Cori Riddle, Francis J Curran, Marina A Kenney, Sally Phillips all of the City of Philadelphia, Pennsylvania, each individually if there be more than one named, its true and lawful attorney-in-fact, to make, execute, seal and deliver on its behalf, and as its act and deed any and all bonds, undertakings, recognizances, contracts and other writings in the nature thereof in penalties not exceeding SEVENTY FIVE MILLION DOLLARS & ZERO CENTS ($75,000,000.00) and the execution of such writings in pursuance of these presents shall be as binding upon said Company, as fully and amply as if they had been duly executed and acknowledged by the regularly elected officers of the Company at its principal office,

IN WITNESS WHEREOF, the said Stephen M. Haney, Vice-President, has hereunto subscribed his name and affixed the Corporate seal of the said WESTCHESTER FIRE INSURANCE COMPANY this 6 day of September 2017

WESTCHESTER FIRE INSURANCE COMPANY

Stephen M. Haney , Vice President

COMMONWEALTH OF PENNSYLVANIA
COUNTY OF PHILADELPHIA ss.

On this 6 day of September, 2017 before me, a Notary Public of the Commonwealth of Pennsylvania in and for the County of Philadelphia came Stephen M. Haney ,Vice-President of the WESTCHESTER FIRE INSURANCE COMPANY to me personally known to be the individual and officer who executed the preceding instrument, and he acknowledged that he executed the same, and that the seal affixed to the preceding instrument is the corporate seal of said Company; that the said corporate seal and his signature were duly affixed by the authority and direction of the said corporation, and that Resolution, adopted by the Board of Directors of said Company, referred to in the preceding Instrument, is now in force.

IN TESTIMONY WHEREOF, I have hereunto set my hand and affixed my official seal at the Cityof Philadelphia the day and year first above written.

COMMONWEALTH OF PENNSYLVANIA
NOTARIAL SEAL
KAREN E. BRANDT, Notary Public
City of Philadelphia, Phila. County
My Commission Expires Sept. 26, 2018

Notary Public

I, the undersigned Assistant Secretary of the WESTCHESTER FIRE INSURANCE COMPANY, do hereby certify that the original POWER OF ATTORNEY, of which the foregoing is a substantially true and correct copy, is in full force and effect.

In witness whereof, I have hereunto subscribed my name as Assistant Secretary, and affixed the corporate seal of the Corporation, this 16th day of April 20 18.

Dawn M. Chloros, Assistant Secretary

THIS POWER OF ATTORNEY MAY NOT BE USED TO EXECUTE ANY BOND WITH AN INCEPTION DATE AFTER SEPTEMBER 06, 2019.

DocuGard #04546 contains a security pantograph, blue background, heat-sensitive ink, coin-reactive watermark, and microtext printing on border.

HEAT SENSITIVE SHIELD

AMENDMENT TO TRUST AGREEMENT DATED [MARCH 25, 2022]

THIS Amendment, dated this 25th day of March, 2022 ("Amendment"), amends the Trust Agreement (the "Agreement"), dated April 28, 2009, and revised on October 15, 2013, by and between The Hertz Corporation, a Delaware corporation (the "Grantor") and The Bank of New York Mellon, a New York banking corporation (the "Trustee"),

WHEREAS, the United States Environmental Protection Agency has established certain regulations applicable to the Grantor, requiring that an owner or operator of a hazardous waste management facility shall provide assurance that funds will be available when needed for closure and/or post-closure car of the facility,

WHEREAS, the Grantor has elected to obtain a Surety Bond and has established a standby trust fund to provide all or part of such financial assurance for the facility identified herein,

WHEREAS, the parties desire to amend the Agreement as set forth herein, and

NOW, THEREFORE, the Grantor and Trustee agree as follows:

1. The existing Exhibit A is replaced with the attached revised Exhibit A.

2. The existing Exhibit B is replaced with the attached revised Exhibit B.

3. Representations and Warranties.

Grantor hereby represents and warrants with respect to itself as of the date of this Amendment, that:

i. It is duly organized and existing under the laws of the jurisdiction of its organization, with full power to cany on its business as now conducted, to enter into this Amendment and to perform its obligations hereunder; and

ii. This Amendment has been duly authorized, executed and delivered by it, constitutes a valid and legally binding obligation of it, enforceable in accordance with its terms, and no statute, regulation, rule, order, judgment or contract binding on it prohibits it's execution or, performance of this Amendment.

4. Governing Law.

This Amendment shall be administered, construed and enforced according to the laws of the State of New Jersey.

5. Successors and Assigns.

This Amendment shall extend to and shall be binding upon the Panics hereto and their respective successors and permitted assignees.

6. Ratification.

Except as hereby amended, the provisions of the Agreement are hereby ratified and confirmed and shall remain in full force and effect.

7. Severability.

In the event that any provision of this Amendment shall be declared invalid or unenforceable by any regulatory body or court having jurisdiction, such invalidity or unenforceability shall not affect the validity or enforceability of the remaining portions of this Amendment, and the invalid, illegal or unenforceable provision shall be replaced by a valid, legal and enforceable provision that comes closest to the intent of the parties underlying the invalid, illegal or unenforceable provision.

8. Headings.

The headings of the Sections have been inserted for convenience of reference only and shall not be deemed to constitute a part of this Amendment.

9. Counterparts.

This Amendment is executed in triplicate original, each of which shall be deemed an original, but which shall each constitute but one Agreement, with each party retaining an executed original. The parties may sign and deliver this Amendment by electronic transmission, including PDF. All the parties agree that the delivery of the Amendment by electronic transmission shall have the same force and effect as delivery of original signatures and that each party may use such electronic signatures as evidence of the execution and delivery of this Amendment by both parties to the same extent that an original signature could be used.

IN WITNESS, whereof the parties have caused this Amendment to be executed by their respective officers duly authorized and their corporate seals, if applicable, to be hereunto affixed and attested as of the date first written above.

ACKNOWLEDGMENT

The State of Tennessee / Department of Environment and Conservation
Commonwealth of Virginia / Virginia Department of Environmental Quality
The State of Washington / Washington Department of Ecology
The State of Wisconsin / Wisconsin Department of Natural Resources

STANDBY TRUST AGREEMENT

Trust agreement, the "Agreement," entered into as of **April 28, 2009** by and between The Hertz Corporation ("Hertz"), a Delaware corporation, the "Grantor," and The Bank of New York, a New York banking corporation, the "Trustee."

Whereas, the United States Environmental Protection Agency, an agency of the United States Government, various state environmental agencies, the "Implementing Agencies" and the specific agencies known as the "State of Alaska Department of Environmental Conservation" and "State of Maryland" have established certain regulations applicable to the Grantor, requiring that an owner or operator of an underground storage tank shall provide assurance that funds will be available when needed for corrective action and third-party compensation for bodily injury and property damage caused by sudden and nonsudden accidental releases arising from the operation of the underground storage tank. The attached Exhibit A lists the number of tanks at each facility and the name(s) and address(es) of the facility(ies) where the tanks are located that are covered by the standby trust agreement.

Whereas, the Grantor has elected to establish a surety bond, to provide all or part of such financial assurance for the underground storage tanks identified herein and is required to establish a standby trust fund able to accept payments from the instrument.

Whereas, the Grantor, acting through its duly authorized officers, has selected the Trustee to be the trustee under this agreement, and the Trustee is willing to act as trustee;

Now, therefore, the Grantor and the Trustee agree as follows:

Section 1. Definitions

As used in this Agreement:

(a) The term "Grantor" means the owner or operator who enters into this Agreement and any successors or assigns of the Grantor.

(b) The term "Trustee" means the Trustee who enters into this Agreement and any successor Trustee.

Section 2. Identification of the Financial Assurance Mechanism

This Agreement pertains to the surety bond.

Section 3. Establishment of Fund

The Grantor and the Trustee hereby establish a trust fund, the "Fund," for the benefit of the **Implementing Agencies**. The Grantor and the Trustee intend that no third party have access to the Fund except as herein provided. The Fund is established initially as a

standby to receive payments and shall not consist of any property. Payments made by the provider of financial assurance pursuant to the **Director of the Implementing Agencies'** instruction are transferred to the Trustee and are referred to as the Fund, together with all earnings and profits thereon, less any payments or distributions made by the Trustee pursuant to this Agreement. The Fund shall be held by the Trustee, IN TRUST, as hereinafter provided. The Trustee shall not be responsible nor shall it undertake any responsibility for the amount or adequacy of, nor any duty to collect from the Grantor as provider of financial assurance, any payments necessary to discharge any liability of the Grantor established by the Implementing Agencies.

Section 4. Payment for "Corrective Action" and/or Third-Party Liability Claims"

The Trustee shall make payments from the Fund as the Director of the Implementing Agencies shall direct, in writing, to provide for the payment of the costs of taking corrective action and/or compensating third parties for bodily injury and property damage caused by either "sudden accidental releases" or "nonsudden accidental releases" or "accidental releases" arising from operating the tanks covered by the financial assurance mechanism identified in this Agreement.

The Fund may not be drawn upon to cover any of the following:

(a) Any obligation of Hertz under a workers' compensation, disability benefits, or unemployment compensation law or other similar law;

(b) Bodily injury to an employee of Hertz arising from, and in the course of employment by Hertz;

(c) Bodily injury or property damage arising from the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle, or watercraft;

(d) Property damage to any property owned, rented, loaned to, in the care, custody, or control of, or occupied by Hertz that is not the direct result of a release from a petroleum underground storage tank;

(e) Bodily injury or property damage for which Hertz is obligated to pay damages by reason of the assumption of liability in a contract or agreement other than a contract or agreement entered into to meet the requirements of 40 CFR 280.93.

The Trustee shall reimburse the Grantor, or other persons as specified by the Director of the Implementing Agency, from the Fund for corrective action expenditures and/or third-party liability claims in such amounts as the Director of the Implementing Agency shall direct in writing. In addition, the Trustee shall refund to the Grantor such amounts as the Director of the Implementing Agency specifies in writing. Upon refund, such funds shall no longer constitute part of the Fund as defined herein.

Section 5. Payments Comprising the Fund

Payments made to the Trustee for the Fund shall consist of cash and securities acceptable to the Trustee.

Section 6. Trustee Management

The Trustee shall invest and reinvest the principal and income of the Fund and keep the Fund invested as a single fund, without distinction between principal and income, in accordance with general investment policies and guidelines which the Grantor may communicate in writing to the Trustee from time to time, subject, however, to the provisions of this Section. In investing, reinvesting, exchanging, selling, and managing the Fund, the Trustee shall discharge his duties with respect to the trust fund solely in the interest of the beneficiaries and with the care, skill, prudence, and diligence under the circumstances then prevailing which persons of prudence, acting in a like capacity and familiar with such matters, would use in the conduct of an enterprise of a like character and with like aims; except that:

(i) Securities or other obligations of the Grantor, or any other owner or operator of the tanks, or any of their affiliates as defined in the Investment Company Act of 1940, as amended, 15 U.S.C. 80a-2(a), shall not be acquired or held, unless they are securities or other obligations of the federal or a state government;

(ii) The Trustee is authorized to invest the Fund in time or demand deposits of the Trustee, to the extent insured by an agency of the federal or state government; and

(iii) The Trustee is authorized to hold cash awaiting investment or distribution uninvested for a reasonable time and without liability for the payment of interest thereon.

Section 7. Commingling and Investment

The Trustee is expressly authorized in its discretion:

(a) To transfer from time to time any or all of the assets of the Fund to any common, commingled, or collective trust fund created by the Trustee in which the Fund is eligible to participate, subject to all of the provisions thereof, to be commingled with the assets of other trusts participating therein; and

(b) To purchase shares in any investment company registered under the Investment Company Act of 1940, 15 U.S.C. 80a-1 et seq., including one which may be created, managed, underwritten, or to which investment advice is rendered or the shares of which are sold by the Trustee. The Trustee may vote such shares in its discretion.

Section 8. Express Powers of Trustee

Without in any way limiting the powers and discretions conferred upon the Trustee by the other provisions of this Agreement or by law, the Trustee is expressly authorized and empowered:

(a) To sell, exchange, convey, transfer, or otherwise dispose of any property held by it, by public or private sale. No person dealing with the Trustee shall be bound to see to the application of the purchase money or to inquire into the validity or expediency of any such sale or other disposition;

(b) To make, execute, acknowledge, and deliver any and all documents of transfer and conveyance and any and all other instruments that may be necessary or appropriate to carry out the powers herein granted;

(c) To register any securities held in the Fund in its own name or in the name of a nominee and to hold any security in bearer form or in book entry, or to combine certificates representing such securities with certificates of the same issue held by the Trustee in other fiduciary capacities, or to deposit or arrange for the deposit of such securities in a qualified central depository even though, when so deposited, such securities may be merged and held in bulk in the name of the nominee of such depository with other securities deposited therein by another person, or to deposit or arrange for the deposit of any securities issued by the United States Government, or any agency or instrumentality thereof, with a Federal Reserve bank, but the books and records of the Trustee shall at all times show that all such securities are part of the Fund;

(d) To deposit any cash in the Fund in interest-bearing accounts maintained or savings certificates issued by the Trustee, in its separate corporate capacity, or in any other banking institution affiliated with the Trustee, to the extent insured by an agency of the federal or state government; and

(e) To compromise or otherwise adjust all claims in favor of or against the Fund.

Section 9. Taxes and Expenses

All taxes of any kind that may be assessed or levied against or in respect of the Fund and all brokerage commissions incurred by the Fund shall be paid from the Fund. All other expenses incurred by the Trustee in connection with the administration of this Trust, including fees for legal services rendered to the Trustee, the compensation of the Trustee to the extent not paid directly by the Grantor, and all other proper charges and disbursements of the Trustee shall be paid from the Fund.

Section 10. Advice of Counsel

The Trustee may from time to time consult with counsel, who may be counsel to the Grantor, with respect to any questions arising as to the construction of this Agreement or any action to be taken hereunder. The Trustee shall be fully protected, to the extent permitted by law, in acting upon the advice of counsel.

Section 11. Trustee Compensation

The Trustee shall be entitled to reasonable compensation for its services as agreed upon in writing from time to time with the Grantor.

Section 12. Successor Trustee

The Trustee may resign or the Grantor may replace the Trustee, but such resignation or replacement shall not be effective until the Grantor has appointed a successor trustee and this successor accepts the appointment. The successor trustee shall have the same powers and duties as those conferred upon the Trustee hereunder. Upon the successor trustee's acceptance of the appointment, the Trustee shall assign, transfer, and pay over to the successor trustee the funds and properties then constituting the Fund. If for any reason the Grantor cannot or does not act in the event of the resignation of the Trustee, the Trustee may apply to a court of competent jurisdiction for the appointment of a successor trustee or for instructions. The successor trustee shall specify the date on which it assumes administration of the trust in writing sent to the Grantor and the present Trustee by certified mail 10 days before such change becomes effective. Any expenses incurred by the Trustee as a result of any of the acts contemplated by this Section shall be paid as provided in Section 9.

Section 13. Instructions to the Trustee

All orders, requests, and instructions by the Grantor to the Trustee shall be in writing, signed by such persons as are designated in the attached Exhibit B or such other designees as the Grantor may designate by amendment to Exhibit B. The Trustee shall be fully protected in acting without inquiry in accordance with the Grantor's orders, requests, and instructions. All orders, requests, and instructions by the Director of the Implementing Agency to the Trustee shall be in writing, signed by the Director of the Implementing Agency, and the Trustee shall act and shall be fully protected in acting in accordance with such orders, requests, and instructions. The Trustee shall have the right to assume, in the absence of written notice to the contrary, that no event constituting a change or a termination of the authority of any person to act on behalf of the Grantor or the Director of the Implementing Agency hereunder has occurred. The Trustee shall have no duty to act in the absence of such orders, requests, and instructions from the Grantor and/or the Director of the Implementing Agency, except as provided for herein.

Section 14. Amendment of Agreement

This Agreement may be amended by an instrument in writing executed by the Grantor and the Trustee, or by the Trustee and the Director of the Implementing Agency if the Grantor ceases to exist.

Section 15. Irrevocability and Termination

Subject to the right of the parties to amend this Agreement as provided in Section 14, this Trust shall be irrevocable and shall continue until terminated at the written direction of the Grantor and the Trustee, or by the Trustee and the Director of the Implementing

Agency, if the Grantor ceases to exist. Upon termination of the Trust, all remaining trust property, less final trust administration expenses, shall be delivered to the Grantor.

Section 16. Immunity and Indemnification

The Trustee shall not incur personal liability of any nature in connection with any act or omission, made in good faith, in the administration of this Trust, or in carrying out any directions by the Grantor or the Director of the Implementing Agency issued in accordance with this Agreement. The Trustee shall be indemnified and saved harmless by the Grantor, from and against any personal liability to which the Trustee may be subjected by reason of any act or conduct in its official capacity, including all expenses reasonably incurred in its defense in the event the Grantor fails to provide such defense.

Section 17. Choice of Law

This Agreement shall be administered, construed, and enforced according to the laws of the state of New Jersey, or the Comptroller of the Currency in the case of National Association banks.

Section 18. Interpretation

As used in this Agreement, words in the singular include the plural and words in the plural include the singular. The descriptive headings for each section of this Agreement shall not affect the interpretation or the legal efficacy of this Agreement.

In Witness where of the parties have caused this Agreement to be executed by their respective officers duly authorized and their corporate seals (if applicable) to be hereunto affixed and attested as of the date first above written. The parties below certify that the wording of this Agreement is identical to the wording specified in 40 CFR 280.103(b)(1) as such regulations were constituted on the date written above.

[Name of the Grantor] The Hertz Corporation; TRACY MASELLA

[Title] Environmental Compliance Manager

[Signature of Grantor] Tracy Masella

Attest:

[Signature of Trustee] THOMAS HACKER VICE PRESIDENT

[Name of the Trustee] The Bank of New York Mellon

[Title]

[Seal]

4.0 SITE BACKGROUND INFORMATION

4.1 SITE DESCRIPTION AND SURROUNDING LAND USE

The site is located at 9000 Airport Boulevard in Los Angeles California (**Figure 1 - Vicinity Map**) and is used for rental car operations. The site consists of five buildings, a car wash system, and refueling systems. The refueling system consists of gasoline underground storage tanks (USTs), one diesel UST, fourteen fuel dispenser islands, and underground distribution lines. The UST system is generally located in the western, central portion of the facility and is bordered to the west by Airport Boulevard and to the north by the main vehicle entryway into and out of the facility.

The site is composed of the two main fueling areas; the "eastern" fueling system and the "western" fueling system.

- The eastern system consists of two 12,000 gallon gasoline USTs and 10 dispenser islands. Each island is equipped with one dispenser, and the ten islands are covered by an overhead canopy. The USTs are located just south of the dispenser islands and are oriented north-south in a common excavation.

- The western system consists of one 20,000 gallon gasoline UST, one split UST consisting of 8,000 gallon gasoline and 12,000 gallon diesel, and four dispenser islands. Three gasoline USTs and one diesel UST are located just north of the dispenser islands and are oriented east-west in a common excavation. Each dispenser island in the western system is equipped with two to three dispensers, and are also covered by a metal overhead canopy structure. The two 20,000 gallon USTs were installed in 2005 when the previous USTs were removed as discussed below

Directly north and adjacent to both the eastern and western systems is an eight foot cinderblock wall, followed by a landscaped planter area immediately to the north, then the paved main entry into and out of the facility. To the west of the western system is an asphalt paved drive/parking area, followed by a traffic guard rail and an eight foot chain link fence, then a landscaped parkway with Airport Boulevard west. It should be noted that immediately to the west, and overhead of the canopy for the four dispenser islands related to the western system, exists a large V-shaped commercial billboard placed for viewing from Airport Boulevard. Toward the east and south of the systems are an asphalt paved parking area and maintenance areas for the Hertz facility, including car wash structures to the south and the main office/locker building for the facility to the southeast.

4.2 PRIOR SITE ASSESSMENT ACTIVITY

In July 2003, ATC directed the advancement of 21 soil borings (B-1 through B-21) to depths ranging from 15 feet to 30 feet below ground surface (bgs) at the locations shown on **Figure 2 - Site Plan**. The purpose of the assessment was to evaluate soil quality prior to pending UST upgrades associated with Senate Bill SB 989. Minor soil impact was detected in the vicinity of the eastern dispenser islands. Based on the results of soil samples collected in this area, it appears that this impact is contained and attributed to minor surface spills at the associated dispensers.

Petroleum hydrocarbons were detected in soil associated with the western fueling system. The hydrocarbon contaminated soil around the western system is confined to the UST area and around the dispenser island closest to those USTs. The horizontal extent of the hydrocarbon contamination in the western system was estimated to be 40 feet by 60 feet. At the completion of the initial soil characterization, the vertical extent was not known. The deepest area of impacted soil would be located along the western portion of the UST pit (between B-11 and B-14). It was in this area that an additional boring and monitoring well was recommended. The details of the soil assessment are found

in ATC's *Site Assessment Report*, dated August 25, 2003. A summary of soil sample analytical results is included in Table 5.

In September 2003, ATC directed and supervised the advancement of a soil boring and installation of one groundwater monitoring well (MW-1) at a location to the west of the western fueling system. The boring was advanced to a depth of 75 feet bgs and soil samples were collected at five foot intervals. ATC selected five soil samples between 45 and 63 feet bgs for laboratory analysis. Soil samples collected between 45 and 55 feet bgs contained the highest levels of MTBE (ranging between 1.3 to 48 micrograms per kilogram (mg/kg). The MTBE concentrations decreased between 55 feet and 63 feet bgs. Monitoring well MW-1 was constructed using 45 feet (surface to 45 feet bgs) of solid 4-inch diameter Schedule 40 PVC casing, and 30 feet of slotted (0.020-inch slots) 4-inch diameter Schedule 40 PVC well screen. Subsequent to its installation, the well was purged and developed.

A groundwater sample was collected during a September 2003 investigation from the onsite monitoring well MW-1 and the results indicated total petroleum hydrocarbons - gasoline range (TPHg) was detected at a concentration of 61 micrograms per liter (µg/L). TBA and MTBE were reported at concentrations of 2,500 µg/L, and 8,700 µg/L, respectively. All other analytes were below their respective detection limits. Depth to water was measured on September 16, 2003 at 71.25 feet below ground surface.

Between March 24 and April 4, 2005 ATC oversaw the excavation of impacted soil during the removal of four gasoline USTs and one diesel UST, and the associated dispenser islands at the western fueling area. Transportation manifests indicated that 1,000 tons of petroleum hydrocarbon-impacted soil was excavated, transported and disposed during the performance of excavation activities. Laboratory analytical results from soil samples collected during the excavation, indicated that TPHg, total petroleum hydrocarbons - diesel range (TPHd), benzene and methyl tert-butyl ether (MTBE) concentrations of up to 150, 720, 0.006, and 0.67 mg/kg, respectively, were still present in the remaining soil. The TPHg, TPHd, and benzene concentrations were below maximum soil screening levels established by the Los Angeles Region California Regional Water Quality Control Board (*Interim Site Assessment and Cleanup Guidebook*, May 1996), based on a depth to groundwater of approximately 53 feet as originally measured in well MW-1. Additionally, the benzene and MTBE concentrations were below the EPAs Preliminary Remediation Goals (PRGs) for industrial and residential soils. The remediation activities were presented in ATC's August 18, 2005 *Remedial Excavation Report* prepared for the facility.

A summary of the historical groundwater and soil analytical data is provided in **Table 3 and 5**.

4.3 SITE AND AREA LITHOLOGY

The site is located within the Los Angeles Basin in a physiographic unit called The El Segundo Sand Hills (California Department of Water Resources [DWR], 1961). The El Segundo Sand Hills extend from Ballona Gap south to Torrance and the Palo Verdes Hills, and approximately three to four miles inland from the ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The sand hills consist of a narrow strip of active or recent dunes along the coast with older stabilized sand dunes inland.

The Site is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Dune Sand has been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands and which now form a portion of the Torrance Plain. Weathering

and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area (DWR, 1961).

Based on soil boring data from previous investigations at the site (ATC, 2003c) and the current additional site assessment, site lithology from the ground surface to approximately 80 feet below ground surface (bgs) consists predominantly of fine to coarse sand interbedded with silt and clay. ATC identified four generalized soil units beneath the site:

1. an upper fine-grained unit from ground surface to approximately 15 to 20 feet bgs;
2. an upper sand unit beginning between 15 and 20 feet bgs and extending to approximately 30 ft bgs;
3. a lower fine-grained unit from approximately 30 feet bgs extending to between 50 and 55 feet bgs;
4. a lower sand unit from between approximately 50 and 55 feet bgs to at least 75 feet bgs.

Base on the DWR (1961) description of the regional units, it is likely that the units described above are within the undifferentiated sediments of Lakewood Formation.

Cross sections describing soil lithology and soil sample analysis are shown in **Figures 5, 6, and 7**.

4.4 AREA HYDROLOGY AND HYDROGEOLOGY

The Site lies within the West Coast (groundwater) Basin, which is part of the larger Los Angeles Coastal Basin (DWR, 1961). The physical boundaries of the West Coast Basin include the Ballona Escarpment to the north; the Rosecrans Hills to the east; and the Pacific Ocean to the west and south. The Palos Verdes Hills form the boundary of the West Coast Basin to the southeast. Water-bearing strata within the West Coast basin includes mid-Miocene to Oligocene-aged marine and continental sediments. The principal aquifers (water-producing formations) beneath the site include (in youngest to oldest stratigraphic order) the Old Dune Sand, Gage-Gardena, Lynwood, Silverado, and Sunnyside aquifers (DRW, 1961). Many of the aquifers located in the western portion of the West Coast Basin are not currently used as practical sources of potable water due to general degradation of the upper groundwater zone due to historical industrial activity, oil production, and seawater intrusion. The regional direction of groundwater flow is toward the south-southwest.

5.0 RECENT ASSESSMENT ACTIVITIES

ATC conducted a field investigation from June 19 through July 11, 2008. Site assessment activities were conducted per the request of the RWQCB in accordance with the *Workplan for Additional Soil and Groundwater Investigation* (ATC Associates, February 29, 2008) approved by the State Water Resources Control Board - Los Angeles Region on March 5, 2008.

Prior to commencement of field activities, ATC obtained well permits from the County of Los Angeles Water & Sewage/Mountain & Rural Programs Environmental Health Division. A copy of the well permit is included in **Appendix A**. The investigation activities are summarized in the following sections, and the field procedures are detailed in **Appendix B**. Also prior to drilling the well borings, ATC contacted Underground Service Alert (USA) and subcontracted with a private utility locator service to verify the presence of any utilities in the vicinity of the proposed well boring locations. Following the utility clearance, drilling was scheduled.

ATC contracted with Martini Drilling for the well installations. A CME-85 drilling rig equipped with 10-inch diameter hollow-stem augers was utilized to complete the monitoring wells. Additional details are provided below.

5.1 GROUNDWATER MONITORING WELL INSTALLATION

Based on the depth to water measurements and the analytical laboratory results of the July & September 2003 investigations, ATC selected the two locations for installation of groundwater monitoring wells. Our objective was to establish onsite locations for collecting groundwater data; including groundwater hydraulic head measurements and dissolved petroleum constituent concentrations. Between June 19 and 20, 2008, ATC installed two groundwater monitoring wells (MW-2 and MW-3) at the site using a hollow-stem auger drilling method. Groundwater monitoring well MW-2 was installed north of the eastern dispenser islands and MW-3 was installed east of the western dispenser islands. The borings were advanced to between 77 and 89 feet bgs and the monitoring wells were installed to total depths of 75 and 85 feet bgs with a 30 ft screen interval used for both wells. Well locations are shown on **Figure 2**. Well installation activities are summarized below and daily records are presented in **Appendix C**.

5.1.1 Soil Sampling

At each location, soil samples were collected at 5-foot intervals from ground surface to the total depth of the boring. The well borings were drilled, sampled and completed as a groundwater monitoring wells in general accordance with ATC's Standard Operating Procedures, which are included in **Appendix B**.

To obtain preliminary data regarding potential petroleum hydrocarbon-impacted soil, a representative sample was collected at each soil sampling location and field screened for volatile organic vapors in general accordance ATC's Standard Operating Procedures, which are included in **Appendix B**. Organic vapor meter readings were collected using a RAE Systems MiniRAE 2000 photo-ionization detector (PID) and were recorded in the boring logs.

All soil samples collected during the investigation were submitted for laboratory analysis. The details of the analysis are presented in **Section 5.1.5** and a discussion of the results is included in **Section 6.3.1**.

An ATC Geologist completed lithologic logs for each boring in general accordance with ASTM Method D 2488-90. ATC selected all soil samples from each boring for chemical analysis. Soil characteristics (observations of staining or odor), Unified Soil Classification System (USCS) designation, and depth to groundwater were recorded on the boring logs provided in **Appendix C**.

5.1.2 Well Specifications and Construction

Following soil sampling, groundwater monitoring wells were installed using 4-inch-diameter, Schedule 40 PVC casing. Groundwater monitoring well MW-2 was constructed using forty-five (45) feet casing, and thirty feet of well screen. The annulus of the screened portions of monitoring well MW-2 was backfilled with a #3 Monterey sand (or equivalent) filter pack from approximately 75 to 45 feet bgs. An approximate 2-foot layer of medium bentonite chips were placed on top of the upper filter pack and hydrated to form an annular seal. The remaining annular space to the bottom of the concrete seal (approximately 40 feet) was filled with bentonite grout.

Based upon groundwater measurements that were collected upon the completion of monitoring well MW-2 it was determined that groundwater was deeper than had been observed in the lithologic logging and as measured during previous monitoring events. It was determined to extend monitoring well MW-3 to 85 feet below ground surface to compensate for the increased depth to groundwater. The screened portions of monitoring well MW-3 was back filled with #3 Monterey sand (or equivalent) filter pack from 85 to 55 bgs. An approximate 2-foot layer of medium bentonite chips were placed on top of the upper filter pack and hydrated to form an annular seal. The remaining annular space of the bentonite chips seal was filled with bentonite grout.

Each well was completed with a two-foot deep surface seal was placed above the bentonite grout and a traffic-rated well box was placed within a circular two-foot diameter perimeter seal. A summary of the final monitoring well construction details is provided in **Table 1** and locations of the monitoring wells are shown on **Figure 2**.

5.1.3 Well Development

On July 3, 2008, ATC developed monitoring wells MW-2 and MW-3 using a combination of surging and bailing methods. Well MW-2 went dry after removing approximately one bailer (less than a casing volume), so the field personnel allowed the well to recharge. Again after removing approximately one casing volume, the well went dry. At this point ATC terminated well development with purged water relatively clear and free of suspended sediment. Well MW-3 went dry after removing approximately one casing volume, so the field personnel allowed the well to recharge. Again after removing approximately one casing volume, the well went dry. At this point ATC terminated well development with purged water relatively clear and free of suspended sediment.

After well development, ATC measured static depth to groundwater and the total well depth in each well. Depth to water was measured (in ft bgs) at 73.68, 74.21, and 76.40 for wells MW-1, MW-2, and MW-3, respectively. Total well depth was recorded in MW-1 at 77.00, MW-2 at 75.00, and in MW-3 at 85.00.

Groundwater purged during well development was contained in 55-gallon drums and remain onsite pending proper disposition. The groundwater monitoring wells were developed in general accordance with ATC's Standard Operating Procedures, which are included in **Appendix B**.

5.1.4 Well Surveying

On July 3, 2008, a California-licensed Professional land Surveyor surveyed the lateral locations and elevations of the newly installed groundwater monitoring wells. Due to an apparent lack of survey data for MW-1, ATC also had MW-1 surveyed. The location and elevation of measuring marks on the north side of each wellhead were surveyed to the nearest 0.01-foot by the licensed surveyor in order to more accurately determine the local groundwater flow direction beneath the site. Survey data is provided in both **Table 1** and **Appendix F**.

5.1.5 Laboratory Analysis

ATC submitted the soil samples to a State of California-certified laboratory, under chain-of-custody procedures. The laboratory analyzed a total of 31 soil samples for:

- TPHg using EPA Method 8260B;
- Ethanol (by direct injection) using EPA Method 8260B;
- BTEX (benzene, toluene, ethylbenzene, and xylenes) and fuel oxygenates methyl tert-butyl ether (MTBE), diisopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), t-amyl methyl ether (TAME), and t-butyl alcohol (TBA) using EPA Method 8260B;
- VOCs (full list) using EPA Method 8260B.

The analytical results are summarized in **Table 4,** and a discussion is included in **Section 6.3.1**. The laboratory analytical reports are provided in **Appendix E**.

5.2 GROUNDWATER MONITORING

ATC gauged and sampled all groundwater monitoring wells (MW-1 through MW-3) at the site on July 11, 2008, after sitting undisturbed for eight days. Groundwater monitoring activities are summarized in the following sections, with well sampling logs included in **Appendix D**.

5.2.1 Downhole Parameter and Groundwater Level Measurements

On July 11, 2008, prior to commencement of purging and sampling activities, ATC gauged and inspected the monitoring wells for phase-separate hydrocarbons and depth to groundwater. During this event, the depth to groundwater in well MW-2 was recorded at 74.10 ft bgs. The depth to groundwater in well MW-3 was recorded at 79.70 ft bgs. The previously installed groundwater well MW-1 depth to water was recorded at 73.63 ft bgs. **Table 1** summarizes well identifications and casing elevations, **Table 2** includes groundwater depths and groundwater elevations. Well sampling records are provided in **Appendix D**.

5.2.2 Purging and Sampling Procedures

ATC used a low-flow purging method to sample the groundwater monitoring wells. During purging, ATC monitored temperature, pH, conductivity, turbidity, and DO. Purge volumes for the monitoring wells were 0.80 gallons (gals), 0.80 gals, and 15 gals for MW-1, MW-2, and MW-3, respectively. Also recorded were the times the purging was commenced and when completed, and when each parameter reading was recorded. Total time to purge the above-mentioned amounts was 30 minutes (mins), 35 mins, and 45 mins for MW-1, MW-2, and MW-3, respectively.

Following purging, groundwater samples were collected from the newly installed monitoring wells (MW-2 and MW-3) and the preexisting groundwater well (MW-1). Field parameter measurements were recorded on the well sampling records, which are included in **Appendix D**.

5.2.3 Laboratory Analysis

ATC submitted the groundwater samples to Enviro-Chem, Inc., a State of California ELAP-certified laboratory, under chain-of-custody procedures. Three groundwater samples were analyzed for:

- TPH - full carbon chain (gasoline, c4-c10; diesel, c11-c22; motor/heavy oils, c23-c35) using EPA Method 8015B;
- Ethanol (by direct injection) using EPA Method 8260B;
- BTEX (benzene, toluene, ethylbenzene, and xylenes) and fuel oxygenates methyl tert-butyl ether (MTBE), diisopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), t-amyl methyl ether (TAME), and t-butyl alcohol (TBA) using EPA Method 8260B;
- VOCs (full list) using EPA Method 8260B.

The analytical results are discussed in **Section 6**; the laboratory analytical reports are provided in **Appendix E**.

5.3 WASTE MANAGEMENT

Drilling and sampling activities generated twenty-six 55-gallon drums of soil cuttings, which await final disposal. Soil analysis performed as part of the assessment will be used to characterize the waste for disposal. Copies of waste disposal manifests will be forwarded upon receipt by The Hertz Corporation. Soil cuttings were managed in accordance with the County of Los Angeles Regulations.

6.0 RESULTS

The cumulative findings of the additional site assessment described in **Section 5** are summarized below.

6.1 DRILLING OBSERVATIONS

Consistent with previous investigations at the site, ATC observed unconsolidated alluvial sediments with grain sizes ranging from clays to gravels. Drilling observations are presented on the boring logs in **Appendix C**. The lithologic units logged and described by ATC can generally be classified within the six soil units described in **Section 4.3**, above. ATC observed PID readings above typical background concentrations in the following:

- MW-2-55' with a PID reading of 327.0 part per million (ppm);
- MW-3-35' at 21.2 ppm;
- MW-3-45' at 24.3 ppm.

Soil samples were collected every 5-feet and all samples were analyzed. In the two monitoring wells, saturated soil was generally encountered from approximately 55 to 70 feet bgs, Due to high moisture content in the samples, water level was initially judged to be around 55-60 ft bgs, in monitoring well MW-2. Water levels dropped significantly after drilling to total depth, with static groundwater levels stabilizing at approximately 73-74 feet bgs.

Groundwater elevation was calculated for each well by subtracting the depth-to-water measurement from the surveyed casing elevation. The survey data for the groundwater monitoring wells is provided in **Appendix F**. Groundwater elevations from the monitoring wells gauged on July 11, 2008 were used to prepare a groundwater elevation contour map (**Figure 3**). The groundwater elevation contours indicate a southeastward flow direction with an approximate hydraulic gradient of 0.005 ft/ft.

6.2 MONITORING WELL OBSERVATIONS

No phase–separate hydrocarbons were observed in any of the wells. Depth-to-water measurements ranging from 73.63 to 79.70 bgs are presented in **Table 2**; groundwater elevation contours are depicted on **Figure 3**.

6.3 ANALYTICAL RESULTS

The analytical results for soil and groundwater samples collected during this field investigation are summarized in **Tables 2 and 3**. Groundwater analytical results are also shown on **Figure 3**. Analytical laboratory reports and chain-of-custody forms are provided in **Appendix E**.

6.3.1 Soil Analysis

During the additional site assessment activities, completed from June 19 through July 11, 2008, thirty-one (31) soil samples were submitted for analytical testing. None of the soil samples submitted for laboratory analysis were reported to contain petroleum hydrocarbon constituent concentrations above their respective laboratory practical quantitation limits (PQL), with the following exceptions:

- MW-2-55' - MTBE, TAME, and TBA concentrations of 5.67, 0.025, 2.70 milligrams per kilograms (mg/kg), respectively;
- MW-2-60' - MTBE and TBA concentrations of 0.188 and 0.051 mg/kg, respectively;
- MW-3-5' - MTBE concentration of 0.043 mg/kg

A summary of soil sample analytical results from the additional site assessment is provided in **Table 4**.

6.3.2 Groundwater Analysis

The groundwater sampling event for all monitoring wells (MW-1 through MW-3), took place on July 11th, 2008. None of the groundwater samples submitted for laboratory analysis were reported to contain petroleum hydrocarbon constituent concentrations above their respective laboratory PQL, with the following exceptions:

- MW-1 MTBE and acetone concentrations of 4.03 and 13.0 µg/l, respectively;
- MW-2 MTBE concentration of 2,740 µg/l

A summary of the groundwater sample analytical results is provided in **Table 2**, and historical groundwater analytical results are in **Table 3**. Laboratory reports and chain-of-custody documentation is included in **Appendix E**.

7.0 FINDINGS AND RECOMMENDATIONS

Based on the laboratory analytical results, it is ATC's opinion that an additional monitoring well is recommended in the area of monitoring well MW-2 based on the elevated concentrations of MTBE. Additional assessment is also recommended in the area of MW-1 due to the elevated levels of MTBE observed in the soil samples at 50 feet. The groundwater samples collected from monitoring well MW-1 and MW-2 indicated detectable concentrations of petroleum hydrocarbon and/or fuel oxygenate constituents. The MTBE and TAME levels in monitoring well MW-1 has decreased significantly. Based on the groundwater monitoring results for this quarter additional quarterly monitoring is recommended.

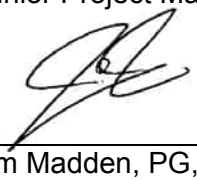
8.0 LIMITATIONS

Our professional services have been performed, our findings obtained, and our recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. This company is not responsible for the independent conclusions, opinions, or recommendations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

It should be noted that all surficial environmental assessments are inherently limited in the sense that conclusions are drawn and recommendations developed from information obtained from limited research and site evaluation. For these types of evaluations, it is often necessary to use information prepared by others and ATC cannot be responsible for the accuracy of such information. In addition, the passage of time may result in a change in the environmental characteristics at this site and surrounding properties. This report does not warrant against future operations or conditions, nor does it warrant operations or conditions present of a type or at a location not investigated. This report is not a regulatory compliance audit and is not intended to satisfy the requirements of any state, federal, or local real estate transfer laws.

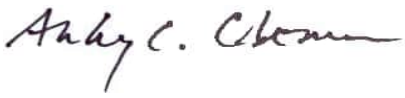
It must be noted that no investigation can absolutely rule out the existence of any hazardous materials at a given site. This assessment has been based upon prior site history, observable conditions, and the subsurface soil sampling described in this report. Existing hazardous materials and contaminants can escape detection using these methods.

This report is for the use and benefit of, and may be relied upon by, Hertz, and any affiliates, and third parties authorized in writing by Hertz and ATC, including the lender(s) in connection with a secured financing of the property, and their respective successors and assigns. Any third party agrees by accepting this report that any use or reliance on this report shall be limited by the exceptions and limitations in this report, and with the acknowledgment that actual site conditions may change with time, and that hidden conditions may exist at the property that were not discovered within the authorized scope of the assessment.



ATC makes no other representation to any third party except that it has used the degree of care and skill ordinarily exercised by environmental consultants in the preparation of the report and in the assembling of data and information related thereto. No other warranties are made to any third party, either express or implied. Unless otherwise agreed upon in writing by ATC and a third party, ATC's liability to any third party authorized to use or rely on this report with respect to any acts or omissions shall be limited to a maximum of $100,000.

9.0 SIGNATURES



This report was prepared by the staff of ATC Associates, Inc., under the supervision of the Senior Geologist whose signature appears hereon. The findings, recommendations, specifications, or professional opinions are presented within the limits described by the client, in accordance with generally accepted practices, using the degree of skill and care ordinarily exercised by environmental consultants under similar circumstances. No warranty is expressed or implied.

4.0 BACKGROUND INFORMATION

4.1 Site History

The site is located at 9000 Airport Boulevard in Los Angeles California as shown in Figure 1 (Vicinity Map) and is used for rental car operations. The site consists of five buildings, a car wash system, and refueling system. The refueling system consists of gasoline underground storage tanks (USTs), one diesel UST, fourteen fuel dispenser islands, and underground distribution lines. The UST system is generally located in the western, central portion of the facility and is bordered to the west by Airport Boulevard and to the north by the main vehicle entry way into and out of the facility as shown in Figure 2 (Site Plan).

The site is composed of the two main fueling areas, the "eastern" fueling system and the "western" fueling system. The eastern system consists of two 12,000 gallon gasoline USTs with 10 dispenser islands. Each island has one fuel dispenser, and the ten islands are covered by an overhead canopy. The USTs are located just south of the dispenser islands and are aligned north-south in a common excavation. The western system consists of four gasoline USTs, one diesel UST, and four dispenser islands. The three gasoline USTs and one diesel UST are located just north of the dispenser islands and are aligned north-south in a common excavation.

The western system consists of four 10,000-gallon gasoline USTs, one 10,000-gallon diesel UST, and four dispenser islands. The gasoline USTs are located to the north of the dispenser islands and are aligned north-south in a common excavation. The diesel UST is located approximately 15-20 feet east of the four gasoline USTs, and is also aligned north-south. This UST was originally installed to store methanol fuel, but has been retrofitted for gasoline. It is unclear at this time whether this tank is located in its own excavation, or shares a common excavation with the four tanks to the west. Each dispenser island in the western system is equipped with two fuel dispensers, and it is likewise covered by a metal canopy structure.

Directly north of both the eastern and western systems is an eight foot cinderblock wall immediately adjacent, followed by a landscaped planter area immediately to the north, then the paved main entry into and out of the facility. To the west of the western system is an asphalt paved drive/parking area, followed by a traffic guard rail and an eight foot chain link fence, then a landscaped parkway with Airport Boulevard west of it. It should be noted that immediately to the west, and overhead of the canopy for the four dispenser islands related to the western system, exists a large commercial billboard placed for viewing from Airport Boulevard. Toward the east and south of the systems are asphalt paved parking area and maintenance areas for the Hertz facility, including car wash structures to the south and the main office/locker building for the facility to the southeast.

4.2 Previous Site Characterizations

In July 2003, ATC Associates Inc. (ATC) directed and supervised the advancement of 21 soil borings (B-1 through B-21) to depths ranging from 15 feet to 30 feet below ground surface (bgs) at the locations shown on Figure 3. The purpose of the assessment was to evaluate possible environmental impact to soil prior to pending UST upgrade activities to comply with Senate Bill SB 989. Borings B-1 through B-8 were advanced in the vicinity of the eastern UST system. Borings B-9 through B-21 were advanced in the vicinity of the western UST system.

Twenty-One (21) soil samples were delivered under chain-of-custody protocol to SPL Laboratory of Houston, Texas for laboratory analysis. The samples were analyzed for total petroleum hydrocarbons characterized as

diesel (TPHd), total petroleum hydrocarbons characterized as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX), and methyl-tert-butyl-ether (MTBE) in accordance with EPA Test Methods 8015 Modified, and EPA Method 8260B.

Seven (7) of the soil samples contained one or more petroleum hydrocarbon constituent concentrations above their respective laboratory reporting limits (RLs). A summary of soil sample analytical results from this site assessment is provided in Table 1. Details of this assessment are presented in the ATC, *Additional Site Assessment Report*, dated August 25, 2003 (ATC Project No. 78.75015.0001).

Neither TPHd nor BTEX compounds were detected above the RLs in the soil samples analyzed. TPHg was detected above the RLs in four samples (B3-5, B11-20, B13-10, and B19-10). Soil sample B3-5 contained a TPHg concentration of 300 micrograms per kilogram (µg/kg). TPHg results ranged from 120 µg/kg in B19-10 to 160 µg/kg in B13-10 to 360 µg/kg in B11-20.

MTBE was detected in six samples collected from borings advanced in the area of the western UST system, near the northernmost fueling island and around the four western-most USTs. MTBE was not detected in the analyzed soil samples collected from the eastern UST system, nor in samples collected near the southern fuel dispensing island of the western system. The laboratory RL for MTBE was less than five (<5) µg/kg. MTBE analytical results ranged from 30 µg/kg in B19-10 and 200 µg/kg in B18-10, to 1,800 µg/kg in B14-25 and 2,000 µg/kg in B11-20.

Minor petroleum hydrocarbon impact to soil was detected in the vicinity of the eastern dispenser islands. Based on the results of soil samples collected in this area, it appeared that this impact was contained and attributed to minor spills at the dispenser. The hydrocarbon contamination around the western UST system appeared to be confined to the UST cavity and around the dispenser island closest to those USTs. The horizontal extent of the hydrocarbon contamination in the western system was estimated to be 40 feet by 60 feet. The vertical extent of the MTBE contamination was not defined by this investigation. Based on the orientation of the western UST system and the analytical results, it appeared that the deepest impacted soil was located in the area along the western portion of the UST cavity (between B-11 and B-14).

In September 2003, ATC directed and supervised the advancement of a soil boring and installation of one groundwater monitoring well (MW-1) at a location to the west of the western fueling system. The boring was advanced to a depth of 75 feet bgs and soil samples were collected at five foot intervals. ATC selected five soil samples between 45 and 63 feet below ground surface for laboratory analysis. The soil samples were shipped overnight to SPL Laboratories (SPL), a California certified laboratory, using proper chain of custody procedures. The samples were analyzed for BTEX, and MTBE in accordance with EPA Test Method 8260 and for TPHg and TPHd, in accordance with EPA Test Method 8015. Soil samples collected between 45 and 55 feet below ground surface contained the highest levels of MTBE (ranging between 1,300 to 48,000 micrograms per liter (ug/L)). The MTBE concentrations decreased between one and two orders of magnitude (to 8 and 18 ug/L) between 55 feet and 63 feet below ground surface. The remaining analytes were at trace levels. A summary of groundwater analytical results from this site assessment is provided in Table 2.

Monitoring well MW-1 was constructed using 45 feet (surface to 45 feet bgs) of blank 4-inch diameter Schedule 40 PVC casing, and 30 feet of slotted (0.020-inch slots) 4-inch diameter Schedule 40 PVC well screen. Subsequent to its installation, the well was purged and developed. On September 16, 2003, groundwater was gauged, purged, and sampled. Depth to groundwater was measured at approximately 53 feet bgs. Analysis of groundwater samples were performed by SPL. The water sample was analyzed for BTEX, and MTBE using EPA Test Method 8260 and for TPHg and TPHd, using EPA Test Method 8015. TPHg was

detected at concentration of 61 ug/L. TBA and MTBE were reported at concentrations of 2,500 ug/L, and 8,700 ug/L, respectively, in the groundwater sample collected from MW-1. All other analytes were not detected above their respective detection limits.

4.3 Scope of Work

This remedial excavation report summarizes the site activities conducted at the site from March 23 to April 7, 2005. ATC conducted the following:

- Prepared a Site Specific Health & Safety Plan (Appendix A).
- Excavated hydrocarbon impacted soils based on the results of prior site assessments. Soil excavation activities were conducted using a backhoe.
- Petroleum hydrocarbon-impacted soil was identified by hydrocarbon staining and odors. A portable organic vapor analyzer (OVA) or photo-ionization detector (PID) was used to monitor the presence of volatile organic compounds (VOCs) in soil and to assess ambient air quality.
- Soil samples were collected from the bottom corners of the excavations and from beneath the former dispenser and piping locations to confirm removal of the hydrocarbon-impacted soil.
- Soil samples were analyzed for total petroleum hydrocarbons characterized as gasoline (TPHg), total petroleum hydrocarbons characterized as diesel (TPHd), benzene, toluene, ethylbenzene, total xylenes (BTEX), and methyl-tertiary-butyl ether (MTBE) in accordance with Environmental Protection Agency (EPA) Test Methods 8015M and 8260, respectively.
- Conducted Organic Vapor Monitoring to obtain preliminary data regarding the degree of potential petroleum hydrocarbon-impact to soil and for health and safety concerns.
- Prepared this Data Evaluation and Remedial Action Report summarizing the findings.

5.0 GEOLOGIC SETTING

5.1 Regional Geology

The site is located within the Los Angeles Basin in a physiographic unit called The El Segundo Sand Hills (California Department of Water Resources [DWR], 1961). The El Segundo Sand Hills extend from the Ballona Gap south, to Torrance and the Palo Verdes Hills, and approximately three to four miles inland from the Pacific Ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The Sand Hills consist of a narrow strip of active or recent dunes along the coast an older stabilized sand dunes inland.

The site is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Sand Dunes have been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands and which now form a portion of the Torrance Plain. Weathering and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area (DWR, 1961).

5.2 Hydrogeology

The Site lies within the West Coast (groundwater) Basin, which is part of the larger Los Angeles Coastal Basin (DWR, 1961). The physical boundaries of the West Coast Basin include the Ballona Escarpment to the north; the Rosecrans Hills to the east; and the Pacific Ocean to the west and south. The Palos Verdes Hills form the boundary of the West Coast Basin to the southeast. Water-bearing strata within the basin includes mid-Miocene to Oligocene-aged marine and continental sediments. The principal aquifers (water-producing formations) beneath the site include (in youngest to oldest stratigraphic order) the Old Dune Sand, Gage-Gardena, Lynwood, Silverado, and Sunnyside aquifers (DRW, 1961). Many of the aquifers located in the western portion of the West Coast Basin are not currently used as practical sources of potable water due to general degradation of the upper groundwater zone due to historical industrial activity, oil production, and seawater intrusion. It is unknown at the present time whether the aquifer underlying the subject site is currently in use. The regional direction of groundwater flow in interpreted to generally be toward the west-southwest.

6.0 FIELD ACTIVITIES

Excavation activities were initiated at the site on March 23, 2005, and excavation and backfilling activities continued until April 7, 2005. H.B. Covey, Inc. (H.B. Covey) was retained by Hertz to provide oversight for the upgrade the UST system at the site and conduct remedial excavation activities under the direction of ATC personnel. H.B. Covey attained all necessary permits for the UST removals. A copy of the tank removal permit is included in Appendix B of this report. Graves Construction Co. (Graves) was subcontracted by H.B. Covey to supply equipment and conduct excavation services. The remedial excavation, as proposed in the workplan was to be limited to the areas adjacent to, and beneath, the former UST locations at the "western" fueling system. The initially proposed excavation limits are illustrated in Figure 3, Site Plan with Extent of Proposed Remedial Excavation (ATC, January 2004). It was initially estimated that approximately 3,000 cubic yards of soil would need to be excavated in order to remove the petroleum hydrocarbon-impacted source area. During the course of excavation operations, overburden soil not impacted with petroleum hydrocarbons was excavated and placed into two stockpiles on-site. One stockpile was designated as the Impacted Stockpile (ISP) and the other was designated as the Clean Stockpile (CSP). Petroleum hydrocarbon-impacted soils were identified by the presence of hydrocarbon staining, field air monitoring, and odors. A portable PID was used to monitor the presence of volatile organic compounds (VOCs) in soil, and to assess ambient air quality. Ambient air in the downwind direction was monitored approximately every 15 to 30 minutes during the removal of the impacted soil in general accordance with ATC Standard Operating Procedures and South Coast Air Quality Management District (SCAQMD) rules 1149 and 1166, included in Appendix C. Per SCAQMD rules 1149 and 1166, ATC maintained rule 1166 soil air monitoring records and notified the SCAQMD by fax within 24 hours of any VOC soil concentration readings exceeding 50 PPM.

The western fueling area was covered with asphalt and concrete pavement. On March 23, a backhoe was utilized to break up the asphalt and concrete pavement around the gasoline USTs and piping runs and load it into trucks for disposal offsite. Based on visual and olfactory observations and PID soil screening readings, pea gravel initially encountered in the UST area did not appear to have any significant contamination. A CSP stockpile was initiated adjacent to the west side of the dispenser canopy. Pea gravel exposed in the piping area appeared to be impacted and an ISP stockpile was established adjacent to the west side of the dispenser canopy to the south of the CSP stockpile. Stockpiled soil was placed on plastic visqueen sheeting.

On March 24, ATC oversaw the excavation of soils around the four gasoline USTs in the western fueling area. Standing water covered was encountered at a depth of approximately one foot bgs in the UST excavation, just below the concrete pavement. A hydrocarbon sheen was observed on the surface of the water. However, the standing water appeared to be localized and did not reflect a groundwater table. The water was removed with a vacuum truck and no additional water was encountered in the excavations. After the USTs were exposed, degassing of the USTs was initiated.

On March 25, ATC oversaw the excavation of soils around a single diesel UST located to the east of the western fueling area gasoline UST excavation. Based on visual and olfactory observations, and on PID soil screening readings, pea gravel encountered in the diesel UST excavation did not appear to have any significant contamination. A second CSP stockpile was initiated adjacent to the east side of the dispenser canopy. After degassing and exposing all of the USTs, the USTs were cleaned and inspected. A crane was utilized to remove the five USTs and place them on flatbed trucks for offsite disposal. Under the supervision of the Los Angeles City Fire Department (LAFD), ATC collected two soil samples from the diesel UST excavation. Soil samples S1-17 and S2-17 were collected from the bottom of the excavation, at a depth of approximately 17 feet below ground surface (bgs), at the northwest and southeast corners of the diesel tank

excavation, respectively. Laboratory analytical data indicated TPHd concentrations of 32 and 86 milligrams per kilogram (mg/kg) in soil samples S1-17 and S2-17, respectively. BTEX constituents and oxygenates were at concentrations below detection limits in both of the samples. A summary of soil sample analytical results is provided in Table 3 and laboratory data reports are included in Appendix D. A soil sample location map is shown in Figure 4. At the direction of the LAFD, no soil samples were collected from the gasoline UST excavation at this time.

On March 29, 30, and 31, 2005, ATC oversaw the additional excavation of the gasoline UST pit and the excavation of the soils beneath the former dispenser locations.

On April 1, 2005, excavation of the soils beneath the former dispenser locations continued. Soil from the ISP stockpile was loaded into trucks for offsite disposal. Copies of non-hazardous soil manifests are included in Appendix E. A total of 15 trucks containing approximately 325 tons of soil were loaded and transported to a state licensed landfill facility for disposal.

On April 4, 2005, loading of ISP stockpiles into trucks for offsite disposal continued. A total of 11 trucks containing approximately 230 tons of soil were loaded and transported to a state licensed landfill facility for disposal. Under the supervision of the LAFD, ATC collected a total of 16 soil samples from the gasoline UST excavation, beneath the former dispenser locations, and beneath the former piping locations. Soil samples S3-18, S4-18, S5-18, and S6-18 were collected from the bottom of the gasoline UST excavation, at a depth of approximately 18 feet bgs, at the northeast, southeast, southwest, and northwest corners of the diesel tank excavation, respectively. Laboratory analytical data indicated TPHg concentrations below laboratory detection limits in soil samples S3-18 and S4-18 and at concentrations of 14 and 1.0 mg/kg in soil samples S5-18 and S6-18, respectively. BTEX constituents were only detected in sample S5-18. Benzene was below laboratory detection limits and toluene, ethylbenzene, and xylenes were present at concentrations of 0.002, 0.014, and 0.79 mg/kg, respectively. MTBE was detected in soil samples S3-18, S4-18, S5-18, and S6-18 at concentrations of 0.11, 0.052, 0.24, and 0.67 mg/kg, respectively.

Soil samples S7-2, S8-2, S11-2, S12-2, S15-2, S16-2, S17-2, and S18-2 were collected from beneath the former fuel dispenser locations at a depth of approximately 2 feet bgs. TPHg was detected in three of the soil samples with concentrations ranging from 0.5 to 150 mg/kg.; TPHd was detected in six of the soil samples with concentrations ranging from 5 to 82 mg/kg; benzene was detected in one soil sample (S12-2) at a concentration of 0.006 mg/kg; toluene, ethylbenzene, and xylenes were detected in two of the soil samples with concentrations ranging from 0.008 mg/kg (ethylbenzene) to 0.43 mg/kg (toluene); and MTBE was detected in six of the soil samples with concentrations ranging from 0.040 to 0.25 mg/kg.

During excavation activities a total of approximately 1,000 tons (approximately 850 cubic yards) of petroleum hydrocarbon-impacted soil was removed from the site. This soil was loaded onto transport trucks for delivery under non-hazardous waste manifest to Candelaria Environmental Company (a state certified disposal facility) located in San Deigo, California. Copies of the soil transportation manifests are included in Appendix E.

Soil samples were analyzed for TPHg and TPHd, by Environmental Protection Agency (EPA) Test Method 8015 Modified and for BTEX and MTBE by EPA Test Method 8260. Soil samples were collected using Encore® samplers utilizing method 5035 preservation method and delivered under chain-of-custody protocol to Zymax Envirotechnology laboratory of San Diego, California.

7.0 CONCLUSIONS AND RECOMMENDATIONS

ATC directed remedial excavation activities at the Hertz facility located at LAX from March 23, 2005 through April 4, 2005. Transportation manifests indicate that 1,000 tons of petroleum hydrocarbon-impacted soil was excavated, transported and disposed during the performance of excavation activities. Laboratory analytical results indicate that TPHg, TPHd, benzene and MTBE concentrations of up to 150, 720, 0.006, and 0.67 mg/kg, respectively, are still present in the remaining soil. The TPHg, TPHd, and benzene concentrations are below maximum soil screening levels established by the Los Angeles Region California Regional Water Quality Control Board in the *Interim Site Assessment and Cleanup Guidebook*, May 1996, based on a depth to groundwater of approximately 53 feet as measured in well MW-1. Additionally, the benzene and MTBE concentrations are below the EPAs Preliminary Remediation Goals (PRGs) for industrial and residential soils.

Based on laboratory analytical results and field observations, no further investigation is deemed necessary in conjunction with the removal of hydrocarbon impacted soils associated with the western fueling system at the site.

As part of a groundwater assessment investigation conducted in September 2003, ATC collected and analyzed a groundwater sample from well MW-1 located adjacent to the gasoline UST area. Laboratory analytical data indicated TPHg, MTBE, and TBA was present in the sample at concentrations of 0.061 mg/l; 8,700 ug/l; and 2,500 ug/l; respectively. The well has not been sampled since September 2003. Based on the elevated concentrations of MTBE and TBA in the previous groundwater sample, ATC recommends the following:

- Perform additional groundwater sampling of well MW-1.

8.0 LIMITATIONS

ATC's professional services were performed, findings obtained and recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. ATC is not responsible for the independent conclusions, opinions or recommendations made by others based on the records reviewed, site inspection, field exploration and/or laboratory data presented in this report.

It should be noted that all environmental assessments are inherently limited in the sense that conclusions are drawn and recommendations developed from information obtained from limited research and site evaluation. Subsequent field investigations may differ from the conditions defined by this investigation. Additionally, the passage of time may result in a change in the environmental characteristics at this site and surrounding properties. This report is not a regulatory compliance audit.

All specific data generated and reports written for this project are the proprietary information of Hertz and will only be released to Hertz, unless otherwise directed by law. These data are for the sole use and reliance of Hertz. The results presented in any oral or written reports are based upon the information acquired during this investigation. ATC considers business considerations set forth in this document to be the proprietary and confidential information of ATC. This report and the information contained herein shall not be used for any purpose other than as specifically stated in this report and shall not be disclosed to any other party without ATC's written consent.

It must be noted that no investigation can absolutely rule out the existence of any hazardous materials at a given site. This assessment was based upon prior site history and observable conditions and activities. Existing hazardous materials and contaminants can escape detection using these methods.

The work performed in conjunction with this assessment and the data developed are intended as a description of available information at the dates and location given. This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

Notes: Results above the laboratory Practical Quantitation Limit (PQL) or Detection Limit (DL) are in boldface font.
All concentrations reported in milligrams per killogram (mg/kg)

TPHg = Total Petroleum Hydrocarbons characterized as Gasoline (EPA Test Method 8260)
MTBE = Methyl-tert-Butyl Ether by EPA Test Method 8260
TAME = tert-Amyl Methyl Ether by EPA Test Method 8260
TBA = tert-Butanol by EPA Test Method 8260
DIPE = Di-isopropyl Ether by EPA Test Method 8260
ETBE = Ethyl tert-Butyl Ether by EPA Test Method 8260
< = Less than the given laboratory detection limit or unknown if no quantifier present
See laboratory anlytical reports for complete list of analytes. Analytes not listed in this table were at concentrations less than the given PQL or DL

HEALTH AND SAFETY PLAN

Appendix 7-4
Form HS 003

ENVIRONMENTAL SITE SAFETY PLAN

Important: Please forward one copy of completed document to the reviewer three (3) working days prior to project start up and maintain a copy on site. Place signed copy in project file. Items marked with "1910.120..." are required by 29 CFR 1910.120 in the paragraph noted.

A. GENERAL INFORMATION (1910.120(c)(4))

Project Name HERTZ / LOS ANGELES (LAX Airport) Project Number 43.75015.0005

Project Manager **Michael Davis** (Print) (Signature)

Site or Building Name HERTZ – LAX AIRPORT

Address 9000 AIRPORT BLVD.

City, State & Zip LOS ANGELES, CALIFORNIA

Client Contact Name and Phone Number Roland Constanzo / (973) 465.6942

Fire #: 213/ 485.6295 **Police #:** 310/ 419.5625 **Ambulance #:** 310.674.6533

Nearest **Hospital** Name **ROBERT F. KENNEDY MEDICAL CENTER**

Address and phone # 4477 W. 118th STREET, HAWTHORNE, CA 90250 / (310) 675.1825

Directions to Hospital South on **AIRPORT BLVD;** Left onto **ARBOR VITAE STREET;** Right onto **S. LA BREA AVE;** Continue on **HAWTHORNE BLVD;** Right onto **W. 118th STREET**

Location of Nearest Phone ATC personnel have their own personal mobile telephones
(With special dialing instructions if any)

Directions for Emergency Escape Identify nearest driveway and proceed to sidewalk or roadway
(Attach diagram if necessary)

Designated Reporting Area Report to sidewalk in front of entrance
(After emergency occurrence)

B. SITE DESCRIPTION (1910.120(c)(4))

Facility History:

The site is an active car rental facility. Oversight remedial excavation and collect soil samples.

Type of Hazard Anticipated On-Site (i.e. tanks, drums, etc.):

Potentially petroleum hydrocarbon impacted soil.

Amount of Hazardous Materials Present:

Unknown

General Site Description:

The site is an active car rental facility.

C. PROJECT OBJECTIVE (S) (1910.120(b)(3))

(Description of work area activities planned:)

Oversight activities during remedial excavation activities.

D. PROJECT ORGANIZATION (1910.120(b)(2))

Team Member	Responsibility	Type of Training	Date of Training
Michael Davis	**Branch/Project Manager**	**HAZWOPER**	**02/2005**

E. CHEMICAL HAZARD ANALYSIS (1910.120(b)(4))

Contaminant	IP (eV)	PEL/TLV (ppm)	IDLH (ppm)	LEL/UEL (%)	Flash Point (°F)	Routes of Exposure
BENZENE	**9.24**	**1 / 0.5**	**500**	**1.2 / 7.8**	**12**	INHALATION DERMAIL INGESTION
TOLUENE	**8.82**	**200 / 50**	**500**	**1.1 / 7.1**	**40**	
ETHYLBENZENE	**8.76**	**100 / 100**	**800**	**0.8 / 6.7**	**55**	
XYLENE (TOTAL)	**8.56**	**100 / 100**	**900**	**1.1 / 7.0**	**81**	
MTBE	**9.70**	**50 / 100**	**1,600**	**2.4 / 8.0**	**52**	
GASOLINE	**N/a**	**N/a**	**N/a**	**1.4 / 7.6**	**- 45**	
This is for general guide only. The listed compounds will be encountered as hazardous waste and will have similar, but different characteristics and concentrations. No MSDS are available.						

NOTE: Attach Material Safety Data Sheets for all substances identified above. See Section (M) (2).

F. OTHER HAZARDS

Heat Stress? [ ] Yes [X] No If yes, please specify precautions to be taken:

Cold Stress? [ ] Yes [X] No If yes, please specify precautions to be taken:

Excessive Noise? [X] Yes [ ] No If yes, please specify precautions to be taken:

Heavy equipment will be utilized. Earplugs are recommended.

Confined Space Entry? [ ] Yes [X] No If yes, attach copy of Confined Space Entry Permit.

Excavations 4' or greater in depth? [X] Yes [ ] No If yes, specify precautions to be taken:

An excavation to approximately 14 feet will be required. No ATC personnel will enter the excavation. All soil sampling will be done at grade utilizing the backhoe bucket.

Welding, Cutting & Brazing? [ ] Yes [X] No If yes, specify precautions to be taken:

Heavy Equipment Operation? [X] Yes [ ] No If yes, specify precautions to be taken:

The excavation will be delineated. All equipment have back-up safety audible alerts.

Slip, Trip or Fall Hazards? [X] Yes [ ] No If yes, specify precautions to be taken:

Slip, trip, or fall hazards may occur. Maintain a clean and organized work environment and keep tools and parts in an organized manner.

Presence of Overhead Utilities

Are overhead utilities present at the project site? [X] Yes [ ] No

If so, always maintain suitable clearance from overhead lines. Reference manual section 12.

Specify location: Overhead utility supply lines are located along the perimeter and enter the site.

Presence of Underground Utilities

Have underground utilities been located and marked at the site? [X] Yes [ ] No [ ] NA

If yes, have the requirements of manual section 33 – Subsurface Investigations been followed? (Attach completed Checklist for Subsurface Clearance - Appendix 33-1) [ ] Yes [X] No

ATC IS THE SUBCONTRACTOR – HB COWEY CONTRACTOR IS RESPONSIBLE FOR EXCAVATION

Specify names and phone number of utilities contact:

Name of Contact(s) UNDERGROUND SERVICES ALERT (USA) OF CALIFORNIA

Phone Number 800/ 422.4133

G. SITE CONTROL (1910.120(d))

Work Zones have been established as shown on the attached **Site Diagram.**

Site Security: Security on site will be maintained by:

XXXXXX Temporary barricades and/or warning tape

N/a Security Fencing

N/a 24 Hour Security

N/a Other (specify) _____

H. PERSONAL PROTECTIVE EQUIPMENT (1910.120(b)(4)) (LIST EXPOSURES UNDER WORK ZONE)

Based on evaluation of potential hazards, the following levels of personal protection have been designated for the applicable work zones:

Work Zone	Level of Protection	Required Protective Equipment (specify exact type e.g. nitrile gloves)	
Exclusion Zone		Respirator:	
		Filters/Cartridges:	
	D	Boots:	
		Inner Gloves:	
	D	Outer Gloves:	
	D	Protective Coverall:	
	D	Hard Hat:	
	D	Eye Protection:	
		Other:	
Contamination Reduction Zone		Respirator:	
		Filters/Cartridges:	
	D	Boots:	
		Inner Gloves:	

D	Outer Gloves:
D	Protective Coverall:
D	Hard Hat:
D	Eye Protection:
	Other:

Exceptions and Modifications:

Minimal exposure is expected due to the inherent characteristics of petroleum oil. Only when PID readings exceed the permissible (and/or above OSHA exposure standards) will exclusion zone and decontamination procedures be implemented. Otherwise, LEVEL D personal protective equipment will be utilized.

I. DECONTAMINATION (1910.120(k))

Personnel Decontamination Procedures

All personnel entering the Exclusion Zone will undergo decontamination prior to leaving the site. Personnel will proceed through the following decontamination stations:

Decontamination Solution: Alconox™ or Liquidnox™

STATION #1:

Equipment Required:

Wash tub or pool; water (hot if possible); decontamination solution; garden hose or Hudson™ pump canister; scrub brush; garbage bags; buckets and 55-gallon drum.

STATION #2:

Equipment Required:

Wash tub or pool; water (hot if possible); garden hose or Hudson™ pump canister; garbage bags; buckets and 55-gallon drum.

STATION #3:

Equipment Required:

Washtub or pool; cold water; garden hose or Hudson™ pump canister.

Equipment Decontamination

Gross Removal By:

Station 1	Hand Scrubbing
Station 1, 2	Cold High Pressure Wash
Station 1	Hot High Pressure Wash (if possible)
Station 1	Steam Cleaning (if possible)
	Other (specify)
Station 3	Clean Rinse
Station 1	Decon solution (specify) Alconox™ or Liquidnox™

Decontamination Waste Water

Collection (specify how):

Wash tub or plastic pool.

Direct Discharge (specify how and where):

NONE - All generated waste is stored and labeled in 55-gallon steel drums.

Pre-Treatment (specify):

N/a

Disposal (specify how and where):

All generated waste is transported and disposed (under contract) under waste manifest to a state certified, RCRA approved treatment facility.

J. AMBIENT AIR MONITORING (1910.120(b)(4))

Activity & Contaminant	Instruments	Action Level	Frequency

Comments: Collect ambient air monitoring data as frequently as possible, up to 4 times per hour

K. PERSONNEL AIR MONITORING (1910.120(h))

Activity/Location	Contaminants(s)	NIOSH/OSHA Protocol
All activities, at any location on- or off-site	**Volatile Organic Compounds (VOCs)**	**If PID displays:** **25 ppm in breathing zone, use respirator.** **250 ppm in breathing zone, stop work.**

L. CONTINGENCY PLAN (1910.120(l))

Emergency Communication Signal(s) (specify): Fist in the air = stop work and ask for further direction.

Emergency Escape Route(s) (specify and indicate on site diagram): Identify nearest driveway and proceed to sidewalk or roadway; report to designated reporting area.

Emergency Equipment On Site: (specify location):

First Aid Kit: ATC vehicle

Fire Extinguishers: ATC vehicle

Telephone: All ATC personnel have dedicated mobile phones.

Eye Wash/Safety Shower: ATC vehicle

Others (specify):

Re-entry to the Exclusion Zone following an on-site emergency shall not be permitted until the following conditions are satisfied:

(1) The conditions resulting in an emergency have been corrected.

(2) The hazards have been re-evaluated.

(3) The HASP has been reviewed and determined adequate for the hazards encountered.

(4) All site personnel have been instructed in any new hazards and changes to the HASP.

M. OTHER REQUIRED INFORMATION

In order to comply with OSHA standards, the following documents MUST be maintained on site:

1) Hazard Communication Manual (1910.1200)

2) Chemical List and Material Safety Data Sheets for all chemicals (1910.1200)

3) Respirator fit test records for all employees who will be required to wear respirators (1910.134)

4) Copy of ATC's Respirator Program (1910.134)

5) Latest medical summary for all personnel (1910.120)

6) Copy of OSHA 200 (300A) Log posted during months of February - April only

APPENDIX B

PERMITS

The UST removal permit was not available to ATC at the time of this report. A copy will be made available upon receipt by ATC.

APPENDIX C

STANDARD OPERATING PROCEDURES

FIEL SOIL VAPOR MONITORING

SCAQMD RULES 1149 AND 1166

STANDARD OPERATING PROCEDURE
SOIL BOREHOLE DRILLING, MONITOR WELL INSTALLATION AND DEVELOPMENT, AND SOIL SAMPLING

Drilling and Soil Sampling

Permits, Site Safety Plan. Utility Clearance

ATC Associates Inc. (ATC) obtains all the required permits, unless otherwise contractually directed. ATC prepares a site specific Site Safety Plan detailing site hazards, site safety and control, decontamination procedures, and emergency response procedures to be employed throughout the defined phase of work. At least 48 hours prior to drilling. Underground Service Alert (USA) or an equivalent agency is notified of the planned work. ATC attempts to locate all underground and above ground utilities by site inspection (in conjunction with its' subcontractors and knowledgeable site managers, if available), and review of site as-built drawings. ATC may employ a private, professional utility locator to refine the site utility inspection.

Drilling Equipment

All soil borings are drilled using a truck-mounted hollow-stem auger drill rig, unless site conditions warrant a different drilling method. Subsurface conditions permitting, the first five feet of each boring is advanced using a hand-auger or post-hole digger. All drilling equipment is inspected daily and maintained in safe working condition by the operator. All down-hole drilling equipment is steam cleaned prior to arriving on site. Working components of the drill rig near the borehole, as well as augers and drill rods are thoroughly steam cleaned between each boring location. All ATC drilling and sampling methods are consistent with ASTM Method D-1452-80 and local, stale and federal regulations.

Soil Sampling and Lithologic Description

Whenever possible and approved by the appropriate regulatory agency, the first ATC boring to be drilled at a site is continuously cored to obtain a complete lithologic description. Otherwise, soil samples are typically collected every 5 feet to the total depth explored, using brass tubes fitted in a California-modified split spoon sampler. If copper or zinc contamination is the subject of the investigation, stainless steel liners are used instead of brass. Additional soil samples may be collected based upon significant changes in lithology or in areas of obvious soil contamination. During soil sample collection, the split spoon sampler is driven 18 to 24 inches past the lead auger by a 140-pound hammer falling a minimum of 30 inches. The number of blows necessary to drive the sampler and the amount of soil recovered is recorded on the Field Exploratory Soil Boring Log. The soil sampler and liners are cleaned with an Alconox® solution and rinsed with tap water prior to each sampling event. New liners are used whenever a soil sample may be retained for laboratory analysis.

Soil samples selected for laboratory analysis are sealed on both ends with Teflon® tape and plastic end caps. The samples are labeled, documented on a chain-of-custody form and placed in a cooler for transport to a state-certified analytical laboratory. Soil contained in remaining liners is removed for lithologic descriptions (according to the Unified Soil Classification System). Additional soil is screened for organic vapors by placing approximately 30 grams of soil in a sealed plastic bag or a glass jar sealed with aluminum foil. The bag or jar is left undisturbed for approximately 15 minutes, in the sun if possible. The headspace in the bag is accessed in a manner to minimize entry of outside air, and is tested for total organic vapor using a calibrated photo ionization detector (PID). The results of the field screening are noted with the lithologic descriptions on the Field Exploratory Soil Boring Log.

On encountering an impermeable (clayey) layer three feet or more in thickness below a saturated permeable layer, where the impermeable layer is considered to be a possible confining layer for an underlying aquifer,

drilling is halted until a decision to proceed is obtained from the project manager. This process minimizes the chance of introducing contamination to an underlying, clean aquifer.

Soil Waste Managment

Soil cuttings are stockpiled on and covered with plastic sheeting to control runoff, or contained in 55-gallon D.O.T.-approved drums on site. Waste soil is sampled to chemically profile it for disposable, and hauled by a licensed waste hauler to an appropriate landfill or certified treatment facility. All waste stored on site is properly labeled at the time of production.

Soil Boring Abandonment

Soil borings which are not to be converted into monitor wells are sealed to the ground surface using neat cement, sand-cement slurry, or hydrated bentonite pellets or chips in accordance with federal, state and local regulations. Native soil may be used to fill the top two to three feet for cosmetic purposes, as permitted.

Monitor Well Installation

Well Casing. Screen and Filter Pack Construction

All well construction is performed in accordance with Department of Water Resources "California Well Standards" and all requirements of local oversight agencies. Soil borings to be converted into single-cased monitor wells are a minimum of eight inches in diameter for 2-inch diameter wells, and a minimum of ten inches in diameter for 4-inch diameter wells. Monitor wells are constructed with schedule 40, threaded. polyvinyl chloride (PVC) casing unless site geochemistry or contamination necessitates an alternative regulatory agency approved material. The wells are constructed with factory-slotted screen and threaded end caps.

The screened interval is placed such that it extends approximately ten feet into the water bearing zone, and at least five feet above the expected maximum water level. The screened interval may extend less than five feet above the maximum water level, only to prevent intersection of the screened interval with the top of the confining layer of a confined aquifer, or where the water table is too shallow to allow this construction. A graded sand filter pack is placed in the annular space across the screened interval and extended approximately one to two feet above the screen, as site conditions permit, so as to prevent extension of the sand pack into an overlying water-bearing unit. The well screen slot size is the maximum size capable of retaining 90% of the filter pack. Typically, 0.010-inch screen is used where the formation is predominantly clay and/or silt or poorly graded fine sand. 0.020-inch screen is used where the formation is predominantly well-graded or medium to coarse sand and/or gravel.

The filter pack grade (mean grain size) is selected according to native sediment type as follows: a) for poorly graded fine sand or silt/clay - 4 times the 70% retained grain size of the formation b) for medium to coarse sand, gravel or well graded sediments - 6 times the 70% retained grain size. Since results of particle size analysis are not always available, ATC often selects screen size and filter pack on the basis of general site stratigraphy, and specifically the finest significantly thick layer of sediment to be screened. Commonly selected grades are Lone Star® 3, 2/12 or 2/16 (or equivalent) with 0.020-inch slotted screen and Lone Star® 1/20 with 0.010-inch slotted screen.

Well Seal and Completion

A minimum two-foot seal of bentonite is placed above the sand pack. The bentonite seal is hydrated by either formation water or potable water. Neat cement or a cement/bentonite grout mixture seals the remaining annular space to the surface. If bentonite is used in the grout mixture, it does not exceed 5% by weight the grout is placed using a tremie pipe, if the top of the bentonite is more than 20 feet below grade, or if water is present in the boring above the bentonite seal. A watertight locking cap and protective traffic-rated vault box is installed on top of each well. Well construction details are presented on the Field Exploratory Soil Boring Log. Following completion of a well, ATC completes and submits, or ensures that

the driller has sufficient information to complete and submit, the state-required Well Completion Report or equivalent document.

Well Development

All newly installed wells are developed prior to sampling to remove fine grained sediments from the well and stabilize the filter pack and the disturbed aquifer materials. Development takes place prior to or at least 24 hours after setting the seal on the well, unless otherwise directed by a local oversight agency. Well development consists of surging with a surge block and removing water from the well with either a pump or bailer, until the well is free of sediment, or until at least 10 well casing volumes have been removed. Depth to bottom is measured to determine casing volume. If the well is sampled immediately following development, temperature, pH, specific conductance and turbidity (qualitative) are monitored during well development (see section "Groundwater Sampling"). All development equipment is cleaned prior to use and between wells with an Alconox® solution, then rinsed in potable water. All data collected during development are recorded on the Well Development Data Sheet and, if necessary, the Purging Data Sheet.

Well Surveying

All well elevations are surveyed at the north side of the top of casing to the nearest ±0.01 foot. The exact survey point (at the center of the survey rod or, if the casing stub is uneven, the point of contact between casing and rod) is clearly marked and maintained on the casing rim. Elevations are referenced either to mean sea level or to a project datum. A project datum is typically chosen so as to minimize the possibility of its' later disturbance. For instance, fire hydrants are commonly selected. Where required, the wells are surveyed by a licensed land surveyor, relative to mean sea level.

STANDARD OPERATING PROCEDURE

FIELD SOIL VAPOR MONITORING

A representative soil sample will be collected from each sample interval and placed in a Ziplock® plastic bag. The bag will be sealed and the soil dissaggregated. At least ten minutes will be allowed for the soil to be heated by direct sunlight and for any VOCs in the soil to accumulate in the headspace of the bag. Volatile gases will then be monitored by inserting the probe of a Photovac 2020 photoionization detector (PID). The PID is equipped with a 10.6 eV lamp which is capable of detecting VOCs at concentrations of 0.1 parts per million (ppm). The PID will be calibrated on-site using 100-ppmV isobutylene-in-air span gas (equivalent to benzene) prior to drilling operations. PID readings will be recorded in the boring logs.

(Adopted August 5, 1988)(Amended July 14, 1995)(Amended May 11, 2001)

RULE 1166. VOLATILE ORGANIC COMPOUND EMISSIONS FROM DECONTAMINATION OF SOIL

(a) Applicability

This rule sets requirements to control the emission of Volatile Organic Compounds (VOC) from excavating, grading, handling and treating VOC-contaminated soil as a result of leakage from storage or transfer operations, accidental spillage, or other deposition.

(b) Definitions

(1) EXCAVATION is the process of digging out and removing materials, including any material necessary to that process such as the digging out and removal of asphalt or concrete necessary to expose, dig out and remove known VOC contaminated soil.

(2) GRADING is the process of leveling off to produce a smooth surface including the removal of any material necessary to that process such as asphalt and concrete necessary to expose known VOC contaminated soil.

(3) SOIL DECONTAMINATION MEASURE is any process approved by the Executive Officer to remediate, destroy, remove, or encapsulate VOC and VOC-contaminated soil.

(4) UNDERGROUND STORAGE TANK means any one or combination of tanks, including pipes connected thereto, which is used for the storage of organic liquid which is more than 50% beneath the surface of the ground.

(5) VOC CONTAMINATED SOIL is a soil which registers a concentration of 50 ppm or greater of Volatile Organic Compounds as measured before suppression materials have been applied and at a distance of no more than three inches from the surface of the excavated soil with an organic vapor analyzer calibrated with hexane.

(6) VOC CONTAMINATED SOIL MITIGATION PLAN is a plan to minimize VOC emissions to the atmosphere during excavation and any subsequent handling of VOC-contaminated soil.

(7) VOLATILE ORGANIC COMPOUND (VOC) is any volatile compound of carbon, excluding methane, carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, ammonium carbonate, and exempt compounds. Exempt compounds are defined in Rule 102—Definition Of Terms.

(8) VOLATILE ORGANIC MATERIALS include gasoline, diesel, crude oil, lubricant, waste oil, adhesive, paint, stain, solvent, resin, monomer, and/or any other material containing VOC.

(c) Requirements

(1) A person excavating an underground storage tank and/or transfer piping storing or previously storing VOC materials, or excavating or grading soil containing VOC materials shall:

(A) Apply for, obtain and operate pursuant to a mitigation plan approved by the Executive Officer prior to commencement of excavation or handling. The mitigation plan general requirement and application requirements are found in Attachment A to this rule. A copy of the approved plan must be on site during the entire excavation period.

(B) Notify the Executive Officer at least 24 hours prior to excavation using a form approved by the Executive Officer which is fully completed.

If the excavation does not commence on start date, renotification is required.

An alternative notification procedure may be authorized for multiple excavations within a single facility, with prior written approval from the Executive Officer.

(C) Monitor for VOC contamination pursuant to subdivision (e), at least once every 15 minutes commencing at the beginning of excavation or grading and record all VOC concentration readings in a format approved by the Executive Officer; and

(D) When VOC-contaminated soil is detected during excavation or grading:

(i) Implement the approved mitigation plan (Attachment A).

(ii) Notify the Executive Officer within 24 hours of detection of VOC-contaminated soil.

(iii) Monitor and record VOC concentration readings as prescribed in the plan. Monitoring records must be kept available on site.

(iv) Keep calibration records for all monitoring instruments available on site.

(2) A person handling VOC-contaminated soil at or from an excavation or grading site shall:

(A) Segregate VOC-contaminated stockpiles from non-VOC contaminated stockpiles such that mixing of the stockpiles does not take place.

(B) Spray VOC-contaminated soil stockpiles with water and/or approved vapor suppressant and cover them with plastic sheeting for all periods of inactivity lasting more than one hour.

(C) Conduct a daily visual inspection of all covered VOC contaminated soil stockpiles to ensure the integrity of the plastic covered surfaces. A daily inspection record must be maintained on site.

(D) Comply with the provisions in subparagraph (c) (1)(A) and clause (c)(1)(D)(i).

(E) Maintain a record of the identification and business addresses of the generator, transporter and storage/treatment facilities. Such record shall be signed by each party at the time custody is transferred.

(F) Treat or remove contaminated soil from an excavation or grading site within 30 days from the time of excavation.

(3) If the VOC concentration in the excavated soil is measured at greater than 1000 ppm, spray the soil with water or vapor suppressant and:

(A) As soon as possible, but not more than 15 minutes, place the soil in sealed containers, or

(B) As soon as possible, but not more than 15 minutes, load into trucks, moisten with additional water, cover and transport off site, or

(C) Implement other alternative storage methods approved in writing by the Executive Officer.

(4) A person treating VOC-contaminated soil shall:

(A) Obtain a permit to construct and operate treatment equipment, as applicable, from the Executive Officer, and

(B) Implement VOC-contaminated soil decontamination measures, as approved by the Executive Officer in writing, which result in Best Available Control Technology applied during all segments, and which include, but are not limited to, at least one of the following:

(i) Installation and operation of an underground VOC collection system and a disposal system prior to excavation.

(ii) Collection and disposal of the VOC from the excavated soil on-site using equipment approved by the Executive Officer.

(iii) Any equivalent VOC-contaminated soil control measure previously approved in writing by the Executive Officer.

(5) A person shall not engage in or allow any on-site or off-site spreading, grading or screening of VOC-contaminated soil, which results in uncontrolled evaporation of VOC to the atmosphere.

(6) Loading trucks for contaminated soil must meet the following:

(A) The truck and trailer shall be adequately tarped prior to leaving the site; no excavated materials shall extend above the sides or rear of the truck or trailer to prevent soil spillage during transport, and

(B) The exterior of the truck, trailer and tires shall be cleaned off prior to the truck leaving the site.

(d) Exemptions

(1) The provisions of this rule shall not apply to the following:

(A) Excavation, handling, and treating of less than one (1) cubic yard of contaminated soil.

(B) Removal of soil for sampling purposes.

(C) Accidental spillage of five (5) gallons or less of VOC containing material.

(2) The provisions of paragraphs (c)(1) and (c)(2) shall not apply to soil excavation or handling as a result of an emergency as declared by an authorized health officer, agricultural commissioner, fire protection officer, or other authorized agency officer. Whenever possible, the Executive Officer shall be notified by telephone prior to commencing such excavation. The Executive Officer shall be notified in writing no later than 48 hours following such excavation. Written notification shall include written emergency declaration from the authorized officer.

(e) Test Methods

(1) A person shall measure excavated soils for volatile organic compounds to determine contamination by:

(A) Using an organic vapor analyzer calibrated with hexane, complying with 40 CFR Part 60 Appendix A, EPA Reference Method 21 Section 3 or any equivalent method with prior approval in writing by the Executive Officer. If other calibrating gases are used, then the measured readings shall be correlated to and expressed as hexane.

(B) Placing the probe inlet at a distance of no more than three inches from the surface of the excavated soil and while slowly moving the probe across the soil surface, observe the instrument readout. If an increased meter reading is observed, continue to sample the excavated soil until the maximum meter reading is obtained. Leave the probe inlet at this maximum reading location for approximately double the instrument response time. If the maximum observed meter reading is greater than the 50 ppm standard in the regulation, record and report the results.

(2) The presence of VOC in stored or spillage materials shall be determined by SCAQMD Method 313 [Determination of Presence of Volatile Organic Compounds (VOC) in Headspace] and/or Method 304 (Determination of Volatile Organic Compounds in Various Materials) contained in the SCAQMD "Laboratory Methods of Analysis for Enforcement Samples" manual.

(f) Enforcement

(1) Violation of any provision of this rule or the violation of the approved mitigation plan shall be grounds for the Executive Officer to amend or revoke the mitigation plan, in addition to penalties provided by the Health & Safety Code.

(2) If the owner or operator is served with a Notice of Violation for creating a public nuisance, the owner or operator shall suspend operation until the public nuisance is mitigated to the satisfaction of the Executive Officer.

ATTACHMENT A

GENERAL MITIGATION PLANS REQUIREMENTS

VOC Contaminated Soil Mitigation Plans shall be written to minimize VOC emissions to the atmosphere during excavation, grading, handling and treatment of VOC contaminated soil. VOC Contaminated Soil Mitigation Plans shall consist of three types: Various Locations, Site Specific and Facility Treatment.

(1) General Requirements

(A) A plan is not transferable.

(B) A person responsible for the excavation, grading or handling of VOC contaminated soil must be completely familiar with the plan and must adhere to the plan requirement. The Executive Officer may require that the plan be signed by the owner and/or operator.

(C) A plan may be amended upon renewal.

(D) Permission to excavate, grade or handle VOC contaminated soil may be withdrawn by the District upon a finding by the Executive Officer that the excavation, grading or handling of the VOC contaminated soil is causing a public nuisance or violating other AQMD rules or regulations.

(2) Various Location Plans:

(A) Shall be limited to the excavation of 2000 cubic yards or less of VOC contaminated soil in any consecutive 12 month period at the same site.

(B) Shall not be used in conjunction with any other various location plan at the same site within a consecutive 12-month period.

(C) Shall expire after one year from issuance unless renewed.

(D) Shall not be issued for nor used for operations that involve grading, soil treatment or remediation, or landfills.

(3) Site Specific Plans:

(A) Shall be for excavation of greater than 2000 cubic yards of VOC contaminated soil.

(B) Shall be issued for specific excavation or grading locations for a period not to exceed two years.

(C) Shall not be renewable.

(4) Facility Treatment Plans:

(A) Shall be issued for a treatment facility at a permanent location.

(B) Shall expire after one year from issuance unless renewed.

(5) Applications for Site Specific Plans shall contain as a minimum:

(A) Reasons for excavation or grading.

(B) Cause of VOC soil contamination and history of the site.

(C) Description of tanks or piping associated with the soil contamination.

(D) An estimate of the amount of contaminated soil.

(E) The operating schedule for excavation and removal.

(F) Description of how the excavation or grading will be conducted.

(G) Description of mitigation measures for dust, odors and VOC.

(H) Details of disposal of VOC contaminated soil, including the ultimate receptor.

(I) Description of monitoring equipment and techniques.

(J) A map showing the facility layout, property line, and surrounding area up to 2500 feet away, and including any schools, residential areas or other sensitive receptors such as hospitals or locations where children or elderly people live or work.

(K) Designation of a person who can conduct a site inspection with the Executive Officer prior to issuance of the plan.

(6) Applications for Facility Treatment Plans shall at a minimum:

(A) Include a list of all AQMD permits to construct or operate which have been issued for that treatment and control equipment.

(B) Provide for the implementation of VOC-contaminated soil decontamination measures, as approved by the Executive Officer in writing, which result in Best Available Control Technology during all operations.

(C) Provide a map showing the facility layout including the location of all proposed VOC and non-VOC contaminated soil stockpiles.

(D) Specify the total amount of VOC contaminated soil proposed to be stockpiled on site.

(E) Provide for VOC contaminated soil stockpiles to be kept moist with water or suppressant and be covered to prevent fugitive emissions.

(F) Provide for VOC contaminated soil stockpiles to be segregated from non-VOC contaminated soil stockpiles.

(G) Provide for maintenance of records for stockpiles according to the source name, address and dates of reception.

(H) Provide for records of the generator, transporter and storage/treatment facilities and indicate their identification and business addresses. Such records shall be signed by each party at the time custody is transferred.

(I) Provide a map showing the facility layout, property line, and surrounding area up to 2500 feet away, and including any schools, residential area or other sensitive receptors such as hospitals, or locations where children or elderly people live or work.

(J) Designation of a person who can conduct a site inspection with the Executive Officer prior to issuance of the plan.

(K) Specify the operating schedule and maximum amount of VOC-contaminated soil proposed to be remediated on a daily basis.

(7) In approving a plan, the Executive Officer require reasonable conditions deemed necessary to ensure the operations comply with the plan and AQMD rules. The conditions may include, but shall not be limited to, procedures for ensuring responsibility for the implementation of the plan, accessibility to the site for AQMD staff, notification of actions required by the plan, identification of emission receptors, monitoring and testing, suppression and covering of stockpiles, prevention of public nuisance from VOC or dust emissions, prevention of fugitive emissions of VOC contaminated soil, loading of truck trailers, and disposal and treatment.

(8) In approving a plan, the Executive Officer may require any records deemed necessary to be maintained by the operator to demonstrate compliance with the plan. Such records shall be retained for at least 2 years and be made available to the Executive officer upon request.

ZymaX envirotechnology, inc. is certified by CA Department of Health Services: Laboratory #1717

*PQL - Practical Quantitation Limit

**MDL - Method Detection Limit

***Results listed as ND would have been reported if present at or above the listed MDL. Constituents reported with a "J" qualifier are below the PQL but greater than the MDL and are estimated values.

Note: Analyzed by EPA 8260 and GC/MS Combination.

Note: Analytical range is C4-C12.

Note: TPH quantitated against gasoline.

Note: Oxygenates included in TPH result.

Note: Extracted by EPA 5035 (Closed-System Purge and Trap)

Percent Surrogate Recovery (Toluene-d8)			94
Percent Surrogate Recovery (4-Bromofluorobenzene)			100

ZymaX envirotechnology, inc. is certified by CA Department of Health Services: Laboratory #1717
*PQL - Practical Quantitation Limit
**MDL - Method Detection Limit
***Results listed as ND would have been reported if present at or above the listed MDL. Constituents reported with a "J" qualifier are below the PQL but greater than the MDL and are estimated values.

Note: Analyzed by EPA 8260 and GC/MS Combination.
Note: Analytical range is C4-C12.
Note: TPH quantitated against gasoline.
Note: Oxygenates included in TPH result.
Note: Extracted by EPA 5035 (Closed-System Purge and Trap)

Collected:	04/04/05
Received:	04/04/05
Matrix:	Soil

Project:	Hertz/LAX
Project Number:	43.75015.0005
Collected by:	David Baltazar

Sample Description:	S18-2'
Analyzed:	04/12/05
Method:	See Below

CONSTITUENT	PQL* mg/kg	MDL** mg/kg	RESULT*** mg/kg
TOTAL PETROLEUM HYDROCARBONS			
Total Petroleum Hydrocarbons (C12-C34)	**10.**	**5.0**	**82.**
Percent Surrogate Recovery			94

ZymaX envirotechnology, inc. is certified by CA Department of Health Services: Laboratory #1717
***PQL - Practical Quantitation Limit**
****MDL - Method Detection Limit**
*****Results listed as ND would have been reported if present at or above the listed MDL. Constituents reported with a "J" qualifier are below the PQL but greater than the MDL and are estimated values.**

Note: Analyzed by GC/FID (8015M).
Note: Extracted by EPA 3550 on 04/08/05.
Note: Analytical range is C8-C40.
Note: TPH quantitated against diesel fuel.

4.0 SITE BACKGROUND INFORMATION

4.1 SITE DESCRIPTION AND SURROUNDING LAND USE

The site is located at 9000 Airport Boulevard in Los Angeles California (**Figure 1 - Vicinity Map**) and is used for rental car operations. The site consists of five buildings, a car wash system, and refueling systems. The refueling system consists of gasoline underground storage tanks (USTs), one diesel UST, fourteen fuel dispenser islands, and underground distribution lines. The UST system is generally located in the western, central portion of the facility and is bordered to the west by Airport Boulevard and to the north by the main vehicle entryway into and out of the facility.

The site is composed of the two main fueling areas; the "eastern" fueling system and the "western" fueling system.

- The eastern system consists of two 12,000 gallon gasoline USTs and 10 dispenser islands. Each island is equipped with one dispenser, and the ten islands are covered by an overhead canopy. The USTs are located just south of the dispenser islands and are oriented north-south in a common excavation.

- The western system consists of one 20,000 gallon gasoline UST, one split UST consisting of 8,000 gallon gasoline and 12,000 gallon diesel, and four dispenser islands. Three gasoline USTs and one diesel UST are located just north of the dispenser islands and are oriented east-west in a common excavation. Each dispenser island in the western system is equipped with two to three dispensers, and are also covered by a metal overhead canopy structure. The two 20,000 gallon USTs were installed in 2005 when the previous USTs were removed as discussed below

Directly north and adjacent to both the eastern and western systems is an eight foot cinderblock wall, followed by a landscaped planter area immediately to the north, then the paved main entry into and out of the facility. To the west of the western system is an asphalt paved drive/parking area, followed by a traffic guard rail and an eight foot chain link fence, then a landscaped parkway with Airport Boulevard west. It should be noted that immediately to the west, and overhead of the canopy for the four dispenser islands related to the western system, exists a large V-shaped commercial billboard placed for viewing from Airport Boulevard. Toward the east and south of the systems are an asphalt paved parking area and maintenance areas for the Hertz facility, including car wash structures to the south and the main office/locker building for the facility to the southeast.

4.2 PRIOR SITE ASSESSMENT ACTIVITY

In July 2003, ATC directed the advancement of 21 soil borings (B-1 through B-21) to depths ranging from 15 feet to 30 feet below ground surface (bgs) at the locations shown on **Figure 2 - Site Plan**. The purpose of the assessment was to evaluate soil quality prior to pending UST upgrades associated with Senate Bill SB 989. Minor soil impact was detected in the vicinity of the eastern dispenser islands. Based on the results of soil samples collected in this area, it appears that this impact is contained and attributed to minor surface spills at the associated dispensers.

Petroleum hydrocarbons were detected in soil associated with the western fueling system. The hydrocarbon contaminated soil around the western system is confined to the UST area and around the dispenser island closest to those USTs. The horizontal extent of the hydrocarbon contamination in the western system was estimated to be 40 feet by 60 feet. At the completion of the initial soil characterization, the vertical extent was not known. The deepest area of impacted soil would be located along the western portion of the UST pit (between B-11 and B-14). It was in this area that an additional boring and monitoring well was recommended. The details of the soil assessment are found

in ATC's *Site Assessment Report*, dated August 25, 2003. A summary of soil sample analytical results is included in Table 5.

In September 2003, ATC directed and supervised the advancement of a soil boring and installation of one groundwater monitoring well (MW-1) at a location to the west of the western fueling system. The boring was advanced to a depth of 75 feet bgs and soil samples were collected at five foot intervals. ATC selected five soil samples between 45 and 63 feet bgs for laboratory analysis. Soil samples collected between 45 and 55 feet bgs contained the highest levels of MTBE (ranging between 1.3 to 48 micrograms per kilogram (mg/kg). The MTBE concentrations decreased between 55 feet and 63 feet bgs. Monitoring well MW-1 was constructed using 45 feet (surface to 45 feet bgs) of solid 4-inch diameter Schedule 40 PVC casing, and 30 feet of slotted (0.020-inch slots) 4-inch diameter Schedule 40 PVC well screen. Subsequent to its installation, the well was purged and developed.

A groundwater sample was collected during a September 2003 investigation from the onsite monitoring well MW-1 and the results indicated total petroleum hydrocarbons - gasoline range (TPHg) was detected at a concentration of 61 micrograms per liter (µg/L). TBA and MTBE were reported at concentrations of 2,500 µg/L, and 8,700 µg/L, respectively. All other analytes were below their respective detection limits. Depth to water was measured on September 16, 2003 at 71.25 feet below ground surface.

Between March 24 and April 4, 2005 ATC oversaw the excavation of impacted soil during the removal of four gasoline USTs and one diesel UST, and the associated dispenser islands at the western fueling area. Transportation manifests indicated that 1,000 tons of petroleum hydrocarbon-impacted soil was excavated, transported and disposed during the performance of excavation activities. Laboratory analytical results from soil samples collected during the excavation, indicated that TPHg, total petroleum hydrocarbons - diesel range (TPHd), benzene and methyl tert-butyl ether (MTBE) concentrations of up to 150, 720, 0.006, and 0.67 mg/kg, respectively, were still present in the remaining soil. The TPHg, TPHd, and benzene concentrations were below maximum soil screening levels established by the Los Angeles Region California Regional Water Quality Control Board (*Interim Site Assessment and Cleanup Guidebook*, May 1996), based on a depth to groundwater of approximately 53 feet as originally measured in well MW-1. Additionally, the benzene and MTBE concentrations were below the EPAs Preliminary Remediation Goals (PRGs) for industrial and residential soils. The remediation activities were presented in ATC's August 18, 2005 *Remedial Excavation Report* prepared for the facility.

A summary of the historical groundwater and soil analytical data is provided in **Table 3 and 5**.

4.3 SITE AND AREA LITHOLOGY

The site is located within the Los Angeles Basin in a physiographic unit called The El Segundo Sand Hills (California Department of Water Resources [DWR], 1961). The El Segundo Sand Hills extend from Ballona Gap south to Torrance and the Palo Verdes Hills, and approximately three to four miles inland from the ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The sand hills consist of a narrow strip of active or recent dunes along the coast with older stabilized sand dunes inland.

The Site is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Dune Sand has been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands and which now form a portion of the Torrance Plain. Weathering

and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area (DWR, 1961).

Based on soil boring data from previous investigations at the site (ATC, 2003c) and the current additional site assessment, site lithology from the ground surface to approximately 80 feet below ground surface (bgs) consists predominantly of fine to coarse sand interbedded with silt and clay. ATC identified four generalized soil units beneath the site:

1. an upper fine-grained unit from ground surface to approximately 15 to 20 feet bgs;
2. an upper sand unit beginning between 15 and 20 feet bgs and extending to approximately 30 ft bgs;
3. a lower fine-grained unit from approximately 30 feet bgs extending to between 50 and 55 feet bgs;
4. a lower sand unit from between approximately 50 and 55 feet bgs to at least 75 feet bgs.

Base on the DWR (1961) description of the regional units, it is likely that the units described above are within the undifferentiated sediments of Lakewood Formation.

Cross sections describing soil lithology and soil sample analysis are shown in **Figures 5, 6, and 7**.

4.4 AREA HYDROLOGY AND HYDROGEOLOGY

The Site lies within the West Coast (groundwater) Basin, which is part of the larger Los Angeles Coastal Basin (DWR, 1961). The physical boundaries of the West Coast Basin include the Ballona Escarpment to the north; the Rosecrans Hills to the east; and the Pacific Ocean to the west and south. The Palos Verdes Hills form the boundary of the West Coast Basin to the southeast. Water-bearing strata within the West Coast basin includes mid-Miocene to Oligocene-aged marine and continental sediments. The principal aquifers (water-producing formations) beneath the site include (in youngest to oldest stratigraphic order) the Old Dune Sand, Gage-Gardena, Lynwood, Silverado, and Sunnyside aquifers (DRW, 1961). Many of the aquifers located in the western portion of the West Coast Basin are not currently used as practical sources of potable water due to general degradation of the upper groundwater zone due to historical industrial activity, oil production, and seawater intrusion. The regional direction of groundwater flow is toward the south-southwest.

5.0 RECENT ASSESSMENT ACTIVITIES

ATC conducted a field investigation from June 19 through July 11, 2008. Site assessment activities were conducted per the request of the RWQCB in accordance with the *Workplan for Additional Soil and Groundwater Investigation* (ATC Associates, February 29, 2008) approved by the State Water Resources Control Board - Los Angeles Region on March 5, 2008.

Prior to commencement of field activities, ATC obtained well permits from the County of Los Angeles Water & Sewage/Mountain & Rural Programs Environmental Health Division. A copy of the well permit is included in **Appendix A**. The investigation activities are summarized in the following sections, and the field procedures are detailed in **Appendix B**. Also prior to drilling the well borings, ATC contacted Underground Service Alert (USA) and subcontracted with a private utility locator service to verify the presence of any utilities in the vicinity of the proposed well boring locations. Following the utility clearance, drilling was scheduled.

ATC contracted with Martini Drilling for the well installations. A CME-85 drilling rig equipped with 10-inch diameter hollow-stem augers was utilized to complete the monitoring wells. Additional details are provided below.

5.1 GROUNDWATER MONITORING WELL INSTALLATION

Based on the depth to water measurements and the analytical laboratory results of the July & September 2003 investigations, ATC selected the two locations for installation of groundwater monitoring wells. Our objective was to establish onsite locations for collecting groundwater data; including groundwater hydraulic head measurements and dissolved petroleum constituent concentrations. Between June 19 and 20, 2008, ATC installed two groundwater monitoring wells (MW-2 and MW-3) at the site using a hollow-stem auger drilling method. Groundwater monitoring well MW-2 was installed north of the eastern dispenser islands and MW-3 was installed east of the western dispenser islands. The borings were advanced to between 77 and 89 feet bgs and the monitoring wells were installed to total depths of 75 and 85 feet bgs with a 30 ft screen interval used for both wells. Well locations are shown on **Figure 2**. Well installation activities are summarized below and daily records are presented in **Appendix C**.

5.1.1 Soil Sampling

At each location, soil samples were collected at 5-foot intervals from ground surface to the total depth of the boring. The well borings were drilled, sampled and completed as a groundwater monitoring wells in general accordance with ATC's Standard Operating Procedures, which are included in **Appendix B**.

To obtain preliminary data regarding potential petroleum hydrocarbon-impacted soil, a representative sample was collected at each soil sampling location and field screened for volatile organic vapors in general accordance ATC's Standard Operating Procedures, which are included in **Appendix B**. Organic vapor meter readings were collected using a RAE Systems MiniRAE 2000 photo-ionization detector (PID) and were recorded in the boring logs.

All soil samples collected during the investigation were submitted for laboratory analysis. The details of the analysis are presented in **Section 5.1.5** and a discussion of the results is included in **Section 6.3.1**.

An ATC Geologist completed lithologic logs for each boring in general accordance with ASTM Method D 2488-90. ATC selected all soil samples from each boring for chemical analysis. Soil characteristics (observations of staining or odor), Unified Soil Classification System (USCS) designation, and depth to groundwater were recorded on the boring logs provided in **Appendix C**.

5.1.2 Well Specifications and Construction

Following soil sampling, groundwater monitoring wells were installed using 4-inch-diameter, Schedule 40 PVC casing. Groundwater monitoring well MW-2 was constructed using forty-five (45) feet casing, and thirty feet of well screen. The annulus of the screened portions of monitoring well MW-2 was backfilled with a #3 Monterey sand (or equivalent) filter pack from approximately 75 to 45 feet bgs. An approximate 2-foot layer of medium bentonite chips were placed on top of the upper filter pack and hydrated to form an annular seal. The remaining annular space to the bottom of the concrete seal (approximately 40 feet) was filled with bentonite grout.

Based upon groundwater measurements that were collected upon the completion of monitoring well MW-2 it was determined that groundwater was deeper than had been observed in the lithologic logging and as measured during previous monitoring events. It was determined to extend monitoring well MW-3 to 85 feet below ground surface to compensate for the increased depth to groundwater. The screened portions of monitoring well MW-3 was back filled with #3 Monterey sand (or equivalent) filter pack from 85 to 55 bgs. An approximate 2-foot layer of medium bentonite chips were placed on top of the upper filter pack and hydrated to form an annular seal. The remaining annular space of the bentonite chips seal was filled with bentonite grout.

Each well was completed with a two-foot deep surface seal was placed above the bentonite grout and a traffic-rated well box was placed within a circular two-foot diameter perimeter seal. A summary of the final monitoring well construction details is provided in **Table 1** and locations of the monitoring wells are shown on **Figure 2**.

5.1.3 Well Development

On July 3, 2008, ATC developed monitoring wells MW-2 and MW-3 using a combination of surging and bailing methods. Well MW-2 went dry after removing approximately one bailer (less than a casing volume), so the field personnel allowed the well to recharge. Again after removing approximately one casing volume, the well went dry. At this point ATC terminated well development with purged water relatively clear and free of suspended sediment. Well MW-3 went dry after removing approximately one casing volume, so the field personnel allowed the well to recharge. Again after removing approximately one casing volume, the well went dry. At this point ATC terminated well development with purged water relatively clear and free of suspended sediment.

After well development, ATC measured static depth to groundwater and the total well depth in each well. Depth to water was measured (in ft bgs) at 73.68, 74.21, and 76.40 for wells MW-1, MW-2, and MW-3, respectively. Total well depth was recorded in MW-1 at 77.00, MW-2 at 75.00, and in MW-3 at 85.00.

Groundwater purged during well development was contained in 55-gallon drums and remain onsite pending proper disposition. The groundwater monitoring wells were developed in general accordance with ATC's Standard Operating Procedures, which are included in **Appendix B**.

5.1.4 Well Surveying

On July 3, 2008, a California-licensed Professional land Surveyor surveyed the lateral locations and elevations of the newly installed groundwater monitoring wells. Due to an apparent lack of survey data for MW-1, ATC also had MW-1 surveyed. The location and elevation of measuring marks on the north side of each wellhead were surveyed to the nearest 0.01-foot by the licensed surveyor in order to more accurately determine the local groundwater flow direction beneath the site. Survey data is provided in both **Table 1** and **Appendix F**.

5.1.5 Laboratory Analysis

ATC submitted the soil samples to a State of California-certified laboratory, under chain-of-custody procedures. The laboratory analyzed a total of 31 soil samples for:

- TPHg using EPA Method 8260B;
- Ethanol (by direct injection) using EPA Method 8260B;
- BTEX (benzene, toluene, ethylbenzene, and xylenes) and fuel oxygenates methyl tert-butyl ether (MTBE), diisopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), t-amyl methyl ether (TAME), and t-butyl alcohol (TBA) using EPA Method 8260B;
- VOCs (full list) using EPA Method 8260B.

The analytical results are summarized in **Table 4,** and a discussion is included in **Section 6.3.1**. The laboratory analytical reports are provided in **Appendix E**.

5.2 GROUNDWATER MONITORING

ATC gauged and sampled all groundwater monitoring wells (MW-1 through MW-3) at the site on July 11, 2008, after sitting undisturbed for eight days. Groundwater monitoring activities are summarized in the following sections, with well sampling logs included in **Appendix D**.

5.2.1 Downhole Parameter and Groundwater Level Measurements

On July 11, 2008, prior to commencement of purging and sampling activities, ATC gauged and inspected the monitoring wells for phase-separate hydrocarbons and depth to groundwater. During this event, the depth to groundwater in well MW-2 was recorded at 74.10 ft bgs. The depth to groundwater in well MW-3 was recorded at 79.70 ft bgs. The previously installed groundwater well MW-1 depth to water was recorded at 73.63 ft bgs. **Table 1** summarizes well identifications and casing elevations, **Table 2** includes groundwater depths and groundwater elevations. Well sampling records are provided in **Appendix D**.

5.2.2 Purging and Sampling Procedures

ATC used a low-flow purging method to sample the groundwater monitoring wells. During purging, ATC monitored temperature, pH, conductivity, turbidity, and DO. Purge volumes for the monitoring wells were 0.80 gallons (gals), 0.80 gals, and 15 gals for MW-1, MW-2, and MW-3, respectively. Also recorded were the times the purging was commenced and when completed, and when each parameter reading was recorded. Total time to purge the above-mentioned amounts was 30 minutes (mins), 35 mins, and 45 mins for MW-1, MW-2, and MW-3, respectively.

Following purging, groundwater samples were collected from the newly installed monitoring wells (MW-2 and MW-3) and the preexisting groundwater well (MW-1). Field parameter measurements were recorded on the well sampling records, which are included in **Appendix D**.

5.2.3 Laboratory Analysis

ATC submitted the groundwater samples to Enviro-Chem, Inc., a State of California ELAP-certified laboratory, under chain-of-custody procedures. Three groundwater samples were analyzed for:

- TPH - full carbon chain (gasoline, c4-c10; diesel, c11-c22; motor/heavy oils, c23-c35) using EPA Method 8015B;
- Ethanol (by direct injection) using EPA Method 8260B;
- BTEX (benzene, toluene, ethylbenzene, and xylenes) and fuel oxygenates methyl tert-butyl ether (MTBE), diisopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), t-amyl methyl ether (TAME), and t-butyl alcohol (TBA) using EPA Method 8260B;
- VOCs (full list) using EPA Method 8260B.

The analytical results are discussed in **Section 6**; the laboratory analytical reports are provided in **Appendix E**.

5.3 WASTE MANAGEMENT

Drilling and sampling activities generated twenty-six 55-gallon drums of soil cuttings, which await final disposal. Soil analysis performed as part of the assessment will be used to characterize the waste for disposal. Copies of waste disposal manifests will be forwarded upon receipt by The Hertz Corporation. Soil cuttings were managed in accordance with the County of Los Angeles Regulations.

6.0 RESULTS

The cumulative findings of the additional site assessment described in **Section 5** are summarized below.

6.1 DRILLING OBSERVATIONS

Consistent with previous investigations at the site, ATC observed unconsolidated alluvial sediments with grain sizes ranging from clays to gravels. Drilling observations are presented on the boring logs in **Appendix C**. The lithologic units logged and described by ATC can generally be classified within the six soil units described in **Section 4.3**, above. ATC observed PID readings above typical background concentrations in the following:

- MW-2-55' with a PID reading of 327.0 part per million (ppm);
- MW-3-35' at 21.2 ppm;
- MW-3-45' at 24.3 ppm.

Soil samples were collected every 5-feet and all samples were analyzed. In the two monitoring wells, saturated soil was generally encountered from approximately 55 to 70 feet bgs, Due to high moisture content in the samples, water level was initially judged to be around 55-60 ft bgs, in monitoring well MW-2. Water levels dropped significantly after drilling to total depth, with static groundwater levels stabilizing at approximately 73-74 feet bgs.

Groundwater elevation was calculated for each well by subtracting the depth-to-water measurement from the surveyed casing elevation. The survey data for the groundwater monitoring wells is provided in **Appendix F**. Groundwater elevations from the monitoring wells gauged on July 11, 2008 were used to prepare a groundwater elevation contour map (**Figure 3**). The groundwater elevation contours indicate a southeastward flow direction with an approximate hydraulic gradient of 0.005 ft/ft.

6.2 MONITORING WELL OBSERVATIONS

No phase–separate hydrocarbons were observed in any of the wells. Depth-to-water measurements ranging from 73.63 to 79.70 bgs are presented in **Table 2**; groundwater elevation contours are depicted on **Figure 3**.

6.3 ANALYTICAL RESULTS

The analytical results for soil and groundwater samples collected during this field investigation are summarized in **Tables 2 and 3**. Groundwater analytical results are also shown on **Figure 3**. Analytical laboratory reports and chain-of-custody forms are provided in **Appendix E**.

6.3.1 Soil Analysis

During the additional site assessment activities, completed from June 19 through July 11, 2008, thirty-one (31) soil samples were submitted for analytical testing. None of the soil samples submitted for laboratory analysis were reported to contain petroleum hydrocarbon constituent concentrations above their respective laboratory practical quantitation limits (PQL), with the following exceptions:

- MW-2-55' - MTBE, TAME, and TBA concentrations of 5.67, 0.025, 2.70 milligrams per kilograms (mg/kg), respectively;
- MW-2-60' - MTBE and TBA concentrations of 0.188 and 0.051 mg/kg, respectively;
- MW-3-5' - MTBE concentration of 0.043 mg/kg

A summary of soil sample analytical results from the additional site assessment is provided in **Table 4**.

6.3.2 Groundwater Analysis

The groundwater sampling event for all monitoring wells (MW-1 through MW-3), took place on July 11th, 2008. None of the groundwater samples submitted for laboratory analysis were reported to contain petroleum hydrocarbon constituent concentrations above their respective laboratory PQL, with the following exceptions:

- MW-1 MTBE and acetone concentrations of 4.03 and 13.0 µg/l, respectively;
- MW-2 MTBE concentration of 2,740 µg/l

A summary of the groundwater sample analytical results is provided in **Table 2**, and historical groundwater analytical results are in **Table 3**. Laboratory reports and chain-of-custody documentation is included in **Appendix E**.

7.0 FINDINGS AND RECOMMENDATIONS

Based on the laboratory analytical results, it is ATC's opinion that an additional monitoring well is recommended in the area of monitoring well MW-2 based on the elevated concentrations of MTBE. Additional assessment is also recommended in the area of MW-1 due to the elevated levels of MTBE observed in the soil samples at 50 feet. The groundwater samples collected from monitoring well MW-1 and MW-2 indicated detectable concentrations of petroleum hydrocarbon and/or fuel oxygenate constituents. The MTBE and TAME levels in monitoring well MW-1 has decreased significantly. Based on the groundwater monitoring results for this quarter additional quarterly monitoring is recommended.

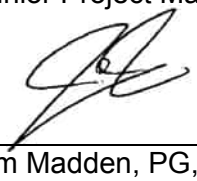
8.0 LIMITATIONS

Our professional services have been performed, our findings obtained, and our recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. This company is not responsible for the independent conclusions, opinions, or recommendations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

It should be noted that all surficial environmental assessments are inherently limited in the sense that conclusions are drawn and recommendations developed from information obtained from limited research and site evaluation. For these types of evaluations, it is often necessary to use information prepared by others and ATC cannot be responsible for the accuracy of such information. In addition, the passage of time may result in a change in the environmental characteristics at this site and surrounding properties. This report does not warrant against future operations or conditions, nor does it warrant operations or conditions present of a type or at a location not investigated. This report is not a regulatory compliance audit and is not intended to satisfy the requirements of any state, federal, or local real estate transfer laws.

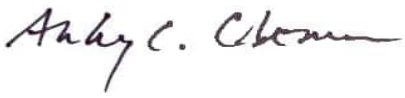
It must be noted that no investigation can absolutely rule out the existence of any hazardous materials at a given site. This assessment has been based upon prior site history, observable conditions, and the subsurface soil sampling described in this report. Existing hazardous materials and contaminants can escape detection using these methods.

This report is for the use and benefit of, and may be relied upon by, Hertz, and any affiliates, and third parties authorized in writing by Hertz and ATC, including the lender(s) in connection with a secured financing of the property, and their respective successors and assigns. Any third party agrees by accepting this report that any use or reliance on this report shall be limited by the exceptions and limitations in this report, and with the acknowledgment that actual site conditions may change with time, and that hidden conditions may exist at the property that were not discovered within the authorized scope of the assessment.



ATC makes no other representation to any third party except that it has used the degree of care and skill ordinarily exercised by environmental consultants in the preparation of the report and in the assembling of data and information related thereto. No other warranties are made to any third party, either express or implied. Unless otherwise agreed upon in writing by ATC and a third party, ATC's liability to any third party authorized to use or rely on this report with respect to any acts or omissions shall be limited to a maximum of $100,000.

9.0 SIGNATURES



This report was prepared by the staff of ATC Associates, Inc., under the supervision of the Senior Geologist whose signature appears hereon. The findings, recommendations, specifications, or professional opinions are presented within the limits described by the client, in accordance with generally accepted practices, using the degree of skill and care ordinarily exercised by environmental consultants under similar circumstances. No warranty is expressed or implied.

IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED IN THE FIELD ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THIS OFFICE, WORK PLAN MODIFICATIONS MAY BE REQUIRED

DISPOSITION OF PERMIT (Department Use Only)
THIS PERMIT IS CONSIDERED COMPLETE WHEN THE WORK PLAN IS APPROVED AND WHEN THE WELL COMPLETION LOG IS RECEIVED. NO WELL CONSTRUCTION OR DECOMMISSIONING CAN BE INITIATED WITHOUT THE WORK PLAN APPROVAL FROM THIS DEPARTMENT

WORK PLAN APPROVAL
This Approval is Valid for 180 Days

Date 6/18/08 R.E.H.S. MICHELLE TSIEBOS

Conditions ON 6/16/08 $402.00 WAS PAID FOR PERMIT # 2323 TO INSTALL 2 MONITORING WELLS (MW-2, MW-3) MAINTAIN ALL SETBACKS. PLEASE NOTIFY ME AT LEAST 48 HOURS PRIOR START OF FIELDWORK TO SCHEDULE ONSITE INSPECTION.

(310) 419-8446

I hereby agree to comply in every respect with all the regulations of the County Environmental Health Division and with all ordinances and laws of the County of Los Angeles and the State of California pertaining to well construction, reconstruction and decommissioning. Upon completion of the well and with in thirty days thereafter, I will furnish the Environmental Health office with a completion log of the well giving date drilled, depth of the well, perforations in the casing, and any other data deemed necessary by County Environmental Health Division.

Applicant's Signature

Applicant Name: (Print) CLINT MCMAHAN - ATC

Fax Number: 323-517-9701

NOTICE

This well permit approval is limited to compliance with the California well standards and the Los Angeles County Health and Safety Code and does not grant any rights to construct, reconstruct, or decommission any well. Applicant is responsible for securing all other permits necessary to perform the work.

APPENDIX B

STANDARD OPERATING PROCEDURES

STANDARD OPERATING PROCEDURE

SOIL BOREHOLE DRILLING, MONITOR WELL INSTALLATION AND DEVELOPMENT, AND SOIL SAMPLING

Drilling and Soil Sampling

Permits, Site Safety Plan. Utility Clearance

ATC Associates Inc. (ATC) obtains all the required permits, unless otherwise contractually directed. ATC prepares a site specific Site Safety Plan detailing site hazards, site safety and control, decontamination procedures, and emergency response procedures to be employed throughout the defined phase of work. At least 48 hours prior to drilling. Underground Service Alert (USA) or an equivalent agency is notified of the planned work. ATC attempts to locate all underground and above ground utilities by site inspection (in conjunction with its' subcontractors and knowledgeable site managers, if available), and review of site as-built drawings. ATC may employ a private, professional utility locator to refine the site utility inspection.

Drilling Equipment

All soil borings are drilled using a truck-mounted hollow-stem auger drill rig, unless site conditions warrant a different drilling method. Subsurface conditions permitting, the first five feet of each boring is advanced using a hand-auger or post-hole digger. All drilling equipment is inspected daily and maintained in safe working condition by the operator. All down-hole drilling equipment is steam cleaned prior to arriving on site. Working components of the drill rig near the borehole, as well as augers and drill rods are thoroughly steam cleaned between each boring location. All ATC drilling and sampling methods are consistent with ASTM Method D-1452-80 and local, stale and federal regulations.

Soil Sampling and Lithologic Description

Whenever possible and approved by the appropriate regulatory agency, the first ATC boring to be drilled at a site is continuously cored to obtain a complete lithologic description. Otherwise, soil samples are typically collected every 5 feet to the total depth explored, using brass tubes fitted in a California-modified split spoon sampler. If copper or zinc contamination is the subject of the investigation, stainless steel liners are used instead of brass. Additional soil samples may be collected based upon significant changes in lithology or in areas of obvious soil contamination. During soil sample collection, the split spoon sampler is driven 18 to 24 inches past the lead auger by a 140-pound hammer falling a minimum of 30 inches. The number of blows necessary to drive the sampler and the amount of soil recovered is recorded on the Field Exploratory Soil Boring Log. The soil sampler and liners are cleaned with an Alconox® solution and rinsed with tap water prior to each sampling event. New liners are used whenever a soil sample may be retained for laboratory analysis.

Soil samples selected for laboratory analysis are sealed on both ends with Teflon® tape and plastic end caps. The samples are labeled, documented on a chain-of-custody form and placed in a cooler for transport to a state-certified analytical laboratory. Soil contained in remaining liners is removed for lithologic descriptions (according to the Unified Soil Classification System). Additional soil is screened for organic vapors by placing approximately 30 grams of soil in a sealed plastic bag or a glass jar sealed with aluminum foil. The bag or jar is left undisturbed for approximately 15 minutes, in the sun if possible. The head space in the bag is accessed in a manner to minimize entry of outside air, and is tested for total organic vapor using a calibrated photo ionization detector (PID). The results of the field screening are noted with the lithologic descriptions on the Field Exploratory Soil Boring Log.

On encountering an impermeable (clayey) layer three feet or more in thickness below a saturated permeable layer, where the impermeable layer is considered to be a possible confining layer for an

underlying aquifer, drilling is halted until a decision to proceed is obtained from the project manager. This process minimizes the chance of introducing contamination to an underlying, clean aquifer.

Soil Waste Management

Soil cuttings are stockpiled on and covered with plastic sheeting to control runoff, or contained in 55-gallon D.O.T.-approved drums on site. Waste soil is sampled to chemically profile it for disposable, and hauled by a licensed waste hauler to an appropriate landfill or certified treatment facility. All waste stored on site is properly labeled at the time of production.

Soil Boring Abandonment

Soil borings which are not to be converted into monitor wells are sealed to the ground surface using neat cement, sand-cement slurry, or hydrated bentonite pellets or chips in accordance with federal, state and local regulations. Native soil may be used to fill the top two to three feet for cosmetic purposes, as permitted.

Monitor Well Installation

Well Casing. Screen and Filter Pack Construction

All well construction is performed in accordance with Department of Water Resources "California Well Standards" and all requirements of local oversight agencies. Soil borings to be converted into single-cased monitor wells are a minimum of eight inches in diameter for 2-inch diameter wells, and a minimum of ten inches in diameter for 4-inch diameter wells. Monitor wells are constructed with schedule 40, threaded. polyvinyl chloride (PVC) casing unless site geochemistry or contamination necessitates an alternative regulatory agency approved material. The wells are constructed with factory-slotted screen and threaded end caps.

The screened interval is placed such that it extends approximately ten feet into the water bearing zone, and at least five feet above the expected maximum water level. The screened interval may extend less than five feet above the maximum water level, only to prevent intersection of the screened interval with the top of the confining layer of a confined aquifer, or where the water table is too shallow to allow this construction. A graded sand filter pack is placed in the annular space across the screened interval and extended approximately one to two feet above the screen, as site conditions permit, so as to prevent extension of the sand pack into an overlying water-bearing unit. The well screen slot size is the maximum size capable of retaining 90% of the filter pack. Typically, 0.010-inch screen is used where the formation is predominantly clay and/or silt or poorly graded fine sand. 0.020-inch screen is used where the formation is predominantly well-graded or medium to coarse sand and/or gravel.

The filter pack grade (mean grain size) is selected according to native sediment type as follows: a) for poorly graded fine sand or silt/clay - 4 times the 70% retained grain size of the formation b) for medium to coarse sand, gravel or well graded sediments - 6 times the 70% retained grain size. Since results of particle size analysis are not always available, ATC often selects screen size and filter pack on the basis of general site stratigraphy, and specifically the finest significantly thick layer of sediment to be screened. Commonly selected grades are Lone Star® 3, 2/12 or 2/16 (or equivalent) with 0.020-inch slotted screen and Lone Star® 1/20 with 0.010-inch slotted screen.

Well Seal and Completion

A minimum two-foot seal of bentonite is placed above the sand pack. The bentonite seal is hydrated by either formation water or potable water. Neat cement or a cement/bentonite grout mixture seals the remaining annular space to the surface. If bentonite is used in the grout mixture, it does not exceed 5% by weight. The grout is placed using a tremie pipe, if the top of the bentonite is more than 20 feet below grade, or if water is present in the boring above the bentonite seal. A watertight locking cap and protective traffic-rated vault box is installed on top of each well. Well construction details are presented on the Field Exploratory Soil Boring Log. Following completion of a well, ATC completes and submits,

or ensures that the driller has sufficient information to complete and submit, the state-required Well Completion Report or equivalent document.

Well Development

All newly installed wells are developed prior to sampling to remove fine grained sediments from the well and stabilize the filter pack and the disturbed aquifer materials. Development takes place prior to or at least 24 hours after setting the seal on the well, unless otherwise directed by a local oversight agency. Well development consists of surging with a surge block and removing water from the well with either a pump or bailer, until the well is free of sediment, or until at least 10 well casing volumes have been removed. Depth to bottom is measured to determine casing volume. If the well is sampled immediately following development, temperature, pH, specific conductance and turbidity (qualitative) are monitored during well development (see section "Groundwater Sampling"). All development equipment is cleaned prior to use and between wells with an Alconox® solution, then rinsed in potable water. All data collected during development are recorded on the Well Development Data Sheet and, if necessary, the Purging Data Sheet.

Well Surveying

All well elevations are surveyed at the north side of the top of casing to the nearest ±0.01 foot. The exact survey point (at the center of the survey rod or, if the casing stub is uneven, the point of contact between casing and rod) is clearly marked and maintained on the casing rim. Elevations are referenced either to mean sea level or to a project datum. A project datum is typically chosen so as to minimize the possibility of its' later disturbance. For instance, fire hydrants are commonly selected. When required, the wells are surveyed, relative to mean sea level, by a licensed land surveyor.

STANDARD OPERATING PROCEDURE

FIELD SOIL VAPOR MONITORING

A representative soil sample will be collected from each sample interval and placed in a Ziplock® plastic bag. The bag will be sealed and the soil disaggregated. At least ten minutes will be allowed for the soil to be heated by direct sunlight and for any VOCs in the soil to accumulate in the head space of the bag. Subsequently, volatile gases are monitored and recorded by inserting the probe of a Photovac 2020 photoionization detector (PID) into the head space. The PID is equipped with a 10.6 eV lamp which is capable of detecting VOCs at concentrations of 0.1 parts per million (ppm). The PID will be calibrated on-site using 100 ppmV isobutylene-in-air span gas (equivalent to benzene) prior to drilling operations. PID readings will be recorded in the boring logs.

STANDARD OPERATING PROCEDURE

GROUNDWATER MONITORING, WELL PURGING, AND SAMPLING

Groundwater Monitoring

Prior to beginning, a decontamination area is established. Decontamination procedures consist of scrubbing downhole equipment in an Alconox® solution wash (wash solution is pumped through any purging pumps used), and rinsing in a first rinse of potable water and a second rinse of potable water or deionized water if the latter is required. Any non-dedicated downhole equipment is decontaminated prior to use.

Prior to purging and sampling a well the static water level is measured to the nearest 0.01 feet with an electronic water sounder. Depth to bottom is typically measured once per year, at the request of the project manager, and during ATC's first visit to a site. The water sounder and tape will be decontaminated between each well. If floating phase-separated hydrocarbons (PSH) are suspected or observed, PSH is collected using a clear, open-ended product bailer, and the thickness is measured to the nearest 0.01 feet in the bailer. PSH may alternatively be measured with an electronic interface probe once the presence of PSH has been established at a site. Any monitoring well containing a measurable thickness of PSH before or during purging is not additionally purged and no sample is collected from that well. Wells containing hydrocarbon sheen are sampled unless otherwise specified by the project manager. Field observations such as well integrity as well as water level measurements and floating product thicknesses are noted on the Gauging Data/Purge Calculations form.

Well Purging

Each monitoring well to be sampled is purged using a stainless steel bailer, a PVC bailer or a submersible pump. Physical parameters (pH, temperature, and conductivity) of the purge water are monitored during purging activities to assess if the water sample collected is representative of the aquifer. If required, parameters such as dissolved oxygen, turbidity, salinity etc. are also measured. Samples are considered representative if parameter stability is achieved. Stability is defined as a change of less than 0.25 pH units, less than 10% change in conductivity in micro mhos, and less than 1.0 degree centigrade (1.8 degrees Fahrenheit) change in temperature. Parameters are measured in a discreet sample decanted from the bailer separately from the rest of the purge water. Parameters are measured at least four times during purging; initially, and at volume intervals of one well volume. Purging continues until three well casing volumes have been removed, until the well completely dewaters, or until measured parameters stabilize as indicated above. Wells that dewater or demonstrate a slow recharge, may be sampled although fewer than three well volumes have been removed. Well purging information is recorded on the Purge Data sheet. All meters used to measure parameters are calibrated daily. Purge water is sealed, labeled, and stored on site in D.O.T.-approved 55-gallon drums. After being chemically profiled, the water is removed to an appropriate disposal facility by a licensed waste hauler.

Groundwater Sample Collection

Groundwater samples are collected immediately after purging or, if purging rate exceeds well recharge rate, when the well has recharged to at least 80% of its static water level. If recharge is extremely slow, the well is allowed to recharge for at least two hours, if practicable, or until sufficient volume has accumulated for sampling. The well is sampled within 24 hours of purging or re-purged. Samples are collected using polyethylene bailers, either disposable or dedicated to the well. Samples being analyzed for compounds most sensitive to volatilization are collected first. Water samples are placed in appropriate laboratory-supplied containers, labeled, documented on a chain of custody form and placed on ice in a cooler for transport to a state-certified analytical laboratory. Analytical detection limits match or surpass standards required by relevant local or regional guidelines.

Quality Assurance Procedures

To prevent contamination of the samples ATC personnel adhere to the following procedures in the field:

- A new, clean pair of latex gloves are put on prior to sampling each well.
- Wells are gauged, purged and groundwater samples are collected in the expected order of increasing degree of contamination based on historical analytical results.
- All purging equipment will be thoroughly decontaminated between each well using the procedures previously described at the beginning of this section.
- During sample collection for volatile organic analysis, the amount of air passing through the sample is minimized. This helps prevent the air from stripping the volatiles from the water. Sample bottles are filled by slowly running the sample down the side of the bottle until there is a convex meniscus over the mouth of the bottle. The lid is carefully screwed onto the bottle such that no air bubbles are present within the bottle. If a bubble is present, the cap is removed and additional water is added to the sample container. After resealing the sample container, if bubbles still are present inside, the sample container is discarded and the procedure is repeated with a new container.

Laboratory and field handling procedures may be monitored, if required by the client or regulators, by including quality control (QC) samples for analysis with the groundwater samples. Examples of different types of QC samples are as follows:

- Trip blanks are prepared at the analytical laboratory by laboratory personnel to check field handling procedures. Trip blanks are transported to the project site in the same manner as the laboratory-supplied sample containers to be filled. They are not opened, and are returned to the laboratory with the samples collected. Trip blanks are analyzed for purgable organic compounds.
- Equipment blanks are prepared in the field to determine if decontamination of field sampling equipment has been effective. The sampling equipment used to collect the groundwater samples is rinsed with distilled water that is then decanted into laboratory-supplied containers. The equipment blanks are transported to the laboratory, and are analyzed for the same chemical constituents as the samples collected at the site.
- Duplicates are collected at the same time that the standard groundwater samples are being collected and are analyzed for the same compounds in order to check the reproducibility of laboratory data. They are typically only collected from one well per sampling event. The duplicate is assigned an identification number that will not associate it with the source well.

Generally, trip blanks and field blanks check field handling and transportation procedures. Duplicates check laboratory procedures. The configuration of QC samples is determined by ATC depending on site conditions and regulatory requirements.

Dear Mr. Madden:

The **analytical results** for the soil samples, received by our lab on June 21, 2008, are attached. The samples were received chilled, intact and accompanying chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets
Vice President/Program Manager

Dear Mr. Madden:

The **analytical results** for the water samples, received by our lab on July 11, 2008, are attached. The samples were received chilled, intact and accompanying chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets
Vice President/Program Manager

Jesse Tu, Ph.D.

1101-15	9000 Airport Blvd Los Angeles CA, 90045	Robert Bramhall	12/9/2022

If any problem is found, contact:		Contact information:	(888) 972-7581

CATEGORY	DESCRIPTION	TANK #	13	14			
		PRODUCT	WO	MO			
TANK COMPONENTS							
Condition of Tank	Are all tank surfaces (and paint) in good condition and free from corrosion? Are there any visible signs of cracking or water/product leakage?		Yes	Yes			
	Concrete pad or dike in good condition? Are there any visible signs of staining?		Yes	Yes			
	Tank has vehicle protection?		Yes	Yes			
	Piping in good shape, no leaks and properly supported?		Yes	Yes			
Tank Gauge	Is the tank gauge accurate and working properly? Is it easily readable		Yes	Yes			
Tank Ladders or Stairs	Is the tank ladder in good condition?		Yes	Yes			
Secondary Containment Areas	Check to confirm secondary is dry.		Yes	Yes			
Leaks	Confirm that there is no leaks. Are there signs of leakage in the interstice, surrounding soil/concrete, or secondary containment?		Yes	Yes			
Vent	Is the primary and emergency vent unrestricted and working properly?		No	No			
Signage	Does the tank have proper signage: Hazard Diamond, product, gallonage, driver delivery instructions and tank number?		No	No			
TANK FILL AREA							
Fill Cover or Door	Fill cover or door present, not broken or damaged.		Yes	Yes			
	Fill covers are identified by color and located on the correct tank.		NA	NA			
Spill Containment Manhole/box (Spill Bucket)	No dirt, trash, water or product in spill containment manhole/box.		Yes	Yes			
	No cracks, bulges or holes in spill containment manhole/box.		Yes	Yes			
Containment Drain Valve	Are the valves operable and in a closed position?		Yes	Yes			
Fill Pipe	Fill cap in good condition, seals tightly.		Yes	Yes			
	No obstruction inside the fill pipe.		Yes	Yes			
DISPENSER AREA							
Insde Dispenser Cabinets	Is dispenser cabinet area free of leaks?		NA	NA			
Shear Valve/Impact Valves	Is hose equipped with a shear valve?		NA	NA			
Breakaways	Is hose equipped with a breakaway?		NA	NA			
Hoses and Nozzles	Are hoses and nozzles in good condition with no leaks?		NA	NA			
PUMPING SYSTEMS							
Used Oil Evacation Pumps	Is the pump equipped with a shut-off device or alarm that can be heard in the collection areas?		Yes	NA			
Used Oil Collection Areas	Is the Used Oil collection area clean, free of spills with no open buckets of oil?		Yes	NA			
Lube Oil Pumps	Is the Lube oil pump working properly and free of leaks?		Yes	NA			

DESCRIBE ANY DEFICIENCIES HERE:

Tanks levels are monitored by a monitoring system.

Instructions: Mark each tank where no problem is observed with a checkmark). If certain equipment is not required and/or not present, make notation in the column. If a defect is found, mark the checklist with an "X", describe the problem in the DEFICIENCIES section, and notify the appropriate person.

MANAGEMENT APPROVAL

This SPCC-HWCP will be implemented as described herein. Full implementation includes:

- Performing and documenting training for personnel who handle oil;
- Performing and documenting inspections of oil containers, piping and secondary containment systems; and
- Completion of corrective measures identified in the Recommendations Table 16-1 of this SPCC Plan.
- Provide a copy of this document to your local fire department.

THE HERTZ CORPORATION
Spill Prevention, Control and Countermeasure
5-year Review Checklist

Facility #: 1101-15

Complete the following checklist and return to Maureen Logan (maureen.logan@atcgs.com) in order to ensure the facility Spill Prevention, Control and Countermeasure (SPCC) plan remains valid and up-to-date.

1. Administrative

Facility Address: 9000 Airport Blvd, Los Angeles, CA 90045 Phone: (310) 568 5199
Facility Operating Hours: Mon. to Fri: 00:00 to 23:59 Sat. to Sun.: 00:00 to 23:59
Facility Manager: Jason Rodgers Facility Manager Phone: (201) 618 1437
Alternate On Site Contact:
Name: Karen Karapetyan Title: General Manager
Phone: (310) 568 5157

2. Is there a current SPCC Plan on-site? (If no, request a copy be forwarded) Yes ☑ No ☐

3. Storage

Complete the Inventory Table on Page 2 and answer the following questions. In the past 5 years (refer to current SPCC if needed):

a. Have tanks been added? Yes ☐ No ☑
b. Have tanks been removed or taken out of service? Yes ☐ No ☑
c. Have tanks been relocated Yes ☐ No ☑
d. Have dispensing lines been changed or altered? Yes ☐ No ☑

4. Containment

a. Are containments dikes or berms present? Yes ☐ No ☑
b. If so, describe type and location. _____
c. Is a drain valve present on the containment system? Yes ☐ No ☑

5. Spill Monitoring and Prevention

a. Are Spill Kits located near containers (tanks and drums) and dispensers? (Provide 1 photo of each area) Yes ☑ No ☐
b. Are they adequate and in good condition? Yes ☑ No ☐
c. Are visual and audible overfill alarms present on or near the tanks? Yes ☑ No ☐

6. Spill Reporting

a. Has there been a reportable spill at the facility in the last 5 years? Yes ☐ No ☑

7. Drainage

a. Is there an oil water separator present? Yes ☑ No ☐
b. Are floor drain present inside of buildings? Yes ☐ No ☑
Briefly describe location: _____
c. Are curbed gutters and/or stormwater catch basins present? Yes ☐ No ☑
Briefly describe location: _____

8. Security

a. Is adequate lighting provided in the tank storage areas? Yes ☑ No ☐
b. Is the facility secured during non-operating hours? Yes ☑ No ☐
c. Are buildings locked and secured during non-operating hours? Yes ☑ No ☐
d. Are ASTs protected from vehicular traffic by bollards or other barriers? Yes ☑ No ☐
e. Are there security cameras showing tank storage areas? Yes ☑ No ☐

CERTIFICATION OF THE APPLICABILITY OF THE SUBSTANTIAL HARM CRITERIA CHECKLIST

FACILITY NAME: Hertz at LAX
FACILITY ADDRESS: 9000 Airport Boulevard, Los Angeles, California

1) Does the facility transfer oil over water to or from vessels and does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?

Yes _____ No X

2) Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?

Yes _____ No X

3) Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the formula in Attachment C-III, Appendix C, 40 CFR 112 or a comparable formula[1]) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Environments" (Section 10, Appendix E, 40 CFR 112 for availability) and the applicable Area Contingency Plan.

Yes _____ No X

4) Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the appropriate formula (Attachment C-III, 40 CFR 112 or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?

Yes _____ No X

5) Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?

Yes _____ No X

CERTIFICATION

I certify that under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.

Oil Storage Inventory (See Sample on Page 3)

Complete the following table for fixed Tanks. Take **three (3)** photos of each AST from different angles. Include additional photos of dispensers, fuel lines and tank labels (size, manufacture date) if visible. Name photos by tank number and angle (i.e. AST3 Looking South).

Tank #	Type	Tank Size (gal.)	Contents	Double- or Single-Walled	Material	Location	Install Date (Year)
1	AST	2,000	Motor Oil	Double	Steel	Maintenance	2005
2	AST	2,000	Used Oil	Double	Steel	Maintenance	2005
3	AST	500	Used Oil	Double	Steel	Behind Bus Building	2004

Complete the following table for other containers (drums and portable tanks). Take a photo of drums, plastic tanks, portable tanks, de-fuelers and generators. Only include drums/tanks that are 55 gal. and larger that contain petroleum products. Exclude windshield washer fluid, antifreeze, DEF and detergents.

Quantity of Cont.	Type	Drum Size (gal.)	Contents	Spill Pallet (Y/N)	Material	Location
8	Drum	55	Used Oil/Used Anti-Freeze	Yes	Steel	Maintenance
10	Drum	55	Motor Oil, Used Oil, Antifreeze	Yes	Steel	Maintenance
4	Drum	55	Anti-Freeze, ATF	Yes	Steel	Maintenance

Type: AST (Above Ground); UST (Underground), DM (Drum), PT (Portable Tank), DF (defueler)
Tank/Drum Contents: Gasoline; Diesel, Motor Oil; Used Oil; Transmission/Hydraulic Fluid; Used Oil filters
Material: Steel; Fiberglass; Polyethylene

CERTIFICATION

Resolutions adopted by the Boards of Directors of FEDERAL INSURANCE COMPANY, VIGILANT INSURANCE COMPANY, and PACIFIC INDEMNITY COMPANY on August 30, 2016; WESTCHESTER FIRE INSURANCE COMPANY on December 11, 2006; and ACE AMERICAN INSURANCE COMPANY on March 20, 2009:

"RESOLVED, that the following authorizations relate to the execution, for and on behalf of the Company, of bonds, undertakings, recognizances, contracts and other written commitments of the Company entered into in the ordinary course of business (each a "Written Commitment"):

(1) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized to execute any Written Commitment for and on behalf of the Company, under the seal of the Company or otherwise.

(2) Each duly appointed attorney-in-fact of the Company is hereby authorized to execute any Written Commitment for and on behalf of the Company, under the seal of the Company or otherwise, to the extent that such action is authorized by the grant of powers provided for in such person's written appointment as such attorney-in-fact.

(3) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized, for and on behalf of the Company, to appoint in writing any person the attorney-in-fact of the Company with full power and authority to execute, for and on behalf of the Company, under the seal of the Company or otherwise, such Written Commitments of the Company as may be specified in such written appointment, which specification may be by general type or class of Written Commitments or by specification of one or more particular Written Commitments.

(4) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized, for and on behalf of the Company, to delegate in writing to any other officer of the Company the authority to execute, for and on behalf of the Company, under the Company's seal or otherwise, such Written Commitments of the Company as are specified in such written delegation, which specification may be by general type or class of Written Commitments or by specification of one or more particular Written Commitments.

(5) The signature of any officer or other person executing any Written Commitment or appointment or delegation pursuant to this Resolution, and the seal of the Company, may be affixed by facsimile on such Written Commitment or written appointment or delegation.

FURTHER RESOLVED, that the foregoing Resolution shall not be deemed to be an exclusive statement of the powers and authority of officers, employees and other persons to act for and on behalf of the Company, and such Resolution shall not limit or otherwise affect the exercise of any such power or authority otherwise validly granted or vested."

I, Dawn M. Chloros, Assistant Secretary of FEDERAL INSURANCE COMPANY, VIGILANT INSURANCE COMPANY, PACIFIC INDEMNITY COMPANY, WESTCHESTER FIRE INSURANCE COMPANY and ACE AMERICAN INSURANCE COMPANY (the "Companies") do hereby certify that

(i) the foregoing Resolutions adopted by the Board of Directors of the Companies are true, correct and in full force and effect,
(ii) the foregoing Power of Attorney is true, correct and in full force and effect.

Given under my hand and seals of said Companies at Whitehouse Station, NJ, this 24th day of March 2022

Dawn M. Chloros

Dawn M. Chloros, Assistant Secretary

THIS BOND REPLACES WESTCHESTER FIRE INSURANCE COMPANY BOND NO. K08306151 EFFECTIVE 04/05/2018

PERFORMANCE BOND

Bond No. K13560468

Date bond executed:	04/26/2018
Period of coverage:	04/05/2018 – 04/05/2019
Principal:	The Hertz Corporation and DTG Operations Inc. 8501 Williams Road Estero, FL 33928
Type of Organization:	Corporation
State of incorporation (if applicable):	Delaware

Surety(ies): Westchester Fire Insurance Company
436 Walnut Street
Philadelphia, PA 19106

Scope of Coverage: The tanks covered by the Bond are listed in Exhibit A, which is made part of this agreement. The coverage guaranteed by the Bond shall include: "taking corrective action" and/or "compensating third parties for bodily injury and property damage caused by" either "sudden accidental releases" or "nonsudden accidental releases" or "accidental releases" "arising from operating the underground storage tank".

Penal sums of bond:

Per occurrence $	$1,000,000
Annual aggregate $	$2,000,000
Surety's bond number:	**K13560468**

Know All Persons by These Presents, that we, the Principal and Surety(ies), hereto are firmly bound to the United States Environmental Protection Agency and the state agencies listed in Exhibit B, in the above penal sums for the payment of which we bind ourselves, our heirs, executors, administrators, successors, and assigns jointly and severally; provided that, where the Surety(ies) are corporations acting as co-sureties, we, the Sureties, bind ourselves in such sums jointly and severally only for the purpose of allowing a joint action or actions against any or all of us, and for all other purposes each Surety binds itself, jointly and severally with the Principal, for the payment of such sums only as is set forth opposite the name of such Surety, but if no limit of liability is indicated, the limit of liability shall be the full amount of the penal sums.

Whereas said Principal is required under Subtitle I of the Solid Waste Disposal Act, as amended, to provide financial assurance for "taking corrective action" and/or "compensating

third parties for bodily injury and property damage caused by" either "sudden accidental releases" or "nonsudden accidental releases" or "accidental releases"; arising from operating the underground storage tanks identified above, and

Whereas said Principal shall establish a standby trust fund as is required when a surety bond is used to provide such financial assurance;

Now, therefore, the conditions of the obligation are such that if the Principal shall faithfully "take corrective action, in accordance with 40 CFR part 280, subpart F and the Director of the state implementing agency's instructions for," and/or "compensate injured third parties for bodily injury and property damage caused by" either "sudden accidental releases" or "nonsudden accidental releases" or "accidental releases" arising from operating the tank(s) identified above, or if the Principal shall provide alternate financial assurance, as specified in 40 CFR part 280, subpart H, within 120 days after the date the notice of cancellation is received by the Principal from the Surety(ies), then this obligation shall be null and void; otherwise it is to remain in full force and effect.

Such obligation does not apply to any of the following:

(a) Any obligation of The Hertz Corporation and DTG Operations Inc. under a workers' compensation, disability benefits, or unemployment compensation law or other similar law;

(b) Bodily injury to an employee of The Hertz Corporation and DTG Operations Inc. arising from, and in the course of, employment by The Hertz Corporation and DTG Operations Inc.;

(c) Bodily injury or property damage arising from the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle, or watercraft;

(d) Property damage to any property owned, rented, loaned to, in the care, custody, or control of, or occupied by The Hertz Corporation and DTG Operations Inc. that is not the direct result of a release from a petroleum underground storage tank;

(e) Bodily injury or property damage for which The Hertz Corporation and DTG Operations Inc. is obligated to pay damages by reason of the assumption of liability in a contract or agreement other than a contract or agreement entered into to meet the requirements of 40 CFR 280.93.

The Surety(ies) shall become liable on this bond obligation only when the Principal has failed to fulfill the conditions described above.

Upon notification by the Directors of the United States Environmental Protection Agency and/or Director of those agencies listed in Exhibit B that the Principal has failed to "take corrective action, in accordance with 40 CFR part 280, subpart F and the Director's instructions," and/or "compensate injured third parties" as guaranteed by this bond, the Surety(ies) shall either perform "corrective action in accordance with 40 CFR part 280 and the Director's instructions," and/or "third-party liability compensation" or place funds in an amount up to the annual aggregate penal sum into the standby trust fund as directed by the Director under 40 CFR 280.112.

Upon notification by the Director that the Principal has failed to provide alternate financial assurance within 60 days after the date the notice of cancellation is received by the Principal

from the Surety(ies) and that the Director has determined or suspects that a release has occurred, the Surety(ies) shall place funds in an amount not exceeding the annual aggregate penal sum into the standby trust fund as directed by the Director under 40 CFR 280.112.

The Surety(ies) hereby waive(s) notification of amendments to applicable laws, statutes, rules, and regulations and agrees that no such amendment shall in any way alleviate its (their) obligation on this bond.

The liability of the Surety(ies) shall not be discharged by any payment or succession of payments hereunder, unless and until such payment or payments shall amount in the annual aggregate to the penal sum shown on the face of the bond, but in no event shall the obligation of the Surety(ies) hereunder exceed the amount of said annual aggregate penal sum.

The Surety(ies) may cancel the bond by sending notice of cancellation by certified mail to the Principal, provided, however, that cancellation shall not occur during the 120 days beginning on the date of receipt of the notice of cancellation by the Principal, as evidenced by the return receipt.

The Principal may terminate this bond by sending written notice to the Surety(ies).

In Witness Thereof, the Principal and Surety(ies) have executed this Bond and have affixed their seals on the date set forth above.

The persons whose signatures appear below hereby certify that they are authorized to execute this surety bond on behalf of the Principal and Surety(ies) and that the wording of this surety bond is identical to the wording specified in 40 CFR 280.98(b) as such regulations were constituted on the date this bond was executed.

Power of Attorney

WESTCHESTER FIRE INSURANCE COMPANY

Know all men by these presents: That WESTCHESTER FIRE INSURANCE COMPANY, a corporation of the Commonwealth of Pennsylvania pursuant to the following Resolution, adopted by the Board of Directors of the said Company on December 11, 2006, to wit:

"RESOLVED, that the following authorizations relate to the execution, for and on behalf of the Company, of bonds, undertakings, recognizances, contracts and other written commitments of the Company entered into the ordinary course of business (each a "Written Commitment"):

(1) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized to execute any Written Commitment for and on behalf of the Company, under the seal of the Company or otherwise.

(2) Each duly appointed attorney-in-fact of the Company is hereby authorized to execute any Written Commitment for and on behalf of the Company, under the seal of the Company or otherwise, to the extent that such action is authorized by the grant of powers provided for in such persons written appointment as such attorney-in-fact .

(3) Each of the Chairman, the President and the Vice Presidents of the Company is hereby authorized, for and on behalf of the Company, to appoint in writing any person the attorney-in-fact of the Company with full power and authority to execute, for and on behalf of the Company, under the seal of the Company or otherwise, such Written Commitments of the Company as may be specified in such written appointment, which specification may be by general type or class of Written Commitments or by specification of one or more particular Written Commitments.

(4) Each of the Chairman, the President and Vice Presidents of the Company is hereby authorized, for and on behalf of the Company, to delegate in writing any other officer of the Company the authority to execute, for and on behalf of the Company, under the Company's seal or otherwise, such Written Commitments of the Company as are specified in such written delegation, which specification may be by general type or class of Written Commitments or by specification of one or more particular Written Commitments.

(5) The signature of any officer or other person executing any Written Commitment or appointment or delegation pursuant to this Resolution, and the seal of the Company, may be affixed by facsimile on such Written Commitment or written appointment or delegation.

FURTHER RESOLVED, that the foregoing Resolution shall not be deemed to be an exclusive statement of the powers and authority of officers, employees and other persons to act for and on behalf of the Company, and such Resolution shall not limit or otherwise affect the exercise of any such power or authority otherwise validly granted or vested.

Does hereby nominate, constitute and appoint Cori Riddle, Francis J Curran, Marina A Kenney, Sally Phillips all of the City of Philadelphia, Pennsylvania, each individually if there be more than one named, its true and lawful attorney-in-fact, to make, execute, seal and deliver on its behalf, and as its act and deed any and all bonds, undertakings, recognizances, contracts and other writings in the nature thereof in penalties not exceeding SEVENTY FIVE MILLION DOLLARS & ZERO CENTS ($75,000,000.00) and the execution of such writings in pursuance of these presents shall be as binding upon said Company, as fully and amply as if they had been duly executed and acknowledged by the regularly elected officers of the Company at its principal office,

IN WITNESS WHEREOF, the said Stephen M. Haney, Vice-President, has hereunto subscribed his name and affixed the Corporate seal of the said WESTCHESTER FIRE INSURANCE COMPANY this 6 day of September 2017

WESTCHESTER FIRE INSURANCE COMPANY

Stephen M. Haney , Vice President

COMMONWEALTH OF PENNSYLVANIA
COUNTY OF PHILADELPHIA ss.

On this 6 day of September, 2017 before me, a Notary Public of the Commonwealth of Pennsylvania in and for the County of Philadelphia came Stephen M. Haney ,Vice-President of the WESTCHESTER FIRE INSURANCE COMPANY to me personally known to be the individual and officer who executed the preceding instrument, and he acknowledged that he executed the same, and that the seal affixed to the preceding instrument is the corporate seal of said Company; that the said corporate seal and his signature were duly affixed by the authority and direction of the said corporation, and that Resolution, adopted by the Board of Directors of said Company, referred to in the preceding Instrument, is now in force.

IN TESTIMONY WHEREOF, I have hereunto set my hand and affixed my official seal at the Cityof Philadelphia the day and year first above written.

COMMONWEALTH OF PENNSYLVANIA
NOTARIAL SEAL
KAREN E. BRANDT, Notary Public
City of Philadelphia, Phila. County
My Commission Expires Sept. 26, 2018

Notary Public

I, the undersigned Assistant Secretary of the WESTCHESTER FIRE INSURANCE COMPANY, do hereby certify that the original POWER OF ATTORNEY, of which the foregoing is a substantially true and correct copy, is in full force and effect.

In witness whereof, I have hereunto subscribed my name as Assistant Secretary, and affixed the corporate seal of the Corporation, this 16th day of April 20 18.

Dawn M. Chloros, Assistant Secretary

THIS POWER OF ATTORNEY MAY NOT BE USED TO EXECUTE ANY BOND WITH AN INCEPTION DATE AFTER SEPTEMBER 06, 2019.

DocuGard #04546 contains a security pantograph, blue background, heat-sensitive ink, coin-reactive watermark, and microtext printing on border.

HEAT SENSITIVE SHIELD

AMENDMENT TO TRUST AGREEMENT DATED [MARCH 25, 2022]

THIS Amendment, dated this 25th day of March, 2022 ("Amendment"), amends the Trust Agreement (the "Agreement"), dated April 28, 2009, and revised on October 15, 2013, by and between The Hertz Corporation, a Delaware corporation (the "Grantor") and The Bank of New York Mellon, a New York banking corporation (the "Trustee"),

WHEREAS, the United States Environmental Protection Agency has established certain regulations applicable to the Grantor, requiring that an owner or operator of a hazardous waste management facility shall provide assurance that funds will be available when needed for closure and/or post-closure car of the facility,

WHEREAS, the Grantor has elected to obtain a Surety Bond and has established a standby trust fund to provide all or part of such financial assurance for the facility identified herein,

WHEREAS, the parties desire to amend the Agreement as set forth herein, and

NOW, THEREFORE, the Grantor and Trustee agree as follows:

1. The existing Exhibit A is replaced with the attached revised Exhibit A.

2. The existing Exhibit B is replaced with the attached revised Exhibit B.

3. Representations and Warranties.

Grantor hereby represents and warrants with respect to itself as of the date of this Amendment, that:

i. It is duly organized and existing under the laws of the jurisdiction of its organization, with full power to cany on its business as now conducted, to enter into this Amendment and to perform its obligations hereunder; and

ii. This Amendment has been duly authorized, executed and delivered by it, constitutes a valid and legally binding obligation of it, enforceable in accordance with its terms, and no statute, regulation, rule, order, judgment or contract binding on it prohibits it's execution or, performance of this Amendment.

4. Governing Law.

This Amendment shall be administered, construed and enforced according to the laws of the State of New Jersey.

5. Successors and Assigns.

This Amendment shall extend to and shall be binding upon the Panics hereto and their respective successors and permitted assignees.

6. Ratification.

Except as hereby amended, the provisions of the Agreement are hereby ratified and confirmed and shall remain in full force and effect.

7. Severability.

In the event that any provision of this Amendment shall be declared invalid or unenforceable by any regulatory body or court having jurisdiction, such invalidity or unenforceability shall not affect the validity or enforceability of the remaining portions of this Amendment, and the invalid, illegal or unenforceable provision shall be replaced by a valid, legal and enforceable provision that comes closest to the intent of the parties underlying the invalid, illegal or unenforceable provision.

8. Headings.

The headings of the Sections have been inserted for convenience of reference only and shall not be deemed to constitute a part of this Amendment.

9. Counterparts.

This Amendment is executed in triplicate original, each of which shall be deemed an original, but which shall each constitute but one Agreement, with each party retaining an executed original. The parties may sign and deliver this Amendment by electronic transmission, including PDF. All the parties agree that the delivery of the Amendment by electronic transmission shall have the same force and effect as delivery of original signatures and that each party may use such electronic signatures as evidence of the execution and delivery of this Amendment by both parties to the same extent that an original signature could be used.

IN WITNESS, whereof the parties have caused this Amendment to be executed by their respective officers duly authorized and their corporate seals, if applicable, to be hereunto affixed and attested as of the date first written above.

STANDBY TRUST AGREEMENT

Trust agreement, the "Agreement," entered into as of **April 28, 2009** by and between The Hertz Corporation ("Hertz"), a Delaware corporation, the "Grantor," and The Bank of New York, a New York banking corporation, the "Trustee."

Whereas, the United States Environmental Protection Agency, an agency of the United States Government, various state environmental agencies, the "Implementing Agencies" and the specific agencies known as the "State of Alaska Department of Environmental Conservation" and "State of Maryland" have established certain regulations applicable to the Grantor, requiring that an owner or operator of an underground storage tank shall provide assurance that funds will be available when needed for corrective action and third-party compensation for bodily injury and property damage caused by sudden and nonsudden accidental releases arising from the operation of the underground storage tank. The attached Exhibit A lists the number of tanks at each facility and the name(s) and address(es) of the facility(ies) where the tanks are located that are covered by the standby trust agreement.

Whereas, the Grantor has elected to establish a surety bond, to provide all or part of such financial assurance for the underground storage tanks identified herein and is required to establish a standby trust fund able to accept payments from the instrument.

Whereas, the Grantor, acting through its duly authorized officers, has selected the Trustee to be the trustee under this agreement, and the Trustee is willing to act as trustee;

Now, therefore, the Grantor and the Trustee agree as follows:

Section 1. Definitions

As used in this Agreement:

(a) The term "Grantor" means the owner or operator who enters into this Agreement and any successors or assigns of the Grantor.

(b) The term "Trustee" means the Trustee who enters into this Agreement and any successor Trustee.

Section 2. Identification of the Financial Assurance Mechanism

This Agreement pertains to the surety bond.

Section 3. Establishment of Fund

The Grantor and the Trustee hereby establish a trust fund, the "Fund," for the benefit of the **Implementing Agencies**. The Grantor and the Trustee intend that no third party have access to the Fund except as herein provided. The Fund is established initially as a

standby to receive payments and shall not consist of any property. Payments made by the provider of financial assurance pursuant to the **Director of the Implementing Agencies'** instruction are transferred to the Trustee and are referred to as the Fund, together with all earnings and profits thereon, less any payments or distributions made by the Trustee pursuant to this Agreement. The Fund shall be held by the Trustee, IN TRUST, as hereinafter provided. The Trustee shall not be responsible nor shall it undertake any responsibility for the amount or adequacy of, nor any duty to collect from the Grantor as provider of financial assurance, any payments necessary to discharge any liability of the Grantor established by the Implementing Agencies.

Section 4. Payment for "Corrective Action" and/or Third-Party Liability Claims"

The Trustee shall make payments from the Fund as the Director of the Implementing Agencies shall direct, in writing, to provide for the payment of the costs of taking corrective action and/or compensating third parties for bodily injury and property damage caused by either "sudden accidental releases" or "nonsudden accidental releases" or "accidental releases" arising from operating the tanks covered by the financial assurance mechanism identified in this Agreement.

The Fund may not be drawn upon to cover any of the following:

(a) Any obligation of Hertz under a workers' compensation, disability benefits, or unemployment compensation law or other similar law;

(b) Bodily injury to an employee of Hertz arising from, and in the course of employment by Hertz;

(c) Bodily injury or property damage arising from the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle, or watercraft;

(d) Property damage to any property owned, rented, loaned to, in the care, custody, or control of, or occupied by Hertz that is not the direct result of a release from a petroleum underground storage tank;

(e) Bodily injury or property damage for which Hertz is obligated to pay damages by reason of the assumption of liability in a contract or agreement other than a contract or agreement entered into to meet the requirements of 40 CFR 280.93.

The Trustee shall reimburse the Grantor, or other persons as specified by the Director of the Implementing Agency, from the Fund for corrective action expenditures and/or third-party liability claims in such amounts as the Director of the Implementing Agency shall direct in writing. In addition, the Trustee shall refund to the Grantor such amounts as the Director of the Implementing Agency specifies in writing. Upon refund, such funds shall no longer constitute part of the Fund as defined herein.

Section 5. Payments Comprising the Fund

Payments made to the Trustee for the Fund shall consist of cash and securities acceptable to the Trustee.

Section 6. Trustee Management

The Trustee shall invest and reinvest the principal and income of the Fund and keep the Fund invested as a single fund, without distinction between principal and income, in accordance with general investment policies and guidelines which the Grantor may communicate in writing to the Trustee from time to time, subject, however, to the provisions of this Section. In investing, reinvesting, exchanging, selling, and managing the Fund, the Trustee shall discharge his duties with respect to the trust fund solely in the interest of the beneficiaries and with the care, skill, prudence, and diligence under the circumstances then prevailing which persons of prudence, acting in a like capacity and familiar with such matters, would use in the conduct of an enterprise of a like character and with like aims; except that:

(i) Securities or other obligations of the Grantor, or any other owner or operator of the tanks, or any of their affiliates as defined in the Investment Company Act of 1940, as amended, 15 U.S.C. 80a-2(a), shall not be acquired or held, unless they are securities or other obligations of the federal or a state government;

(ii) The Trustee is authorized to invest the Fund in time or demand deposits of the Trustee, to the extent insured by an agency of the federal or state government; and

(iii) The Trustee is authorized to hold cash awaiting investment or distribution uninvested for a reasonable time and without liability for the payment of interest thereon.

Section 7. Commingling and Investment

The Trustee is expressly authorized in its discretion:

(a) To transfer from time to time any or all of the assets of the Fund to any common, commingled, or collective trust fund created by the Trustee in which the Fund is eligible to participate, subject to all of the provisions thereof, to be commingled with the assets of other trusts participating therein; and

(b) To purchase shares in any investment company registered under the Investment Company Act of 1940, 15 U.S.C. 80a-1 et seq., including one which may be created, managed, underwritten, or to which investment advice is rendered or the shares of which are sold by the Trustee. The Trustee may vote such shares in its discretion.

Section 8. Express Powers of Trustee

Without in any way limiting the powers and discretions conferred upon the Trustee by the other provisions of this Agreement or by law, the Trustee is expressly authorized and empowered:

(a) To sell, exchange, convey, transfer, or otherwise dispose of any property held by it, by public or private sale. No person dealing with the Trustee shall be bound to see to the application of the purchase money or to inquire into the validity or expediency of any such sale or other disposition;

(b) To make, execute, acknowledge, and deliver any and all documents of transfer and conveyance and any and all other instruments that may be necessary or appropriate to carry out the powers herein granted;

(c) To register any securities held in the Fund in its own name or in the name of a nominee and to hold any security in bearer form or in book entry, or to combine certificates representing such securities with certificates of the same issue held by the Trustee in other fiduciary capacities, or to deposit or arrange for the deposit of such securities in a qualified central depository even though, when so deposited, such securities may be merged and held in bulk in the name of the nominee of such depository with other securities deposited therein by another person, or to deposit or arrange for the deposit of any securities issued by the United States Government, or any agency or instrumentality thereof, with a Federal Reserve bank, but the books and records of the Trustee shall at all times show that all such securities are part of the Fund;

(d) To deposit any cash in the Fund in interest-bearing accounts maintained or savings certificates issued by the Trustee, in its separate corporate capacity, or in any other banking institution affiliated with the Trustee, to the extent insured by an agency of the federal or state government; and

(e) To compromise or otherwise adjust all claims in favor of or against the Fund.

Section 9. Taxes and Expenses

All taxes of any kind that may be assessed or levied against or in respect of the Fund and all brokerage commissions incurred by the Fund shall be paid from the Fund. All other expenses incurred by the Trustee in connection with the administration of this Trust, including fees for legal services rendered to the Trustee, the compensation of the Trustee to the extent not paid directly by the Grantor, and all other proper charges and disbursements of the Trustee shall be paid from the Fund.

Section 10. Advice of Counsel

The Trustee may from time to time consult with counsel, who may be counsel to the Grantor, with respect to any questions arising as to the construction of this Agreement or any action to be taken hereunder. The Trustee shall be fully protected, to the extent permitted by law, in acting upon the advice of counsel.

Section 11. Trustee Compensation

The Trustee shall be entitled to reasonable compensation for its services as agreed upon in writing from time to time with the Grantor.

Section 12. Successor Trustee

The Trustee may resign or the Grantor may replace the Trustee, but such resignation or replacement shall not be effective until the Grantor has appointed a successor trustee and this successor accepts the appointment. The successor trustee shall have the same powers and duties as those conferred upon the Trustee hereunder. Upon the successor trustee's acceptance of the appointment, the Trustee shall assign, transfer, and pay over to the successor trustee the funds and properties then constituting the Fund. If for any reason the Grantor cannot or does not act in the event of the resignation of the Trustee, the Trustee may apply to a court of competent jurisdiction for the appointment of a successor trustee or for instructions. The successor trustee shall specify the date on which it assumes administration of the trust in writing sent to the Grantor and the present Trustee by certified mail 10 days before such change becomes effective. Any expenses incurred by the Trustee as a result of any of the acts contemplated by this Section shall be paid as provided in Section 9.

Section 13. Instructions to the Trustee

All orders, requests, and instructions by the Grantor to the Trustee shall be in writing, signed by such persons as are designated in the attached Exhibit B or such other designees as the Grantor may designate by amendment to Exhibit B. The Trustee shall be fully protected in acting without inquiry in accordance with the Grantor's orders, requests, and instructions. All orders, requests, and instructions by the Director of the Implementing Agency to the Trustee shall be in writing, signed by the Director of the Implementing Agency, and the Trustee shall act and shall be fully protected in acting in accordance with such orders, requests, and instructions. The Trustee shall have the right to assume, in the absence of written notice to the contrary, that no event constituting a change or a termination of the authority of any person to act on behalf of the Grantor or the Director of the Implementing Agency hereunder has occurred. The Trustee shall have no duty to act in the absence of such orders, requests, and instructions from the Grantor and/or the Director of the Implementing Agency, except as provided for herein.

Section 14. Amendment of Agreement

This Agreement may be amended by an instrument in writing executed by the Grantor and the Trustee, or by the Trustee and the Director of the Implementing Agency if the Grantor ceases to exist.

Section 15. Irrevocability and Termination

Subject to the right of the parties to amend this Agreement as provided in Section 14, this Trust shall be irrevocable and shall continue until terminated at the written direction of the Grantor and the Trustee, or by the Trustee and the Director of the Implementing

Agency, if the Grantor ceases to exist. Upon termination of the Trust, all remaining trust property, less final trust administration expenses, shall be delivered to the Grantor.

Section 16. Immunity and Indemnification

The Trustee shall not incur personal liability of any nature in connection with any act or omission, made in good faith, in the administration of this Trust, or in carrying out any directions by the Grantor or the Director of the Implementing Agency issued in accordance with this Agreement. The Trustee shall be indemnified and saved harmless by the Grantor, from and against any personal liability to which the Trustee may be subjected by reason of any act or conduct in its official capacity, including all expenses reasonably incurred in its defense in the event the Grantor fails to provide such defense.

Section 17. Choice of Law

This Agreement shall be administered, construed, and enforced according to the laws of the state of New Jersey, or the Comptroller of the Currency in the case of National Association banks.

Section 18. Interpretation

As used in this Agreement, words in the singular include the plural and words in the plural include the singular. The descriptive headings for each section of this Agreement shall not affect the interpretation or the legal efficacy of this Agreement.

In Witness where of the parties have caused this Agreement to be executed by their respective officers duly authorized and their corporate seals (if applicable) to be hereunto affixed and attested as of the date first above written. The parties below certify that the wording of this Agreement is identical to the wording specified in 40 CFR 280.103(b)(1) as such regulations were constituted on the date written above.

4.0 BACKGROUND INFORMATION

4.1 Site History

The site is located at 9000 Airport Boulevard in Los Angeles California as shown in Figure 1 (Vicinity Map) and is used for rental car operations. The site consists of five buildings, a car wash system, and refueling system. The refueling system consists of gasoline underground storage tanks (USTs), one diesel UST, fourteen fuel dispenser islands, and underground distribution lines. The UST system is generally located in the western, central portion of the facility and is bordered to the west by Airport Boulevard and to the north by the main vehicle entry way into and out of the facility as shown in Figure 2 (Site Plan).

The site is composed of the two main fueling areas, the "eastern" fueling system and the "western" fueling system. The eastern system consists of two 12,000 gallon gasoline USTs with 10 dispenser islands. Each island has one fuel dispenser, and the ten islands are covered by an overhead canopy. The USTs are located just south of the dispenser islands and are aligned north-south in a common excavation. The western system consists of four gasoline USTs, one diesel UST, and four dispenser islands. The three gasoline USTs and one diesel UST are located just north of the dispenser islands and are aligned north-south in a common excavation.

The western system consists of four 10,000-gallon gasoline USTs, one 10,000-gallon diesel UST, and four dispenser islands. The gasoline USTs are located to the north of the dispenser islands and are aligned north-south in a common excavation. The diesel UST is located approximately 15-20 feet east of the four gasoline USTs, and is also aligned north-south. This UST was originally installed to store methanol fuel, but has been retrofitted for gasoline. It is unclear at this time whether this tank is located in its own excavation, or shares a common excavation with the four tanks to the west. Each dispenser island in the western system is equipped with two fuel dispensers, and it is likewise covered by a metal canopy structure.

Directly north of both the eastern and western systems is an eight foot cinderblock wall immediately adjacent, followed by a landscaped planter area immediately to the north, then the paved main entry into and out of the facility. To the west of the western system is an asphalt paved drive/parking area, followed by a traffic guard rail and an eight foot chain link fence, then a landscaped parkway with Airport Boulevard west of it. It should be noted that immediately to the west, and overhead of the canopy for the four dispenser islands related to the western system, exists a large commercial billboard placed for viewing from Airport Boulevard. Toward the east and south of the systems are asphalt paved parking area and maintenance areas for the Hertz facility, including car wash structures to the south and the main office/locker building for the facility to the southeast.

4.2 Previous Site Characterizations

In July 2003, ATC Associates Inc. (ATC) directed and supervised the advancement of 21 soil borings (B-1 through B-21) to depths ranging from 15 feet to 30 feet below ground surface (bgs) at the locations shown on Figure 3. The purpose of the assessment was to evaluate possible environmental impact to soil prior to pending UST upgrade activities to comply with Senate Bill SB 989. Borings B-1 through B-8 were advanced in the vicinity of the eastern UST system. Borings B-9 through B-21 were advanced in the vicinity of the western UST system.

Twenty-One (21) soil samples were delivered under chain-of-custody protocol to SPL Laboratory of Houston, Texas for laboratory analysis. The samples were analyzed for total petroleum hydrocarbons characterized as

diesel (TPHd), total petroleum hydrocarbons characterized as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX), and methyl-tert-butyl-ether (MTBE) in accordance with EPA Test Methods 8015 Modified, and EPA Method 8260B.

Seven (7) of the soil samples contained one or more petroleum hydrocarbon constituent concentrations above their respective laboratory reporting limits (RLs). A summary of soil sample analytical results from this site assessment is provided in Table 1. Details of this assessment are presented in the ATC, *Additional Site Assessment Report*, dated August 25, 2003 (ATC Project No. 78.75015.0001).

Neither TPHd nor BTEX compounds were detected above the RLs in the soil samples analyzed. TPHg was detected above the RLs in four samples (B3-5, B11-20, B13-10, and B19-10). Soil sample B3-5 contained a TPHg concentration of 300 micrograms per kilogram (µg/kg). TPHg results ranged from 120 µg/kg in B19-10 to 160 µg/kg in B13-10 to 360 µg/kg in B11-20.

MTBE was detected in six samples collected from borings advanced in the area of the western UST system, near the northernmost fueling island and around the four western-most USTs. MTBE was not detected in the analyzed soil samples collected from the eastern UST system, nor in samples collected near the southern fuel dispensing island of the western system. The laboratory RL for MTBE was less than five (<5) µg/kg. MTBE analytical results ranged from 30 µg/kg in B19-10 and 200 µg/kg in B18-10, to 1,800 µg/kg in B14-25 and 2,000 µg/kg in B11-20.

Minor petroleum hydrocarbon impact to soil was detected in the vicinity of the eastern dispenser islands. Based on the results of soil samples collected in this area, it appeared that this impact was contained and attributed to minor spills at the dispenser. The hydrocarbon contamination around the western UST system appeared to be confined to the UST cavity and around the dispenser island closest to those USTs. The horizontal extent of the hydrocarbon contamination in the western system was estimated to be 40 feet by 60 feet. The vertical extent of the MTBE contamination was not defined by this investigation. Based on the orientation of the western UST system and the analytical results, it appeared that the deepest impacted soil was located in the area along the western portion of the UST cavity (between B-11 and B-14).

In September 2003, ATC directed and supervised the advancement of a soil boring and installation of one groundwater monitoring well (MW-1) at a location to the west of the western fueling system. The boring was advanced to a depth of 75 feet bgs and soil samples were collected at five foot intervals. ATC selected five soil samples between 45 and 63 feet below ground surface for laboratory analysis. The soil samples were shipped overnight to SPL Laboratories (SPL), a California certified laboratory, using proper chain of custody procedures. The samples were analyzed for BTEX, and MTBE in accordance with EPA Test Method 8260 and for TPHg and TPHd, in accordance with EPA Test Method 8015. Soil samples collected between 45 and 55 feet below ground surface contained the highest levels of MTBE (ranging between 1,300 to 48,000 micrograms per liter (ug/L)). The MTBE concentrations decreased between one and two orders of magnitude (to 8 and 18 ug/L) between 55 feet and 63 feet below ground surface. The remaining analytes were at trace levels. A summary of groundwater analytical results from this site assessment is provided in Table 2.

Monitoring well MW-1 was constructed using 45 feet (surface to 45 feet bgs) of blank 4-inch diameter Schedule 40 PVC casing, and 30 feet of slotted (0.020-inch slots) 4-inch diameter Schedule 40 PVC well screen. Subsequent to its installation, the well was purged and developed. On September 16, 2003, groundwater was gauged, purged, and sampled. Depth to groundwater was measured at approximately 53 feet bgs. Analysis of groundwater samples were performed by SPL. The water sample was analyzed for BTEX, and MTBE using EPA Test Method 8260 and for TPHg and TPHd, using EPA Test Method 8015. TPHg was

detected at concentration of 61 ug/L. TBA and MTBE were reported at concentrations of 2,500 ug/L, and 8,700 ug/L, respectively, in the groundwater sample collected from MW-1. All other analytes were not detected above their respective detection limits.

4.3 Scope of Work

This remedial excavation report summarizes the site activities conducted at the site from March 23 to April 7, 2005. ATC conducted the following:

- Prepared a Site Specific Health & Safety Plan (Appendix A).
- Excavated hydrocarbon impacted soils based on the results of prior site assessments. Soil excavation activities were conducted using a backhoe.
- Petroleum hydrocarbon-impacted soil was identified by hydrocarbon staining and odors. A portable organic vapor analyzer (OVA) or photo-ionization detector (PID) was used to monitor the presence of volatile organic compounds (VOCs) in soil and to assess ambient air quality.
- Soil samples were collected from the bottom corners of the excavations and from beneath the former dispenser and piping locations to confirm removal of the hydrocarbon-impacted soil.
- Soil samples were analyzed for total petroleum hydrocarbons characterized as gasoline (TPHg), total petroleum hydrocarbons characterized as diesel (TPHd), benzene, toluene, ethylbenzene, total xylenes (BTEX), and methyl-tertiary-butyl ether (MTBE) in accordance with Environmental Protection Agency (EPA) Test Methods 8015M and 8260, respectively.
- Conducted Organic Vapor Monitoring to obtain preliminary data regarding the degree of potential petroleum hydrocarbon-impact to soil and for health and safety concerns.
- Prepared this Data Evaluation and Remedial Action Report summarizing the findings.

5.0 GEOLOGIC SETTING

5.1 Regional Geology

The site is located within the Los Angeles Basin in a physiographic unit called The El Segundo Sand Hills (California Department of Water Resources [DWR], 1961). The El Segundo Sand Hills extend from the Ballona Gap south, to Torrance and the Palo Verdes Hills, and approximately three to four miles inland from the Pacific Ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The Sand Hills consist of a narrow strip of active or recent dunes along the coast an older stabilized sand dunes inland.

The site is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Sand Dunes have been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands and which now form a portion of the Torrance Plain. Weathering and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area (DWR, 1961).

5.2 Hydrogeology

The Site lies within the West Coast (groundwater) Basin, which is part of the larger Los Angeles Coastal Basin (DWR, 1961). The physical boundaries of the West Coast Basin include the Ballona Escarpment to the north; the Rosecrans Hills to the east; and the Pacific Ocean to the west and south. The Palos Verdes Hills form the boundary of the West Coast Basin to the southeast. Water-bearing strata within the basin includes mid-Miocene to Oligocene-aged marine and continental sediments. The principal aquifers (water-producing formations) beneath the site include (in youngest to oldest stratigraphic order) the Old Dune Sand, Gage-Gardena, Lynwood, Silverado, and Sunnyside aquifers (DRW, 1961). Many of the aquifers located in the western portion of the West Coast Basin are not currently used as practical sources of potable water due to general degradation of the upper groundwater zone due to historical industrial activity, oil production, and seawater intrusion. It is unknown at the present time whether the aquifer underlying the subject site is currently in use. The regional direction of groundwater flow in interpreted to generally be toward the west-southwest.

6.0 FIELD ACTIVITIES

Excavation activities were initiated at the site on March 23, 2005, and excavation and backfilling activities continued until April 7, 2005. H.B. Covey, Inc. (H.B. Covey) was retained by Hertz to provide oversight for the upgrade the UST system at the site and conduct remedial excavation activities under the direction of ATC personnel. H.B. Covey attained all necessary permits for the UST removals. A copy of the tank removal permit is included in Appendix B of this report. Graves Construction Co. (Graves) was subcontracted by H.B. Covey to supply equipment and conduct excavation services. The remedial excavation, as proposed in the workplan was to be limited to the areas adjacent to, and beneath, the former UST locations at the "western" fueling system. The initially proposed excavation limits are illustrated in Figure 3, Site Plan with Extent of Proposed Remedial Excavation (ATC, January 2004). It was initially estimated that approximately 3,000 cubic yards of soil would need to be excavated in order to remove the petroleum hydrocarbon-impacted source area. During the course of excavation operations, overburden soil not impacted with petroleum hydrocarbons was excavated and placed into two stockpiles on-site. One stockpile was designated as the Impacted Stockpile (ISP) and the other was designated as the Clean Stockpile (CSP). Petroleum hydrocarbon-impacted soils were identified by the presence of hydrocarbon staining, field air monitoring, and odors. A portable PID was used to monitor the presence of volatile organic compounds (VOCs) in soil, and to assess ambient air quality. Ambient air in the downwind direction was monitored approximately every 15 to 30 minutes during the removal of the impacted soil in general accordance with ATC Standard Operating Procedures and South Coast Air Quality Management District (SCAQMD) rules 1149 and 1166, included in Appendix C. Per SCAQMD rules 1149 and 1166, ATC maintained rule 1166 soil air monitoring records and notified the SCAQMD by fax within 24 hours of any VOC soil concentration readings exceeding 50 PPM.

The western fueling area was covered with asphalt and concrete pavement. On March 23, a backhoe was utilized to break up the asphalt and concrete pavement around the gasoline USTs and piping runs and load it into trucks for disposal offsite. Based on visual and olfactory observations and PID soil screening readings, pea gravel initially encountered in the UST area did not appear to have any significant contamination. A CSP stockpile was initiated adjacent to the west side of the dispenser canopy. Pea gravel exposed in the piping area appeared to be impacted and an ISP stockpile was established adjacent to the west side of the dispenser canopy to the south of the CSP stockpile. Stockpiled soil was placed on plastic visqueen sheeting.

On March 24, ATC oversaw the excavation of soils around the four gasoline USTs in the western fueling area. Standing water covered was encountered at a depth of approximately one foot bgs in the UST excavation, just below the concrete pavement. A hydrocarbon sheen was observed on the surface of the water. However, the standing water appeared to be localized and did not reflect a groundwater table. The water was removed with a vacuum truck and no additional water was encountered in the excavations. After the USTs were exposed, degassing of the USTs was initiated.

On March 25, ATC oversaw the excavation of soils around a single diesel UST located to the east of the western fueling area gasoline UST excavation. Based on visual and olfactory observations, and on PID soil screening readings, pea gravel encountered in the diesel UST excavation did not appear to have any significant contamination. A second CSP stockpile was initiated adjacent to the east side of the dispenser canopy. After degassing and exposing all of the USTs, the USTs were cleaned and inspected. A crane was utilized to remove the five USTs and place them on flatbed trucks for offsite disposal. Under the supervision of the Los Angeles City Fire Department (LAFD), ATC collected two soil samples from the diesel UST excavation. Soil samples S1-17 and S2-17 were collected from the bottom of the excavation, at a depth of approximately 17 feet below ground surface (bgs), at the northwest and southeast corners of the diesel tank

excavation, respectively. Laboratory analytical data indicated TPHd concentrations of 32 and 86 milligrams per kilogram (mg/kg) in soil samples S1-17 and S2-17, respectively. BTEX constituents and oxygenates were at concentrations below detection limits in both of the samples. A summary of soil sample analytical results is provided in Table 3 and laboratory data reports are included in Appendix D. A soil sample location map is shown in Figure 4. At the direction of the LAFD, no soil samples were collected from the gasoline UST excavation at this time.

On March 29, 30, and 31, 2005, ATC oversaw the additional excavation of the gasoline UST pit and the excavation of the soils beneath the former dispenser locations.

On April 1, 2005, excavation of the soils beneath the former dispenser locations continued. Soil from the ISP stockpile was loaded into trucks for offsite disposal. Copies of non-hazardous soil manifests are included in Appendix E. A total of 15 trucks containing approximately 325 tons of soil were loaded and transported to a state licensed landfill facility for disposal.

On April 4, 2005, loading of ISP stockpiles into trucks for offsite disposal continued. A total of 11 trucks containing approximately 230 tons of soil were loaded and transported to a state licensed landfill facility for disposal. Under the supervision of the LAFD, ATC collected a total of 16 soil samples from the gasoline UST excavation, beneath the former dispenser locations, and beneath the former piping locations. Soil samples S3-18, S4-18, S5-18, and S6-18 were collected from the bottom of the gasoline UST excavation, at a depth of approximately 18 feet bgs, at the northeast, southeast, southwest, and northwest corners of the diesel tank excavation, respectively. Laboratory analytical data indicated TPHg concentrations below laboratory detection limits in soil samples S3-18 and S4-18 and at concentrations of 14 and 1.0 mg/kg in soil samples S5-18 and S6-18, respectively. BTEX constituents were only detected in sample S5-18. Benzene was below laboratory detection limits and toluene, ethylbenzene, and xylenes were present at concentrations of 0.002, 0.014, and 0.79 mg/kg, respectively. MTBE was detected in soil samples S3-18, S4-18, S5-18, and S6-18 at concentrations of 0.11, 0.052, 0.24, and 0.67 mg/kg, respectively.

Soil samples S7-2, S8-2, S11-2, S12-2, S15-2, S16-2, S17-2, and S18-2 were collected from beneath the former fuel dispenser locations at a depth of approximately 2 feet bgs. TPHg was detected in three of the soil samples with concentrations ranging from 0.5 to 150 mg/kg.; TPHd was detected in six of the soil samples with concentrations ranging from 5 to 82 mg/kg; benzene was detected in one soil sample (S12-2) at a concentration of 0.006 mg/kg; toluene, ethylbenzene, and xylenes were detected in two of the soil samples with concentrations ranging from 0.008 mg/kg (ethylbenzene) to 0.43 mg/kg (toluene); and MTBE was detected in six of the soil samples with concentrations ranging from 0.040 to 0.25 mg/kg.

During excavation activities a total of approximately 1,000 tons (approximately 850 cubic yards) of petroleum hydrocarbon-impacted soil was removed from the site. This soil was loaded onto transport trucks for delivery under non-hazardous waste manifest to Candelaria Environmental Company (a state certified disposal facility) located in San Deigo, California. Copies of the soil transportation manifests are included in Appendix E.

Soil samples were analyzed for TPHg and TPHd, by Environmental Protection Agency (EPA) Test Method 8015 Modified and for BTEX and MTBE by EPA Test Method 8260. Soil samples were collected using Encore® samplers utilizing method 5035 preservation method and delivered under chain-of-custody protocol to Zymax Envirotechnology laboratory of San Diego, California.

7.0 CONCLUSIONS AND RECOMMENDATIONS

ATC directed remedial excavation activities at the Hertz facility located at LAX from March 23, 2005 through April 4, 2005. Transportation manifests indicate that 1,000 tons of petroleum hydrocarbon-impacted soil was excavated, transported and disposed during the performance of excavation activities. Laboratory analytical results indicate that TPHg, TPHd, benzene and MTBE concentrations of up to 150, 720, 0.006, and 0.67 mg/kg, respectively, are still present in the remaining soil. The TPHg, TPHd, and benzene concentrations are below maximum soil screening levels established by the Los Angeles Region California Regional Water Quality Control Board in the *Interim Site Assessment and Cleanup Guidebook*, May 1996, based on a depth to groundwater of approximately 53 feet as measured in well MW-1. Additionally, the benzene and MTBE concentrations are below the EPAs Preliminary Remediation Goals (PRGs) for industrial and residential soils.

Based on laboratory analytical results and field observations, no further investigation is deemed necessary in conjunction with the removal of hydrocarbon impacted soils associated with the western fueling system at the site.

As part of a groundwater assessment investigation conducted in September 2003, ATC collected and analyzed a groundwater sample from well MW-1 located adjacent to the gasoline UST area. Laboratory analytical data indicated TPHg, MTBE, and TBA was present in the sample at concentrations of 0.061 mg/l; 8,700 ug/l; and 2,500 ug/l; respectively. The well has not been sampled since September 2003. Based on the elevated concentrations of MTBE and TBA in the previous groundwater sample, ATC recommends the following:

- Perform additional groundwater sampling of well MW-1.

8.0 LIMITATIONS

ATC's professional services were performed, findings obtained and recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. ATC is not responsible for the independent conclusions, opinions or recommendations made by others based on the records reviewed, site inspection, field exploration and/or laboratory data presented in this report.

It should be noted that all environmental assessments are inherently limited in the sense that conclusions are drawn and recommendations developed from information obtained from limited research and site evaluation. Subsequent field investigations may differ from the conditions defined by this investigation. Additionally, the passage of time may result in a change in the environmental characteristics at this site and surrounding properties. This report is not a regulatory compliance audit.

All specific data generated and reports written for this project are the proprietary information of Hertz and will only be released to Hertz, unless otherwise directed by law. These data are for the sole use and reliance of Hertz. The results presented in any oral or written reports are based upon the information acquired during this investigation. ATC considers business considerations set forth in this document to be the proprietary and confidential information of ATC. This report and the information contained herein shall not be used for any purpose other than as specifically stated in this report and shall not be disclosed to any other party without ATC's written consent.

It must be noted that no investigation can absolutely rule out the existence of any hazardous materials at a given site. This assessment was based upon prior site history and observable conditions and activities. Existing hazardous materials and contaminants can escape detection using these methods.

The work performed in conjunction with this assessment and the data developed are intended as a description of available information at the dates and location given. This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

B19-20	20	<2	<100	<5	<5

Notes:

TPHd = total petroleum hydrocarbons as diesel
TPHg = total petroleum hydrocarbons as gasoline
BTEX = benzene, toluene, ethylbenzene, xylene
MTBE = methyl-tert-butyl-ether
mg/kg = milligrams per kilogram
ug/kg = micrograms per kilogram
<2 = less than the Reporting Limit

TABLE 2
Previous Site Investigation
Groundwater Analytical Results

The Hertz Corporation
9000 Airport Boulevard
Los Angeles, California 90045

Well ID.	Sampling Date	PSH (feet)	TPHg (mg/L)	TPHd (mg/L)	B (µg/L)	T (µg/L)	E (µg/L)	X (µg/L)	MTBE (µg/L)	TBA (µg/L)	DIPE (µg/L)	ETBE (µg/L)	TAME (µg/L)

Notes:

PSH = Phase Separate Hydrocarbon thickness.
TPHg = Total Petroleum Hydrocarbons as Gasoline, C4 to C20 (EPA Method 8260).
TPHd = Total Petroleum Hydrocarbons as Diesel, C8 to C40 (GC/MS Combination).
B = Benzene (EPA Method 8260)
T = Toluene (EPA Method 8260)
E = Ethylbenzene (EPA Method 8260)
X = Total Xylenes (EPA Method 8260)
TAME = t - Amyl Methyl Ether.
TBA = t - Butyl Alcohol.
DIPE = Diisopropyl Ether.
ETBE = Ethyl - t - Butyl Ether.
MTBE = Methyl - t - Butyl Ether.
µg/L = Micrograms per liter (~parts per billion).
mg/L = Milliagrams per liter (~parts per million).
< = Analytical result below the given laboratory Practical Quantitation Limit.

Notes: Results above the laboratory Practical Quantitation Limit (PQL) or Detection Limit (DL) are in boldface font.
All concentrations reported in milligrams per killogram (mg/kg)

TPHg = Total Petroleum Hydrocarbons characterized as Gasoline (EPA Test Method 8260)
MTBE = Methyl-tert-Butyl Ether by EPA Test Method 8260
TAME = tert-Amyl Methyl Ether by EPA Test Method 8260
TBA = tert-Butanol by EPA Test Method 8260
DIPE = Di-isopropyl Ether by EPA Test Method 8260
ETBE = Ethyl tert-Butyl Ether by EPA Test Method 8260
< = Less than the given laboratory detection limit or unknown if no quantifier present
See laboratory anlytical reports for complete list of analytes. Analytes not listed in this table were at concentrations less than the given PQL or DL

APPENDICES

APPENDIX A

HEALTH AND SAFETY PLAN

Appendix 7-4
Form HS 003

ENVIRONMENTAL SITE SAFETY PLAN

Important: Please forward one copy of completed document to the reviewer three (3) working days prior to project start up and maintain a copy on site. Place signed copy in project file. Items marked with "1910.120..." are required by 29 CFR 1910.120 in the paragraph noted.

A. GENERAL INFORMATION (1910.120(c)(4))

Project Name HERTZ / LOS ANGELES (LAX Airport) Project Number 43.75015.0005

Project Manager **Michael Davis** (Print) (Signature)

Site or Building Name HERTZ – LAX AIRPORT

Address 9000 AIRPORT BLVD.

City, State & Zip LOS ANGELES, CALIFORNIA

Client Contact Name and Phone Number Roland Constanzo / (973) 465.6942

Fire #: 213/ 485.6295 **Police #:** 310/ 419.5625 **Ambulance #:** 310.674.6533

Nearest **Hospital** Name **ROBERT F. KENNEDY MEDICAL CENTER**

Address and phone # 4477 W. 118th STREET, HAWTHORNE, CA 90250 / (310) 675.1825

Directions to Hospital South on **AIRPORT BLVD;** Left onto **ARBOR VITAE STREET;** Right onto **S. LA BREA AVE;** Continue on **HAWTHORNE BLVD;** Right onto **W. 118th STREET**

Location of Nearest Phone ATC personnel have their own personal mobile telephones
(With special dialing instructions if any)

Directions for Emergency Escape Identify nearest driveway and proceed to sidewalk or roadway
(Attach diagram if necessary)

Designated Reporting Area Report to sidewalk in front of entrance
(After emergency occurrence)

B. SITE DESCRIPTION (1910.120(c)(4))

Facility History:

The site is an active car rental facility. Oversight remedial excavation and collect soil samples.

Type of Hazard Anticipated On-Site (i.e. tanks, drums, etc.):

Potentially petroleum hydrocarbon impacted soil.

Amount of Hazardous Materials Present:

Unknown

General Site Description:

The site is an active car rental facility.

C. PROJECT OBJECTIVE (S) (1910.120(b)(3))

(Description of work area activities planned:)

Oversight activities during remedial excavation activities.

D. PROJECT ORGANIZATION (1910.120(b)(2))

Team Member	Responsibility	Type of Training	Date of Training
Michael Davis	**Branch/Project Manager**	**HAZWOPER**	**02/2005**

E. CHEMICAL HAZARD ANALYSIS (1910.120(b)(4))

Contaminant	IP (eV)	PEL/TLV (ppm)	IDLH (ppm)	LEL/UEL (%)	Flash Point (°F)	Routes of Exposure
BENZENE	**9.24**	**1 / 0.5**	**500**	**1.2 / 7.8**	**12**	INHALATION DERMAIL INGESTION
TOLUENE	**8.82**	**200 / 50**	**500**	**1.1 / 7.1**	**40**	
ETHYLBENZENE	**8.76**	**100 / 100**	**800**	**0.8 / 6.7**	**55**	
XYLENE (TOTAL)	**8.56**	**100 / 100**	**900**	**1.1 / 7.0**	**81**	
MTBE	**9.70**	**50 / 100**	**1,600**	**2.4 / 8.0**	**52**	
GASOLINE	**N/a**	**N/a**	**N/a**	**1.4 / 7.6**	**- 45**	
This is for general guide only. The listed compounds will be encountered as hazardous waste and will have similar, but different characteristics and concentrations. No MSDS are available.						

NOTE: Attach Material Safety Data Sheets for all substances identified above. See Section (M) (2).

F. OTHER HAZARDS

Heat Stress? [ ] Yes [X] No If yes, please specify precautions to be taken:

Cold Stress? [ ] Yes [X] No If yes, please specify precautions to be taken:

Excessive Noise? [X] Yes [ ] No If yes, please specify precautions to be taken:

Heavy equipment will be utilized. Earplugs are recommended.

Confined Space Entry? [ ] Yes [X] No If yes, attach copy of Confined Space Entry Permit.

Excavations 4' or greater in depth? [X] Yes [ ] No If yes, specify precautions to be taken:

An excavation to approximately 14 feet will be required. No ATC personnel will enter the excavation. All soil sampling will be done at grade utilizing the backhoe bucket.

Welding, Cutting & Brazing? [ ] Yes [X] No If yes, specify precautions to be taken:

Heavy Equipment Operation? [X] Yes [ ] No If yes, specify precautions to be taken:

The excavation will be delineated. All equipment have back-up safety audible alerts.

Slip, Trip or Fall Hazards? [X] Yes [ ] No If yes, specify precautions to be taken:

Slip, trip, or fall hazards may occur. Maintain a clean and organized work environment and keep tools and parts in an organized manner.

Presence of Overhead Utilities

Are overhead utilities present at the project site? [X] Yes [ ] No

If so, always maintain suitable clearance from overhead lines. Reference manual section 12.

Specify location: Overhead utility supply lines are located along the perimeter and enter the site.

Presence of Underground Utilities

Have underground utilities been located and marked at the site? [X] Yes [ ] No [ ] NA

If yes, have the requirements of manual section 33 – Subsurface Investigations been followed? (Attach completed Checklist for Subsurface Clearance - Appendix 33-1) [ ] Yes [X] No

ATC IS THE SUBCONTRACTOR – HB COWEY CONTRACTOR IS RESPONSIBLE FOR EXCAVATION

Specify names and phone number of utilities contact:

Name of Contact(s) UNDERGROUND SERVICES ALERT (USA) OF CALIFORNIA

Phone Number 800/ 422.4133

G. SITE CONTROL (1910.120(d))

Work Zones have been established as shown on the attached **Site Diagram.**

Site Security: Security on site will be maintained by:

XXXXXX Temporary barricades and/or warning tape

N/a Security Fencing

N/a 24 Hour Security

N/a Other (specify) _____

H. PERSONAL PROTECTIVE EQUIPMENT (1910.120(b)(4)) (LIST EXPOSURES UNDER WORK ZONE)

Based on evaluation of potential hazards, the following levels of personal protection have been designated for the applicable work zones:

Work Zone	Level of Protection	Required Protective Equipment (specify exact type e.g. nitrile gloves)	
Exclusion Zone		Respirator:	
		Filters/Cartridges:	
	D	Boots:	
		Inner Gloves:	
	D	Outer Gloves:	
	D	Protective Coverall:	
	D	Hard Hat:	
	D	Eye Protection:	
		Other:	
Contamination Reduction Zone		Respirator:	
		Filters/Cartridges:	
	D	Boots:	
		Inner Gloves:	

D	Outer Gloves:
D	Protective Coverall:
D	Hard Hat:
D	Eye Protection:
	Other:

Exceptions and Modifications:

Minimal exposure is expected due to the inherent characteristics of petroleum oil. Only when PID readings exceed the permissible (and/or above OSHA exposure standards) will exclusion zone and decontamination procedures be implemented. Otherwise, LEVEL D personal protective equipment will be utilized.

I. DECONTAMINATION (1910.120(k))

Personnel Decontamination Procedures

All personnel entering the Exclusion Zone will undergo decontamination prior to leaving the site. Personnel will proceed through the following decontamination stations:

Decontamination Solution: Alconox™ or Liquidnox™

STATION #1:

Equipment Required:

Wash tub or pool; water (hot if possible); decontamination solution; garden hose or Hudson™ pump canister; scrub brush; garbage bags; buckets and 55-gallon drum.

STATION #2:

Equipment Required:

Wash tub or pool; water (hot if possible); garden hose or Hudson™ pump canister; garbage bags; buckets and 55-gallon drum.

STATION #3:

Equipment Required:

Washtub or pool; cold water; garden hose or Hudson™ pump canister.

Equipment Decontamination

Gross Removal By:

Station 1	Hand Scrubbing
Station 1, 2	Cold High Pressure Wash
Station 1	Hot High Pressure Wash (if possible)
Station 1	Steam Cleaning (if possible)
	Other (specify)
Station 3	Clean Rinse
Station 1	Decon solution (specify) Alconox™ or Liquidnox™

Decontamination Waste Water

Collection (specify how):

Wash tub or plastic pool.

Direct Discharge (specify how and where):

NONE - All generated waste is stored and labeled in 55-gallon steel drums.

Pre-Treatment (specify):

N/a

Disposal (specify how and where):

All generated waste is transported and disposed (under contract) under waste manifest to a state certified, RCRA approved treatment facility.

J. AMBIENT AIR MONITORING (1910.120(b)(4))

Activity & Contaminant	Instruments	Action Level	Frequency

Comments: Collect ambient air monitoring data as frequently as possible, up to 4 times per hour

K. PERSONNEL AIR MONITORING (1910.120(h))

Activity/Location	Contaminants(s)	NIOSH/OSHA Protocol
All activities, at any location on- or off-site	**Volatile Organic Compounds (VOCs)**	**If PID displays:** **25 ppm in breathing zone, use respirator.** **250 ppm in breathing zone, stop work.**

L. CONTINGENCY PLAN (1910.120(l))

Emergency Communication Signal(s) (specify): Fist in the air = stop work and ask for further direction.

Emergency Escape Route(s) (specify and indicate on site diagram): Identify nearest driveway and proceed to sidewalk or roadway; report to designated reporting area.

Emergency Equipment On Site: (specify location):

First Aid Kit: ATC vehicle

Fire Extinguishers: ATC vehicle

Telephone: All ATC personnel have dedicated mobile phones.

Eye Wash/Safety Shower: ATC vehicle

Others (specify):

Re-entry to the Exclusion Zone following an on-site emergency shall not be permitted until the following conditions are satisfied:

(1) The conditions resulting in an emergency have been corrected.

(2) The hazards have been re-evaluated.

(3) The HASP has been reviewed and determined adequate for the hazards encountered.

(4) All site personnel have been instructed in any new hazards and changes to the HASP.

M. OTHER REQUIRED INFORMATION

In order to comply with OSHA standards, the following documents MUST be maintained on site:

1) Hazard Communication Manual (1910.1200)

2) Chemical List and Material Safety Data Sheets for all chemicals (1910.1200)

3) Respirator fit test records for all employees who will be required to wear respirators (1910.134)

4) Copy of ATC's Respirator Program (1910.134)

5) Latest medical summary for all personnel (1910.120)

6) Copy of OSHA 200 (300A) Log posted during months of February - April only

APPENDIX B

PERMITS

The UST removal permit was not available to ATC at the time of this report. A copy will be made available upon receipt by ATC.

APPENDIX C

STANDARD OPERATING PROCEDURES

FIEL SOIL VAPOR MONITORING

SCAQMD RULES 1149 AND 1166

STANDARD OPERATING PROCEDURE
SOIL BOREHOLE DRILLING, MONITOR WELL INSTALLATION AND DEVELOPMENT, AND SOIL SAMPLING

Drilling and Soil Sampling

Permits, Site Safety Plan. Utility Clearance

ATC Associates Inc. (ATC) obtains all the required permits, unless otherwise contractually directed. ATC prepares a site specific Site Safety Plan detailing site hazards, site safety and control, decontamination procedures, and emergency response procedures to be employed throughout the defined phase of work. At least 48 hours prior to drilling. Underground Service Alert (USA) or an equivalent agency is notified of the planned work. ATC attempts to locate all underground and above ground utilities by site inspection (in conjunction with its' subcontractors and knowledgeable site managers, if available), and review of site as-built drawings. ATC may employ a private, professional utility locator to refine the site utility inspection.

Drilling Equipment

All soil borings are drilled using a truck-mounted hollow-stem auger drill rig, unless site conditions warrant a different drilling method. Subsurface conditions permitting, the first five feet of each boring is advanced using a hand-auger or post-hole digger. All drilling equipment is inspected daily and maintained in safe working condition by the operator. All down-hole drilling equipment is steam cleaned prior to arriving on site. Working components of the drill rig near the borehole, as well as augers and drill rods are thoroughly steam cleaned between each boring location. All ATC drilling and sampling methods are consistent with ASTM Method D-1452-80 and local, stale and federal regulations.

Soil Sampling and Lithologic Description

Whenever possible and approved by the appropriate regulatory agency, the first ATC boring to be drilled at a site is continuously cored to obtain a complete lithologic description. Otherwise, soil samples are typically collected every 5 feet to the total depth explored, using brass tubes fitted in a California-modified split spoon sampler. If copper or zinc contamination is the subject of the investigation, stainless steel liners are used instead of brass. Additional soil samples may be collected based upon significant changes in lithology or in areas of obvious soil contamination. During soil sample collection, the split spoon sampler is driven 18 to 24 inches past the lead auger by a 140-pound hammer falling a minimum of 30 inches. The number of blows necessary to drive the sampler and the amount of soil recovered is recorded on the Field Exploratory Soil Boring Log. The soil sampler and liners are cleaned with an Alconox® solution and rinsed with tap water prior to each sampling event. New liners are used whenever a soil sample may be retained for laboratory analysis.

Soil samples selected for laboratory analysis are sealed on both ends with Teflon® tape and plastic end caps. The samples are labeled, documented on a chain-of-custody form and placed in a cooler for transport to a state-certified analytical laboratory. Soil contained in remaining liners is removed for lithologic descriptions (according to the Unified Soil Classification System). Additional soil is screened for organic vapors by placing approximately 30 grams of soil in a sealed plastic bag or a glass jar sealed with aluminum foil. The bag or jar is left undisturbed for approximately 15 minutes, in the sun if possible. The headspace in the bag is accessed in a manner to minimize entry of outside air, and is tested for total organic vapor using a calibrated photo ionization detector (PID). The results of the field screening are noted with the lithologic descriptions on the Field Exploratory Soil Boring Log.

On encountering an impermeable (clayey) layer three feet or more in thickness below a saturated permeable layer, where the impermeable layer is considered to be a possible confining layer for an underlying aquifer,

drilling is halted until a decision to proceed is obtained from the project manager. This process minimizes the chance of introducing contamination to an underlying, clean aquifer.

Soil Waste Managment

Soil cuttings are stockpiled on and covered with plastic sheeting to control runoff, or contained in 55-gallon D.O.T.-approved drums on site. Waste soil is sampled to chemically profile it for disposable, and hauled by a licensed waste hauler to an appropriate landfill or certified treatment facility. All waste stored on site is properly labeled at the time of production.

Soil Boring Abandonment

Soil borings which are not to be converted into monitor wells are sealed to the ground surface using neat cement, sand-cement slurry, or hydrated bentonite pellets or chips in accordance with federal, state and local regulations. Native soil may be used to fill the top two to three feet for cosmetic purposes, as permitted.

Monitor Well Installation

Well Casing. Screen and Filter Pack Construction

All well construction is performed in accordance with Department of Water Resources "California Well Standards" and all requirements of local oversight agencies. Soil borings to be converted into single-cased monitor wells are a minimum of eight inches in diameter for 2-inch diameter wells, and a minimum of ten inches in diameter for 4-inch diameter wells. Monitor wells are constructed with schedule 40, threaded. polyvinyl chloride (PVC) casing unless site geochemistry or contamination necessitates an alternative regulatory agency approved material. The wells are constructed with factory-slotted screen and threaded end caps.

The screened interval is placed such that it extends approximately ten feet into the water bearing zone, and at least five feet above the expected maximum water level. The screened interval may extend less than five feet above the maximum water level, only to prevent intersection of the screened interval with the top of the confining layer of a confined aquifer, or where the water table is too shallow to allow this construction. A graded sand filter pack is placed in the annular space across the screened interval and extended approximately one to two feet above the screen, as site conditions permit, so as to prevent extension of the sand pack into an overlying water-bearing unit. The well screen slot size is the maximum size capable of retaining 90% of the filter pack. Typically, 0.010-inch screen is used where the formation is predominantly clay and/or silt or poorly graded fine sand. 0.020-inch screen is used where the formation is predominantly well-graded or medium to coarse sand and/or gravel.

The filter pack grade (mean grain size) is selected according to native sediment type as follows: a) for poorly graded fine sand or silt/clay - 4 times the 70% retained grain size of the formation b) for medium to coarse sand, gravel or well graded sediments - 6 times the 70% retained grain size. Since results of particle size analysis are not always available, ATC often selects screen size and filter pack on the basis of general site stratigraphy, and specifically the finest significantly thick layer of sediment to be screened. Commonly selected grades are Lone Star® 3, 2/12 or 2/16 (or equivalent) with 0.020-inch slotted screen and Lone Star® 1/20 with 0.010-inch slotted screen.

Well Seal and Completion

A minimum two-foot seal of bentonite is placed above the sand pack. The bentonite seal is hydrated by either formation water or potable water. Neat cement or a cement/bentonite grout mixture seals the remaining annular space to the surface. If bentonite is used in the grout mixture, it does not exceed 5% by weight the grout is placed using a tremie pipe, if the top of the bentonite is more than 20 feet below grade, or if water is present in the boring above the bentonite seal. A watertight locking cap and protective traffic-rated vault box is installed on top of each well. Well construction details are presented on the Field Exploratory Soil Boring Log. Following completion of a well, ATC completes and submits, or ensures that

the driller has sufficient information to complete and submit, the state-required Well Completion Report or equivalent document.

Well Development

All newly installed wells are developed prior to sampling to remove fine grained sediments from the well and stabilize the filter pack and the disturbed aquifer materials. Development takes place prior to or at least 24 hours after setting the seal on the well, unless otherwise directed by a local oversight agency. Well development consists of surging with a surge block and removing water from the well with either a pump or bailer, until the well is free of sediment, or until at least 10 well casing volumes have been removed. Depth to bottom is measured to determine casing volume. If the well is sampled immediately following development, temperature, pH, specific conductance and turbidity (qualitative) are monitored during well development (see section "Groundwater Sampling"). All development equipment is cleaned prior to use and between wells with an Alconox® solution, then rinsed in potable water. All data collected during development are recorded on the Well Development Data Sheet and, if necessary, the Purging Data Sheet.

Well Surveying

All well elevations are surveyed at the north side of the top of casing to the nearest ±0.01 foot. The exact survey point (at the center of the survey rod or, if the casing stub is uneven, the point of contact between casing and rod) is clearly marked and maintained on the casing rim. Elevations are referenced either to mean sea level or to a project datum. A project datum is typically chosen so as to minimize the possibility of its' later disturbance. For instance, fire hydrants are commonly selected. Where required, the wells are surveyed by a licensed land surveyor, relative to mean sea level.

STANDARD OPERATING PROCEDURE

FIELD SOIL VAPOR MONITORING

A representative soil sample will be collected from each sample interval and placed in a Ziplock® plastic bag. The bag will be sealed and the soil dissaggregated. At least ten minutes will be allowed for the soil to be heated by direct sunlight and for any VOCs in the soil to accumulate in the headspace of the bag. Volatile gases will then be monitored by inserting the probe of a Photovac 2020 photoionization detector (PID). The PID is equipped with a 10.6 eV lamp which is capable of detecting VOCs at concentrations of 0.1 parts per million (ppm). The PID will be calibrated on-site using 100-ppmV isobutylene-in-air span gas (equivalent to benzene) prior to drilling operations. PID readings will be recorded in the boring logs.

(Adopted August 5, 1988)(Amended July 14, 1995)(Amended May 11, 2001)

RULE 1166. VOLATILE ORGANIC COMPOUND EMISSIONS FROM DECONTAMINATION OF SOIL

(a) Applicability

This rule sets requirements to control the emission of Volatile Organic Compounds (VOC) from excavating, grading, handling and treating VOC-contaminated soil as a result of leakage from storage or transfer operations, accidental spillage, or other deposition.

(b) Definitions

(1) EXCAVATION is the process of digging out and removing materials, including any material necessary to that process such as the digging out and removal of asphalt or concrete necessary to expose, dig out and remove known VOC contaminated soil.

(2) GRADING is the process of leveling off to produce a smooth surface including the removal of any material necessary to that process such as asphalt and concrete necessary to expose known VOC contaminated soil.

(3) SOIL DECONTAMINATION MEASURE is any process approved by the Executive Officer to remediate, destroy, remove, or encapsulate VOC and VOC-contaminated soil.

(4) UNDERGROUND STORAGE TANK means any one or combination of tanks, including pipes connected thereto, which is used for the storage of organic liquid which is more than 50% beneath the surface of the ground.

(5) VOC CONTAMINATED SOIL is a soil which registers a concentration of 50 ppm or greater of Volatile Organic Compounds as measured before suppression materials have been applied and at a distance of no more than three inches from the surface of the excavated soil with an organic vapor analyzer calibrated with hexane.

(6) VOC CONTAMINATED SOIL MITIGATION PLAN is a plan to minimize VOC emissions to the atmosphere during excavation and any subsequent handling of VOC-contaminated soil.

(7) VOLATILE ORGANIC COMPOUND (VOC) is any volatile compound of carbon, excluding methane, carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, ammonium carbonate, and exempt compounds. Exempt compounds are defined in Rule 102—Definition Of Terms.

(8) VOLATILE ORGANIC MATERIALS include gasoline, diesel, crude oil, lubricant, waste oil, adhesive, paint, stain, solvent, resin, monomer, and/or any other material containing VOC.

(c) Requirements

(1) A person excavating an underground storage tank and/or transfer piping storing or previously storing VOC materials, or excavating or grading soil containing VOC materials shall:

(A) Apply for, obtain and operate pursuant to a mitigation plan approved by the Executive Officer prior to commencement of excavation or handling. The mitigation plan general requirement and application requirements are found in Attachment A to this rule. A copy of the approved plan must be on site during the entire excavation period.

(B) Notify the Executive Officer at least 24 hours prior to excavation using a form approved by the Executive Officer which is fully completed.

If the excavation does not commence on start date, renotification is required.

An alternative notification procedure may be authorized for multiple excavations within a single facility, with prior written approval from the Executive Officer.

(C) Monitor for VOC contamination pursuant to subdivision (e), at least once every 15 minutes commencing at the beginning of excavation or grading and record all VOC concentration readings in a format approved by the Executive Officer; and

(D) When VOC-contaminated soil is detected during excavation or grading:

(i) Implement the approved mitigation plan (Attachment A).

(ii) Notify the Executive Officer within 24 hours of detection of VOC-contaminated soil.

(iii) Monitor and record VOC concentration readings as prescribed in the plan. Monitoring records must be kept available on site.

(iv) Keep calibration records for all monitoring instruments available on site.

(2) A person handling VOC-contaminated soil at or from an excavation or grading site shall:

(A) Segregate VOC-contaminated stockpiles from non-VOC contaminated stockpiles such that mixing of the stockpiles does not take place.

(B) Spray VOC-contaminated soil stockpiles with water and/or approved vapor suppressant and cover them with plastic sheeting for all periods of inactivity lasting more than one hour.

(C) Conduct a daily visual inspection of all covered VOC contaminated soil stockpiles to ensure the integrity of the plastic covered surfaces. A daily inspection record must be maintained on site.

(D) Comply with the provisions in subparagraph (c) (1)(A) and clause (c)(1)(D)(i).

(E) Maintain a record of the identification and business addresses of the generator, transporter and storage/treatment facilities. Such record shall be signed by each party at the time custody is transferred.

(F) Treat or remove contaminated soil from an excavation or grading site within 30 days from the time of excavation.

(3) If the VOC concentration in the excavated soil is measured at greater than 1000 ppm, spray the soil with water or vapor suppressant and:

(A) As soon as possible, but not more than 15 minutes, place the soil in sealed containers, or

(B) As soon as possible, but not more than 15 minutes, load into trucks, moisten with additional water, cover and transport off site, or

(C) Implement other alternative storage methods approved in writing by the Executive Officer.

(4) A person treating VOC-contaminated soil shall:

(A) Obtain a permit to construct and operate treatment equipment, as applicable, from the Executive Officer, and

(B) Implement VOC-contaminated soil decontamination measures, as approved by the Executive Officer in writing, which result in Best Available Control Technology applied during all segments, and which include, but are not limited to, at least one of the following:

(i) Installation and operation of an underground VOC collection system and a disposal system prior to excavation.

(ii) Collection and disposal of the VOC from the excavated soil on-site using equipment approved by the Executive Officer.

(iii) Any equivalent VOC-contaminated soil control measure previously approved in writing by the Executive Officer.

(5) A person shall not engage in or allow any on-site or off-site spreading, grading or screening of VOC-contaminated soil, which results in uncontrolled evaporation of VOC to the atmosphere.

(6) Loading trucks for contaminated soil must meet the following:

(A) The truck and trailer shall be adequately tarped prior to leaving the site; no excavated materials shall extend above the sides or rear of the truck or trailer to prevent soil spillage during transport, and

(B) The exterior of the truck, trailer and tires shall be cleaned off prior to the truck leaving the site.

(d) Exemptions

(1) The provisions of this rule shall not apply to the following:

(A) Excavation, handling, and treating of less than one (1) cubic yard of contaminated soil.

(B) Removal of soil for sampling purposes.

(C) Accidental spillage of five (5) gallons or less of VOC containing material.

(2) The provisions of paragraphs (c)(1) and (c)(2) shall not apply to soil excavation or handling as a result of an emergency as declared by an authorized health officer, agricultural commissioner, fire protection officer, or other authorized agency officer. Whenever possible, the Executive Officer shall be notified by telephone prior to commencing such excavation. The Executive Officer shall be notified in writing no later than 48 hours following such excavation. Written notification shall include written emergency declaration from the authorized officer.

(e) Test Methods

(1) A person shall measure excavated soils for volatile organic compounds to determine contamination by:

(A) Using an organic vapor analyzer calibrated with hexane, complying with 40 CFR Part 60 Appendix A, EPA Reference Method 21 Section 3 or any equivalent method with prior approval in writing by the Executive Officer. If other calibrating gases are used, then the measured readings shall be correlated to and expressed as hexane.

(B) Placing the probe inlet at a distance of no more than three inches from the surface of the excavated soil and while slowly moving the probe across the soil surface, observe the instrument readout. If an increased meter reading is observed, continue to sample the excavated soil until the maximum meter reading is obtained. Leave the probe inlet at this maximum reading location for approximately double the instrument response time. If the maximum observed meter reading is greater than the 50 ppm standard in the regulation, record and report the results.

(2) The presence of VOC in stored or spillage materials shall be determined by SCAQMD Method 313 [Determination of Presence of Volatile Organic Compounds (VOC) in Headspace] and/or Method 304 (Determination of Volatile Organic Compounds in Various Materials) contained in the SCAQMD "Laboratory Methods of Analysis for Enforcement Samples" manual.

(f) Enforcement

(1) Violation of any provision of this rule or the violation of the approved mitigation plan shall be grounds for the Executive Officer to amend or revoke the mitigation plan, in addition to penalties provided by the Health & Safety Code.

(2) If the owner or operator is served with a Notice of Violation for creating a public nuisance, the owner or operator shall suspend operation until the public nuisance is mitigated to the satisfaction of the Executive Officer.

ATTACHMENT A

GENERAL MITIGATION PLANS REQUIREMENTS

VOC Contaminated Soil Mitigation Plans shall be written to minimize VOC emissions to the atmosphere during excavation, grading, handling and treatment of VOC contaminated soil. VOC Contaminated Soil Mitigation Plans shall consist of three types: Various Locations, Site Specific and Facility Treatment.

(1) General Requirements

(A) A plan is not transferable.

(B) A person responsible for the excavation, grading or handling of VOC contaminated soil must be completely familiar with the plan and must adhere to the plan requirement. The Executive Officer may require that the plan be signed by the owner and/or operator.

(C) A plan may be amended upon renewal.

(D) Permission to excavate, grade or handle VOC contaminated soil may be withdrawn by the District upon a finding by the Executive Officer that the excavation, grading or handling of the VOC contaminated soil is causing a public nuisance or violating other AQMD rules or regulations.

(2) Various Location Plans:

(A) Shall be limited to the excavation of 2000 cubic yards or less of VOC contaminated soil in any consecutive 12 month period at the same site.

(B) Shall not be used in conjunction with any other various location plan at the same site within a consecutive 12-month period.

(C) Shall expire after one year from issuance unless renewed.

(D) Shall not be issued for nor used for operations that involve grading, soil treatment or remediation, or landfills.

(3) Site Specific Plans:

(A) Shall be for excavation of greater than 2000 cubic yards of VOC contaminated soil.

(B) Shall be issued for specific excavation or grading locations for a period not to exceed two years.

(C) Shall not be renewable.

(4) Facility Treatment Plans:

(A) Shall be issued for a treatment facility at a permanent location.

(B) Shall expire after one year from issuance unless renewed.

(5) Applications for Site Specific Plans shall contain as a minimum:

(A) Reasons for excavation or grading.

(B) Cause of VOC soil contamination and history of the site.

(C) Description of tanks or piping associated with the soil contamination.

(D) An estimate of the amount of contaminated soil.

(E) The operating schedule for excavation and removal.

(F) Description of how the excavation or grading will be conducted.

(G) Description of mitigation measures for dust, odors and VOC.

(H) Details of disposal of VOC contaminated soil, including the ultimate receptor.

(I) Description of monitoring equipment and techniques.

(J) A map showing the facility layout, property line, and surrounding area up to 2500 feet away, and including any schools, residential areas or other sensitive receptors such as hospitals or locations where children or elderly people live or work.

(K) Designation of a person who can conduct a site inspection with the Executive Officer prior to issuance of the plan.

(6) Applications for Facility Treatment Plans shall at a minimum:

(A) Include a list of all AQMD permits to construct or operate which have been issued for that treatment and control equipment.

(B) Provide for the implementation of VOC-contaminated soil decontamination measures, as approved by the Executive Officer in writing, which result in Best Available Control Technology during all operations.

(C) Provide a map showing the facility layout including the location of all proposed VOC and non-VOC contaminated soil stockpiles.

(D) Specify the total amount of VOC contaminated soil proposed to be stockpiled on site.

(E) Provide for VOC contaminated soil stockpiles to be kept moist with water or suppressant and be covered to prevent fugitive emissions.

(F) Provide for VOC contaminated soil stockpiles to be segregated from non-VOC contaminated soil stockpiles.

(G) Provide for maintenance of records for stockpiles according to the source name, address and dates of reception.

(H) Provide for records of the generator, transporter and storage/treatment facilities and indicate their identification and business addresses. Such records shall be signed by each party at the time custody is transferred.

(I) Provide a map showing the facility layout, property line, and surrounding area up to 2500 feet away, and including any schools, residential area or other sensitive receptors such as hospitals, or locations where children or elderly people live or work.

(J) Designation of a person who can conduct a site inspection with the Executive Officer prior to issuance of the plan.

(K) Specify the operating schedule and maximum amount of VOC-contaminated soil proposed to be remediated on a daily basis.

(7) In approving a plan, the Executive Officer require reasonable conditions deemed necessary to ensure the operations comply with the plan and AQMD rules. The conditions may include, but shall not be limited to, procedures for ensuring responsibility for the implementation of the plan, accessibility to the site for AQMD staff, notification of actions required by the plan, identification of emission receptors, monitoring and testing, suppression and covering of stockpiles, prevention of public nuisance from VOC or dust emissions, prevention of fugitive emissions of VOC contaminated soil, loading of truck trailers, and disposal and treatment.

(8) In approving a plan, the Executive Officer may require any records deemed necessary to be maintained by the operator to demonstrate compliance with the plan. Such records shall be retained for at least 2 years and be made available to the Executive officer upon request.

*PQL - Practical Quantitation Limit

**MDL - Method Detection Limit

***Results listed as ND would have been reported if present at or above the listed MDL. Constituents reported with a "J" qualifier are below the PQL but greater than the MDL and are estimated values.

Note: Analyzed by EPA 8260 and GC/MS Combination.
Note: Analytical range is C4-C12.
Note: TPH quantitated against gasoline.
Note: Oxygenates included in TPH result.
Note: Extracted by EPA 5035 (Closed-System Purge and Trap)

*PQL - Practical Quantitation Limit

**MDL - Method Detection Limit

***Results listed as ND would have been reported if present at or above the listed MDL. Constituents reported with a "J" qualifier are below the PQL but greater than the MDL and are estimated values.

Note: Analyzed by EPA 8260 and GC/MS Combination.
Note: Analytical range is C4-C12.
Note: TPH quantitated against gasoline.
Note: Oxygenates included in TPH result.
Note: Extracted by EPA 5035 (Closed-System Purge and Trap)

RE: **UNDERGROUND STORAGE TANK REMOVAL**
Hertz Rental Car Facility
9000 Airport Boulevard
Los Angeles, California 90045
ATC Project No. 52.75015.0006

Dear Mr. Owens:

Enclosed is a copy of the closure report for the removal of an 8,000-gallon waste oil UST, an 8,000-gallon new oil UST, a 2,000-gallon waste oil UST, a 2,000-gallon new oil UST, and associated product piping from the Hertz Rental Car Facility located at 9000 Airport Boulevard in Los Angeles. Based on laboratory analytical results and field observations, no further investigation is deemed necessary in conjunction with the removal of the above referenced USTs. Therefore, ATC requests a regulatory closure for the site.

Should you have questions on this report or require additional environmental information, please contact one of the undersigned at (626) 447-5216.

Sincerely,

ATC Associates Inc.

1.0 INTRODUCTION

ATC Associates Inc. (ATC) has prepared this report to present the observations, conclusions and recommendations associated with the underground storage tank (UST) removal project at the Hertz Rental Car Facility located at 9000 Airport Boulevard in Los Angeles, California (site). This report contains information pertaining to the removal and disposal of an 8,000-gallon waste oil UST, an 8,000-gallon new oil UST, and associated product piping located adjacent to a vehicle maintenance building on the southern portion of the site and the removal and disposal of a 2,000-gallon waste oil UST, a 2,000-gallon new oil UST, and associated product piping located adjacent to a vehicle maintenance building on the northern portion of the site. H.B. Covey, Inc. (H.B. Covey) was retained by Hertz to conduct excavation activities and provide oversight for the excavation, removal, and disposal of the four USTs and associated product piping. H.B. Covey attained all necessary permits for the UST removals. A copy of the UST removal permit issued by the LAFD is included in Appendix A.

2.0 BACKGROUND

2.1 Site Conditions

The site is located at 9000 Airport Boulevard in Los Angeles California as shown in Figure 1 (Vicinity Map) and is used for rental car operations. The site consists of five buildings, a car wash system, and refueling system. The refueling system consists of gasoline USTs, one diesel UST, fourteen fuel dispenser islands, and underground distribution lines. The UST system is generally located in the western, central portion of the facility and is bordered to the west by Airport Boulevard and to the north by the main vehicle entry way into and out of the facility as shown in Figure 2 (Site Plan).

The 8,000-gallon new oil UST (UST 1) and 8,000-gallon waste oil UST (UST 2) were located approximately 20 feet to the east of the southern vehicle maintenance building. A product piping run extended south from the USTs for a distance of approximately 65 feet before making a 90 degree turn to the west and continuing to the building. The locations of UST 1, UST 2, and the associated piping run is shown in Figure 3 (Tank 1 and 2 Detail). A 2,000-gallon waste oil UST (UST 3) and a 2,000-gallon new oil UST (UST 4) were located approximately 15 feet to the south of the northern vehicle maintenance building. A product piping run extended south from the USTs to the building. The locations of UST 3, UST 4, and the associated piping run is shown in Figure 4 (Tank 3 and 4 Detail).

2.2 Geologic and Hydrologic Conditions

The site is located within the Los Angeles Basin in a physiographic unit called The El Segundo Sand Hills (California Department of Water Resources [DWR], 1961). The El Segundo Sand Hills extend from the Ballona Gap south, to Torrance and the Palo Verdes Hills, and

approximately three to four miles inland from the Pacific Ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The Sand Hills consist of a narrow strip of active or recent dunes along the coast an older stabilized sand dunes inland.

The site is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Sand Dunes have been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands and which now form a portion of the Torrance Plain. Weathering and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area (DWR, 1961).

The Site lies within the West Coast (groundwater) Basin, which is part of the larger Los Angeles Coastal Basin (DWR, 1961). The physical boundaries of the West Coast Basin include the Ballona Escarpment to the north; the Rosecrans Hills to the east; and the Pacific Ocean to the west and south. The Palos Verdes Hills form the boundary of the West Coast Basin to the southeast. Water-bearing strata within the basin includes mid-Miocene to Oligocene-aged marine and continental sediments. The principal aquifers (water-producing formations) beneath the site include (in youngest to oldest stratigraphic order) the Old Dune Sand, Gage-Gardena, Lynwood, Silverado, and Sunnyside aquifers (DRW, 1961). Many of the aquifers located in the western portion of the West Coast Basin are not currently used as practical sources of potable water due to general degradation of the upper groundwater zone due to historical industrial activity, oil production, and seawater intrusion. It is unknown at the present time whether the aquifer underlying the subject site is currently in use. The regional direction of groundwater flow in interpreted to generally be toward the west-southwest.

Native soil observed in the excavation sidewalls and bottom sample of the hydraulic lift consisted of brown, silty sand to a depth of approximately 17 feet bgs, the maximum depth of the UST excavations. Groundwater was not encountered at the base of the UST excavations.

3.0 SCOPE OF SERVICES

This UST Removal and Closure report summarizes the site activities conducted at the site on October 18 and 20, 2005. ATC conducted the following:

- Prepared a Site Specific Health & Safety Plan.
- A portable organic vapor analyzer (OVA) or photo-ionization detector (PID) was used to monitor the presence of volatile organic compounds (VOCs) in soil.
- Soil samples were collected from the bottoms of the excavations and from beneath the former piping locations, under the supervision of the LAFD Inspector.
- Soil samples were analyzed for total petroleum hydrocarbons characterized as gasoline (TPHg), and for volatile organic compounds including oxygenates in accordance with Environmental Protection Agency (EPA) Test Methods 8015M and 8260, respectively.
- Conducted Organic Vapor Monitoring to obtain preliminary data regarding the degree of potential petroleum hydrocarbon-impact to soil and for health and safety concerns.
- Prepared this Data Evaluation and Remedial Action Report summarizing the findings.

4.0 INVESTIGATIVE AND LABORATORY METHODS

4.1 Field Procedures

The UST system closure procedures were conducted in accordance with UST removal requirements stipulated by the City of Los Angeles Fire Department (LAFD) guidelines, the Los Angeles County Guidelines, the South Coast Air Quality Management District (AQMD) guidelines, and the Underground Storage Tank Regulations contained in the California Code of Regulations (CCR) Title 23. Site activities were conducted under the supervision of a State of California Professional Geologist (P.G.). Field operations were monitored and conducted by a qualified staff engineer supervised by the P.G. All field operations personnel were trained in accordance with 29 CFR 1910 (40-hour OSHA Hazardous Materials Handling, and Health and Safety Training).

The UST removal permit was obtained by H.B. Covey, prior to performing the UST removal activities. A Copy of the regulatory agency permit is presented in Appendix A. Inspector Vincent Owens was the on-site representative from the LAFD, the local implementing state Certified Unified Program Agency (CUPA) responsible for regulatory oversight of the UST removal. H.B. Covey commenced UST system removal activities on October 10, 2005.

4.2 UST Cleaning

A total of approximately 530-gallons of non-RCRA hazardous waste rinsate liquid was evacuated from the four USTs and transported to the Crosby and Overton in Long Beach, California, under a uniform hazardous waste manifest. A copy of the waste manifests are presented in Appendix B. Following vapor evacuation, the interior of the UST was pressure washed and rinsed using available onsite potable water. Following UST cleaning procedures, the UST was inspected and certified by a Certified Industrial Hygienist. A copy of the Hazardous Waste Tank Closure Certifications is presented in Appendix B.

4.3 UST and Product Piping Removal Procedures

Following certification by the Industrial Hygienist, UST removal activities commenced. On October 18, 2005, UST 2 (8,000-gallon new oil UST) was removed from the tank excavation adjacent to the east side of the southern maintenance building; UST 3 (2,000-gallon waste oil UST) and UST 4 (2,000-gallon new oil UST) were removed from the tank pit adjacent to the west side of the northern maintenance building. A truck-mounted crane was used to remove the USTs from the excavations and loaded them onto flatbed trailers for transportation to a disposal facility. Subsequent to their removal, the USTs were visually inspected for signs of damage. Upon inspection of the USTs, no obvious signs of leaks were observed by ATC on any of the USTs. Additionally, approximately 65 feet of piping associated with UST 1 was removed. On October 20, 2005, UST 1 (8,000-gallon waste oil UST) was removed from the tank pit adjacent to the east side of the southern maintenance building.

4.4 Transportation and Disposal of USTs

On October 18, 2005, Dynamic Transport (Dynamic) transported UST 2, UST 3, and UST 4 to the San Bernardino County Mid-Valley Landfill facility located in Rialto, California for disposal. On October 20, 2005, Dynamic transported UST 1 to the San Bernardino County Mid-Valley Landfill facility for disposal. Delivery tickets and weight receipts for the USTs are provided in Appendix B.

4.5 Collection of Confirmatory Soil Samples

Under the direction of an onsite LAFD inspector, ATC collected a total of ten (10) confirmation soil samples as described as follows:

- Two soil samples (T1-N and T1-S) were collected in native soil beneath the northern and southern ends of the 8,000-gallon new oil UST (UST 1)
- Two soil samples (T2-N and T2-S) were collected in native soil beneath the northern and southern ends of the 8,000-gallon waste oil UST (UST 2)
- Three soil samples (P1, P2, and P3) were collected in native soil beneath the former piping run to the south of UST 1 and UST 2

- One soil sample (T3) was collected in native soil beneath the 2,000-gallon waste oil UST (UST 3)
- One soil sample was (T4) collected in native soil beneath the 2,000-gallon new oil UST (UST 4)
- One soil sample (P4) was collected in native soil beneath the piping run to the east of UST 3 and UST 4

Figures 3 and 4 illustrates the identifications and locations of the UST system confirmation soil samples.

The soil sampling protocol outlined in Appendix C was utilized for the collection of all soil samples in conjunction with this scope of work. Following collection, soil samples were submitted for analytical testing to Enviro-Chem, Inc. laboratories (EnviroChem), a state-certified analytical laboratory, in Pomona, California. Laboratory analytical results are presented in Table 1, Summary of Soil Sample Analytical Results. Copies of the laboratory analytical results and accompanying chain-of-custody documentation are presented in Appendix D.

4.6 Analytical Methods

All confirmation soil samples were analyzed for the following constituents as requested by the LAFD Inspector:

- Total Petroleum Hydrocarbons – Gasoline Range (TPHg) by EPA Test Method 8015M using preservation method 5035.
- Volatile organic compounds including oxygenates by EPA Test Method 8260B using preservation method 5035.

A copy of the LAFD Underground Tank Abandonment Reports specifying the number of samples requested and laboratory analysis requested is presented in Appendix B.

5.0 RESULTS

All four of the USTs removed were of single-walled fiberglass construction. All four of the USTs appeared to be in good condition upon removal from the excavation area. No ruptures, pits, holes or stains were observed when the USTs were inspected by ATC. Native soil in the perimeter base of the excavation consisted of silty sand. Neither petroleum hydrocarbon odors nor stains were observed in the base or walls of the UST excavation. No groundwater was encountered in the base of either of the excavations.

A total of ten soil samples were collected from beneath the UST excavations and from beneath the associated product piping runs. Soil samples were analyzed for TPHg and for VOCs including fuel oxygenates. Laboratory analytical data indicated that concentrations of TPHg, VOCs, and fuel oxygenates were below laboratory detection limits in all ten soil samples analyzed. A summary of the soil analytical results for the four UST system samples are presented in Table 1.

6.0 CONCLUSIONS AND RECOMMENDATIONS

No evidence of petroleum hydrocarbon product release into the soil was observed from the UST system. No stained or odorous soil was observed in soil sample collected from the base of the UST excavation, the product piping excavations, or in the soil stockpiles. A visual inspection of the UST upon removal from the excavations found no indication of cracking or holes.

Laboratory analytical data indicated that concentrations of TPHg, VOCs, and fuel oxygenates were below laboratory detection limits in all ten soil confirmation samples analyzed.

Based on laboratory analytical results and field observations, no further investigation is deemed necessary in conjunction with the removal of the above referenced USTs. Therefore, ATC requests a regulatory closure for the site.

APPENDIX C

SOIL SAMPLING PROTOCOL

SOIL SAMPLING PROTOCOL

Native soil samples were collected utilizing the heavy equipment excavation bucket. The sample location of the bucket was directed by the on-site LAFD inspector. Soil samples were collected with 5035 preservation method sampling kits. The sample kits were labeled and transported in an ice-cooled cooler to the laboratory for chemical analyses.

The samples collected were labeled with the sample identifier, location, and time and date of sample collection using a black indelible marking pen. The samples collected were recorded on a Chain-of-Custody form by the analyzing laboratory, which tracks the samples from time of collection to delivery to the state-certified analytical laboratory. All information recorded on the Chain-of-Custody form was entered in ink.

APPENDIX D

Dear Mr. Hankins:

The **analytical results** for the soil samples, received by our lab on October 18, 2005, are attached. The samples were received chilled, intact and accompanying chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets

Dear Mr. Hankins:

The **analytical results** for the soil samples, received by our lab on October 20, 2005, are attached. The samples were received chilled, intact and accompanying chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets

Dear Mr. Huang,

ATC Associates Inc. (ATC), on behalf of The Hertz Corporation (Hertz), is submitting this Additional Site Assessment Report for the above-referenced project located in Los Angeles, CA. This report includes a description of field activities and analytical results. Should you have questions or require additional information, please do not hesitate to contact us at (323) 517-9780.

Sincerely,
ATC Associates, Inc.

4.0 SITE BACKGROUND INFORMATION

4.1 SITE DESCRIPTION AND SURROUNDING LAND USE

The site is located at 9000 Airport Boulevard in Los Angeles California (**Figure 1 - Vicinity Map**) and is used for rental car operations. The site consists of five buildings, a car wash system, and refueling systems. The refueling system consists of gasoline underground storage tanks (USTs), one diesel UST, fourteen fuel dispenser islands, and underground distribution lines. The UST system is generally located in the western, central portion of the facility and is bordered to the west by Airport Boulevard and to the north by the main vehicle entryway into and out of the facility.

The site is composed of the two main fueling areas; the "eastern" fueling system and the "western" fueling system.

- The eastern system consists of two 12,000 gallon gasoline USTs and 10 dispenser islands. Each island is equipped with one dispenser, and the ten islands are covered by an overhead canopy. The USTs are located just south of the dispenser islands and are oriented north-south in a common excavation.

- The western system consists of one 20,000 gallon gasoline UST, one split UST consisting of 8,000 gallon gasoline and 12,000 gallon diesel, and four dispenser islands. Three gasoline USTs and one diesel UST are located just north of the dispenser islands and are oriented east-west in a common excavation. Each dispenser island in the western system is equipped with two to three dispensers, and are also covered by a metal overhead canopy structure. The two 20,000 gallon USTs were installed in 2005 when the previous USTs were removed as discussed below

Directly north and adjacent to both the eastern and western systems is an eight foot cinderblock wall, followed by a landscaped planter area immediately to the north, then the paved main entry into and out of the facility. To the west of the western system is an asphalt paved drive/parking area, followed by a traffic guard rail and an eight foot chain link fence, then a landscaped parkway with Airport Boulevard west. It should be noted that immediately to the west, and overhead of the canopy for the four dispenser islands related to the western system, exists a large V-shaped commercial billboard placed for viewing from Airport Boulevard. Toward the east and south of the systems are an asphalt paved parking area and maintenance areas for the Hertz facility, including car wash structures to the south and the main office/locker building for the facility to the southeast.

4.2 PRIOR SITE ASSESSMENT ACTIVITY

In July 2003, ATC directed the advancement of 21 soil borings (B-1 through B-21) to depths ranging from 15 feet to 30 feet below ground surface (bgs) at the locations shown on **Figure 2 - Site Plan**. The purpose of the assessment was to evaluate soil quality prior to pending UST upgrades associated with Senate Bill SB 989. Minor soil impact was detected in the vicinity of the eastern dispenser islands. Based on the results of soil samples collected in this area, it appears that this impact is contained and attributed to minor surface spills at the associated dispensers.

Petroleum hydrocarbons were detected in soil associated with the western fueling system. The hydrocarbon contaminated soil around the western system is confined to the UST area and around the dispenser island closest to those USTs. The horizontal extent of the hydrocarbon contamination in the western system was estimated to be 40 feet by 60 feet. At the completion of the initial soil characterization, the vertical extent was not known. The deepest area of impacted soil would be located along the western portion of the UST pit (between B-11 and B-14). It was in this area that an additional boring and monitoring well was recommended. The details of the soil assessment are found

in ATC's *Site Assessment Report*, dated August 25, 2003. A summary of soil sample analytical results is included in Table 5.

In September 2003, ATC directed and supervised the advancement of a soil boring and installation of one groundwater monitoring well (MW-1) at a location to the west of the western fueling system. The boring was advanced to a depth of 75 feet bgs and soil samples were collected at five foot intervals. ATC selected five soil samples between 45 and 63 feet bgs for laboratory analysis. Soil samples collected between 45 and 55 feet bgs contained the highest levels of MTBE (ranging between 1.3 to 48 micrograms per kilogram (mg/kg). The MTBE concentrations decreased between 55 feet and 63 feet bgs. Monitoring well MW-1 was constructed using 45 feet (surface to 45 feet bgs) of solid 4-inch diameter Schedule 40 PVC casing, and 30 feet of slotted (0.020-inch slots) 4-inch diameter Schedule 40 PVC well screen. Subsequent to its installation, the well was purged and developed.

A groundwater sample was collected during a September 2003 investigation from the onsite monitoring well MW-1 and the results indicated total petroleum hydrocarbons - gasoline range (TPHg) was detected at a concentration of 61 micrograms per liter (µg/L). TBA and MTBE were reported at concentrations of 2,500 µg/L, and 8,700 µg/L, respectively. All other analytes were below their respective detection limits. Depth to water was measured on September 16, 2003 at 71.25 feet below ground surface.

Between March 24 and April 4, 2005 ATC oversaw the excavation of impacted soil during the removal of four gasoline USTs and one diesel UST, and the associated dispenser islands at the western fueling area. Transportation manifests indicated that 1,000 tons of petroleum hydrocarbon-impacted soil was excavated, transported and disposed during the performance of excavation activities. Laboratory analytical results from soil samples collected during the excavation, indicated that TPHg, total petroleum hydrocarbons - diesel range (TPHd), benzene and methyl tert-butyl ether (MTBE) concentrations of up to 150, 720, 0.006, and 0.67 mg/kg, respectively, were still present in the remaining soil. The TPHg, TPHd, and benzene concentrations were below maximum soil screening levels established by the Los Angeles Region California Regional Water Quality Control Board (*Interim Site Assessment and Cleanup Guidebook*, May 1996), based on a depth to groundwater of approximately 53 feet as originally measured in well MW-1. Additionally, the benzene and MTBE concentrations were below the EPAs Preliminary Remediation Goals (PRGs) for industrial and residential soils. The remediation activities were presented in ATC's August 18, 2005 *Remedial Excavation Report* prepared for the facility.

A summary of the historical groundwater and soil analytical data is provided in **Table 3 and 5**.

4.3 SITE AND AREA LITHOLOGY

The site is located within the Los Angeles Basin in a physiographic unit called The El Segundo Sand Hills (California Department of Water Resources [DWR], 1961). The El Segundo Sand Hills extend from Ballona Gap south to Torrance and the Palo Verdes Hills, and approximately three to four miles inland from the ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The sand hills consist of a narrow strip of active or recent dunes along the coast with older stabilized sand dunes inland.

The Site is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Dune Sand has been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands and which now form a portion of the Torrance Plain. Weathering

and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area (DWR, 1961).

Based on soil boring data from previous investigations at the site (ATC, 2003c) and the current additional site assessment, site lithology from the ground surface to approximately 80 feet below ground surface (bgs) consists predominantly of fine to coarse sand interbedded with silt and clay. ATC identified four generalized soil units beneath the site:

1. an upper fine-grained unit from ground surface to approximately 15 to 20 feet bgs;
2. an upper sand unit beginning between 15 and 20 feet bgs and extending to approximately 30 ft bgs;
3. a lower fine-grained unit from approximately 30 feet bgs extending to between 50 and 55 feet bgs;
4. a lower sand unit from between approximately 50 and 55 feet bgs to at least 75 feet bgs.

Base on the DWR (1961) description of the regional units, it is likely that the units described above are within the undifferentiated sediments of Lakewood Formation.

Cross sections describing soil lithology and soil sample analysis are shown in **Figures 5, 6, and 7**.

4.4 AREA HYDROLOGY AND HYDROGEOLOGY

The Site lies within the West Coast (groundwater) Basin, which is part of the larger Los Angeles Coastal Basin (DWR, 1961). The physical boundaries of the West Coast Basin include the Ballona Escarpment to the north; the Rosecrans Hills to the east; and the Pacific Ocean to the west and south. The Palos Verdes Hills form the boundary of the West Coast Basin to the southeast. Water-bearing strata within the West Coast basin includes mid-Miocene to Oligocene-aged marine and continental sediments. The principal aquifers (water-producing formations) beneath the site include (in youngest to oldest stratigraphic order) the Old Dune Sand, Gage-Gardena, Lynwood, Silverado, and Sunnyside aquifers (DRW, 1961). Many of the aquifers located in the western portion of the West Coast Basin are not currently used as practical sources of potable water due to general degradation of the upper groundwater zone due to historical industrial activity, oil production, and seawater intrusion. The regional direction of groundwater flow is toward the south-southwest.

5.0 RECENT ASSESSMENT ACTIVITIES

ATC conducted a field investigation from June 19 through July 11, 2008. Site assessment activities were conducted per the request of the RWQCB in accordance with the *Workplan for Additional Soil and Groundwater Investigation* (ATC Associates, February 29, 2008) approved by the State Water Resources Control Board - Los Angeles Region on March 5, 2008.

Prior to commencement of field activities, ATC obtained well permits from the County of Los Angeles Water & Sewage/Mountain & Rural Programs Environmental Health Division. A copy of the well permit is included in **Appendix A**. The investigation activities are summarized in the following sections, and the field procedures are detailed in **Appendix B**. Also prior to drilling the well borings, ATC contacted Underground Service Alert (USA) and subcontracted with a private utility locator service to verify the presence of any utilities in the vicinity of the proposed well boring locations. Following the utility clearance, drilling was scheduled.

ATC contracted with Martini Drilling for the well installations. A CME-85 drilling rig equipped with 10-inch diameter hollow-stem augers was utilized to complete the monitoring wells. Additional details are provided below.

5.1 GROUNDWATER MONITORING WELL INSTALLATION

Based on the depth to water measurements and the analytical laboratory results of the July & September 2003 investigations, ATC selected the two locations for installation of groundwater monitoring wells. Our objective was to establish onsite locations for collecting groundwater data; including groundwater hydraulic head measurements and dissolved petroleum constituent concentrations. Between June 19 and 20, 2008, ATC installed two groundwater monitoring wells (MW-2 and MW-3) at the site using a hollow-stem auger drilling method. Groundwater monitoring well MW-2 was installed north of the eastern dispenser islands and MW-3 was installed east of the western dispenser islands. The borings were advanced to between 77 and 89 feet bgs and the monitoring wells were installed to total depths of 75 and 85 feet bgs with a 30 ft screen interval used for both wells. Well locations are shown on **Figure 2**. Well installation activities are summarized below and daily records are presented in **Appendix C**.

5.1.1 Soil Sampling

At each location, soil samples were collected at 5-foot intervals from ground surface to the total depth of the boring. The well borings were drilled, sampled and completed as a groundwater monitoring wells in general accordance with ATC's Standard Operating Procedures, which are included in **Appendix B**.

To obtain preliminary data regarding potential petroleum hydrocarbon-impacted soil, a representative sample was collected at each soil sampling location and field screened for volatile organic vapors in general accordance ATC's Standard Operating Procedures, which are included in **Appendix B**. Organic vapor meter readings were collected using a RAE Systems MiniRAE 2000 photo-ionization detector (PID) and were recorded in the boring logs.

All soil samples collected during the investigation were submitted for laboratory analysis. The details of the analysis are presented in **Section 5.1.5** and a discussion of the results is included in **Section 6.3.1**.

An ATC Geologist completed lithologic logs for each boring in general accordance with ASTM Method D 2488-90. ATC selected all soil samples from each boring for chemical analysis. Soil characteristics (observations of staining or odor), Unified Soil Classification System (USCS) designation, and depth to groundwater were recorded on the boring logs provided in **Appendix C**.

5.1.2 Well Specifications and Construction

Following soil sampling, groundwater monitoring wells were installed using 4-inch-diameter, Schedule 40 PVC casing. Groundwater monitoring well MW-2 was constructed using forty-five (45) feet casing, and thirty feet of well screen. The annulus of the screened portions of monitoring well MW-2 was backfilled with a #3 Monterey sand (or equivalent) filter pack from approximately 75 to 45 feet bgs. An approximate 2-foot layer of medium bentonite chips were placed on top of the upper filter pack and hydrated to form an annular seal. The remaining annular space to the bottom of the concrete seal (approximately 40 feet) was filled with bentonite grout.

Based upon groundwater measurements that were collected upon the completion of monitoring well MW-2 it was determined that groundwater was deeper than had been observed in the lithologic logging and as measured during previous monitoring events. It was determined to extend monitoring well MW-3 to 85 feet below ground surface to compensate for the increased depth to groundwater. The screened portions of monitoring well MW-3 was back filled with #3 Monterey sand (or equivalent) filter pack from 85 to 55 bgs. An approximate 2-foot layer of medium bentonite chips were placed on top of the upper filter pack and hydrated to form an annular seal. The remaining annular space of the bentonite chips seal was filled with bentonite grout.

Each well was completed with a two-foot deep surface seal was placed above the bentonite grout and a traffic-rated well box was placed within a circular two-foot diameter perimeter seal. A summary of the final monitoring well construction details is provided in **Table 1** and locations of the monitoring wells are shown on **Figure 2**.

5.1.3 Well Development

On July 3, 2008, ATC developed monitoring wells MW-2 and MW-3 using a combination of surging and bailing methods. Well MW-2 went dry after removing approximately one bailer (less than a casing volume), so the field personnel allowed the well to recharge. Again after removing approximately one casing volume, the well went dry. At this point ATC terminated well development with purged water relatively clear and free of suspended sediment. Well MW-3 went dry after removing approximately one casing volume, so the field personnel allowed the well to recharge. Again after removing approximately one casing volume, the well went dry. At this point ATC terminated well development with purged water relatively clear and free of suspended sediment.

After well development, ATC measured static depth to groundwater and the total well depth in each well. Depth to water was measured (in ft bgs) at 73.68, 74.21, and 76.40 for wells MW-1, MW-2, and MW-3, respectively. Total well depth was recorded in MW-1 at 77.00, MW-2 at 75.00, and in MW-3 at 85.00.

Groundwater purged during well development was contained in 55-gallon drums and remain onsite pending proper disposition. The groundwater monitoring wells were developed in general accordance with ATC's Standard Operating Procedures, which are included in **Appendix B**.

5.1.4 Well Surveying

On July 3, 2008, a California-licensed Professional land Surveyor surveyed the lateral locations and elevations of the newly installed groundwater monitoring wells. Due to an apparent lack of survey data for MW-1, ATC also had MW-1 surveyed. The location and elevation of measuring marks on the north side of each wellhead were surveyed to the nearest 0.01-foot by the licensed surveyor in order to more accurately determine the local groundwater flow direction beneath the site. Survey data is provided in both **Table 1** and **Appendix F**.

5.1.5 Laboratory Analysis

ATC submitted the soil samples to a State of California-certified laboratory, under chain-of-custody procedures. The laboratory analyzed a total of 31 soil samples for:

- TPHg using EPA Method 8260B;
- Ethanol (by direct injection) using EPA Method 8260B;
- BTEX (benzene, toluene, ethylbenzene, and xylenes) and fuel oxygenates methyl tert-butyl ether (MTBE), diisopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), t-amyl methyl ether (TAME), and t-butyl alcohol (TBA) using EPA Method 8260B;
- VOCs (full list) using EPA Method 8260B.

The analytical results are summarized in **Table 4,** and a discussion is included in **Section 6.3.1**. The laboratory analytical reports are provided in **Appendix E**.

5.2 GROUNDWATER MONITORING

ATC gauged and sampled all groundwater monitoring wells (MW-1 through MW-3) at the site on July 11, 2008, after sitting undisturbed for eight days. Groundwater monitoring activities are summarized in the following sections, with well sampling logs included in **Appendix D**.

5.2.1 Downhole Parameter and Groundwater Level Measurements

On July 11, 2008, prior to commencement of purging and sampling activities, ATC gauged and inspected the monitoring wells for phase-separate hydrocarbons and depth to groundwater. During this event, the depth to groundwater in well MW-2 was recorded at 74.10 ft bgs. The depth to groundwater in well MW-3 was recorded at 79.70 ft bgs. The previously installed groundwater well MW-1 depth to water was recorded at 73.63 ft bgs. **Table 1** summarizes well identifications and casing elevations, **Table 2** includes groundwater depths and groundwater elevations. Well sampling records are provided in **Appendix D**.

5.2.2 Purging and Sampling Procedures

ATC used a low-flow purging method to sample the groundwater monitoring wells. During purging, ATC monitored temperature, pH, conductivity, turbidity, and DO. Purge volumes for the monitoring wells were 0.80 gallons (gals), 0.80 gals, and 15 gals for MW-1, MW-2, and MW-3, respectively. Also recorded were the times the purging was commenced and when completed, and when each parameter reading was recorded. Total time to purge the above-mentioned amounts was 30 minutes (mins), 35 mins, and 45 mins for MW-1, MW-2, and MW-3, respectively.

Following purging, groundwater samples were collected from the newly installed monitoring wells (MW-2 and MW-3) and the preexisting groundwater well (MW-1). Field parameter measurements were recorded on the well sampling records, which are included in **Appendix D**.

5.2.3 Laboratory Analysis

ATC submitted the groundwater samples to Enviro-Chem, Inc., a State of California ELAP-certified laboratory, under chain-of-custody procedures. Three groundwater samples were analyzed for:

- TPH - full carbon chain (gasoline, c4-c10; diesel, c11-c22; motor/heavy oils, c23-c35) using EPA Method 8015B;
- Ethanol (by direct injection) using EPA Method 8260B;
- BTEX (benzene, toluene, ethylbenzene, and xylenes) and fuel oxygenates methyl tert-butyl ether (MTBE), diisopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), t-amyl methyl ether (TAME), and t-butyl alcohol (TBA) using EPA Method 8260B;
- VOCs (full list) using EPA Method 8260B.

The analytical results are discussed in **Section 6**; the laboratory analytical reports are provided in **Appendix E**.

5.3 WASTE MANAGEMENT

Drilling and sampling activities generated twenty-six 55-gallon drums of soil cuttings, which await final disposal. Soil analysis performed as part of the assessment will be used to characterize the waste for disposal. Copies of waste disposal manifests will be forwarded upon receipt by The Hertz Corporation. Soil cuttings were managed in accordance with the County of Los Angeles Regulations.

6.0 RESULTS

The cumulative findings of the additional site assessment described in **Section 5** are summarized below.

6.1 DRILLING OBSERVATIONS

Consistent with previous investigations at the site, ATC observed unconsolidated alluvial sediments with grain sizes ranging from clays to gravels. Drilling observations are presented on the boring logs in **Appendix C**. The lithologic units logged and described by ATC can generally be classified within the six soil units described in **Section 4.3**, above. ATC observed PID readings above typical background concentrations in the following:

- MW-2-55' with a PID reading of 327.0 part per million (ppm);
- MW-3-35' at 21.2 ppm;
- MW-3-45' at 24.3 ppm.

Soil samples were collected every 5-feet and all samples were analyzed. In the two monitoring wells, saturated soil was generally encountered from approximately 55 to 70 feet bgs, Due to high moisture content in the samples, water level was initially judged to be around 55-60 ft bgs, in monitoring well MW-2. Water levels dropped significantly after drilling to total depth, with static groundwater levels stabilizing at approximately 73-74 feet bgs.

Groundwater elevation was calculated for each well by subtracting the depth-to-water measurement from the surveyed casing elevation. The survey data for the groundwater monitoring wells is provided in **Appendix F**. Groundwater elevations from the monitoring wells gauged on July 11, 2008 were used to prepare a groundwater elevation contour map (**Figure 3**). The groundwater elevation contours indicate a southeastward flow direction with an approximate hydraulic gradient of 0.005 ft/ft.

6.2 MONITORING WELL OBSERVATIONS

No phase–separate hydrocarbons were observed in any of the wells. Depth-to-water measurements ranging from 73.63 to 79.70 bgs are presented in **Table 2**; groundwater elevation contours are depicted on **Figure 3**.

6.3 ANALYTICAL RESULTS

The analytical results for soil and groundwater samples collected during this field investigation are summarized in **Tables 2 and 3**. Groundwater analytical results are also shown on **Figure 3**. Analytical laboratory reports and chain-of-custody forms are provided in **Appendix E**.

6.3.1 Soil Analysis

During the additional site assessment activities, completed from June 19 through July 11, 2008, thirty-one (31) soil samples were submitted for analytical testing. None of the soil samples submitted for laboratory analysis were reported to contain petroleum hydrocarbon constituent concentrations above their respective laboratory practical quantitation limits (PQL), with the following exceptions:

- MW-2-55' - MTBE, TAME, and TBA concentrations of 5.67, 0.025, 2.70 milligrams per kilograms (mg/kg), respectively;
- MW-2-60' - MTBE and TBA concentrations of 0.188 and 0.051 mg/kg, respectively;
- MW-3-5' - MTBE concentration of 0.043 mg/kg

A summary of soil sample analytical results from the additional site assessment is provided in **Table 4**.

6.3.2 Groundwater Analysis

The groundwater sampling event for all monitoring wells (MW-1 through MW-3), took place on July 11th, 2008. None of the groundwater samples submitted for laboratory analysis were reported to contain petroleum hydrocarbon constituent concentrations above their respective laboratory PQL, with the following exceptions:

- MW-1 MTBE and acetone concentrations of 4.03 and 13.0 µg/l, respectively;
- MW-2 MTBE concentration of 2,740 µg/l

A summary of the groundwater sample analytical results is provided in **Table 2**, and historical groundwater analytical results are in **Table 3**. Laboratory reports and chain-of-custody documentation is included in **Appendix E**.

7.0 FINDINGS AND RECOMMENDATIONS

Based on the laboratory analytical results, it is ATC's opinion that an additional monitoring well is recommended in the area of monitoring well MW-2 based on the elevated concentrations of MTBE. Additional assessment is also recommended in the area of MW-1 due to the elevated levels of MTBE observed in the soil samples at 50 feet. The groundwater samples collected from monitoring well MW-1 and MW-2 indicated detectable concentrations of petroleum hydrocarbon and/or fuel oxygenate constituents. The MTBE and TAME levels in monitoring well MW-1 has decreased significantly. Based on the groundwater monitoring results for this quarter additional quarterly monitoring is recommended.

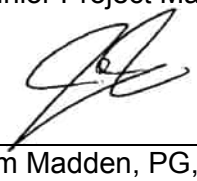
8.0 LIMITATIONS

Our professional services have been performed, our findings obtained, and our recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. This company is not responsible for the independent conclusions, opinions, or recommendations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

It should be noted that all surficial environmental assessments are inherently limited in the sense that conclusions are drawn and recommendations developed from information obtained from limited research and site evaluation. For these types of evaluations, it is often necessary to use information prepared by others and ATC cannot be responsible for the accuracy of such information. In addition, the passage of time may result in a change in the environmental characteristics at this site and surrounding properties. This report does not warrant against future operations or conditions, nor does it warrant operations or conditions present of a type or at a location not investigated. This report is not a regulatory compliance audit and is not intended to satisfy the requirements of any state, federal, or local real estate transfer laws.

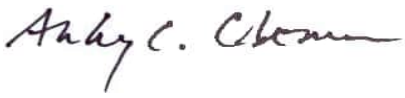
It must be noted that no investigation can absolutely rule out the existence of any hazardous materials at a given site. This assessment has been based upon prior site history, observable conditions, and the subsurface soil sampling described in this report. Existing hazardous materials and contaminants can escape detection using these methods.

This report is for the use and benefit of, and may be relied upon by, Hertz, and any affiliates, and third parties authorized in writing by Hertz and ATC, including the lender(s) in connection with a secured financing of the property, and their respective successors and assigns. Any third party agrees by accepting this report that any use or reliance on this report shall be limited by the exceptions and limitations in this report, and with the acknowledgment that actual site conditions may change with time, and that hidden conditions may exist at the property that were not discovered within the authorized scope of the assessment.



ATC makes no other representation to any third party except that it has used the degree of care and skill ordinarily exercised by environmental consultants in the preparation of the report and in the assembling of data and information related thereto. No other warranties are made to any third party, either express or implied. Unless otherwise agreed upon in writing by ATC and a third party, ATC's liability to any third party authorized to use or rely on this report with respect to any acts or omissions shall be limited to a maximum of $100,000.

9.0 SIGNATURES



This report was prepared by the staff of ATC Associates, Inc., under the supervision of the Senior Geologist whose signature appears hereon. The findings, recommendations, specifications, or professional opinions are presented within the limits described by the client, in accordance with generally accepted practices, using the degree of skill and care ordinarily exercised by environmental consultants under similar circumstances. No warranty is expressed or implied.

DISPOSITION OF PERMIT (Department Use Only)
THIS PERMIT IS CONSIDERED COMPLETE WHEN THE WORK PLAN IS APPROVED AND WHEN THE WELL COMPLETION LOG IS RECEIVED. NO WELL CONSTRUCTION OR DECOMMISSIONING CAN BE INITIATED WITHOUT THE WORK PLAN APPROVAL FROM THIS DEPARTMENT

WORK PLAN APPROVAL
This Approval is Valid for 180 Days

Date 6/18/08 R.E.H.S. MICHELLE TSIEBOS

Conditions ON 6/16/08 $402.00 WAS PAID FOR PERMIT # 2323 TO INSTALL 2 MONITORING WELLS (MW-2, MW-3) MAINTAIN ALL SETBACKS. PLEASE NOTIFY ME AT LEAST 48 HOURS PRIOR START OF FIELDWORK TO SCHEDULE ONSITE INSPECTION.

(310) 419-8446

I hereby agree to comply in every respect with all the regulations of the County Environmental Health Division and with all ordinances and laws of the County of Los Angeles and the State of California pertaining to well construction, reconstruction and decommissioning. Upon completion of the well and with in thirty days thereafter, I will furnish the Environmental Health office with a completion log of the well giving date drilled, depth of the well, perforations in the casing, and any other data deemed necessary by County Environmental Health Division.

Applicant's Signature

Applicant Name: (Print) CLINT MCMAHAN - ATC

Fax Number: 323-517-9701

NOTICE

This well permit approval is limited to compliance with the California well standards and the Los Angeles County Health and Safety Code and does not grant any rights to construct, reconstruct, or decommission any well. Applicant is responsible for securing all other permits necessary to perform the work.

APPENDIX B

STANDARD OPERATING PROCEDURES

STANDARD OPERATING PROCEDURE

SOIL BOREHOLE DRILLING, MONITOR WELL INSTALLATION AND DEVELOPMENT, AND SOIL SAMPLING

Drilling and Soil Sampling

Permits, Site Safety Plan. Utility Clearance

ATC Associates Inc. (ATC) obtains all the required permits, unless otherwise contractually directed. ATC prepares a site specific Site Safety Plan detailing site hazards, site safety and control, decontamination procedures, and emergency response procedures to be employed throughout the defined phase of work. At least 48 hours prior to drilling. Underground Service Alert (USA) or an equivalent agency is notified of the planned work. ATC attempts to locate all underground and above ground utilities by site inspection (in conjunction with its' subcontractors and knowledgeable site managers, if available), and review of site as-built drawings. ATC may employ a private, professional utility locator to refine the site utility inspection.

Drilling Equipment

All soil borings are drilled using a truck-mounted hollow-stem auger drill rig, unless site conditions warrant a different drilling method. Subsurface conditions permitting, the first five feet of each boring is advanced using a hand-auger or post-hole digger. All drilling equipment is inspected daily and maintained in safe working condition by the operator. All down-hole drilling equipment is steam cleaned prior to arriving on site. Working components of the drill rig near the borehole, as well as augers and drill rods are thoroughly steam cleaned between each boring location. All ATC drilling and sampling methods are consistent with ASTM Method D-1452-80 and local, stale and federal regulations.

Soil Sampling and Lithologic Description

Whenever possible and approved by the appropriate regulatory agency, the first ATC boring to be drilled at a site is continuously cored to obtain a complete lithologic description. Otherwise, soil samples are typically collected every 5 feet to the total depth explored, using brass tubes fitted in a California-modified split spoon sampler. If copper or zinc contamination is the subject of the investigation, stainless steel liners are used instead of brass. Additional soil samples may be collected based upon significant changes in lithology or in areas of obvious soil contamination. During soil sample collection, the split spoon sampler is driven 18 to 24 inches past the lead auger by a 140-pound hammer falling a minimum of 30 inches. The number of blows necessary to drive the sampler and the amount of soil recovered is recorded on the Field Exploratory Soil Boring Log. The soil sampler and liners are cleaned with an Alconox® solution and rinsed with tap water prior to each sampling event. New liners are used whenever a soil sample may be retained for laboratory analysis.

Soil samples selected for laboratory analysis are sealed on both ends with Teflon® tape and plastic end caps. The samples are labeled, documented on a chain-of-custody form and placed in a cooler for transport to a state-certified analytical laboratory. Soil contained in remaining liners is removed for lithologic descriptions (according to the Unified Soil Classification System). Additional soil is screened for organic vapors by placing approximately 30 grams of soil in a sealed plastic bag or a glass jar sealed with aluminum foil. The bag or jar is left undisturbed for approximately 15 minutes, in the sun if possible. The head space in the bag is accessed in a manner to minimize entry of outside air, and is tested for total organic vapor using a calibrated photo ionization detector (PID). The results of the field screening are noted with the lithologic descriptions on the Field Exploratory Soil Boring Log.

On encountering an impermeable (clayey) layer three feet or more in thickness below a saturated permeable layer, where the impermeable layer is considered to be a possible confining layer for an

underlying aquifer, drilling is halted until a decision to proceed is obtained from the project manager. This process minimizes the chance of introducing contamination to an underlying, clean aquifer.

Soil Waste Management

Soil cuttings are stockpiled on and covered with plastic sheeting to control runoff, or contained in 55-gallon D.O.T.-approved drums on site. Waste soil is sampled to chemically profile it for disposable, and hauled by a licensed waste hauler to an appropriate landfill or certified treatment facility. All waste stored on site is properly labeled at the time of production.

Soil Boring Abandonment

Soil borings which are not to be converted into monitor wells are sealed to the ground surface using neat cement, sand-cement slurry, or hydrated bentonite pellets or chips in accordance with federal, state and local regulations. Native soil may be used to fill the top two to three feet for cosmetic purposes, as permitted.

Monitor Well Installation

Well Casing. Screen and Filter Pack Construction

All well construction is performed in accordance with Department of Water Resources "California Well Standards" and all requirements of local oversight agencies. Soil borings to be converted into single-cased monitor wells are a minimum of eight inches in diameter for 2-inch diameter wells, and a minimum of ten inches in diameter for 4-inch diameter wells. Monitor wells are constructed with schedule 40, threaded. polyvinyl chloride (PVC) casing unless site geochemistry or contamination necessitates an alternative regulatory agency approved material. The wells are constructed with factory-slotted screen and threaded end caps.

The screened interval is placed such that it extends approximately ten feet into the water bearing zone, and at least five feet above the expected maximum water level. The screened interval may extend less than five feet above the maximum water level, only to prevent intersection of the screened interval with the top of the confining layer of a confined aquifer, or where the water table is too shallow to allow this construction. A graded sand filter pack is placed in the annular space across the screened interval and extended approximately one to two feet above the screen, as site conditions permit, so as to prevent extension of the sand pack into an overlying water-bearing unit. The well screen slot size is the maximum size capable of retaining 90% of the filter pack. Typically, 0.010-inch screen is used where the formation is predominantly clay and/or silt or poorly graded fine sand. 0.020-inch screen is used where the formation is predominantly well-graded or medium to coarse sand and/or gravel.

The filter pack grade (mean grain size) is selected according to native sediment type as follows: a) for poorly graded fine sand or silt/clay - 4 times the 70% retained grain size of the formation b) for medium to coarse sand, gravel or well graded sediments - 6 times the 70% retained grain size. Since results of particle size analysis are not always available, ATC often selects screen size and filter pack on the basis of general site stratigraphy, and specifically the finest significantly thick layer of sediment to be screened. Commonly selected grades are Lone Star® 3, 2/12 or 2/16 (or equivalent) with 0.020-inch slotted screen and Lone Star® 1/20 with 0.010-inch slotted screen.

Well Seal and Completion

A minimum two-foot seal of bentonite is placed above the sand pack. The bentonite seal is hydrated by either formation water or potable water. Neat cement or a cement/bentonite grout mixture seals the remaining annular space to the surface. If bentonite is used in the grout mixture, it does not exceed 5% by weight. The grout is placed using a tremie pipe, if the top of the bentonite is more than 20 feet below grade, or if water is present in the boring above the bentonite seal. A watertight locking cap and protective traffic-rated vault box is installed on top of each well. Well construction details are presented on the Field Exploratory Soil Boring Log. Following completion of a well, ATC completes and submits,

or ensures that the driller has sufficient information to complete and submit, the state-required Well Completion Report or equivalent document.

Well Development

All newly installed wells are developed prior to sampling to remove fine grained sediments from the well and stabilize the filter pack and the disturbed aquifer materials. Development takes place prior to or at least 24 hours after setting the seal on the well, unless otherwise directed by a local oversight agency. Well development consists of surging with a surge block and removing water from the well with either a pump or bailer, until the well is free of sediment, or until at least 10 well casing volumes have been removed. Depth to bottom is measured to determine casing volume. If the well is sampled immediately following development, temperature, pH, specific conductance and turbidity (qualitative) are monitored during well development (see section "Groundwater Sampling"). All development equipment is cleaned prior to use and between wells with an Alconox® solution, then rinsed in potable water. All data collected during development are recorded on the Well Development Data Sheet and, if necessary, the Purging Data Sheet.

Well Surveying

All well elevations are surveyed at the north side of the top of casing to the nearest ±0.01 foot. The exact survey point (at the center of the survey rod or, if the casing stub is uneven, the point of contact between casing and rod) is clearly marked and maintained on the casing rim. Elevations are referenced either to mean sea level or to a project datum. A project datum is typically chosen so as to minimize the possibility of its' later disturbance. For instance, fire hydrants are commonly selected. When required, the wells are surveyed, relative to mean sea level, by a licensed land surveyor.

STANDARD OPERATING PROCEDURE

FIELD SOIL VAPOR MONITORING

A representative soil sample will be collected from each sample interval and placed in a Ziplock® plastic bag. The bag will be sealed and the soil disaggregated. At least ten minutes will be allowed for the soil to be heated by direct sunlight and for any VOCs in the soil to accumulate in the head space of the bag. Subsequently, volatile gases are monitored and recorded by inserting the probe of a Photovac 2020 photoionization detector (PID) into the head space. The PID is equipped with a 10.6 eV lamp which is capable of detecting VOCs at concentrations of 0.1 parts per million (ppm). The PID will be calibrated on-site using 100 ppmV isobutylene-in-air span gas (equivalent to benzene) prior to drilling operations. PID readings will be recorded in the boring logs.

STANDARD OPERATING PROCEDURE

GROUNDWATER MONITORING, WELL PURGING, AND SAMPLING

Groundwater Monitoring

Prior to beginning, a decontamination area is established. Decontamination procedures consist of scrubbing downhole equipment in an Alconox® solution wash (wash solution is pumped through any purging pumps used), and rinsing in a first rinse of potable water and a second rinse of potable water or deionized water if the latter is required. Any non-dedicated downhole equipment is decontaminated prior to use.

Prior to purging and sampling a well the static water level is measured to the nearest 0.01 feet with an electronic water sounder. Depth to bottom is typically measured once per year, at the request of the project manager, and during ATC's first visit to a site. The water sounder and tape will be decontaminated between each well. If floating phase-separated hydrocarbons (PSH) are suspected or observed, PSH is collected using a clear, open-ended product bailer, and the thickness is measured to the nearest 0.01 feet in the bailer. PSH may alternatively be measured with an electronic interface probe once the presence of PSH has been established at a site. Any monitoring well containing a measurable thickness of PSH before or during purging is not additionally purged and no sample is collected from that well. Wells containing hydrocarbon sheen are sampled unless otherwise specified by the project manager. Field observations such as well integrity as well as water level measurements and floating product thicknesses are noted on the Gauging Data/Purge Calculations form.

Well Purging

Each monitoring well to be sampled is purged using a stainless steel bailer, a PVC bailer or a submersible pump. Physical parameters (pH, temperature, and conductivity) of the purge water are monitored during purging activities to assess if the water sample collected is representative of the aquifer. If required, parameters such as dissolved oxygen, turbidity, salinity etc. are also measured. Samples are considered representative if parameter stability is achieved. Stability is defined as a change of less than 0.25 pH units, less than 10% change in conductivity in micro mhos, and less than 1.0 degree centigrade (1.8 degrees Fahrenheit) change in temperature. Parameters are measured in a discreet sample decanted from the bailer separately from the rest of the purge water. Parameters are measured at least four times during purging; initially, and at volume intervals of one well volume. Purging continues until three well casing volumes have been removed, until the well completely dewaters, or until measured parameters stabilize as indicated above. Wells that dewater or demonstrate a slow recharge, may be sampled although fewer than three well volumes have been removed. Well purging information is recorded on the Purge Data sheet. All meters used to measure parameters are calibrated daily. Purge water is sealed, labeled, and stored on site in D.O.T.-approved 55-gallon drums. After being chemically profiled, the water is removed to an appropriate disposal facility by a licensed waste hauler.

Groundwater Sample Collection

Groundwater samples are collected immediately after purging or, if purging rate exceeds well recharge rate, when the well has recharged to at least 80% of its static water level. If recharge is extremely slow, the well is allowed to recharge for at least two hours, if practicable, or until sufficient volume has accumulated for sampling. The well is sampled within 24 hours of purging or re-purged. Samples are collected using polyethylene bailers, either disposable or dedicated to the well. Samples being analyzed for compounds most sensitive to volatilization are collected first. Water samples are placed in appropriate laboratory-supplied containers, labeled, documented on a chain of custody form and placed on ice in a cooler for transport to a state-certified analytical laboratory. Analytical detection limits match or surpass standards required by relevant local or regional guidelines.

Quality Assurance Procedures

To prevent contamination of the samples ATC personnel adhere to the following procedures in the field:

- A new, clean pair of latex gloves are put on prior to sampling each well.
- Wells are gauged, purged and groundwater samples are collected in the expected order of increasing degree of contamination based on historical analytical results.
- All purging equipment will be thoroughly decontaminated between each well using the procedures previously described at the beginning of this section.
- During sample collection for volatile organic analysis, the amount of air passing through the sample is minimized. This helps prevent the air from stripping the volatiles from the water. Sample bottles are filled by slowly running the sample down the side of the bottle until there is a convex meniscus over the mouth of the bottle. The lid is carefully screwed onto the bottle such that no air bubbles are present within the bottle. If a bubble is present, the cap is removed and additional water is added to the sample container. After resealing the sample container, if bubbles still are present inside, the sample container is discarded and the procedure is repeated with a new container.

Laboratory and field handling procedures may be monitored, if required by the client or regulators, by including quality control (QC) samples for analysis with the groundwater samples. Examples of different types of QC samples are as follows:

- Trip blanks are prepared at the analytical laboratory by laboratory personnel to check field handling procedures. Trip blanks are transported to the project site in the same manner as the laboratory-supplied sample containers to be filled. They are not opened, and are returned to the laboratory with the samples collected. Trip blanks are analyzed for purgable organic compounds.
- Equipment blanks are prepared in the field to determine if decontamination of field sampling equipment has been effective. The sampling equipment used to collect the groundwater samples is rinsed with distilled water that is then decanted into laboratory-supplied containers. The equipment blanks are transported to the laboratory, and are analyzed for the same chemical constituents as the samples collected at the site.
- Duplicates are collected at the same time that the standard groundwater samples are being collected and are analyzed for the same compounds in order to check the reproducibility of laboratory data. They are typically only collected from one well per sampling event. The duplicate is assigned an identification number that will not associate it with the source well.

Generally, trip blanks and field blanks check field handling and transportation procedures. Duplicates check laboratory procedures. The configuration of QC samples is determined by ATC depending on site conditions and regulatory requirements.

Dear Mr. Madden:

The **analytical results** for the soil samples, received by our lab on June 21, 2008, are attached. The samples were received chilled, intact and accompanying chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets
Vice President/Program Manager

Dear Mr. Madden:

The **analytical results** for the water samples, received by our lab on July 11, 2008, are attached. The samples were received chilled, intact and accompanying chain of custody record.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets
Vice President/Program Manager

SUBJECT: ADDITIONAL SITE ASSESSMENT REPORT
HERTZ LAX FACILITY
9000 AIRPORT BLVD, LOS ANGELES, CA 90045
ATC PROJECT NO. 52.75015.0006
(I.D. # 900450670) (D-1)

Dear Mr. Huang,

ATC Associates Inc. (ATC), on behalf of The Hertz Corporation (Hertz), is submitting this Additional Site Assessment Report for the above-referenced project located in Los Angeles, CA. This report includes a description of field activities and analytical results. Should you have questions or require additional information, please do not hesitate to contact us at (323) 517-9780.

Sincerely,
ATC Associates, Inc.

Michele Berisford

4.0 SITE BACKGROUND INFORMATION

4.1 SITE DESCRIPTION AND SURROUNDING LAND USE

The site is located at 9000 Airport Boulevard in Los Angeles California (**Figure 1 - Vicinity Map and Figure 2 – Site Plan**) and is used for rental car operations. The site consists of five buildings, a car wash system, and refueling systems. The refueling system consists of gasoline underground storage tanks (USTs), one diesel UST, fourteen fuel dispenser islands, and underground distribution lines. The UST system is located in the western, central portion of the facility and is bordered to the west by Airport Boulevard and to the north by the main vehicle entryway into and out of the facility.

The site is composed of the two main fueling areas; the "eastern" fueling system and the "western" fueling system.

- The eastern system consists of two 12,000-gallon gasoline USTs and 10 dispenser islands. Each island is equipped with one dispenser, and the ten islands are covered by an overhead canopy. The USTs are located just south of the dispenser islands and are oriented north-south in a common excavation.

- The western system consists of one 20,000-gallon gasoline UST, one split UST consisting of 8,000-gallon gasoline and 12,000-gallon diesel, and four dispenser islands. Three gasoline USTs and one diesel UST are located just north of the dispenser islands and are oriented east-west in a common excavation. Each dispenser island in the western system is equipped with two to three dispensers, and is also covered by a metal overhead canopy structure. The two 20,000 gallon USTs were installed in 2005 when the previous USTs were removed as discussed below

Directly north and adjacent to both the eastern and western systems is an eight-foot high cinderblock wall, with a landscaped planter area immediately to the north, and a paved main entry into and out of the facility. To the west of the western system is an asphalt paved drive/parking area, with a traffic guard rail, eight-foot high chain link fence, and a landscaped parkway with Airport Boulevard to the west. It should be noted that a large V-shaped commercial billboard placed for viewing from Airport Boulevard is located immediately to the west and above the canopy for the four western system dispenser islands. Toward the east and south of the systems are an asphalt paved parking area and maintenance areas for the Hertz facility, including car wash structures to the south and the main office/locker building for the facility to the southeast.

4.2 PRIOR SITE ASSESSMENT ACTIVITY

In July 2003, ATC directed the advancement of 21 soil borings (B-1 through B-21) to depths ranging from 15 feet to 30 feet below ground surface (bgs) at the locations shown on **Figure 6 - Geologic Cross Section Lines and Previous Soil Borings**. The purpose of the assessment was to evaluate soil conditions prior to pending UST upgrades associated with Senate Bill SB 989. Minor soil impact was detected in the vicinity of the eastern dispenser islands. Based on the results of soil samples collected in this area, it appears that this impact is limited in extent and attributable to minor surface spills at the eastern dispensers.

Petroleum hydrocarbons were detected in soil associated with the western fueling system. The hydrocarbon contaminated soil around the western system is confined to the UST area and around the dispenser island closest to those USTs. The horizontal extent of the hydrocarbon contamination in the western system was estimated to be 40 feet by 60 feet. At the completion of the initial soil characterization, the vertical extent was not known. The deepest area of impacted soil was anticipated

to be located along the western portion of the UST pit (between B-11 and B-14). It was in this area that an additional boring and monitoring well was recommended. The details of the soil assessment are found in ATC's *Site Assessment Report*, dated August 25, 2003. A summary of soil sample analytical results is included in Table 5.

In September 2003, ATC directed the advancement of a soil boring and installation of one groundwater monitoring well (MW-1) at a location to the west of the western fueling system. The boring was advanced to a depth of 75 feet bgs and soil samples were collected at five foot intervals. ATC selected five soil samples between 45 and 63 feet bgs for laboratory analysis. Soil samples collected between 45 and 55 feet bgs contained the highest levels of MTBE (ranging between 1.3 to 48 micrograms per kilogram (µg/kg). The MTBE concentrations decreased between 55 feet and 63 feet bgs. Monitoring well MW-1 was constructed using 45 feet of solid 4-inch diameter Schedule 40 PVC casing from surface to 45 feet bgs, and 30 feet of 0.020-inch slotted, 4-inch diameter Schedule 40 PVC well screen from 45 to 75 feet bgs. Subsequent to its installation, the well was developed via purging.

A groundwater sample collected from well MW-1 during a September 2003 investigation was submitted for laboratory analysis, and was reported to contain total petroleum hydrocarbons - gasoline range (TPHg) at a concentration of 61 micrograms per liter (µg/L). Tert-butyl alcohol (TBA) and MTBE were also reported in the September 2003 groundwater sample at concentrations of 2,500 µg/L and 8,700 µg/L, respectively. All other analytes were below their respective detection limits.

Between March 24 and April 4, 2005 ATC oversaw the excavation of impacted soil during the removal of four gasoline USTs and one diesel UST, and the associated dispenser islands at the western fueling area. Transportation manifests indicated that 1,000 tons of petroleum hydrocarbon-impacted soil was excavated, transported and disposed during the excavation activities. Laboratory analytical results from soil samples collected during the excavation indicated that TPHg, total petroleum hydrocarbons - diesel range (TPHd), benzene and MTBE concentrations of up to 150, 720, 0.006, and 0.67 mg/kg, respectively, were still present in the remaining soil. The TPHg, TPHd, and benzene concentrations were below maximum soil screening levels established by the Los Angeles Region California Regional Water Quality Control Board (*Interim Site Assessment and Cleanup Guidebook*, May 1996), based on a depth to groundwater of approximately 53 feet as originally measured in well MW-1. Additionally, the benzene and MTBE concentrations were below the EPAs Preliminary Remediation Goals (PRGs) for industrial and residential soils. The remediation activities were presented in ATC's August 18, 2005 *Remedial Excavation Report* prepared for the facility.

ATC conducted a field investigation from June 19 through July 11, 2008. Site assessment activities were conducted per the request of the RWQCB in accordance with the *Workplan for Additional Soil and Groundwater Investigation* (ATC Associates, February 29, 2008) approved by the State Water Resources Control Board - Los Angeles Region on March 5, 2008. ATC supervised the installation of two groundwater wells, MW-2 and MW-3, at the site in an attempt to further delineate the lateral extent of the MTBE plume. MW-2 was installed northeast of MW-1 just north of the first fuel dispenser on the western edge of the 'eastern fueling station'. MW-3 was installed east of the third fuel dispenser island of the 'western fueling station' (see **Figure 2 – Site Plan** for groundwater monitoring well locations).

MW-2 was advanced to a depth of 75 feet bgs and soil samples were collected at five foot intervals. MTBE, tert-amyl methyl ether (TAME), and TBA concentrations of 5.67, 0.025, 2.70 milligrams per kilograms (mg/kg) were detected at a depth of 55-feet bgs, respectively. MTBE and TBA concentrations of 0.188 and 0.051 mg/kg were also detected at 60 feet bgs.

MW-3 was advanced to a depth of 85 feet bgs, and soil samples were collected at five foot intervals. The soil samples were analyzed and were found to contain no VOC concentrations above laboratory detection limits with the exception of the five-foot sample which contained a MTBE concentration of 0.043 mg/kg.

A summary of the groundwater and soil analytical data is provided in **Table 3 and 5**.

4.3 SITE AND AREA LITHOLOGY

The site is located within the Los Angeles Basin in a physiographic unit called The El Segundo Sand Hills (California Department of Water Resources [DWR], 1961). The El Segundo Sand Hills extend from the Ballona Gap south to Torrance and the Palo Verdes Hills, and approximately three to four miles inland from the ocean. Remnants of similar hills are found on the western edge of Ocean Park Plain. The sand hills consist of a narrow strip of active or recent dunes along the coast with older stabilized sand dunes inland.

The Site is located over the older stabilized Pleistocene-aged dunes called the Older Sand Dunes. Since deposition, the Older Sand Dune has been tilted, weathered, eroded, and further altered by cementation and leaching processes. Surface water percolates into the dunes from closed depressions after heavy rains, and some perched water bodies may occur. In several areas of the El Segundo Sand Hills, fossils and sedimentary features in excavations indicate that these older sand dunes were originally beach deposits which have been altered in form by wind action and deeply weathered. One to three miles inland, the older sand dunes overlie silts and clays which apparently were deposited on the landward side of the beach sands and which now form a portion of the Torrance Plain. Weathering and associated stabilizing processes have removed all but the gross features of dune topography in the older sand dune area (DWR, 1961).

Based on soil boring data from previous investigations at the site (ATC, 2003) and the current additional site assessment, site lithology from the ground surface to approximately 80 feet below ground surface (bgs) consists predominantly of fine to coarse sand interbedded with silt and clay. Based on the DWR (1961) description of the regional units, it is likely that the units described above are within the undifferentiated sediments of the Lakewood Formation.

Cross sections describing soil lithology and soil sample analysis are shown in **Figures 6, 7, and 8**.

4.4 AREA HYDROLOGY AND HYDROGEOLOGY

The Site lies within the West Coast (groundwater) Basin, which is part of the larger Los Angeles Coastal Basin (DWR, 1961). The physical boundaries of the West Coast Basin include the Ballona Escarpment to the north; the Rosecrans Hills to the east; and the Pacific Ocean to the west and south. The Palos Verdes Hills form the boundary of the West Coast Basin to the southeast. The water-bearing stratum within the West Coast basin includes middle Miocene to Oligocene-aged marine and continental sediments. The principal aquifers (water-producing formations) beneath the site include (in youngest to oldest stratigraphic order) the Old Dune Sand, Gage-Gardena, Lynwood, Silverado, and Sunnyside aquifers (DRW, 1961).

Many of the aquifers located in the western portion of the West Coast Basin are not currently used as practical sources of potable water due to general degradation of the upper groundwater zone resulting from historical industrial activity, oil production, and seawater intrusion. It is unknown at the present time whether the aquifer underlying the subject site is currently in use. The regional direction of groundwater flow is interpreted to be to the northeast.

5.0 RECENT ASSESSMENT ACTIVITIES

Prior to commencement of field activities, ATC obtained well permits from the County of Los Angeles Water & Sewage/Mountain & Rural Programs Environmental Health Division. A copy of the well permit is included in **Appendix A**. The investigation activities are summarized in the following sections, and the field procedures are detailed in **Appendix B**. Also prior to drilling the well borings, ATC contacted Underground Service Alert (USA) and subcontracted with a private utility locator service to verify the presence of any utilities in the vicinity of the proposed well boring locations. Following the utility clearance, drilling was scheduled.

ATC contracted with ABC Liovin Drilling for the well installations. A CME-85 Limited Access Drill rig equipped with 10-inch diameter hollow-stem augers was utilized to complete the monitoring wells. Additional details are provided below.

5.1 GROUNDWATER MONITORING WELL INSTALLATION

Based on the depth to water measurements and the analytical laboratory results of the July & September 2003 and June-July 2008 investigations, ATC selected the two locations for installation of groundwater monitoring wells. The investigation objective was to establish onsite locations for collecting groundwater data; including groundwater hydraulic head measurements and dissolved petroleum constituent concentrations.

On July 7 and 8, 2009, ATC installed two groundwater monitoring wells (MW-4 and MW-5) at the site using a hollow-stem auger drilling method. Groundwater monitoring well MW-4 was installed north of the western dispenser islands and MW-5 was installed south of the eastern dispenser islands. Well MW-5 had to be relocated due to underground PVC piping that was encountered. The borings were advanced to between 95 and 96 feet bgs and the monitoring wells were installed to total depths of 95 feet bgs with a 20 ft screen interval used for both wells. Well locations are shown on **Figure 2**. Well installation activities are summarized below, and daily records are presented in **Appendix C**.

5.1.1 Soil Sampling

At each location, soil samples were collected at 5-foot intervals from ground surface to the total depth of the boring. The borings were drilled, sampled and completed as a groundwater monitoring wells in general accordance with ATC's Standard Operating Procedures, which are included in **Appendix B**.

To obtain preliminary data regarding potential petroleum hydrocarbon-impacted soil, a representative sample was collected at each soil sampling location and field screened for volatile organic vapors in general accordance ATC's Standard Operating Procedures, which are included in **Appendix B**. Organic vapor meter readings were collected using a RAE Systems Mini-RAE 2000 photo-ionization detector (PID) and were recorded in the boring logs.

All soil samples collected during the investigation were submitted for laboratory analysis. The details of the analysis are presented in **Section 5.1.5** and a discussion of the results is included in **Section 6.3.1**.

An ATC geologist completed lithologic logs for each boring in general accordance with ASTM Method D 2488-90. ATC selected all soil samples from each boring for chemical analysis. Soil characteristics (observations of staining or odor), Unified Soil Classification System (USCS) designation, and depth to groundwater were recorded on the boring logs provided in **Appendix C**.

5.1.2 Well Specifications and Construction

Following soil sampling, groundwater monitoring wells were installed using 4-inch-diameter, Schedule 40 PVC casing. Groundwater monitoring well MW-4 was constructed using 75 feet of solid PVC casing, and 20 feet of 0.020 inch slotted well screen. The annulus of the screened portions of monitoring well MW-4 was backfilled with a #3 Monterey sand filter pack from approximately 95 to 72 feet bgs. An approximate three-foot thick layer of medium bentonite chips were placed on top of the upper filter pack and hydrated to form an annular seal. The remaining annular space to the bottom of the concrete seal (approximately 68 feet) was filled with bentonite grout. Based upon groundwater measurements that were collected upon the completion of monitoring well MW-4, it was determined that the static groundwater level was approximately equal to the observed in the lithologic logging.

Groundwater monitoring well MW-5 was advanced to 95 feet below ground surface. The screened interval of monitoring well MW-5 was back filled with #3 Monterey sand (or equivalent) filter pack from 95 to 72 bgs. An approximate three-foot layer of medium bentonite chips were placed on top of the upper filter pack and hydrated to form an annular seal. The remaining annular space from the bentonite chips seal to the bottom of the concrete seal (approximately 68 feet) was filled with bentonite grout.

Each well was completed with a two-foot deep surface seal that was placed above the bentonite grout and a traffic-rated well box was placed within a circular two-foot diameter perimeter seal. A summary of the final monitoring well construction details is provided in **Table 1** and locations of the monitoring wells are shown on **Figure 2**.

5.1.3 Well Development

On July 17, 2009, ATC developed monitoring wells MW-4 and MW-5 using a combination of surging and bailing methods. Well MW-4 went dry after removing approximately eight bailers of water, so the field personnel allowed the well to recharge. After an additional four bailers of water were removed, the well went dry. At this point ATC terminated well development, since the purged water was relatively clear and free of suspended sediment. Well MW-5 went dry after removing approximately seven bailers of water, so the field personnel ceased bailing and allowed the well to recharge. After an additional six bailers of water were removed, the well went dry again. At this point ATC terminated well development, since the purged water was relatively clear and free of suspended sediment.

After well development, ATC measured static depth to groundwater and the total well depth in each well. The depths to water measured in wells MW-3, MW-4, and MW-5 were 81.19, 85.43, and 85.94 ft bgs, respectively. Wells MW-1 and MW-2 were dry. Total well depth at wells were 85.15, 93.36, and 95.48 feet below top of casing at wells MW-3, MW-4, and MW-5, respectively.

Groundwater purged during well development was contained in 55-gallon drums and remained on site pending proper disposition. The groundwater monitoring wells were developed in general accordance with ATC's Standard Operating Procedures, which are included in **Appendix B**.

5.1.4 Well Surveying

On July 17, 2009, a California-licensed Professional Land Surveyor (W.M. Meagher Surveyors) surveyed the lateral locations and elevations of the newly installed groundwater monitoring wells. The locations and elevations of measuring marks on the north side of each wellhead were surveyed. Each well was surveyed to the nearest 0.01-foot by the surveyor in order to more accurately determine the local groundwater flow direction beneath the site. Survey data is provided in **Appendix F**.

5.1.5 Laboratory Analysis

ATC submitted the soil samples to a State of California-certified laboratory under chain-of-custody procedures. The laboratory analyzed a total of 31 soil samples for:

- Total Petroleum Hydrocarbon – gasoline (TPHg) using EPA Method 8260B;
- Ethanol (by direct injection) using EPA Method 8260B;
- BTEX (benzene, toluene, ethylbenzene, and xylenes) and fuel oxygenates MTBE, di-isopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), TAME, and TBA using EPA Method 8260B;
- Volatile organic compounds (VOCs) using EPA Method 8260B.

The analytical results are summarized in **Table 4,** and a discussion is included in **Section 6.3.1**. The laboratory analytical reports are provided in **Appendix E**.

5.2 GROUNDWATER MONITORING

ATC gauged all wells (MW-1 through MW-5) and sampled groundwater monitoring wells (MW-3 through MW-5) at the site on August 6, 2009, after allowing wells MW-4 and MW-5 to sit undisturbed for 19 days. Groundwater monitoring activities are summarized in the following sections, with well sampling logs included in **Appendix D**.

5.2.1 Downhole Parameter and Groundwater Level Measurements

On August 6, 2009, prior to commencement of purging and sampling activities, ATC gauged and inspected the monitoring wells for separate-phase hydrocarbons and depth to groundwater. During this event, measurable groundwater was not present in wells MW-1 and MW-2. The total depth of groundwater wells MW-1 and MW-2 are 75 feet bgs. The depth to groundwater in well MW-3 was 81.19 ft below top of casing, and the depths to groundwater in newly installed wells MW-4 and MW-5 were 85.43 and 85.94 feet below top of casing, respectively. **Table 1** summarizes well identifications and casing elevations, **Table 2** includes groundwater depths and groundwater elevations. Well sampling records are provided in **Appendix D**.

5.2.2 Purging and Sampling Procedures

ATC used a low-flow purging method to sample the groundwater monitoring wells utilizing a three-inch Grundfos pump with cooling shroud. During purging, ATC monitored temperature, pH, conductivity, turbidity, and dissolved oxygen (DO). Purge volumes for the sampled monitoring wells were 7.72 gallons (MW-3), 7.93 gallons (MW-4), and 18.60 gallons (MW-5).

Following gauging and purging, groundwater samples were collected from the newly installed monitoring wells (MW-4 and MW-5) and the pre-existing groundwater well (MW-3). Field parameter measurements were recorded on the well sampling records, which are included in **Appendix D**.

5.2.3 Laboratory Analysis

ATC submitted the groundwater samples to Advanced Technology Laboratory, a State of California ELAP-certified laboratory, under chain-of-custody procedures. Three groundwater samples were analyzed for:

- TPHg (c4-c10) using EPA Method 8015B;
- Ethanol using EPA Method 8015B;

- BTEX (benzene, toluene, ethylbenzene, and xylenes) and fuel oxygenates MTBE, di-isopropyl ether (DIPE), ethyl-t-butyl ether (ETBE), TAME, and TBA using EPA Method 8260B;
- VOCs using EPA Method 8260B.

The analytical results are discussed in **Section 6**; the laboratory analytical reports are provided in **Appendix E**.

5.3 WASTE MANAGEMENT

Drilling and sampling activities generated thirty-one 55-gallon drums of soil cuttings and non-hazardous decon and sample water. The drums were removed from the site on August 24th, 2009 after soil analysis was performed as part of the assessment and was used to characterize the waste for disposal. Copies of waste disposal manifests will be forwarded upon receipt by The Hertz Corporation. Soil cuttings were managed in accordance with the County of Los Angeles regulations.

6.0 RESULTS

The cumulative findings of the additional site assessment described in **Section 5** are summarized below.

6.1 Drilling Observations

Consistent with previous investigations at the site, ATC observed unconsolidated alluvial sediments with grain sizes ranging from clays to gravels. Drilling observations are presented on the boring logs in **Appendix C**. The lithologic units logged and described by ATC can generally be classified within the six soil units described in **Section 4.3** above as sand, silty sand, and clayey silt. ATC detected no VOC PID readings above background levels in the soil samples collected during drilling activities.

Soil samples were collected every five-feet in both borings and all samples were analyzed. In the two monitoring wells, saturated soil was generally encountered from approximately 75 to 95 feet bgs. Due to high moisture content in the samples, water level was initially judged to be approximately 81 feet bgs in both monitoring wells. Water levels dropped significantly after drilling to total depth, with static groundwater levels stabilizing at approximately 85 feet bgs.

Groundwater elevation was calculated for each well by subtracting the depth-to-water measurement from the surveyed casing elevation. The survey data for the groundwater monitoring wells is provided in **Appendix F**. Groundwater elevations from the monitoring wells gauged on August 6, 2009 were used to prepare a groundwater elevation contour map (**Figure 4**). The groundwater elevation contours indicate groundwater flow to the northeast at an approximate gradient of 0.05 feet per foot (ft/ft).

6.2 MONITORING WELL OBSERVATIONS

No separate-phase hydrocarbons were observed in any of the wells. Depth-to-water measurements ranged from 81.19 to 85.94 feet below top of casing (**Table 2**); groundwater elevation contours are depicted on **Figure 4**.

6.3 ANALYTICAL RESULTS

The analytical results for soil and groundwater samples collected during this field investigation are summarized in **Tables 2 and 3**. Groundwater analytical results are also shown on **Figure 3**. Analytical laboratory reports and chain-of-custody forms are provided in **Appendix E**.

6.3.1 Soil Analysis

During the additional site assessment activities, completed from July 7 and 8, 2009, 31 soil samples were submitted for analytical testing. None of the soil samples collected during the installation of well MW-5 on July 8, 2009 contained detectable concentrations of petroleum hydrocarbons.

Soil samples collected during the installation of well MW-4 on July 7, 2009 did not contain detectable concentrations of petroleum hydrocarbons, with the following exceptions:

- MW-4-5’ - MTBE and TBA concentrations of 9.7 and 18 µg/kg, respectively;
- MW-4-10’ - TPHg, MTBE and TBA concentrations of 0.92, 310, and 1800 µg/kg, respectively;
- MW-4-15’ - MTBE and TBA concentrations of 1.6 and 150 µg/kg, respectively;
- MW-4-20’ - TPHg and MTBE concentrations of 0.18 and 0.95 µg/kg respectively;

- MW-4-25' - TPHg, Chloromethane, MTBE, and TBA concentrations of 0.36, 1.5, 13, and 7700 µg/kg, respectively;
- MW-4-30' - TPHg, MTBE, and TBA concentrations of 0.59, 2.7, and 20,000 µg/kg, respectively;
- MW-4-35' - TPHg, MTBE, and TBA concentrations of 0.40, 72, and 18,000 µg/kg, respectively;
- MW-4-40' - TPHg, TAME, MTBE, and TBA concentrations of 3.6, 25, 16,000 and 61,000 µg/kg, respectively;
- MW-4-45' - TPHg, ETBE, TAME, MTBE and TBA concentrations of 2.1, 4.4, 43, 20,000 and 10,000 µg/kg, respectively;
- MW-4-50' - TPHg, ETBE, TAME, MTBE and TBA concentrations of 13, 6.6, 65, 28,000 and 15,000 µg/kg, respectively;
- MW-4-55' - TPHg, ETBE, TAME, MTBE and TBA concentrations of 6.0, 1.1, 9.6, 6,500 and 16,000 µg/kg, respectively;
- MW-4-60' - TPHg, TAME, MTBE, and TBA concentrations of 1.6, 3.2, 1,500 and 180 µg/kg, respectively;
- MW-4-65' - TPHg, MTBE, and TBA concentrations of 2.1, 5.4, and 11 µg/kg, respectively;
- MW-4-70' - TPHg, TAME, MTBE, and TBA concentrations of 0.57, 2.7, 980 and 6,300 µg/kg, respectively;
- MW-4-75' - TPHg, MTBE, and TBA concentrations of 0.94, 9.9, and 650 µg/kg, respectively;
- MW-4-80' - TPHg and TBA concentrations of 0.39 and 21 µg/kg, respectively.

A summary of soil sample analytical results is provided in **Table 4** and **Figure 5**. The Geologic Cross-Section Lines & Previous Soil Borings Map is presented as **Figure 6**, with Geologic Cross-Section A-A' is presented as **Figure 7**, and Geologic Cross-Section B-B' as **Figure 8**.

6.3.2 Groundwater Analysis

The groundwater sampling event for all monitoring wells (MW-3 through MW-5), took place on August 6, 2009. None of the groundwater samples submitted for laboratory analysis contained detectable concentrations of petroleum hydrocarbons.

A summary of the groundwater sample analytical results is provided in **Table 2**, and historical groundwater analytical results are in **Table 3**. Laboratory reports and chain-of-custody documentation is included in **Appendix E**.

7.0 FINDINGS AND RECOMMENDATIONS

Monitoring wells MW-1 and MW-2 were dry during this event. The groundwater samples collected from monitoring wells MW-3 through MW-5 did not contain detectable concentrations of petroleum hydrocarbons, BTEX, or fuel oxygenates.

Soil samples during the installation of MW-5 did not contain detectable concentrations of fuel oxygenates or VOCs, which indicates that the MTBE and hydrocarbon plume does not extend laterally to the east-southeast of the USTs and eastern fueling islands.

Soil sampling results for newly-installed well MW-4 indicated concentrations of fuel oxygenates, however, the levels decreased below 50-feet below ground surface and were not impacting groundwater based upon the groundwater analytical results. Based on the groundwater monitoring and soil results for this quarter, additional quarterly monitoring is recommended.

8.0 LIMITATIONS

Our professional services have been performed, our findings obtained, and our recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. This company is not responsible for the independent conclusions, opinions, or recommendations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

It should be noted that all surficial environmental assessments are inherently limited in the sense that conclusions are drawn and recommendations developed from information obtained from limited research and site evaluation. For these types of evaluations, it is often necessary to use information prepared by others and ATC cannot be responsible for the accuracy of such information. In addition, the passage of time may result in a change in the environmental characteristics at this site and surrounding properties. This report does not warrant against future operations or conditions, nor does it warrant operations or conditions present of a type or at a location not investigated. This report is not a regulatory compliance audit and is not intended to satisfy the requirements of any state, federal, or local real estate transfer laws.

It must be noted that no investigation can absolutely rule out the existence of any hazardous materials at a given site. This assessment has been based upon prior site history, observable conditions, and the subsurface soil sampling described in this report. Existing hazardous materials and contaminants can escape detection using these methods.

This report is for the use and benefit of, and may be relied upon by, Hertz, and any affiliates, and third parties authorized in writing by Hertz and ATC, including the lender(s) in connection with a secured financing of the property, and their respective successors and assigns. Any third party agrees by accepting this report that any use or reliance on this report shall be limited by the exceptions and limitations in this report, and with the acknowledgment that actual site conditions may change with time, and that hidden conditions may exist at the property that were not discovered within the authorized scope of the assessment.

ATC makes no other representation to any third party except that it has used the degree of care and skill ordinarily exercised by environmental consultants in the preparation of the report and in the assembling of data and information related thereto. No other warranties are made to any third party, either express or implied. Unless otherwise agreed upon in writing by ATC and a third party, ATC's liability to any third party authorized to use or rely on this report with respect to any acts or omissions shall be limited to a maximum of $100,000.

9.0 SIGNATURES

This report was prepared by the staff of ATC Associates, Inc., under the supervision of the Senior Geologist whose signature appears hereon. The findings, recommendations, specifications, or professional opinions are presented within the limits described by the client, in accordance with generally accepted practices, using the degree of skill and care ordinarily exercised by environmental consultants under similar circumstances. No warranty is expressed or implied.

ATTENTION: WORK PLAN MODIFICATIONS MAY BE REQUIRED IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED AT THE SITE INSPECTION ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THIS DEPARTMENT.

I hereby agree to comply in every respect with all the regulations of the County Environmental Health Division and with all ordinances and laws of the County of Los Angeles and the State of California pertaining to well construction, reconstruction, and decommissioning data deemed necessary by the County Environmental Health Division Of Los Angeles County.

Signature of Applicant: Michele Berisford Printed Name: Michele Berisford

THIS PERMIT IS NOT COMPLETE UNTIL ALL OF THE FOLLOWING REQUIREMENTS ARE SIGNED OFF BY THE DEPUTY HEALTH OFFICER. WELL CONSTRUCTION OR DECOMMISSIONING CANNOT BE INITIATED WITHOUT A WORK PLAN APPROVAL FROM THIS DEPARTMENT.

********** (DEPARTMENT USE ONLY) **********

WORK PLAN APPROVAL (This Approval is Valid for 180 Days)	REHS	DATE
Conditions: On 6/09/09 $402.00 was paid for permit # 9065 for install 2 monitoring wells (MW-4, MW-5). Maintain all setbacks. Please notify me at least 48 HRS prior to starting fieldwork to schedule on-site inspection. MTSIEBOS @ PH.LACOUNTY.GOV (213) 351-5145	MICHELLE TSIEBOS	6/11/09
FINAL INSPECTION The placement of the annular seal must be witnessed by a Deputy Health Officer for the permit to be valid. Contact this Department to arrange for an appointment	REHS	DATE
	Erich.	7/08/09

NOTICE

This well permit approval is limited to compliance with the California Well Standards and the Los Angeles County Code and does not grant any rights to construct, reconstruct, or decommission any well. The applicant is responsible for securing all other necessary permits.

6/11/09

APPENDIX B

STANDARD OPERATING PROCEDURES

STANDARD OPERATING PROCEDURE

SOIL BOREHOLE DRILLING, MONITOR WELL INSTALLATION AND DEVELOPMENT, AND SOIL SAMPLING

Drilling and Soil Sampling

Permits, Site Safety Plan. Utility Clearance

ATC Associates Inc. (ATC) obtains all the required permits, unless otherwise contractually directed. ATC prepares a site specific Site Safety Plan detailing site hazards, site safety and control, decontamination procedures, and emergency response procedures to be employed throughout the defined phase of work. At least 48 hours prior to drilling. Underground Service Alert (USA) or an equivalent agency is notified of the planned work. ATC attempts to locate all underground and above ground utilities by site inspection (in conjunction with its' subcontractors and knowledgeable site managers, if available), and review of site as-built drawings. ATC may employ a private, professional utility locator to refine the site utility inspection.

Drilling Equipment

All soil borings are drilled using a truck-mounted hollow-stem auger drill rig, unless site conditions warrant a different drilling method. Subsurface conditions permitting, the first five feet of each boring is advanced using a hand-auger or post-hole digger. All drilling equipment is inspected daily and maintained in safe working condition by the operator. All down-hole drilling equipment is steam cleaned prior to arriving on site. Working components of the drill rig near the borehole, as well as augers and drill rods are thoroughly steam cleaned between each boring location. All ATC drilling and sampling methods are consistent with ASTM Method D-1452-80 and local, stale and federal regulations.

Soil Sampling and Lithologic Description

Whenever possible and approved by the appropriate regulatory agency, the first ATC boring to be drilled at a site is continuously cored to obtain a complete lithologic description. Otherwise, soil samples are typically collected every 5 feet to the total depth explored, using brass tubes fitted in a California-modified split spoon sampler. If copper or zinc contamination is the subject of the investigation, stainless steel liners are used instead of brass. Additional soil samples may be collected based upon significant changes in lithology or in areas of obvious soil contamination. During soil sample collection, the split spoon sampler is driven 18 to 24 inches past the lead auger by a 140-pound hammer falling a minimum of 30 inches. The number of blows necessary to drive the sampler and the amount of soil recovered is recorded on the Field Exploratory Soil Boring Log. The soil sampler and liners are cleaned with an Alconox® solution and rinsed with tap water prior to each sampling event. New liners are used whenever a soil sample may be retained for laboratory analysis.

Soil samples selected for laboratory analysis are sealed on both ends with Teflon® tape and plastic end caps. The samples are labeled, documented on a chain-of-custody form and placed in a cooler for transport to a state-certified analytical laboratory. Soil contained in remaining liners is removed for lithologic descriptions (according to the Unified Soil Classification System). Additional soil is screened for organic vapors by placing approximately 30 grams of soil in a sealed plastic bag or a glass jar sealed with aluminum foil. The bag or jar is left undisturbed for approximately 15 minutes, in the sun if possible. The head space in the bag is accessed in a manner to minimize entry of outside air, and is tested for total organic vapor using a calibrated photo ionization detector (PID). The results of the field screening are noted with the lithologic descriptions on the Field Exploratory Soil Boring Log.

On encountering an impermeable (clayey) layer three feet or more in thickness below a saturated permeable layer, where the impermeable layer is considered to be a possible confining layer for an

underlying aquifer, drilling is halted until a decision to proceed is obtained from the project manager. This process minimizes the chance of introducing contamination to an underlying, clean aquifer.

Soil Waste Management

Soil cuttings are stockpiled on and covered with plastic sheeting to control runoff, or contained in 55-gallon D.O.T.-approved drums on site. Waste soil is sampled to chemically profile it for disposable, and hauled by a licensed waste hauler to an appropriate landfill or certified treatment facility. All waste stored on site is properly labeled at the time of production.

Soil Boring Abandonment

Soil borings which are not to be converted into monitor wells are sealed to the ground surface using neat cement, sand-cement slurry, or hydrated bentonite pellets or chips in accordance with federal, state and local regulations. Native soil may be used to fill the top two to three feet for cosmetic purposes, as permitted.

Monitor Well Installation

Well Casing. Screen and Filter Pack Construction

All well construction is performed in accordance with Department of Water Resources "California Well Standards" and all requirements of local oversight agencies. Soil borings to be converted into single-cased monitor wells are a minimum of eight inches in diameter for 2-inch diameter wells, and a minimum of ten inches in diameter for 4-inch diameter wells. Monitor wells are constructed with schedule 40, threaded. polyvinyl chloride (PVC) casing unless site geochemistry or contamination necessitates an alternative regulatory agency approved material. The wells are constructed with factory-slotted screen and threaded end caps.

The screened interval is placed such that it extends approximately ten feet into the water bearing zone, and at least five feet above the expected maximum water level. The screened interval may extend less than five feet above the maximum water level, only to prevent intersection of the screened interval with the top of the confining layer of a confined aquifer, or where the water table is too shallow to allow this construction. A graded sand filter pack is placed in the annular space across the screened interval and extended approximately one to two feet above the screen, as site conditions permit, so as to prevent extension of the sand pack into an overlying water-bearing unit. The well screen slot size is the maximum size capable of retaining 90% of the filter pack. Typically, 0.010-inch screen is used where the formation is predominantly clay and/or silt or poorly graded fine sand. 0.020-inch screen is used where the formation is predominantly well-graded or medium to coarse sand and/or gravel.

The filter pack grade (mean grain size) is selected according to native sediment type as follows: a) for poorly graded fine sand or silt/clay - 4 times the 70% retained grain size of the formation b) for medium to coarse sand, gravel or well graded sediments - 6 times the 70% retained grain size. Since results of particle size analysis are not always available, ATC often selects screen size and filter pack on the basis of general site stratigraphy, and specifically the finest significantly thick layer of sediment to be screened. Commonly selected grades are Lone Star® 3, 2/12 or 2/16 (or equivalent) with 0.020-inch slotted screen and Lone Star® 1/20 with 0.010-inch slotted screen.

Well Seal and Completion

A minimum two-foot seal of bentonite is placed above the sand pack. The bentonite seal is hydrated by either formation water or potable water. Neat cement or a cement/bentonite grout mixture seals the remaining annular space to the surface. If bentonite is used in the grout mixture, it does not exceed 5% by weight. The grout is placed using a tremie pipe, if the top of the bentonite is more than 20 feet below grade, or if water is present in the boring above the bentonite seal. A watertight locking cap and protective traffic-rated vault box is installed on top of each well. Well construction details are presented on the Field Exploratory Soil Boring Log. Following completion of a well, ATC completes and submits,

or ensures that the driller has sufficient information to complete and submit, the state-required Well Completion Report or equivalent document.

Well Development

All newly installed wells are developed prior to sampling to remove fine grained sediments from the well and stabilize the filter pack and the disturbed aquifer materials. Development takes place prior to or at least 24 hours after setting the seal on the well, unless otherwise directed by a local oversight agency. Well development consists of surging with a surge block and removing water from the well with either a pump or bailer, until the well is free of sediment, or until at least 10 well casing volumes have been removed. Depth to bottom is measured to determine casing volume. If the well is sampled immediately following development, temperature, pH, specific conductance and turbidity (qualitative) are monitored during well development (see section "Groundwater Sampling"). All development equipment is cleaned prior to use and between wells with an Alconox® solution, then rinsed in potable water. All data collected during development are recorded on the Well Development Data Sheet and, if necessary, the Purging Data Sheet.

Well Surveying

All well elevations are surveyed at the north side of the top of casing to the nearest ±0.01 foot. The exact survey point (at the center of the survey rod or, if the casing stub is uneven, the point of contact between casing and rod) is clearly marked and maintained on the casing rim. Elevations are referenced either to mean sea level or to a project datum. A project datum is typically chosen so as to minimize the possibility of its' later disturbance. For instance, fire hydrants are commonly selected. When required, the wells are surveyed, relative to mean sea level, by a licensed land surveyor.

STANDARD OPERATING PROCEDURE

FIELD SOIL VAPOR MONITORING

A representative soil sample will be collected from each sample interval and placed in a Ziplock® plastic bag. The bag will be sealed and the soil disaggregated. At least ten minutes will be allowed for the soil to be heated by direct sunlight and for any VOCs in the soil to accumulate in the head space of the bag. Subsequently, volatile gases are monitored and recorded by inserting the probe of a Photovac 2020 photoionization detector (PID) into the head space. The PID is equipped with a 10.6 eV lamp which is capable of detecting VOCs at concentrations of 0.1 parts per million (ppm). The PID will be calibrated on-site using 100 ppmV isobutylene-in-air span gas (equivalent to benzene) prior to drilling operations. PID readings will be recorded in the boring logs.

STANDARD OPERATING PROCEDURE

GROUNDWATER MONITORING, WELL PURGING, AND SAMPLING

Groundwater Monitoring

Prior to beginning, a decontamination area is established. Decontamination procedures consist of scrubbing downhole equipment in an Alconox® solution wash (wash solution is pumped through any purging pumps used), and rinsing in a first rinse of potable water and a second rinse of potable water or deionized water if the latter is required. Any non-dedicated downhole equipment is decontaminated prior to use.

Prior to purging and sampling a well the static water level is measured to the nearest 0.01 feet with an electronic water sounder. Depth to bottom is typically measured once per year, at the request of the project manager, and during ATC's first visit to a site. The water sounder and tape will be decontaminated between each well. If floating phase-separated hydrocarbons (PSH) are suspected or observed, PSH is collected using a clear, open-ended product bailer, and the thickness is measured to the nearest 0.01 feet in the bailer. PSH may alternatively be measured with an electronic interface probe once the presence of PSH has been established at a site. Any monitoring well containing a measurable thickness of PSH before or during purging is not additionally purged and no sample is collected from that well. Wells containing hydrocarbon sheen are sampled unless otherwise specified by the project manager. Field observations such as well integrity as well as water level measurements and floating product thicknesses are noted on the Gauging Data/Purge Calculations form.

Well Purging

Each monitoring well to be sampled is purged using a stainless steel bailer, a PVC bailer or a submersible pump. Physical parameters (pH, temperature, and conductivity) of the purge water are monitored during purging activities to assess if the water sample collected is representative of the aquifer. If required, parameters such as dissolved oxygen, turbidity, salinity etc. are also measured. Samples are considered representative if parameter stability is achieved. Stability is defined as a change of less than 0.25 pH units, less than 10% change in conductivity in micro mhos, and less than 1.0 degree centigrade (1.8 degrees Fahrenheit) change in temperature. Parameters are measured in a discreet sample decanted from the bailer separately from the rest of the purge water. Parameters are measured at least four times during purging; initially, and at volume intervals of one well volume. Purging continues until three well casing volumes have been removed, until the well completely dewaters, or until measured parameters stabilize as indicated above. Wells that dewater or demonstrate a slow recharge, may be sampled although fewer than three well volumes have been removed. Well purging information is recorded on the Purge Data sheet. All meters used to measure parameters are calibrated daily. Purge water is sealed, labeled, and stored on site in D.O.T.-approved 55-gallon drums. After being chemically profiled, the water is removed to an appropriate disposal facility by a licensed waste hauler.

Groundwater Sample Collection

Groundwater samples are collected immediately after purging or, if purging rate exceeds well recharge rate, when the well has recharged to at least 80% of its static water level. If recharge is extremely slow, the well is allowed to recharge for at least two hours, if practicable, or until sufficient volume has accumulated for sampling. The well is sampled within 24 hours of purging or re-purged. Samples are collected using polyethylene bailers, either disposable or dedicated to the well. Samples being analyzed for compounds most sensitive to volatilization are collected first. Water samples are placed in appropriate laboratory-supplied containers, labeled, documented on a chain of custody form and placed on ice in a cooler for transport to a state-certified analytical laboratory. Analytical detection limits match or surpass standards required by relevant local or regional guidelines.

Quality Assurance Procedures

To prevent contamination of the samples ATC personnel adhere to the following procedures in the field:

- A new, clean pair of latex gloves are put on prior to sampling each well.
- Wells are gauged, purged and groundwater samples are collected in the expected order of increasing degree of contamination based on historical analytical results.
- All purging equipment will be thoroughly decontaminated between each well using the procedures previously described at the beginning of this section.
- During sample collection for volatile organic analysis, the amount of air passing through the sample is minimized. This helps prevent the air from stripping the volatiles from the water. Sample bottles are filled by slowly running the sample down the side of the bottle until there is a convex meniscus over the mouth of the bottle. The lid is carefully screwed onto the bottle such that no air bubbles are present within the bottle. If a bubble is present, the cap is removed and additional water is added to the sample container. After resealing the sample container, if bubbles still are present inside, the sample container is discarded and the procedure is repeated with a new container.

Laboratory and field handling procedures may be monitored, if required by the client or regulators, by including quality control (QC) samples for analysis with the groundwater samples. Examples of different types of QC samples are as follows:

- Trip blanks are prepared at the analytical laboratory by laboratory personnel to check field handling procedures. Trip blanks are transported to the project site in the same manner as the laboratory-supplied sample containers to be filled. They are not opened, and are returned to the laboratory with the samples collected. Trip blanks are analyzed for purgable organic compounds.
- Equipment blanks are prepared in the field to determine if decontamination of field sampling equipment has been effective. The sampling equipment used to collect the groundwater samples is rinsed with distilled water that is then decanted into laboratory-supplied containers. The equipment blanks are transported to the laboratory, and are analyzed for the same chemical constituents as the samples collected at the site.
- Duplicates are collected at the same time that the standard groundwater samples are being collected and are analyzed for the same compounds in order to check the reproducibility of laboratory data. They are typically only collected from one well per sampling event. The duplicate is assigned an identification number that will not associate it with the source well.

Generally, trip blanks and field blanks check field handling and transportation procedures. Duplicates check laboratory procedures. The configuration of QC samples is determined by ATC depending on site conditions and regulatory requirements.

ATC Branch: Los Angeles	Date: 7.8.09	Page 1 of 2
ATC Representative(s): Michele Berisford, Frank Roanhorse	Project: LAX/Hertz	
Role: Project Geologist, Proj. Eng.	Location: 9000 Airport Blvd.	
Contact Information: Jim Madden / Chris Averling	Project No: 52.75015.0006	Task No: 6
Scope of Work: Install MW-5. Hertz	Weather: Cloudy → Sunny	Temperature: 70°-75°F
X Monitoring __ Assessment __ Remediation __ Closure	Contractor: ~~None~~ ABC / TW	

Time:	Comments:
0530	Stop to get ice for drinks + Samples.
0547	Get to office, load supplies / coolers.
0601	Leave for Site
0650	Arrive @ Site, pull on + park - Note conditions
	- Main turned on / leaking - ground wet.
	- MW-4 ok.
0704	ABC on site, mobe to MW-4 to finish well. (Justin, Matt, Raoul)
0715	Morning tailgate.
0745	Grout/Bentonite the remaining 8' of hole, - begin.
0801	Cement the hole, Have cars removed from new MW-5 location (~40' East of last due to spatial constraints), Driller checks on location (Sewer might be issue)
0818	Mobe to new MW-5 location, set up Chase truck, drop trailer + move Rig into hole.
1030	~~Encounter~~ Knock out Poddy ~~Knockout~~ untwisted Sitting @ bottom of hole ~ 50'.
1040	Water System Inspector stopped by to inspect UST covers
1056	Poddy recovered, resume drilling
1159	Last sample @ 80', drilled to 85'.
1209	Stop for water to charge, take a lunch.
1206	Frank Roanhorse onsite
1301	Tag MW-5 (81.40').
1400	Began well placement (PVC total length 95')

Equipment Used: Co. truck, PID, Cooler, ice, Gatorade, Nitriles, Encores

CSDLAC No.: 10196

Workorder No.: 106293

RE: Hertz LAX

Attention: Jim Madden

Enclosed are the results for sample(s) received on July 08, 2009 by Advanced Technology Laboratories . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

Eddie F. Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and cannot be reproduced in part or in its entirety without written permission from the client and Advanced Technology Laboratories.

Results were J-Flag. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" Flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

EPA 8260B analysis was performed using 5035 preservation requirements except sample MW-4/70'. Any high level dilutions were performed on a preserved methanol sample unless otherwise noted.

Analytical Comments for EPA 8260B

Sample 106293-005B, Tert-Butanol was reported with "E" qualifier (value above quantitation range). The sample was ran at 50x with result less than PQL.

Samples 106293-014AMS and 106293-014AMSD, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria. Also, MTBE was reported with "E" qualifier (value above quantitation range) possibly due to high concentration of MTBE. The analytical batch was validated by the Laboratory Control Sample (LCS).
