**RE: AB&I Redevelopment – Acknowledgement Statement**
7825 San Leandro Street
Oakland, California 94621
ACEHD Case No. RO0003535

Dear Ms. Roe:

Duke Realty Foundry LP has retained the environmental consultant referenced on the attached *Data Gap Investigation Report,* dated October 8, 2024, for the project referenced above. The attached report is being submitted on behalf of Duke Realty Foundry LP.

I have read and acknowledge the content, recommendations, and/or conclusions contained in the attached document or report submitted on my behalf to ACEHD's FTP server and the State Water Resources Control Board GeoTracker website.

Sincerely,

Gavin Polite Fisco
Director, Global Environmental & Engineering Services
Duke Realty Foundry LP

# 1 Introduction

On behalf of Duke Realty Foundry LP (Prologis), Roux Associates, Inc. (Roux) has prepared this *Data Gap Investigation Report* (Report) summarizing the activities of a Data Gap Investigation (DGI) for the proposed redevelopment at the former American Brass & Iron (AB&I) Foundry Site located at 7825 San Leandro Street in Oakland, California (Site; Figure 1).

The Alameda County Environmental Health Department (ACEHD) Local Oversight Program (LOP) for Hazardous Materials Releases is the lead regulatory agency for the Site. Environmental investigations and clean-up actions at the Site are performed by Prologis under the oversight of ACEHD's Site Clean-up Program (SCP), with GeoTracker Global ID T10000019792 and ACEHD Case Number RO0003535.

The DGI was conducted in general accordance with the *Revised Site Conceptual Model and Data Gap Investigation Work Plan* (Work Plan) dated May 13, 2024, prepared by Roux on behalf of Prologis (Roux, 2024c). The Work Plan was approved by ACEHD and presented to the public by ACEHD during a public meeting on May 13, 2024. The scope of work proposed in the Work Plan included:

1. Delineate volatile organic compounds (VOCs) previously detected in passive soil vapor samples at the Site;
2. Assess benzene in soil vapor in three distinct areas at the Site;
3. Assess VOCs in soil vapor and bioattenuation potential by installing and sampling soil vapor probes;
4. Analyze the extent of potential vapor intrusion risk from soil vapor beneath the Site; and,
5. Assess concentrations of compounds in shallow soil across the Site and within proposed utility corridors and bio-swales.

The scope of work was discussed between Roux, Prologis, Craig Communications, and the ACEHD on October 17, 2023, March 7, 2024, March 25, 2024, April 19, 2024, April 23, 2024, and May 9, 2024. The Work Plan was prepared to address ACEHD's comments related to the 2023 Passive Soil Gas and Groundwater Investigation (2023 Investigation) conducted by Roux and the proposed scope of work presented in the *Conceptual Supplemental Subsurface Investigation Memorandum* dated October 16, 2023 (Roux, 2023a).

# 2 Background

## 2.1 Site Location and Description

The Site consists of the former AB&I Foundry located at 7741, 7825, and 7929 San Leandro Street in Oakland, California (Figure 1). For simplicity and consistency with regulatory communication, 7825 San Leandro Street is used to reference the location henceforth. The Site consists of approximately 14.5 acres in a mixed commercial/industrial land use area. The Site was previously developed with a two-story office building, multiple warehouses, a foundry and manufacturing building, a material storage area, and a parking lot. Demolition of all aboveground/vertical structures was completed in November 2023 by Prologis as part of the planned redevelopment. Currently, the Site is covered with concrete and asphalt/concrete pavement with a small portion of soil along the southwestern edge of the Site (Figure 2).

The Site is bounded by commercial/industrial properties on all sides. San Leandro Street and a raised segment of the Bay Area Rapid Transit rail is located to the northeast, SF Oakland Truck Stop to the southeast, a Union Pacific Railroad is located to the southwest, Elmhurst Creek along the southern property corner, and Hegenberger Road to the northwest. San Leandro Bay is located approximately one mile to the west. The nearest residential areas are located approximately 1,100 feet northeast of the Site.

## 2.2 Site History

The former Site owner and operator (AB&I) operated at the Site as a foundry from at least 1940 until October 2022. During foundry operations, the Site was utilized for the manufacture of metal pipe and pipe fittings. Operations at the Site included the production of cast iron for the manufacturing of fittings and pipe from recycled scrap iron, pig iron, and steel, which it accepted and stockpiled on-Site. Major operations involved scrap metal melting, mold making, fitting and pipe casting, and final finishing and coating of pipes and fittings (AB&I, 2011a). AB&I ceased foundry operations in October 2022 and vacated the Site in April 2023.

## 2.3 Site Geology and Hydrogeology

### 2.3.1 Site Geology

The Site is a flat parcel ranging in elevation between 11.5 and 14.5 feet (ft).[1] As discussed above, the Site is located approximately one mile east of San Leandro Bay and is bounded to the south by Elmhurst Creek. The Arroyo Viejo Creek lies to the northwest of the Site across Hegenberger Road. The Site is within an area identified as the East Bay Plain. The East Bay Plain is situated on the east side of the San Francisco Bay depression. The alluvial sediments of the East Bay Plain consist of a mixture of gravel, sand, and clay deposited by coalescing alluvial fans. Alluvial and estuarine deposits have been mapped near the Site (Helley, et. al., 1979). The fluvial deposits are described as “unconsolidated, moderately sorted, fine sand and silt, with clayey-silt and occasional thin beds of coarse sand” (Muir, K.S., 1993). The near-shore deposits are described as “a well-sorted, fine to medium grained sand and silt, with lenses of sandy clay and clay” (AB&I, 2010a). A geologic map prepared by Graymer (2000) depicts Holocene basin deposits and natural levee deposits across the Site (Figure 3). Graymer describes the natural levee deposits as, “loose, moderately-sorted to well-sorted sandy or clayey silt grading to sandy or silty clay.” The basin deposits are

[1] All vertical elevations are referenced to the North American Vertical Datum of 1988 (NAVD 88).

described as, “very fine silty-clay to clay deposits occupying flat-floored basins at the distal edge of alluvial fans adjacent to the bay mud” (Graymer, 2000).

Borings advanced by others at the Site between 1993 and 2024 have extended to an approximate depth of 101 feet below ground surface (bgs). Soils encountered in the unsaturated zone beneath the Site are predominantly fill material (well-graded sand), while soils encountered in the saturated zone are dominated by lean/fat clay with interfingered lenses of mixtures that include sand, silt, clay, and gravel, to the maximum depth explored. Boring logs completed by Roux and others indicate that lean and fat clays dominate the lithology below the Site with lesser amounts of gravel, sand, and silt. Geologic cross sections of historical borings and borings advanced during this DGI are included in Appendix A.

### 2.3.2 Site Hydrogeology

Regional groundwater flow in the vicinity of the Site is interpreted to be toward the west, toward San Leandro Bay. Regional groundwater flow appears to be influenced by the regional and local geologic sedimentary framework of hydraulically conductive natural levee deposits trending east to west in the eastern, western, and southern quadrants of the Site, and finer-grained basin deposits in the northern quadrant of the Site (Figure 3).

Historical shallow groundwater conditions are observed at the Site with water elevations in existing monitoring wells ranging between 4.13 and 8.29 feet above mean sea level (North American Vertical Datum 1988 [NAVD 88]), as of March 2024. The groundwater gradient at the Site appears to be influenced by the regional and local geologic sedimentary framework of the Site. The overall flow direction of groundwater at the Site historically averages as flowing to the northwest, with a southerly component in the northern portion of the Site. Historical groundwater monitoring data indicated that groundwater generally flowed to the northwest at a hydraulic gradient of approximately 0.006 feet per foot (ft/ft) (AB&I, 2010a).

The alluvial and estuarine deposits at the Site described in Section 2.3.1 result in a hydrogeologic regime consisting of lenses of high- and low-conductivity soil. Based on field observations during previous investigation at the Site (discussed in detail below in Section 2.4), this hydrogeological regime results in multiple water-bearing zones with discontinuous units of fine (clay and silt) and coarse (sand and gravel) units.

Although groundwater in the East Bay Plain is generally considered a potential future source of drinking water, there are no permitted drinking water wells within one mile of the Site, nor is the shallow groundwater in this area likely to be used as a public drinking water source in the foreseeable future (AB&I, 2008a). Additionally, groundwater monitoring activities from permanent wells at the Site have identified total dissolved solids in groundwater above 1,000 milligrams per liter (mg/L), exceeding California State Water Resources Control Board Secondary Maximum Contaminant Levels (MLCs) for TDS of 1,000 mg/L.

## 2.4 Previous Environmental Activities

A summary of previous environmental investigation activities and associated results are provided below.

### 2.4.1 Leaking Underground Storage Tank Removals

Seven underground storage tanks (USTs) were previously located on the Site, including:

- One 8,000-gallon UST used for storing unleaded gasoline;

- One 8,000-gallon UST used for the storage of mineral spirits, and later 1,1,1-trichloroethane (1,1,1-TCA);
- One 550-gallon UST used for storing regular leaded gasoline;
- One 10,000-gallon UST used for storing diesel; and
- Three 10,000-gallon USTs used for storing gasoline.

All USTs noted above were removed from the Site between 1982 and the early 1990s. The ACEHD provided regulatory oversight of the Leaking Underground Storage Tank (LUST) case (RO0000092) and closed the case in November 2011 with a covenant and environmental restriction that limits future land use to industrial purposes (AB&I, 2010a; AB&I, 2011a). The locations of the historical USTs are shown on Figure 2.

### 2.4.2 Soil and Groundwater Assessment – 2006

In July/August 2006, an assessment of soil and groundwater was conducted as part of a property transfer. The assessment consisted of sampling three monitoring wells (MW-1, MW-3, and MW-4); abandoning damaged well MW-2; and installing and sampling six new groundwater monitoring wells (MW-2R, and MW-5 through MW-9). Soil samples were collected at various depth intervals during the installation of monitoring wells MW-5 through MW-8. Results of the assessment were presented in the *Preliminary Groundwater Investigation Report,* dated June 11, 2007, prepared by BSK Associates, Inc (BSK), on behalf of AB&I. The results indicated that at least one compound in five of the nine wells had concentrations that exceeded their respective United States Environmental Protection Agency (USEPA) maximum contaminant level (MCL) or San Francisco Bay Regional Water Quality Control Board (RWQCB) environmental screening level (ESL) for groundwater, impacting a current or potential source of drinking water (BSK, 2007).

### 2.4.3 Groundwater and Soil Vapor Investigations – 2007 to 2010

On behalf of AB&I, the Source Group, Inc. (SGI) conducted additional soil, groundwater, and soil vapor investigations in 2007, 2008, 2009, and 2010. The results of these investigations indicated that groundwater near the parking lot area (located in the vicinity and northwest of former well MW-8; Figure 2) contained VOCs, including 1,1,1-TCA; 1,1-dichloroethane; 1,1-dichloroethene (1,1-DCE); chloroethane; cis-1,2-dichloroethene (cis-1,2-DCE); trans-1,2-dichloroethene; and vinyl chloride. Groundwater near the former three 10,000-gallon USTs (located in the vicinity of former well MW-9) contained petroleum hydrocarbons, including benzene; toluene; ethylbenzene; and xylenes (BTEX), total petroleum hydrocarbons (TPH) as gasoline (TPH-g), and TPH as diesel (TPH-d) (AB&I, 2008a; AB&I, 2008b; AB&I, 2008c; AB&I, 2009a; AB&I, 2009b; AB&I, 2009c; AB&I, 2009d; AB&I, 2010a; AB&I, 2010b).

Results of the soil vapor analysis indicated that benzene, ethylbenzene, vinyl chloride, and tetrachloroethene (PCE) were detected at concentrations exceeding 2007 RWQCB ESLs[2] under the commercial/industrial land use scenario. SGI conducted a site-specific risk assessment, which concluded that the risks posed by soil vapor concentrations were acceptable, and no further action was recommended (AB&I, 2009b). The ACEHD concurred with the report conclusions in a letter dated May 20, 2009 (ACEHD, 2009).

---

[2] Soil vapor results were compared to ESLs issued by the RWQCB entitled *Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, Interim Final – November 2007*, updated May 2008.

### 2.4.4 In-Situ Remediation – 2009

In June 2009, in-situ remediation was implemented to enhance the degradation of VOCs and petroleum hydrocarbons in groundwater in two areas of the Site. Injections of emulsified oil substrate were performed beneath the parking lot area (near former wells MW-3 and MW-8) to enhance anaerobic biodegradation, and injections of Oxygen Releasing Compound/Regenox were performed near the former three 10,000-gallon USTs (near former well MW-9) to enhance aerobic biodegradation.

Groundwater monitoring was performed between 2009 and 2010 to track the progress of bioremediation in the subsurface (AB&I, 2009c; AB&I, 2009d; AB&I, 2010a; AB&I, 2010b). In a letter dated March 2, 2010, the ACEHD indicated that no further active remediation was required at that time related to groundwater at the Site (ACEHD, 2010).

### 2.4.5 Request for Site Closure – 2011

On behalf of AB&I, SGI prepared a semi-annual report that described the results of first and second quarter 2010 groundwater monitoring activities, and formally requested Site closure. The closure request concluded that known UST sources had been removed from the Site, soil vapor impacts were low and did not warrant remediation or monitoring, and groundwater concentrations of VOCs and petroleum hydrocarbons were stable or had declined. As such, AB&I proposed preparation of a risk management plan and deed restriction (AB&I, 2010a). In a letter dated April 28, 2011, the ACEHD accepted the proposed course of action and requested submittal of a deed restriction and Site Management Plan (ACEHD, 2011).

### 2.4.6 Well Decommissioning Report – 2011

On October 11, 2011, nine monitoring wells (MW-1, MW-2R, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, and MW-9) located on the Site were destroyed via tremie grout method in accordance with Alameda County Public Works Agency (ACPWA) requirements. The necessary well destruction permits were obtained, and all well destruction activities were performed under the oversight of SGI and the ACPWA. As required by the California Department of Water Resources, well destruction reports were completed following the destruction of the monitoring wells (AB&I, 2011b).

### 2.4.7 Phase I Environmental Assessment and Limited Phase II Investigation – 2022

As part of the pre-acquisition due diligence process, Haley & Aldrich, Inc. (H&A) completed a Phase I Environmental Site Assessment (Phase I ESA) at the Site, dated April 2022 (H&A, 2022a). The Phase I ESA identified several recognized environmental conditions, which H&A subsequently investigated during a limited Phase II Environmental Investigation (2022 Phase II investigation), dated May 2022 (H&A, 2022b). The 2022 Phase II investigation included the advancement of four soil borings (E-2, E-4, E-5, and E-6; Figure 2) for collection of soil, soil vapor, and groundwater samples, and collection and analysis of eight soil samples, two groundwater samples, and two soil vapor samples.

Soil sample analytical results indicated that shallow soil near borings E-4, E-5, and E-6 contained benzene above 2019 RWQCB Commercial/Industrial Soil ESLs (RWQCB, 2019). Arsenic was detected below the background arsenic concentrations for the San Francisco Bay region (Duvergé, 2011).

The following compounds were detected in soil vapor in exceedance of their respective Commercial/Industrial Direct Exposure ESLs:

- Chloroform (E-2) – 21 micrograms per cubic meter ($\mu g/m^3$);

- Benzene (E-4) – 11,000 µg/m$^3$;
- Ethylbenzene (E-4) – 2,600 µg/m$^3$;
- Trichloroethene (TCE) (E-4) – 740 µg/m$^3$;
- Vinyl chloride (E-4) – 63 µg/m$^3$; and
- TPH-g (E-4) – 820,000 µg/m$^3$.

Vinyl chloride was also detected in groundwater at concentrations exceeding its Commercial/Industrial ESL of 0.14 micrograms per liter (µg/L) for groundwater vapor intrusion human health risk (boring E-2, 8.87 µg/L); however, vinyl chloride was not detected in soil vapor sample E-2, which was collected from the same boring as the groundwater sample.

### 2.4.8 Passive Soil Gas and Groundwater Investigation – 2023

Between July 24 and August 9, 2023, Roux conducted the 2023 Investigation at the Site to evaluate whether potential Site contaminants are present in Site soil vapor and groundwater at concentrations that may require mitigation or remediation.

To evaluate Site-wide soil vapor and groundwater, Roux installed 64 passive soil vapor samplers on a grid system across the Site and eight groundwater monitoring wells (MW-10 through MW-17) along the perimeter of the Site. The passive soil vapor samplers were installed at a depth of approximately 1-foot bgs. During groundwater well installation activities, soil samples were also collected from varying discrete depths from each boring. The groundwater monitoring well and passive soil vapor sampling locations are shown in Figure 2.

The passive soil vapor results indicated that PCE, TCE, benzene, and 1,4-dioxane were present at concentrations exceeding their respective RWQCB Commercial/Industrial ESLs. Heat maps of passive soil vapor results provided by Beacon Environmental (Beacon) are included in Appendix B.

The groundwater results indicated that metals (arsenic, barium, chromium, cobalt, lead, and nickel) were detected at concentrations exceeding their respective California MCLs in two or more wells. No other analytes, including pesticides and polychlorinated biphenyls (PCBs), were detected in groundwater above their respective California MCLs or RWQCB Commercial/Industrial ESLs.

The soil results indicated that arsenic, lead, and TPH-d were detected at concentrations exceeding their respective RWQCB Commercial/Industrial ESLs. Further details are available in the Passive Soil Gas and Groundwater Investigation Report (Roux, 2023b).

### 2.4.9 Quarterly Groundwater Monitoring – 2023 to 2024

Quarterly groundwater monitoring of wells MW-10 through MW-17 has been conducted at the Site since the fourth quarter of 2023. The eight groundwater monitoring wells (MW-10 through MW-17) were gauged, purged, and sampled according to low-flow sampling methodologies in November 2023, January 2024, April 2024, and July 2024 (Roux, 2023b; Roux, 2024a; Roux, 2024b; Roux, 2024d; Roux, 2024e). Groundwater flow direction, calculated hydraulic gradient, and groundwater quality conditions underlying the Site were assessed during each quarterly monitoring event. A groundwater elevation contour map from the Third Quarter 2024 is provided in Figure 4.

Groundwater monitoring analytical data collected over the past three quarterly groundwater monitoring events indicate that concentrations of VOCs, TPHs, and metals are generally consistent from quarter to quarter, indicating that groundwater conditions at the Site are relatively stable. Since commencing quarterly groundwater monitoring at the Site, the following constituents have been identified exceeding their respective screening criteria:

- Arsenic (maximum of 13 µg/L detected in well MW-13);
- Cobalt (maximum of 8.0 µg/L detected in well MW-17);
- Lead (maximum of 18 µg/L detected in well MW-16);
- TPH-g (maximum of 1,300 µg/L detected in well MW-11);
- TPH-d (maximum of 530 µg/L detected in well MW-16);
- 1,1-DCE (maximum of 360 µg/L detected in well MW-12);
- 1,2-Dichloroethane (1,2-DCA) (maximum of 0.9 µg/L detected in well MW-11);
- Methyl-tert butyl ether (MTBE) (maximum of 6.1 µg/L detected in well MW-15); and
- Vinyl chloride (maximum of 5.6 µg/L detected in well MW-12).

Groundwater monitoring data from the three quarterly events indicates that concentrations for VOCs, TPHs, and metals are consistent with or lower than concentrations detected during the 2006 July/August investigation (BSK, 2007) and the 2023 Investigation.

### 2.4.10 Langan Geotechnical Investigation – 2024

In May 2024, Langan prepared a work plan to implement a Supplemental Geotechnical Exploring Program at the Site (Langan, 2024). Langan implemented the Supplemental Geotechnical Exploration Program in June 2024 to supplement available geotechnical information with additional geotechnical data in locations that were previously inaccessible prior to the demolition of the above-grade structures at the Site. Langan advanced 11 cone penetration test (CPT) borings (LC-1 through LC-11) across the Site, as shown on Figure 2. The CPT data collected during this geotechnical investigation is provided in Appendix C and has been incorporated into the updated geologic cross sections presented in Appendix A.

## 2.5 Proposed Site Redevelopment

Prologis intends to redevelop the Site with the construction of an approximately 320,000-square-foot warehouse building and associated parking lot. Utility corridors throughout the Site will provide access for underground utilities to the proposed warehouse. Bio-swales along the perimeter of the Site are also proposed for construction during redevelopment activities. The proposed warehouse building footprint, utility corridor, and bio-swales are shown in Figure 5.

## 2.6 Contaminants of Potential Concern

Based on historical and nearby Site operations, as well as analytical data associated with investigation activities, the following contaminants of potential concern (COPCs) have been identified for the Site. The table below lists the COPCs associated with the Site, as well as their potential source(s).

| COPC | Potential Source(s) |
|---|---|
| Metals (arsenic, barium, beryllium, cadmium, chromium, copper, nickel, lead, and zinc) in soil and/or groundwater | Historical use of the Site as a foundry and former residential dwellings and other buildings present on the Site since 1925. |
| TPH-g, TPH-d, benzene, ethylbenzene, naphthalene, and toluene, in soil and/or groundwater; TPH-g, benzene, ethylbenzene, naphthalene, and toluene in soil vapor, possibly posing a vapor intrusion risk | Historical industrial use of the Site as a foundry and petroleum hydrocarbons stored/released near the former USTs, fuel dispensers, aboveground storage tanks (ASTs), and storage facility and yard areas. |
| VOCs, including 1,1-dichloroethane, 1,1-DCE, cis-1,2-DCE, PCE, TCE, and vinyl chloride, in soil gas and/or groundwater possibly posing a vapor intrusion risk | Historical industrial use of the Site as a foundry and VOC-containing chemicals stored/released near the former USTs, ASTs, wastewater treatment plant, and special finishing storage facility. |

## 2.7 DGI Scope of Work

As listed in Section 1, the scope of the DGI intended to: 1) delineate VOCs in soil vapor from additional step-out passive soil vapor sample locations; 2) confirm previously detected VOCs in passive soil vapor samples by installing and sampling permanent soil vapor probes at the Site; 3) assess VOC concentrations in soil vapor and bioattenuation potential by installing and sampling permanent soil vapor probes; 4) interpret the potential vapor intrusion risk extent from soil vapor beneath the Site; and 5) assess COPC concentrations in shallow soil from across the Site and within proposed utility corridors and bio-swales.

The scope of work of this DGI included the following:

- Advancement of 57 borings for the collection of soil and grab groundwater samples to a maximum depth of 35 feet bgs;
- Installation and sampling of 22 permanent active soil vapor probes;
- Collection of passive soil vapor samples at 16 locations.

The soil and grab groundwater sampling locations are shown on Figure 5, and the active soil vapor probe and passive soil vapor sampling locations are shown on Figure 6.

# 3 Pre-Field Activities

This section provides details regarding pre-field activities in accordance with the approved Work Plan at the Site.

## 3.1 Health and Safety Plan

Roux prepared a Site-specific Health and Safety Plan (HASP) to provide guidelines to all Site workers and visitors during fieldwork. The HASP was always kept on Site when fieldwork occurred. The HASP was reviewed daily and was signed by all Site workers prior to commencing work.

## 3.2 Permits

Prior to initiating subsurface investigations, Roux obtained permits for all borings from the ACPWA. Permit numbers W2024-0329 and W2024-0330 were approved on May 17, 2024, and are presented in Appendix D.

## 3.3 Sample Grid and Sample Identification Nomenclature

As part of the Work Plan development and pre-field planning activities in anticipation of implementation of this DGI, Roux subdivided the Site into a 150-foot by 150-foot grid to characterize near-surface soil across the Site, as shown on Figure 5. The grid consisted of three rows numbered 1 through 4 and nine columns lettered A through I.

### 3.3.1 Soil Boring Location Identification Nomenclature

To indicate the intended purpose of each soil boring within the grid, Roux identified each boring type with a descriptive prefix. The following prefixes were used to identify different boring types:

- “G” – soil boring intended to provide Site-wide grid coverage;
- “UC” – soil borings located in the planned utility corridor;
- “BS” – soil borings located on the planned bio-swales.

Some soil boring locations had more than one intended purpose, and in those instances, a combined prefix of “G/UC” or “G/BS” was assigned. Following the boring prefix, the grid letter and number were then identified (i.e., A1 for a soil boring in cell A1). Finally, the boring was assigned a sequential number to help identify when multiple borings of the same purpose were located within the same grid cell. For example, in grid cell B4, two utility corridor samples were proposed. One of those locations also represented a Site-wide grid sampling location and therefore includes a combined prefix. The following nomenclature was utilized for the two B4 utility corridor borings:

- G/UC-B4-1: representing a soil boring intended for Site-wide grid coverage and utility corridor exploration in grid cell B4; and,
- UC-B4-2: representing a second utility corridor exploration soil boring within grid cell B4.

### 3.3.2 Soil Sample Identification Nomenclature

Discrete soil samples collected within each soil boring were identified by adding the sample depth to the end of the sample ID. The sample depth represented the deepest portion of the sample interval collected. For

example, a soil boring collected from boring location G-A1-1 between 0.5 and 1 foot bgs was given the following sample ID:

- G-A1-1-1.0

It should be noted that the sampling depth nomenclature was subsequently removed from the sample ID during tabulation of the data set. The sample depth is instead indicated in a separate row associated with the sample location.

### 3.3.3 Groundwater Boring and Sample Identification Nomenclature

Boring locations where groundwater samples were proposed followed a separate naming convention. Groundwater sampling locations were identified by the following prefixes:

- "GW" – groundwater sampling location targeting areas of previously detected COPCs in the subsurface; and,
- "P" – groundwater sampling locations targeting subgrade pits that were identified following demolition of the above-grade structures at the Site.

Some groundwater sampling borings were combined with soil sampling borings within the same borehole. At these locations, the groundwater sampling nomenclature was added to the end of the soil boring nomenclature. Additionally, at the "GW" sampling locations, multiple water-bearing depths were targeted during the investigation. First and second water-bearing zones were identified by Rouxs' field geologist based on moisture content observations from drill cuttings and the identification of aquicludes (i.e., low permeability silts and clays) separating saturated material. Samples collected from the first encountered water-bearing zone were given a "-1" at the end of the sample ID and a "-2" for samples collected from the second encountered water-bearing zone.

It should be noted that "P" groundwater sample IDs do not contain a "-1" indicating the samples were all collected from the first encountered water-bearing zone.

### 3.3.4 Soil Vapor Sample Identification Nomenclature

Active soil vapor probe sampling locations that where installed at locations corresponding to previous passive soil vapor sample locations, began with the prefix "SVP" to denote the active soil vapor sample to be collected from a permanent active soil vapor probe, followed by the previous passive soil vapor sample location number, and then followed by the depth the soil vapor probe was installed. For example, the active soil vapor probe installed at the previous passive soil vapor sample location PSG-41 at 5 feet bgs was identified as "SVP-41-5".

Step-out passive soil vapor sample locations began with the prefix "PSG" to denote the passive soil vapor sample to be collected from the passive soil vapor sample location. Four passive soil vapor sample locations were installed in a 25- by 25-foot grid centered around the previously investigated passive soil vapor sample locations and were identified ending in "A" through "D". For example, the step-out passive soil vapor sampling locations surrounding the previous passive soil vapor probe, PSG-41, were identified as "PSG-41A", "PSG-41B", "PSG-41C", and "PSG-41D".

# 4 Investigation Field Activities

This section describes the implementation of field activities in accordance with the approved Work Plan. Field DGI activities were completed between May 15 and June 4, 2024.

## 4.1 Surveying

Roux contracted with Cal Vada Surveying Inc. (Cal Vada), a California State-registered surveyor, to measure the horizontal coordinates and vertical elevation of all proposed boring locations, in accordance with State of California requirements. On May 15 and 16, 2024, Cal Vada, under the oversight of Roux, surveyed all proposed sample locations. A Site plan with the survey data of each sample location is provided in Appendix E.

## 4.2 Utility Location and Borehole Clearance

Roux contacted Underground Service Alert of Northern California and Nevada (USA North 811) 48 hours prior to subsurface activities and submitted a USA Ticket (Ticket #2024051302814) to notify utility operators of the planned work and to request the marking of nearby utilities (i.e., natural gas, electric, water, sewer, telephone, fiber optic, etc.). Additionally, Roux contracted with two private geophysical services and utility locating firms, Subtronic Corporation (Subtronic) and Ground Penetrating Radar Services (GPRS), to evaluate the proposed boring locations and mark out existing subsurface utility lines to mitigate the risk of potentially damaging subsurface utilities at the Site.

On May 15, 16, 17, and 20, 2024, Subtronic and/or GPRS cleared the proposed boring locations of subsurface utilities under the oversight of Roux.

## 4.3 Boring Advancement

Between May 15 and June 4, 2024, Cascade Drilling (Cascade), under the oversight of Roux, advanced a total of 70 borings for the collection of soil, groundwater, and soil vapor samples (Figure 5 and 6). All borings were advanced from the ground surface using direct push technology (DPT). The depth of the borings varied from 5 feet bgs to a maximum depth of 35 feet bgs. Cascade used a star drill bit to penetrate the concrete and/or asphalt surfaces at each boring location. Dual tube DPT drill rods with Macro-core acetate liners were utilized for soil and groundwater sample collection. The dual tube DPT method minimizes cross contamination between water-bearing zones as soil is removed from the inner liner while the outer casing remains at depth until immediately prior to groundwater sample collection.

Soil was logged by a Roux field geologist under the oversight of a California licensed Professional Geologist in accordance with the Unified Soil Classification System (USCS). Headspace measurements for organic vapors in soil were then collected from the sealed bags in the field using a photo-ionization detector (PID). Soil from each sample interval (or approximately every 2 feet) was placed in a sealable plastic bag, the bag was sealed, and the soil broken up to allow for volatilization of organics within the soil. A detailed field boring log of each boring was prepared noting soil type, soil color, groundwater depth, moisture, (density, stiffness, and plasticity, as applicable), and PID headspace readings. Boring logs are included in Appendix F.

Borings proposed for the collection of groundwater at the locations identified as “GW-” were advanced to the observed depth of first and second encountered water-bearing zones based on observations of soil saturation and aquicludes separating saturated soil units while drilling. Each “GW-” location consisted of co-located

borings targeting the two water-bearing zones to minimize cross-contamination during sample collection. At each suspected water-bearing zone, the presence of sufficient groundwater for sampling was assessed by lifting the drill casing above the suspected groundwater zone and monitoring the groundwater recharge within the drill casing. Once it was determined that the targeted water-bearing zone was suitable for sample collection, grab groundwater sampling was performed. Groundwater sample collection methods are discussed below in Section 4.7.

Drilling casing was decontaminated between boring locations. Decontamination consisted of removing visible soil particles from the drilling equipment, washing and scrubbing the drilling equipment with water containing a detergent (i.e., Alconox®), and triple rinsing the equipment to removal the detergent solution. All decontamination water was contained in 55-gallon Department of Transportation (DOT) rated drums, labeled, and stored at the Site pending waste characterization and disposal.

## 4.4 Soil Vapor Probe Installations

On May 21, 24, 28, 29, 2024, under the oversight of Roux, Cascade installed twenty one soil vapor probes at the Site: SVP-06-5, SVP-06-8, SVP-10-5, SVP-10-8, SVP-13-5, SVP-13-8, SVP-25-5, SVP-25-8, SVP-32-5, SVP-32-8, SVP-36-5, SVP-36-8, SVP-41-5, SVP-41-8, SVP-45-5, SVP-52-5, SVP-52-8, SVP-53-5, SVP-57-5, SVP-61-4, and SVP-62-4 (Figure 6).

The soil vapor probes for active soil vapor sampling (active soil vapor probes) were installed in accordance with the Work Plan and the California Department of Toxic Substance Control (DTSC) *Soil Gas Advisory* guidance (DTSC, 2015). The active soil vapor probes were installed on a concrete or soil surface as permanent soil vapor wells. Approximately 1 foot of sand was placed at the bottom of the borings surrounding the soil vapor probe tip and well tubing, followed by 1 foot of dry granular bentonite, filled to within six inches of the surface with neat cement grout, and finished to grade with a traffic rated well box. At select locations (SVP-06-8, SVP-10-8, SVP-13-8, SVP-25-8, SVP-32-8, SVP-36-8, SVP-41-8, SVP-52-8, SVP-53-5, and SVP-57-5) low-permeability soil was encountered and the permanent active soil vapor wells were installed with 2 feet of sand placed at the bottom of the borings surrounding the soil vapor probe tip, followed by 1 foot of dry granular bentonite, filled to within six inches of the surface with neat cement grout, and finished to grade with a traffic rated well box. Each permanent active soil vapor probe consists of 1/4-inch-diameter Teflon tubing with a stainless-steel filter tip installed at 4, 5, and/or 8 feet bgs centered within the layer of sand (soil vapor probe depth is indicated by the last number in the soil vapor well name). The active soil vapor probes were allowed to equilibrate for at least 48 hours before collecting samples per DTSC *Soil Gas Advisory* guidance (DTSC, 2015). The well construction logs are included in boring logs (Appendix F).

## 4.5 Passive Soil Vapor Sampler Installations

On May 20, 2024, Cascade, under the oversight of Roux, installed 16 Beacon Environmental (Beacon)-supplied passive soil vapor samplers at the Site: PSG-10A through PSG-10D, PSG-25A through PSG-25D, PSG-41A through PSG-41D, and PSG-62A through PSG-62D (Figure 6).

The samplers were installed following advancement of a boring through the surficial hardscape into the underlying soils using a rotary hammer drill and fitted with a 1-1/2-inch-diameter hole drill bit to the designated sample depth. Sixteen (16) of the samplers were installed in hardscape areas covered with concrete slab or asphalt ranging from approximately 6 to 8 inches thick. Once through the surfacing, a 1/2-inch-diameter drill bit was used to extend the hole a minimum of 3 feet (ft) below the hardscape. The hole was then sleeved with a pre-cleaned, aluminum pipe that was pushed or tapped into the drilled hole using a hammer or tapping

dowel. Once installed, the bottom of the pipe was at approximately 12 inches bgs. The sampler was installed inside the metal pipe and the hole was patched with an aluminum foil plug and a thin concrete patch to protect the sampler and seal the borehole during sample collection. A passive soil vapor sampler construction detail is provided in Appendix G.

## 4.6 Soil Sampling and Analysis

Soil samples were collected from each boring location in accordance with the Work Plan at depths detailed on Table 1. If stained/discolored soil was observed or an elevated PID response greater than 10 parts per million was measured in a headspace sample while logging subsurface soils, additional soil samples were collected. A total of 289 soil samples were collected during this DGI. To minimize volatilization during transport following sampling, soil samples for VOCs were collected into laboratory-provided Terra Core® containers. Soil samples for all other analysis were collected into laboratory provided glass jars. All samples were appropriately labelled, packaged, and immediately placed on ice for delivery under COC protocols to Pace Analytical (Pace), a California-certified laboratory, for environmental analyses. Soil samples were analyzed for all/some of the following analytical tests and reported on a dry-weight basis:

- VOCs by USEPA Method 8260B;
- Semi-volatile organic compounds (SVOCs) by USEPA Method 8270C;
- TPH-g, TPH-d and TPH as motor oil (TPH-mo) by USEPA Method 8015;
- Title 22 Metals by USEPA Method; and,
- PCBs by USEPA Method 8082A.

Of the 289 samples collected, 267 soil samples were analyzed for one or more of the analyses listed above. The remaining 22 samples were collected for contingency purposes and were ultimately not analyzed. Duplicate samples were not collected due to the heterogeneity of soil. Soil analytical results are summarized in Tables 2 through 6 and the laboratory analytical reports are included in Appendix H.

## 4.7 Groundwater Sampling and Analysis

Grab groundwater sampling was performed at each boring advanced for groundwater sample collection, as detailed on Table 1, in co-located borings for collection of samples from the first and second encountered water-bearing zones from separate borings. Following boring advancement of the dual tube DPT system and identification of the target water-bearing zone at each boring, temporary pre-packed well screen and blank schedule 40 polyvinyl chloride (PVC) casing was installed into the center of the drill rod to the total depth of the boring. The DPT drilling rods were lifted to expose the temporary well screen to the water-bearing zone. For collection of grab groundwater from the second water-bearing zone, Roux ensured that the drill rods were only exposing the second water-bearing zone and were not lifted past the base of the first water-bearing zone (as defined by the observed aquiclude between the distinct water-bearing zones and moisture observations logged while drilling), to avoid cross contamination between the two zones. The drill rods remained in the borings until sampling was complete. The temporary wells were allowed to recharge for at least 1 hour prior to sample collection. Non-stabilized groundwater levels were recorded with a water level meter prior to sample collection.

A low-flow pump (bladder pump) was used to limit volatilization of VOCs during sample collection. Due to the high turbidity of the groundwater within the temporary groundwater wells, Roux purged approximately one casing volume of water from the temporary well casing prior to collecting groundwater samples to reduce the

turbidity of the groundwater samples. Water quality parameters were monitored during the purge at each grab groundwater sampling location using a YSI 556 Multiprobe Water Quality Meter including temperature, pH, conductivity, and turbidity. After approximately one casing volume of water was purged from the temporary groundwater wells, a grab groundwater sample was collected into laboratory-provided sample containers. Groundwater was passed through a 0.45-micron filter for the collection of dissolved metal samples in the field. Groundwater sample containers were labeled, placed on ice, and sent to Pace under chain-of-custody protocol for the following analyses:

- VOCs by USEPA Method 8260B;
- TPH-g/d/mo by USEPA Method 8015; and
- Title 22 Metals by USEPA Method 6010B, 6020 and 7470A (dissolved and total metals analyzed for grab groundwater samples).

A total of 21 grab groundwater samples (including duplicates) were collected and analyzed during this DGI. Following sampling activities, the temporary well casing was removed from each boring and the boring was prepped for backfill. See Section 4.11 for details regarding borehole abandonment activities. The grab groundwater sampling results are summarized in Tables 7 through 10 and the laboratory analytical reports are included in Appendix H. Groundwater Sampling Forms including collected groundwater parameters are presented in Appendix I.

## 4.8 Active Soil Vapor Sampling and Analysis

After each active soil vapor probe was allowed to equilibrate for 48 hours per the DTSC *Soil Gas Advisory* guidance, soil vapor samples were collected into individually certified one-liter evacuated SUMMA® canisters (DTSC, 2015).

Prior to the collection of soil vapor samples, Roux performed an analysis of percent relative error for each one-liter SUMMA® canister to verify initial canister pressure was less than the absolute vacuum. Calculation of the percent relative error introduced by null existing gas (e.g., existing gas that is absent of constituents of concern) uses the following equation:

$$\% \text{ Relative Error} = (P_A - P_I)/(P_A - P_F)$$

Where $P_A$ = absolute vacuum pressure, $P_I$ = initial vacuum pressure within the canister at the start of sampling, and $P_F$ = final vacuum pressure within the canister at the end of sampling.

Assuming a final vacuum pressure of 5 inches of mercury (in-Hg) and an absolute vacuum pressure of 30 in-Hg, the break point for 10% relative error was at 27.5 in-Hg. All canisters used for sample collection were below the 10% relative error criteria.

Next, a “negative pressure shut-in test” was performed to check for leaks in the above-ground soil vapor sampling equipment. The sampling apparatus (sample canister and manifold) were assembled and then put under negative pressure using a 3-way valve and syringe for a six-minute interval. If no loss of canister vacuum was observed, the sampling apparatus was connected to the soil vapor well. Following the “negative pressure shut-in test”, approximately three purge volumes were purged from the sample collection tubing using a GilAir Plus Air Sampling Pump before soil vapor sample collection began. Purge activities were conducted at the same flow rate used for soil vapor sample collection (approximately 150-200 milliliters per minute). During purging and soil vapor sample collection activities, a helium shroud test was performed using

1) a shroud, which enclosed the soil vapor probe vault, probe tubing, and the entire sampling manifold, and 2) helium as a tracer gas. A minimum helium concentration of 20 percent was maintained within the shroud during the purging and soil vapor sample collection period. At the completion of sampling, the aboveground tubing from the permanent soil vapor wells were coiled into the space below the well box and covered using a silicone cap. The samples were labeled appropriately and submitted under chain-of-custody protocol to Enthalpy Analytical (Enthalpy), a California certified laboratory in Berkeley, California.

A total of 22 soil vapor samples (including duplicates) were collected from soil vapor probes using active soil vapor sample collection methods and analyzed during this DGI. The soil vapor sampling results are summarized in Table 11 and the laboratory analytical reports are included in Appendix H. Field sampling criteria, including location, time, sample container and manifold IDs, sampler(s), pressure readings, and helium shroud percentage, were recorded on the Soil Vapor Sampling Logs. The Soil Vapor Sampling Logs are presented in Appendix J.

## 4.9 Passive Soil Vapor Sampling and Analysis

A total of 18 passive soil vapor samples (including duplicates) were collected during this DGI. Sample collection at each location began upon emplacement of the passive soil vapor samplers within each hole. Each sampler was exposed to subsurface gas for 15 days, the typical exposure duration in accordance with laboratory provided standard operating procedures (SOPs) included in Appendix K. Following the exposure period completion, the samplers were retrieved, packaged, and sealed in accordance with the laboratory-provided SOPs. The samplers were then shipped under chain-of-custody protocols to Beacon Environmental (Beacon) for analysis of VOCs and TPH (C-4 to C-9 and C-10 to C15) by EPA Method 8260C.

The passive soil vapor results are summarized in Table 12 and the laboratory analytical reports are included in Appendix H.

## 4.10 Quality Assurance/Quality Control Sampling and Analysis

To assess the reliability of the data gathered during this DGI, Roux collected quality assurance/quality control (QA/QC) samples in accordance with the Work Plan. QA/QC samples included trip blanks, equipment blanks, and duplicate groundwater and soil vapor samples.

Trip blanks were prepared and provided by Pace and Beacon. One trip blank sample was submitted for each day of soil and groundwater sample collection for submittal to Pace for analysis. One trip blank (Trip-1) also accompanied the passive soil vapor samples during transport to Beacon for analysis. All trip blanks shipped to Pace were labeled as “TB-[date of transport]” and traveled in the same container as the soil and groundwater samples. Additionally, an equipment blank sample was collected each day of sample collection from the DPT drill shoe to ensure adequate decontamination procedures were implemented. Equipment blank samples were collected in the field by pouring laboratory provided deionized water over the reusable drilling equipment and collecting the rinse water into laboratory provided containers. Equipment blank samples were labeled as “EB-[date of collection]”, placed in an ice-filled chest, and shipped under chain-of-custody to Pace. The trip blank sent to Beacon was labeled “TB-1”. Trip blank samples were analyzed for VOCs by USEPA Method 8260B. Equipment blank samples were analyzed for the following:

- VOCs by USEPA Method 8260B;
- TPH-g, TPH-d, and TPH-mo by USEPA Method 8260B and/or 8015; and,
- Title 22 metals by USEPA Method 6020 (unfiltered).

The passive soil vapor trip blank was analyzed for VOCs by USEPA Method 8260C. The results of the trip blank and equipment blank samples are presented on Tables 7 through 10 and 12.

A duplicate grab groundwater sample was collected each day during grab groundwater sampling activities. This rate of duplicate sample collection also complied with the one duplicate per 10 samples collected QA/QC requirement. A total of three duplicate grab groundwater samples [P-10 (DUP-1), GW-2-2 (DUP-2), and P-06 (DUP-3)] were collected immediately following collection of their respective primary samples. It is important to note that, due to the requirement to use low-flow sample methodology, sample collection times between primary and duplicate samples were between approximately 1 and 1.5 hours apart. The duplicate samples were contained within laboratory-provided sample containers, labeled appropriately, and placed in an ice-filled chest pending delivery under chain-of-custody protocol to Pace for analysis. Duplicate grab groundwater samples were analyzed for the same constituents as their respective primary samples. The results of the duplicate grab groundwater samples are presented on Tables 7 through 10.

Duplicate active soil vapor samples were collected at a rate of one duplicate per 10 primary active soil vapor samples. A total of three duplicate soil vapor samples [SVP-10-5 (SVP-DUP-1), SVP-13-5 (SVP-DUP-2), and SVP-62-4 (SVP-DUP-3)] were collected using individually certified dual sampling manifold provided by Enthalpy. Duplicate active soil vapor sample results are presented on Table 11.

The laboratory-provided SOP for passive soil vapor sampling indicates that duplicate sample analysis is performed by reanalysis of a primary passive soil vapor sampler. Roux selected two primary samples to be analyzed twice as duplicates (PSG-10A [DUP-01] and PSG-62A [DUP-02]). Duplicate passive soil vapor samples were analyzed by Beacon and are presented on Table 12.

## 4.11 Borehole Abandonment Activities

Following sample collection, each soil and groundwater borehole was abandoned by Cascade in accordance with the requirements of the ACPWA permit under the oversight of an ACPWA inspector. Each borehole was backfilled with neat cement grout to ground surface. For boreholes that extended below groundwater, a tremie pipe was utilized to avoid grout bridging and ensure proper borehole abandonment.

## 4.12 Deviations From Workplan

The following deviations from the Work Plan were made due to unexpected conditions encountered in the field:

- Soil boring and grab groundwater boring G-F3-1/P-03 was advanced to 4.5 feet bgs rather than the targeted 10 feet due to refusal. Two additional step-outs were attempted at G-F3-1/P-03 with each attempt encountering refusal at 4.5 feet bgs. Soil samples were collected to 4.5 ft bgs. No groundwater interface soil sample was collected and no groundwater sample was collected at P-03.
- Soil boring G/UC-H4-1 was advanced to 4.75 feet bgs rather than the targeted 10 feet due to refusal. Two additional step-outs were attempted at G/UC-H4-1 with each attempt encountering refusal at 4.75 feet bgs. Soil samples were collected to 4.75 ft bgs.
- Soil vapor probes SVP-45-8, SVP-57-8, SVP-61-8, and SVP-62-8 were not installed due to first encountered groundwater at approximately 7 feet bgs. However, the shallower (4 to 5 feet bgs) soil vapor probes were installed at each of these soil vapor probe locations.
- Soil vapor sample from probe SVP-32-5 was not collected due to high downhole vacuum during sample purge.

- Soil vapor probes SVP-61-4 and SVP-62-4 were installed at 4 feet bgs rather than the targeted 5 feet bgs due to first encountered groundwater at these boring locations at 5 feet bgs.
- Soil vapor sample at soil vapor well SVP-61-4 was not collected due to water encountered in the sample line during purging.
- The second groundwater zone at GW-1-2 was not observed while drilling. Grab groundwater boring GW-1-2 was advanced to 35 ft bgs and the boring was dry after 24 hours. No grab groundwater sample was collected at GW-1-2.
- Select soil samples intended for analysis for vertical delineation of metals, TPH-d, and PCBs were not analyzed due to the disposal of the samples by the laboratory prior to request for analysis. These samples were disposed of by the laboratory without prior notice to Roux and are identified on Tables 2, 5, and 6 and Figures 7 through 9.

## 4.13 Investigation-Derived Waste

All soil and groundwater investigation-derived waste (IDW) was stored in a Department of Transportation (DOT)-approved 55-gallon drums. Two waste soil drums and two wastewater drums were generated during the investigation. One composite soil sample and one drum-water characterization sample were collected from the drums and submitted under chain-of-custody protocol to Pace for analysis of the following analyses:

- VOCs by USEPA method 8260B;
- Title 22 Metals by USEPA method 6020; and,
- TPH-g, TPH-d, and TPH-mo by USEPA method 8015B.

Upon receipt of laboratory analytical results for the representative samples, the material was profiled as non-hazardous and transported to and disposed of at an appropriate waste disposal facility on August 7, 2024. The non-hazardous waste manifests are included in Appendix L.

# 5 Investigation Results

This section provides the analytical results from the DGI activities. All associated laboratory reports for the foregoing analytical results are included in Appendix H.

## 5.1 Screening Criteria

Based on the objectives of this investigation, analytical data was screened against the following criteria for each specific sampling media (applicable screening levels):

Soil

- Soil sample results are screened against the 2019 RWQCB ESLs for direct exposure for Construction Worker and Commercial/Industrial exposure scenarios (Construction Worker ESL and Commercial/Industrial ESL, respectively); and
- Arsenic concentrations in soil were compared to the accepted background concentration for the San Francisco Bay Region as presented in *Established Background Arsenic in Soil of the Urbanized San Francisco Bay Region* (Duvergé, 2011).
- When Construction Worker or Commercial/Industrial ESLs were not available, the Regional Screening Levels (RSLs) for Industrial Soil were used, if available.

Groundwater

- California and Federal MCLs for Title 22 metals;
- 2019 RWQCB ESLs for direct exposure human health risk levels MCL priority and Commercial Industrial ESLs for vapor intrusion for VOCs; and
- 2019 RWQCB ESLs for direct exposure human health risk levels MCL priority for TPH-chain (TPH-g, TPH-d, and TPH-mo).

Soil Vapor (passive and active)

- 2019 RWQCB Soil Gas ESLs for potential vapor intrusion risk for Commercial/Industrial land use.

## 5.2 Soil Analytical Results

Of the 289 soil samples collected during this investigation, 267 were analyzed for Title 22 metals, VOC, SVOCs, TPH-g, TPH-d/mo, and/or PCB. The remaining 22 samples were collected for contingency purposes and were ultimately not analyzed. The complete list of soil samples and their respective analyses is presented in Table 1. The following constituents detected in soil exceeded their respective applicable soil screening levels as discussed in Section 5.1:

Metals

- Arsenic was detected above screening criteria in 21 soil samples at concentrations ranging between 12.2 (G/UC-B4-1-2.0) and 3,460 mg/kg (G/UC-B1-1-3.0), exceeding the background level of 11 mg/kg;
- Cobalt was detected above screening criteria in one sample (BS-I1-1-3.0) at a concentration of 43.3 mg/kg, exceeding the Construction Worker ESL of 27.9 mg/kg;
- Copper was detected above screening criteria in two samples at concentrations of 15,300 (G-B2-1-2.0) and 28,200 (G-B2-1-3.0) mg/kg, exceeding the Construction Worker ESL of 14,200 mg/kg;

- Lead was detected above screening criteria in 49 soil samples at concentration ranging between 164 (G-D2-1-2.0) and 6,190 (G/BS-F4-1-1.0) mg/kg, exceeding the Construction Worker ESL of 160 mg/kg. Additionally, 30 of the elevated concentrations of lead exceeded the Commercial/Industrial ESL of 320 mg/kg; and
- Nickel was detected above screening criteria in 13 samples ranging between 87.7 (G-B3-1-2.0) and 320 (BS-G1-1-2.0) mg/kg, exceeding the Construction Worker ESL of 86.3 mg/kg.

VOCs

- Benzene was detected above screening criteria in one sample (P-01-16.5) at a concentration of 3.56 mg/kg, exceeding the Commercial/Industrial ESL of 1.45 mg/kg;
- Ethylbenzene was detected above screening criteria in one sample (P-01-16.5) at a concentration of 75.4 mg/kg, exceeding the Commercial/Industrial ESL of 25.9 mg/kg; and
- Naphthalene was detected above screening criteria in one sample (P-01-16.5) at a concentration of 49.6 mg/kg, exceeding the Commercial/Industrial ESL of 16.7 mg/kg.

SVOCs

- Benzo(a)pyrene was detected above screening criteria in six samples at concentrations ranging between 2.84 (G/BS-H1-1.0) and 20 (G-F2-1-1.0) mg/kg, exceeding the Commercial/Industrial ESL of 2.19 mg/kg. Additionally, two benzo(a)pyrene concentrations exceeded the Construction Worker ESL of 10.1 mg/kg;
- Benzo(b)fluoranthene was detected above screening criteria in one sample (G-F2-1-2.0) at a concentration of 25.9 mg/kg, exceeding the Commercial/Industrial ESL of 21.1 mg/kg; and
- Dibenz(a,h)anthracene was detected above screening criteria in one sample (G-F2-1-3.0) at a concentration of 2.21 mg/kg, exceeding the Commercial/Industrial ESL of 2.11 mg/kg.

PCBs

- PCB-1242 was detected above screening criteria in one sample (G-E3-1-1.0) at a concentration of 1.88 mg/kg, exceeding the Commercial/Industrial ESL of 0.94 mg/kg;
- PCB-1254 was detected above screening criteria in two samples at concentrations of 1.14 (G-E3-1-1.0) and 3.69 (G/BS-D4-1-2.0) mg/kg, exceeding the Commercial/Industrial ESL of 0.94 mg/kg; and
- PCB-1260 was detected above screening criteria in four samples at concentrations ranging between 0.997 (G-H3-1-3.0) and 2.51 (G-H2-1-1.0) mg/kg, exceeding the Commercial/Industrial ESL of 0.94 mg/kg.

TPHs

- TPH-g was detected above screening criteria in one sample (P-01-16.5) at a concentration of 2,340 mg/kg, exceeding the Construction Workers and Commercial/Industrial ESLs of 1,820 and 2,000 mg/kg, respectively;
- TPH-d (C12-C22) was detected above screening criteria in five samples at concentrations ranging between 1,430 (G-G1-1-3.0) and 7,040 (SVP-57-5-6.0) mg/kg, exceeding the Construction Worker and Commercial/Industrial ESLs of 1,080 and 1,220 mg/kg, respectively; and
- TPH-d (C22-C32) was detected above screening criteria in 17 samples at concentrations ranging between 1,210 (G-C3-1-4.0) and 20,000 (G-G2-1-3.0) mg/kg, exceeding the Construction Worker ESL of 1,080 mg/kg. Additionally, 16 of the elevated concentrations exceeded the Commercial/Industrial ESL of 1,220 mg/kg.

Concentrations of all other Title 22 metals, VOC, SVOCs, PCBs, TPH-g, TPH-d, and TPH-mo in soil samples were below their respective Construction Worker, Commercial/Industrial ESLs or RSLs for Industrial Soil

(where available). The analytical results for Title 22 metals, VOC, SVOCs, PCBs, and TPH-g/d/mo in soil are summarized in Tables 2 through 6, respectively. All soil samples exceeding applicable screening levels are presented on Figures 7, 8, and 9. The soil laboratory analytical reports are included in Appendix H.

## 5.3 Groundwater Analytical Results

Twenty-one groundwater samples were collected from eighteen temporary groundwater wells (GW-1-1, GW-2-1, GW-2-2, GW-3-1, GW-3-2, GW-4-1, GW-4-2, GW-5-1, GW-5-2, GW-6-1, GW-6-2, P-01, P-02, P-06, P-08, P-10, P-11, and P-12) including three duplicate samples (P-10 [DUP-1], GW-2-2 [DUP-2], and P-06 [DUP-3]) and analyzed for Title 22 metals (total and dissolved), VOCs, and TPH-g/d/mo. The following constituents detected in groundwater exceeded their respective applicable screening criteria as discussed in Section 5.1:

Total Metals

- Total antimony was detected above screening criteria in one sample (P-08) at a concentration of 39.3 µg/L, exceeding the California and Federal MCL of 6.0 µg/L;
- Total arsenic was detected above screening criteria in seven samples (including one duplicate) ranging in concentration between 10.6 (P-02) and 30.5 (P-01) µg/L, exceeding the California and Federal MCL of 10 µg/L;
- Total barium was detected above screening criteria in two samples at concentrations of 1,050 (GW-3-1) and 2,610 (GW-4-1) µg/L, exceeding the California MCL of 1,000 µg/L. Additionally, one elevated concentration exceeded the Federal MCL of 2,000 µg/L;
- Total beryllium was detected above screening criteria in two samples (including one duplicate) at concentrations of 8.59 (P-10) and 9.33 (DUP-3) µg/L, exceeding the California and Federal MCL of 4.0 µg/L;
- Total cadmium was detected above screening criteria in two samples at concentrations of 6.1 (P-11) and 53.3 (P-08) µg/L, exceeding the California and Federal MCL of 5.0 µg/L;
- Total chromium was detected above screening criteria in four samples (including one duplicate) at concentrations ranging between 50.7 (P-10) and 185 (GW-2-2) µg/L, exceeding the California MCL of 50.0 µg/L. Additionally, one elevated concentration exceeded the Federal MCL of 100 µg/L;
- Total lead was detected above screening criteria in nine samples (including two duplicates) ranging in concentration between 24.5 (DUP-2) and 9,470 (P-08) µg/L, exceeding the Federal MCL of 15 µg/L;
- Total nickel was detected above screening criteria in five samples (including two duplicates) ranging in concentration between 131 (GW-6-2) and 364 (DUP-3) µg/L, exceeding the California MCL of 100 µg/L;
- Total zinc was detected above screening criteria in one sample (P-08) at a concentration of 7,100 µg/L, exceeding the Federal MCL of 500 µg/L.

Dissolved Metals

- Dissolved antimony was detected above screening criteria in one sample (P-08) at a concentration of 39.2 µg/L, the California and Federal MCL of 6.0 µg/L;
- Dissolved arsenic was detected above screening criteria in four at concentrations ranging between 13.1 (GW-2-1) and 29.3 (P-01) µg/L, exceeding the California and Federal MCL of 10 µg/L; and
- Dissolved cadmium was detected above screening criteria in one sample (P-11) at a concentration of 5.17 µg/L, exceeding the California and Federal MCL of 5.0 µg/L.

VOCs

- 1,1-Dichloroethane (1,1-DCA) was detected above screening criteria in one sample (P-08) at a concentration of 6.04 µg/L, exceeding the MCL Priority ESL of 5.0 µg/L;
- 1,1-DCE was detected above screening criteria two samples at concentrations of 108 (GW-3-1) 315 (GW-3-2) µg/L, exceeding the MCL Priority ESL of 6.0 µg/L. Additionally, one elevated concentration exceeded the Commercial/Industrial ESL of 280 µg/L;
- Benzene was detected above screening criteria in three samples at concentrations ranging between 2.45 (P-08) and 991 (P-01) µg/L, exceeding the MCL Priority ESL of 1.0 µg/L and the Commercial/Industrial ESL of 1.8 µg/L.
- Cis-1,2-DCE was detected above screening criteria in three samples (including one duplicate) at concentrations ranging between 25.6 (P-08) and 186 (DUP-1) µg/L, exceeding the MCL Priority ESL of 6.0 µg/L;
- Ethylbenzene was detected above screening criteria in one sample (P-01) at a concentration of 1,020 µg/L, the MCL Priority ESL of 30 µg/L and the Commercial/Industrial ESL of 15 µg/L for ethylbenzene;
- Naphthalene was detected above screening criteria in two samples at concentrations of 5.84 (GW-6-1) and 275 (P-01) µg/L, exceeding the MCL Priority ESL of 0.17 µg/L. Additionally, one elevated concentration exceeded the Commercial/Industrial ESL of 20 µg/L;
- PCE was detected above screening criteria in two samples at concentrations of 5.57 (P-10) and 6.1 (DUP-3) µg/L, exceeding the MCL Priority ESL of 5.0 µg/L and the Commercial/Industrial ESL of 2.79 µg/L;
- Toluene was detected above screening criteria in one sample (P-01) at a concentration of 70.7 µg/L, exceeding the MCL Priority ESL of 40 µg/L;
- TCE was detected above screening criteria in four samples (including two duplicates) at concentrations ranging between 5.12 (DUP-1) and 6.42 (DUP-3) µg/L, exceeding the MCL Priority ESL of 5.0 µg/L; and
- Vinyl chloride was detected above screening criteria in five samples at concentrations ranging between 1.26 (GW-2-1) and 47.4 (DUP-2) µg/L, exceeding the MCL Priority ESL of 0.5 µg/L and the Commercial/Industrial ESL of 0.14 µg/L.

TPHs

- TPH-g C5-C12 was detected above screening criteria in two groundwater samples at concentrations of 928 (GW-6-1) and 18,300 (P-01) µg/L, exceeding the MCL Priority ESL of 760.0 µg/L;
- TPH-d C12-C22 was detected above screening criteria in 12 samples at concentrations ranging between 293 (GW-2-2) and 2,680 (P-01) µg/L, exceeding the MCL Priority ESL of 200 µg/L for TPH-d C12-C22; and
- TPH-d C22-C32 was detected above screening criteria in 13 samples at concentrations ranging between 208 (P-11) and 2,890 (P-08) µg/L, exceeding the MCL Priority ESL of 200 µg/L.

Concentrations for all other Title 22 metals, VOC, TPH-g, TPH-d, and TPH-mo in groundwater samples were below their respective MCL Priority ESL and Commercial/Industrial ESL or do not have an established ESL. The analytical results for Title 22 metals (total and dissolved), VOC, TPH-g/d/mo in groundwater are summarized in Tables 7 through 10, respectively. All groundwater exceedances of applicable screening levels are presented on Figures 10 and 11. The groundwater laboratory analytical reports are included in Appendix H.

## 5.4 Active Soil Vapor Analytical Results

Twenty-two soil vapor samples were collected by active sampling methods and analyzed for VOC and TPH-g from 19 soil vapor probes (SVP-06-5, SVP-06-8, SVP-10-5, SVP-10-8, SVP-13-5, SVP-13-8, SVP-25-5, SVP-25-8, SVP-32-8, SVP-36-5, SVP-36-8, SVP-41-5, SVP-41-8, SVP-45-5, SVP-52-8, SVP-53-5, SVP-53-8, SVP-57-5, and SVP-62-4) including three duplicate samples (SVP-10-5 [DUP-1], SVP-13-5 [DUP-2], and SVP-62-4 [DUP-3]). Results of VOCs and TPH-g in active soil vapor are presented on Table 11 and shown on Figure 12, with additional isocontours and heat maps for individual analytes shown on Figures 13a through 17. The following constituents detected in active soil vapor exceeded their respective applicable screening levels as discussed in Section 5.1:

- 1,1-DCE was detected above screening criteria in one sample (SVP-36-5) at a concentration of 12,000 µg/m$^3$, exceeding the Commercial/Industrial ESL of 260 µg/m$^3$;
- 1,4-Dichlorobenzene was detected above screening criteria in four samples at concentrations ranging between 270 (SVP-62-4) and 1,300 (SVP-36-5) µg/m$^3$, exceeding the Commercial/Industrial ESL of 37 µg/m$^3$;
- Benzene was detected above screening criteria in nine samples at concentrations ranging between 22 (SVP-06-5) and 170 (SVP-57-5) µg/m$^3$, exceeding the Commercial/Industrial ESL of 14 µg/m$^3$;
- Chloroform was detected above screening criteria in four samples at concentrations ranging between 19 (SVP-13-5 and SVP-DUP-02) and 34 (SVP-13-8) µg/m$^3$, exceeding the Commercial/Industrial ESL of 18 µg/m$^3$;
- PCE was detected above screening criteria in four samples at concentrations ranging between 270 (SVP-25-5) and 1,100 (SVP-25-8) µg/m$^3$, exceeding the Commercial/Industrial ESL of 67 µg/m$^3$;
- TCE was detected above screening criteria in three samples at concentrations ranging between 130 (SVP-62-4, and SVP-DUP-03) and 250 (SVP-25-8) µg/m$^3$, exceeding the Commercial/Industrial ESL of 100 µg/m$^3$;
- Vinyl chloride was detected above screening criteria in six samples (including one duplicate sample) at concentrations ranging between 41 (SVP-32-8) and 320 (SVP-57-5) µg/m$^3$, exceeding the Commercial/Industrial ESL of 5.2 µg/m$^3$; and
- TPH-g was detected above screening criteria in 10 samples at concentrations ranging between 110,000 (SVP-62-4, and SVP-DUP-03]) and 2,300,000 (SVP-10-8) µg/m$^3$, exceeding the Commercial/Industrial ESL of 83,000 µg/m$^3$.

Concentrations for all other VOCs and TPH-g in active soil vapor samples were below their respective 2019 RWQCB Soil Gas ESLs for potential vapor intrusion risk for Commercial/Industrial land use or do not have an established ESL.

Fixed gases are not compared to any screening criteria; however, the analysis can provide important information regarding the potential for bioattenuation and the quality of the chemical results. Results of the fixed gas analysis are provided in Table 11 and summarized below:

- Carbon dioxide was detected in all soil vapor samples (including duplicates) at concentrations ranging between 0.41% and 17%, above the atmospheric percentage of 0.04%, with the maximum percentage of carbon dioxide observed in vapor sample SVP-13-5;
- Carbon monoxide was not detected above its laboratory reporting limit in any of the soil vapor samples;
- Helium, utilized as a leak detection compound, was not detected at any concentration in any samples except two: helium was detected at 0.36% and 0.39% in samples SVP-10-8 and SVP-36-8,

respectively. The Soil Gas Advisory states that an ambient air leak of up to 5% of the minimum helium concentration is acceptable if quantitative tracer testing is performed by shrouding. During sample collection, helium concentrations were maintained at 20% by volume within the sampling shroud. Given this ground concentration and the leak significance threshold of 5%, helium detected at concentrations below 1% (that is, below 5% of the minimum helium shroud concentration of 20%) are not considered to be significant. Therefore, all active soil vapor results are valid as no unacceptable helium leaks were detected;

- Methane was detected above the laboratory reporting limit in 16 samples ranging between 0.25% (SVP-13-8) and 52% (SVP-13-5 and SVP-DUP-02). Of the 16 samples reporting methane concentrations above the laboratory reporting limit, six sample results exceeded the lower explosive limit of 5% for methane with the maximum detection observed in vapor sample SVP-13-8;
- Nitrogen was detected in all samples ranging between 28% and 91%, both below and above the average atmospheric concentration of nitrogen of 78%; and
- Oxygen was detected in 13 soil vapor samples between 3.2% and 19%, below the average atmospheric concentration of 21%. Concentrations in 12 of the 13 sample detections were above 4%, which is the threshold indicating favorable conditions for bioattenuation under aerobic conditions.

## 5.5 Passive Soil Vapor Analytical Results

Eighteen passive soil vapor samples were collected and analyzed for VOCs, TPH-g, and TPH-d from sixteen passive soil vapor samplers (PSG-10A, PSG-10B, PSG-10C, PSG-10D, PSG-25A, PSG-25B, PSG-25C, PSG-25D, PSG-41A, PSG-41B, PSG-41C, PSG-41D, PSG-62A, PSG-62B, PSG-62C, and PSG-62D) including two duplicate samples (PSG-10A [DUP-1] and PSG-62A [DUP-2]). The following constituents detected in passive soil vapor exceeded their respective applicable screening criteria as discussed in Section 5.1:

- Benzene was detected above screening criteria in three samples at concentrations ranging between 14.3 (PSG-25A) and 25 (PSG-25B) µg/m$^3$, exceeding the Commercial/Industrial ESL of 14 µg/m$^3$;
- Naphthalene was detected above screening criteria in three samples (including one duplicate sample) at concentrations ranging between 16.5 (PSG-62B) and 1,210 (DUP-02) µg/m$^3$, exceeding the Commercial/Industrial ESL of 12 µg/m$^3$;
- PCE was detected above screening criteria in two samples at concentrations of 103 (PSG-10C) and 301 (PSG-62D) µg/m$^3$, exceeding the Commercial/Industrial ESL of 67 µg/m$^3$; and
- TCE was detected above screening criteria in six samples at concentrations ranging between 149 (PSG-62C) and 6,440 (PSG-62D) µg/m$^3$, exceeding the Commercial/Industrial ESL of 100 µg/m$^3$.

Concentrations for all other VOCs, TPH-g, and TPH-d in passive soil vapor samples were below their respective 2019 RWQCB Soil Gas ESLs for potential vapor intrusion risk for Commercial/Industrial land use or do not have an established ESL. The analytical results for VOCs, TPH-g, and TPH-d in passive soil vapor are summarized in Table 12 and shown on Figure 12.

## 5.6 Quality Control/Quality Assurance Samples

Quality assurance/quality control samples (QA/QC) were collected in the form of duplicate soil vapor and groundwater samples collected at a minimum of one field duplicate collected for every 10 investigative samples per distinct media sampled. During this investigation, a total of three groundwater duplicate samples (DUP-1 for P-10, DUP-2 for GW-2-2, and DUP-3 for P-06), three active soil vapor duplicate samples (SVP-DUP-01 for SVP-10-5, SVP-DUP-02 for SVP-13-5, and SVP-DUP-03 for SVP-62-4) and two passive soil vapor samples (DUP-01 for PSG-10A and DUP-02 for PSG-62A) were collected and analyzed to check for

sampling and analytical reproducibility. The calculated relative percent difference (RPD) for 9 of the 64 detected compounds was greater than 50%.

- The RPD between the primary and duplicate groundwater sample results for total chromium, total vanadium, and total zinc in DUP-2 and GW-2-2 were greater than 50%;
- The RPD between the primary and duplicate active soil vapor sample results for n-hexane in SVP-DUP-01 and SVP-10-5 was greater than 50%; and
- The RPD between the primary and duplicate passive soil vapor sample results for o-xylene, p&m-xylene, PCE, toluene, and TCE in DUP-01 and PSG-62A were greater than 50%.

All other duplicate compounds were within an acceptable allowance of differences from the primary groundwater samples and primary soil vapor samples, per the Soil Gas Advisory (DTSC, 2015). Duplicate sample results of groundwater are presented in Tables 7 through Table 10, duplicate results of active soil vapor are presented in Table 11, and duplicate results for passive soil vapor are presented on Table 12.

In addition to duplicate samples collected, field quality QA/QC samples for this event were submitted on a daily basis during soil and groundwater sample collection. QA/QC samples consisted of a daily trip blank and equipment blank. One VOC (4-bromofluorobenzene) was detected in each trip blank and equipment blank at concentrations ranging between 15.2 and 18.4 µg/L. 4-Bromofluorobenzene was detected in all primary and duplicate samples within the same range of the detections in equipment blanks. Additionally, one detection of barium was observed in equipment blank sample EB-052124.

# 6 Discussion

This section discusses conditions at the Site as interpreted from the analytical data and field observations from this DGI. The discussion below is organized by media and analytical groups.

## 6.1 Soil

In anticipation of redevelopment activities at the Site, soil samples were collected on a 150-foot by 150-foot grid, within the proposed utility corridors, and along the perimeter of the Site where bio-swales have been proposed. Soil samples collected during this DGI include depth intervals ranging from 0 and 18.5 feet bgs. A preliminary set of collected samples from each boring were analyzed for specific analytes as detailed in the Work Plan. Where concentrations exceeded screening criteria at the maximum depth interval analyzed, the next deepest interval was analyzed for constituents exceeding screening criteria (if available). Soil analytical results of all samples analyzed are presented on Tables 2 through 6. The following subsections discuss detections exceeding screening criteria for each analytical group.

### 6.1.1 Metals in Soil

Soil samples collected and analyzed from the Site contained concentrations of arsenic, cobalt, copper, lead, and nickel above their respective Construction Worker ESL, Commercial/Industrial ESL, and/or accepted background concentrations for the San Francisco Bay Area. The depth ranges for each metal exceeding screening criteria are as follows:

- Arsenic: 0 to 4 feet bgs;
- Cobalt: 2 to 3 feet bgs;
- Copper: 1 to 3 feet bgs;
- Lead: 0 to 4 feet bgs; and
- Nickel: 0 to 4 feet bgs.

Exceedances of screening criteria for arsenic, lead and nickel were observed across most of the Site to some degree. Cobalt and copper exceedances were limited to single detections across the Site. At six boring locations, detections of arsenic, lead, and/or nickel exceeded screening criteria at the maximum sample depth interval analyzed; however, the deeper samples collected were not analyzed due to laboratory disposal of samples without notice. Exceedances of metals screening criteria in soil are depicted on Figure 7.

### 6.1.2 VOCs in Soil

Concentrations of VOCs exceeding their respective Construction Worker and/or Commercial/Industrial ESLs were detected in a single soil sample from boring P-01. This sample was collected at the groundwater interface downgradient of Pit-01 and within the location of three former 10,000-gallon USTs at the Site. VOCs with concentrations above their respective screening criteria included benzene, ethylbenzene, and naphthalene. Exceedances of VOC screening criteria in soil are depicted on Figure 8.

### 6.1.3 SVOCs in Soil

Concentrations of SVOCs exceeding their respective Construction Worker and/or Commercial/Industrial ESLs were detected in six soil samples. The SVOCs in exceedance of screening levels, and the depths of the detected exceedances, are as follows:

- Benzo(a)pyrene: 0 to 4 feet bgs:
- Benzo(b)fluoranthene: 1 to 2 feet bgs: and
- Dibenz(a,h)anthrancene: 2 to 3 feet bgs.

Exceedances of SVOC screening criteria in soil are depicted on Figure 8.

### 6.1.4 TPH in Soil

Concentrations of TPH fractions exceeding their respective Construction Worker and Commercial/Industrial ESLs were detected in 18 soil samples. TPH fractions in exceedance of screening levels, and the depths of the detected exceedances, are as follows:

- TPH-g (C5-12): 15.5 to 16.5 feet bgs;
- TPH-d (C12-C22): 2 to 16.5 feet bgs; and
- TPH-d (C22-32): 2 to 8 feet bgs.

TPH impacts in soil are present in several areas around the Site. Several exceedances are limited to narrow depth intervals, while some exceedances extend to the maximum depths sampled at individual boring locations, with multiple exceedances through the soil profile. Exceedances of TPH screening criteria in soil are depicted on Figure 8.

### 6.1.5 PCBs in Soil

Concentrations of PCBs above their respective Commercial/Industrial ESLs have been detected in shallow soil in four borings. PCB detections are consistently below Construction Worker ESLs. The PCBs in exceedance of the Commercial/Industrial ESLs, and the depths of the detected exceedances, are as follows:

- PCB-1242: 0 to 1 foot bgs;
- PCB-1254: 0 to 2 feet bgs; and
- PCB-1260: 0 to 3 feet bgs.

PCB exceedances are limited across the Site. Exceedances of PCB screening criteria in soil are depicted on Figure 9.

## 6.2 Groundwater

Roux collected grab groundwater samples at 13 locations (P-01, P-02, P-04, P-06, P-08, P-10, P-11, and GW-1 through GW-6) across the Site, targeting data gaps identified following the 2023 Investigation and the demolition of the above grade structures in 2023. Twelve pits were identified following demolition activities at the Site in 2023 and Roux collected nine grab groundwater samples (P-01, P-02, P-04, P-06, P-08, P-10, and P-11, and two duplicate samples) at locations downgradient of each pit or cluster of closely located pits. A groundwater sample was not collected at location P-03 due to refusal before first encountered groundwater. Eight groundwater samples were collected near well MW-12 (GW-1-1 through GW-4-1, GW-2-2 through GW-4-2, and one duplicate sample) to investigate the presence of vinyl chloride previously detected during quarterly groundwater monitoring events. A groundwater sample was not collected at boring GW-1-2 due to the boring being dry. Additionally, four groundwater samples (GW-5-1, GW-5-2, GW-6-1, and GW-6-2) were collected near previously elevated detections of VOCs in passive soil vapor identified during the 2023 Investigation.

### 6.2.1 Metals in Groundwater

Fourteen out of 21 groundwater samples collected and analyzed during this DGI contained concentrations of dissolved and/or total metals above their respective California and/or Federal MCLs. Metals concentrations, including both total and dissolved metals, in 11 groundwater samples (10 primary and one duplicate) collected in the first encountered water-bearing zone exceeded screening criteria; total metals concentrations in three samples (two primary and one duplicate) collected in the second encountered water-bearing zone exceeded screening criteria. Metals with concentrations above screening criteria in each of the water-bearing zones, and the respective sample locations, are as follows:

1st Encountered Water-Bearing Zone:

- Antimony: P-08;
- Arsenic: GW-1, GW-2, GW-3, P-01, P-02, P-08;
- Barium: GW-3, GW-4;
- Beryllium: P-10;
- Cadmium: P-08, P-11;
- Chromium: P-08, P-10;
- Lead: GW-2, GW-3, GW-4, P-08, P-10, P-11, P-12;
- Nickel: P-10; and
- Zinc: P-08.

2nd Encountered Water-Bearing Zone

- Arsenic: GW-2;
- Chromium: GW-2;
- Lead: GW-2; and
- Nickel: GW-2, GW-6.

Most of the exceedances of metals screening criteria were found in the first encountered water-bearing zone. Dissolved metals concentrations did not exceed screening criteria in the second encountered water-bearing zone. Exceedances of metals screening criteria in groundwater are depicted on Figure 10.

### 6.2.2 VOCs in Groundwater

Twelve (nine primary and three duplicate) out of 21 groundwater samples collected and analyzed during this DGI contained VOC concentrations exceeding the California and/or Federal MCLs. A total of 11 groundwater samples (9 primary and two duplicate) in the first encountered water-bearing zone and one sample in the second encountered water-bearing zone contained VOCs at concentrations exceeding screening criteria. VOCs with concentrations above screening criteria in each of the water-bearing zones, and the respective sample locations, are as follows:

1st Encountered Water-Bearing Zone

- 1,1-DCA: P-08;

- 1,1,-DCE: GW-3;
- Benzene: GW-6, P-01, P-08;
- Cis-1,2-DCE: P-06, P-08;
- Ethylbenzene: P-01;
- Naphthalene: GW-6, P-01;
- PCE: P-10, DUP-3;
- Toluene: P-01;
- TCE: P-06, P-10, DUP-3; and
- Vinyl chloride: GW-1, GW-2, GW-3.

2nd Encountered Water-Bearing Zone

- 1,1-DCE: GW-3; and
- Vinyl chloride: GW-3.

Most of the exceedances of VOC screening criteria were found in the first encountered water-bearing zone. Exceedances of VOC screening criteria in groundwater are depicted on Figure 11.

Grab-groundwater sample locations GW-1 through GW-4 were installed to the northwest, west southwest, and south of groundwater monitoring well MW-12, respectively (Figure 11). Vinyl chloride concentrations in groundwater sampled from well MW-12 have ranged from 2.9 to 5.1 µg/L during the last four quarters of groundwater monitoring. Vinyl chloride concentrations in grab-groundwater samples GW-1, GW-2, and GW-3 were 1.26 to 47.4 µg/L, which are similar to the range of concentrations measured in well MW-12. Vinyl chloride was not detected in grab-groundwater samples collected from location GW-4.

### 6.2.3 TPH in Groundwater

Fourteen (12 primary and 2 duplicate) out of 21 groundwater samples collected and analyzed during this DGI contained concentrations of one or more TPH fractions exceeding the California and/or Federal MCLs. Twelve groundwater samples (11 primary and one duplicate) in the first encountered water-bearing zone and two samples (1 primary and 1 duplicate) in the second encountered water-bearing zone contained TPH concentrations exceeding screening criteria. TPH with concentrations above screening criteria in each of the water-bearing zones, and the respective sample locations, are as follows:

1st Encountered Water-Bearing Zone

- TPH-g: GW-6, P-01;
- TPH-d (C12-C22): GW-2, GW-3, GW-4, GW-5, GW-6, P-01, P-02, P-06, P-08; and
- TPH-d (C22-C32): GW-1, GW-2, GW-3, GW-4, GW-5, P-01, P-02, P-06, P-08, P-11.

2nd Encountered Water-Bearing Zone

- TPH-d (C12-C22): GW-2; and
- TPH-d (C22-C32): GW-2.

Most of the exceedances of TPH screening levels in groundwater are found in the first encountered water-bearing zone downgradient of former USTs and existing pits. TPH exceedances in the second encountered water-bearing zone are limited to one location, GW-2 (primary and duplicate samples). Exceedances of TPH screening levels in groundwater are depicted on Figure 11.

## 6.3 Active and Passive Soil Vapor

Roux collected 21 active and 18 passive soil vapor samples (including duplicates) to delineate and confirm previous VOC detections in soil vapor and assess potential bio-attenuation conditions in the subsurface at the Site. Active soil vapor samples were collected from depths between 4 and 8 feet bgs; passive soil vapor samples were collected at approximately 1.0 foot bgs. All soil vapor samples were analyzed for VOCs and TPH-g; active soil vapor samples were also analyzed for fixed gasses (carbon dioxide, carbon monoxide, helium, methane, nitrogen, and oxygen). VOCs with concentrations above screening criteria, and the respective samples, are as follows:

- 1,1-DCA: SVP-36-5;
- 1,4-dichlorobenzene (DCB): SVP-36-5, SVP-36-8 SV-62-4;
- Benzene: SVP-06-5, SVP-13-5, SVP-32-8, SVP-36-8, SVP-53-5, SVP-57-5, SVP-62-4, PSG-25A, PSG-25B, PSG-62A;
- Chloroform: SVP-13-5, SVP-13-8, SVP-25-5,
- Naphthalene: PSG-62B, DUP-02, PSG-62A;
- PCE: SVP-10-5, SVP-25-5, SVP-25-8, PSG-10C, PSG-62D;
- TCE: SVP-25-8, SV-62-4, PSG-41B, PSG-41C, PSG-41D, PSG-62B, PSG-62C, PSG-62D;
- Vinyl chloride: SVP-32-8, SVP-36-5, SVP-45-5, SVP-57-5, SVP-62-4; and
- TPH-g: SVP-10-8, SVP-13-5, SVP-25-5, SVP-36-5, SVP-36-8, SVP-53-5, SVP-57-5, SVP-62-4.

The following discussion presents the delineation of VOCs at each previously identified hot spot and the potential for natural bio-attenuation of petroleum-related compounds (benzene and TPH-g) near the active soil vapor sampling locations sampled during this DGI. Exceedances of VOCs and TPH-g are summarized on Figure 12 and concentration maps of PCE, TCE, benzene, vinyl chloride, and TPH-g concentrations are presented on Figures 13a through 17.

PCE

The highest PCE concentrations in soil vapor had been identified during the 2023 Investigation at passive soil vapor sampling locations PSG-10, PSG-25, and PSG-62. Passive step-out and active soil vapor samples at each of these locations were collected to confirm and delineate PCE in soil vapor, as shown on Figures 13a and 13b.

The active soil vapor sample collected at location SVP-10, coincident with historical location PSG-10, confirmed the presence of elevated PCE concentrations. The passive step-out samples to the north, east, and south delineate the extent of PCE above screening criteria around location SVP-10; however, the PCE concentration in step-out location PSG-10C to the west of location SVP-10 exceeds screening criteria.

The active soil vapor sample collected at location SVP-25, coincident with historical location PSG-25, confirmed the presence of elevated PCE concentrations. The passive step-out samples delineate PCE above

screening criteria in all directions around location SVP-25 because PCE concentrations, when detected, were below screening criteria at all step-out locations.

The active soil vapor sample collected at location SVP-62, coincident with historical location PSG-62, did not contain PCE concentrations above screening levels. The passive step-out samples delineate PCE to the east, north, and west of location SVP-62; however, the PCE concentration in step-out location PSG-62D to the south of location SVP-62 exceeds screening criteria.

No other exceedances of PCE screening criteria in active or passive soil vapor samples were detected at the Site during this DGI. However, the PCE reporting limits for soil vapor samples collected at sample location SVP-36, located to the west of SVP-25, were above PCE screening criteria in soil vapor (Figures 13b).

TCE

The highest TCE concentrations in soil vapor had been identified during the 2023 Investigation at passive soil vapor locations PSG-25, PSG-41, and PSG-62. Passive step-out and active soil vapor samples at each of these locations were collected to confirm and delineate TCE in soil vapor, as shown on Figures 14a and 14b.

At the active soil vapor sample collected at location SVP-25, coincident with historical location PSG-25, the TCE concentration in soil vapor at 5 feet bgs was detected just below the screening criteria while the TCE concentration at 8 feet bgs was detected above screening criteria. TCE was not detected above screening criteria in step-out passive soil vapor samples collected around SVP-25, indicating that the extent of TCE above screening levels has been delineated around location SVP-25.

TCE was not detected above screening criteria in the active soil vapor sample collected at location SVP-41, coincident with historical location PSG-41. However, passive soil vapor samples contain TCE concentrations above screening criteria to the east, south, and west of SVP-41.

The active soil vapor sample collected at location SVP-62, coincident with historical location PSG-62, confirmed the presence of elevated TCE concentrations. TCE was detected above screening criteria in all four step-out passive soil vapor sample locations. The highest TCE concentration was detected in the passive soil vapor sample PSG-62D, to the south of SVP-62.

No other exceedances of TCE screening criteria in active or passive soil vapor samples were detected at the Site during the DGI. However, the TCE reporting limit for the shallow soil-vapor sample collected from active soil vapor sample location SVP-36 was elevated above the TCE screening criteria due to interference related to high TPH-g concentrations in this sample.

Benzene

Results of the 2023 Investigation indicated that benzene exceeded screening criteria in soil vapor across large portions of the Site. Of the 12 active and 16 passive soil vapors sample locations across the Site during the DGI, benzene concentrations at seven active (at 4, 5 and/or 8-feet bgs depth; including two duplicates) and three passive sample locations were equal to or exceeded screening criteria for benzene. The DGI results confirm that benzene is present in soil vapor in most areas of the Site. However, most of the benzene detections are below screening levels and most of the screening-level exceedances are minor (Figures 15a and 15b). Only six benzene detections are greater than two times the screening level of 14 µg/$m^3$.

Figure 15b depicts the DGI soil vapor results with isoconcentrations and heat mapping to demonstrate the estimated extent of benzene concentrations above screening levels around each investigation point.

Vinyl chloride

Vinyl chloride was not detected in soil vapor above its screening criteria during the 2023 Investigation. During the DGI, vinyl chloride was detected above screening criteria at six active soil vapor samples (including one duplicate), primarily at a depth of 4 to 5 feet bgs. However, similar to previous passive soil vapor investigation results, vinyl chloride was not detected above laboratory reporting limits in passive soil vapor samples. Figure 16 depicts the DGI soil vapor results with isoconcentrations to demonstrate the estimated extent of vinyl chloride concentrations above screening levels around each investigation point.

TPH-g

TPH-g was not detected in soil vapor above its screening criteria during the 2023 Investigation. During the DGI, TPH-g was detected above screening criteria in 10 active soil vapor samples (8 primary and 2 duplicates), primarily at a depth of 4 to 5 feet bgs. TPH-g was not detected above screening criteria in any of the passive soil vapor samples analyzed from the Site during the DGI. All TPH-g exceedances of screening criteria were detected within/adjacent to the footprint of the former structures or downgradient of former USTs at the Site.

Bioattenuation Potential for Petroleum-Related Compounds

Bioattenuation potential is evaluated based on the presence of oxygen in the subsurface, among other physical attributes of the Site Conceptual Model at a petroleum release site. Oxygen concentrations above 4% at depths greater than 5 feet bgs generally indicate favorable conditions for bioattenuation of petroleum-related compounds in soil vapor. The DGI provides an initial evaluation of Site-wide subsurface oxygen concentrations. Oxygen concentrations observed across the Site indicate a bioattenuation potential, however, at some locations where concentrations of petroleum-related compounds were detected in exceedance of their respective screening criteria, oxygen in the subsurface appears to have already been consumed via the bioattenuation process. At these locations, concentrations of petroleum compounds exceed acceptable soil-vapor-risk-based limits for their vapor intrusion potential to indoor air, limiting the bioattenuation potential at the Site.

Oxygen data collected at each active soil vapor sampling probe is presented on Table 11 and shown on Figure 12. The oxygen data details the bioattenuation potential for petroleum related compounds detected in soil vapor at the Site. Approximately half of the detections exceeding applicable screening criteria qualify as potential locations where natural bioattenuation of soil vapor impacts can be expected.

# 7 Conclusions and Recommendations

This section presents the conclusions and recommendations based on the results of the DGI.

## 7.1 Soil

In preparation for the anticipated redevelopment of the Site, 267 soil samples were collected and analyzed from across the Site to characterize near-surface soil. Soil samples were analyzed for metals, VOCs, SVOCs, TPH-g/d/mo, and/or PCBs.

Exceedances of applicable screening levels for arsenic, cobalt, lead, nickel, benzene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, ethylbenzene, naphthalene, TPH-g, TPH-d C12-C22, TPH-d C22-32, PCB-1242, PCB-1254, and PCB-1260 were observed in shallow soils at the Site. The exceedances of soil screening criteria are sporadic and relatively minor, except for lead concentrations.

During proposed redevelopment activities for the construction of the 320,000-square-foot warehouse building and associated parking lot at the Site, shallow soil will be reworked and construction workers are likely to be exposed to elevated metals in soil. It is recommended that all soil disturbing activities at the Site be conducted in accordance with the approved Revised Site Management Plan (AB&I, 2011a). Upon completion of redevelopment activities at the Site, the majority of the Site will be covered by the proposed building, concrete, and asphalt, with a thin bio-swale skirting the edges of the Site, as shown in Figure 5. To prevent post-redevelopment exposure of soil impacts within the proposed bio-swales, it is recommended to use geotextile fabric to reduce the exposure of impacted soil during landscaping activities.

The DGI generated a large data set that can be used to evaluate and mitigate risk to construction workers and future commercial/industrial workers at the site. There are sufficient soil data to adequately characterize soil conditions in the planned utility corridors and bio-swales, and that can be used to ensure worker safety. The data collected during this DGI are sufficient to inform waste management decisions. However, additional data may be collected as needed to satisfy landfill requirements and the Revised Site Management Plan.

The nearly complete coverage of the Site with the planned building and paved areas will eliminate direct contact with soil after Site redevelopment is completed. A land use covenant (LUC) will be required for the Site. The LUC and related documents will provide protection for potential receptors through the maintenance of engineering and institutional controls. Additional characterization of soil at the Site would not provide any needed information and, therefore, is not warranted or recommended.

## 7.2 Groundwater

Roux collected groundwater samples at 13 locations (P-01, P-02, P-04, P-06, P-08, P-10, P-11, and GW-1 through GW-6) across the Site and analyzed for total and dissolved metals, VOCs, and TPH with the purpose of targeting data gaps identified following the 2023 Investigation and the demolition of the historical structures in November 2023.

Exceedances of applicable screening criteria for arsenic, barium, beryllium, cadmium, chromium, lead, nickel, zinc, 1,1-DCA, 1,1-DCE, benzene, cis-1,2-DCE, ethylbenzene, naphthalene, PCE, toluene, TCE, vinyl chloride, TPH-g, and TPH-d were detected in groundwater samples collected at the Site. The screening-level exceedances for organic compounds and dissolved metals are relatively minor. The data collected during the DGI and the data collected quarterly from permanent wells provide an adequate characterization of

groundwater conditions at the Site. The existing monitoring wells will continue to be sampled quarterly with the next round scheduled during fourth quarter 2024. No additional groundwater investigations are warranted or recommended.

## 7.3 Soil Vapor

Active and passive soil vapor samples collected during this DGI confirmed the presence of previously detected compounds in soil vapor at the Site, including 1,1-DCE, 1,4-DCB, benzene, chloroform, naphthalene, PCE, TCE, vinyl chloride, and TPH-g. Passive step-out soil vapor samples provided limited delineation of previously detected VOCs. Data collected during this DGI provide delineation of the lateral extent of VOCs in soil vapor, relative to screening criteria.

Based on the soil vapor results of this investigation, Roux recommends the development of a Vapor Intrusion Site Conceptual Model (VICSM) in accordance with ACEHD's Decision Matrix for Development Vapor Intrusion Conceptual Site Model and Vapor Intrusion Risk Classification, dated May 14, 2021. The DGI results provide the data needed to prepare the VICSM. Therefore, no additional soil-vapor investigations are warranted or recommended.

| IDW-WATER | – | | | | | | | • | • | • | | | | | | | | |

Notes:

"•" indicates discrete sample collected from this location and depth and run for the given analysis.

"–" indicates not applicable.

"As" indicates arsenic analysis.

"Co" indicated cobalt analysis.

"Cu" indicates copper analysis.

"ft bgs" indicates feet below ground surface.

"GW" indicates groundwater.

"IDW" indicates investigation-derived waste.

"Pb" indicated lead analysis.

"PID" indicates photoionization detector.

"Ni" indicates nickel analysis.

"~~Strikethrough~~" indicates sample was not collected.

"PCE" indicates tetrachloroethylene.

"TCE" indicates trichloroethylene.

(1) "Sample Depths" indicates approximate feet below current ground surface (ft bgs) of top of sample unless otherwise specified.

(2) "Analyses" indicates laboratory analytical methods as follows:

"TO-3" indicates total petroleum hydrocarbons as gasoline by USEPA Method TO-3.

"TO-15" indicates volatile organic compounds by USEPA Method TO-15.

"Fixed Gases" for soil gas analyses indicates helium, carbon monoxide, carbon dioxide, methane, nitrogen and oxygen by ASTM Method D-1946.

"VOCs" for soil and groundwater analyses indicates Volatile Organic Compounds by USEPA Method 8260B.

"SVOCs" for soil analysis indicates Semi-Volatile Organic Compounds by USEPA Method 8270C.

"CAM 17 Metals" for soil and groundwater analyses indicates the Title 22/CAM 17 list of Metals by USEPA Method 6020. Water samples will be filtered (0.45 micron) and unfiltered.

"TPH g/d/mo" for soil and groundwater analyses indicates Total Petroleum Hydrocarbons as gasoline, diesel and motor oil by USEPA Method 8260B and/or 8015.

"PCBs" for soil analyses indicates Polychlorinated biphenyls by USEPA Method 8082A.

"VOCs, TPH C4-C9, and TPH C10-15" for soil gas analyses indicates chlorinated volatile organic compounds and volatile hydrocarbons by USEPA Method 8260C.

*All borings were continuously logged by a Roux geologist or engineer and screened for VOCs with a photoionization detector (PID). In addition to the scope described above, soil samples were collected at depths where elevated PID readings were observed. Soil samples were not collected below the groundwater interface. Multi-depth grab groundwater samples were collected from co-located borings noted as "1st Encountered GW" and "2nd Encountered GW".

**Notes:**

Yellow shaded concentrations exceed the Construction Worker ESLs or accepted background concentrations.

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Sample not analyzed.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

Metals analyzed by United States Environmental Protection Agency (EPA) Methods 6020/7471A.

mg/kg = Milligrams per kilogram.

NA* = Not analyzed due to lab disposing of sample without notice.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SFBR = San Francisco Bay Region.

B = The same analyte is found in the associated blank.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

O1 = The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.

V = The sample concentration is too high to evaluate accurate spike recoveries.

- = Result biased low due to laboratory quality assurance/quality control issues.

+ = Result biased high due to laboratory quality assurance/quality control issues.

**Notes:**

Yellow shaded concentrations exceed the Construction Worker ESLs or accepted background concentrations.

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Sample not analyzed.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

Metals analyzed by United States Environmental Protection Agency (EPA) Methods 6020/7471A.

mg/kg = Milligrams per kilogram.

NA* = Not analyzed due to lab disposing of sample without notice.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SFBR = San Francisco Bay Region.

B = The same analyte is found in the associated blank.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

O1 = The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.

V = The sample concentration is too high to evaluate accurate spike recoveries.

- = Result biased low due to laboratory quality assurance/quality control issues.

+ = Result biased high due to laboratory quality assurance/quality control issues.

**Notes:**

Yellow shaded concentrations exceed the Construction Worker ESLs or accepted background concentrations.

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Sample not analyzed.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

Metals analyzed by United States Environmental Protection Agency (EPA) Methods 6020/7471A.

mg/kg = Milligrams per kilogram.

NA* = Not analyzed due to lab disposing of sample without notice.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SFBR = San Francisco Bay Region.

B = The same analyte is found in the associated blank.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

O1 = The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.

V = The sample concentration is too high to evaluate accurate spike recoveries.

- = Result biased low due to laboratory quality assurance/quality control issues.

+ = Result biased high due to laboratory quality assurance/quality control issues.

**Notes:**

Yellow shaded concentrations exceed the Construction Worker ESLs or accepted background concentrations.

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Sample not analyzed.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

Metals analyzed by United States Environmental Protection Agency (EPA) Methods 6020/7471A.

mg/kg = Milligrams per kilogram.

NA* = Not analyzed due to lab disposing of sample without notice.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SFBR = San Francisco Bay Region.

B = The same analyte is found in the associated blank.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

O1 = The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.

V = The sample concentration is too high to evaluate accurate spike recoveries.

- = Result biased low due to laboratory quality assurance/quality control issues.

+ = Result biased high due to laboratory quality assurance/quality control issues.

**Notes:**

Yellow shaded concentrations exceed the Construction Worker ESLs or accepted background concentrations.

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Sample not analyzed.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

Metals analyzed by United States Environmental Protection Agency (EPA) Methods 6020/7471A.

mg/kg = Milligrams per kilogram.

NA* = Not analyzed due to lab disposing of sample without notice.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SFBR = San Francisco Bay Region.

B = The same analyte is found in the associated blank.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

O1 = The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.

V = The sample concentration is too high to evaluate accurate spike recoveries.

- = Result biased low due to laboratory quality assurance/quality control issues.

+ = Result biased high due to laboratory quality assurance/quality control issues.

**Notes:**

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Not used

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RSL = Regional Screening Level.

RWQCB = Regional Water Quality Control Board.

USEPA = United States Environmental Protection Agency.

VOCs = Volatile Organic Compounds.

VOCs analyzed by United States Environmental Protection Agency (EPA) Method 8260B.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

**Notes:**

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Not used

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RSL = Regional Screening Level.

RWQCB = Regional Water Quality Control Board.

USEPA = United States Environmental Protection Agency.

VOCs = Volatile Organic Compounds.

VOCs analyzed by United States Environmental Protection Agency (EPA) Method 8260B.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

**Notes:**

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Not used

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligram's per kilogram.

NS = No standard established.

RSL = Regional Screening Level.

RWQCB = Regional Water Quality Control Board.

USEPA = United States Environmental Protection Agency.

VOCs = Volatile Organic Compounds.

VOCs analyzed by United States Environmental Protection Agency (EPA) Method 8260B.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

**Notes:**

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Not used

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RSL = Regional Screening Level.

RWQCB = Regional Water Quality Control Board.

USEPA = United States Environmental Protection Agency.

VOCs = Volatile Organic Compounds.

VOCs analyzed by United States Environmental Protection Agency (EPA) Method 8260B.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

**Notes:**

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Not used

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RSL = Regional Screening Level.

RWQCB = Regional Water Quality Control Board.

USEPA = United States Environmental Protection Agency.

VOCs = Volatile Organic Compounds.

VOCs analyzed by United States Environmental Protection Agency (EPA) Method 8260B.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

**Notes:**

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Not used

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RSL = Regional Screening Level.

RWQCB = Regional Water Quality Control Board.

USEPA = United States Environmental Protection Agency.

VOCs = Volatile Organic Compounds.

VOCs analyzed by United States Environmental Protection Agency (EPA) Method 8260B.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

**Notes:**

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Not used

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RSL = Regional Screening Level.

RWQCB = Regional Water Quality Control Board.

USEPA = United States Environmental Protection Agency.

VOCs = Volatile Organic Compounds.

VOCs analyzed by United States Environmental Protection Agency (EPA) Method 8260B.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

**Notes:**

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Not used

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RSL = Regional Screening Level.

RWQCB = Regional Water Quality Control Board.

USEPA = United States Environmental Protection Agency.

VOCs = Volatile Organic Compounds.

VOCs analyzed by United States Environmental Protection Agency (EPA) Method 8260B.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

**Notes:**

Yellow shaded concentrations exceed the Construction Worker ESLs.

Boxed concentrations exceed the Commercial/Industrial ESLs.

— = Not used.

< = Not detected at or above method detection limit.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.

R = Data rejected for laboratory quality assurance/quality control reasons.

T6 = Sample received past/too close to holding time expiration.

Notes:
Yellow shaded concentrations exceed the Construction Worker ESLs.
Boxed concentrations exceed the Commercial/Industrial ESLs.
-- = Not used.
< = Not detected at or above method detection limit.
Bold = Detected concentration.
ESL = Environmental Screening Level.
ft bgs = Feet below ground surface.
mg/kg = Milligrams per kilogram.
NS = No standard established.
RWQCB = Regional Water Quality Control Board.
SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.
J = The identification of the analyte is acceptable; the report value is an estimate.
J3 = The associated batch quality control was outside the established quality control for precision.
J4 = The associated batch quality control was outside the established quality control for accuracy.
J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.
J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.
R = Data rejected for laboratory quality assurance/quality control reasons.
T8 = Sample received past/too close to holding time expiration.

Notes:

Yellow shaded concentrations exceed the Construction Worker ESLs.

Boxed concentrations exceed the Commercial/Industrial ESLs.

--- = Not used.

< = Not detected at or above method detection limit.

Bold = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.

R = Data rejected for laboratory quality assurance/quality control reasons.

TB = Sample received past/too close to holding time expiration.

Notes:
Yellow shaded concentrations exceed the Construction Worker ESLs.
Boxed concentrations exceed the Commercial/Industrial ESLs.
— = Not used.
< = Not detected at or above method detection limit.
Bold = Detected concentration.
ESL = Environmental Screening Level.
ft bgs = Feet below ground surface.
mg/kg = Milligrams per kilogram.
NS = No standard established.
RWQCB = Regional Water Quality Control Board.
SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.
J = The identification of the analyte is acceptable; the report value is an estimate.
J3 = The associated batch quality control was outside the established quality control for precision.
J4 = The associated batch quality control was outside the established quality control for accuracy.
J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.
J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.
R = Data rejected for laboratory quality assurance/quality control reasons.
T8 = Sample received past/too close to holding time expiration.

Notes:
Yellow shaded concentrations exceed the Construction Worker ESLs.
Red shaded concentrations exceed the Commercial/Industrial ESLs.
— = Not used.
< = Not detected at or above method detection limit.
Bold = Detected concentration.
ESL = Environmental Screening Level.
ft bgs = Feet below ground surface.
mg/kg = Milligrams per kilogram.
NS = No standard established.
RWQCB = Regional Water Quality Control Board.
SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.
J = The identification of the analyte is acceptable; the report value is an estimate.
J3 = The associated batch quality control was outside the established quality control for precision.
J4 = The associated batch quality control was outside the established quality control for accuracy.
J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.
J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.
R = Data rejected for laboratory quality assurance/quality control reasons.
TB = Sample received past/too close to holding time expiration.

Notes:

Yellow shaded concentrations exceed the Construction Worker ESLs.

Boxed concentrations exceed the Commercial/Industrial ESLs.

--- = Not used.

< = Not detected at or above method detection limit.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.

R = Data rejected for laboratory quality assurance/quality control reasons.

T8 = Sample received past/too close to holding time expiration.

Notes:
Yellow shaded concentrations exceed the Construction Worker ESLs.
Boxed concentrations exceed the Commercial/Industrial ESLs.
— = Not rated.
< = Not detected at or above method detection limit.
Bold = Detected concentration.
ESL = Environmental Screening Level.
ft bgs = Feet below ground surface.
mg/kg = Milligrams per kilogram.
NS = No standard established.
RWQCB = Regional Water Quality Control Board.
SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.
J = The identification of the analyte is acceptable; the report value is an estimate.
J3 = The associated batch quality control was outside the established quality control for precision.
J4 = The associated batch quality control was outside the established quality control for accuracy.
J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.
J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.
R = Data rejected for laboratory quality assurance/quality control reasons.
T8 = Sample received past/too close to holding time expiration.

Notes:
Yellow shaded concentrations exceed the Construction Worker ESLs.
Bolded concentrations exceed the Commercial/Industrial ESLs.
--- = Not used.
< = Not detected at or above method detection limit.
**Bold** = Detected concentration.
ESL = Environmental Screening Level.
ft bgs = Feet below ground surface.
mg/kg = Milligrams per kilogram.
NS = No standard established.
RWQCB = Regional Water Quality Control Board.
SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.
J = The identification of the analyte is acceptable; the report value is an estimate.
J3 = The associated batch quality control was outside the established quality control for precision.
J4 = The associated batch quality control was outside the established quality control for accuracy.
J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.
J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.
R = Data rejected for laboratory quality assurance/quality control reasons.
TB = Sample received past/too close to holding time expiration.

Notes:

Yellow shaded concentrations exceed the Construction Worker ESLs.

Boxed concentrations exceed the Commercial/Industrial ESLs.

"--" = Not used.

< = Not detected at or above method detection limit.

Bold = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

NS = No standard established.

RWQCB = Regional Water Quality Control Board.

SVOCs analyzed by United States Environmental Protection Agency (EPA) Method 8270C.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J5 = The sample matrix interfered with the ability to make any accurate determination; spike value is high.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

J7 = Surrogate recovery cannot be used for control limit evaluation due to dilution.

R = Data rejected for laboratory quality assurance/quality control reasons.

TS = Sample received past/too close to holding time expiration.

**Notes:**

Yellow shaded concentrations exceed the Construction Worker ESLs.

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Sample not analyzed.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

RWQCB = Regional Water Quality Control Board.

Total Petroleum Hydrocarbons analyzed be United States Environmental Protection Agency (EPA) Method 8015.

TPH-g = Total Petroluem Hydrocarbons as gasoline.

TPH-d = Total Petroluem Hydrocarbons as diesel.

TPH-mo = Total Petroluem Hydrocarbons as motor oil.

B = Analyte also detected in the laboratory blank.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

Q = Sample was prepared and/or analyzed past holding time as defined in the method. Concentrations should beconsidered minimum values.

T8 = Sample received past/too close to holding time expiration.

V = The sample concentration is too high to evaluate accurate spike recoveries.

- = Result biased low due to laboratory quality assurance/quality control issues

+ = Result biased high due to laboratory quality assurance/quality control issues

**Notes:**

Yellow shaded concentrations exceed the Construction Worker ESLs.

Boxed concentrations exceed the Commercial/Industrial ESLs.

< = Not detected at or above method detection limit.

— = Sample not analyzed.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

ft bgs = Feet below ground surface.

mg/kg = Milligrams per kilogram.

RWQCB = Regional Water Quality Control Board.

Total Petroleum Hydrocarbons analyzed be United States Environmental Protection Agency (EPA) Method 8015.

TPH-g = Total Petroluem Hydrocarbons as gasoline.

TPH-d = Total Petroluem Hydrocarbons as diesel.

TPH-mo = Total Petroluem Hydrocarbons as motor oil.

B = Analyte also detected in the laboratory blank.

J = The identification of the analyte is acceptable; the report value is an estimate.

J3 = The associated batch quality control was outside the established quality control for precision.

J6 = The sample matrix interfered with the ability to make any accurate determination; spike value is low.

Q = Sample was prepared and/or analyzed past holding time as defined in the method. Concentrations should beconsidered minimum values.

T8 = Sample received past/too close to holding time expiration.

V = The sample concentration is too high to evaluate accurate spike recoveries.

- = Result biased low due to laboratory quality assurance/quality control issues

+ = Result biased high due to laboratory quality assurance/quality control issues

**Notes:**

Yellow shaded concentrations exceed the California MCLs.

Boxed concentrations exceed the Federal MCLs.

< = Not detected at or above method detection limit.

**Bold** = Detected concentration.

MCL = Maximum Contaminant Level.

Metals analyzed by United States Environmental Protection Agency (EPA) Methods 6020/7471A.

NA = Not applicable.

NS = No standard established.

USEPA = United States Environmental Protection Agency.

µg/l = Micrograms per liter.

J = The identification of the analyte is acceptable; the report value is an estimate.

O1 = The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference,matrix interference.

J6 = The sample matrix interfered with the ability to make an accurate determination; spike value is low.

- = Result biased low due to laboratory quality assurance/quality control issues.

[1]First and second water-bearing zones were identified by Rouxs' field geologist based on moisture content observations from drill cuttings and the identification aquicludes (i.e., low permeability silts and clays) separating saturated material.

[2]Title 22 Chapter 12 California and Federal MCLs for Regulated Drinking Water Contaminants. October 2018.

[3]DUP-2 is the duplicate sample of GW-2-2.

[4]DUP-3 is the duplicate of sample P-06.

[5]DUP-1 is the duplicate of sample P-10.

**Notes:**

Yellow shaded concentrations exceed the ESLs Direct Exposure - MCL Priority.

Boxed concentrations exceed the minimum of the Cancer and Non-Cancer ESLs GW VI – Commercial/Industrial.

< = Not detected at or above method detection limit.

**Bold** = Detected concentration.

EB = Equipment Blank.

ESL = Environmental screening level.

ft bgs = feet below ground surface.

MCL = Maximum contaminant level.

NA = Not applicable.

NS = No standard established.

TB = Trip Blank.

VI = Vapor Intrusion.

VOC = Volatile organic compound.

VOCs analyzed by Environmental Protection Agency Method 8260B.

µg/l = Micrograms per liter.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J = The identification of the analyte is acceptable, the report value is an estimate.

[1] First and second water-bearing zones were identified by Rouse' field geologist based on moisture content observations from drill cuttings and the identification equitards (i.e., low permeability silts and clays) separating saturated material.

[2] San Francisco Bay Regional Water Quality Control Board (RWQCB). 2019. Environmental Screening Levels (ESLs): Groundwater Direct Exposure, Human Health Risk Levels (Table GW-1), MCL Priority, January 2019.

[3] San Francisco Bay Regional Water Quality Control Board (RWQCB). 2019. Environmental Screening Levels (ESLs): Groundwater Vapor Intrusion: Human Health Risk Levels (Table GW-3). January 2019.

[4] DUP-2 is the duplicate sample of GW-2-2.

[5] DUP-3 is the duplicate of sample P-06.

[6] DUP-1 is the duplicate of sample P-10.

**Notes:**

Yellow shading concentrations exceed the ESLs Direct Exposure - MCL Priority.

Boxed concentrations exceed the minimum of the Cancer and Non-Cancer ESLs GW VI – Commercial/Industrial.

< = Not detected at or above method detection limit.

**Bold** = Detected concentration.

EB = Equipment Blank.

ESL = Environmental screening level.

ft bgs = feet below ground surface.

MCL = Maximum contaminant level.

NA = Not available.

NS = No standard established.

TB = Trip Blank.

VI = Vapor Intrusion.

VOC = Volatile organic compound.

VOCs analyzed by Environmental Protection Agency Method 8260B.

µg/l = Micrograms per liter.

J3 = The associated batch quality control was outside the established quality control for precision.

J4 = The associated batch quality control was outside the established quality control for accuracy.

J = The identification of the analyte is acceptable, the report value is an estimate.

[1] First and second water-bearing zones were identified by Rowe' field geologist based on moisture content observations from drill cuttings and the identification aquicludes (i.e., low permeability silts and clays) separating saturated material.

**Notes:**

Yellow shaded concentrations exceed the minimum of the SFBRWQCB 2019 VI HHRL Commercial/Industrial Cancer and Non-Cancer ESL.

< = Not detected above laboratory reporting limit.

Bold = Detected concentration.

ESL = Environmental Screening Level.

Fixed Gases analyzed by American Society for Testing and Materials (ASTM) Method D1946.

ft bgs = Feet below ground surface.

HHRL = Human Health Risk Level.

NS = No standard established.

SFBRWQCB = San Francisco Bay Regional Water Quality Control Board.

Total Petroleum Hydrocarbons (TPH) analyzed by USEPA Method TO-3.

VI = Vapor Intrusion.

Volatile organic compounds (VOCs) analyzed by United States Protection Agency (USEPA) Method TO-15.

When the applicable state standard applies to mixed isomers and the laboratory reports individual isomers, the total standard is listed for each isomer.

µg/m³ = Micrograms per cubic meter.

%v/v = Percent Volume by Volume.

J = The identification of the analyte is acceptable; the report value is an estimate.

Total Petroleum Hydrocarbons (TPH) analyzed by USEPA Method TO-3.

VI = Vapor Intrusion.

Volatile organic compounds (VOCs) analyzed by United States Protection Agency (USEPA) Method TO-15.

When the applicable state standard applies to mixed isomers and the laboratory reports individual isomers, the total stand.

µg/m³ = Micrograms per cubic meter.

%v/v = Percent Volume by Volume.

J = The identification of the analyte is acceptable; the report value is an estimate.

**Notes:**

Yellow shaded concentrations exceed the minimum of the SFBRWQCB 2019 VI HHRL Commercial/Industrial Cancer and Non-Cancer ESL.

< = Not detected above laboratory reporting limit.

**Bold** = Detected concentration.

ESL = Environmental Screening Level.

HHRL = Human Health Risk Level.

NS = No standard established.

SFBRWQCB = San Francisco Bay Regional Water Quality Control Board.

VI = Vapor Intrustion.

Volatile organic compounds (VOCs) and Total Petroluem Hydrocarbons (TPH) analyzed by United States Protection Agency (USEPA) Method 8260C.

When the applicable state standard applies to mixed isomers and the laboratory reports individual isomers, the total standard is listed for each isomer.

µg/m³ = Micrograms per cubic meter.

J = The identification of the analyte is acceptable; the report value is an estimate.

LEGEND

- Groundwater Sample Location (ID, Elev.)
- Approximate Site Boundary
- Cupola Area
- Proposed Building Footprint
- Former Buildings
- Groundwater Elevation Contour
- Inferred Groundwater Elevation Contour
- Inferred Groundwater Flow Direction

NOTES

1. Aerial Source: Nearmap Imagery (2/23/2024).
2. Groundwater elevations referenced to North American Vertical Datum (NAVD88).
3. i = Approximate hydraulic gradient.
4. 1,1-TCA = 1,1-Trichloroethane
   ft = feet
   gal = gallon
   UST = underground storage tank
5. Groundwater elevation data from MW-16 is excluded from groundwater contouring due to an anomalous groundwater level measurement from this well.
6. Groundwater well gauging data was collected July 2, 2024.
7. All buildings have been demolished as of December 2023.

NOTES

1. Aerial Source: Nearmap Imagery (2/23/2024).
2. All buildings have been demolished as of November 2023.
3. 150' X 150' grid established across the Site.
4. San Francisco Bay Regional Water Quality Control Board (RWQCB), 2019. Environmental Screening Levels (ESLs): Soil Direct Human Exposure (Table S-1): Shallow Soil Exposure. January 2019.
5. Arsenic concentrations are compared to the accepted background concentration for the San Francisco Bay Region as presented in "Establishing Background Arsenic in Soil of The Urbanized San Francisco Bay Region" by Dylan Jacques Duverge, December 2011.
6. All concentrations are in milligrams per kilogram (mg/kg)
7. **Bold** = Detected Concentration.
8. Yellow shaded concentrations exceed the Construction Worker ESLs or accepted background concentrations.
9. + = concentration exceeds the Commercial/Industrial ESLs.
10. <X = Not detected at or above the method detection limit.
11. ft bgs = Feet below ground surface.
12. gal = gallon.
13. NA = Not analyzed.
14. NA* = Not analyzed due to lab disposing of sample without notice.
15. 1,1-TCA = 1,1-Trichloroethane
16. UST = Underground storage tank.

NOTES

1. Aerial Source: Nearmap Imagery (2/23/2024).
2. San Francisco Regional Water Quality Control Board 2019. Environmental Screening Levels (ESLs): Direct Exposure Human Health Risk Levels (table GW-1) MCL Priority. January 2019 (revision 2).
3. San Francisco Regional Water Quality Control Board 2019. ESLs: Groundwater Vapor Intrusion Human Health Risk Levels (table GW-3) Commercial/Industrial. January 2019 (revision 2).
4. All concentrations reported in micrograms per liter (µg/L).
5. Yellow highlighted concentrations indicate an exceedance of the MCL Priority ESLs.
6. + = Concentration exceeds MCL Priority and GW Vapor Intrusion Commercial/Industrial ESLs.
7. All buildings have been demolished as of November 2023.
8. <X = Not detected at or above the method detection limit.
9. Ft bgs = Feet below ground surface.
10. gal = gallon.
11. NS = No standard established.
12. 1,1-DCA = 1,1-Dichloroethane
13. 1,1-DCE = 1,1-Dichloroethene
14. 1,1-TCA = 1,1-Trichloroethane.
15. PCE = Tetrachloroethene.
16. TCE = Trichloroethene.
17. TPH-g = total petroleum hydrocarbon as gasoline
18. TPH-d = total petroleum hydrocarbon as diesel
19. TPH-mo = total petroleum hydrocarbon as motor oil
20. TPH = Total petroleum hydrocarbon.
21. UST = Underground storage tank.
22. VOC = Volatile organic compound.

| Vinyl Chloride | 5.2E+00 |
| TPH Gasoline | 8.3E+04 |

Typical Step-Out Sampling Layout:

NOTES

1. Aerial Source: Nearmap Imagery (2/23/2024).
2. All buildings have been demolished as of November 2023.
3. All concentrations reported in micrograms per cubic meter (µg/m³).
4. < X = Not detected at or above the method detection limit.
5. San Francisco Bay Regional Water Quality Control Board (RWQCB) 2019. Environmental Screening Levels (ESLs): Subslab/ Soil Gas Vapor Intrusion: Human Health Risk Levels (Table SG-1). January 2019 (Revision 2).
6. Yellow highlighted concentration exceeds the Commercial/Industrial ESL for vapor intrusion risk.
7. 1,1-DCE = 1,1-Dichloroethene.
8. 1,4-DCB = 1,4-Dichlorobenzene.
9. DUP = Duplicate sample.
10. Ft bgs = Feet below ground surface.
11. gal = gallon.
12. PCE: Tetrachloroethene.
13. 1,1-TCA = 1,1-Trichloroethane.
14. TCE: Trichloroethene.
15. TPH = total petroleum hydrocarbon.
16. UST = Underground storage tank.
17. VOC = volatile orgnanic compound.

**Works Requesting Permits:**

Borehole(s) for Investigation-Soil and water only-Environmental/Monitorinig Study - 57 Boreholes
Driller: Cascade Environmental - Lic #: 1058336 - Method: DP **Work Total: $4950.00**

**Specifications**

| Permit Number | Issued Dt | Expire Dt | # Boreholes | Hole Diam | Max Depth |
|---|---|---|---|---|---|
| W2024-0330 | 05/17/2024 | 08/18/2024 | 57 | 2.25 in. | 30.00 ft |

**Specific Work Permit Conditions**

1. Backfill bore hole by tremie with cement grout or cement grout/sand mixture. Upper two-three feet replaced in kind or with compacted cuttings. All cuttings remaining or unused shall be containerized and hauled off site. The containers shall be clearly labeled to the ownership of the container and labeled hazardous or non-hazardous.

2. Boreholes shall not be left open for a period of more than 24 hours. All boreholes left open more than 24 hours will need approval from Alameda County Public Works Agency, Water Resources Section. All boreholes shall be backfilled according to permit destruction requirements and all concrete material and asphalt material shall be to Caltrans Spec or County/City Codes. No borehole(s) shall be left in a manner to act as a conduit at any time.

3. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.

4. Applicant shall contact assigned inspector listed on the top of the permit at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.

5. All borehole destruction work requires inspection by ACPWA; Except for special circumstances, all work that requires inspection must be performed during the work hours of 9:00 a.m. to 3:30 p.m., Monday through Friday, except holidays.

6. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of $500.00.

7. Electronic Reporting Regulations (Chapter 30, Division 3 of Title 23 & Division 3 of Title 27, CCR) require electronic submission of any report or data required by a regulatory agency from a cleanup site. Submission dates are set by a Regional Water Board or by a regulatory agency. Once a report/data is successfully uploaded, as required, you have met the reporting requirement (i.e. the compliance measure for electronic submittals is the actual upload itself). The upload date should be on or prior to the regulatory due date.

8. NOTE:
Under California laws, the owner/operator are responsible for reporting the contamination to the governmental regulatory agencies under Section 25295(a). The owner/operator is liable for civil penalties under Section 25299(a)(4) and criminal penalties under Section 25299(d) for failure to report a leak. The owner/operator is liable for civil penalties under Section 25299(b)(4) for knowing failure to ensure compliance with the law by the operator. These penalty provisions do not apply to a potential buyer.

9. Prior to any drilling activities onto any public right-of-ways, it shall be the applicants responsibilities to contact and coordinate a Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits required for that City or to the County and follow all City or County Ordinances. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County a Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained. Provide copies of all approved permits obtained to County inspector prior to starting drilling.

10. Permit is valid only for the purpose specified herein. No changes in construction procedures, as described on this permit application. Boreholes shall not be converted to monitoring wells, without a permit application process.

**Specific Work Permit Conditions**

1. Drilling Permit(s) can be voided/ cancelled only in writing. It is the applicant's responsibility to notify Alameda County

Public Works Agency, Water Resources Section in writing for an extension or to cancel the drilling permit application. No drilling permit application(s) shall be extended beyond ninety (90) days from the original start date. Applicants may not cancel a drilling permit application after the completion date of the permit issued has passed.

2. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.

3. Permittee, permittee's contractors, consultants or agents shall be responsible to assure that all material or waters generated during drilling, boring destruction, and/or other activities associated with this Permit will be safely handled, properly managed, and disposed of according to all applicable federal, state, and local statutes regulating such. In no case shall these materials and/or waters be allowed to enter, or potentially enter, on or off-site storm sewers, dry wells, or waterways or be allowed to move off the property where work is being completed.

4. Prior to any drilling activities, it shall be the applicant's responsibility to contact and coordinate an Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits or agreements required for that Federal, State, County or City, and follow all City or County Ordinances. No work shall begin until all the permits and requirements have been approved or obtained. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County an Traffic Safety Plan for any lane closures or detours planned.

5. No changes in construction procedures or well type shall change, as described on this permit application. This permit may be voided if it contains incorrect information.

6. Applicant shall submit the copies of the approved encroachment permit to this office within 10 days.

7. Applicant shall contact assigned inspector listed on the top of the permit at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.

8. Wells shall have a Christy box or similar structure with a locking cap or cover. Well(s) shall be kept locked at all times. Well(s) that become damaged by traffic or construction shall be repaired in a timely manner or destroyed immediately (through permit process). No well(s) shall be left in a manner to act as a conduit at any time.

9. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of $500.00.

10. Electronic Reporting Regulations (Chapter 30, Division 3 of Title 23 & Division 3 of Title 27, CCR) require electronic submission of any report or data required by a regulatory agency from a cleanup site. Submission dates are set by a Regional Water Board or by a regulatory agency. Once a report/data is successfully uploaded, as required, you have met the reporting requirement (i.e. the compliance measure for electronic submittals is the actual upload itself). The upload date should be on or prior to the regulatory due date.

11. Vapor monitoring wells above water level constructed with tubing maybe be backfilled with pancake-batter consistency bentonite. Minimum surface seal thickness is two inches of cement grout around well box.

Vapor monitoring wells above water level constructed with pvc pipe shall have a minimum seal depth (Neat Cement Seal) of 2 feet below ground surface (BGS). Minimum surface seal thickness is two inches of cement grout around well box. All other conditions for monitoring well construction shall apply.

12. All borehole destruction work requires inspection by ACPWA; Except for special circumstances, all work that requires inspection must be performed during the work hours of 9:00 a.m. to 3:30 p.m., Monday through Friday, except holidays.

### BASIS OF COORDINATES

THE COORDINATES SHOWN HEREON ARE BASED UPON THE CALIFORNIA COORDINATE SYSTEM OF 1983, CCS83, ZONE 3, (2022) IN ACCORDANCE TO THE CALIFORNIA PUBLIC RESOURCES CODE SECTIONS 8801–8819; SAID COORDINATES ARE DETERMINED LOCALLY UPON FIELD–OBSERVED TIES TO THE FOLLOWING CALIFORNIA SURVEYING & DRAFTING SUPPLY REAL TIME NETWORK (C.S.D.S. R.T.N.) CONTINUOUSLY OPERATING REFERENCE STATIONS (C.O.R.S.):

C.S.D.S. C.O.R.S. BR1J:
NORTHING = 2145466.38' EASTING = 6053797.72'

C.S.D.S. C.O.R.S. HM1J:
NORTHING = 2011442.91' EASTING = 5988530.78'

THE COMBINATION FACTOR FOR THIS PROJECT WAS APPLIED AT THE FOLLOWING POINT:
NORTHING = 2099983.38' EASTING = 6071874.61'

MAPPING ANGLE = –1°02'14" SCALE FACTOR = 1.00006633

### BENCHMARK

THE ELEVATIONS SHOWN HEREON ARE BASED UPON NGS POINT PID "HT0281"; ELEVATION 14.20 FEET (NAVD 88) (USGS QUAD 2018).

DESCRIPTION: DESCRIBED BY COAST AND GEODETIC SURVEY 1969 – 0.6 MI NW FROM OAKLAND. 0.6 MILE NORTHWEST ALONG THE SOUTHERN PACIFIC COMPANY RAILROAD FROM THE CROSSING OF 98TH AVENUE AT OAKLAND, 0.1 MILE SOUTHEAST OF THE CROSSING OF 85TH AVENUE, IN THE TOP AND 1.1 FEET NORTHWEST OF THE SOUTHEAST EN D OF THE SOUTHWEST CONCRETE HEAD WALL OF A 36–INCH PIPE CULVERT, 46.6 FEET SOUTHWEST OF THE SOUTHWEST RAIL, 24 1/2 FEET NORTHEAST OF THE CENTER LINE OF RAILROAD AVENUE. ABOUT 1 FOOT LOWER THAN THE RAILROAD TRACK AND 2 1/2 FEET HIGHER THAN THE AVENUE

# APPENDIX H

Laboratory Analytical Reports & Chain-of-Custody Records

| | |
|---|---|
| Date: | September 16, 2024 |
| Project Name: | American Brass and Iron (AB&I) Foundry |
| Laboratory: | Beacon Environmental |
| Lab Job Number: | 7787 |
| Sample Media: | Passive Soil Vapor |
| Samples: | All sample IDs in the report |

Data review was performed for the data package generated by Beacon Environmental for samples collected at American Brass and Iron (AB&I) Foundry at 7825 San Leandro Street in Oakland, CA in April 2024.

The data validation was done in accordance with Department of Defense (DOD)[1][2] United States Environmental Protection Agency (USEPA)[3] [4] validation documents and included the following items:

- Data deliverable completeness
- Laboratory case narratives
- Chain of custody documentation
- Holding times
- Limit of quantification
- Control Samples
    - Blank spiked and trip blanks
    - Method Blanks
    - Field duplicate samples

The items above that have issues potentially affecting data usability are discussed in this report.

**Data Deliverable Completeness**

Complete deliverable data packages were provided by the laboratory, which included reporting forms necessary to validate the reported analytical results. The laboratory followed adequate corrective action processes and all anomalies were discussed in the case narrative. The laboratory submitted all required deliverables. Sample results and related quality control data were received as data sheet (e.g., excel). Electronic data were verified against the laboratory report; no errors were found.

**Laboratory Case Narratives**

The laboratory case narratives included in the report detail how the issue of high concentrations was addressed. Specifically, the narratives explain the corrective actions taken, including the appropriate

[1] USDOD, Environmental Data Quality Workgroup. *Data Validation Guidelines Module 5: Data Validation Procedure for Metals by ICP-MS*. 11/09/2022.
[2] *USDOD, Environmental Data Quality Workgroup. Data Validation Guidelines Module 4: Data Validation Procedure for Organic Analysis by GC*
[3] USEPA. *National Functional Guidelines for Inorganic Superfund Method Data Review.* EPA 542-R-20-006. November, 2020.
[4] USEPA. *National Functional Guidelines for Organic Superfund Method Data Review.* EPA 540-R-20-005.

dilution steps for real samples and considerations for the limit of quantification (LOQ). All necessary adjustments were accounted for to ensure accurate results. The narratives also confirmed that all samples were delivered to the laboratory at the correct temperature, in the proper container, and with the appropriate preservatives.

**Chain of Custody Documentation**

Sample identification (ID) numbers listed on the chain-of-custody record are consistent with the sample ID reported in the Analytical laboratory reports.

**Sample Receipt/Holding Times**

All samples were analyzed within the holding times for the requested analytical methods.

**Limits of Quantitation**

All limits of quantitation (LOQs) are below the project environmental screening levels and all analytes are detectable at concentrations lower than the screening level.

**Quality Control Samples**

The method blanks had no contamination. The relative percent difference (RPD) for lab control sample (LCS) and duplicate (LCSD) was within the recommended limit. The spike recovery rates of all tested samples were within the recommended limit; however, there were some analytes with high spike recovery rates due to matrix interferences but should be accepted because the associated field samples had no detected concentrations.

The table below shows the RPDs for the field primary sample and its respective duplicate collected from sample location PSG-10A. The RPD values presented below indicate that the variability of benzene in passive soil vapor was higher than 20%. Because the concentrations were higher than the LOQ but lower than five times the LOQ and the absolute difference between the primary and duplicate samples is less than the LOQ, the limits for RPDs do not apply based on EPA guidelines[5].

| Analyte | PSG-10A | DUP-01 | RPD (%) | LOQ |
|---|---|---|---|---|
| Benzene | 3.46 | 2.79 | 21.4 | 2.19 |

**Notes:**
All concentrations in micrograms per cubic meter
% = percent
LOQ = Limit of quantitation
RPD = Relative percent difference

The table below shows the PRDs for the field primary and its respective duplicate collected from sample location PSG-62A. The PRD values presented below indicate that the variability of select compounds in passive soil vapor was higher than 20%. Concentrations of benzene, trichloroethene, tetrachloroethene, toluene, p & m-xylene, and o-xylene have an RPD greater than 20%, their concentrations are greater than five times the LOQ, and their absolute differences between primary and duplicate samples are greater than the LOQ. For these reasons, these results should be flagged as estimated (J). Concentrations of cis-1,2-dichloroethene, ethylbenzene, 1,3,5-trimethylbenzene, and total petroleum hydrocarbons C4-C9 in passive soil vapor exceed 20%, however, because the concentrations were higher than the LOQ but lower than five times the LOQ and the absolute difference between the primary and duplicate samples is less than the LOQ, the limits for RPDs do not apply based on EPA guidelines.

[5] USEPA. *National Functional Guidelines for Organic Superfund Method Data Review.* EPA 540-R-20-005.

| Analyte | PSG-62A | DUP-02 | RPD (%) | LOQ |
|---|---|---|---|---|
| Benzene | 18.4 | 5.29 | 111 | 2.23 |
| cis-1,2-Dichloroethene | 1.6 | <0.89 | 57 | 0.89 |
| TCE | 92.1 | 53.9 | 52.3 | 1.43 |
| Toluene | 16.8 | 4.56 | 115 | 2.95 |
| PCE | 54.6 | 21.8 | 85.9 | 1.15 |
| Ethylbenzene | 1.98 | <1.39 | 35 | 1.39 |
| p & m-Xylene | 5.12 | 2.23 | 78.6 | 1.34 |
| o-Xylene | 4.18 | 1.57 | 90.8 | 1.34 |
| 1,3,5-Trimethylbenzene | 5.25 | 4.2 | 22.2 | 1.42 |
| TPH C4-C9 | 763 | <400 | 62.4 | 400 |

**Notes:**
Yellow highlight = RPD and LOQ values exceed acceptable limits. Values should be considered estimates.
All concentrations in micrograms per cubic meter
% = percent
LOQ = Limit of quantitation
PCE = Tetrachloroethene
RPD = Relative percent difference
TCE = Trichloroethene
TPH = Total petroleum hydrocarbons

**Overall Assessment**

Based on high RPDs in samples PSG-62A and DUP-02, concentrations of benzene, benzene, trichloroethene, tetrachloroethene, toluene, p & m-xylene, and o-xylene should be qualified as estimates (J) for these samples.

There were no other issues identified that would require additional qualifiers for the data.

If you have any questions regarding this data validation report, please contact Michael Friedman at 415-967-6000.

## *Case Narrative*

**U.S. EPA Method 8260C**

All samples were analyzed using thermal desorption-gas chromatography/mass spectrometry (TD-GC/MS) instrumentation following U.S. EPA Method 8260C, with laboratory results provided in nanograms (ng) and micrograms per cubic meter ($\mu g/m^3$). Laboratory QA/QC procedures included internal standards, surrogates, and blanks based on EPA Method 8260C. Analyses and reporting were under BEACON's Quality Assurance Project Plan.

**Passive Soil-Gas Survey Notes**

If sample locations are covered with or near the edge of an impervious surface (*e.g.*, asphalt or concrete), the concentrations of compounds in soil gas are higher than if the surfacing was not present. Therefore, the sample location conditions should be considered when comparing results between locations.

Survey findings are exclusive to this project and when the spatial relationships are compared with results of other BEACON Surveys it is necessary to incorporate information from both investigations (*e.g.*, depth to sources, soil types, porosity, soil moisture, presence of impervious surfacing, sample collection times).

**Reporting Limits**

The RLs represent a baseline above which results meet laboratory-determined limits of precision and accuracy. Beacon performed dilution analysis when results exceeded the upper calibration limit, bringing all reported results within the calibration range. The project method quantitation limit (MQL) is the limit of quantitation (LOQ) as noted in the data tables. Beacon determined uptake rates for a suite of compounds with the Beacon sampler for sampling in air. Beacon calculated the uptake rates for the remaining compounds using Graham's Law of Diffusion. The reported data includes LOQ limits.

**Project Details**

Samples were received in proper condition and laboratory control parameters were met unless otherwise noted below. The work performed was in accordance with ISO/IEC 17025:2017, except compounds reported with ∉ are not included in Beacon's scope of accreditation and samples were analyzed within a 24-hour tune window.

Calculations:

$$C = \frac{1000 \times M \times DF}{U \times t}$$

where: C = concentration ($\mu g/m^3$)
M = mass (ng)
DF = dilution factor
t = sampling time (minutes)
U = compound specific uptake rate

[g] = Uptake rate determined using Graham's Law of Diffusion.

## Qualifiers/Notes and Definitions

***General Definitions:***

| | |
|---|---|
| DF | Dilution Factor |
| DL | Detection Limit |
| LOD | Limit of Detection |
| LOQ | Limit of Quantitation |
| NA | Not Applicable |
| Q | Qualifier |
| RPD | Relative Percent Difference |
| RT | Retention Times in Minutes |
| RRT | Evaluation of Relative Retention Times in RRT Units (qualified if outside $\pm$0.06 control limits) |
| VISL | EPA Vapor Intrusion Screening Level |
| 3σ | Uncertainty |
| ∉ | Compound not on scope of accreditation |
| + | values are outside method/contract required QC limits |
| ∅ | Compound not on scope of accreditation and analyzed with a one-point calibration |

***Sample/Sample Receipt Qualifiers and Notes:***

| | |
|---|---|
| D | Dilution required to report within calibration Limits. |
| S4 | Matrix interference caused surrogate recovery outside control limits. |

Special Instructions: Analyze all samples for EPA Method 8260C

| For Lab Use Only | Beacon Job No: 7787 | Beacon Proposal: 240216R01 | Analytical Method: 8260C |
|---|---|---|---|

| | |
|---|---|
| Date: | September 16, 2024 |
| Project Name: | American Brass and Iron (AB&I) Foundry |
| Laboratory: | Enthalpy Analytical |
| Lab Job Number: | 509527 |
| Sample Media: | Active Soil Vapor |
| Samples: | All sample IDs in the report |

Data review was performed for the data package generated by Enthalpy Analytical for samples collected at American Brass and Iron (AB&I) Foundry at 7825 San Leandro Street in Oakland, CA in April 2024, associated with laboratory job number 509527.

The data validation was done in accordance with Department of Defense (DOD)[1,2] and United States Environmental Protection Agency (USEPA)[3,4] validation documents and included the following items:

- Data deliverable completeness
- Laboratory case narratives
- Chain of custody documentation
- Holding times
- Limit of quantification
- Control Samples
    - Blank spiked and blank spiked duplicate
    - Method Blanks
    - Field duplicate samples

The items above that have issues potentially affecting data usability are discussed in this report.

## Data Deliverable Completeness

Complete deliverable data packages were provided by the laboratory, which included reporting forms necessary to validate the reported analytical results. The laboratory followed adequate corrective action processes and all anomalies were discussed in the case narrative. The laboratory submitted all required deliverables. Sample results and related quality control data were received. Electronic data were verified against the laboratory report; no data deliverable completeness issues were identified.

## Laboratory Case Narratives

The laboratory case narrative included in the report detail how the issue of high concentrations were addressed. Specifically, the narrative explains the corrective actions taken, including the appropriate dilution steps for samples and considerations for the limit of quantification (LOQ). All necessary adjustments were accounted for to ensure accurate results. The narrative also confirms that all

1 USDOD, Environmental Data Quality Workgroup. *Data Validation Guidelines Module 5: Data Validation Procedure for Metals by ICP-MS.* 11/09/2022.
2 *USDOD, Environmental Data Quality Workgroup. Data Validation Guidelines Module 4: Data Validation Procedure for Organic Analysis by GC*
3 USEPA. *National Functional Guidelines for Inorganic Superfund Method Data Review.* EPA 542-R-20-006, November, 2020.
4 USEPA. *National Functional Guidelines for Organic Superfund Method Data Review.* EPA 540-R-20-005.

samples were delivered to the laboratory at the correct temperature, in the proper container, and with the appropriate preservatives.

**Chain of Custody Documentation**

Sample identification (ID) numbers and requested analyses listed on the chain-of-custody record are consistent with the sample ID and analyses reported in the analytical laboratory reports.

**Sample Receipt/Holding Times**

All samples were received and analyzed within the holding times for the requested analytical methods.

**Limits of Quantitation**

All LOQs are below the project environmental screening levels and all analytes are detectable at concentrations lower than the screening level.

**Quality Control Samples**

All the blanks had no contamination. The relative percent differences (RPDs) for the blanks spike (BS) and BS duplicate (BSD) were within the recommended limits. The spike recovery rates of all tested samples were within the recommended limits.

The table below shows the PRDs for the field primary and its respective duplicate collected from sample location SVP-10-5. The PRD values presented below indicate that the variability of select compounds in active soil vapor was higher than 20%. Concentrations of benzene-hexane, and total petroleum hydrocarbons (TPH) as gasoline have an RPD greater than 20%, their respective concentrations are greater than five times the LOQ, and their absolute differences between primary and duplicate samples are greater than the LOQ. For these reasons, these results should be flagged as estimated (J).

| Analyte | SVP-10-5 | SVP-DUP-01 | RPD (%) | LOQ |
|---|---|---|---|---|
| Benzene | <2.7 | 10 | 115 | 2.7 |
| n-Hexane | 3.2 | 34 | 165.6 | 3.0 |
| TPH Gasoline | 1,300 | 1,800 | 32.3 | 60 |

Notes:
Yellow highlight = RPD and LOQ values exceed acceptable limits. Values should be considered estimates.
All concentrations in micrograms per cubic meter.
% = percent
LOQ = Limit of quantitation
RPD = Relative percent difference
TPH = Total petroleum hydrocarbon

The table below shows the RPDs for the field primary sample and its respective duplicate collected from sample location PSG-10A. The RPD values presented below indicate that the variability of benzene in passive soil vapor was higher than 20%. Because the concentrations were higher than the LOQ but lower than five times the LOQ and the absolute difference between the primary and duplicate samples is less than the LOQ, the limits for RPDs do not apply based on EPA guidelines.

| Analyte | SVP-62-4 | SVP-DUP-03 | RPD (%) | LOQ |
|---|---|---|---|---|
| Acetone | 77 | 100 | 26 | 57 |

Notes:
All concentrations in micrograms per cubic meter.
% = percent
LOQ = Limit of quantitation
RPD = Relative percent difference

**Overall Assessment**

Based on high RPDs in samples SVP-10-5 and SVP-DUP-01, concentrations of benzene, benzene, n-hexane, and TPH as gasoline should be qualified as estimates (J) for these samples.

There were no other issues that would require additional qualifiers in the data.

If you have any questions regarding this data validation report, please contact Michael Friedman at 415-967-6000.

This data package contains sample and QC results for twenty two air samples, requested for the above referenced project on 06/04/24. The samples were received intact.

**Volatile Organics in Air by MS (EPA TO-15):**

- High ICAL percent RSD (relative standard deviation) was observed for naphthalene in the calibration analyzed 05/09/24 17:52; affected data was qualified with "b".
- No other analytical problems were encountered.

**Volatile Organics in Air GC (ASTM D1946):**

No analytical problems were encountered.

**Volatile Organics in Air GC - TO3 (EPA TO-3M):**

No analytical problems were encountered.

## SAMPLE RECEIPT CHECKLIST

**Section 1: General Info**

Date Received: 6/4/24 Login # 509527 Client: Rose

**Section 2: Shipping / Custody**

Shipping Info: _____

Are custody seals present? ☑ No ☐ Yes If yes, where? ☐ on cooler, ☐ on samples, ☐ on package

Custody seals intact on arrival? ☐ Yes ☐ No ☑ N/A Date: _____ # of seals _____ ☐ Signature ☐ Initials

**Section 3: Condition / Packaging** ***Important*: Notify PM if temperature exceeds 6°C or arrive frozen**

Date Opened 6/4/24 By (print) 6/4/24 (sign) _____

☐ Samples received on ice directly from the field. Cooling process had begun. (if checked, skip temperatures)

If no cooler: Sample Temp (°C): Ambient

How many coolers? 0 Temp (°C): #1:_____ #2:_____ #3:_____ #4:_____ #5:_____ #6: _____

Temperature measured using ☐ Thermometer ID: _____, or IR Gun # ☐ B ☐ C

Type of ice used : ☐ Wet, ☐ Blue/Gel, ☑ None Temperature blank(s) included? ☐ Yes, ☐ No

| **Section 4: Containers / Labels / Samples** | YES | NO | N/A |
|---|---|---|---|
| Were custody papers dry, filled out properly, and the project identifiable? | ✓ | | |
| Were Method 5035 sampling containers present? Transferred to freezer @:_____ | | ✓ | |
| Did all containers arrive unbroken/unopened? | ✓ | | |
| Are there any missing / extra samples? | | ✓ | |
| Are samples in the appropriate containers for indicated tests? | ✓ | | |
| Are sample labels present, in good condition and complete? | ✓ | | |
| Does the container count match the COC? | ✓ | | |
| Do the sample labels agree with custody papers? | | ✓ | |
| Was sufficient amount of sample sent for tests requested? | ✓ | | |
| Did you change the hold time in LIMS for unpreserved VOAs? | | | ✓ |
| Did you change the hold time in LIMS for preserved terracores? | | | ✓ |
| Are bubbles > 6mm present in VOA samples? | | | ✓ |
| Was the client contacted about this delivery? Contacted:_____ By:_____ Date:_____ | | | |

| **Section 5: Preservatives** | YES | NO | N/A |
|---|---|---|---|
| Are the samples appropriately preserved? (if yes, skip the rest of section 5) | | | |
| Did any samples / containers require preservation upon receipt? | | | |
| Did you document your preservative check in the bench book? | | | |

Preservative added:

☐ H2SO4 lot#_____ added to samples_____ Date/Time_____

☐ HCL lot#_____ added to samples_____ Date/Time_____

☐ HNO3 lot#_____ added to samples_____ Date/Time_____

☐ CrVI Buffer lot#_____ added to samples_____ Date/Time_____

**Section 6: Explanations / Comments**

Two samples have ID "SVP-10-5", one identified as "SSS SVP-10-8" by container number.

Sample -001 does not match COC; confirmed by container number

**Date Logged** 6/4/24 **By (print)** [illegible] **(sign)** _____

**Date Labeled** 6/4/24 **By (print)** [illegible] **(sign)** _____

ENTHALPY ANALYTICAL

# SAMPLE ACCEPTANCE CHECKLIST

**Section 1**

Client: Roux Associates  Project: AB&I Foundry

Date Received: 6/5/24  Sampler's Name Present: ☑ Yes ☐ No

**Section 2**

Sample(s) received in a cooler? ☐ Yes, How many? _____ ☑ No (skip section 2)  Sample Temp (°C) (No Cooler): AMB

Sample Temp (°C), One from each cooler: #1: _____ #2: _____ #3: _____ #4: _____

*(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)*

Shipping Information: _____

**Section 3**

Was the cooler packed with: ☐ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: _____ #2: _____ #3: _____ #4: _____

| Section 4 | YES | NO | N/A |
|---|---|---|---|
| Was a COC received? | ✓ | | |
| Are sample IDs present? | ✓ | | |
| Are sampling dates & times present? | ✓ | | |
| Is a relinquished signature present? | ✓ | | |
| Are the tests required clearly indicated on the COC? | ✓ | | |
| Are custody seals present? | ✓ | | |
| If custody seals are present, were they intact? | ✓ | | |
| Are all samples sealed in plastic bags? (Recommended for Microbiology samples) | | | ✓ |
| Did all samples arrive intact? If no, indicate in Section 4 below. | ✓ | | |
| Did all bottle labels agree with COC? (ID, dates and times) | ✓ | | |
| Were the samples collected in the correct containers for the required tests? | ✓ | | |
| Are the containers labeled with the correct preservatives? | | | ✓ |
| Is there headspace in the VOA vials greater than 5-6 mm in diameter? | | | ✓ |
| Was a sufficient amount of sample submitted for the requested tests? | ✓ | | |

**Section 5** Explanations/Comments

**Section 6**

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 6-5-24

| Laboratory: | Pace Analytical Laboratory |
| Sample Delivery Groups (SDG): | L1738627, L1739342, L1739664, L1740224, L1740636, L1740641, L1740668, L1740925, L1741416, L1741491, L1741921, L1742685, L1745043, L1753333, L1754750, L1754913, and L1758292. |
| Sample Media: | Soil and Groundwater |
| Samples: | All sample IDs in the laboratory reports (SDGs) |

Data review was performed for the sample delivery groups (SDGs) generated by Pace Analytical Services, LLC for samples collected at American Brass & Iron (AB&I) Foundry at 7825 San Leandro Street in Oakland, CA in April 2024.

Data validation was done in general accordance with Department of Defense (DOD)[1,2] and United States Environmental Protection Agency (USEPA)[3,4] validation documents and included a review of the following items:

- Data Deliverable Completeness
- Laboratory Case Narratives
- Chain of Custody Documentation
- Sample Receipt/Holding Time
- Limit of Quantification
- Control Samples
  - Method Blanks, Equipment and Trip Blanks (EB and TB)
  - Lab Control Samples/Duplicate (LCS/LCSD)
  - Matrix Spike and Matrix Spike Duplicate (MS/MSD)
  - Field duplicate Samples

The items above that have issues potentially affecting data usability are discussed below for each laboratory SDG and are summarized for all SDGs at the end of this data validation report. For analytes not reported, validation issues are not discussed.

## OVERALL ASSESSMENT

### Data Deliverable Completeness

Complete data package deliverables were provided by the laboratory, which included reporting forms (sample log-in, quality control summaries, definition of terms and qualifiers, etc.) necessary to validate the reported analytical results. The laboratory followed adequate corrective action processes, and most anomalies were discussed in case narratives, and other anomalies are discussed later in this report. The laboratory submitted all required deliverables. Sample results and related quality control data were

1 USDOD, Environmental Data Quality Workgroup. *Data Validation Guidelines Module 5: Data Validation Procedure for Metals by ICP-MS.* 11/09/2022.
2 *USDOD, Environmental Data Quality Workgroup. Data Validation Guidelines Module 4: Data Validation Procedure for Organic Analysis by GC.*
3 USEPA. *National Functional Guidelines for Inorganic Superfund Method Data Review.* EPA 542-R-20-006. November 2020.
4 USEPA. *National Functional Guidelines for Organic Superfund Method Data Review.* EPA 540-R-20-005.

received as portable document format (pdf) files and electronic data deliverable files (e.g., excel). Electronic data were verified against each SDG; no data deliverable completeness issues were identified.

**Laboratory Case Narratives**

The SDGs include laboratory case narratives that confirm all samples were delivered to the laboratory at the correct temperature, in the proper container, with the appropriate preservatives, and address issues encountered during the analytical process. The case narratives discuss the issue of high concentrations. Specifically, the narratives explain the corrective actions taken, including the appropriate dilution steps for samples and considerations for the limit of quantification (LOQ). All necessary adjustments were accounted for to ensure accurate results.

**Chain of Custody Documentation**

Sample identification (ID) numbers and requested analyses listed on the chain-of-custody record are consistent with the sample IDs and analyses reported in the analytical laboratory reports. However, there are discrepancies in some SDGs as follows:

1- For L1739664, one sample, TB-052224, is mistakenly reported twice on the chain of custody, indicating an error in the documentation.

2- For L1740925, one sample, EB-052824, is mistakenly reported twice on the chain of custody, indicating an error in the documentation.

3- For L1741921, several samples are reported in the SDG but are not listed on the chain of custody. These samples are: G/BS-H1-1.0, G/BS-H1-2.0, G/BS-H1-3.0, G/BS-H1-4.0, and G/BS-H1-5.0

**Sample Receipt/Holding Times**

All samples were received intact and within a temperature range of 2° to 6° Celsius. Most samples—except which are listed in Attachment A—were analyzed within the required holding times for the specified analytical methods. The samples listed in Attachment A analyzed by EPA methods 8015 and 8270C exceeded the recommended holding times by one to five days. The concentrations of the analytes for the affected samples should be qualified with noted low bias.

**Limits of Quantitation**

All LOQs are below the project environmental screening levels.

**Quality Control Samples**

1- For **L1740641:**

   a. There was a lower spike recovery rate for the MS/MSD samples for mercury in laboratory batch WG2294965. The associated field samples did not have detected concentrations of mercury. The relative percent differences (RPDs) for the MS/MSD samples within acceptable limits.

2- For **L1740925:**

   a. The spike recovery rate of the LCS/LCSD samples was within the recommended limits. The RPDs for some LCS/LCSD analytes were greater than 20%, however, the associated analytes in the field samples were not detected.

   b. There was a lower spike recovery rate for the MS/MSD samples for mercury in laboratory batches WG2294965 and WG2295935. The associated field samples did not have detected concentrations of mercury in laboratory batch WG2294965 and had detected concentration in laboratory batch WG2295935. Additionally, spike recovery rate of benzidine and hexachlorocyclopentadiene (HCCPD) was very low (<10%) in laboratory

batch WG2299140. The associated field samples concentrations were less than the reporting limit (not detected).

The MS/MSD's RPD for mercury (60.20%) and benzidine (200%) were higher than the acceptable range (20%).

c. The RPDs for the hydrocarbons in the table below were greater than 20%. The concentrations of hydrocarbons were less than five times (5x) the LOQ, and the absolute difference between primary and duplicate samples is less than the LOQ.[5]

| Analyte | P-06 | DUP-3 | RPD (%) | LOQ |
|---|---|---|---|---|
| C22-C32 Hydrocarbons | 268 | 333 | 21.6 | 100 |
| C32-C40 Hydrocarbons | 100 | 199 | 66.2 | 100 |

**Notes:**
All concentrations in micrograms per liter.
% = percent
LOQ = Limit of quantitation
RPD = Relative percent difference

3- For **L1738627**

a. The LCS/LCSD spike recovery rate was higher than the recommended limit, and the associated field samples were not detected. The RPD was higher than the recommended limit (20%), however, concentrations of these analytes in associated field samples were not detected.

b. The MS/MSD spike recovery rates for antimony (in laboratory batches WG2291334 and WG2293711), nickel (WG2291334), and copper (WG2293711) were lower than the recommended limits (80%). For copper (WG2291334), the spike recovery rate was higher than the recommended limit. In laboratory batch WG2294807, the analytes 2,4-dinitrophenol, di-n-octyl phthalate, HCCPD, and n-nitrosodimethylamine, had spike recovery rates lower than 10%. Concentrations of these analytes in associated field samples were not detected.

The RPD of lead (in the laboratory batches WG2291334 and WG2293711) and HCCPD had a higher value than the recommended limit (20%). As noted, HCCPD failed in both MS/MSD spike recovery rate and RPD.

| LCS/LCSD | | | MS/MSD | | |
|---|---|---|---|---|---|
| **Matrix** | **Analyte** | **RPD (%)** | **Matrix** | **Analyte** | **RPD (%)** |
| Soil | Hexachloro-1,3-butadiene | 25.8 | Soil | Lead (WG2291334) | 26.3 |
| Soil | Naphthalene | 24.5 | Soil | HCCPD | 52 |
| Water | n-Butylbenzene | 21.2 | Soil | Lead (WG2293711) | 26.1 |

**Notes:**
% = percent
LCS/LCSD = Laboratory control spike/laboratory control spike duplicate
MS/MSD = Matrix spike/matrix spike duplicate
RPD = Relative percent difference

[5] In accordance with the National Functional Guidelines for both inorganic and organic analytes, duplicate sample concentrations limits may not apply when the sample and duplicate concentrations are less than 5x the Quantitation Limit (QL) due to high statistical variance as concentrations near the LOQ.

4- For **L1739342**

a. The field EB had a concentration of barium (5.29 µg/L).

b. The LCS/LCSD spike recovery rates were lower than the recommended limit for 2-butanone (MEK; in laboratory batches WG2293082 and WG2295400), acetone (WG2293082 and WG2295400), trichlorofluoromethane (WG2293082), 1,2-dichloropropane (WG2293082), 1,2,3-trimethylbenzene (WG2295165), 1,2,4-trimethylbenzene (WG2295165), and 1,3,5-trimethylbenzene (WG2295165). Concentrations of these analytes in associated field samples were not detected. The RPDs for LCS/LCSD for acetone and hexachloro-1,3-butadiene, as listed in the table below, were higher than the recommended limit (20%). Concentrations of these analytes in associated field samples were not detected.

c. The MS/MSD spike recovery rate of barium (in laboratory batch WG2295058), nickel (in laboratory batches WG2295058; WG2295060), antimony (in laboratory batch WG2295060), and zinc (in laboratory batch WG2295060) exceeded the recommended RPD limit (20%). The laboratory batch WG2299534 with the hydrocarbons C12-C22 and C22-C32 and the laboratory batch WG2295239 with benzidine, HCCPD, and phenol, had spike recovery rates lower than 10%.

The RPDs for several analytes (metals in laboratory batch WG2295060, VOC in WG2295242, and hydrocarbons in WG2295239) were greater than the RPD limits (table below). For these metals, the original sample concentrations were greater than 4-times (4x) the spiked concentration and the MS/MSD limits do not apply. [6]

| LCS/LCSD | | | MS/MSD | | |
|---|---|---|---|---|---|
| **Matrix** | **Analyte** | **RPD (%)** | **Matrix** | **Analyte** | **RPD (%)** |
| Soil | Acetone | 23.2 | Soil | Arsenic | 23.9 |
| Soil | Hexchloro-1,3-butadiene | 24.1 | Soil | Barium | 21.7 |
| | | | Soil | Chromium | 41.8 |
| | | | Soil | Nickel | 27.6 |
| | | | Soil | 2,4-Dinitrophenol | 42.8 |
| | | | Soil | 4-Chloro-3-methylphenol | 64.3 |
| | | | Soil | Phenol | 200 |
| | | | Soil | C12-C22 Hydrocarbons | 26.3 |
| | | | Soil | C22-C32 Hydrocarbons | 22.5 |

**Notes:**
% = percent
LCS/LCSD = Laboratory control spike/laboratory control spike duplicate
MS/MSD = Matrix spike/matrix spike duplicate
RPD = Relative percent difference

5- For **L1739664**

a. The LCS/LCSD spike recovery rate was lower than the recommended limit for 1,2,4-trimethylbenzene (in laboratory batch WG2296712) and 1,3,5-trimethylbenzene (in laboratory batch WG2296712). The RPDs in laboratory batch WG2294587 for the analytes list below were higher than 20%.

b. In laboratory batch WG2298678, the MS/MSD spike recovery rate of HCCPD and benzidine was lower than 10%. The RPDs for the listed analytes in the table below were higher than the recommended limit (20%).

[6] USDOD, Environmental Data Quality Workgroup. *Data Validation Guidelines Module 5: Data Validation Procedure for Metals by ICP-MS*

| LCS/LCSD | | | MS/MSD | | |
|---|---|---|---|---|---|
| **Matrix** | **Analyte** | **RPD (%)** | **Matrix** | **Analyte** | **RPD (%)** |
| Soil | Acetone | 69.5 | Soil | Benzo(a)anthracene | 32.7 |
| Soil | Bromomethane | 22.4 | Soil | Benzo(a)pyrene | 37.6 |
| Soil | Dichlorodifluoromethane | 26.3 | Soil | Benzo(b)fluoranthene | 44.1 |
| Soil | Hexachloro-1,3-butadiene | 22.1 | Soil | Benzo(g,h,i)perylene | 35.2 |
| Soil | Vinyl chloride | 20.2 | Soil | Chrysene | 38.7 |
| | | | Soil | HCCPD | 73.7 |
| | | | Soil | Indeno(1,2,3-cd)pyrene | 33.5 |
| | | | Soil | Pyrene | 32.3 |

**Notes:**
HCCPD
% = percent
HCCPD = Hexachlorocyclopentadiene
LCS/LCSD = Laboratory control spike/laboratory control spike duplicate
MS/MSD = Matrix spike/matrix spike duplicate
RPD = Relative percent difference

6- For **L1740224**

a. The LCS/LCSD's RPD for 2,2-Dichloropropane was greater than 20%.

b. MS/MSD spike recovery rate for mercury in laboratory batch WG2293345 was lower than 8%. In laboratory batch WG2296790, the analytes 2,4-dinitrophenol, benzidine, hexachlorobenzene, and HCCPD had spike recovery rates lower than 10%. The RPDs for the MS/MSD for mercury and pyrene were higher than 20%.

c. The surrogate recovery rate of o-Terphenyl in laboratory batch WG2300018 was greater than the recommended limit.

d. The RPDs of groundwater duplicates for mercury, chromium, and zinc (table below) were greater than 20%, and the sample concentrations were higher than 5x LOQ[7]. The RPD of cadmium and nickel (dissolved) in the table below was also higher than 20%, however, the concentrations were lower than 5x LOQ and the absolute difference was less than LOQ.

| Analyte | P-10 (µg/L) | DUP-1 (µg/L) | RPD (%) | LOQ |
|---|---|---|---|---|
| Mercury | 1.32 | 1.68 | 24 | 0.2 |
| Cadmium | 2.22 | 2.74 | 20.97 | 1.0 |
| Chromium | 50.7 | 37.8 | 29.15 | 2.0 |
| Nickel, Dissolved | 5.66 | 4.3 | 27.31 | 2.0 |
| Zinc, Total | 223 | 182 | 20.25 | 25 |

**Notes:**
Yellow highlight = RPD and LOQ values exceed acceptable limits. Values should be considered estimates.
µg/L = micrograms per liter
% = percent
LOQ = Limit of quantitation
RPD = Relative percent difference

7- For **L1740636**

a. The method blank in this laboratory batch WG2296309 had a concentration of barium, dissolved.

b. The LCS/LCSD RPDs for the analytes noted below were greater than 20%.

[7] In accordance with the National Functional Guidelines for both inorganic and organic analytes, duplicate sample concentrations limits may not apply when the sample and duplicate concentrations are less than 5x the Quantitation Limit (QL) due to high statistical variance as concentrations near the LOQ.

| LCS/LCSD | | |
|---|---|---|
| **Matrix** | **Analyte** | **RPD (%)** |
| Water | 1,1,1,2-Tetrachloroethane | 23.8 |
| Water | 1,1,1-Trichloroethane | 21.4 |
| Water | 1,1,2-Trichloroethane | 25.6 |
| Water | 1,1,2-Trichlorotrifluoroethane | 25 |
| Water | 1,2,4-Trichlorobenzene | 20.2 |
| Water | 2,2-Dichloropropane | 30.5 |
| Water | Acetone | 20.7 |
| Water | Benzene | 21.4 |
| Water | Bromoform | 24.4 |
| Water | Bromomethane | 37 |
| Water | Carbon tetrachloride | 21.2 |
| Water | Chloroethane | 42.4 |
| Water | Cis-1,2-Dichloroethene | 22.5 |
| Water | Di-isopropyl ether | 20.9 |
| Water | Dichlorodifluoromethane | 22.4 |
| Water | Isopropylbenzene | 23.7 |
| Water | Naphthalene | 20.4 |
| Water | p-Isopropyltoluene | 21.7 |
| Water | Sec-Butylbenzene | 21 |
| Water | Toluene | 22.6 |
| Water | Trans-1-2-Dichloroethene | 20.2 |
| Water | Trichlorofluoromethane | 23.8 |
| Water | Vinyl chloride | 20.7 |
| Water | Xylenes, total | 20.7 |

**Notes:**
% = percent
LCS/LCSD = Laboratory control spike/laboratory control spike duplicate
RPD = Relative percent difference

c. The surrogate recovery rate of o-Terphenyl in the laboratory batch WG2295250 was lower than the recommended limit.

d. There were 77 analytes for the duplicate pair GW-2-2 and DUP-2 that had RPDs greater than 20%. Eleven of the RPDs were lower than 100% and the remainder were greater than 100%.

8- For **L1741416**

a. The field EB had a detected concentration of barium.

b. LCS/LCSD spike recovery rate was high for a few analytes and the associated field samples were not detected.

c. Antimony in laboratory batch WG2305335 had a higher spike recovery rate than the recommended limit. The spike recovery rate of hydrocarbons in laboratory batch WG2303717 was higher than the recommended limit, and the original sample had a concentration greater than the spiked concentration (i.e., 4x spiked concentration).[8] In laboratory batch WG2303704, the analytes 2,2-oxybis(1-chloropropane), 2,4-dinitrophenol, bis(2-chloroethyl)ether, bis(2-ethylhexyl)phthalate, HCCPD, n-nitrosodi-n-propylamine, and n-nitrosodimethylamine had lower spike recovery rates than the recommended limit. In the same batch, analytes 2,4-dimethylphenol, 2-nitrophenol, benzidine, hexachloroethane, isophorone, and pyrene had higher spike recovery rates than the recommended limit.

[8] In accordance with the National Functional Guidelines for organic analytes, spike recovery limits do not apply when the sample concentration before being spiked is greater than 4x spike concentration.

RPDs of the analytes listed below were higher than 20%. 2,2-oxybis(1-chloropropane), bis(2-chloroethyl)ether, and n-nitrosodi-n-propylamine did not meet the criteria for both MS/MSD spike recovery rate and the RPD.

| MS/MSD | | |
|---|---|---|
| **Matrix** | **Analyte** | **RPD (%)** |
| Soil | Lead | 28.6 |
| Soil | 2,2-Oxybis(1-Chloropropane) | 200 |
| Soil | 2,4-Dichlorophenol | 47.9 |
| Soil | Bis(2-chloroethyl)ether | 200 |
| Soil | n-Nitrosodi-n-propylamine | 200 |

**Notes:**
% = percent
MS/MSD = Matrix spike/matrix spike duplicate
RPD = Relative percent difference

9- For **L1741921**

a. The spike recovery rates and RPDs of the LCS/LCSD were higher for a few analytes, and the associated samples were not detected.

b. In laboratory batch WG2299939, the MS/MSD's spike recovery rates for the metals antimony, lead, zinc, and copper were lower than the recommended limit (80%). In laboratory batch WG2299945, the spike recovery rates of antimony and zinc were higher than the recommended limit. For volatile organic compounds, the spike recovery rates for benzidine (WG2303251), HCCPD (WG2304128), and 2,4-dinitrophenol (WG2304128), were lower than 10%. The RPDs for the analytes listed below were greater than 20%.

| LCS/LCSD | | | MS/MSD | | |
|---|---|---|---|---|---|
| **Matrix** | **Analyte** | **RPD (%)** | **Matrix** | **Analyte** | **RPD (%)** |
| Soil | 1,1,2-Trichlorotrifluoroethane | 24.3 | Soil | Arsenic | 46 |
| Soil | 2-Butanone (MEK) | 29.6 | Soil | Barium | 50.2 |
| Soil | Acetone | 41.1 | Soil | Copper | 31.1 |
| Soil | 1,2,4-Trichlorobenzene | 20.6 | Soil | Lead | 35.7 |
| Soil | Acetone | 37.5 | Soil | Zinc | 47.6 |
| Soil | Acrylonitrile | 20.4 | Soil | Lead | 24.7 |
| Soil | Naphthalene | 23.7 | Soil | Zinc | 22.1 |
| | | | Soil | C22-C32 Hydrocarbons | 27.2 |
| | | | Soil | Benzidine | 200 |
| | | | Soil | 2,4-Dinitrophenol | 200 |
| | | | Soil | HCCPD | 40.3 |

**Notes:**
% = percent
HCCPD = Hexachlorocyclopentadiene
LCS/LCSD = Laboratory control spike/laboratory control spike duplicate
MS/MSD = Matrix spike/matrix spike duplicate
RPD = Relative percent difference

**Overall Assessment**

**a. Method Blanks, EBs, and TBs**

All the SDGs are considered free of contamination. Even though a few laboratory batches in three SDGs (L1739342, L1740636, and L1741416) had a concentration of barium in their respective EB or method blank samples, this background contamination would not affect the reliability of data due to the concentrations of barium of associate field samples was higher than 5 times the concentrations observed in the EB and method blank samples.

No issues were observed with TB samples.

**b. LCS/LCSD**

The LCS/LCSD recovery rate did not meet the recommended limit for some analytes in certain laboratory batches reported in the following SDGs: L1738627, L1739342, L1739664, L1740925, L1741416, L1741921.

i. When the recovery rate was high (for SDGs: L1738627, L1741416, and L1741921), the associated non-detect field samples can be accepted.
ii. When the recovery rate was low (for SDGs: L1739342 and L1739664), the detected concentrations of associated field samples for specific analytes should be noted as low bias, while no detected concentrations of associated field samples and for specific analytes and laboratory batch numbers are recommended to be excluded from the data set.

The RPDs for LCS/LCSD was higher than 20% for some analytes in certain laboratory batches reported in the following SDGs: L1740925, L1738627, L1739342, L1739664, L1740224, L1740636, and L1741921. The associated field samples having detected concentration should be estimated (J), while the associated field samples with no detected concentrations should be accepted.

**c. MS/MSD**

MS/MSD recovery rate did not meet the recommended limit for some analytes in certain laboratory batches reported in the following SDGs: L1740641, L1740925, L1738627, L1739342, L1739664, L1740224, L1741416, and L1741921.

i. Results are acceptable when the MS/MSD recovery rate is high and concentrations were not detected.
ii. When the recovery rate was high, the associated field samples should be estimated with high bias (J+) for detected concentrations.
iii. Results of non-detect when the MS/MSD recovery rate was low should be estimated biased low (J-).
iv. When the MS/MSD recovery rate was low, the associated field samples should be estimated with a low bias (J-).

The RPDs for MS/MSDs were higher than 20% for some analytes in laboratory batches reported in the following SDGs: L1740925, L1738627, L1739342, L1739664, L1740224, L1741416, and L1741921. The associated field samples with detectable concentration should be estimated (J), while the associated field samples with no detectable concentrations should be accepted. However, some analytes did not meet the recommended limit for both spike recovery rate and RPD, and therefore, these analytes should be estimated low bias (J-). There is no action required for some analytes because the original samples concentrations were higher than four times the spiked concentrations[9].

**d. Surrogate recovery rate**

Surrogate recovery rates did not meet the guideline limit for o-Terphenyl in laboratory batches reported for the following two SDGs: L1739664 and L1740636.

i. Because the recovery rate was high in SDG L1739664, the field associated samples should be estimated with a high bias (J+).
ii. In this SDG L1740636, the recovery rate was low and therefore, the associated field samples should be estimated with low bias for detected concentrations. Non-detect values should be estimated (J).

[9] USDOD, Environmental Data Quality Workgroup. *Data Validation Guidelines Module 5: Data Validation Procedure for Metals by ICP-MS.* 11/09/2022.

**e. Field duplicate**

Three groundwater field duplicates were evaluated associated with SDGs: L1740925, L1740224, and L1740636.

i. For L1740925, the limits for RPDs do not apply based on EPA guidelines[10] since the concentration of hydrocarbons was less than LOQ.

ii. For L1740224, the associated samples of mercury, chromium, and zinc should be estimated (J) because the concentration of samples was higher than LOQ. The associated samples of cadmium and nickel (dissolved) should be accepted because the concentration were lower than five times the LOQ and the absolute difference was lower than LOQ.

iii. For L1740636, the high number of analytes with RPDs greater than the acceptable limits suggests that there was non-heterogeneity of the groundwater sampled. The high RPDs between the primary and duplicate samples may be a result of high sediment load in the sample effecting the analytes concentrations.

**Definitions of Roux Validation Data Qualifiers**

| Qualifier | Definition |
|---|---|
| J | The analyte was positively identified; the associated numerical value is an approximate concentration of the analyte in the sample.<br><br>For surrogates or TIC, result is an estimate. |
| J- | Result is an estimate. Low biased |
| J+ | Result is an estimate. High biased |
| R | The sample results should be considered rejected and unusable. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jennifer Gambill
Project Manager

## Report Revision History

Level II Report - Version 1: 07/08/24 16:28
Level II Report - Version 2: 08/16/24 10:41

## Project Narrative

The following report has been revised to include the MDL information.

For the following samples: L1738627-18 and -23, due to the high prevalence of shared congeners between Aroclors 1254 and 1260, and the similarities in chemical properties, only the most prevalent PCB aroclor was quantified for reporting. Quantification and reporting of both PCB aroclors would result in significant high bias error in the sample results.

GeoTracker EDD
