# Accreditation/Certification Summary

Client: EEC Environmental
Job ID: 570-130377-1
Project/Site: Soil Vapor Assessment / Rosemead Holding / PDC

## Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | State | 3082 | 07-31-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 8260B | 5035 | Solid | 1,1,2-Trichloro-1,2,2-trifluoroethane |
| 8260B | 5035 | Solid | 1,1-Dichloropropene |
| 8260B | 5035 | Solid | 1,2,3-Trichlorobenzene |
| 8260B | 5035 | Solid | 1,2,4-Trimethylbenzene |

**Creator: Nguyen, Tina**

**List Source: Eurofins Calscience**

| Question | Answer | Comment |
|---|---|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

## Job Notes

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender and destroy this report immediately. This report shall not be reproduced except in full, without prior express written approval by the laboratory.

The data in the report relate to the field sample(s) as received by the laboratory and associated QC. All results have been reviewed and have been found to be compliant with laboratory and accreditation requirements, with the exception of the noted deviation(s). For questions, please contact the Project Manager.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Case Narrative

Client: EEC Environmental
Job ID: 570-130391-1
Project/Site: Soil Vapor Assessment / Rosemead Holding / PDC

## Job ID: 570-130391-1

### Laboratory: Eurofins Calscience

**Narrative**

**Job Narrative**
**570-130391-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/7/2023 5:10 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.7º C.

**Receipt Exceptions**
The 40ml Terracore vial w/ MeOH was recieved with no methanol for the following sample:
HP-12-10 (570-130391-2)

**GC/MS VOA**
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-310059. The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-310189.The laboratory control sample (LCS) was performed in duplicate (LCSD) to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**VOA Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

# Accreditation/Certification Summary

Client: EEC Environmental
Job ID: 570-130391-1
Project/Site: Soil Vapor Assessment / Rosemead Holding / PDC

## Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | State | 3082 | 07-31-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 8260B | 5035 | Solid | 1,1,2-Trichloro-1,2,2-trifluoroethane |
| 8260B | 5035 | Solid | 1,1-Dichloropropene |
| 8260B | 5035 | Solid | 1,2,3-Trichlorobenzene |
| 8260B | 5035 | Solid | 1,2,4-Trimethylbenzene |
| 8260B | 5035 | Solid | 1,3,5-Trimethylbenzene |
| 8260B | 5035 | Solid | 1,3-Dichloropropane |
| 8260B | 5035 | Solid | 2,2-Dichloropropane |
| 8260B | 5035 | Solid | 2-Butanone |
| 8260B | 5035 | Solid | 2-Chlorotoluene |
| 8260B | 5035 | Solid | 2-Hexanone |
| 8260B | 5035 | Solid | Acetone |
| 8260B | 5035 | Solid | Ethanol |
| 8260B | 5035 | Solid | Isopropylbenzene |
| 8260B | 5035 | Solid | p-Isopropyltoluene |
| 8260B | 5035 | Solid | Vinyl acetate |

# Login Sample Receipt Checklist

Client: EEC Environmental

Job Number: 570-130391-1

**Login Number: 130391**
**List Number: 1**
**Creator: Ortiz-Luis, Michael**

**List Source: Eurofins Calscience**

| Question | Answer | Comment |
|---|---|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

**QUALIFIERS**

B = Detected in the associated Method Blank at a concentration above the routine RL
B1= BOD blank is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution
E = Estimated value
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference
J = Analyte concentration detected between RL and MDL

**ABBREVIATIONS**

DF = Dilution Factor
RL = Reporting Limit
MDL = Method Detection Limit
Qual = Qualifier
Tech = Technician

The data and information on this, and other accompanying documents, represent only the sample(s) analyzed and is rendered upon condition that it is not to be reproduced, wholly or in part, for advertising or other purposes without approval from the laboratory.

**QUALIFIERS**

B = Detected in the associated Method Blank at a concentration above the routine RL
B1= BOD blank is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution
E = Estimated value
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference
J = Analyte concentration detected between RL and MDL

**ABBREVIATIONS**

DF = Dilution Factor
RL = Reporting Limit
MDL = Method Detection Limit
Qual = Qualifier
Tech = Technician

**QUALIFIERS**

B = Detected in the associated Method Blank at a concentration above the routine RL
B1= BOD blank is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution
E = Estimated value
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference
J = Analyte concentration detected between RL and MDL

**ABBREVIATIONS**

DF = Dilution Factor
RL = Reporting Limit
MDL = Method Detection Limit
Qual = Qualifier
Tech = Technician

The data and information on this, and other accompanying documents, represent only the sample(s) analyzed and is rendered upon condition that it is not to be reproduced, wholly or in part, for advertising or other purposes without approval from the laboratory.

**QUALIFIERS**

B = Detected in the associated Method Blank at a concentration above the routine RL
B1= BOD blank is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution
E = Estimated value
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference
J = Analyte concentration detected between RL and MDL

**ABBREVIATIONS**

DF = Dilution Factor
RL = Reporting Limit
MDL = Method Detection Limit
Qual = Qualifier
Tech = Technician

The data and information on this, and other accompanying documents, represent only the sample(s) analyzed and is rendered upon condition that it is not to be reproduced, wholly or in part, for advertising or other purposes without approval from the laboratory.

# ANALYTICAL REPORT

## PREPARED FOR

Attn: Bina Patel
EEC Environmental
One City Blvd
Suite 1800
Orange, California 92868

Generated 4/14/2023 2:45:16 PM Revision 1

## JOB DESCRIPTION

S-3597.04T

## JOB NUMBER

570-134847-1

Eurofins Calscience
2841 Dow Avenue, Suite 100
Tustin CA 92780

See page two for job notes and contact information.

my EOL

## Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Calscience Project Manager.

Job ID: 570-134847-1

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| S1+ | Surrogate recovery exceeds control limits, high biased. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Case Narrative

Client: EEC Environmental
Project/Site: S-3597.04T

Job ID: 570-134847-1

## Job ID: 570-134847-1

### Laboratory: Eurofins Calscience

**Narrative**

**Job Narrative**
**570-134847-1**

**Comments**
No additional comments.

**Revision**
The report being provided is a revision of the original report sent on 4/14/2023. The report (revision 1) is being revised due to: Revised to report in ug/m3.

**Receipt**
The sample was received on 4/13/2023 11:41 AM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 22.0º C.

**Air Toxics**
Method 8260B: Surrogate recovery for the following sample was outside control limits: HP-4-40 (570-134847-1). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

# Detection Summary

## Laboratory: Eurofins Calscience

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | State | 3082 | 07-31-24 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 8260B | | Air | 1,1,1-Trichloroethane |
| 8260B | | Air | 1,1,2,2-Tetrachloroethane |
| 8260B | | Air | 1,1,2-Trichloro-1,2,2-trifluoroethane |
| 8260B | | Air | 1,1,2-Trichloroethane |
| 8260B | | Air | 1,1-Dichloroethane |
| 8260B | | Air | 1,1-Dichloroethene |
| 8260B | | Air | 1,1-Difluoroethane |
| 8260B | | Air | 1,2,4-Trichlorobenzene |
| 8260B | | Air | 1,2,4-Trimethylbenzene |
| 8260B | | Air | 1,2-Dibromoethane |

Client: EEC Environmental

Job Number: 570-134847-1

**Login Number: 134847**
**List Number: 1**
**Creator: Cortez Diaz, Antonio**

**List Source: Eurofins Calscience**

| Question | Answer | Comment |
|---|---|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | False | Thermal preservation not required. |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | N/A | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

**Key:**

ND<X = not detected above the indicated method detection limit (MDL)

DCE = dichloroethene

DCA = Dichloroethane

ft bgs = feet below ground surface

J = Estimated value between the MDL and Reporting Limit

MTBE = Methyl-t-Butyl Ether

PCE = tetrachloroethene

TCE = trichloroethene

TCA = Trichloroethane

USEPA = United States Environmental Protection Agency

VOCs = volatile organic compounds

µg/m³ = micrograms per cubic meter

SFRWQCB = San Francisco Regional Water Quality Control Board

ESL = Environmental Screening Levels

REP = Replicate

DUP = Duplicate

**Notes:**

(1) = Sample results are considered anamalous.

(2) = Sample analyzed by Eurofins Calscience

(3) = SFRWQCB ESLs Subslab/Soil Gas Screening Levels, updated 2019; commercial/industrial shallow soil exposure (cancer risk)

(4) = SFRWQCB ESLs Subslab/Soil Gas Screening Levels, updated 2019; commercial/industrial shallow soil exposure (non-cancer risk)

**BOLD** = Exceeds screening level value

# 1.0 INTRODUCTION

This Interim Soil Contingency and Management Plan (ISCMP) has been prepared by Leighton Consulting, Inc. (Leighton) for Rosemead Holding LLC (Rosemead) to address known and potential environmental impacts and minimize construction delays associated with the Phase 1 redevelopment of the former industrial property located at 2200 North Rosemead Boulevard, California (the site or subject property). As discussed with the LARWQCB on March 17, 2023, the ISCMP is considered an "interim" document because it does not address any vapor intrusion issues at the Site. Rosemead will provide information regarding vapor intrusion mitigation as an Addendum to the ISCMP. Figure 1 is a site location map of the subject property. The site is approximately 5.1-acres and primarily consists of concrete and asphalt pavement with limited areas of exposed soil and vegetation in the southern portion.

As a part of Rosemead's Phase 1 development plans, the buildings on this former industrial site were demolished in January and February 2022 with the pavement left intact. Prior to the demolition (Figure 2), the central, northern, and western portions of the subject property were developed with five buildings; the easternmost buildings were utilized for industrial cleaning activities associated with Ditty Container, Inc. The westernmost buildings were previously used for automotive repair and tire services. The northeast and eastern portions of the subject site were utilized for storage of used metal 55-gallon drums, cubic plastic tote containers, and associated accessories used in the food industry. The southern portion of the site consisted of an asphalt and unpaved lot which was used as storage for truck trailers and shipping containers for the transport of food drums and related items. With the exception of former landscaped areas and portions of the southern site where exposed soil is evident, the vast majority of site is paved.

The proposed land use for the site consists of one three-story building which on the ground floor includes approximately 112,405 square feet (SF) of warehouse space, 8,200 SF of retail space, 1,950 SF of office space, resulting in a building footprint of approximately 122,555 SF. The second floor and mezzanine of the building will have 14,445 SF of warehouse storage space and 8,875 SF of office space. The third floor of the building will have 9,705 SF of office space. The total square footage for the building is approximately 155,580. Only surface parking is planned in the areas peripheral to the Phase 1 development building. The proposed improvements detailed in the Site Plan may be subject to some modifications in the future.

Prior to the commencement of redevelopment activities, the ISCMP will be reviewed and approved by the California Regional Water Quality Control Board, Los Angeles

Region (RWQCB) which is providing regulatory environmental oversight for the project under Site Cleanup Program Oversite Cost Reimbursement Account WIP No. 107.0266 (dated September 27, 2021). Once approved by the RWQCB, the ISCMP will be implemented during construction as a means to address pre-existing and previously undiscovered environmental conditions present in shallow soil onsite.

The site is generally located north of Rush Street and east of Rosemead Boulevard in the City of South El Monte, California (Figure 1). The site incorporates the Los Angeles County AIN parcels: 8102-039-031, 8102-039-035, 8102-039-029, and 8102-039-030 which are being merged by the City of South El Monte into a single lot (Appendix A). The merged parcels are also subject to a City of South El Monte Lot Line Adjustment (Appendix A).

The RWQCB has indicated that potential exposures to the chemicals of concern (COCs) in shallow soil must be protective of (1) the future occupants at the subject property and (2) groundwater. To evaluate risks from the COCs at the site, a Preliminary Endangerment Assessment (Appendix B) was prepared by Enviro-Tox Services, Inc. The purpose of the PEA was to determine if the presence of anthropogenic chemicals in soil at the site represents a threat to current and future site occupants. A copy of the PEA is presented in Appendix B.

The ISCMP is also designed to protect construction workers in the event that soils/materials are encountered that are contaminated by hazardous substances or petroleum products. The ISCMP will also help minimize impacts to construction activities and schedules during the project.

Contractors and subcontractors (hereinafter, contractors) retained by Rosemead for redevelopment purposes will be provided with an electronic copy of the ISCMP and be required to monitor for potential environmental impacts to soil during the demolition of the building slabs/paving and during grading of the subject property. The contractors will be required to attend a “kick-off meeting” onsite prior to initiation of site demolition and grading activities. At the kick-off meeting, key elements of the ISCMP will be explained and contractors, Rosemead’s project personnel, and Rosemead’s environmental consultant will be provided with a contact list identifying individual responsibilities for communications and response should previously unidentified environmental impacts in soil be discovered during site demolition and grading activities. If requested by Rosemead, the City of South El Monte will also be provided with an electronic copy of the ISCMP.

## 2.0 PURPOSE

The procedures described in this ISCMP will facilitate the proper characterization and handling of COC-affected soil that workers are likely to encounter during site redevelopment. Additionally, this ISCMP details procedures if previously unknown historical improvements such as underground storage tanks (USTs), clarifiers, sumps, interceptors, vaults, buried containers (e.g., 55-gallon drums), and/or piping are encountered during site demolition, grading and redevelopment.

Contractors, subcontractors, equipment operators and other personnel working on environmental and activities associated with this project must be Hazardous Waste Operations and Emergency Response (HAZWOPER) trained with up-to-date refresher training. The contractors will be responsible for the health and safety of their respective workers and for properly communicating the presence of suspected COCs to Rosemead and Rosemead's environmental consultant when evidence of such is encountered. Leighton will conduct field screening, soil sampling, characterizing/profiling, dust monitoring (i.e., in compliance with South Coast Air Quality Management District's (SCAQMD) Rules 402, 403, and 1466), VOC monitoring (in compliance with SCAQMD Rule 1166), and coordinating the handling and/or removal of materials affected by hazardous substances and/or petroleum products.

Contractors for the redevelopment project will be provided with a copy of the ISCMP and be required to monitor for potential unidentified environmental concerns in soil during the work. In addition, the contractors will be required to attend a "kick-off meeting" prior to initiation of onsite activities. At the kick-off meeting, key elements of the ISCMP will be explained and a contact list will be provided to identify individuals with responsibilities for communications and response should previously unidentified environmental impacts be discovered during the work. The preparation and implementation of a site-specific Health and Safety Plan (HASP) will be the responsibility of each individual contractor (including the environmental consultant).

Pertinent information relevant to environmental conditions in shallow soil at the site can be obtained from review of Leighton's September 3, 2021 *Report, Limited Soil and Soil Vapor Site Investigation, Rosemead Holding, LLC – Phase I Development 2200 North Rosemead Boulevard South El Monte, California* (Appendix C). Additional information regarding prior soil, soil gas, and groundwater investigations conducted at the site is summarized in Section 4.0 of this ISCMP.

# 3.0 SITE BACKGROUND

## 3.1 Site Description

The information presented in this section was primarily excerpted from the September 3, 2021 Report (Appendix C) prepared by Leighton on behalf of Rosemead, regarding the subject property.

The site is generally located north of Rush Street and east of Rosemead Boulevard in the City of South El Monte, California (see Figure 1). The site includes all or portions of the following Los Angeles County AIN parcels: 8102-039-031, 8102-039-035, 8102-039-029, and 8102-039-030. For the site and as noted, Rosemead has filed for a Lot Merger and Lot Line Adjustment with the City of South El Monte.

The former, now vacated tenants of the various APNs included:

1. the easternmost and most significant portion of the site was occupied by Ditty Container, Inc. (Ditty). Ditty subleased the property from Pacific Coast Drum Company (PCD) from 1996 and has left the site. Both PCD and Ditty cleaned, refurbished, and in some cases, repainted drums and refurbished plastic tote containers since the 1940s, primarily for the food industry.

2. the northwestern-most portion of the site was formerly operated by BJ's Tire Spot and used for tire and truck tire repairs.

3. the two buildings south of BJ's Tire Spot were occupied by DreamWorks Auto Center and were used for auto body repair. Some of the building office space was shared with both Ditty and DreamWorks Auto Center.

   Based on a review of historical documents and aerial photographs, the subject property appears to have the following historical and current land use history:

   - Approximately 1928 through 1948 - Agricultural land use
   - Approximately 1948 through 1959 – Construction equipment storage
   - 1959 - Pacific Coast Drum Company (PCD) develops site and adjoining property to the north as a drum cooperage facility for reconditioning of steel drums primarily used in the food industry

- 1996 to late 2021 – Ditty Container Company, Inc. (drum cleaning and reconditioning); including aboveground/underground storage tanks (AST/UST) and sumps
- 1996 to late 2021 - various auto body shops have occupied the western portion of the subject property
- Early 2022 – Surface demolition of all site buildings has been accomplished. Remaining onsite is the pavement\building slabs; however, limited areas of exposed soil are present in the southeastern portion of the site.
- Late April 2022 – Interim remedial measures associated with a soil vapor extraction (SVE) pilot test are ongoing and have been communicated to the RWQCB as a part of their oversight program.

## 3.2 Geological Description

### 3.2.1 Regional Geology

The proposed development lies within the western portion of the San Gabriel Valley, which is an east-trending, sediment-filled structural trough adjacent to the southern flank of the San Gabriel Mountains. The San Gabriel Mountains are a major component of the Transverse Ranges geomorphic province of California. The Montebello and Puente hills lie southwest and southeast of the site, respectively. These elevated areas are separated by Whittier Narrows, a gap through which the Rio Hondo and San Gabriel rivers pass through. The Rio Hondo River lies less than a mile west of the site. Published geologic maps indicate the site is underlain by Quaternary age young alluvial fan deposits (Dibblee, 1999; Yerkes and Campbell, 2005; Figure 3, *Regional Geology Map*). These deposits typically consist of varying amounts of silt, sand, and gravel layers (Yerkes et al, 1965).

### 3.2.2 Site-Specific Geology

The subject site, approximately 237 feet above mean sea level (AMSL), is located approximately 0.25 miles east of the Rio Hondo River and approximately 2.75 miles west of the San Gabriel River, within the Los Angeles Basin (Basin), a structural trough located within Southern California. The Basin is a northwest-trending lowland plain about 50 miles

long and 20 miles wide with extensive alluviation. Mountains and hills that generally expose Late Cretaceous to Late Pleistocene-age sedimentary and igneous rocks bound the Basin along the north, northeast, east and southeast (Dibblee, Jr., 1999).

The Basin is part of the Peninsular Ranges geomorphic province of California, which is characterized by subparallel blocks sliced longitudinally by young, steeply dipping northwest-trending fault zones. The Basin is a region of active sedimentation, and strata are interpreted to be as much as 31,000 feet thick in the center of the trough.

The near-surface native soils at the subject site are Holocene-age non-marine alluvium comprised of varying proportions of sand, gravel, silt, and clay deposited by the rivers. These deposits are anticipated to be on the order of several hundred feet in thickness, where they are subsequently underlain by thick (several thousands of feet) sequences of sedimentary rock formations (Dibblee, Jr., 1999).

During Leighton's 2021 site investigation, the borings were observed and logged for geologic descriptions. Generally, the soils encountered in the subsurface of the subject property consisted primarily of light brown, brown, or dark brown poorly-graded sand and clay with varied gravel content, sandy clay, silt, silty sand, and clayey sand ranging between two (2) inches and 4.5 feet in thickness.

## 3.3 Hydrogeological Description

### 3.3.1 Regional Hydrogeology

The site is located in the San Gabriel Valley (SGV) Groundwater Basin (Basin Number 4-013) of the South Coast Hydrologic Region. The SGV receives an average annual precipitation between 15 to 31 inches and much of this surface water is drained by the San Gabriel River and its tributaries [CWDR, 2004]. Groundwater flows from the edges to the Rio Hondo and San Gabriel drainages, through the Whittier Narrows, and into the Coastal Plain of Los Angeles Basin.

Groundwater within the SGV basin is primarily calcium bicarbonate in nature [CDWR, 2004]. The SGV Basin has an estimated storage capacity of 10,740,00 acre-feet (ac-ft) of groundwater (includes the Raymond and

Upper Santa Ana Valley Basins), with a maximum thickness of water-bearing alluvial deposits in the central portion of the SGV Basin of about 4,100 ft [CDWR, 2004]. Groundwater in this region is mainly unconfined and, since water adjudication in the 1980s, levels have remained reasonably stable, although up to 95 ft variations in water level in the has occurred historically (CDWR, 2004).

### 3.3.2 Site-Specific Hydrogeology

Groundwater was not encountered in any boring drilled during the soil investigations performed by Leighton in 2021. However, two onsite groundwater monitoring wells, MW-2 and MW-3, were gauged during the June 2021 investigation, and respectively exhibited depths of 47.5 and 45.8 feet below the top of their casings. A few feet of water was present in each well: however, further details of their constructions are unknown. Groundwater elevations have lowered over time and depths to groundwater was reported at approximately 32 to 34 feet below ground surface (bgs) in 2002. In 2020, groundwater was measured at 45 feet bgs in October 2020 (EEC, 2020), and approximately 46 to 48 feet bgs during Leighton's June 2021 investigation.

### 3.3.3 Groundwater Usage

The South Coast Hydrologic Region meets approximately 34% of its agricultural and municipal water demands with groundwater [CDWR, 2013].

Based on the California State Water Resources Control Board's Groundwater Ambient Monitoring and Assessment (GAMA) online database (SWRCB, 2021), there are eleven (11) supply wells within one mile of the site. All of these wells are California Department of Water Resources wells, and only limited information about these wells could be identified.

## 3.4 Relevant Site Investigations and Assessments.

### 3.4.1 Current Pre-Remediation Site Investigations

Leighton reviewed multiple reports prepared by several environmental consultants between the years 1988 to 1998. Many of these documents were prepared in response to regulatory oversight that was conducted by the RWQCB. The RWQCB issued a March 17, 1998 No Further Requirements (NFR) letter to the Former Pacific Coast Drum Company (Appendix D). The NFR letter summarized past activities that were conducted under regulatory oversight at the subject property.

Recent site investigations began in 2020 as part of site acquisition and development. In 2020, EEC conducted soil and groundwater investigations which were summarized in EEC Environmental's October 19, 2020 *Technical Memorandum, Results of Phase II Subsurface Investigation in August and September 2020*. Shallow soil sampling from 33 borings and analytical testing for COCs were performed. Dual nested soil vapor probes were installed and sampled for VOCs in 22 borings at depths of 5 feet bgs and 15 feet bgs. Lastly, four additional soil borings to a depth of 48 feet bgs were installed to collect groundwater samples. All of the analytical test data were compared to the San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (2019) established for a commercial/industrial scenario. EEC's analytical test results are summarized in the Leighton's September 3, 2021 report provided in Appendix C.

EFI Global issued an *Additional Site Characterization Report* which was prepared December 9, 2020. The EFI report also included soil sampling activities that were conducted on the site. EFI advanced 16 soil borings in November 2020 to further characterize and document lead and PCB impacts in soil in the eastern and southern portion of the subject property. The results of EFI's soil investigation are also summarized in Appendix C.

Leighton's review of the historical analytical test data from soil sampling indicates that shallow soil beneath portions of 2200 North Rosemead Boulevard is reported to have been affected by elevated concentrations of lead and PCBs. In addition, soil vapor and groundwater are reported to have been affected by elevated concentrations of VOCs.

The above EEC and EFI analytical test data summarized in Appendix C were evaluated against the following multiple sources of soil screening levels established for a commercial setting: the San Francisco Bay Regional Water Quality Control Board (SFBRWQB) Environmental Screening Levels (ESLs) (January 2019), United States Environmental Protection Agency (US EPA) Regional Screening Levels (RSLs) (May 2020), and the California EPA, Department of Toxic Substances Control Screening Levels (DTSC-SLs) (June 2020). These screening levels were not proposed as remedial goals and are presented in the report solely for context in reviewing areas of the site where COCs may require remediation.

A soil and soil vapor investigation conducted by Leighton from June 18, 2021 through June 29, 2021, further characterized the lateral and vertical extent of CAM-17 metals, PCBs, and VOCs in soil, as well as VOCs in soil vapor, in locations beneath the site not investigated by previous consultants. The investigation included 20 soil borings, with ten (10) of these locations having dual- or multi-nested soil vapor probes also installed, up to a maximum depth of 35 feet bgs. The results of Leighton's soil and soil vapor investigation are provided in Appendix C.

Shallow soil at the site has been adequately characterized. Some metals, TPH, and PCBs were detected in excess of their respective commercial ESLs, but generally are limited to the upper 1 to 3 feet, and are limited to the eastern third of the site. Specific COCs include lead, chromium, and PCBs.

## 4.0 REMEDIAL ACTION GOALS FOR SOIL

As identified in the PEA (Enviro-Tox, November 2022) (Appendix B), the maximum detected concentration or the 95% UCL (whichever was higher) of chemicals detected in soil samples were used identify to chemicals of potential concern (COPCs) for the site. The COPCs were then evaluated to identify which COPCs exceeded risk thresholds to identify COCs for the site. For the COPCs, only lead and Cr VI were identified as COCs where the 95% UCL exceeded the risk threshold for that chemical. In order to reduce the risk to human health and the environment, Leighton proposes to remediate soil in the upper 5 feet of the subsurface in order to reduce the 95% UCL of lead and CR VI to below 320 mg/kg and 55.36 mg/kg, respectively. Additionally, soil with concentrations of any chemicals exceeding the non-RCRA or RCRA based hazardous waste threshold levels for these chemicals will be remediated to minimize the future generation of hazardous waste at the site.

The following Remedial Action Goals (RAGs) are proposed to identify the maximum concentration of COCs that may be reused at the site. Soil with concentrations of COCs equal to and in excess of these limits may be reused if they are treated to reduce the concentration to or below their respective RAG.

- Cr VI – Soil with concentrations causing the 95% UCL to exceed 55.36 mg/kg,
- Cr VI – Soil with concentrations exceeding 5,000 mg/kg,
- Cr VI – Soil with leachable concentrations exceeding 5.0 milligrams per liter (mg/L) using the California Waste Extraction Test (CA-WET) method,
- Lead – Soil with concentrations causing the 95% UCL to exceed of 320 mg/kg.
- Lead – Soil with concentrations exceeding 1,000 mg/kg,
- Lead – Soil with leachable concentrations equal to or exceeding 5.0 mg/L using either the CA-WET or TCLP analytical test methods, and
- All other COCs with concentrations exceeding the regulatory thresholds requiring management as a non-RCRA or RCRA hazardous waste.

# 5.0 SITE REMEDIATION ACTIVITIES FOR KNOWN AND UNKNOWN AREAS OF ENVIRONMENTAL CONCERN

The site remediation activities will involve excavation of areas of COC-affected soil, stockpiling, sampling, profiling and evaluation of COC-affected soil suitable for treatment and reuse onsite or requiring offsite disposal at an appropriate permitted landfill or treatment facility. Additionally, soil confirmation sampling activities are required to evaluate if the soil in excess of the RAGs have been removed. The approximate areas of the site with known concentration of COCs in excess of the RAGs thresholds are shown on Figure 4. An important component of the remedial activities is profiling the soil as expeditiously as possible so that continued redevelopment activities can proceed without significant delay.

## 5.1 Excavation of Known Environmentally Impaired Soils

The known environmentally impaired soils consist of the metal-affected soils located in the eastern portion of the site. The metal-affected soils are roughly distributed in a rectangular area in approximately 390 feet north to south and 180 feet west to east (Figure 4). Within this area are metal-affected soils requiring management as either a non-hazardous, non-RCRA or RCRA hazardous waste (Figure 4). An estimated 28,000 $yd^3$ of soil affected by metals will need to be excavated, managed, sampled and treated and/or disposed of. The metal-affected soils are beneath the existing pavement/building slabs at the site. The following approach should be conducted to address the metal-affected soils requiring removal:

- **Create and Manage Separate Soil Stockpiles Based on Field Observation -** After the removal of the concrete and asphalt pavement and building slabs from the site, underlying soil should be observed for their color and physical evidence of environmental impacts (e.g., metal debris, refuse, odor, VOCs as measured with a calibrated photoionization detector [PID], etc.). Soils that appear discolored or exhibiting physical indications of environmental concern will be stockpiled with soil exhibiting similar characteristics separately from soils that appear to represent background conditions. Review of historical analytical test data from prior soil investigations indicates that that the metal-affected soils are primarily distributed in shallow soil (i.e., less than 3 feet thick) in the eastern one-third of the (Figure 4). As the excavated soil may contain Toxic Air Contaminants (lead and PCBs) as defined by SCAQMD Rule 1466, no stockpile shall

exceed 400 cubic yards ($yd^3$) of soil and be greater in height than the perimeter fencing and windscreen.

- **Create and Manage Separate Soil Stockpiles Based on Existing Soil Sampling Data –** Select areas of the site with previous analytical test data indicating that the soil contains concentrations of COCs that would require management as a non-RCRA or RCRA hazardous waste may be excavated and segregated into stockpiles based on this existing data. It may not be possible to segregate all soil that was previously considered a hazardous waste, and it may be possible that the segregated soil stockpiles are further profiled as a different waste classification than was estimated during the initial soil sampling and testing events.

Based on the concentrations of VOCs detected in the shallow soil sampling data, Leighton does not expect to encounter "VOC contaminated soil", which, as defined by SCAQMD Rule 1166, "is a soil which registers a concentration of 50 [parts per million by volume (ppmv)] or greater of Volatile Organic Compounds as measured before suppression materials have been applied and at a distance of no more than three inches from the surface of the excavated soil with an organic vapor analyzer [OVA] calibrated with hexane." However, if soil is encountered with VOCs measured using a calibrated OVA exceeding 50 ppmv, the excavation of those areas will be conducted in accordance with the requirements of a SCAQMD Rule 1166 various location or site specific plan. In accordance with SCAQMD Rule 1166, the VOCs in soil at the site will need to be monitored under a SCAQMD site Specific Mitigation Plan. If offsite disposal of VOC contaminated soil (if present) is required, information pertinent to the concentrations of VOCs in soil will need to be communicated to permitted landfills to conform to their profiling criteria.

## 5.2 Grading and Construction in Areas Without Known Environmentally Impaired Soils

Following the excavation of the known COC-affected soils, a possibility exists that additional soil affected by COCs above their RAGs may be encountered. Excavation and grading activities at the site in areas outside of those with known environmentally impaired soils will be periodically monitored by a geologist under the direction of a California-Professional Geologist or Professional Engineer. These monitoring activities will consist of visually observing the soil to evaluate for detectable evidence of COC-affected soil, including PID response, odor, discoloration, and staining. Additionally, in the unusual circumstance that

unknown subsurface features may be encountered, monitoring activities will be performed including:

- Visual observation of soil to detect areas that may be affected by metals, PCBs, VOCs, petroleum products or other hazardous substances that were previously not identified.

- Compliance with South Coast Air Quality Management District (SCAQMD) Rule 1166 (Amended May 11, 2001) monitoring during excavation using a PID in accordance with the contractor's SCAQMD permit. The Rosemead contractor is responsible for implementing SCAQMD Rule 1166 and monitoring for "VOC Contaminated Soil" during all excavation activities conducted onsite. According to the SCAQMD, "…*VOC Contaminated Soil is a soil which registers a concentration of 50 ppm or greater of Volatile Organic Compounds as measured before suppression materials have been applied and at a distance of no more than three inches from the surface of the excavated soil with an organic vapor analyzer calibrated with hexane*."

- Due to the presence of Applicable Toxic Air Contaminants (e.g., lead and PCBs) in soil at the site, the Rosemead contractors involved with any earthmoving activities at the site shall comply with SCAQMD Rule 1466, a copy of which is presented in Appendix E of the ISCMP. Detailed information pertinent to Rule 1466 can be found in Section 6.1.5 and in Appendix E, the Air/Dust Monitoring procedures of this ISCMP. Where no impacts by Toxic Air Contaminants have been identified, only general construction requirements are needed.

- If unexpected environmental impacts are encountered, soil sampling and analytical testing will be conducted to evaluate if the soil contains COCs above the RAGs. Freshly exposed soil will be evaluated visually by trained personnel (HAZWOPER trained) using handheld direct reading instruments (e.g., PID) for monitoring VOCs. The contractor will segregate COC-affected stockpiles from non-COC affected stockpiles to avoid mixing.

- During removal activities, concrete and asphalt paving and/or slabs will be observed for evidence of discoloration and segregated from non-discolored material. The discolored concrete may require profiling prior to offsite disposal or for reuse. The permitted landfills should be contacted to assess the profiling procedures for discolored concrete.

- Depending upon the visual, olfactory, and instrument indications, soil samples may be collected for chemical testing at a state-certified laboratory. The test results will be compared to State of California and Federal criteria routinely used for waste classification purposes including the California Code of Regulations, Title 22, Article 11 and for Federal or RCRA waste, 40 CFR parts 260 through 273.

Table 1 below presents a summary of the proposed soil sampling procedures, sample frequency, and test methods. An excavation completion report will include documentation from field monitoring and sampling including laboratory analytical reports and chain-of-custody forms.

**Table 1**
**Sampling and Analysis of Previously Unknown Areas of Potential Environmental Concern for Soil Observed at Rosemead Holding Site during Grading**

| Task | Sample Locations | Frequency | Test Method | Documentation |
|---|---|---|---|---|
| Visual Observation | All surface soil and beneath paving and/or building slabs, subgrade structures (e.g., former clarifiers, sumps, USTs associated piping, etc.). | Continuously as new soil is exposed. | Depending on field indicators or documented historical land uses, one or more of the following laboratory test methods may be selected:<br><br>For newly discovered areas of dark or oil-stained soil, at least one soil sample of the suspected contaminated area and at least one soil sample beneath the observed area of environmental concern (i.e., based on physical observations) will be analyzed for:<br><br>US EPA Method 6000/7000 series (CAM-17 metals), US EPA Method 8260B (VOCs) using USEPA Method 5035 for sample preservation, US EPA Method 8015M (TPH-gasoline/diesel/motor oil), US EPA Method 8270B for semi-volatile organic compounds (SVOCs) and US EPA Method 8081 (PCBs). PCB testing would only be performed if soil appears to have been affected by an oil-like liquid or material (e.g., dielectric fluid or hydraulic oil). After identifying the COCs, additional testing would be limited to the analytes detected, as applicable. | Field logs and schematics identifying locations of stained or discolored or odorous soil not already characterized. Photographs as necessary (e.g., stains larger than 10 square-feet in area). Lab reports and documentation will be included in the excavation completion report. |

| Task | Sample Locations | Frequency | Test Method | Documentation |
|---|---|---|---|---|
| On-Site VOC screening of areas previously not identified | VOC monitoring for VOC Contaminated Soil will occur in previously unidentified areas where suspected petroleum hydrocarbons and/or hazardous substances are observed during demolition and or grading activities. | As per SCAQMD Rule 1166. As soon as possible in the area where the suspected affected soil is observed and as notified by either the contractor or the on-site environmental consultant. | PID or organic vapor analyzer (calibrated with hexane) to measure concentrations of VOCs emanating from the soil. If the instrument reading is greater than 50 parts per million (ppm) equivalents (i.e., VOC Contaminated Soil), collect a soil sample for potential laboratory analysis using EPA method 8260B. | Documentation and notification will be performed in accordance with SCAQMD Rule 1166. Daily headspace logs to record the sample I.D., PID reading, and location.<br><br>If soil is disposed at Simi Valley Landfill (SVL), soil with less than 50 ppm equivalents can be used as daily cover. VOC Contaminated Soil (VOC monitoring of soil exceeding 50 ppm equivalents) will be placed into a separate stockpile and profiled as 1166 Soil which will require disposal at SVL. Soil that exceeds 1,000 ppm equivalents will be identified as +1000 1166 soil prior to transport and disposal at SVL.<br><br>The location of the VOC Contaminated Soil will be plotted on a site map. A data summary will be presented in an end of project report. Lab reports and documentation will be included in the excavation completion report. |
| Soil Sampling and Laboratory Analysis | At locations where soil appears discolored or odorous in areas which have not already been characterized | One soil sample of the affected area and at least one floor sample beneath the affected area where suspected contamination appears to attenuate. | Analyze using one or more of the laboratory tests specified and similar to sampling of stained areas detected discovered during visual observation, if area has not already been characterized. | Field logs identifying locations of stained or discolored soil not already characterized. Photographs as necessary (e.g., stains larger than 10 square-feet in area). Lab reports and documentation will be included in the excavation completion report. |

The table is followed by more detailed information describing the procedures to address areas where soil affected by hazardous substances and/or petroleum products is suspected. These include:

### 5.2.1 Underground Storage Tanks

If a previously unidentified UST is encountered during the site demolition or grading activities, a licensed contractor will be mobilized to the site to conduct UST closure activities. The UST will be exposed, and the contents sampled to evaluate if the UST can be removed. If the UST has not been filled with slurry or other solid material, any residual liquid will be sampled and profiled for disposal, the liquid will be evacuated and transported off site for disposal in accordance with California and federal regulations.

The UST removal will be permitted as required and the UST will be removed in accordance with local and state requirements. The soil underlying the UST will be sampled in a minimum of two locations for TPH, VOCs, and Title 22 Metals. Based on the contents of the UST, and the results of the soil samples, additional soil excavation may be recommended. Leighton will coordinate with the Los Angeles City Fire Department (LACFD) and the RWQCB to collect soil samples to facilitate tank closure activities.

### 5.2.2 Clarifiers and Pits

If a previously unidentified clarifier, pit, or similar feature is encountered during the site demolition or grading activities, the feature will be exposed, and the contents sampled to evaluate if the feature can be demolished and removed. If the feature contains residual liquids, those liquids will be sampled and profiled for disposal. The liquid will be evacuated and transported off site for disposal in accordance with California and federal regulations.

The feature will be permitted if required and demolished and removed in accordance with local and state requirements. The soil underlying the feature will be sampled in a minimum of one location for every 100 square feet of surface area for TPH, VOCs, and Title 22 Metals. Based on the contents of the feature and the results of the soil samples, additional soil excavation may be recommended. Leighton will coordinate with LACFD

and RWQCB personnel to collect soil samples to facilitate closure activities, if required

### 5.2.3 Vertical Features and Structures

If a previously unidentified vertical structure, such as a hydraulic lift or a dry well is encountered during site demolition or grading activities, Leighton will attempt to identify the depth of the structure and if any potentially hazardous materials are associated with the structure. The structure will be removed, and soil samples will be obtained from the nearby soil. A boring will be advanced adjacent to the structure to a minimum of 10 feet below the depth of the structure and soil samples will be collected at five-foot intervals. The soil samples will be analyzed for TPH, semi-volatile organic compounds (SVOCs), and Title 22 Metals. Soil samples will be screened in the field for the presence of VOCs and soil samples may be subsampled in accordance with USEPA Method 5035 and analyzed for VOCs by USEPA Method 8260.

### 5.2.4 Horizontal Features and Structures

If previously unidentified horizontal structures are encountered during site demolition or grading activities, Leighton will sample the underlying soil at a rate of 1 sample per 25 linear feet of the structure, with additional soil samples at identified bends as required. Sewer lines connected to site plumbing are not considered horizontal features for this purpose.

Soil samples will be collected as close as practical under the structure. Additional soil samples may be collected at a second depth up to 7 feet bgs depending on the type of structure. Samples will be analyzed for TPH, VOCs, and Title 22 Metals in the case of liquid fuels lines and other similar structures.

### 5.2.5 Stained, Discolored or Odorous Soils and VOC Contaminated Soils

During demolition and grading activities, if stained, discolored, or odorous soils are encountered, the area will be documented and excavation activities (if ongoing) will be ceased in the area and Leighton will be contacted to evaluate the extent and nature of the potential impacts. Potential sources of stained, discolored or odorous soil include, but are not limited to, VOCs, liquid fuel, machine or other lubricating oils, and other wastes.

For areas of limited extent, the soil will be excavated, stockpiled, and profiled. For areas where the extent of staining exceeds 300 square feet ($ft^2$), the soil may be profiled in place to quantify the COCs and define the limits of a subsequent remedial excavation. Soil stockpiles generated during remedial excavations will managed in accordance with SCAQMD requirements, be less than 400 $yd^3$ in size (only if toxic air contaminants are present as per SCAQMD Rule 1466), be underlain and covered by plastic sheeting (with sand bags for cover stability and a two-feet sheeting overlap) or containerized. Soil samples will be collected of the stockpiled soil to profile the soil for disposal.

Following the remedial excavation, soil samples will be collected from the bottom and sidewalls of the excavated area to document the conditions of the surrounding soil. Samples will be collected at a rate of 1 per 25 linear feet of sidewall with a minimum of one per sidewall. Bottom samples will be collected at a rate of 1 for 100 $ft^2$ of excavation. Soil samples will be analyzed for Title 22 metals, TPH, and SVOCs. For areas with detectable VOC emissions utilizing a PID exceeding 50 ppm equivalents, soil samples will be collected in accordance with USEPA Method 5035 and analyzed for VOCs using USEPA Method 8260B.

### 5.2.6 Visual Observation

During the demolition and grading activities, the exposed soil beneath the building foundations, floors, pavement, and other features will be visually observed. A field log will be maintained and areas of soil staining or sampling will be plotted on a site map to document locations suspected of being affected by hazardous substances or petroleum products, which has not already been characterized. Soil color and associated features (e.g., USTs, machine pits, hydraulic lifts, interceptors, sumps, and clarifiers) will be described on the field log. Any observed discoloration, odor, or other evidence of potential hazardous materials impact will be documented to serve as the basis for further evaluation, as appropriate. A copy of the Field Log Form is attached to this ISCMP.

### 5.2.7 Soil Sampling and Laboratory Testing

Soil samples will be collected when necessary for laboratory analyses to evaluate for the presence of suspected hazardous substances and petroleum products in the soil as per Table 1, above.

### 5.2.8 Soil Sample Collection Procedures

Soil samples to be analyzed for VOCs will be collected in accordance with EPA Method 5035. For soil samples to be analyzed for TPH, metals, SVOCs, or PCBs, the soil can be collected using either a slide-hammer sampler fitted with a stainless-steel sampling sleeve, or the soil can compacted into a pre-cleaned glass jar with minimal headspace. Sampling of newly exposed soil may be facilitated by backhoes, excavators or scrapers. If the slide-hammer sampler is used, the ends of the sample sleeves will be covered with Teflon sheets and capped with plastic end caps. Each soil sample container will be labeled with a unique sample identification number based on the location where the sample was collected. The label will also indicate the date and time when the sample was collected, name of the person handling the sample, and the specific chemical tests being requested from the laboratory. After labeling, the sample will be placed into a properly chilled cooler pending delivery to the analytical laboratory. All soil samples will be documented on a chain-of-custody record. The locations where soil samples are collected will be plotted on the site map and recorded in the field log.

### 5.2.9 Laboratory Analysis Selection

When suspect soils must be tested for waste profiling purposes, soil samples will be submitted to a certified environmental laboratory (mobile of fixed lab). The soil sample collected for analysis at the offsite laboratory may be analyzed on a 24-hour “rush” turnaround time (TAT) basis in order to minimize delays to the construction schedule. This rush TAT will be determined at the discretion of the onsite California Professional Geologist after coordination with Rosemead or affiliated representative. If time allows (e.g., in an area where construction activities may not be occurring for a couple of weeks), analysis using standard turnaround time will be performed. The type of laboratory analytical method(s) to be used will be based on two main criteria:

Criteria 1 – Visual Appearance: Soil characteristics (e.g., discoloration, staining, or odors, etc.) will be closely monitored by field personnel. Soil that appears dark or oil stained will be analyzed by EPA Method 8015M for TPH (gasoline/diesel/motor oil) and by EPA Method 8260B for VOCs (collected using EPA Method 5035). Soil that appears discolored in a manner typical of potential metal impacts (e.g., red, yellow, green, gray, or silvery) will be analyzed for CAM-17 using EPA Method 6010/7000 series.

Additional analyses (e.g., for PCBs or SVOCs) may be performed if indicated by historical equipment information or suspected chemical usage (e.g., former hydraulic lift or electrical transformer areas). Some shallow soils in the eastern portion of the site contain PCBs (see Section 4.0 for Aroclor RAGs). The location where the soil samples are collected will be annotated on the field base map and the field form.

Criteria 2 – Elevated PID Screening Levels: At least one representative soil sample will be collected for laboratory testing if the headspace PID measurement exceeds 50 ppm equivalents during the on-site screening. The soil sample will be analyzed using EPA Method 8260 for VOCs (collected using EPA Method 5035). Additional analyses may include TPH gasoline range, BTEX, MTBE and fuel oxygenates, and/or other substances based on historical chemical usage information.

# 6.0 SOIL HANDLING AND REMEDIAL ACTIVITIES

The following sections detail the policies and procedures to be utilized during the excavation, stockpiling, sampling, remediation and disposal of environmentally-affected soils at the sites. Soil excavation activities will be directed by the previous sampling activities as modified by confirmation sampling activities. Soil remediation and disposal activities will be directed by soil stockpile sampling activities.

## 6.1 Soil Excavation Activities

Based on past soil investigations, the metal and PCB-affected soils requiring management as either a non-RCRA or RCRA hazardous waste are generally distributed in the upper three feet of soil in the eastern one-third of the site is generally noted on Figure 4. The excavation activities to be conducted at the site will first be focused on these areas so that they can be properly managed, profiled, and if necessary, properly transported and disposed at permitted facilities off-site. Figure 4 shows the areas of the site with known concentrations of COCs exceeding the RAGs.

In addition to the surgical removal of the COC-affected soils exceeding their respective RAGs, we assume grading activities on-site will generally require the excavation and, if suitable, re-compaction of the upper 5 feet of soil (this depth of grading will be better clarified on the final grading plan). In the eastern portion of the subject property, deeper excavation to a depth of approximately 13 feet below existing grade is required due to presence of undocumented fill (Leighton, *Supplemental Geotechnical Exploration*, September 27, 2021). At the time of preparing this report, grading plan was not yet available.

In accordance with SCAQMD requirements as it relates to Rule 1466 (i.e., the applicable toxic air contaminants in the form of lead and PCBs [aroclors 1254 and 1260]), soil will be excavated and temporarily placed in individual stockpiles not exceeding approximately 400 $yd^3$ in volume. Each stockpile will be placed on plastic sheeting a minimum of 10 mil in thickness and covered with plastic sheeting a minimum of 10 mil in thickness when the stockpile is not in active use. Stockpiles will be numbered sequentially and will be marked with the stockpile number on the plastic sheeting. When covered, the plastic sheeting will be secured with sandbags and/or weights. If excavation activities are scheduled during the rainy season, additional best management practices may be required to control potential run-off from the stockpiles.

### 6.1.1 Additional Excavation of Suspect Wastes Based on Field Observations

Prior investigations across the site indicates that Non-RCRA or RCRA hazardous waste is likely to be encountered in the metal/PCB-affected soils area primarily located in the eastern one-third of the site in shallow soils generally less than 3 feet deep; however, if heavily discolored, stained, or odorous soils, and soils emitting elevated VOCs above 50 ppmv are encountered, the excavation will be expanded laterally to the maximum of the site boundaries or vertically to a maximum depth of five feet bgs (or deeper, not exceeding a depth of 10 feet bgs, if affecting undocumented fill). In areas where discolored, stained, or odorous soils are encountered and excavations are planned to extend beyond 5 feet bgs, the discolored, stained, or odorous soils will be excavated to the planned final grading depth.

### 6.1.2 Excavation Area Confirmation Soil Sampling

After the planned excavation limits have been reached and additional discolored, stained, or odorous soils have been removed, relatively undisturbed confirmation soil samples will be collected from the sidewalls and floor of the excavation for laboratory analysis. The confirmation soil samples will be used to evaluate whether the in-place soil bounding the excavation exceeds the respective RAGs criteria. The confirmation soil samples from the floor of the excavation will be collected on a grid system every 25 feet. Markings will be placed on the exterior of the excavation area indicating the distance from the northeast corner of the property and sample locations will be designated “EFS-NS-EW-DD” where EFS designates “excavation floor sample”, NS designates the distance south from the northeast corner, EW designates the distance west from the northeast corner and DD designates the depth. Thus EFS-50-100-03 would be an excavation floor sample collected 50 feet south and 100 feet west of the northeast corner at a depth of 3 feet bgs.

Sidewall samples will be collected for each sidewall greater than 3 feet in height. Sidewall samples will be collected at 25 foot lateral intervals at the approximate midpoint depth of the sidewall. Sidewall soil samples will be designate “SIDEWALL-NSEW-DD” where SIDEWALL designates from which sidewall the sample was collected, NSEW designates the linear distance along the sidewall from the northern or east site boundary, and DD designates the depth. Thus “SOUTH-100-2” designates the sample

collected along the southern sidewall of the excavation, 100 feet west of the eastern site boundary at an approximate depth of 2 feet.

When possible, the confirmation soil samples will be collected in a pre-cleaned glass jar provided by the analytical laboratory. Alternatively, a slide-hammer hand sampler equipped with stainless steel sleeves may be utilized. After a soil sample is collected, in the slide hammer, the ends of the stainless steel sleeve will be covered with Teflon sheets and capped with plastic end caps. If a soil sampling location is inaccessible to hand-sampling equipment, soil sample collection will be accomplished with the aid of the backhoe/excavator. Care will be taken to sample only representative and relatively undisturbed areas when practical. The confirmation soil samples will be labeled and transported to the analytical laboratory. Entry into an excavation will only be conducted in accordance with California Code of Regulations Title 8, CAL-OSHA Construction Safety Orders, Article 6 Excavations.

All soil removed from the site will be profiled for disposal at permitted landfills. No soil will be transported offsite without receiving prior approval for disposal at the appropriate landfill. If soil is discovered that requires management as VOC Contaminated Soil (per SCAQMD Rule 1166), Non-RCRA hazardous waste or RCRA hazardous waste, this soil will be removed from the excavation and will be temporarily stockpiled at the site at a pre-designated staging area (coordinated with Rosemead contractors).

### 6.1.3 Excavation Area Expansion Due to Confirmation Samples Exceeding RAGs

In areas where the confirmation soil samples analytical test results exceed the RAGs, the excavation area will be expanded and resampled. For samples from the soil of the floor of the excavation, the 25 foot square area centered on the sample location will be extended a minimum or 1 foot and a confirmation soil sample will be collected at this new depth. For side-wall samples, the 25-foot long area of the sidewall centered on the sample location will be extended a minimum of 1 feet and a confirmation sample will be collected of the expanded sidewall.

Alternatively, hand auger soil samples may be collected to direct excavation activities. For excavation floor samples, a hand auger may be used to advance a boring in 1-foot increments and a slide hammer used to

collect a confirmation soil sample at each depth. Sidewall soil samples may be collected by advancing a boring into the undisturbed soil in line with the sidewall sample but a minimum of 1 foot laterally outside the excavation to the same depth as the original sample. However, if observation (e.g., soil discoloration) suggests the COC-affected soils are more laterally extensive, the decision to collect the confirmation soil samples will be conducted at the discretion of the field geologist. A slide hammer soil sample or soil sample collected with a backhoe, will be used to collect confirmation soil samples in each area. Additional step-out soil samples may be collected at the discretion of the field geologist to evaluate the extent of the excavation expansion. Step-out soil samples may be analyzed incrementally until soil analytical results are reported below the RAGs.

### 6.1.4 Excavation Monitoring

The excavated soil and in-place soil at the perimeter of the excavation will be monitored for evidence of discoloration, odors, or other indicators of contamination. In addition to visual observations, a PID will be used to screen for VOCs in the stockpiled soil and around the perimeter of the excavation, as described in Table 1. For example, in accordance with Waste Management's Simi Valley Landfill (SVL) soil profiling guidelines, soil that has less than 50 ppm equivalents when measured with the PID will be suitable for daily cover at SVL; however, soil which registers a concentration greater than 50 ppm equivalents will require disposal at the SVL. Dust monitoring will be conducted in accordance with SCAQMD Rules 402, 403, and 1466, as further described below.

### 6.1.5 Air/Dust Monitoring

**SCAQMD Rules 403 and 402** - Dust monitoring will be conducted during the excavation and grading operations to monitor for dust and particulate matter at the property boundary in accordance with SCAQMD Rule 403 requirements. Excessive fugitive dust emissions shall be controlled by regular watering and other dust suppression measures, as specified in the SCAQMD's Rules and Regulations. In addition, SCAQMD Rule 402 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off-site. Implementation of the following measures would reduce short-term fugitive dust impacts on nearby sensitive receptors:

- All active portions of the construction site shall be watered every three hours during daily construction activities and when dust is observed migrating from the project site to prevent excessive amounts of dust.
- Pave or apply water every three hours during daily construction activities or apply non-toxic soil stabilizers on all unpaved access roads, parking areas, and staging areas. More frequent watering shall occur if dust is observed migrating from the site during site disturbance.
- Any on-site stockpiles of debris, dirt, or other dusty material shall be enclosed, covered, or watered twice daily or non-toxic soil binders shall be applied.
- All grading and excavation operations shall be suspended when wind speeds exceed 25 mph.
- Disturbed areas shall be replaced with groundcover or paved immediately after construction is completed in the affected area.
- On-site vehicle speed should be limited to 15 miles per hour.
- Visible dust beyond the subject property limits which emanates from the site shall be prevented to the maximum extent feasible.
- All material transported offsite shall be either sufficiently watered or securely covered to prevent excessive amounts of dust prior to departing the site.
- Reroute construction trucks away from congested streets or sensitive receptor areas to the extent feasible. Rumble strips or trackout hardware should be installed at all site egress areas.

**SCAQMD Rule 1466** – Due to the presence of Applicable Toxic Air Contaminants (primarily lead and PCBs [aroclors 1254 and 1260]) in shallow soil in selected areas at the site, compliance with Rule 1466 is where elevated metals/PCBs are present in much of the shallow soil that will require excavation. During the grading, soil excavation, stockpiling, and loading activities at the site, particulate (dust) monitoring per Rule 1466 will be implemented during all earth-moving activities. The purpose of Rule 1466 is to minimize the amount of off-site fugitive dust emissions containing toxic air contaminants by reducing particulate emissions in the

ambient air as a result of earth-moving activities, including, excavating, grading, handling, treating, stockpiling, transferring, and removing soil that contains Applicable Toxic Air Contaminants from sites that meet the applicability requirements. A copy of the Applicable Toxic Air Contaminants can be found in Table I of Rule 1466 in Appendix E.

At least 72 hours and no more than 30 days prior to conducting any earth-moving activities on any site meeting the applicability requirements of subdivision, the owner or operator shall electronically notify the SCAQMD Executive Officer, using a format approved by the Executive Officer, of the intent to conduct any earth-moving activities. There are multiple Rule 1466 notifications that are required that must be performed by either Rosemead or their designated contractor.

The monitoring required for Rule 1466 consists of taking continuous direct-reading measurements of particulate matter (PM) less than 10 micrometers ($PM_{10}$) in diameter. One $PM_{10}$ meter will be placed along the upwind side of the seasonal prevailing wind direction (generally from the western portion of the site in a secure area just east of North Rosemead Boulevard) with another $PM_{10}$ meter placed along the downwind side of the site (generally on the eastern portion of the site. An additional $PM_{10}$ meter will be placed adjacent to the north side of the residential trailer park near the southeast portion of the site. As wind directions can often vary in Southern California (e.g., during Santa Ana wind conditions), the field geologist/scientist will make the determination as to the upwind and downwind locations of the meters. These meters are set to take particulate readings every ten minutes to ensure that the $PM_{10}$ concentration over 2 hours does not exceed 25 micrograms per cubic meter ($\mu g/m^3$). The $PM_{10}$ meters will be identical in make and model; settings; calibration; configuration and calibration, correction, and correlation factors.

The meters will collect ambient $PM_{10}$ data with a data acquisition system that is capable of logging direct-reading near real-time data providing the date, time, and $PM_{10}$ concentration in $\mu g/m^3$ every ten minutes or less.

The $PM_{10}$ concentration is the absolute difference between the upwind and downwind monitors. If the $PM_{10}$ concentration averaged over two hours exceeds 25 $\mu g/m^3$, the owner or operator (e.g., the Rosemead contractor) shall cease earth-moving activities, apply dust suppressant to fugitive dust sources, or implement other dust control measures as

necessary until the $PM_{10}$ concentration is equal to or less than $\mu g/m^3$ averaged over 30 minutes.

The Rosemead contractor shall post signs at all entrances of the site to designate the speed limit as 15 miles per hour. In addition to the particulate monitors, water trucks will be stationed at the grading and excavation portions of the site during all earth-moving activities. The water trucks will supply constant dust suppression to reduce, or essentially eliminate, dust produced during the earth-moving activities. Soil stockpiles generated during excavation and grading activities will be underlain and covered with visqueen stabilized with sandbags to minimize fugitive particulate emissions. The Rosemead contractor shall comply with other provisions of Rule 1466, Section (e) *Requirements to Minimize Fugitive Dust Emissions*. During earth-moving activities, Rosemead's contractor shall have an on-site dust control supervisor that complies with Rule 1466 Section (e), 9.

During the soil removal activities, the metal and PCB-affected soils will be directly loaded in end-dump trucks equipped with tarps. Once the load has been placed, the load will be completely tarped and exterior of the truck, trailer, and tires will be cleaned prior to the truck leaving the site. In addition to sweeping vehicles prior to exit, the trucks will drive over a pad of gravel at least 50 feet long, followed by a section of shaker plates at least 24 feet long, to remove as much soil as possible prior to leaving the site. The egress of the site will be swept each day to remove any soil tracked offsite from the roadway (i.e., North Rosemead Boulevard).

The Rosemead contractor will comply with the recordkeeping requirements detailed in Rule 1466 and maintain the records for period of not less than three years and shall make such records available to the SCAQMD Executive Officer upon request. As noted, the Rosemead earthmoving contractors will conduct their activities in compliance with Rule 1466 which is presented in its complete form in Appendix E.

### 6.1.6 Laboratory Analysis of Confirmation Soil Samples

The confirmation soil samples from the excavation and sidewalls will be analyzed for the chemical constituents that previously exceeded the RAGs. Soil samples will be analyzed (possibly on a 24-hour TAT basis) by a state-certified environmental laboratory.

### 6.1.7 Step-Out Excavations

If the results of the confirmation samples indicate that the soil underlying or adjacent to the excavation areas has not reached the remedial goals, additional excavation activities will be required. At a minimum, for areas where, the bottom sample does not meet the remedial action goal, the 25' by 25' area will be excavated one additional foot and resampled. If a sidewall sample does not meet the remedial action goal, the 25' section of sidewall represented by the sample location will be expanded outward a minimum of one foot and resampled. As noted, if visual or olfactory evidence of COC-affected soils are still observable, the excavation can be expanded at the discretion of the field geologist followed by resampling and analytical testing to confirm the lateral and vertical extent of the COC-affected soils or below their respective RAGs.

### 6.1.8 Soil Stockpile Management and Sampling

Where previously unidentified RECs are encountered and direct loading of soil is not possible, the resulting soil stockpiles will be evaluated for their potential waste characteristic and will be placed in an area designated by Rosemead and/or their designated contractor. Excavated soil will be placed on plastic sheeting and securely covered with plastic sheeting at the end of each field day. Sandbags may be placed on top of the stockpile to ensure stability of the plastic sheeting. Caution tape will be placed around the base of the stockpile at the end of each field day. Soil stockpiles will be segregated by area of generation and will be designated on that basis.

**Waste Classification** – The waste classifications of the soil exceeding their respective RAGs will be investigated for their waste designation. Soil samples collected from the site will analyzed to assess if the metal/PCB levels in the soil samples exceed their California Total Threshold Limit Concentration (TTLC) or the California Soluble Threshold Limit Concentration (STLC) as presented in the California Code of Regulations, Title 22, Article 11. In conformance with the general practice in California regarding waste classification, soil samples with total metal detections that are greater than 10 times their STLC (e.g., 50 mg/kg for lead) will also be analyzed using the California Waste Extraction Test (WET) to determine whether they constitute Non-RCRA Hazardous Waste. Soil with concentrations of chemicals in excess of the threshold for characterization as a non-RCRA hazardous waste based on the TTLC characterization do

not require WET analysis. . Selected soil samples will also be analyzed using the Toxicity Characteristic Leaching Procedure (TCLP) to assess if they require management as a federal (i.e., RCRA) hazardous waste. Soil stockpiles generated during excavation of soils exceeding their RAGs will be representatively profiled (by resampling and analytical testing) for their waste characteristic prior to disposal at an off-site permitted landfill.

**Stockpile Size and Profiling** - In conformance with SCAQMD Rule 1466, Section 4C, stockpiles containing soil with toxic air contaminants (e.g., lead and PCBs), will not exceed a size of 400 $yd^3$ and will not be greater in height than the perimeter fencing and windscreen. The number of soil stockpile samples collected for profiling will generally conform with the *DTSC 2001 Information Advisory Clean Imported Fill Material* which requires one soil sample for each 250 $yd^3$ of stockpiled material. Therefore, for a soil stockpile containing 400 $yd^3$, two soil samples will be collected for profiling purposes. The soil samples should be collected at a depth of at least 1 foot below the surface of the soil stockpile,

For soil stockpiles that likely do not contain toxic air contaminants the stockpile size is not restricted to 400 $yd^3$ (e.g., soil generated from the western two-thirds of the site). However, if soils are observed to be potentially affected by COCs, a stockpile with a size of 1,000 to 5,000 $yd^3$, four soil samples should be collected for the first 1,000 $yd^3$ and one soil sample should be collected for each additional 500 $yd^3$ (DTSC, 2001). For a soil stockpile greater than 5,000 $yd^3$, 12 soil samples should be collected for the first 5,000 cubic yards and one soil sample per each additional 1,000 $yd^3$ (DTSC, 2001).

**Waste Management -** Based on review of the soil sampling analytical test results, the soil stockpiles will be placed in one of four categories:

- Suitable for site reuse,
- Non-hazardous waste,
- Non-RCRA hazardous waste, and
- RCRA hazardous waste.

**Chemical Fixation Option for Non-RCRA and RCRA Hazardous Waste** – Non-RCRA hazardous waste soils with COCs that exceed their respective STLCs but not their respective TTLCs or TCLPs, may be suitable for stabilization using a chemical fixation process to render the

soil into a nonhazardous waste. Additionally, RCRA hazardous waste may be suitable for stabilization using a chemical fixation process to render the soil into either a non-RCRA or nonhazardous waste. Soil where the TTLC for classification as a non-RCRA hazardous waste is exceeded but the TCLP threshold for characterization as a RCRA hazardous waste is not exceeded will not be recommended for chemical fixation and will be disposed off-site at a facility permitted to accept the COCs at the concentrations present in the soil.

Soil that is suitable for chemical fixation will be mixed in a pug mill or other similar equipment with a fixation agent to reduce the leachability of COCs in the waste. The processing plant will be mobilized to the site under a Transportable Treatment Unit (TTU) permit issued by the DTSC and USEPA to treat the site COCs. In general, the excavated soil is mixed with Portland cement (or other binding agent) and water so that the soil wastes are incorporated in the cement (or other agent) mixture, reducing the leachability of the COCs. Chemical fixation is not suitable for dilution of the waste so as to reduce the total concentration of the COCs, hence soil with COCs in excess of the TTLC threshold for characterization as a non-RCRA hazardous waste will be profiled as a non-RCRA hazardous waste even if treated. Soils will be batch treated and post treatment samples will be collected to confirm that the leachability of the COCs has been reduced to facilitate disposal or reuse. As with excavated soil, stabilized soil sampling may indicate that the soil is in one of four waste characterization profiles:

- Suitable for unrestricted use on site: Soil STLC and TCLP concentrations have been reduced to below the thresholds for characterization as a non-RCRA or RCRA hazardous waste;
- Non-hazardous waste: Soil STLC and TCLP concentrations have been reduced to below the thresholds for characterization as a non-RCRA or RCRA hazardous waste but the TTLC concentrations are in excess of RAGs but below the threshold for classification as a non-RCRA hazardous waste;
- Non-RCRA hazardous waste: Soil TCLP concentrations have been reduced to below the thresholds for characterization as a RCRA hazardous waste, but the STLC or TCLP COC concentrations are in excess of the threshold for classification as a non-RCRA hazardous waste. Soils where the STLC in excess of the threshold for

classification as a non-RCRA hazardous waste but the TTLC is below the threshold may be retreated and retested or disposed off-site at a facility permitted to accept these wastes; or

- RCRA hazardous waste: Soil TCLP concentrations are above the thresholds for characterization as a RCRA hazardous waste. These soils may be retreated and retested or disposed off-site at a facility permitted to accept these wastes.

Prior to full scale treatment of site soils, a bench scale test may be conducted to evaluate the optimal fixation agents and required volumes for soil stabilization. A decision tree detailing the process to evaluate if waste may be treated on site, reused on site, or disposed off-site is included as Figure 5.

**Soils Suitable for Reuse Onsite**

Soils which are suitable for site reuse are soils with concentrations of all COCs below their respective RAGs are primarily distributed in soil located on the western two-thirds of the site (Figure 4). These soils will be segregated and may be reused on site in an unrestricted manner. Review of the soil conditions for geophysical attributes may indicate the soil requires off-site disposal due to geotechnical unsuitability. If this is the case, it will be profiled and disposed as non-hazardous waste soil in accordance with the profiling requirements of the permitted facility.

**Non-Hazardous Waste with Permitted Facilities**

Non-hazardous waste soils are those soils with concentrations of any COC exceeding the site RAGs but not containing any COC at concentrations that exceed any screening criteria for management as a non-RCRA or RCRA hazardous waste. Unless otherwise approved for re-use on site, this soil will be disposed at an off-site facility permitted to accept the COCs at the detected concentrations. Permitted nonhazardous waste facilities in California include:

WM – Simi Valley Landfill
2801 Madera Road
Simi Valley, California
Phone: (805) 579-7267

Chiquita Canyon Landfill

29201 Henry Mayo Drive Castaic
California 91384
Phone: (661) 257-3655

Bradley Municipal Landfill
9081 Tujunga Avenue
Sun Valley, California 91352
Phone: (818) 767-6180

Crosby & Overton (Drums only)
1630 W 17th Street
Long Beach, CA 90813
Phone (562) 432-5445

**Non-RCRA Hazardous Waste with Permitted Facilities**

Non-RCRA hazardous waste soils are those soils with concentrations of COCs exceeding either the TTLC or the STLC threshold (e.g., for lead, equal to or greater than 5.0 mg/L) but with no COCs exceeding the TCLP threshold for management as a RCRA hazardous waste. Soils that exceed the TTLC threshold for management as a non-RCRA hazardous waste will be profiled and disposed at an off-site facility permitted to accept Non-RCRA hazardous waste. Non-RCRA hazardous wastes may be disposed at permitted facilities outside of California as a non-hazardous waste, but will be transported and manifested as a non-RCRA hazardous waste.

Non-RCRA hazardous waste permitted facilities in California and Arizona include:

Clean Harbors Buttonwillow
2500 West Lokern Road
Buttonwillow, California 93206
USEPA ID No. CAD980675276
Phone: (661) 762-6200

Phone: (928) 341-9300

**Chemical Fixation Option for Non-RCRA Hazardous Waste – See Section 6.1.8**

**RCRA Hazardous Waste with Permitted Facilities**

RCRA hazardous waste soils are those soils with concentrations of COCs exceeding their respective TCLP thresholds for management as a RCRA hazardous waste. RCRA hazardous waste may be suitable for stabilization on site with stabilization agents to reduce the leaching characteristic which designates it as a hazardous waste. Soil stabilization is described in Section 6.1.8. Soil that is chemically stabilized so that the post-treatment COC concentrations do not exceed the TTLC, STLC, or TCLP thresholds for management as a non-RCRA or RCRA hazardous waste may be reused on site as nonhazardous waste if the concentrations of COCs are below the RAGs. The stabilized soil may also be disposed of off-site as a non-hazardous waste at a permitted landfill if it meets their profiling requirements. Stabilized RCRA hazardous waste that does not have a COC exceeding its TCLP but exceeds the COC's TTLC will be disposed of at an off-site permitted landfill as Non-RCRA hazardous waste. RCRA hazardous waste permitted facilities in California and Nevada include:

Clean Harbors Buttonwillow
2500 West Lokern Road,
Buttonwillow, California 93206
USEPA ID No. CAD980675276
Phone: (661) 762-6200

6.1.9 Dewatering of Excavation if Perched Groundwater is Encountered

It is not anticipated that dewatering will be required for this site. However, should unanticipated perched groundwater be discovered during site redevelopment activities, the RWQCB project manager will be contacted and samples shall be obtained from the groundwater and analyzed for COCs designated by the RWQCB. Should the groundwater samples exceed applicable discharge requirements, a dewatering plan shall be prepared by the Rosemead licensed contractor and submitted to the RWQCB and other appropriate agencies determined appropriate in consultation with the RWQCB for review and approval. The plan shall include but not be limited to sampling of groundwater that may be contaminated; and treatment and disposal of COC-affected groundwater in compliance with applicable regulatory requirements. Written verification from the RWQCB of approval of a dewatering plan would be required. Should perched groundwater be encountered, the Rosemead environmental consultant will contact the RWQCB to evaluate if they will provide oversight and permitting for the dewatering program or will defer these activities to another regulatory oversight entity.

## 7.0 FEATURES REQUIRING PERMITS

It is very unlikely that site development and excavation will result in the discovery of regulated underground features such as USTs, clarifiers, and their associated piping that have not previously been identified and investigated. However, if such features are unearthed, the contractor is to immediately halt work in that area and notify Rosemead, the designated environmental consultant and the Site Safety Officer. The potential hazard posed by the feature should be assessed prior to any additional work at that location. If it is deemed safe to continue working at that location, personnel should attempt to expose the feature and determine its size and purpose. In addition, the UST or feature should be evaluated for potentially hazardous contents (type of substance and quantity). With Rosemead's approval, the environmental consultant should contact the RWQCB project manager, City of South El Monte Building and Safety Department, and the Los Angeles County Fire Department (LACFD; (626) 430-3050; CUPA for the site). An application/permit for removal of the UST and piping should be completed. Soil sampling around/under the UST or feature may be necessary for proper closure and to evaluate for potential contamination. The newly discovered feature will not be disturbed until the City of South El Monte and LACFD permit procedure is established. The physical location of the UST or feature will be noted and recorded on the Daily Field Log and site base map. The work performed to investigate and remove the feature will be documented in a summary report and submitted to the permitting agency and to the RWQCB.

Compliance with all elements of SCAQMD Rules 402, 403, 1166, and 1466 including obtaining proper permits, monitoring for VOC Contaminated Soil, preparing a VOC Contaminated Soil Mitigation Plan (if needed), and providing notifications and documentation/reporting to SCAQMD (if required) shall be the responsibility of the contractor and/or environmental consultant.

Prior to any soil excavation activities, Rosemead will acquire a site-specific DTSC Temporary State ID Number for the possible removal of California hazardous waste generated from the site. The temporary state ID number issuance website for this application from the DTSC is https://dtsc-web01.dtsc.ca.gov/epaid/Default.aspx

To address non-hazardous waste generated from the site, waste manifests, and weight tickets will be provided in the report. To address non-RCRA hazardous waste and RCRA hazardous waste, generator waste profile sheets or waste material profile sheets, and Uniform Hazardous Waste Manifests, and weight tickets documenting the transport and disposal of hazardous waste, if present, will be provided in the report. Should RCRA waste be generated, Rosemead will complete and submit a RCRA Subtitle C Site Identification Form to the United States Environmental Protection Agency.

# 8.0 REPORTING

## 8.1 RWQCB Notification of Newly Discovered Areas Potentially Affected by Hazardous Substances and Petroleum Products

With the approval of Rosemead, the RWQCB Project Manager will be notified and consulted for proper delineation and removal of California hazardous waste or RCRA hazardous waste if newly discovered areas of contamination are discovered during redevelopment exceeding a volume greater than a 55-gallon drum. This notification will occur via a telephone call and via email at the direction of the California Professional Geologist who is the designated point-of-contact for this redevelopment project.

## 8.2 Preparation of Summary Report

At the conclusion of site demolition and grading activities, a report will be prepared that summarizes the field activities, describes pertinent observations and conclusions, and documents the disposal of any regulated wastes. Recommendations for further action or the need for further action will also be provided in the report, if necessary. The report will include the laboratory analytical reports, and a base map illustrating the extent of the excavation and any previously unidentified features that were unearthed and removed. All of the field logs and disposal documentation will be presented as appendices to the report.

# Disclaimer

This Preliminary Endangerment Assessment (PEA) report was prepared by Enviro-Tox Services, Inc. (Enviro-Tox) for the use of Rosemead Holding, LLC and Leighton Consulting, Inc. (Leighton). The PEA is based on soil data provided by Leighton for the Rosemead Holding, LLC site located in South El Monte, California.

This PEA report was prepared based partially on information supplied by Leighton, which is in the public domain, and partially from information and data generated by consultants during investigations conducted in 2020 and 2021 of the South El Monte site. Documentation for the statements made in this PEA report is on file at either Leighton or Enviro-Tox offices. Enviro-Tox makes no warranty as to the accuracy of statements made by others which are contained in this PEA report, nor are any other warranties or guarantees, express or implied, included or intended in this PEA report with respect to information supplied by outside sources or conclusions or recommendations substantially based on information supplied by outside sources. This PEA report has been prepared in accordance with the current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professional consultants or firms performing the same or similar services. Since the facts forming the basis for this PEA report are subject to professional interpretation, differing conclusions could be reached. Enviro-Tox does not assume responsibility for the discovery and/or elimination of hazards, which could possibly cause accidents, injuries, or damage unless those hazards were apparent, and should have been discovered, as a result of the services Enviro-Tox performed for Leighton. This PEA report represents the professional judgment of Enviro-Tox; however, compliance with submitted recommendations or suggestions does not assure elimination of hazards or the fulfillment of Leighton or Rosemead Holding, LLC's obligations under local, state, or federal laws, or any modifications or changes to such laws.

None of the work performed hereunder shall constitute or be represented as a legal opinion of any kind or nature but shall be a representation of findings of fact from records examined.

This Preliminary Endangerment Assessment (PEA) report was prepared by Enviro-Tox Services Inc. This Report is intended for use by Leighton Consulting, Inc. and Rosemead Holding, LLC for the evaluation of soil quality conditions at the industrial site located at 2200 North Rosemead Boulevard in South El Monte, California. The professional services provided have been performed in accordance with practices generally accepted by other scientists and engineers practicing under similar conditions in California. No other warranty, either expressed or implied, is made. As with all environmental projects, there is no guarantee that the implemented scope of work will necessarily identify all and any of the potential health risks and hazards posed by chemicals detected within the Rosemead Holding, LLC site.

# EXECUTIVE SUMMARY

At the request of Leighton Consulting, Inc. (Leighton), Enviro-Tox Services, Inc. (Enviro-Tox) conducted a Preliminary Endangerment Assessment (PEA) for the Rosemead Holding, LLC industrial site located at 2200 North Rosemead Boulevard in South El Monte, California. The objectives of the PEA are to (1) evaluate potential risks to human health from site-related chemicals detected in soil at the site; and (2) develop Risk-Based Cleanup Levels (RBCLs) for anthropogenic (human-made) chemicals detected in soil at the site.

The site comprises approximately 5.1 acres of industrial land that was formerly developed with five structures, all of which have been demolished as of February 2022. The building slabs and pavement currently remain in place with limited areas of exposed soil and vegetation in the southern portion of the site. The easternmost portion of the site was previously occupied by a business that cleaned, refurbished and, in some cases, repainted 55-gallon drums and refurbished plastic tote containers for the food industry. The westernmost buildings at the site were previously used for automotive repair and tire services.

Site assessment activities undertaken in the past two years indicated the presence of chemicals of potential concern (COPCs) including some metals, polychlorinated biphenyls (PCBs), petroleum hydrocarbons, and volatile organic compounds (VOCs), in soil, groundwater, and/or soil gas at the site. The Los Angeles Regional Water Quality Control Board (LARWQCB) had issued a No Further Requirements (NFR) letter in March 1998 related to groundwater at the site. Additional soil and soil gas investigations were subsequently conducted in 2020 and 2021, to evaluate site conditions in advance of planned demolition and industrial redevelopment.

In April 2022, EEC Environmental installed a soil vapor extraction (SVE) system on the southern portion of the site with six dual-nested SVE wells and a SVE remediation system designed to remediate VOCs in soil gas. Because SVE has been implemented but is not yet complete, this PEA does not include or evaluate soil gas data as the available soil gas data may not be representative of current or future site conditions due to the ongoing remediation activities. Health risks associated with soil gas may be evaluated and analyzed in a future risk evaluation for the site.

Consistent with previous investigations that resulted in the NFR determination, environmental assessments indicated the presence of metals, petroleum hydrocarbons, and PCBs in shallow soil. The impacted soil was generally limited to the upper 1 to 5 feet below grade and to the eastern third of the site.

All chemicals detected at least once in soil were included in this PEA as chemicals of potential concern (COPCs). Assuming the site will continue to be used as an industrial facility, the only potential receptors at the site were assumed to be onsite workers. For the purposes of this assessment, the potential receptors evaluated are:

- *Onsite Nonintrusive Maintenance Workers*. It was assumed that onsite workers might come in contact with chemical-impacted surface soil and dust while at work. However, these workers were not assumed to conduct earth-moving activities and/or dig trenches. Hence these workers are referred to as nonintrusive workers. Onsite workers include:

    - *Full-time workers.* Full time workers including administrative and operations staff that work at an onsite commercial/industrial facility. These employees work 40-hour weeks and about 250 days per year.

    - *Part-time workers.* Part-time workers may include specialized maintenance and operations personnel. Part-time workers may be present at the site in response to sporadic labor and specialized personnel needs. These workers operate from temporary onsite offices and are not limited to 40-hour weeks. Employment duration for temporary workers is usually less than one year onsite.

    - *Visitors.* Visitors are likely to be at the site for no more than a few hours per week.

- *Onsite Construction Workers.* These workers are defined here as future construction workers and utility-line workers whom might be engaged in short-term intrusive activities. These workers might come in contact with chemical-impacted soil or dust while at the Subject Property.

In accordance with established risk assessment guidance, cancer risks were estimated by multiplying chemical-specific cancer slope factors by lifetime chemical intake estimates. Non-cancer health hazards were estimated by dividing average daily chemical intakes by chemical-specific reference doses. Together, cancer risk estimates and non-cancer health hazard estimates characterize health risks associated with potential exposures to the potential receptors evaluated in this PEA.

The estimated cancer risks and the total hazard indices that could result from worker exposures to onsite soil under current conditions are summarized in Table ES-1.

Table ES-1. Estimated Cancer Risks and Health Hazards for Onsite Receptors

| | Incremental Cancer Risk (unitless) | Hazard Index (unitless) |
|---|---|---|
| Onsite Nonintrusive Workers Exposed to Soil and Dust | 2E-05 | 0.6 |
| Onsite Construction Worker Exposed to Soil and Dust | 1E-05 | 2 |

The "risk driver" identified was hexavalent chromium (Cr VI) detected in soil sample LV-10-1. All other samples analyzed for Cr VI had either non-detected concentrations or their detected concentrations were below levels considered to pose a health risk.

Due to the unique toxicological properties of arsenic and lead, the California Department of Toxic Substances Control (DTSC) recommends the use of screening levels developed specifically for each metal. In addition, for sites that have been well characterized, the DTSC allows for the use of the 95 percent upper confidence limit concentration (95UCL) as the representative soil chemical concentration.

For arsenic, the DTSC recommends the use of local background soil arsenic concentrations as the screening level. The local background arsenic concentration at the site was estimated to be 10.63 milligrams per kilogram (mg/kg). Therefore, the screening level used in this PEA for arsenic is the local background concentration of 10.63 mg/kg. The 95UCL soil arsenic concentration at the site was estimated to be 4.88 mg/kg. This value is lower than the local background concentration of 10.63 mg/kg. Since the soil arsenic 95UCL is below the soil background concentration, arsenic detected at the site is considered to be within background levels and deemed to pose no health risk to onsite workers.

For lead, the DTSC recently published a commercial/industrial soil screening level of 500 mg/kg for lead. The DTSC considers average soil lead concentrations lower than 500 mg/kg to pose no health threat to onsite workers. The 95UCL soil lead concentration for the site was estimated to be 1,443 mg/kg. Therefore, lead in soil at the site is considered to pose a potential health hazard to exposed workers.

In anticipation of site redevelopment, RBCLs for the protection of onsite receptors were developed for all COPCs identified for the site. Estimated soil exposure risks and hazards can be mitigated (if not eliminated) from the site by implementing soil Risk Management controls. Some of the soil Risk Management controls that can be considered for the site are:

- Onsite soil management including the necessary Best Management Practices (BMPs) and institutional controls.
- Containment, fixation, capping, encapsulation or stabilization of Cr VI and lead in soil.
- The excavation and removal of Cr VI- and lead-impacted soils. If excavation were to be considered for Cr VI, the goal of soil remediation should be to excavate and remove soil sample LV-10-1. Confirmation samples collected at and around the excavated sample should be at or below the RBCLs developed in this PEA for Cr VI. For lead, soil excavation and removal should reduce the soil lead 95UCL to less than the DTSC's soil lead screening level of 500 mg/kg.

All conclusions and recommendations presented in this report are based on reported chemical concentrations in soil and the current land use of the site without considering the operation of the SVE system. In this PEA, all fate-and-transport models, parameters, toxicity data and assumptions were used in accordance with federal and state regulatory guidelines. These guidelines are meant to protect the public and tend to overestimate potential health risks. As

such, this PEA provides a conservative estimate of the upper boundary of potential health risks, rather than an accurate representation of true health risks posed by the site.

# 1.0 INTRODUCTION

At the request of Leighton Consulting, Inc. (Leighton), Enviro-Tox Services, Inc. (Enviro-Tox) conducted a Preliminary Endangerment Assessment (PEA) for the Rosemead Holding, LLC property located at 2200 Rosemead Boulevard in South El Monte, California (the site; Figure 1). The major objectives of the risk assessment are to (1) evaluate potential risks to human health from site-related chemicals detected in soil; and (2) develop Risk-Based Cleanup Levels (RBCLs) for anthropogenic (human-made) chemicals detected in soil at the site.

## 1.1 PROJECT BACKGROUND AND OBJECTIVES

Environmental investigations conducted at the site have detected metals, polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs) and petroleum hydrocarbons in soil. The location and the lateral extent of impacted soil has been investigated. For the purposes of this risk assessment, all soil data collected at the site have been combined and evaluated as a single area of potential concern. This approach to evaluating potential health risks resulting from simultaneous exposures to all chemicals detected is considered to be health-protective and conservative because this approach assumes that:

1. Current and future receptors at the site would be exposed simultaneously to all man-made chemicals identified at the site;

2. Current and future receptors at the site would be exposed to chemicals at concentrations that are either the maximum detected concentration or concentrations that represent the upper bound concentrations of all detections at the site;

3. Future potential receptors at the site would have extensive contact with chemicals identified at the site through incidental ingestion of soil and dust inhalation; and,

4. Potential receptors would engage in behavior that results in higher-than-normal exposures to site-related chemicals, that is, exposures are assumed to occur under a "Reasonable Maximum Exposure" scenario.

These assumptions significantly overstate likely exposures, but by using this approach to the risk assessment, risk-based cleanup levels were purposefully derived to be conservatively protective of onsite receptors.

## 1.2 SCOPE

The scope of the PEA presented in this report is limited to evaluation of potential health risks and hazards associated with chemicals detected in soil within the site boundaries. Proposed soil

cleanup standards were developed with the overall aim of protecting human health and the environment.

Exposure pathways evaluated in this PEA include (1) incidental ingestion of soil, (2) dermal contact with soil and dust, and (3) inhalation of soil particles suspended in air. Potential health risks associated with exposures outside the site were not evaluated in this risk assessment because no potential offsite exposure pathway was found to be complete.

The human health risk assessment followed guidance developed by United States Environmental Protection Agency (USEPA) and the California Department of Toxic Substances Control (DTSC). Specific guidance included: *EPA Risk Assessment Guidance for Superfund: Volume 1 – Human Health Evaluation Manual Part B, Development of Risk-Based Preliminary Remediation* (USEPA, 1991a); *EPA Risk Assessment Guidance for Superfund: Volume 1 – Human Health Evaluation Manual Part C, Risk Evaluation of Remedial Alternatives* (USEPA, 1991b); *Preliminary Endangerment Assessment Guidance Manual* (DTSC, 2015); and DTSC Human Health Risk Assessment Notes No. 1 through 12 (https://dtsc.ca.gov/human-health-risk-hero/).

Site-specific data were used whenever possible. This approach is consistent with guidance issued by the USEPA and the DTSC stressing the use of site-specific data to evaluate potential health risks. Conservative assumptions (i.e., assumptions that generally overestimate risk) were used in this assessment when site-specific data were lacking or incomplete.

# 2.0 SITE CHARACTERIZATION

The proposed developed site is formally referenced by Rosemead Holding as Phase 1 and currently comprises approximately 5.1 acres (223,987 square feet) of industrial land. The balance of the site is concrete- and asphalt-paved, with limited areas of exposed soil and vegetation in the southern portion of the site. The easternmost portion of the site was previously occupied by Ditty Container, Inc. (Ditty), which had subleased the property from Pacific Coast Drum Company (PCD) since 1996 and has recently vacated the site. Both PCD and Ditty cleaned, refurbished, and, in some cases, repainted drums and refurbished plastic tote containers since the 1940s, primarily for the food industry. The former westernmost buildings at the site were previously used for automotive repair and tire services.

The proposed industrial development consists of one three-story building which on the ground floor includes approximately 112,405 square feet (sf) of warehouse space, 8,200 sf of retail space, and 1,950 sf of office space resulting in a total building footprint of 122,555 sf. The second floor and mezzanine of the building will have 14,445 of warehouse storage space and 8,875 sf of office space. The third floor of the building will have 9,705 sf of office space. The total square footage for the building is approximately 155,580 sf. The retail and office spaces are in the western portion of the building. Only surface parking is planned in the areas peripheral to the Phase 1 development building. The proposed improvements detailed in the Site Plan may be subject to some modifications in the future. The proposed development plan is shown on Figure 2.

## 2.1 ENVIRONMENTAL ASSESSMENT SUMMARY

Site assessment activities have indicated the presence of chemicals of potential concern (COPCs) including metals, polychlorinated biphenyls (PCBs), petroleum hydrocarbons, and volatile organic compounds (VOCs) in soil at the site. Since the mid 1980s, many investigations have been conducted onsite. The Los Angeles Regional Water Quality Control Board (LARWQCB) issued a No Further Requirements (NFR) in March 1998 with regard to soil cleanup. Additional soil investigations were subsequently conducted in 2020 and 2021, as part of a real estate transaction, to evaluate site conditions associated with potential demolition and redevelopment.

In 2021, Leighton conducted a review of previous site investigations and historical analytical test data to evaluate potential data gaps and further evaluate the extent of COPCs previously investigated by others at the site. Rosemead Holding LLC entered into a voluntary Site Cleanup Program agreement with the LARWQCB with the objective of determining what actions, if any, are required as part of redevelopment.

In June 2021, Leighton conducted soil sampling at the site to further characterize the lateral and vertical extent of COPCs such as metals, PCBs, and VOCs in soil at locations not investigated by

previous consultants. The investigation included 20 soil borings up to a maximum depth of 35 feet below ground surface (bgs). A comprehensive report detailing the site investigation history and the soil and soil gas data (Leighton, 2021) was submitted to the LARWQCB in October 2021.

Soil analytical data collected by Leighton and others at the site are summarized in Tables 1 through 4. Environmental assessments indicated the presence of metals (Table 1), PCBs (Table 2), petroleum hydrocarbons (Table 3), and VOCs (Table 4) in soil. The impacted soil was generally limited to the upper 1 to 5 feet bgs and to the eastern third of the site. Leighton reported that VOCs in soil gas are widely distributed over the site, and that the data do not indicate a likely source area for VOCs. The primary COPCs in soil gas are chlorinated VOCs, specifically tetrachloroethylene (PCE), trichloroethylene (TCE), cis 1,2-dichloroethylene (DCE), 1,1-dichloroethane (DCA) and vinyl chloride. In April 2022, a soil vapor extraction (SVE) system was installed by EEC Environmental (EEC) on the southern portion of the site. EEC installed six dual-nested SVE wells and a SVE remediation system designed to focus on the remediation of VOCs in soil gas at the site. EEC is providing the LARWQCB with quarterly Soil Vapor Extraction System Installation and Remedial Progress Reports. Because the SVE system is currently operating to reduce VOCs in soil gas, the soil gas analytical data may not be representative of current or future conditions and is therefore not analyzed further in this report.

## 2.2 GEOLOGY AND HYDROGEOLOGY

According to Leighton (2021), the near-surface native soils at the subject site are Holocene-age non-marine alluvium comprising varying proportions of sand, gravel, silt, and clay deposited by the streams. These deposits are anticipated to be on the order of several hundred feet in thickness, where they are subsequently underlain by thick (several thousands of feet) sequences of sedimentary rock formations.

Groundwater depth was measured at 45 feet bgs in October 2020 (EEC, 2020), and at approximately 46 to 48 feet bgs during Leighton's 2021 investigation.

# 3.0 SELECTION OF CHEMICALS OF POTENTIAL CONCERN

All chemicals detected at the site (Tables 1 through 4) were included in a formal selection of COPCs. Copies of Leighton's soil data tables for the site are included in Appendix A.

As described in current USEPA and DTSC risk assessment guidance, the purpose of selecting COPCs is to focus the assessment on those chemicals that could reasonably be expected to pose a significant health risk. COPCs were selected so that the most prevalent, and potentially toxic, compounds detected at the site (i.e., those chemicals that represent the greatest potential threat to human health) were quantitatively evaluated in the health risk evaluation.

## 3.1 ORGANIC COMPOUNDS

Organic compounds detected in soil at concentrations above laboratory reporting limits at least once were considered to be COPCs for the site. Chemicals detected in soil at the site are listed in Tables 1 through 4.

## 3.2 METALS

In a conventional risk assessment, metal elements detected in soil at concentrations deemed to be within natural, background concentrations are excluded from the risk evaluation (USEPA, 1989 and DTSC, 2015). For this evaluation, the background metal data set was obtained from soil metal data collected from California Air Force facilities (Hunter, Davis, and Roach, 2004). Maximum detected soil metal concentrations were compared to the 95$^{th}$ percentile concentration obtained from the Air Force facilities. The comparison to background concentrations is presented in Table 5. In addition, maximum detected soil metal concentrations were compared to soil screening levels. In an effort to be conservative, screening levels selected were taken from published soil screening levels deemed to be protective of residential receptors. Any metal detected in soil at concentrations higher than either the background concentration and the established screening levels for residential land use were retained in this PEA as COPCs. The only metals selected in soil as COPCs were antimony, arsenic, hexavalent chromium (Cr VI), cobalt, lead, and molybdenum. The selection of metal COPCs is presented in Table 5.

*Statistical Analysis of Soil Arsenic Data*

The purpose of the statistical analysis was to determine whether there are any distribution patterns in the soil arsenic data. The statistical methods used in the arsenic data evaluation were taken directly from DTSC's policy for selecting chemicals of potential concern at hazardous waste sites and permitted facilities (DTSC, 1997). The first objective of the statistical analysis is to determine if the soil arsenic data is likely to be drawn from the same population (i.e., all samples collected from a non-contaminated site). For this type of analysis, the DTSC

recommends to "construct a table showing […] the frequency of detection, range of detected values, range of sample quantitation limits, arithmetic means, standard deviations, and coefficients of variation. Typically, data drawn from just one population will display a range of detected values of no more than 2 orders of magnitude and a coefficient of variation of no greater than 1. When either of these conditions is not met, one must suspect that values representative of contamination have been included in the population" (DTSC, 1997, Section 7.3, page 4). The table recommended by the DTSC has been constructed for this analysis and is presented in Table 6.

As can be seen in Table 6, the conditions stipulated by the DTSC for one population data (i.e., detected values within 2 orders of magnitude and coefficients of variation of less than 1) are met by the soil arsenic data. Therefore, based on this analysis it can be concluded that soil arsenic data was probably drawn from one population. In other words, the results of this preliminary analysis seem to indicate that arsenic data detected in soil at the site are representative of regional, ambient conditions. The next step in the analysis of soil arsenic data was to determine whether there are any soil arsenic data that are outside the norm (possible outliers). The potential presence of outliers in the data was evaluated using a "Fourth Spread" analysis as recommended by the DTSC (2009). The Fourth Spread (Fs) of the soil arsenic data was obtained using the following formula:

$$Fs = (Q3 - Q1)$$

Where:

| | | |
|---|---|---|
| Fs | = | Fourth spread (milligrams per kilogram [mg/kg]) |
| Q3 | = | Third quartile (5.0 mg/kg) |
| Q1 | = | First quartile (1.25 mg/kg) |

The estimated Fs for the site is 3.75 mg/kg.

The upper bound of the site-specific arsenic concentration is defined as:

All data points greater than Q3 + [1.5 x Fs]

or

5.0 mg/kg + [1.5 x 3.75 mg/kg] = 10.63 mg/kg

According to these calculations, the upper bound of the site-specific soil arsenic concentration is 10.63 mg/kg.

## 3.3 TOTAL PETROLEUM HYDROCARBONS (TPH)

TPH is a mixture of hundreds of organic chemicals found in crude oil, natural gas, coal, coal tar, petroleum products, and other similar materials. It is not possible to determine the chemical, physical, and toxicological properties of TPH because its composition varies widely depending on its source, composition, and the industrial processes it has undergone. In addition, petroleum hydrocarbons in the environment (soil, water, and air) vary widely from one site to another because they are subjected to modifications by chemical, physical, and biological processes naturally present in the environment. Because of these considerations, it is not practicable to evaluate every compound present in petroleum products in a risk assessment. For these reasons, risk assessments of petroleum hydrocarbons are conducted by assessing the potential impacts from a select group of "indicator" chemicals. The indicator chemicals usually selected are those chemicals known to be present in most petroleum hydrocarbons and known to be the most toxic, persistent, and mobile in the environment. The chemicals known to be the most toxic and persistent components of TPH are the aromatic compounds.

The indicator chemicals usually selected are aromatic hydrocarbons and aliphatic fractions. Since aromatic hydrocarbons were detected in soil at the site (Table 3), the potential health risks and hazards posed by aromatic hydrocarbons are evaluated by assessing the risks posed by the individual VOCs detected. However, in an effort to be conservative it was assumed detected TPH is made up of 50-percent aromatics and 50-percent aliphatics.

# 4.0 EXPOSURE ASSESSMENT

California health and environmental protection agencies require the remediation of chemical spills and leaks if the release represents a threat to human health and the environment. Similarly, cleanup of an accidental release has to be conducted to the extent that the threat posed by the release is reduced to acceptable levels. The purpose of this PEA was to determine if the presence of anthropogenic chemicals in soil at the Site represents a threat to current and future site occupants.

## 4.1 CONCEPTUAL SITE MODEL

The potential for human exposure to chemicals residing in soil at the site is influenced by at least four factors:

- The types of chemicals present at the site;
- Chemical and physical interaction between the chemicals and the environment that act to move and transform the chemicals;
- Location and activities of onsite receptors that may place them in contact with either onsite or migrated chemicals; and
- Specific behaviors of these receptors that allow uptake of the chemical(s), either currently or in the future.

The Conceptual Site Model (CSM) developed for the site evaluates those exposure pathways that link the chemical sources and types of releases with human receptors.

An exposure pathway is considered complete if all of the following components are present:

- A chemical source;
- A release and transport (i.e., chemical migration) mechanism;
- A receptor (i.e., a potentially exposed person);
- An exposure point at a receptor location (i.e., chemicals are present where receptors are located); and
- An exposure route through which a receptor may be exposed (i.e., a chemical uptake route such as ingestion, inhalation, or dermal contact).

Each of these components and their interactions that may result in complete, incomplete or insignificant exposure pathways are discussed below. All exposure pathways considered in the evaluation are presented in Figure 3. In order to construct a realistic CSM, it is assumed that the

Site will be occupied by some form of industrial or commercial facility into the foreseeable future.

### *4.1.1 Identification of Potential Receptors*

As stated earlier, the site is located within an industrialized area of South El Monte, California. Therefore, the most likely future receptors at the site are commercial/industrial workers. The identification of potentially exposed populations is based on the location of the potential receptors. For this CSM, two distinct receptor locations are considered: onsite and off-site receptors. However, only the onsite receptors were quantitatively evaluated in this PEA, as off-site receptor exposures are likely to be much lower than those estimated for onsite receptors. In addition, protective measures and cleanup levels estimated to be protective of onsite receptors will also be protective of off-site receptors.

Onsite receptors include:

- *Full-time workers.* Full-time workers may include administrative and operations staff that work at a commercial/industrial facility at the site. These employees work 40-hour weeks and about 250 days per year.
- *Part-time workers.* Part-time workers may include specialized maintenance and operations personnel. Part-time workers may be present at the site in response to sporadic labor and specialized personnel needs. These workers are assumed to operate from temporary onsite offices and are not limited to 40-hour weeks. Employment duration for temporary workers is usually less than one year onsite.
- *Visitors.* Visitors are likely to be at the site for no more than a few hours a week.

For the purposes of this assessment, the potential receptors evaluated are:

- *Onsite Nonintrusive Maintenance Workers*. It is assumed some of the workers at the site would work almost exclusively outdoors. These workers may come in contact with chemical-impacted surface soil and dust while at work (Figure 3). However, these workers are not assumed to conduct earth-moving activities and/or dig trenches. Hence these workers are referred to as nonintrusive workers.
- *Onsite Construction Workers.* These workers are defined here as future construction workers and/or utility-line workers who might be engaged in short-term intrusive activities. These workers might come in contact with chemical-impacted soil while at the Subject Property (Figure 3).

As stated above, part-time workers and visitors could also be exposed to site-related chemicals while at the site. However, exposures for these two types of sporadic receptors are likely to be much lower than those potentially experienced by full-time workers. Therefore, only the onsite,

full-time worker exposure scenario was evaluated in this PEA. In addition, protective measures and cleanup levels estimated to be protective of full-time workers will also be protective of future part-time workers and visitors.

### *4.1.2 Identification of Exposure Media and Pathways*

As stated previously, onsite receptors might be exposed to impacted soil and dust. Soil represents a source and transport medium for site-related chemicals. Potential release mechanisms for contaminants in surface and shallow-subsurface soil include tracking, excavation, fugitive dust generation, volatilization, and uptake from contact. Human receptors may be indirectly exposed to contaminants from soil via inhalation of dust and may be directly exposed to contaminants in surface or shallow subsurface soils via incidental ingestion and dermal contact (Figure 3). Receptor-specific pathways for exposure to COPCs in soil that are considered in this PEA include current and/or future nonintrusive (maintenance) workers and construction workers may be exposed to COPCs in soil via incidental ingestion and dermal contact with soil, inhalation of fugitive dusts from surface soils (containing semivolatile chemicals), and potential volatilization of VOCs to ambient air from soil that could be brought up to the surface as a result of construction activities (Figure 3).

It should be noted that soil gas pathways are not evaluated in this PEA because, as a result of ongoing SVE remediation, the existing soil gas data may not be reflective of current or future site conditions. However, in general, VOCs may migrate into soil pore-space and then escape into indoor and outdoor air (Figure 3). The indoor air exposure pathway is not considered to be complete for construction and outdoor nonintrusive workers (Figure 3).

Although offsite receptors may also be exposed to site-related chemicals, their exposure should be substantially less than that estimated for onsite workers because of wind dispersion and dilution. Therefore, only exposure to onsite workers were quantitatively evaluated in this assessment (Figure 3).

## 4.2 EXPOSURE POINT CONCENTRATIONS

For direct contact exposures, such as soil ingestion and dermal absorption, Exposure Point Concentrations (EPCs) relate directly to measured chemical concentrations. The DTSC (2015 and 2019b) recommends the use of the use of the 95-percent upper confidence limit concentration (95UCL) as the representative soil EPC. For this evaluation, either the 95UCL or the maximum detected chemical concentrations were used as the EPCs for soil exposures. For inhalation exposures, EPCs were estimated by modeling contaminant concentrations in dust, vapors or fumes that may reach the breathing zone of a receptor.

The 95UCL for chemicals detected in soil was conducted using the ProUCL (Version 5.1) software (Singh, A. and Maichele, R., 2015), which is recommended by the USEPA. Only soil

quality data collected in the upper 10 feet of soil were included in the evaluation. Statistical parameters obtained for metals, PCBs, and TPH are presented in Tables 6, 7 and 8, respectively.

The USEPA (2002) recommends that the one-sided 95 percent upper confidence limit of the arithmetic mean (95UCL) be used as an upper bound chemical concentration that can be expected at a site. The 95UCL provides reasonable confidence that the true site average will not be underestimated. According to the USEPA (2002), risk assessment exposure concentrations should use the 95UCL for each COPC unless the 95UCL exceeds the maximum detected concentration for a particular chemical. Where the 95UCL exceeds the maximum detected concentration, the maximum detected concentration is used as the upper limit exposure concentration. The 95UCL can exceed the maximum detected concentration for several reasons, including small sample sizes and large sample variances. Following USEPA guidance, the lower value of the maximum concentration or the 95UCL was used in the risk calculations (USEPA, 2002). Copies of the ProUCL printouts are included in Appendix B.

Given the low frequency of detection for Cr VI (Table 1), Aroclor-1262 and Aroclor-1268 (Table 2) and VOCs (Table 4) a statistical analysis of soil data was not conducted for these chemicals, and the maximum detected concentration was used as the EPC.

### *4.2.1 Fate and Transport Modeling*

Vapor and particulate dust inhalation EPCs were modeled as follows:

*Particulate Emission Modeling* – Exposure to non-volatile chemicals may occur via inhalation of fugitive dust. Inhalation exposure to non-volatile compounds in fugitive dust is typically minor when compared to direct ingestion exposure (USEPA, 2002). Nevertheless, a relationship must be estimated between the chemical concentration in soil and the concentration in air (secondary media) due to fugitive dust emissions from soil. The USEPA (2002) and DTSC (2015) recommend using a particulate emission factor (PEF) to model chemical concentrations in airborne dust. The PEF is used in this risk evaluation to estimate inhalation exposures to fugitive dust at the site.

The PEF represents an annual average emission rate based on wind erosion. For this PEA, a PEF value of 1.36E+09 cubic meters per kilogram ($m^3/kg$) was used as the PEF for non-intrusive workers and a PEF of 1.0E+06 $m^3/kg$ was used to model dust exposure for construction workers (DTSC, 2019b). The ambient chemical air concentration due to dust emissions was obtained by dividing the soil chemical concentrations by the PEF. The estimated ambient air EPCs were used to estimate dust inhalation exposures.

*Vapor Emission Modeling* – Emissions of VOCs from soil to ambient outdoor air were modeled using a Volatilization Emission Factor (VEF) as described in USEPA's Supplemental Guidance

for Developing Soil Screening Levels for Superfund sites (USEPA, 2002). The VEF equation applicable to industrial/commercial sites is:

$$VEF = Q/C_{vol} * [(3.14 * D_A * T)^{1/2} * 10^{-4}]/(2 * P_b * D_A)$$

Where:

| | | |
|---|---|---|
| VEF | = | Volatilization emission factor ($m^3$/kg) |
| $Q/C_{vol}$ | = | Inverse of the ratio of the geometric mean air concentration to the volatilization flux at center of a square source (grams per square meter per second per kilogram per cubic meter [$g/m^2$-sec per $kg/m^3$]) |
| T | = | exposure interval (seconds [sec]) |
| $P_b$ | = | dry soil bulk density (grams per cubic centimeter [$g/cm^3$]) |
| $D_A$ | = | apparent diffusivity (square centimeters per second [$cm^2$/sec]) |

The above VEF equation employs an apparent diffusivity factor ($D_A$), which defines the tendency of a chemical to diffuse into soil gas as a function of the physical properties of the chemical and surrounding soil. To facilitate calculation of $D_A$ values, site-specific parameters were used. The dispersion factor term ($Q/C_{vol}$), which accounts for dispersion of the volatilized soil VOC into ambient air, can be modeled for sites ranging in size from 0.5 to 500 acres, and can be tailored to predominant meteorological conditions associated with particular cities within the United States. The estimated $Q/C_{vol}$ value of 68.81 $g/m^2$-sec per $kg/m^3$ associated with a 5-acre site located in Los Angeles, California was used. Vapor emission calculations were based on exposure durations of 25 years for non-intrusive workers. Substituting the above values and site-specific $D_A$ values into the above equation yielded individual VEFs for each soil VOC as shown in Table 9. These VEF values were used to model soil VOC emissions for onsite nonintrusive and construction workers.

## 4.3 DOSE ESTIMATION

Two types of chronic, chemical intake doses were calculated. Chemical intakes associated with non-carcinogenic adverse health effects were estimated by calculating the average daily intake (ADI). Non-carcinogenic exposures are expected to last as long as the receptor has contact with the site, which is typically less than a lifetime. In contrast, chemical intakes associated with carcinogenic health effects are averaged of a lifetime of 70 years, even though actual site exposures are also typically less than a lifetime. Thus, carcinogenic chemical intakes were estimated by calculating the lifetime average daily intake (LADI). The equation used to calculate ADI and/or LADI values for each exposure pathway and COPC is shown below:

$$(L)ADI = EPC \cdot \frac{RIF \cdot EF \cdot ED}{BW \cdot AT}$$

Where:

| | | |
|---|---|---|
| (L)ADI | = | (Lifetime) Average daily intake (mg/kg-day) |
| EPC | = | Exposure point concentration (units vary by media) |
| RIF | = | Route-specific intake factor (milligrams per day [mg/day]) |
| EF | = | Exposure frequency (days/year) |
| ED | = | Exposure duration (years) |
| BW | = | Body weight (kilograms [kg]) |
| AT | = | Averaging time (days) |

For ingestion, the RIF equals the soil ingestion rate. For dermal contact, RIF = SA*AF*ABS where SA = skin surface area, AF = soil to skin adherence factor and ABS = dermal absorption factor (chemical specific). For outdoor particulate and vapor inhalation, the RIF is the air inhalation rate (IR-A). These exposure parameters used to calculate the ADI and LADI for workers and construction workers under standard RME scenarios are listed in Table 10.

Health risks associated with environmental exposures are directly related to the duration of exposure. Provided the chemical concentrations in environmental media remain constant, the populations facing longer exposures will receive the highest dose and hence would face the highest estimated health risk. Therefore, it is customary to assess health risks based on the populations expected to receive a higher dose. If the health risks estimated for the "high dose populations" are found to be within acceptable levels, then other populations having lower intensity of exposure do not have to be evaluated as their exposures and health risks can be concluded to fall within acceptable levels.

# 5.0 TOXICITY VALUES

The term "toxicity values" refers to either "slope factors" that have been experimentally determined for carcinogens, or to "reference doses" that have been experimentally determined for chemicals that have other (or additional), non-carcinogenic adverse health effects. The slope factor (SF) is the result of application of a low-dose extrapolation procedure and is presented in units of "$[(mg/kg)/day]^{-1}$." The SF is used to estimate an upper-bound probability of an individual developing cancer as a result of a 30-year exposure to a carcinogen averaged over a lifetime. The higher the SF value, the greater is the probability that a particular chemical will cause cancer. For risk assessment purposes, any exposure to a carcinogen, regardless of the dose, is viewed as having the potential to cause cancer.

A reference dose (RfD) is an estimate (with uncertainty spanning perhaps an order of magnitude or greater) of a daily exposure level for the human population, including sensitive subpopulations, that is likely to be without an appreciable risk of causing deleterious effects during a lifetime. Hence, non-carcinogenic adverse health effects are dose-dependent. Regulators derive an RfD value for a chemical by dividing an experimentally determined "no observable adverse effect level" (NOAEL) by uncertainty factors (UFs) and modifying factors (MFs) that together may range from 3 to 1,000. Uncertainty factors and MFs are values that have been incorporated into the RfD to account for uncertainties in such variables as extrapolation of data from animals to humans, using dose-response information from short-term studies to predict chronic effects, and using dose-response data derived from healthy animal or human populations and extrapolating it to sensitive subpopulations, such as children and people in frail health. Hence, the UFs and MFs provide a margin of safety so that resulting RfD values are considered to be protective of all human health, including sensitive persons.

Both SFs and RfDs are dependent on the route of exposure. Therefore, SFs for a particular carcinogen may be different for oral (SForal), dermal (SFdermal) and inhalation (SFinh or Unit Risk Factor [URF]) exposure routes. The URF is defined as the probability of developing cancer from inhalation when exposed to 1 $ug/m^3$ of a chemical over a lifetime. Chronic Reference Exposure Levels (RELs) provided by the Office of Environmental Health Hazard Assessment (OEHHA) on their website are equivalent to RfCinh values (OEHHA, 2019). Similarly to SFs and URFs, RfDs may be different for oral (RfDoral), dermal (RfDdermal) and inhalation (RfCinh) exposure routes, where RfCinh refers to reference concentration in milligrams chemical/cubic meters air ($mg/m^3$). The purpose of the discussion below is to document the use of appropriate SFs and RfDs for the COPCs identified at the site.

## 5.1 SLOPE FACTORS

Potentially carcinogenic COPCs identified at the site are those for which a SF is listed in Table 11. Preliminary Endangerment Assessment (PEA) guidelines were followed in choosing appropriate slope factors for these compounds. That is, preference was given first to those SFs listed by OEHHA on their Toxicity Criteria Database (OEHHA, 2021), then to the USEPA as listed on their Integrated Risk Information System (IRIS) database (USEPA, 2019). Finally, if toxicity values were unavailable from either of these sources, then values listed through the harmonized efforts of USEPA Regions III, VI and IX in their Regional Screening Levels (RSL) Table were used (USEPA, 2021).

Confidence in SF values is expressed either by the USEPA or by the International Agency for Research on Cancer (IARC) as a "weight of evidence classification." According to the USEPA classification system, Class A carcinogens are those which are supported by human data. Class B1 or B2 carcinogens are regarded as probable carcinogens, where B1 indicates that limited human data are available and B2 indicates that sufficient evidence exists in animals, but there is inadequate or no data in humans. Class C indicates that the chemical is a possible human carcinogen. Class D indicates that the compound is not classifiable as a human carcinogen. Class E indicates that evidence exists supporting the idea that the chemical is not carcinogenic in humans.

In this assessment, chronic toxicity criteria were selected in accordance with the DTSC Regulation "Toxicity Criteria for Human Health Risk Assessment" (effective September 2018) (https://dtsc.ca.gov/LawsRegsPolicies/Regs/Toxicity-Criteria-for-Human-Health-Risk-Assessment.cfm). Toxicity information was obtained from the DTSC Human and Ecological Risk Office (HERO) HHRA Note 10, Toxicity Criteria (DTSC, 2019a). Cancer slope factors and unit risk factors used for the COPCs detected at the site are summarized in Table 11.

## 5.2 REFERENCE DOSES

Reference doses (RfDs) for COPCs identified at the Site are also listed in Table 11. DTSC guidelines were followed in choosing appropriate reference doses (DTSC, 2019a); i.e., preference was given first to those Reference Exposure Levels (RELs) listed on OEHHA's Toxicity Criteria Database (OEHHA lists only inhalation) (OEHHA, 2021), then to RfCs and RfDs listed on USEPA's IRIS web site (USEPA, 2019), and finally to RfDs listed on USEPA Region IX's RSL table (USEPA, 2021). OEHHA RELs or $RfC_{inh}$ values were used to calculate $RfD_{inh}$ values when the latter were unavailable (DTSC, 2019a). RfD and RfC for COPCs detected at the site are summarized in Table 11.

# 6.0 RISK CHARACTERIZATION

The Risk Characterization section provides a quantitative estimation of the health risks associated with chemical exposure. The risk characterization used the toxicity information from Section 5.0; the exposure factors estimated in Section 4.0; and the estimated chemical EPCs from Sections 2.0 and 3.0 to evaluate both non-carcinogenic and carcinogenic health effects. Non-carcinogenic health effects were characterized with respect to established regulatory criteria and carcinogenic health risks were characterized with respect to acceptable cancer risks.

Health risk and hazard estimates presented in this section have been developed for nonintrusive workers and construction workers. For all exposure scenarios evaluated, health risk and hazards were estimated assuming that shallow soils would be excavated and exposed to the surface. Under these conditions, it was assumed that nonintrusive workers and construction workers will have direct contact with soil and dust through the ingestion, dermal contact and inhalation pathways.

## 6.1 NON-CARCINOGENIC RISK CHARACTERIZATION

USEPA's policy regarding non-carcinogenic chemicals differs from its policy for carcinogens (USEPA, 1989). With respect to non-carcinogens, it has been postulated that for systemic toxicity effects to occur, physiological, homeostatic, compensating, and adaptive mechanisms existing in humans must first be rendered inactive prior to any manifestation of a particular toxic response. USEPA's theory for non-carcinogens is that the toxic response has a "threshold" concentration above which toxic effects may occur. USEPA has established RfDs for several of the non-carcinogenic COPCs, which represent the dose of the chemical not expected to result in adverse health effects, even over a lifetime of exposure.

The likelihood of manifesting non-carcinogenic effects is not expressed as a probability as is the likelihood for carcinogenic risk. USEPA recommends evaluation of non-carcinogenic potential using a calculation of hazard quotients (HQ) and hazard indices (HI). The HQ is a pathway-specific (e.g., dermal, inhalation) ratio of the average daily intake (ADI) for each chemical compared to the agency-established, chemical-specific chemical reference dose (RfD). Reference doses are chemical doses considered to be "safe" for lifetime exposures by regulatory agencies. The HI is the sum of all the HQs for an individual pathway and from all pathways of exposure and is used to assess total non-carcinogenic risks. If either an HQ or the HI exceeds a value of 1.0, there "may be a concern for potential non-carcinogenic effects" (USEPA, 1989). Any HQ or HI less than 1.0 indicates that there is a low probability of adverse health effects occurring for the evaluated exposure scenarios.

The evaluation of non-carcinogenic health hazards began with a calculation of the hazard quotient or HQ for each chemical. The HQ can be expressed according to the following equation:

$$HQ = \frac{ADI}{RfD}$$

Where:

$$ADI = EPC \bullet Pathway\ Specific\ EFn$$

And:

| | | |
|---|---|---|
| HQ | = | Hazard quotient (unitless) |
| ADI | = | Average daily intake (mg/kg/day) |
| RfD | = | Reference dose (mg/kg/day) |
| EPC | = | Exposure point concentration ($mg/m^3$ for air, mg/kg for soil) |
| EFn | = | Exposure factor for non-carcinogens, $m^3$/kg-day for inhalation and kg/kg-day for oral and dermal. |

The HQs for each chemical and all exposure pathways were summed to estimate the hazard index (HI) for each receptor as follows:

$$HI = \sum_{n}^{1} HQ_i$$

Where:

| | | |
|---|---|---|
| HI | = | Hazard index, unitless |
| HQi | = | as defined above, unitless |

The HIs and HQs estimated for onsite nonintrusive and construction workers exposed to chemical-affected dust and soil through the ingestion, dermal and inhalation pathway are presented in Table 12. Supporting calculations for each exposure pathway are presented in Appendix C. The estimated HQs for each receptor are summarized below:

*Onsite Nonintrusive Maintenance Workers*

- 0.6 for nonintrusive workers exposed to soil, dust and outdoor volatiles through the ingestion, dermal and inhalation pathways (Table 12).

*Onsite Construction Worker*

- 2 for construction workers exposed to soil, dust and outdoor volatiles through the

ingestion, dermal and inhalation pathways (Table 12).

According to the USEPA (1989), if the HI is less than 1, there is no concern for potential chronic adverse health effects from the chemical exposures. In cases where the total HI exceeds 1, DTSC (2015) guidance recommends evaluating "risk drivers" by the target organ of toxicity. If the HI estimated for each target organ of toxicity is less than 1, then it can be concluded that there is no concern for chronic exposures. The HI estimated in this PEA for construction workers slightly exceeds the acceptable value of 1. The HI "risk drivers" identified for the site are antimony, cobalt, Cr VI and TPH in soil (Table 12). The target organ of toxicity for the "risk drivers" are:

- Gastrointestinal damage for antimony.
- Thyroid damage for cobalt.
- Liver and kidney damage Cr VI.
- Heart and central nervous system damage for TPH.

Since none of the HI "risk drivers" identified have a common target organ of toxicity, it can be concluded that exposure to the COPCs detected in soil at the site do not pose a health hazard to future onsite workers.

Due to the unique toxicological properties of arsenic and lead, the DTSC (2020) recommends the use of screening levels developed specifically for each metal. For arsenic, the DTSC (2009) recommends the use of local background soil arsenic concentrations as the screening level. The local background arsenic concentration at the site was estimated to be 10.63 mg/kg (discussed in Section 3.2). Therefore, the screening level used in this PEA for arsenic is the local background concentration of 10.63 mg/kg. The 95UCL soil arsenic concentration at the site was estimated to be 4.88 mg/kg (Table 6). This value is lower than the local background concentration of 10.63 mg/kg. Since the soil arsenic 95UCL is below the soil background concentration, arsenic detected at the site is considered to be within background levels and deemed to pose no health risk to onsite workers.

For lead, the DTSC recently published a soil screening level (DTSC-SL). The commercial/industrial DTSC-SL for lead is 500 mg/kg (DTSC 2022). The DTSC considers average soil lead concentrations lower than 500 mg/kg to pose no health threat to onsite workers. The 95UCL soil lead concentration for the site was estimated to be 1,443 mg/kg (Table 6). Therefore, lead in soil at the site is considered to pose a potential health hazard to exposed workers.

## 6.2 INCREMENTAL CANCER RISKS

Cancer risks are expressed as the upper-bound, increased likelihood of an individual developing cancer as a result of exposure to a particular chemical. For example, a cancer risk of 1E-04 refers to an upper-bound increased chance of one in ten thousand of developing cancer over a lifetime (0.01 percent risk). The potential increase in cancer risk from exposure to the chemicals detected in soil at the site is in addition to a background risk of Americans developing cancer. The background risk is one chance in three (0.3 or 3E-01) for every American female, and one chance in two (0.5 or 5E-01) for every American male, of eventually developing cancer (ACS, 1997). The chemical-specific exposure estimates (i.e., the lifetime average daily dose or LADD) are multiplied by the chemical- and route-specific slope factor to arrive at a unitless probability (e.g., 1E-05) of an individual developing cancer.

Incremental lifetime human health risks associated with exposure to carcinogenic COPCs was calculated in accordance with DTSC (2015) and USEPA (1989) guidelines. The following equation was used to calculate incremental lifetime carcinogenic risks from exposure to carcinogenic COPCs as shown below (USEPA, 1989):

$$Risk = (LADI) \bullet SF$$

Where:

$$LADI = Co \bullet Pathway\ Specific\ EFc$$

And:

| | | |
|---|---|---|
| Risk | = | Upper bound incremental lifetime carcinogenic risk (unitless) |
| LADI | = | Lifetime averaged daily intake (milligrams per kilogram per day [mg/kg/day]) |
| Co | = | Exposure point concentration, (milligrams per cubic meter [$mg/m^3$]) in air, (mg/kg) in soil |
| EFc | = | Intake factor for carcinogens ($m^3$/kg-day) for inhalation and (kg/kg-day) for oral and dermal. |
| SF | = | Cancer slope factor $(mg/kg/day)^{-1}$ |

The incremental cancer risks estimated for nonintrusive and construction workers exposed to chemical-impacted soil and dust through the ingestion, dermal and inhalation pathway are presented in Table 12. Supporting calculations for each exposure pathway are presented in Appendix C. The estimated incremental cancer risks for the exposure scenarios evaluated were:

*Onsite Nonintrusive Workers*

- 2E-05 for nonintrusive workers exposed to soil, dust and outdoor volatiles through the

ingestion, dermal and inhalation pathways (Table 12).

*Onsite Construction Worker*

- 1E-05 for construction workers exposed to soil, dust and outdoor volatiles through the ingestion, dermal and inhalation pathways (Table 12).

The calculated excess carcinogenic risks were compared to the "acceptable" risk value of 1.0E-05 (ten excess cancer cases in a population of 1,000,000 exposed individuals). Incremental cancer risks estimated in this PEA for nonintrusive workers exposed to soil and dust slightly exceed the acceptable risk value of 1E-05.

The “risk driver” identified in soil was Cr VI. Although present in a very small number of samples and not widely dispersed throughout the site (see Table 1), this metal detected in soil contributed up to 97% and 67% of the estimated cancer risk for construction workers and nonintrusive workers, respectively.

# 7.0 RISK-BASED CLEANUP LEVEL DEVELOPMENT

Results of the risk evaluation presented above indicate that, in the absence of soil remediation, Cr VI and lead in soil may be present at concentrations that could pose a health hazard and/or a cancer risk to onsite workers.

In anticipation of site redevelopment, RBCLs for the protection of human health were developed for the site. RBCLs are soil concentrations that are believed to be protective of human health and the environment. RBCLs developed for the site express a COPC concentration and an exposure route, rather than a concentration alone, because protectiveness may be achieved by reducing exposure by means other than COPC mitigation (such as capping an area, limiting access, stabilization or other engineering controls).

Site-specific RBCLs for soil were calculated considering human health exposure pathways, and background concentrations using a methodology and approach recommended by the DTSC (2015 and 2020). The RBCLs were developed assuming that impacted soils are accessible to maintenance and construction workers. In reality, the majority of the site will be paved or covered by buildings and exposure would be very limited. For these covered areas, soils exceeding RBCLs can remain in place provided administrative controls (such as a land use covenant and soil management plan) are used to minimize or prevent worker exposure to chemical-impacted soils. Some of the soil risk management controls that can be considered for the site are:

- Onsite soil management including the necessary Best Management Practices (BMPs) and institutional controls.
- Containment, fixation, capping, encapsulation or stabilization of Cr VI and lead in soil.
- The excavation and removal of Cr VI- and lead-impacted soils. If excavation were to be considered for Cr VI, the goal of soil remediation should be to excavate and remove soil sample LV-10-1 (see Table 1) as only this sample contained Cr VI at concentrations deemed to pose a cancer risk. Confirmation soil samples collected at and around the excavated soil sample should be at or below the RBCLs developed in this chemical (55.36 mg/kg; Table 13). For lead, soil excavation and removal should reduce the soil lead 95UCL to less than the DTSC's soil lead screening level of 500 mg/kg.

Enviro-Tox conducted a virtual soil remediation by removing from the statistical analysis all samples containing lead in soil at concentrations higher than 2,000 mg/kg. The estimated soil lead 95UCL at the completion of the virtual remediation was 150 mg/kg (Appendix B). Based

on the results of the virtual remediation, Enviro-Tox model resulted in the removal of only soils containing lead at concentrations higher than 2,000 mg/kg. Enviro-Tox also recommends confirmation soil samples be taken at the completion of excavation activities and that the soil lead 95UCL be calculated. Excavation activities for the remediation of lead-impacted soils should be considered complete once the overall soil lead concentration 95UCL is below 500 mg/kg.

## 7.1 DEVELOPMENT OF RISK-BASED CLEANUP LEVELS

RBCLs for the site were developed using applicable USEPA (1991a and b) and DTSC (2015) methodology and development criteria. This section describes in detail the development of RBCLs for the site.

The equations used to estimate RBCLs for soil involve the reverse of the calculation procedure used for the health risk assessment presented in previous sections of this report. Given a target risk limit at the exposure points, the maximum allowable concentration at the source zone is back-calculated based on the applicable exposure factors and toxicity parameters.

RBCL for carcinogenic chemicals were calculated by setting the target risk for occupational receptors at a DTSC-acceptable level of 10 in 1 million cancer risk (1E-05) and then solving for the concentration variable using the previously estimated incremental cancer risk associated with a soil exposure point concentration. The following equation defines the relationship between RBCLs, exposure point concentrations and cancer risk:

$$RBCL = EPC \times \frac{TR}{Chemical - Specific\ \&\ Site - Specifc\ CR}$$

Where:

| | | |
|---|---|---|
| RBCL | = | Risk-based cleanup levels (mg/kg for soil) |
| EPC | = | Chemical exposure point concentration used in the risk calculation (mg/kg) |
| TR | = | Target risk limit for carcinogenic effects (1E-05; unitless) |
| CR | = | Incremental cancer risk estimated to be associated with the site- and chemical-specific exposure point concentration (unitless) |

RBCLs for non-carcinogens are set by choosing an acceptable hazard index for the site and then solving for a chemical concentration in the environmental media that meets the chosen hazard index. The equation that defines the relationship between soil exposure point concentrations, hazard index and RBCLs is:

$$RBCL = EPC \times \frac{THI}{Chemical-Specific\ \&\ Site-Specific\ HI}$$

Where:

THI = Target hazard index for non-carcinogenic effects (1.0; unitless)
HI = Hazard index estimated to result from multipathway exposures at site-and chemical-specific exposure point concentrations (unitless).
All others as previously defined.

The target hazard index (THI) chosen was 1.0 in accordance with DTSC (2015) regulatory guidance.

Calculations of soil RBCLs for protection against cancer and non-cancer effects through the inhalation, incidental ingestion, dermal contact with soil and inhalation of outdoor air are presented in Table 13.

The final step in the derivation of RBCL is the selection of cleanup levels for protection against non-carcinogenic and carcinogenic effects. For chemicals having target cleanup levels for protection against carcinogenic and non-carcinogenic effects, the lower of the two values was selected as the RBCLs (Table 13). For all other chemicals not known to be carcinogenic, the RBCLs adopted were the cleanup levels estimated to protect from non-carcinogenic effects (Table 13).

# 8.0 UNCERTAINTY ANALYSIS

The frequency and duration of soil and dust contact activities are a significant factor affecting the potential for adverse human health impacts from the site. In addition, the chemical distribution in site soils can significantly affect the interpretation of risk results based on the exposure point concentrations used in the analysis. These factors are discussed in more detail below.

This PEA is based on the application of conservative methods and assumptions in all phases of the assessment. Because exposure point concentrations were derived from fate and transport modeling, conservative assumptions and methodology were necessarily employed to eliminate the possibility of underestimating risks. This practice, although commonly used in the risk assessment process, necessarily introduces a significant level of conservatism in the conclusions derived from the assessment. Examples of some of the conservatism in this assessment include:

- The assumption that future receptors at the site would be exposed to chemicals in soil and dust 100 percent of the time. In reality, future receptors are not likely to be onsite for more than 8 hours per day, for no more than 10 years.
- The assumption that future onsite commercial/industrial workers have contact with soil. However, it is known that the entire surface area of the site will be occupied by a new warehouse and office buildings, asphalt and concrete paving or landscaped areas. Thus, onsite workers are not likely to come in contact with soil while at the site.
- Carcinogenic risks for all pathways for onsite commercial/industrial workers were based on an exposure of 250 days per year for 25 years. A more realistic exposure scenario for a typical worker would be to assume an exposure frequency of 250 days per year for a duration of no more than 7 years.
- It was also assumed that COPC concentrations would remain constant over time. It is more likely that, due to natural degradation processes, COPC concentrations would decrease over time. Thus, estimated COPC intake would decrease over time, which would result in lower risk estimates than presented in the PEA.
- Toxicity values used in risk assessments present overestimates of the potential toxicity of chemicals to humans. Assumptions used to develop toxicity values include the addition of safety factors to account for uncertainties associated with extrapolating high doses to low doses and uncertainties associated with the use of laboratory animal studies to assess potential toxicity to human receptors.

All conclusions and recommendations presented in this report are based on reported chemical concentrations in soil and the current land use of the site without considering the operation of the SVE system. In this risk assessment, all fate-and-transport models, parameters, toxicity data and

assumptions were used in accordance with federal and state regulatory guidelines. These guidelines are meant to protect the public and tend to overestimate potential health risks. As such, this risk assessment provides a conservative estimate of the upper boundary of potential health risks, rather than an accurate representation of true health risks posed by the site.

Notes:
-- = not analyzed
< "X" = not detected above the method detection limit or reporting limit "X"
EEC = EEC Environmental
EFI = EFI Global
J = Estimated value; concentration above the method detection limit but below the reporting limit
LCI = Leighton Consulting, Inc.
ug/kg = micrograms per kilogram

Notes:
-- = not analyzed
< "X" = not detected above the method detection limit or reporting limit "X"
J = Estimated value; concentration above the method detection limit but below the reporting limit
ug/kg = micrograms per kilogram

Table 5 - Comparison of Metals in Soil To Background and Soil Screening Levels
2200 North Rosemead Boulevard
South El Monte, California

| Metal | Maximum Sitewide Concentration (mg/kg)[a] | Soil Background Levels Based on California Air Force Bases | | Residential Soil Screening Levels | | | Selected as a COPC? |
|---|---|---|---|---|---|---|---|
| | | 95th Percentile (mg/kg)[b] | Exceeds Soil Background Levels? | USEPA Soil RSLs (mg/kg) | Note 3 Soil SLs (mg/kg) | Exceeds Soil Screening Levels? | |
| Antimony | 730 | 12.5 | Yes | 31.00 | na | Yes | **Yes** |
| Arsenic | 40 | 10.63 (site-specific) | Yes | 0.68 | 0.11 | Yes | **Yes** |
| Barium | 2200 | 320 | Yes | 15,000 | na | No | No |
| Beryllium | 0.796 | 1.1 | No | 160 | 16 | No | No |
| Cadmium | 15 | 2.2 | Yes | 71.0 | 71.0 | No | No |
| Chromium | 5100 | 49.4 | Yes | 120,000 | 36,000 | No | No |
| Chromium (VI) | 73 | 2.00 | Yes | 0.30 | 0.30 | Yes | **Yes** |
| Cobalt | 35 | 22 | Yes | 23 | na | Yes | **Yes** |
| Copper | 1250 | 53.3 | Yes | 3,100 | na | No | No |
| Lead | 2600 | 25 | Yes | 400 | 80 | Yes | **Yes** |
| Mercury | 2.3 | 0.3 | Yes | 23 | 1.0 | No | No |
| Molybdenum | 480 | 20 | Yes | 390 | na | Yes | **Yes** |
| Nickel | 120 | 41.5 | Yes | 1,500 | 820 | No | No |
| Silver | 5.1 | 2.1 | Yes | 390 | na | No | No |
| Thallium | 1.6 | 25 | No | 0.78 | na | Yes | No |
| Vanadium | 75.3 | 88.3 | No | 390 | na | No | No |
| Zinc | 1770 | 104 | Yes | 23,000 | na | No | No |

Notes:

mg/kg - milligrams per kilogram

a - Maximum concentration from the 0 to 10 foot soil depth below ground surface.

b - Naturally Occurring Concentrations of Inorganic Chemicals in Ground Water and Soil at California Air Force Installations. DTSC

RSL - Regional Screening Level. From Regional Screening Level Table (RSL) Master (EPA, 2021)

Note 3 SLs - Cal-EPA 2020. Human Health Risk Assessment (HHRA) Note Number 3. DTSC-modified Screening Levels. June

na - Not Available

**Bold+Shaded** Indicates the concentrations which exceeded their respective residential soil screening level; therefore, these metals were selected as chemicals of potential concern (COPCs)

Table 6 - Statistical Parameters for Metals Selected as Chemicals of Potential Concern
2200 North Rosemead Boulevard
South El Monte, California

| Statistical Parameters | Metals | | | | |
|---|---|---|---|---|---|
| | Antimony | Arsenic | Cobalt | Lead | Molybdenum |
| Number of Samples | 112 | 123 | 111 | 181 | 119 |
| Number Detected | 21 | 61 | 109 | 122 | 20 |
| Number Non Detected | 91 | 62 | 2 | 59 | 99 |
| Percent Non-Detected | 81.25 | 50.41 | 1.8 | 32.6 | 83.19 |
| Minimum Detected (mg/Kg) | 1.6 | 1.6 | 0.991 | 3.6 | 0.543 |
| Maximum Detected (mg/Kg) | 730 | 40.2 | 35 | 26000 | 480 |
| Mean Concentration (mg/Kg) | 44.44 | 7.38 | 8.581 | 821.1 | 34.99 |
| Median Concentration (mg/Kg) | 2.98 | 5 | 7.8 | 18.5 | 3.075 |
| Standard Deviation | 158 | 6.973 | 5.522 | 3308 | 106.8 |
| Coefficient of Variability | 3.556 | 0.945 | 0.644 | 4.028 | 3.053 |
| 95 Percent Upper Confidence Limit (95UCL) (mg/Kg) | 72.45 | 4.879 | 9.37 | 1443 | 1.67 |

Notes:

mg/Kg = Milligrams per kilogram

NC = Not calculated due to insufficient detections.

Table 7 - Statistical Parameters for PCBs Selected as Chemicals of Potential Concern
2200 North Rosemead Boulevard
South El Monte, California

| Statistical Parameters | Polychlorinated Biphenyls | | |
|---|---|---|---|
| | **Aroclor-1248** | **Aroclor-1254** | **Aroclor-1260** |
| Number of Samples | 106 | 158 | 158 |
| Number Detected | 4 | 33 | 25 |
| Number Non Detected | 102 | 125 | 133 |
| Percent Non-Detected | 96.23 | 79.11 | 84.18 |
| Minimum Detected (mg/Kg) | 0.069 | 0.0667 | 0.073 |
| Maximum Detected (mg/Kg) | 13 | 30.6 | 4 |
| Mean Concentration (mg/Kg) | 3.655 | 4.472 | 0.674 |
| Median Concentration (mg/Kg) | 0.775 | 0.906 | 0.216 |
| Standard Deviation | 6.254 | 8.372 | 1.021 |
| Coefficient of Variability | 1.711 | 1.872 | 1.514 |
| 95 Percent Upper Confidence Limit (95UCL) (mg/Kg) | 0.697 | 0.37 | 0.105 |

Notes:
mg/Kg = Milligrams per kilogram
NC = Not calculated due to insufficient detections.

Table 8 - Statistical Parameters for TPH Fractions Selected as Chemicals of Potential Concern
2200 North Rosemead Boulevard
South El Monte, California

| Statistical Parameters | Total Petroleum Hydrocarbons | | |
|---|---|---|---|
| | TPH-g | TPH-d | TPH-mo |
| Number of Samples | 124 | 144 | 144 |
| Number Detected | 13 | 56 | 104 |
| Number Non Detected | 111 | 88 | 40 |
| Percent Non-Detected | 89.52 | 61.11 | 27.78 |
| Minimum Detected (mg/Kg) | 0.16 | 4.2 | 4.5 |
| Maximum Detected (mg/Kg) | 2600 | 8500 | 33000 |
| Mean Concentration (mg/Kg) | 255 | 511.3 | 917.6 |
| Median Concentration (mg/Kg) | 8.2 | 15.5 | 17 |
| Standard Deviation | 711.1 | 1426 | 3780 |
| Coefficient of Variability | 2.789 | 2.789 | 4.12 |
| 95 Percent Upper Confidence Limit (95UCL) (mg/K | 129.5 | 537.4 | 1841 |

Notes:
mg/Kg = Milligrams per kilogram
NC = Not calculated due to insufficient detections.

Table 9 - Volatilization Emission Factor Calculation
Construction Worker and Non-Intrusive Worker Exposure Scenarios
2200 North Rosemead Boulevard
South El Monte, California

| Soil Parameters | Value Used | Units | Reference |
|---|---|---|---|
| Water filled soil porosity (Theta w) | 3.40E-01 | (Lwater-Lsoil) | Default |
| Total soil porosity (n) | 4.40E-01 | (Lpore-Lsoil) | Default |
| Air filled soil porosity (Theta a) | 1.00E-01 | (Lair-Lsoil) | Default |
| Soil particle density (ps) | 2.69E+00 | $g/cm^3$ | Default |
| Exposure Interval (T) | 9.50E+08 | sec | Default (EPA 1996) |
| Soil Bulk Density (Pb) | 1.5 | $g/cm^3$ | Default |
| Fraction organic carbon in soil | 3.00E-03 | unitless | Default |
| Inverse of mean concentration (Q/C) (for VF) | 68.81 | ($g/m^2$-s per $kg/m^3$) | Default for a 5-acre site in Los Angeles (EPA 1996) |

| Compound | Diffusivity in air (Di) ($cm^2$/sec) | Henry's Law Const (H') (dimensionless) | Diffusivity in water (Dw) ($cm^2$/sec) | Soil-water partition coefficient (Kd) ($cm^3$/g) | Soil organic carbon partition coefficient (Koc) ($cm^3$/g) | Apparent Diffusivity (Da) | Volatilization Factor (VF) |
|---|---|---|---|---|---|---|---|
| **VOCs** | | | | | | | |

-- = not analyzed
(a) = San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (ESLs), July 2019; Table S-1.
(b) = Department of Toxic Substances Control (DTSC) Screening Level for Industrial Soils; June 2020
J = Estimated value; concentration above the method detection limit but below the reporting limit
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
< 2.6 = not detected above the method detection limit or reporting limit
EEC = EEC Environmental
EFI = EFI Global
LCI = Leighton Consulting, Inc.
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
TCLP = Toxicity Characteristic Leaching Procedure

Key:
-- = not analyzed
J = Estimated value; concentration above the method detection limit but below the reporting limit
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram

< "X" = not detected above the method detection limit or reporting limit "X"
B = Constituent found in associated method blank
EEC = EEC Environmental
EFI = EFI Global
LCI = Leighton Consulting, Inc.

Key:
-- = not analyzed
J = Estimated value; concentration above the method detection limit but below the reporting limit
DF = Dilution Factor
ug/kg = micrograms per kilogram
< "X" = not detected above the method detection limit or reporting limit "X"
EEC = EEC Environmental
EFI = EFI Global
LCI = Leighton Consulting, Inc.

### Gamma Statistics on Detected Data Only

| | | | |
|---|---|---|---|
| k hat (MLE) | 2.032 | k star (bias corrected MLE) | 1.943 |
| Theta hat (MLE) | 3.632 | Theta star (bias corrected MLE) | 3.798 |
| nu hat (MLE) | 247.9 | nu star (bias corrected) | 237.1 |

| | |
|---|---|
| Mean (detects) | 7.38 |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |
|---|---|---|---|
| Minimum | 0.01 | Mean | 3.665 |
| Maximum | 40.2 | Median | 0.01 |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |
|---|---|---|---|
| Minimum | 0.01 | Mean | 5.889 |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| SD in Original Scale | 918.4 | SD in Log Scale | 1.82 |
| 95% t UCL (Assumes normality) | 329.4 | 95% H-Stat UCL | 84.06 |

DL/2 is not a recommended method, provided for comparisons and historical reasons

**Nonparametric Distribution Free UCL Statistics**

Data do not follow a Discernible Distribution at 5% Significance Level

**Suggested UCL to Use**

| | |
|---|---|
| 95% KM (Chebyshev) UCL | 537.4 |

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

**Detected Data Not Gamma Distributed at 5% Significance Level**

**Gamma Statistics on Detected Data Only**

| | | | |
|---|---|---|---|
| k hat (MLE) | 0.238 | k star (bias corrected MLE) | 0.237 |
| Theta hat (MLE) | 3858 | Theta star (bias corrected MLE) | 3866 |
| nu hat (MLE) | 49.47 | nu star (bias corrected) | 49.37 |
| Mean (detects) | 917.6 | | |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |
|---|---|---|---|
| Minimum | 0.01 | Mean | 662.7 |
| Maximum | 33000 | Median | 9.75 |
| SD | 3235 | CV | 4.881 |

Table C-2
Health Hazards from Dermal Contact with Soil
Construction Worker and Non-Intrusive Worker Exposure Scenarios
2200 North Rosemead Boulevard
South El Monte, California

| COPC | Exposure Point Concentration (mg/kg) | Soil-to-Skin Absorption Factor (Unitless) | Oral/Dermal Reference Dose (mg/kg-day) | Worker Exposure Scenario | | | |
|---|---|---|---|---|---|---|---|
| | | | | Average Daily Intake (mg/kg-day) | | Hazard Quotient (Unitless) | |
| | | | | Construction Worker | Non-Intrusive Worker | Construction Worker | Non-Intrusive Worker |
| **Total Hazard Index** | | | | | | **7.9E-01** | **2.0E-01** |

Notes: "nd" not detected
mg/kg = milligrams per kilogram
NA = Not applicable
Equations:
Construction Worker $INTAKE_{noncancer}$ (mg/kg-day) = (CS * SAiw * AFiw * ABS * FE * EFiw * EDiw * CF) / (BWiw * $AT_{noncancer}$)
Non-Intrusive Worker $INTAKE_{noncancer}$ (mg/kg-day) = (CS * SAcw * AFcw * ABS * FE * EFcw * EDcw * CF) / (BWcw * $AT_{noncancer}$)
Noncancer Hazard = ($INTAKE_{noncancer}$ / RfD)

mg/kg = milligrams per kilogram
NA = Not applicable
Equations:
Construction Worker $INTAKE_{cancer}$ (mg/kg-day) = (CS * IR-Siw * FE * EFiw * Ediw * CF) / (BWiw * $AT_{cancer}$)
Non-Intrusive Worker $INTAKE_{cancer}$ (mg/kg-day) = (CS * IR-Scw * FE * EFcw * EDcw * CF) / ($BW_{cw}$ * $AT_{cancer}$)
Cancer Risk = ($INTAKE_{cancer}$ * CSF)

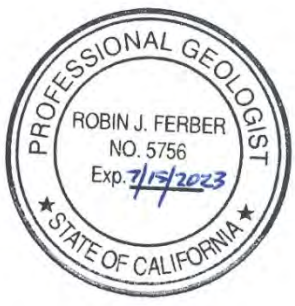
Attention: Mr. Wayne Wang, Owner

**Subject:** **Report - Limited Soil and Soil Vapor Site Investigation**
**Rosemead Holding, LLC - Phase 1 Development Site**
**2200 North Rosemead Boulevard**
**South El Monte, California**

This Limited Soil and Soil Vapor Site Investigation Report was prepared for Rosemead Holding, LLC's Phase 1 development project, which is located at 2200 North Rosemead Boulevard, South El Monte, California. The report was prepared by Leighton Consulting Inc. for Rosemead Holding, LLC, in a manner consistent with the level of care and skill ordinarily exercised by professional geologists and environmental scientists. This Report was prepared under the technical direction of the undersigned which include a California Professional Engineer and a California Professional Geologist.

Respectfully submitted,

LEIGHTON CONSULTING, INC.



Marius Vilkas
Staff Geologist

# 1.0 INTRODUCTION

Leighton Consulting, Inc. (Leighton) has prepared this report for Rosemead Holding, LLC (RH) to summarize the results of the limited soil and soil vapor investigation conducted in June 2021 at 2200 Rosemead Boulevard in South El Monte, California (the site or subject property). The site includes all or portions of the following Los Angeles County AIN parcels: 8102-039-031, 8102-039-035, 8102-039-029, and 8102-039-030.

The tenants located at or recently vacated the site include:

1. The easternmost and most significant portion of the site is occupied by Ditty Container, Inc. Ditty subleased the from Pacific Coast Drum Company (PCD) from in 1996 and is in the process of vacating the site. Both PCD and Ditty cleaned, refurbished, and in some cases repainted drums and refurbished plastic tote containers since the 1940s, primarily for the food industry.

2. The northwestern-most portion of the site was formerly operated by BJ's Tire Spot and used for tire and truck tire repairs. We understand this tenant has vacated the site.

3. The two buildings south of BJ's Tire Spot were occupied by DreamWorks Auto Center and were used for auto body repair. Some of the building office space was shared between both with Ditty and DreamWorks Auto Center. We understand DreamWorks Auto Center has vacated the site.

The site is generally located north of Rush Street and east of Rosemead Boulevard in the City of South El Monte, California (see Figure 1).

This report also provides information for RH on how to address areas of the site where shallow soil is affected with selected metals, volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and total petroleum hydrocarbons (TPH) exceeding regulatory-approved screening levels. In addition, this report addresses options associated with VOCs in soil vapor that exceed screening levels and may require mitigation. Soils requiring management as nonhazardous waste, non-RCRA hazardous waste, and/or RCRA hazardous waste requiring offsite disposal at a permitted landfill or facility are also discussed.

This industrial site is approximately 5.1-acres primarily consisting of concrete and asphalt paved lots with limited areas of exposed soil and vegetation in the southern portion. (Figure 2). The central, northern, and western portions of the subject property have five buildings; the easternmost buildings have been utilized for industrial cleaning

activities associated with Ditty Container, Inc. The westernmost buildings are currently vacant but were previously used for automotive repair and tire services (Figure 2). The northeast and eastern portions of the subject site are currently utilized for storage of used metal 55-gallon drums, cubic plastic tote containers, and associated accessories used in the food industry. The southern portion of the site consists of an asphalt and unpaved lot which is currently used as storage for truck trailers and shipping containers for the transport of food drums and related items.

The soil and soil vapor investigation, which was conducted by Leighton from June 18 through June 29, 2021, was performed to further characterize the lateral and vertical extent of CAM-17 metals, PCBs, and VOCs in soil, as well as VOCs in soil vapor, in locations beneath the site not investigated by previous consultants. The investigation included 20 soil borings, with ten (10) of these locations having dual- or multi-nested soil vapor probes also installed, up to a maximum depth of 35 feet below ground surface (bgs).

The proposed land use for the site is for commercial and industrial purposes, including street-front retail space, warehouse storage, and subterranean parking beneath the western most portion of the future building (Figure 3).

## 2.0 PURPOSE OF INVESTIGATION

The primary objective of this investigation was to characterize the lateral and vertical extent of the 17 metals listed in the California Code of Regulations, Title 22, Article 11 (i.e., the CAM-17 metals), PCBs, and VOCs in soil, as well as VOCs in soil vapor detected beneath the subject property, in conjunction with data from previous investigations. Soil sampling and analytical testing was also performed on soil samples collected along the eastern-most boundary of the site not previously been investigated. Soil and soil vapor sample locations were selected in areas where data gaps in previous site investigations were identified, and also to better define the lateral extent of chemicals of potential concern (COPCs) in the soil and soil vapor. Note that two separate rounds of subsurface investigations were conducted in 2020 as part of due diligence during the acquisition of the subject property and are discussed below. The three recent subsurface investigation and prior work undertaken in the 1990s, demonstrate that the subject property has been well characterized.

# 3.0 SITE BACKGROUND

## 3.1. HISTORICAL LAND USE

Based on a review of historical documents and aerial photographs (provided in Appendix B), the subject property appears to have the following historical and current land use history:

- Approximately 1928 through 1948 - Agricultural land use
- Approximately 1948 through 1959 – Construction equipment storage
- 1959 - Pacific Coast Drum Company (PCD) develops site and adjoining property to the north as a drum cooperage facility for reconditioning of steel drums primarily used in the food industry
- 1996 to Present Day – Ditty Container Company, Inc. (drum cleaning and reconditioning); including aboveground/underground storage tanks (AST/UST) and sumps
- 1996 to Present Day - various auto body shops have occupied the western portion of the subject property

## 3.2. HISTORICAL INVESTIGATIONS

As part of the scope of this investigation, Leighton completed a review of the pertinent historical investigative reports pertaining to the Site, which were provided by RH.

- Leighton reviewed multiple reports prepared by several environmental consultants between the years 1988 to1998. Many of these documents were prepared in response to regulatory oversight that was conducted by the Los Angeles Regional Water Quality Control Board (LARWQCB). The LARWQCB issued a March 17, 1998 No Further Requirements (NFR) letter to the Former Pacific Coast Drum Company (Appendix A). The letter summarized past activities that were conducted under regulatory oversight at the subject property. The NFR letter noted the following past activities:
    - Areas of concern at the site included a former underground storage tank (UST) containing gasoline; a drum storage area along the eastern and southern portions of the site; one clarifier and three sumps; and a drum storage area in the northeast corner of the site.

- A 12,000-gallon UST was removed in closed by the Los Angeles County Department of Public Works in October 1986.
- In 1988, a soil investigation was performed near the clarifier and sumps area and included exploratory soil borings to a maximum depth of 50 feet below ground surface (bgs). Acetone was detected at 5 feet bgs and TPH was detected at 40 feet bgs. Two of the exploratory soil borings were converted into monitoring wells (MW-1 and MW-2).
- In August 1990, one monitoring well (MW-3) was installed in the former drum storage area in the northeast corner of the site. Some VOCs were detected in soil at 30 feet bgs.
- In September 1991, a soil vapor survey was performed which included a total of 85 soil vapor probes installed at a depth of 5 feet bgs. Low concentrations of methane gas and vinyl chloride were detected in the probes. The LARWQCB noted that the soil vapor survey data was questionable as there were quality assurance/quality control problems.
- In August 1994, a soil investigation was performed which included a total of 16 borings drilled to a depth of 10 feet bgs. The VOCs detected in the probes included 1,1-dichloroethane (1,1-DCA), perchloroethylene (PCE), and trichloroethylene (TCE).
- In March 1995, a soil vapor survey was performed and the results were submitted by EST in a report dated April 5, 1995. Nested soil vapor probes were installed near the sumps and clarifier areas. Chlorinated VOCS including 1,1-DCA, cis-1,2-DCE, PCE, and TCE were detected in the soil vapor samples.
- In August 1995, another soil vapor survey was performed in the former drum storage area and the northeast corner of the site (currently offsite and to the north of the subject property). Concentrations of 1,1-Dichloroethylene (DCE), PCE and TCE were detected in the probes.
- In January 1996, an additional soil vapor survey was performed in the former drum storage area to the northeast corner of the site. Four nested probes were installed with probes at depths of 1 foot and 20 feet bgs. Elevated BTEX, PCE, and TCE were detected in the probes.
- Between April 18, 1997 and January 29, 1998, a total of four nested soil vapor probes at depths of approximately 15 and 20 feet bgs were sampled to monitor the VOC vapor concentrations in the vadose zone. Based on a total of four sets of vapor monitoring data, PCE, the compound detected at

the highest concentrations, reduced from 241 ug/l to 38 ug/l and became stabilized over the monitoring period.

- Three groundwater monitoring wells have been installed and sampled seven times since September 1990. VOCs detected in the groundwater samples included 1,1-DCA, 1,1-DCE, 1,2-DCE, PCE, trichloroethene (TCA), and TCE. The most elevated VOCs concentrations were detected in the monitoring well near the sumps and clarifier areas (i.e., MW-2). The groundwater was measured in February 1997 at a depth of approximately 21 feet bgs. (Note: Leighton measured the depth to groundwater in MW-2 in June 2021 at a depth of approximately 45 feet bgs.)

Based on the multiple investigations historically conducted between 1986 and 1998, the LARWQCB NFR letter summarized that further soil cleanup was not required. The LARWQCB indicated that residual VOCs concentrations in the vadose zone stabilized or declined over the monitoring period. The letter noted that further vapor monitoring was not warranted. In addition, the letter indicated that *"…the subject site has completed Regional Board staff requirements and we will not require any further remedial and investigative work with regarding [sic] to the soil contamination."* Lastly, the letter noted that "…*Because past operations have impacted groundwater beneath this facility, you remain a potentially responsible party for the regional groundwater cleanup which is being led by USEPA. This Regional Board encourages you to continue to participate and cooperate in the ongoing regional groundwater cleanup. Sampling of the three existing groundwater monitoring wells required by this Regional Board can be discontinued. However all monitoring wells must be properly maintained and made available for possible future sampling that may be required by USEPA."* In over 30 years, the USEPA has not requested any groundwater sampling from the site.

To evaluate site conditions associated with the potential demolition and redevelopment of the subject property by other parties including Rosemead Holding, more recent soil and soil vapor investigations were conducted at the site including the following:

- EEC Environmental's October 19, 2020 *Technical Memorandum, Results of Phase II Subsurface Investigation in August and September 2020*. The Phase II subsurface investigation included sampling of soil, soil vapor, and grab groundwater samples. EEC conducted a Phase II Subsurface Investigation in August and September 2020. A total of 33 soil borings were drilled to a depth of approximately 15 feet bgs. Soil samples were collected at depths of 2, 5, 10 and 15 feet bgs in each of the 33 soil borings. In addition, in 22 of the

33 borings, dual nested soil vapor probes were installed at depths of 5 feet bgs and 15 feet bgs and soil vapor samples were collected. Lastly, four additional soil borings to a depth of 48 feet bgs were installed to collect groundwater samples in soil samples in areas of concern. All of the analytical test data were compared to the San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels established for a commercial/industrial scenario.

Eighty-four soil samples were analyzed for VOCs. VOCs were detected in all soil samples with PCE, TCE, and BTEX compounds being the dominant VOCs detected. With the exception of soil sample SB-21 at 5 feet bgs (located in the south-central portion of the site) which contained PCE at 4,100 ug/kg exceeding its 2,700 ug/kg commercial ESL, there were no soil sampling data discovered by EEC that would indicate a source area for VOCs detected in the soil vapor samples collected by EEC. Total petroleum hydrocarbons (TPH) as gasoline and TPH as diesel detected in multiple soil samples some of which exceeded their respective ESLs. Twenty soil samples were analyzed for PCBs and three soil samples exceeded their respective commercial ESL for PCB Aroclors. Polycyclic aromatic hydrocarbons (PAHs) were analyzed for in 33 soil samples; however, only benzo(a)pyrene was detected above its commercial ESL in one soil sample (SB-14) in the northeast portion of the site at a depth of 2 feet bgs. Concentrations of antimony, arsenic, and lead were detected above their respective ESLs in various boring locations.

Results of soil vapor samples analyzed for VOCs indicated that elevated concentrations of VOCs are present throughout the site with the most elevated samples found along the southern portion of the subject property. Four groundwater samples were analyzed for VOCs and some of the VOCs exceeded their respective Maximum Contaminant Levels but EEC noted the VOCs were not present at concentrations that typically require remediation. Selected analytical test data from the EEC investigation are summarized in Appendix B.

- EFI Global *Additional Site Characterization Report*, prepared December 9, 2020. The EFI report also included soil sampling activities that were conducted on the site. EFI advanced 16 soil borings in November 2020 to further characterize and document lead and PCB impacts in soil in the eastern and southern portion of the subject property. The soil borings were drilled to a maximum depth of 4 feet bgs. A total of 69 soil samples were collected and selected soil samples were analyzed for total lead and PCBs. In addition, soil samples with elevated lead concentrations were also analyzed using the California Waste Extraction Test (CA WET) and Toxicity

Characteristic Leaching Procedure (TCLP) to evaluate their waste characteristic.

EFI found that total lead was detected in soil samples at concentrations ranging from 6.36 milligrams per kilogram (mg/kg) to 19,900 mg/kg. EFI's site characterization revealed soils with total lead concentrations that exceed the California-EPA, Department of Toxic Substances Control (DTSC)-Screening Level established for total lead (320 mg/kg) in a commercial/industrial setting. Based on the CA WET and TCLP extractions, some of the soil samples exceeded the 5.0 mg/l criteria that requires their management as Non-RCRA hazardous waste and RCRA hazardous waste when excavated.

The analysis of soil samples for PCBs revealed concentrations ranging from 66.7 ug/kg to 30,600 ug/kg. Multiple shallow soil samples exceeded the DTSC-SLs established for PCBs. The elevated PCB and total lead concentrations were found co-located at multiple boring all locations in shallow soil at depths generally less than 4 feet bgs. Selected analytical test data from the EFI characterization activities are summarized in Appendix B.

Leighton's review of the historical analytical test data from soil sampling indicates that shallow soil beneath portions of 2200 North Rosemead Boulevard is reported to have been affected by elevated concentrations of lead and PCBs. In addition, soil vapor and groundwater are reported to have been affected by elevated concentrations of VOCs.

The primary purpose of the soil investigation and soil vapor survey conducted by Leighton was to evaluate for the presence of data gaps and further evaluate the extent of COPCs previously investigated by others at the site with the ultimate goal of establishing a voluntary cleanup agreement with the Los Angeles Regional Water Quality Control Board and obtaining no further action status to facilitate the development of the site.

In the above-listed reports from 2020, the analytical test data were evaluated against the following multiple sources of soil screening levels established for a commercial setting: the San Francisco Bay Regional Water Quality Control Board (SFBRWQB) Environmental Screening Levels (ESLs) (January 2019), United States Environmental Protection Agency (US EPA) Regional Screening Levels (RSLs) (May 2020), and the California EPA, Department of Toxic Substances Control Screening Levels (DTSC-SLs) (June 2020). These screening levels were not proposed as remedial goals, and are presented in the report solely for context in reviewing areas of the site where COPCs may require remediation.

## 3.3. REGIONAL/SITE GROUNDWATER STATUS

The site is located in the San Gabriel Valley of California. The San Gabriel Valley includes the South El Monte Operable Unit (SEMOU) of the San Gabriel Valley Superfund site, which has been affected by groundwater contamination from VOCs including perchloroethylene (PCE), trichloroethylene (TCE), carbon tetrachloride, perchlorate, 1,4-dioxane, and other chemicals of concern (COCs). A May 15, 2012 Consent Decree between the US EPA/DTSC (Plaintiff) and various Settling Defendant parties (including PCD) was signed in 2012 and pertains to the SEMOU. The Settling Defendants of the Consent Decree (including PCD) entered into this agreement to protect public health but did not admit liability arising from any of the previous or current releases.

Two groundwater monitoring wells (MW-2 and MW-3) are located on the southern portion of the subject site (i.e., 2200 Rosemead Blvd parcel). It is unknown when the MW-2 and MW-3 monitoring wells were last sampled and tested. EEC encountered groundwater during Hydropunch sampling, in September 2020, at a depth of 45 feet bgs in four locations (EEC, October, 2020). The results of EEC's September 2020 grab groundwater sampling from four temporary Hydropunch groundwater wells indicated the presence of PCE, TCE, cis-1,2-DCE, 1,1-DCA, toluene, ethylbenzene, and total xylenes at concentrations exceeding the California Maximum Contaminant Level (CA MCL) for drinking water.

## 3.4. CURRENT REGULATORY STATUS

As noted above in Section 3.2, the LARWQCB issued a "No Further Requirements" letter to the Former Pacific Coast Drum Company on March 17, 1998. This letter stated that "…*To date, the subject site has completed Regional Board staff requirements and we will not require any further remedial and investigative work with regarding [sic] to the soil contamination."* In addition, the letter noted "…*we do not believe that further vapor monitoring is warranted*." No additional investigation of remedial activities was required for soil or soil vapor conditions at the site. Regulatory oversight for groundwater issues are discussed in the above Section 3.3.

# 4.0 PHYSICAL SETTING

## 4.1. SITE GEOLOGY

The subject site, approximately 237 feet above mean sea level (AMSL), is located approximately 0.25 miles east of the Rio Hondo River and approximately 2.75 miles west of the San Gabriel River, within the Los Angeles Basin (Basin), a structural trough located within Southern California. The Basin is a northwest-trending lowland plain about 50 miles long and 20 miles wide with extensive alluviation. Mountains and hills that generally expose Late Cretaceous to Late Pleistocene-age sedimentary and igneous rocks bound the Basin along the north, northeast, east and southeast (Dibblee, Jr., 1999).

The Basin is part of the Peninsular Ranges geomorphic province of California, which is characterized by subparallel blocks sliced longitudinally by young, steeply dipping northwest-trending fault zones. The Basin is a region of active sedimentation, and strata are interpreted to be as much as 31,000 feet thick in the center of the trough.

The near-surface native soils at the subject site are Holocene-age non-marine alluvium comprised of varying proportions of sand, gravel, silt, and clay deposited by the rivers. These deposits are anticipated to be on the order of several hundred feet in thickness, where they are subsequently underlain by thick (several thousands of feet) sequences of sedimentary rock formations (Dibblee, Jr., 1999).

## 4.2. HYDROGEOLOGY

Groundwater was not encountered in any boring drilled during the soil investigations performed by Leighton. However, two onsite groundwater monitoring wells, MW-2 and MW-3, were gauged during the June 2021 investigation, and respectively exhibited depths of 47.5 and 45.8 feet below the top of their casings. A few feet of water was present in each well: however, further details of their constructions are unknown. Groundwater elevations have lowered over time and depths to groundwater was reported at approximately 32 to 34 feet bgs in 2002. In 2020, groundwater was measured at 45 feet bgs in October 2020 (EEC, 2020), and approximately 46 to 48 feet during Leighton's current June 2021 investigation.

# 5.0 REGULATORY FRAMEWORK FOR SOIL INVESTIGATIONS

All analytical results for the soil samples collected were compared to the July 2019 SFBRWCQBESLs for a commercial/industrial setting. Additionally, all soil vapor sample results were compared to the July 2019 SFBRWQCB ESLs for sub-slab gas in a commercial/industrial setting. ESLs were utilized solely for comparison as a preliminary overview of the analytical results. No cleanup goals have been established for the site, or for the reuse of excavated soil during future building demolition or grading activities. ESLs may not represent the final clean-up levels for the future development of the site.

**Waste Classification and Management** – In addition to screening soil sample laboratory analytical results against ESLs, the analytical test results were also reviewed to evaluate if concentrations of COPCs are likely to require disposal as a nonhazardous waste, a Resource Conservation and Recovery Act (RCRA) hazardous waste, or as a non-RCRA hazardous waste (aka California hazardous waste). Selected soil samples from the site with concentrations of total lead, chromium or copper that were more than 10 times their respective California Soluble Threshold Limit Concentration (STLC) were analyzed using the California Waste Extraction Test (CA WET). Soil samples that contained metals at concentrations more than 20 times their respective STLC were analyzed using the Toxicity Characteristic Leaching Procedure (TCLP) to evaluate if they required potential management as a RCRA or federal hazardous waste.

# 6.0 INVESTIGATIVE METHODOLOGY

## 6.1. PRE-FIELD ACTIVITIES

The tasks described in the subsections below were performed prior to initiating drilling activities.

### 6.1.1. PRELIMINARY SITE WALK

On June 14th, representatives of Leighton conducted a preliminary site walk with the purpose of surveying and marking the proposed boring and soil vapor probe locations. The proposed locations had been predetermined via satellite imagery and were assigned in locations that met the scope of data gap refinement for the subject property. During the site walk, the proposed locations were ground-verified for drill rig access, and were moved if suspected limited access was an issue. The locations were subsequently marked with white paint and coordinates for the drilling locations were captured utilizing a GPS unit (Trimble Geo 7x). A summary of the boring locations, their coordinates, and additional affiliated information is detailed in Table 1.

### 6.1.2. SITE-SPECIFIC HEALTH AND SAFETY PLAN (HASP)

Prior to conducting the field activities, a site-specific health and safety plan (HASP) was updated to encompass the field activities completed for this investigation, and to address potentially hazardous substances and petroleum products that may be encountered during the field work. The HASP specified the protective clothing and monitoring equipment to be used during the investigation and outlined implementation measures in the event of an emergency.

### 6.1.3. NOTIFY UNDERGROUND SERVICES ALERT (USA)

Each of the nineteen soil boring locations selected for this investigation (Figure 3) were field marked, and Underground Services Alert (USA) of Southern California (a.k.a. DigAlert) was notified on June 14, 2021, and requested to identify and demarcate the location of public utilities that may be entering the site. The location of each soil boring was identified with white paint in the field.

## 6.2. JUNE 2021 SOIL & SOIL VAPOR INVESTIGATION

The following tasks were performed as a part of the field portion of the investigation.

### 6.2.1. GEOPHYSICAL UTILITY CLEARANCE

Prior the initial concrete coring and drilling for the collection of subsurface soil samples, Leighton subcontracted Spectrum Geophysical (Spectrum) to survey the drilling locations for underground utilities in supplement to contacting USA DigAlert. On June 18th, technicians from Spectrum met with Leighton personnel, who directed them to the designated boring locations within the subject property. The boring locations were cleared for subsurface utility lines, and other potential obstructions, with a couple of locations slightly adjusted due to potential conflicts. .

### 6.2.2. SOIL SAMPLING & LOGGING ACTIVITIES

On June 18th, 21st, 22nd, and 23rd, 20 soil borings were advanced by Interphase Environmental, Inc. (Interphase) using a Geoprobe 6600 truck-mounted and a Geoprobe 6620dt track-mounted direct push rig. The track-mounted rig was utilized for the boring locations that had limited access. The locations of the 20 borings, designated LV-1 through LV-20, are provided on Figure 4.

At each boring location, soil samples were obtained at various intervals starting at one (1) foot bgs, to a depth of approximately 10 or 20 feet bgs (boring dependent) using a direct-push drill rig by advancing drilling rods containing acetate sleeves to the desired depth.

Borings LV-1 through LV-10 were sampled at the intervals of 1, 5, 10, 15, and 20 feet bgs and drilled to a final approximate depth of 35.5 feet bgs. Borings LV-11 through LV-19 were sampled at intervals of 1, 2.5, 5, 7.5, and 10 feet bgs, and drilled to an approximate depth of 10 feet bgs. The drilling rods were retracted, and the acetate sleeve containing a continuous cored soil interval was observed by the Leighton field geologist after it was split open. At each desired sampling depth, an approximate 7-inch section of the soil sequence was sampled into a set of five volatile organic analysis (VOA) vials via TerraCore™ samplers in general accordance with EPA Method 5035, for VOC and Carbon-Chain analysis. Additionally, soil samples from the same interval were collected into either a laboratory-supplied glass jar containing a minimum of 8 ounces of soil (compacted to minimize head space) or a six-inch section of acetate sleeve that was cut from the desired sampling interval, and capped with Teflon sheeting and endcaps. Each soil sample container and sleeve was clearly marked with a sample ID, sampling depth, and time and date collected, and then placed in an ice-cooled chest for temporary storage pending transport under proper chain-of-custody protocol to Eurofins

Calscience, LLC (Eurofins), a State of California-Certified analytical laboratory located in Garden Grove, California.

The soil intervals were continuously cored and logged for soil classification purposes, to observe for potential staining or discoloration, and potentially for correlation purposes. The soils encountered were logged for soil type in accordance with the Unified Soil Classification System (USCS). Logs of each boring were recorded and include the name of the drilling company, initials of the geologist, drilling method, auger size, approximate sampling interval, photoionization detector (PID) measurements, odors, color, and discolorations (if present). During boring advancement, a PID calibrated to a standard gas, was used to evaluate the soil cuttings and samples for VOCs. Copies of the boring logs recorded are presented in Appendix C.

### 6.2.3. SOIL VAPOR PROBE CONSTRUCTION

Ten (10) sets of dual- or multi-nested soil vapor probes were installed between June 18th and June 23rd in general accordance with the 2012 Advisory for Active Soil Gas Investigations (DTSC, 2012). Soil vapor probes were installed at locations LV-1 through LV-10. Probes were set at approximate depths of 5, 15, and 35 feet bgs for locations LV-3, LV-4, and LV-7 through LV 10, and at approximate depths of 20 and 35 feet bgs for locations LV-1, LV-2, LV-5, and LV-6. Depths were slightly adjusted by the field geologist in consideration of existing soil composition, with emplacement focused on permeable soil (e.g., coarse-grained soils). Specific soil vapor probe depths for each drilling location are indicated on the logs in Appendix C.

The dual- or multi-nested soil vapor probes consisted of porous soil vapor implants connected to inert ¼-inch diameter Nylaflow tubing. The deep probe was suspended in the borehole at the appropriate depth, and 1.0 foot of silica sand was poured around the probe. Approximately six (6) inches of dry bentonite granules was placed above the filter pack, followed by a hydrated bentonite seal until the next probe depth. Six inches dry bentonite chips were added to the top of the hydrated bentonite grout, which aided the installation of the shallow soil vapor probe using the same construction as the deep probe. From the top of the dry bentonite above the shallow soil vapor probe, hydrated bentonite was added to the borehole via tremie pipe to approximately 0.5 feet bgs. Traffic-rated well boxes were then installed to complete the dual-nested soil vapor probe. The probes were allowed to equilibrate for a minimum of 24 hours before soil vapor samples were collected. Depths and construction for each dual-nested soil vapor probe are detailed in the boring logs located in Appendix C.

### 6.2.4. SOIL VAPOR SAMPLING ACTIVITIES

A total of 28 soil vapor samples were collected on June 28 and 29, 2021 by H & P Geochemistry, Inc. field personnel in general accordance with the DTSC Guidance.

Prior to purging and sampling, a shut-in test was conducted along the sampling train setup at each probe sampling depth and location. A tracer gas mixture of n-pentane, n-hexane, and n-heptane was applied to the dual-nested soil vapor probes at each point of connection in which ambient air could enter the sampling system. These connection points include the top of the probe where the tubing meets the probe connection, and the surface cement seals. If a leak was detected, the sampling train will be reset and adjusted until no leaks are detected. An electric vacuum pump set to draw 0.200 liters/min of soil vapor at a maximum vacuum of 100 inches of water was attached to purge each probe prior to sample collection. A standard of three purge volumes was used to remove stagnant air from the sampling system so that representative soil vapor samples could be collected. After purging was completed, soil vapor samples were obtained using a dedicated, pre-cleaned glass, gas-tight syringe with Teflon® plungers, by drawing the sample through the Luer lock connection that connects the sampling probe tubing to the syringe. Soil vapor samples were then collected into the syringe and immediately injected into the onsite mobile laboratory gas chromatograph purge and trap system.

## 6.3. LABORATORY ANALYSES

Ninety-two (92) soil samples were analyzed by the analytical laboratory by for a specified combination of US EPA Methods including US EPA Method 6010B for Title 22 Metals, 7471A for Mercury, 8082 for PCBs, 8015B for TPH-DRO and TPH-ORO, and by 5035/8260B for TPH-GRO and VOCs. Twenty five (25) soil vapor samples were analyzed for VOCs and TPH-GRO by US EPA Method 8260SV. The laboratory analytical reports accompanied by their chain-of-custody documentation are presented in Appendix D.

# 7.0 LEIGHTON INVESTIGATIVE RESULTS

## 7.1. FIELD OBSERVATIONS

Soil sampling activities were performed by Leighton personnel at the site on June 18th, and from June 21st through June 23rd. Logs of boring were prepared for each soil boring and include soil descriptions, PID measurements for VOCs, and observations of any potential soil discoloration and/or unusual odors. The logs for borings LV-1 through LV-19 are presented in Appendix C.

Generally, the soils encountered in the subsurface of the subject property consisted primarily of light brown, brown, or dark brown poorly-graded sand and clay with varied gravel content, sandy clay, silt, silty sand, and clayey sand ranging between two (2) inches and 4.5 feet in thickness.

Soils with a degraded petroleum hydrocarbon-like odor were observed emanating from soil intervals in some of the soil borings at near surface depths (0 to 5 feet bgs), which include soil borings LV-3, LV-8, LV-14A, LV-14B, and LV-17. PID measurements for VOCs were collected at each soil boring at depths between five feet bgs to the total drilled depth. Measured PID readings during drilling below ground surface (bgs) ranged between 0.0 parts per million (ppm) to 650.5 ppm. PID readings are detailed out in the boring logs in Appendix C.

## 7.2. ANALYTICAL TEST RESULTS – LEIGHTON SOIL SAMPLES

A total of 92 soil samples were collected and analyzed by Leighton as a part of this limited site investigation. Laboratory reports and chain-of-custody documentation for the soil samples are presented in Appendix D. All of the soil samples were analyzed by the methods listed on the chain-of-custody form that accompanied the samples. Every soil sample was analyzed by for TPH as gasoline range organics (GRO) by US EPA Methods 8015B, VOCs by US EPA Method 8260B, metals by USEPA Methods 6010B and 7471A, and for PCBs by USEPA Method 8082. However, soil samples at the intervals of 2.5 and 7.5 feet bgs in borings LV-11 through LV-19, and the soil sample retrieved at LV-14B and LV-20, were not analyzed for VOCs (US EPA Method 8260B).

The section below summarizes and discusses the laboratory analytical testing results for the soil samples collected at the site.

### 7.2.1. TITLE 22 METALS IN SOIL

Table 2 provides a summary of Title 22 Metal concentrations detected in soil samples, and Plate 1 shows the distribution of select metal concentrations

detected in samples from each soil boring location, along with historical metal concentration data from previous investigations.

- Antimony was detected in 3 soil samples at concentrations ranging from 2.98 mg/kg in soil sample LV-19-1 to 13.6 mg/kg in soil sample LV-15-1.
- Arsenic was detected in 23 soil samples at concentrations ranging from 2.4 mg/kg in soil sample LV-6-1 to 40.2 mg/kg in soil sample LV-7-5.
- Barium was detected in 86 soil samples at concentrations ranging from 11.7 mg/kg in soil sample LV-6-10 to 434 mg/kg in soil sample LV-10-1.
- Beryllium was detected in 55 soil samples at concentrations ranging from 0.25 mg/kg in soil sample LV-5-10 to 0.796 mg/kg in soil sample LV-19-10.
- Cadmium was detected in 55 soil samples at concentrations ranging from 0.479 mg/kg in soil sample LV-11-7.5 to 3.22 mg/kg in soil sample LV-101.
- Chromium was detected in 86 soil samples at concentrations ranging from 1.84 mg/kg in soil sample LV-11-7.5 to 207 mg/kg in soil sample LV-10-1.
- Cobalt was detected in 84 soil samples at concentrations ranging from 0.991 mg/kg in soil sample LV-6-1 to 22 mg/kg in soil sample LV-3-1.
- Copper was detected in 85 soil samples at concentrations ranging from 1.13 mg/kg in soil sample LV-6-1 to 1250 mg/kg in soil sample LV-7-5.
- Lead was detected in 27 soil samples at concentrations ranging from 5.23 mg/kg in soil sample LV-1-15 to 2680 mg/kg in soil sample LV-10-1.
- Molybdenum was detected in 7 soil samples at concentrations ranging from 0.543 mg/kg in soil sample LV-17-1 to 22.7 mg/kg in soil sample LV-10-1.
- Nickel was detected in 86 soil samples at concentrations ranging from 0.491 mg/kg in soil sample LV-6-5 to 106 mg/kg in soil sample LV-3-1.
- Silver was detected in one (1) soil sample at a concentration of 1.74 mg/kg in soil sample LV-10-1.
- Vanadium was detected in 86 soil samples at concentrations ranging from 2.42 mg/kg in soil sample LV-6-5 to 75.3 mg/kg in soil sample LV-19-10.
- Zinc was detected in 79 soil samples at concentrations ranging from 12 mg/kg in soil sample LV-2-5 to 1770 mg/kg in soil sample LV-7-5.

- Mercury was detected in 24 soil samples at concentrations ranging from 0.0833 mg/kg in soil sample LV-14A-2.5 to 1.22 mg/kg in soil sample LV-10-1.

### 7.2.2. TITLE 22 METALS – STLC, TCLP, AND CHROMIUM VI RESULTS

After review of the results for metals in the soil samples collected during the June 2021 investigation, some soil samples required additional waste characterization analyses.

As noted in Section 5.0, selected soil samples from the site with concentrations of total lead, chromium or copper that were more than 10 times their respective California STLC were analyzed using the CA WET to evaluate if they potentially require management as a Non-RCRA hazardous waste (aka, California hazardous waste). Soil samples that contained metals at concentrations more than 20 times their respective STLC were analyzed using the TCLP to evaluate if they require potential management as a RCRA or federal hazardous waste.

If the metal concentration of a soil sample initially exceeded its California Total Threshold Limit Concentration (TTLC), it will be managed as a Non-RCRA hazardous waste and potentially as a RCRA hazardous waste based on the results of the TCLP.

Any soil samples that exhibited total chromium concentrations exceeding 50 mg/kg (i.e., 10 times the 5.0 mg/l STLC established for chromium), the soil samples were also analyzed for hexavalent chromium (Cr VI). Table 2 provides a summary of the STLC, TTLC, and Cr VI results of the select soil samples. A summary discussion of metal results requiring additional lab work is detailed below.

<u>Chromium:</u>

- CA WET analysis for chromium was required for soil samples LV-3-1, LV-3-5, LV-3-10, LV-7-1, LV-7-10, LV-9-10, LV-10-1, LV-15-1, and LV-19-10. None of the soil samples exhibited soluble chromium detections, which therefore did not exceed the STLC of 5 mg/L for chromium.
- TCLP analysis for chromium was required for soil sample LV-7-10. No detected chromium was reported by the TCLP analysis.
- Cr VI analyses were required for soil samples LV-3-1, LV-3-5, LV-3-10, LV-7-1, LV-7-10, LV-9-10, LV-10-1, LV-15-1, and LV-19-10. Cr VI was

detected in six (6) soil samples with concentrations ranging from 480 µg/kg in soil sample LV-7-10 to 73,000 µg/kg in soil sample LV-10-1.

Copper:

- CA WET analyses for copper were required for soil samples LV-7-5 and LV-9-5. None of the soil samples exhibited detections above the STLC of 25 mg/L established for copper.

Lead:

- WET analyses for lead were required for soil LV-7-5, LV-9-5, LV-12-1, LV-18-1, LV-19-1, and LV-20-0.5. None of the soil samples exhibited soluble lead detections, which therefore did not exceed the STLC of 5 mg/L for lead.
- TCLP analyses for lead were required for soil LV-7-5, LV-10-1, LV-12-1, LV-15-1, LV-18-1, LV-19-1, and LV-20-0.5. None of the soil samples were reported to contain detected lead by the TCLP analysis, which therefore did not exceed the TCLP of 5 mg/L for lead.

### 7.2.3. POLYCHLORINATED BIPHENYLS (PCBS) IN SOIL

Table 3 provides a summary of PCB concentrations detected in soil samples, and Plate 2 shows the distribution of select PCB concentrations detected in samples from each soil boring location, along with historical PCB concentration data from previous investigations.

- Aroclor-1248 was detected in 4 soil samples at concentrations ranging from 69 µg/kg in soil sample LV-4-1 to 13,000 µg/kg in soil sample LV-8-1.
- Aroclor-1254 was detected in 7 soil samples at concentrations ranging from 110 µg/kg in soil sample LV-19-1 to 15,000 µg/kg in soil sample LV-8-1.
- Aroclor-1260 was detected in 6 soil samples at concentrations ranging from 73 µg/kg in soil sample LV-7-1 to 4,000 µg/kg in soil sample LV-8-1.
- Aroclor-1262 was detected in one (1) soil sample, LV-17-2.5, at a concentration of 580 µg/kg.
- Aroclor-1268 was detected in one (1) soil sample, LV-17-2.5, at a concentration of 260 µg/kg.

### 7.2.4. VOCS IN SOIL

Table 4 provides a summary of VOC concentrations detected in soil samples. Due to the lack of consistent VOC concentrations exceeding their respective SFRWCQB ESLs for the June 2021 soil samples, Plate 3 only shows the distribution of select concentrations detected in samples from historical VOC concentration data from previous investigations. In regards to the current soil samples:

- PCE was detected in 16 soil samples at concentrations ranging from 0.99 µg/kg in soil sample LV-18-10-DUP to 59 µg/kg in soil sample LV-8-1.
- TCE was detected in 5 soil samples at concentrations ranging from 1.70 µg/kg in soil sample LV-13-1 to 160 µg/kg in soil sample LV-8-1.
- cis-1,2-DCE was detected in one (1) soil sample, LV-3-1, at a concentration of 2.50 µg/kg.
- Benzene was detected in 28 soil samples at concentrations ranging from 1.00 µg/kg in soil sample LV-4-5 to 7.30 µg/kg in soil sample LV-11-5.
- Toluene was detected in 28 soil samples at concentrations ranging from 0.86 µg/kg in soil sample LV-1-1 to 2,200 µg/kg in soil sample LV-8-1.
- Ethylbenzene was detected in fine (5) soil samples at concentrations ranging from 0.91 µg/kg in soil sample LV-12-5 to 1000 µg/kg in soil sample LV-8-1.
- Total Xylenes were detected in five (5) soil samples at concentrations ranging from 2.0 µg/kg in soil sample LV-3-10-DUP to 2,400 µg/kg in soil sample LV-8-1.
- 1,2,4-Trimethylbenzene (1,2,4-TMB) was detected in four (4) soil samples at concentrations ranging from 3.50 µg/kg in soil sample LV-7-1 to 6,900 µg/kg in soil sample LV-17-5.
- 1,3,5-Trimethylbenzene (1,3,5-TMB) was detected in two (2) soil samples, LV-14A-1, and LV-17-5, at concentrations of 4.0 µg/kg in soil sample LV-14A-1 and 2,700 µg/kg in soil sample LV-17-5.
- 1,1-Dichloroethane (1,1-DCA) was detected in three (3) soil samples at concentrations ranging from 0.90 µg/kg in soil sample LV-3-1 and 120 µg/kg in soil sample LV-8-1.

- Acetone was detected in 36 soil samples at concentrations ranging from 15.0 µg/kg in soil sample LV-18-10-DUP and 290 µg/kg in soil sample LV-19-1.
- 2-Butanone was detected in three (3) soil samples at concentrations ranging from 22.0 µg/kg in soil sample LV-14A-1 and 26.0 µg/kg in soil sample LV-19-1.
- Isopropylbenzene was detected in one (1) soil sample, LV-8-1, at a concentration of 100 µg/kg.
- Methyl tert-butyl ether (MTBE) was detected in one (1) soil sample, LV-14A-5, at a concentration of 1.70 µg/kg.
- 1,4-Dichlorobenzene was detected in one (1) soil sample, LV-8-1, at a concentration 45 µg/kg.
- n-Butylbenzene was detected in two (2) soil samples, LV-8-1 and 17-5, at concentration of 300 µg/kg and 1000 µg/kg, respectively.
- n-Propylbenzene was detected in two (2) soil samples, LV-8-1 and 17-5, at concentration of 140 µg/kg and 390 µg/kg, respectively.
- p-Isopropyltoluene was detected in two (2) soil samples, LV-8-1 and 17-5, at concentration of 100 µg/kg and 780 µg/kg, respectively.
- sec-Butylbenzene was detected in two (2) soil samples, LV-8-1 and 17-5, at concentration of 90 µg/kg and 410 µg/kg, respectively.
- Styrene was detected in one (1) soil samples, LV-8-1, at a concentration of 150 µg/kg.
- Trichlorofluoromethane was detected in one (1) soil samples, LV-8-1, at a concentration of 550 µg/kg.

### 7.2.5. TPH IN SOIL

Table 4 also provides a summary of TPH concentrations detected in soil samples.

- TPH-GRO (carbon chain C4-C12) were detected in seven (7) soil samples at concentrations ranging from 0.16 µg/kg in soil sample LV-14A-1 to 270 µg/kg in soil sample LV-17-5.
- TPH-Diesel Range Organics (TPH-DRO; C13-C22) were detected in 40 soil samples at concentrations ranging from 5.10 µg/kg in soil sample LV-

12-1 to 3,900 µg/kg in soil sample LV-7-1. TPH-Oil Range Organics (TPH-ORO; C23-C40) were detected in 61 soil samples at concentrations ranging from 5.00 µg/kg in soil sample LV-8-10 to13,000 µg/kg in soil sample LV-7-1.

## 7.3. ANALYTICAL TEST RESULTS – LEIGHTON SOIL VAPOR SAMPLES

A total of 28 soil vapor samples were collected and analyzed by H&P Geochemistry as a part of this limited site investigation. Laboratory report and chain-of-custody documentation for the soil vapor samples are presented in Appendix D. All of the soil vapor samples were analyzed by the US EPA Method 8260SV, which is listed on the chain-of-custody form that accompanied the samples. The concentrations of VOCs detected in soil vapor samples collected from multiple depths are summarized in Table 5. Plates 4 and 5 illustrate the distribution of select VOCs of concern detected in the soil vapor samples collected at multiple depths from historical investigations and from current soil vapor samples collected from the probes during this investigation, respectively.

The following summarizes the soil vapor sample depths (the depth of collection is the last number in the soil vapor sample ID number) and concentration ranges for each VOC detected in the soil vapor samples:

- PCE was detected in 24 of 28 soil vapor samples at concentrations ranging from 32 µg/$m^3$ in soil vapor sample LV-1-35 to 6,800 µg/$m^3$ in soil vapor sample LV-9-15.
- TCE was detected in all 28 soil vapor samples at concentrations ranging from 31 µg/$m^3$ in soil vapor sample LV-4-35-DUP to 10,000 µg/$m^3$ in soil vapor sample LV-4-14.
- cis-1,2-DCE was detected in 18 soil vapor samples at concentrations ranging from 200 µg/$m^3$ in soil vapor sample LV-6-20 to 16,000 µg/$m^3$ in soil vapor sample LV-4-35.
- 1,1-DCA was detected in 23 soil vapor samples at concentrations ranging from 40 µg/$m^3$ in soil vapor sample LV-2-20 to 6,500 µg/$m^3$ in soil vapor sample LV-7-15 REP.
- Benzene was detected in nine (9) soil vapor samples at concentrations ranging from 11 µg/$m^3$ in soil vapor sample LV-9-6 to 82 µg/$m^3$ in soil vapor sample LV-8-5.
- Ethylbenzene was detected in one (1) soil vapor sample, LV-5-34 at a concentration of 44 µg/$m^3$.

- Vinyl Chloride was detected in 12 soil vapor samples at concentrations ranging from 14 µg/m$^3$ in soil vapor sample LV-4-5 to 6,100 µg/m$^3$ in soil vapor sample LV-3-35.
- Freon 12 was detected in three (3) soil vapor samples at concentrations ranging from 44 µg/m$^3$ in soil vapor sample LV-3-10 to 61 µg/m$^3$ in soil vapor sample LV-3-15.
- Freon 113 was detected in 16 soil vapor samples at concentrations ranging from 68 µg/m$^3$ in soil vapor sample LV-2-35 to 260 µg/m$^3$ in soil vapor sample LV-7-7.
- trans-1,2-DCE was detected in nine (9) soil vapor samples at concentrations ranging from 60 µg/m$^3$ in soil vapor sample LV-8-35 to 190 µg/m$^3$ in soil vapor sample LV-3-35.
- 1,1-DCE was detected in 10 soil vapor samples at concentrations ranging from 68 µg/m$^3$ in soil vapor sample LV-9-35 to 500 µg/m$^3$ in soil vapor sample LV-8-15.
- 1,1,1-TCA was detected in three (3) soil vapor samples at concentrations ranging from 41 µg/m$^3$ in soil vapor sample LV-9-35 to 77 µg/m$^3$ in soil vapor sample LV-8-15.
- 1,2,4-TMB was detected in five (5) soil vapor samples at concentrations ranging from 42 µg/m$^3$ in soil vapor sample LV-5-34 to 73 µg/m$^3$ in soil vapor sample LV-7-35.
- 1,2-DCP was detected in four (4) soil vapor samples at concentrations ranging from 53 µg/m$^3$ in soil vapor sample LV-6-35 to 240 µg/m$^3$ in soil vapor sample LV-3-15.
- p-Isopropyltoluene was detected in one (1) soil vapor sample, LV-5-34, at a concentration of 41 µg/m$^3$.
- MTBE was detected in nine (9) soil vapor samples at concentrations ranging from 58 µg/m$^3$ in soil vapor sample LV-9-35 to 260 µg/m$^3$ in soil vapor sample LV-7-35.
- Chloroethane was detected in one (1) soil vapor sample, LV-5-34, at a concentration of 41 µg/m$^3$.
- 1,2-DCA was detected in two (2) soil vapor samples, LV-8-15 and LV-8-35, at a concentration of 160 µg/m$^3$ and 77 µg/m$^3$, respectively.

- 1,1,1-TCE was detected in three (3) soil vapor samples at concentrations ranging from 41 µg/$m^3$ in soil vapor sample LV-9-6 REP to 77 µg/$m^3$ in soil vapor sample LV-9-15.

To summarize, VOCs in soil vapor are widely distributed over the subject property and the soil vapor data does not indicate a likely source area for VOCs at the site. The primary COPCs in soil vapor are chlorinated compounds, specifically PCE, TCE, cis-1,2-DCE and 1,1-DCA. Natural degradation of PCE and TCE may account for the presence of cis-1,2-DCE in the subsurface, as this break-down product is typically not encountered in the same borings at the same sample depths as PCE and TCE.

# 8.0 EXTENT OF COPCS

The following sections describe the extent of COPCs encountered at concentrations exceeding non-RCRA or RCRA hazardous waste criteria, and the SFRWQCB ESLs. Results from the 2020 EFI and EEC soil investigations, including VOCs in soil vapor from investigations dating as far back as 1991, as well as the current investigation, are discussed in this section.

Appendix B provides a summary of historical analytical test data in table format from the following soil and soil vapor investigations conducted by other firms:

- Table C1 summarizes CAM-17 metals soil data from the 2020 EFI and EEC site investigations.
- Table C2 summarizes PCB soil data from the 2020 EFI and EEC investigations
- Table C3 summarizes VOC and TPH soil data from the 2020 EEC site investigation.
- In addition, VOCs detected in soil vapor samples collected by multiple consultants from 1991 through 2020 are summarized in Table C4.

## 8.1. METALS IN SOIL

### 8.1.1. LEAD

Lead was reported in the majority of soil samples collected in the upper 1 to 2 feet bgs in the eastern portion of the property in excess of its ESL (Plate 1). The only sample deeper than 2 feet bgs that exceeded the ESL was a 3 feet sample from B6. All soil samples exceeding the lead ESL were bound by deeper samples, typically at 3 to 5 feet bgs, that had concentrations of lead below the ESL. Borings EFI1 through EFI5 were the exception and not sampled below 2 feet bgs.

For the samples that exceeded the ESL for lead, a total of 26 samples were subject to the CA WET, with 13 of those samples reported with soluble lead concentrations in excess of the 5 mg/L, exceeding the threshold for non-RCRA hazardous waste. An additional 12 samples had total lead concentrations in excess of 1,000 mg/kg and also require management as Non-RCRA hazardous waste. Thirty-one samples were subject to the TCLP extraction process; five samples of which exceeded the 5 mg/l threshold indicating they will require management as RCRA hazardous waste.

The upper two feet of the eastern third of the site has lead-impacted soil above its ESL, with the possibility that it may also require the soil to be

managed as a non-RCRA hazardous waste or RCRA hazardous waste. The preparation of a soil contingency and management plan will address the proper profiling and waste characteristic of soil onsite as well as soil suitable for reuse onsite.

Lead was not detected in excess of its ESL in the western two-thirds of the site.

### 8.1.2. ARSENIC

Arsenic concentrations in soil were compared to the 12 mg/kg default background concentration of arsenic in Southern California soils established by the DTSC. Only eight of 122 samples were reported with concentrations of arsenic above this concentration, with the maximum being 40 mg/kg in the 5 foot sample from LV-7.

### 8.1.3. CHROMIUM

Chromium was not detected in any sample at concentrations exceeding its ESL. One sample, SB-19 at 2 feet bgs contained total chromium in excess of 2,500 mg/kg, the threshold for classification as a non-RCRA hazardous waste. This sample location also contained lead in excess of the non-RCRA hazardous waste threshold.

Of the 86 samples collected as part of the Leighton 2021 limited site investigation, nine were reported with total chromium concentrations above 50 mg/kg, triggering extraction and analyses by the CA WET method, as well as analyses for the presence of hexavalent chromium. None of the extracts were reported with concentrations exceeding the threshold for classification as a Non-RCRA hazardous waste. Two samples, LV-10 and LV-15, both at 1 foot bgs, each had hexavalent chromium concentrations exceeding the ESL. Both of these sample locations also contained lead at concentrations exceeding the Non-RCRA hazardous waste threshold.

While hexavalent chromium was reported in two samples in excess of its ESL, those sample locations also were reported with lead in excess of the threshold for characterization as a non-RCRA hazardous waste. No other samples collected by Leighton exceeded the RSL or the non-RCRA or RCRA hazardous waste threshold for chromium or hexavalent chromium.

### 8.1.4. OTHER METALS

Antimony was detected in only one sample in excess of its ESL: SB-23 at 2 feet bgs.

Copper was not detected in any samples above its ESL, but two samples were reported with copper at concentrations triggering further analysis to evaluate if the sample was a Non-RCRA hazardous waste. The extract from the two samples were reported at non-detect, resulting in non-hazardous classification for this compound.

## 8.2. PCBS IN SOIL

PCBs were reported in soil samples in excess of the ESL for samples collected in the upper 1 to 4 feet bgs, on the eastern third of the Site (Plate 2). With the exception of borings SB-14 and LB-9, all soil samples with detections of PCBs in excess of their respective commercial ESLs also were reported co-located with metal concentrations in excess of their respective commercial ESLs. With the exception of B5 at 4 feet bgs, all detections of PCBs above the ESL were bound by samples collected at a lower depth with reported concentrations below the

PCB ESLs. There were no detections of PCBs deeper than 5 feet bgs, nor were there detections in the western two-thirds of the Site.

## 8.3. VOCS IN SOIL

No VOCs were detected in soil samples, collected by either EEC in 2020 or Leighton in 2021, that exceed SFRWQCB RSLs or non-RCRA or RCRA hazardous waste classification criteria (Plate 3). With the exception of soil sample SB-21 at 5 feet bgs which contained PCE at 4,100 ug/kg exceeding its 2,700 ug/kg commercial ESL, there are no soil sampling data to date that would indicate a source area for VOCs detected in the soil vapor. Soil samples from SB-21 collected and analyzed from a depth of 2 feet bgs (<5.0 ug/kg) and 10 feet bgs (0.30 ug/kg J) did not contain PCE at concentrations exceeding the 2,700 ug/kg commercial ESL. Considering that since 2020, a total of 176 soil samples were analyzed for VOCs, the PCE commercial ESL exceedance in soil sample SB-21 at 5 feet bgs should be considered an outlier.

## 8.4. TPH IN SOIL

TPH samples were speciated into three ranges based on carbon chain length. TPH-GRO was represented by carbon chains C4/C6 through C12, TPH-DRO by carbon chains C13 through C22, and TPH-ORO by carbon chains C23 through C40/44. The variability in the lower bound for GRO and upper bound for ORO is due to differences in the laboratories analyzing the data.

One sample, SB-23 at 2 feet bgs (Plate 3), was reported with a TPH-GRO concentration of 2,600 mg/kg exceeding its 2,000 mg/kg commercial ESL. The soil sample (i.e., SB-23 at 2 feet bgs) was also reported with a TPH-DRO concentration of 8,500 mg/kg which is in excess of the 1,200 mg/kg commercial ESL established for TPH-DRO.

A total of seven samples were reported with concentrations of TPH-DRO in excess of the SFRWQCB ESL of 1,200 mg/kg. In general, these samples are located in the upper 1 to 2.5 feet, and are bound by deeper samples with concentrations below the ESL. The one exception is SB-21, which was reported with 1,500 mg/kg at 5 feet bgs, which slightly exceeds the TPH-DRO ESL of 1,200 mg/kg.

The distribution and the infrequency of soil samples exceeding the ESLs for TPH indicate that TPH impacts are very limited in extent.

## 8.5. VOCS IN SOIL VAPOR

VOCs in soil vapor have been investigated in multiple phases, in 1995, 1997, 2020, and 2021. As noted above, VOCs detected in soil vapor samples collected by multiple consultants from 1991 through 2020 are summarized in Table C4 in Appendix B. Plates 4 and 5 summarize the VOCs detected is soil vapor by EEC in October 2020 and Leighton in June 2021, respectively. In general, detected soil vapor concentrations appear to have decreased over time in each investigation. As an example, the maximum detected PCE concentration in the 1995 investigation was 241,000 µg/$m^3$, in 2020 it was 100,000 µg/$m^3$, and in 2021 it was 6,800 µg/$m^3$. This declining trend in maximum soil vapor sample concentrations suggests that whatever historically was the source of the chlorinated VOCs in soil vapor may no longer be an active source, and/or residual concentrations are naturally attenuating.

# 9.0 CONCLUSIONS AND RECOMMENDATIONS

The shallow Site soil has been adequately characterized. Some metals, TPH, and PCBs were detected in excess of their respective ESLs, but generally are limited to the upper 1 to 5 feet, and are limited to the eastern third of the Site. Specific COPC concerns include:

- Lead is the COPC with the largest number of soil samples reported above its ESL. The majority of these soil samples were in the upper 1 to 2 feet of the subsurface, and in the eastern third of the Site. The only sample deeper than 2 feet bgs that exceeded the ESL was a single sample at 3 feet bgs. All soil samples exceeding the lead ESL were bound by deeper samples, typically at 3 to 5 feet bgs, with the exception of samples EFI1 through EFI5, which were not sampled below 2 feet bgs.
- Soluble lead in excess of the threshold for management as a Non-RCRA hazardous waste was detected at concentrations above the STLC in 13 of 25 soil samples when analyzed by the CA WET method. An additional twelve soil samples had total lead concentrations in excess of 1,000 mg/kg, which indicates they likely exceed the Non-RCRA hazardous waste threshold. Five soil samples exceeded the lead threshold for management as a RCRA hazardous waste utilizing the TCLP.
- Arsenic was only reported in eight soil samples in excess of the DTSC-approved default background concentration of 12 mg/kg.
- Total chromium was not detected in any soil sample at concentrations exceeding its ESL. One soil sample, SB-19 at 2 feet bgs, contained total chromium in excess of 2,500 mg/kg, the threshold for management as a Non-RCRA hazardous waste.
- No soil samples was reported with leachable total chromium exceeding the threshold for management as a Non-RCRA hazardous waste.
- Two soil samples, LV-10 and LV-15 at 1 foot bgs each, had hexavalent chromium concentrations exceeding its ESL.
- Antimony was detected in only one soil sample in excess of its ESL.
- PCBs were reported in soil samples in excess of the ESL for samples collected in the upper 1 to 4 feet bgs on the eastern third of the Site. With the exception of B5 at 4 feet bgs, all detections of PCBs above their ESLs were bound by soil samples collected deeper with reported concentrations below their ESLs.
- With the exception of EEC soil sample SB-21 (collected from a depth of 5 feet bgs) which contained PCE at 4,100 ug/kg exceeding its 2,700 ug/kg commercial ESL, there are no soil sampling data to date that would indicate a source area for VOCs

detected in the soil vapor samples. Soil samples from SB-21 collected and analyzed from a depth of 2 feet bgs (<5.0 ug/kg) and 10 feet bgs (0.30 ug/kg J) did not contain PCE at concentrations exceeding the 2,700 ug/kg commercial ESL. Considering that since 2020, a total of 176 soil samples were analyzed for VOCs, the PCE commercial ESL exceedance in soil sample SB-21 at 5 feet bgs should be considered an outlier.

- One soil sample was reported with TPH-GRO concentrations exceeding its ESL. It was also reported with TPH-DRO concentrations in excess of its ESL.
- A total of seven soil samples were reported with concentrations of TPH-DRO in excess of its ESL. These soil samples are located in the upper 1 to 2.5 feet, and are bound by deeper soil samples with concentrations below the ESL, with the exception at SB-21 at 5 feet bgs.
- The distribution and the infrequency of soil samples exceeding the ESLs indicate that TPH impacts are very limited in extent.
- VOCs have been detected in soil vapor samples collected at multiple depths over the entire site during the current and prior soil vapor investigations.
- Maximum concentrations of chlorinated VOCs in soil vapor have generally declined over time based on a comparison of data from sampling events conducted in 1995, 2020, 2021.
- Concentrations of chlorinated VOCs in soil vapor appear to be in relatively steady state with groundwater concentrations based on comparison with the 2020 hydropunch groundwater data collected previously by EEC.

Based on the above conclusions, Leighton recommends the following actions:

- Assist client with execution of voluntary oversight agreement between themselves and the LARWQCB.
- Preparation of a Soil Management and Contingency Plan (SMCP) to detail the handling, stockpiling, sampling and reuse or disposal of soil with concentrations of COPCs in excess of their respective SFRWQCB ESLs or site-specific soil cleanup levels that may be established as part of a Human Health Risk Assessment (HHRA) and integrated into the SCMP with LARWQCB concurrence.
- Design and installation of a sub-slab vapor barrier to protect future workers from potential vapor intrusion by VOCs in the soil vapor which are likely to exist post demolition, and after site grading for the new construction.

- Preparation of a Remedial Action Closure Report detailing the removal actions, sampling and disposal actions conducted during site redevelopment, as well as details of the design of the sub-slab vapor mitigation system, and details on any unknown environmental liabilities detected and remediated.
- Request from the LARWQCB for issuance of a ‘No Further Action” letter once the remedial activities have been completed in concurrence with the approved SCMP.

## 10.0 LIMITATIONS/DISCLOSURE

Services were performed in accordance with Leighton Consulting, Inc.'s agreement and understanding with Rosemead Holding, LLC and solely for their use and their designated representatives. Opinions and/or recommendations are intended for use by Rosemead Holding, LLC and the purpose, site, location, time frame, and project parameters indicated. Leighton Consulting, Inc. is not responsible for subsequent separation, detachment, or partial use of this document. Any reliance on this report by a third party shall be at such party's sole risk.

Key:
-- = not analyzed
(a) = San Francisco Bay Regiol Water Quality Control Board Environmental Screening Levels (ESLs), July 2019; Table S-1.
USEPA = United Stated Environmental Protection Agency
J = Estimated value; concentration above the method detection limit but below the reporting limit
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
**1800** = at or exceeds commercial ESL
<50 = not detected above the method detection limit or reporting limit "X"
B = Constituent found in associated method blank
LCI = Leighton Consulting, Inc.

Notes:

-- = Screening level not established

µg/m$^3$ = micrograms per cubic meter

(a) = San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (ESLs), July 2019

(b) = Department of Toxic Substances (DTSC) HHRA Note 3 June 2020, Table 3. DTSC-recommended Screening Levels for Ambient Air Analytes

(c) = United States Environmental Protection Agency (USEPA) Regional Screening Levels, May 2021, for industrial air, cancer endpoint; noncancer enpoint used where cancer endpoint unavailable

J = Estimated value. Concentration detected above the method detection limit but below the reporting limit

NA = Not Analyzed

<8 = Not detected above method detection limit

LCI = Leighton Consulting, Inc.

**RED** = at or exceeds Commercial Screening Level (a)

< = Less than Laboratory Detection Limit

(m,p) = m,p-Xylene only for total

BDCM = Bromodichloromethane

DCA = Dichloroethane

DCE = Dichloroethene

DCP = Dichloropropane

PCE = Tetrachloroethylene

TCA = Trichloeoethane

TCE = Trichloroethylene

TMB = Trimethylbenzene

MTBE = Methyl tertiary-butyl ether

FAX (213) 266-7600

March 17, 1998

Mr. Gary Mearns
Former Pacific Coast Drum Co.
P.O. Box 3593
South El Monte, CA 91733

SAN GABRIEL VALLEY CLEANUP PROGRAM - NO FURTHER REQUIREMENTS, FORMER PACIFIC COAST DRUM CO., 2200 ROSEMEAD BLVD., SOUTH EL MONTE, CA (FILE NO. 107.0266)

Recent review of files and documents pertaining to this case revealed the following:

1. Based on past inspections by Regional Board staff, areas of concern at the site included: 1) a former gasoline underground storage tank (UST); 2) a drum storage area along the eastern portion of the site; 3) a drum storage area along the southern portion of the site; 4) one clarifier and three sumps; and 5) a drum storage area in the northeast corner of the site.

2. The 12,000-gallon UST was removed and closed by Los Angeles County Department of Public Works in October 1986.

3. In November 1988, a soil assessment was performed and results were submitted by Conservtech in a report dated December 5, 1988. Three borings to a maximum depth of 50 feet below ground surface (bgs) were drilled near the clarifier and sumps area. Maximum concentrations of acetone (1,150 ug/kg) were detected to five feet bgs; and TPH (60 mg/kg) was detected to 40 feet bgs. Two borings were converted to monitoring wells (MW-1 and 2).

4. In August 1990, one monitoring well (MW-3) was installed in the former drum storage area in the northeast corner of the site, and results were submitted by Conservtech in a report dated September 4, 1990. Maximum concentrations of 1,2-DCA (780 ug/kg) and methylene chloride (900 ug/kg) were detected in soil to 30 feet bgs.

5. In September 1991, a soil gas survey was performed and results were submitted by Inland Empire Environmental Service in a report dated October 7, 1991. A total of eighty-five (85) 5-foot probes were installed. Low concentrations of methane and vinyl chloride were detected in the probes. However, QA/QC problems were found in the survey data and results are questionable.

6. In August 1994, a soil assessment was performed and results were submitted by Conservtech in a report dated January 12, 1995. A total of sixteen (16) 10-foot borings were drilled in the entire site. Maximum concentrations of 1,1-DCA (5 ug/kg), PCE (150 ug/kg), and TCE (20 ug/kg) were detected to five feet bgs near the **sumps and clarifier area**.

7. In March 1995, a soil gas survey was performed and results were submitted by EST in a report dated April 5, 1995. Four nested probes, each with probes at 1, 15, and 25 feet bgs, were installed near the **sumps and clarifier area**. Maximum concentrations of 1,1-DCA (50 ug/l), c-1,2-DCE (55 ug/l), PCE (134 ug/l), and TCE (38 ug/l) were detected in the probes.

8. In August 1995, a soil gas survey was performed and results were submitted by EST in a report dated September 6, 1995. Four nested probes, each with probes at 1, and 15 feet bgs, were installed in the **former drum storage area to the northeast corner of the site**. Maximum concentrations of DCE (12 ug/l), PCE (241 ug/l) and TCE (21 ug/l) were detected in the probes.

9. In January 1996, a soil gas survey was performed and results were submitted by EST in a report dated February 14, 1996. Four nested probes, each with probes at 1, and 15 feet bgs, were installed in the **former drum storage area to the northeast corner of the site**. Maximum concentrations of BTEX (466 ug/l of total xylenes), PCE (117 ug/l) and TCE (14 ug/l) were detected in the probes.

10. Between April 18, 1997 and January 29, 1998, a total of four nested probes, each with probes at approximately 15 and 20 feet bgs, were sampled to monitor the trend of VOC vapor concentrations in the vadose zone. Based on a total of four sets of vapor monitoring data, PCE, the compound detected at the highest concentrations, reduced from 241 ug/l to 38 ug/l and became stabilized over the monitoring period.

11. Three monitoring wells have been installed and sampled seven times since September 1990. Maximum concentrations of 1,1-DCA (592 ug/l), 1,1-DCE (28 ug/l), 1,2-DCE (1,050 ug/l), PCE (285 ug/l), TCA (89 ug/l), and TCE (215 ug/l) were detected in the groundwater. Highest VOC concentrations were detected in the monitoring well near the **sumps and clarifier area** (MW-2). Depth to groundwater was measured in February 1997 at approximately 21 feet bgs.

12. The subject facility has been notified by the United States Environmental Protection Agency (USEPA) to join the regional groundwater cleanup program.

The above site assessment data demonstrated that releases of liquid wastes from the subject site impacted the soil and groundwater beneath the site. A soil cleanup was not required. Instead, four nested soil vapor probes were sampled four times between April 1997 and January 1998 to monitor the trend of VOC vapor concentrations in the vadose zone between over a year. Such monitoring data suggested that residual VOC concentrations in the vadose zone stabilized or declined over the monitoring period. Therefore, we do not believe that further vapor monitoring is warranted. To date, the subject site has completed Regional Board staff requirements and we will not require any further remedial and investigative work with regarding to the soil contamination.

**Because past operations have impacted groundwater beneath this facility, you remain a potentially responsible party for the regional groundwater cleanup which is being led by USEPA. This Regional Board encourages you to continue to participate and cooperate in the ongoing regional groundwater cleanup. Sampling of the three existing groundwater monitoring wells required by this Regional Board can be discontinued. However, all monitoring wells must be properly maintained and made available for possible future sampling that may be required by USEPA.**

The jurisdiction requirements of other agencies, such as the USEPA, are not affected by this Regional Board's "no further requirement" decision. Such agencies may choose to make their own decisions regarding the groundwater contamination in the region.

ARTHUR G. HEATH, Ph.D.
Environmental Specialist IV

Notes:
-- = not analyzed
(a) = San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (ESLs), July 2019; Table S-1.
(b) = Department of Toxic Substances Control (DTSC) Screening Level for Industrial Soils; June 2020
J = Estimated value; concentration above the method detection limit but below the reporting limit
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
< 2.6 = not detected above the method detection limit or reporting limit
EEC = EEC Environmental

EFI = EFI Global
TTLC = Total Threshold Limit Concentration
STLC = Soluble Threshold Limit Concentration
TCLP = Toxicity Characteristic Leaching Procedure
RED = Exceeds Commercial Screening Level for Soil
= Manage corresponding sample as Non-RCRA Hazardous Waste
= Manage corresponding sample as RCRA Hazardous Waste

Notes:

-- = not analyzed

(a) = San Francisco Bay Regiol Water Quality Control Board Environmental Screening Levels (ESLs), July 2019; Table S-1.

< ## = not detected above the method detection limit or reporting limit "X"

B = Constituent found in associated method blank

EEC = EEC Environmental

J = Estimated value; concentration above the method detection limit but below the reporting limit

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

**RED** = at or exceeds commercial ESL

**TABLE C4.** HISTORICAL SOIL VAPOR ANALYTICAL TEST RESULTS-DETECTED VOLATILE ORGANIC COMPOUNDS (VOCs) in µg/m$^3$

Notes:

-- = Screening level not established
µg/m$^3$ = micrograms per cubic meter
(a) = San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels (ESLs), July 2019
(b) = Department of Toxic Substances (DTSC) HHRA Note 3 June 2020, Table 3. DTSC-recommended Screening Levels for Ambient Air Analytes
(c) = United States Environmental Protection Agency (USEPA) Regional Screening Levels, May 2021, for industrial air, cancer endpoint; noncancer enpoint used where cancer endpoint unavailable
J = Estimated value. Concentration detected above the method detection limit but below the reporting limit
NA = Not Analyzed
ND = Not detected above method detection limit
EEC = EEC Environmental
WOLFF = Michael Wolff, Inc.
EST = Environmental Support Technologies
IEEC = Inland Empire Environmental Services

< = Less than Laboratory Detection Limit
(m,p) = m,p-Xylene only for total
BDCM = Bromodichloromethane
DCA = Dichloroethane
DCE = Dichloroethene
DCP = Dichloropropane
PCE = Tetrachloroethylene
TCA = Trichloeoethane
TCE = Trichloroethylene
TMB = Trimethylbenzene
MTBE = Methyl tertiary-butyl ether
RED = at or exceeds commercial ESL

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| *+ | LCS and/or LCSD is outside acceptance limits, high biased. |

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |
| S1+ | Surrogate recovery exceeds control limits, high biased. |

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F1 | MS and/or MSD recovery exceeds control limits. |
| F2 | MS/MSD RPD exceeds control limits |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

## Job ID: 570-62241-1

### Laboratory: Eurofins Calscience LLC

**Narrative**

**Job Narrative**
570-62241-1

**Comments**

**LV-14A-1 (570-62241-8)**
There were 5 Terracores submitted for this sample, four Terracores in water preserved with NaHSO4 for low level analysis and 1 Terracore in methanol for dilution analysis via method 5035. All four Terracores in water were used to analyze for 8015-Gasoline Range Organics and 8260-VOCs, however, the data for 8260-VOC were not reportable due to the lack of acceptable QC response. The preliminary data showed the detections were low and would not need to analyze with dilution using the Terracores in methanol.

A vinyl sleeve was also provided for this sample. An aliquot from the sleeve was prepared via method 5030 and analyzed for 8260-VOCs. Client was notified of the issue and approved the change of the preparation method.

All other samples were reported by EPA 8260/5035 and EPA 8015/5035.

No additional comments.

**Receipt**
The samples were received on 6/18/2021 6:35 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.5º C.

**GC/MS VOA**
Method 8260B: The initial calibration curve analyzed in batch 570-158636 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte(s) is considered an estimated concentration.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-158636.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-158836.

Method 8260B: The following analyte(s) recovered outside control limits for the LCS/LCSD associated with analytical batch 570-158836: Dibromochloromethane and Bromoform. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following sample associated with preparation batch 570-159143 and analytical batch 570-159176 were outside control limits: (570-62213-A-1-C MS). The associated laboratory control sample (LCS) recovery met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC VOA**
Method 8015B: The continuing calibration verification (CCV) associated with batch 158754 recovered above the upper control limit for Gasoline Range Organics (C4-C13). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 570-158754/34).

Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 158746.

Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 158949.

## Job ID: 570-62241-1 (Continued)

### Laboratory: Eurofins Calscience LLC (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC Semi VOA**

Method 8082: The following sample appears to contain polychlorinated biphenyls (PCBs); however, due to weathering or other environmental processes, the PCBs in the sample do not closely match any of the laboratory's Aroclor standards used for instrument calibration: LV-14B-2 (570-62241-13). The sample(s) has been quantified and reported as Aroclor 1260. Due to the poor match with the Aroclor standard(s), there is increased qualitative and quantitative uncertainty associated with this result.

Method 8082: Surrogate recovery for the following sample was outside control limits: LV-8-1 (570-62241-4). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Metals**

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-159345 and analytical batch 570-159635 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 7471A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-159348 and analytical batch 570-159634 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Organic Prep**

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**VOA Prep**

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

# Accreditation/Certification Summary

Client: Leighton and Associates Inc
Job ID: 570-62241-1
Project/Site: Rosemead Holding LLC /13111.001

## Laboratory: Eurofins Calscience LLC

The accreditations/certifications listed below are applicable to this report.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | State | 2944 | 09-30-21 |
| Oregon | NELAP | CA300001 | 01-30-22 |

# Method Summary

Client: Leighton and Associates Inc
Project/Site: Rosemead Holding LLC /13111.001

Job ID: 570-62241-1

| Method | Method Description | Protocol | Laboratory |
|---|---|---|---|
| 8260B | Volatile Organic Compounds (GC/MS) | SW846 | ECL 2 |
| 8015B | Gasoline Range Organics - (GC) | SW846 | ECL 2 |
| 8015B | Diesel Range Organics (DRO) (GC) | SW846 | ECL 1 |
| 8082 | Polychlorinated Biphenyls (PCBs) by Gas Chromatography | SW846 | ECL 1 |
| 6010B | Metals (ICP) | SW846 | ECL 1 |
| 7471A | Mercury (CVAA) | SW846 | ECL 1 |
| 3050B | Preparation, Metals | SW846 | ECL 1 |
| 3546 | Microwave Extraction | SW846 | ECL 1 |
| 3550C | Ultrasonic Extraction | SW846 | ECL 1 |
| 5030C | Purge and Trap | SW846 | ECL 2 |
| 5035 | Closed System Purge and Trap | SW846 | ECL 2 |
| 7471A | Preparation, Mercury | SW846 | ECL 1 |

**Subject:** Eurofins Calscience report files from 570-62241-1 Rosemead Holding LLC /13111.001

HI Marius,

We have a problem with 8260 analysis for sample #8 LV-14A-1 (570-62241-8). There were 4 low level terracores (in water) and 1 high level terracore (in methanol) submitted for 8015-GRO and 8260-VOC.
8015-GRO used both low level terracores for analysis.
8260-VOC used both terracores for analysis but could not report either data due to QC did not meet the method's criteria.

There is one high level terracore in methanol left to use for analysis, however, the reporting limits if using this terracore in methanol will be100x higher than the low level terracores in water.
We also received a vinyl sleeve for this sample for other analyses.

There are a couple options to proceed with the 8260 analysis. Please advise which option works for you:

1. Use the methanol terracore so all samples will have the same prep method 5035. the reporting limit for this analysis will be 100x higher than the analysis using low level terracores

2. Use an aliquot from the vinyl sleeve to prepare for analysis, the prep method will be 5030 instead of 5035, however, the reporting limits for this analysis will be the same as the low level terracore.

Please feel free to contact me if you have any questions.

Thank you.

Job ID: 570-62332-1

## Qualifiers

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F1 | MS and/or MSD recovery exceeds control limits. |
| L | A negative instrument reading had an absolute value greater than the reporting limit |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

## Job ID: 570-62332-1

### Laboratory: Eurofins Calscience LLC

**Narrative**

**Job Narrative**
**570-62332-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 6/21/2021 5:10 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.6º C and 2.8º C.

**GC/MS VOA**
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-159363.

Method 8260B: The initial calibration curve analyzed in batch 570-159363 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte(s) is considered an estimated concentration.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-159453.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-159461.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC VOA**
Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with analytical batch 570-159654.

Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-159777.

Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-159497.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC Semi VOA**
Method 8082: The following sample appears to contain polychlorinated biphenyls (PCBs); however, due to weathering or other environmental processes, the PCBs in the sample do not closely match any of the laboratory's Aroclor standards used for instrument calibration: LV-17-2.5 (570-62332-23). The sample(s) has been quantified and reported as Aroclor 1268. Due to the poor match with the Aroclor standard(s), there is increased qualitative and quantitative uncertainty associated with this result.

Method 8082: The following sample appears to contain polychlorinated biphenyls (PCBs); however, due to weathering or other environmental processes, the PCBs in the sample do not closely match any of the laboratory's Aroclor standards used for instrument calibration: LV-10-1 (570-62332-39). The sample(s) has been quantified and reported as Aroclor 1260. Due to the poor match with the Aroclor standard(s), there is increased qualitative and quantitative uncertainty associated with this result.

Method 8082: The following sample appears to contain polychlorinated biphenyls (PCBs); however, due to weathering or other environmental processes, the PCBs in the sample do not closely match any of the laboratory's Aroclor standards used for instrument calibration: LV-15-1 (570-62332-12). The sample(s) has been quantified and reported as Aroclor 1254 and 1260. Due to the poor match with the Aroclor standard(s), there is increased qualitative and quantitative uncertainty associated with this result.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Job ID: 570-62332-1 (Continued)

### Laboratory: Eurofins Calscience LLC (Continued)

**Metals**

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-159530 and analytical batch 570-160312 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010B: The absolute response for Antimony and Selenium was greater than the method reporting limit (RL) in the following samples: LV-11-2.5 (570-62332-3) and LV-11-5 (570-62332-4).
The instrument raw data has been manually reviewed and the result can be reported as ND.

Method 6010B: The absolute response for Arsenic was greater than the method reporting limit (RL) in the following samples: LV-11-10 (570-62332-6), LV-12-10 (570-62332-11) and LV-16-10 (570-62332-21).
The instrument raw data has been manually reviewed and the result can be reported as ND.

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-159584 and analytical batch 570-160312 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010B: The absolute response for Arsenic was greater than the method reporting limit (RL) in the following samples: LV-17-10 (570-62332-26), LV-19-10 (570-62332-31), LV-18-10 (570-62332-37) and LV-10-10 (570-62332-41).
The instrument raw data has been manually reviewed and the result can be reported as ND.

Method 6010B: The absolute response for Molybdenum was greater than the method reporting limit (RL) in the following samples: LV-11-7.5 (570-62332-5), LV-11-10 (570-62332-6), LV-12-2.5 (570-62332-8), LV-12-10 (570-62332-11), LV-15-7.5 (570-62332-15), LV-16-10 (570-62332-21), LV-17-10 (570-62332-26), LV-19-10 (570-62332-31), LV-18-7.5 (570-62332-36), LV-18-10 (570-62332-37) and LV-10-10 (570-62332-41).
The instrument raw data has been manually reviewed and the result can be reported as ND.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

This Detection Summary does not include radiochemical test results.

## Client Sample ID: LV-15-7.5 (Continued) — Lab Sample ID: 570-62332-15

| Analyte | Result | Qualifier | RL | | Unit | Dil Fac | D | Method | Prep Type |
|---|---|---|---|---|---|---|---|---|---|
| Vanadium | 42.9 | | 1.01 | | mg/Kg | 1 | | 6010B | Total/NA |
| Zinc | 51.0 | | 10.1 | | mg/Kg | 1 | | 6010B | Total/NA |

## Client Sample ID: LV-15-10 — Lab Sample ID: 570-62332-16

| Analyte | Result | Qualifier | RL | | Unit | Dil Fac | D | Method | Prep Type |
|---|---|---|---|---|---|---|---|---|---|
| Acetone | 25 | | 18 | | ug/Kg | 1 | | 8260B | Total/NA |
| Barium | 116 | | 0.495 | | mg/Kg | 1 | | 6010B | Total/NA |
| Beryllium | 0.386 | | 0.248 | | mg/Kg | 1 | | 6010B | Total/NA |
| Cobalt | 8.93 | | 0.990 | | mg/Kg | 1 | | 6010B | Total/NA |
| Chromium | 13.8 | | 0.990 | | mg/Kg | 1 | | 6010B | Total/NA |
| Copper | 20.6 | | 0.990 | | mg/Kg | 1 | | 6010B | Total/NA |
| Nickel | 12.3 | | 0.495 | | mg/Kg | 1 | | 6010B | Total/NA |
| Vanadium | 29.4 | | 0.990 | | mg/Kg | 1 | | 6010B | Total/NA |
| Zinc | 37.7 | | 9.90 | | mg/Kg | 1 | | 6010B | Total/NA |

## Client Sample ID: LV-16-1 — Lab Sample ID: 570-62332-17

| Analyte | Result | Qualifier | RL | | Unit | Dil Fac | D | Method | Prep Type |
|---|---|---|---|---|---|---|---|---|---|
| Acetone | 37 | | 15 | | ug/Kg | 1 | | 8260B | Total/NA |
| Benzene | 1.4 | | 0.76 | | ug/Kg | 1 | | 8260B | Total/NA |
| Toluene | 0.93 | | 0.76 | | ug/Kg | 1 | | 8260B | Total/NA |
| C13-C22 | 8.4 | | 4.8 | | mg/Kg | 1 | | 8015B | Total/NA |
| C23-C40 | 5.3 | | 4.8 | | mg/Kg | 1 | | 8015B | Total/NA |
| Barium | 67.2 | | 0.485 | | mg/Kg | 1 | | 6010B | Total/NA |
| Cobalt | 10.9 | | 0.971 | | mg/Kg | 1 | | 6010B | Total/NA |
| Chromium | 5.27 | | 0.971 | | mg/Kg | 1 | | 6010B | Total/NA |
| Copper | 11.3 | | 0.971 | | mg/Kg | 1 | | 6010B | Total/NA |
| Nickel | 4.26 | | 0.485 | | mg/Kg | 1 | | 6010B | Total/NA |
| Vanadium | 11.5 | | 0.971 | | mg/Kg | 1 | | 6010B | Total/NA |
| Zinc | 19.6 | | 9.71 | | mg/Kg | 1 | | 6010B | Total/NA |

## Client Sample ID: LV-16-2.5 — Lab Sample ID: 570-62332-18

| Analyte | Result | Qualifier | RL | | Unit | Dil Fac | D | Method | Prep Type |
|---|---|---|---|---|---|---|---|---|---|
| C23-C40 | 83 | | 5.2 | | mg/Kg | 1 | | 8015B | Total/NA |
| Arsenic | 7.67 | | 2.43 | | mg/Kg | 1 | | 6010B | Total/NA |
| Barium | 136 | | 0.485 | | mg/Kg | 1 | | 6010B | Total/NA |
| Beryllium | 0.515 | | 0.243 | | mg/Kg | 1 | | 6010B | Total/NA |
| Cobalt | 8.94 | | 0.971 | | mg/Kg | 1 | | 6010B | Total/NA |
| Chromium | 17.6 | | 0.971 | | mg/Kg | 1 | | 6010B | Total/NA |
| Copper | 27.7 | | 0.971 | | mg/Kg | 1 | | 6010B | Total/NA |
| Nickel | 13.4 | | 0.485 | | mg/Kg | 1 | | 6010B | Total/NA |
| Vanadium | 30.6 | | 0.971 | | mg/Kg | 1 | | 6010B | Total/NA |
| Zinc | 41.2 | | 9.71 | | mg/Kg | 1 | | 6010B | Total/NA |

## Client Sample ID: LV-16-5 — Lab Sample ID: 570-62332-19

| Analyte | Result | Qualifier | RL | | Unit | Dil Fac | D | Method | Prep Type |
|---|---|---|---|---|---|---|---|---|---|
| Benzene | 1.5 | | 0.38 | | ug/Kg | 1 | | 8260B | Total/NA |
| Toluene | 1.6 | | 0.38 | | ug/Kg | 1 | | 8260B | Total/NA |
| C13-C22 | 6.2 | | 4.9 | | mg/Kg | 1 | | 8015B | Total/NA |
