Hazardous Substances Abatement Plan
Mission Bay Park Improvements PEIR
Mission Bay
San Diego, California

Prepared For:
DUDEK
605 Third Street
Encinitas, California 92024

Prepared By:
The Bodhi Group, Inc.

April 2025
Project No. 9127010

April 15, 2025
Project No. 9127010

Mr. Matt Valerio
Principal/Coastal Services Manager
DUDEK
605 Third Street
Encinitas, California 92024

Subject: Hazardous Substances Abatement Plan
Mission Bay Park Improvements PEIR
San Diego, California

Dear Mr. Valerio,

We are pleased to submit this Hazardous Substances Abatement Plan in support of the Mission Bay Park Improvements PEIR in Mission Bay, San Diego, California.

Respectfully submitted,

THE BODHI GROUP, INC.

Sree Gopinath, P.E.

Appendix A – EDR Reports

1. INTRODUCTION

This Hazardous Substances Abatement Plan has been prepared for the City of San Diego on behalf Dudek of as part of an Environmental Impact Report (EIR) for the Mission Bay Park Improvements Program (Program) in San Diego, California. The Program is inclusive of site-specific project elements and bay-wide programmatic elements (Dudek 2025). The program location consists of the Mission Bay Park Improvement Zone (Improvement Zone), as defined in City of San Diego Charter Section 55.2 and shown on Figure 1.

The following table lists the proposed project elements (e.g., Upland Habitat and Preserve Expansion at Fiesta Island No. 1 South) as well as programmatic elements to be implemented throughout the Mission Bay Park area (e.g., Deferred Maintenance). The EIR addresses the various proposed improvements, including wetland and water quality improvements, shoreline restoration, expansion of habitat preserves, bicycle and pedestrian improvements, restoration of seawall bulkhead, and deferred maintenance activities. Individual project elements within the Improvement Zone are shown on Figure 1.

Table 1 – Project Elements within Mission Bay Park Improvement Zone

Wetland and Water Quality Improvements
North Fiesta Island
Tecolote Creek and Fiesta Island Causeway
Cudahy Creek
Shoreline Restoration
Vacation Island NW
Vacation Island NE
Vacation Island SW
Ventura Cove
Crown Point
West Sail Bay
Bonita Cove
Bahia Point
Upland Habitat and Preserve Expansion
Fiesta Island Site No. 1 South
Fiesta Island Site No. 3 Near Youth Camping
Fiesta Island Site No. 4 North
Fiesta Island Site No. 5 Least Tern Preserve
Sea World Drive / San Diego River Site No. 1a Cloverleaf
Sea World Drive/San Diego River Site No. 3c Triangle
Sea World Drive/San Diego River Site No. 4d South Shores

Bicycle and Pedestrian Improvements
Rose Creek Bike Path
Fiesta Island Causeway
Ocean Beach Bike Path
Robb Field/Gateway Connectivity Path
Restoration of Seawall Bulkhead – Mission Beach – Pacific Beach
Deferred Maintenance – Bay-wide
Signage Update – Bay-wide

Under the scope of this Hazardous Substances Abatement Plan, a hazardous materials assessment was completed to identify the potential presence of subsurface contamination from historical operations or from former spills and leaks of hazardous substances within the Improvement Zone. The assessment analyzed the potential impacts of these hazardous substances on proposed project elements and the potential effects of the contamination on human health and the environment. The findings of this hazardous materials assessment are presented in this document. This document also recommends measures to mitigate the effects of potential subsurface contamination, if encountered during construction.

This assessment meets and exceeds the American Society for Testing and Materials (ASTM) standard for preparing Phase I Environmental Site Assessment (ESA) reports in accordance with ASTM E1527-21 (i.e., Phase I standard; ASTM 2021). This assessment also meets the requirements of an Initial Site Assessment to identify potential or known hazardous materials, hazardous waste, and contamination in the Improvement Zone, the National Environmental Protection Act guidelines under the Comprehensive Environmental Review, Compensation, and Liability Act, Section VIII ‘Hazards and Hazardous Materials’ of Appendix G of the California Environmental Quality Act Statute and Guidelines, and the County of San Diego Guidelines for Determining Significance of Hazardous Materials and Existing Contamination.

The objective of this assessment is to document, to the extent feasible, hazardous materials that may be present within the Improvement Zone that may adversely affect the proposed project elements. These hazardous materials conditions are also known as Recognized Environmental Conditions (RECs) in the Phase I standard. RECs are defined by ASTM as “the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.” De minimis conditions, if noted, are conditions of contamination that do not rise to the level of RECs as they do not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

Consistent with the requirements indicated above, this assessment identified locations within or adjacent to the proposed project elements, where hazardous chemicals and petroleum have been used, stored, conveyed, or dispensed, and locations where there have been documented spills or unauthorized releases of hazardous chemicals or petroleum to the subsurface.

Based on the type of hazardous materials released, the location, depths of affected media relative to the estimated depths of construction, toxicity and persistence of the chemicals involved, and residual contamination, the hazardous materials conditions have been screened and weighted with a hazard rank based on the potential of the residual contamination to have adverse impacts to the proposed project elements.

The Bodhi Group conducted a drive-by reconnaissance from public access points (streets, sidewalks). However, since the hazards at these properties are subsurface, the assessment did not provide further information on the presence of hazardous materials.

Intrusive investigation, including the collection and analysis of subsurface media samples, was beyond the scope of this evaluation. Intrusive investigation (referred to as a Phase II ESA) could confirm or revise the findings of this study of the presence of subsurface hazardous materials and petroleum constituents.

1.1. Significant Assumptions

Documentation and data referred to in the preparation of this assessment, are assumed to be complete and correct and have been used and referenced with the understanding that the Bodhi Group assumes no responsibility or liability for their accuracy. The conclusions contained herein are based upon information and documentation as they existed on the date of this report. Because subsurface conditions may change over time and additional data may become available, conclusions drawn in this report are limited to current conditions and may not be relied upon on at a significantly later date or if changes have occurred in the Improvement Zone that were not known at the time of report preparation.

1.2. Limitations and Exceptions

Reasonable efforts were made to identify locations of potential environmental concern. “Reasonable efforts” are limited to information gained from recorded database information and regulatory records readily accessible to the public. Such methods may not identify contaminant sources that are not listed in information readily accessible to the public. While some observations and discussion in this report may address conditions and/or operations that may be regulated, the regulatory compliance of those conditions and/or operations is outside the scope of this evaluation. Nothing in this report constitutes a legal opinion or legal advice.

This evaluation does not address radon, lead in drinking water, wetlands, protected environments and habitat, threatened or endangered species, industrial hygiene concerns, human health risk assessment, indoor air quality, high voltage power lines, geotechnical conditions, cultural and historical resources, health and safety, and mold. Monetary valuation was not performed for this assessment. In some instances, we may provide an opinion on the potential for adverse health effects from volatile chemicals emitted from subsurface contamination into temporary trenches excavated for construction.

1.3. User Reliance

This report was prepared for the use solely and exclusively by Dudek and the City of San Diego. The report is not for the use or benefit of, nor may it be relied upon by, any other person or entity for any purpose without the advance written consent of the Bodhi Group. In the preparation of this report, the Bodhi Group has used the degree of care and skill ordinarily exercised by a reasonably prudent

environmental professional in the same community in the same time frame given the same or similar facts and circumstances.

2. PROJECT

The Mission Bay Park Improvement Zone is located in the City of San Diego, between Interstate 5 to the east and the Pacific Ocean to the west, generally bounded by the communities of Pacific Beach on the northern side and Ocean Beach on the southern side, as shown on Figure 1. The Improvement Zone encompasses the 4,235-acre Mission Bay Park as well as several additional nearby areas. Specific project areas ("elements") are located within the Improvement Zone, as shown on Figure 1.

2.1. Land Use

Land use in the Improvement Zone and vicinity is varied and includes recreational, residential, and commercial land uses and designated habitat areas, beaches, and open water. Portions of the Improvement Zone are developed with buildings, paved streets, parking lots, sidewalks, and bike paths. Historical review of the Improvement Zone did not indicate significant or widespread industrial or military land use of the properties (with the exception of some minor military use; see Sections 3 and 6 for additional details).

2.2. Topography

Elevations in the Improvement Zone are generally less than 20 feet above the North American Vertical Datum of 1988 (NAVD 88; United States Geological Survey 2021).

2.3. Hydrogeology

According to the San Diego Regional Water Quality Control Board's (RWQCB's) Water Quality Control Plan for the San Diego Region (RWQCB 1994), the majority of the Improvement Zone lies within the Penasquitos Hydrologic Unit, including the Hydrologic Areas listed below.

- Scripps (Mission Beach/Pacific Beach and Crown Point).
- Miramar (Rose Creek and eastern portion of Mission Bay).
- Tecolote (Tecolote Creek area).
- Fiesta Island (Fiesta Island and areas on the north side of the San Diego River channel).
- Vacation Isle (Vacation Island).
- Mission Bay (waters of Mission Bay).

The Ocean Beach Bike Path and Robb Field Gateway/Connectivity Path elements, south of the San Diego River channel, lie within the Mission San Diego Hydrologic Subarea of the Lower San Diego Hydrologic Area, in the San Diego Hydrologic Unit.

According to the Water Quality Control Plan, groundwater in these hydrologic areas (west of Interstate 5), is exempted from municipal use, and there are no other existing or potential beneficial uses of groundwater in the Improvement Zone.

A review of groundwater depth data from monitoring wells indicated the approximate depths-to-water near project sites in the Improvement Zone, summarized below.

- Vacation Island NW/NE – 8 feet below ground surface (bgs).
- Rose Creek Bike Path – 11 feet bgs.
- Robb Field/Gateway Connectivity Path - 19 to 23 feet bgs.

- Fiesta Island – 11 to 18 feet bgs.
- Sea World Drive/San Diego River Site 4d South Shores East Area – 15 to 20 feet bgs.

Shallow groundwater provides a medium for contamination in soil to leach to groundwater and migrate into areas excavated for project elements or by an induced gradient from construction dewatering. For this reason, the potential for contamination in groundwater to adversely affect project elements is significantly greater where groundwater is shallower. Based on a review of the project descriptions (Dudek 2025), many of the proposed improvements will likely not extend to groundwater, such as sidewalk removal and replacement, weed removal, and fencing. However, some improvements, such as excavations for wetlands and deep foundations may encounter groundwater. A conceptual site model describing the potential for direct contact exposure with contaminated groundwater is provided in Section 5.

According to the regulatory closure letter for the former sludge drying operations on Fiesta Island, “Very little difference in contaminant concentrations exists between Fiesta Island groundwater and ambient Mission Bay waters” (Section 6.6).

2.4. Geology

The geologic units exposed in the Improvement Zone consist of artificial fill (dredged hydraulic fill), young beach deposits, and Old paralic deposits (Unit 6). It is believed that the artificial fill is underlain locally by young alluvium and young estuarine deposits, characterized as poorly consolidated sand, silt, and clay layers. The young deposits are likely underlain by Old paralic deposits (Unit 6), which consist of poorly sorted, moderately permeable, well consolidated, reddish brown, interfingered strandline, beach, estuarine, and colluvial deposits composed of siltstone, sandstone, and conglomerate. Older Pliocene and Eocene sedimentary rocks unconformably underlie the Old paralic deposits (Bodhi Group 2018).

3. HISTORICAL RECORDS SEARCH

The following sections summarize the results of searches of federal, state, and local databases by Environmental Database Resources, LLC (EDR) and historical information including aerial photographs, topographic maps, and Sanborn fire insurance maps (EDR 2025a-d).

3.1. Standard Environmental Record Sources

The environmental databases searched ("standard environmental record searches"), corresponding search radii, and properties within specific search radii and identified on environmental databases are provided in the EDR report in Appendix A (EDR 2025a). The search radii were modified to focus on environmental conditions that could potentially adversely affect project elements, and the results are summarized in Section 6 of this report.

Table 2 – Standard Environmental Databases

Database Name	Search Radius (Mile)	No. of Mapped Listings
FEDERAL DATABASES		
National Priority List (NPL)	1.0	0
Proposed NPL (Proposed National Priority List Sites)	1.0	0

California RGA (Recovered Government Archive) LUST	Improvement Zone	0

3.2. Non-Geocoded (Unmapped) Listings

This portion of the regulatory database report includes properties for which regulatory agencies did not report sufficient address information to be plotted by EDR. There were 1,001 of these “orphan” sites listed in the database report (EDR 2025a). Based on their location description (e.g., Naval Air Station North Island), many reported orphans were determined to be located beyond the applicable search radii for the indicated database. Others were duplicates of listings in the radius search. The majority of listings were related to spills to the surface waters of Mission Bay from leaking or sinking boats. The remaining orphan sites that are not discussed in Section 6 of this Report are not of significant environmental concern to the proposed project elements.

3.3. Regulatory Records Review

Properties regulated for unauthorized releases of chemicals were identified through a search of the State Water Resources Control Board (SWRCB) Geotracker database, the California Environmental Protection Agency Department of Toxic Substances Control (DTSC)-managed EnviroStor website (Envirostor), San Diego County Department of Environmental Health and Quality (DEHQ) online files, CalRecycle's Solid Waste Facilities website, and EDR reports.

There is redundancy between the EDR reports and sites searched on Geotracker, Envirostor, DEHQ, CalRecycle, and the State of California Office of Emergency Services spills list. Properties with potential hazardous materials significance to the proposed project elements are discussed in Section 6.

3.4. Historical Aerial Photographs, Topographic Maps, and Sanborn Fire Insurance Maps

The historical resources listed below were reviewed for the proposed Improvement Zone.

- Aerial photographs from 1928, 1949, 1953, 1964, 1966, 1970, 1979, 1985, 1994, 1997, 2002, 2005, 2009, 2012, 2016 and 2020 provided by EDR were reviewed (EDR 2025b). The aerial photographs are included in the electronic GIS data submitted with this report.
- Topographic maps from 1903/04, 1930, 1942/1943, 1953, 1967, 1975, 1991, 1994, 1996, 2012, 2015, 2018, and 2021 provided by EDR were reviewed (EDR 2025c). The topographic maps are included in the electronic GIS data.
- Sanborn fire insurance maps from 1921, 1929, 1937, 1940, 1950, 1956, 1958, 1959, and 1965 provided by EDR were reviewed (EDR 2025c). The Sanborn maps are included in the electronic GIS data.

The following sections summarize the results of the historical review for the project areas. In general, the historical land use identified through the review of historical aerial, topographic, and insurance maps have largely been unchanged and consisted of residential, recreational, and commercial use. Significant or widespread industrial or military uses of land were not identified within the Improvement Zone during the historical research (with the exception of some minor military use; see Section 6.4 for additional details).

Facilities of potential environmental concern are further discussed in Section 6, Hazardous Conditions. Facilities that are listed but not discussed in Section 6 were evaluated to be not of concern based on the distance from the proposed improvements, the type and quantities of potential chemical releases, and the potential media affected.

3.4.1. Rose Creek Bike Path – Bike and Pedestrian Improvements

The lower portion of the Rose Inlet area was formerly tidal flats and was filled in between 1949 and 1953. The channelization of the Rose Inlet was generally complete by 1970. What appears to be an oval racetrack was depicted on the west side of Rose Creek/Rose Inlet in the 1903/1904 historical topographic map. Also in the 1903/1904 topographic map, former railroad tracks (La Jolla B&M Railroad) crossed the project area in an east-west direction at what is now Garnet Avenue.

Between 1953 and 1964, commercial development increased along Garnet Avenue, steadily increasing through the 1960s/1970s. The golf course, mobile homes, and Mission Bay High School were also developed during this time along the inlet.

Facilities of potential environmental concern identified from the review of historical resources that could potentially affect the proposed project elements are listed below.

- A gas station appeared to be historically present at 2662 Garnet Avenue, from approximately the 1950s to 1970s. This location corresponds to a Historical Auto Station listing in the EDR report, discussed in Section 6.1.
- Additional gas stations were noted on the northwest corner of what is now Mission Bay Drive and Garnet Avenue, approximately 400 feet southeast of the proposed project elements, discussed in Section 6.10.
- An auto repair facility was noted on the 1965 Sanborn map on the north side of Garnet Avenue, approximately 250 feet south of the project bikeway improvements, approximately 1,100 feet west of what is now Mission Bay Drive, discussed in Section 6.10.
- A "printing" facility was noted on the 1965 Sanborn map on the north side of Garnet Avenue, approximately 150 feet south of the project bikeway improvements, corresponding to approximately 2720 Balboa Avenue, discussed in Section 6.10.

3.4.2. Crown Point Restoration/Vacation Island Restoration (Ski Beach, NW, SW)

Crown Point has been developed with roads and scattered residences since as early as 1928, and was fully developed with residences by 1949.

Vacation Island/Paradise Point was created from fill soils by 1949. By 1953, the northeastern portion remained to be filled in. By 1964, resort development was present on the northwestern portion, and by 1970, the park was present on the northeastern portion. By 1985, the island appeared to be developed similarly to its current configuration.

No facilities of potential environmental concern in the Crown Point Restoration/Vacation Island Restoration areas were identified in the historical resources reviewed.

3.4.3. North Fiesta Island Wetland/Site No. 3 Near Youth Camping/Site No. 4 North/Site No. 5 Least Tern Preserve/Cudahy Creek Wetlands

Fiesta Island and the eastern shore comprising the Cudahy Creek Wetlands project element were created with fill soils between 1953 and 1964 (previously part of Mission Bay).

Between 1966 and 1970, the eastern shoreline/Cudahy Creek Wetlands area was further modified/carved out, and parks were created on the eastern shoreline of Mission Bay, similar to current configurations.

No facilities of potential environmental concern in the North Fiesta Island Wetland/Site No. 3 Near Youth Camping/Site No. 4 North/ Site No. 5 Least Tern Preserve /Cudahy Creek Wetlands project areas were identified in the historical resources reviewed.

3.4.4. Fiesta Island Site No. 1 South/Tecolote Creek and Fiesta Island Causeway

Fiesta Island was created with fill soils between 1953 and 1964. Prior to that time, the area was generally tidal/mud flats of Mission Bay. Portions of this area were formerly developed in the 1940s with scattered shacks, known as the "Duckville" area.

Starting in the 1930s, the northwestern portion of the former "Pike" or "Peik" airfield's mud runway in Duckville transected the southeastern portion of the proposed project elements. The airfield operated until 1953.

Facilities of potential environmental concern identified from the review of historical resources that could potentially affect the proposed project elements are listed below.

- The southwestern portion of Fiesta Island was used for sludge drying activities from approximately the 1960s to the 1990s. These operations are discussed in Section 6.5.
- In 1985/1994, an additional area of disturbance, possibly bermed areas or ponds, is identified approximately 250 feet northwest of Fiesta Island Site No. 1 on southeastern Fiesta Island. While most of the sludge drying activities were located on the southwestern portion of Fiesta Island, across the "Hidden Anchorage" Inlet and greater than 1,000 feet west of the project area, this smaller area of potential sludge drying was of limited duration and located closer to the proposed project elements. This area is discussed in Section 6.5.
- The former airfield and associated features of potential environmental concern are discussed in Section 6.6.

3.4.5. Mission Beach – Pacific Beach Seawall Bulkhead Restoration

Mission Beach has been developed since the 1920s, with commercial development intensifying in the 1950s and 1960s.

Based on a review of historical maps and aerial photographs, the seawall and oceanfront walk in Mission Beach have been present since as early as 1929.

The amusement park south of Ventura Boulevard, adjacent to the southeast of the proposed project elements, has been developed since as early as 1928.

Facilities of potential environmental concern identified from the review of historical resources that could potentially affect the proposed project elements are listed below all of which are historical gas stations, with the exception of the drycleaning facility. While there are no documented releases associated with these facilities, the type of facility and period of operation indicates that there is a potential for unauthorized releases of hazardous materials or petroleum at these locations.

- Southeast corner of Grand Avenue and Mission Boulevard (1966-1979).
- Northwest and northeast corners of Grand Avenue and Mission Boulevard (1964).
- Southwest corner of Lido Court and Mission Boulevard (1966-1979).
- Northwest corner of San Luis Obispo Place and Mission Boulevard (1956-1970).
- Northeast corner of Pacific Beach Drive and Mission Boulevard (1953-1970).
- Northeast corner of Reed Avenue and Mission Boulevard (1966-1970).
- Northwest corner of Santa Clara Place and Mission Boulevard (1958).
- A drycleaning facility located on the northeast corner of Redondo Court and Mission Boulevard (1958).

These facilities are discussed in Section 6.10.

3.4.6. West Sail Bay Restoration

Residences have been located along West Sail Bay since the 1920s. In the area of the proposed project elements, on the west side of Sail Bay, it appears that additional sand was placed and the beach was expanded between 1928 and 1949. The areas of proposed project elements at this location have otherwise remained generally unchanged until the present.

What is now the Catamaran Resort was developed to the north of the proposed project elements on Sail Bay by the 1960s.

No facilities of potential environmental concern in the West Sail Bay Restoration project element were identified in the historical resources reviewed.

3.4.7. Bahia Point/Ventura Cove/Bonita Cove Restoration

The Bahia Point and Ventura Cove areas of the proposed project elements were formerly part of Mission Bay and were filled between 1928 and 1949.

The Bonita Cove project area and adjacent areas south of Mission Bay Drive (now parks and parking lots) formerly comprised a cove with a different configuration (including an island), which was filled in between 1953 and 1964.

What is now known as the Bahia Point Hotel, adjacent to the Bahia Point Shoreline Restoration area, was under construction in the 1950s and appeared similar to its current configuration by 1964.

Facilities of potential environmental concern identified from the review of historical resources that could potentially affect the proposed project elements are listed below.

- A historical gas station was formerly located on the southeast corner of Mission Boulevard and Mission Bay Drive, approximately 700 feet from the closest Bonita Cove proposed project element, from approximately the 1940s to 1970s.
- A small auto repair building was located approximately 250 feet southwest of the proposed project element at Bonita Cove, from 1956 to 1959.

These facilities are discussed in Section 6.10.

3.4.8. Robb Field – Gateway Connectivity Path – Bike and Pedestrian Improvements

The area of proposed bike and pedestrian improvements along Sunset Cliffs and West Point Loma Boulevard, adjacent to Robb Field, was formerly part of Mission Bay and was filled in between 1949 and 1953. Prior to filling, the bay was crossed by a railroad (San Diego Electric Railway), which traversed the northern tip of the Improvement Zone. The railroad was removed when the area was filled in by 1953. Prior to being filled in, several dwellings (residences) were located along the shoreline, in the area of the proposed project elements.

What is now known as Robb Field was developed by 1964 with baseball diamonds and continued being developed throughout the 1970s.

Between 2012 and 2016, the bikeway/trail entrance was created at the northwest corner of Sunset Cliffs Boulevard and Point Loma Boulevard.

The only facility of potential environmental concern identified from the review of historical resources that could potentially affect the proposed project elements is a gas station at 2305 Sunset Cliffs Boulevard, which has likely been present since the 1950s. This facility is discussed in Section 6.3.

3.4.9. Ocean Beach Bike Path – Bike and Pedestrian Improvements

Ocean Beach has been developed with residences and commercial businesses since at least as early as the 1920s. The areas of proposed project elements and adjacent properties were formerly tidal flats and part

of Mission Bay, which was filled at the time of the channelization of the San Diego River in approximately the early 1950s. Prior to filling/channelization, some commercial and residential structures, including a dance hall, which later became cottages and a motel, were present along the waterfront, adjacent to the south of the proposed project elements.

Between 1953 and 1964, development increased along West Point Loma Boulevard, from scattered stores and residences to larger motels and some commercial businesses. The parking lot at the western end of Ocean Beach, near Dog Beach, was created between 1966 and 1970. Robb Field, adjacent to the south of the eastern portion of the proposed bike/pedestrian improvements, continued to expand with baseball diamonds and park facilities in the 1970s and 1980s.

Until channelization in the early 1950s, a bridge formerly linked Ocean Beach to Mission Beach and may have supported railroad tracks. The bridge extended from approximately the current location of West Point Loma Boulevard and Bacon Street, north across Mission Bay and into Mission Beach.

No facilities of potential environmental concern in the proposed bike and pedestrian improvement project area were identified in the historical resources reviewed.

3.4.10. Fiesta Island Site No. 4d South Shores East Area

The proposed project elements in this area overlap with the former Mission Bay Landfill, which operated from approximately 1952 to 1959 and is discussed in Section 6.9. Based on review of the 1953 aerial photograph and review of documents for the Mission Bay Landfill, landfilling operations likely occurred within this project area.

The Fiesta Island Site No. 4d area lies between Mission Bay to the north and Sea World Drive to the south. Prior to channelization of the San Diego River in approximately 1949/1950, this area was tidal flats and was part of an area known as “Duckville.” The San Diego River channel crossed the southwestern portion of this area.

Duckville was a residential community and included an airfield, “Pike/Peik Airport.” In the 1930s through 1953, a portion of the airfield extended onto the northern portion of Site No. 4d. Temporary military barracks were located at the airfield during World War II in the 1940s (Duvall 2024). The airfield reportedly had an approximately 2,600-foot oiled runway and three hangars and “offered storage, repairs, charter, and fuel” (Freeman 2025). A “maintenance hangar” is referenced in 1945. Review of historical photographs of the airfield dated 1946 and 1952 show bulk aboveground storage, possibly of fuel (Freeman 2025).

The majority of the Site No. 4d project area was otherwise vacant, undeveloped mudflats.

The entire area north of the levee for the newly created San Diego River Channel was filled between 1953 and 1964. Thereafter, Site No. 4d area was generally vacant.

By 1975, Sea World Drive was present in its current configuration around the southern and eastern edges of the project area.

What is now South Shores Cove had been carved out from a filled shoreline between 1985 and 1994. The adjacent South Shores Park area, along with the associated parking lots and parkway, was developed

between 1994 and 1997. In 1994, the western portion of Site No. 4d appeared to be graded, similarly to the South Shores Park zone.

Since at least 2002, a cleared rectangular area (identified on current maps as an electric flyers park runway) has been present in the southwestern portion of Site 4d.

Facilities of potential environmental concern identified from the review of historical resources that could potentially affect the proposed project elements are listed below.

- The former airfield, discussed in Section 6.6.
- The former Mission Bay Landfill, discussed in Section 6.9.

3.4.11. Sea World Drive/San Diego River Site No. 1a – Cloverleaf Least Tern Preserve Area and Site No. 3c – Triangle Restoration Area

The proposed project elements in these areas overlap with the former Mission Bay Landfill, which operated from approximately 1952 to 1959 and is discussed in Section 6.9.

Sites No. 1a and 3c are bounded by Sea World Drive to the north and "Old Sea World Drive" or "Mission Bay Drive" to the south. Prior to channelization of the San Diego River in approximately 1949/1950, this area was tidal flats and was part of an area known as "Duckville." As part of channelization, raised levee embankments with riprap slope protection were constructed on the north and south sides of the river channel. The former Sea World Drive ("Old Sea World Drive" or "Mission Bay Drive") was located at the top of the levee.

The entire area north of the levee, including the project area, was filled between 1953 and 1964.

Based on review of the 1953 aerial photograph and review of documents for the Mission Bay Landfill, landfilling operations likely occurred within the Improvement Zone.

Sewage disposal ponds were located within Site No. 1a Cloverleaf Least Tern Preserve Area, southeast of what is now the interchange between West Mission Bay Drive and Sea World Drive, since sometime between 1953 and 1964. By 1964, a portion of the Sea World complex to the north was completed, and the sewage disposal ponds are visible on aerial photographs and topographic maps from that period. A linear feature, possibly a trench or track, extends from the sewage disposal ponds to Sea World. The ponds continue to be present through 1985, after which time they appear more as a depression than filled ponds. The 2012 and 2015 topographic maps depict the former pond area as a depression.

The Site No. 3c Triangle Restoration Area, which constitutes a triangular area between the intersection of Sea World Drive and Friars Road and "Old Sea World Drive," has been vacant since the area was filled in the 1950s/1960s. In the 1997 aerial photograph, it appears that this area has been disturbed, giving a hummocky appearance. This is likely related to previous vegetation enhancement and restoration activities discussed in the project description (Dudek 2025). By the mid-2000s, the vegetation appeared to be growing back in, similar to its current configuration.

Facilities of potential environmental concern identified from the review of historical resources that could potentially affect the proposed project elements are listed below.

- The former sewage disposal ponds, discussed in Section 6.8.
- The former Mission Bay Landfill, discussed in Section 6.9.

4. PROJECT AREA RECONAISSANCE

A reconnaissance of the areas of proposed project elements consisted of a drive-by assessment from publicly-accessible viewpoints and observations made during other investigations. No specific conditions of environmental concern were noted. Hazardous materials conditions of concern, if present, will be in the subsurface, with minimal or no evidence of the impacts at the surface. However, a reconnaissance is typical of environmental assessments and has been included for completeness (Table 3).

Table 3 – Improvement Zone Observations

Conditions	Not Observed or Noted	Observed or Noted	Significant Concern?
Hazardous Substances/Petroleum Products		X	No. Multiple gasoline service stations and auto mechanic shops are located within the Improvement Zone; where petroleum products are stored and dispensed. These locations are discussed in Section 6, if they present a concern to the proposed project elements.
Waste Generation/Storage/Disposal		X	No. Multiple covered dumpsters (waste storage/disposal) associated with businesses and residences are located in the Improvement Zone. No significant violation of waste disposal was observed.
ASTs		X	No. ASTs may be present at retail service stations and commercial businesses. No significant issues related to ASTs were identified.
Potential Evidence of USTs		X	No. USTs will be present at gasoline service stations; surface observations of significant releases were not observed.
Potential Polychlorinated Biphenyl (PCB)-Containing Equipment		X	No. Transformers were observed and may or may not contain PCBs. The observed transformers were in good condition.
Chemical/Petroleum Odors		X	No. Petroleum odors are common at gas stations, where petroleum products are stored and dispensed.
Suspect Concrete Patches/Pads		X	No. Patches will be present in roads, sidewalks, and parking areas; by themselves they are not evidence of subsurface contamination unless accompanied by other indicators.

Conditions	Not Observed or Noted	Observed or Noted	Significant Concern?
Pools of Liquid	X		Not observed from publicly accessible viewpoints.
Sewage Discharge Pipes	X		Not observed from publicly accessible viewpoints.
Floor Drains/Sumps	X		Not observed from publicly-accessible viewpoints.
Hydraulic Elevator	X		Not observed from publicly accessible viewpoints.
Wells		X	Monitoring wells were not observed from the publicly accessible viewpoints. However, monitoring wells are known to be present in the Improvement Zone, including at Mission Bay landfill.
Drums	X		Not observed from publicly accessible viewpoints.
Unidentified Substance Containers	X		Not observed from publicly accessible viewpoints.
Stained Soil or Pavement		X	Minor stains on pavement areas were observed and appear to be a result of vehicle traffic and parking and are not of significant concern to the project.
Stressed Vegetation	X		Not observed from publicly accessible viewpoints.
Pits, Ponds, or Lagoons	X		Not observed from publicly accessible viewpoints.
Wastewater Discharge Disposal Systems	X		Not observed from publicly accessible viewpoints.
Septic Systems/Cesspools	X		Not observed from publicly accessible viewpoints.
Municipal Solid Waste Disposal Areas	X		Not observed from publicly accessible viewpoints.
Other Conditions	X		Not observed.

5. CONCEPTUAL SITE MODEL

Based on a review of regulatory records, online databases, and the third-party database search report, the primary **sources** of contamination within the Improvement Zone with the potential for adverse impacts on proposed project element design, construction, and operation are listed below.

- Releases of petroleum from storage and conveyance systems, such as underground storage tank (UST) systems, resulting in petroleum hydrocarbon contamination in soil, groundwater, and soil vapor.
- Releases of organic chemicals and/or metals from waste disposal, resulting in impacts to soil, groundwater, and soil vapor.
- Historical leaded-gasoline vehicle emissions resulting in lead contamination in shallow soil.
- Historical practices associated with the disposal and burning of waste resulting in lead, other heavy metals, and organic contamination in soil.

Potential **receptors** who may be exposed to contamination from project construction and operation are described below.

- During excavation activities for proposed project elements, workers may be directly exposed to contamination in soil or groundwater, through dermal contact during trenching, dewatering, dredging, or stockpiling of soil. This potential exposure pathway exists for future maintenance activities involving excavation.
- During construction, workers and the public may be exposed to contaminated dust generated during trenching and/or excavation or volatile chemicals emanating from trenches, pits, stockpiles, and/or groundwater in trenches and/or excavations. This potential exposure pathway exists for future maintenance activities involving excavation.
- During construction, aquatic receptors in Mission Bay may be exposed to contamination through the discharge of contaminated soil or groundwater into the storm drain system during a storm event.

Some of the proposed project elements will involve earthwork, where there is a potential for direct contact exposure with contaminated soil. A summary of major earthwork activities for the proposed project elements is summarized in the following table.

Table 4 – Summary of Earthwork for Proposed Project Elements

Project Element and Location	Nature of Proposed Improvements
Wetland and Water Quality Improvements	
North Fiesta Island	Approximately 315,000 cubic yards of soil will be excavated for wetland improvements and used in other projects
Tecolote Creek and Fiesta Island Causeway	Earthwork and grading to create a channel under the Fiesta Island Causeway and create 12 acres of wetlands and construction of a forebay at the mouth of Tecolote Creek. Import of 180,000 cubic yards of material into the proposed wetland footprint at the existing location of the Tecolote Creek mouth and east Mission Bay.

Project Element and Location	Nature of Proposed Improvements
Cudahy Creek	Create wetlands area including oyster bags, berm, riprap revetment; import of approximately 58,000 cubic yards of soil
Shoreline Restoration	
Vacation Island NW	Restore and stabilize sandy beach with sand replenishment; install boardwalk
Vacation Island NE	Beach nourishment/stabilization; riprap revetment
Vacation Island SW	Repair and improve riprap revetment to create a perched beach
Ventura Cove	Repair riprap revetment
Crown Point	Construct a seawall for shoreline protection
West Sail Bay	Beach nourishment
Bonita Cove	Beach nourishment; sidewalk relocation
Bahia Point	Beach nourishment and stormwater improvements
Upland Habitat and Preserve Expansion	
Fiesta Island Site No. 1 South	Habitat restoration, including removal of non-native plants, berm grading, temporary irrigation system; fencing
Fiesta Island Site No. 3 Near Youth Camping	None at this time
Fiesta Island Site No. 4 North	Berm modification and establishment; reconfigure trails
Fiesta Island Site No. 5 Least Tern Preserve	Berm revegetation and import of sand and shells
Sea World Drive / San Diego River Site No. 1a Cloverleaf	Removal of non-native plants; import of sand and shells; minor topographic variation and mounding
Sea World Drive/San Diego River Site No. 3c Triangle	Remove non-native plants; installation of native container plants and seeds
Sea World Drive/San Diego River Site No. 4d South Shores	Remove non-native plants; import of soil/sand; installation of native container plants and seeds
Bicycle and Pedestrian Improvements	Remove and replace existing pavement (3 inches of concrete over 9 inches of crushed aggregate base)
Rose Creek Bike Path	Extend several storm drain systems; lower some portions of bike path for clearance
Fiesta Island Causeway	No utilities impacted
Ocean Beach Bike Path	No utilities impacted
Robb Field/Gateway Connectivity Path	Relocate utility cabinet; install retaining wall with footings
Restoration of Seawall Bulkhead – Mission Beach – Pacific Beach	New wall placed on top of existing pile caps; grouting to fill voids under boardwalk; new wall with spread footings to Crystal Pier; replace stairways to beach; create vehicle access at Thomas Road
Deferred Maintenance – Bay-wide	Varied; may include repairs to parking lots, lighting, comfort stations, playgrounds, fire pits, stormwater infrastructure
Signage Update – Bay-wide	De minimis

Excavation for construction of the proposed project elements, such as footings for retaining walls, foundations, excavation for wetlands creation and a channel beneath the Fiesta Island Causeway, may encounter groundwater.

6. ANALYSIS OF HAZARDOUS CONDITIONS

Based on the research and analysis discussed in Section 3, approximately 2,402 records of hazardous materials storage, transport, use, disposal, or releases were identified in searches performed by EDR and review of Geotracker, Envirostor, CalRecycle, and DEHQ sources. Some of the records were multiple entries for the same facility/address (e.g. multiple permits, disposal records, or multiple releases). As indicated in Section 3, a majority of the release sites analyzed were fuel service stations, automobile repair shops, waste disposal facilities (i.e., landfill, sewage treatment), and an airport. No significant industrial process or military use was identified in the Improvement Zone.

These sites were further screened to evaluate hazardous materials conditions that could result in potential adverse impacts to the proposed project elements. The screening criteria are listed below.

- Known or suspected historical storage and use of hazardous chemicals (e.g., dry cleaners) in sufficient proximity to the proposed project elements. More recent storage and use of hazardous chemicals (i.e., within the last 25 years) were likely under regulatory permit, regulatory inspections, and/or used good housekeeping practices and therefore are not of potential concern unless there was a documented release.
- Known or suspected unauthorized releases of hazardous chemicals or petroleum within sufficient proximity to the proposed project elements (e.g., regulatory cases or gasoline service stations).
- Known residual concentrations of chemicals in the subsurface in sufficient proximity to the proposed project elements (e.g., previous environmental investigations of sites with regulatory cases).

The sites that did not meet any of the above criteria were not considered to be of potential concern and were eliminated from further analysis. The degree of potential adverse impacts differ based on the specifics of each release and are influenced by the type and quantity of chemicals released (i.e., volatility, solubility, toxicity, persistence), affected media (i.e., soil, groundwater, soil gas), source area concentrations (if known), physical characteristics of the site such as geology and hydrogeology (e.g., soil type, depth-to-water, direction of groundwater flow), preferential pathways for contaminant migration (if present), proximity to proposed project elements, and whether the chemicals have effectively attenuated or have been actively remediated to levels that are less than significant.

The influence of distance (proximity) from the proposed project elements depends on whether the release of hazardous materials impacted soil-only or if soil gas and groundwater were also impacted, and whether the proposed project elements are downgradient of the hazardous materials release in terms of groundwater flow. For example, a soil-only release of non-volatile chemicals would have to be sufficiently close (e.g., within 50 feet) to be considered for additional analysis. However, a significant release of hazardous materials that includes a volatile component and has resulted in groundwater contamination may have a potential adverse impact downgradient of the release (which may also be informed by previous subsurface investigations).

Based on an evaluation of the above criteria and our experience, the 2,402 records from regulatory sources and historical research were screened to **13 sites/conditions** that could potentially have adverse impacts on proposed project elements and are discussed in Sections 6.1 through 6.13. These conditions were assigned a hazard ranking from 1 to 3, with 3 being the highest potential hazard and 1, the lowest. Each site and the hazardous materials conditions are discussed and summarized in this section (with a hazard ranking).

Table 5 – Hazard Ranking Criteria

Hazard Rank	Description	Potential Mitigation Measures
3	Potentially acute threat to construction workers or public exposed to toxic levels of hazardous materials during project construction (this condition is rare).	Immediate action is needed to mitigate the threat.
2	Potentially significant risk to workers (but not an acute threat), the public, or the environment due to residual contaminants in soil, soil gas, and/or groundwater	Environmental monitoring of excavated soil for indications of residual contamination (soil discoloration or odors) is recommended during construction. Excavated soil may require special handling and disposal. Environmental monitoring for Volatile Organic Compounds (VOCs) using a photoionization detector (PID) is recommended in the worker's breathing zone. Air and dust monitoring may be needed to protect the community. The City may elect to perform Phase 2 ESAs at some locations for a more accurate assessment of risk prior to project construction.
1	De minimis conditions.	No action or special management needed.

6.1. Historical Gas Station (2662 Garnet Avenue)

This property is located on the north side of Garnet Avenue, adjacent to the east of the Rose Creek Bike Path area in Pacific Beach (Figure 3). Review of historical aerial photographs and Sanborn fire insurance maps indicated that this facility was a historical gas station from approximately the 1950s to the 1970s. This facility was also listed in the EDR report as a historical gas station from 1966 to 1985.

Depth-to-groundwater at a nearby release case (2710 Garnet Avenue, located approximately 250 feet to the east) was reported to be 11 feet bgs, with an estimated direction of groundwater flow to the west-southwest.

Historical gas stations likely had USTs containing gasoline. Based on the age of the facility, it is reasonable to expect that petroleum would have leaked into the subsurface from the UST system. The locations of the USTs are unknown, but the facility is adjacent to proposed bike/pedestrian improvements along the Rose Creek Bike Path.

There is a potential for contaminated soil to be encountered during project construction. Although the actual contents of the USTs are unknown, the primary contaminants of concern in soil from unauthorized releases of petroleum are potentially total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), and polycyclic aromatic hydrocarbons (PAHs). There is also the potential for exposure by inhalation of vapor phase VOCs, which can volatilize from impacted soil and groundwater, migrate through the unsaturated zone, and accumulate in excavations and trenches. The type of chemical exposure and degree of exposure is not known; but based on other similar cases, it is unlikely that residual contamination at this location poses an acute threat to workers or the public. Accordingly, a hazard ranking of 2 is assigned to this location.

6.2. Dry Clean Empire (2710 Garnet Avenue)

This property is located adjacent to the south of the proposed Rose Creek Bike Path (Figure 3). Review of the environmental database report indicates that this property is listed on unauthorized release databases with a case-closed status. According to the Case Closure Letter dated November 17, 2005, a Phase I Environmental Site Assessment had indicated a former dry-cleaning facility at this location. Chlorinated hydrocarbons were not detected in groundwater samples collected during due diligence activities. Low levels of tetrachloroethylene (PCE) and 1,1-dichloroethylene (DCE) were detected in soil vapor, and low levels of PCE were detected in soil; however, a risk assessment indicated no increased cancer risk to site occupants.

The closest project element for bike/pedestrian improvements would be approximately 100 feet north of the former dry-cleaning facility. Based on the distance of the proposed improvements from the release area, and the limited nature of the release to soil, impacted media will likely not be encountered during construction activities. Therefore, a hazard ranking of 1 is assigned to this location.

6.3. Ocean Beach Mobil/Ocean Beach Gas (2305 Sunset Cliffs Boulevard)

This property is located on the eastern corner of Sunset Cliffs Boulevard and Point Loma Boulevard, approximately 100 feet southeast of the proposed Robb Field/Gateway Connectivity Path bike/pedestrian improvements (Figure 6). The property is associated with several closed unauthorized release cases and is listed as a historical and active UST location. The first two cases were closed in the early 1990s and appeared to be associated with releases of waste oil and/or gasoline. Although specific information regarding the location(s) and nature(s) of these early releases was not available in the records reviewed, the third case (discussed below) included soil and groundwater delineation information for the property as a whole.

The third unauthorized release case was associated with impacts discovered during dispenser and piping upgrades. According to the Closure Letter dated November 30, 2007, approximately 333 cubic yards of impacted soil remains at the release location, with an average soil TPH-gasoline (TPH-g) concentration of 2,667 milligrams per kilogram (mg/kg). Depth to groundwater was 18.97 to 23.3 feet bgs, with a direction of groundwater flow to the north. Free product was not observed in any of the five groundwater monitoring wells sampled over the course of 13 rounds of groundwater sampling. The DEHQ concurred with the Corrective Action Plan (CAP) recommending regulatory site closure with expectation that the chemical contamination would be reduced through natural attenuation.

According to the CAP, monitoring well MW-2 was located within the center of Sunset Cliffs Boulevard, approximately 50 feet southeast of the area of proposed improvements. Dissolved-phase benzene and methyl tert-butyl ethylene (MTBE) were detected in MW-2, in the direction of the proposed project elements, at concentrations of 0.98 micrograms per liter (ug/l) and 1.58 ug/l, respectively, as of November 2005.

Based on the reported depth-to-groundwater, the low concentrations of benzene and MTBE in groundwater, the amount of time since constituents of concern were detected in groundwater (approximately 20 years), the residual concentrations of benzene and MTBE may be lower than those detected in 2005.

Based on the distance of the proposed construction excavation (if any) at the Robb Field/Gateway Connectivity Path to this site, residual contamination in soil is not expected to be encountered. Some minor residual contamination may be present in groundwater that may be encountered during construction dewatering, such as for retaining wall footings. There is also a potential to encounter low levels of chlorinated hydrocarbons in the soil gas phase that may be present in trenches excavated for project construction. To account for the potential of encountering residual contamination, a hazard ranking of 2 is assigned to this location.

6.4. Radar Station L-6 MIS ("Mission Beach")

This facility is listed on the DTSC Envirostor database as a Formerly Used Defense Site (FUDS) property. According to Envirostor records, the site is located between the parking lot for South Shore Park and the proposed Sea World Drive/San Diego River Site No. 4d - South Shores East Area element (Figure 4). The location is within the footprint of the former Mission Bay Landfill discussed in Section 6.9. The status is reported to be inactive as of 2005.

According to the FUDS GIS database, this site was a 23-acre area used for radar operations and a campsite. As of the 2022 Management Action Report, the site was owned by the City of San Diego and was proposed to be developed by Chilcote Construction. No environmental restoration sites were reported or planned for this location, and no 5-year reviews were planned.

Based on the records reviewed, the inactive status, the reported former military activity (radar and campsite), and the lack of documentation of a release, it is unlikely that impacted soil or groundwater from this site, if any, would be encountered during project construction. Therefore, a hazard ranking of 1 is assigned to this site.

6.5. Fiesta Island Sludge Drying (1000 Fiesta Island Drive)

According to a DEHQ Case Closure Letter dated March 2000, the unauthorized release at this facility was associated with the Fiesta Island Sludge Drying Facility, owned by the City of San Diego Metropolitan Wastewater Department. This site was historically used for drying domestic sludge from the Point Loma Treatment facility, and comprised approximately 100 acres, with 19 sludge drying beds, nine decant ponds, and transfer channels and sludge belt presses. The underlying soils were reportedly impacted with metals and pesticides from drying of domestic sewage sludge. The closure letter states that after operations ceased, "remaining sludge was disposed off-site and the area was capped with 5 to 7 feet of clean imported soil." After cleanup, the total concentrations of metals in the underlying soils were reportedly within acceptable regulatory limits.

Depth-to-groundwater was reported to range from 11 to 18 feet bgs. According to the closure letter, "Very little difference in contaminant concentrations exists between Fiesta Island groundwater and ambient Mission Bay waters."

The case received regulatory closure based on the current/proposed use of the site as a recreational facility/park. The closure letter states: "Any future excavation conducted at this site must consider possible contaminants in the soil from previous land use. Contaminated soil must be managed in accordance with applicable regulatory requirements."

The proposed project elements for the Fiesta Island area will include Upland Habitat and Preserve Expansion (Fiesta Island Site Nos. 1, 2, 3, 4, and 5), Bicycle and Pedestrian Improvements (Fiesta Island Causeway), and Water Quality/Wetland Restoration (North Fiesta Island). Based on historical DEHQ document review, the sludge drying operations were formerly located on the southwestern portion of Fiesta Island, west of the "Hidden Anchorage" inlet. Project elements are not proposed for this area; the closest proposed elements are Fiesta Island Site Nos. 1 and 4, located more than 1,000 feet to the east and north, respectively (Figure 4). Therefore, a hazard ranking of 1 is assigned to the sludge drying operations formerly located west of Hidden Anchorage.

In 1985/1994, an additional, smaller area of disturbance, possibly bermed areas, ponds, or additional sludge drying operations were identified, approximately 250 feet northwest of Fiesta Island Site No. 1 (Figure 4). While most of the sludge drying activities were located on the southwestern portion of Fiesta Island, across the "Hidden Anchorage" Inlet, this smaller area was of limited duration and located closer to the proposed project elements. Review of documentation for the larger sludge drying operations on the southwestern portion of Fiesta Island indicates that the transfer of this area from the Metropolitan Wastewater Department to the City of San Diego Parks and Recreation Department may have occurred at an earlier time, for which assessment/cleanup records are not available. Based on the distance of this area from the closest proposed project element (Fiesta Island Site No. 1) and the significantly shorter duration of operations, a hazard ranking of 1 is assigned to this area.

6.6. Former Pike/Peik Airfield

Portions of Sea World Drive/San Diego River Site No. 4d South Shores East and Tecolote Creek/Fiesta Island Causeway project sites are underlain by a former airfield, "Pike/Peik Airport" (Figure 4). In the 1930s through 1953, a portion of the airfield extended onto the northern portion of Site No. 4d, and the runway extended onto the Tecolote Creek/Fiesta Island Causeway area. As discussed in Section 3.4, the airfield reportedly had an approximately 2,600-foot oiled runway and three hangars and "offered storage, repairs, charter, and fuel" (Freeman 2025). A "maintenance hangar" is referenced in 1945. Review of historical photographs of the airfield dated 1946 and 1952 show bulk aboveground storage (Figure 4), possibly of fuel (Freeman 2025). The airport ceased operations in the early- to mid-1950s, and this entire area was thereafter filled in. The areas of the former airport and runway were covered with dredged fill material.

Constituents of concern associated with the former oiled runway may include polychlorinated biphenyls (PCBs, which may have been present in waste oil), petroleum hydrocarbons, and other organic and inorganic chemicals. Proposed project activities at the Fiesta Island Causeway, which overlies the former runway, include creation of an open channel beneath the causeway to create a hydraulic connection between the basins on either side. The channel would require excavation and grading activities. Because the thickness of fill material in the area of the former runway is unknown, it is possible that earthwork activities may encounter contaminated media associated with the waste oil application (soil, soil vapor, or groundwater). Therefore, a hazard ranking of 2 is assigned to the former runway area.

Newer airports (i.e., that operated during and after the 1960s) may have stored and used aqueous film forming foam (AFFF), which is one of the most significant sources of per- and polyfluoroalkyl substances (PFAS), a class of chemicals that is of emerging concern to regulators and the public (ITRC 2020). Two PFAS chemicals have been recently designated as hazardous by the U.S. Environmental Protection

Agency (EPA 2024). AFFF has been used at airports to extinguish petroleum fires, including crash pit training by Aircraft Rescue and Fire Fighting teams. Because Pike Airport ceased operations by the mid-1950s and there is no historical evidence of crash pit or other firefighting training at this location, it is unlikely that AFFF was stored or used at this location. For this reason, PFAS are not considered chemicals-of-concern at this location.

Based on a review of historical aerial photographs, the storage and repair of aircraft and fuel systems likely occurred under what is now Site No. 4d South Shores East (Figure 4). It is reasonable to expect that surface spills of petroleum, oil, and/or lubricants from historical aircraft repair/maintenance facilities and/or former fuel storage areas may have impacted shallow soil. Chemicals-of-concern can include TPH, VOCs, PAHs, and heavy metals.

The thickness of fill material in the area of the former aircraft and fuel storage/repair areas associated with the airport is unknown. It is anticipated that earthwork at Site No. 4d is limited to disturbance of shallow soils/sands, including grading of soils/sands that may be imported to the project site. No deep construction activities (e.g., footings, excavations) are anticipated. Depth-to-groundwater is greater than 15 feet below grade in this area; therefore, groundwater is not expected to be encountered. It is possible that some minor petroleum contamination in soil attributed to surface spills at the former airport may be encountered. For this reason, a hazard ranking of 2 is assigned to the use of this location for aircraft maintenance.

6.7. Sea World (500 Sea World Drive)

The Sea World amusement park complex is located adjacent to the north of the Sea World Drive/San Diego River Site No. 1a - Cloverleaf Least Tern Preserve Area Upland Habitat and Preserve Expansion area. However, the Sea World amusement park and facilities are separated from San Diego River Site No. 1a by at least approximately 800 feet of parking lots and Sea World Drive. With the exception of a storage area located in the southeast corner of the parking lots, the areas closest to the river are parking lots.

The Sea World amusement park is associated with a closed unauthorized release case (H00905-001), which involved a failed integrity test for a fuel UST and was closed as of 1987. Records indicate that six monitoring wells, located approximately 1,500 feet north of Site No. 1a, were abandoned in January 2011. Additional information regarding the media impacted was not available for review. However, based on the distance of these wells (1,500 feet) and the Sea World facility in general (at least 800 feet) from Site No. 1a, there is a low likelihood that impacted soil or groundwater remaining from the release, if any, would impact the proposed project elements (Figure 4).

The address 500 Sea World Drive was also listed on the California Hazardous Incident Reporting System (CHMIRS) for various petroleum releases from sinking and leaking vessels in the Sea World Marina to surface waters of Mission Bay, and from a hydraulic oil filter that fell off a truck into a parking lot. The petroleum releases were de minimis quantities and were reported to be contained and soaked up with absorbents. Based on the distance of the marina to Site No. 1a - Cloverleaf Least Tern Preserve Area (approximately 2,200 feet or 0.40 mile) and the limited nature of the releases, there is a low potential of contact with contaminated surface water during project activities.

Based on the records reviewed, it is unlikely that impacted soil, surface water, or groundwater from the releases discussed above, if any, would be encountered during project construction. Therefore, a hazard ranking of 1 is assigned to this location.

6.8. Former Sewage Disposal Ponds (Old Sea World Drive)

Sewage disposal ponds were depicted on historical aerial photographs and topographic maps as being located along what is now known as Old Sea World Drive (historically called Mission Bay Drive,). The former pond location is within the Sea World Drive/San Diego River Site No. 1a - Cloverleaf Least Tern Preserve Area Upland Habitat and Preserve Expansion, southeast of what is now the interchange between West Mission Bay Drive and Sea World Drive (Figure 4). According to project descriptions provided by Dudek, Site No. 1a is now a Least Tern Preserve. A portion of Site No. 1a was previously restored as a Southern Coastal Salt Marsh habitat mitigation site.

Between 1953 and 1964, the area north of the San Diego River channel was filled in, and the Sea World Drive commercial complex began operation north of Site No. 1a. A linear feature, possibly a trench or track, extended from the sewage disposal ponds to Sea World. The ponds continued to be present through 1985, after which time they appear more as a depression than filled ponds. The 2012 and 2015 topographic maps depict the area of the former ponds as a depression.

Information regarding the type of waste disposed into the ponds, the responsible party, and/or the method of closure (i.e., whether waste was cleaned up) was not revealed during the course of this assessment.

Proposed activities in Site No. 1a – Cloverleaf Least Tern Preserve Area include weed removal, import of sand to increase bird nesting areas, revegetation in buffer zone areas, and “minor topographic variation and mounding.”

If improvements are proposed in the area of the former sewage disposal ponds, there is a potential for contaminated soil to be encountered during project activities. Although the actual type of waste disposed to the ponds is unknown, if the waste is assumed to be domestic sewage, primary chemicals-of-concern in soil may include metals, VOCs, PFAS, and PAHs. There is also the potential for exposure by inhalation of vapor phase VOCs, which can volatilize from impacted soil and groundwater, migrate through the unsaturated zone, and accumulate in project excavations and trenches. The type of chemical exposure and degree of exposure is not known; but based on other similar cases, it is unlikely that residual contamination at this location poses an acute threat to workers or the public. Accordingly, a hazard ranking of 2 is assigned to this location.

6.9. Former Mission Bay Landfill (Between San Diego River and Mission Bay)

The Mission Bay Landfill site is a closed, unpermitted former landfill located between the San Diego River and Mission Bay. It comprises approximately 113 acres between Sea World to the west and Interstate 5 to the east. Based on review of maps provided on the SWRCB Geotracker website and the figures from a 2006 site assessment report (SCS 2006), Site No. 4d South Shores and Site No. 3c Triangle Restoration Area are located within the boundaries of the former landfill (Figure 4).

The former landfill is regulated by the City of San Diego Solid Waste Local Enforcement Agency (LEA) and the RWQCB. According to a the 2006 site assessment report by SCS Engineers (SCS 2006), the San Diego River was channelized in approximately 1949/1950, before the landfill operations from

approximately 1952 to 1959. As part of channelization, raised levee embankments with riprap slope protection were constructed on the north and south sides of the river channel. The former Sea World Drive ("Old Sea World Drive") was located at the top of the levee.

The 2006 report indicated that the estimated soil cover thickness ranged from 5 to 15 feet at Site No. 3c and 10 to 15 feet at Site No. 4d. Landfill gas samples collected at Site No. 3c included concentrations of hydrogen sulfide up to 21.0 parts per million (ppm), and methane up to 41.0 percent. In Site No. 4d, hydrogen sulfide was detected in landfill gas samples at concentrations ranging from 0.001 ppm to 4.5 ppm, with 2.8 to 57.3 percent methane.

The SCS report (2006) stated that "with respect to surface emissions, the combination of the low generation rate, the low quantities of [constituents of potential concern] COPCs in the raw gas, and the presence of the soil cover result in no significant emissions. Neither the surface sampling nor the Air Pollution Control District's ambient air testing resulted in the detection of any COPCs above background. There appears to be no significant human health risk and therefore no need for any type of gas control system at the Site." However, the SCS report stated that methane concentrations "significantly exceed San Diego County's acceptable limits for safe construction. In addition, hydrogen sulfide concentrations in landfill gas may pose a risk to construction workers" (SCS 2006).

Concentrations of COPCs were detected in surface soil samples collected from Site Nos. 3c and 4d; however, SCS stated that "surficial soils do not have COPCs at significant concentrations." A review of surficial soil sampling data collected from less than 1 foot bgs within Site No. 4d indicated concentrations of the following COPCs: arsenic (up to 4.76 mg/kg), chromium (up to 26.8 mg/kg), lead (up to 17.9 mg/kg), hexavalent chromium (0.75 mg/kg), benzo(b) fluoranthene (24 ug/kg), and chrysene (20 ug/kg).

A Human Health Risk Assessment was conducted by SCS to evaluate potential health risks to receptors, including recreational users, swimmers, commercial workers, construction workers, and homeless or transient adults.

SWRCB Geotracker records were reviewed for groundwater sampling events associated with the landfill. Groundwater monitoring of three upgradient/background wells and five compliance/downgradient wells is conducted on a semiannual basis, with annual reporting, in accordance with RWQCB Waste Discharge Requirements (WDR) Order No. R9-2012-0001 and Monitoring and Reporting Program (M&RP) Order No. R9-2012-0002. Surface water sampling at four sample points is performed annually. Groundwater samples are analyzed for general chemistry and VOCs. The October 2024 annual monitoring report prepared by Geo-Logic Associates (Geo-Logic) indicates the following:

> *"During the October 2023 through September 2024 monitoring period, no violations or areas of concern were noted by the Local Enforcement Agency (LEA). The City continues to perform corrective action measures for minor deficiencies observed during the quarterly site inspections performed by the City. During the monitoring period the general condition of the landfill cover and slopes was good and no seepage or exposed waste was noted. The landfill cover and drainage systems are performing as designed, [best management practices] BMPs are in place and the site has been certified by the City to be protective of water quality and beneficial uses" (Geo-Logic, 2024).*

For this monitoring period from October 2023 to September 2024, Geo-Logic reported that the results of the water quality analyses were consistent with historical results and that no changes to the groundwater monitoring system were made. Groundwater generally flows to the north-northeast.

Groundwater monitoring wells MBW-1 and MB-10 are within the boundaries of Site No. 4d. Depth-to-groundwater in these wells in July 2024 was 17.33 (MBW-1) and 19.75 (MB-10 feet below top of casing (BTOC). The maximum concentrations of COPCs detected in onsite wells MBW-1 and MB-10 since 2020 are the following: acetone (11 ug/l), carbon disulfide (1.1 ug/l), and diethyl ether (0.59 ug/l). Metals have not been analyzed in these wells since 2016; the maximum concentrations of metals in 2016 were arsenic (0.036 milligrams per liter [mg/l]), barium (1.2 mg/l), cobalt (0.0066 mg/l), copper (0.022 mg/l), nickel (0.037 mg/l), selenium (0.12 mg/l), vanadium (0.013 mg/l), and zinc (0.036 mg/l).

Groundwater monitoring well MBE-6 is located adjacent to the south of Site No. 3c Triangle Restoration Area. Depth-to-groundwater in this well in July 2024 was 15.89 BTOC. VOCs have not been detected in well MBE-6 for the past 5 years. Detections of PFAS in October 2019 are discussed below. The maximum concentrations of metals in 2016 were arsenic (0.048 mg/l), barium (0.35 mg/l), cobalt (0.0041 mg/l), copper (0.021 mg/l), nickel (0.048 mg/l), selenium (0.29 mg/l), vanadium (0.0054 mg/l), and zinc (0.017 mg/l).

The Mission Bay Landfill site is regularly inspected by the City of San Diego. The most recent inspection was conducted in January 2025. Along Sea World Drive and Old Sea World Drive, “some minor cracking and settling were observed.” No violations or areas of concern were reported (CalRecycle 2025).

The Mission Bay Landfill was also listed on the Northeastern University PFAS Project List in the EDR report. PFAS are typically detected in landfill leachate along with other chemicals such as chlorinated solvents, metals, petroleum hydrocarbons, and other organic chemicals. In October 2019, Geosyntec (on behalf of the City of San Diego) collected groundwater samples from three wells to evaluate the presence of PFAS around the former landfill (Geosyntec, 2019). Nine PFAS analytes were detected in groundwater at the upgradient well MBE-6, located adjacent to the south of Site No. 3c Triangle Restoration Area, including perfluorobutanesulfonic acid (7.2 nanograms per liter [ng/l]), perfluorobutanoic acid (7.1 ng/l), perfluoroheptanoic acid (4.1 ng/l), perfluorohexanesulfonic acid (11 ng/l), perfluorohexanoic acid (8.0 ng/l), perfluorononanoic acid (7.3 ng/l), perfluorooctanesulfonic acid (44 ng/l), perfluorooctanoic acid (11 ng/l), and perfluoropentanoic acid (7.4 ng/l). At downgradient well MBW-2, located approximately 950 feet west of Site No. 4d and 1,400 feet east of Site No. 3c, only perfluorooctanoic acid was detected at 10 ng/l. The following analytes were detected at downgradient well MBW-5, located approximately 700 feet east of Site No. 4d: perfluorobutanoic acid (3.2 ng/l, estimated value) and perfluorooctanoic acid (3.6 ng/l, estimated value) (Geosyntec, 2019).

The proposed improvements at Site No. 4d include upland habitat and preserve expansion. Non-native plant species would be removed, followed by potential import of soil and sand to provide for native vegetation restoration (Dudek 2025). Site grading would then be conducted to promote topographic variation for the vegetation communities. After soil/sand import and grading, native plant species would be installed from seeding and container plantings.

The proposed improvements at Site No. 3c Triangle Restoration area include removal of non-native plants and installation of native plants through container plantings and seedings.

There is potential for contaminated media (soil, groundwater, vapors) to be encountered during project construction. The primary chemicals-of-concern are organic chemicals and metals in soil and groundwater, and methane and non-methane organic compounds (NMOC) in gases emitting from the landfill. The potential exposure pathways are direct contact with contaminated soil and inhalation of VOC vapors that can potentially volatilize from contaminated soil and groundwater, migrate through the unsaturated zone, and accumulate in project trenches/excavations.

A more acute and immediate threat can result from the accumulation of methane emitting from the landfill that can present an explosion and fire threat to workers and the public. In addition, NMOC, including hydrogen sulfide and carbon monoxide, can be both toxic and act as asphyxiants at certain concentrations.

However, project activities at Site Nos. 3 and 4d are understood to be limited to disturbance of shallow soils/sands, including grading of soils/sands that may be imported to the project sites. No deep construction activities (e.g., footings, excavations) are proposed. Depth to groundwater is greater than 15 feet bgs; therefore, groundwater is not expected to be encountered. The City of San Diego inspects the former landfill on a regular basis. In addition, a Human Health Risk Assessment was conducted as part of site assessment activities in 2006, which indicated no increased cancer risk or non-cancer hazard to receptors from exposure to surficial soils. Because the portions of Site Nos. 3c and 4d that overlie the landfill are reported to have an estimated soil cover thickness of at least 5 feet, it is not anticipated that proposed project activities will significantly disturb buried landfill wastes. To account for the possibility of encountering minor levels of landfill gases and buried waste, a hazard ranking of 2 is assigned to this location. Should more extensive construction be planned for the project elements within or in proximity to the buried waste, a higher hazard ranking may be warranted.

6.10. Other Historical Facilities of Potential Environmental Concern

Review of historical aerial photographs, Sanborn fire insurance maps, and topographic maps indicated the presence of other historical facilities. While there is no documentary evidence of releases or the presence of contamination at these facilities, the type of facility and operating period suggest a potential for releases that may result in adverse impacts to the proposed project elements. These facilities are discussed below and shown on Figures 3 through 6.

Restoration of Seawall Bulkhead (Mission Beach/Southern Pacific Beach) Area:

- Gas station on the southeast corner of Grand Avenue and Mission Boulevard (1966-1979), approximately 450 feet east of the proposed seawall restoration element;
- Gas stations on the northwest and northeast corners of Grand Avenue and Mission Boulevard (1964), approximately 350 feet and 470 feet northeast of the seawall restoration element, respectively;
- Gas station on the southwest corner of Lido Court and Mission Boulevard (1966-1979), approximately 175 feet east of the seawall restoration element;
- Gas station on the northwest corner of San Luis Obispo Place and Mission Boulevard (1956-1970), approximately 190 feet east of the seawall restoration element;
- Gas station on the northeast corner of Pacific Beach Drive and Mission Boulevard (1953-1970), approximately 485 feet east of the seawall restoration element;
- Gas station on the northeast corner of Reed Avenue and Mission Boulevard (1966-1970), approximately 450 feet east of the seawall restoration element;

- Gas station on the northwest corner of Santa Clara Place and Mission Boulevard (1958), approximately 255 feet east of the seawall restoration element; and
- A drycleaning facility located on the northeast corner of Redondo Court and Mission Boulevard (1958), approximately 375 feet east of the seawall restoration element.

Rose Creek Bike Path:

- Gas stations on the northwest and northeast corners of what is now Mission Bay Drive and Garnet Avenue, approximately 400 feet southeast of the proposed project elements;
- An auto repair facility on the 1965 Sanborn map on the north side of Garnet Avenue, approximately 250 feet south of the proposed bikeway improvements, approximately 1,100 feet west of what is now Mission Bay Drive; and
- A "printing" facility on the 1965 Sanborn map on the north side of Garnet Avenue, approximately 150 feet south of the proposed bikeway improvements, corresponding to approximately 2720 Balboa Avenue.

Bonita Cove Restoration Area:

- Gas station formerly located on the southeast corner of Mission Boulevard and Mission Bay Drive, approximately 700 feet from the closest Bonita Cove proposed project element, from approximately the 1940s to 1970s.
- A small auto repair building was located approximately 250 feet west of the proposed project elements at Bonita Cove Point, from 1956 to 1959.

These facilities are typically historical gas stations, automobile repair shops, and dry cleaners. The chemicals of concern at these facilities are generally petroleum hydrocarbons (TPH, VOCs, PAHs) and chlorinated solvents (TCE, PCE, DCE, and vinyl chloride). Potential impacts include contaminated soil encountered in project excavations, contaminated soil gas accumulation in project trenches, and contaminated groundwater encountered in excavations and during dewatering.

None of these facilities were reported to be located contiguously adjacent to the proposed project elements. Based on their respective distances from the proposed project elements (greater than at least 150 feet), it is unlikely that contaminated media would be encountered during project. Therefore, a hazard ranking of 1 is assigned to these locations.

6.11. Disposal and Burning of Waste (Non-Point Source)

In the late 1800s and early 1900s, it was not uncommon to place waste in trenches or pits and burn the waste to minimize its volume. Burning the waste (that may have included both industrial and municipal waste) can concentrate heavy metals (lead in particular) and create by-products such as PAHs and dioxins and furans from the partial combustion of organic compounds. The burned waste is often identifiable as burn ash, which has construction debris, wires, and fused glass in an ashy gray and black matrix.

It is possible that pockets and layers of burned waste may be encountered during project construction. If present, the burn ash pockets will be encountered in shallow soil, above groundwater, and will be visually identifiable. Chemical analysis of burn ash samples may indicate toxic and hazardous waste levels of lead and other chemicals. Based on the potential for direct contact with burn ash during project construction, this environmental condition is assigned a hazard ranking of 2.

6.12. Aerially-Deposited Lead (Non-Point Source)

Along well-traveled road corridors that existed prior to the phasing out of leaded gasoline, exposed soil may have been contaminated with aerially deposited lead (ADL) caused by historical emissions from vehicle exhausts (tetraethyl lead was mixed with gasoline from the 1920s to the 1970s as an anti-knock agent).

A review of the historical aerial photographs and topographic maps indicates that corridors corresponding to present day ROW in the Improvement Zone were in use during the time leaded gasoline was used. Some sections of these streets, including the sidewalk, may have been unpaved for some time, although there is no information on when the street sections were paved. Soil in the historically unpaved sections of soil could have been contaminated with ADL, which can contain toxic and hazardous waste levels of lead. Because there is a potential of encountering ADL during construction, the hazard ranking for this environmental condition is 2.

6.13. Hazardous Building Materials

Review of the project description (Dudek, 2025) indicates that the EIR includes a programmatic Deferred Maintenance component. Various improvements to City-owned facilities such as playgrounds, comfort stations, furnishings, and parking lots in need of repair, and stormwater improvements, are proposed throughout the Improvement Zone. Hazardous building materials such as lead-based paint, asbestos-containing materials, PCB-containing equipment, mercury in lighting equipment, and others may be present in infrastructure. In addition, utility or underground pipelines coated with asbestos cement may be present within the Improvement Zone. Because there is a potential to encounter hazardous building materials during demolition activities, the hazard ranking for this environmental condition is 2.

7. MITIGATION MEASURES

This section outlines general mitigation measures that may be considered for the Improvement Zone. As the design of each project element evolves and more information of the location of soil disturbance, the extent and depth of excavation and dewatering become available, the general mitigation measures can be developed into location-specific measures in element-specific Soil and Groundwater Management Plans, Worker Health and Safety Plans, and Community Health and Safety Plans. The potential mitigation measures can fall into Design and Construction phases, as discussed below.

7.1. Design Phase

During the design phase, controls and tools necessary to protect worker health and safety, community health and safety, and the environmental should be developed. These include plans that may be part of bidding documents or required to be prepared as part of the Contractor submittals prior to start of construction.

7.1.1. Permits and Notifications

Appropriate environmental permits may be necessary for demolition and construction. Required notifications may need to be made to the County of San Diego Air Pollution Control District for abatement and demolition-related activities and to the State Water Resources Control Board for stormwater-related permits, as applicable. In areas where subsurface contamination is anticipated, the City may consider requesting the DEHQ to provide regulatory oversight through the Voluntary Assistance Program.

Residents and businesses in the immediate vicinity of the project areas where subsurface contamination may be encountered (within 500 feet) should be notified of the potential chemical hazards generated during construction activities. In accordance with Section 25249.6 of the California Health and Safety Code, a Proposition 65 Warning should be posted along the limits of work. Notification should include the following:

- the names(s) and 24-hour telephone number(s) of the person(s) to contact regarding problems (i.e., odors, dust, noise);
- brief description of the proposed activities; and
- dates and times that the work will be conducted and an estimate of when the work will be completed.

7.1.2. Worker Health and Safety Plan

Worker Health and Safety Plans should be prepared for work in areas where there is the potential for worker exposure to chemical hazards, including subsurface contamination. The Plans, at a minimum, should be prepared in accordance with the Federal Occupational Safety and Health Administration (OSHA) Hazardous Waste Operators and Emergency Response standard prescribed in Title 29 of the Code of Federal Regulations Section 1910.29 (29 CFR 1910.29) and Cal-OSHA standard prescribed in Title 8 of the California Code of Regulations Section 5192 (8 CCR 5192). The Plans should specify administrative and engineering controls and personal protective equipment for worker safety. The Plans should specify monitoring to verify that workers are not exposed to chemical hazards, including subsurface contamination, at levels exceeding limits set by OSHA and Cal-OSHA. Work will only begin after the Plans have been reviewed and accepted by the City.

7.1.3. Site Control and Work Zones

Demolition and construction activities that could potentially encounter contamination should consider the use of site control and work zones. Only authorized personnel with the requisite training and protection should be allowed access to the controlled zones. Notices should be posted along the site construction fence to notify the public and adjacent residents of potential hazards (if any). Notices should also be distributed to the adjacent residents.

In areas of anticipated contamination, the work area can be segregated into three zones: Exclusion Zone (EZ), Contamination Reduction Zone (CRZ), and Support Zone (SZ). The delineation can be established with physical controls (e.g., caution tape and barriers) or administrative controls. The EZ includes the excavation area where there is the most potential for worker exposure. The CRZ is a transition zone from EZ to the SZ, where decontamination methods will reduce the transfer of contamination from the EZ. The SZ stages support for work in the other zones. The control zones can be shown in the Worker Health and Safety Plan.

The degree of training, administrative and engineering controls, and personal protective equipment (PPE) increase from the SZ to the EZ. Hazard communication described in the Contractor's Health and Safety Plan should be implemented to notify the workers of potential chemical exposure. Only trained workers with proper medical surveillance should be allowed access to the EZ.

7.1.4. Community Health and Safety Plan

Community Health and Safety Plans (CHSP) should be prepared to evaluate exposure of the community and environment to potential exposure to contamination during construction. The CHSP should recommend controls to minimize dispersal of site contamination at harmful levels (if present) and specify air monitoring to ensure and demonstrate public protection.

7.2. Construction Phase

Construction phase measures will consist of implementing the plans described above, monitoring and protecting worker and public health and safety, identifying soil with evidence of contamination, managing the excavated soil and extracted groundwater, sampling and profiling the waste for disposal, construction of facilities for the proper temporary storage of waste (contaminated soil and extracted groundwater), and the transportation and disposal of waste to permitted facilities.

Such measures may include use of administrative and engineering controls to protect workers and the public, including dust control, misting and covering stockpiles and open excavations, use of odor suppressors, containing groundwater in liquid-tight tanks with locking covers, protecting storm drain inlets, use of decontamination measures to prevent the spread of contamination, and monitoring for the presence of contaminants in dust and air during activities that generate dust or volatile emissions. The monitoring would consider the breathing zone of workers (e.g., within a trench or excavation) and fence-monitoring for evaluating potential public exposure. Worker protection can also be enhanced with the use of PPE.

Temporary soil stockpiles are anticipated from the significant volumes of earth generated from project elements on Fiesta Island as shown on Figure 1 and Figure 4. The City may consider baseline sampling in the footprint of the stockpile areas prior to stockpiling and to compare the data with samples collected

after removal of the stockpiles to confirm that chemical impacts, if present, are not attributable to the stockpiles. The element-specific Soil Management Plans will specify the sampling program (number of samples, analytes, regulatory criteria for comparison, etc.).

7.2.1. Dust Control Measures

In areas of soil contamination, construction activities can generate dust that may be harmful to workers and the public. The dust may contain site contaminants and inhalation of dust particles may result in significant risk to receptors.

Control measures, such as wetting construction areas, and avoiding soil disturbance during periods of high wind speed should be utilized to minimize potential fugitive dust impacts. If required by the element-specific CHSPs, air monitoring equipment and field screening devices may be deployed during project activities. A dust control monitor may be used to monitor dust levels to determine the need for control measures. Air sampling can be performed using upwind and downwind samplers. The upwind and downwind samplers can collect samples of particulate matter in ambient air. The results of the air monitoring will help determine when and if corrective measures will be needed to control adverse conditions. Dust and emission control measures may include the following:

- Unpaved areas should be wetted down, to eliminate dust formation and reduce particulate matter. Application of dispersed water spray may be sufficient to prevent airborne dust from leaving the site. When wind velocity exceeds 15 mph, the construction sites should be watered more frequently.
- All excavation, grading, and demolition activities can be suspended when average wind speeds exceed 20 mph.
- All volatile liquids, including fuels or solvents brought to the construction site should be in closed containers.
- The on-site burning of debris, lumber and other scrap should be prohibited.
- Equipment should be properly maintained to reduce gaseous pollutant emissions.
- Exposed (unpaved) areas should be seeded, treated with soil binders or paved as soon as possible.
- Temporary stockpiles of contaminated soil should be constructed with a bottom liner consisting of a layer of high-density polyethylene (HDPE) liner with a minimum thickness of 8-mil. The bottom liner should be able to resist point-penetration by gravel and have sufficient mechanical strength to handle the ground pressure of at least 10 feet of soil. Around the stockpile perimeter, a continuous berm of sandbags should be constructed with the bottom liner extending to cover the sandbags and anchored with additional sandbags so that run-off does not escape at the seams. The temporary stockpiles should be constructed to a maximum height of 7 feet with flat tops (± 6-inches) to facilitate sampling
- When not actively being worked on or prior to rain events, the stockpiled material should be covered with 8-mil thick HDPE liner extended to cover the berm and be anchored with sandbags to minimize rain or water used for dust control from contacting the waste and collecting in the stockpile area and to minimize transport of contaminated sediments by wind. When the stockpiles are actively worked on, light misting can be used to minimize generation of dust. As an alternative to covering the stockpile, an ecologically friendly liquid co-polymer soil sealant, such as Gorilla-Snot®, can be used to cover the stockpiled soil to prevent sediment transport by wind erosion from the stockpiles.
- Trucks hauling soil, debris, sand or other loose materials should be covered. All trucks leaving the site should maintain sufficient freeboard (i.e., the minimum required space between the top of the load and the top of the trailer).

- All trucks and equipment, including tires, should be subject to dry decontamination prior to leaving the site. Rumble strips or gravel beds can be installed as appropriate to remove soil buildup on tires and tracks to prevent/diminish track-out before leaving the site.
- All visible mud or dirt track-out onto adjacent public roads should be removed using street sweepers.
- Vehicle speeds on unpaved roads should be limited to 15 miles per hour.
- Transfer of soil, including loading trucks should be performed in a manner to minimize dust by reducing drop height.
- Idling times on all diesel-fueled commercial vehicles over 10,000 lbs. should be minimized either by shutting equipment off when not in use or reducing the maximum idling time (Title 13, Section 2485, of the California Code of Regulations).
- Idling times on all diesel-fueled off-road vehicles over 25 horsepower should be minimized either by shutting equipment off when not in use or reducing the maximum idling time (Title 13, Section 2449 of the California Code of Regulations).

7.2.2. Waste Transportation and Disposal

Non-hazardous waste manifests and bills of lading will be used to track the transportation and disposal of non-hazardous waste. The following landfills can receive non-hazardous waste:

- Republic Services Otay Landfill in Chula Vista, California;
- Waste Management Azusa Landfill, Azusa, California; and
- C.R. & R South Yuma County Landfill in Yuma, Arizona.

The Contractor may elect to dispose of the waste at other permitted facilities only after submitting the required landfill documentation to the City evidencing that the landfill is permitted to receive the waste, submitting approval from the landfill that the waste is accepted for disposal at the facility (approval of waste profile), and after receiving approval from the City that the proposed landfill facility is acceptable.

California-hazardous non-RCRA waste (waste that exceeds State hazardous wastes criteria but does not exceed Federal hazardous waste criteria) can be disposed of at a Class I facility permitted by the State of California or, if located outside California, permitted by equivalent state agencies to receive the properly characterized and classified waste. For example, in Arizona, California-hazardous non-RCRA waste can be disposed of as non-hazardous waste in a Subtitle D landfill provided landfill requirements are met. The following landfills can receive California-hazardous non-RCRA waste:

- Clean Harbors Class I Landfill, Buttonwillow, California;
- Waste Management Class I Landfill, Kettleman City, California;
- C.R. & R South Yuma County Landfill in Yuma, Arizona; and
- Republic Services Copper Mountain Landfill in Wellton, Arizona.

Soil that exceeds Federal hazardous waste criteria, will also by definition, exceed State hazardous waste criteria, and will be classified as RCRA hazardous waste. This waste can only be disposed of at a Class I facility permitted by the State of California or a RCRA hazardous landfill outside California. The following landfills can receive RCRA hazardous waste:

- Clean Harbors Class I Landfill, Buttonwillow, California;
- Waste Management Class I Landfill, Kettleman City, California; and
- US Ecology Landfill, Beatty, Nevada.

Uniform hazardous waste manifests will be used to track the transportation and disposal of California-non-RCRA hazardous waste and RCRA hazardous waste.

Statutory requirements governing hazardous waste transportation in California are specified in Division 20, Chapter 6.5, Article 6.5, Article 6.6, and Article 13 of the California Health and Safety Code. Regulations adopted pursuant to these statutes are specified in, Division 4.5, Chapter 13, and Chapter 29 of the California Code of Regulations, Title 22.

Hazardous waste will only be transported by a transportation company which holds a valid registration from the California Department of Toxic Substances Control (DTSC). Requirements for hazardous waste transporter can be found at http://www.dtsc.ca.gov/HazardousWaste/Transporters/. Other requirements include, but are not limited to:

- A valid Motor Carrier Permit from the California Department of Motor Vehicles;
- U. S. Environmental Protection Agency Identification number;
- U. S. Department of Transportation Identification number; and
- U. S. Department of Transportation Hazardous Materials Certificate of Registration.

Certain contaminated materials (e.g., treated-wood waste) may have chemicals present at concentrations that make the waste hazardous in California. California has promulgated regulations (Assembly Bill 1353) that allow for materials to be managed and disposed of as non-hazardous waste, provided specific requirements and protocols are followed and documented. The element-specific Soil Management Plans will discuss these requirements in further detail.

7.2.3. Spill Reporting

If conditions are encountered that present an immediate threat of injury to human health or the environment, the Contractor should secure the area and notify the City. "911" will be called to summon emergency services, if needed. The DEHQ should be notified.

If previously unknown hazardous substances or conditions are encountered that do not present an immediate threat to human health or water quality, the Contractor should immediately notify the City. The area surrounding the discovery of unknown contamination should be isolated with markings and the DEHQ should be notified.

If a spill or discharge occurs and is reportable, the Contractor should immediately notify the City, the California Office of Emergency Services at (800) 852-7550, the National Response Center at (800) 424-8802, and the DEHQ at (858) 505-6657.

If there is an immediate fire, explosion, or health and safety threat, the Fire Department should be notified by calling 911. Reportable spills are defined in the California Hazardous Materials Spill/Release Notification Guidance published by the State of California Governor’s Office of Emergency Services.

7.2.4. Contractor Procured Substances

The Contractor may bring materials on Site that may have hazardous chemicals or constituents. These materials should be managed in accordance with the element-specific Health and Safety Plan and Soil Management Plan. The materials will be containerized and placed away from drainage areas and locations

where a spill or leak may result in risk to the public and the environment. Safety Data Sheets (SDS) for each chemical should be submitted to the City prior to bringing these materials on site.

All containers, drums, and tanks should be inspected on arrival and only allowed to remain on site if the container is in good condition. All containers should be appropriately labeled and kept closed unless the containers are opened to obtain product. Separate chemicals should not be stored in the same container in the event they are incompatible. Secondary containment with a capacity of 110% of the volume of stored chemicals should be provided for storage areas containing 55 gallons or more of chemicals and fuels. The containers, secondary containment, and storage areas should be inspected weekly (for damage and integrity) and maintained with good housekeeping practices (i.e., areas should be kept organized and cleaned and containers will be properly labeled).

A spill kit should be kept on site to respond to a spill, leak, or other unauthorized release. The kit should include plastic sheeting, absorbents, sand, and kitty litter. Only 40-hour trained HAZWOPER crew should respond to a spill. If there is immediate threat to health and safety, the Fire Department will be called via 911. If there is no immediate threat to health and safety, the first response should be to contain the spill so it does not spread and then to clean it up to the extent practicable.

There is the potential for release of petroleum products from the Contractor’s equipment or during refueling. In the event of such a release, the Contractor should collect soil samples from the impacted soil and analyze for TPH by EPA method 8015, VOCs by EPA method 8260B, and PAHs by EPA method 8270C. The impacted soil from the Contractor’s release will likely have a waste classification of nonhazardous that can be confirmed through laboratory analysis of the soil samples as indicated above. The Contractor should excavate the non-hazardous waste for disposal as described in the preceding sections. Confirmation samples collected after removal of impacted soil should be analyzed for TPH, VOCs, and PAHs to verify that impacts caused by the release have been removed.

8. CONCLUSIONS AND RECOMMENDATIONS

Specific environmental conditions have been ranked from 1 to 2 based on the type of chemical and quantities released, and the medium affected, as discussed in Section 6 (none of the conditions merited a rank of "3"). Conditions assigned a rank of “1” do not require further investigation or action and conditions assigned a ranking of 2 have the potential for encountering residual contamination during project construction. In summary, of the sites considered to have the potential to impact project activities, eight sites/conditions were assigned a hazard ranking of 2, and five sites/conditions were assigned a hazard ranking of 1. The following table summarizes the hazard rankings for sites and environmental conditions discussed in Section 6.

Table 6 – Summary of Hazard Rankings

Hazard Ranking	Site/Environmental Condition Name	Project Elements Affected
3	None	Not applicable
2	Former Mission Bay Landfill	Sea World Drive/San Diego River Site Nos. 3c Triangle Restoration Area and 4d South Shores East
	Former Sewage Disposal Ponds	Sea World Drive/San Diego River Site No. 1a Cloverleaf
	Historical Pike Airport	Sea World Drive/San Diego River Site No. 4d South Shores East and Tecolote Creek and Fiesta Island Causeway
	Ocean Beach Gas Station – 2305 Sunset Cliffs Boulevard	Robb Field/Gateway Connectivity Path
	Historical Gas Station – 2662 Garnet Avenue	Rose Creek Bike Path
	Disposal and Burning of Waste (Non-Point Source)	Improvement Zone
	Aerially-Deposited Lead (Non-Point Source)	Improvement Zone
	Hazardous Building Materials	Improvement Zone

Hazard Ranking	Site/Environmental Condition Name	Project Elements Affected
1	RAD Station (FUDS)	Sea World Drive/San Diego River Site No. 4d South Shores East
	Dry Clean Empire – 2710 Garnet Avenue	Rose Creek Bike Path
	Former Sludge Drying on Fiesta Island	Fiesta Island Site No. 1 South and Fiesta Island Site No. 4 North
	Sea World – 500 Sea World Drive	Sea World Drive/San Diego River Site No. 1a Cloverleaf
	Other Facilities of Potential Environmental Concern	Improvement Zone

The City may elect to perform Phase II ESAs for locations with a hazard ranking of 2 to reduce the uncertainty of receptor exposure and risk to the environment. General mitigation measures are discussed in Section 7. As additional design details of the specific project elements become available, health and safety and soil and groundwater management plans that are specific to the design and construction for the project element can be developed to provide more location-specific guidance to the City and Contractors.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Environmental Interest/Information System:
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:

The California Environmental Reporting System (CERS) is a statewide web-based user and information exchange system to support over 140,000 regulated businesses and over 130 local agencies in electronically collecting and reporting significant hazardous materials, hazardous waste and compliance and enforcement data as mandated by California law. Under oversight by Cal/EPA, certified local governing agencies (Unified Program Agencies - UPAs) consolidate, coordinate and provide consistent regulatory activities for six state and federal

JIFFY LUBE #1019 (Continued) **1007676793**

environmental programs.
The Used Oil Recycling System (UORS) is managed by the California Integrated Waste Management Board (CIWMB). The CIWMB helps communities establish and promote convenient collection opportunities for used oil and used oil filters.
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Have a functional drain valve or other method for the removal of liquid from the spill container. Be resistant to galvanic corrosion. Perform a tightness test at installation, every 12 months thereafter, or within 30 days after a repair to the spill container, tested using applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Tested by a certified UST service technician. Maintain records of spill containment testing for 36 months. 23 CCR 2635(b), 2637.1(a-c), 2665(a-b), 2712(b)(1)(F); HSC 25284.2

Environmental Interest/Information System:

The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Waste Code:	D011
Waste Description:	Silver
Waste Code:	D018
Waste Description:	Benzene
Waste Code:	D035
Waste Description:	Methyl Ethyl Ketone
Waste Code:	D040
Waste Description:	Trichloroethylene
Waste Code:	F002
Waste Description:	The Following Spent Halogenated Solvents: Tetrachloroethylene, Methylene Chloride, Trichloroethylene, 1,1,1-Trichloroethane, Chlorobenzene, 1,1,2-Trichloro-1,2,2-Trifluoroethane, Ortho-Dichlorobenzene, Trichlorofluoromethane, And 1,1,2, Trichloroethane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F001, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F003
Waste Description:	The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl

SEAWORLD SAN DIEGO (Continued) **1007199601**

Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F005
Waste Description: The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: P036
Waste Description: Arsonous Dichloride, Phenyl- (Or) Dichlorophenylarsine

Waste Code: P042
Waste Description: 1,2-Benzenediol, 4-[1-Hydroxy-2-(Methylamino)Ethyl]-, (R)- (Or) Epinephrine

Waste Code: U044
Waste Description: Chloroform (Or) Methane, Trichloro-

Waste Code: U080
Waste Description: Methane, Dichloro- (Or) Methylene Chloride

Waste Code: U122
Waste Description: Formaldehyde

Waste Code: U154
Waste Description: Methanol (I) (Or) Methyl Alcohol (I)

Waste Code: U160
Waste Description: 2-Butanone, Peroxide (R,T) (Or) Methyl Ethyl Ketone Peroxide (R,T)

Environmental Interest/Information System:
All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RWQCB Region:	SAN DIEGO RWQCB (REGION 9)
Site History:	5/83 Four (one 6,000-, two 8,000-, and one 12,000-gallon) single-wall fiberglass gasoline USTs were installed. 12/87 One 550-gallon double-wall fiberglass used-oil UST was installed. 3/95 Three double-wall fiberglass gasoline USTs (one 6,000-, two 8,000-, and one 12,000-gallon), associated product piping, and dispensers were installed. DEH opened environmental case #H12849-003. 8/95 Five vapor wells (VEW-1 through VEW-5) and three groundwatermonitoring wells (MW-1 through MW-3) were installed. 11/99 Three groundwater monitoring wells (MW-4, MW-5, and MW-6) were installed. 3/01 Performed 48-hour DPE pilot test. 10/01 One offsite groundwater monitoring well (MW-8) was installed. 11/01 All monitoring wells were surveyed per state requirement AB2886. 1/03 Three double-wall fiberglass gasoline USTs (one 15,000-gallon and two 8,000-gallon), associated product lines, and dispensers were installed. A total of 774.75 tons of hydrocarbon-impacted soil was removed from the site. 4/04 Two groundwater monitoring wells (MW-7 and MW-9) were installed. 3/05 DEH concurred that no further groundwater assessment were necessary and subsequently requested two additional quarters of groundwater sampling. 11/05 Two soil gas probes (SGP-1 and SGP-2)

MOBIL SERVICE STATION #18 (Continued) **S104747526**

were installed. 12/06 DEH requested the installation of an additional well downgradient of MW-9 due to increased MTBE concentrations in MW-9. 4/07 Environmental consulting and management activities transferred from TRC to ETIC Engineering Inc. 8/07 Submitted access request for the installation of proposed offsite monitoring well. 6/08 Station closed for business. 12/08 Station demolished site is now vacant and fenced. 2014 CAPA submitted for Natural Attenuation. Approved
