WATER DEMAND AND WATER AVAILABILITY ANALYSIS

March 10, 2023

It is proposed that the new vineyard (1.37 net acres) will be irrigated using groundwater. This analysis presents water demand for all uses on the Atlas Rock Holdings parcel.

There are no locally monitored irrigation systems from which to draw estimates of long-term water demand. This discussion is guided by the Napa County Water Availability Guidance Document, in which it is estimated that vineyard irrigation is 0.2 – 0.5 afa (acre-feet per annum), or 0.27 – 0.68 afa for the proposed 1.37 acre vineyard.

Also, a small two bedroom residence is planned for future replacement of the house destroyed in the 2017 fire. There will be no irrigated landscape. For this analysis, it will be assumed that two residents will live there full time, with two guests for up to forty days per year. Domestic water demand is:

Residents: (2 people)(75 gal/day ¹)(365 days/yr)	= 54,750 gal/yr
Guests: (2 people)(75 gal/day ¹)(40 days/yr)	= 6,000 gal/yr
Total Domestic water demand	= 60,750 gal/yr = 0.18 afa

Additionally, the new trees to be planted in the restoration area will require irrigation for 2 years. The maximum irrigation will be 10 gallons/tree during the first year for the 4 new trees; the total water use will be 40 gallons, or .0001 af, an insignificant amount.

Historic rainfall analysis using the PRISM (The PRISM Climate Group at Oregon State University; <http://prism.oregonstate.edu>) Grid Cell Interpolation (Figure 1) provides water year (October 1 through September 30) rainfall data. As a conservative approach, annual rainfall data for the recent 10 year (2011/12 through 2020/21) interval (Table 1), is presented and it shows an average annual rainfall of 27.81" over that time span. On average, the 4.84-acre parcel will receive ±11.22 afa of rainfall. In the "Updated Hydrogeologic Conceptualization and Characterization of Conditions", LSCE and MBK Engineers provide an analysis which presents a groundwater recharge of 8% for the Milliken Creek watershed. At that rate, the Atlas Rock parcel will contribute an average of ± 0.90 afa (11.22 afa x 8%) to groundwater.

¹ Exhibit B. California Code of Regulations, Title 23: Section 697

Assuming that domestic need is the primary use for water and that the maximum allowable use will be 0.90 afa, then 0.72 afa (0.90 – 0.18) is available for vineyard use, or 0.52 afa/acre, more than Napa County Guidelines and sufficient to sustain the proposed vineyard development. Attached (Attachments A-1, A-2) is the driller's log, and a recent aquifer test for the well which indicates a production rate of 22 gallons per minute. At that rate, the well will need to operate less than 2.5 hours/day to meet peak daily demand. Groundwater pumping will be monitored, and reports will be submitted to Napa County as required to demonstrate compliance.

Attached is a map (Figure 2) showing the existing project well's proximity to offsite wells and to significant streams. The well is greater than 500' from any offsite well, and it greater than 1500' from the nearest significant stream.

§ 697. Examples of Amounts Considered Reasonably Necessary.

The amount of water considered reasonably necessary for certain uses when the appropriation will be by direct diversion shall be determined in the following manner:

(a) Irrigation Use.

(1) In most portions of the central valley of California and elsewhere in the State where similar conditions prevail a duty of one cubic foot per second continuous flow to each 80 acres shall be considered a reasonable headgate duty for most crops. Where there is a greater abundance of water and a heavy transportation loss, or the land to be irrigated is of a porous, sandy or gavelly character a continuous flow allowance of one cubic foot per second to each 50 acres may be considered reasonable. Under other conditions where water supply is less abundant and conditions are favorable to a more economical use a duty of one cubic foot per second to 150 acres may be considered reasonable for most crops. For the irrigation of rice the customary allowance shall be one cubic foot per second continuous flow to each 40 acres of irrigated land.

(2) The equivalent of these continuous flow allowances for any 30 -day period may be diverted in a lesser time at a greater rate so long as there is no interference with other users, and a clause allowing such rotation will be included in a permit issued for irrigation purposes.

(b) Domestic Use. Allowances for domestic use are variable, depending upon the character of the place of use, method of use, character of use and availability of water. The quantities considered reasonable for the respective domestic uses are as follows:

Homes, Resorts, Motels, Organization Camps, etc

Fully plumbed	55 to 75 gallons per day per person
Sink and flush toilet only	40 gallons per day per person
Sink and shower only	35 gallons per day per person
Sink only	25 gallons per day per person
Outside supply only	15 gallons per day per person
Cafe, fountain, etc	2.5 gallons per day per person

Camp Grounds

Depending upon facilities provided, allowances range from 5 gallons per day per person, where faucets only are provided, to 30 gallons per day per person where washbowls, showers, flush toilets and laundry trays are provided.

Lawn, Garden, Orchard and Grounds

Irrigation	8.5 gallons per day per 100 square feet
Sprinkling to allay dust. ...	7.5 to 10 gallons per day per 100 square feet

Livestock

Milch cows	30 gallons per day per head
Horses	15 gallons per day per head
Goats and hogs	2.5 gallons per day per head
