PG&E	Pacific Gas & Electric Company

# 1 Introduction

This report summarizes Dudek's evaluation and analysis of tree resources within the development area at the proposed Cormorant Energy Storage Project (project) site in Daly City, California (City). The site, consisting of a battery energy storage system (BESS) facility, is generally located north of Martin Street, east of Carter Street, south of Geneva Avenue, and west of the Cow Palace. The project includes a generation transmission (gen-tie) line connecting the BESS facility to a substation to the east (see Figure 1, Project Site).

Dudek conducted two tree surveys for the project as the project design progressed. The initial field inventory and assessment of the trees within the project area (development footprint + original gen-tie line buffer area) was conducted from April 14 to May 5, 2023. On March 5, 2024, a second field inventory and assessment of the trees for the project was conducted for the trees in the buffer area along a new gen-tie line route. In April 2024, Dudek was provided with an updated set of three potential gen-tie line routes; however, a third tree survey was not conducted because there were no additional trees within the buffer areas of these gen-tie line routes that are anticipated to be impacted. The focus of Dudek's field evaluations was to identify and inventory all trees that are subject to regulation by the Daly City Municipal Code that are within the limits of disturbance (LOD) for the proposed development based on the project boundaries (Figure 1). This includes the trees within the development footprint of the BESS facility and trees within the buffer area of the gen-tie line. In addition to the requirements of the Daly City Municipal Code as a condition of project approval, Daly City requires the applicant to prepare and submit an arborist study.

This arborist study meets the City municipal code requirements and conditions of project approval by describing the project site, summarizing Dudek's tree inventory and assessment, and listing the inventoried trees recommended for removal and preservation. Three routes were being considered for the gen-tie line at the time of this report's preparation. This report contains the methods of assessment; the results of Dudek's tree inventory and assessment, including a summary of the inventoried trees recommended for removal and preservation for each route; and tree management recommendations based on the assessment.

## 1.1 Assignment

Dudek's International Society of Arboriculture (ISA)-certified arborists performed the following tasks:

- Assessed and inventoried all protected trees within the LOD of the BESS facility and within the buffer corridor for each gen-tie line route.
- Mapped the location of surveyed trees on surveyed site base data and used GPS technology, as necessary, to develop a tree location exhibit.
- Assigned a unique identification number to each surveyed tree.
- Prepared a tree information matrix that details the attributes of each protected tree that the project will impact.
- Identified trees recommended for removal because of construction impacts or tree condition.
- Prepared this report to document the field survey results and identify the trees that will be removed for the project.

## 1.2 Project Description

Dudek's understanding of the project is based on documents provided by Arevon, including plan sheets, GIS files, and project LOD maps.

The project area consists of a BESS facility and the gen-tie line routes. The BESS facility will be located on an undeveloped parcel west of the Cow Palace and abutting Carter Street. The BESS facility will cover approximately 11.50 acres of land and will consist of 212 modular battery energy storage units, transmission equipment for converting energy for storage or distribution, access roads, and drainage facilities.

The BESS will be connected to the Pacific Gas & Electric Company (PG&E) electrical system by a gen-tie line from the BESS facility to PG&E's Martin Substation. The applicant is considering three routes for the project's gen-tie line: Routes 1, 1A, and 3.<sup>1</sup>

Gen-Tie Line Route 1 begins on the north side of the BESS facility and extends west to Carter Street. The route turns south along Carter Street and continues to the intersection of Carter Street and Martin Street, then travels east along Martin Street to Schwerin Street. The last leg of Route 1 extends north along Schwerin Street to connect to the PG&E Martin Substation. The gen-tie line for Route 1 will consist entirely of underground electrical lines extending approximately 1.1 miles from the BESS facility to the southwest corner of the PG&E Martin Substation, near the east end of Ottilia Street.

Gen-Tie Line Route 1A follows a similar path to Route 1. It begins on the north side of the BESS facility and extends west to Carter Street. The route turns south along Carter Street and continues to the intersection of Carter Street and Martin Street, then travels east along Martin Street to Oriente Street. This leg of Route 1A extends north along Oriente Street to the intersection of Oriente Street and Ottilia Street. The last leg of the route extends one block east on Ottilia Street and then turns briefly south on Schwerin Street to connect to the PG&E Martin Substation. The gen-tie line for Route 1A will consist entirely of underground electrical lines extending approximately 1.2 miles from the BESS facility to the southwest corner of the PG&E Martin Substation, near the east end of Ottilia Street.

Gen-Tie Line Route 3 begins on the east side of the BESS facility and extends north and east onto the Cow Palace property. The route skirts the buildings on the Cow Palace property by turning north and then travels east, following along the north edge of the property until reaching the east side of the property, where the route turns south. The route extends south along the eastern edge of the Cow Palace property to the west end of Ottilia Street. At this point, it turns east again, exiting the property through a small community open space between the Cow Palace property and Ottilia Street. The route continues east along Ottilia Street until Schwerin Street, where it extends briefly to the south to connect to the PG&E Martin Substation. The gen-tie line for Route 3 will consist entirely of underground electrical lines extending approximately 0.7 miles from the BESS facility to the southwest corner of the PG&E Martin Substation, near the east end of Ottilia Street.

## 1.3 Location/Setting

The project area is in the Bayshore Heights neighborhood of Daly City. Specifically, the BESS facility will cover a portion of an undeveloped lot between Geneva Avenue to the north and Martin Street to the south. The BESS will abut Carter Street on the west and the Cow Palace property on the east. The gen-tie line and its LOD buffer will

---

<sup>1</sup> A Gen-Tie Line Route 2 was proposed but is not being considered for this project.

cover an approximately 40-foot-wide path. Outside the BESS facility, the three gen-tie line routes are primarily located in the Cow Palace parking lots and the following public streets: Carter Street, Martin Street, Ottilia Street, Schwerin Street, and Oriente Street.

The BESS facility site is currently a storage yard for electrical utility equipment and vehicles. The property is primarily covered with several large gravel pads. A paved driveway from Carter Street accesses the BESS facility site, and a modular building in the northwest corner of the property serves as the office. Along the south and west sides of the property are long, roughly straight berms approximately 50 feet tall. The gen-tie line routes pass through primarily developed areas: residential neighborhoods, public streets, and parking lots. Figure 1 shows an aerial image of the BESS facility site, the three gen-tie line routes, and the PG&E Martin Substation.

## 1.4 Relevant Codes and Regulations

Chapter 12.40 – Urban Forestry in the Daly City Municipal Code contains the codes relevant to the protection of trees and permitting tree removal in Daly City. It is worth noting that the City Municipal Code does not explicitly regulate the protection or removal of trees on private property. The exception would be trees that obstruct the public right-of-way or are identified as a public nuisance, as noted in Section 12.40.050. Chapter 12.40 broadly applies to “Street Trees,” defined by Section 12.40.020 as follows:

[I]includes any woody perennial plant which when mature has the following characteristics: a single main axis or stem commonly achieving fifteen feet in height, and capable of being shaped and pruned to develop a branch free trunk at least nine feet in height or capable of being pruned in such a manner that the branching will grow parallel with the sidewalk or street which is growing upon any parkway, easement, right-of-ways or other publicly-owned area.

Only three trees included in this report meet the City’s definition of a street tree. These are the three trees on the public open space at the west end of Ottilia Street. The following code sections regulate these trees.

### 12.40.020 – Definitions

**“Easement”** means a right-of-way, easement, or use restriction acquired for public use by dedication or otherwise for sewers, pipelines, pole lines, electrical transmission and communication lines, pathways, storm drains, drainage canals, water transmission lines, light and air and other limited use public easements other than for street and highway purposes.

**“Public places”** includes all publicly owned grounds, other than streets or parks, which are publicly owned and open to the public.

**“Street tree”** includes any woody perennial plant which, when mature, has the following characteristics: a single main axis or stem commonly achieving fifteen feet in height, and capable of being shaped and pruned to develop a branch free trunk at least nine feet in height or capable of being pruned in such a manner that the branching will grow parallel with the sidewalk or street which is growing upon any parkway, easement, right-of-ways or other publicly-owned areas.

**“Tree”** includes any woody perennial plant having a single main axis or stem commonly achieving fifteen feet in height.

**"Urban forest"** means all trees, shrubs, flowers, and vines within the city limits, which are subject to the jurisdiction of the city parks and recreation department.

#### **12.40.030 – Enforcement/appeals**

The director of public works or his/her authorized representative shall be responsible for the administration and enforcement of this chapter.

- A. Any action of the director of public works may be appealed and heard by the parks advisory board. To be effective, an appeal must be filed within ten days after the decision of the director. The appeal shall be in writing and shall be filed with the director for placement in the board's agenda. The appeal shall clearly specify the reason for which a hearing is requested. After a hearing, the parks advisory board shall render its decision.

Any action of the parks advisory board may be appealed and heard by the city council. To be effective, an appeal must be filed within ten days after the decision of the board. The appeal shall clearly specify the reason for which a hearing is requested. After a hearing, the city council shall render its decision which shall be final.

- B. Alternatively, violations, appeals, cost recovery and abatement of any violation of this chapter may be addressed pursuant to Chapter 8.16, the city's property maintenance and nuisance abatement ordinance.

#### **12.40.040 – Abutting owner and occupant responsibilities**

Nothing in this chapter shall impose any liability upon the city or upon any of its officers or employees, nor relieve the owner and occupant of any private property from the duty to keep trees and shrubs upon private property or under their control, nor to relieve the owner and occupant of any private property from the duty to keep sidewalks and parkways in front of such private property in a safe condition, or to relieve the owner and occupant of any private property from the duty to keep any tree, shrub or other plants in such a condition as to prevent it from constituting a hazard or an impediment to vision or travel upon any street, sidewalk, park or public place in the city.

#### **12.40.050 – Nuisances—Designated**

For the purposes of this chapter, the following conditions are determined to be a nuisance, and may be abated pursuant to this chapter, or pursuant to Chapter 8.16, the city's property maintenance and nuisance abatement ordinance:

- A. Any dead, diseased, infested, dying or structurally hazardous tree on private property so near to any street tree so as to constitute a danger to street trees, streets, sidewalks or alleys or vehicular or pedestrian traffic;
- B. Any tree, shrub, vine or flower or any private property that is interfering with, impairing or destroying any street improvements, sidewalks, curbs, gutters, sewers, water or gas lines, block walls, street trees, or other related street hardware;
- C. Any tree, shrub, vine or flower that is deemed harmful on oral or other physical contact by a person as determined by the director of public works or an authorized representative;

- D. Within the thirty-foot triangle of private property at the intersection on any street improved for vehicular traffic, any tree limb, shrub, or other plant reaching a height of more than thirty inches above the grade adjacent thereto, except tree trunks having no limbs lower than nine feet above curb grade;
- E. Vines or climbing plants growing into or over any street tree or any public hydrant, pole, street sign, stop sign or electrolier;
- F. A publicly owned tree in direct or intermittent contact with any electrical conductor owned by a utility company which must be trimmed away from the conductor;
- G. The existence of any branches or foliage that interferes with visibility of, free use of, or access to any portion of any street, sidewalk or alley improved for vehicular or pedestrian travel;
- H. Tree houses, ladders, aerials, swings, ropes or any other material attached to publicly owned trees.

#### **12.40.060 – Nuisances—Abatement**

- A. When any public nuisance as defined in Section 12.40.050(C) above exists, a notice shall be placed on the door of the residence. Utility companies responsible for electrical conductors shall be notified by a documented telephone call. A follow-up notice shall be mailed to the resident property owner by ordinary United States mail. The notice shall describe the condition, state the work necessary to remedy the condition and shall specify the time within which the work must be performed. Any property owner may, within ten days after the mailing of the notice, request a hearing before the appeals board on the issue of whether a public nuisance actually exists. Appeals shall be conducted in accordance with the procedures set forth in Section 12.40.030.
- B. If, at the end of the time for correction specified in the notice or order if the matter was appealed, such work has not been performed, the city may perform such work and the cost thereof shall constitute a charge against the property owner, and such charge shall be a lien on such property. If the property owner fails to pay such charge within thirty days after a bill is submitted by the city, such charge shall be assessed against the parcel of land of the property owner, and shall be transmitted to the tax collector for collection. The assessment shall have the same priority as other city taxes.

#### **12.40.070 – Damage or injury**

- A. No person shall abuse, destroy or mutilate any tree, plant or shrub in a parkway, easement or any other public place, nor attach or place any rope, wire (other than one used to support a young or broken tree) sign, poster, handbill or other things to or on any tree growing in a public place, or to cause or permit any gaseous, liquid or solid substance which is harmful to such trees to come in contact with their roots, trunk or leaves.
- B. Violation of this section may be handled pursuant to Sections 12.40.030 and 12.40.100.

#### **12.40.080 – Construction work—Protection measures**

Plans submitted to the city for the construction; repair or alteration of any building, house or structure shall include provisions for sufficient guards or protectors to prevent injury to any existing publicly owned trees, shrubs, flowers or vines. Such plans for protection shall be approved by the director of public works ten days prior to the issuance of permit to proceed.

## **12.40.090 – Construction work—Displacement of trees**

If construction, repair or alteration of any building, house or structure in the city causes a tree to be removed from public property and there is insufficient space to replace the tree in the parkway, easement or public area, the property owner shall:

- A. Plant a comparable size tree species approved by the city parks division, minimum twenty-four inch box size, in the private landscape area; or
- B. Pay to the city the city's cost of replacing the removed tree, as provided by Section 12.40.100.

## **12.40.100 – Recovery of damages**

- A. Replacement trees shall be a minimum of two, each twenty-four-inch box size, the combined canopy of which is approximately ten percent of the average street tree canopy in the city, (one hundred seventy-five square feet), or replacement canopy of seventeen square feet. The applicant shall post a cash deposit with the city in an amount determined by the director of public works which shall include labor costs for replanting and removal if the director of public works determines that the tree is a total loss.
- B. If it is determined that replacement trees cannot be planted in the same frontage costs for two trees, each twenty-four-inch box size plus labor for planting, shall remain in effect. These replacement trees shall be planted on specified alternate public property.
- C. Where injury has occurred to the tree, shrub, flower or vine during the erection, repair, construction or alteration of any building, house or structure, or by truck and/or car accident, house moving or by acts of vandalism, the offending party or insurance company shall not be released from liability until the director of public works or his/her authorized representative determines that the tree has fully recovered (see Section 12.40.140).

## **12.40.110 – Permit application—Tree maintenance**

- A. No person shall spray, root-prune, fertilize, stake, guy, rod, cable, plant, transplant, grade or trench within the foliage drip line or remove any public, right-of-way or street tree, vine, shrub or flower without obtaining a permit from the director of public works. Notwithstanding, weed and trash removal from the base of the tree is permitted and is the responsibility of the abutting property owner.
- B. Violation of this section may be handled pursuant to Sections 12.40.030 and 12.40.100.

## **12.40.120 – Removal of live growing trees**

- A. It is unlawful for any person, firm or corporation to cut down, remove or destroy any tree growing upon any parkway, easement, right-of-ways or other publicly owned area without first securing a permit to do so from the director of public works.
- B. Application for a permit to cut down, remove, transplant or destroy any live growing tree on any parkway, easement, right-of-ways or other publicly-owned area within the city shall be filed in the office of the director of public works and shall be accompanied by the specific reasons for removal. The director of public works shall investigate the application to determine the conditions under which the permit may be granted or denied. The application shall also be accompanied with a permit fee.

- C. The director of public works or his/her authorized representative shall submit a report and decision to the requester with a copy to public works/engineering and economic and community development (ECD)/planning.
- D. If the decision is to grant the removal of a live, healthy tree, the requester will pay the costs of removal.
- E. The requester may obtain removal cost estimates from a private tree contractor. The city will require removal specifications and inspection of the private contractor's work.
- F. The director of public works shall deposit a cash deposit in an amount specified by the public works department to ensure job completion and cleanup.

The remainder of the trees included in this report are located on private property. The City does not regulate trees on private property except for specific trees that obstruct public rights-of-way or are declared a public nuisance. Therefore, no code requirements describe which trees must be surveyed to prepare the arborist report or what information the arborist report must contain.

For consistency, Dudek arborists used the City's definition of a "tree" in Chapter 12.40 to determine which trees on private property were surveyed and included in the report.

## 2 Methods

The following sections describe the methods Dudek's ISA-certified arborists used to inventory and evaluate trees in the tree survey area.

### 2.1 Field Tree Inventory and Evaluation

Dudek's ISA-certified arborists Jeremy Cawn (no. NY-5876AM) and Jared Davis (no. WE-13396A) conducted the initial tree inventory and evaluation from April 14 to May 5, 2023, to document tree locations and attribute information for all trees within the survey area. Dudek forestry specialist Drew Morgan conducted the second tree inventory under the supervision of Jeremy Cawn on March 5, 2024.

The arborists examined the trees located within the project boundaries. Tree attribute data collected during the field survey included species, trunk diameter, tree height, canopy spread, general health condition, and structural condition. Trunk diameters were measured using a diameter tape, which provides adjusted numbers for diameter measurements when wrapping the tape around the circumference of a tree trunk. Diameter measurements were collected using the standard protocol described by the Council of Tree and Landscape Appraisers in its Guide for Plant Appraisal (CTLA 2020). Trunk diameter measurements were taken at 4.5 feet above the ground along the trunk axis, with a few standard exceptions. In cases where the trunk of a tree was split into multiple stems at approximately 4.5 feet above the ground, the measurement was made at the location that best represented the trunk's diameter. Tree height was measured using a clinometer with a 66-foot baseline or using a laser rangefinder/digital hypsometer. Visual estimates for tree height were made when multiple trees of a similar height were adjacent and at least one nearby tree height had been measured with the clinometer or hypsometer. Crown width was measured by pacing off, based on the arborist's knowledge of their stride length (5 feet), or by visually estimating the canopy width.

Following methods in the Guide for Plant Appraisal (CTLA 2000), tree health and structure were evaluated with respect to five distinct tree components: roots, trunk, scaffold branches, small branches, and foliage. Health was graded as *very good, good, fair, poor, critical, or dead*. Trees with good health exhibit full crowns with healthy foliage, good vigor, and no significant infections or infestations. Trees with fair health exhibit thinning crowns with mostly healthy foliage, acceptable vigor, and indicators of insect and disease damage. Trees with poor or critical health exhibit sparse crowns with chlorotic and necrotic foliage present, low vigor, and widespread indications of insect infestations or disease. The structure was graded as *good, fair, poor, or very poor*. Trees with good structure exhibited balanced crowns, strong branch attachments, and defect-free trunk and root flares. Trees exhibiting fair structure had structural defects that affected a portion of the tree (crown, trunk, or root flare) but were not likely to result in whole tree failure in the next 12 months. Trees with poor structure exhibited multiple defects that impacted the structural integrity of the whole tree or a significant portion of the tree. Trees with very poor structure exhibited similar defects as those graded as poor, except the arborist concluded that the tree would likely fail in the next 30 days. Representative photos of the survey area trees are provided in Appendix A, Tree Survey Area Representative Photographs.

The location of each tree was mapped using the internal GPS in an Apple iPhone, running the ArcGIS Field Maps software for the initial tree inventory. A Bluetooth-enabled GNSS receiver (Arrow 100) was connected to the ArcGIS Field Maps software for the second tree inventory. Concurrent with tree mapping efforts, Dudek arborists recorded tree attribute data, including species, the number of individual trunks, trunk diameters, overall height, canopy extent, general health, structural conditions, and overall condition, in the Field Maps software. Each measured tree was assigned a unique tree ID number, and a metal tag was affixed to the north side of each tree except where the tree trunk was inaccessible. The tree ID numbers are not consecutive because several tree inventories were conducted and not all inventoried trees were included in the final project. Tree ID numbers for this report range from 167 to 1,196. Appendix B, Tree Information Matrices, contains the tree measurements collected for each inventoried tree, including the tree ID number.

Dudek used the data collected to create a master tree inventory data set, including all regulated trees within the tree survey area. This data was used to prepare this arborist study and its appendices.

## 2.2 Arborist Report

Dudek arborists inventoried more than 1,400 trees for the project as the design progressed and alternative layouts were considered. For this report, Dudek included only the protected trees that have the potential to be impacted or damaged/destroyed by the project's development. This included trees within the LOD plus a 10-foot-wide buffer for the BESS facility and trees whose trunks lie within the path of the proposed gen-tie line routes. Inventoried trees outside these areas were determined to have a low likelihood of impact and were not included in the report.

Representative photos of the trees in the study area are presented in Appendix A. Individual tree attribute data is provided in Appendix B, Tree Information Matrices. Individual tree locations are presented in Appendix C, Tree Location Maps.

## 2.3 Scope of Work Limitations

This report presents the results of a visual assessment of the project trees. Assessments were performed from the ground using the tools described in Section 2.1, Field Tree Inventory and Evaluation. No root crown excavations or investigations, internal probing, or aerial canopy inspections were performed during the tree assessment.

Therefore, the presence or absence of internal decay or other hidden or inaccessible inferiorities in individual trees could not be confirmed.

Per discussion with Dudek Project Manager Bradley Cole, the focus of the tree survey and this report is on trees that could be impacted by the construction of the project. Not all trees that overlap with the project boundaries were assessed. Specifically, trees along the gen-tie line routes that overlap the buffer area with their crowns only were not assessed, because the gen-tie line will be underground and primarily in the middle of the street or beneath paved surfaces, there is a very low likelihood that the project would impact these trees.

## 3 Findings/Results

Dudek arborists reviewed three gen-tie line routes for this project. We assume that only one of the routes will be selected for the final project design, so this section has been divided into three sections, one for each gen-tie line route. The following sections summarize the surveyed trees anticipated to be impacted by the project along each gen-tie line route and the surveyed trees within the BESS facility site. It is worth noting that the development footprint for the BESS facility does not change based on the gen-tie line route, so differences in the findings and results for each section are solely due to the different trees along each gen-tie line route.

### 3.1 BESS Facility and Gen-Tie Line Route 1

#### 3.1.1 Inventory Summary – BESS Facility and Gen-Tie Line Route 1

Dudek's arborists recorded 326 trees that meet the City's definition of a tree within the LOD of the BESS facility and the Gen-Tie Line Route 1 buffer corridor. It should be noted that no protected trees within the Route 1 buffer corridor are anticipated to be impacted by the project. Therefore, the summary of the trees surveyed in this chapter is limited to trees within the LOD of the BESS facility.

Table 1 summarizes the species of the trees surveyed within LOD for the BESS facility and Gen-Tie Line Route 1. The tree species composition is predominantly blue gum eucalyptus trees; approximately half of the trees (181) are small trees, 6 inches in diameter or less.

**Table 1. Surveyed Trees for BESS Facility and Gen-Tie Line Route 1**

Common Name	Scientific Name	Tree Quantities (for Each Species)
Blue gum eucalyptus	<i>Eucalyptus globulus</i>	325
Monterey pine	<i>Pinus radiata</i>	1
	<b>Total</b>	<b>326</b>

As presented in Appendix B-1, of the total 326 trees, 192 trees (59%) exhibit good health, 99 trees (30%) exhibit fair health, and 35 trees (11%) exhibit poor to critical health. One dead tree was surveyed within the BESS facility LOD and the Gen-Tie Line Route 1 buffer corridor. Furthermore, 209 trees (82%) exhibit good structure, 38 trees (15%) exhibit fair structure, and 4 trees (3%) exhibit poor structure. The most common structural defects observed

were dead branches and weak attachments, where the connection between stems or branches and the trunk produced a less-than-optimal attachment.

Of the 326 trees in the survey area, trunk diameters range from 1 inch to 63 inches. Single-stem trees are more common than multi-stem trees. Tree heights vary from 10 feet to 140 feet. Tree canopy extents range from 2 feet to 60 feet. Individual attributes of each tree are presented in Appendix B-1.

### 3.1.2 Tree Impact Summary – BESS Facility and Gen-Tie Line Route 1

The LOD of the BESS facility is primarily located in the middle of the existing open area, which consists of a gravel pad. The edges of the BESS facility LOD, including graded areas and retaining walls, overlap with the existing tree cover along portions of all four sides of the facility. The south and west side have the heaviest tree cover, so trees in these areas will experience the heaviest project impact. Additionally, several trees are scattered within the existing gravel pad and will be impacted by the development of the BESS facility. Based on the preliminary grading drawings, any tree within the LOD of the BESS facility will be destroyed when the site is graded; therefore, these trees are recommended for removal. Additionally, there is a high likelihood that trees within 10 feet of the LOD will be significantly impacted by the project, specifically by the loss of a portion of the root system and the removal of available growing space resulting from the grading and development of the BESS facility. All 326 trees within the LOD or within 10 feet of the LOD borders are recommended for removal.

Gen-Tie Line Route 1 will be entirely underground and will be in the middle of the public right-of-way on Carter Street, Martin Street, and Schwerin Street. Although trees are adjacent to these roads, no trees are close enough to the gen-tie line route to be impacted by the installation of the gen-tie line. It is unlikely that construction would inadvertently impact these adjacent trees because they are located on private property, generally behind privacy fences or walls.

Appendix C-1 provides maps of the trees recommended for removal for the BESS site and Gen-Tie Line Route 1.

## 3.2 BESS Facility and Gen-Tie Line Route 1A

### 3.2.1 Inventory Summary – BESS Facility and Gen-Tie Line Route 1A

Dudek's arborists recorded 326 trees that meet the City's definition of a tree within the project boundaries of the BESS facility and Gen-Tie Line Route 1A. It should be noted that no trees along Route 1A are anticipated to be impacted by the project. Therefore, the summary of the trees surveyed in this section is limited to trees within the LOD of the BESS facility.

Table 2 summarizes the species of the trees surveyed within the LOD for the BESS facility and Route 1A. The tree species composition is predominantly blue gum eucalyptus trees; approximately half of the trees (181) are small trees, 6 inches in diameter or less.

**Table 2. Surveyed Trees for BESS Facility and Gen-Tie Line Route 1A**

Common Name	Scientific Name	Tree Quantities (for Each Species)
Blue gum eucalyptus	<i>Eucalyptus globulus</i>	325
Monterey pine	<i>Pinus radiata</i>	1
<b>Total</b>		<b>326</b>

As presented in Appendix B-2, of the total 326 trees, 192 trees (59%) exhibit good health, 99 trees (30%) exhibit fair health, and 35 trees (11%) exhibit poor to critical health. One dead tree was surveyed in the BESS facility LOD and gen-tie route buffer corridor. Furthermore, 209 trees (82%) exhibit good structure, 38 trees (15%) exhibit fair structure, and 4 trees (3%) exhibit poor structure. The most common structural defects observed were dead branches and weak attachments, where the connection between stems or branches and the trunk produced a less-than-optimal attachment.

Of the 326 trees in the survey area, trunk diameters range from 1 inch to 63 inches. Single-stem trees are more common than multi-stem trees. Tree heights vary from 10 feet to 140 feet. Tree canopy extents range from 2 feet to 60 feet. Individual attributes of each tree are presented in Appendix B-2.

### 3.2.2 Tree Impact Summary – BESS Facility and Gen-Tie Line Route 1A

The LOD of the BESS facility is primarily located in the middle of the existing open area, which consists of a gravel pad. The edges of the BESS facility LOD, including graded areas and retaining walls, overlap with the existing tree cover along portions of all four sides of the facility. The south and west side have the heaviest tree cover, so trees in these areas will experience the heaviest project impacts. Additionally, several trees are scattered within the existing gravel pad and will be impacted by the development of the BESS facility. Based on the preliminary grading drawings, any tree within the LOD of the BESS facility will be destroyed when the site is graded; therefore, these trees are recommended for removal. Additionally, there is a high likelihood that trees within 10 feet of the LOD will be significantly impacted by the project, specifically by the loss of a portion of the root system and the removal of available growing space resulting from the grading and development of the BESS facility. All 326 trees within the LOD or within 10 feet of the LOD borders are recommended for removal.

Gen-Tie Line Route 1A will be entirely underground and in the middle of the public right-of-way on Carter Street, Martin Street, Oriente Street, Ottilia Street, and Schwerin Street. Although trees are adjacent to these roads, No trees are close enough to the gen-tie line route to be impacted by the installation of the gen-tie line. It is unlikely that construction will inadvertently impact these adjacent trees, because they are located on private property, generally behind privacy fences or walls.

Appendix C-2 provides a map of the trees recommended for removal for the BESS Facility and Gen-Tie Line Route 1A.

### 3.3 BESS Facility and Gen-Tie Line Route 3

#### 3.3.1 Inventory Summary – BESS Facility and Gen-Tie Line Route 3

Dudek's arborists recorded 333 trees that meet the City's definition of a tree within the project boundaries of the BESS facility and Gen-Tie Line Route 3. Unlike Routes 1 and 1A, a small portion of Route 3 extends through a community open space and crosses a tree line along the east side of the BESS facility site, and impacts to trees along this gen-tie line route are anticipated.

Table 3 summarizes the species of the trees surveyed within the LOD for the BESS facility and Gen-Tie Line Route 3. The tree species composition is predominantly blue gum eucalyptus trees; approximately half (184) of the trees are small trees, 6 inches in diameter or less.

**Table 3. Surveyed Trees for BESS Facility and Gen-Tie Line Route 3**

Common Name	Scientific Name	Tree Quantities (for Each Species)
Blue gum eucalyptus	<i>Eucalyptus globulus</i>	329
Monterey pine	<i>Pinus radiata</i>	1
Coast live oak	<i>Quercus agrifolia</i>	1
Catalina ironwood	<i>Lyonothamnus floribundas</i>	2
<b>Total</b>		<b>333</b>

As presented in Appendix B-3, of the total 333 trees in the study area, 196 trees exhibit good health, 101 trees (30%) exhibit fair health, and 36 trees (11%) exhibit poor to critical health. One dead tree was surveyed in the BESS facility LOD and Gen-Tie Line Route 3 buffer corridor. Furthermore, 263 trees (79%) exhibit good structure, 61 trees (18%) exhibit fair structure, and 9 trees (3%) exhibit poor structure. The most common structural defects observed were dead branches and weak attachments, where the connection between stems or branches and the trunk produced a less-than-optimal attachment.

Of the 333 trees in the survey area, trunk diameters range from 1 inch to 88 inches. Single-stem trees are more common than multi-stem trees. Tree heights vary from 8 feet to 140 feet. Tree canopy extents range from 2 feet to 60 feet. Individual attributes of each tree are presented in Appendix B-3.

#### 3.3.2 Tree Impact Summary – BESS Facility and Gen-Tie Line Route 3

The LOD of the BESS facility is primarily located in the middle of the existing open area, which consists of a gravel pad. The edges of the BESS facility LOD, including graded areas and retaining walls, overlap with the existing tree cover along portions of all four sides of the facility. The south and west side have the heaviest tree cover, so trees in these areas will experience the heaviest project impacts. Additionally, several trees are scattered within the existing gravel pad and will be impacted by the development of the BESS facility. Based on the preliminary grading drawings, any tree within the LOD of the BESS facility will be destroyed when the site is graded; therefore, these trees are recommended for removal. Additionally, there is a high likelihood that trees within 10 feet of the LOD will

be significantly impacted by the project, specifically by the loss of a portion of the root system and the removal of available growing space resulting from the grading and development of the ESS facility. Of the 333 trees within the LOD or within 10 feet of the LOD borders of the BESS facility, all are recommended for removal.

Gen-Tie Line Route 3 will be entirely underground and will connect to the BESS facility east of the site, extending through a row of trees onto the Cow Palace property and then around the buildings on the property by traveling north to the northern Cow Palace property line along Geneva Avenue. The route travels east, paralleling Geneva Avenue, until it clears the buildings on the Cow Palace property, then it heads south along the eastern property line until it is in line with the west end of Ottilia Street. At this point, the route extends east off the Cow Palace property down a small hill and through a community open space before entering Ottilia Street. The route then extends east in the middle of the public right-of-way on Ottilia Street until Schwerin Street. Then it turns south briefly before connecting to the PG&E Martin Substation. There are trees within the route at two points. The first is where the route passes through the tree line just east of the BESS facility site; there are four trees at this point. The second is where the route passes through the community open space at the western end of Ottilia Street; there are three trees at this second point. The remainder of the route is within a parking lot or the middle of a public street. These seven trees are within the proposed location of the trench for the gen-tie line or within 5 feet of the trench and are therefore recommended for removal.

Appendix C-3 provides a map of the trees recommended for removal for the BESS facility and Gen-Tie Line Route 3.

## 4 Tree Management Recommendations

### 4.1 Removals

Depending on the gen-tie line route selected, up to 333 trees are recommended for removal due to construction impacts. Dudek recommends that these trees be removed under the supervision of an ISA-certified arborist. Tree removals ideally should be conducted outside of nesting bird season (February to September). If removals must be conducted during nesting bird season, then the pre-work survey should be performed by a qualified biologist to verify that the trees identified for removal do not have active nests. Trees with active bird nests should be avoided until the nests have been abandoned.

Blue gum eucalyptus trees are the most common tree species recommended for removal. Because these trees are capable of prolific sprouting from the cut stump, it is recommended that all trees removed for the project should include grinding or removal of the stump.

The locations of the trees recommended for removal are shown in the tree location maps in Appendix C.

### 4.2 Tree Permits

Section 12.40.120 of the City Municipal Code requires a permit from the City to remove a live street tree. Of the 326 to 333 trees recommended for removal, only 3 trees (all within Gen-Tie Line Route 3) meet the City's definition of street tree. An approved permit from the City is required before removing these 3 trees. Street tree permits can be obtained from the City's Public Works Department.

Appendix B-3 identifies the 3 street trees recommended for removal along Gen-Tie Line Route 3.

## 4.3 Replacement Trees

Sections 12.40.090, 12.40.100, and 12.40.140 of the City Municipal Code describe the requirements for property owners who remove a street tree for construction work to provide a suitable replacement tree on public property if suitable conditions permit planting replacement trees. The code requirement is to plant two trees for each street tree removed. Replacement trees should be a minimum size of a 24-inch-box tree. If there is insufficient space in the public area, the property owner can pay the City to replace the removed tree, as described in Section 12.40.100. Installing replacement trees or paying the City to plant replacement trees is subject to approval by the Public Works Director.

## 4.4 Tree Protection Measures

Section 12.40.080 of the City Municipal Code requires plans submitted for construction to include provisions for sufficient protection to prevent injury to any existing publicly owned trees. There are no public trees close to the proposed BESS facility. The distance between the nearest public tree and the BESS facility is sufficient to protect these trees and prevent injury. No public trees are near the gen-tie line routes except for the three trees recommended for removal in the open space at the end of Ottilia Street. The distance between the nearest public tree and Gen-Tie Line Route 3 is sufficient protection to prevent injury to these trees.

Although private trees are not required to be protected, Dudek recommends the following protection measures for the trees at the ESS Facility:

- **Fencing:** It is recommended that protective fencing be installed around the perimeter of the construction site for the BESS facility to separate and protect the adjacent trees from damage during project development. The protective fencing should be 5 to 6 feet tall, and the metal chain-link fencing should be secured to metal poles set at least 2 feet into the ground or on pads sufficiently large enough to support the weight of the fence.
- **Construction Storage and Disposal:** Construction materials, equipment, and debris should not be stored within the dripline (the area beneath the tree from the trunk to the edge of the tree canopy) of any tree adjacent to the BESS facility LOD or the gen-tie line route. Vehicles should not be parked within the dripline of a tree except on paved surfaces. Vehicles—heavy construction equipment in particular—should not sit idling within the dripline of a tree.
- **Equipment Service and Cleaning:** Construction equipment and vehicles should not be serviced or cleaned within a tree's dripline. No vehicle or equipment fluids, including fuels, coolant, or lubricants, should be allowed to flow onto the ground within the dripline of a tree, and concrete containers should not be washed out within the dripline of a tree.
- **Nesting Bird Surveys:** Dudek recommends removing the trees identified for removal outside of the nesting bird season (February to September, depending on species and weather). If tree and vegetation removal or trimming occurs during the nesting season, a qualified biologist will conduct pre-work nest surveys within 5 days before tree removal. The survey will cover the work limits and suitable nesting habitat within 500 feet for raptors and 100 feet for other nesting birds, as feasible and accessible.

## 5 Conclusion

The project site will consist of a BESS facility and a gen-tie line with potential impacts to 326 to 333 protected trees, depending on the chosen gen-tie line route. All of the impacted trees identified in this report are recommended for removal either because the tree is located within the development footprint and would be destroyed by construction activities or because it is close enough to construction activities that these would likely result in the severing of a significant portion of the tree's root system, seriously compromising tree health and stability. In total, this report recommends 326 to 333 trees for removal. Three of these trees meet the City's definition of a street tree and require the property owner to obtain a tree permit from the City prior to removing the trees.

The trees located more than 10 feet outside of the development footprint of the BESS facility site are not expected to be significantly impacted by the project development because the belowground root systems and aboveground tree parts are anticipated to remain largely untouched by the proposed construction. Trees outside the area of the trench for the gen-tie routes are not expected to be impacted by the installation of the gen-tie line because the trench will be entirely underground and primarily in the middle of a street or parking lot, where tree roots are not expected to be encountered. Installing protective fencing around the BESS facility construction site and ensuring that construction activities stay within the construction area will ensure that the development of the BESS facility does not impact these trees.

## 6 Disclosure

This arborist report provides conclusions and recommendations based only on a visual examination of the trees within the tree survey area by ISA-certified arborists and reasonable reliance on the completeness and accuracy of the information provided to the arborists. The examination did not include subterranean or internal examination of the trees.

Arborists are tree specialists who use their education, knowledge, training, and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near them. Although trees provide many benefits to those who live near them, they also include inherent risks from breakage or failure that can be minimized but not eliminated.

Arborists cannot detect every condition that could lead to a tree's failure. Trees are living organisms subject to attack by disease, insects, fungi, weather, and other forces of nature, and conditions that lead to failure are often hidden within trees and belowground. There are some inherent risks with trees that cannot be predicted with any degree of certainty, even by a skilled and experienced arborist. Arborists cannot predict acts of nature, including, without limitation, storms of sufficient strength, which can cause a healthy tree to fail. Additionally, arborists cannot guarantee that a tree will be healthy or safe under all circumstances or for any specific period. A tree's condition could change over a short or long period due to climatic, cultural, or environmental conditions. Further, there is no guarantee or certainty that recommendations or efforts to correct unsafe conditions will prevent future breakage or failure of a tree.

To live or work near trees is to accept some degree of risk. Neither the author of this arborist report nor Dudek assumes any responsibility for or will be liable for any claims, losses, or damages for damage to any tree, death or injury to any person, or any loss of or damage to any personal or real property.
