6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	20.8
AQ-PM	18.0
AQ-DPM	78.0
Drinking Water	22.7
Lead Risk Housing	14.1
Pesticides	0.00
Toxic Releases	31.5
Traffic	86.8
Effect Indicators	—
CleanUp Sites	50.3
Groundwater	89.9
Haz Waste Facilities/Generators	56.7
Impaired Water Bodies	23.9
Solid Waste	52.9

Sensitive Population	—
Asthma	26.4
Cardio-vascular	32.0
Low Birth Weights	72.5
Socioeconomic Factor Indicators	—
Education	3.52
Housing	12.8
Linguistic	41.4
Poverty	19.6
Unemployment	0.91

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	82.08648787
Employed	99.84601566
Median HI	76.27357885
Education	—
Bachelor's or higher	85.98742461
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—
Auto Access	49.51879892
Active commuting	82.24047222
Social	—

Other Indices	—
Hardship	1.4
Other Decision Support	—
2016 Voting	74.9

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	26.0

Healthy Places Index Score for Project Location (b)	92.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Condo land use acreage adjusted to match site plan. Landscaped area set to match open space plan.
Operations: Vehicle Data	Trip generation rate updated per project-specific traffic report.
Operations: Water and Waste Water	Parking lot water use set to 0
Construction: Construction Phases	Construction phasing provided.
Construction: Off-Road Equipment	Construction equipment provided.
Construction: Trips and VMT	Number of workers provided. Vendor/haul trips left as defaults.
Operations: Hearths	RFI notes all-electric units.

Architectural Coating	Hauling	0.00	20.0	HHDT

Architectural Coating	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	221,616	73,872	0.00	0.00	1,411

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Paving	0.00	0.00	0.00	0.00	0.54

5.6.2. Construction Earthmoving Control Strategies

Non-applicable. No control strategies activated by user.

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Condo/Townhouse High Rise	—	0%
Parking Lot	0.54	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O

2029	0.00	204	0.03	< 0.005
2030	0.00	204	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1.2. Mitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.1.2. Mitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	20.8
AQ-PM	18.0
AQ-DPM	78.0
Drinking Water	22.7
Lead Risk Housing	14.1
Pesticides	0.00
Toxic Releases	31.5
Traffic	86.8
Effect Indicators	—
CleanUp Sites	50.3
Groundwater	89.9
Haz Waste Facilities/Generators	56.7
Impaired Water Bodies	23.9
Solid Waste	52.9
Sensitive Population	—
Asthma	26.4
Cardio-vascular	32.0
Low Birth Weights	72.5
Socioeconomic Factor Indicators	—
Education	3.52
Housing	12.8
Linguistic	41.4
Poverty	19.6
Unemployment	0.91

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	82.08648787
Employed	99.84601566
Median HI	76.27357885
Education	—
Bachelor's or higher	85.98742461
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—
Auto Access	49.51879892

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	26.0
Healthy Places Index Score for Project Location (b)	92.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Condo land use acreage adjusted to match site plan. Landscaped area set to match open space plan.
Operations: Vehicle Data	Trip generation rate updated per project-specific traffic report.
Operations: Water and Waste Water	Parking lot water use set to 0
Construction: Construction Phases	Construction phasing provided.
Construction: Off-Road Equipment	Construction equipment provided.
Construction: Trips and VMT	Number of workers provided. Vendor/haul trips left as defaults.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	20.8
AQ-PM	18.0
AQ-DPM	78.0
Drinking Water	22.7
Lead Risk Housing	14.1
Pesticides	0.00
Toxic Releases	31.5
Traffic	86.8
Effect Indicators	—
CleanUp Sites	50.3
Groundwater	89.9

Haz Waste Facilities/Generators	56.7
Impaired Water Bodies	23.9
Solid Waste	52.9
Sensitive Population	—
Asthma	26.4
Cardio-vascular	32.0
Low Birth Weights	72.5
Socioeconomic Factor Indicators	—
Education	3.52
Housing	12.8
Linguistic	41.4
Poverty	19.6
Unemployment	0.91

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	82.08648787
Employed	99.84601566
Median HI	76.27357885
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	26.0
Healthy Places Index Score for Project Location (b)	92.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Condo land use acreage adjusted to match site plan. Landscaped area set to match open space plan.
Operations: Vehicle Data	Trip generation rate updated per project-specific traffic report. Total of 1,701 ADT.
Operations: Water and Waste Water	Parking lot water use set to 0
Operations: Hearths	Per RFI, units would be all electric (no natural gas hearths/fireplaces)

Appendix B Health Risk Assessment Results

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =     44000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Accepts FLAGPOLE Receptor . Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates ANNUAL Averages

 **This Run Includes:      1 Source(s);       1 Source Group(s); and    2802
```

Receptor(s)

                with: 0 POINT(s), including
                           0 POINTCAP(s) and   0 POINTHOR(s)
                 and: 0 VOLUME source(s)
                 and: 1 AREA type source(s)

                 and: 0 RLINE/RLINEXT source(s)
                 and: 0 OPENPIT source(s)
                 and: 0 BUOYANT LINE source(s) with a total of   0 line(s)
                 and: 0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date: 18081

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) =   15.50 ; Decay
Coef. =   0.000   ; Rot. Angle =   0.0
                  Emission Units = GRAMS/SEC   ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =   3.8 MB of RAM.

 **Input Runstream File: aermod.inp

 **Output Print File: aermod.out

 **Detailed Error/Message File: 48_Campbell Tech Park Construction.err

 **File for Summary of Results: 48_Campbell Tech Park Construction.sum

- - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =     44000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Accepts FLAGPOLE Receptor . Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates ANNUAL Averages
```

```
 **This Run Includes:      1 Source(s);       1 Source Group(s); and    2070
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      1 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    15.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

Stantec

Stantec is a global leader in sustainable architecture, engineering, and environmental consulting. The diverse perspectives of our partners and interested parties drive us to think beyond what's previously been done on critical issues like climate change, digital transformation, and future-proofing our cities and infrastructure. We innovate at the intersection of community, creativity, and client relationships to advance communities everywhere, so that together we can redefine what's possible.

Appendix E
Energy Calculations

Campbell Tech Park—Energy Consumption Summary

Date of Last Revision: January 29, 2024

Summary of Energy Use During Construction		(Annually)
Construction vehicle fuel	109,545	gallons (gasoline, diesel)
Construction equipment fuel	131,137	gallons (diesel)

Summary of Energy Use During Proposed Operations		(Annually)
Operational vehicle fuel consumption	147,344	gallons (gasoline, diesel)
Operational electricity consumption	1,111,596	kilowatt hours
Operational natural gas consumption	3,563,463	kBTU

Construction Vehicle Fuel Calculations (Page 1 of 2)

California Air Resource Board (CARB). 2024. EMFAC2021 Web Database. Accessed Jan 29, 2025.

Source: EMFAC2021 (v1.0.2) Emissions Inventory
Region Type: County
Region: Santa Clara
Calendar Year: 2026, 2030
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, kWh/day for Energy Consumption, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

VMT = Vehicle Miles Traveled
FE = Fuel Economy

Notes:
Equipment assumptions are provided in the CalEEMod output files.
Source of usage estimates: California Air Resource Board (CARB). 2024. OFFROAD2021 (v1.0.7) Emissions Inventory
Website: https://arb.ca.gov/emfac/offroad/emissions-inventory/. Accessed Jan 29, 2025.

State 3600000000
0.0036%

Model Output: OFFROAD2021 (v1.0.9) Emissions Inventory
Region Type: County
Region: Santa Clara
Calendar Year: 2026
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

Region	CalYr	Vehicle Class + HP Bin	Model Year	Fuel	Fuel Consumption (gallons/year)	Horsepower Hours (HP-hours/year)	Fuel (gallons/HP-hour)

Operational Fuel Calculation—Project-Generated Operational Trips (Page 1 of 2)

California Air Resource Board (CARB). 2024. EMFAC2021 Web Database. Accessed Jan 29, 2025.

Source: EMFAC2021 (v1.0.2) Emissions Inventory
Region Type: County
Region: Santa Clara
Calendar Year: 2026, 2030
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, kWh/day for Energy Consumption, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

VMT = Vehicle Miles Traveled
FE = Fuel Economy

			Given						*Calculations*

Appendix G
Transportation Analysis

HEXAGON TRANSPORTATION CONSULTANTS, INC.

Memorandum

Date: March 18, 2026

To: Matthew Jue, City of Campbell

From: Gary Black and Michelle Hunt

Subject: Transportation Analysis for the Proposed Residential Development Project at 635, 655, 675, and 695 Campbell Technology Parkway in Campbell, California

Hexagon Transportation Consultants, Inc. has completed a transportation analysis for the proposed residential development located at 635, 655, 675, and 695 Campbell Technology Parkway in Campbell, California (see Figure 1). The project proposes replacing the current partially occupied research and development facilities on the site with a housing development comprised of 27 detached small-lot single-family homes and 263 townhomes for a total of 290 dwelling units (see Figure 2). The project would provide 718 parking spaces with access via three driveways on Campbell Technology Parkway.

The transportation study was conducted for the purpose of identifying transportation impacts and operational issues related to the proposed development.

Scope of Study

CEQA Transportation Analysis

Per the California Environmental Quality Act (CEQA) Guidelines checklist, the study evaluates the project's transportation impacts to address the following questions.

- Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?
- Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b) regarding vehicle miles traveled (VMT)?
- Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
- Would the project result in inadequate emergency access?

Local Transportation Analysis

The local transportation analysis (LTA) includes an analysis of the traffic operational effects of the project on the key intersections, freeway segments, and freeway ramps in the study area. The LTA also includes an evaluation of site access and circulation.

The effects of the project were evaluated in accordance with the standards set forth by the City of Cambell and the Santa Clara Valley Transportation Authority (VTA) Congestion Management Program (CMP).

Project Site Location and Study Intersections

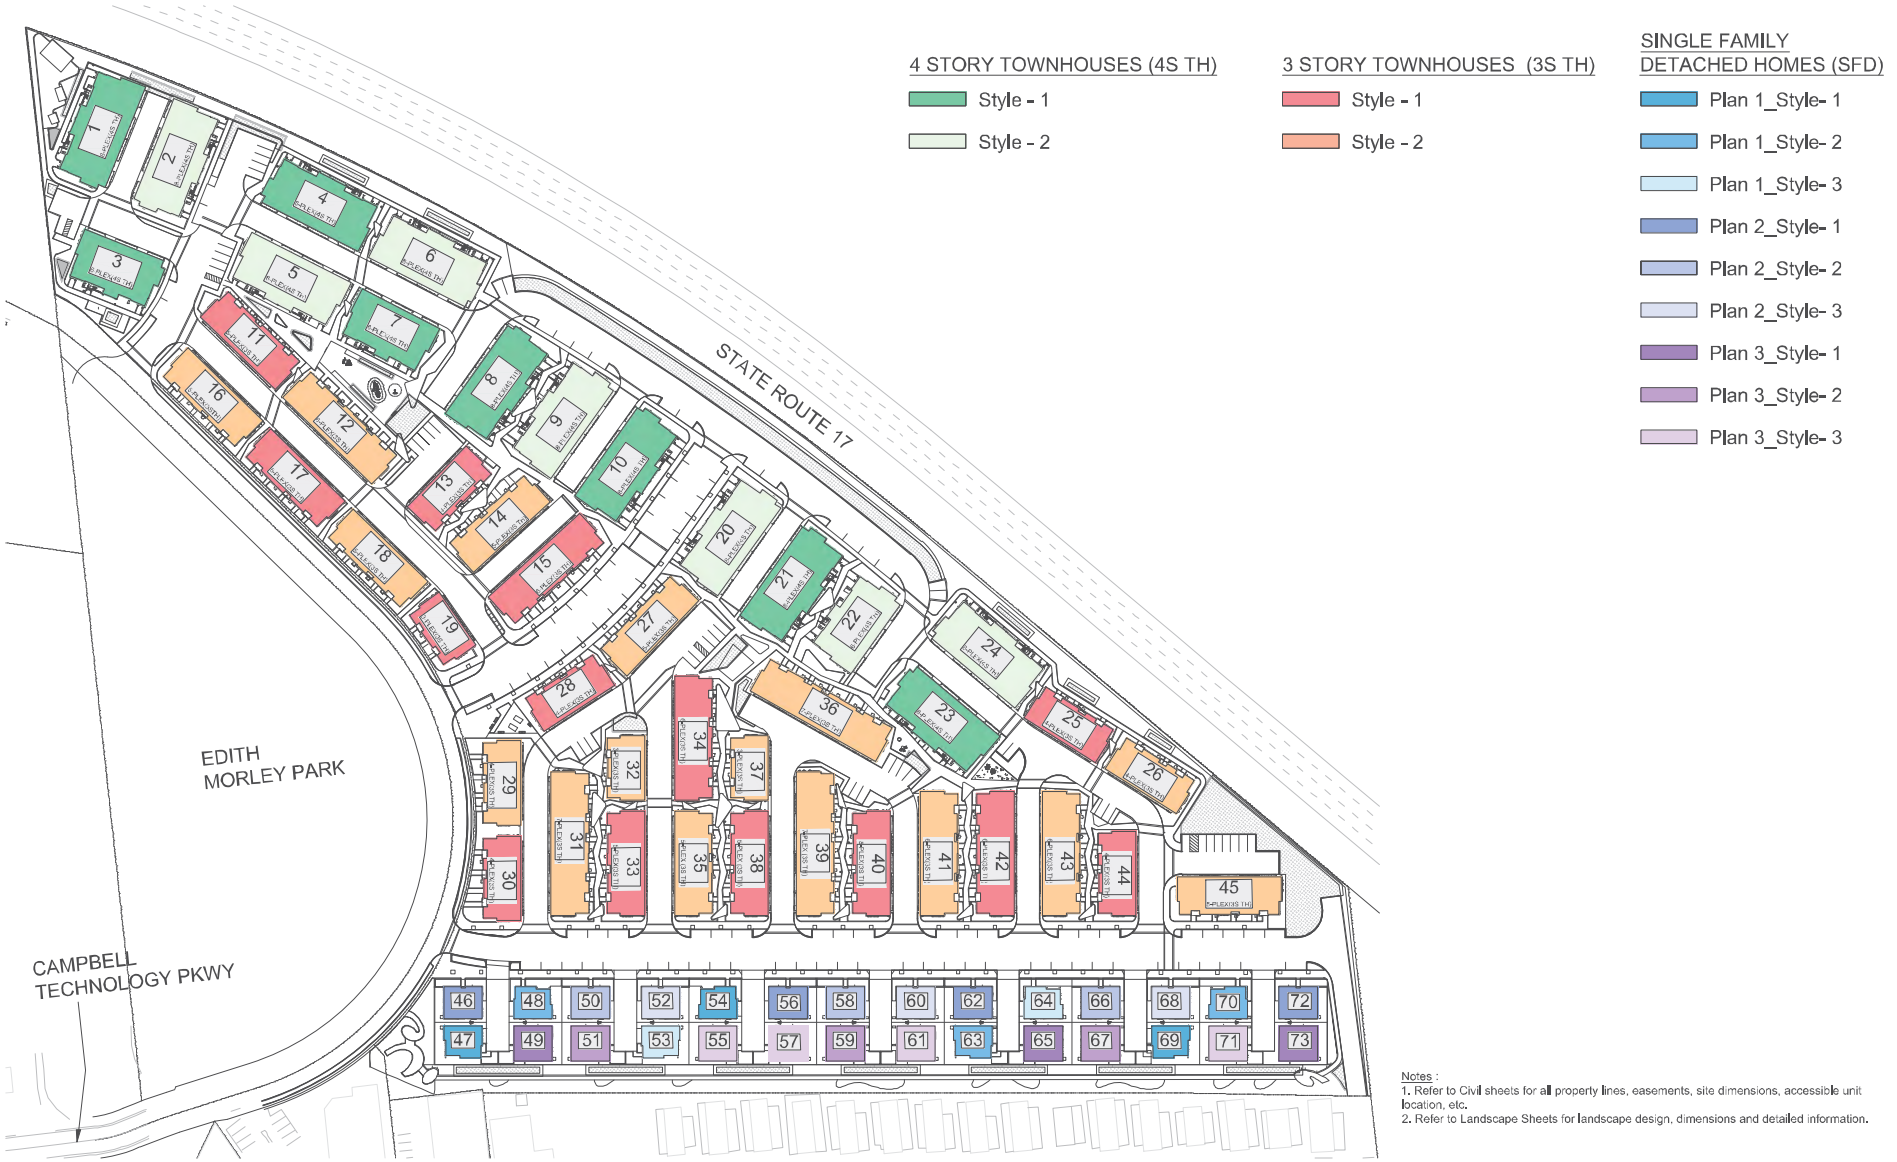

Figure 2
Site Plan

CEQA Transportation Analysis

Pedestrian, Bicycle, and Transit Analysis

Campbell does not have any policies regarding how to analyze or define pedestrian, bicycle, or transit impacts. For the purposes of this study, pedestrian impacts would occur if the project would interfere with or conflict with an existing or planned pedestrian facility or create a demand for pedestrian facilities where none exist or are planned. For the purposes of this study, bicycle impacts will be defined based on Bicycle Level of Traffic Stress (BLTS), which is defined in detail below. An impact would occur if the project would add motor vehicle traffic to a street with a BLTS score of 3 or 4. For the purposes of this study, a transit impact will be defined as affecting bus stops or routes or adding riders beyond the system capacity.

Pedestrian Access and Circulation

The project site is far removed from typical pedestrian destinations such as schools, stores, and bus stops. However, there is a neighborhood park directly across the street. Pedestrian trips generated by the proposed project were estimated based on the generation rates for "Single-Family Attached Housing" (Land Use Code 215) published by the ITE *Trip Generation Manual, 11th Edition*. Based on the ITE trip generation rates, it is estimated that the proposed project would generate 392 daily pedestrian trips, with 32 pedestrian trips during the AM peak hour and 46 pedestrian trips during the PM peak hour (see Table 1). The pedestrian trips generated by the existing R&D buildings were estimated by applying the pedestrian trip rates for "Research and Development (Land Use Code 760)". The estimated number of pedestrian trips generated by the existing development was deducted from the estimated number of trips generated by the proposed project, which results in an estimated net increase of 322 daily pedestrian trips with 26 additional pedestrian trips in the AM peak hour and 38 additional pedestrian trips in the PM peak hour (see Table 1). These estimates based on ITE data may overestimate the number of pedestrian trips because of the lack of destinations in the area. There are no schools or retail areas within walking distance. There is a park directly across the street, however, that would attract pedestrian trips. Future residents of the project who want to walk to Edith Morley Park would need to cross Campbell Technology Parkway.

Between the project site and McGlincy Lane, there is a continuous sidewalk on the west side of Campbell Technology Parkway and a discontinuous sidewalk on the east side of the street (see Figure 3). Continuous sidewalks also are present along both sides of McGlincy Lane to the east toward Union Avenue. There are no sidewalks on McGlincy Lane to the west of Campbell Technology Parkway. There is a marked crosswalk on the west leg across McGlincy Lane at the Campbell Technology Parkway intersection. The City has not identified any planned pedestrian improvements within walking distance of the project site. The project would provide wider sidewalks with landscaping along the project frontage to enhance the pedestrian environment.

While the project would not interfere with or conflict with existing or planned pedestrian facilities, the project would create a demand for pedestrian facilities on the east side of Campbell Technology Parkway where the sidewalk is discontinuous. This constitutes a significant impact. To mitigate the impact, the project should install a high visibility ADA-compliant crosswalk across Campbell Technology Parkway at the project's mid-block driveway along with the associated pedestrian warning signs and yield lines in each direction and new ADA-compliant ramps at both ends of this new crosswalk. The project also should install a crosswalk along the north leg of the Campbell Technology Parkway at East McGlincy Lane intersection to connect the northeast and northwest corners of the Campbell Technology Parkway/East McGlincy Lane intersection. The two existing curb ramps should be retrofitted to be made ADA compliant. The project also should provide an

easement across the property for a potential future bicycle and pedestrian bridge across Highway 17 that is currently being studied by Campbell. Implementation of this mitigation measure would reduce the pedestrian impact to a less than significant level.

Table 1
Trip Generation Summary – Pedestrian Trips

			Pedestrian Trips									
			Daily	Daily	AM Peak-Hour Trips				PM Peak-Hour Trips			
Land Use	Size	Units	Rate	Trips	Rate	In	Out	Total	Rate	In	Out	Total

Net New Pedestrian/Walk Trips				**391**		**25**	**7**	**32**		**15**	**31**	**46**

Notes:
du = dwelling units
s.f. = square feet

[1] AM and PM peak hour pedestrian trips generated by the proposed single-family housing is based bicycel trip generation rates published in the ITE Trip Generation online database for Single-Family Attached Housing (Land Use Code 215). Daily trips are estimated by (AM trips + PM trips)/2*10.

[2] AM and PM peak hour pedestrian trips generated by the proposed townhomes is based bicycel trip generation rates published in the ITE Trip Generation online database for Single-Family Attached Housing (Land Use Code 215). Daily trips are estimated by (AM trips + PM trips)/2*10.

[3] AM and PM peak hour pedestrian trips generated by the existing R&D use is based on the bicycel trip generation rates published in the ITE Trip Generation online database for Research & Development (Land Use Code 760). No splits information is available for pedestrian trips. The inbound and outbound split is based on person trips. Daily trips are estimated by (AM trips + PM trips)/2*10.

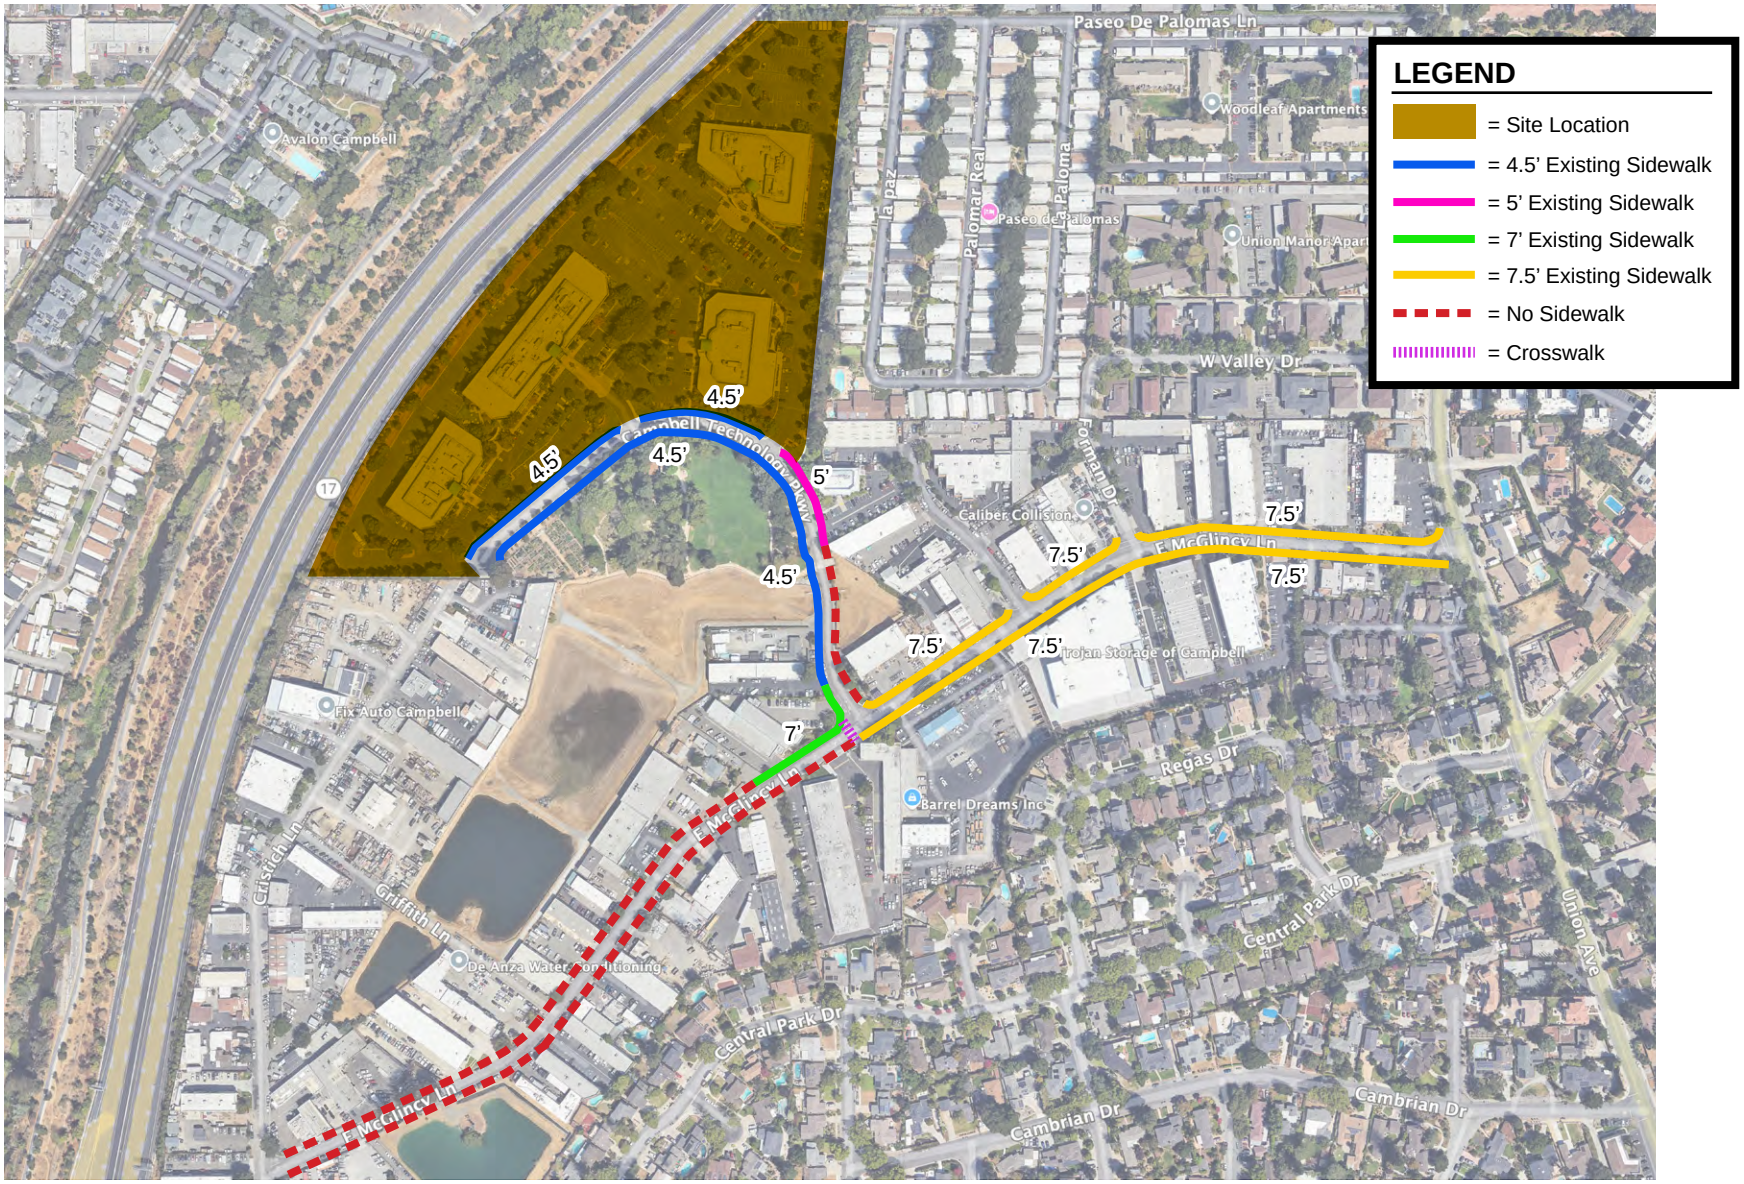

Figure 3
Existing Pedestrian Facilities

NORTH
Not to Scale

Bicycle Access and Circulation

Bicycle facilities in the project area are limited and not well-connected. In the vicinity of the project site, Class II bicycle lanes are only present on Union Avenue north of East McGlincy Lane and a short segment of Railway Avenue (see Figure 4). Other bicycle facilities near the project site include the Los Gatos Creek Trail, bike lanes on a portion of Campbell Avenue, and bike routes on Campbell Avenue and Railway Avenue. While the neighborhood streets in the vicinity of the project site do not have bicycle lanes, they are conducive to bicycle travel due to their low traffic volumes and low speeds.

The number of bicycle trips generated by the proposed project was estimated based on the bicycle trip generation rates for "Single-Family Attached Housing" (Land Use Code 215) published by the ITE *Trip Generation Manual, 11th Edition*. Based on the ITE trip generation rates, it is estimated that the proposed project would generate 58 daily bicycle trips, with 3 bicycle trips during the AM peak hour and 9 bicycle trips during the PM peak hour (see Table 2). The bicycle traffic generated by the existing R&D building was estimated by applying the bicycle trip rates for "General Office Building (Land Use Code 710)". The total number of trips generated by the existing development was deducted from the estimated number of trips generated by the proposed project, which results in a net increase of 51 bicycle trips on a daily basis with 2 additional bicycle trips in the AM peak hour and 9 additional bicycle trips in the PM peak hour (see Table 2).

The project would provide short-term bicycle parking spaces on-site. The short-term bicycle racks would be located at 12 locations throughout the site, and each would have a six-bike capacity. All bicycle parking spaces would be accessible from the main project driveway. Each unit also would have a garage that could be used for bicycle storage.

Table 2
Trip Generation Summary – Bicycle Trips

			Bicycle Trips									
			Daily	Daily	AM Peak-Hour Trips				PM Peak-Hour Trips

[1] Bicycle trips generated by the proposed single-family housing is based on bicycel trip generation rates published in the ITE Trip Generation online database for Single-Family Attached Housing (Land Use Code 215). Daily trips are estimated by (AM trips + PM trips)/2*10.

[2] Bicycle trips generated by the proposed townhomes is based on bicycel trip generation rates published in the ITE Trip Generation online database for Single-Family Attached Housing (Land Use Code 215). Daily trips are estimated by (AM trips + PM trips)/2*10.

[3] Bicycle trips generated by the existing R&D development is based on the bicycel trip generation rates published in the ITE Trip Generation online database for General Offic Building (Land Use Code 710). No split information is available for bicycle trips. The inbound and outbound split is based on person trips. Daily trips are estimated by (AM trips + PM trips)/2*10.

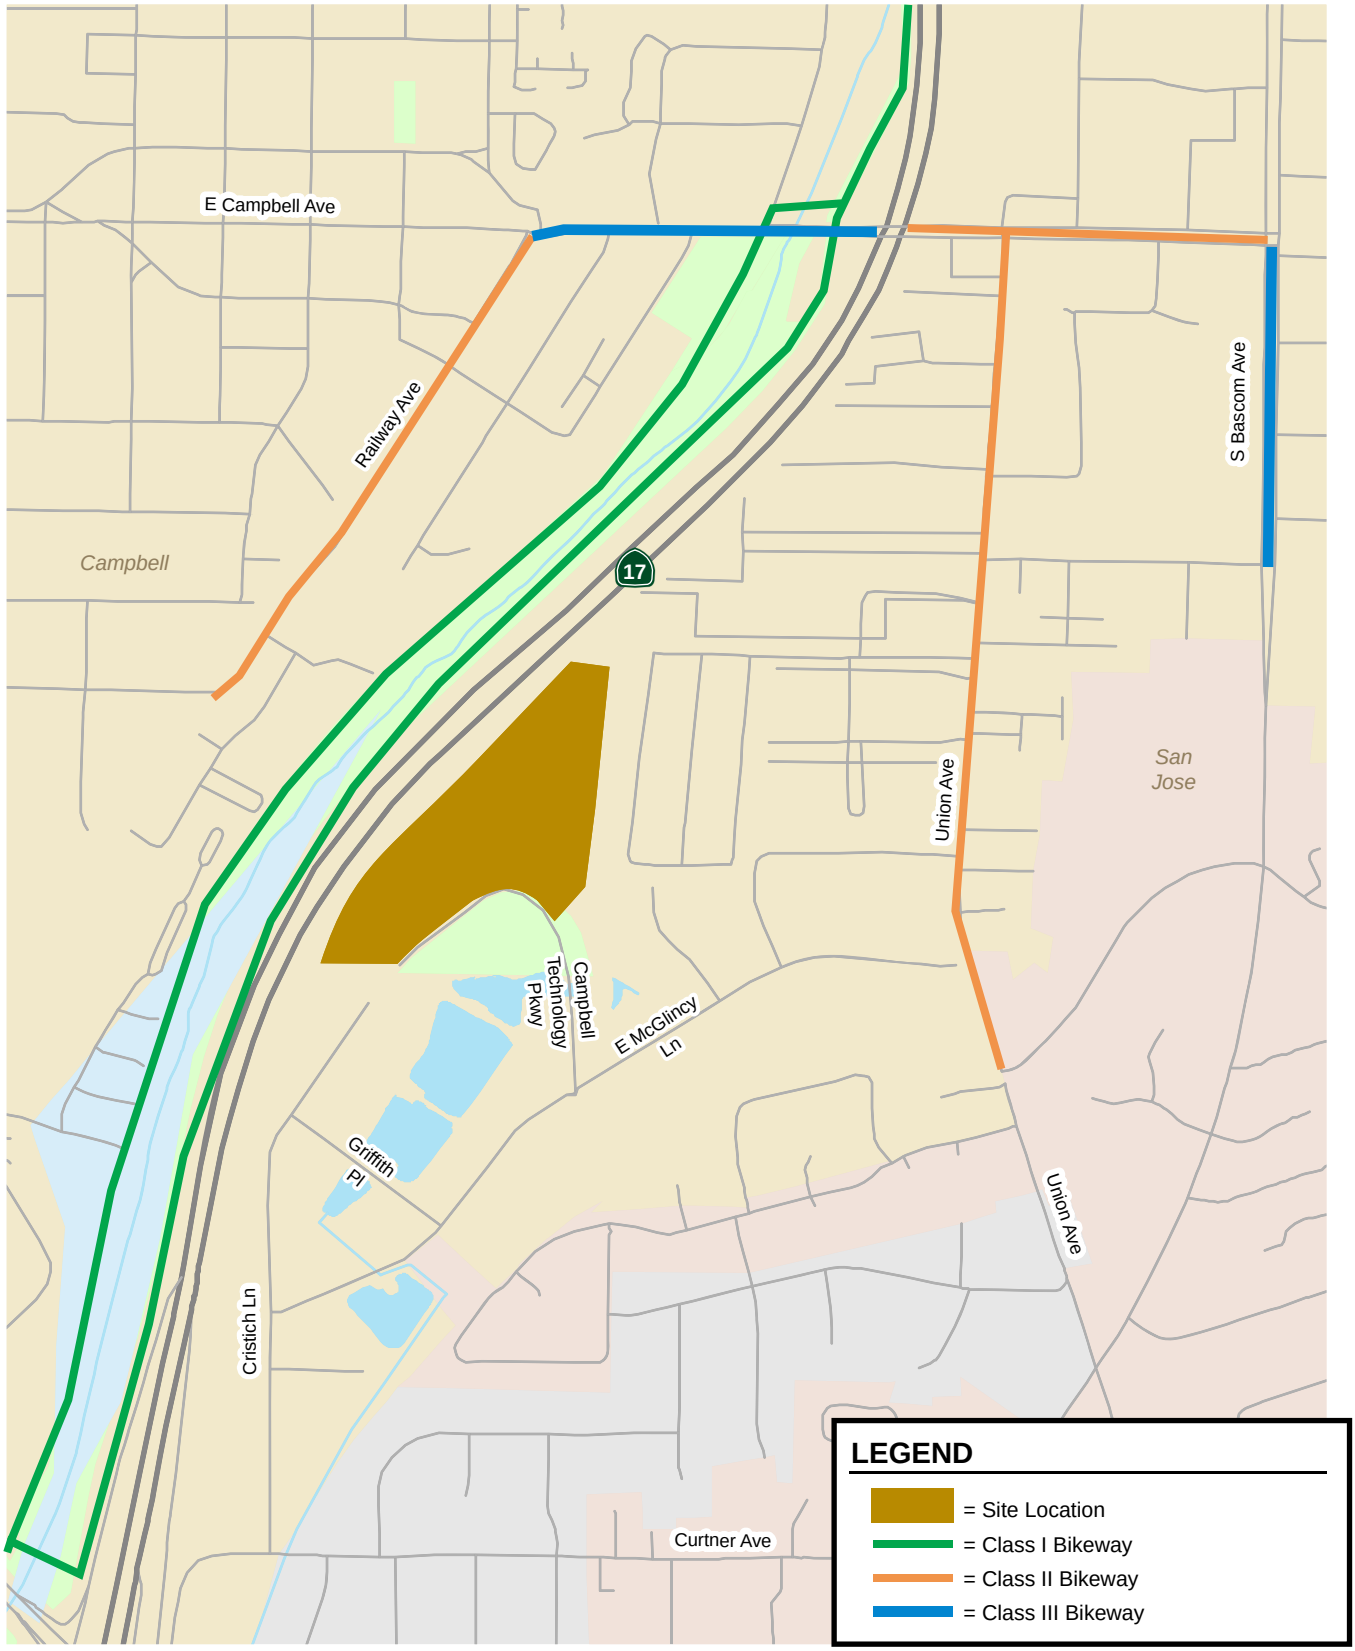

Figure 4
Existing Bicycle Facilities

Bicycle Level of Traffic Stress

Many factors contribute to a person's comfort and perceived safety when bicycling. VTA used Level of Traffic Stress (LTS) analysis to measure the comfort of roads and bikeways in the county. LTS analysis considers the posted speed limit, number of lanes of traffic, and type of bikeway provided. Streets are graded on a scale, with 1 being the lowest stress, and 4 being the highest stress. These categories reflect the amount of stress that different types of bicyclists will tolerate.

- LTS1: Most children feel comfortable bicycling.
- LTS2: The mainstream adult population feels comfortable bicycling.
- LTS3: Bicyclists who are considered "enthused and confident" but still prefer having their own dedicated space feel comfortable while bicycling.
- LTS4: Only "strong and fearless" bicyclists feel comfortable while bicycling. These routes have high speed limits, multiple travel lanes, limited or non-existent bicycle lanes and signage, and large distances to cross at intersections.

The VTA has developed a BLTS map[1] to identify the perceived comfort and safety of existing roads and bikeway facilities from the perspective of cyclists, as indicated with a BLTS score ranging from 1 to 4. Based on the VTA's BLTS map, both East McGlincy Lane and Campbell Technology Pkwy have a BLTS of 2, which indicates that an average adult population feels comfortable bicycling.

A project would result in a significant impact on bicycle operations if the project increases motor vehicle trips to a roadway with a bicycle level of traffic stress (BLTS) score of 3 or 4. The project would add traffic to Campbell Technology Parkway and E. McGlincy Lane, but those streets have a BLTS score of 2. Therefore, the project bicycle impact would be less than significant.

Transit Services Analysis

The project site is located within a 0.5-mile radius of the VTA Winchester light rail transit station as well as the South Bascom Avenue and Surrey Place bus stop. Since the proposed project is located within 0.5-mile of a light rail station, the proposed project meets the Transit Screening criteria and hence can be presumed to have a less than significant impact on VMT.

Vehicle Miles Traveled Analysis

The City implemented a VMT policy to comply with California SB 743 on July 1, 2020, as required by CEQA and was updated in April 2024. The VMT Policy provides the CEQA Project Screening Criteria and Thresholds of Significance for the preparation of CEQA transportation analysis. Based on the City's guidance, if a project meets one or more of the established screening criteria, a detailed CEQA transportation analysis is not required since the project is presumed to result in less than significant VMT impacts.

[1] https://gis.vta.org/portal/apps/PublicInformation/index.html?appid=dff791e5848a488c89a5d406c14481a4. Accessed on 4/10/2025

Consistent with the City's VMT policy and state guidelines, projects shall be presumed to have a less than significant transportation impact if they meet any of the following screening criteria:

- Small Project Screening: Any development that would generate fewer than 110 daily vehicle trips shall be presumed to have a less than significant transportation impact.
- Local-Serving Retail Screening: Retail commercial projects comprised of stores of up to 60,000 gross square feet shall be presumed to have a less than significant transportation impact.
- Local-Serving Public Facilities Screening: Local-serving public facilities (publicly owned or controlled), excluding private schools, high schools and middle schools, shall be presumed to have a less than significant VMT impact. Examples of these projects include a park, branch library, community center, fire station, and public elementary school.
- Affordable Housing Screening: Projects with 100 percent affordable housing shall be presumed to have a less than significant transportation impact on VMT.
- Transit Screening: All land-use projects located within 0.5-mile of a light-rail station shall be presumed to have a less than significant transportation impact on VMT presuming these projects are consistent with the General Plan.
- Screening based on Existing Use: Redevelopment projects that replace existing VMT-generating uses and result in a net decrease in total VMT shall be presumed to cause a less than significant impact. For redevelopment projects that result in a net increase in total VMT, the screening criteria for each land use will be based on the size of the proposed development without any credit for the existing use.
- Transportation Project Screening: Transportation projects that reduce or do not increase VMT shall be presumed to have a less than significant VMT impact. Examples include transportation projects that enhance pedestrian, bike, or transit infrastructure, and transportation projects that maintain current infrastructure, without adding new automobile capacity.
- Project Consistent with the 2040 General Plan (incorporated with the April 2024 VMT Policy update): Any development where the (1) proposed project land use is consistent with the General Plan; (2) the proposed project land use is within the increment of land use change evaluated in the General Plan EIR by Transportation Analysis Zone (TAZ); and (3) the proposed project is consistent with General Plan VMT policies, shall be presumed to have a less than significant transportation impact.

The City's VMT policy specifies that land use projects located within 0.5-mile of a light rail station shall be presumed to have a less than significant transportation impact on VMT presuming these projects are consistent with the General Plan. The City's VMT policy complies with state law requirements including CEQA Guidelines Section 15064.3, which states: "generally, projects within 0.5-mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact." Distance to transit for purposes of VMT evaluation is measured by straight-line distance. The proposed project

site is within 0.5-mile of the Winchester light rail transit station. The project site is also located within 0.5-mile of the South Bascom Avenue and Surrey Place bus stop, which includes Routes 26 and 61, running 15- and 20-min intervals, respectively, during peak periods. While bus stops are not specifically included in the City's Transit Screening criteria, the project site's proximity to this station is relevant given that a 0.5-mile radius to a major transit stop is a commonly accepted distance for transit priority areas where it can be assumed there will be a reduction in VMT[2]. Finally, as already established, the City must treat the proposed project as consistent with its General Plan for all purposes under AB 1893 (Government Code 65589.5(f)(6)(D)). In light of the foregoing, the City finds that the proposed project meets the screening criteria for transit and is presumed to have a less than significant transportation impact. Therefore, the proposed project is presumed to have a less than significant VMT impact.

Roadway Hazards

The project would not alter any streets in the area. Project driveways and other street system features would be designed in accordance with City standards. The project would generate mostly passenger vehicles with few delivery trucks, for which the surrounding roadway system is designed to accommodate. Therefore, the project would not create roadway hazards or generate incompatible uses on the surrounding roadways.

Sight distance was checked at the project driveways. Sight distance recommendations vary depending on the roadway speeds. There is no posted speed limit on Campbell Technology Parkway. The first project driveway has a sight distance of approximately 250 feet, the second project driveway has a sight distance of approximately 300 feet, and the driveway at the end of the street has approximately 500 feet of sight distance. Based on the Caltrans' recommended stopping sight distances, a sight distance of 250 feet is sufficient for a design speed up to 35 mph. Thus, the existing sight distance is adequate. Currently, on-street parking is not allowed along the project frontage on Campbell Technology Parkway. The project proposes to accommodate on-street parking along its frontage. Fifteen feet of red curb to the east and five feet to the west should be provided at each driveway to maintain sight distance for exiting vehicles. With the parking restrictions at each driveway and the pedestrian improvements proposed as mitigation for the project's impact on pedestrians, the project would not substantially increase hazards due to a geometric design feature or incompatible uses. Thus, its impact associated with roadway hazards would be less than significant.

Emergency Vehicle Access

Emergency vehicles would follow the same circulation routes as passenger vehicles. The project's fire access plan shows that emergency vehicles would be able to access the project site via the driveways and would be able to maneuver around the project site through specific streets within the site (see Figure 5). Because the project would not result in inadequate emergency access, its impact would be less than significant.

Local Transportation Analysis

Study Intersections

The traffic analysis was based on levels of service for the following study intersections:

1. Campbell Technology Parkway and East McGlincy Lane (unsignalized)

[2] *Why Creating Affordable Homes Near Transit is a Highly Effective Climate Strategy*, California Housing Partnership, May 2024.

2. Curtner Avenue/White Oaks Road and Camden Avenue (signalized)

The study intersections were selected due to the expected vehicle routes to and from the project site, following the 10 added trips per lane VTA guidelines. The study intersections are shown on Figure 1.

Traffic conditions at the study intersections were analyzed for both the weekday AM and PM peak hours of adjacent street traffic. The AM peak hour typically occurs between 7:00 AM and 9:00 AM and the PM peak hour typically occurs between 4:00 PM and 6:00 PM on a regular weekday. These are the peak commute hours during which most weekday traffic congestion occurs on the roadways in the study area.

This transportation study includes an analysis of the scenarios listed below.

Scenario 1: *Existing Conditions.* Existing conditions are based on traffic counts collected on Tuesday, January 9, 2024, and existing counts. The existing counts were taken from the Camden Avenue and White Oaks Striping project prepared by Hexagon on December 5, 2023. The AM counts were conducted November 8, 2023, and PM counts were conducted September 1, 2022. The counts are provided as Attachment 2.

Scenario 2: *Existing Plus Project Conditions.* Existing plus project conditions were estimated by adding the additional traffic generated by the project to existing traffic volumes. Existing plus project conditions were evaluated relative to existing conditions in order to determine potential traffic operational issues that could occur as a result of the project.

Scenario 3: *Background Conditions.* Background conditions were estimated by adding the projected volumes from approved but not yet completed and occupied developments in the study area to existing peak-hour volumes.

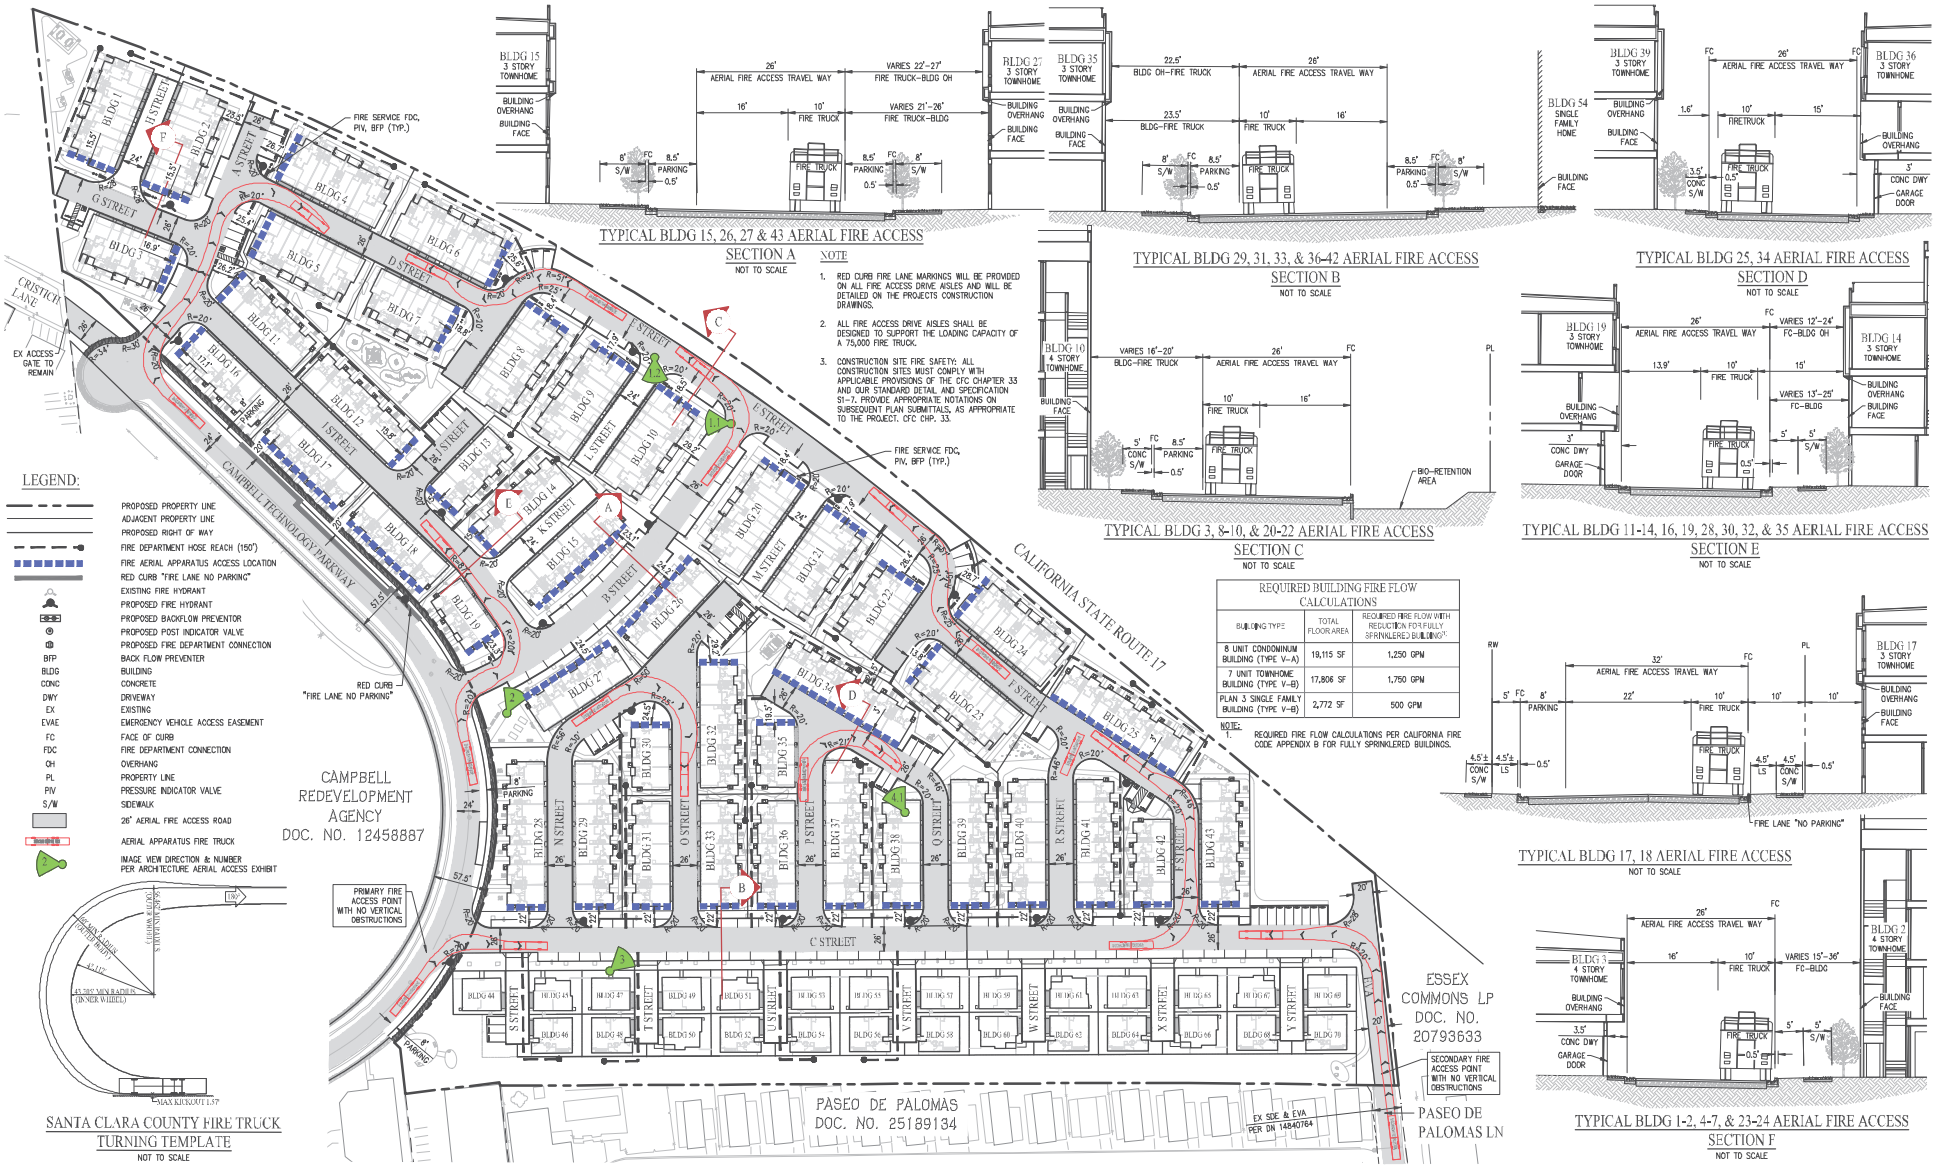

Figure 5
Emergency Vehicle Access Plan

HEXAGON

NORTH
Not to Scale

Scenario 4: *Background Plus Project Conditions.* Background plus project conditions were estimated by adding the additional traffic generated by the project to background traffic volumes. Background plus project conditions were evaluated relative to background conditions in order to determine potential traffic operational issues that could occur as a result of the project.

Scenario 5: *Cumulative Conditions.* Cumulative traffic conditions were estimated by applying a 1% per year growth rate to the existing counts for 5 years and adding the projected volumes from approved projects.

Scenario 6: *Cumulative Plus Project Conditions.* Cumulative plus project conditions were estimated by adding the additional traffic generated by the project to cumulative traffic volumes. Cumulative plus project conditions were evaluated relative to cumulative conditions in order to determine potential traffic operational issues that could occur as a result of the project.

Freeway Segment Capacity Evaluation

The City is required to conform to the requirements of the VTA that establishes a uniform program for evaluating the transportation impacts of land use decisions on the designated CMP Roadway System. The VTA's CMP has yet to adopt and implement guidelines and standards for the evaluation of the CMP roadway system using VMT. Therefore, the effects of the proposed project on freeway segments in the vicinity of the project area following the current methodologies as outlined in the *VTA TIA Guidelines* was completed. However, this analysis is presented for informational purposes only. The freeway capacity was evaluated for the SR 17 segment between Camden Avenue and Hamilton Avenue in the project area.

According to VTA's Guidelines, a freeway level of service analysis is required if the number of project trips added to any freeway segment equals or exceeds one percent of the capacity of the segment. The key freeway segments in the study area were evaluated to determine if the project traffic on each segment would exceed this threshold. SR 17 has three mixed flow lanes in each direction in the vicinity of the project site. The CMP specifies that a mixed-flow lane capacity of 2,300 vehicles per hour per lane (vphpl) be used for segments six lanes or wider in both directions and a capacity of 2,200 vphpl be used for segments with less than six lanes. Thus, the three lanes on SR 17 freeway segments near the project site have a capacity of 6,900 vph in each direction. Using the VTA's one-percent threshold, a freeway level of service analysis for SR 17 would be needed if the project would add 69 or more peak-hour trips to the freeway segments near the site. A review of the project trip assignment indicates that the greatest number of project trips in any direction on the subject freeway segment would be no more than 10 trips during the AM and PM peak hours (see Table 4).

Table 3
Freeway Segment Analysis

				Existing Conditions - Mixed Flow Lanes[1]						Project Conditions	
Freeway	Dir.	Segment	Peak Hour	Avg. Speed (mph)	# of Lanes	Capacity	Density (pc/mi/ln)	Volume	LOS	Project Trips	% Capacity
SR 17	NB	Camden Avenue On-Ramp to	AM	16	3	6,900	**73.0**	**3,528**	**F**	10	0.14%
		Hamilton Avenue Off-Ramp	PM	63	3	6,900	24.0	4,539	C	1	0.01%

Notes
Dir. = direction, NB = northbound, mph = miles per hour, pc/mi/ln = passenger cars per mile per lane

[1] Existing freeway conditions information is published in the Santa Clara Valley Transportation Authority (VTA) *2018 CMP Monitoring and Conformance*

BOLD indicates substandard level of service.

Study Freeway Ramps

The freeway ramp capacity at the SR 17 Northbound on-ramp and Camden Avenue interchange was evaluated.

Other Transportation Issues

The study includes an evaluation of intersection queuing and a review of site access and on-site circulation.

Intersection Operations Analysis Methodology

The intersection operations analysis is intended to be a performance measure that quantifies the operations of the study intersection and identifies potential adverse effects due to the addition of project traffic. The intersection operations analysis methodology, standards, and results are discussed below.

Level of Service Analysis Methodology and Standards

Traffic conditions at the study intersection were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays.

This study utilized the TRAFFIX software to analyze the level of service at the study intersection. This software evaluates intersection operations based on the *Highway Capacity Manual* (HCM) 2000 methodology. The HCM 2000 methodology estimates the average control delay per vehicle in seconds. *Control delay* is the amount of delay that is attributed to the particular traffic control device at the intersection, and includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For stop-controlled intersections, the delay is reported for the intersection movements that have stop signs. The average control delay can then be correlated to a level of service. Table 5 and Table 6 present the level of service definitions for unsignalized and signalized intersections, respectively.

Table 4
Unsignalized Intersection Level of Service Definitions Based on Average Control Delay

Level of Service	Level of Service	Average Delay Per Vehicle (Sec.)
A	Little or no traffic delay	10.0 or less
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Source: Transportation Research Board, *2000 Highway Capacity Manual* (Washington, D.C., 2000) p17-2.

Table 5
Signalized Intersection Level of Service Definition Based on Average Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 20.0
C	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though may still pass through the intersection without stopping.	20.1 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lenghts, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *2000 Highway Capacity Manual* (Washington, D.C., 2000) p10-16.

CMP Signalized Intersections

The study intersection of Camden Avenue and Curtner Avenue/White Oaks Road is a CMP intersection and was analyzed using the CMP standard of LOS E.

Adverse Intersection Operations Effects

For CMP intersections, an adverse effect on signalized intersection operations would occur if for either peak hour:

1. The level of service at the intersection degrades from an acceptable level (LOS E or better) under background conditions to an unacceptable LOS F under background plus project conditions, or
2. The level of service at the intersection is an unacceptable level (LOS F) under background conditions and the addition of project trips cause both the critical-movement delay at the intersection to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

The exception to the thresholds listed as #2 above is when the addition of project traffic reduces the amount of average control delay for critical movements, i.e., the change in average control delay for critical movements is negative. In this case, the threshold is when the project increases the critical v/c value by 0.01 or more.

Freeway Ramp Analysis Methodology

A freeway ramp analysis was performed in order to verify that the freeway ramp would have sufficient capacity to serve the expected traffic volumes with and without the project. This analysis consisted of a volume-to-capacity ratio evaluation of the freeway ramp at the selected interchange. The ramp capacities were obtained from the *Highway Capacity Manual 2000*, and consider the free-flow speed, the number of lanes on the ramp, and the ramp metering.

Definition of Significant Freeway Ramp Impacts

A freeway ramp analysis was performed in order to verify that the freeway ramps would have sufficient capacity to serve the expected traffic volumes with and without the project. For the purpose of this study, the project is said to create a significant adverse impact on a freeway ramp if its implementation:

1. Causes the volume-to-capacity (v/c) ratio of the freeway ramp to exceed 1.0; or
2. Increases the amount of traffic on a freeway ramp that is already exceeding its capacity by more than one percent (1%) of the ramp's capacity.

Existing Roadway Network

Local access to the project site is provided via Campbell Technology Parkway and East McGlincy Lane.

East McGlincy Lane is a two-lane east-west arterial street between Union in the east and Cristich Lane in the west. The posted speed limit is 25 mph. Sidewalks exist along both sides of the street east of Campbell Technology Parkway. West of Campbell Technology Parkway, no sidewalks are available along either side of East McGlincy Lane except for a short segment (approximately 100 feet) along the north side just west of Campbell Technology Parkway. On-street parking is allowed along both sides of the street. East McGlincy Lane provides access to the project site via Campbell Technology Parkway.

Campbell Technology Parkway is a two-lane local street that extends north from East McGlincy Lane for about 800 feet and then curves to become an east–west street and ends with a cul-de-sac. Sidewalks are present along both sides of the street except for a small segment along the east side of the street (about 350 feet) north of East McGlincy Lane. On street parking is permitted along the nearby park side of the street. On street parking is prohibited along the east side of the street. Close to the intersection at East McGlincy Lane, on-street parking is prohibited along both sides of the street. Campbell Technology Parkway serves as the southern boundary for the Project site and provides direct access to the site vis three full-access driveways at the end of the cul-de-sac.

Project Trip Generation, Distribution, and Assignment

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment.

Trip Generation

Through empirical research, data have been collected that show trip generation rates for many types of land uses. The data are published in the Institute of Transportation Engineers' (ITE) Trip Generation online database. The magnitude of traffic added to the roadway system by a

development is estimated by multiplying the applicable trip generation rates by the size of the development. The trip generation rates published for "Single-Family Detached Housing" (Land Use Code 210) were applied to the 27 single-family homes and "Single-Family Attached Housing" (Land Use Code 215) were applied to the 263 townhomes.

Traffic from the existing R&D buildings on the site would be removed with the site redevelopment. Driveway counts were collected on January 9, 2024, to determine the trip generation of the existing R&D buildings.

After applying the applicable trip rates and trip credits for the existing buildings on site, it is estimated that the project would generate a net increase of 1,368 daily vehicle trips, including 39 net new vehicles trips during the AM peak hour and 103 net new vehicle trips during the PM peak hour (see Table 7).

Table 6
Trip Generation Summary – Vehicle Trips

			Vehicle Trips						
			Daily	AM Peak-Hour Trips			PM Peak-Hour Trips		
Land Use	Size	Units	Trips	In	Out	Total	In	Out	Total
Proposed									
Single-Family Detached Housing [1]	27	du	303	6	17	23	18	11	29
Townhomes [2]	263	du	1,954	33	98	131	91	63	154
Subtotal Project Trips			*2,257*	*39*	*115*	*154*	*109*	*74*	*183*
Existing									
R&D [3]	280	s.f.	889	98	17	115	8	72	80
Net New Vehicle Trips			**1,368**	**(59)**	**98**	**39**	**101**	**2**	**103**

Notes:
du = dwelling units
s.f. = square feet

[1] Single-family housing vehicle trip generation is based on the fitted curve equations published in the ITE Trip Generation online database for Single-Family Detached Housing (Land Use Code 210).

[2] Townhome vehicle trip generation is based on the fitted curve equations published in the ITE Trip Generation online database for Single-Family Attached Housing (Land Use Code 215).

[3] Existing research and development trip generation is based on driveway counts collected on January 9, 2024.

Trip Distribution and Assignment

The trip distribution pattern for the project was estimated based on the traffic counts at the study intersections (see Figure 6). The peak-hour trips generated by the project were assigned to the roadway network in accordance with the trip distribution pattern (see Figure 7).

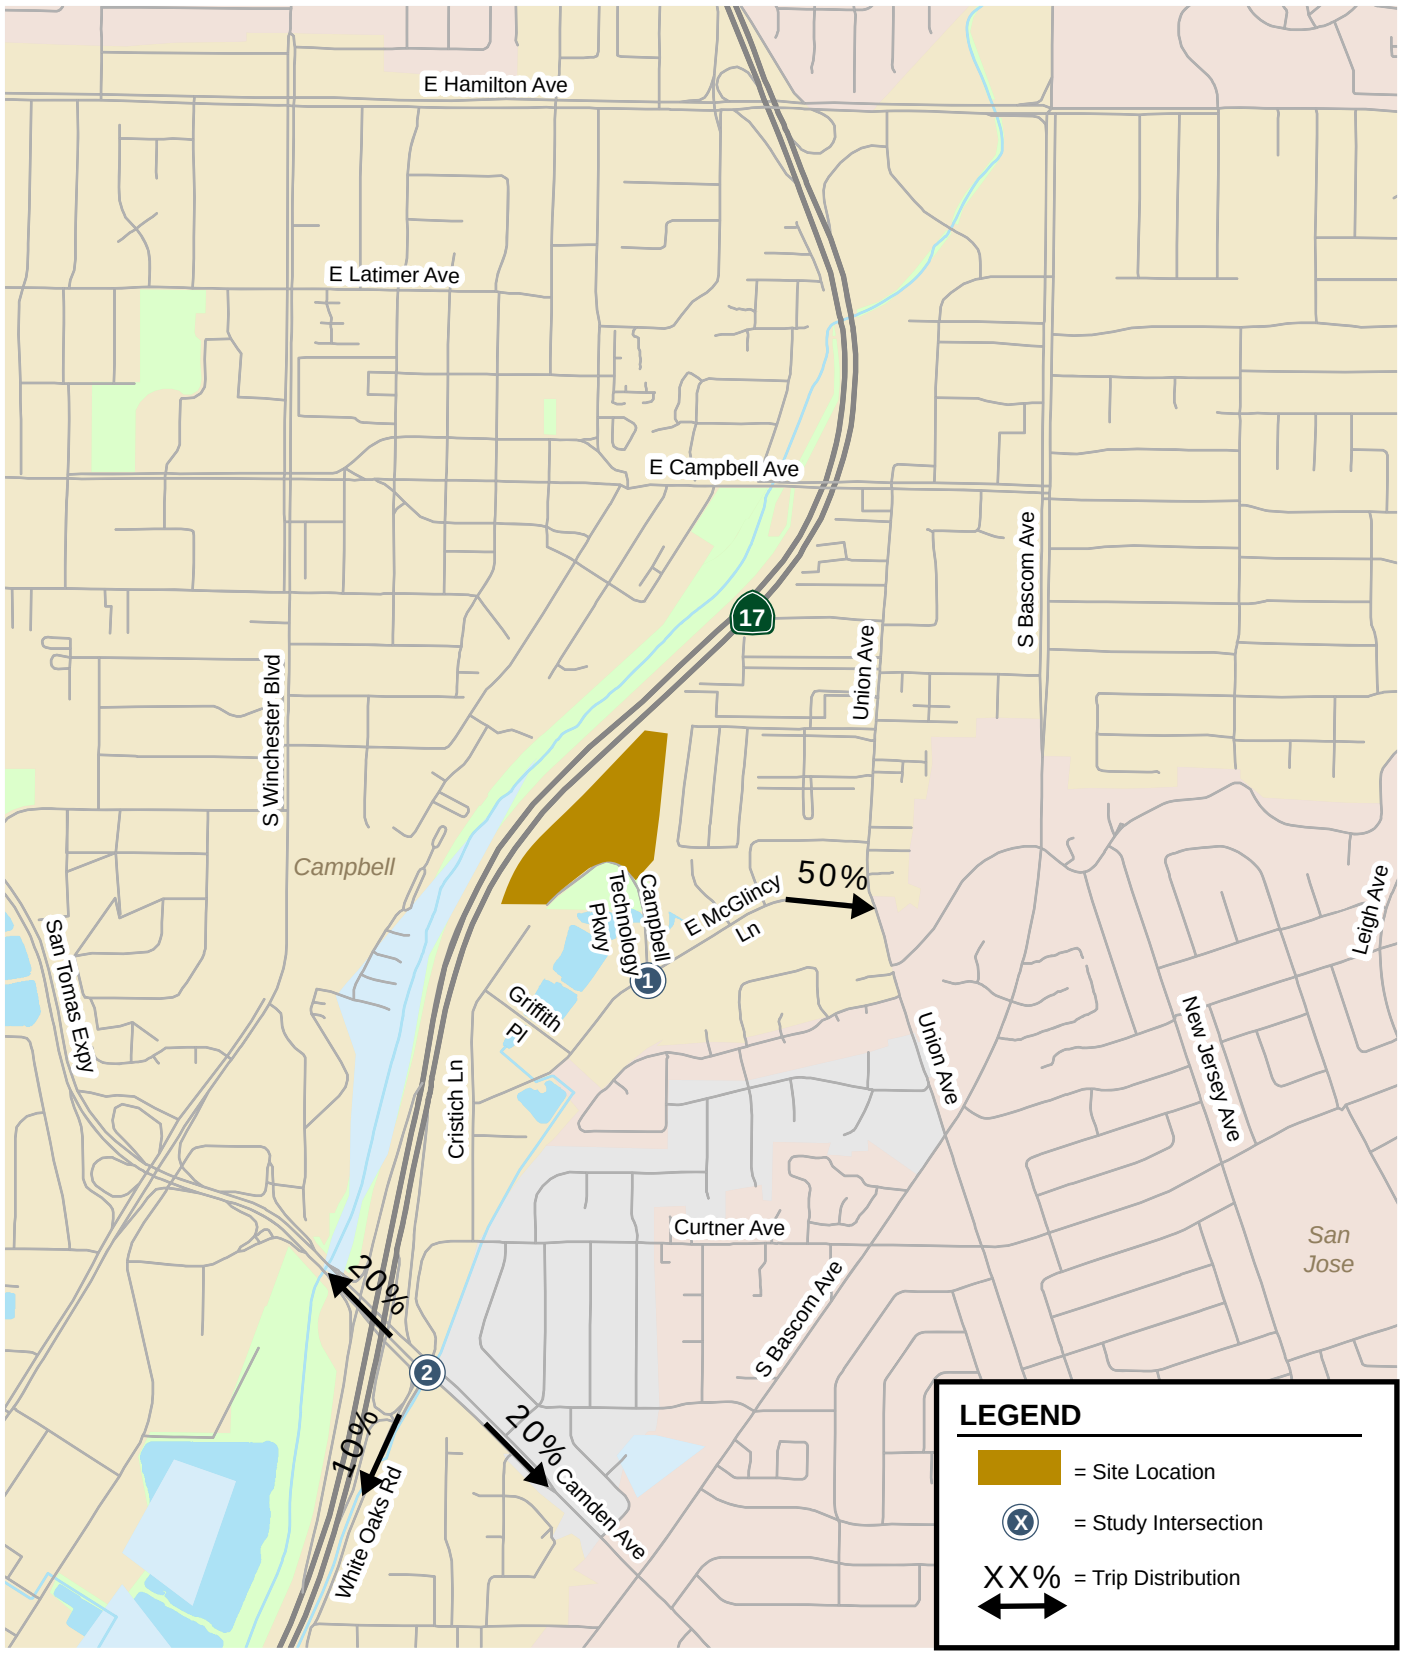

Figure 6
Project Trip Distribution

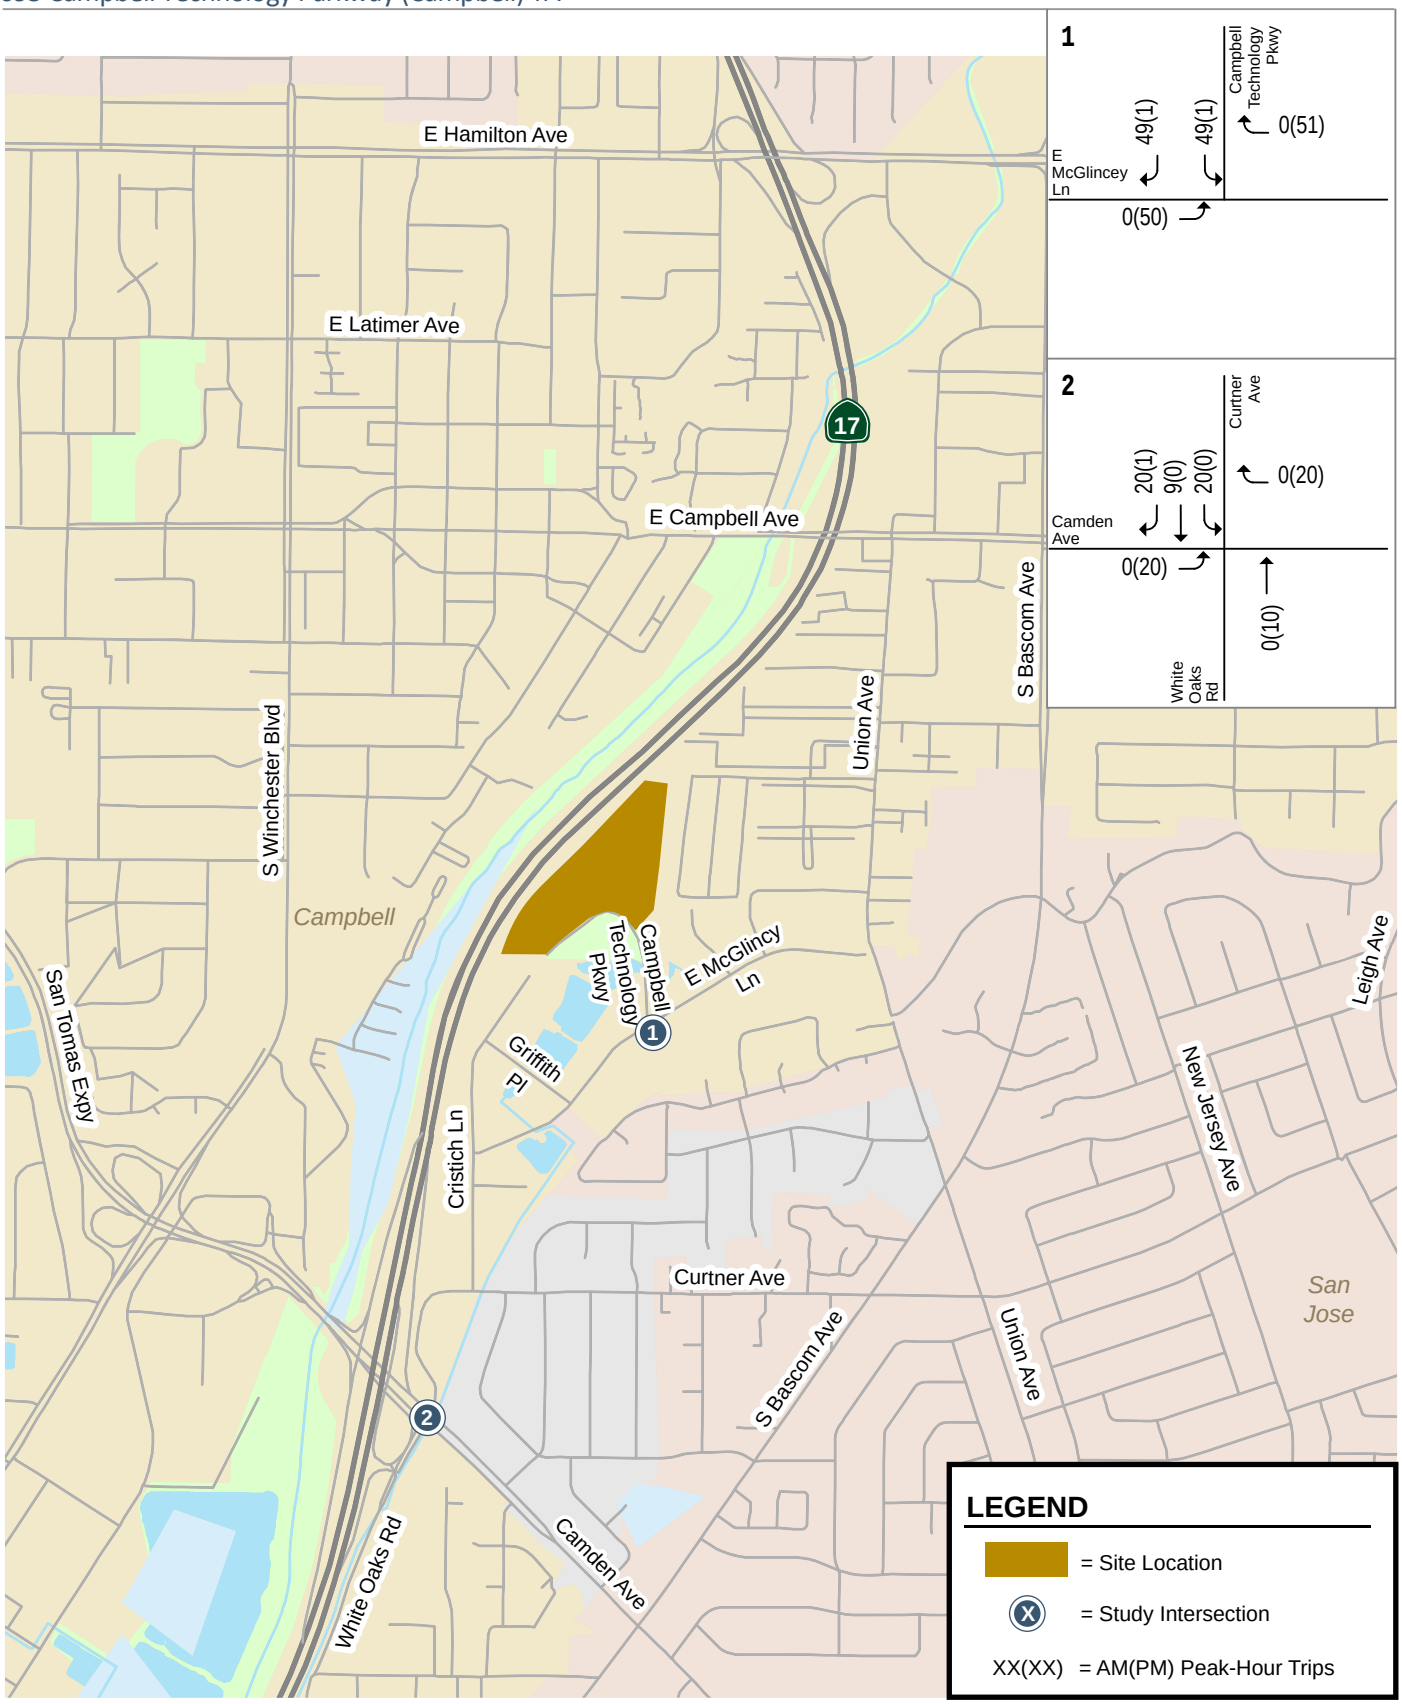

Figure 7
Project Trip Assignment

Intersection Level of Service Analysis

The level of service analysis for each scenario is presented below. At the Campbell Technology Parkway/McGlincy Lane intersection, Campbell Technology Parkway has a stop sign, and McGlincy Lane is uncontrolled. The level of service calculations for each scenario are provided in Attachment 3.

Existing Conditions

The existing conditions peak-hour traffic volumes at the study intersections are shown in Figure 8. In addition to the peak hour traffic volumes, 24-hour traffic counts were conducted on Campbell Technology Parkway and McGlincy Lane (see Attachment 2). The results of the existing conditions level of service analysis show that with the existing traffic volumes each study intersection operates at an acceptable level of service during the AM and PM peak hours (see Table 8).

Existing Plus Project Conditions

The existing plus project peak-hour traffic volumes at the study intersections are shown in Figure 9. The results of the level of service analysis under existing plus project conditions are summarized in Table 8. The results show that each study intersection would continue to operate at an acceptable level of service during the AM and PM peak hours with the addition of project traffic.

Table 7
Existing and Existing Plus Project Level of Service Summary

#	Intersection	Peak Hour	Existing Conditions		Existing + Project Conditions	
			Avg. Delay (sec/veh) [1]	LOS	Avg. Delay (sec/veh) [1]	LOS
1	Campbell Technology Parkway & East McGlincy Lane	AM	10.1	B	10.2	B
		PM	9.8	A	10.5	B
2	Curtner Avenue/White Oaks Road & Camden Avenue	AM	53.3	D	54.5	D
		PM	44.1	D	44.3	D

Notes:

[1] For signalized intersections, level of service (LOS) is based on the intersection average delay. For the side-street stop controlled intersections, LOS is based on the approach delay for the worst stop controlled movement.

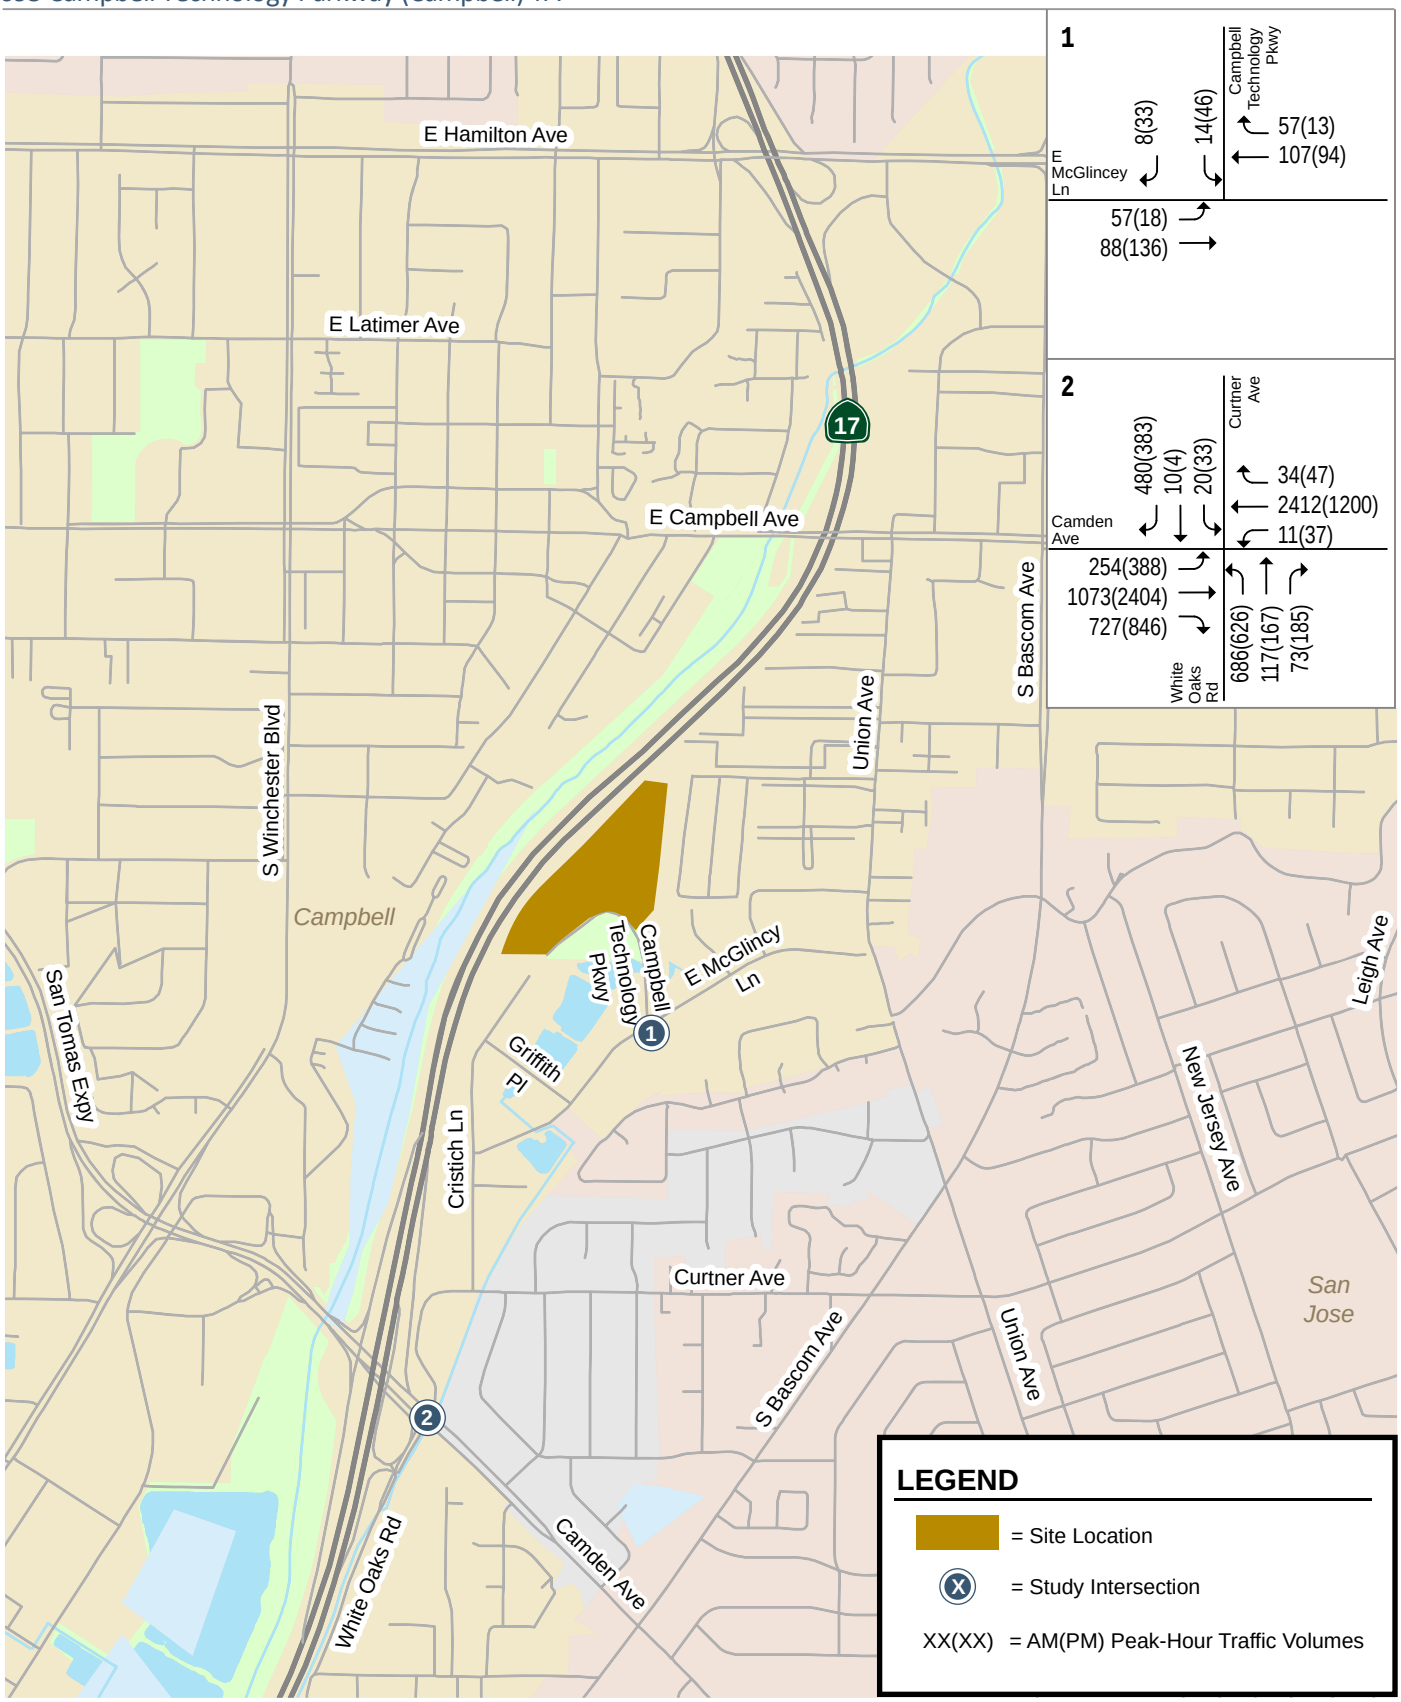

Figure 8
Existing Traffic Volumes

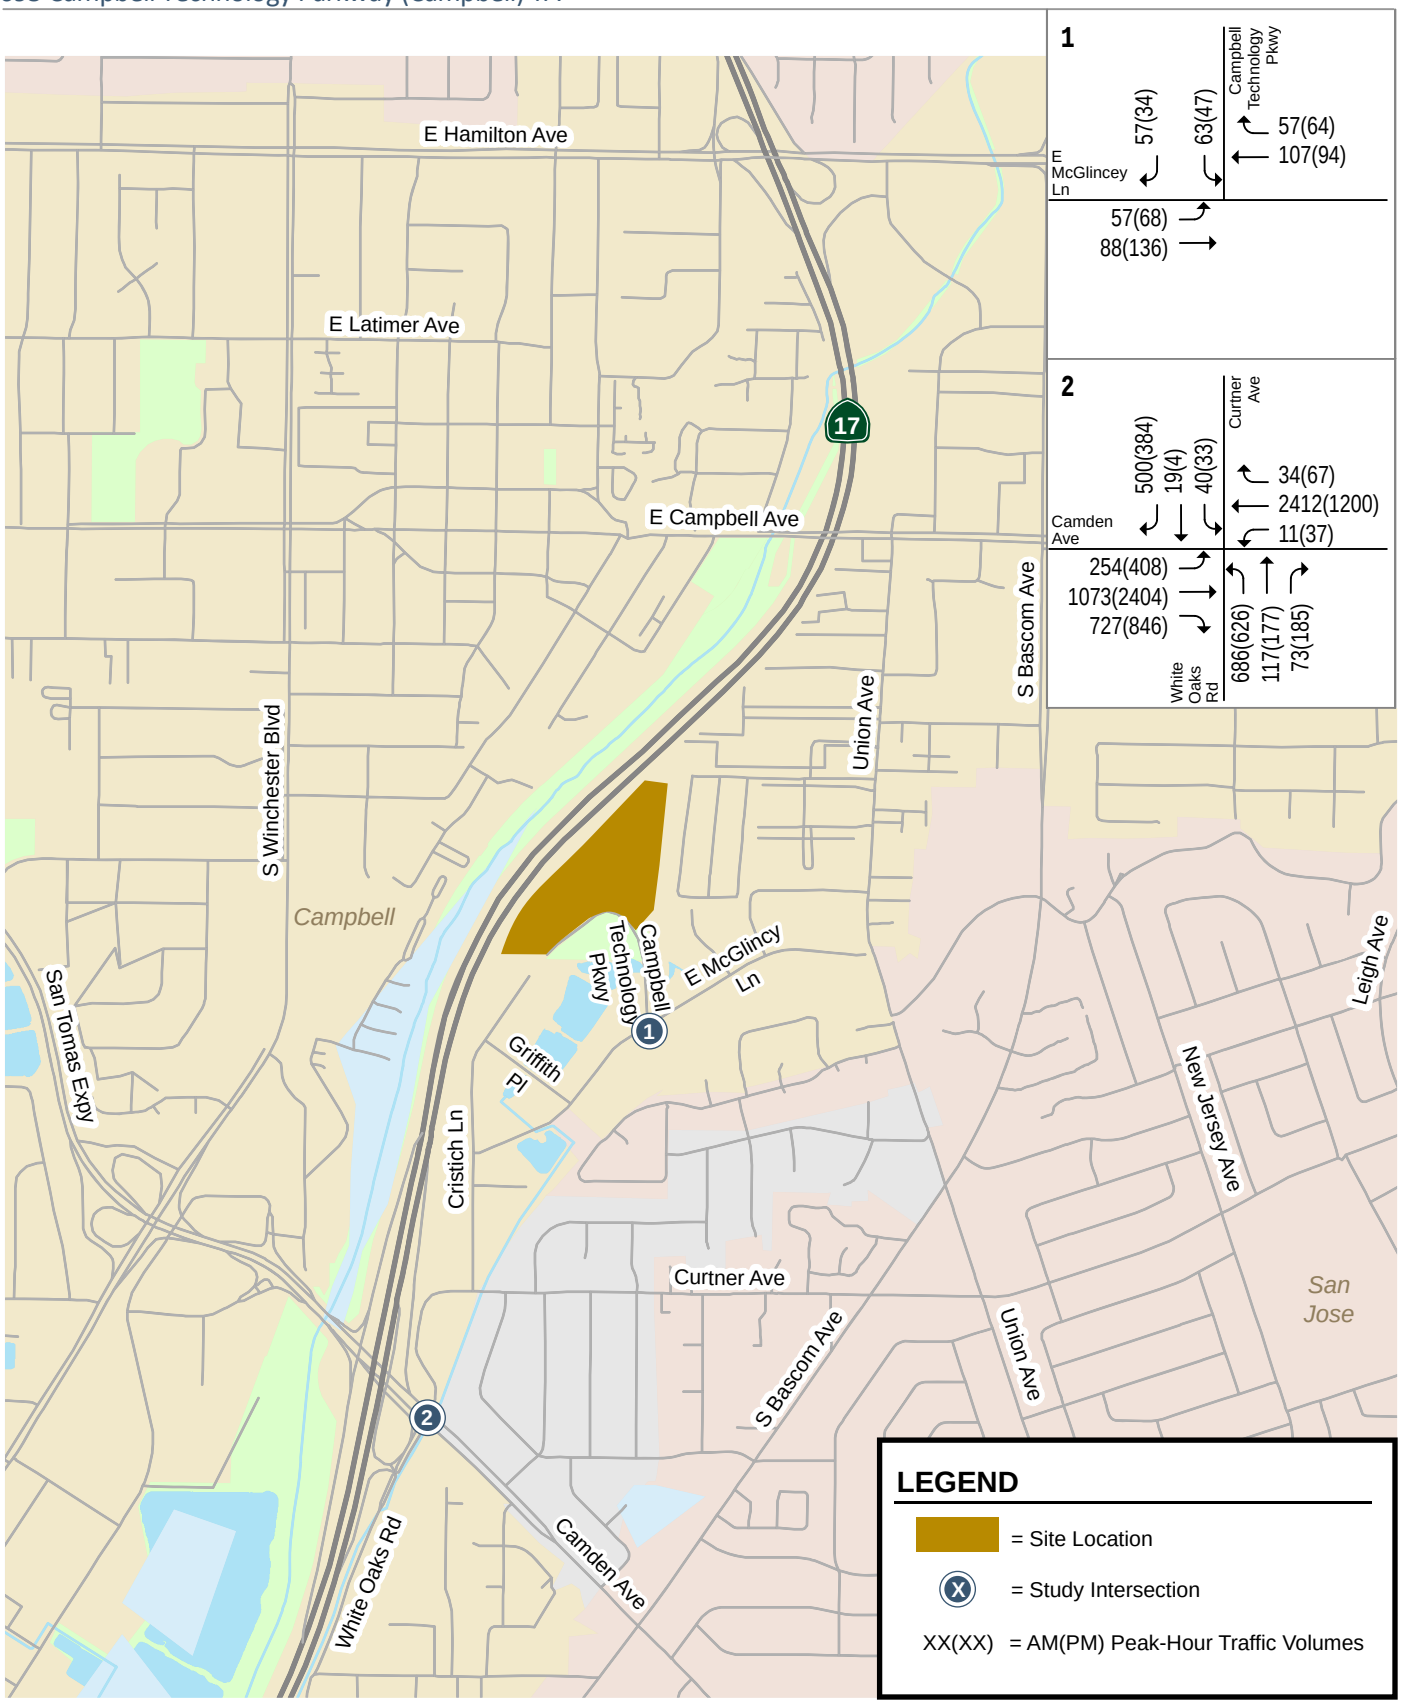

Figure 9
Existing Plus Project Traffic Volumes

Background Conditions

Background peak-hour traffic volumes are estimated by adding to existing traffic volumes the volumes from approved but not yet completed developments in the study area. The added traffic from approved but not yet completed developments was provided by the City of San Jose in the form of the Approved Trips Inventory (ATI). Trips from the approved 1700 Dell Avenue project were provided by the City of Campbell.

The background conditions peak-hour traffic volumes are shown on Figure 10. The peak-hour traffic volumes for each background project at each study intersection are provided in Attachment 4. The results of the background conditions level of service analysis show that during the AM and PM peak hours each study intersection would operate at an acceptable level of service (see Table 9).

Background Plus Project Conditions

The background plus project conditions peak-hour traffic volumes at the study intersections are shown on Figure 11. The results of the level of service analysis under background plus project conditions are summarized in Table 9. The results show that each study intersection would operate at an acceptable level of service during the AM and PM peak hours.

Table 8
Background and Background Plus Project Level of Service Summary

#	Intersection	Peak Hour	Background Conditions		Background + Project Conditions			
			Avg. Delay (sec/veh) [1]	LOS	Avg. Delay (sec/veh) [1]	LOS	Incr. In Crit. Delay (sec/veh)	Incr. In Crit. V/C
1	Campbell Technology Parkway & East McGlincy Lane	AM	10.1	B	10.2	B	-	-
		PM	9.8	A	10.5	B	-	-
2	Curtner Avenue/White Oaks Road & Camden Avenue	AM	53.3	D	54.5	D	1.70	0.01
		PM	44.2	D	44.5	D	0.00	0.00

Notes:

[1] For signalized intersections, level of service (LOS) is based on the intersection average delay. For the side-street stop controlled intersections, LOS is based on the approach delay for the worst stop controlled movement.

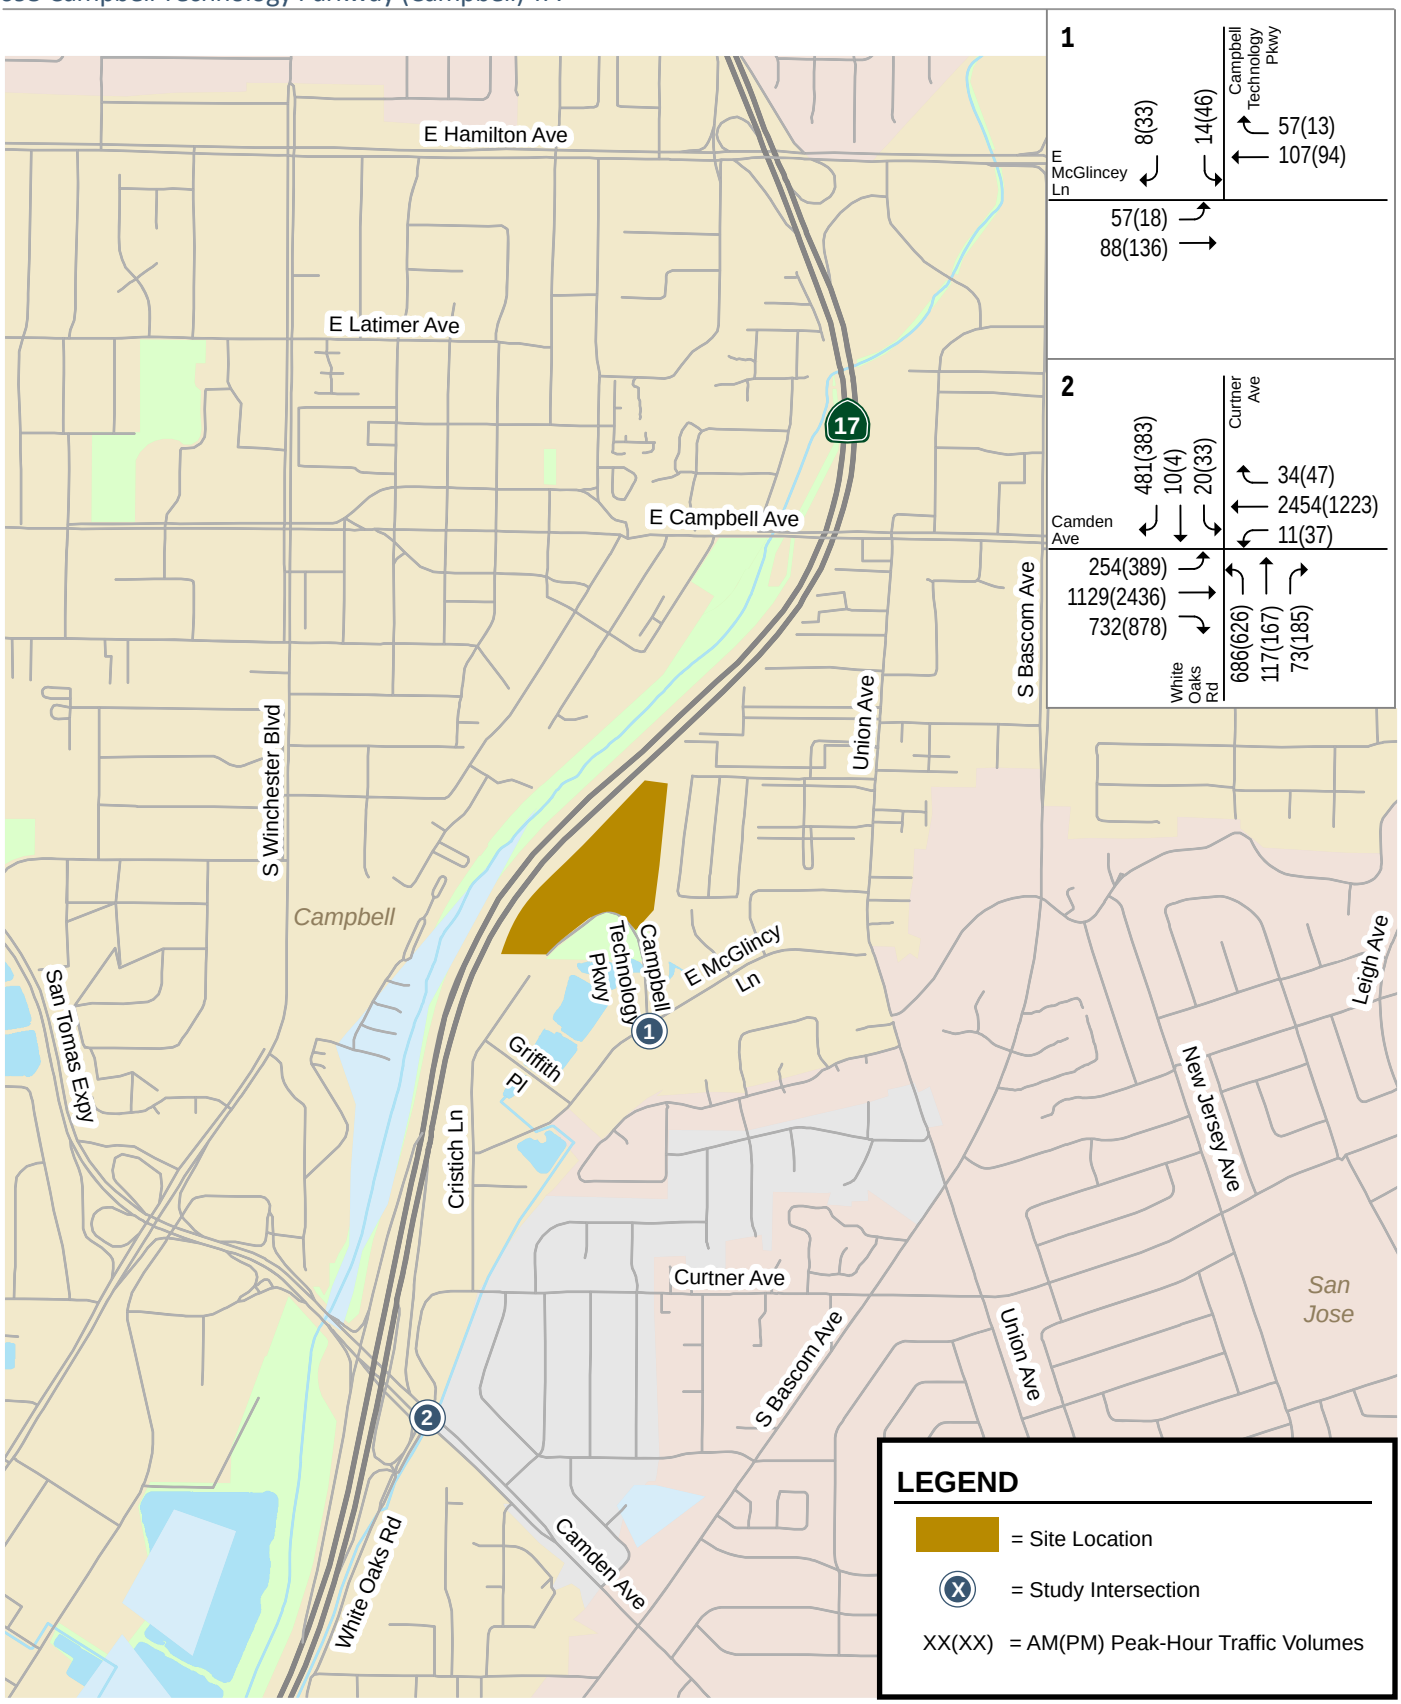

Figure 10
Background Traffic Volumes

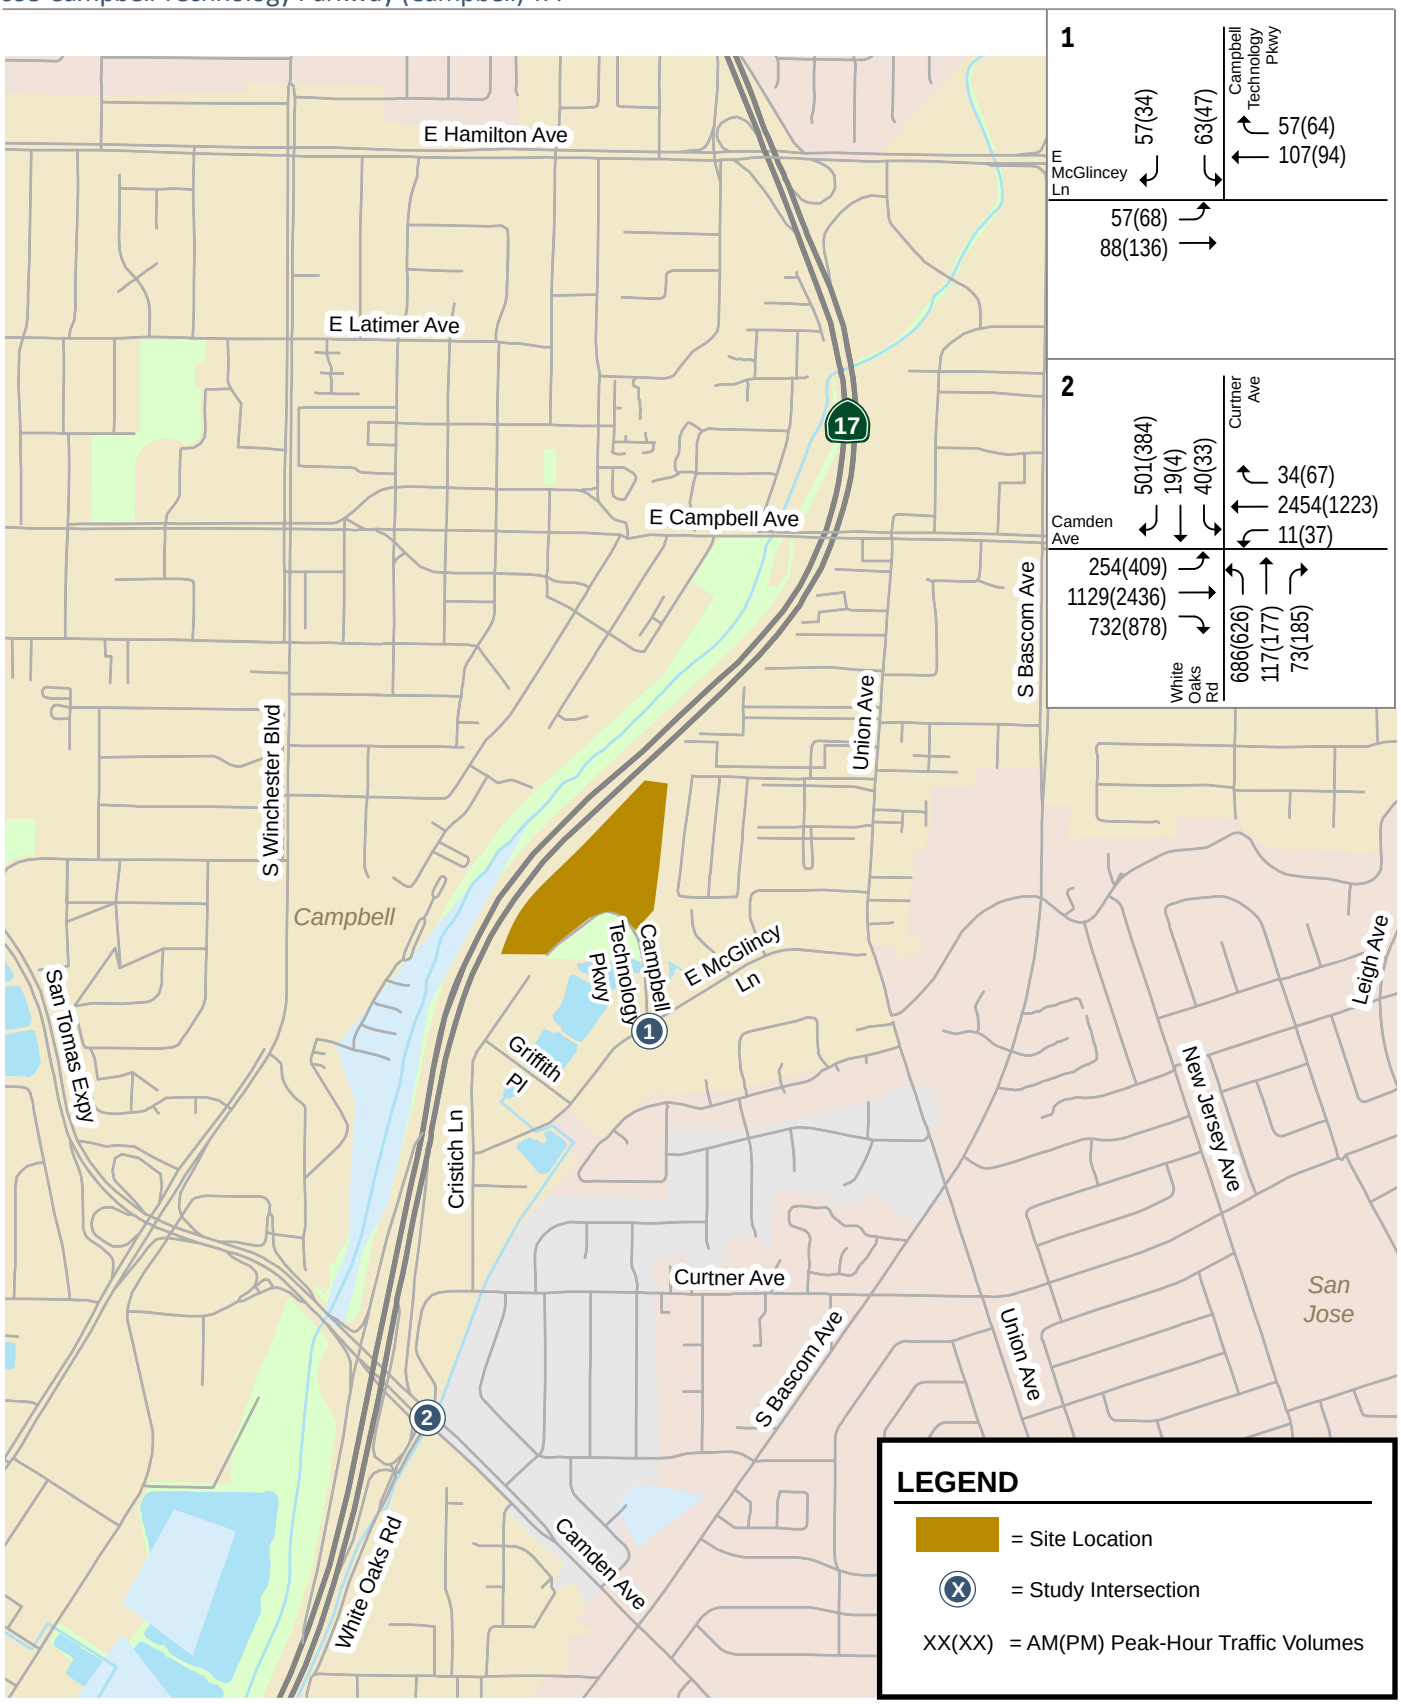

Figure 11
Background Plus Project Traffic Volumes

NORTH
Not to Scale

Cumulative Conditions

Cumulative peak-hour traffic volumes are estimated by applying a 1% growth rate for five years to the existing counts and adding the approved projects. For 10 years before COVID, the typical traffic volume growth in the Bay Area was found to average 1% per year. It is expected this growth rate will continue, and the project will be built within five years.

The cumulative conditions peak-hour traffic volumes are shown on Figure 12. The peak-hour traffic volumes for each cumulative project at each study intersection are provided in Attachment 4. The results of the level of service analysis under cumulative plus project conditions are summarized in Table 10. The results show that the intersection of Campbell Technology Parkway and East McGlincy Lane would operate at an acceptable level of service during the AM and PM peak hours. The results show that the intersection of Curtner Avenue/White Oaks Road and Camden Avenue also would operate at acceptable levels of service during the peak hours.

Cumulative Plus Project Conditions

The cumulative plus project conditions peak-hour traffic volumes at the study intersections are shown on Figure 13. The results of the level of service analysis under cumulative plus project conditions are summarized in Table 10. The results show that the study intersections would continue to operate at an acceptable level of service during the AM and PM peak hours.

Table 9
Cumulative and Cumulative Plus Project Level of Service Summary

#	Intersection	Peak Hour	Cumulative Conditions		Cumulative + Project Conditions			
			Avg. Delay (sec/veh) [1]	LOS	Avg. Delay (sec/veh) [1]	LOS	Incr. In Crit. Delay (sec/veh)	Incr. In Crit. V/C
1	Campbell Technology Parkway	AM	10.2	B	10.4	B	-	-
	& East McGlincy Lane	PM	9.8	A	10.6	B	-	-
2	Curtner Avenue/White Oaks	AM	55.8	E	57.2	E	2.30	0.01
	Road & Camden Avenue	PM	46.2	D	46.4	D	0.00	0.00

Notes:

[1] For signalized intersections, level of service (LOS) is based on the intersection average delay. For the side-street stop controlled intersections, LOS is based on the approach delay for the worst stop controlled movement.

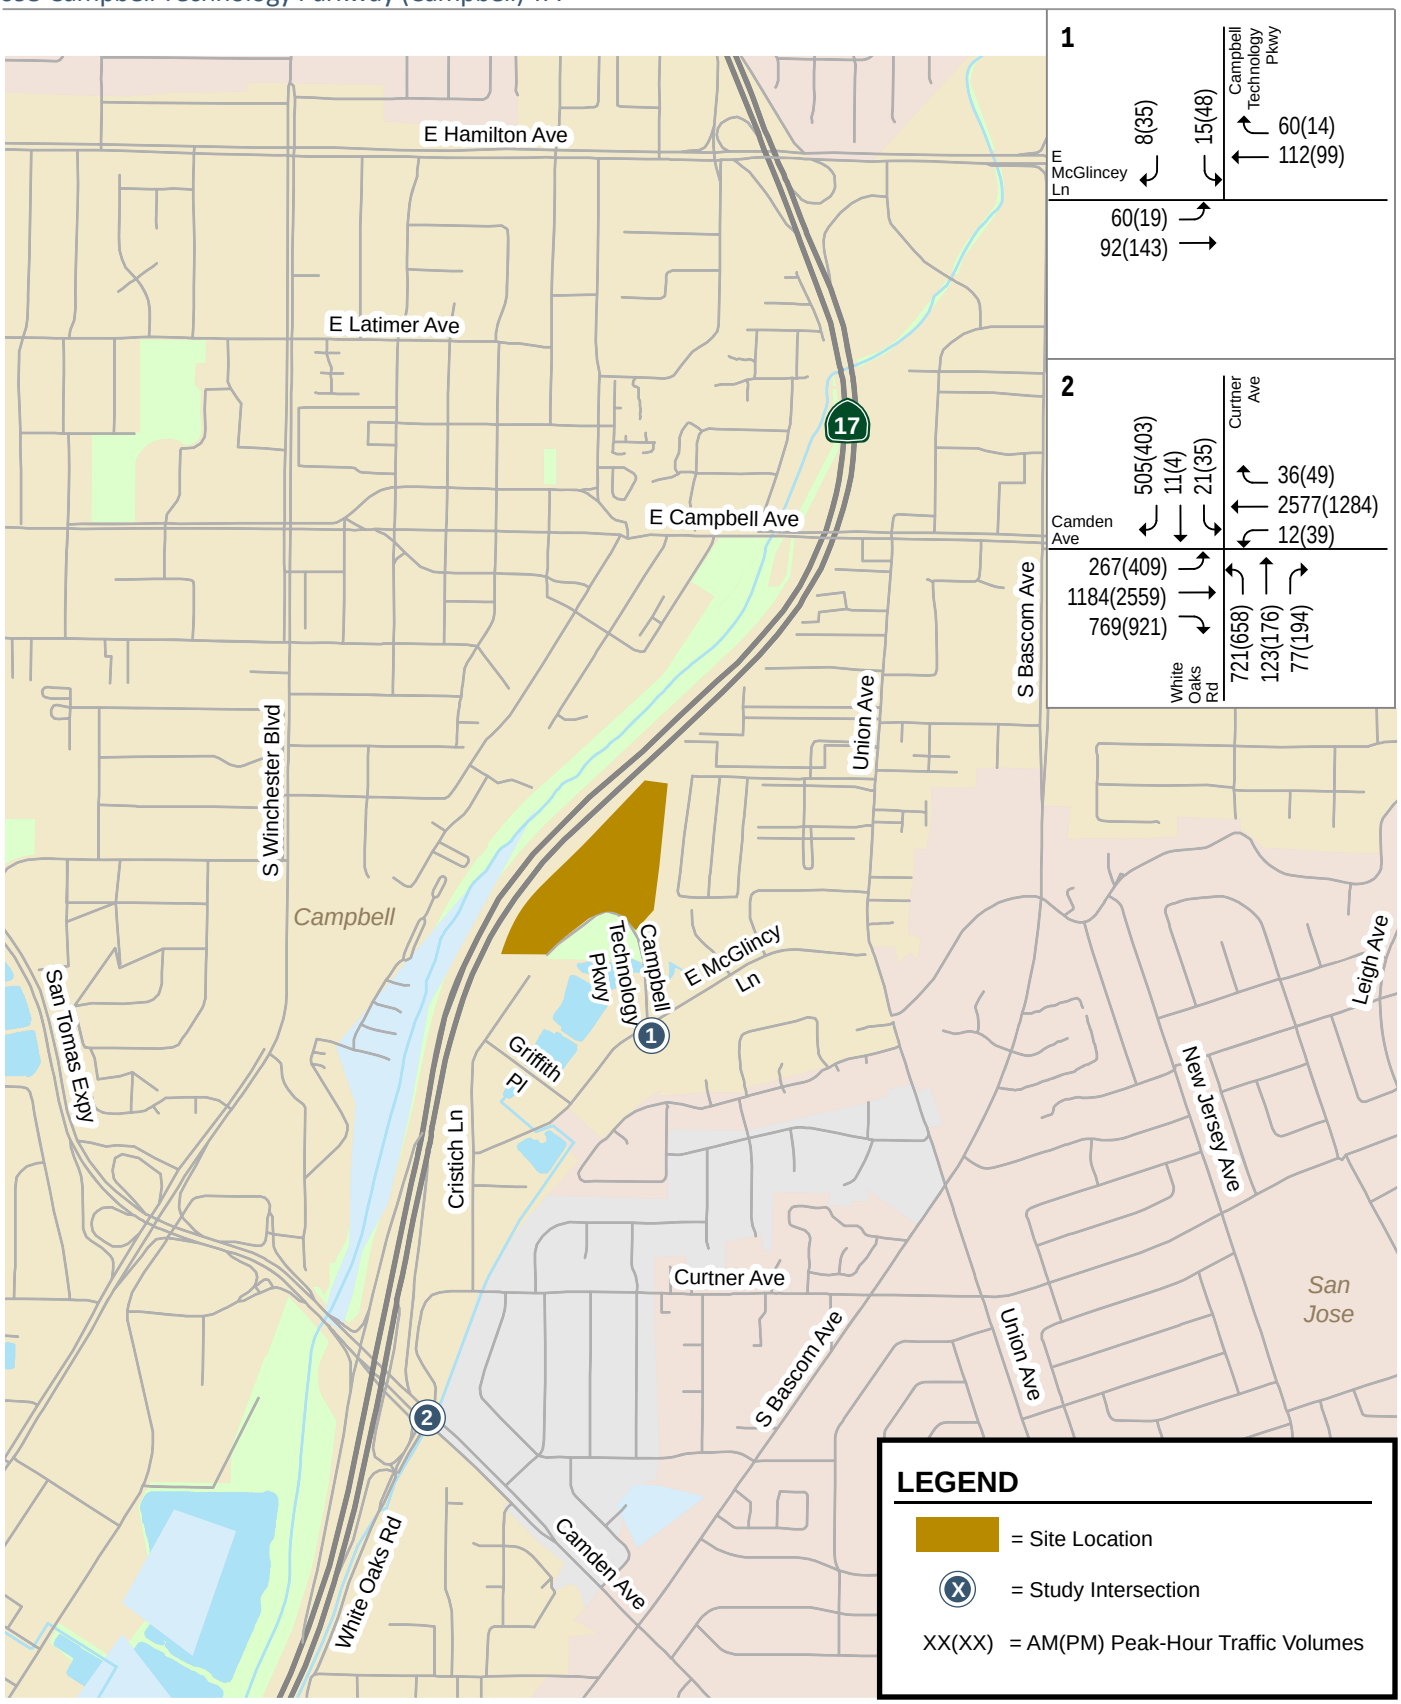

Figure 12
Cumulative Traffic Volumes

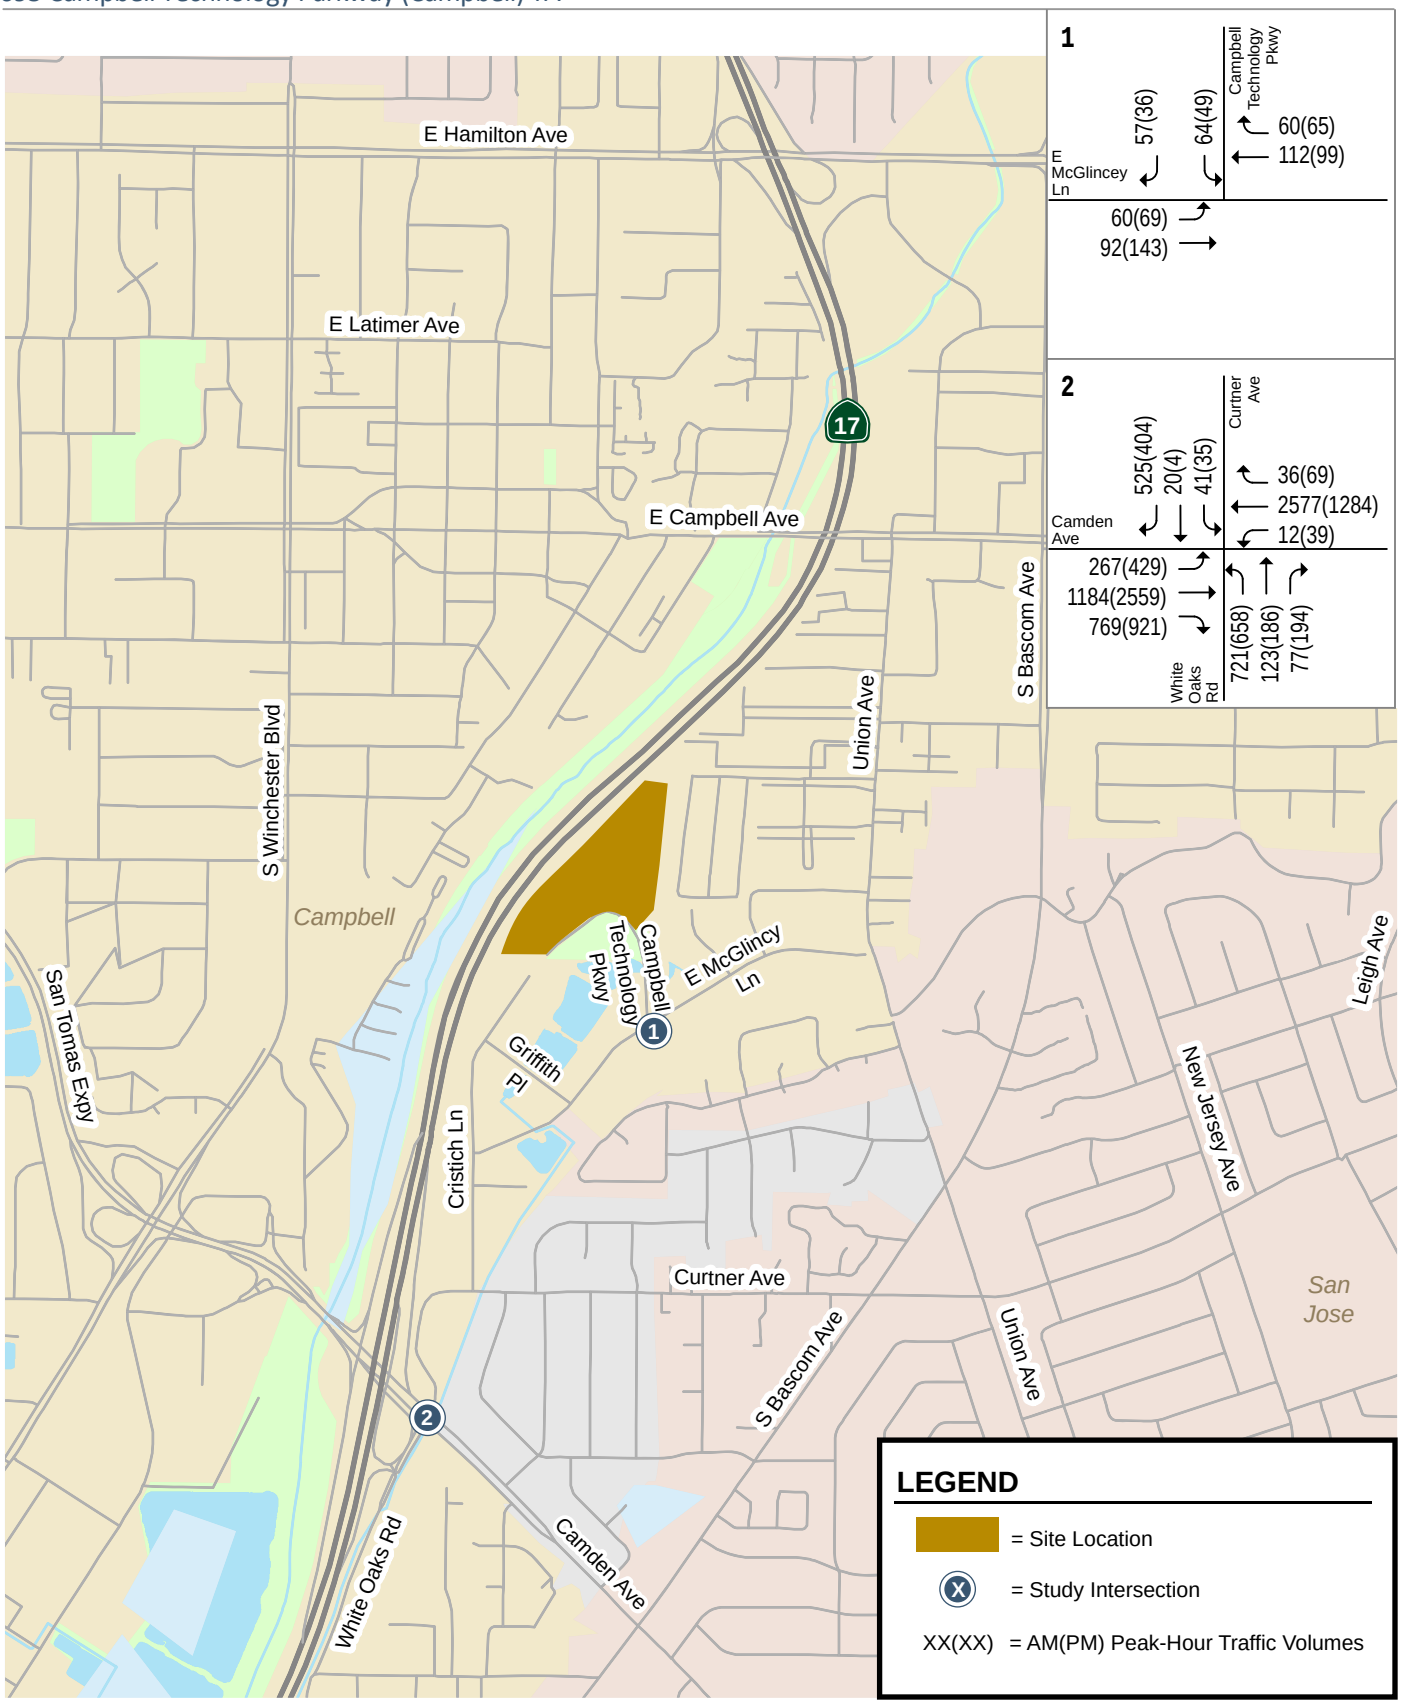

Figure 13
Cumulative Plus Project Traffic Volumes

Traffic Signal Warrant Analysis

Traffic conditions at the unsignalized intersection of Campbell Technology Parkway and McGlincy Lane were assessed to determine whether a traffic signal would be warranted based on the peak-hour volume signal warrant (Warrant #3) described in the 2014 California Manual on Uniform Traffic Control Devices (CA MUTCD). This method provides an indication of whether traffic conditions and peak-hour traffic levels are, or would be, sufficient to justify installation of a traffic signal. Note that this is just one tool used to evaluate whether installation of a traffic signal would be justified. The analysis showed that the AM and PM peak-hour traffic volumes at the intersection do not satisfy the signal warrant under any of the scenarios. The peak-hour signal warrant calculations are provided in Attachment 5.

Intersection Queuing Analysis

An evaluation of vehicle queuing was conducted using the Traffix software. The basis of the analysis is as follows: (1) the Traffix software is used to estimate the 95th percentile maximum number of queued vehicles; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the available storage capacity.

The southbound and eastbound left turn movements at the Curtner Avenue/White Oaks Road and Camden Avenue intersection were analyzed. The results of the analysis are shown in Table 11. The 95th percentile queue length was compared to the length of storage for the right and thru/left turn lanes in the southbound direction and the left turn lane for the eastbound direction. The analysis shows that during both peak hours, the queue length exceeds the available storage for both movements. It will not be possible to extend the storage lanes, However, the City of Campbell has plans to restripe the intersection of Camden Avenue and Curtner Avenue/White Oaks Road. The restriping project would improve operations and reduce queue lengths for the eastbound left and southbound right turn lanes, as shown in Table 11. The project should contribute to the cost of the restripe.

Difference w/o Restriping	-1	-1	0	0	-3	-1
Storage (ft./ln)	245	245	170	170	170	170
Adequate (Y/N)	N	N	Y	Y	N	N

Notes:

EBL = eastbound left; SBT-L = southbound thru and left turn; SBR = southbound right turn

[1] Vehicle queues are from Traffix outputs and are rounded up to the next whole number. Assumes 1 vehicle equals 25 feet of queue.

Freeway Ramp Capacity Analysis

This analysis consists of a volume-to-capacity ratio evaluation of the freeway on-ramp at the interchange of SR 17 and Camden Avenue. The ramp capacity was obtained from the *Highway Capacity Manual 2000*, which considers the free-flow speed, the number of lanes on the study ramp, and ramp metering.

Hexagon conducted field observations at the study freeway ramp in March 2024. The field observations showed that the SR 17 northbound on-ramp from Camden Avenue has a ramp meter installed, but the meter was not operating during the AM and PM peak hours.

It is assumed that the ramp would have a capacity of 900 vehicles per hour per lane for the mixed-flow lanes. A capacity of 900 vehicles per hour is assumed for the HOV lane. The peak-hour freeway ramp volumes were obtained through PEMS data from Caltrans. As shown on Table 12, the freeway on-ramp currently have sufficient capacity to serve the existing traffic volumes, with volume-to-capacity ratios that are well below 1.0, which means that the existing traffic demand is lower than the ramp capacity during the AM and PM peak hours.

Table 11
Existing Freeway Ramp Capacity Summary

Interchange	Ramp	Type	Peak Hour	Lanes			Existing Conditions		
				Mixed-Flow	HOV	Meter[1]	Capacity[2] (vphpl)	Peak Volume[3]	v/c
SR 17/Camden Avenue	NB On-Ramp from Camden Avenue	Diagonal	AM	2	1	Equipment	1,800	811	0.45
			PM			Present	1,800	535	0.30

Notes:
NB=northbound, v/c = volume-to-capacity ratio

[1] As a conservative approach, if an on-ramp has meter equipment present, the ramp is analyzed assuming it is metered.
[2] Ramp capacities were obtained from the Highway Capacity Manual, 2000 (pg 25-4), and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
[3] Peak-hour volumes are obtained through maximum AADT from PEMS data from Caltrans.

Freeway ramp volumes under project conditions were estimated by adding project trips to the existing volumes obtained from Caltrans. The peak hour ramp volumes under existing plus project conditions are shown in Table 13.

The ramp analysis shows that the selected ramp would continue to have sufficient capacity to serve the projected traffic volumes under project conditions.

Table 12
Project Conditions Freeway Ramp Analysis

Interchange	Ramp	Type	Peak Hour	Existing Conditions			Project Conditions		
				Capacity[1]	Peak Volume[2]	v/c	Project Trips	Peak Volume	v/c
SR 17/Camden Avenue	NB On-Ramp from Camden Avenue	Diagonal	AM	1,800	811	0.45	10	821	0.46
			PM	1,800	535	0.30	1	536	0.30

Notes:
NB=northbound, v/c = volume-to-capacity ratio

[1] Ramp capacities were obtained from the Highway Capacity Manual, 2000 (pg 25-4), and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
[2] Peak-hour volumes are obtained from PEMS from Caltrans.

Collision Data Review and Analysis

Collision data from the Statewide Integrated Traffic Records System (SWITRS) were reviewed along East McGlincy Lane and Campbell Technology Parkway, which provide primary site access.

The result indicates that there was only one collision on East McGlincy Lane over a six-year span between January 1, 2019, and December 31, 2024 (see Table 14). The reported collision on East McGlincy Lane was located about 50 feet east of Campbell Technology Parkway and was due to improper turning. One of the vehicles was a motorcycle, and alcohol was involved.

Given only one collision in six years, it appears that these streets do not have a collision problem. The proposed project would add trips to the roadways but would not alter their design. Therefore, the project is not expected to cause an increase in the collision rate.

Vehicle Classification and Speed Counts

Campbell Technology Parkway east of McGlincy Lane and McGlincy Lane west of Cambell Technology Parkway were counted for vehicle classification, speed, and volume for a 24-hour period. Table 14 summarizes the vehicle classification for each direction and Table 15 summarizes the 85th percentile speed on each segment. The number of trucks on either roadway is modest (approximately 5 to 6 percent of all vehicles). In addition, the speeds along Campbell Technology Parkway are low, and the speed along McGlincy Lane is modest.

Table 13
Vehicle Classification

Vehicle Classification	Campbell Technology Parkway		McGlincy Lane	
	Northbound	Southbound	Eastbound	Westbound
Motorcycles	2	5	21	18.00
Passenger Vehicle	458	453	1222	1257

Table 14
Vehicle Speeds

Street	Posted Speed Limit (mph)	85th Percentile Speed (mph) Northbound/ Eastbound	85th Percentile Speed (mph) Southbound/ Westbound
Campbell Technology Parkway	-- [1]	28	28
McGlincy Lane	25	34	33

Source: 24-hour counts conducted on April 15, 2025.
Notes:
1. Campbell Technology Parkway does not have a posted speed limit.

Site Access and Circulation

The site access and on-site circulation evaluation is based on the site plan dated September 25, 2023 (see Figure 2). Site access was evaluated to determine the adequacy of the site's driveways with regard to the following: traffic volume, vehicle queues, geometric design, and stopping sight distance. On-site vehicular circulation and parking layout were reviewed in accordance with generally accepted traffic engineering standards and transportation planning principles.

Site Access and Driveway Operations

The site plan shows that vehicular access to the project would be provided by three full access driveways on Campbell Technology Parkway. The driveways are proposed in approximately the same locations as the existing three driveways to the site.

According to the City's Zoning Code (Section 21.28.090 B2), driveways should have a minimum unobstructed width of at least 20 feet for two-way access. The project driveways show an adequate width for two-way access. Due to the relatively low number of project-generated trips at each driveway, operational issues related to vehicle queuing and/or vehicle delay are not expected to occur (see Figure 14).

Sight Distance

As previously discussed, the existing sight distance is adequate. Fifteen feet of red curb to the east and five feet to the west should be provided at each driveway to maintain sight distance for exiting vehicles.

Vehicle Parking Requirements

Vehicle parking requirements are based on California AB 2097, which states that projects within half mile of major transit stop do not need to meet a minimum parking requirement. This is to be measured by a direct line from parcel edge to the transit stop and not based on walking distance. The project proposes a two-car garage for each single-family home and townhome plus 138 on-site parking spaces.

Proposed On-Site Circulation

Parking for the proposed project would be located on-site in surface parking spaces and residential in-garage spaces below the units.

Figure 14
Driveway Operations

The parking areas would be directly accessible from the project driveways. The project site would include a network of drive aisles that connect the surface parking spaces and residential units. The project drive aisles would be at least 24 feet wide, which is adequate for two-way traffic. Overall, the site plan shows acceptable connectivity and maneuvering space.

Loading and Emergency Vehicle Access

As previously discussed, the project's fire access plan shows adequate emergency vehicles access via the project site driveways.

Conclusions and Recommendations

The results and recommendations of the transportation study for the 695 Campbell Technology Parkway project are summarized below.

- The project would generate 1,368 net new daily vehicle trips, with 39 net new trips occurring during the AM peak hour and 103 net new trips occurring during the PM peak hour.
- The project would have a negligible effect on traffic operations on nearby streets and intersections.
- The queuing analysis shows that the southbound leg and eastbound left turn pocket at the intersection of Curtner Avenue/White Oaks Road and Camden Avenue have queues that extend beyond the available storage lanes provided.
- The City proposes a restriping project for the intersection to increase the eastbound left turn storage. The project should contribute to the cost of restriping project.
- Hexagon recommends installing 15 feet of red curb to the east and 5 feet of red curb to the west of each driveway to maintain sight distance for exiting vehicles.
- The project would not have a significant impact on vehicle miles traveled (VMT).
- The project would create a demand for pedestrian facilities on the east side of Campbell Technology Parkway where the sidewalk is discontinuous, which constitutes a significant impact. The project should install a high visibility ADA-compliant crosswalk across Campbell Technology Parkway at the project's mid-block driveway along with the associated pedestrian warning signs and yield lines in both directions and new ADA-compliant ramps at both ends, a crosswalk along the north leg of the Campbell Technology Parkway at East McGlincy Lane intersection (from northeast to northwest corners) with retrofitted ramps that are ADA compliant, and provide a public access easement across the property streets to preserve bicycle and pedestrian access for a potential future bicycle and pedestrian bridge across Highway 17 to mitigate the impact to pedestrians. Implementation of this mitigation measure would reduce the pedestrian impact to a less than significant level.
- The project would not have a significant impact on bicycle or transit operations.
- The project would not have a significant impact associated with roadway hazards or emergency access.

Peak Hour Delay Signal Warrant Report

****

Intersection #3 Campbell Technology Parkway/McGlincy Lane

****

Future Volume Alternative: Peak Hour Warrant NOT Met

 Copyright (c) 2008 Dowling Associates, Inc.

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	- T	- R	L	- T	- R	L	- T	- R	L	- T	- R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0	0 0	0	1 0	0 0	1	1 0	1 0	0	0 0	0 1	0
Initial Vol:	0	0	0	14	0	8	57	88	0	0	107	57
ApproachDel:	xxxxxx			10.1			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.1]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=22]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=331]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0	0 0	0	1	0 0	1	1	0 1	0	0	0 1	0
Initial Vol:	0	0	0	47	0	34	68	136	0	0	94	64

Major Street Volume: 362
Minor Approach Volume: 81
Minor Approach Volume Threshold: 811

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.1]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=22]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=331]
FAIL - Total volume less than 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

****

Intersection #3 Campbell Technology Parkway/McGlincy Lane

****

Future Volume Alternative: Peak Hour Warrant NOT Met

 Copyright (c) 2008 Dowling Associates, Inc.

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0 0	0 0	0	1	0 0	1	1	0 1	0	0	0 1	0
Initial Vol:	0	0	0	15	0	8	60	92	0	0	112	60
ApproachDel:	xxxxxx			10.2			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.1]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=23]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=347]
FAIL - Total volume less than 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	xxxxxx			9.8			xxxxxx			xxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.2]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=83]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=358]
FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

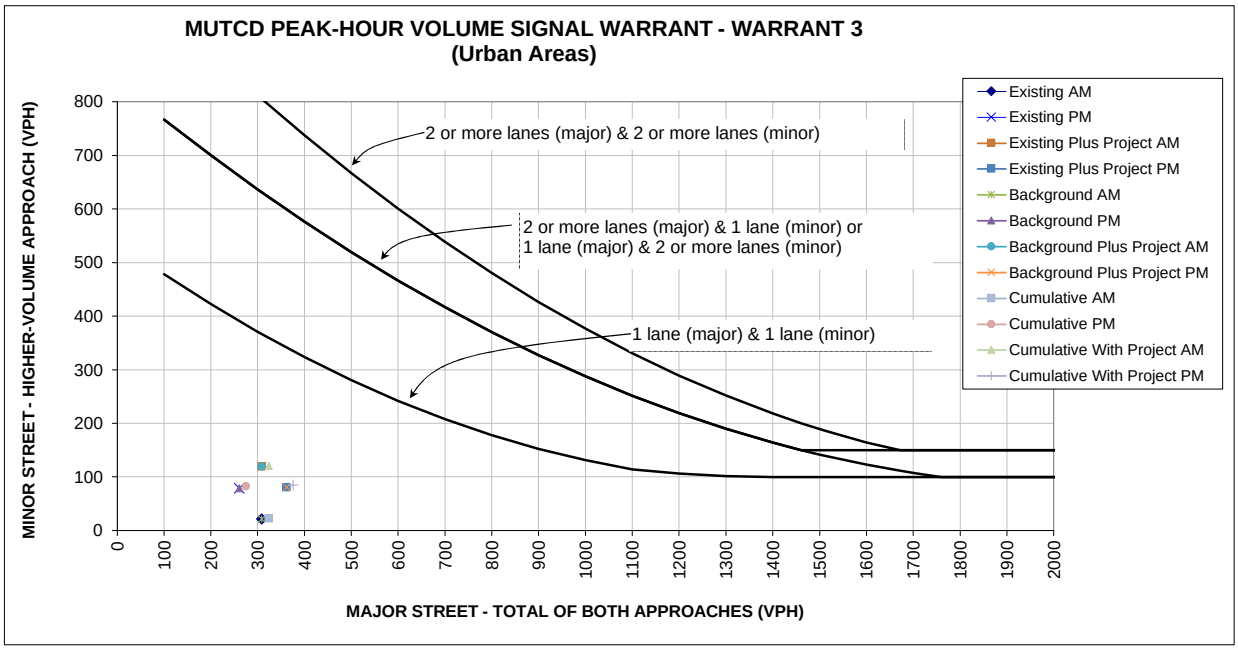
Signal Warrant Analysis

695 Campbell Technology Parkway Transportation Study - Signal Warrant Analysis

McGlincy Lane (major) / Campbell Technology Parkway (minor)



Source: Figure 4C-3 of the Manual on Unifrom Traffic Control and Devices (MUTCD) 2014 Edition from California Department of Transportation (Caltrans).
* 150 vph applies as the lower threshold volume for a minor-street approach with two or more lanes
and 100 vph applies as the lower threshold volume for a minor-street approach with one lane.

AM Peak Hour

		Existing Approach Lanes: One	Existing Approach Lanes: 2 or More	Existing AM	Existing Plus Project AM	Background AM	Background Plus Project AM	Cumulative AM	Cumulative With Project AM
