Walnut Creek, CA 94597

Table of Contents

EXECUTIVE SUMMARY ES-1
ES.1 SUMMARY OF PROPOSED PROJECT ES-1
ES.1.1 Project Objectives ES-1
ES.1.2 Project Approvals ES-1
ES.1.3 Responsible and Trustee Agencies ES-2
ES.2 AREAS OF CONTROVERSY/ISSUES TO BE RESOLVED ES-2
ES.3 ALTERNATIVES TO THE PROPOSED PROJECT ES-3
ES.4 SUMMARY OF IMPACTS AND MITIGATION MEASURES ES-4
ES.5 REVIEW OF THE DRAFT EIR ES-26

1.0 INTRODUCTION 1-1
1.1 THE ENVIRONMENTAL REVIEW PROCESS 1-1
1.1.1 Purpose and Authority 1-1
1.1.2 Type of Environmental Impact Report 1-2
1.1.3 Lead Agency Determination 1-2
1.2 SCOPE OF DRAFT EIR 1-2
1.2.1 Location and Overview 1-13
1.2.2 Environmental Issues Determined Not to Be Significant 1-13
1.3 ORGANIZATION OF THE DRAFT EIR 1-14
1.4 REVIEW OF THE DRAFT EIR 1-16
1.4.1 Effectively Commenting on an EIR 1-16
1.4.2 Final EIR 1-17

2.0 PROJECT DESCRIPTION 2-18
2.1 PROJECT OVERVIEW 2-18
2.1.1 Project Location 2-18
2.1.2 General Plan Land Use Designation 2-18
2.1.3 Zoning 2-22
2.1.4 Existing Site Conditions and Operations 2-22
2.1.5 Surrounding Land Uses 2-22
2.2 PROJECT CHARACTERISTICS 2-22
2.2.1 Single-Family Homes 2-24
2.2.2 Three-Story Townhome-style Condominiums 2-24
2.2.3 Four-Story Townhome-style Condominiums 2-24
2.2.4 Affordable Housing 2-24
2.2.5 Open Space and Landscaping 2-29
2.2.6 Lighting 2-29
2.2.7 Vehicular and Pedestrian Access 2-31
2.2.8 Parking 2-31
2.2.9 Utilities 2-31
2.2.10 Offsite Improvements 2-38
2.3 PROJECT CONSTRUCTION 2-38
2.3.1 Schedule 2-38
2.3.2 Access and Staging 2-39
2.3.3 Construction Equipment and Workers 2-40
2.3.4 Grading, Excavation, and Demolition 2-40
2.4 PROJECT OBJECTIVES AND REQUIRED PROJECT APPROVALS 2-41

2.4.1 Objectives 2-41
2.4.2 Approvals 2-41

3.0 ENVIRONMENTAL IMPACT ANALYSIS 3-42
3.1 AIR QUALITY 3-46
3.1.1 Environmental Setting 3-46
3.1.2 Regulatory Setting 3-54
3.1.3 Environmental Impacts 3-60
3.2 CULTURAL RESOURCES 3-75
3.2.1 Environmental Setting 3-75
3.2.2 Regulatory Setting 3-77
3.2.3 Environmental Impacts 3-79
3.3 ENERGY 3-87
3.3.1 Environmental Setting 3-87
3.3.2 Regulatory Setting 3-87
3.3.3 Environmental Impacts 3-92
3.4 GREENHOUSE GAS EMISSIONS 3-98
3.4.1 Environmental Setting 3-98
3.4.2 Regulatory Setting 3-101
3.4.3 Environmental Impacts 3-108
3.5 LAND USE AND PLANNING 3-115
3.5.1 Environmental Setting 3-115
3.5.2 Regulatory Setting 3-116
3.5.3 Environmental Impacts 3-118
3.6 NOISE 3-127
3.6.1 Environmental Setting 3-127
3.6.2 Regulatory Setting 3-134
3.6.3 Environmental Impacts 3-142
3.7 TRANSPORTATION 3-153
3.7.1 Environmental Setting 3-153
3.7.2 Regulatory Setting 3-154
3.7.3 Environmental Impacts 3-157
3.8 TRIBAL CULTURAL RESOURCES 3-165
3.8.1 Environmental Setting 3-165
3.8.2 Regulatory Setting 3-167
3.8.3 Environmental Impacts 3-168
3.9 UTILITIES AND SERVICE SYSTEMS 3-173
3.9.1 Environmental Setting 3-173
3.9.2 Regulatory Setting 3-175
3.9.3 Environmental Impacts 3-176

4.0 CUMULATIVE EFFECTS 4-180
4.1 INTRODUCTION 4-180
4.2 CUMULATIVE IMPACT SETTING 4-180
4.3 GEOGRAPHIC SCOPE 4-181
4.4 LIST OF RELATED PROJECTS 4-182
4.5 CUMULATIVE IMPACT ANALYSIS 4-185
4.5.1 Air Quality 4-186
4.5.2 Cultural Resources 4-187
4.5.3 Energy 4-187
4.5.4 Greenhouse Gas Emissions 4-188

4.5.5 Land Use and Planning 4-188
4.5.6 Noise and Vibration 4-189
4.5.7 Transportation 4-190
4.5.8 Tribal Cultural Resources 4-190
4.5.9 Utilities and Service Systems 4-191

5.0 ALTERNATIVES TO THE PROPOSED PROJECT 5-194
5.1 INTRODUCTION 5-194
5.2 REQUIREMENTS FOR THE CONSIDERATION OF ALTERNATIVES 5-194
5.2.1 No Project Alternative 5-195
5.2.2 Consistency with Project Objectives 5-195
5.2.3 Feasibility 5-195
5.3 METHODOLOGY AND SCREENING CRITERIA 5-196
5.4 ALTERNATIVES CONSIDERED AND REJECTED FROM FURTHER CONSIDERATION 5-196
5.4.1 Mixed Use Alternative 5-197
5.5 ALTERNATIVES CONSIDERED 5-198
5.5.1 No Project No Development Alternative 5-198
5.5.2 No Project Future Development Alternative 5-200
5.6 ENVIRONMENTALLY SUPERIOR ALTERNATIVE 5-204

6.0 OTHER CEQA CONSIDERATIONS 6-207
6.1 GROWTH-INDUCING IMPACTS 6-207
6.1.1 Population Growth 6-208
6.1.2 Removal of Barrier to Growth 6-208
6.2 SIGNIFICANT AND UNAVOIDABLE IMPACTS 6-209
6.3 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES 6-209
6.4 MANDATORY FINDINGS OF SIGNIFICANCE 6-210

7.0 EFFECTS FOUND NOT TO BE SIGNIFICANT 7-212

8.0 LIST OF PREPARERS AND ORGANIZATIONS CONSULTED 8-231
LEAD AGENCY 8-231
REPORT PREPARERS 8-231

9.0 REFERENCES 9-232

WSA	Water Supply Assessment
WVSD	West Valley Sanitation District
ZEV	Zero Emission Vehicle
$\mu g/m^3$	Micrograms Per Cubic Meter

EXECUTIVE SUMMARY

This document is a Draft Environmental Impact Report (EIR) for the proposed Campbell Tech Park Project (proposed project). This section of the Draft EIR provides a summary of the proposed project, the anticipated environmental impacts of the proposed project, the alternatives, and areas of known controversy to be resolved.

ES.1 SUMMARY OF PROPOSED PROJECT

The proposed project is located at 635, 655, 675, and 695 Campbell Technology Parkway in the City of Campbell (City) on an approximately 17.28-acre site (project site). The project site consists of four contiguous parcels and is bounded by State Route (SR)-17 to the north and west, Campbell Technology Parkway and commercial uses to the south, and single-family developments to the east. The project site is located within a highly urbanized area and the site is entirely developed with a research and development (R&D) campus consisting of four buildings that total approximately 280,684 square feet, known as the Campbell Technology Park. Campbell Technology Park, LLC (Applicant) is proposing to demolish the existing onsite structures to construct a new residential development consisting of 290 residential units. The proposed development would consist of 27 two-story single-family detached homes, three-story townhome-style condominiums with 149 units across 28 buildings, and four-story townhome-style condominiums with 114 units across 15 buildings. Additionally, the proposed project would include public and private open space and on and offsite public improvements.

A detailed description of the proposed project is provided in Section 2.0, Project Description.

ES.1.1 Project Objectives

The objectives of the proposed project are as follows:

- Maximize development of medium-density housing in the City of Campbell while assisting the City in achieving its share of low-income and above-moderate-income housing under the 2023-2031 Regional Housing Needs Allocation.
- Facilitate development of a diversity of housing types and availability of housing units for a diversity of income levels, including market rate units and affordable units.
- Facilitate development of infill areas that have been previously paved and developed to promote preservation of existing open spaces within the City and location of residential uses proximate to public transit.

ES.1.2 Project Approvals

The following permits and approvals are required:

City of Campbell

- Entitlement Approvals

  - Planned Development Permit
  - Vesting Tentative Subdivision Map
  - Tree Removal Permit
- Post Entitlement Approvals
  - Grading/Building Permits
  - Encroachment Permit
  - Street Improvement Agreement
  - Demolition Permit
  - Tract Map Approval
  - Street/Easement Vacation
  - Right of Way Dedication

Regional Water Quality Control Board

- Stormwater Pollution Prevention Plan (SWPPP)/Construction General Permit

ES.1.3 Responsible and Trustee Agencies

Under the California Environmental Quality Act (CEQA), a responsible agency is a public agency, other than the lead agency, which has responsibility to carry out or approve a project (Public Resource Code [PRC] Section 21069). A trustee agency is a state agency that has jurisdiction by law over natural resources that are held in trust for the people of the State of California (PRC Section 21070).

The following agencies may serve as responsible and/or trustee agencies:

- San Francisco Bay Regional Water Quality Control Board (RWQCB)

ES.2 AREAS OF CONTROVERSY/ISSUES TO BE RESOLVED

Section 15123 of the state CEQA Guidelines requires that a summary of an EIR identify areas of controversy known to the lead agency, including issues raised by agencies and the public. The City distributed a Notice of Preparation (NOP) of the Draft EIR for the proposed project beginning on January 6, 2025. The NOP was circulated for an extended 30-day public review and comment period, ending on February 14, 2025. 17 commenters submitted written responses to the NOP and Initial Study. Thirteen written comments received were from interested individuals, business owners in the City, and organizations and four were from agencies including the California Department of Transportation (Caltrans), Department of Toxic Substances Control (DTSC), Santa Clara Valley Water District (Valley Water), and Santa Clara Valley Transportation Authority (VTA). Additionally, comments were received orally during the Public Scoping Meeting held on January 28, 2025. Written comments received are

included in Appendix B. Comments in response to the NOP and Initial Study generally identified the following areas of potential concern:

- Traffic safety
- Increased pedestrian, bicycle, and vehicle traffic
- Nearby odor

This Draft EIR contains substantial evidence to support the conclusions presented herein. It is possible that there will be disagreement among various parties regarding these conclusions, although the City of Campbell is not aware of any disputed conclusions at the time of this writing. Both the CEQA Guidelines and case law clearly provide the standards for treating disagreement among experts. Where evidence and opinions conflict on an issue concerning the environment, and the lead agency knows of these controversies in advance, the EIR must acknowledge the controversies, summarize the conflicting opinions of the experts, and include sufficient information to allow the public and decision-makers to make an informed judgment about the environmental consequences of the proposed project.

ES.3 ALTERNATIVES TO THE PROPOSED PROJECT

The project alternatives and their potential impacts are discussed in Section 5.0, Alternatives to the Proposed Project, of this Draft EIR. As authorized under CEQA, the alternatives are discussed in less detail than the proposed project.

No Project No Development Alternative

CEQA Guidelines Section 15126.6(e)(1) requires that the no project alternative be described and analyzed, “to allow decision-makers to compare the impacts of approving the project with the impacts of not approving the project.” The no project analysis is required to discuss, “the existing conditions at the time the Notice of Preparation is published . . . as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services” (Section 15126.6(e)(2)).

The No Project No Development Alternative assumes that no additional development would occur on the project site. Under this alternative, the project site would remain developed with the existing R&D uses and structures. The project site’s land use designation and zoning would default to the land use designation and zoning identified in the City’s 2040 General Plan.

The No Project No Development Alternative would result in greater impacts than the proposed project to air quality, energy, GHGs, and land use and planning. The No Project No Development Alternative would result in less impacts to cultural and tribal cultural resources, noise, transportation, and utilities and service systems. The No Project No Development Alternative would not achieve any of the project objectives, assist the City in meetings its Regional Housing Needs Allocation (RHNA) and affordable housing needs, facilitate development of a diversity of housing types, or facilitate development of infill areas.

No Project Future Development Alternative

Under the No Project Future Development Alternative, the proposed project would not be constructed. However, this alternative analyzes the potential impacts that could result if the project site was developed in accordance with the uses envisioned in the City's 6th Cycle Housing Element and 2040 General Plan. Under the recently adopted 6th Cycle Housing Element and 2040 General Plan, three of the project site parcels (Assessor's Parcel Numbers [APNs] 412-29-015, 412-29-012, and 412-29-011) were redesignated as High Density Mixed-Use (HD MU) which has a density requirement of 34-45 units/acre; however, APN 412-29-010 was not redesignated and remained R&D. Therefore, under the No Project Future Development Alternative, the three parcels redesignated as HD MU would be redeveloped with residential uses and the remaining fourth parcel would remain R&D and the existing structure would remain on the fourth parcel.

Under the No Project Future Development Alternative, the three redesignated parcels would be developed in accordance with the capacity assumptions utilized in the 6th Cycle Housing Element and therefore, the No Project Future Development Alternative would develop the three parcels with at least 467 total units. As the No Project Future Development Alternative would require redevelopment of the three parcels, demolition of the existing structures on the three sites would be required. As the fourth parcel was not redesignated, the existing structure on the fourth parcel would remain and the existing R&D uses on the site would remain.

The No Project Future Development Alternative would have greater impacts than the proposed project to air quality, energy, GHG, and noise. Land use would have less impacts and transportation, utilities and service systems, and cultural and tribal cultural resources would have an equivalent impact as the proposed project. Additionally, the No Project Future Development Alternative would not meet the project's objectives listed below:

- Maximize development of medium-density housing in the City of Campbell while assisting the City in achieving its share of low-income and above-moderate-income housing under the 2023-2031 Regional Housing Needs Allocation.
- Facilitate development of a diversity of housing types and availability of housing units for a diversity of income levels, including market rate units and affordable units.

ES.4 SUMMARY OF IMPACTS AND MITIGATION MEASURES

This Draft EIR analyzes the potential environmental effects of the proposed project. The Initial Study (Appendix A) determined that the following topics would have either no significant impact or impacts that would be reduced to less than significant with mitigation:

- Aesthetics
- Agriculture and Forestry Resources
- Biological Resources
- Geology and Soils
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Mineral Resources
- Population and Housing

- Public Services
- Recreation
- Wildfire

The proposed project would be required to comply with all mitigation measures identified in the Initial Study. For a complete discussion of potential impacts identified in the Initial Study, please refer to the specific discussion within each resource section of the Initial Study, included in Appendix A of this Draft EIR. Section 7.0, Effects Found Not to be Significant, also includes a summary of each finding for each resource not discussed in this Draft EIR.

The Initial Study identified impacts related to air quality, cultural resources, energy, greenhouse gases, land use and planning, noise, population and housing, transportation, tribal cultural resources, and utilities and services systems requiring a more detailed evaluation, which is discussed in Section 3.0, Environmental Impact Analysis, of this Draft EIR.

Table ES-1, Summary of Impacts and Mitigation Measures from the Initial Study, summarizes the environmental effects of the proposed project and the mitigation measures from the Initial Study. Table ES-2, Summary of Impacts and Mitigation Measures from the EIR, has been organized to correspond with environmental issues discussed in Section 3.0, Environmental Impact Analysis, of this EIR. Table ES-1 and ES-2 are arranged in four columns: (1) impacts; (2) level of significance without mitigation; (3) mitigation measures; and (4) level of significance with mitigation.

As indicated in Table ES-2 and discussed in detail in Section 3.0, Environmental Impact Analysis, the analysis conducted for this Draft EIR determined that the proposed project would result in less than significant impacts or less than significant impacts with mitigation for all resources analyzed in this Draft EIR.

Additionally, CEQA requires public agencies to establish a mitigation monitoring and reporting program for the purpose of ensuring compliance with those mitigation measures identified in an EIR and/or adopted as conditions of approval in order to mitigate or avoid significant environmental impacts identified in an EIR. A mitigation monitoring and reporting program, incorporating the mitigation measures set forth in this document, will be recommended for adoption at the time certification of the Final EIR is proposed.

Table ES-1: Summary of Impacts and Mitigation Measures from the Initial Study

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Initial Study Section 3.1 - Aesthetics			
Impact AES-a: The proposed project would not have a substantial effect on a scenic vista.	No Impact	None required.	No Impact
Impact AES-b: The proposed project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.	No Impact	None required.	No Impact
Impact AES-c: The proposed project would not, in non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings; or if the project is in an urbanized area, would not conflict with applicable zoning and other regulations governing scenic quality.	Less than Significant Impact	None required.	Less than Significant Impact
Impact AES-d: The proposed project would not create a new source of substantial light and glare which would adversely affect day or nighttime views in the area.	Less than Significant Impact	None required.	Less than Significant Impact
Initial Study Section 3.2 – Agricultural and Forestry Resources			
Impact AG-a: The proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.	No Impact	None required.	No Impact
Impact AG-b: The proposed project would not conflict with existing zoning for agricultural use, or a Williamson Act contract.	No Impact	None required.	No Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact AG-c: The proposed project would not conflict with existing zoning for, or cause rezoning of, forest land (as defined by Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production as defined by Government Code Section 51104(g)).	No Impact	None required.	No Impact
Impact AG-d: The proposed project would not result in loss of forest land or conversion of forest land to non-forest use.	No Impact	None required.	No Impact
Impact AG-e: The proposed project would not involve other changes in the existing environment, which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use, or conversion of forest land to non-forest use.	No Impact	None required.	No Impact
Initial Study Section 3.4 – Biological Resources			
Impact BIO-a: The proposed project could have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.	Potentially Significant Impact	**Impact MM BIO-1: Northern California Legless Lizard Pre-Construction Surveys.** A comprehensive survey for Northern California legless lizard of all areas exclusive of buildings, pavement or lawn shall be conducted within the project area within 14 days prior to construction. If no Northern California legless lizards are found, no further mitigation is necessary. If a Northern California legless lizard is observed within the proposed impact area, a qualified biologist shall relocate the individual to other suitable habitat a sufficient distance outside of the project area to preclude its return to the project area prior to construction. **Impact MM BIO-2: Pre-Construction Nesting Bird Surveys.** If construction activities (including tree and building removal) are proposed during the bird nesting season (February 1 – August 31), a focused survey for nesting raptors (including Swainson's hawk) and migratory bird nests shall be conducted by a qualified	Less than Significant Impact with Mitigation

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		biologist within 14 days prior to the beginning of construction activities in order to identify active nests. This survey shall be conducted within the proposed construction area and all accessible areas within 250 feet of the construction area. If active raptor nests are found, no construction activities shall take place within 500 feet of the nest until the young have fledged. If active songbird nests are found, a 100-foot no disturbance buffer will be established. These no-disturbance buffers may be reduced based on consultation and approval by the CEQA lead agency. The perimeter of the protected area shall be indicated by bright orange temporary fencing. No construction activities or personnel shall enter the protected area, except with approval of the biologist. If tree removal is necessary, trees containing nests, or burrows that must be removed as a result of project implementation shall be removed during the nonbreeding season (late September to March). If no active nests are found during the focused survey, no further mitigation will be required.	
		Impact MM BIO-3: Pre-Construction Roosting Bat Surveys. A qualified biologist shall conduct a bat habitat assessment of all trees proposed for removal. This habitat assessment shall identify all potentially suitable roosting habitat and may be conducted up to one (1) year prior to the start of construction. If potential roosting habitat is identified (cavities in trees) within trees proposed for removal, the biologist shall survey the potential roosting habitat during the active season (generally April through October or from January through March on days with temperatures in excess of 50 degrees Fahrenheit) to determine presence of roosting bats. These surveys are recommended to be conducted utilizing methods that are considered acceptable by California Department of Fish and Wildlife and bat experts. Methods may include evening emergence	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		surveys, acoustic surveys, inspecting potential roosting habitat with fiberoptic cameras or a combination thereof. If pre-construction surveys indicate that no roosts of special-status bats are present, or that roosts are inactive or potential habitat is unoccupied, no further mitigation is required. If roosting bats are identified within any of the trees planned for removal, or if presence is assumed, the trees shall be removed outside of pup season only on days with temperatures in excess of 50 degrees Fahrenheit. Pup season is generally during the months of May through August. Two-step tree removal shall be utilized under the supervision of the qualified biologist. Two-step tree removal involves removal of all branches of the tree that do not provide roosting habitat on the first day, and then the next day cutting down the remaining portion of the tree. Once the bats have been excluded, tree removal may occur.	
Impact BIO-b: The proposed project would not Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.	No Impact	None required.	No Impact
Impact BIO-c: The proposed project would not have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.	No Impact	None required.	No Impact
Impact BIO-d: The proposed project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	No Impact	None required.	No Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact BIO-e: The proposed project could conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	Potentially Significant Impact	**MM BIO-4: Removal of Protected Trees.** In accordance with the City's Tree Protection Ordinance, the Applicant shall prepare a tree survey plan and submit that along with a Tree Removal permit Application to the City. Mitigation for the tree removal may include planting of replacement trees (with the species, size, and location determined by the City), payment of in-lieu fee, or a combination of both options.	Less than Significant Impact with Mitigation
Impact BIO-f: The proposed project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.	No Impact	None required.	No Impact
Initial Study Section 3.7 - Geology and Soils			
Impact GEO-a: The proposed project could directly or indirectly cause potential substantial adverse effects, including the risk or loss, injury, or death involving: i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault	Less than Significant Impact	None required.	Less than Significant Impact
ii) Strong seismic ground shaking.	Potentially Significant Impact	**MM GEO-1: Preparation of a Design-Level Geotechnical Exploration Report.** Prior to the approval of a building permit, the project Applicant shall prepare a site-specific, design-level geotechnical exploration report. All recommendations included in the report shall be incorporated into the project site plans and the proposed project shall be designed and constructed in accordance with all recommendations included in the report. The report and site plans with the recommendations incorporated shall be submitted and reviewed by the City	Less than Significant Impact with Mitigation

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		to ensure compliance with City requirements and standards.	
iii) Seismic-related ground failure, including liquefaction.	Potentially Significant Impact	Mitigation Measure GEO-1 would be required.	Less than Significant Impact with Mitigation
iv) Landslides.	No Impact	None required.	No Impact
Impact GEO-b: The proposed project would not result in substantial soil erosion or the loss of topsoil.	Less than Significant Impact	None required.	Less than Significant Impact
Impact GEO-c: The proposed project could be located on strata or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse.	Potentially Significant Impact	Mitigation Measure GEO-1 would be required.	Less than Significant Impact with Mitigation
Impact GEO-d: The proposed project could be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code, creating substantial direct or indirect risks to life or property.	Potentially Significant Impact	Mitigation Measure GEO-1 would be required.	Less than Significant Impact with Mitigation
Impact GEO-e: The proposed project would not Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.	No Impact	None required.	No Impact
Impact GEO-f: The proposed project would not directly or indirectly destroy a unique paleontological resource or site or unique geologic features.	Less than Significant Impact	None required.	Less than Significant Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Initial Study Section 3.9 – Hazards and Hazardous Materials			
Impact HAZ-a: The proposed project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	Less than Significant Impact	None required.	Less than Significant Impact
Impact HAZ-b: The proposed project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.	Less than Significant Impact	None required.	Less than Significant Impact
Impact HAZ-c: The proposed project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.	No Impact	None required.	No Impact
Impact HAZ-d: The proposed project would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.	No Impact	None required.	No Impact
Impact HAZ-e: For a project located within an airport land use compatibility plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the project would not result in a safety hazard or excessive noise for people residing or working in the project area?	No Impact	None required.	No Impact
Impact HAZ-f: The proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	Less than Significant Impact	None required.	Less than Significant Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact HAZ-g: The proposed project would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.	Less than Significant Impact	None required.	Less than Significant Impact
Initial Study Section 3.10 – Hydrology and Water Quality			
Impact HYD-a: The proposed project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.	Less than Significant Impact	None required.	Less than Significant Impact
Impact HYD-b: The proposed project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.	Less than Significant Impact	None required.	Less than Significant Impact
Impact HYD-c: The proposed project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would i) Result in substantial soil erosion on or offsite; ii) Substantially increase the rate or amount of surface runoff in a manger which would result in flood on or offsite; iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted; or iv) impede or redirect flood flows.	Less than Significant Impact	None required.	Less than Significant Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact HYD-d: The proposed project would not be located in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.	No Impact	None required.	No Impact
Impact HYD-e: The proposed project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.	No Impact	None required.	No Impact
Initial Study Section 3.11 – Land Use and Planning			
Impact LU-1: The proposed project would not physically divide an established community.	No Impact	None required.	No Impact
Initial Study Section 3.12 – Mineral Resources			
Impact MIN-a: The proposed project would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.	No Impact	None required.	No Impact
Impact MIN-b: The proposed project would not result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.	No Impact	None required.	No Impact
Initial Study Section 3.13 – Noise			
Impact NOI-c: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the proposed project would not expose people residing or working in the project area to excessive noise levels.	No Impact	None required.	No Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Initial Study Section 3.14 – Population and Housing			
Impact POP-a: The proposed project would not induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).	Less than Significant Impact	None required.	Less than Significant Impact
Impact POP-b: The proposed project would not displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.	No Impact	None required.	No Impact
Initial Study Section 3.15 – Public Services			
Impact PUB-a: The proposed project would not Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services: Fire protection; Police protection; Schools; Parks; Other public facilities.	Less than Significant Impact	None required.	Less than Significant Impact
Initial Study Section 3.16 – Recreation			
Impact REC-a: The proposed project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	Less than Significant Impact	None required.	Less than Significant Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact REC-b: The proposed project would not include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.	Less than Significant Impact	None required.	Less than Significant Impact
Initial Study Section 3.19 – Utilities and Service Systems			
Impact UTIL-a: The proposed project would not require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.	Less than Significant Impact	None required.	Less than Significant Impact
Impact UTIL-d: The proposed project would not generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.	Less than Significant Impact	None required.	Less than Significant Impact
Impact UTIL-e: The proposed project would comply with federal, state, and local management and reduction statutes and regulations related to solid waste.	Less than Significant Impact	None required.	Less than Significant Impact
Initial Study Section 3.20 – Wildfire			
Impact WF-a: The proposed project would not substantially impair an adopted emergency response plan or emergency evacuation plan.	No Impact	None required.	No Impact
Impact WF-b: The proposed project would not, due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.	No Impact	None required.	No Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact WF-c: The proposed project would not require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.	No Impact	None required.	No Impact
Impact WF-d: The proposed project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.	No Impact	None required.	No Impact

Table ES-2: Summary of Impacts and Mitigation Measures from the Draft EIR

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Draft EIR Section 3.1 – Air Quality			
Impact AIR-a: The proposed project would not conflict with or obstruct implementation of the applicable air quality plan.	Less than Significant Impact	None required.	Less Than Significant Impact
Impact AIR-b: The proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.	Less Than Significant Impact	None required.	Less Than Significant Impact
Impact AIR-c: The proposed project could expose sensitive receptors to substantial pollutant concentrations.	Potentially Significant Impact	**MM AIR-1: Minimize Construction Exhaust Emissions.** Exhaust emissions shall be minimized during construction activities with the use of off-road equipment engines that meet or exceed CARB's Tier 4 Final engine emissions standards for off-road equipment exceeding 50 horsepower (hp). At a minimum, all construction equipment shall be certified as compliant with the Tier 4 Final engine emissions standards as provided in CCR, Title 13, section 2423(b)(1)(B). Engines can achieve these standards through the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, or other options as they become available. **MM AIR-2: HEPA Filter Maintenance Schedule Information.** Prior to occupancy, the Applicant shall provide all tenants with information on the routine maintenance schedule to replace and/or clean their MERV 13 filters. Filters should be replaced on a three-month basis in order to ensure that proper filtration levels are maintained.	Less Than Significant Impact with Mitigation

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact AIR-d: The proposed project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.	Less Than Significant Impact	None required.	Less Than Significant Impact
Draft EIR Section 3.2 – Cultural Resources			
Impact CUL-a: The proposed project could cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5.	Potentially Significant Impact	**MM CUL-1: Development of an Archaeological Monitoring Plan and Archaeological Monitoring.** A. Prior to any project-related ground disturbance an Archaeological Monitoring Plan (AMP) shall be developed by a qualified archaeologist who meets the Secretary of the Interior's (SOI) Professional Qualifications Standards for Archaeology for review and approval by the City. i. The AMP shall include but not limited to, 1) archaeological monitoring methods specific to project grading and utilities excavation; 2) protocols and a chain of contact if unanticipated archaeological discoveries are encountered during project-related ground disturbance; 3) a summary of documentation procedures for unanticipated discoveries; 4) a description of the types of archaeological deposits that are likely to be encountered specific to the site; and 5) procedures for evaluating these archaeological deposit types as historical resources or unique archaeological resources pursuant to PRC Section 5024.1 or PRC Section 21083.2(g) B. Prior to any project-related ground disturbance, the Applicant shall retain the services of an SOI qualified archaeologist to implement the AMP and oversee archaeological monitoring of project grading, utilities, and foundation excavation pursuant to the AMP. i. If archaeological deposits are encountered during project-related ground disturbance, the monitoring	Less Than Significant Impact with Mitigation

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		archaeologist shall have the authority to stop work in the area (50-foot radius) and implement the procedures outlined in the AMP. ii. Work shall not resume until the monitoring archaeologist under the oversight of the SOI qualified archaeologist and, in consultation with the City, determines that all applicable protocols of the AMP have been meet and that the archaeological deposit does not qualify as a historical resource or unique archaeological resource pursuant to PRC Section 5024.1 or PRC Section 21083.2(g) and no further archaeological investigation is necessary. iii. Should the monitoring archaeologist under the oversight if the SOI qualified archaeologist and, in consultation with the City, determine the archaeological deposit does qualify as a historical resource or unique archaeological resource pursuant to PRC Section 5024.1 or PRC Section 21083.2(g), a treatment plan with appropriate protection and preservation measure will be developed for review, approval, and implementation by the City to mitigate impacts to the resource. iv. Following the completion of all ground disturbance associated with project construction, the results of the archeological monitoring will be summarized in a technical document. The technical document shall be provided to the City for review and approval and submitted to the NWIC.	
		MM CUL-2: Conduct Cultural Resource Sensitivity Training. Prior to any project-related ground disturbance, the Applicant shall retain the services of an SOI qualified archaeologist to oversee and ensure that all construction workers involved in ground disturbing activities receive Cultural Resource Sensitivity Training by an archaeologist who is experienced in teaching non-specialists to recognize archaeological resources in the event that any are	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		discovered during construction. Construction staff directly overseeing or engaged in ground disturbing activities must participate in this training. This training shall be provided once to each worker involved in ground-disturbing activities before they begin work and shall be documented in training records submitted to the City. This training shall be administered as stand-alone trainings or included as part of an overall environmental awareness training required by the Applicant and/or contractor prior to construction. The training shall include, at minimum, the following: • the appearance and types of cultural and archaeological resources that are likely to be encountered; • the notification procedures and protocols to be taken in the event of an inadvertent cultural or archaeological resource discovery; and • the penalties for disturbing or destroying cultural resources.	
		MM CUL-3: Stop Work if Archaeological Deposits and/or Human Remains Are Encountered During Ground-Disturbing Activities. If archaeological deposits are encountered during project-related ground disturbance, work in the area (50-foot radius) shall stop immediately and the procedures outlined in the AMP will be implemented. If any human remains are discovered during ground-disturbing activities, there shall be no further excavation or disturbance of the site, or any nearby area reasonably suspected to overlie adjacent human remains. These remains shall be treated in accordance with existing state laws, including California PRC Section 5097.98 and California Health and Safety Code Section 7050.5.	

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Impact CUL-b: The proposed project could cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5.	Potentially Significant Impact	Mitigation Measures CUL-1, CUL-2, and CUL-3 would be required.	Less Than Significant Impact with Mitigation
Impact CUL-c: The proposed project could disturb any human remains, including those interred outside of formal cemeteries.	Potentially Significant Impact	Mitigation Measures CUL-1, CUL-2, and CUL-3 would be required.	Less Than Significant Impact with Mitigation
Draft EIR Section 3.3 - Energy			
Impact EN-a: The proposed project would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.	Less Than Significant Impact	None required.	Less Than Significant Impact
Impact EN-b: The proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.	Less Than Significant Impact	None required.	Less Than Significant Impact
Draft EIR Section 3.4 - Greenhouse Gas Emissions			
Impact GHG-a: The proposed project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.	Less Than Significant Impact	None required.	Less Than Significant Impact
Impact GHG-b: The proposed project would not conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.	Less Than Significant Impact	None required.	Less Than Significant Impact

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Draft EIR Section 3.5: Land Use and Planning			
Impact LU-b: The proposed project could cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.	Potentially Significant Impact	Mitigation Measure AIR-2 is required.	Less Than Significant Impact with Mitigation
Draft EIR Section 3.6 – Noise			
Impact NOI-a: The proposed project would not generate a substantial temporary or permanent increase in the ambient noise levels in the vicinity of the project noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Less Than Significant Impact	None required.	Less Than Significant Impact
Impact NOI-b: The proposed project would not generate excessive groundborne vibration or groundborne noise levels?	Less Than Significant Impact	None required.	Less Than Significant Impact
Draft EIR Section 3.7 - Transportation			
Impact TRANS-a: The proposed project could conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.	Potentially Significant Impact	**MM TRANS-1: Construct Pedestrian Improvements.** The proposed project shall implement the following pedestrian improvements: • Install a high visibility ADA compliant crosswalk across Campbell Technology Parkway at the project site's mid-block driveway along with the associated pedestrian warning signs, yield signs, and yield lines in each direction. • Install new ADA compliant ramps at both ends of the new crosswalk. • Install a crosswalk along the north leg of Campbell Technology Parkway at East McGlincy Lane intersection to connect the northeast and northwest corners of the	Less Than Significant Impact with Mitigation

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
		Campbell Technology Parkway/East McGlincy Lane intersection. • Two existing curb ramps should be retrofitted to be ADA compliant. • Provide public access easement across the property streets to preserve bicycle and pedestrian access for a potential future bicycle and pedestrian bridge across SR-17. • Provide fifteen feet of red curb to the east and five feet to the west at each driveway to maintain sight distance for exiting vehicles.	
Impact TRANS-b: The proposed project would conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).	Less Than Significant Impact	None required.	Less Than Significant Impact
Impact TRANS-c: The proposed project could substantially increase hazards to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).	Potentially Significant Impact	Mitigation Measure TRANS-1 would be required.	Less than Significant Impact with Mitigation
Impact TRANS-d: The proposed project would not result in inadequate emergency access.	Less than Significant Impact	None required.	Less than Significant Impact
Draft EIR Section 3.8 – Tribal Cultural Resources			
Impact TCR -a: The proposed project could **c**ause a substantial adverse change in the significance of a tribal cultural resource, defined by PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:	Potentially Significant Impact	Mitigation Measures CUL-1, CUL-2, and CUL-3 would be required.	Less Than Significant Impact with Mitigation

Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
a) Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in PRC Section 5020.1(k), or b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1? In applying the criteria set forth in subdivision (c) of PRC Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.			
Draft EIR Section 3.9 – Utilities and Service Systems			
Impact UTIL-b: The proposed project would have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.	Less Than Significant Impact	None required.	Less Than Significant Impact
Impact UTIL-c: The proposed project would not result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.	Less Than Significant Impact	None required.	Less Than Significant Impact

ES.5 REVIEW OF THE DRAFT EIR

The Draft EIR will be available for public review for a 45-day review period and will circulate from **April 15, 2026 through June 1, 2026.** The Draft EIR is available electronically on the City of Campbell's project webpage: https://www.campbellca.gov/Archive.aspx?ADID=3379.

Agencies, organizations, and interested parties will have the opportunity to comment on this Draft EIR during the 45-day public review period. The City of Campbell encourages the electronic submission of comments. Please indicate a contact person for your agency or organization and send your comments to: techparkproject@campbellca.gov. Please include Campbell Tech Park Project in the subject line.

Written comments on this Draft EIR should be addressed to:

City of Campbell – Community Development Department
Attention: Daniel Fama, Senior Planner
70 N. First Street
Campbell, CA 95008

1.0 INTRODUCTION

This Draft Environmental Impact Report (EIR) is prepared in accordance with the California Environmental Quality Act (CEQA) to evaluate the potential environmental impacts associated with the Campbell Tech Park Project (proposed project). This document is prepared in conformance with CEQA (California Public Resources Code [PRC] Section 21000, et seq.) and the CEQA Guidelines (California Code of Regulations [CCR], Title 14, Section 15000, et seq.). This Draft EIR is intended to serve as an informational document for the public agency decision makers and the public regarding the proposed project.

1.1 THE ENVIRONMENTAL REVIEW PROCESS

CEQA requires public agencies to identify, disclose, and consider the potential environmental impacts of proposed discretionary actions that lead agencies are considering for approval. A project that may have a significant impact on the environment cannot be approved unless the lead agency makes the approval contingent upon the implementation of mitigation measures that would reduce or avoid that impact to the extent feasible. When a project may have significant environmental impacts, the lead agency must prepare an EIR before it considers whether to approve the project.

The City of Campbell (City), as the lead agency for the proposed project, has prepared this Draft EIR for public review and comment. As discussed below, the Draft EIR will be available for review and comment by public agencies and the general public for a period of 45 days). Prior to considering the proposed project, the City will prepare a Final EIR that includes the Draft EIR, the comments received on the Draft EIR, written responses to those comments, a list of commenters, and any revisions being made to the Draft EIR in response to the comments. The Final EIR will be considered by the City's discretionary bodies when taking action on the proposed project.

1.1.1 Purpose and Authority

This Draft EIR has been prepared pursuant to the state CEQA Guidelines (CCR Title 14, Section 15000, et seq.). CEQA requires that state and local government agencies consider the environmental consequences of projects over which they have discretionary authority before acting on those projects (PRC 21000 et seq.).

According to CEQA Guidelines Section 15064(f)(1), preparation of an EIR is required whenever a project may result in a significant adverse environmental impact. The purpose of this Draft EIR is to analyze the potential environmental impacts of the proposed project, to indicate ways to reduce or avoid potential environmental impacts associated with the proposed project, and to identify alternatives to the project that reduce or avoid significant environmental impacts. CEQA requires that each public agency mitigate or avoid the significant environmental effects of projects it approves or implements whenever feasible.

An EIR is an informational document used in state, regional, and local planning and decision-making processes to meet the requirements of CEQA. The purpose of the EIR is not to recommend approval or denial of a project. However, the City's decision whether to approve or to deny the project must take into consideration the information provided by the EIR. A public agency may approve a project even if it would

result in significant and unavoidable environmental impacts, provided the agency adopts a statement of overriding considerations.

The Draft EIR must disclose the following: the proposed project's environmental effects, including those that cannot be avoided; the proposed project's growth inducing effects; the project-related effects found not to be significant; and cumulative impacts.

1.1.2 Type of Environmental Impact Report

In accordance with CEQA Guidelines Section 15161, this document is a project EIR that examines the environmental impacts of a specific project. This type of EIR focuses on the changes in the environment that would result from a specific project. In accordance with CEQA Guidelines Section 15161, a project EIR must examine the environmental effects of all phases of the project, including construction and operation. Additional resource-specific studies and modeling, such as air quality, cultural resources, noise, and traffic have been prepared for this Draft EIR to provide detailed information about the proposed project's potential impacts on the environment. The mitigation measures identified in this Draft EIR are sufficiently detailed to ensure that they would be effectively carried out to reduce the proposed project's impacts. This is a project-level EIR although information from the City's 2022 General Plan EIR is relevant and the contents of such are incorporated by reference. The 2022 General Plan EIR is available for inspection at City Hall located at: 70 N. First Street, Campbell, CA 95008.

1.1.3 Lead Agency Determination

The City is designated as the lead agency for the proposed project. CEQA Guidelines Section 15367 defines the lead agency as, "...the public agency, which has the principal responsibility for carrying out or approving a project." Other public agencies may use this document in their decision making or permit processes (e.g., Department of Water Resources, Bay Area Air District [BAAD], California Department of Transportation [Caltrans], etc.).

This Draft EIR was prepared by the City with technical assistance provided by Stantec Consulting Services Inc. (Stantec), an environmental consultant. Prior to public review, this Draft EIR was extensively reviewed and evaluated by the City staff and, as such, the Draft EIR reflects the independent judgment and analysis of the City, as required by CEQA. Lists of organizations and persons consulted and the report preparation personnel are provided in Section 8.0, List of Preparers, of this Draft EIR.

1.2 SCOPE OF DRAFT EIR

Pursuant to CEQA and the CEQA Guidelines, a lead agency shall focus an EIR discussion on potentially significant environmental effects and may limit discussion on other effects to brief explanations about why they are not significant (PRC Section 21002.1, CEQA Guidelines Section 15128). A determination of which impacts would be potentially significant was made for this project based on review of the information presented in the Initial Study prepared for the project (Appendix A) and comments received as part of the public scoping process (Appendix B), as well as additional research and analysis of relevant project data obtained during preparation of this Draft EIR. This Draft EIR addresses the potential environmental effects of the proposed project. The City distributed a Notice of Preparation (NOP) of a Draft EIR for the proposed project beginning on January 6, 2025. The NOP was distributed for an extended 30-day comment period (for a total of 40 days) that ended on February 14, 2025. The Public

Scoping Meeting on the Draft EIR for the proposed project was held on January 28, 2025. The comments received on the NOP and during the Public Scoping Meeting were considered in the preparation of this Draft EIR. The scope of this Draft EIR includes the potential impacts identified in the NOP and issues raised by agencies and the public in response to the NOP.

The City has determined that the proposed project has the potential to result in significant environmental impacts on the following resources, which are addressed in detail in this Draft EIR.

- Air Quality
- Cultural Resources
- Energy
- Greenhouse Gas Emissions
- Land Use and Planning
- Noise
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems

Please refer to Section 1.2.2, Environmental Issues Determined Not to Be Significant, for a list of environmental issues and resource topics determined to be not significant. Environmental issues and resource topics determined not to be significant were analyzed in the Initial Study prepared for the proposed project (Appendix A), which determined that implementation of the proposed project would result in no impact or less than significant environmental impacts with or without mitigation related to the environmental issues and resource topics. Environmental issues and resource topics evaluated in this EIR required additional analysis that was outside of the scope of analysis for the Initial Study and therefore, required further evaluation in this EIR.

Table 1.2-1 lists the comment letters received during the project scoping period.

Table 1.2-1: Comments Received on the NOP

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
Private Parties - Written				
Interested Individual	Arash Kerman	February 11, 2025	The commenter requests the Draft EIR examines the following topics: • Traffic and safety hazards due to increased traffic and pedestrians • Disruption to local businesses operations due to noise and vehicle activity complaints from future residents	• EIR Section 3.5, Land Use and Planning • EIR Section 3.6, Noise • EIR Section 3.7, Transportation *The project Applicant prepared a response to*

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
			• Parking and access issues in nearby areas	*comments for some of the comment letters received during the NOP comment period including the comment letter described here to proactively provide responses for concerns regarding the proposed project. The Applicant's June 2025 Response to Comments Letter is included in Appendix B to this Draft EIR.*
Interested Individual – Accurate Smog Check	Christa Rumpler	February 12, 2025	The commenter expressed concerns with limited sidewalks on East McGlincy Lane to ensure safety for pedestrians; concerns with increased crime along East McGlincy Lane; concerns with safety from adding more vehicles to the area due to existing safety issues at the intersection of Curtner Avenue and East McGlincy Lane. The commenter would also like to see additional traffic safety measures on Curtner Avenue between Camden Avenue and East McGlincy Lane as well as on East McGlincy Lane between Curtner Avenue and East McGlincy Lane.	*Issues and impacts related to crime are not a CEQA issue. CEQA analyses the impacts of the proposed project on the environment.* *Intersection of Curtner Avenue and East McGlincy Lane where the commenter requests additional traffic safety measures is located approximately 0.5 mile from the project site. The proposed project does not currently propose any offsite improvements outside of the project site frontage.* *The Applicant's June 2025 Response to Comments Letter is included in Appendix B to this Draft EIR provide additional responses to this comment.*
Interested Individual – Kobett Metals	Daniel Vigneri	February 12, 2025	The commenter expressed concerns regarding traffic congestion and impacts to local business operations. The commenter expressed concerns regarding limited existing street parking and notes that Campbell Technology Park represents the last remaining industrial area in the City and must be preserved.	• EIR Section 2.2.8, Parking • EIR Section 3.5, Land Use and Planning • EIR Section 3.7, Transportation *The proposed project would not reduce the amount of street parking available in the area and the proposed project would provide 718 total parking spaces onsite; therefore, future residents are not anticipated to utilize the existing available street parking.* *The Applicant's June 2025 Response to Comments Letter is included in Appendix B to this Draft EIR*

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
				provide additional responses to this comment.
Interested Individual - Lambert and Sons Floor Covering Company	Nathan Lambert	February 12, 2025	The commenter expressed concerns regarding increased traffic and congestion in the area as a result of the proposed project leading to fire and egress issues; concerns with safety due to increased pedestrian and bicycle traffic; and concerns with existing industrial uses being pushed out of the area.	• EIR Section 3.5, Land Use and Planning • EIR Section 3.7, Transportation • EIR Section 7.0, Effects Found Not to be Significant
Interested Individual	Wayne Prescott	January 24, 2025	The commenter expressed concerns with creating a residential island in an industrial district and requests the roadway be repaved after construction has been completed.	• EIR Section 3.5, Land Use and Planning *As described in Section 2.0. Project Description, the proposed project would include construction along Campbell Technology Parkway for connection of utility lines and frontage improvements. Campbell Technology Parkway would be repaved after completion of required construction activities.*
Santa Clara Valley Bird Alliance	Mikayla Kerba	February 8, 2025	The commenter requests Mitigation Measure BIO-2 identified in the Initial Study be modified to require consultation with CDFW prior to approaching any reduction in no-disturbance buffer. The commenter also requests a mitigation measure requiring Crotch's Bumble Bee survey be implemented. The commenter provided recommendations to be prevent and reduce light pollution impacts and requested aesthetic impacts to views from Edith Morley Park from the loss of trees be analyzed and provide a tree barrier between the park and the development.	• Draft EIR Section 2.2.5, Open Space and Landscaping • Draft EIR Section 2.2.6, Lighting • Draft EIR Section 7.0, Effects Found Not to be Significant • Initial Study Section 3.1, Aesthetics • Initial Study Section 3.4, Biological Resources *There is no legal requirement for consultation with CDFW on nesting bird surveys or any requirement for CDFW to provide a response; therefore, the lead agency should work with a qualified biologist to determine the appropriate buffer. The mitigation measure has been modified as shown in Table ES-1 to include requirements for consultation with a qualified biologist.* *As identified in Initial Study Appendix A Biological*

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
				Resources Analysis Memo, there is no suitable habitat onsite for Crotch's Bumble Bee and therefore, a requirement for pre-construction survey is not required. *As identified in Draft EIR Section 2.2.6, Lighting, lighting constructed onsite would be in compliance with the City's lighting requirements and would not require additional measures.* *The commenter states the loss of existing trees onsite would impact views from Edith Morley Park and result in aesthetic impacts. Edith Morley Park nor the project site are identified as scenic resources. Though views from Edith Morley Park would be altered with development of the proposed project, it would not result in impacts as it would not affect an identified scenic resource or scenic vista.*
DTSC	Dave Kereazis	January 9, 2025	The commenter provided recommendations including surveys for buildings and structures proposed to be demolished for asbestos and lead based paints, and all imported soil and fill materials be tested for contaminants.	*Structures constructed before the 1980s are likely to contain hazardous building materials such as asbestos and lead based paints. The existing Campbell Technology Park's buildings and structures were constructed less than 30 years ago and therefore, are anticipated to have a very low potential to contain hazardous building materials.*
Interested Individual	Toni Bonito	February 4, 2025	The commenter questioned whether Edith Morley Park will be closed during construction of the proposed project and what would happen to the garden area at the park.	*The comments do not relate to the proposed project or its related environmental analysis. As identified in Section 2.0, Project Description, the proposed project would not make any modifications to the existing park and the park would continue to operate as normal during the construction period.*

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
Interested Individual	Tyler Ascione	February 6, 2025	The commenter expressed excitement over the prospect of new housing in the City and asked about the approval timeline of the project.	*The comments do not relate to the environmental analysis of the proposed project and therefore, a response is not required. Currently the proposed project is in its Draft EIR phase.*
Interested Individual – West Valley Construction	Kevin P. Kelly	February 10, 2025	The commenter expressed concerns with potential complaints from future residents about noise and dust from operation of their business; concerns with pedestrian and bicycle safety and temporary traffic delays along the roadways due to large delivery trucks accessing the business; concerns regarding compatibility with existing industrial operations.	• EIR Section 3.1, Air Quality • EIR Section 3.5, Land Use and Planning • EIR Section 3.6, Noise • EIR Section 3.7, Transportation *The Applicant's June 2025 Response to Comments Letter is included in Appendix B to this Draft EIR provide additional responses to this comment.*
Hoge, Fenton, Jones & Appel, Inc. representing West Valley Construction	Sblend A. Sblendorio	January 12, 2025	The commenter urges the EIR scope including the following: • Detailed baseline analysis of existing industrial/commercial setting • An analysis of effects on Recreation including access to Edith Morley Park and available street parking • An analysis of effects on public health and safety (traffic and pedestrian safety, air quality) • Issues resulting from project funneling all traffic through Campbell Technology Parkway • An analysis of topics raised by Fehr & Peers in its memorandum and any impacts associated with transportation	• EIR Section 3.1, Air Quality • EIR Section 3.5, Land Use and Planning • EIR Section 3.7, Transportation • EIR Section 7.0, Effects Found Not to be Significant *The Applicant's June 2025 Response to Comments Letter is included in Appendix B to this Draft EIR provide additional responses to this comment.*
Fehr & Peers representing West Valley Construction	Elynor Zhou and Matt Haynes	February 12, 2025	The commenter was engaged to review the Transportation Analysis dated April 12, 2024 prepared by Hexagon Transportation Consultants, Inc. (Hexagon). In their opinion, the review found that the Transportation Analysis does not adequately acknowledge or make recommendations to address concerns regarding the area's lack of infrastructure and high level trucking activities leading to bike/pedestrian circulation and other	• EIR Section 3.7, Transportation *The Applicant's June 2025 Response to Comments Letter is included in Appendix B to this Draft EIR provide additional responses to this comment.*

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
			safety issues. Therefore, the commenter recommends the scope for the EIR address these topics including: • Documenting existing and planned pedestrian/bicycle facilities in area • Documenting existing pedestrian/bicycle/traffic levels in the area and existing truck activity • Documenting collision history in area • Analyze adequacy of bicycle/pedestrian facilities and travel routes to accommodate increased generation by proposed project • Evaluate conflicts with site plan and planned SR-17 bridge • Evaluate conflict with project related vehicle trips and bicyclists/pedestrians with existing truck operations • Evaluate queuing and safety at intersection • Evaluate whether proposed development would pose challenges for emergency response and evacuation and evaluate alternative routes	
Interested Individual	Joe Burman	February 15, 2025	The commenter expressed their opposition for the proposed project and stated their concerns related to increased traffic and congestion along nearby roadways that already have existing congestion issues.	• EIR Section 3.7, Transportation
Infinite Networks, Inc.	Sean Betti	February 14, 2025	The commenter expressed concerns related to traffic, congestion, and safety along the roadways. The commenter expressed that as the area is serviced by frequent delivery and shipping trucks, adding additional vehicles on the roadway due to the development would result in increased congestion and potential safety impacts. The commenter provided recommendations including construction of an additional roadway or a dedicated freeway entrance and exit to accommodate the influx of residential traffic.	• EIR Section 3.7, Transportation

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
Caltrans	Llisel Ayon	February 14, 2025	The commenter outlined requirements for conducting travel demand analysis, handling of stormwater runoff and floodplain impacts, mitigation strategies, impact fees and construction related impacts.	• EIR Section 3.7, Transportation Caltrans comm*ents are general in nature and the proposed project and its environmental analysis would be conducted in accordance with all applicable requirements including those as outlines by Caltrans.*
Santa Clara Valley Water District (Valley Water)	Andrew Quan	February 13, 2025	The commenter provided recommendations for water conservation measures that could be implemented for the proposed project and identified potential impacts that could occur and information related to groundwater recharge areas, dam failure inundation, and flooding. Additionally, the commenter outlines requirements for well abandonment if existing wells are located onsite.	• EIR Section 7.0, Effects Found Not to be Significant • Initial Study Section 3.10, Hydrology and Water Resources *The proposed project would be developed in accordance with the City's water conservation requirements and any other applicable requirements. Impacts related to groundwater recharge, dam failure inundation, and flooding were analyzed in the Initial Study (Appendix A). Additionally, there are no existing wells located onsite.*
Santa Clara Valley Transportation Authority	Larissa Sanderfer	March 11, 2025	The commenter recommended that the Applicant use Santa Clara Valley Transportation Authority (VTA)'s Community Design and Transportation manual to guide the project design. Additionally, the commenter stated that VTA's Countywide Bicycle Plan identifies the project site as a potential site for a bike and pedestrian bridge and the EIR should reference the VTA's Countywide Bicycle Plan in the analysis.	• EIR Section 3.7, Transportation
Private Parties – Oral[1]				
Interested Individual	Anne Souza	January 28, 2025	The commenter expressed concerns regarding pedestrian access, lack of sidewalks, safety, and impacts to public services.	• EIR Section 3.7, Transportation • EIR Section 7.0, Effects Found Not to be Significant • Initial Study Section 3.15, Public Services

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
Interested Individual	Susan Landry	January 28, 2025	The commenter presented a map highlighting concerns about bus stops, pedestrian safety, access to public transportation, parking, and lack of sidewalks and bike lanes in the area, specifically on Union, Camden and Curtner. The commenter also brought up the proposal for a potential bridge over the highway and expressed concern about if there would be enough space available for the bridge landing if the project is constructed.	• EIR Section 3.7, Transportation *The commenter provided a map that displays roadway and related facilities improvements in the general project area; however, the improvements are not currently proposed as part of the proposed project and therefore, is not related to the proposed project or its environmental analysis. The bridge project mentioned by the commenter is related to a County proposed improvement that is not a component of the proposed project and therefore, is not relevant to the EIR. However, the proposed project will provide an easement across the property for a potential future bicycle and pedestrian bridge as described in EIR Section 3.7, Transportation.*
Interested Individual	Kevin Pasket	January 28, 2025	The commenter expressed concerns regarding traffic and circulation and the need for parking.	• EIR Section 2.2.8, Parking • EIR Section 3.7, Transportation
West Valley Construction	Chris Gorman	January 28, 2025	The commenter expressed concerns related to safety in regard to truck traffic and lack of sidewalks on East McGlincy Lane and requests the City conduct a robust study on traffic and circulation impacts. Additionally, the comment requested an analysis of noise impacts from existing businesses.	• EIR Section 3.6, Noise • EIR Section 3.7, Transportation
Interested Individual	Thomas Keller	January 28, 2025	The commenter expressed safety concerns regarding traffic and proposed installing a four-way stop at the intersection of Curtner Avenue.	• EIR Section 3.7, Transportation *The proposal presented by the commenter is not a proposed component of the proposed project and therefore, does not pertain to the environmental analysis of the proposed project. The closest segment of Curtner Avenue to the project site is located more than 0.4 mile away from the project site. The impacts of a project on*

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
				an intersection's level of service is not a required topic of analysis under CEQA. However, if the proposed project was determined to result in significant safety related impacts to any nearby intersections, the proposed project would be required to provide mitigation to reduce potential impacts. Impacts to nearby intersections in relation to safety at the intersections are analyzed in Draft EIR Section 3.7, Transportation. As outlined in Section 3.7, Transportation, the analysis determined that the proposed project would not result in any safety related transportation impacts along the Curtner Avenue intersection.
Campbell Collision Center and Bob's Towing Service	Amir N.	January 28, 2025	The commenter expressed concerns about the potential impact of increased traffic on their business and response times for first responders. Additionally, the commenter expressed concerns regarding existing operational noise and residents of the proposed project lodging complaints.	• EIR Section 3.6, Noise • EIR Section 3.7, Transportation • EIR Section 7.0, Effects Found Not to be Significant • Initial Study Section 3.15, Public Services
Interested Individual	Tyler	January 28, 2025	The commenter described a personal experience of a fire that occurred at their shop on East McGlincy Lane and expressed concerns about the potential fire risks with the increased housing.	• EIR Section 7.0, Effects Found Not to be Significant • Initial Study Section 3.15, Public Services
Interested Individual	Chad Renold	January 28, 2025	The commenter expressed concerns about potential impact to the area specifically concerning traffic and parking as the proposed project would exacerbate the impact. Additionally, the commenter mentioned rubbish and overgrowth near the percolation ponds	• EIR Section 2.2.8, Parking • EIR Section 3.7, Transportation *The percolation pond located near the project site is owned and operated by Valley Water and they are the responsible party for ensuring the ponds are kept clean of rubbish and overgrowth. The comment does not relate to the proposed project or its environmental analysis and therefore, does not require further response.*

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed
Interested Individual	Toni Bido	January 28, 2025	The commenter shared their concerns regarding the potential impact on parking and access to the nearby park.	• EIR Section 2.2.8, Parking • EIR Section 7.0, Effects Found Not to be Significant • Initial Study Section 3.16, Recreation
Planning Commissioner	Alan Zisser	January 28, 2025	The commissioner stated they have the same concerns as public such as traffic and safety. The commissioner questioned whether they could incorporate requirement into the proposed project to include improvements to nearby roadways and whether that relates to the EIR.	• EIR Section 3.7, Transportation *The incorporation of improvement requirements as a Condition of Approval for the proposed project is at the discretion of the City. Conditions of Approval requiring improvements does not relate to the environmental analysis for the proposed project unless the improvement is being required as a means to reduce potential impacts.*
Planning Commissioner	Adam Buchbinder	January 28, 2025	The commissioner stated the City is currently working on a multimodal plan and that should be tied to the proposed project. Additionally, the commissioner stated the project would result in increased use of Edith Morley Park and potentially requiring more investment in the park to provide amenities.	• EIR Section 7.0, Effects Found Not to be Significant • Initial Study Section 3.16, Recreation *The multimodal plan is currently in the process of being prepared by the City and therefore, is not available for use in the EIR analysis. However, the City may take into account the proposed project when determining potential roadway and infrastructure improvements to be included in the multimodal plan.*
Planning Commissioner (former)	Michael Krey	January 28, 2025	The commissioner stated that they were surprised that water quality and wildfire were not identified as topics to be analyzed in the EIR.	• EIR Section 7.0, Effects Found Not to be Significant • Initial Study Section 3.10, Hydrology and Water Resources • Initial Study Section 3.20, Recreation *Topics related to wildfire and water quality were analyzed in the Initial Study and were determined to result in a less than significant impact and would not require further analysis in the EIR.*

Affiliation	Signatory	Date	Comment Description	Response/CEQA Document Where Comment is Addressed

[1] Oral comments taken at the Public Scoping Meeting held on January 28, 2025.

1.2.1 Location and Overview

The project site is located within the City of Campbell at 635, 655, 675, and 695 Campbell Technology Parkway on an approximately 17.28-acre site. The project site consists of four contiguous parcels and is bounded State Route (SR)-17 to the north and west, Campbell Technology Parkway and commercial uses to the south, and single-family developments to the east. The four contiguous parcels that make up the approximately 17.28-acre project site are identified as Assessor's Parcel Numbers (APNs) 142-29-010, 412-29-011, 412-29-012, and 412-29-015.

Campbell Technology Park, LLC (Applicant) is proposing to demolish the existing onsite structures to construct a new residential development consisting of 290 residential units. The proposed development would consist of 27 two-story single-family detached homes, three-story townhome-style condominiums with 149 units across 28 buildings, and four-story townhome-style condominiums with 114 units across 15 buildings. Additionally, the proposed project would include public and private open space and on and offsite public improvements. Section 2.0, Project Description, includes more detailed information about the proposed project.

1.2.2 Environmental Issues Determined Not to Be Significant

Pursuant to CEQA, the discussion of the potential effects on the physical environment is focused on those impacts that may be significant or potentially significant. CEQA allows a lead agency to limit the details of discussion of the environmental effects that are not considered potentially significant (PRC Section 21100, CEQA Guidelines Sections 15126.2[a] and 15128). CEQA requires that the discussion of any significant effects on the environment be limited to substantial or potentially substantial adverse changes in physical conditions that exist within the affected area, as defined in PRC Section 21060.5 (Statutory definition of "environment"). Effects dismissed in an analysis as clearly insignificant and unlikely to occur need not be discussed further in the Draft EIR unless the lead agency subsequently receives information inconsistent with the finding (CEQA Guidelines Section 15143).

Based on a review of the project information provided in the NOP (Appendix A) and comments received as part of the public scoping process (Appendix B), as well as additional research and analysis of relevant project data obtained during preparation of this Draft EIR, the following were identified as resources that would not experience any significant environmental impacts from the proposed project. Accordingly, these resources are not addressed further in this Draft EIR but are identified below. A brief explanation as to why impacts to each resource are not anticipated, as required by CEQA is provided in Section 7.0, Effects Found Not to Be Significant.

- Aesthetics
- Agriculture and Forestry Resources
- Biological Resources
- Geology and Soils
- Hazards and Hazardous Materials
- Hydrology and Water Quality

- Mineral Resources
- Population and Housing
- Public Services
- Recreation
- Wildfire

In addition, certain subjects within various environmental resource topics were determined not to be significant. Other potentially significant issues are analyzed within these environmental resource topics; however, the following issues are not analyzed, but a brief explanation as to why impacts are less than significant as required by CEQA is provided in Section 7.0, Effects Found Not to Be Significant. Would the project:

- Physically divide an established community? (Section 3.5, Land Use and Planning)
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels? (Section 3.6, Noise)
- Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects? (Section 3.9, Utilities and Service Systems)
- Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals? (Section 3.9, Utilities and Service Systems)
- Comply with federal, state, and local management and reduction statues and regulations related to solid waste? (Section 3.9, Utilities and Service Systems)

1.3 ORGANIZATION OF THE DRAFT EIR

This Draft EIR is arranged into the following sections, which contain the contents of an EIR as required by CEQA Guidelines Section 15120 through 15132.

Section ES: Executive Summary. The Executive Summary provides a summary of the proposed project and the project alternatives, including a summary of project impacts, recommended mitigation measures, and the level of significance after mitigation for each environmental issue.

Section 1.0: Introduction. The Introduction provides an overview of the proposed project and the CEQA process and describes the purpose, scope, and components of this Draft EIR.

Section 2.0: Project Description. The Project Description provides a detailed description of the proposed project, including the location and project characteristics. The intended uses of this Draft EIR, project background, project objectives, and required project approvals are also addressed.

Section 3.0: Environmental Impact Analysis. The Environmental Impact Analysis analyzes the environmental effects of the proposed project. Impacts are organized into major environmental topic

areas. Each topic area includes a description of the regulatory setting, environmental setting, significance criteria, project impacts, mitigation measures, and level of significance after mitigation. The specific environmental topic areas that are addressed in Section 3.0 include the following:

- Section 3.1: Air Quality
- Section 3.2: Cultural Resources
- Section 3.3: Energy
- Section 3.4: Greenhouse Gas Emissions
- Section 3.5: Land Use and Planning
- Section 3.6: Noise
- Section 3.7: Transportation
- Section 3.8: Tribal Cultural Resources
- Section 3.9: Utilities and Service Systems

Section 4.0: Cumulative Effects. Section 15130 of the CEQA Guidelines requires an EIR to discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable. A cumulative impact consists of an impact created because of the combination of the project evaluated in the EIR together with other reasonably foreseeable projects causing related impact.

Section 5.0: Alternatives to the Proposed Project. Describes and compares the proposed project alternatives to the proposed project.

Section 6.0: Other CEQA Considerations. The Other CEQA Considerations section provides a summary of significant environmental effects, including unavoidable, irreversible, and growth-inducing impacts.

Section 7.0: Effects Found Not to Be Significant. This section provides a summary of project impacts that have been determined, through preparation of the NOP, to result in a less than significant or no impact.

Section 8.0: List of Preparers and Organizations Consulted. The List of Preparers and Organizations Consulted section provides a list of the organizations and persons consulted, and the various individuals who contributed to the preparation of this Draft EIR. This section also includes a list of the lead agency personnel and technical consultants used to prepare this Draft EIR.

Section 9.0: References. This section provides a list of the technical studies and other documents used to prepare this Draft EIR.

Appendices. The appendices contain the NOP (including comments) and technical studies prepared to support the analyses and conclusions in this Draft EIR.

1.4 REVIEW OF THE DRAFT EIR

CEQA does not require formal hearings at any stage of the environmental review process (CEQA Guidelines Section 15202[a]). However, it does encourage, "wide public involvement, formal and informal, in order to receive and evaluate public reactions to environmental issues" (CEQA Guidelines Section 15201). The City distributed an NOP of a Draft EIR for the project beginning on January 6, 2025. The NOP was distributed for an extended 30-day comment period (for a total of 40 days) that ended on February 14, 2025. The comments received on the NOP and during the Public Scoping Meeting on January 28, 2025, were considered in the preparation of this Draft EIR. Appendix B contains the written comments received on the NOP.

The City of Campbell has filed a Notice of Completion (NOC) with Governor's Office of Land Use and Climate Innovation (LCI) to begin the public review period (PRC, Section 21161). Concurrent with the NOC, this Draft EIR has been distributed to responsible and trustee agencies, other affected agencies, surrounding cities, and interested parties, as well as to all parties requesting a copy of the Draft EIR in accordance with PRC Section 21092(b)(3). During the public review period, the Draft EIR, including the technical appendices, are available for review online at: https://www.campbellca.gov/Archive.aspx?ADID=3379.

Agencies, organizations, and interested parties have the opportunity to comment on this Draft EIR during the 45-day public review period, which will begin on **April 15, 2026** and end on **June 1, 2026**.

The City of Campbell encourages the electronic submission of comments.

Send your comments by email to Daniel Fama, Senior Planner at: techparkproject@campbellca.gov. Please include Campbell Tech Park Project Draft EIR in the subject line.

Written comments on this Draft EIR should be addressed to:

City of Campbell – Community Development Department
Attention: Daniel Fama, Senior Planner
70 N. First Street
Campbell, CA 95008

Upon completion of the public review period, written responses to all environmental issues raised will be prepared and made available for review by the commenting agencies at least 10 days prior to any public hearing on the proposed project at which the certification of the Final EIR will be considered. Comments received and the responses to comments will be included as part of the record for consideration by decision-makers for the proposed project.

1.4.1 Effectively Commenting on an EIR

Readers are invited to review and comment on the adequacy and completeness of this Draft EIR in describing the potential impacts of the proposed project, the level of severity of each impact, the mitigation measures being proposed to reduce or avoid those impacts, and the project alternatives being considered. The most effective comments are those that focus on the adequacy and completeness of the

environmental analysis and that are supported by factual evidence. Comments that focus on whether the proposed project should be approved or denied are not comments on the adequacy of this Draft EIR.

1.4.2 Final EIR

After the end of the review period, the City will review the comments received, prepare written responses to those comments, make any related revisions to the Draft EIR, and publish the Final EIR, which will include the Draft EIR, comments on the Draft EIR, responses to comments and any revisions to the Draft EIR.

The Final EIR will be considered by the City's Planning Commission and City Council when taking action on the proposed project. If the proposed project is approved, CEQA requires the City to adopt findings describing how each of the significant impacts identified in the EIR would be mitigated. The findings are required to describe the reasons why significant unavoidable impacts, if any, cannot be mitigated. The findings must also describe the project alternatives analyzed in the EIR and explain whether or not any alternative or portion of an alternative has been adopted. The City must also adopt a mitigation monitoring and reporting plan that describes how it would ensure the mitigation measures being required of the proposed project will be carried out.

2.0 PROJECT DESCRIPTION

2.1 PROJECT OVERVIEW

The Applicant is proposing development of the Campbell Tech Park Project in the City of Campbell, California on an approximately 17.28-acre project site. The Applicant is proposing to demolish the existing onsite structures to construct a new residential development consisting of 290 residential units. The proposed development would consist of 27 two-story single-family detached homes, three-story townhome-style condominiums with 149 units across 28 buildings, and four-story townhome-style condominiums with 114 units across 15 buildings. Pursuant to Government Code Section 65589.5(d), 20 percent of the proposed units would be set aside for low-income households as required by the Builder's Remedy provision of the Housing Accountability Act. The proposed project would reserve five of the single-family homes, 30 of the three-story townhome units, and 23 of the four-story condominium units as below market rate units for a total of 58 units provided as affordable housing. Additionally, the proposed project would include public and private open space and on and offsite public improvements.

2.1.1 Project Location

The proposed project is located at 635, 655, 675, and 695 Campbell Technology Parkway in the City (Figure 2-1). The project site is approximately 17.28 acres and consists of four contiguous parcels identified as APNs 412-29-015, 412-29-012, 412-29-011, and 412-29-010 (Figure 2-2, Figure 2-3). The project site is bounded by SR-17, commonly referred to as Highway 17, to the north and west, Campbell Technology Parkway and commercial uses to the south, and single-family development to the east.

2.1.2 General Plan Land Use Designation

The City's 2001 General Plan Land Use Map designated the project site as Research and Development (R&D). Under the recently adopted 6th Cycle Housing Element and 2040 General Plan, three of the project site parcels (APNs 412-29-015, 412-29-012, and 412-29-011) were redesignated as High Density Mixed-Use (HD MU) (34-45 units/acre); however, APN 412-29-010 was not redesignated and remained R&D.

Notwithstanding these land use changes, the Applicant submitted Senate Bill (SB) 330 (Housing Crisis Act) pre-application on April 18, 2023 for a 334-unit townhome development. At the time the pre-application was submitted, the City had not yet adopted the updated 6th Cycle Housing Element and 2040 General Plan, meaning the City was subject to the "Builder's Remedy" provision of the California Housing Accountability Act (ABAG 2022). The Applicant's submission of a pre-application under the Housing Crisis Act therefore conferred upon the Applicant's vested right to proceed under the standards in effect at the time of pre-application submittal and to apply the protections of the Builder's Remedy through its entitlement process. State law provides in these circumstances that a city may not deny the project based on inconsistency with these General Plan land use regulations. Therefore, the City may not deny the proposed project based on inconsistency with the 2001 General Plan R&D land use designation that applied on April 18, 2023 (or the current HD MU designation). However, other provisions and requirements of the 2001 General Plan remain applicable to the project, provided they do not render the proposed project infeasible.

2.1.3 Zoning

Under the current 2040 General Plan, APN 412-29-010 is zoned Planned Development (P-D) and APNs 412-29-015, 412-29-012, and 412-29-011 are zoned HD MU. However, prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan, the project site parcels were zoned P-D. As explained above, the Applicant submitted a Builder's Remedy application and SB 330 (Housing Crisis Act) pre-application prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan which included rezoning the project site. State law provides that the City may not deny the proposed project based on consistency with the P-D zoning district that existed on April 18, 2023 or the City's current zoning districts.

2.1.4 Existing Site Conditions and Operations

The project site is located within a highly urbanized area. The project site is entirely developed with an R&D campus consisting of four buildings that total approximately 280,864 square feet, known as the Campbell Technology Park. Additionally, the project site is developed with paved surface parking stalls, drive-aisles, walkways, and landscaping throughout the site. The existing onsite buildings are one to two stories high and were recently occupied by R&D professional office tenants. The site has now been vacated of tenants and secured by perimeter security fencing.

2.1.5 Surrounding Land Uses

The project site is surrounded by the following land uses:

- **North** –SR-17
- **East** –single-family residential uses
- **South** – Campbell Technology Parkway, Edith Morley Park, and commercial uses
- **West** – SR-17

2.2 PROJECT CHARACTERISTICS

The proposed project consists of the development of 290 residential units, which is within the allowable 20 percent deviation from the SB 330 pre-application. The proposed development would consist of 27 two-story single-family detached homes, three-story townhome-style condominiums with 149 units across 28 buildings, and four-story townhome-style condominiums with 114 units across 15 buildings (Figure 2-4). Each unit would have a private two-car garage, and balconies and decks would provide private outdoor space for each unit. The proposed project would have a density of 16.78 units per acre.

Pursuant to Government Code Section 65589.5(d), the proposed project would set aside 20 percent of the proposed units for low-income households as required by the Builder's Remedy provision of the Housing Accountability Act.

Title
Site Plan

Stantec

2.2.1 Single-Family Homes

The proposed project would construct 27 two-story single-family detached homes. Figure 2-5 shows a rendering of the proposed single-family homes. The single-family homes would have four building types ranging from 2,505 square feet to 2,722 square feet. The single-family homes would range from three to four bedrooms with two to three bathrooms. One of the building types for the single-family homes would have an optional accessory dwelling unit (ADU).

The single-family homes would be provided along the eastern edge of the project site. The single-family homes would be separated from the existing residential developments located along the eastern edge of the project site by existing trees and fencing located within the project site's property line. The single-family homes would have a maximum height of 30 feet and 5 inches.

2.2.2 Three-Story Townhome-style Condominiums

The proposed project would construct 28 three-story townhome-style condominiums that would have a combined unit count of 149 units. Figure 2-6 shows a rendering of the proposed three-story townhome-style condominiums. The three-story townhomes would have five building types that would range from three- to seven-plex constructions. The three-story townhomes would range from three to four bedrooms with 2.5 to 3.5 bathrooms. One of the building types for the three-story townhome would have an optional ADU. The three-story townhomes would have a maximum height of 44 feet.

2.2.3 Four-Story Townhome-style Condominiums

The proposed project would construct 15 four-story townhome-style condominiums that would have a combined unit count of 114 units. Figure 2-7 shows a rendering of the proposed four-story townhome-style condominiums. The four-story condominiums would have two building types identified as six- and eight-plex constructions. The four-story condominiums would range from two to three bedrooms with two to three bathrooms. The four-story condominiums would have a maximum height of 47 feet.

2.2.4 Affordable Housing

Pursuant to Government Code Section 65589.5(d), 20 percent of the proposed units would be set aside for low-income households as required by the Builder's Remedy provision of the Housing Accountability Act.

The proposed project would reserve five of the single-family homes, 30 of the three-story townhome units, and 23 of the four-story condominium units as below market rate units for a total of 58 units provided as affordable housing. The affordable housing units would be dispersed throughout the project site (Figure 2-8).

The City's Inclusionary Housing Ordinance under Chapter 21.24 of the Campbell Municipal Code requires that at least fifteen percent of all units in a residential project be made available at affordable rents or affordable ownership cost. As the proposed project would set aside 20 percent of the proposed total units as affordable housing, the proposed project would meet the City's Inclusionary Housing Ordinance requirements.

2.2.5 Open Space and Landscaping

The project site is currently fully paved, developed with R&D uses, and includes landscaping and trees located throughout the site. The proposed project would require removal of 116 existing trees onsite to complete construction of the proposed project. The proposed project would be required to comply with Campbell Municipal Code Chapter 21.32 - Tree Protection Regulations which outlines standards and regulations related to removal of protected trees. In accordance with City requirements, the proposed project would be required to obtain a Tree Removal Permit concurrently with the City processing the development application proposal, which would include requirement for replacement trees to be planted. Landscaping would be provided throughout the project site and internal streets and sidewalks would be planted with various street trees, placed to maximize solar exposure. Low-growing groundcover would enhance pedestrian connections to the public sidewalks. The proposed project would use native and drought tolerant landscaping to meet the City's Water Efficient Landscape Guidelines. Landscaping provided onsite would be designed and constructed in accordance with the requirements and standards outlined in City Municipal Code Chapter 21.26 - Landscaping Requirements and the State of California Model Water Efficient Landscape Ordinance.

The proposed project would include development of 125,943 square feet of usable open space throughout the site (Figure 2-9). A linear open space area is programmed through the central portion of the project site. Amenities are located throughout this linear zone, including a playground for children aged 2 through 12, seating areas that allow for passive recreation, shaded picnic areas for gathering, and a ping-pong table area. The linear open space is designed to be lined with trees and shade canopies to provide usable recreation space most of the year. Along the southern edge of the project site, a small pocket park would provide a shaded picnic and BBQ area. Additional usable open space areas located throughout the site would provide passive recreational areas.

Additionally, the single-family homes would be developed with a total of 17,415 square feet of private yard space. The townhome-style condominiums would also provide balconies, resulting in approximately 18,000 square feet of private open space. The single-family homes would be separated by fencing. Additionally, a concrete wall would separate the single-family homes from the common open space area located along the eastern boundary of the project site. A pre-cast wall would also be constructed along the western, eastern, northern, and southern boundaries of the project site to separate the proposed project from the surrounding developments and SR-17. The proposed fencing and concrete walls would range from 6 to 8 feet in height.

2.2.6 Lighting

Lighting is proposed throughout the project site. Street lighting would be placed along the roadways and pedestrian level lighting would be placed throughout the common areas for security purposes. Additionally, each house would be designed to have a porch light and a light at the garage. The proposed project would use cutoff or full cutoff lighting for illuminating outdoor spaces to control and limit light pollution and light trespass. Lighting provided onsite would be designed and constructed in accordance with the requirements and standards outlined in City Municipal Code Section 21.18.090 - Lighting Design Standards and Section 21.16.060 - Outdoor Light and Glare.

Title
Open Space

Stantec

2.2.7 Vehicular and Pedestrian Access

Primary access to the project site would be via three proposed driveways and street connections located off Campbell Technology Parkway (Figure 2-10). Internal streets would be constructed throughout the project site for vehicular access. All three driveways and internal streets would be constructed in accordance with City standards for fire and emergency access and to allow for emergency vehicle egress/ingress, subject to an "alternative means and methods request" (AMMR) approved by the Santa Clara County Fire District (SCCFD) (SCCFD 2024). The proposed driveways would all be 26 feet wide and the internal drive aisles would have a minimum width of 24 feet. Pedestrian walkways would also connect to the existing Campbell Technology Parkway. Emergency vehicle access (EVA) would be provided via an existing EVA easement at the northern end of the project site from Paseo de Palomas Lane. The EVA lane would have a minimum width of 20 feet. Section 21.28.090 of the Campbell Municipal Code requires drive aisles for multi-family dwellings to a minimum of 20 feet wide for a two-way drive aisle.

2.2.8 Parking

Per Campbell Municipal Code Section 21.28.040, Number of parking spaces required, residential uses are required to provide 2 parking spaces for each single-family units and 2.5 spaces for multi-family units with two or more bedrooms. As the proposed project would include development of 27 single-family units and 263 multi-family units with two or more bedrooms, the proposed project is required to provide a total of 711.5 parking spaces. A total of 718 parking spaces would be provided to accommodate the proposed residential developments, and the proposed project would meet the parking requirement for the City. Of the total 718 parking spaces, 580 parking spaces would be provided as residential in-garage spaces and 138 spaces would be guest parking spaces dispersed throughout the site. Of the total 138 guest parking spaces, the proposed project would provide 7 accessible spaces, 14 electric vehicle (EV) capable spaces, 35 EV ready spaces, and 7 EV charging spaces. The proposed project would also provide 12 bicycle racks throughout the site. Each bicycle rack would provide six bicycle spaces. Parking provided onsite would be designed and constructed in accordance with the dimensional requirements and standards outlined in City Municipal Code Chapter 21.28 – Parking and Loading.

2.2.9 Utilities

The project site is currently served by underground electric and communication lines, stormwater lines, sanitary sewer lines, and domestic water lines. As part of the proposed project, new sanitary sewer mains and laterals, new water mains and services, and storm drain infrastructure would be provided to serve the development (Figure 2-11). Stormwater treatment bioretention areas would be provided for treatment of runoff generated from the proposed project. Additionally, private streetlights are proposed to service the project site. Existing and proposed utility connections are discussed in more detail below.

Stantec

Water Supply

Water service at the project site is provided by the San Jose Water Company (SJWC). The proposed project would include the installation of new 8-inch water lines throughout the site that would connect to the existing 8-inch potable water mains within Campbell Technology Parkway. The Applicant determined that the proposed project is anticipated to have an annual water usage of 30 million gallons per year (mgy). This demand estimate was calculated using a flow generation rate of 109 gallons per capita per day (gpcd) assumed per the 2020 Urban Water Management Plan (UWMP) and the City's average household size of 2.6 persons per household per the U.S. Census Bureau, last updated in 2021.

Wastewater

Wastewater service at the project site is provided by West Valley Sanitation District (WVSD). The proposed project would connect to the existing 8-inch sanitary sewer main along Campbell Technology Parkway that enter and traverse the site in the northerly direction through a series of public sewer easements as well as the existing 8-inch sanitary sewer main located along Paseo de Palomas Lane. The existing 8-inch sanitary sewer main that traverse the site ultimately leaves the site in the northeast corner of the project site at Paseo de Palomas Lane and drains east toward Union Avenue. The proposed project would relocate the existing public sanitary sewer main that crosses the project site to be within the proposed streets. The proposed project would utilize the existing 8-inch sanitary sewer lines that exist throughout the site and would include construction of new 8-inch sanitary sewer lines throughout the site to connect to each proposed building. The 8-inch sanitary sewer lines would connect to the existing 8-inch sanitary sewer main located along Campbell Technology Parkway and the existing 8-inch sewer main located along Paseo de Palomas Lane. The Applicant determined that the proposed project is anticipated to result in a sanitary sewer flow generation of 49,010 gpd or 17.89 mgy. This estimate was calculated using a flow generation rate of 65 gpcd assumed per the West Valley Sanitation Design Standards and the City's average household size of 2.6 persons per household per the U.S. Census Bureau, last updated in 2021. West Valley Sanitation Standards note an average household size of 2.46 persons per multi-family dwelling units; however, the census information was used for a conservative analysis.

Stormwater

The proposed project would include approximately 24,309 square feet of bioretention facilities that would be constructed throughout the site (Figure 2-12). The proposed bioretention facilities would collect and treat stormwater runoff before being conveyed to the proposed storm drain lines throughout the project site. Various sized storm drain lines, ranging from 12-inches to 36-inches, would be constructed throughout the site to convey stormwater runoff to the treatment areas and to the designated discharge points. Additionally, an existing storm drain main that crosses the project site would be relocated to be within the proposed streets. The stormwater runoff would eventually be discharged to the existing storm drain mains located in Campbell Technology Parkway, as well as the existing storm drain mains located along the northern corner of the project site in Paseo de Palomas Lane. Proposed storm drainage facilities would conform to the C.3 Stormwater Technical guidelines and requirements.

Electricity, Gas, and Telecommunication

Electricity and gas service is provided to the project site by the Pacific Gas & Electric Company (PG&E). The proposed project would include connections to existing electrical lines within the area. Additionally, an existing electric pole and overhead line that is located in the northwest corner of the project site would require relocation to not conflict with the proposed site improvements.

All residential units and associated building systems and appliances/fixtures are proposed to be 100 percent electric, and the proposed project would not utilize natural gas. Additionally, all homes are proposed to have solar photovoltaic systems installed, either individually or for the larger condominium building as a whole. All homes are proposed to have a single dedicated Level 1 and a single dedicated Level 2 receptacle in the garage for EV charging and all homes would have the option of a battery backup located in the garage.

2.2.10 Offsite Improvements

The proposed project would include construction of several offsite improvements to support the development. The proposed project would widen Campbell Technology Parkway and improvements along the Campbell Technology Parkway frontage is proposed which include new curb and gutters, sidewalks, and accessible curb ramps at all pedestrian road crossings. Additionally, new street trees, street lighting, and fire hydrants are proposed along the Campell Technology Parkway frontage. Stormwater bioretention areas would be provided to treat the stormwater from the roadway along the project frontage and new storm drain infrastructure would be provided to serve the stormwater treatment areas. Additionally, the proposed project would include sanitary sewer, water, and storm drain connections to the existing infrastructure within the Campbell Technology Parkway frontage.

2.3 PROJECT CONSTRUCTION

2.3.1 Schedule

Construction is anticipated to begin in March 2027 and would be completed by February 2032. Construction of the proposed project is anticipated to occur during normal business hours and no nighttime work is proposed.

Construction is proposed to be completed in four phases[1]. Phase 1 would include demolition of the existing buildings and pavement and site preparation of the entire project site. Phase 2 would include construction of the 27 single-family homes and 49 three-story townhome-style condominiums. Phase 3 would include construction of the remaining 100 three-story townhome-style condominiums. Lastly, Phase 4 would include construction of the 114 four-story townhome-style condominium. Each phase of construction would take place immediately following the ending of the prior phase.

Construction activities would occur Monday through Friday, between 8 AM and 5 PM, and Saturday 9 AM to 4 PM, consistent with the City's Municipal Code applicable to construction activities. Any work outside of the City's construction hours would require special permits. Table 2.3-1 through Table 2.3-4 shows the

[1] In this context, the term "phase" refers only to the planned sequence of construction activity. It does not refer to the phasing of land use entitlements governed by CMC Sec. 21.56.030 or to the use of multiple final maps corresponding to those phases.

anticipated construction schedule with the assumption that activities would begin in March 2027 and end in February 2032 with buildout taking place over four phases. This construction schedule is dependent on market conditions, regulatory approvals, and other factors; therefore, it is subject to change.

Table 2.3-1: Phase 1 Construction Schedule

Task	Start Date	End Date	Workdays
Site Demolition	3/1/2027	5/30/2027	65
Grading	5/31/2027	7/30/2027	43
Site Preparation	7/31/2027	8/30/2027	22

Architectural Coating	1/14/2032	2/13/2032	22

2.3.2 Access and Staging

Construction staging would be located onsite, and workers would access the project site via gated vehicular entry points along Campbell Technology Parkway.

The proposed project is anticipated to require some temporary restrictions and closures for a portion of Campbell Technology Parkway along the project site boundary to complete the frontage improvements and connect new utility lines to the existing utility mains located along Campbell Technology Parkway. For any temporary restrictions or closures required for adjacent roadways, the proposed project would prepare and implement a Traffic Control Plan (TCP).

2.3.3 Construction Equipment and Workers

Construction equipment anticipated onsite is listed in Table 2.3-5. Project construction would utilize Tier 4 construction equipment and construction is expected to require approximately 100 workers during peak construction stage (building construction).

Table 2.3-5: Proposed Construction Equipment

Phase Name	Equipment Type	Number of Equipment	Usage (hours/day)
Demolition	Concrete/Industrial Saw	1	8
	Excavators	3	8
	Rubber Tired Dozers	2	8
Site Preparation	Rubber Tired Dozers	3	8
	Tractors/Loaders/Backhoes	4	8
Grading	Excavators	2	8

	Welders	1	8
Paving	Pavers	2	8
	Paving Equipment	2	8
	Rollers	2	8
Architectural Coating	Air Compressors	1	6

2.3.4 Grading, Excavation, and Demolition

As the project site is currently developed with existing buildings and impervious surfaces, the proposed project would require demolition of existing onsite structures and surfaces prior to the start of construction activities. To meet the City's waste diversion requirements, 65 percent of construction debris would be diverted from landfills.

The proposed project is anticipated to require 18,000 cubic yards of cut and 23,000 cubic yards of fill for a net 5,000 cubic yards of fill. The project site is currently developed with approximately 13.01 acres of impervious area and 4.27 acres of pervious area. Post-construction, the proposed project is anticipated to result in 13.5 acres of impervious area and 3.78 acres of pervious area. It is anticipated that maximum depth of excavation for building pads would be approximately 5 feet, and the maximum depth of utility trenching would be approximately 15 feet.

2.4 PROJECT OBJECTIVES AND REQUIRED PROJECT APPROVALS

2.4.1 Objectives

The objectives of the proposed project are as follows:

- Maximize development of medium-density housing in the City of Campbell while assisting the City in achieving its share of low-income and above-moderate-income housing under the 2023-2031 Regional Housing Needs Allocation.
- Facilitate development of a diversity of housing types and availability of housing units for a diversity of income levels, including market rate units and affordable units.
- Facilitate development of infill areas that have been previously paved and developed to promote preservation of existing open spaces within the City and location of residential uses proximate to public transit.

2.4.2 Approvals

The proposed project requires the following permits and approvals:

City of Campbell

- Entitlement Approvals
    - Planned Development Permit
    - Vesting Tentative Subdivision Map
    - Tree Removal Permit
- Post Entitlement Approvals
    - Grading/Building Permits
    - Encroachment Permit
    - Street Improvement Agreement
    - Demolition Permit
    - Tract Map Approval
    - Street/Easement Vacation
    - Right of Way Dedication

Regional Water Quality Control Board

- Stormwater Pollution Prevention Plan (SWPPP)/Construction General Permit

3.0 ENVIRONMENTAL IMPACT ANALYSIS

Housing Crisis Act and Builder's Remedy

The Housing Crisis Act, established by SB 330 in 2019 limits local laws over housing development. When a pre-application for a housing development is submitted under the Housing Crisis Act, the housing development is then only subject to those ordinances and policies in effect when the completed pre-application was submitted. Therefore, the proposed project is subject to the ordinances and policies in effect on April 18, 2023 when the pre-application was submitted.

Additionally, under the Builder's Remedy provision of the Housing Accountability Act, if a locality has not adopted a housing element in substantial compliance with state law, developers may propose eligible housing development projects that do not comply with either the zoning or general plan. Under state law, housing elements are required to comply with the current state housing element law on the established due date, which is January 31, 2023, in the Association of Bay Area Governments (ABAG) region. The City of Campbell's 6th Cycle Housing Element was adopted on April 18, 2023 and therefore, the City was in non-compliance with the state housing element law for the period between the established due date and the adoption date. Though the City's 6th Cycle Housing Element has been adopted and the City is no longer in non-compliance with state law, the Applicant submitted their Housing Crisis Act pre-application prior to the City Council meeting where the 6th Cycle Housing Element was adopted and therefore, is able to utilize the Builder's Remedy provision to "lock in" the Applicant's vested right to proceed under the standards in effect at the time of pre-application submittal. Therefore, as the 6th Cycle Housing Element was not adopted at the time of pre-application submittal, the Applicant is able to propose eligible housing development projects that do not comply with either the zoning or general plan of the site.

Therefore, the following analysis provided in this EIR is subject to the goals and policies included in the 2001 General Plan as well as the ordinances and regulations that were in place at the time the pre-application was submitted on April 18, 2023. References in this EIR to the current 2040 General Plan and 6th Cycle Housing Element are used only as current sources of Citywide data and policy context. For land use consistency and Housing Crisis Act/ Housing Accountability Act purposes, the applicable regulatory plan remains the 2001 General Plan in effect at the time of pre-application.

Additionally, the Applicant of the proposed project opted into certain provisions of AB 1893 which amended certain provisions of the Housing Accountability Act and associated Builder's Remedy effective January 1, 2025. AB 1893's amendments to the Housing Accountability Act are intended to provide clear guidance to cities on how applicants may adjust Builder's Remedy applications without forfeiting rights. To this end, the revised Government Code section 65589.5(f)(7)(A) provides that any project that qualifies as a Builder's Remedy project under new provisions of AB 1893, but submitted a preliminary application prior to January 1, 2025, may "choose to be subject to any or all of the provisions of this section applicable as of January 1, 2025." The proposed project meets the criteria for a Builder's Remedy project as set forth under AB 1893. At this time, the Applicant is choosing to be subject to the AB 1893-amended Government Code section 65589.5(f)(6)(D), which requires that City treat the proposed project as consistent with its General Plan and zoning regulations for all purposes. The City accepted the Applicant's election.

Approach to Environmental Analysis

In accordance with CEQA Guidelines Section 15126.2, this Draft EIR identifies and focuses on the significant direct and indirect environmental effects of the proposed project, giving due consideration to both its short- and long-term effects. Short-term effects are generally those associated with construction of the proposed project, while long-term effects are generally those associated with operation of project components.

As described in Section 1.0, Introduction, this analysis focuses on a limited number of environmental resource topics as other topics were addressed in the Initial Study analysis that accompanied the NOP (Appendix A). However, based on community feedback received, the one additional impact question related to air quality and two additional impact questions related to transportation that were scoped out in the Initial Study process were evaluated further in the Draft EIR. Sections 3.1 through 3.9 of this Draft EIR contain discussions of the potential environmental impacts related to the construction and operation of the proposed project.

Environmental Resource Topics

The potential environmental effects associated with the implementation of the proposed project are evaluated in the following environmental resource areas:

- Air Quality
- Cultural Resources
- Energy
- Greenhouse Gas Emissions
- Land Use and Planning
- Noise
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems

Organization of Environmental Resource Sections

Each environmental resource section contains the following:

Regulatory Setting presents the laws, regulations, plans, and policies that are relevant to each resource topic. Regulations originating from the federal, state, and/or local levels are each discussed as appropriate.

Environmental Setting presents the existing environmental conditions on the project site and within the surrounding area as appropriate, in accordance with CEQA Guidelines Section 15125. The extent of the environmental setting area evaluated (the project study area) differs among resources, depending on the locations where impacts would be expected. For example, air quality impacts are assessed for the air basin (macro-scale), as well as the site vicinity (micro-scale), whereas noise impacts are assessed for the project vicinity only.

In determining the level of significance of environmental impacts associated with the proposed project, the analysis in this Draft EIR assumes that the proposed project would comply with relevant federal and state laws and regulations, and City of Campbell General Plan policies, ordinances, and other adopted

City documents, unless otherwise noted. Therefore, such mandatory policies, ordinances, and standards are not identified as mitigation measures, but rather are discussed as part of the "regulatory setting" governing the proposed project.

Thresholds of Significance identifies the thresholds of significance used to determine the level of significance of the environmental impacts for each resource topic, in accordance with CEQA Guidelines Sections 15126, 15126.2, and 15143. The thresholds of significance used in this Draft EIR are based on the checklist presented in Appendix G of the CEQA Guidelines; best available data; and regulatory standards of federal, state, and local agencies.

Project Impacts identifies the level of each environmental impact by comparing the effects of the proposed project to the environmental setting. Key methods and assumptions used to frame and conduct the impact analysis, as well as issues or potential impacts not discussed further (i.e., such issues for which the project would have no impact), are also described.

Project impacts are organized alphabetically in each subsection (e.g., Impact AIR-a, Impact AIR-b, Impact AIR-c). A bold-font environmental impact statement precedes the discussion of each impact while its level of significance succeeds the discussion of each impact. The discussion that follows the impact summary includes the substantial evidence supporting the impact significance conclusion.

Mitigation Measures describe any feasible measures that could avoid, minimize, rectify, reduce, or compensate for significant adverse impacts, with measures having to be fully enforceable through incorporation into the project (PRC Section 21081.6[b]). Mitigation measures are not required for environmental impacts that are found to be less than significant. Where feasible mitigation for a significant environmental impact is available, it is described following the impact. Where sufficient feasible mitigation is not available to reduce environmental impacts to a less than significant level, or where the lead agency lacks the authority to ensure that the mitigation is implemented when needed, the impacts are identified as significant and unavoidable.

Level of Significance After Mitigation describes the level of impact significance remaining after mitigation measures are implemented.

Level of Significance

Determining the severity of project impacts is fundamental to achieving the objectives of CEQA. CEQA Guidelines Section 15091 requires that decision makers mitigate the significant impacts identified in the Final EIR to less than significant, if feasible. If the EIR identifies any significant unmitigated impacts, CEQA Guidelines Section 15093 requires decision-makers to adopt a statement of overriding considerations that explains why the benefits of the project outweigh the adverse environmental consequences identified in the EIR.

The level of significance for each impact examined in this Draft EIR is determined by considering the predicted magnitude of the impact against the applicable threshold. Thresholds were developed using criteria from the CEQA Guidelines and Appendix G Checklist; federal, state, and local regulatory schemes; regional and local plans and ordinances; accepted practice; consultation with recognized experts; and other professional opinions.

Format Used for Impact Analysis and Mitigation Measures

The format adopted in this Draft EIR to present the evaluation of environmental impacts is described and illustrated below.

Summary Heading of Impact

Impact AIR-a: **An impact summary heading appears immediately preceding the impact description (Summary Heading of Impact in this example). The impact abbreviation identifies the section of the report (AIR for Air Quality in this example) and the sequential order of the impact (in this example) within that section. To the right of the impact number is the impact statement, which identifies the potential impact.**

Impact Analysis
A narrative analysis follows the impact statement.

Level of Significance Before Mitigation
This section identifies the level of significance of the impact before any mitigation is proposed.

Mitigation Measures
In some cases, following the impact discussion, reference is made to federal and state regulations and agency policies that would fully or partially mitigate the impact. In addition, policies and programs from applicable local land use plans that partially or fully mitigate the impact may be cited.

Project-specific mitigation measures, beyond those contained in other documents, are set off with a summary heading and described using the format presented below:

MM AIR-1: Project-specific mitigation is identified that would reduce the impact to the lowest degree feasible. The mitigation number links the particular mitigation to the impact with which it is associated (AIR-a in this example).

Abbreviations used in the mitigation measure numbering are shown in Table 3.0-1.

Table 3.0-1: Environmental Resource Abbreviations

Code	Environmental Resource Topic
AIR	Air Quality
CUL	Cultural Resources
EN	Energy
GHG	Greenhouse Gas Emissions
LU	Land Use and Planning
NOI	Noise
TRANS	Transportation
TCR	Tribal Cultural Resources
UTIL	Utilities and Service Systems

Level of Significance After Mitigation

This section identifies the resulting level of significance of the impact following mitigation.

3.1 AIR QUALITY

This section describes the environmental and regulatory setting for air quality. It also describes existing conditions and potential impacts related to air quality that would result from implementation of the proposed project, and identifies mitigation measures for potentially significant impacts, where feasible.

3.1.1 Environmental Setting

The project site lies within the San Francisco Bay Area Air Basin (SFBAAB) which is under the jurisdiction of the BAAD. The SFBAAB encompasses all of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, and Santa Clara counties, the southern portion of Sonoma, and the southwestern portion of Solano County. Air quality in this area is determined by natural factors including topography, meteorology, and climate, in addition to the presence of existing air pollution sources and ambient conditions.

Climate and Meteorology

Climate and meteorology are important considerations for air quality. Local dispersion and regional transport of air pollutants directly relate to prevailing meteorological factors. Wind directions and speeds, and vertical temperature structure (inversions) are the primary determinants of transport and dispersion effects.

The SFBAAB is characterized by complex terrain, consisting of coastal mountain ranges, inland valleys, and bays, which distort normal wind flow patterns. The Coast Range splits resulting in a western coast gap (Golden Gate) and an eastern coast gap (Carquinez Strait), which allows air to flow in and out of the SFBAAB and the Central Valley.

The climate is dominated by the strength and location of a semi-permanent, subtropical high-pressure cell. During the summer, the Pacific high-pressure cell is centered over the northeastern Pacific Ocean resulting in stable meteorological conditions and a steady northwesterly wind flow. This high-pressure cell keeps storms from affecting the California coast. Hence, the SFBAAB experiences little precipitation in the summer months. Winds tend to blow on shore out of the north/northwest. Upwelling of cold ocean water from below to the surface because of the northwesterly flow produces a band of cold water off the California coast. The cool and moisture-laden air approaching the coast from the Pacific Ocean is further cooled by the presence of the cold water band resulting in condensation and the presence of fog and stratus clouds along the Northern California coast.

In the winter, the Pacific high-pressure cell weakens and shifts southward resulting in wind flow offshore, the absence of upwelling, and the occurrence of storms. Weak inversions coupled with moderate winds result in a low air pollution potential.

Criteria Air Pollutants

Criteria air pollutants include ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter (PM) measured both in units of smaller than 2.5 microns in diameter ($PM_{2.5}$) and in units smaller than 10 microns in diameter (PM_{10}), and lead (Pb).

Ozone. Most ground-level O_3 is formed as a result of complex photochemical reactions in the atmosphere between reactive organic gases (ROG), nitrogen oxides (NOx), and oxygen. ROG and NOx are considered precursors to the formation of O_3, a highly reactive gas that can damage lung tissue and affect respiratory function. O_3 can damage the respiratory tract, causing inflammation and irritation, and it can induce symptoms, such as coughing, chest tightness, shortness of breath, and worsening of asthmatic symptoms. O_3 in sufficient doses increases the permeability of lung cells, rendering them more susceptible to toxins and microorganisms. Exposure to high concentrations of O_3 (above the current ambient air quality standard) leads to lung inflammation, lung tissue damage, and a reduction in the amount of air inhaled into the lungs. Health effects include potential increased susceptibility to respiratory infections and reduced ability to exercise. Health effects are more severe in people with asthma and other respiratory ailments. People who work or play outdoors are at a greater risk for harmful health effects from O_3. Children and adolescents are also at greater risk because they are more likely than adults to spend time engaged in vigorous activities. While O_3 in the lower atmosphere is considered a damaging air pollutant, O_3 in the upper atmosphere is beneficial, as it protects Earth from harmful ultraviolet radiation. However, atmospheric processes preclude ground-level O_3 from reaching the upper atmosphere (USEPA 2024a).

Carbon Monoxide. CO is a colorless, odorless, poisonous gas produced by the incomplete combustion of fossil fuels. Elevated levels of CO can result in harmful health effects, especially for the young and elderly, and can also contribute to global climate change (USEPA 2024a). When inhaled, CO enters the bloodstream and binds more readily to hemoglobin, the oxygen-carrying protein in blood, than oxygen, thereby reducing the oxygen-carrying capacity of blood and reducing oxygen delivery to organs and tissues. The health threat from CO is most serious for those who suffer from cardiovascular disease. Healthy individuals are also affected, but only at higher levels of exposure. Exposure to CO can cause chest pain, headaches, and reduced mental alertness. At high concentrations, CO can cause heart difficulties in people with chronic diseases and can impair mental abilities. Exposure to elevated CO levels is associated with visual impairment, reduced work capacity, reduced manual dexterity, poor learning ability, difficulty performing complex tasks, and, with prolonged enclosed exposure, death.

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas primarily produced as a result of the burning of fossil fuels. NO_2 can also lead to the formation of O_3 in the lower atmosphere. NO_2 can cause respiratory ailments, especially in the young and elderly, and can lead to degradations in the health of aquatic and terrestrial ecosystems (USEPA 2024a). Direct inhalation of NO_2 can cause a wide range of health effects, including irritation of the lungs, lung damage, and lowered resistance to respiratory infections, such as influenza. Short-term exposures (e.g., less than three hours) to low levels of NO_2 may lead to changes in airway responsiveness and lung function in individuals with preexisting respiratory illnesses. These exposures may also increase respiratory illnesses in children. Long-term exposures to NO_2 may lead to increased susceptibility to respiratory infection and may cause irreversible lung damage. Other health effects associated with NO_2 include an increase in the incidence of chronic bronchitis and lung irritation.

Sulfur Dioxide. SO_2 is primarily emitted from the combustion of coal and oil by steel mills, pulp and paper mills, and non-ferrous smelters. High concentrations of SO_2 can aggravate existing respiratory and cardiovascular diseases in asthmatics and others who suffer from emphysema or bronchitis. High concentrations of SO_2 can result in temporary breathing impairment for asthmatic children and adults who are active outdoors. Health effects from exposure to emissions of SO_2 include aggravation of lung diseases, especially bronchitis, and constricting of breathing passages, especially in asthmatics and

people involved in moderate to heavy exercise. Short-term exposures of individuals to elevated SO_2 levels during moderate activity may result in health effects, including breathing difficulties that can be accompanied by symptoms, such as wheezing, chest tightness, or shortness of breath. Other health effects that have been associated with longer-term exposures to high concentrations of SO_2, in conjunction with high levels of particulate matter, include aggravation of existing cardiovascular disease, respiratory illness, and alterations in the lungs' defenses. SO_2 also contributes to acid rain, which in turn, can lead to the acidification of lakes and streams (USEPA 2024a).

Particulate Matter. Airborne PM is not a single pollutant, but rather is a mixture of many chemical species. PM is a complex mixture of solids and aerosols composed of small droplets of liquid, dry solid fragments, and solid cores with liquid coatings. Particles vary widely in size, shape, and chemical composition; and they may contain inorganic ions, metallic compounds, elemental carbon, organic compounds, and compounds from Earth's crust. Particles are defined by their diameter for air quality regulatory purposes. Those with a diameter of 10 microns or less (PM_{10}) are inhalable into the lungs and can induce adverse health effects. Fine particulate matter is defined as particles that are 2.5 microns or less in diameter ($PM_{2.5}$) and is a portion of PM_{10}. Emissions from combustion of gasoline, oil, diesel fuel, or wood produce much of the $PM_{2.5}$ pollution found in outdoor air and a significant proportion of PM_{10}. PM_{10} also includes dust from construction sites, landfills and agriculture, wildfires and brush or waste burning, industrial sources, wind-blown dust from open lands, pollen, and fragments of bacteria.

PM may be either directly emitted from sources (primarily particles) or formed in the atmosphere through chemical reactions of gases (secondary particles) such as SO_2, NOx, and certain organic compounds (USEPA 2024a).

PM_{10} and $PM_{2.5}$ particles are small enough—about one-seventh the thickness of a human hair or smaller—to be inhaled and lodged in the deepest parts of the lung, where they evade the respiratory system's natural defenses and can be trapped in the nose, throat, and upper respiratory tract. Health effects from exposure to PM_{10} and $PM_{2.5}$ occur when the body reacts to these foreign particles. Acute and chronic health effects associated with high particulate levels include the aggravation of chronic respiratory diseases; heart and lung disease; and coughing, bronchitis, and respiratory illnesses in children. Recent mortality studies have shown a statistically significant direct association between mortality and daily concentrations of PM in the air. PM_{10} and $PM_{2.5}$ can aggravate respiratory disease and cause lung damage, cancer, and premature death. Sensitive populations, including children, the elderly, exercising adults, and those suffering from chronic lung disease, such as asthma or bronchitis, are especially vulnerable to the effects of PM. Of greatest concern are recent studies that link PM exposure to the premature death of people who already have heart and lung disease, especially the elderly. Acidic PM can also damage humanmade materials and is a major cause of reduced visibility in many parts of the United States. Non-health-related effects include reduced visibility and soiling of buildings.

Lead. Sources of Pb include pipes, fuel, and paint, although the use of Pb in these materials has declined dramatically over the years. Historically, the main source of Pb was automobile emissions. Pb can be inhaled directly or ingested by consuming Pb-contaminated food, water, or dust. Fetuses and children are most susceptible to Pb poisoning, which can result in heart disease and nervous system damage. Through regulations, the United States Environmental Protection Agency (USEPA) has gradually reduced the Pb content of gasoline. This program has essentially eliminated violations of the Pb standard in urban areas except those areas with Pb point sources. Exposure to Pb occurs mainly through inhalation of air

and ingestion of Pb in food, water, soil, or dust. It accumulates in the blood, bones, and soft tissues and can adversely affect the kidneys, liver, nervous system, and other organs. Excessive exposure to Pb may cause neurological impairments, such as seizures, mental retardation, and behavioral disorders. Even at low doses, Pb exposure is associated with damage to the nervous systems of fetuses and young children, resulting in learning deficits and lowered IQ. Recent studies also show that Pb may be a factor in high blood pressure and subsequent heart disease. Pb can also be deposited on the leaves of plants, presenting a hazard to grazing animals and humans through ingestion (USEPA 2024b).

Ambient Air Quality Standards and Attainment Status

The USEPA and California Air Resources Board (CARB) designate air basins where ambient air quality standards are exceeded as "non-attainment" areas. If standards are met, the area is designated as an "attainment" area. If there is inadequate or inconclusive data to make a definitive attainment designation, they are considered "unclassified." National non-attainment areas are further designated as marginal, moderate, serious, severe, or extreme as a function of deviation from standards. Attainment status is based on the National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS). Each standard has a different definition, or "form" of what constitutes attainment, based on specific air quality statistics. For example, the federal 8-hour CO standard is not to be exceeded more than once per year; therefore, an area is in attainment of the CO standard if no more than one 8-hour ambient air monitoring value exceeds the threshold per year. In contrast, the federal annual standard for $PM_{2.5}$ is met if the 3-year average of the annual average $PM_{2.5}$ concentration is less than or equal to the standard.

The Federal Clean Air Act (FCAA) identifies two types of NAAQS. Primary standards provide public health protection, including protecting the health of sensitive populations such as asthmatics, children, and the elderly. Secondary standards provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings (USEPA 2024a). The CAAQS are equal to or more stringent than the NAAQS and include pollutants for which national standards do not exist. Table 3.1-1 presents the applicable NAAQS and CAAQS. The BAAD is designated as nonattainment for federal and state ozone and $PM_{2.5}$ as well as state PM_{10} (BAAD 2017a). The BAAD is in attainment or unclassified for all other NAAQS and CAAQS.

Table 3.1-1: California and National Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[1]	National Standards[2]	
			Primary	Secondary
Ozone (O_3)	8-hour	0.070 ppm (137 µg/m^3)	0.070 ppm (137 µg/m^3)	Same as Primary Standards
	1-hour	0.09 ppm (180 µg/m^3)	--	
Carbon monoxide (CO)	8-hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	--
	1-hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	
Nitrogen dioxide (NO_2)	Annual arithmetic mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)	Same as Primary Standard
	1-hour	0.18 ppm (339 µg/m^3)	100 ppb (188 µg/m^3)	
Sulfur dioxide (SO_2)	Annual arithmetic mean	--	0.030 ppm (80 µg/m^3)	--
	24-hour	0.04 ppm (105 µg/m^3)	0.14 ppm (80 µg/m^3)	--

Pollutant	Averaging Time	California Standards[1]	National Standards[2]	
			Primary	Secondary
	3-hour	--	--	0.5 ppm (1300 µg/m^3)
	1-hour	0.25 ppm (655 µg/m^3)	--	--
Respirable Particulate Matter Smaller than 10 Microns in Diameter (PM_{10})	Annual arithmetic mean	20 µg/m^3	--	Same as Primary Standards
	24-hour	50 µg/m^3	150 µg/m^3	
Respirable Particulate Matter Smaller than 2.5 Microns in Diameter ($PM_{2.5}$)[3]	Annual arithmetic mean	12 µg/m^3	9.0 µg/m^3	15 µg/m^3
	24-hour	No separate standard	35 µg/m^3	Same as Primary Standards
Sulfates	24-hour	25 µg/m^3	--	--
Lead (Pb)	30-day average	1.5 µg/m^3	--	--
	Calendar quarter	--	1.5 µg/m^3	Same as Primary Standard
	Rolling 3-month average	--	0.15 µg/m^3	
Hydrogen sulfide (H_2S)	1-hour	0.03 ppm (42 µg/m^3)	--	--
Vinyl chloride (chloroethene)	24-hour	0.01 ppm (26 µg/m^3)	--	--
Visibility reducing particles	8-hour	In 1989, the Air Resources Board converted the general statewide 10-mile visibility standard to instrumental equivalents, which are extinction of 0.23 per kilometer.	--	--

Notes:
1. CO, SO_2 (1- and 24-hour), NO_2, O_3, PM_{10}, and visibility reducing particles standards are not to be exceeded.
2. Not to be exceeded more than once a year except for annual standards.
3. On February 7, 2024, the USEPA issued a pre-publication version of the Final Rule to lower the primary annual NAAQS for $PM_{2.5}$ from 12.0 µg/m^3 to 9.0 µg/m^3 (USEPA 2024d).
-- = no standard established
µg/m^3 = micrograms per cubic meter
mg/m^3 = milligrams per cubic meter
ppm = parts per million
ppb = parts per billion
Sources: CARB 2024a, USEPA 2024d

Ambient Air Quality

Local air quality can be evaluated by reviewing relevant air pollution concentrations near the project site. The nearest air quality monitoring stations to the project site are the Los Gatos and San Jose-Jackson Street monitoring stations. The Los Gatos Monitoring Station, which is approximately 4 miles southwest of the project Site, monitors O_3 only, and the San Jose-Jackson Monitoring Station, which is approximately 5 miles northeast of the project Site, monitors O_3, PM_{10}, $PM_{2.5}$, NO_2. Table 3.1-2 includes a summary of the air quality monitoring data for the years 2022 through 2024.

Table 3.1-2: Los Gatos Monitoring Station and San Jose-Jackson Street Monitoring Station Data (2022-2024)

Pollutant	Air Pollutant, Averaging Time (Units)	2022	2023	2024
Los Gatos Monitoring Station				
Ozone (ppm)	Maximum 1-hour	0.080	0.090	0.046
	California 1-hour number of days over standard	0	0	0
	Maximum 8-hour	0.069	0.055	0.044
	National 8-hour number of days over standard	0	0	0
	California 8-hour number of days over standard	0	0	0
San Jose-Jackson Street Monitoring Station				
Ozone (ppm)	Maximum 1-hour	0.090	0.087	0.040
	California 1-hour number of days over standard	0	0	0
	Maximum 8-hour	0.074	0.068	0.035
	National 8-hour number of days over standard	1	0	0
	California 8-hour number of days over standard	1	0	0
PM_{10} ($\mu g/m^3$)	Maximum 24-hour	41.1	*	*
	National 24-hour number days over standard	0	0	0

Odors

Typically, odors are regarded as an annoyance rather than a health hazard. However, manifestations of a person's reaction to foul odors can range from the psychological (i.e., irritation, anger, or anxiety) to the physiological (i.e., circulatory and respiratory effects, nausea, vomiting, and headache).

The ability to detect odors varies considerably among the population and is subjective. Some individuals can smell very minute quantities of specific substances; others have varying sensitivities to odors; and people may have different reactions to the same odor (e.g., bakery, gasoline). It is important to note that an unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. This

is because of the phenomenon known as odor fatigue, in which a person can become desensitized to almost any odor and recognition only occurs with an alteration in the intensity.

Quality and intensity are two properties present in any odor. The quality of an odor indicates the nature of the smell experience, e.g., a description of flowery or sweet. Intensity refers to the strength of the odor and depends on the odorant concentration in the air. When an odorous sample is progressively diluted, the odorant concentration decreases, the odor intensity weakens, and it eventually becomes so low that the detection or recognition of the odor is quite difficult. At some point during dilution, the concentration of the odorant drops below a human's detection threshold.

Neither the state nor the federal governments have adopted rules or regulations for the control of odor sources. Potential odors would be subject to BAAD Regulation 7, Odorous Substances (BAAD 1982).

Toxic Air Contaminants

Toxic air contaminants (TACs) are air pollutants that may cause or contribute to an increase in mortality or serious illness, or which may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; but due to their high toxicity, they may pose a threat to public health even at very low concentrations. Because there is no threshold level below which adverse health impacts are not expected to occur, TACs differ from criteria pollutants for which acceptable levels of exposure can be determined and for which state and federal governments have set ambient air quality standards. TACs, therefore, are not considered "criteria pollutants" under either the FCAA or the California Clean Air Act (CCAA) and are not subject to NAAQS or CAAQS ambient air quality standards. Instead, USEPA and CARB regulate hazardous air pollutants (HAPs) and TACs, respectively, through statutes and regulations that generally require the use of the maximum or best available control technology to limit emissions. In conjunction with air district rules, these federal and state statutes and regulations establish the regulatory framework for TACs. At the national level, USEPA has established national emission standards for hazardous air pollutants (NESHAP) in accordance with the requirements of the FCAA and subsequent amendments. These are technology-based, source-specific regulations that limit allowable emissions of HAPs.

The following provides a summary of the primary TACs of concern relevant to the proposed project within the State of California and related health effects.

Asbestos

Asbestos is the name given to a number of naturally occurring fibrous silicate minerals with useful properties such as thermal insulation, chemical and thermal stability, and high tensile strength. The three most common types of asbestos are chrysotile, amosite, and crocidolite. Chrysotile, also known as white asbestos, is the most common type of asbestos found in buildings. Chrysotile makes up approximately 90 to 95 percent of all asbestos contained in buildings in the United States. Exposure to asbestos fibers may result in health issues such as lung cancer, mesothelioma (a rare cancer of the thin membranes lining the lungs, chest, and abdominal cavity), and asbestosis (a non-cancerous lung disease that causes scarring of the lungs). Exposure to asbestos can occur during demolition or remodeling of buildings constructed prior to 1977 when it was banned for use in buildings. Exposure to naturally occurring asbestos can occur during soil disturbing activities in areas with deposits present (USEPA 2024c).

Diesel Particulate Matter

Diesel particulate matter (DPM) was identified as a TAC by CARB in August 1998. DPM is emitted from both mobile and stationary sources. In California, DPM emissions are generated from mobile and stationary sources. Mobile sources include on-road vehicles (trucks, buses, etc.), off-road vehicles and equipment (locomotives, tractors, cargo handling equipment, construction equipment, etc.), marine vessels (recreational watercraft, commercial harbor craft, and ocean-going vessels), and transport refrigeration units. Stationary sources include stationary engines used in emergency-standby generators, prime generators, and agricultural irrigation pumps, as well as portable equipment such as portable generators and pumps (Office of Environmental Health Hazard Assessment [OEHHA] 2001).

DPM is typically composed of carbon particles (“soot”, also called black carbon) and numerous organic compounds, including over 40 known cancer-causing organic substances. Examples of these chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene. Diesel exhaust also contains gaseous pollutants, including ROG and NOx. NOx emissions from diesel engines are important because they can undergo chemical reactions in the atmosphere leading to formation of $PM_{2.5}$ and O_3.

In California, diesel exhaust particles have been identified as a carcinogen accounting for an estimated 70 percent of the total known cancer risks in California. DPM is estimated to increase statewide cancer risk by 520 cancers per million residents exposed over an estimated 70-year lifetime. Non-cancer health effects associated with exposure to DPM include premature death, exacerbated chronic heart and lung disease, including asthma, and decreased lung function in children. Short-term exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. Individuals most vulnerable to non-cancer health effects of DPM are children, whose lungs are still developing, the elderly, who often have chronic health problems, and people with emphysema, asthma, and chronic heart and lung disease (CARB 2024c). In addition to its health effects, DPM significantly contributes to haze and reduced visibility.

Sensitive Receptors

Those who are sensitive to air pollution include children, the elderly, and persons with pre-existing respiratory or cardiovascular illness. For the purposes of CEQA, a sensitive receptor is considered to be a location that houses or attracts children, the elderly, people with illnesses, or others who are especially sensitive to the effects of air pollutants. Examples of sensitive receptors include hospitals, residences, convalescent facilities, and schools.

Single-family residences are located immediately east of the project site, and multi-family residences are located to the northeast, north of Paseo De Palomas Lane. Additional residential uses are located to the west, across SR-17.

3.1.2 Regulatory Setting

The agencies with regulatory authority over air emissions in the project area are the USEPA, the CARB, and the BAAD. Each of these jurisdictions develops rules, regulations, and policies to attain the goals or directives imposed upon them through legislation. Although USEPA regulations may not be superseded, both state and local regulations may be more stringent.

Federal

U.S. Environmental Protection Agency

At the federal level, the USEPA has been charged with implementing national air quality programs. The USEPA's air quality mandates are drawn primarily from the FCAA, which was signed into law in 1970. Congress substantially amended the FCAA in 1977 and again in 1990.

Federal Clean Air Act

The FCAA required USEPA to establish NAAQS and set deadlines for their attainment. Two types of NAAQS have been established: primary standards, which protect public health, and secondary standards, which protect public welfare from non-health-related adverse effects, such as visibility restrictions. NAAQS are summarized in Table 3.1-1.

National Emission Standards for Hazardous Air Pollutants

Pursuant to the FCAA of 1970, USEPA established NESHAP. These are technology-based source-specific regulations that limit allowable emissions of HAPs. These sources include asbestos-containing building materials (ACBM). NESHAPs include requirements pertaining to the inspection, notification, handling, and disposal of ACBMs associated with the demolition and renovation of structures.

Non-Road Diesel Rule

The USEPA has established a series of increasingly strict emissions standards for new off-road diesel vehicles and engines, including aircraft, heavy equipment, and locomotives. Any off-road construction equipment used for the proposed project would be required to comply with the applicable emissions standards.

State

California Air Resources Board

CARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California and for implementing the CCAA of 1988. Other CARB duties include monitoring air quality in conjunction with air monitoring networks maintained by air pollution control districts and air quality management districts, establishing CAAQS, which in many cases are more stringent than the NAAQS, and setting emissions standards for new motor vehicles. The emission standards established for motor vehicles differ depending on various factors including the model year, and the type of vehicle, fuel, and engine used. The CAAQS are set to be protective of human health and are summarized in Table 3.1-1. These standards apply to the same criteria pollutants as the FCAA and also include sulfates, visibility reducing particulates, hydrogen sulfide, and vinyl chloride. There are currently no NAAQS for these latter pollutants.

California Clean Air Act

The CCAA requires that all air districts in the state endeavor to achieve and maintain CAAQS for O_3, CO, SO_2, and NO_2 by the earliest practical date. The CCAA specifies that districts focus attention on reducing the emissions from transportation and area wide emission sources, and the act provides districts with authority to regulate indirect sources. Each district plan is required to either (1) achieve a five percent annual reduction, averaged over consecutive 3-year periods, in district-wide emissions of each non-attainment pollutant or its precursors, or (2) to provide for implementation of all feasible measures to reduce emissions. Any planning effort for air quality attainment would thus need to consider both state and federal planning requirements.

Assembly Bills 1807 and 2588 – Toxic Air Contaminants

Within California, TACs are regulated primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act) and AB 2588 (Air Toxics Hot Spots Information and Assessment Act of 1987). AB 1807 sets forth a formal procedure for CARB to designate substances as TACs. This includes research, public participation, and scientific peer review before CARB designates a substance as a TAC.

Existing sources of TACs that are subject to the Air Toxics Hot Spots Information and Assessment Act are required to: (1) prepare a toxic emissions inventory; (2) prepare a risk assessment if emissions are significant; (3) notify the public of significant risk levels; and (4) prepare and implement risk reduction measures.

Assembly Bill 617 – Community Air Protection Program

In response to AB 617 (C. Garcia, Chapter 136, Statutes of 2017), CARB established the Community Air Protection Program. The Community Air Protection Program includes community air monitoring, and the community emissions reduction program's focus is to reduce exposure in communities most impacted by air pollution. The California Legislature has appropriated funding to support early actions to address localized air pollution through targeted incentive funding to deploy cleaner technologies in these communities and grants to support community participation in the AB 617 process. AB 617 also includes new requirements for accelerated retrofit of pollution controls on industrial sources, increased penalty fees, and greater transparency and availability of air quality and emissions data, which will help advance air pollution control efforts throughout the state.

Regulatory Attainment Designations

Under the CCAA, CARB is required to designate areas of the state as attainment, non-attainment, or unclassified with respect to applicable standards. An "attainment" designation for an area signifies that pollutant concentrations did not violate the applicable standard in that area. A "non-attainment" designation indicates that a pollutant concentration violated the applicable standard at least once, excluding those occasions when a violation was caused by an exceptional event, as defined in the criteria. Depending on the frequency and severity of pollutants exceeding applicable standards, the non-attainment designation can be further classified as serious non-attainment, severe non-attainment, or extreme non-attainment, with extreme non-attainment being the most severe of the classifications. An "unclassified" designation signifies that the data does not support either an attainment or non-attainment

designation. The CCAA divides districts into moderate, serious, and severe air pollution categories, with increasingly stringent control requirements mandated for each category.

USEPA designates areas for O_3, CO, and NO_2 as "does not meet the primary standards," "cannot be classified," or "better than national standards." For SO_2, areas are designated as "does not meet the primary standards," "does not meet the secondary standards," "cannot be classified," or "better than national standards." However, CARB terminology of attainment, non-attainment, and unclassified is more frequently used. The USEPA uses the same sub-categories for non-attainment status: serious, severe, and extreme. In 1991, USEPA assigned new non-attainment designations to areas that had previously been classified as Group I, II, or III for PM_{10} based on the likelihood that they would violate national PM_{10} standards. All other areas are designated as unclassified.

Low-Emission Vehicle Program and Zero-Emission Vehicle Program

CARB first adopted Low-Emission Vehicle (LEV) program standards in 1990. The first LEV program standards ran from 1994 through 2003. LEV II regulations, running from 2004 through 2010, represented continuing progress in emission reductions. As the state's passenger vehicle fleet continued to grow and more sport utility vehicles and pickup trucks are used as passenger cars rather than work vehicles, the more stringent LEV II standards were adopted to provide reductions necessary for California to meet federally mandated clean air goals outlined in the 1994 State Implementation Plan (SIP). In 2012, CARB adopted the LEV III amendments to California's LEV regulations. These amendments include more stringent emission standards for both criteria pollutants and greenhouse gases (GHGs) for new passenger vehicles.

The Advanced Clean Cars II (ACC II) regulation builds on the Advanced Clean Cars (ACC) rule adopted in 2012. ACC II decreases emissions by increasing EV sales via two programs. First, the Zero-Emission Vehicle (ZEV) program requires ZEVs, defined as battery-electric vehicles or fuel-cell-electric vehicles to comprise an increasing portion of annual vehicle sales. Under the ZEV program, original equipment manufacturers must increase sales of ZEVs from 35 percent in 2026 to 100 percent in 2035. Second, ACC II further strengthened the LEV program discussed above, with more stringent emission standards beginning with model year 2025.

On-Road Heavy-Duty Vehicle Program

CARB has adopted standards for emissions from various types of new on-road heavy-duty vehicles. Section 1956.8, Title 13, CCR contains California's emission standards for on-road heavy-duty engines and vehicles, and test procedures. CARB has also adopted programs to reduce emissions from in-use heavy-duty vehicles including the Heavy-Duty Diesel Vehicle Idling Reduction Program, the Heavy-Duty Diesel In-Use Compliance Program, the Public Bus Fleet Rule and Engine Standards, and the School Bus Program and others.

In addition, the CARB's Truck and Bus regulation was established to meet federal attainment standards. This regulation requires heavy-duty diesel vehicles that operate in California to reduce TAC emissions from their exhaust. Diesel exhaust is responsible for 70 percent of the cancer risk from airborne toxics. Therefore, as of January 1, 2023, nearly all trucks and buses are required to have 2010 or newer model year engines to reduce PM and NOx emissions.

In-Use Off-Road Diesel-Fueled Fleets Regulation

CARB has adopted the In-Use Off-Road Diesel-Fueled Fleets Regulation with the intent to reduce PM and NOx emissions from existing off-road heavy-duty diesel vehicles in California. In general, the regulation imposes limits on vehicle idling; requires all vehicle usage be reported to CARB; restricts the addition of older vehicles into fleets; requires the phase-out of the oldest and least efficient engines; and, as of 2024, requires the procurement and use of renewable diesel.

Advanced Clean Truck Act

To reduce emissions, the Advanced Clean Truck Act (ACT) requires original equipment manufacturers of medium- and heavy-duty vehicles to sell ZEVs or near-zero-emissions vehicles, such as plug-in electric hybrids, at an increasing percentage of their annual sales from 2024 to 2035. A ZEV is a vehicle that produces zero tail-pipe emissions, including battery EVs and hydrogen fuel cell vehicles. A near-zero-emissions vehicle is a vehicle with an internal combustion engine and an electric energy storage system, including plug-in hybrid vehicles and hydrogen internal combustion engine vehicles. The ACT includes a cap-and-trade system, capping the number of fossil fuel vehicles sold by stipulating annual sales percentage requirements. Manufacturers can comply with the ACT by generating compliance credits through the sale of ZEVs or near-ZEVs or through the trading of compliance credits.

California State Implementation Plan

The FCAA (and its subsequent amendments) requires each state to prepare an air quality control plan referred to as the SIP. The SIP is a living document that is periodically modified to reflect the latest emissions inventories, plans, and rules and regulations of air basins as reported by the agencies with jurisdiction over them. The FCAA Amendments dictate that states with areas violating the NAAQS revise their SIPs to include extra control measures to reduce air pollution. The SIP includes strategies and control measures to attain the NAAQS by deadlines established by the CAA. The USEPA has the responsibility to review all SIPs to determine if they conform to the requirements of the CAA. State law makes CARB the lead agency for all purposes related to the SIP. Local air districts and other agencies prepare SIP elements and submit them to CARB for review and approval. CARB then forwards SIP revisions to the USEPA for approval and publication in the Federal Register.

Regional

Bay Area Air District

The BAAD is the public agency entrusted with regulating stationary sources of air pollution in the nine counties that surround San Francisco Bay: Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, southwestern Solano, and southern Sonoma counties. The BAAD has prepared their own CEQA Air Quality Guidelines, which is intended to be used for assistance with CEQA review (BAAD 2022). The BAAD CEQA Air Quality Guidelines include thresholds of significance and project screening levels for criteria air pollutants (ROG, NO_X, PM_{10}, and $PM_{2.5}$), GHGs, TACs, CO, and odors, as well as methods to assess and mitigate project-level and plan-level impacts.

Current Air Quality Plans

As noted previously, the BAAD is designated as nonattainment for federal and state ozone and $PM_{2.5}$ as well as state PM_{10} (BAAD 2017a). The BAAD adopted the 2017 Clean Air Plan in April 2017 that includes control strategies to reduce ozone precursors (ROG and NOx), particulate matter, TACs, and GHG emissions. The 2017 Clean Air Plan includes several measures for reducing particulate matter emissions from stationary sources and wood burning (BAAD 2017b).

Rules and Regulations

BAAD's regulations and rules include, but are not limited to, the following (BAAD 2024):

Regulation 2: Permits.

- **Rule 1: General Permit Requirements.** This regulation includes criteria for issuance or denial of permits, exemptions, and appeals against decisions of the Air Pollution Control Officer and BAAD actions on applications.

Regulation 6: Particulate Matter and Visible Emissions.

- **Rule 1: General Requirements.** The purpose of this regulation is to limit the quantity of particulate matter in the atmosphere through the establishment of limitations on emission rates, emission concentrations, visible emissions, and opacity.
- **Rule 6: Prohibition of Trackout.** The purpose of this rule is to limit the quantity of particulate matter in the atmosphere through control of trackout of solid materials onto paved public roads outside the boundaries of Large Bulk Material Site, Large Construction Site, and Large Disturbed Surface sites including landfills. This rule does not apply to Bulk Material Sites, Construction Sites and Disturbed Surface Sites less than 1 acre.

Regulation 7: Odorous Substances. Regulation 7 places general limitations on odorous substances and specific emission limitations on certain odorous compounds. The limitations of this regulation shall not be applicable until BAAD receives odor complaints from 10 or more complainants within a 90-day period alleging that a person has caused odors perceived at or beyond the property line of such person and deemed to be objectionable by the complainants in the normal course of their work, travel, or residence. BAAD staff shall investigate and track all odor complaints they receive and shall attempt to visit the site, identify the source of the objectionable odor, and assist the owner or facility in finding a way to reduce the odor.

Regulation 8: Organic Compounds

- **Rule 3: Architectural Coatings.** The purpose of this rule is to limit the quantity of volatile organic compounds in architectural coatings supplied, sold, offered for sale, applied, solicited for application, or manufactured for use within the District.
- **Rule 15: Emulsified and Liquid Asphalts.** The purpose of this Rule is to limit the emissions of VOCs caused by the use of Emulsified and Liquid asphalt in paving material and paving and maintenance operations.

Regulation 11: Hazardous Pollutants

- **Rule 2: Asbestos Demolition, Renovation and Manufacturing.** The purpose of this rule is to control emissions of asbestos to the atmosphere during demolition, renovation, milling and manufacturing and establish appropriate waste disposal procedures.

In addition, all construction within BAAD's jurisdiction is required to implement the BAAD's Basic Best Management Practices (BMPs) for Construction-Related Fugitive Dust Emissions, listed below (BAAD 2022):

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
2. All haul trucks transporting soil, sand, or other loose material offsite shall be covered.
3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
4. All vehicle speeds on unpaved roads shall be limited to 15 miles per hour (mph).
5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
6. All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph.
7. All trucks and equipment, including their tires, shall be washed off prior to leaving the site.
8. Unpaved roads providing access to sites located 100 feet or further from a paved road shall be treated with a 6- to 12-inch layer of compacted layer of wood chips, mulch, or gravel.
9. Publicly visible signs shall be posted with the telephone number and name of the person to contact at the lead agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's General Air Pollution Complaints number shall also be visible to ensure compliance with applicable regulations.

Local

Campbell General Plan

The Envision Campbell General Plan Update (2040 General Plan) was adopted on April 18, 2023 and provided an update to the 2001 General Plan. As previously noted, although an updated General Plan has been adopted by the City that would supersede the City's 2001 General Plan, as the Housing Crisis Act pre-application was submitted prior to adoption of the 2040 General Plan, the proposed project is subject to the goals and policies of the 2001 General Plan which was in effect at the time of pre-

application submittal. Therefore, the goals and policies of the City's historical General Plan is listed below.[2]

The City's 2001 General Plan include the following goals and policies related to air quality that may be applicable to the proposed project (City of Campbell 2001):

Goal CNR-11: Work toward improving air quality and meeting all federal and state ambient air quality standards.

- **Policy CNR-11.1:** Air Quality Impacts: Reduce adverse air quality impacts of City operations.
- **Policy CNR-11.2:** Effects of Development on Air Quality: Use the City's development review proves and the California Environmental Quality Act to evaluate and mitigate the local and cumulative effects on new development on air quality.
- **Policy CNR-11.3:** Air Quality Improvement Programs: Support regional, state, and federal programs to improve air quality.

3.1.3 Environmental Impacts

This section analyzes the project's potential to result in significant air quality impacts. When an impact is determined to be significant, mitigation measures are identified that would reduce or avoid impacts.

Methodology for Analysis

Criterial Pollutant Emissions

The California Emissions Estimator Model (CalEEMod) is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions associated with both construction and operations from a variety of land use projects. CalEEMod quantifies direct GHG emissions, such as construction and operational activities and vehicle use, and indirect emissions, such as energy use, solid waste disposal, vegetation planting and/or removal, and water use. Further, CalEEMod identifies mitigation measures to reduce criteria pollutant and GHG emissions along with calculating the benefits achieved from measures chosen by the user.

CalEEMod was developed for the California Air Pollution Control Officers Association in collaboration with the California Air Districts. Default data (e.g., emission factors, trip lengths, meteorology, source inventory) have been provided by the various California Air Districts to account for local requirements and conditions. CalEEMod is a comprehensive tool for quantifying air quality impacts from land use projects located throughout California. The model can be used for a variety of situations where an air quality analysis is necessary or desirable, such as preparing CEQA or National Environmental Policy Act

[2] An explanation of the applicability of the City's 2001 General Plan is provided here to provide context for the use of the City's 2001 General Plan in this Draft EIR rather than the updated City General Plan that supersedes the 2001 General Plan. The explanation is omitted from the individual resource sections following this section but is cross referenced to this section to provide the reader with context on the applicability of the 2001 General Plan. For further explanation on the applicability of the 2001 General Plan, see Section 3.0, Environmental Impact Analysis.

documents, conducting pre-project planning, and verifying compliance with local air quality rules and regulations, etc.

CalEEMod version 2022.1.1.29 was used to estimate construction and operational emissions of the proposed project.

Detailed modeling assumptions and inputs can be found in Appendix C of this Draft EIR.

Health Risk Assessment

In order to identify the risk posed to nearby sensitive receptors during project construction, a health risk assessment (HRA) was conducted consistent with BAAD and the OEHHA guidance.

An air dispersion model is a mathematical formulation used to estimate the air quality impacts at specific locations (receptors) surrounding a source of emissions given the rate of emissions and prevailing meteorological conditions. This assessment relied on the USEPA's AMS/EPA Regulatory Model (AERMOD) Version 23132 air dispersion model applied in the Lakes Software AERMOD View Version 12.0.0 interface. The AERMOD model was used to estimate the concentration of TACs at sensitive receptor locations from potential sources of project generated TACs. After using AERMOD to determine the concentration of TACs at sensitive receptor locations, the associated health risks were calculated using the CARB's Hotspot Analysis Reporting Program Version 2 (HARP 2) Risk Assessment Standalone Tool (RAST), which calculates the cancer and non-cancer health impacts using the OEHHA's Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2015).

Detailed modeling assumptions and inputs can be found in Appendix C of this Draft EIR.

Thresholds of Significance

While the final determination of whether a project is significant is within the purview of the lead agency pursuant to Section 15064(b) of the CEQA Guidelines, the BAAD has adopted CEQA thresholds of significance for individual development projects, which establish maximum allowable emissions for ROG, NO_X, PM_{10}, and $PM_{2.5}$ (BAAD 2022). If the lead agency finds that the project has the potential to exceed these air pollution thresholds, the project should be considered to have significant air quality impacts. The BAAD thresholds are presented in Table 3.1-3.

Table 3.1-3: BAAD Criteria Pollutant Thresholds of Significance

Pollutant	Construction	Operation	
	Average Daily Emissions (lbs/day)	Average Daily Emissions (lbs/day)	Maximum Annual Emissions (tpy)
ROG	54	54	10
NOx	54	54	10
PM_{10}	82 (exhaust)	82	15
$PM_{2.5}$	54 (exhaust)	54	10

Note: Construction particulate matter thresholds only account for exhaust particulate matter emissions.
Source: BAAD 2022

According to the BAAD, a project would result in a significant impact if it would individually expose sensitive receptors to TACs resulting in an increased cancer risk greater than 10.0 in 1 million, an increased non-cancer risk of greater than 1.0 on the hazard index (chronic or acute), or an annual average ambient $PM_{2.5}$ increase greater than 0.3 $\mu g/m^3$.

CEQA Guidelines

In accordance with the CEQA Guidelines' Appendix G Environmental Checklist, the following questions were analyzed and evaluated to determine whether the proposed project's air quality impacts are significant.

Would the proposed project:

- Conflict with or obstruct implementation of the applicable air quality plan?
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is a nonattainment area under the applicable federal or state ambient air quality standard?
- Expose sensitive receptors to substantial pollutant concentrations?
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Project Impact Analysis and Mitigation Measures

Air Quality Plan

Impact AIR-a	**The proposed project would not conflict with or obstruct implementation of the applicable air quality plan.**

Impact Analysis

Air districts are required to prepare air quality plans to identify strategies to bring regional emissions into compliance with federal and state air quality standards. The BAAD's 2017 Clean Air Plan is the applicable air quality plan in the SFAB to reduce emissions from area, stationary, and mobile sources. Consistency determination with the Air Quality Management Plan plays an important role in local agency project review by linking local planning and individual projects to the 2017 Clean Air Plan. It fulfills the CEQA goal of informing decision-makers of the proposed project's environmental effects under consideration early enough to ensure that air quality concerns are fully addressed. It also provides the local agency with ongoing information as to whether they are contributing to the clean air goals in the 2017 Clean Air Plan. Individual projects can show consistency by: (1) meeting the growth projections used within the 2017 Clean Air Plan; (2) demonstrate consistency with applicable 2017 Clean Air Plan control measures; and/or (3) meet BAAD air quality thresholds.

Growth Projections

Regional emissions calculated within the 2017 Clean Air Plan are regional population, housing, and employment projections developed by the Association of Bay Area Governments (ABAG) based on local government's land use planning. The proposed project is not the anticipated use of the site when evaluated within the 2017 Clean Air Plan as the 2017 Clean Air Plan was based on the 2001 General

Plan which designated the site as R&D. The proposed project would construct 290 residential units and have an anticipated population of 772 residents. Furthermore, the City's 2040 General Plan designated the majority of the project site for housing with a greater density and higher maximum unit count than the proposed project. The 2022 General Plan EIR (the EIR for the 2040 General Plan) concluded that the City's 2040 General Plan, including the potential residential development of the project site, remained consistent with the 2017 Clean Air Plan. As discussed below, the proposed project would be consistent with the applicable control measures and would not exceed BAAD thresholds. Therefore, it would still be considered consistent with the 2017 Clean Air Plan.

Consistency Analysis

Table 3.1-4 identifies the project-applicable control measures in the 2017 Clean Air Plan required by BAAD to reduce emissions for a range of stationary and mobile sources as well as the proposed project's consistency with those control measures. As shown in Table 3.1-4, the proposed project would not conflict with these control measures.

Table 3.1-4: BAAD Criteria Pollutant Thresholds of Significance

Measure	Consistency
Stationary Source Control Measures	
SS18: Basin-Wide Combustion Strategy. Stabilize and then reduce emissions of GHGs, criteria air pollutant and toxic emissions from stationary combustion sources throughout the Air District by first establishing carbon intensity caps on major GHG sources, and then adopting new rules to (1) reduce fuel use on a source-type by source type basis, and (2) evaluate alternatives to decarbonize abatement devices.	**Consistent.** Stationary sources are regulated directly by the BAAD which implements rules and regulations to control stationary source emissions. Any new stationary sources associated with the project would be required to comply with BAAD's rules and regulations including issuance of a permit. The proposed project would construct new residential units and is not anticipated to require any new stationary sources.
SS21: New Source Review for Air Toxics. Propose revisions to Air District Rule 2-5, New Source Review of Toxic Air Contaminants, based on OEHHA's 2015 Health Risk Assessment Guidelines and ARB/California Air resource Board/ California Air Pollution Control Officers Association's 2015 Risk Management Guidance. Revise the Air District's Health Risk Assessment trigger levels for each toxic air contaminant using the 2015 Guidelines and most recent health effects values.	**Consistent.** Stationary sources are regulated directly by the BAAD which implements rules and regulations to control stationary source emissions. Any new stationary sources associated with the project would be required to comply with BAAD's rules and regulations including issuance of a permit. The proposed project would construct new residential units and is not anticipated to require any new stationary sources.
SS 36: PM from Trackout. Develop new Air District rule to prevent mud/dirt and other solid trackout from construction, landfills, quarries and other bulk material sites.	**Consistent.** The proposed project would be required to comply with BAAD's Regulation 6, Rule 1 and Rule 6 as well as BAAD's BMPs for Construction-Related Fugitive Dust Emissions.
SS 37: PM from Asphalt Operations. Develop an Air District rule to require abatement/control of blue smoke emissions related to asphalt delivery to roadway paving projects.	**Consistent.** The proposed project would be required to comply with BAAD Regulation 8, Rule 15.
Transportation Control Measures	
TR 9: Bicycle and Pedestrian Access and Facilities. Encourage planning for bicycle and pedestrian facilities in local plans, e.g., general and	**Consistent.** Transportation control measures are strategies to reduce vehicle trips, vehicle use, Vehicle Miles Traveled (VMT), vehicle idling, and traffic congestion to reduce motor vehicle emissions. Most

Measure	Consistency
specific plans, fund bike lanes, routes, paths and bicycle parking facilities.	traffic control measures are implemented at the regional level by ABAG. Regardless, the proposed project would have a less than significant impact on vehicle miles traveled (VMT). Moreover, the proposed project would include bicycle racks throughout the project site that would allow for a total of 72 exterior bicycle parking spaces.
Energy and Climate Control Measures	
EN1: Decarbonize Electricity Production. Engage with PG&E, municipal electric utilities and Community Choice Energy to maximize the amount of renewable energy contributing to the production of electricity within the Bay Area as well as electricity imported into the region. Work with local governments to implement local renewable energy programs. Engage with stakeholders including dairy farms, forest managers, water treatment facilities, food processors, public works agencies, and waste management to increase use of biomass in electricity production.	**Consistent.** The proposed project would be all electric and would not include natural gas infrastructure, and all homes are proposed to have solar photovoltaic systems installed, either individually or for the larger condominium building as a whole. Additionally, all structures would comply with the relevant provisions of the CALGreen Code and would not contribute substantially to regional carbon emissions.
EN2: Decrease Electricity Demand. Work with local governments to adopt additional energy efficiency policies and programs. Support local government energy efficiency program via best practices, model ordinances, and technical support. Work with partners to develop messaging to decrease electricity demand during peak times.	**Consistent.** The proposed project would include a solar photovoltaic system.
Building Control Measures	
BL2: Decarbonize Buildings. Explore potential Air District rulemaking options regarding the sale of fossil fuel-based space and water heating systems for both residential and commercial use. Explore incentives for property owners to replace their furnace, water heater, or natural gas powered appliances with zero-carbon alternatives. Update Air District guidance documents to recommend that commercial and multi-family developments install ground source heat pumps and solar hot water heaters.	**Consistent.** The proposed project would be all electric and would not include natural gas infrastructure, and all homes are proposed to have solar photovoltaic systems installed, either individually or for the larger condominium building as a whole. Additionally, all structures would comply with the relevant provisions of the CALGreen Code and would not contribute substantially to regional carbon emissions.
Natural and Working Lands Control Measures	
NW-3: Carbon Sequestration in Wetlands. Identify federal, State, and regional agencies, and collaborative working groups that the Air District can assist with technical expertise, research or incentive funds to enhance carbon sequestration in wetlands around the Bay Area. Assist agencies and organizations that are working to secure the protection and restoration of wetlands in the San Francisco Bay.	**Not Applicable.** This control measure focuses on increasing carbon sequestration on wetlands. The proposed project would not be constructed on wetlands.
Waste Management Control Measures	
WA-4: Recycling and Waste Reduction. Develop model policies to facilitate local adoption of ordinances and programs to reduce the amount of green waste going to landfills.	**Consistent**. The control measure includes strategies to increase waste diversion rates through efforts to reduce, reuse, and recycle. The proposed project would comply with City policies related to reducing the green waste going to landfills. Additionally, the Project would be required to comply with SB 1383 which requires

Measure	Consistency
	building management to provide organics collection service, education, and outreach.
Water Control Measures	
WR-2: Support Water Conservation. Develop a list of best practices that reduce water consumption and increase on-site water recycling in new and existing buildings; incorporate into local planning guidance.	**Consistent.** The proposed project would include water efficiency measures required under CALGreen.
Super GHG Control Measures	
SL-1: Short-Lived Climate Pollutants. Reduce methane from landfills and farming activities through various control measures listed under waste and agriculture sectors. Develop a rule to reduce methane emissions from natural gas pipelines and processing operations and amend regulations to reduce emissions of methane and other organic gases from equipment leaks at oil refineries. Enforce applicable regulations of the servicing of existing air conditioning units in motor vehicles, support the adoption of more stringent regulations by ARB and/or USEPA, and encourage better HFC disposal practices.	**Not Applicable**. Super-GHGs include methane, black carbon, and fluorinated gases. These compounds are sometimes referred to as short-lived climate pollutants because their lifetime in the atmosphere is generally short. The proposed project would not include any land uses that generate significant levels of short-lived climate pollutants.

Source: BAAD 2017.

Emissions

Air districts establish emissions thresholds for individual projects to demonstrate the point at which a project would be considered to increase the air quality violations. A project would conflict with the applicable air quality plan if they exceeded any emissions thresholds for which the region is in nonattainment. The BAAD's adopted thresholds of significance indicate the levels of emissions that projects may emit while the region still moves towards attainments of the CAAQS and NAAQS. Projects that exceed thresholds would be considered to conflict with the 2017 Clean Air Plan. As described under Impact AIR-2, implementation of the proposed project would not result in net new emissions that exceed the thresholds established by the BAAD. As a result, the proposed project would not conflict with or obstruct implementation of the applicable air quality plan.

Therefore, because the proposed project is consistent with the applicable control measures and fall below BAAD significance thresholds, it is consistent with the 2017 Clean Air Plan. Therefore, the impact is less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Criteria Pollutants

Impact AIR-b **The proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.**

Impact Analysis

In developing thresholds of significance for air pollutants, the BAAD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. Construction and operational emissions are discussed separately below.

Construction Emissions

The proposed project's estimated construction emissions are provided in Table 3.1-5 below. Emissions were calculated using CalEEMod, detailed calculation assumptions are provided in Appendix C. As shown therein, construction of the proposed project would not result in emissions that exceed BAAD thresholds.

Table 3.1-5: Construction Criteria Pollutant Emissions

Phase[a, b]	Average Daily Emissions (lbs/day)			
	ROG	NOx	PM_{10}[c]	$PM_{2.5}$[c]
Phase 1 and Phase 2	3.55	10.08	3.52	1.49
Phase 3	3.51	6.51	1.29	0.44
Phase 4	3.79	6.15	1.29	0.44
BAAD Thresholds	**54**	**54**	**82**	**54**
Exceed BAAD Thresholds?	***No***	***No***	***No***	***No***

Notes:

[a] Construction emissions were modeled assuming a construction period from 2026 through 2030. Since the emissions were modeled, the proposed construction schedule shifted back by 14 months and Phase 1 construction was extended by approximately 20 working days. Emissions previously run were determined to be similar if not a conservative estimate of the Project emissions due to the following: (1) emissions tend to decrease over time due to emerging technologies and stricter regulations; and (2) BAAD measures emissions in average pounds per day, therefore an extended construction period would result in less emissions per day on average.

[b] The average daily emissions were calculated for each construction phase based on the annual emissions divided by the total days of construction within each phase.

[c] BAAD thresholds for PM_{10} and $PM_{2.5}$ are intended for exhaust emissions only. The emissions presented above include total particulate matter (exhaust emissions and fugitive emissions) and are therefore a conservative estimate.

Source: Appendix C

Consistent with BAAD requirements, the proposed project would implement BAAD's Basic BMPs for Construction-Related Fugitive Dust Emissions and would comply with Regulation 6, both of which would reduce fugitive PM emissions during construction.

Based on the above, the proposed project's construction emissions would not result in a cumulatively considerable net increase in criteria air pollutant emissions.

Operational Emissions

The proposed project would include redevelopment of the existing R&D campus with a new residential development. This analysis considers the net change in emissions that would occur from implementation of the proposed project as compared to the emissions that occur under existing conditions. Emissions were calculated using CalEEMod, detailed calculation assumptions are provided in Appendix C. Table 3.1-6 presents the estimated criteria pollutant emissions that occur under existing conditions. Table 3.1-7 presents the estimated criteria pollutant emissions that would occur under the proposed project, as well as the net change in emissions from implementation of the proposed project. As shown therein, the net increase in emissions associated with implementation of the proposed project would not exceed the BAAD's thresholds of significance.

Overlapping Emissions

The potential exists for the initial phases of the proposed project to become operational while construction of the remaining phases continues. For example, the structures built during Phase 2 (27 single-family homes and 49 three-story townhome-style condominiums) may become occupied and result in operational emissions while construction of Phase 3 is underway and generating construction emissions. Table 3.1-8 shows the potential overlapping emissions that may occur during implementation of the proposed project in comparison to the BAAD's daily emission thresholds of significance.

Table 3.1-8: Overlapping Criteria Pollutant Emissions

Project Component	Average Daily Emissions (lbs/day)			
	ROG	**NOx**	**PM_{10}**	**$PM_{2.5}$**
Operation of Phase 2	4.08	1.41	2.21	0.60
Construction of Phase 3	3.83	6.94	1.43	0.49
Overlapping Emissions	*7.90*	*8.35*	*3.64*	*1.08*
Operation of Phase 2 and Phase 3	8.20	2.67	4.77	1.27
Construction of Phase 4	4.84	5.19	1.11	0.37
Overlapping Emissions	*13.04*	*7.86*	*5.88*	*1.64*
BAAD Thresholds	**54**	**54**	**82**	**54**
Exceed BAAD Thresholds?	***No***	***No***	***No***	***No***

Source: Appendix C

As demonstrated through the discussion above, criteria pollutant emissions would not exceed any applicable threshold of significance during project construction, operation, or during overlapping phases. Therefore, the proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the region is non-attainment under an applicable federal or state ambient air quality standard, and the impact would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Sensitive Receptors

Impact AIR-c	**The proposed project could expose sensitive receptors to substantial pollutant concentrations.**

Impact Analysis

This discussion addresses whether the proposed project would expose sensitive receptors to construction-generated fugitive dust (PM_{10}), naturally occurring asbestos (NOA), construction-generated DPM, or operational related TACs.

According to CARB, some land uses are considered more sensitive to air pollution than others due to the types of population groups or activities involved. Heightened sensitivity may be caused by health problems, proximity to the emissions source, or duration of exposure to air pollutants. Children, pregnant women, the elderly, and those with existing health problems are especially vulnerable to the effects of air pollution. Accordingly, land uses that are typically considered to be sensitive receptors include residences, schools, childcare centers, playgrounds, retirement homes, convalescent homes, hospitals, and medical clinics. The nearest sensitive receptors to the project site include the single-family residences located immediately to the east, and the multi-family residences located to the northeast, north of Paseo De Palomas Lane. Additional residential uses are located to the west of the project site, across SR-17.

Construction Emissions

During project construction, the potential exists for emissions of fugitive dust, NOA, and DPM to be released. Each TAC is discussed separately below.

Fugitive Dust

Fugitive dust would be generated from site grading and other earth-moving activities. Most of this fugitive dust would remain localized and would be deposited near the project site. However, the potential for impacts from fugitive dust exists unless control measures are implemented to reduce the emissions from the project site. All projects within the jurisdiction of the BAAD are required to implement all of the BAAD's BMPs (BAAD 2022). The proposed project's required implementation of the BAAD's BMPs, as well as compliance with Regulation 6, Particulate Matter and Visible Emissions, would minimize construction-related fugitive dust emissions to 20 percent opacity for particulate matter emissions.

Asbestos

Based on historical aerial imagery, the onsite buildings were constructed after the 1989 California ban of asbestos on new construction. As a result, workers and nearby receptors would not be exposed to ACBMs during demolition.

Construction in areas of rock formations that contain NOA could release asbestos to the air and pose a health hazard. However, a review of the map with areas more likely to have rock formations containing NOA in California indicates that there is no asbestos in the immediate project area (U.S. Geological Survey 2011). Therefore, construction of the proposed project would not expose sensitive receptors to NOA.

Diesel Particulate Matter

Exposure to DPM from diesel vehicles and off-road construction equipment can result in health risks to nearby sensitive receptors. An HRA was prepared in accordance with BAAD and OEHHA guidance. As shown in Table 3.1-9, the health risk posed to the maximally exposed worker receptor would not exceed any threshold. However, the level of cancer risk posed to the maximally exposed residential receptor could exceed the BAAD thresholds of 10.0 in 1 million. As such, the proposed project would be required to implement Mitigation Measure AIR-1 which requires the use of Tier 4 equipment. Implementation of Mitigation Measure AIR-1 would reduce the risk at the maximally exposed residential receptor to less than significant levels. Health risk output files are provided in Appendix C.

Table 3.1-9: Construction Health Risk Assessment Results

Receptor Type	Cancer Risk (in 1 million)	Chronic Hazard Index	$PM_{2.5}$ ($\mu g/m^3$)
Unmitigated			
Residential	32.60	0.02	0.08
Worker	0.76	0.02	0.08
BAAD Thresholds	**10.0**	**1.0**	**0.30**
Exceed BAAD Thresholds?	***Yes***	***No***	***No***
Mitigated			
Residential	6.92	0.003	0.02
BAAD Thresholds	**10.0**	**1.0**	**0.30**
Exceed BAAD Thresholds?	***No***	***No***	***No***

Source: Appendix C

The potential exists for the initial phases of the proposed project to become operational while construction of the remaining phases continues. For example, the structures built during Phase 2 (27 single-family homes and 49 3-story townhome-style condominiums) may become occupied and result in operational emissions while construction of Phase 3 is underway and generating construction emissions. Then Phases 2 and 3 could be occupied as Phase 4 is constructed. As such, there could be new receptors located at the project site while construction occurs. However, the offsite receptors would be exposed over a longer period of time (Phases 1 through 4 of construction) as compared to the onsite receptors which would be exposed for a shorter duration (maximum Phases 3 through 4 of construction). Moreover, the highest level of PM_{10} exhaust emissions would occur during demolition, site preparation, and grading activities which would occur during Phase 1 of construction. The offsite receptor evaluated for the HRA was located immediately adjacent to the project site and it was determined that with the implementation of Mitigation Measure AIR-1, health risk impacts would be less than significant. As the new onsite residential receptors would be similarly distanced to any future construction phases and would be exposed to a shorter construction duration after the peak of construction emissions, the health risk posed to any new, onsite receptors was determined to be less than the risk posed to the offsite receptor. As such, the impacts posed to any new, onsite receptor would similarly be less than significant with the implementation of Mitigation Measure AIR-1.

Operational Emissions

The greatest potential for exposure to TACs during long-term operations is from the use of heavy-duty diesel trucks and stationary generators that use diesel fuel. The proposed project is a residential development. Once operational, the majority of vehicle trips to the project site would be from residents and, as a result, the project would attract very few diesel truck trips. Additionally, the proposed project would not include any stationary generators onsite. In terms of carbon monoxide hotspots, the proposed project is estimated to generate approximately 1,701 vehicle trips per day, or a net increase of 145 trips per day compared to existing conditions. The BAAD has determined that a project would have a less than significant impact to carbon monoxide if project-generated traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour. Because implementation of the proposed project would result in a negligible increase in traffic volumes at nearby intersections (approximately 0.3 percent of BAAD's screening threshold), it is determined that the proposed project would not generate any new carbon monoxide hotspots. For these reasons, once operational, the proposed project would not be expected to expose existing nearby sensitive receptors to substantial amounts of TACs.

Once operational, the proposed project would be considered a sensitive receptor location and future residents could be exposed to TAC emissions from nearby mobile and stationary sources. In the California Building Industry Association v. BAAD (62 Cal.4th 369 [2015] [Case No. S213478]), the California Supreme Court held that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents. When a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the project's impact on the environment—and not the environment's impact on the project—that compels an evaluation of how future residents or users could be affected by exacerbated conditions." Although the Court ruled that impacts from the existing environment on projects are not required to be addressed under CEQA, land uses such as gasoline stations, dry cleaners, distribution centers, freeways, and auto body shops can expose residents to high levels of TAC emissions if they are in proximity of the project site. As such, this EIR examines the effects of air pollution on future users to better inform mitigation strategies, per the recommendation of the BAAD. The following discussion considers the potential impact of TACs from nearby mobile and stationary sources on future residents of the proposed project.

The project site is located south of SR-17. The BAAD has prepared a Mobile Source Screening Map that estimates the concentration of $PM_{2.5}$, the cancer risk, and chronic hazard index from roadway sources. Additionally, per the BAAD's Stationary Source Screening Map, the following 10 permitted stationary sources of emissions are located within 1,000 feet of the project site (see Table 3.1-10). It is noted that source number 6, the generator at Aoptix Technologies, is associated with the existing uses on the project site and would not be present following implementation of the proposed project. Therefore, health impacts from the generator at Aoptix Technologies were excluded from the cumulative analysis. Table 3.1-11 presents the cumulative health risks that may be posed to onsite receptors from mobile and stationary sources.

Sources: BAAD 2026a; BAAD 2026b

As shown in the table above, the cumulative total health risk posed to receptors of the proposed project would exceed the applicable cumulative threshold of significance for $PM_{2.5}$. However, pursuant to the California Building Standards Code, all project residential units would be required to install MERV 13 filters or better. According to the USEPA, MERV 13 filters have an efficiency rating of 50 percent for particles 0.30 to 1.0 microns, 80 percent for particles 1.0 to 3.0 microns, and 90 percent for particles 3.0 to 10.0 microns (USEPA 2024e). $PM_{2.5}$ refers to particles under 2.5 microns in diameter, so filtration efficacy would be a minimum of 50 percent, and the indoor concentration of $PM_{2.5}$ would be reduced to

0.57 µg/m^3. Mitigation Measure AIR-2 is required to ensure that all tenants are informed of how to properly maintain the MERV 13 filters. Therefore, the required installation of MERV filters would ensure that indoor concentrations of PM would be reduced to below the applicable threshold and future residents of the proposed project would not be exposed to substantial pollution concentrations.

Based on the analysis above, the proposed project would not expose sensitive receptors to substantial pollutant concentrations with implementation of Mitigation Measures AIR-1 and AIR-2, and the impact would be less than significant with mitigation.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM AIR-1 **Minimize Construction Exhaust Emissions.** Exhaust emissions shall be minimized during construction activities with the use of off-road equipment engines that meet or exceed CARB's Tier 4 Final engine emissions standards for off-road equipment exceeding 50 horsepower (hp). At a minimum, all construction equipment shall be certified as compliant with the Tier 4 Final engine emissions standards as provided in CCR, Title 13, section 2423(b)(1)(B). Engines can achieve these standards through the use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, add-on devices such as particulate filters, or other options as they become available.

MM AIR-2 **HEPA Filter Maintenance Schedule Information**. Prior to occupancy, the Applicant shall provide all tenants with information on the routine maintenance schedule to replace and/or clean their MERV 13 filters. Filters should be replaced on a three-month basis in order to ensure that proper filtration levels are maintained.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Odors

Impact AIR-d	**The proposed project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.**

Impact Analysis

While offensive odors rarely cause any physical harm, they can still be unpleasant, leading to distress among the public and often generating citizen complaints to local governments and BAAD. The occurrence and severity of odor impacts depends on numerous factors, including nature, frequency, and intensity of the source, the wind speed and direction, and the sensitivity of the receptor. The nearest receptors to the project site include the residences located south of the project site.

Construction activities associated with the proposed project could result in short-term odorous emissions from diesel exhaust associated with diesel-fueled equipment. However, these emissions would be intermittent and would dissipate rapidly from the source. Project construction would also be required to

comply with all applicable CARB and BAAD rules and regulations, such as the In-Use Off-Road Diesel Regulations. Compliance with the aforementioned regulations would help to minimize emissions, including emissions leading to odors.

Land uses typically considered as associated with the production of odors during operations include wastewater treatment facilities, waste disposal facilities, and agricultural operations. The proposed project does not include any of the foregoing land uses that are typically associated with emitting objectionable odors. It is noted that several auto body repair facilities are located south of the project site, including facility numbers 1 through 4 and 7 listed in Table 3.1-9. The closest auto shop to the project site is located approximately 250 feet south of the site. The auto shops may use paints, solvents, adhesives, and other materials that result in emissions of odors. Operations of the auto shops would include potential odor-generating activities during business hours. The odors are primarily associated with volatile organic compound (VOC) emissions. However, auto coating operations are subject to BAAD Regulation 8 Rule 45, Motor Vehicle and Mobile Equipment Coating Operations, which includes limits on the amount of VOCs allowable in coatings and provides rules to limit solvent loss. Furthermore, the prevailing wind direction in the project area is most often from the northwest blowing to the southeast. Therefore, the project site is located upwind of the auto facility and, as a result, odors from the facilities would most often be blown away from the receptors (Iowa State University 2025).[3]

Finally, BAAD regulates objectionable odors through Regulation 7, Odorous Substances, which does not become applicable until the Air Pollution Control Officer (APCO) receives odor complaints from ten or more complainants within a 90-day period. Once effective, Regulation 7 places general limitation on odorous substances and specific emission limitations on certain odorous compounds, which remain effective until such time that citizen complaints have not been received by the APCO for one year. The limits of Regulation 7 become applicable again when the APCO receives odor complaints from five or more complainants within a 90-day period (BAAD 1982). Thus, although not anticipated, if odor complaints are made after the project is developed, the BAAD would ensure that such odors are addressed, and any potential odor effects are minimized or eliminated.

Based on the above, the proposed project would not result in other emissions, such as those leading to odors, affecting a substantial number of people. Therefore, the impact would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

[3] This information is included for informative purposes only and is included to inform the public of the nearby offsite odor sources and to note that there would not be a problem due to existing regulations.

3.2 CULTURAL RESOURCES

This section describes the environmental and regulatory setting for cultural resources. It also describes existing conditions and potential impacts related to cultural resources that would result from implementation of the proposed project, and mitigation for potentially significant impacts, where feasible. The term "cultural resources" refers to built-environment resources (e.g., buildings, structures, objects, districts) and archaeological resources.

The environmental setting section is based on information provided in the Cultural Resources Study[4] (Stantec 2025) (Appendix D). The proposed project's ethnographic setting and impacts on tribal cultural resources are addressed in Section 3.8, Tribal Cultural Resources, of this Draft EIR.

3.2.1 Environmental Setting

The environmental setting section provides a brief pre-European contact Cultural Chronology, and historical overview of the project site.

Pre-European Contact Cultural Chronology

In the San Francisco Bay Area region of central California, researchers have developed a chronology to describe the general evolution of precontact cultures through time. This chronology, summarized below, consists of a sequence comprised of six periods [5].

Early Holocene/ Lower Archaic (8000-3500 Before Common Era [BCE])

The Early Holocene is characterized by "a generalized mobile forager pattern," as indicated by assemblages containing millingslabs and handstones, as well as large wide-stemmed and leaf-shaped projectile points. Early Holocene archaeological sites are rare, although this may in part be due to ancient deposits likely underlying several feet of sediment or submerged by sea-level rise. Sites from this period include terrestrial mammal remains, chipped stone tools, milling implements, and remnants of acorns.

Early Period/ Middle Archaic (3500-500 BCE)

The Early Period is generally marked by increased sedentism, regional trade, and symbolic integration as evidenced by ground stone technology and thick rectangular Olivella (a type of marine snail) shell beads in a mortuary context. Some of the earliest known cut and-shaped shell beads in a San Francisco Bay Area were recovered in Santa Clara County.

[4] This report contains confidential information regarding the location of archaeological resources. Such resources are nonrenewable, and their scientific, cultural, and aesthetic values can be significantly impaired by disturbance. To deter vandalism, artifact hunting, and other activities that can damage such resources, this study is not included in the appendices. The legal authority to restrict cultural resources information is in Section 304 of the National Historic Preservation Act of 1966, as amended. Furthermore, California Government Section Code 6254.10 exempts archaeological sites from the California Public Records Act, which requires that public records be open to public inspection.
[5] These phases are academic constructs and do not necessarily reflect the views of Indigenous groups of California.

Lower Middle Period/ Initial Upper Archaic 500 BCE – CE 430)

Symbolic integration and technology evolved during the Lower Middle Period. At the onset of the Middle Period, rectangular shell beads, markers of the Early Period, are replaced in the archaeological record with stylistically new beads, including split-beveled and saucer Olivella types. Other artifacts introduced during this period include barbless fish spears, elk femur spatula, tubes, whistles, and bone basketry awls.

Upper Middle Period/ Late Upper Archaic (430-1050 Common Era [CE])

The Upper Middle Period is characterized by dramatic cultural and demographic disruption which began during the Lower Middle Period and climaxed during the Upper Middle Period circa CE 1000. During this time, a new population, known as the Meganos Aspect, migrated from the San Joaquin Delta to most of the East Bay's interior valleys and the Santa Clara Valley. This new population was distinguished by a distinct mortuary complex and stylistic and temporally distinct Olivella saddle beads.

Initial Late Period/ Lower Emergent (1050-1550 CE)

The Initial Late Period represents the ethnographically documented cultures present at the time of European contact. This period is marked in part by increased sedentism, status ascription, and social stratification observed in burial practices, and by the emergence of the Kuksu Cult, a ceremonial system that unified several language groups in central California. Late Period deposits in central California have been documented from most interior valleys and bayshore locations, as well as from upland contexts, where habitation and task-specific sites have been reported. New technology was also introduced during this period, notably the bow-and-arrow, which is evidenced in the archaeological record by small dart-sized projectile points. Other artifacts associated with the Initial Late Period include abalone-shell banjo-shaped ornaments, collared smoking pipes, and temporally distinct Olivella beads.

Terminal (Phase 2) Late Period (1550-1850 CE)

Archaeologists refer to the time after circa CE 1500 until Euro-American contact as Phase 2 of the Late Period in central California, characterized in part by new bead types such as those made from saltwater clam shells, Dentalium (a marine snail) shells, and magnesite. These new artifacts were used as a medium of monetized exchange until Euro-American contact, representing social and economic integration previously unseen in the archaeological record for central California.

Historic Setting[6]

City of Campbell

Some of the early settlers crossing the plains for a better life in California included the William Campbell family. William Campbell, born in Kentucky, had moved to Saline County, Missouri. He arrived in Santa Clara County with his family in 1846, reportedly travelling for the first part of the plains crossing with what became the ill-fated Donner party. In 1847, Campbell oversaw the survey of the towns of Santa Clara and San Jose. From 1847 to 1848, he built a saw mill about three miles from what is now Saratoga.

[6] Adapted from City of Campbell. 2023. Envision Campbell General Plan Update.

William's son, Benjamin, born in 1826, came across the plains with his family and worked with him in various enterprises. In 1851, Benjamin returned to Missouri and married there. The following year, he and his wife re-crossed the Plains.

Benjamin Campbell had purchased land northeast of his father's sawmill. He and his wife settled on that land. The land became subject to litigation by other claimants, but eventually Benjamin was able to obtain a patent for the 165 acres on what is now Campbell Avenue

Benjamin Campbell became fairly prosperous, initially growing wheat on his land. In 1870, his farm was valued at over $12,000 and he had horses, cattle, swine, dairy cows, and produced 2,000 bushels of spring wheat and 200 bushels of barley. Ten years later, the farm had increased in value to $17,500 and had diversified with additional livestock, more land for cattle and sheep pasturage, and other portions established in vineyards and orchards. Neighboring land owners also had large tracts of land.

An illustration of his farm and land-holdings, which now covers the City of Campbell, was printed in an 1876 Santa Clara County history, giving an excellent view of the original setting of the community.

The increasing farming of more perishable products rather than just grain by Campbell and his neighbors led to the need for a quicker means of transporting these items to a larger marketplace. As a result, a railroad line was built through the region, and Benjamin Campbell sold an acre of land to the railroad for Campbell Station. A post office was established in 1885, with Benjamin Campbell serving as the first postmaster until 1888.

Benjamin Campbell subdivided and sold off much of his land beginning in 1885, with his holding only 52 acres in 1888. Many in the area planted orchards. One source claims that the lands sold by Benjamin Campbell contained a proviso that the lands would be forfeit to the original owner should alcohol be sold on the property. His land became the core of Campbell's downtown district.

The change of crops in the region is also evident in the listing for Benjamin Campbell in the Great Register of Voters in 1896 — he was an "orchardist." There was a large fruit drying yard and three fruit canneries in town, and the City was known for many years as the "Orchard City."

Campbell officially incorporated in 1952. The City has transitioned from a small farm community to a progressive community with a population of over 40,000.

3.2.2 Regulatory Setting

State

California Environmental Quality Act, Public Resources Code Section 21082.2, and State CEQA Guidelines

CEQA requires the lead agency to consider the effects of a project on historical resources. State CEQA Guidelines Section 15064.5 provides specific guidance for determining the significance of impacts on historical resources (state CEQA Guidelines Section 15064.5(b)) and unique archaeological resources (state CEQA Guidelines Section 15064.5(b) and PRC Section 21083.2). Under CEQA, these resources are called "historical resources" whether they are of historic or pre-European contact age. CEQA Section 21084.1 defines *historical resources* as those listed, or eligible for listing, in the California Register of

Historical Resources (CRHR), or those listed in the historical register of a local jurisdiction (county or city) unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant. National Register of Historic Places (NRHP)-listed “historic properties” in California are considered historical resources for the purposes of CEQA and are also listed in the CRHR. The CRHR criteria for listing such resources are based on, and are very similar to, the NRHP criteria. CEQA Section 21083.2 and state CEQA Guidelines Section 15064.5(c) provide further definitions and guidance for archaeological sites and their treatment.

California Register of Historical Resources (PRC Section 5024.1)

PRC Section 5024.1 establishes the CRHR. The register lists California properties considered to be significant historical resources. The CRHR also includes all properties listed or determined eligible for listing in the NRHP. The criteria for listing in the CRHR, criteria 1–4, are similar to those of the NRHP:

- Criterion 1: Resources associated with important events that have made a significant contribution to the broad patterns of our history.
- Criterion 2: Resources associated with the lives of persons important to our past.
- Criterion 3: Resources that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master.
- Criterion 4: Resources that have yielded, or may be likely to yield, information important in prehistory or history.

The CRHR regulations govern the nomination of resources to the CRHR (14 CCR Section 4850). The regulations set forth the criteria for eligibility as well as guidelines for assessing historical integrity and resources that have special considerations.

Unique Archaeological Resources

State CEQA Guidelines Section 15064.5(c) specifies how CEQA applies to archaeological sites, including archaeological sites that are historical resources, unique archaeological resources, or neither.

PRC Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. It contains information needed to answer important scientific research questions, and there is a demonstrable public interest in that information.
2. It has a special and particular quality, such as being the oldest of its type or the best available example of its type.
3. It is directly associated with a scientifically recognized important prehistoric or historic event or person.

State CEQA Guidelines Sections 15064.5(d) and (e) specify responsibilities and respectful treatment of human remains, including Native American human remains, that are found or likely to be found within a project site.

Human Remains – Health and Safety Code 7050.5

In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, Section 7050.5 of the Health and Safety Code states that there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the remains were discovered has determined whether the remains are subject to the coroner's authority. If the human remains are of Native American origin, the coroner must notify the Native American Heritage Commission (NAHC) within 24 hours of this identification. State CEQA Guidelines Sections 15064.5(d) and (e) specify responsibilities regarding human remains as well as the respectful treatment of human remains, including Native American human remains, that are found or likely to be found within a project site.

Local

Campbell General Plan

As outlined in Section 3.0, Environmental Impact Analysis, the proposed project is subject to the goals and policies of the 2001 General Plan which was in effect at the time of pre-application submittal.[7] Therefore, the goals and policies of the City's historical General Plan is listed below.

The City's 2001 General Plan includes the following goals and policies related to cultural resources that may be applicable to the proposed project (City of Campbell 2001):

Goal CNR-1: A high level of community participation in historic preservation efforts to build a strong sense of community identity.

- **Policy CNR-1.1:** Historic Resource Preservation: Ensure that the City and its citizens preserve historic resources as much as possible.

3.2.3 Environmental Impacts

This section describes the impact analysis relating to cultural resources for the proposed project. It describes the methods used to determine the impacts of the proposed project and lists the thresholds used to conclude whether an impact would be significant. Measures to mitigate (i.e., avoid, minimize, rectify, reduce, eliminate, or compensate for) significant impacts accompany each significant impact discussion.

[7] For an explanation of the applicability of the City's 2001 General Plan in this Draft EIR, see Section 3.0, Environmental Impact Analysis, and Section 3.1.2, Regulatory Setting - Local.

Methodology for Analysis

Cultural Resource Data Sources

This section describes the methods used to identify cultural resources at the project site and in the vicinity and determine their significance under CEQA.

The Cultural Resources Study (Stantec 2025) documents background research to identify cultural resources and studies within the project site and to assess the potential for subsurface archaeological deposits. The background research consisted of a records search at the Northwest Information Center (NWIC) and a literature and historical map review. The results are summarized below.

California Historical Resources Information Systems (CHRIS) Record Search

On November 5, 2024, a records search was conducted for the project site and a 0.25-mile radius at the NWIC (NWIC File #24-0662). The NWIC, an affiliate of the California Office of Historic Preservation, is the official state repository of cultural resources records and reports for Santa Clara County. As part of the records search, the following local and state inventories were reviewed:

- *California Register of Historical Resources* Office of Historic Preservation
- *California Points of Historical Interest*
- *California Historical Landmarks*
- Five Views *Five Views: An Ethnic Historic Site Survey for California*

No previously recorded built environment or archaeological resources were identified in or adjacent to the project site. In addition, no archaeological resources were recorded within 0.25-miles of the project site. Two archaeological resources studies were previously conducted within the project site and two were conducted within 0.25-miles of the project site and are listed in Table 3.2-1 below.

Table 3.2-1: Previous Archaeological Studies In and Within 0.25-miles of the Project Site

Author/Year	Report Number	Title	Location
David Chavez and Jan M. Hupman 1990	S-012437	*Cultural Resources Investigation for the Vasona Transportation Corridor Project, Santa Clara County, California*	Within 0.25-miles
Robert Cartier 1991	S-012542	*Cultural Resource Evaluation of the Campbell Apartment Project in the City of Campbell, County of Santa Clara*	Within 0.25-miles

Buried Site Sensitivity

A review of geologic maps to assess the project site's potential for containing as-yet undocumented buried pre-European contact archaeological deposits indication the project site is underlain by Holocene-age alluvium deposits that were most likely available for human habitation and have the potential for containing as-yet undocumented buried pre-European contact archaeological resources.

The project site is underlain by Holocene (<11,700 years old) alluvium sediments that were deposited by stream activity atop a larger and older alluvial fan. Immediately west of the project area are alluvial gravels recently deposited by Los Gatos Creek. The proposed project's soils are mapped as Urban land-Still complex soils, which include a mixture of disturbed "urban land" and Still series clay loams. Urban soils are defined as soil that has a non-agricultural, man-made surface layer produced by mixing, filling, or by the contamination of a land surface in urban and suburban areas. Still series loams are deep floodplain soils formed from alluvial parent material that have the potential to contain paleosols at depths over three feet. The potential for the project site to contain buried paleosols arises from its proximity to Los Gatos Creek, which would have periodically covered the project site in flood deposits prior to the establishment of flood control infrastructure in the twentieth century indicating sensitivity for buried precontact archaeological deposits.

Archival maps indicate that the project site had limited development and was primarily orchards until the 1960s with the construction of a drive in movie theater and later the construction of the Campbell Technology Park which was built between 1998 and 2000. This indicates a low potential for intact historic-period deposits at shallow depths just below the surface (e.g., artifact-filled features such as wells or privies).

Thresholds of Significance

In accordance with the Appendix G of the CEQA Guidelines, the following questions were analyzed and evaluated to determine whether the proposed project's impacts to cultural resources are significant.

Would the proposed project:

- Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?
- Disturb any human remains, including those interred outside of formal cemeteries?

Project Impact Analysis and Mitigation Measures

Historical Resources

Impact CUL-a **The proposed project could cause a substantial adverse change in the significance of a historical resource as identified in Section 15064.5.**

Impact Analysis

For a cultural resource to be considered a historical resource (i.e., eligible for listing in the CRHR), it must generally be 50 years or older. Under CEQA, historical resources can include pre-European contact (i.e., Native American) archaeological deposits, historic-period archaeological deposits, historic buildings, and historic districts. CEQA requires that agencies considering projects that are subject to discretionary action shall consider the potential impacts on cultural resources that may occur from project implementation.

Built Environment

The proposed project site neither contains nor is adjacent to any built environment resource that qualifies as a historical resource for the purposes of CEQA. Therefore, new development on the proposed project site would not have the potential to cause a substantial adverse change to the significance of any built environment historical resource, as defined in Section 15064.5 of the CEQA Guidelines.

Archaeology

According to the state CEQA Guidelines, “When a project will impact an archaeological site, a lead agency shall first determine whether the site is an historical resource” (state CEQA Guidelines Section 15064.5[c][1]).

The results of the NWIC records search indicate that no previously recorded archaeological deposits are located in or within 0.25-miles of the project site. Archival maps indicate that the project site had limited development and was primarily unincorporated fields until the construction of the Campbell Technology Park which was built in 2000; therefore, it is unlikely that any historic-period archaeological deposits are located within the project site. However, a review of geologic maps to assess the project site’s potential for containing as-yet undocumented buried archaeological resources indicate sensitivity for buried pre-European contact archaeological deposits.

Although the project site was subject to extensive excavation during the construction of the Campbell Technology Park between 1998 and 2006, proposed project construction could require additional excavation at a deeper depth in previously disturbed areas and therefore could encounter pre-European contact archaeological deposits and result in an adverse change to a buried archaeological deposit that could qualify as a historical resource. Thus, potentially significant impacts related to buried archaeological deposits could result from construction of the proposed project.

Implementation of Mitigation Measures CUL-1, CUL-2, and CUL-3 would ensure that impacts related to archaeological resources that qualify as historical resources would be reduced to less than significant impact with mitigation through implementation of a monitoring plan, worker awareness training, and requirements to stop work if archaeological deposits are encountered during ground-disturbing activities. Therefore, with implementation of mitigation measures, the proposed project would not cause a

substantial adverse change in the significance of a historical resource as identified in Section 15064.5 and impacts would be less than significant.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM CUL-1 Development of an Archaeological Monitoring Plan and Archaeological Monitoring.

A. Prior to any project-related ground disturbance an Archaeological Monitoring Plan (AMP) shall be developed by a qualified archaeologist who meets the Secretary of the Interior's (SOI) Professional Qualifications Standards for Archaeology for review and approval by the City.

   i. The AMP shall include but not limited to, 1) archaeological monitoring methods specific to project grading and utilities excavation; 2) protocols and a chain of contact if unanticipated archaeological discoveries are encountered during project-related ground disturbance; 3) a summary of documentation procedures for unanticipated discoveries; 4) a description of the types of archaeological deposits that are likely to be encountered specific to the site; and 5) procedures for evaluating these archaeological deposit types as historical resources or unique archaeological resources pursuant to PRC Section 5024.1 or PRC Section 21083.2(g)

B. Prior to any project-related ground disturbance, the Applicant shall retain the services of an SOI qualified archaeologist to implement the AMP and oversee archaeological monitoring of project grading, utilities, and foundation excavation pursuant to the AMP.

   i. If archaeological deposits are encountered during project-related ground disturbance, the monitoring archaeologist shall have the authority to stop work in the area (50-foot radius) and implement the procedures outlined in the AMP.

   ii. Work shall not resume until the monitoring archaeologist under the oversight of the SOI qualified archaeologist and, in consultation with the City, determines that all applicable protocols of the AMP have been meet and that the archaeological deposit does not qualify as a historical resource or unique archaeological resource pursuant to PRC Section 5024.1 or PRC Section 21083.2(g) and no further archaeological investigation is necessary.

   iii. Should the monitoring archaeologist under the oversight if the SOI qualified archaeologist and, in consultation with the City, determine the archaeological deposit does qualify as a historical resource or unique archaeological resource pursuant to PRC Section 5024.1 or PRC Section 21083.2(g), a treatment plan with appropriate protection and preservation measure will be developed for

review, approval, and implementation by the City to mitigate impacts to the resource.

iv. Following the completion of all ground disturbance associated with project construction, the results of the archeological monitoring will be summarized in a technical document. The technical document shall be provided to the City for review and approval and submitted to the NWIC

MM CUL-2 **Conduct Cultural Resource Sensitivity Training.** Prior to any project-related ground disturbance, the Applicant shall retain the services of an SOI qualified archaeologist to oversee and ensure that all construction workers involved in ground disturbing activities receive Cultural Resource Sensitivity Training by an archaeologist who is experienced in teaching non-specialists to recognize archaeological resources in the event that any are discovered during construction. Construction staff directly overseeing or engaged in ground disturbing activities must participate in this training. This training shall be provided once to each worker involved in ground-disturbing activities before they begin work and shall be documented in training records submitted to the City.

This training shall be administered as stand-alone trainings or included as part of an overall environmental awareness training required by the Applicant and/or contractor prior to construction. The training shall include, at minimum, the following:

- the appearance and types of cultural and archaeological resources that are likely to be encountered;
- the notification procedures and protocols to be taken in the event of an inadvertent cultural or archaeological resource discovery; and
- the penalties for disturbing or destroying cultural resources.

MM CUL-3 **Stop Work if Archaeological Deposits and/or Human Remains Are Encountered During Ground-Disturbing Activities.** If archaeological deposits are encountered during project-related ground disturbance, work in the area (50-foot radius) shall stop immediately and the procedures outlined in the AMP will be implemented. If any human remains are discovered during ground-disturbing activities, there shall be no further excavation or disturbance of the site, or any nearby area reasonably suspected to overlie adjacent human remains. These remains shall be treated in accordance with existing state laws, including California PRC Section 5097.98 and California Health and Safety Code Section 7050.5.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Archaeological Resources

Impact CUL-b	**The proposed project could cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5.**

Impact Analysis

According to the state CEQA Guidelines, archaeological sites that do not qualify as historical resources shall be assessed to determine if they qualify as "unique archaeological resources" (PRC Section 21083.2; state CEQA Guidelines Section 15064.5[c][3]). As discussed above, excavations related to proposed project construction could encounter archaeological deposits and result in an adverse change to a buried archaeological deposit that could qualify as an archaeological resource. Thus, potentially significant impacts related to unidentified archaeological resources could result from construction of the proposed project.

Implementation of Mitigation Measures CUL-1, CUL-2, and CUL-3 would reduce potential impacts related to archaeological deposits that qualify as archaeological resource through implementation of a monitoring plan, worker awareness training, and requirements to stop work if archaeological deposits are encountered during ground-disturbing activities. Therefore, with implementation of mitigation measures, the proposed project would not cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5 and impacts would be less than significant.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measures CUL-1, CUL-2, and CUL-3 would be required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Human Remains

Impact CUL-c	**The proposed project could disturb any human remains, including those interred outside of dedicated cemeteries.**

Impact Analysis

Based on the records search results and the desktop archaeological sensitivity assessment described above, excavations related to proposed project construction could result in substantial adverse changes to historical resources and/or archaeological deposits that may contain human remains. Thus, potentially significant impacts and disturbance of human remains outside of dedicated cemeteries could result from construction of the proposed project.

In the event that human remains are identified during proposed project activities, these remains would be required to be treated in accordance with Section 7050.5 of the California Health and Safety Code and Section 5097.98 of the PRC, as appropriate. Section 7050.5 of the California Health and Safety Code states that, in the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area

reasonably suspected to overlie adjacent remains until the Santa Clara County Coroner has determined whether or not the remains are subject to the Coroner's authority. If the human remains are of Native American origin, the coroner must notify the NAHC within 24 hours of this identification. The NAHC will identify a Native American Most Likely Descendent (MLD) to inspect the site and provide recommendations for the proper treatment of the remains and associated grave goods. Compliance with the California Health and Safety Code and implementation of Mitigation Measures CUL-1, CUL-2, CUL-3, would reduce impacts to human remains in any location other than a dedicated cemetery to a less than significant level.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measures CUL-1, CUL-2, and CUL-3 would be required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

3.3 ENERGY

This section describes the environmental and regulatory setting for energy resources. It also describes existing conditions and potential impacts relative to energy resources that would result from implementation of the proposed project, and identifies mitigation measures for potentially significant impacts, where feasible.

3.3.1 Environmental Setting

PG&E is the utility company that provides electricity and natural gas services to the City of Campbell, including the project area. PG&E is one of the largest combination natural gas and electric utilities in the United States. PG&E provides service to approximately 16 million people throughout a 70,000-square-mile service area in northern and central California (PG&E 2025). PG&E and other utilities within California are regulated by the California Public Utilities Commission (CPUC). CPUC was created to ensure consumers within California have access to safe, reliable utility services and infrastructure at reasonable rates.

In 2022, PG&E's electricity power mix for the base plan included roughly 95 percent GHG free sources. Specifically, approximately 38.3 percent of the electricity provided came from renewable sources (biomass and waste, geothermal, small hydroelectric, solar, and wind), 49.3 percent came from nuclear power, 7.6 percent from large hydroelectric plants, and the remaining 4.8 percent from natural gas (CEC 2025). In 2022, Santa Clara County, in which the project site is located, consumed approximately 17,102 gigawatt hours (GWh) of electricity and 424 million therms of natural gas (CEC 2016a; CEC 2016b).

3.3.2 Regulatory Setting

Federal

Federal Energy Regulatory Commission

The Federal Energy Regulatory Commission (FERC) is an independent agency that regulates the interstate transmission of electricity, natural gas, and oil. FERC also reviews proposals to build liquefied natural gas terminals and interstate natural gas pipelines, and licenses hydropower projects. Licensing of hydroelectric facilities under FERC's authority includes input from state and federal energy and power generation, environmental protection, fish and wildlife, and water quality agencies.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act (EISA) aimed to increase U.S. energy security, increased CAFE standards for motor vehicles, and included provisions related to energy efficiency, such as renewable fuel standards (RFS), appliance and lighting efficiency standards, and building energy efficiency standards. The EISA required increasing levels of renewable fuels to replace petroleum. The USEPA is responsible for developing and implementing regulations to ensure transportation fuel sold into the U.S. contains a minimum volume of renewable fuel.

The RFS programs regulations were developed in collaboration with refiners, renewable fuel products, and other stakeholders and were created under the Energy Policy Act of 2005. The RFS program established the first renewable fuel volume mandate in the U.S. As required under the EISA, the original

RFS program required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. The RFS program was expanded in several ways that laid the foundation for achieving significant reductions of GHG emissions through the use of renewable fuels, for reducing imported petroleum, and for encouraging the development and expansion of the nation's renewable fuels sector. The updated program is referred to as RFS2, and includes the following:

- EISA expanded the RFS program to include diesel, in addition to gasoline;
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022;
- EISA established new categories of renewable fuel and set separate volume requirements for each one; and
- EISA required by the USEPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

Additional provisions of the EISA address energy savings in government and public institutions, promoting research for alternate energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."

National Energy Conservation Policy Act

The National Energy Conservation Policy Act (42 U.S. Code Section 8201 et seq.) serves as the underlying authority for federal energy management goals and requirements and is the foundation of most federal energy requirements. The National Energy Conservation Policy Act also established fuel economy standards for on-road motor vehicles in the United States. The National Highway Traffic Safety Administration (NHTSA) is responsible for establishing additional vehicle standards and for revising existing standards. NHTSA and the USEPA are taking coordinated steps to enable the production of clean energy vehicles with improved fuel efficiency. NHTSA sets the Corporate Average Fuel Economy (CAFE) levels, which are rapidly increasing over the next several years to improve energy security and reduce fuel consumption.

Corporate Average Fuel Economy Standards

The Energy Policy and Conservation Act of 1975 (EPCA) mandated that NHTSA establish and implement a regulatory program for motor vehicle fuel economy, known as the CAFE program, to reduce national energy consumption. The CAFE program establishes average fuel economy standards for passenger cars and light trucks (*see* 49 U.S.C. Section 32901 et seq.). The EISA, discussed above, amended the CAFE program requirements by providing the Department of Transportation (USDOT) additional rulemaking authority and responsibilities. In July 2024, the NHTSA announced a final rule for CAFE standards for model years 2027 to 2031 and for heavy-duty trucks (identified as Class 7 or Class 8 trucks) and vans. The rule requires an industry-wide fleet average of approximately 50.4 miles per gallon by model year 2031 for passenger cars and light trucks, and an industry fleet-wide average for heavy-duty trucks and vans of roughly 2.85 gallons per 100 miles by model year 2035. The NHTSA projects that the foregoing standards will avoid the consumption of approximately 70 billion gallons of gasoline through 2050 (NHTSA 2024).

Inflation Reduction Act of 2022

The Inflation Reduction Act (IRA) of 2022 is considered the most ambitious climate law in U.S. history, and is intended to reduce GHG emissions, help build a clean economy, reduce energy costs for Americans, and advance environmental justice. With funding from the IRA, the USEPA has launched a network of clean energy financing and provided grant funding for climate pollution reduction programs (USEPA 2025).

Executive Order 14156: Declaring a National Energy Emergency

In January 2025, an Executive Order (EO) was issued declaring a national energy emergency. The EO is intended to address the identified emergency and reduce energy prices by expediting energy and infrastructure projects and facilitating the production of domestic energy resources, which include, but are not limited to, crude oil, natural gas, petroleum products, coal, biofuels, hydropower, and minerals.

One Big Beautiful Bill Act

The One Big Beautiful Bill Act (OBBBA) was signed into law on July 4, 2025 as a budget reconciliation bill. In terms of energy, OBBBA phased out tax credits created under the Inflation Reduction Act of 2022 for renewable energy projects. Additionally, the bill expanded federal leasing requirements for onshore and offshore petroleum and reduced federal royalties on coal.

State

California Public Utilities Commission

The CPUC is a state agency created by a constitutional amendment to regulate privately-owned utilities providing telecommunications, electric, natural gas, water, railroad, rail transit, and passenger transportation services and in-state moving companies. The CPUC is responsible for ensuring that California utility customers have safe, reliable utility services at reasonable rates, while protecting utility customers from fraud. The CPUC regulates the planning and approval for the physical construction of electric generation, transmission, or distribution facilities, and local distribution pipelines of natural gas.

California Energy Code

Compliance with the California Energy Code (Title 24, Part 6, of the CCR, California's Energy Efficiency Standards) and Title 20, Public Utilities and Energy, standards must occur for all new buildings constructed in California. These efficiency standards apply to new construction of both residential and nonresidential buildings, and they regulate energy consumed for heating, cooling, ventilation, water heating, and lighting. The building efficiency standards are enforced through the local building permit processes, and local government agencies may adopt and enforce energy standards for new buildings provided that these standards meet or exceed those provided in the Title 24 guidelines.

Warren-Alquist Energy Resources Conservation and Development Act

Initially passed in 1974 and amended since, the Warren-Alquist Energy Resources Conservation and Development Act (Warren-Alquist Act) created the California Energy Commission (CEC), California's primary energy policy and planning agency. The seven responsibilities of the CEC are forecasting future energy needs, promoting energy efficiency and conservation through setting standards, supporting

energy-related research, developing renewable energy resources, advancing alternative and renewable transportation fuels and technologies, certifying thermal power plants 50 megawatts or larger, and planning for and directing state response to energy emergencies. The CEC regulates energy resources by encouraging and coordinating research into energy supply and demand problems to reduce the rate of growth of energy consumption. Additionally, the Warren-Alquist Act acknowledges the need for renewable energy resources and encourages the CEC to explore renewable energy options that would be in line with environmental and public safety goals (Warren-Alquist Act PRC section 25000 et seq.)

California Integrated Energy Policy

The California Integrated Energy Policy, SB 1389, requires the CEC to "conduct assessments and forecasts of all aspects of energy industry supply, production, transportation, delivery and distribution, demand, and prices. The CEC shall use these assessments and forecasts to develop energy policies that conserve resources, protect the environment, ensure energy reliability, enhance the state's economy, and protect public health and safety." (PRC Section 25301[a]). The CEC adopts an Integrated Energy Policy Report every two years and an update every other year. The most recent adopted version is the 2023 Integrated Energy Policy Report, and the Draft 2024 Integrated Energy Policy Report Update has been released for public review (CEC 2024a).

California Renewables Portfolio Standard

California's Renewable Portfolio Standard (RPS) was initially established in 2002 by SB 1078, with the initial requirement that 20 percent of electricity retail sales be served by renewable resources by 2017. The program was accelerated in 2006 under SB 107, which required that the 20 percent mandate be met by 2010. In April 2011, SB 2 was signed into law, requiring electricity retailers in the state to procure 33 percent of their energy sources from renewable energy sources by the end of 2020 (CPUC 2025). SB 350, passed in 2015, directs California utilities to further increase the amount of renewable energy delivered to customers to 50 percent by 2030. Finally, in 2018 SB 100 increased the RPS to 60 percent by 2030 and established a goal for 100 percent of the state's electricity to come from renewable and carbon-free resources by 2045.

CPUC implements and administers RPS compliance rules for California's retail sellers of electricity, which include large and small investor-owned utilities, publicly owned utilities, electric service providers, and community choice aggregators. The CEC is responsible for the certification of electrical generation facilities as eligible renewable energy resources and adopting regulations for the enforcement of RPS procurement requirements of public owned utilities.

Title 20 and Title 24, California Code of Regulations

New buildings constructed in California must comply with the standards in Title 20, Energy Building Regulations, and Title 24, Energy Conservation Standards, of the CCR. Title 20 contains a range of standards, such as power plant procedures and siting, energy efficiency standards for appliances, and ensuring reliable energy sources are provided and diversified through energy-efficiency and renewable energy resources. Title 24 (AB 970) contains energy-efficiency standards for residential and nonresidential buildings based on a state mandate to reduce California's energy demand. Specifically, Title 24 addresses a number of energy-efficiency measures that impact energy used for lighting, water

heating, heating, and air conditioning, including the energy impact of the building envelope such as windows, doors, skylights, wall/floor/ceiling assemblies, attics, and roofs.

Part 11 of Title 24 is the California Green Building Standards Code (CALGreen), which sets minimum and mandatory sustainability requirements to reduce environmental impact through better planning, design, and construction practices. CALGreen works along with the mandatory construction codes of Title 24 and is enforced at the local level. Any project-related construction would be required to comply with the Title 24 codes currently in place, including the CALGreen code.

Local

Campbell General Plan

As outlined in Section 3.0, Environmental Impact Analysis, the proposed project is subject to the goals and policies of the 2001 General Plan which was in effect at the time of pre-application submittal.[8] Therefore, the goals and policies of the City's historical General Plan is listed below.

The City's 2001 General Plan include the following goals and policies related to energy that may be applicable to the proposed project (City of Campbell 2001):

Goal CNR-12: Promote energy conservation in Campbell.

- **Policy CNR-12.2:** Advanced Energy Technology and Building Materials: Facilitate the use of advanced energy technology and building materials to create energy -efficient residences and buildings.
- **Policy CNR-12.3:** Landscaping Requirements: Continue to enforce landscaping requirements that facilitate energy efficient uses and conservation.

Goal H-1: Maintain and enhance the quality of existing housing and residential neighborhoods in Campbell.

- **Policy H-1.2:** Green Building: Encourage the use of sustainable and green building design in new and existing housing.
- **Policy H-1.3:** Energy Efficiency: Energy costs can reduce the affordability of housing for lower income households. The City will continue to promote programs and opportunities for improved energy efficiency and weatherization. To address energy conservation in existing buildings, Campbell's website promotes Pacific Gas and Electric utility assistance programs. These programs primarily serve extremely low and very low income households.

Envision Campbell General Plan 2040 (Listed for Informational Purposes)

The Envision Campbell General Plan 2040 document expands on the information provided in the City's 2001 General Plan and provides the following goals and policies related to energy that are appliable to the proposed project.

[8] For an explanation of the applicability of the City's 2001 General Plan in this Draft EIR, see Section 3.0, Environmental Impact Analysis, and Section 3.1.2, Regulatory Setting - Local.

Goal COS-8: Conserve energy and other natural resources through consumption reduction programs and the maximum use of renewable resources.

- **Policy COS-8.1:** Require all development projects to comply with the mandatory energy efficiency requirements of the California Green Building Standards Code (CALGreen) and Building and Energy Efficiency Standards.
- **Policy COS-8.2:** Support and encourage the implementation of innovative and green building best management practices including, but not limited to, sustainable site planning, solar opportunities, LEED certification for new development, the local adoption of Reach Codes, and incorporation of net zero energy development standards in the California Code of Regulations (CCR), Title 24, if feasible.
- **Policy COS-8.5:** Continue to participate in Silicon Valley Clean Energy (SVCE) whereby city-owned facilities, parks, and streetlights will run on 100% renewable energy sources like wind and solar, and motivate and encourage Campbell residents and businesses to participate in Silicon Valley Clean Energy (SVCE) to reduce greenhouse gas emissions and support statewide alternative energy use.
- **Policy COS-8.6:** Coordinate with Pacific Gas and Electric Company (PG&E) to increase public awareness of electrical and natural gas conservation practices and programs, such as rebate programs and energy efficiency audits.

Goal CSF-7: Ensure reliable and adequate electric, natural gas, and telecommunication services are available to all users

- **Policy CSF-7.3:** Comply with all State requirements regarding the generation of power and encourage energy providers to investigate the use or expansion of renewable sources of energy.

3.3.3 Environmental Impacts

This section analyzes the proposed project's potential to result in significant energy impacts. When an impact is determined to be significant, mitigation measures are identified that would reduce or avoid impacts.

Methodology for Analysis

Project energy demand during construction and operations was determined based on the air quality and GHG emissions modeling that was conducted for the proposed project using CalEEMod (see Appendix E) and using vehicle and equipment emission factors from the CARB's EMFAC2021 (v1.0.2) and EMFAC OFFROAD2021 (v1.0.4). The energy calculations are included as Appendix E to this Draft EIR.

Thresholds of Significance

In accordance with the Appendix G of the CEQA Guidelines, the following questions were analyzed and evaluated to determine whether the proposed project's impacts to energy are significant.

Would the proposed project:

- Result in potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Project Impact Analysis and Mitigation Measures

Wasteful, Inefficient, or Unnecessary Use of Energy

Impact EN-a	**The proposed project would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.**

Impact Analysis

The proposed project would be determined to have a significant impact related to wasteful, inefficient, or unnecessary consumption of energy resources if the proposed project's construction or operation was determined to consume significantly more energy resources than projects of similar size and scale in the area, would require the use of construction equipment or vehicles that are not energy efficient, if it would result in unnecessary consumption of energy resources, or if it would not comply with energy efficiency standards set forth in applicable state and local guidelines and regulations.

The energy requirements for the proposed project were determined using the construction and operational estimates generated from the calculation worksheets for energy consumption, see Appendix E. This impact addresses the energy consumption from both construction and operations, discussed separately below.

Construction Energy Demand

During construction of the proposed project, energy resources would be consumed in the form of diesel and gasoline fuel from the use of off-road equipment (i.e., tractors, excavators, cranes) and on-road vehicles (i.e., construction employee commutes, haul trucks). Construction is not anticipated to require electricity or natural gas.

Off-Road Equipment

Construction activities associated with the proposed project, including site preparation, grading, paving, building construction, and architectural coating, are estimated to consume 131,137 gallons of diesel fuel from the use of off-road equipment. For comparison, in 2022, the State of California consumed approximately 3.6 billion gallons of diesel fuel (CEC 2024b). Thus, the diesel fuel required to power the off-road equipment during construction of the proposed project would represent approximately 0.004 percent of the state's annual diesel demand.

On-Road Vehicles

On-road vehicles for construction workers, vendors, and haulers would require fuel for travel to and from the site during construction. Table 3.3-1 provides an estimate of the potential total on-road vehicle fuel usage during construction.

Table 3.3-1: Construction On-Road Equipment Fuel Consumption

Project Component	Average Fuel Economy (miles/gallon)	Total VMT	Total Fuel Consumption (gallons)
Worker Trips	28.30	2,469,145	87,238
Vendor Trips	9.38	89,317	9,524
Haul Trips	6.03	77,094	12,782
Total Construction On-Road Trips		**2,635,555**	**109,545**

Notes:
Calculations use unrounded numbers; totals may not appear to sum exactly due to rounding.
VMT = vehicle miles traveled
Source: Appendix E

As shown in the table, construction of the proposed project is estimated to consume 109,545 gallons of a combination of gasoline and diesel fuel from on-road vehicles. In 2022, the State of California consumed approximately 3.6 billion gallons of diesel fuel and 13.6 billion gallons of gasoline (CEC 2024b, CEC 2024c). If it was conservatively assumed that all on-road fuel consumed during proposed project construction is diesel fuel, then on-road equipment used during project construction would consume 0.003 percent of the state's annual diesel consumption.

Overall, construction activities associated with the proposed project would result in the consumption of petroleum-based fuels. However, there are no unusual project characteristics that would necessitate the use of construction equipment or vehicles that would be less energy efficient than at comparable construction sites in other parts of the state. Implementation of Mitigation Measure AIR-1 would require the use of Tier 4 construction equipment that is more efficient than other tiers. All hauling trips associated with proposed project construction would comply with CARB rules including the five-minute idling rule which would limit diesel fuel consumed. Therefore, it is expected that construction fuel consumption associated with the proposed project would not be any more inefficient, wasteful, or unnecessary than at other construction sites in the region.

Operational Energy Demand

During operations of the proposed project, energy would be required to power the proposed residential buildings and to fuel the vehicles travelling to and from the site. The proposed project would be 100 percent electric and would not utilize natural gas.

Building Energy

The proposed residences would require energy for normal operations, such as lighting and temperature controls. Based on the CalEEMod modeling (see Section 3.1, Air Quality), it is estimated that over the course of a year, operational energy consumption would total 1,117,088 kilowatt-hours of electricity. For comparison, in 2022, Santa Clara County used a total of 17,102 GWh of electricity. Based on the countywide data, project building energy would consume approximately 0.007 percent of the county's electricity demand. It is noted that the proposed project would be constructed in compliance with the energy efficiency standards set forth in the California Building Standards Code in effect at the time that building permits are issued. Finally, the proposed project would involve redevelopment of the project site with newer buildings, which will inherently be more energy efficient than the older buildings that are

currently onsite due to updated technologies and regulations including CALGreen that updates sustainable design standards in new construction in California every three years. Therefore, the proposed project's total energy consumption would not result in the inefficient, wasteful, or unnecessary use of energy.

Transportation Energy

Future residents of the proposed project would travel to and from the site during normal operations. Table 3.3-2 provides an estimate of the annual fuel consumed by vehicles traveling to and from the project site. These estimates were derived using the same assumptions used in the operational air quality and GHG analysis for the proposed project.[9]

Table 3.3-2: Long-Term Operational Vehicle Fuel Consumption

Vehicle Type	Percent of Vehicle Trips	Annual VMT	Average Fuel Economy (miles/gallon)	Total Annual Fuel Consumption (gallons)
Passenger Cars (LDA)	51.50%	2,060,707	33.95	60,690
Light Trucks and Medium Duty Vehicles (LDT1, LDT2, MDV)	41.07%	1,643,543	26.19	62,762
Light-Heavy to Heavy-Heavy Diesel Trucks (LHD1, LHD2, MHDT, HHDT)	4.79%	191,806	9.77	19,625
Motorcycles (MCY)	2.20%	87,835	42.87	2,049
Other (OBUS, UBUS, SBUS, MH)	0.44%	17,659	7.96	2,218
Total	**-**	***4,001,550.08***	**-**	***147,344.30***

Source: Appendix E

As shown in the table, annual vehicular fuel consumption is estimated to be 147,344 gallons of a combination of gasoline and diesel fuel. In 2022, the State of California consumed approximately 3.6 billion gallons of diesel fuel and 13.6 billion gallons of gasoline (CEC 2024b, CEC 2024c). If it was conservatively assumed that all on-road fuel consumed during project operations is diesel fuel, then on-road equipment used during project construction would consume 0.004 percent of the state's annual diesel consumption.

Further, over the proposed project lifetime, vehicle fuel efficiency is anticipated to increase as a result of federal and state laws governing fleet standards. As such, the amount of fuel consumed as a result of vehicular trips to and from the project site during operation would decrease over time. Additionally, it is noted that the proposed project would constitute infill development within an established community and would not be opening a new geographical area for development such that it would draw mostly new trips or substantially lengthen existing trips. The proposed project would not be any more inefficient, wasteful, or unnecessary than other vehicle uses in the region.

9 Under existing conditions, the development onsite generates vehicle trips that consume fuel. The net increase in annual fuel consumption due to implementation of the proposed project would be less than what is presented herein.

Conclusion

Based on the analysis above, the proposed project would not result in a potentially significant environmental impact due to the wasteful, inefficient, or unnecessary consumption of energy resources; therefore, the impact would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Conflict with Renewable Energy/Energy Efficiency Plan

Impact EN-b	**The proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.**

Impact Analysis

The following discussion evaluates the proposed project's consistency with applicable plans for renewable energy or energy efficiency during construction and operations.

Construction

During construction activities, off-road equipment and on-road vehicles would comply with all applicable federal and state requirements governing fuel efficiency. For example, at a minimum, all off-road equipment would be subject to the most recent Off-Road Regulations adopted by the CARB, which establish engine efficiency requirements, among other requirements (CARB 2024). Off-road engines are categorized per engine tier, with Tier 0 being the least efficient and Tier 4 Final being the cleanest and most efficient. Compliance with the Off-Road Regulations would ensure that the project construction fleet would consist of energy-efficient engines. With the implementation of Mitigation Measure AIR-1, off-road equipment with engines greater than 50 horsepower would be equipped with Tier 4 Final engines, which is more efficient than what is required to meet state regulations.

With respect to the on-road vehicle fleet operations, heavy-duty trucks (Class 7 and Class 8 trucks) would be required to comply with CARB's 5-minute idling limits which would reduce fuel consumption. Although the foregoing regulations were primarily designed to reduce air quality emissions, they would also result in an increase in energy efficiency during construction activities. Construction of the proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Operations

California adopted the RPS in order to increase the amount of renewable energy supplied by utilities within the state. The proposed project would be 100 percent electric and project operations would primarily use electricity from the PG&E grid. PG&E would continue to be subject to state RPS requirements, and the proposed project would not preclude achievement of the RPS goals. In addition,

the new structures developed as part of the proposed project would comply with federal, state, and local regulations aimed at reducing energy consumption, including the Building Energy Efficiency Standards (CCR Title 24, Part 6) and the CALGreen Code (CCR Title 24, Part 11). Finally, the proposed project would replace older and less efficient buildings, which would improve the overall energy efficiency onsite. The proposed project's compliance with CALGreen standards, 100 percent electric operation, and incorporation of solar photovoltaic infrastructure, ensure the proposed project will not conflict with or obstruct any of the relevant goals and policies from the City's 2001 General Plan or the 2040 General Plan. Overall, operations of the proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Conclusion

For the above reasons, the proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency, and impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

3.4 GREENHOUSE GAS EMISSIONS

This section describes the impacts on GHG emissions that would result from implementation of the proposed project. Included is a review of existing conditions, a summary of applicable policies and regulations related to GHG emissions, and analysis of environmental impacts of the proposed project. Where applicable, mitigation measures are described as they relate to foreseeable significant impacts.

3.4.1 Environmental Setting

To fully understand global climate change, it is important to recognize the naturally occurring "greenhouse effect" and to define the GHGs that contribute to this phenomenon. Various gases in the earth's atmosphere, classified as atmospheric GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space, and a portion of the radiation is absorbed by the earth's surface. The earth emits this radiation back toward space, but the properties of the radiation change from high-frequency solar radiation to lower-frequency infrared radiation. GHGs, which are transparent to solar radiation, are effective in absorbing infrared radiation. As a result, this radiation that would have escaped back into space is now retained, resulting in a warming of the atmosphere. This phenomenon is known as the greenhouse effect.

Greenhouse Gases

Among the prominent GHGs contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), nitrogen trifluoride (NF_3), and sulfur hexafluoride (SF_6). Primary GHGs attributed to global climate change, are discussed in the following subsections.

Carbon Dioxide. CO_2 is a colorless, odorless gas. CO_2 is emitted in a number of ways, both naturally and through human activities. The largest source of CO_2 emissions globally is the combustion of fossil fuels such as coal, oil, and gas in power plants, automobiles, industrial facilities, and other sources. A number of specialized industrial processes, such as mineral production and metal production, and the use of petroleum-based products can also lead to CO_2 emissions. The atmospheric lifetime of CO_2 is variable because it is so readily exchanged in the atmosphere (USEPA 2024a).

Methane. CH_4 is a colorless and odorless gas. CH_4 is the major component of natural gas, about 87 percent by volume. It is also formed and released to the atmosphere by biological processes occurring in anaerobic environments. CH_4 is emitted from a variety of both human-related and natural sources. Human-related sources include fossil fuel production, animal husbandry (e.g., enteric fermentation in livestock and manure management), rice cultivation, biomass burning, and waste management. These activities release significant quantities of CH_4 to the atmosphere. Natural sources of CH_4 include wetlands, gas hydrates, permafrost, termites, oceans, freshwater bodies, non-wetland soils, and other sources such as wildfires. The atmospheric lifetime of CH_4 is about 12 years (USEPA 2024a).

Nitrous Oxide. N_2O is a clear, colorless gas with a slightly sweet odor. N_2O is produced by both natural and human-related sources. Primary human-related sources of N_2O are agricultural soil management, animal manure management, sewage treatment, mobile and stationary combustion of fossil fuels, adipic acid production, and nitric acid production. N_2O is also produced naturally from a wide variety of biological

sources in soil and water, particularly microbial action in wet tropical forests. The atmospheric lifetime of N_2O is approximately 120 years (USEPA 2024a).

Hydrofluorocarbons. HFCs are manufactured chemicals, many of which have been developed as alternatives to ozone-depleting substances for industrial, commercial, and consumer products. The only significant emissions of HFCs before 1990 were of the chemical HFC-23, which is generated as a byproduct of the production of HFC-22, or Freon 22, used in air conditioning applications. The atmospheric lifetime for HFCs varies from just over a year for HFC-152a to 260 years for HFC-23. Most of the commercially used HFCs have atmospheric lifetimes of less than 15 years (e.g., HFC-134a, which is used in automobile air conditioning and refrigeration, has an atmospheric life of 14 years) (USEPA 2024a).

Perfluorocarbons. PFCs are colorless, highly dense, chemically inert, and nontoxic. There are seven PFC gases: perfluoromethane (CF_4), perfluoroethane (C_2F_6), perfluoropropane (C_3F_8), perfluorobutane (C_4F_{10}), perfluorocyclobutane (C_4F_8), perfluoropentane (C_5F_{12}), and perfluorohexane (C_6F_{14}). Natural geological emissions have been responsible for the PFCs that have accumulated in the atmosphere in the past; however, the largest current source is aluminum production, which releases CF_4 and C_2F_6 as byproducts. The estimated atmospheric lifetimes for CF_4 and C_2F_6 are 50,000 and 10,000 years, respectively (USEPA 2024a).

Nitrogen Trifluoride. NF_3 is an inorganic, colorless, odorless, toxic, nonflammable gas used as an etchant in microelectronics. NF_3 is predominantly employed in the cleaning of the plasma-enhanced chemical vapor deposition chambers in the production of liquid crystal displays and silicon-based thin film solar cells. In 2009, NF_3 was listed by California as a potential GHG to be listed and regulated under AB 32, Section 38505 Health and Safety Code. NF_3 has an atmospheric lifetime of 740 years (USEPA 2024a).

Sulfur Hexafluoride. SF_6 is an inorganic compound that is colorless, odorless, nontoxic, and generally nonflammable. SF_6 is primarily used as an electrical insulator in high voltage equipment. The electric power industry uses roughly 80 percent of all SF_6 produced worldwide. Leaks of SF_6 occur from aging equipment and during equipment maintenance and servicing. The use of SF_6 in electric power systems has decreased dramatically in recent years; for example, according to the USEPA, an old circuit breaker can contain up to 2,000 pounds of SF_6 while modern breakers usually contain less than 100 pounds. Best practices to reduce the potential for SF_6 leaks include training staff to handle SF_6 properly; implement leak detection and repair strategies; and decommissioning equipment appropriately. SF_6 has an atmospheric life of 3,200 years (USEPA 2024b).

Black Carbon. Black carbon is the most strongly light-absorbing component of PM emitted from burning fuels such as coal, diesel, and biomass. Black carbon contributes to climate change both directly by absorbing sunlight and indirectly by depositing on snow and by interacting with clouds and affecting cloud formation. Black carbon is considered a short-lived species, which can vary spatially and, consequently, it is very difficult to quantify associated global warming potentials. The main sources of black carbon in California are wildfires, off-road vehicles (e.g., locomotives, marine vessels, tractors, excavators, dozers), on-road vehicles (e.g., cars, trucks, and buses), fireplaces, agricultural waste burning, and prescribed burning of forest or wildlands. California has been an international leader in reducing emissions of black

carbon, including programs that target reducing PM from diesel engines and burning activities (CARB 2013).

Global Warming Potential

Each GHG differs in its ability to absorb heat in the atmosphere based on the lifetime, or persistence, of the gas molecule in the atmosphere. Often, estimates of GHG emissions are presented in carbon dioxide equivalents (CO_2e), which weigh each gas by its global warming potential (GWP).

Expressing GHG emissions in carbon dioxide equivalents takes the contribution of all GHG emissions to the greenhouse effect and converts them to a single unit equivalent to the effect that would occur if only CO_2 were being emitted. Based on a 100-year time horizon, CH_4 traps over 25 times more heat per molecule than CO_2; and N_2O absorbs roughly 298 times more heat per molecule than CO_2. Additional GHGs with high GWP include NF_3, SF_6, PFCs, and black carbon.

Sources of Greenhouse Gas Emissions

On a global scale, GHG emissions are predominantly associated with activities related to energy production from fossil-fuel sources; changes in land use, such as deforestation and land clearing; industrial sources; agricultural activities; transportation; waste and wastewater generation; and commercial and residential land uses. Worldwide, energy production including the burning of coal, natural gas, and oil for electricity and heat is the largest single source of global GHG emissions.

United States of America

In 2022, GHG emissions in the United States totaled 6,343.2 million metric tons (MMT) CO_2e. Within the United States, the largest contributor to GHG emissions is the transportation sector (28 percent). The next largest contributors are from electricity production (25 percent) and industry (23 percent), followed by the commercial and residential sector (13 percent) and the agricultural sector (10 percent). Transportation emissions primarily come from burning fossil fuels for cars, trucks, ships, trains, and planes. Over 94 percent of the fuel used for transportation is petroleum-based, which includes primarily gasoline and diesel. The bulk of emissions generated from energy production come from burning fossil fuels, mostly coal and natural gas. Industry emissions are also primarily generated from fossil fuels burned for heat, the use of certain products that contain GHGs, and the handling of waste. Similar to industry sector emissions, commercial and residential uses arise primarily from fossil fuels for heat, the use of certain products that contain GHGs, and the handling of waste. Agricultural emissions come from livestock such as cows, agricultural soil, and rice production. The land use and forestry sector within the U.S. serves as a carbon sink. Carbon sinks absorb CO_2 from the atmosphere. Land areas across the U.S. absorbed approximately 13 percent of the 2021 GHG emissions (USEPA 2024c).

California

In 2022, GHG emissions within California totaled 371.1 $MMTCO_2e$. Similar to national emissions, in California, the transportation sector is the largest contributor. Transportation emissions account for approximately 39 percent of the total statewide GHG emissions. The majority of transportation emissions are derived from passenger vehicles and heavy-duty trucks. Emissions associated with industrial uses are the second largest contributor, totaling roughly 23 percent. Industrial emissions are driven by fuel

combustion from sources that include refineries, oil and gas extraction, cement plants, and the portion of cogeneration emissions attribution to thermal energy output. Electricity generation (in-state and imports) totaled roughly 16 percent. Other GHG sources include agriculture (8 percent), residential (8 percent), and commercial (6 percent) (CARB 2024a).

City of Campbell

The City of Campbell prepared a GHG emissions inventory for the year 2022, which includes communitywide emissions as well as emissions from municipal operations. The analysis determined that the City emitted approximately 221,755 $MTCO_2e$ in the year 2022. The largest contributor of emissions was determined to be from on-road transportation (59 percent), followed by building natural gas (26 percent) (City of Campbell 2024a).

Effects of Global Climate Change

There are uncertainties as to exactly what the climate changes will be in various local areas of the earth. There are also uncertainties associated with the magnitude and timing of other consequences of a warmer planet: sea level rise, spread of certain diseases out of their usual geographic range, the effect on agricultural production, water supply, sustainability of ecosystems, increased strength and frequency of storms, extreme heat events, increased air pollution episodes, and the consequence of these effects on the economy.

Within California, climate changes would likely alter the ecological characteristics of many ecosystems throughout the state. Such alterations would likely include increases in surface temperatures and changes in the form, timing, and intensity of precipitation. For instance, historical records are depicting an increasing trend toward earlier snowmelt in the Sierra Nevada. This snowpack is a principal supply of water for the state, providing roughly 50 percent of the state's annual runoff. If this trend continues, some areas of the state may experience an increased danger of floods during the winter months and possible exhaustion of the snowpack during spring and summer months. An earlier snowmelt would also impact the state's energy resources. An early exhaustion of the Sierra snowpack may force electricity producers to switch to more costly or non-renewable forms of electricity generation during spring and summer months. A changing climate may also impact agricultural crop yields, coastal structures, and biodiversity. As a result, resultant changes in climate will likely have detrimental effects on some of California's largest industries, including agriculture, wine, tourism, skiing, recreational and commercial fishing, and forestry.

3.4.2 Regulatory Setting

There are considerable regulatory actions regarding GHGs and climate change at the federal, state, regional, and local level. The following includes the key regulations applicable to the proposed project.

Federal

USEPA

As noted previously, the USEPA is the federal agency responsible for implementing the FCAA. On April 2, 2007, the U.S. Supreme Court held that the USEPA must consider regulation of motor vehicle GHG emissions. In addition, in 2010, the USEPA issued a GHG Tailoring Rule, which relates to permitting GHG emissions of major sources.

The Inflation Reduction Act of 2022 is a multi-faceted, landmark federal law intended to reduce GHG emissions, help build a clean economy, reduce energy costs for Americans, and advance environmental justice. The Inflation Reduction Act affirms USEPA's authority to regulate GHG emissions under the FCAA.

State

Executive Order S-3-05

EO S-3-05, issued in June 2005, set forth the following target dates by which statewide GHG emissions shall be progressively reduced:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

Assembly Bill 32 – The California Global Warming Solutions Act

In line with EO S-3-05, AB 32, passed in 2006, required that GHGs emitted in California be reduced to 1990 levels by the year 2020. GHGs, as defined under AB 32, include CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6. Since AB 32 was enacted, a seventh chemical, NF_3, has also been added to the list of GHGs. CARB is the state agency charged with monitoring and regulating sources of GHGs. AB 32 states the following:

> *Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other human health-related problems.*

CARB approved the 1990 GHG emissions level of 427 $MMTCO_2e$ on December 6, 2007. Therefore, to meet the state's target, emissions generated in California in 2020 were required to be equal to or less than 427 $MMTCO_2e$. In order to set a framework for the state to meet this target, CARB was tasked with creating a Scoping Plan (as described below). California announced in July 2018 that the state emitted 427 $MMTCO_2e$ in 2016 and achieved AB 32 goals (CARB 2018).

Executive Order B-30-15

EO B-30-15, issued in April 2015, established a statewide GHG reduction goal of 40 percent below 1990 levels by 2030. The emission reduction target acts as an interim goal between the AB 32 goal (i.e., achieve 1990 emission levels by 2020) and EO S-3-05 goal of reducing statewide emissions 80 percent below 1990 levels by 2050.

Senate Bill 32

SB 32 is an amendment to the California Global Warming Solutions Act (AB 32) and was signed into law on September 8, 2016. SB 32 states that "In adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions authorized by this division, the state

[air resources] board shall ensure that statewide GHG emissions are reduced to at least 40 percent below the statewide GHG emissions limit no later than December 31, 2030." In other words, SB 32 codified the interim goal established in EO B-30-15 of reducing statewide emissions to 40 percent below 1990 levels by 2030.

Assembly Bill 1279: The California Climate Crisis Act

On September 16, 2022, AB 1279, also known as the California Climate Crisis Act, codified the carbon neutrality goal established by EO B-55-18. AB 1279 establishes the policy of the state to achieve carbon neutrality as soon as possible, but no later than 2045, and maintain net negative GHG emissions thereafter. AB 1279 would also ensure that by 2045 the statewide anthropogenic GHG emissions are reduced by at least 85 percent below 1990 levels. The bill would require CARB to ensure that an updated Scoping Plan identifies and recommends measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal and carbon capture, utilization, and storage technologies to complement AB 1279's emissions reduction requirements.

2022 Climate Change Scoping Plan

CARB's 2022 Climate Change Scoping Plan (2022 Scoping Plan) was approved in December 2022 and assesses progress toward achieving the interim 2030 Target and laying out a path to achieve carbon neutrality no later than 2045. The 2022 Scoping Plan focuses on outcomes needed to achieve carbon neutrality by assessing paths for clean technology, energy deployment, natural and working lands, and others, and is designed to meet the state's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities (CARB 2022a).

Cap-and-Trade Program

CARB administers the state's Cap-and-Trade Program, which covers GHG sources that emit more than 25,000 metric tons CO_2e ($MTCO_2e$) per year, such as refineries, power plants, and industrial facilities. This market-based approach to reducing GHG emissions provides economic incentives for achieving GHG emission reductions.

The governor signed AB 398 on July 25, 2017, to extend the Cap-and-Trade Program to 2030. The legislation includes provisions to ensure that offsets used by sources are limited to 4 percent of their compliance obligation from 2021 to 2025 and 6 percent of their compliance obligation from 2026 through 2030. AB 398 also prevents air districts from adopting or implementing emission reduction rules from stationary sources that are also subject to the Cap-and-Trade Program (CARB 2022b).

Senate Bill 375: The Sustainable Communities and Climate Protection Act of 2008

SB 375 was signed into law on September 30, 2008. According to SB 375, the transportation sector is the largest contributor of GHG emissions, which emits more than 40 percent of the total GHG emissions in California. SB 375 states, "Without improved land use and transportation policy, California will not be able to achieve the goals of AB 32." SB 375 does the following: (1) requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, (2) aligns planning for transportation and housing, and (3) creates specified incentives for the implementation of the strategies.

On March 22, 2018, CARB updated the SB 375 Greenhouse Gas Emission Reduction Targets setting GHG reduction targets for metropolitan planning organizations for 2020 and 2035 (CARB 2024b). The Bay Area reduction targets for per capita vehicular emissions were 10 percent by 2020 and are 19 percent by 2035. Updates to the regional targets are underway and will be approved in 2026.

Assembly Bill 1493: Pavley Regulations and Fuel Efficiency Standards

AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations and fuel efficiency standards that reduce GHGs emitted by passenger vehicles and light duty trucks. The fuel efficiency standards were phased in during the 2009 through 2016 model years.

The second phase of the implementation for AB 1493 was incorporated into Amendments to the LEV III or the ACC program. The ACC program combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of requirements for model years 2017 through 2025. The rules helped promote a reduction in pollutants from gasoline and diesel-powered cars and helped deliver increasing numbers of zero-emission technologies, such as full battery EVs, newly emerging plug-in hybrid EVs, and hydrogen fuel cell cars. The regulations also encouraged adequate fueling infrastructure.

Senate Bill 1368: Emission Performance Standards

Enacted in 2006, SB 1368 directs the California Public Utilities Commission to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 seeks to limit carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than five years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant.

Because of the carbon content of its fuel source, a coal-fired plant cannot meet this standard because such plants emit roughly twice as much carbon as natural gas, combined cycle plants. Accordingly, the law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the state. The California Public Utilities Commission adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, of 1,100 pounds of CO_2 per megawatt-hour.

Senate Bill 1078: Renewable Electricity Standards

SB 1078 (September 12, 2002) required California to generate 20 percent of its electricity from renewable energy by 2017. SB 107 changed the due date to 2010 instead of 2017. On November 17, 2008, the governor signed EO S-14-08, which established the RPS target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. EO S-21-09 directed CARB to adopt a regulation by July 31, 2010, requiring the state's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010, by Resolution 10-23. In 2011, the state legislature adopted this higher standard in SB X1-2. Renewable sources of electricity include wind, small hydropower, solar, geothermal, biomass, and biogas.

Senate Bill 350: Clean Energy and Pollution Reduction Act of 2015

SB 350 (October 7, 2015) reaffirms California's commitment to reducing its GHG emissions and addressing climate change. Key provisions include an increase in the Renewable Portfolio Standards, higher energy efficiency requirements for buildings, initial strategies toward a regional electricity grid, and improved infrastructure for EV charging stations.

Senate Bill 100: California Renewables Portfolio Standard Program

SB 100 (September 10, 2018) revised the RPS goals to achieve the 50 percent renewable resources target by December 31, 2026, and to achieve a 60 percent target by December 31, 2030. The bill requires that retail sellers and local publicly owned electric utilities procure a minimum quantity of electricity products from eligible renewable energy resources so that the total kilowatt hours of those products sold to their retail end-use customers achieve 44 percent of retail sales by December 31, 2024; 52 percent by December 31, 2027; and 60 percent by December 31, 2030. The bill also establishes a state policy that eligible renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity to California end-use customers and 100 percent of electricity procured to serve all state agencies by December 31, 2045. Under the bill, the state cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

Executive Order S-01-07: Low Carbon Fuel Standard

EO S-01-07 was signed on January 18, 2007. The EO mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. In particular, the EO established a Low Carbon Fuel Standard (LCFS) and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission, CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. This analysis supporting development of the protocols was included in an implementation plan for the State Alternative Fuels Plan adopted by California Energy Commission on December 24, 2007, and was submitted to CARB for consideration as an "early action" item under AB 32. CARB adopted the LCFS on April 23, 2009.

The LCFS was subject to legal challenge in 2011. Ultimately, CARB was required to bring a new LCFS regulation for consideration in February 2015. The proposed LCFS regulation was required to contain revisions to the 2010 LCFS and new provisions designed to foster investments in the production of the low-carbon fuels, offer additional flexibility to regulated parties, update critical technical information, simplify and streamline program operations, and enhance enforcement. The Office of Administrative Law approved the regulation on November 16, 2015. The regulation was last amended in 2019 and approved on May 27, 2020. The 2019 Amendments provide clarification related to the Clean Fuel Reward program costs, credit transactions, fuels transactions and compliance reporting (CARB 2020). 2024 Amendments were approved in November 2024 and established new targets to reduce the carbon intensity of transportation fuel by 30 percent by 2030 and 90 percent by 2045. In addition, the 2024 Amendments increase support for ZEV infrastructure (CARB 2024c).

Executive Order S-13-08: Climate Adaptation Strategy

EO S-13-08 states that, "climate change in California during the next century is expected to shift precipitation patterns, accelerate sea level rise and increase temperatures, thereby posing a serious threat to California's economy, to the health and welfare of its population and to its natural resources." Pursuant to the requirements in this EO, the 2009 California Climate Adaptation Strategy was adopted, which is the, "… first statewide, multi-sector, region-specific, and information-based climate change adaptation strategy in the United States." Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order B-48-18

In January 2018, Governor Brown signed EO B-48-18 requiring all state entities to work with the private sector to have at least 5 million ZEVs on the road by 2030, as well as install 200 hydrogen fueling stations and 250,000 EV charging stations by 2025. This order also requires all state entities to continue to partner with local and regional governments to streamline the installation of ZEV infrastructure. Additionally, all state entities are to support and recommend policies and actions to expand ZEV infrastructure at residential land uses, through the LCFS Program and recommend how to ensure affordability and accessibility for all drivers.

Regional

Plan Bay Area 2050

In October 2021, the Metropolitan Transportation Commission (MTC) and ABAG adopted the Plan Bay Area 2050, which is the Bay Area's long-range plan for sustainable growth, and includes strategies focused on the following sectors: housing, economy, transportation, and environment. Plan Bay Area 2050 also serves as the Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) for the region (MTC/ABAG 2021).

Local

Campbell General Plan

As outlined in Section 3.0, Environmental Impact Analysis, the proposed project is subject to the goals and policies of the 2001 General Plan which was in effect at the time of pre-application submittal.[10] Therefore, the goals and policies of the City's historical General Plan is listed below.

The City's 2001 General Plan include the following goals and policies related to GHG that may be applicable to the proposed project (City of Campbell 2001):

Goal CNR-11: Work toward improving air quality and meeting all federal and state ambient air quality standards.

- **Policy CNR-11.1:** Air Quality Impacts: Reduce adverse air quality impacts of City operations.

[10] For an explanation of the applicability of the City's 2001 General Plan in this Draft EIR, see Section 3.0, Environmental Impact Analysis, and Section 3.1.2, Regulatory Setting - Local.

- **Policy CNR-11.2:** Effects of Development on Air Quality: Use the City's development review process and the California Environmental Quality Act to evaluate and mitigate the local and cumulative effects on new development on air quality.

- **Policy CNR-11.3:** Air Quality Improvement Programs: Support regional, state, and federal programs to improve air quality.

Goal CNR-12: Promote energy conservation in Campbell.

- **Policy CNR-12.2:** Advanced Energy Technology and Building Materials: Facilitate the use of advanced energy technology and building materials to create energy -efficient residences and buildings.

- **Policy CNR-12.3:** Landscaping Requirements: Continue to enforce landscaping requirements that facilitate energy efficient uses and conservation.

Goal H-1: Maintain and enhance the quality of existing housing and residential neighborhoods in Campbell.

- **Policy H-1.2:** Green Building: Encourage the use of sustainable and green building design in new and existing housing.

- **Policy H-1.3:** Energy Efficiency: Energy costs can reduce the affordability of housing for lower income households. The City will continue to promote programs and opportunities for improved energy efficiency and weatherization. To address energy conservation in existing buildings, Campbell's website promotes Pacific Gas and Electric utility assistance programs. These programs primarily serve extremely low and very low income households.

Envision Campbell General Plan 2040 (Listed for Informational Purposes)

The Envision Campbell General Plan 2040 document expands on the information provided in the City's 2001 General Plan and provides the following goals and policies related to GHG emissions that are applicable to the proposed project.

Goal COS-7: Protect and maintain animal and plant species, city trees, waterways, and other supporting biological habitats within Campbell.

- **Policy COS-7.7:** Build upon existing streetscapes and develop an urban forest along the city's major corridors and in residential neighborhoods to provide avian habitat, sequester carbon emissions, foster pedestrian activity, and provide shade.

Goal COS-8: Conserve energy and other natural resources through consumption reduction programs and the maximum use of renewable resources.

- **Policy COS-8.1:** Require all development projects to comply with the mandatory energy efficiency requirements of the California Green Building Standards Code (CALGreen) and Building and Energy Efficiency Standards.

- **Policy COS-8.2:** Support and encourage the implementation of innovative and green building best management practices including, but not limited to, sustainable site planning, solar opportunities, LEED certification for new development, the local adoption of Reach Codes, and incorporation of net zero energy development standards in the California Code of Regulations (CCR), Title 24, if feasible.

- **Policy COS-8.5:** Continue to participate in Silicon Valley Clean Energy (SVCE) whereby city-owned facilities, parks, and streetlights will run on 100% renewable energy sources like wind and solar, and motivate and encourage Campbell residents and businesses to participate in Silicon Valley Clean Energy (SVCE) to reduce greenhouse gas emissions and support statewide alternative energy use.

Goal COS-10: Improve air quality in Campbell and the region through reductions in air pollutants and greenhouse gas (GHG) emissions.

- **Policy COS-10.2:** Align the city's local GHG reduction targets with the statewide GHG reduction targets of Assembly Bill 32, and align the city's GHG reduction goal with the statewide GHG reduction goal of Executive Order S-03-05.

- **Policy COS-10.9:** Coordinate with Santa Clara County and nearby cities to implement regional GHG reduction plans and consolidate efforts to reduce GHGs throughout the county.

Goal SA-7: Minimize risks to life, property, the economy, and the environment through climate adaptation strategies that enhance and promote Campbell's community resiliency.

- **Policy SA-7.1:** Consider climate change impacts and adaptive responses in long-term planning and current development decisions.

- **Policy SA-7.4:** Promote community awareness of climate-resilient actions that can be implemented by citizens and businesses, such as water conservation, on-site water collection, passive solar designs, and alternative energy strategies.

- **Policy SA-7.5** Ensure that climate impacts and climate adaptation measures aimed at reducing climate risks do not lead to disproportionally adverse effects on vulnerable populations.

Goal T-1: Create a Complete Streets network that accommodates all users.

- **Policy T-1.1:** Develop and implement a connected multi-modal transportation network that balances transportation modes, encourages non-automobile travel, and reduces greenhouse gas emissions, while promoting healthier travel alternatives for all users and respecting context.

3.4.3 Environmental Impacts

This section discusses how GHG thresholds were determined, BAAD's project-specific thresholds, and the methodology and approach taken to conduct the analysis. Additionally, this section analyzes the project's potential to result in significant GHG impacts. When an impact is determined to be significant, mitigation measures are identified that would reduce or avoid impacts.

Methodology for Analysis

CalEEMod version 2022.1.1.29 was used to estimate construction and operational emissions of the proposed project. Detailed modeling assumptions and inputs can be found in Appendix C of this Draft EIR.

Thresholds of Significance

In April 2022, the BAAD Board of Directors adopted the CEQA Thresholds for Evaluating the Significance of Climate Impacts from Land Use Projects and Plans, which updated the BAAD's previous guidance related to evaluating GHG emissions to address the most recent climate legislation.

Because construction emissions are temporary and variable, the BAAD has not developed a quantitative threshold of significance for construction-related GHG emissions. However, BAAD recommends that construction related GHG emissions should still be quantified and disclosed in environmental documents.

For land use projects, the BAAD considers a project to have a less than significant impact related to GHG emissions if it either (1) is consistent with a local GHG reduction strategy that meets the requirements of CEQA Guidelines Section 15183.5(b) or (2) meets specific project design elements related to buildings and transportation (BAAD 2022). These design elements include:

Buildings

a. The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).

b. The project will not result in any wasteful, inefficient, or unnecessary energy usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the state CEQA Guidelines.

Transportation

a. Achieve a reduction in project-generated vehicle miles traveled (VMT) below the regional average consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent) or meet a locally adopted Senate Bill 743 VMT target, reflecting the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA:

    i. Residential projects: 15 percent below the existing VMT per capita

    ii. Office projects: 15 percent below the existing VMT per employee

    iii. Retail projects: no net increase in existing VMT

b. Achieve compliance with off-street electric vehicle requirements in the most recently adopted version of CALGreen Tier 2.

It is noted that the City of Campbell is currently preparing their first Climate Action and Adaptation Plan (CAAP), which is anticipated to be adopted in Spring 2026 (City of Campbell 2024b). Because the City

does not have an adopted CAAP, this analysis evaluates the significance of GHG impacts based on meeting the BAAD's project design elements listed above.

CEQA Guidelines

In accordance with the CEQA Guidelines' Appendix G Environmental Checklist, the following questions were analyzed and evaluated to determine whether the proposed project's GHG impacts are significant.

Would the proposed project:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Project Impact Analysis and Mitigation Measures

Generation of Greenhouse Gases

Impact GHG-a	**The proposed project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.**

Impact Analysis

As noted previously, the BAAD's applicable thresholds for the significance of GHG emissions are qualitative, and the following GHG emissions inventories are provided for informational purposes. Potential impacts related to GHG emissions resulting from implementation of the proposed project are considered in comparison with BAAD's adopted thresholds of significance below.

Construction Emission Inventory

Construction GHGs would be emitted by the off-road construction equipment and vehicle travel by workers and material deliveries to the project site. The estimated construction GHG emissions are shown in Table 3.4-1. The BAAD does not have a quantitative threshold for construction projects. Consistent with other analyses conducted for projects within the city, construction GHG emissions are amortized over an estimated 30-year project lifetime and added to total operational emissions. Additionally, annual construction emissions were also compared to BAAD's stationary source bright-line threshold of 10,000 MT CO_2e to demonstrate that the proposed project would not result in a significant amount of construction GHG emissions. As shown in Table 3.4-1, the annual construction emissions would fall below this threshold.

Table 3.4-1: Construction Greenhouse Gas Emissions

Phase	Annual Emissions ($MTCO_2e$/yr)
Phase 1 and Phase 2	1,009
Phase 3	679
Phase 4	677
Total	***2,365***

Phase	Annual Emissions ($MTCO_2e/yr$)
BAAD Bright-Line Threshold	***10,000***
Exceed?	***No***
Amortized over 30 years	*78.83*

Source: Appendix C

Operational Emission Inventory

Operational, or long-term, emissions occur over the life of the proposed project. Operational activities of the proposed project would generate GHG emissions primarily from mobile sources. Table 3.4-2 presents the estimated GHG emissions that occur under existing conditions. Table 3.4-3 presents the estimated GHG emissions that would occur under the proposed project, as well as the net change in emissions from implementation of the proposed project. As demonstrated in Table 3.4-3, implementation of the proposed project is expected to result in a net decrease in GHG emissions.

Table 3.4-2: Operational Greenhouse Gas Emissions – Existing Conditions

Source	Annual Emissions ($MTCO_2e/yr$)
Mobile	1,177.98
Area	4.12
Energy	910.47
Water	272.41
Waste	6.66
Refrigeration	1.19
Total	***2,372.84***

Consistency with BAAD's Project Design Elements

According to the BAAD's guidance, in order to find a less than significant GHG impact, projects must include certain project design elements. The proposed project is evaluated in relation to each design element in Table 3.4-4.

Table 3.4-4: Project Consistency with BAAD's Project Design Elements

Measure	Consistency Determination
Buildings	
a) The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).	**Consistent.** The proposed project would include all electric appliances and plumbing and, therefore, would not include natural gas appliances or natural gas plumbing.
b) The project will not result in any wasteful, inefficient, or unnecessary energy use as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the state CEQA Guidelines	**Consistent.** The proposed project would comply with all applicable federal, state, and local regulations regarding energy use during both project construction and operations. Specifically, the proposed project would comply with CARB's 5-minute idling rule which would reduce fuel consumption and develop the Project to meet the latest CALGreen standards. Therefore, as further described in Section 3.3.3, Environmental Impacts, the proposed project would not result in any wasteful, inefficient, or unnecessary energy use.
Transportation	
a) The project will achieve a reduction in project-generated VMT below the regional average consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent) or meet a locally adopted Senate Bill 743 VMT target that reflects the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA: i. Residential projects: 15 percent below the existing VMT per capita; ii. Office projects: 15 percent below the existing VMT per employee; iii. Retail projects: no net increase in existing VMT.	**Consistent.** The proposed project is presumed to have a less than significant VMT impact based on meeting the Transit Screening criteria, see Section 3.7, Transportation, of this Draft EIR. Therefore, the proposed project would meet the City's SB 743 VMT policy.
b) The project will achieve compliance with off-street electric vehicle requirements in the most recently adopted version of CALGreen Tier 2.	**Consistent.** A total of 718 parking spaces would be provided onsite to accommodate the proposed residential development. Of the total 718 parking spaces, 580 parking spaces would be provided as residential in-garage spaces and 138 spaces would be guest parking dispersed throughout the site. All homes are proposed to have a single dedicated Level 1 and a single dedicated Level 2 receptacle in the garage for EV charging, which complies with the Tier 2 CALGreen requirement for single-family residential land uses. Of the 138 guest spaces, the proposed project would provide 14 EV capable spaces, 35 EV ready spaces, and 7 EV charging spaces (56 total spaces). Pursuant to the Tier 2 CALGreen requirements, 40 percent of spaces at multi-family residential projects must be EV ready (288 spaces) and 15 percent of

Measure	Consistency Determination
	those spaces must be equipped with Level 2 charging equipment (43 spaces). The in-garage EV parking and guest EV parking spaces would exceed the required number of spaces and, therefore, the proposed project would comply with the residential Tier 2 CALGreen standards.

Source: BAAD 2022

Based on the analysis included in the table above, the proposed project would comply with the BAAD's project design elements. Therefore, the proposed project would not generate GHG emissions that may have a significant impact on the environment, and the impact would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Conflict with an Applicable Plan, Policy, or Regulation

Impact GHG-b **The proposed project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.**

Impact Analysis

Pursuant to Appendix G of the CEQA Guidelines, a significant GHG impact is identified if the project could conflict with applicable GHG reduction plans, policies, or regulations. The proposed project would be subject to complying with the CARB's 2022 Scoping Plan which includes measures adopted for the purpose of reducing GHG emissions.

CARB approved the 2022 Scoping Plan in December 2022. The 2022 Scoping Plan builds upon previous iterations of state scoping plans to achieve carbon neutrality and reduce anthropogenic GHG emissions below 85 percent below 1990 no later than 2045, as directed by AB 1279 (CARB 2022a). Table 3.4-5 identifies the Scoping Plan policies that may be relevant to the proposed project.

Table 3.4-5: Project Consistency with 2022 Scoping Plan Greenhouse Gas Reduction Strategies

Measure	Consistency Determination
Deploy ZEVs and reduce driving demand	**Consistent.** Within the guest parking spaces, the proposed project would include 14 EV capable spaces, 35 EV ready spaces, and 7 EV charging spaces to support the use of ZEVs. Additionally, all homes are proposed to have a single dedicated Level 1 and a single dedicated Level 2 receptacle in the garage to support in-garage EV charging.

Measure	Consistency Determination
Coordinate supply of liquid fossil fuels with declining CA fuel demand	**Not Applicable.** This measure is aimed at petroleum refineries and fossil fuel extraction operations.
Generate clean electricity	**Consistent.** All homes are proposed to have solar photovoltaic systems installed, either individually or for the larger condominium building as a whole. Therefore, the proposed project would generate clean electricity for use onsite.
Decarbonize Buildings	**Consistent.** As noted above, the proposed project would be all electric and would not include natural gas infrastructure, and all homes are proposed to have solar photovoltaic systems installed, either individually or for the larger condominium building as a whole. Additionally, all structures would comply with the relevant provisions of the CALGreen Code and would not contribute substantially to regional carbon emissions.
Decarbonize Industrial Energy Supply	**Not Applicable.** The proposed project is a residential project and would not affect industrial energy supply.
Reduce non-combustion emissions (Methane)	**Consistent.** The proposed project would not include any land uses that generate significant levels of methane, such as landfills or dairy farms.
Reduce non-combustion emissions (HFCs)	**Consistent.** The proposed project would comply with all state regulations governing SLCPs, including HFCs.
Compensate for remaining emissions	**Not Applicable.** This measure is aimed at the state government to reduce statewide emissions to meet AB 1279 goals. The proposed project would not interfere with this goal.

Source: CARB 2022a

This analysis finds the proposed project would be consistent with the applicable strategies recommended in the 2022 Scoping Plan. The 2022 BAAD Project Thresholds for GHG emissions were designed to evaluate whether an individual project does it's "fair share" to achieve the state's climate goals, including those set forth in AB 32, SB 32, EO B-55-18, and EO S-03-05. Since the proposed project incorporates the measures discussed in Impact GHG-a, the proposed project will not conflict with applicable initiatives to reduce GHG emissions. The proposed project's consistency with state climate goals, compliance with CALGreen standards, 100 percent electric operation, incorporation of solar photovoltaic infrastructure, and incorporation of street trees ensure that the proposed project will not conflict with or obstruct any of the relevant foals and policies from the City's 2001 General Plan or 2040 General Plan. Therefore, the proposed project would not conflict with an applicable plan adopted for the purpose of reducing GHG emissions; therefore, impacts would be considered less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

3.5 LAND USE AND PLANNING

This section describes the environmental and regulatory setting for land use and planning. It also describes existing conditions and potential impacts related to land use and planning that would result from implementation of the proposed project, and identifies mitigation measures for potentially significant impacts, where feasible.

3.5.1 Environmental Setting

Regional Setting

The City of Campbell was officially incorporated in 1952 and since then, the City has transformed from a small farm community to an urbanized community with a population of over 40,000 residents (City of Campbell 2022). The primary land use within the City's boundaries is its residential uses which includes a variety of single-family and multi-family developments. Single-family residential uses account for approximately 47.5 percent of the City's land area. Additionally, the majority of non-residential developments in the City is in commercial uses.

Project Site Setting

The project site is approximately 17.28 acres and is located along Campbell Technology Parkway. The project site consists of four contiguous parcels that are currently developed with a R&D campus, known as Campbell Technology Park, consisting of four buildings that total approximately 280,864 square feet. The project site is bounded by SR-17 the north and west, Campbell Technology Parkway and commercial uses to the south, and single-family developments to the east. Additionally, the project site is developed with paved surface parking stalls, drive-aisles, walkways, and landscaping throughout the site. The existing onsite buildings are one to two stories high and are developed with R&D uses that is currently 50 percent occupied with a mix of professional office tenants.

General Plan Land Use Designation

The City's 2001 General Plan Land Use Map designated the project site as R&D. Under the recently adopted 6th Cycle Housing Element and 2040 General Plan, three of the project site parcels (APNs 412-29-015, 412-29-012, and 412-29-011) were redesignated as HD MU (34-45 units/acre); however, APN 412-29-010 was not redesignated and remained R&D. The R&D land use designation generally consists of campus-like environments for corporate headquarters, R&D facilities and offices. The HD MU land use designation generally consists of residential uses as provided for by the High Density Residential land use designation and commercial uses as provided for by the General Commercial land use designation. Mixed-use residential projects are encouraged within the HD MU designation but not required (City of Campbell 2022).

Notwithstanding the above, because the proposed project is subject to the "Builder's Remedy" provision of the California Housing Accountability Act, it is deemed consist with the City's General Plan and zoning regulations as a matter of law (Government Code Section 65589.5(f)(6)(D)(iii).) Consequently, no significant impact can arise from a land use plan or zoning conflict.

Zoning

Under the current 2040 General Plan, APN 412-29-010 is zoned P-D and APNs 412-29-015, 412-29-012, and 412-29-011 are zoned HD MU. However, prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan, the project site parcels were zoned P-D.

As identified in the City's Zoning Code, the purpose of the P-D zoning district is:

1. To provide a means for the planned coordination of development and land uses with a degree of flexibility that is not available in other zoning districts to allow developments which are more innovative, affordable, and/or responsive to site characteristics.

2. To incentivize increases in the quantity, quality, and functionality of open space, and the incorporation of community serving amenities and design features.

The HD MU zoning designation generally consists of residential uses as provided for by the High Density Residential land use designation and commercial uses as provided for by the General Commercial land use designation and mixed-use residential projects are encouraged within this designation but not required.

As explained above, however, because the Applicant submitted a Builder's Remedy application and SB 330 (Housing Crisis Act) pre-application, the City may not deny the proposed project based on inconsistency with the zoning district and as a matter of law, the proposed project is deemed consistent.

3.5.2 Regulatory Setting

State

General Plans

The land use planning and zoning authority of local jurisdictions in California is set forth in the state's planning laws. California Government Code Section 65300, et seq. obliges cities and counties to adopt and implement general plans. The general plan is a comprehensive, long-term, and general document that describes plans for the physical development of a city or county and of any land outside its boundaries that, in the city's or county's judgment, bears relation to its planning. The general plan addresses a broad range of topics including, at a minimum, land use, circulation, housing, conservation, open space, noise, and safety. In addressing these topics, the general plan identifies the goals, objectives, policies, principles, standards, and plan proposals that support the city's or county's vision for the area. The general plan is a long-range document that typically addresses the physical character of an area over a 20-year period. Although the general plan serves as a blueprint for future development and identifies the overall vision for the planning area, it remains general enough to allow flexibility in the approach taken to achieve the plan's goals.

State Zoning Law

The State Zoning Law (California Government Code Section 65800, et seq.) establishes that zoning ordinances, which are laws that define allowable land uses within a specific district, are required to be consistent with the general plan and any applicable specific plans. When amendments to the general plan are made, corresponding changes in the zoning ordinance may be required within a reasonable time to

ensure the land uses designated in the general plan would also be allowable by the zoning ordinance (Government Code Section 65860, sub.[c]).

Subdivision Map Act

The State of California Subdivision Map Act's (Government Code 66410-66499.58) purpose is to regulate and control design and improvement of subdivisions with proper consideration for their relation to adjoining areas; require subdividers to install streets and other improvements; prevent fraud and exploitation; and protect both the public and purchasers of subdivided lands. Regulation and control of the design and improvement of subdivision are vested in the legislative bodies of local agencies and each local agency shall, by ordinance, regulate and control the initial design and improvement of common interest developments as defined in Section 4100 or 6534 of the Civil Code and subdivisions for which this division requires a tentative and final or parcel map.

Local

Campbell General Plan

The City Council adopted the most recent Envision Campbell General Plan Update (2040 General Plan) on April 18, 2023. The 2040 General Plan provides an update to the 2001 General Plan. Though an updated General Plan has been adopted by the City that would supersede the City's 2001 General Plan, as the SB 330 pre-application was submitted prior to adoption of the 2040 General Plan, the proposed project is subject to the goals and policies of the 2001 General Plan which was in effect at the time of pre-application submittal.[11]

The Campbell General Plan provides a blueprint for growth within the City limits and sphere of influence. The City Council adopted the most recent Envision Campbell General Plan Update (2040 General Plan) on April 18, 2023. The General Plan identifies the community's vision for the future and provides a framework that will guide decisions on growth, development, and conservation of open space and resources in a manner that is consistent with the quality of life desired by the city's residents and businesses. Each topical element contained within the General Plan establishes a set of goals, policies, and implementing actions to guide future land use activities and development within the General Plan boundaries. The General Plan also establishes land use designations for each parcel to guide development.

Government Code Section 65589.5(f)(6)(D(iii) provides that a housing development qualifying under the Builder's Remedy shall be deemed consistent with any applicable plan, policy, or regulation for all purposes. Therefore, this EIR evaluates only the environmental issues underlying applicable General Plan policies (e.g., wildlife movement, wildfire risk) using CEQA's independent significance thresholds.

Campbell Municipal and Zoning Code

Title 21 of the Campbell Municipal Code outlines the City's Zoning Code. The Zoning Code consists of a zoning map that delineates the boundaries of zoning designations within the City and regulations that govern the use of land and placement of buildings and improvements within the various classes of districts. The purpose of the Zoning Code is to protect the health, safety, peace, morals, comfort,

[11] For an explanation of the applicability of the City's 2001 General Plan in this Draft EIR, see Section 3.0, Environmental Impact Analysis, and Section 3.1.2, Regulatory Setting - Local.

convenience, and general welfare of the people of Campbell, and to serve as an instrument for the effectuation of the General Plan.

3.5.3 Environmental Impacts

This section analyzes the project's potential to result in significant land use and planning impacts. When an impact is determined to be significant, mitigation measures are identified that would reduce or avoid impacts.

Methodology for Analysis

The analysis of potential land use impacts considers the project's consistency with adopted plans and policies that regulate land use on the project site, and the project's compatibility with surrounding land uses. The determination of consistency with applicable land use policies and ordinances is based upon a review of the previously identified planning documents that regulate land use or guide land use decisions pertaining to the project site. CEQA Guidelines section 15125(d) requires that an EIR discuss inconsistencies with applicable plans that the decision-makers should address. Evaluations are made to determine whether a project is consistent with such plans. Projects are considered consistent with regulatory plans if they are compatible with the general intent of the plans and would not preclude the attainment of their primary goals. The intent of the consistency evaluation is to determine if noncompliance with regulatory plans would result in a significant impact. The following impact analysis was based on a review of the City's 2001 General Plan to identify planned land uses and policies applicable to the project. Existing land uses were determined from site reconnaissance and General Plan designations. The City's zoning regulations were also reviewed to determine the project's consistency with existing zoning.

Thresholds of Significance

In accordance with the CEQA Guidelines' Appendix G Environmental Checklist, the following questions were analyzed and evaluated to determine whether the proposed project's impacts to land use and planning are significant.

Would the proposed project:

- Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

The following issues were determined to have no impact or a less than significant impact during the Initial Study and NOP Scoping process. These issues are summarized in Section 7.0, Effects Found Not to Be Significant, and are not discussed further in this section.

Would the proposed project:

- Physically divide an established community?

Project Impact Analysis and Mitigation Measures

Conflict with Plans, Policies, or Regulations

Impact LU-b	**The proposed project could cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.**

Impact Analysis

General Plan Consistency Analysis

As explained previously, the Applicant submitted a pre-application pursuant to Government Code Section 65589.5(d), also known as the Builder's Remedy provision, under the Housing Accountability Act. Under Government Code Section 65589.5(o), a project is subject only to the ordinances, policies, and standards adopted and in effect when a pre-application was submitted. As such, the proposed project would be subject to applicable policies in the City's 2001 General Plan which was in place at the time the pre-application was submitted. Under Government Code Section 6.5589.5(d)(5), the City may not deny the proposed project based on inconsistency with the zoning and land use designation as it existed on the date the application was deemed complete. Nevertheless, a detailed analysis of the proposed project's consistency with applicable 2001 General Plan policies is provided in Table 3.5-1 below. The General Plan Consistency Analysis table is provided to identify whether the proposed project would create an inconsistency with the 2001 General Plan. The analysis provided in Table 3.5-1 demonstrated that the proposed project would be consistent with applicable 2001 General Plan policies and goals.

Table 3.5-1: 2001 General Plan Consistency Analysis

Policy	Consistency Analysis
Land Use and Transportation Element	
LUT-2.3: Roadway and Intersection Disruption Minimization: Minimize traffic disruptions along arterial roadways and major intersections.	**Consistent.** As discussed in Section 2.3.2, Access and Staging, for any temporary restrictions or closures required for adjacent roadways during construction, the proposed project would prepare and implement a TCP to minimize any construction related traffic disruptions along adjacent roadways. Additionally, the proposed project would not result in construction of new roadways or modifications to roadways that would result in traffic disruptions along adjacent roadways and intersections.
LUT-3.1: Variety of Residential Densities: Provide land use categories for and maintenance of a variety of residential densities to offer existing and future residents of all income levels, age groups and special needs sufficient opportunities and choices for locating in Campbell.	**Consistent.** The proposed project includes development of a variety of residential densities ranging from single-family homes to multi-family townhome style condominiums. Additionally, the project proposes to set aside 20 percent of the proposed units for low-income households.
LUT-4: Campbell Community Design Study: Ensure projects comply with the recommendations of the Campbell Community Design Study.	**Consistent.** As outlined in Section 3.1, Aesthetics, of the Initial Study (Appendix A), the proposed project would be designed and constructed in accordance with City guidelines and standards for residential developments including the City's Single-Family Homes Design Guidelines and Low-Medium Density Residential Design Guidelines.

Policy	Consistency Analysis
LUT-7.1: Road Maintenance: Maintain and repair roads.	**Consistent.** As outlined in Section 2.2.10, Offsite Improvements, the proposed project would include offsite roadway improvements including widening of Campbell Technology Parkway and improvements along the Campbell Technology Parkway frontage that would include new curb and gutters, sidewalks, and accessible curb ramps at all pedestrian road crossings.
LUT-7.2: Public Utilities and Improvements: Provide a comprehensive network of sidewalks, public utilities and multi-modal improvements that are safe, attractive, efficient, well maintained and accessible for pedestrians, bicyclists and motorists.	**Consistent.** As outlined above under discussion of Policy LUT-7.1, the proposed project would include offsite improvements including widening of Campbell Technology Parkway and improvements along the Campbell Technology Parkway frontage that would include new curb and gutters, sidewalks, and accessible curb ramps at all pedestrian road crossings. In addition, the proposed project includes implementation of Mitigation Measure TRANS-1 which outlines specific pedestrian improvements to be constructed by the proposed project. Additionally, the proposed project would include construction of new utility improvements on and offsite. All utilities and infrastructure improvements proposed as part of the project would be designed and constructed in accordance with City standards and regulations.
LUT-7.3: Transportation Safety: Make safety a priority of citywide transportation design and planning.	**Consistent.** All proposed roadway improvements along Campbell Technology Parkway would be designed and constructed in accordance with the City's design requirements and standards for roadways. Additionally, the proposed driveways and street connections off Campbell Technology Parkway, and internal streets constructed throughout the site would be constructed in accordance with City standards for fire and emergency access to ensure a safe transportation network on and offsite.
LUT-9.3: Design and Planning Compatibility: Promote high quality, creative design and site planning that is compatible with surrounding development, public spaces, and natural resources.	**Consistent.** The proposed project would be designed to be compatible with the surrounding developments. The proposed single-family homes would be adjacent to the existing residential neighborhood located to the east which would allow for a gradual change in the scale of development as the taller multi-family development would be located further away from the existing residential neighborhood.
LUT-10.1: Landscaping: Encourage the retention and planting of landscaping to enhance the natural and built environment.	**Consistent.** As identified in Section 2.2.5, Open Space and Landscaping, landscaping would be provided throughout the project site and the internal street and sidewalks would be planted with various street trees. Low-growing groundcover would be planted throughout the site to enhance pedestrian connections to the public sidewalks.
Open Space, Parks and Public Facilities Element	
OSP-3.1: Standards for Residential Projects: Ensure the provision of private open space or recreational facilities in residential projects.	**Consistent.** As identified in Section 2.2.5, Open Space and Landscaping, the proposed project would include 125,943 square feet of usable open space throughout the site that would provide recreational amenities such as playgrounds, seating and open space areas that allow for passive recreation, and a small pocket park. Additionally, the single-family homes would be

Policy	Consistency Analysis
	developed with a total of 17,415 square feet of private yard space and the townhome-style condominiums would provide balconies, resulting in approximately 18,000 square feet of private open space.
OSP-3.2: Park Impact Fees: Continue to require new residential development to pay park impact fees to use for the acquisition and development of park land and recreational facilities.	**Consistent.** As identified in Section 3.16, Recreation, of the Initial Study (Appendix A), in accordance with this policy and City Municipal Code Chapter 13.08, Park Impact Fees and Parkland Dedication Developments, and Chapter 20.24, Impact Fees and Park Land Dedication Subdivision, the proposed project would pay all required fees to contribute to the City's establishment and rehabilitation of parks and recreational facilities.
OSP-4.1: Street Trees: Encourage planting and retention of street trees in landscaped street medians and along City streets.	**Consistent.** As identified in Section 2.2.5, Open Space and Landscaping, landscaping would be provided throughout the project site and the internal street and sidewalks would be planted with various street trees. Additionally, as identified in Section 2.4.10, Offsite Improvements, new street trees are proposed along the Campbell Technology Parkway frontage.
OSP-4.4: Pedestrian and Bike Routes: Provide pedestrian and bike routes that link residential areas to open space, parks and recreation facilities to create a physically connected community.	**Consistent.** The project proposes new curb and gutters, sidewalks, and accessible curb ramps at all pedestrian road crossings along the Campbell Technology Parkway frontage which would provide pedestrian routes to nearby areas.
OSP-9.1: Drainage Facilities: Ensure that drainage facilities convey storm runoff without polluting local watercourses.	**Consistent.** As identified in Section 2.2.9, Utilities, the proposed project would construct approximately 24,309 square feet of bioretention facilities throughout the site. Stormwater runoff from the site would be conveyed to the treatment areas prior to being discharged into the City's stormwater system. Additionally, as identified in Section 3.10, Hydrology and Water Quality, of the Initial Study (Appendix A), the proposed stormwater drainage system would be designed and constructed in accordance with Provision C.3 of the Municipal Regional Stormwater National Pollutant Discharge Elimination System (NPDES) Permit which mandates criteria that new developments are required to meet including incorporating source control and treatment measures into the project design, and minimizing the discharge of pollutants in stormwater runoff.
OSP-9.2: NPDES: Comply with the federal Clean Water Act requirements for NPDES permits.	**Consistent.** As identified in Section 3.10, Hydrology and Water Quality, of the Initial Study (Appendix A), the proposed project would comply with the NPDES General Construction Permit which requires preparation and implementation of a SWPPP for construction activities. Additionally, the proposed project's stormwater drainage system would be designed and constructed in accordance with Provision C.3 of the Municipal Regional Stormwater NPDES Permit.
Health and Safety Element	
HS-2.4: Fire Safety: Promote fire safety through education and building design.	**Consistent.** As identified in Section 3.15, Public Services, of the Initial Study (Appendix A), the proposed project would be constructed and operated in accordance with California Fire Code requirements and

Policy	Consistency Analysis
	City standards (automatic sprinkler systems, fire hydrants, etc.) for fire safety.
HS-3.1: Construction-related Risk Reduction: Reduce construction-related risks.	**Consistent.** The proposed project's construction activities would be completed in accordance with construction safety and Occupational Safety and Health Administration requirements to reduce potential construction related risks to workers. As identified in Section 3.9, Hazards and Hazardous Materials, of the Initial Study, project construction would be completed in accordance with state and local laws including the NPDES Construction General Permit and would prepare and implement a SWPPP which would reduce potential construction-related risks related to water quality and polluted runoff.
HS-3.2: Seismic Risk Reduction: Minimize the potential damage to buildings, humans and property from geologic and seismic hazards, including ground shaking, liquefaction and fault rupture.	**Consistent.** As identified in Section 3.7, Geology and Soils, of the Initial Study (Appendix A), the proposed project would be required to implement Mitigation Measure GEO-1 which requires preparation of a site-specific, design-level geotechnical exploration report and incorporation of design and construction recommendations included in the report into the project design to reduce potential geotechnical impacts. Additionally, the proposed project would be designed and constructed in accordance with California Building Code requirements which would ensure the proposed project would be designed and constructed to withstand geologic and seismic hazards.
HS-5.1: Flood Regulations: Enforce flood regulations during the development review process.	**Consistent.** An analysis of potential flooding related impacts was included in Section 3.10, Hydrology and Water Quality, of the Initial Study (Appendix A) which determined that the project site is located within an area identified as having minimal flood hazards. Therefore, the proposed project is not required to implement City flood regulations and requirements for structures within a flood zone.
HS-6.1: Aircraft Overflight Hazards and New Development: Ensure that new development does not create potential hazards associated with aircraft overflight.	**Consistent.** As identified in Section 3.9, Hazards and Hazardous Materials, of the Initial Study (Appendix A), the project site is not near an airport and is not located within an airport land use compatibility plan. Therefore, the proposed project would not have the potential to create hazards associated with overflight aircrafts.
HS-6.2: Noise and Safety Impacts: Protect Campbell residents from noise and safety impacts associated with airport overflights.	**Consistent.** As identified in Section 3.13, Noise, of the Initial Study (Appendix A), the closest airport is the San Jose International Airport which is located more than five miles from the project site and therefore, the proposed project's residents would not be exposed to noise and safety impacts associated with airport overflight.
Conservation and Natural Resources Element	
CNR-4.1: Tree Planting: Plant additional trees to maintain and enhance the City's suburban forest.	**Consistent.** See discussion for Policy OSP-4.1.
CNR-5.1: Water Quality Enhancement: Enhance the quality of surface water and groundwater resources and prevent their contamination.	**Consistent.** See discussion for Policies OSP-9.1 and OSP-9.2.

Policy	Consistency Analysis
CNR-6.1: Water Conservation: Encourage residents and businesses to conserve water.	**Consistent.** As identified in Section 2.2.5, Open Space and Landscaping, the proposed project would utilize native and drought tolerant plants to reduce water use associated with maintaining landscaped areas.
CNR-9.1: Source Reduction and Recycling Efforts: Participate in source reduction and recycling efforts.	**Consistent.** The proposed project would require demolition of existing structures onsite which would result in generation of construction waste. As identified in Section 2.3.4, Grading, Excavation, and Demolition, of this Draft EIR, 65 percent of construction debris would be diverted from landfills to meet the City's waste diversion requirements and to ensure proper disposal and recycling of demolition materials.
CNR-11.2: Effects of Development on Air Quality: Use the City's development review process and CEQA to evaluate and mitigate the local and cumulative effects of new development on air quality.	**Consistent.** As identified in Section 3.1, Air Quality, construction and operation of the proposed project would require implementation of Mitigation Measures AIR-1 and AIR-2 to reduce potential impacts related to air quality. Mitigation Measure AIR-1 requires minimization of construction exhaust emissions with the use of off-road equipment engines that meet or exceed CARB's Tier 4 Final engine emissions standards and Mitigation Measure AIR-2 requires the Applicant to provide all tenants with information on management of their MERV 13 filters prior to occupancy. See Section 3.1, Air Quality, for an evaluation of the proposed project's effects on air quality in accordance with CEQA and the proposed measures to mitigate and reduce potential effects.
CNR-12.2: Advanced Energy Technology and Building Materials: Facilitate the use of advanced energy technology and building materials to create energy-efficient residences and buildings.	**Consistent.** As identified in Section 2.2.9, Utilities, the project proposes all homes to be constructed with solar photovoltaic systems installed, either individually or for the larger condominium buildings as a whole. Additionally, all homes are proposed to have a single dedicated Level 1 and a single dedicated Level 2 receptacle in the garage for EV charging and all homes would have the option of a battery backup located in the garage.
Housing Element	
H-1.2: Green Buildings: Encourage the use of sustainable and green building design in new and existing housing.	**Consistent.** The proposed project would be designed and constructed in accordance with applicable green building guidelines including the California Green Building Standards Code.
H-3.1: Inclusionary Housing: Support the development of additional affordable housing by nonprofit and for-profit developers through financial assistance and/or regulatory incentives. Ensure that new residential development in Campbell integrates units affordable to lower- and moderate-income households, or contributes funds to support affordable housing activities (when funding is available). Create additional levels of affordability within the Inclusionary Housing Ordinance in a way that does not create a governmental constraint to housing production.	**Consistent.** As identified in Section 2.2.4, Affordable Housing, the project proposes to reserve 20 percent of the total proposed units for low-income households which would exceed the City's Inclusionary Housing Ordinance requirement of provide 15 percent of residential units as affordable housing.

Campbell Zoning Code Consistency

Under the current 2040 General Plan, APN 412-29-010 is zoned P-D and APNs 412-29-015, 412-29-012, and 412-29-011 are zoned HD MU. However, prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan, the project site parcels were zoned P-D. As explained previously, the Applicant submitted a Builder's Remedy application and SB 330 (Housing Crisis Act) pre-application prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan which included rezoning the project site. Under Government Code Section 65589.5(o), a project is subject only to the ordinances, policies, and standards adopted and in effect when a pre-application was submitted. As such, the proposed project would be subject to the development standards for the site's P-D zoning district which was in place at the time the pre-application was submitted.

The P-D zoning district does not have specified development standards within the City's Zoning Code. As identified in the City's Zoning Code, the P-D zoning district's subdivision standards shall be the same as the zoning district that directly corresponds to the general plan land use designation of the property. As the proposed project's General Plan land use designation at the time of pre-application submittal was R&D, the proposed project would be subject to the development standards of the R&D zoning district which directly corresponds with the general plan land use designation of R&D. The R&D zoning district does not permit residential uses onsite and therefore, the proposed project would be inconsistent with the City's Zoning Code. However, as the proposed project is a SB 330 project, under Government Code Section 65589.5(d)(5), the City may not deny the proposed project based on inconsistency with the zoning designation as it existed on the date the application was deemed complete. It is important to note that with regard to potential physical impacts resulting from the proposed project, the proposed project would comply with applicable objective design standards included in the City's Single-Family Homes Design Guidelines and Low-Medium Density Residential Design Guidelines. Additionally, the proposed project would be consistent with applicable 2001 General Plan policies and would provide new housing and affordable housing for the City which would result in a beneficial impact. Compliance with applicable 2001 General Plan policies and City guidelines and standards would reduce potential impacts and the proposed project would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Impacts would be less than significant.

Conflicts with Proposed and Existing Land Uses

CEQA does not have a single, universal "land use conflict standard." Instead, it requires a lead agency to analyze whether a project would conflict with applicable land use plans, policies, or regulations that were adopted for the purpose of avoiding or mitigating an environmental effect.

The project's proposed land use may result in conflicts with existing land uses nearby as it would place residential uses adjacent to light industrial uses. The City's 2001 General Plan Land Use Map designated the project site as R&D and therefore, the proposed project conflicts with the land use designation of the site. However, as described under Section 3.5.1, Environmental Setting, because the proposed project is subject to the "Builder's Remedy" provision of the California Housing Accountability Act, it is deemed consistent with all local land use plans and regulations as a matter of law (Government Code Section 65589.5(f)(6)(D)(iii)). Consequently, no significant impact can arise from a land use plan designation conflict. However, the statute does not relieve the City of its duty to analyze resource specific physical

impacts that could result from the proposed project since CEQA significance is tied to physical environmental change, not to generalized policy consistency. Since the Housing Crisis Act has removed the possibility of a legal conflict, the only remaining CEQA question is whether the proposed project would cause any physical impacts that the City's planning documents are intended to prevent.

As described previously in Section 3.5.1, Environmental Setting, three of the four project site parcels located on the northern portion of the project site adjacent to existing residential uses were identified in the City's 6th Cycle Housing Element as opportunity sites for future housing development and were rezoned HD MU. However, the fourth parcel, located on the southern portion of the project site, adjacent to the existing light industrial uses to the south, was not redesignated and remained R&D. The southern most parcel was not redesignated for residential uses to provide a buffer of approximately 400 feet for the residential designated parcels from the adjacent existing light industrial uses to the south. However, as the project proposes to develop the parcel located on the southern portion of the site with residential uses, a buffer from the existing light industrial uses to the south would not be provided and could result in conflicts between the proposed and existing land uses. Conflicts with the proposed uses and existing adjacent light industrial uses could occur if it was determined that the adjacent uses would result in air quality and noise related impacts to the proposed development.

As identified in Section 3.1, Air Quality, stationary sources of emissions are located within 1,000 feet of the project site and the cumulative total health risk posed to receptors of the proposed project would exceed the applicable cumulative threshold of significance for $PM_{2.5}$. However, to reduce these impacts, pursuant to the California Building Standards Code, all proposed residential units would be required to install MERV 13 filters or better. With the use of MERV 13 filters, the indoor concentration of $PM_{2.5}$ would be reduced to acceptable levels. Additionally, Mitigation Measure AIR-2 is required to ensure that all tenants are informed of how to properly maintain the filters. Therefore, as identified in Section 3.1, Air Quality, the required installation of MERV filters would ensure that indoor concentrations of PM would be reduced to below the applicable threshold and future residents of the proposed project would not be exposed to substantial pollution concentrations. Furthermore, the prevailing wind direction in the project area is most often from the northwest blowing to the southeast. Therefore, the project site is located upwind of the auto facility and the proposed project is not anticipated to be exposed to substantial objectional odors from the adjacent uses.

As identified in Section 3.6, Noise, a project specific acoustical analysis is required to be completed for new multi-family residential projects exposed to ambient noise levels above 65 A-weighted decibels [dB(A)] day-night noise level (Ldn) and new single-family residential project exposed to noise levels above 60 dB(A) Ldn. In accordance with City requirements, the acoustical analysis would determine appropriate mitigation to reduce indoor noise levels within residential uses to 45 dB(A) Ldn and include ways to incorporate such mitigation into the project design and implementation. The analysis prepared in Section 3.6, Noise, determined that with implementation of City requirements and standards the impact of noise on the interior of the residential units would be less than significant.

Therefore, with implementation of existing regulations, buildings standards, and Mitigation Measure AIR-2, the proposed project's development of the site with residential uses would not conflict with the existing light industrial uses located to the south of the project site and impacts would be less than significant.

The proposed project would develop 290 residential units on three housing opportunity sites that were envisioned in the City's 6th Cycle Housing Element as providing 464 total residential units and therefore, there would be a deficit of 174 units. The remaining 174 units would be reallocated to other housing opportunity sites identified in the Sites Inventory. The City's 6th Cycle Housing Element identified a total of 122 housing opportunity sites. As the proposed project encompasses three of the identified housing opportunity sites, there would be 119 housing opportunity sites remaining that could potentially take on the remaining 174 units. If the 174 remaining units were spread across the 119 remaining housing opportunity sites, each site would have to take on an additional 1.5 units. As the development potential for housing opportunity sites identified in the Sites Inventory was calculated using the minimum density requirements of the site, there would be sufficient capacity available at the sites to take on the remaining 174 units. Adequate capacity and development potential exists at all housing opportunity sites identified in the Sites Inventory and therefore, development of the proposed project would not require identification of additional sites within the City for future development with residential uses. The proposed project would not result in conflicts with existing plans that would result in physical impacts to the environment and impacts would be less than significant.

The proposed project would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect and impacts would be less than significant.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measure AIR-2 is required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

3.6 NOISE

This section describes the environmental and regulatory setting for noise and vibration. It also describes existing conditions and potential impacts related to noise that would result from the implementation of the proposed project, and identifies mitigation measures for potentially significant impacts, where feasible. Descriptions and analysis in this section are based on noise modeling performed by Stantec. The noise modeling output is included in this Draft EIR as Appendix F.

3.6.1 Environmental Setting

Noise Fundamentals and Terminology

Noise is generally defined as unwanted sound that annoys or disturbs people and potentially causes an adverse psychological or physiological effect on human health. Because noise is an environmental pollutant that can interfere with human activities, evaluation of noise is necessary when considering the environmental impacts of a proposed project.

Sound is mechanical energy transmitted by pressure waves over a medium such as air or water. Sound is characterized by various parameters that include the rate of oscillation of sound waves (frequency), the speed of propagation, and the pressure level or energy content (amplitude). In particular, the sound pressure level (SPL) is the most common descriptor used to characterize the loudness of an existing sound level.

Although the decibel (dB) scale, a logarithmic scale, is used to quantify sound intensity, it does not accurately describe how sound intensity is perceived by human hearing. The perceived loudness of sound is dependent upon many factors, including sound pressure level and frequency content. The human ear is not equally sensitive to all frequencies in the entire spectrum, so noise measurements are weighted more heavily for frequencies to which humans are sensitive in a process called A-weighting, written as dB(A) and referred to as A-weighted decibels. There is a strong correlation between A-weighted sound levels and community response to noise. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. Table 3.6-1 summarizes typical A-weighted sound levels for different common noise sources.

Table 3.6-1: Typical A-Weighted Sound Levels

Common Outdoor Activities	Noise Level (dB(A))	Common Indoor Activities
	-110-	Rock band
Jet flyover at 1,000 Feet		
	-100-	
Gas lawnmower at 3 Feet		
	-90-	
Diesel truck at 50 Feet at 50 mph		Food blender at 3 Feet
Noisy urban area, daytime	-80-	Garbage Disposal at 3 Feet
Gas lawnmower, 100 Feet		
Commercial area	-70-	Vacuum Cleaner at 10 Feet
Heavy traffic at 300 Feet		Normal Speech at 3 Feet
	-60-	
Quiet urban daytime		Large business office
	-50-	Dishwasher in next room
Quiet urban nighttime		
Quiet suburban nighttime	-40-	Theater, large conference room (Background)
	-30-	
Quiet rural nighttime		Library
	-20-	Bedroom at night, concert hall (Background)
	-10-	
		Broadcast/recording studio
	-0-	

Source: Caltrans 2013

Different types of measurements are used to characterize the time-varying nature of sound. These measurements include the equivalent sound level (Leq), the minimum and maximum sound levels (Lmin and Lmax), percentile-exceeded sound levels (such as L10, L20), the day-night sound level (Ldn), and the community noise equivalent level (CNEL). Ldn and CNEL values often differ by less than 1 dB. As a matter of practice, Ldn and CNEL values are considered to be equivalent and are treated as such in this assessment. Table 3.6-2 defines sound measurements and other terminology used in this report.

Table 3.6-2: Definition of Sound Measurements

Sound Measurements	Definition
Decibel (dB)	A unitless measure of sound on a logarithmic scale, which indicates the squared ratio of sound pressure amplitude to a reference sound pressure amplitude. The reference pressure is 20 micro-pascals.
A-Weighted Decibel (dB(A))	An overall frequency-weighted sound level in decibels that approximates the frequency response of the human ear.
Maximum Sound Level (Lmax)	The maximum sound level measured during the measurement period.

Sound Measurements	Definition
Minimum Sound Level (Lmin)	The minimum sound level measured during the measurement period.
Equivalent Sound Level (Leq)	The equivalent steady state sound level that in a stated period of time would contain the same acoustical energy.
Percentile-Exceeded Sound Level (Lxx)	The sound level exceeded xx percent of a specific time period. L10 is the sound level exceeded 10 percent of the time. L90 is the sound level exceeded 90 percent of the time. L90 is often considered to be representative of the background noise level in a given area.
Day-Night Level (Ldn)	The energy average of the A-weighted sound levels occurring during a 24-hour period, with 10 dB added to the A-weighted sound levels occurring during the period from 10:00 PM to 7:00 AM
Community Noise Equivalent Level (CNEL)	The energy average of the A-weighted sound levels occurring during a 24-hour period with 5 dB added to the A-weighted sound levels occurring during the period from 7:00 PM to 10:00 PM and 10 dB added to the A-weighted sound levels occurring during the period from 10:00 PM to 7:00 AM.
Peak Particle Velocity (Peak Velocity or PPV)	A measurement of ground vibration defined as the maximum speed (measured in inches per second) at which a particle in the ground is moving relative to its inactive state. PPV is usually expressed in inches/second.
Frequency: Hertz (Hz)	The number of complete pressure fluctuations per second above and below atmospheric pressure.

Source: Federal Highway Administration (FHWA) 2006

With respect to how humans perceive and react to changes in noise levels, a 1 dB(A) increase is imperceptible, a 3 dB(A) increase is barely perceptible, a 5 dB(A) increase is clearly noticeable, and a 10 dB(A) increase is subjectively perceived as approximately twice as loud. These subjective reactions to changes in noise levels were developed on the basis of test subjects' reactions to changes in the levels of steady-state pure tones or broadband noise and to changes in levels of a given noise source. These statistical indicators are thought to be most applicable to noise levels in the range of 50 to 70 dB(A), as this is the usual range of voice and interior noise levels. Numbers of agencies and municipalities have developed or adopted noise level standards, consistent with these and other similar studies to help prevent annoyance and to protect against the degradation of the existing noise environment.

For a point source such as a stationary compressor or construction equipment, sound attenuates based on geometry at a rate of 6 dB per doubling of distance. For a line source such as free-flowing traffic on a freeway, sound attenuates at a rate of 3 dB per doubling of distance. Atmospheric conditions including wind, temperature gradients, and humidity can change how sound propagates over distance and can affect the level of sound received at a given location. The degree to which the ground surface absorbs acoustical energy also affects sound propagation. Sound that travels over an acoustically absorptive surface, such as grass, attenuates at a slightly greater rate than sound that travels over a hard surface, such as pavement. The increased attenuation is typically in the range of 1–2 dB per doubling of distance.

Barriers, such as buildings and topography that block the line of sight between a source and receiver, also increase the attenuation of sound over distance.

Decibel Addition

Because decibels are logarithmic units, sound pressure levels cannot be added or subtracted through ordinary arithmetic. On the dB scale, a doubling of sound energy corresponds to a 3 dB increase. In other words, when two identical sources are each producing sound of the same loudness, their combined sound level at a given distance would be 3 dB higher than one source under the same conditions. For example, if one source produces a sound pressure level of 70 dB(A), two identical sources would combine to produce 73 dB(A). The cumulative sound level of any number of sources can be determined using decibel addition.

Vibration Standards

Vibration is like noise such that it involves a source, a transmission path, and a receiver. While related to noise, vibration differs in that noise is generally considered to be pressure waves transmitted through air, whereas vibration usually consists of the excitation of a structure or surface. As with noise, vibration consists of an amplitude and frequency. A person's perception to vibration depends on their individual sensitivity to vibration, as well as the amplitude and frequency of the source and the response of the system that is vibrating.

Vibration can be measured in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration in terms of peak particle velocity in inches per second (in/sec) PPV). Standards pertaining to perception as well as damage to structures have been developed for vibration levels defined in terms of in/sec PPV.

Vibration can be measured in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration in terms of peak particle velocity in in/sec PPV. Standards pertaining to perception as well as damage to structures have been developed for vibration levels defined in terms of in/sec PPV. Human and structural response to different vibration levels is influenced by a number of factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. Table 3.6-3 describes the reaction of people and damage to building from continuous or frequent intermittent vibration levels.

Table 3.6-3: Guideline Vibration Annoyance and Damage Potential Criteria

Velocity Level, PPV (in/sec)	Human Reaction	Effect on Buildings
0.01	Barely perceptible.	No effect.
0.04	Distinctly perceptible.	Vibration unlikely to cause damage of any type to any structures.
0.08	Distinctly perceptible to strongly perceptible	Recommended upper level of the vibration to which ruins and ancient monuments should be subjected.
0.1	Strongly perceptible.	Virtually no risk of damage to normal buildings.

Velocity Level, PPV (in/sec)	Human Reaction	Effect on Buildings
0.3	Strongly perceptible to severe.	Threshold at which there is a risk of damage to newer residential structures.
0.5	Severe – Vibration Considered Unpleasant	Architectural damage and possible minor structural damage

Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seal equipment, vibratory pile drivers, and vibratory compaction equipment.
Source: Caltrans 2020

The operation of heavy construction equipment, particularly pile driving, and other impact devices, such as pavement breakers, create seismic waves that radiate along the surface of the ground and downward into the earth. These surface waves can be felt as ground vibration. Vibration from the operation of this equipment can result in effects ranging from annoyance of people to damage of structures. Varying geology and distance will result in different vibration levels containing different frequencies and displacements. In all cases, vibration amplitudes will decrease with increasing distance. Perceptible groundborne vibration is generally limited to areas within a few hundred feet of construction activities.

Table 7-4, Vibration Source Levels for Construction Equipment, in the 2018 Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual (FTA 2018) lists vibration source levels for the construction equipment most likely to generate high levels of ground vibration. The equipment listed in the FTA table includes impact and sonic pile drivers, clam shovel drops, hydromills, vibratory rollers, hoe rams, large and small bulldozers, caisson drilling, loaded trucks, and jackhammers. Table 3.6-4 below summarizes typical reference vibration levels generated by select construction equipment proposed for this project.

Table 3.6-4: Vibration Source Levels for Construction Equipment

Equipment	PPVref at 25 Feet
Vibratory roller	0.210
Large bulldozer	0.089
Loaded trucks	0.076
Small bulldozer	0.003

Source: FTA 2018

Vibration amplitude attenuates over distance and is a complex function of how energy is imparted into the ground and the soil conditions through which the vibration is traveling. The following equation can be used to estimate the vibration level at a given distance for typical soil conditions (FTA 2018). “PPVref” is the reference PPV from Table 5 and “Distance” is the distance between the source and the receptor:

$$PPV = PPVref \times (25/Distance)^{1.5}$$

Existing Project Setting

Sensitive Receptors

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are considered to be more sensitive to noise intrusion than are commercial or industrial activities. Ambient noise levels can also affect the perceived desirability or livability of a development.

The proposed project is located at 635, 655, 675, and 695 Campbell Technology Parkway in the City of Campbell. The project site is bounded by SR-17 to the north and west, Campbell Technology Parkway and commercial uses to the south, and single-family development to the east. The closest noise sensitive receptors to the project site are the single-family homes in the Paseo de Palomas Mobile Home Park to the east of the project site and the Commons Apartments located to the northeast of the project site. The closest residential structures are directly adjacent to the property line along the western edge of the project site and approximately 50 feet from the northeast corner of the project site.

Existing Ambient Noise Levels

The City of Campbell, including the project site, is exposed to noise generated by several sources, including major interstates, such as SR-17, major arterial roads, traffic from local roadways, and noise generated from various commercial and residential activities.

The current ambient noise levels at the project site were determined through a community noise survey. The community noise survey was conducted on Monday, February 10, 2025, and consisted of documenting noise levels at and around the project site by taking short-term (15-minute) noise measurements during daytime and nighttime hours at four separate locations. The locations of the measurements are shown as blue pins in Figure 3-1 below and are noted in Table 3.6-5.

Table 3.6-5: Ambient Noise Measurement Locations

Measurement Number	Measurement Location
Measurement M1	Southwest corner of project site near SR-17.
Measurement M2	South central edge of project site near Edith Morley Park.
Measurement M3	East edge of project site near Paseo de Palomas.
Measurement M4	North corner of project site near SR-17.

Figure 3-1: Ambient Noise Measurement Locations

All measurements were taken with a fully calibrated Larson Davis 821 sound level meter. The sound level meter was manned for all measurements. The microphone for all measurements was located about 5 feet above local ground for all measurements. A description of the measurement location, the short-term measurement results, and the estimated Ldn at each measurement location is shown below in Table 3.6-6. All Ldn levels were calculated using the equations in Appendix E: "Determining Existing Noise" in the Federal Transit Administration Transit Noise and Vibration Impact Assessment Manual.

Table 3.6-6: Measured Short-Term Noise Levels Around Project Site

Measurement Location	Leq, dB(A)		Estimated Ldn, dB(A)
	Daytime Hours (7AM to 10 PM)	Nighttime Hours (10 PM to 7 AM)	
Measurement M1: Southwest corner of project site near SR-17.	62.5	60.9	65.6
Measurement M2: South central edge of project site near Edith Morley Park	55.9	49.5	55.6
Measurement M3: East edge of project site near Paseo de Palomas Residential along Old Redwood Highway	59.4	49.9	57.6
Measurement M4: North corner of project site near SR-17.	57.9	56.0	60.7

The loudest source of noise at the project site was vehicular traffic on SR-17 and the local roadways. Other sources of noise at the project site include parking lot activity, noise from adjacent industrial uses, distant construction noise, and nature-based noises.

3.6.2 Regulatory Setting

Federal, state, and local agencies regulate different aspects of environmental noise. Generally, the federal government sets standards for transportation-related noise sources closely linked to interstate commerce, including aircraft, locomotives, and trucks. No federal noise standards are directly applicable to this proposed project. The state government sets standards for transportation noise sources such as automobiles, light trucks, and motorcycles. Noise sources associated with industrial, commercial, and construction activities are generally subject to local control through noise ordinances and general plan policies. Local general plans identify general principles intended to guide and influence development plans.

State

California Building Code

Part 2, Title 24 of the California Code of Regulations California Noise Insulation Standards establishes minimum noise insulation standards to protect persons within new hotels, motels, dormitories, long-term care facilities, apartment houses, and dwellings other than single-family residences. Under Section 1207.11, Exterior Sound Transmission Control, interior noise levels attributable to exterior noise sources cannot exceed 45 dB(A) Ldn in any habitable room. Where such residences are located in an environment where exterior noise is 60 dB(A) Ldn or greater, an acoustical analysis is required to ensure interior levels do not exceed the 45 dB(A) Ldn interior standard. If the interior allowable noise levels are met by requiring that windows be kept closed, the design for the building must also specify a ventilation or air conditioning system to provide a habitable interior environment.

California Green Building Standards

CalGreen establishes interior noise insulation standards for non-residential occupied buildings, such as office buildings. The CalGreen code also applies to occupied non-residential spaces within a multi-family residential building, such as community rooms, offices, etc. CalGreen Section 5.507, Environmental Comfort, states the following:

> *5.507.4.1 Exterior noise transmission. Wall and roof-ceiling assemblies exposed to the noise source making up the building or addition envelope or altered envelope shall meet a composite sound transmission class (STC) rating of at least 50 or a composite Outdoor/Indoor Transmission Class (OITC) rating of no less than 40, with exterior windows of a minimum STC of 40 or OITC of 30 in the following locations:*
>
> *Within the 65 CNEL noise contour of an airport*
>
> *Exceptions:*
>
> *Ldn or CNEL for military airports shall be determined by the facility Air Installation Compatible Land Use Zone (AICUZ) plan.*

Ldn or CNEL for other airports and heliports for which a land use plan that has not been developed shall be determined by the local general plan noise element.

Within the 65 CNEL or Ldn noise contour of a freeway or expressway, railroad, industrial source or fxed-guideway notice source as determined by the Noise Element of the General Plan.

5.507.4.1.1 Noise exposure where noise contours are not readily available. Buildings exposed to a noise level of 65 dB Leq-1-hr during any hour of operation shall have building, addition or alteration exterior wall and roof-ceiling assemblies exposed to the noise source meeting a composite STC rating of at least 45 (or OITC 35), with exterior windows of a minimum STC of 40 (or OITC 30).

5.507.4.2 Performance method. For buildings located as defined in Section 5.507.4.1 or 5.507.4.1.1, wall and roof-ceiling assemblies exposed to the noise source making up the building or addition envelope or altered envelope shall be constructed to provide an interior noise environment attributable to exterior sources that does not exceed an hourly equivalent noise level (Leq -1Hr) of 50 dBA in occupied areas during any hours of operations

5.507.4.2.1 Site features. Exterior features such as sound walls or earth berms may be utilized as appropriate to the building, addition, or alteration project to mitigate sound migration to the interior.

5.507.4.2.2 Documentation of compliance. An acoustical analysis documenting complying interior sound levels shall be prepared by personnel approved by the architect or engineer of record.

5.507.4.3 Interior sound transmission. Wall and floor-ceiling assemblies separating tenant spaces and tenant spaces and public places shall have an STC of at least 40.

California Environmental Quality Act

CEQA Guidelines, Appendix G, indicates a significant noise impact may occur if a project exposes persons to noise or vibration levels in excess of local general plans or noise ordinance standards, or cause a substantial permanent or temporary increase in ambient noise levels. CEQA standards are discussed more below under Section 3.6.3, Environmental Impacts.

Local

Campbell General Plan

As outlined in Section 3.0, Environmental Impact Analysis, the proposed project is subject to the goals and policies of the 2001 General Plan which was in effect at the time of pre-application submittal.[12] Therefore, the goals and policies of the City's historical General Plan is listed below.

The City's 2001 General Plan includes the following goals and policies related to noise that may be applicable to the proposed project (City of Campbell 2001):

[12] For an explanation of the applicability of the City's 2001 General Plan in this Draft EIR, see Section 3.0, Environmental Impact Analysis, and Section 3.1.2, Regulatory Setting - Local.

Goal CNR-10: Protect the community, especially sensitive noise receptors such as schools, hospitals, and senior facilities, from excessive noise.

- **Policy CNR-10.1:** Noise Reduction: Reduce noise levels at the source.

Envision Campbell General Plan 2040 (Listed for Informational Purposes)

The Noise Element within the Envision Campbell General Plan 2040 document expands on the information provided in the City's 2001 General Plan and "provides goals and policies to guide compatible land uses and the incorporation of noise attenuation measures for new uses to protect people living and working in the city from an excessive noise environment."

The land use compatibility chart shown in Table N-1 identifies compatibility standards for land uses impacted by transportation and non-transportation noise sources.

Table N-1: Land Use Compatibility for Community Noise Environment

Land Use Category	Exterior Noise Exposure (Ldn)						
	55	60	65	70	75	80	
Single-Family Residential							
Multi-Family Residential, Hotels, and Motels							
Outdoor Sports and Recreation, Neighborhood Parks and Playgrounds							
Schools, Libraries, Museums, Hospitals, Personal Care, Public Assembly							
Office Buildings, Business Commercial, and Professional							
Industrial							

Note: Residential components of Mixed-Use developments are subject to the Multi-Family Residential Noise Standards unless otherwise allowed in conjunction with Policy N-2.2.

The white-colored area in Table N-1 signifies "Normally Acceptable" noise levels. This means the specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special insulation requirements. The light beige area in Table N-1 indicates "Conditionally Acceptable" noise levels. Within this range, the specified land use may be permitted only after a detailed analysis of the noise reduction requirements and needed noise insulation features included in the design. The dark-colored areas of Table N-1 note "Unacceptable" noise levels. New construction or development should generally not be undertaken because mitigation was found to be infeasible to comply with noise element policies.

Table N-2 in the Envision Campbell General Plan 2040 document lists noise level standards for stationary (non-transportation) noise sources as follows:

Table N-2: Stationary (Non-Transportation) Noise Source Standards

Land Use Receiving the Noise	Hourly Noise-Level Descriptor	Exterior Noise-Level Standard (dBA)	
		Daytime (6am-11pm)	Nighttime (11pm-6am)
Residential	L_{eq} L_{max}	55 70	45 65

Notes:

a) The residential standards apply to all properties that are zoned for residential use. The exterior noise level standard is to be applied at the property line of the receiving land use or at a designated outdoor activity area. For mixed-use projects, the exterior noise level standard may be waived (at the discretion of the decision-making body) if the residential portion of the project does not include a designated activity area and mitigation of property line noise is not practical.

b) Each of the noise levels specified above shall be lowered by 5 dBA for tonal noises characterized by a whine, screech, or hum, noises consisting primarily of speech or music, or recurring impulsive noises. In no case shall mitigation be required to a level that is less than existing ambient noise levels, as determined through measurements conducted during the same operational period as the subject noise source.

c) In situations where the existing noise level exceeds the noise levels indicated in the above table, any new noise source must include mitigation that reduces the noise level of the noise source to the existing level plus 3 dB.

Tonal Noises are characterized by a whine, screech, beep, or hum, consisting primarily of speech or music, or recurring impulsive noises. Tonal noises can cause unpleasant experiences in spaces adjacent to areas that produce tonal noise, which annoys occupants and, in turn, lead to increased complaints from nearby sensitive receptors.

The Envision Campbell General Plan 2040 document also includes the following goals, policies, and action items relevant to the proposed project:

Goal N-1: Preserve and enhance the quality of existing and future land uses by minimizing exposure to harmful and excessive noise.

- **Policy N-1.1:** Consider the noise compatibility of existing and future development when making land use planning decisions with an emphasis on protecting neighborhoods and people from excessive noise levels, while still accommodating new development and uses.
- **Policy N-1.2:** to be consistent with the standards indicated in Table N-1 to ensure acceptable noise levels for existing and future development.
- **Policy N-1.3:** Require new development to reduce excessive noise to the standards indicated in Tables N-1 and N-2 through best practices, including building location and orientation, building design features, placement of noise-generating equipment away from sensitive receptors, shielding of noise-generating equipment, placement of noise-tolerant features between noise sources and sensitive receptors, and use of noise-minimizing materials.
- **Policy N-1.4:** Ensure that new development does not result in indoor noise levels exceeding 45 dBA Ldn for residential uses by requiring the implementation of construction techniques and noise reduction measures for all new residential development.

- **Policy N-1.5:** Encourage the use of open spaces, trees, and landscaping to buffer new and existing development from noise sources. Use fences and sound walls for sound attenuation only when other measures are not practical or when recommended by an acoustical expert as part of a mitigation measure. When sound walls are required for compliance with noise standards, ensure sounds walls are built to be visually compatible with the surrounding area, at the minimum height necessary to achieve the required sound attenuation. As feasible, sound walls should incorporate treatments to resist graffiti.

- **Policy N-1.6:** Require acoustical studies for new noise-generating and developments, and transportation improvements that would increase roadway capacity, move traffic closer to sensitive receptors, or add traffic to areas that do not currently have notable exposure to roadway noise.

- **Policy N-1.8:** For projects that are required to prepare an acoustical study, the following stationary and transportation noise source criteria shall be used to determine the significance of those impacts:

  Stationary and Non-Transportation Noise Sources

  - A significant impact will occur if the project results in an exceedance of the noise level standards contained in this element, or for instances where the ambient noise level is already above the standards contained in this element, the project will result in an increase in ambient noise levels by more than 3 dB.

  - This does not apply to construction activities which are conducted according to the best practices contained in Chapter 18.04 of the Campbell Municipal Code and outlined in Action N-1f. Compliance with these requirements shall be sufficient to reduce construction-related noise impacts to a less than significant level.

  Transportation Noise Sources

  - Where existing traffic noise levels are 60 dB Ldn or less at the outdoor activity areas of noise-sensitive uses, a +5 dB Ldn increase in roadway noise levels will be considered significant;

  - Where existing traffic noise levels are greater than 60 dB Ldn and up to 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +3 dB Ldn increase in roadway noise levels will be considered significant; and

  - Where existing traffic noise levels are greater than 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a + 1.5 dB Ldn increase in roadway noise levels will be considered significant.

- **Policy N-1.9:** Support noise-compatible land uses along Highways 17 and 85 and San Tomas Expressway.

- **Policy N-1.10:** Regional and pass-thru truck traffic shall be limited to specific routes as described in Chapter 10.40 of the Campbell Municipal Code (Restricted-Unrestricted Streets).

- **Policy N-1.11:** Require developers to prepare a construction management plan that defines best management practices to reduce construction noise, and includes proposed truck routes as part of the entitlement process.

- **Policy N-1.13:** Continue to ensure that existing development is protected, to the greatest extent feasible, from noise impacts due to construction on adjacent or nearby properties.

- **Policy N-1.16:** Require non-transportation related noise from site specific noise sources to comply with the standards shown in Table N-2.

- **Policy N-1.17:** Require construction activities to comply with standard best practices (see Action N-1h and Chapter 18.04 of the Municipal Code). Construction activities outside of the permitted construction hours identified in the Campbell Municipal Code (Chapter 18.04 - Building Code) may be approved on a case by case basis by the Building Official.

Goal N-2: Provide vibrant commercial and mixed-use areas in Campbell, while protecting existing and future sensitive uses from excessive noise levels.

- **Policy N-2.2:** Through the development review process, the city may elect to allow new noise-sensitive land uses on a case by case basis in proximity to transportation noise sources and commercial or mixed-use areas that fall within the Conditionally Acceptable Land Use Compatibility Standards in Table N-1. Noise mitigation, including an acoustical analysis, shall be required to reduce interior space noise levels to 45 dB Ldn, or less, for sensitive receptors. Exterior noise levels may be reduced using building orientation, construction and design features; however ultimately, noise levels may fall within the Conditionally Acceptable noise standards identified in Table N-1.

- **Policy N-2.3:** Ensure that existing residential development is protected from excessive noise created by commercial, mixed-use, and other development projects or uses. New development and/or new uses shall demonstrate that impacts to nearby residential properties comply with standards identified in Table N-1 and N-2.

Campbell Municipal Code

The Campbell Municipal Code includes the following requirements related to noise that are applicable to the proposed project.

Chapter 21.16.070 "Noise"

E. Residential noise standards.

1. Noise from stationary sources. New residential development shall conform to a stationary source noise exposure standard of sixty-five dBA for exterior noise levels and forty-five dBA for interior noise levels.

2. Traffic-related noise. New residential development shall conform to a traffic-related noise exposure standard of sixty dBA CNEL for outdoor noise in noise-sensitive outdoor activity

areas and forty-five dBA CNEL for indoor noise. New development that does not and cannot be made to conform to this standard shall not be allowed.

F. Acoustical studies required.

1. Acoustical studies. Acoustical studies are required for all new noise-sensitive projects that may be affected by existing noise from stationary sources, including all new residential developments with a noise exposure greater than 60 dBA CNEL. The studies shall also satisfy the requirements set forth in Title 24, Part 2, of the California Administrative Code, Noise Insulation Standards, for multiple-family attached residential projects, hotels, motels, etc., regulated by Title 24.

2. Mitigation measures. Where acoustical studies show that existing stationary noise sources exceed, or will exceed maximum allowable noise levels, mitigation shall be identified to reduce noise exposure to or below the allowable levels of this chapter. Mitigation measures may include increased setbacks between uses, earth berms, sound walls, landscaping, and site design that shields noise-sensitive uses with nonsensitive structures, (e.g., parking lots, utility areas and garages), or orientation of buildings to shield outdoor spaces from noise sources. In cases where sound walls are used as mitigation, they should be encouraged to help create an attractive setting with features such as setbacks, changes in alignment, detail and texture, pedestrian access (if appropriate) and landscaping.

G. Exemptions. Sound or noise emanating from the following sources and activities are exempt from the provisions of this chapter:

1. Municipal Code provisions. The provisions of this chapter shall not apply where noise standards are specified elsewhere in the Municipal Code.

2. City parks. The provisions of this chapter shall not apply to city-sanctioned recreational activities/programs conducted in public parks.

3. Safety, warning, and alarm devices. Safety, warning, and alarm devices, including house and car alarms, and other warning devices that are designed to protect the health, safety, and welfare, provided the devices are not negligently maintained or operated.

4. Schools. The normal operation of public and private schools typically consisting of classes, daytime recreation, and other school-sponsored activities.

5. Emergencies. Emergencies involving the execution of the duties of duly authorized governmental personnel and others providing emergency response to the general public, including sworn peace officers, emergency personnel, utility personnel, and the operation of emergency response vehicles and equipment. Also included is work by private or public utilities when restoring utility services.

6. Private construction. Private construction (e.g., construction, alteration or repair activities) between the hours of eight a.m. and five p.m. Monday through Friday, and between the hours of nine a.m. and four p.m. Saturday, in compliance with Section 18.04.052 of the Municipal

Code. The community development director may impose further limitations on the hours and day of construction or other measures to mitigate significant noise impacts on sensitive uses.

7. Powered equipment. Powered equipment shall be limited to the hours of eight a.m. and seven p.m. Monday through Friday, and between the hours of nine a.m. and six p.m. Saturday, Sunday and nationally recognized holidays.

8. City projects and activities. Noise from construction of public works projects and maintenance activities, or city-sponsored events, may be exempted from the provisions of the noise ordinance by the city manager or his designee should the public benefit of alternative work hours and or noise levels require such modification.

Chapter 21.16.090 "Vibration"

Uses, activities, and processes shall not generate ground vibration that is perceptible without instruments by the average person at any point along or beyond the property line of the parcel containing the activities. Vibrations from temporary construction, demolition, and vehicles that enter and leave the subject parcel (e.g., construction equipment, trains, trucks, etc.) shall be exempt.

Chapter 18.04.052 "Hours of construction – Time and noise limitations"

Construction activity shall be limited to the hours of eight a.m. and five p.m. daily, Monday through Friday. Saturday hours of construction shall be nine a.m. and four p.m. There shall be no construction activity on Sundays or Public holidays, as defined by Title 5 U.S. Code Section 6103(a).

No loud environmentally disruptive noise will be allowed during the authorized hours of construction, Monday through Saturday, where such noise may be a nuisance to adjacent residential neighbors. Such nuisances shall be discontinued.

Exception.

a) Construction activity is permitted for homeowner permits, when the work is being performed by only the owner of the property, provided no construction activity or loud noises are conducted prior to six a.m. or after seven p.m., Monday through Saturday, and prior to eight a.m. or after six p.m. on Sundays or National Holidays.

b) Where emergency conditions exist, as determined by the building official, construction activity or construction noise may be permitted at any hour or day of the week. Such emergencies shall be completed as rapidly as possible to prevent any disruption to the residential neighborhood.

c) When the building official determines that construction activity and/or construction noises will not be detrimental to the adjacent neighbors, an exception to the time of work activity may be granted to the general contractor who shall be responsible for controlling the site for loud disruptive noises as described above. Hours of operation shall be determined by the building official on a case-by-case basis.

   If the building official determines that construction activity and/or construction noises, as described herein above, allowed by exception, are unreasonably interfering in the reasonable use

and enjoyment of adjacent properties, the building official shall notify the general contractor or owner in writing that the exception has been voided and canceled and the construction time and noise conditions as described in Section 18.04.052 shall apply immediately and the general contractor or owner shall be subject to the penalty(ies) as provided for in this code.

d) (1) Construction activity, under contracts awarded by the city for public improvements, shall be allowed during the working hours specified by the city engineer, as described in the construction project contract documents. Such working hours shall be designed to prevent unnecessary hazard or inconvenience to members of the public. In establishing such working hours, the city engineer may consider:

(A) The impact of the work on vehicular and pedestrian traffic;

(B) The proximity of the work to residential neighborhoods, schools, hospitals and libraries; and

(C) Other factors relating to the public safety, health and welfare.

(2) Deviation from the working hours specified in the contract documents shall be deemed a violation of a mandatory provision of the code.

3.6.3 Environmental Impacts

Methodology for Analysis

As noted above, the ambient noise levels at the project site were estimated using Caltrans published average annual daily traffic volumes and the United States Department of Housing and Urban Development (HUD) Day / Night Noise Level Calculator (Caltrans 2022; HUD 2025). For the purpose of this analysis, potential sensitive receptors were determined by reviewing current aerial photography.

Impacts from future project-related traffic were estimated using the proposed project's trip generation analysis presented in Section 3.7, Transportation.

The FHWA Roadway Construction Noise Model (RCNM) was used to estimate the impact from short-term construction activities. The RCNM is used as the FHWA's national standard for predicting noise generated from construction activities. The RCNM analysis includes the calculation of noise levels at a defined distance for a variety of construction equipment. The spreadsheet inputs include acoustical use factors and distance to receptors and calculates the expected Lmax values and Leq values at a selected receptor.

Groundborne vibration levels associated with construction-related activities for the proposed project were evaluated utilizing typical groundborne vibration levels associated with construction equipment. Potential groundborne vibration impacts related to structural damage and human annoyance were evaluated, taking into account the distance from construction activities to nearby structures and typically applied criteria for structural damage and human annoyance.

Thresholds of Significance

In accordance with the CEQA Guidelines' Appendix G Environmental Checklist, the following questions were analyzed and evaluated to determine whether the proposed project's impacts to noise are significant.

Would the proposed project result in:

- Generation of a substantial temporary or permanent increase in the ambient noise levels in the vicinity of the project noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
- Generation of excessive groundborne vibration or groundborne noise levels?

The following issues were determined to have no impact or a less than significant impact during the NOP Scoping. These issues are summarized in Section 7.0, Effects Found Not to Be Significant and are not discussed further in this section.

- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

USEPA Guidelines

As noted previously in this section, with respect to how humans perceive and react to changes in noise levels, a 1 dB(A) increase is imperceptible, a 3 dB(A) increase is barely perceptible, a 6 dB(A) increase is clearly noticeable, and a 10 dB(A) increase is subjectively perceived as approximately twice as loud (Caltrans 2013). These levels are based on the USEPA established guidelines (USEPA 1978) for assessing the impact of an increase in noise levels. These guidelines have been used for several years as industry standards to determine the potential impact of noise increases on communities. Most people will tolerate a small increase in background noise (up to about 5 dB(A)) without complaint, especially if the increase is gradual over a period of years (such as from gradually increasing traffic volumes). Increases greater than 5 dB(A) may cause complaints and interference with sleep. Increases above 10 dB(A) (heard as a doubling of judged loudness) are likely to cause complaints and should be considered a serious increase. Table 3.6-7 defines each of the traditional impact descriptions, their quantitative range, and the qualitative human response to changes in noise levels.

Table 3.6-7: USEPA Impact Guidelines

Increase over Existing or Baseline Sound Levels	Impact Per USEPA Region Guidelines	Qualitative Human Perception of Difference in Sound Levels
0 dB to 5 dB	Minimum Impact	Imperceivable or Slight Difference
6 dB to 10 dB	Significant Impact	Significant Noticeable Difference – Complaints Possible
Over 10 dB	Serious Impact	Loudness Changes by a Factor of Two or Greater. Clearly Audible Difference – Complaints Likely

City of Campbell Criteria for Acceptable Noise and Vibration Exposure (Listed for Informational Purposes)

Based on CEQA guidelines and Envision Campbell General Plan 2040 and Municipal Code noise standards, noise and vibration impacts at sensitive areas of existing uses in the project vicinity are considered significant if the following were to result from the proposed project:

- Exterior Traffic Noise:
    - Increases in exterior ambient noise levels of 5 dB(A) or more from project traffic where baseline ambient conditions at sensitive receptors are currently 60 dB(A) Ldn or less.
    - Increases in exterior ambient noise levels of 3 dB(A) or more from project traffic where baseline ambient conditions at sensitive receptors are currently above 60 and up to 65 dB(A) Ldn.
    - Increases in exterior ambient noise levels of 1.5 dB(A) or more from project traffic where baseline ambient conditions at sensitive receptors are currently above 65 dB(A) Ldn.
- Fixed-Source Noise: noise levels from project-related stationary noise sources exceeding the noise standards listed Chapter 21.16.070 “Noise” in the Campbell Municipal Code or ambient levels +3 dB(A), whichever is greater.
- Construction Noise: Although no standardized criteria have been developed for assessing construction noise impacts, the Federal Transit Administration’s Transit Noise and Vibration Impact Assessment Manual contains guidance for use in assessing potential noise associated with project construction as follows:

  “Where local noise ordinances provide guidance with respect to construction noise, they typically relate to nuisance and hours of allowed activity, and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the impact of a construction project. The following guidelines can be considered reasonable criteria for assessment. Construction noise levels of 90 dB(A) and 80 dB(A) Leq at residential land uses during daytime and nighttime hours, respectively. If these criteria are exceeded, there may be adverse community reaction.”
- Construction Vibration
    - Transient vibration levels associated with project construction exceeding the Caltrans vibration criterion for damage to residential structures of 0.5 PPV (in/sec) (Table 3.6-3).
    - Transient vibration levels associated with project construction exceeding the strongly perceptible Caltrans vibration criterion of 0.1 PPV (in/sec) (Table 3.6-3).

Project Impact Analysis and Mitigation Measures

Noise Levels in Excess of Standards

Impact NOI-a **The proposed project would not result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.**

Impact Analysis

Exterior Traffic Noise Level Impacts

Traffic noise depends primarily on vehicle speed (tire noise increases with speed), proportion of medium and large truck traffic (trucks generate engine, exhaust, and wind noise in addition to tire noise), and number of speed control devices, such as traffic lights and stop signs (accelerating and decelerating vehicles and trucks can generate more noise).

Changes in traffic volumes can also have an impact on overall traffic noise levels. For example, it takes 25 percent more traffic volume to produce an increase of only 1 dB(A) in the ambient noise level. For roads already heavy with traffic volume, an increase in traffic numbers could even reduce noise because the heavier volumes could slow down the average speed of the vehicles. A doubling of traffic volume results in a 3 dB(A) increase in noise levels.

To describe future noise levels due to traffic added from the proposed project, AM and PM peak hour existing traffic volumes (with and without the proposed project) listed in Figures 8 and 9 in the Transportation Analysis provided by Hexagon (Appendix G) were used to determine the percentage increase of traffic on the roads adjacent to the project site and nearby sensitive receptors.

Table 3.6-8 shows the peak hour volumes associated with traffic on the local roadway network under the existing and existing plus proposed project traffic conditions. The last columns in the table show the overall percentage change and the estimated difference in peak hour noise level in dB(A).

Table 3.6-8: Traffic Peak Hour Volumes and Estimated Noise Increase

Roadway Intersection	Existing Peak Hour Traffic Volumes	Existing Peak Hour Traffic Volumes with Project	Percentage Change	Estimated dB(A) Change
Campbell Technology Parkway and East McGlincy Lane	328 (340)	429 (443)	30.8% (30.3%)	1.2 (1.2)
White Oaks Road / Curtner Avenue and Camden Avenue	5897 (6320)	5923 (6371)	0.4% (0.8%)	0.02 (0.03)

Notes:
Numbers in parenthesis are PM peak hour traffic volumes; numbers not in parenthesis are AM peak hour traffic volumes.

The proposed project is expected to minimally increase traffic counts along the surrounding roadways. There will essentially be no change in traffic noise (1.2 dB(A) or less) expected along these streets.

The Project is expected to minimally increase traffic counts along the surrounding roadways. There will essentially be no change in traffic noise (1.2 dB(A) or less) expected along these streets. Therefore, based on EPA Impact Guidelines, the Project should not cause increased traffic noise levels over the baseline conditions at the neighboring sensitive receptors, and this would be a less than significant impact relative to this topic.

Comparison to the City of Campbell Criteria for Acceptable Noise and Vibration Exposure (Listed for Informational Purposes)

According to Table 3.6-6 above, the estimated ambient Ldn noise level near the closest noise-sensitive receptors (Measurement Location 3) is 57.6 dB(A) Ldn. The City of Cambell's adopted criterion for acceptable noise and vibration allows for noise level increases up to 5 dB(A) from project traffic where baseline ambient conditions at sensitive receptors are currently 60 dB(A) Ldn or less. The calculated increase in exterior traffic noise of 1.2 dB(A) shown in Table 3.6-8 is below this criterion. Therefore, the proposed project should not cause increased traffic noise levels over the baseline conditions at the neighboring sensitive receptors, and this would again be a less than significant impact relative to this topic.

Interior Traffic Noise Level Impacts

***Note** – In accordance with California Building Industry Association v. Bay Area Air Quality Management District (2015) 62 Cal.4th 369., the effect of the environment on the project is not generally a CEQA consideration, unless the project would exacerbate an existing condition. However, this analysis takes into consideration potential impacts to interior noise levels resulting from nearby traffic noises for information purposes.*

The California Building Code, the Envision Campbell General Plan 2040 document, and the Campbell Municipal and Zoning Code states the interior noise levels attributable to exterior sources shall not exceed 45 dB(A) Ldn in any habitable room within multi-family residential units. The needed sound isolation requirements of a building's exterior façade will be dependent on the following conditions:

- The dimension of the rooms with exterior windows;
- The finishes within the rooms;
- The ratio of clear glass to solid wall in the exterior wall assembly; and
- The exterior solid wall construction.

Modern construction with punch windows typically provides a 25 dB(A) exterior-to-interior noise level reduction with the windows closed. Therefore, generally speaking, sensitive receptors exposed to an exterior noise level of 70 dB(A) Ldn or less will typically comply with the code-required interior noise level standard. Modern construction utilizing window walls, curtainwalls, or a high ratio of exterior clear glass will provide less reduction with the windows closed. Buildings using a high amount of glass will typically comply with the code-required interior noise level standard if exposed to exterior noise levels of 67 dB(A) Ldn or less.

According to Strategy CNR-10.1.c in the 2001 General Plan, a project specific acoustical analysis shall be completed for new residential projects exposed to ambient noise levels above 60 dB(A) CNEL. The acoustical analysis will determine appropriate mitigation to reduce indoor noise levels within residential uses to 45 dB(A) Ldn and include ways to incorporate such mitigation into the project design and implementation.

Based on the ambient noise measurements at the project site, the residential buildings situated closest to SR-17 may experience noise levels above 60 dB(A) CNEL and would require a project specific acoustical analysis. Therefore, with the requirements listed in the 2001 General Plan, the interior noise levels within the residential uses proposed for the project will achieve code requirements and the impact of traffic noise on the interior of the residential units would be less than significant.

Proposed Project Fixed-Source Noise

Typical residential building construction would commonly involve new mechanical equipment, such as air conditioning units and exhaust fans. This equipment would generate noise that would radiate to neighboring properties. The noise from this equipment would be obliged to comply with the maximum noise level limits listed in Paragraph 21.16.070.E in the Campbell Municipal Code.

When the actual onsite equipment is selected, the equipment would be designed to incorporate measures as needed, such as shielding, barriers, and/or attenuators, to reduce noise levels that may affect nearby properties. Therefore, the impact of fixed-source noise to the neighboring properties would be less than significant.

Comparison to the City of Campbell Criteria for Acceptable Noise and Vibration Exposure (Listed for Informational Purposes)

Noise from HVAC equipment can vary greatly, depending on the size of the equipment and the type of equipment used. While the project Applicant has not selected the exact mechanical equipment to be installed on the project site, the following assumptions were used in an initial exterior analysis of the mechanical equipment based on typical outdoor residential HVAC equipment similar to what may be used on the proposed project:

- A standard residential outdoor heat pump unit would produce sound pressure levels of approximately 53 dB(A) at 5 feet from the unit.[13]
- One residential outdoor heat pump unit was assumed for each townhome and each single-family detached home.
- The residential outdoor heat pump units were assumed to be located on the roof of all townhome buildings and in the small alley between the single family detached homes.
- The height above ground of the residential outdoor heat pumps was assumed to be 44 feet for the four story townhome buildings, 38 feet 7 inches for the three-story townhome buildings, and 3 feet for the single-family detached homes.

[13] Based on field measurements of a Carrier Model 25HBC5 outdoor unit conducted by Stantec on April 1, 2026.

- Noise levels from the residential units were calculated at the center of the east property line shared with the closest noise-sensitive residential receptors in the Paso de Palomas Mobile Home Park. The receptor for the calculation was assumed to be 5 feet above ground.

- To simulate a worst case scenario, no losses were taken from potential rooftop screens or shielding from other residential buildings. All residential outdoor heat pump units for all 70 buildings were assumed to be operating simultaneously.

Using the sound pressure levels and the analysis assumptions listed above, the noise level calculated at the center of the east property line was 40.2 dB(A). The supporting calculation for the property line analysis is included in Appendix F.The City of Campbell's adopted criterion for acceptable noise levels from fixed source equipment listed above states that noise levels from project-related stationary noise sources may not exceed the noise standards listed in Chapter 21.16.070 "Noise" in the Campbell Municipal Code or ambient levels +3 dB(A), whichever is greater. The Campbell Municipal Code lists a maximum nighttime noise level of 45 dB(A) at all residential properties from fixed source noise. According to Table 3.6-6 above, the measured nighttime noise level near the closest noise-sensitive receptors (Measurement Location 3) is 49.9 dB(A) Leq. Therefore, noise generated from the proposed project's fixed source equipment may be as loud as 52.9 dB(A) as per the Criteria for Acceptable Noise and Vibration section above. The calculated worst-case noise level of 40.2 dB(A) is well below this criterion.

Again, during the design phase, when the actual onsite equipment is selected, the equipment would be reanalyzed to incorporate measures as needed, such as shielding, barriers, and/or attenuators, to reduce noise levels that may affect nearby properties. Therefore, the impact of fixed-source noise to the neighboring properties would again be less than significant.

Short-term Construction Noise Impacts

Two types of short-term noise impacts could occur during construction. The first type of noise is from construction crew vehicular commutes. Construction crew commutes could incrementally increase noise levels on access roads leading to the project site.

As noted in Section 2.3, Project Construction, the construction of the project would involve a peak of approximately 100 construction workers traveling to and from the site. Construction workers would access the project site via gated vehicular entry points along Campbell Technology Parkway and not pass through any residential areas. Therefore, the impact of construction crew commutes to the project site would result in a less than significant impact.

The second type of noise generated during construction is from the construction activity itself. Construction activities would include demolition, site preparation, grading, building construction, paving, and architectural coating. Each construction stage has its own mix of equipment, and consequently, its own noise characteristics. The various construction operations would change the character of the noise generated at the project site and therefore, the noise level as construction progresses. The loudest stages of construction typically include earthmoving and grading equipment The main types of noise-producing equipment for each construction stage are shown in Table 3.6-9.

Table 3.6-9: Construction Stage Equipment

Construction Stage	Construction Equipment	
Demolition	• Concrete Saw • Rubber-Tired Dozers (2)	• Excavators (3)
Site Preparation	• Rubber-Tired Dozers (3) • Front End Loader	• Tractors (2) • Backhoe
Grading	• Excavators (2) • Rubber-Tired Dozer • Tractor	• Grader • Scrapers (2) • Front End Loader
Building Construction	• Crane • Generator Set • Front End Loader • Welder	• Gradall Forklifts (3) • Tractor • Backhoe
Paving	• Pavers and Paving Equipment (4)	• Rollers (2)
Architectural Coating	• Air Compressor	

Table 3.6-10 lists the types of construction equipment, and the average operational noise level as measured at 50 feet from the operating equipment. The 50-foot distance represents the approximate distance between the proposed project and the closest noise-sensitive residential receptors in the Paso de Palomas Mobile Home Park.

Table 3.6-10: Federal Highway Administration Roadway Construction Noise Model Source Noise Levels

Construction Equipment Source at the Project Site	Distance to Nearest Sensitive Receptor, feet	Sound Level at Receptor	
		Acoustical Use Factor (%)	Leq, dB(A)
Backhoe	50	40	73.6
Compressor (Air)	50	40	73.7
Concrete Saw	50	20	82.6
Crane	50	16	72.6
Excavator	50	40	76.7
Front-End Loader	50	40	75.1
Generator	50	50	77.6
Gradall Forklift	50	40	79.4
Grader	50	40	81.0

Construction Equipment Source at the Project Site	Distance to Nearest Sensitive Receptor, feet	Sound Level at Receptor	
		Acoustical Use Factor (%)	Leq, dB(A)
Paver and Paving Equipment	50	50	74.2
Roller	50	20	73.0
Rubber-Tired Dozer	50	40	77.7
Scraper	50	40	79.6
Tractor	50	40	80.0
Welder	50	40	70.0

Source: Federal Highway Administration RCNM v1.1 2008

A worst-case condition for construction activity would assume all noise-generating equipment were operating at the same time and at the same distance from the closest noise-sensitive receptor. Using this assumption, the RCNM program calculated the following combined Leq noise levels from each stage of construction as shown in Table 3.6-11.

Table 3.6-11: Calculated Noise Level from Each Construction Stage

Construction Stage	Distance to Closest Noise Sensitive Receptor, ft	Calculated Leq, dB(A)
Demolition	50	86.4
Site Preparation	50	86.4
Grading	50	87.7
Building Construction	50	87.0
Paving	50	81.6
Architectural Coating	50	73.7

Construction activities and increases in noise levels from construction activities would be temporary and construction activities would be limited to the restrictions set by Paragraph 18.04.052 in the Campbell Municipal Code. Construction activities would occur Monday through Friday, between 8 AM and 5 PM, and Saturday 9 AM to 4 PM, consistent with the City's Municipal Code applicable to construction activities. Any work outside of the City's construction hours would require special permits. As stated in Paragraph 21.16.070.G of the Campbell Municipal Code, construction between the hours of 8 AM and 5 PM Monday through Friday, and between the hours of 9 AM and 4 PM Saturday, in compliance with Section 18.04.052 of the Municipal Code is exempt from the noise limits in the code.

In addition, Strategy CNR-10.1e in the 2001 General Plan requires mitigation measures during construction, including limits on operating times of noise-producing activities (including vehicles). Strategy CNR-10.1.j in the 2001 General Plan also limits construction truck traffic in residential areas.

In conclusion, construction noise would be short-term and intermittent, and would be under the federal thresholds identified above. Furthermore, the implementation of the restrictions as dictated by the City Municipal Code and the 2001 General Plan would reduce construction noise to the closest noise-sensitive receptors to the extent feasible. Therefore, impacts from construction noise would be less than significant.

Comparison to the City of Campbell Criteria for Acceptable Noise and Vibration Exposure (Listed for Informational Purposes)

As previously noted, the FTA's Transit Noise and Vibration Impact Assessment Manual lists a construction noise guideline of 90 dB(A) Leq during daytime hours at residential land uses to limit adverse community reaction. All calculated Leq construction noise levels listed above in Table 3.6-11 are below the FTA guideline. Therefore, the impact of construction noise to the neighboring properties would again be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Excessive Groundborne Vibration

Impact NOI-b	**The proposed project would not result in the generation of excessive groundborne vibration or groundborne noise levels.**

Impact Analysis

During construction of the proposed project, equipment such as bulldozers, trucks, and rollers may be used as close as 50 feet from the nearest sensitive residential receptors in the Paseo de Palomas Mobile Home Park. Equipment used during project construction could generate vibration levels between 0.0011 PPV and 0.0742 PPV at 50 feet, as shown below in Table 3.6-12. All estimated vibration levels would be below the Caltrans vibration threshold at which human annoyance could occur and below the threshold for potential building damage as defined in Table 3.6-3. Therefore, impacts from construction vibration would be less than significant.

Table 3.6-12: Calculated Vibration Levels for Construction Equipment

Type of Equipment	Distance to Closest Receptor, Feet	Calculated Peak Particle Velocity	Threshold at which Human Annoyance Could Occur, PPV	Potential for Proposed Project to Exceed Threshold
Large Bulldozer	50	0.0315	0.10	No

Type of Equipment	Distance to Closest Receptor, Feet	Calculated Peak Particle Velocity	Threshold at which Human Annoyance Could Occur, PPV	Potential for Proposed Project to Exceed Threshold
Loaded Trucks	50	0.0269	0.10	No
Small Bulldozer	50	0.0011	0.10	No
Vibratory Roller	50	0.0742	0.10	No

Source: FTA 2018

Comparison to the City of Campbell Criteria for Acceptable Noise and Vibration Exposure (Listed for Informational Purposes)

Again, all estimated vibration levels would be below the Caltrans vibration threshold at which human annoyance could occur and below the threshold for potential building damage as defined in Table 3.6 3. Therefore, impacts from construction vibration would again be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

3.7 TRANSPORTATION

Following is a discussion of the existing transportation setting and the proposed project's potential effects on transportation. This section describes the environmental and regulatory setting for transportation. It also describes existing conditions and potential impacts related to transportation that would result from implementation of the proposed project, and identifies mitigation measures for potentially significant impacts, where feasible.

3.7.1 Environmental Setting

Roadway System

The project site is bounded by SR-17 to the north and west and Campbell Technology Parkway to the south. The following describes the local roadways that would serve the proposed project.

State Route 17. SR-17 provides regional access to the project site. SR-17 is a six-lane freeway (with additional auxiliary lanes) located along the westerly frontage of the project site. It runs generally in a north/south direction in the vicinity of the proposed project with a speed limit of 65 mph.

Campbell Technology Parkway. Campbell Technology Parkway is a two-lane undivided local street. It is approximately 1,500 feet in length with multiple driveways and does not provide through access. It begins at the stop-controlled T-intersection with East McGlincy Lane and ends at the project site. It has sidewalks on both sides of the roadway with the exception of approximately 400 feet on the east side of the roadway nearest to the intersection with East McGlincy Lane. Edith Morley Park is located on the east side of the street. On-street parking is available only along the park frontage and from 7:00 AM to 6:00 PM, Monday through Friday, parking is limited to a 3-hour duration.

East McGlincy Lane. East McGlincy Lane is classified as a Commercial/Industrial Collector in the City's General Plan and connects the proposed project's street to the City's arterial network. It is a two-lane undivided roadway with a posted speed limit of 25 mph. It is approximately 0.8 miles in length and runs from Union Avenue to Curtner Avenue.

Union Avenue. Union Avenue is classified as a Class II Arterial in the City's General Plan. In the vicinity of the project site, it is generally a two-lane roadway with sidewalks on both sides. It has a posted speed limit of 30 mph.

Cristich Lane. Cristich Lane is a private street that abuts the project site at the southwest corner. However, because it is private street, it does not provide access to the project site nor connect to Campbell Technology Parkway. This condition would not change with the proposed project.

Active Transportation

Active transportation refers to non-motorized means of travel such as walking or biking. The proposed project would encourage the use of non-auto transportation modes by providing a residential use in a neighborhood comprised of diverse land uses. A complete sidewalk network is present along the project site frontage on Campbell Technology Parkway and along the streets in the vicinity of the project site, with the exception of about 400 feet of sidewalk along the east side of Campbell Technology Parkway as

discussed above. At the Campbell Technology Parkway and East McGlincy Lane T-intersection, a marked crosswalk is present on the west leg of East McGlincy Lane and is enhanced with warning signs, a pedestrian activated rectangular rapid flashing beacon (RRFB) system, and pavement markings. Pedestrians would use the sidewalks and the marked crosswalk along Campbell Technology Parkway, East McGlincy Lane, and Union Avenue to travel to and from the nearest bus stops discussed below.

A Class II bikeway is present on Union Avenue from East McGlincy Lane north to East Campbell Avenue. The Los Gatos Creek Trail is a 9.7-mile-long pedestrian trail and Class I bikeway that runs along the west side of SR-17, from the Lexington Reservoir in Los Gatos in the south, to Meridian Avenue in San Jose to the north. The Los Gatos Creek Trail can be accessed from the project site via Curtner Avenue and Camden Avenue to the south, or via Union Avenue, Campbell Avenue, and the Pruneyard Creek Trail to the north.

Transit Facilities

Santa Clara Valley Transportation Authority (VTA) provides local bus, light rail, and paratransit services in the vicinity of the project site, specifically the VTA light rail Green Line, VTA bus routes 26 and 61, and VTA shuttle route 202, which is a late-night Green Line replacement bus shuttle. The light rail transit stop nearest to the project site is the Winchester Station that is located within a 0.5-mile radius of the project site. The bus stops nearest to the project site are on Bascom Avenue and are located within 0.5-mile from the project site.

3.7.2 Regulatory Setting

Federal

There are no federal plans, policies, regulations, or ordinances related to transportation that apply to the proposed project.

State

California Department of Transportation

Caltrans is responsible for planning, designing, constructing, operating, and maintaining all state-owned roadways. The nearest state facility providing regional access to and from the project site is SR-17.

Senate Bill 743

CEQA guidelines (Section 15064.3) recommend the use of VMT as the primary metric to identify a transportation impact for land use and transportation projects. Generally, SB 743 moves away from using delay-based Level of Service (LOS) as the primary metric for identifying a project's significant impact within CEQA, and instead uses VMT.

SB 743 required the Governor's OPR[14] to establish recommendations for identifying and mitigating transportation impacts within CEQA. In response, OPR prepared a document referred to in this memorandum as OPR's Technical Advisory. OPR's Technical Advisory recommends methodologies for

[14] OPR referred to here is now identified as LCI. Since the time of preparation of the document referred to as OPR's Technical Advisory, the naming of OPR has been revised to be LCI.

quantifying VMT, significance thresholds for identifying a transportation impact, and screening criteria to quickly identify if a project can be presumed to have a less than significant impact. Lead agencies can adopt local guidelines appropriate for their jurisdiction. The City amended their General Plan Transportation Element to include VMT requirements that are based on the OPR recommendations.

Local

Campbell General Plan

As outlined in Section 3.0, Environmental Impact Analysis, the proposed project is subject to the goals and policies of the 2001 General Plan which was in effect at the time of pre-application submittal.[15] Therefore, the goals and policies of the City's historical General Plan is listed below.

The City's 2001 General Plan include the following goals and policies related to transportation that may be applicable to the proposed project (City of Campbell 2001):

Goal LUT-1: Coordinated land use and transportation planning in the region.

- **Policy LUT-1.2:** Regional Land Use and Transportation Planning: Promote integrated and coordinated regional land use and transportation planning.
- **Policy LUT-1.5:** Land Use Planning and the Regional Transportation System: Support land use planning that complements the regional transportation system.

Goal LUT-2: To achieve a safe, balanced and functional multi-modal transportation network that accommodates all users.

- **Policy LUT-2.3:** Roadway and Intersection Disruption Minimization: Minimize traffic disruptions along arterial roadways and major intersections.

Goal LUT-7: Attractive, well-maintained and safe streets, public improvements and utilities.

- **Policy LUT-7.1:** Road Maintenance: Maintain and repair roads.
- **Policy LUT-7.2:** Public Utilities and Improvements: Provide a comprehensive network of sidewalks, public utilities and multi-modal improvements that are safe, attractive, efficient, well maintained and accessible for pedestrians, bicyclists and motorists.
- **Policy LUT-7.3:** Transportation Safety: Make safety a priority of citywide transportation design and planning.

Goal LUT-11: A physically connected, efficient community with safe access and linkages throughout the city for a variety of transportation modes and users.

- **Policy LUT-11.1:** Physically Connected Transportation Infrastructure: Strive to achieve physically connected transportation infrastructure.

[15] For an explanation of the applicability of the City's 2001 General Plan in this Draft EIR, see Section 3.0, Environmental Impact Analysis, and Section 3.1.2, Regulatory Setting - Local.

Goal LUT-12: Minimal traffic disruptions along commercial corridors and arterial roadways, and coordinated development of independent sites.

City of Campbell VMT Policy

The City implemented a VMT policy to comply with California SB 743 on July 1, 2020, as required by CEQA and was updated in April 2024. The VMT Policy provides the CEQA Project Screening Criteria and Thresholds of Significance for the preparation of CEQA transportation analysis. Based on the City's guidance, if a project meets one or more of the established screening criteria, a detailed CEQA transportation analysis is not required since the project is presumed to result in less than significant VMT impacts.

Project Screening Assessment

Consistent with the City's VMT policy and state guidelines, projects shall be presumed to have a less than significant transportation impact if they meet any of the following screening criteria:

- Small Project Screening: Any development that would generate fewer than 110 daily vehicle trips shall be presumed to have a less than significant transportation impact.
- Local-Serving Retail Screening: Retail commercial projects comprised of stores of up to 60,000 gross square feet shall be presumed to have a less than significant transportation impact.
- Local-Serving Public Facilities Screening: Local-serving public facilities (publicly owned or controlled), excluding private schools, high schools and middle schools, shall be presumed to have a less than significant VMT impact. Examples of these projects include a park, branch library, community center, fire station, and public elementary school.
- Affordable Housing Screening: Projects with 100 percent affordable housing shall be presumed to have a less than significant transportation impact on VMT.
- Transit Screening: All land-use projects located within 0.5-mile of a light-rail station shall be presumed to have a less than significant transportation impact on VMT presuming these projects are consistent with the General Plan.
- Screening based on Existing Use: Redevelopment projects that replace existing VMT-generating uses and result in a net decrease in total VMT shall be presumed to cause a less than significant impact. For redevelopment projects that result in a net increase in total VMT, the screening criteria for each land use will be based on the size of the proposed development without any credit for the existing use.
- Transportation Project Screening: Transportation projects that reduce or do not increase VMT shall be presumed to have a less than significant VMT impact. Examples include transportation projects that enhance pedestrian, bike, or transit infrastructure, and transportation projects that maintain current infrastructure, without adding new automobile capacity.
- Project Consistent with the 2040 General Plan (incorporated with the April 2024 VMT Policy update): Any development where the (1) proposed project land use is consistent with the General

Plan; (2) the proposed project land use is within the increment of land use change evaluated in the General Plan EIR by Transportation Analysis Zone (TAZ); and (3) the proposed project is consistent with General Plan VMT policies, shall be presumed to have a less than significant transportation impact.

3.7.3 Environmental Impacts

Methodology of Analysis

The analysis included in this section is prepared in accordance with the City's General Plan, the OPR's Technical Advisory, and is consistent with Section 15064.3 of the CEQA Guidelines. A Transportation Analysis was prepared for the proposed project by Hexagon Transportation Consultants, Inc. (Hexagon) on March 18, 2026 (Appendix G). The results of the Transportation Analysis have been incorporated into the analysis provided below.

Trip Generation

Trip generation estimates for the proposed project were prepared based on standardized Institute of Transportation Engineers (ITE) 11th Edition trip generation rates. The proposed project would replace the existing R&D campus, consisting of four buildings, with development of 290 residential units that include 27 detached small-lot single-family homes and 263 townhomes. The existing R&D campus, per the Applicant, has historically been near capacity, but is currently vacated and secured by perimeter security fencing. The Applicant reports the campus is vacant because, in the event the City approved the proposed project, it did not want leases to encumber the Applicant's ability to development the proposed project. Meanwhile, the campus was partially occupied at the time the traffic analysis was conducted and, conservatively, this partial occupancy baseline was adopted in lieu of the campus' historical occupancy. The proposed project's estimated trip generation has been derived using the Single-Family Detached Housing (ITE Code 210), and Single-Family Attached Housing (ITE Code 215 land use categories. Trips generated by the existing R&D use are derived based on driveway counts (Hexagon 2026).

Table 3.7-1 summarizes the trip generation for the existing use and the proposed project. As shown, on a typical weekday the proposed project would generate a total of approximately 154 trips during the AM peak hour, 183 trips during the PM peak hour and 2,257 total average daily trips (ADT).

With a partial occupancy, the existing building generated approximately 889 total daily trips. Comparing trips generated by the partially occupied existing use to the proposed project, the proposed project would result in a net increase of 1,368 ADT.

Table 3.7-1: Trip Generation Summary

Land Use	ITE Code/ Amount	Unit	AM Peak Hour			PM Peak Hour			ADT Rate
			In	Out	Total	In	Out	Total	
Trip Rates									
Single Family Detached Housing	210	DU	Ln(T) = 0.91 Ln(X) + 0.12 In - 25%; Out - 75%			Ln(T) = 0.94 Ln(X) + 0.27 In - 63%; Out - 37%			Ln(T) = 0.92 Ln(X) + 2.68
Single Family Attached Housing	215	DU	T = 0.52(X) - 5.70 In - 25%; Out - 75%			T = 0.60(X) - 3.93 In - 59%; Out - 41%			T = 7.62(X) - 50.48
Trip Generation									
Existing									
R&D Center - Partial Occupancy [1]	139.00	TSF	98	17	115	8	72	80	889
Proposed									
Single Family Detached	27	DU	6	17	23	18	11	29	303
Townhomes	263	DU	33	98	131	91	63	154	1,954
Total (Proposed)	**290**	**DU**	**39**	**115**	**154**	**109**	**74**	**183**	**2,257**
Net New Trips			**-59**	**98**	**39**	**101**	**2**	**103**	**1,368**

Trip Rate Source: Institute of Transportation Engineers (ITE), Trip Generation Manual 11th Edition
ADT - Average Daily Trips
TSF - Thousand Square Feet
DU - Dwelling Units
[1]driveway counts

Thresholds of Significance

In accordance with the CEQA Guidelines' Appendix G Environmental Checklist, the following questions were analyzed and evaluated to determine whether the proposed project's impacts to transportation are significant.

Would the proposed project:

- Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?
- Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?
- Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
- Result in inadequate emergency access?

Project Impact Analysis and Mitigation Measures

Conflict with Program, Plan, Ordinance, or Policy

Impact TRANS-a **The proposed project could conflict with program plan, ordinance or policy addressing the circulation system, including transit roadway, bicycle and pedestrian facilities.**

Impact Analysis

Regional access to the project site is provided by SR-17 and primary access to the site would be via three proposed driveways and street connections located off Campbell Technology Parkway. Fire access would be provided via an existing EVA easement at the northern end of the project site from Paseo de Palomas Lane. See the previously referenced Figure 2-10 for the Project Circulation Plan. A total of approximately 718 vehicle parking spaces are proposed including 580 in-garage spaces for residents and 138 spaces for guests. Twelve bicycle racks with six bicycle spaces on each rack, for a total of 72 exterior bicycle parking spaces, are also proposed throughout the site.

Pedestrian Access and Circulation

For the purpose of this analysis, pedestrian impacts would occur if the project would interfere or conflict with an existing or planned pedestrian facility or create a demand for pedestrian facilities where none exist or are planned.

Pedestrian trip generation estimates for the proposed project were prepared using the ITE 11th Edition trip generation rates. The proposed project would generate a net increase of 322 daily pedestrian trips with 26 additional pedestrian trips in the AM peak hour and 38 additional pedestrian trips in the PM peak hour. The forecasted pedestrian trips, which are based on standardized ITE pedestrian trip generation rates, may be overestimated because of the lack of pedestrian destinations in the area within walking distance like schools, retail stores and bus stops. However, there is Edith Morley Park directly across the street that would attract pedestrian trips. Future residents of the proposed project would need to cross Campbell Technology Parkway to walk to the park.

While the proposed project would not interfere with or conflict with existing or planned pedestrian facilities, the proposed project would create a demand for pedestrian facilities on Campbell Technology Parkway where the sidewalk is discontinuous. Therefore, the proposed project would have a potentially significant impact related to pedestrian access and circulation. To reduce potential impacts, the proposed project would be required to implement Mitigation Measure TRANS-1 which outlines pedestrian improvements required to be constructed by the Applicant. Required improvements include the installation of a high visibility crosswalk across Campbell Technology Parkway, installation of ADA compliant ramps at the crosswalks, installation of a crosswalk at the East McGlincy Lane intersection, providing red curb at each project driveway to maintain sight distance for exiting vehicles, and providing an easement across the project site for future development of a potential bicycle and pedestrian bridge across SR-17 as identified in the Santa Clara Countywide Bicycle Plan (VTA 2018). With implementation of Mitigation Measure TRANS-1, potential impacts to pedestrian access and circulation would be reduced to a less than significant level.

Bicycle Access and Circulation

For the purpose of this analysis, a bicycle impact would occur if the proposed project would add motor vehicle traffic to a street with a bicycle level of traffic stress (BLTS) score of 3 or 4.

Bicycle trip generation estimates for the proposed project were prepared using the standardized ITE 11th Edition trip generation rates for bicycles. The proposed project would generate a net increase of 51 daily bicycle trips with 2 additional bicycle trips in the AM peak hour and 9 additional bicycle trips in the PM peak hour.

VTA uses Level of Traffic Stress (LTS) analysis to measure the comfort of roads and bikeways in the county. Streets are graded on a scale, with 1 being the lowest stress, and 4 being the highest stress. Based on the VTA's BLTS map, both East McGlincy Lane and Campbell Technology Parkway have a BLTS score of 2.

The proposed project would add traffic to Campbell Technology Parkway and East McGlincy Lane, but the streets have a BLTS score of 2. Therefore, the proposed project's bicycle impact would be less than significant.

Transit Service Analysis

For the purpose of this analysis a transit impact is defined as negatively affecting bus stops or routes or adding riders beyond the system capacity.

As discussed above, the project site is located within a 0.5-mile radius of the VTA Winchester light rail transit station as well as the South Bascom Avenue and Surrey Place bus stop. Since the proposed project is located within 0.5-mile of a light-rail station, the proposed project meets the Transit Screening criteria and hence can be presumed to have a less than significant impact on VMT.

Construction Access and Circulation

During construction, the proposed project is anticipated to require some temporary restrictions and closures for a portion of Campbell Technology Parkway along the project boundary to complete the frontage improvements and connect new utility lines to the existing utility mains located along Campbell Technology Parkway. For any temporary restrictions or closures required for adjacent roadways, the proposed project would prepare and implement a TCP. The pedestrian facilities in the immediate vicinity of the project site would not be affected by the project-related construction activity except potentially for limited circumstances that are temporary, such as with short-term closures for the movement or temporary placement of construction equipment and materials, in which case appropriate treatments will be provided in accordance with City standards.

By complying with City standards and implementing the pedestrian mitigation measures, the proposed project would not create hazards or barriers for pedestrians, bicyclists, or local transit service. Therefore, the proposed project would not modify or interfere with the pedestrian, bicycle, and bus facilities adjacent to the project site during construction or operation, and the proposed project's impacts would be less than significant.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM TRANS-1 Construct Pedestrian Improvements. The proposed project shall implement the following pedestrian improvements:

- Install a high visibility ADA compliant crosswalk across Campbell Technology Parkway at the project site's mid-block driveway along with the associated pedestrian warning signs, yield signs, and yield lines in each direction.
- Install new ADA compliant ramps at both ends of the new crosswalk.
- Install a crosswalk along the north leg of Campbell Technology Parkway at East McGlincy Lane intersection to connect the northeast and northwest corners of the Campbell Technology Parkway/East McGlincy Lane intersection.
- Two existing curb ramps should be retrofitted to be ADA compliant.
- Provide public access easement across the property streets to preserve bicycle and pedestrian access for a potential future bicycle and pedestrian bridge across SR-17.
- Provide fifteen feet of red curb to the east and five feet to the west at each driveway to maintain sight distance for exiting vehicles.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Vehicle Miles Travelled

Impact TRANS-b The proposed project would not conflict or be inconsistent with CEQA Guidelines Section 15064.3, Subdivision(b).

Impact Analysis

According to CEQA Guidelines Section 15064.3 Subdivision (b)(1), VMT exceeding an applicable threshold of significance may indicate a significant impact. OPR guidelines provide screening criteria that is used to identify if a project is expected to have a less than significant impact without conducting a full VMT analysis. A project is exempt from VMT analysis if it meets one of the screening criteria discussed below.

Project Screening Assessment

The City's VMT Policy was updated on April 16, 2024, and is intended to ensure the City complies with California SB 743. Projects shall be presumed to have a less than significant transportation impact if they meet any of the following screening criteria:

- *Small Project Screening*

- *Local-Serving Retail Screening*
- *Local-Serving Public Facilities Screening*
- *Affordable Housing Screening*
- *Transit Screening*
- *Screening based on Existing Use*
- *Transportation Project Screening*
- *Project Consistent with 2040 General Plan*

The City's VMT Policy and the project screening criteria are described under Section 3.7.2 above. The City's VMT policy specifies that land use projects located within 0.5-mile of a light rail station shall be presumed to have a less than significant transportation impact on VMT presuming these projects are consistent with the General Plan. The City's VMT policy complies with state law requirements including CEQA Guidelines Section 15064.3, which states: "generally, projects within 0.5-mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact." Distance to transit for purposes of VMT evaluation is measured by straight-line distance. The proposed project site is within 0.5-mile of the Winchester light rail transit station. The project site is also located within 0.5-mile of the South Bascom Avenue and Surrey Place bus stop, which includes Routes 26 and 61, running 15- and 20-min intervals, respectively, during peak periods. While bus stops are not specifically included in the City's Transit Screening criteria, the project site's proximity to this station is relevant given that a 0.5-mile radius to a major transit stop is a commonly accepted distance for transit priority areas where it can be assumed there will be a reduction in VMT[16]. Finally, as already established, the City must treat the proposed project as consistent with its General Plan for all purposes under AB 1893 (Government Code 65589.5(f)(6)(D)). In light of the foregoing, the City finds that the proposed project meets the screening criteria for transit and is presumed to have a less than significant transportation impact. Therefore, the proposed project is presumed to have a less than significant VMT impact.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures

No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

[16] *Why Creating Affordable Homes Near Transit is a Highly Effective Climate Strategy*, California Housing Partnership, May 2024.

Hazardous Design Feature

Impact TRANS-c	**The proposed project could substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).**

Impact Analysis

The proposed project would not alter any streets in the area. Project driveways and other street system features would be designed in accordance with City standards. The proposed project would generate mostly passenger vehicles with few delivery trucks, for which the surrounding roadway system is designed to accommodate. Therefore, the proposed project would not create roadway hazards or generate incompatible uses on the surrounding roadways.

Sight distance was analyzed at the project driveways to identify any potential hazards. Sight distance recommendations vary depending on the roadway speeds. There is no posted speed limit on Campbell Technology Parkway. The first project driveway has a sight distance of approximately 250 feet, with the second project driveway having a sight distance of approximately 300 feet, and the driveway at the end of the street having approximately 500 feet of sight distance. Based on the Caltrans' recommended stopping sight distances, a sight distance of 250 feet is sufficient for roadways designed to operate at speeds up to 35 mph. Thus, the existing sight distance is adequate to serve the proposed project and would not result in hazards due to project design. Currently, on-street parking is not allowed along the project frontage on Campbell Technology Parkway. However, the project proposes to accommodate on-street parking along its frontage. Therefore, as described above under Impact TRANS-1, the proposed project would include implementation of Mitigation Measure TRANS-1 which outlines pedestrian improvements to reduce potential impacts related to circulation and safety and would require the proposed project to provide fifteen feet of red curb to the east and five feet to the west at each driveway to maintain sight distance for exiting vehicles. With the parking restrictions at each driveway and the pedestrian improvements proposed as Mitigation Measure TRANS-1, the proposed project would not substantially increase hazards due to a geometric design feature or incompatible uses. Thus, the proposed project's impact associated with roadway hazards would be less than significant.

Several comments regarding traffic and pedestrian safety near the project site were received during the NOP comment period. These comments are documented in Table 1.2-1 and in Appendix B of this Draft EIR. Additionally, the project Applicant prepared the June 2025 Response to Comments Letter to address some of the comment letters received during the NOP comment period regarding traffic safety impacts to proactively provide responses for concerns regarding the proposed project. The Applicant provided June 2025 Response to Comments Letter is included in Appendix B to this Draft EIR.

The Transportation Analysis prepared by Hexagon (Appendix G) included an analysis of the baseline traffic and safety conditions that currently exist at the site. Though an analysis of existing baseline traffic and safety conditions is not a required topic of analysis under CEQA, this information is provided for informational purposes only to address comments received during the NOP comment period.

Campbell Technology Parkway east of East McGlincy Lane and East McGlincy Lane west of Cambell Technology Parkway were counted for vehicle classification, speed, and volume for a 24-hour period. The number of trucks on either roadway was identified to be modest (approximately 5 to 6 percent of all

vehicles) and speeds along Campbell Technology Parkway were identified to be low, and the speed along East McGlincy Lane was identified to be modest. Collision data from the Statewide Integrated Traffic Records System was reviewed along East McGlincy Lane and Campbell Technology Parkway, which provide primary site access. The result indicates that there was only one collision on East McGlincy Lane over a six-year span between January 1, 2019, and December 31, 2024. The reported collision on East McGlincy Lane was located about 50 feet east of Campbell Technology Parkway and was due to improper turning. One of the vehicles was a motorcycle, and alcohol was involved. Given only one collision in six years, it appears that these streets do not have a collision problem. The proposed project would add trips to the roadways but would not alter their design. Therefore, the proposed project is not expected to cause an increase in the collision rate and result in safety hazards.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measure TRANS-1 would be required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Emergency Access

Impact TRANS-d The proposed project would not result in inadequate emergency access.

Impact Analysis

Emergency vehicles traveling through the project site would follow the same circulation routes as passenger vehicles. Additionally, emergency vehicles would access the site via an existing EVA easement through the Paseo de Palomas Lane, which connects to Union Avenue. The proposed project's fire access plan shows that emergency vehicles would be able to access the project site via the proposed driveways and would be able to maneuver around the project site through specific streets within the site. The onsite circulation system would be constructed in accordance with City standards for fire and emergency access and to allow for emergency vehicle egress/ingress, subject to an AMMR approved by the SCCFD. As such, the proposed project would not result in inadequate emergency access and its impact would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

3.8 TRIBAL CULTURAL RESOURCES

This section describes the existing environment for tribal cultural resources within and around the project site and evaluates the potential for impacts related to tribal cultural resources to occur as a result of development of the proposed project. Section 3.2, Cultural Resources, of this Draft EIR addresses impacts on built environment and archaeological/historical cultural resources.

The term tribal cultural resources refers to sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either included in or determined eligible for inclusion in the CRHR or included in a qualifying local register of historic and other resources that have been determined by a lead agency to be significant pursuant to the criteria for listing in the CRHR. Included in this section are brief descriptions of the ethnographic and contemporary setting of the project site.

3.8.1 Environmental Setting

The indigenous people who occupied the southern edge of the Carquinez Strait to a portion of the Big Sur and Salinas Rivers south of Monterey Bay, to approximately 50 miles inland from the coast were referred to by ethnographers as Ohlone or Costanoan, derived from the Spanish word Costeños meaning coast people which was the name given by the Spanish when establishing Missions in the area.

Linguists identify Costanoan as sub-family of the Utian language group which includes Miwokan languages spoken in the North Bay, Clear Lake Basin, and the Consumnes, Mokelumne, and lower Sacramento River drainages of the Central Valley and western Sierra foothills. In the San Francisco Bay Area, linguists have identified six languages with three dialects.

The City is within the ethnolinguistic boundary of the Tamyen language group. However, it is important to note that not all the Indigenous communities of the San Francisco Bay Area agree that all Costanoan language family descend from a single ethnic group that should be called the Ohlone/Costanoan ethnic community. Tamyen, present day referred to as Tamien, identify their traditional cultural affiliation as extending north to Redwood City. The contemporary Tamien community descended from the Indigenous population forcefully displaced to Mission Santa Clara, Mission Santa Cruz, and Mission San Juan Bautista. Tamien Nation recently exercised their self-determination, and the language is being actively revitalized and documented.

The Amah Mutsun Tribal Band is composed of the direct descendants of the people whose territories fell under the influence of Mission Santa Cruz (Awaswas) and Mission San Juan Bautista (Mutsun). Amah villages were distinct from those outside the San Juan Valley because no other tribe spoke Mutsun.

The Muwekma Ohlone, also known as the Pleasanton or Verona Band of Alameda County, identifies their territorial boundaries to include San Francisco, San Mateo, most of Santa Clara, Alameda, Contra Costa, and portions of Napa, Santa Cruz, Solano, and San Joaquin counties and crosscut linguistic and tribal boundaries.

According to the ethnographic and archeological studies, the San Francisco Bay area was dotted with resource-related occupational and specialized task sites, lesser villages, as well as semi-sedentary and sedentary villages. Communities generally consisted of one main, strategically situated principal

ceremonial village occupied year-round and a series of smaller hamlets with resource gathering and processing locations occupied intermittently or seasonally. Encompassing the territorial areas of each group were larger regions composed of several villages and their outliers (ceremonial shrines, cemeteries, and specialized task sites). The Spanish explorers called these territorial units rancherias and anthropologists have described these larger regions variably.

Acorns gathered from different oak species were a diet staple, as well as nuts from the buckeye tree; hazelnuts; grassland and plant seeds from buttercup, chia, redmaids, tarweed, and grey pine; wild strawberries, elderberries, and madrone berries; and wild grapes. Hunting and gathering of numerous creek, shore, and terrestrial species supplemented the diet Groups with access to bay and estuarine resources used tule balsas for watercraft, and acquired shellfish, waterfowl, salmon, sturgeon, and lamprey eels. Larger terrestrial mammals (e.g., grizzly bear, Roosevelt elk, black tailed deer) were hunted with the bow and arrow, while communal drives and nets were used to capture smaller game (e.g., rabbits, mice, rats). Bow and arrow, cordage, bone tools, and twined basketry to procure and process their foodstuffs. Larger mammals, in addition to being a food source, had ceremonial and religious importance, as demonstrated in the archaeological record by ceremonial burials of elk, coyotes, wolves, and bears in the archaeological record.

The most common type of dwelling was a thatched domed structure consisting of a framework of poles and pole binders. Other common structures included sweathouses, dance enclosures and assembly houses consisting of excavated semi-subterranean buildings which likely uses boughs of hardwood or redwood trees as center posts for structural support. The sweat lodges and dance houses (túupentak in the Chochenyo dialect, but more commonly referred to in the literature by the Mexican term “temescal”) may also have been earth covered as elsewhere in California.

Between 1776 and 1797, seven Spanish missions were founded in Ohlone territory and where many Ohlone were forcefully brought to live and work. While living within the mission system, the Ohlone commingled with other groups, including the Esselen, Yokuts, Miwok, and Patwin. Exposure to European diseases, unsanitary living conditions, and malnutrition was devastating to the Ohlone population residing at the missions. By 1832, the Ohlones numbered less than 2,000.

Under the Mexican government, secularization of the mission lands began in earnest in 1834. Most of the former mission land was divided into ranchos and granted to loyal Mexican subjects. Following the secularization of the missions, the surviving missionized Indigenous population continued to live and work in several post-contact communities at various rancherias and Californio ranchos surrounding each of the other greater Bay Area missions.

In 1850, California became a part of the United States and laws were established which restricted the civil rights of the Indigenous communities and prevented them from having representation in the government, eliminated the right to testify in court, serve on juries, or be recognized as citizens. Laws allowed members of the Indigenous communities to be arrested for vagrancy and auctioned out as laborers for periods of four months at a time. Another law provided that children could be given to white citizens as wards until adulthood.

In 1851 U.S. government agents negotiated treaties, signed by representatives of groups living to the north and east of the old mission lands, agreeing to set aside large tracts of Central Valley and northern

California land as reservations. However, due to pressure from the California Congressional delegation, the United States Senate refused to sign the treaties that had been negotiated and placed the treaties under seal. Between the un-ratified treaties and the Land Claims Act of 1851, many members of Indigenous communities became homeless.

During the early 20th century Indigenous groups participated in legal efforts to obtain recognition by the federal government, including two legal suits brought against the U.S. government by Indians of California (1928–1964) for reparation due to them for the loss of traditional lands. Although these Indigenous groups have yet to receive formal recognition from the federal government, they are becoming increasingly organized as a political unit and have developed an active interest in preserving their ancestral heritage and advocating for Native American issues (Stantec 2025).

3.8.2 Regulatory Setting

State

Tribal Cultural Resources

CEQA defines a "tribal cultural resource" as any one of the following (PRC Section 21074):

- Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either (1) included in or eligible for inclusion in the CRHR, or (2) included in a local register of historical resources.
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. The lead agency shall consider the significance of the resource to a California Native American tribe.
- A cultural landscape that meets the requirements listed above and is geographically defined in size and scope.

Archaeological sites, including those that qualify as historical resources (PRC Section 21084.1), unique archaeological resources (PRC Section 21083.2(g)), and non-unique archaeological resources (PRC Section 21083.2(h)), may qualify as tribal cultural resources.

Prior to the release of a Negative Declaration, Mitigated Negative Declaration, or EIR, the agency must initiate consultation with tribes that are traditionally and culturally affiliated with the geographic area of the proposed project if (1) the tribe requested of the agency, in writing, to be informed through formal notification of proposed projects in the geographic area that is traditionally and culturally affiliated with the tribe; and (2) the tribe responds, in writing, within 30 days of receipt of the formal notification of a proposed project and requests consultation with the agency (PRC Section 21080.3.1(b)).

Consultation is concluded when the agency and tribe(s) agree to measures to mitigate or avoid significant effects on a tribal cultural resource, or if either party concludes that mutual agreement cannot be reached after a good-faith and reasonable effort (PRC Section 21080.3.2(b)).

Health and Safety Code 7050.5: Human Remains

Section 7050.5 of the California Health and Safety Code states that, in the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the County Coroner has determined whether the remains are subject to the coroner's authority. If the human remains are of Native American origin, the coroner must notify the NAHC within 24 hours of this identification.

Public Resources Code 5097.98: Notification of Most Likely Descendant

PRC Section 5097.98 states that the NAHC, upon receiving notification of the discovery of Native American human remains pursuant to Health and Safety Code Section 7050.5, shall immediately notify the MLD of the deceased. With permission of the landowner or a designated representative, the MLD may inspect the remains and any associated cultural materials and make recommendations for treatment or disposition of the remains and associated grave goods. The MLD shall provide recommendations or preferences for treatment of the remains and associated cultural materials within 48 hours of being granted access to the site.

3.8.3 Environmental Impacts

The following section analyzes potential impacts on tribal cultural resources that may be caused by the proposed project. In accordance with PRC Section 21084.2, the analysis considers the potential for proposed project activities to cause a substantial adverse change in the significance of a tribal cultural resource. When an impact is determined to be significant, mitigation measures are identified that would reduce or avoid that impact.

Methodology for Analysis

The NAHC is a state agency that maintains the Sacred Lands File (SLF), an official list of sites that have cultural and religious importance to California Native American tribes. To identify areas within the proposed project site that may be considered sensitive by local Indigenous tribal groups, the NAHC was contacted on October 30, 2024. The NAHC responded on October 31, 2024, with a negative result; however, the NAHC included in the response, a list of 23 tribal representatives from nine tribal groups.

Invitation to consult letters pursuant to PRC Section 21080.3.1 were sent to the 23 representatives from the following nine tribal groups on November 20, 2024. Included in the letters were details about the proposed project and a location map. In addition, the City sent follow-up emails on November 21, 2024, and conducted follow-up phone calls to all 23 tribal representatives on December 9, 2024, to confirm receipt of the invitation to consult letter.

- Amah Mutsun Tribal Band
- Amah Mutsun Tribal Band of Mission San Juan Bautista
- Costanoan Rumsen Carmel Tribe
- Indian Canyon Mutsun Band of Costanoan

- Muwekma Ohlone Indian Tribe of the San Francisco Bay Area
- Northern Valley Yokuts / Ohlone Tribe
- Tamien Nation
- The Ohlone Indian Tribe
- Wuksachi Indian Tribe/Eshom Valley Band

The City received communication from five of the above tribal groups: the Amah Mutsun Tribal Band of Mission San Juan Bautista, Costanoan Rumsen Carmel Tribe, Indian Canyon Mutsun Band of Costanoan, Muwekma Ohlone Indian Tribe of the San Francisco Bay Area, and Tamien Nation

Amah Mutsun Tribal Band of Mission San Juan Bautista

The City received communication via email on November 25, 2024, from the Amah Mutsun Tribal Band of San Juan Bautista that expressed interest in monitoring and consulting on the project and requested to review the cultural resources study.

The City responded on December 20, 2024, that the cultural resources study was in progress and proposed a meeting to discuss the proposed project. No further response was received from the Amah Mutsun Tribal Band of Mission San Juan Bautista.

The City sent an email on February 11, 2025 to the Amah Mutsun Tribal Band of Mission San Juan Bautista confirming that the Amah Mutsun Tribal Band of Mission San Juan Bautista has declined the consultation invitation pursuant to PRC Section 21080.3.1 (i.e., AB 52) and PRC Section 21084.3.

Costanoan Rumsen Carmel Tribe

The City received communication via phone on December 9, 2024, from the Costanoan Rumsen Carmel Tribe requesting the City resend the invitation to consult letter. The City provided a copy of the letter via email on December 9, 2024. No additional response was received.

On February 11, 2025, the City sent an email to the Costanoan Rumsen Carmel Tribe confirming that the Costanoan Rumsen Carmel Tribe has declined the consultation invitation pursuant to PRC Section 21080.3.1 (i.e., AB 52) and PRC Section 21084.3.

Indian Canyon Mutsun Band of Costanoan

The City received communication via phone on December 9, 2024, inquiring the result of the records search and buried site sensitivity. In addition, the City received communication via email on January 6, 2025 that expressed interest in consulting on the proposed project.

The City responded via email on January 10, February 10, and February 25, 2025 proposing meeting times and dates, no response was received from the Indian Canyon Mutsun Band of Costanoan.

On February 11, 2024, the City sent an email to the Indian Canyon Mutsun Band of Costanoan confirming that the Indian Canyon Mutsun Band of Costanoan has declined the consultation invitation pursuant to PRC Section 21080.3.1 (i.e., AB 52) and PRC Section 21084.3.

Muwekma Ohlone Indian Tribe of the San Francisco Bay Area

On February 22, 2025 the City received communication via email that stated they were interested in the proposed project and would like to have further discussions in assisting you with our services if needed. The email did not request tribal consultation. On February 25, 2025, the City responded via email asking if the Muwekma Ohlone Tribe like to schedule a consultation (virtual) meeting with the City of Campbell pursuant to PRC Section 21080.3.1(b). No response was received.

Tamien Nation

On November 25, 2024, a response was provided via email that Tamien Nation would like to consult with the City regarding the proposed project.

On February 27, 2025, the City met with Tamien Nation and provided a presentation on the proposed project which included: 1) project location, purpose, and need; 2) record search and survey results; and 3) proposed environmental document preparation schedule. Following the presentation, an open discussion was held in which Tamien Nation expressed concerns regarding the overall sensitivity of the site and the depth of excavation for utilities. Tamien Nation did not request a follow-up meeting.

On August 7, 2025, the City sent an email to Tamien Nation stating, “Pursuant to subdivision (b) of PRC Section 21080.3.2, and in the absence of further input, the City will proceed with closing consultation on the understanding that Tamien Nation does not have additional comments at this time.”

Thresholds of Significance

In accordance with the CEQA Guidelines’ Appendix G Environmental Checklist, the following questions were analyzed and evaluated to determine whether impacts to tribal cultural resources are significant.

Would the proposed project:

- Cause a substantial adverse change in the significance of a tribal cultural resource, defined by PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

  i) Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in PRC Section 5020.1(k), or

  ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1? In applying the criteria set forth in subdivision (c) of PRC Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Project Impact Analysis and Mitigation Measures

Tribal Cultural Resources

Impact TCR -a **The proposed project could cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to California Native American tribe, and that is:**

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Impact Analysis

The results of the NWIC records search as described in Section 3.2, Cultural Resources of this Draft EIR indicate that no previously recorded archaeological deposits are located in or within 0.25-miles of the project site. However, a review of geologic maps to assess the project site's potential for containing as-yet undocumented buried archaeological resources indicate sensitivity for buried pre-European contact archaeological deposits. No tribal representatives provided additional information about Tribal Cultural Resources (TCRs) that may be affected by the proposed project as a result of the City's consultation pursuant to PRC Section 21080.3.1

As discussed in Section 3.2, Cultural Resources, archaeological deposits that may qualify as TCRs could be encountered during project excavation. Such resources may be eligible for listing in the CRHR or a local register of historical resources, or the lead agency, in its discretion and supported by substantial evidence, could determine the resources to be significant pursuant to the criteria set forth in subdivision (c) of PRC Section 5024.1. Should deposits be encountered during proposed project excavation, this could result in an adverse change to a TCR. Thus, potentially significant impacts related to TCRs could result from construction of the proposed project.

Should Native American human remains be encountered during proposed project excavation, the Santa Clara County Coroner would be required to notify the NAHC as provided by Mitigation Measure CUL-3, and all applicable state and federal regulations governing the treatment of human remains will be followed.

Implementation of Mitigation Measures CUL-1, CUL-2, and CUL-3, described in Section 3.2, Cultural Resources, would ensure that impacts related to any TCRs that may be uncovered at the project site would be less than significant with mitigation through development and implementation of an AMP, implementation of cultural resources sensitivity training for all construction crews participating in ground-

disturbing activities, and requirements to stop work if archaeological deposits are encountered during ground-disturbing activities. Therefore, with implementation of mitigation measures, the proposed project would not cause a substantial adverse change in the significance of a tribal cultural resource and impacts would be less than significant.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measures CUL-1 CUL-2, CUL-3 would be required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

3.9 UTILITIES AND SERVICE SYSTEMS

This section describes the environmental and regulatory setting for utilities and service systems. It also describes existing conditions and potential impacts related to utilities and service systems that would result from implementation of the proposed project, and identifies mitigation measures for potentially significant impacts, where feasible.

3.9.1 Environmental Setting

Water Supply

Potable Water Supply

SJWC owns and operates its water distribution system that consists of a pipe network, which lies predominantly beneath the traveled roadways in the public street right-of-way. The SJWC provides the water supply for potable water and fire suppression in the City. SJWC's service area encompasses 139 square miles, including most of San Jose, most of Cupertino, the entire cities of Campbell, Monte Sereno, Saratoga, the Town of Los Gatos, and parts of unincorporated Santa Clara County. In addition to its own water system, SJWC also operates, maintains, and improves the Cupertino Municipal Water System through a lease agreement (SJWC 2021).

The regional wholesale supplier of water to the South Bay Area, which includes the SJWC, is the Santa Clara Valley Water District (Valley Water), which derives water from local, recycled, and imported supplies (City of Campbell 2022). The Valley Water's water supply system is comprised of storage, conveyance, recharge, treatment and distribution facilities that include local reservoirs, the groundwater basin, groundwater recharge facilities, treatment plants, imported supply, and raw and treated water conveyance facilities.

The SJWC has three primary sources of potable water supply: purchased or imported treated surface water from Valley Water, groundwater from the Santa Clara Subbasin, and surface water from local watersheds. Non-potable recycled water is a fourth and growing source of supply (SJWC 2021). On average, purchased water from Valley Water makes up over half of SJWC's total water supply. This water originates from several sources including Valley Water's local reservoirs, the State Water Project and the federally funded Central Valley Project San Felipe Division. Water is piped into SJWC's system at various turnouts after it is treated at one of three Valley Water-operated water treatment plants.

SJWC draws water from the Santa Clara Subbasin, which is part of the larger Santa Clara Valley Basin. Valley Water is responsible for maintaining the subbasin and ensuring the subbasin does not become overdrafted. Aquifers in the subbasin are recharged naturally by rainfall and streams and artificially mainly by recharge ponds operated by Valley Water. On average, groundwater from the Santa Clara Subbasin accounts for 30 to 40 percent of SJWC's total water supply.

Surface water utilized for potable water by SJWC include Saratoga Creek and Los Gatos Creek. SJWC has "pre-1914 water rights" to surface water in Saratoga Creek, Los Gatos Creek, and associated watersheds (City of Campbell 2022). SJWC diverts surface water in the local Saratoga Creek and Los Gatos Creek watersheds to one of the three SJWC water treatment plants for treatment prior to entering the distribution system. Surface water supplies are highly variable depending on annual rainfall and

generally contribute less than 10 percent of total water supply. Additionally, as of 2020, recycled water made up 2 percent of the total water supply (SJWC 2021).

SJWC's is required to prepare and update a UWMP every five years. SJWC's most recent UWMP is its 2020 UWMP which includes an analysis of projected demand and supply for water in its service area through the year 2045. According to the UWMP, in 2020, the total demand for potable and non-potable water within the SJWC service area was 39,592 million gallons (MG). The 2020 UWMP estimates that total water demand for SJWC's service area would increase to approximately 45,605 mgy in 2045 (SJWC 2021).

Table 3.9-1 below shows a summary of current and planned water supplies and a comparison of the projected supply and demand in a normal year scenario for SJWC's service area.

Table 3.9-1: Projected Supply vs. Demand for Normal Year Scenario

	Year				
	2025	**2030**	**2035**	**2040**	**2045**
Water Supply	44,201	44,275	44,629	45,156	45,605
Water Demand	44,201	44,275	44,629	45,156	45,605
Surplus or (Deficit)	*0*	*0*	*0*	*0*	*0*

Recycled Water

South Bay Water Recycling (SBWR) has been serving Silicon Valley communities since 1993 with a sustainable, high-quality recycled water supply. In 1997, SJWC entered into a Wholesaler-Retailer Agreement with the City of San Jose to provide recycled water to SJWC's existing and new customers near SBWR recycled water distribution facilities; whereas, the City of San Jose is the wholesaler and SJWC is the retailer. At the time, the involvement of SJWC was largely to assist the City in meeting its wastewater regulatory obligations. In accordance with the terms of this agreement, SJWC allowed SBWR to construct recycled water pipelines in its service area, SJWC would only own the recycled water meters, while SBWR would own, operate, and maintain the recycled water distribution system.

In 2010, this Wholesaler-Retailer Agreement was amended to allow SJWC to construct recycled water infrastructure that would be owned, operated, and maintained by SJWC. Then in 2012, this Wholesaler-Retailer Agreement was again amended to allow SJWC to construct additional recycled water infrastructure (City of Campbell 2022).

Wastewater

Wastewater collection and disposal services for the City are provided by WVSD. WVSD contracts with the San Jose-Santa Clara Regional Wastewater Facility (RWF) for wastewater treatment and disposal. The plant treats wastewater from local municipalities and sanitation districts and discharges the treated wastewater into San Francisco Bay. WVSD and the RWF both have regularly updated capital improvement programs that assess needs and plan for improvements. The WVSD accounts for about seven percent of plant treatment capacity with WVSD's current allocation being 13 mgd. As identified in the City's 2022 General Plan EIR, the RWF has over 70 mgd of remaining capacity (City of Campbell 2022).

Currently, all wastewater collected from the City is treated at the RWF, which has a total wastewater treatment capacity of 167 mgd. The City contributes approximately three percent of the RWF's total incoming wastewater. Current flows to the plant are approximately 110 mgd. The RWF receives and treats wastewater from a total of eight municipalities in the South Bay and the RWF's treatment capacity is allocated to each tributary agency on the basis of the peak five day dry weather flow, also referred to as the peak week flow. The 2015 peak dry weather flow to the plant was 96.15 mgd, with 10.26 mgd attributed to the WVSD (City of Campbell 2022).

3.9.2 Regulatory Setting

State

Urban Water Management Planning Act

In 1983, the California Legislature enacted the Urban Water Management Planning Act (Water Code Sections 10610–10656). The Urban Water Management Planning Act requires that every urban water supplier that provides water to 3,000 or more customers, or that provides over 3,000 acre feet per year (afy) shall prepare and adopt an UWMP. Water suppliers are required to prepare a UWMP within a year of becoming an urban water supplier and update the plan at least once every five years. The Urban Water Management Planning Act also specifies the content that is to be included in an UWMP. It is the intention of the legislature to permit levels of water management planning commensurate with the number of customers served and the volume of water supplied. The Urban Water Management Planning Act states that urban water suppliers should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple-dry years. The Urban Water Management Planning Act also states that the management of urban water demands, and the efficient use of water shall be actively pursued to protect both the people of the state and their water resources. SJWC is the service provider for the City and therefore, prepared the UWMP. The latest SJWC UWMP is the 2020 UWMP which was adopted in 2021.

California State SB 610 and 221

The purpose and legislative intent of SB 610 and SB 221 is to preclude projects from being approved without specific evaluations being performed and documented by the local water provider proving that water is available to serve the project.

SB 610 (codified at Section 10910 – 10915 of the California Water Code) requires the preparation of a Water Supply Assessment (WSA) for large-scale development projects, typically defined as any project involving a water demand increase equivalent to that associated with 500 or more dwelling units or other types of developments (e.g., hotels and motels, commercial buildings, industrial parks, etc.) using a comparable amount of water. The WSA evaluates the water supply available for new development based on anticipated demand. For the broad range of projects that are subject to this law, the statutory WSA must be requested by the lead agency from the local water provider at the time the lead agency determines that an EIR is required for the project under CEQA.

SB 221 (codified at California Government Code Section 66473.7) requires verification from applicable public water systems that a sufficient long-term water supply is available to meet projected demand

associated with a proposed subdivision comprising water demand equivalent to 500 or more dwelling units.

Local

Campbell General Plan

As outlined in Section 3.0, Environmental Impact Analysis, the proposed project is subject to the goals and policies of the 2001 General Plan which was in effect at the time of pre-application submittal.[17] Therefore, the goals and policies of the City's historical General Plan is listed below.

The City's 2001 General Plan include the following goals and policies related to utilities and service systems that may be applicable to the proposed project (City of Campbell 2001):

Goal LUT-7: Attractive, well-maintained and safe streets, public improvements and utilities.

- **Policy LUT-7.2:** Public Utilities and Improvements: Provide a comprehensive network of sidewalks, public utilities and multi-modal improvements that are safe, attractive, efficient, well maintained and accessible for pedestrians, bicyclists and motorists.

Goal OSP-10: Ensure efficient sewer and wastewater treatment.

- **Policy OSP-10.1:** Sewer And Wastewater Facilities: Ensure that sewer and wastewater facilities meet the needs of Campbell's residents.

Goal CNR-6: Encourage local participation in water conservation efforts to ensure a positive contribution to regional water conservation.

- **Policy CNR-6.1:** Water Conservation: Encourage residents and businesses to conserve water.

Goal CNR-7: Increased water recycling.

- **Policy CNR-7.1:** Water Recycling: Take part in and promote water recycling efforts.

3.9.3 Environmental Impacts

This section analyzes the proposed project's potential to result in significant utilities and service systems impacts. When an impact is determined to be significant, mitigation measures are identified that would reduce or avoid impacts.

Methodology for Analysis

The following analysis is based on a review of documents pertaining to the project site, including the General Plan, the General Plan EIR, 2020 UWMP, and Section 2.0, Project Description, of this EIR. The following impact discussions consider the impacts of the proposed project related to utilities and service systems in the City.

[17] For an explanation of the applicability of the City's 2001 General Plan in this Draft EIR, see Section 3.0, Environmental Impact Analysis, and Section 3.1.2, Regulatory Setting - Local.

Thresholds of Significance

In accordance with the CEQA Guidelines' Appendix G Environmental Checklist, the following questions were analyzed and evaluated to determine whether the proposed project's impacts to utilities and service system are significant.

Would the proposed project:

- Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

The following issues were determined to have no impact or a less than significant impact during the NOP Scoping. These issues are summarized in Section 7.0, Effects Found Not to Be Significant, and are not discussed further in this section.

Would the proposed project:

- Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects?
- Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or other impair the attainment of solid waste reduction goals?
- Comply with federal, state and local management and reduction statues and regulations related to solid waste?

Project Impact Analysis and Mitigation Measures

Water Supply

Impact UTIL-b	**The proposed project would have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.**

Impact Analysis

As identified in Section 2.2.9, Utilities, the Applicant determined that the proposed project is anticipated to result in an average daily water demand of 82,126 gallons per day (gpd) or 30 mgy. This demand estimate was calculated using a flow generation rate of 109 gpcd assumed per the 2020 UWMP and the City's average household size of 2.6 persons per household per the U.S. Census Bureau, last updated in 2021. The 2020 UWMP identifies that SJWC's actual water use in 2020 was 109 gpcd.

However, as stated in the 2020 UWMP, for demand projections included in the 2020 UWMP, it was assumed that all developments constructed after 2020 would require high water efficiency fixtures and thus, a lower daily per capita water use of 75 gpcd was applied to new population growth after 2020

(SJWC 2021). Additionally, as identified in Section 3.14, Population and Housing, of the Initial Study (Appendix A), to accurately estimate the resulting population of the proposed project, the population and average household size identified in the City's most recent 2022 General Plan EIR was utilized to calculate the anticipated population growth from implementation of the proposed project. The City's 2022 General Plan EIR identifies an average household size of 2.49 persons per household. Using this more updated data and the projected daily per capita water use of 75 gpcd for new developments, the proposed project is anticipated to result in a water demand of 54,150 gpd or 19.8 mgy.

The 2020 UWMP identified that projected water demand in 2025 for SJWC's service boundary was 44,201 MG. The proposed project's anticipated water demand of 19.8 mgy would represent approximately 0.04 percent of SJWC's total water demand for 2025. Therefore, the proposed project would not result in a substantial increase in demand for water. Additionally, as the project site is currently developed and operated as a R&D campus, there is already existing water demand at the site that is serviced by SJWC. At the time of preparation of this EIR, we do not have information regarding how much water demand exists at the site from operation of the existing R&D campus. However, as we know that there is existing water demand at the site, the existing water demand would offset some of the total water demand anticipated from implementation of the project and the anticipated increase in total water demand at the site would be less than 19.8 mgy. The proposed project would also include design features to reduce water use such as the use of native and drought-tolerant plants and use of water efficient fixtures that would meet specified water use rates as required by the California Plumbing Code.

The 2020 UWMP identified that SJWC anticipated adequate water supplies to meet demand under normal year, single dry, and multiple dry year scenarios through 2045. Therefore, as the proposed project is not anticipated to result in substantial increases in water demand at the site, there would be sufficient water supplies available to serve the proposed project and reasonably foreseeable future development during normal, dry and multiple dry years. As such, the proposed project would result in a less than significant impact to water supplies.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Wastewater Treatment

Impact UTIL-c	**The proposed project would not result in a determination by the wastewater treatment provider, which serves or may serve the project that it does not have adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.**

Impact Analysis

As identified above under Section 3.9.1, Environmental Setting, wastewater collection and disposal services for the City is provided by WVSD who contracts with the San Jose-Santa Clara RWF for

wastewater treatment and disposal. The San Jose-Santa Clara RWF has a total wastewater treatment capacity of 167 mgd and current flows to the plant are approximately 110 mgd (City of Campbell 2022). Therefore, the San Jose-Santa Clara RWF has sufficient capacity to serve additional developments and connections.

The WVSD accounts for about seven percent of San Jose-Santa Clara RWF's treatment capacity with WVSD's current allocation being 13 mgd. As identified in the WVSD's 2023-2024 Annual Report, in fiscal year 2023-2024, WVSD collected and conveyed 9.6 mgd of wastewater to the San Jose-Santa Clara RWF (WVSD 2024). Therefore, there is sufficient capacity within WVSD's treatment allocation to serve additional developments.

As identified in Section 2.2.9, Utilities, the Applicant determined that the proposed project is anticipated to result in a sanitary sewer flow generation of 49,010 gpd or 17.89 mgy. The proposed project's sewer generation of 49,010 gpd would represent a 0.5 percent increase in wastewater generated within WVSD's service area when utilizing the total wastewater generated in fiscal year 2023-2024. The proposed project's wastewater would be adequately handled by San Jose-Santa Clara RWF's existing capacity and would be within the treatment capacity allocation identified for WVSD, and both the RWF and WVSD facilities are upgraded consistent with capital improvement plans and related planning documents that are continually updated. Therefore, as there is sufficient capacity remaining within WVSD's treatment capacity allocation and treatment capacity at the San Jose-Santa Clara RWF, the proposed project would not result in a determination by the wastewater treatment provider that it does not have adequate capacity to serve the proposed project and impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

4.0 CUMULATIVE EFFECTS

4.1 INTRODUCTION

Section 15130(a) of the state CEQA Guidelines requires a discussion of the cumulative impacts of a project when the project's incremental effect is cumulatively considerable. Cumulatively considerable, as defined in CEQA Guidelines Section 15065(a)(3), means that the "incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." The state CEQA Guidelines Section 15355 defines a cumulative impact as two or more individual effects that, when considered together, are considerable or that compound or increase other environmental impacts. Cumulative impacts can result from individually minor but collectively significant projects taking place over time.

According to the CEQA Guidelines:

> *Cumulative impacts refer to two or more individual effects that, when considered together, are considerable and that compound or increase other environmental impacts.*
>
> *a) The individual effects may be changes resulting from a single project or multiple separate projects.*
>
> *b) "The cumulative impact from several projects is the change in the environment, which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probably future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time." (CCR, Title 14, Division 6, Chapter 3, Section 15355)*

In addition, as stated in the CEQA Guidelines:

> *The mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable (CCR, Title 14, Division 6, Chapter 3, Section 15064[T][5]).*

4.2 CUMULATIVE IMPACT SETTING

Cumulative impact discussions for each environmental issue area are provided for each environmental resource topic analyzed in the Draft EIR. As established in the CEQA Guidelines, related projects consist of "closely related past, present, and reasonably foreseeable probable future projects that would likely result in similar impacts and are located in the same geographic area" (CCR, Title 14, Division 6, Chapter 3, Section 15355).

The state CEQA Guidelines define a cumulative impact as two or more individual impacts that, when considered together, are significant or that compound or increase other significant environmental impacts. Cumulative impacts can result from individually minor but collectively significant projects taking place over time (state CEQA Guidelines Section 15355). The incremental impact of a project, although less than significant on its own, may be considerable when viewed in the cumulative context of other closely related

past, present, and reasonably foreseeable projects. A considerable contribution is considered significant from the point of view of cumulative impact analysis.

CEQA Guidelines Section 15130 identifies two basic methods for establishing the cumulative environment in which a project is considered: the use of a list of past, present, and probable future projects or the use of adopted projections from a general plan, other regional planning document, or a certified EIR for such a planning document. This cumulative analysis uses a combination of the "list" approach and the "projections" approach to identify the cumulative setting. The plan and projections approach relies on an adopted plan or reliable projection that describes the significant cumulative impact. This Draft EIR combines both the project list and projection approaches to generate the most reliable future projections possible.

4.3 GEOGRAPHIC SCOPE

The geographic area analyzed for cumulative impacts is dependent on the resource being analyzed. The geographic area associated with the proposed project's environmental impacts defines the boundaries of the area used for compiling the list of past, present, and reasonably foreseeable projects considered in the cumulative impact analysis.

Each environmental resource topic analyzed in this Draft EIR considers a specific geographic area that is directly related to the individual topic. For example, the analysis of air quality is based on a regional level because air quality impacts are regional in nature, whereas analysis of aesthetic impacts only considers related projects in the vicinity of the project site because of the localized nature of the impact.

The geographic area that could be affected by implementation of the proposed project in combination with other projects varies depending on the type of environmental resource being considered. Table 4.3-1 provides the geographic area and the method of evaluation utilized in the cumulative analysis for each resource area.

Table 4.3-1: Geographic Scope of Cumulative Impact and Method of Evaluation

Resource Topic	Geographic Area	Method of Evaluation
Air Quality	Local (toxic air contaminants) air basin (construction-related and mobile sources)	Projects and Projections
Cultural Resources	Project site	Projects
Energy	Immediate project vicinity and region	Projections
Greenhouse Gas Emissions	State	Projections
Land Use and Planning	Immediate project vicinity	Projects
Noise	Immediate project vicinity (effects are highly localized)	Projects
Transportation	Region	Projects and Projections
Tribal Cultural Resources	Project site only (does not contribute to cumulative impacts)	Projects
Utilities and Service Systems	Local	Projects

Notes:

Resource Topic	Geographic Area	Method of Evaluation

Projects = the use of a list of past, present, and reasonably foreseeable projects
Projections = the use of projections contained in relevant planning documents

For those environmental resources that were evaluated based on the projections approach, the projections take into consideration future projects that are not included in the below list of related plans and projects.

4.4 LIST OF RELATED PROJECTS

The list of past, present, and probable future projects used for this cumulative analysis is restricted to those projects that have occurred or are planned to occur (i.e., pending applications at the time of the NOP release). For the purposes of this discussion, these projects that may have a cumulative effect on the resources of the project area will be referred to as the "related projects." These related projects are described in Table 4.4-1 and shown in Figure 4-1. As discussed above under Section 4.3, Geographic Scope, the geographic area analyzed for cumulative impacts is dependent on the resources being analyzed. The geographic area associated with the proposed project's environmental impacts defines the boundaries of the area used for compiling the list of past, present, and reasonably foreseeable projects considered in the cumulative impact analysis. The list of related projects identified for the proposed project does not include all projects currently pending citywide. The list of related projects was determined based on the resource topics analyzed in this EIR and the specific geographic area that is directly related to the individual topics analyzed. For example, cumulative analysis of noise impacts only considers related projects in the vicinity of the project site because of the localized nature of the impact. As identified above in Table 4.3-1, the geographic scope of majority of resource topics analyzed in this EIR is identified as the project site or the immediate project vicinity. Therefore, the list of related projects only includes projects that have occurred or are planned to occur within the vicinity of the project site. Resource topics identified in Table 4.3-1 that have a geographic scope outside of the immediate project vicinity use projections as the method of evaluation which take into consideration of future projects that are not included in the related projects list identified in Table 4.4-1.

CEQA defines "probable future projects" as those with an active application at the time the NOP was released for a project (in this case, January 6, 2025). The list of projects in Table 4.4-1 was used in the development and analysis of the cumulative settings and impacts for each resource topic. Past and current projects in the project vicinity were also considered as part of the cumulative setting as they contribute to the existing conditions upon which the project and each probable future project's environmental effects are compared.

Unless otherwise specified, significance criteria are the same for cumulative impacts as they are for project impacts for each environmental topic area. When considered in relation to other reasonably foreseeable projects, cumulative impacts to some resources would be significant and more severe than those caused by the project alone.

GPHE – General Plan Housing Element

4.5 CUMULATIVE IMPACT ANALYSIS

For purposes of this Draft EIR, the proposed project would result in a significant cumulative effect if:

- The cumulative effects of related projects (past, current, and probable future projects) are not significant, and the incremental impact of implementing the proposed project is substantial enough when added to the cumulative effects of related projects to result in a new cumulatively significant impact; or
- The cumulative effects of related projects (past, current, and probable future projects) are already significant, and implementation of the proposed project makes a considerable contribution to the effect. The standards used herein to determine a considerable contribution are that either the impact must be substantial or must exceed an established threshold of significance.

This cumulative analysis assumes that all mitigation measures identified in Sections 3.1 through 3.9 to mitigate project impacts are adopted. The analysis herein analyzes whether, after adoption of project-specific mitigation, the residual impacts of the project would cause a cumulatively significant impact or would contribute considerably to existing and anticipated (without the project) cumulatively significant effects. Where the project would so contribute, additional mitigation is recommended where feasible.

The EIR evaluates cumulative impacts consistent with CEQA Guidelines Section 15130, focusing on resource areas where the proposed project could result in a cumulatively considerable contribution to a significant impact. The scope of cumulative analysis is informed by the City of Campbell 2022 General Plan EIR, which previously evaluated environmental impacts associated with buildout of the City under cumulative conditions.

Pursuant to CEQA Guidelines Section 15152 (tiering), this EIR relies on the 2022 General Plan EIR for cumulative impact analysis where appropriate. The 2022 General Plan EIR evaluated the environmental effects of development under full buildout conditions, including growth projections, infrastructure demands, and citywide cumulative conditions associated with implementation of the adopted land use framework.

For resource areas where the proposed project is consistent with the land use designation, density, and development intensity evaluated in the 2022 General Plan EIR, and where impacts are not peculiar to the project or site, cumulative impacts have been adequately addressed at the programmatic level in the 2022 General Plan EIR. In these cases, the project's incremental contribution to cumulative impacts is within the scope of impacts previously analyzed in the 2022 General Plan EIR, and further cumulative analysis in this EIR is not required.

Consistent with CEQA Guidelines Sections 15130 and 15152, this EIR focuses cumulative analysis on resource areas where: (1) the project may result in a cumulatively considerable contribution to a significant impact not previously addressed, (2) site-specific conditions may result in impacts that are peculiar to the project, or (3) the project could result in impacts that are more severe than those identified in the General Plan EIR.

For resource areas that do not meet these criteria (resources scoped out in the Initial Study process), the Draft EIR relies on the 2022 General Plan EIR and does not provide additional cumulative analysis, as

such impacts for resource sections scoped out in the Initial Study process have been previously evaluated and no new or more severe impacts would occur. The 2022 General Plan EIR did not identify any potentially significant cumulative impacts for any of the resource sections scoped out in the Initial Study process and outlined in Section 7.0, Effects Found Not to be Significant, of this Draft EIR.

4.5.1 Air Quality

The geographic scope for air quality is the SFBAAB, which is under the jurisdiction of the BAAD. Air pollution is largely a cumulative impact by nature, and no single project is sufficient to result in nonattainment of ambient air quality standards.

The SFBAAB is designated as nonattainment for federal and state ozone and $PM_{2.5}$ as well as state PM_{10}. As a result, the BAAD has prepared the 2017 Clean Air Plan and adopted rules and regulations to work towards attainment status. In addition, the BAAD significance thresholds are intended to analyze whether a project's contribution to the cumulative impact is considerable. If a project exceeds the identified significance thresholds, its emissions would also be considered cumulatively considerable, resulting in a significant adverse air quality impact to the region's existing air quality conditions. As discussed in Section 3.1, Air Quality, the proposed project would be consistent with the 2017 Clean Air Plan and would not result in criteria pollutant emissions that exceed the adopted thresholds of significance. Thus, the proposed project would not exceed the allowable incremental contribution of an individual development project and would not hinder progress toward overall attainment within the SFBAAB.

With regard to health impacts, the BAAD recommends a thousand-foot radius around a project site to evaluate the risks posed to sensitive receptors. Review of Figure 4-1 demonstrates that the 2400 South Winchester Boulevard Project lies just over 1,000 feet from the project site. Therefore, single family residences along Timber Cover Drive could be impacted by the cumulative risk from both the proposed project and Winchester Boulevard Project. The greatest risk would occur during construction. However, the 2400 South Winchester Boulevard has already received permit approval and as a result, construction likely would not occur at the same time as proposed project construction. As residential developments, neither project is anticipated to generate significant levels of TACs during operation. Moreover, the proposed project would implement Mitigation Measures AIR-1 and AIR-2, the impact related to exposing sensitive receptors to substantial pollutant concentrations would be reduced to less than significant levels.

Therefore, since the proposed project falls below BAAD thresholds for local emissions and health risks, it would not be cumulatively considerable.

The proposed project does not include any of the foregoing land uses that are typically associated with emitting objectionable odors and is not located adjacent to any related projects that would include land uses that would emit substantial sources of odors. Therefore, the proposed project's contribution to odor related impacts would not be cumulatively considerable.

Past, present, and reasonably foreseeable development near the project site have contributed to and would continue to contribute to air quality impacts in the project vicinity. Other projects would also be subject to applicable BAAD rules and guidelines, and may be required to implement mitigation measures to ensure that emissions are reduced to less-than-significant levels.

Based on the above, with the implementation of Mitigation Measures AIR-1 and AIR-2, the proposed project would not result in significant impacts to air quality and would not result in cumulatively considerable air quality impacts.

4.5.2 Cultural Resources

The geographic scope for the analysis of cumulative impacts associated with cultural resources is the project site and the immediate vicinity. Because significant cultural resources are unique and non-renewable members of finite classes, all adverse effects erode a swindling resource base. The loss of any one archaeological site could affect the scientific value of others in a region because these resources are best understood in the context of the entirety of the cultural system of which they are a part. The cultural system is represented archaeologically by the total inventory of all sites and other cultural remains in the region. As a result, a meaningful approach to preserving and managing cultural resources must focus on the likely distribution of cultural resources, rather than on a single project or parcel boundary.

Built Environment

Cumulative impacts are addressed only for those thresholds that would result in a project-related impact. If the proposed project would result in no impact with respect to a particular threshold, it would not contribute, by definition, to a cumulative impact. Therefore, no cumulative analysis would be required. The proposed project would not affect a built environment historical resource; thus, built environment is not analyzed for cumulative impacts.

Archaeology

Because the project site is situated in an archaeologically sensitive area, the possibility exists of encountering unknown archaeological resources during ground-disturbing activities associated with proposed project construction. The proposed project could contribute to a cumulative loss of archaeological resources and disturbance of human remains. Therefore, the proposed project's cumulative impact prior to the application of mitigation measures could be significant. However, in addition to adopted policies and existing regulations to protect cultural resources and human remains, the proposed project would be subject to Mitigation Measures CUL-1, CUL-2 and CUL-3, which call for development and implementation of a monitoring plan, worker awareness training, and requirements to stop work if archaeological deposits are encountered during ground-disturbing activities.

It is reasonable to assume that other development projects would undergo environmental review to evaluate potential impacts to archaeological resources, would be required to adhere to state and federal regulation, and would be required to mitigate for impacts in a manner similar to the proposed project. **Therefore, with implementation of Mitigation Measures CUL-1, CUL-2 and CUL-3, impacts to archeological resources would be less than significant and would not result in a cumulatively considerable impact.**

4.5.3 Energy

The geographic scope of the cumulative energy resources analysis is the PG&E service area, which consists of most of central and northern California. Increased demand for electrical and natural gas

supplies and infrastructure is a byproduct of all future land uses and development projects. Energy is consumed for heating, cooling, and electricity in homes and businesses; for public infrastructure and service operations; and for agriculture, industry, and commercial uses. Each service provider is responsible for ensuring adequate provision of these utilities within their jurisdictional boundaries and would be responsible for upgrading their existing electrical and natural gas distribution systems or constructing new distribution systems to meet the demands of individual projects.

The proposed residential units would be 100 percent electric, and the structures would be designed and constructed in accordance with all applicable CALGreen and Title 24 standards to increase energy efficiency. These standards include minimum efficiency requirements related to building envelope, mechanical systems (heating, ventilation, air conditioning, and water heating systems), indoor and outdoor lighting, and illuminated signage. The proposed project would also place new residents near existing transit that would likely reduce VMT and the associated fuel consumption from vehicles. This would ensure that the project would not result in the inefficient, unnecessary, or wasteful consumption of energy. Other planned projects in the vicinity and region would similarly be designed to meet existing CALGreen and Title 24 standards and would comply with applicable standards related to energy efficiency. **Thus, the proposed project, in conjunction with related projects, would not have a cumulatively considerable impact on energy.**

4.5.4 Greenhouse Gas Emissions

The geographic scope of the cumulative GHG analysis is the State of California. However, GHG impacts are inherently cumulative, and all GHG emissions contribute to the significant environmental impacts of global climate change. Although an individual project cannot generate enough GHG emissions to change climactic conditions, the combination of GHG emissions from an individual project in combination with other future projects could contribute to global climate change.

As discussed in Section 3.4, Greenhouse Gas Emissions, the proposed project is expected to result in a net reduction in GHG emissions as compared to the existing use onsite. In addition, the proposed project would incorporate the BAAD's design elements that contribute to community-wide reductions in GHGs, and the project would comply with the applicable GHG reduction measures included in the CARB's 2022 Scoping Plan. As a result, the proposed project was determined to result in a less than significant impact related to GHG emissions. The project, in combination with other past, present, and reasonably foreseeable projects throughout the state, would each contribute to the cumulatively significant impact related to GHGs. **However, the proposed project would result in a less than significant incremental contribution to the cumulative GHG impact.**

4.5.5 Land Use and Planning

The geographic scope of the cumulative land use analysis is the immediate project vicinity. The land use analysis in Section 3.5, Land Use and Planning, found the proposed project to be consistent with the applicable goals and policies of the City's 2001 General Plan. Though the proposed project would not be consistent with the requirements of the land use and zoning district designation of the project site, the proposed project would develop the site with residential uses as was envisioned in the City's 6th Cycle Housing Element.

Lands that surround the project site are designated and zoned for a mix of urban uses, including residential and industrial uses. Lands located to the north and east of the project site are designated and zoned medium-high density residential and mobile home park. As the proposed project is proposing a residential development, the proposed project would not be inconsistent with these existing residential uses. Lands to the south of the site are designated and zoned park and open space, and light industrial. As the proposed project would involve construction of a residential development, the proposed project could be inconsistent with the existing light industrial uses to the south of the site. However, the proposed project would be buffered from the adjacent light industrial uses as open space areas and landscaping trees are proposed to be located between the nearest residential building to the southern property line and the existing industrial uses. Buffering of the proposed project from existing light industrial uses would reduce potential impacts and conflicts between the proposed and existing uses. None of the related projects are located adjacent to or within close proximity to the proposed project site and therefore, is not anticipated to result in cumulative impacts to land use due to inconsistent land uses. In addition, other development in the project vicinity would be required to demonstrate consistency with the City's General Plan and development standards through the project design or the implementation of mitigation measures. **Therefore, the proposed project in conjunction with other related projects would not have a cumulatively considerable impact on land use.**

4.5.6 Noise and Vibration

The geographic scope of the cumulative noise analysis is the immediate project vicinity. Construction activities associated with the proposed project would be temporary, anticipated to begin in March 2027 and be completed by February 2032, and would not include blasting or pile driving. As described in Impact NOI-1 in Section 3.6, Noise, construction noise and vibration from the proposed project would increase noise levels. However, construction activities and increases in noise levels from construction activities would be temporary and construction activities would be limited to the restrictions set by Section 18.04.052 in the Campbell Municipal Code.

The proposed project would also implement 2001 General Plan Strategy CNR-10.1c which requires a project specific acoustical analysis be completed for new residential projects exposed to ambient noise levels above 60 dB(A) CNEL. The acoustical analysis would determine appropriate mitigation to reduce indoor noise levels within residential uses to 45 dB(A) Ldn and include ways to incorporate such mitigation into the project design and implementation. Additionally, operation of the proposed project would involve typical residential building mechanical equipment, such as air conditioning units and exhaust fans that would generate noise that would radiate to neighboring properties. The noise from this equipment would be obliged to comply with the maximum noise level limits listed in Section 21.16.070.E in the Campbell Municipal Code. When the actual onsite equipment is selected, the equipment would be designed to incorporate measures as needed, such as shielding, barriers, and/or attenuators, to reduce noise levels that may affect nearby properties.

Cumulative impacts from construction-generated noise could result if other future planned construction activities were to take place near the project site and cumulatively combine with construction noise from the proposed project. Construction of the related projects that are currently proposed and listed in Table 4.4-1 is not anticipated to take place within the same timeframe as the construction of the proposed project and there are no related projects that are located within the vicinity of the project site that could cumulatively combine with noise resulting from the proposed project. Given the distance between the

related construction projects and the project site, short-term construction noise and vibration generated by the proposed project would not combine with any other related construction project. Furthermore, the construction and operation of the other related projects would be required to comply with the same City noise requirements and implement mitigation to reduce noise levels and vibration. **Therefore, construction and operation noise generated by the proposed project would not have a cumulatively considerable impact.**

4.5.7 Transportation

As discussed in Section 3.7, Transportation, the proposed project would not conflict with any program plan, ordinance, or policy addressing the circulation system and would not result in safety impacts to pedestrians. However, Mitigation Measure TRANS-1 was included which would require construction of pedestrian improvements along the project frontage to ensure pedestrian safety and reduce potential impacts. Additionally, the analysis provided in Section 3.7, Transportation, of this Draft EIR determined that the project design would be designed and constructed in accordance with City requirements and standards and therefore, would not result in impacts related to emergency access. The related projects identified in Table 4.4-1 are not located within close proximity to the project site and would not utilize the same roadways as the proposed project and therefore, would not increase identified pedestrian safety impacts or impact emergency access to the site. Other related projects that propose to amend or adjust the roadway network would be required to demonstrate consistency with applicable plans, programs, and ordinances related to traffic improvements. Other related projects identified in Table 4.4-1 are not proposed to be constructed during the same construction timeframe as the proposed project.

According to OPR's Technical Advisory on *Evaluating Transportation Impacts in CEQA*: "A project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less than significant project impact would imply a less than significant cumulative impact, and vice versa." As discussed in Section 3.7, Transportation, the City of Campbell's General Plan Transportation Element includes VMT screening criteria that is used to identify if a project is expected to have a less than significant impact without conducting a full VMT analysis. If a project meets one of the screening criteria, then the project is presumed to have a less than significant impact on transportation.

Since the project is consistent with the General Plan and is located within a 0.5-mile radius of the VTA Winchester light rail transit station, the proposed project meets the City's Transit Screening criteria and would result in a less than significant VMT impact. As the proposed project would result in a less than significant VMT impact, the proposed project would not have a cumulative impact on transportation. **Therefore, the proposed project would result in a less than significant cumulative traffic impact.**

4.5.8 Tribal Cultural Resources

The geographic scope for the analysis of cumulative impacts associated with TCRs is the proposed project site and the immediate vicinity. Because these resources are unique and non-renewable, all adverse effects or negative impacts erode a dwindling resource base. For this reason, the cumulative effects of development in the region on TCRs are considered significant.

Although TCRs can encompass features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe, none of these resource types were identified in the project site or immediate vicinity as a result of the NAHC SLF search or tribal outreach pursuant to pursuant to PRC Section 21080.3; however, because the project site is situated in an archaeologically sensitive area, the possibility exists of encountering unknown archaeological deposits that qualify as TCRs during project excavation. Therefore, the proposed project could contribute to a cumulative loss of TCRs through the disturbance prior to the application of mitigation measures. However, in addition to adopted policies and existing regulations to protect TCRs and Native American human remains, the proposed project would be subject to Mitigation Measures CUL-1, CUL-2 and CUL-3 which call for development and implementation of a monitoring plan, worker awareness training, and requirements to stop work if archaeological deposits are encountered during ground-disturbing activities. **Therefore, with implementation of mitigation measures identified in the Draft EIR, the proposed project would not have a cumulatively considerable impact on tribal cultural resources.**

4.5.9 Utilities and Service Systems

The proposed project proposes development of 290 residential units. 14 out of 15 of the related projects identified in Section 4.4, List of Related Projects, propose development of less residential units compared to the proposed project (these 14 related projects collectively include 947 units compared the proposed project's 290 units). As such, these related projects would each be anticipated to result in less water demand and wastewater generation than the proposed project. The last related project, the Pruneyard Master Use Permit Project, proposes mostly commercial/retail uses with limited office uses and as such, would not be anticipated to result in more water demand and sewer generation than the proposed project.

The geographic area for cumulative utilities and service systems impacts is the service area of the utility and service systems providers. Therefore, the geographic area for cumulative water supply impacts is the service area of the SJW and WVSD which provide potable water and wastewater services to the City, respectively. As discussed in Section 3.9, Utilities and Service Systems, the analysis conducted for the proposed project determined that SJW would have adequate water supplies available to serve the proposed project and all other users and the proposed project would not result in an increase in water supply shortage. Therefore, the proposed project would result in a less than significant impact related to available water supplies. Additionally, the proposed project includes water efficiency measures to reduce anticipated demand during operation of the proposed project. Related projects in SJW's service area would have the potential to result in a cumulative impact associated with available water supplies if the related project would substantially increase demand in the City. As determined in Section 3.9, Utilities and Service Systems, the proposed project's anticipated water demand would represent approximately 0.04 percent of SJWC's total water demand for 2025. As also explained in Section 3.9, Utilities and Service Systems, and the City's 2022 General Plan EIR, the 2020 UWMP identified that SJWC anticipated adequate water supplies to meet demand under normal, single dry, and multiple dry year scenarios through 2045. Finally, implementation and buildout of the General Plan, as disclosed in the 2022 General Plan EIR, would not result in the need to construct or expand water supply and treatment facilities that have not already been described and accounted for in the relevant water master plans, which include the SJWC UWMP, SCVWD UWMP, and Santa Clara Valley Water District Water Supply and Infrastructure Master Plan, incorporated herein by reference.

As the related projects are expected to result in less water demand than the proposed project, even with the combination of the proposed project and related projects, SJW would be anticipated to have adequate water supplies available to serve the proposed project and related projects. Related projects in the City would be required to prepare an environmental analysis and demonstrate that there would be sufficient water supplies available to serve the proposed related project in addition to the existing users. Related projects would also be required to implement water conservation measures to reduce water consumption in accordance with City requirements and standards. If related projects determine that the project would substantially increase demands and the City would not have sufficient water supplies available to serve the related project, the related project would be required to implement measures to reduce water demand.

In regard to wastewater services, as discussed in Section 3.9, Utilities and Service Systems, the RWF has a total wastewater treatment capacity of 167 mgd and current flows to the plant are approximately 110 mgd (City of Campbell 2022). Additionally, WVSD has a treatment capacity allocation of 13 mgd but WVSD's current flow to the plant for fiscal year 2023-2024 was 9.6 mgd (WVSD 2024). As determined in Section 3.9, Utilities and Service Systems, the proposed project's anticipated sewer generation would represent approximately a 0.5 percent increase in wastewater generated within WVSD's service area when utilizing the total wastewater generated in fiscal year 2023-2024. Long-term capital planning is continually undertaken and updated by the WVSD, which has adopted a 2025 Sewer System Management Plan and a 2025-2030 Capital Improvement Program. Similarly, the San Jose-Santa Clara RWF is subject to a 30-year Capital Improvement Program that has planned for $2.2 billion in wastewater facility investments through 2043. Meanwhile, various policy and regulatory mandates prohibit aggregate development to exceed capacity, in the City's General Plan and elsewhere. For the foreseeable future, there is sufficient system-wide capacity to accommodate Citywide development and, as indicated in the City's 2022 General Plan EIR, impacts are anticipated to be less than significant. Note the proposed project has a scope smaller than the development envisioned for the project site by the 2022 General Plan EIR, such that the project contribution would be less than previously studied. Moreover, as the related projects are expected to result in less sewer generation than the proposed project, even with the combination of the proposed project and related projects (which would collectively generate demand of 3 to 4 times the proposed project's demand, for a cumulative increase of approximately 2 to 2.5 percent[18]), the RWF would be anticipated to have sufficient capacity to serve additional developments and connections and there would be sufficient capacity within WVSD's treatment allocation to serve additional developments. Similar to the proposed project, related projects in the City would be required to prepare an environmental analysis and demonstrate that there would be sufficient wastewater treatment capacity available to serve the proposed related project in addition to the existing users. If related projects determine that the project would substantially increase wastewater generation and the RWF would not have sufficient treatment capacity available to serve the related project, the related project would be required to implement measures to reduce water demand. As the majority of identified related projects within the City are located on sites that are already developed and has existing water supply and wastewater treatment demand from existing uses, redevelopment of these sites with the proposed related projects would not be anticipated to significantly increase demand on these sites. **Therefore, the**

[18] This calculation is conservative, and does not account for any redevelopment of the sites in which new development demand replaces existing demand.

proposed project would not have a cumulatively considerable impact on utilities and service systems.

5.0 ALTERNATIVES TO THE PROPOSED PROJECT

5.1 INTRODUCTION

The purpose of an alternatives analysis pursuant to CEQA is to identify feasible options that would attain most of the basic objectives of a proposed project while reducing its significant effects. Provisions of CEQA Guidelines (Section 15126.6) that address the number of project alternatives required in an EIR state the following:

> *The range of alternatives required in an EIR is governed by a "rule of reason;" the EIR must evaluate only those alternatives necessary to permit a reasonable choice. The alternatives shall be limited to those that would avoid or substantially lessen any of the significant effects of a proposed project while meeting most of the underlying project objectives.*

5.2 REQUIREMENTS FOR THE CONSIDERATION OF ALTERNATIVES

An important aspect of EIR preparation is the identification and assessment of alternatives to the proposed project that have the potential to avoid or substantially lessen potentially significant impacts. In addition to mandating consideration of the no project alternative, CEQA Guidelines (Section 15126.6(e)) emphasize the selection of a reasonable range of feasible alternatives and adequate assessment, which allows decision-makers to use a comparative analysis. CEQA Guidelines (Section 15126.6(a)) states:

> *An EIR shall describe a reasonable range of alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation.*

In accordance with CEQA Guidelines 15126.6, this EIR contains a comparative impact assessment of alternatives to the proposed project. The primary purpose of this assessment is to provide decision-makers and the public with a reasonable number of feasible project alternatives that could attain most of the basic project objectives while avoiding or reducing any of the project's significant adverse environmental effects. Important considerations for these alternatives' analyses are provided below:

- An EIR need not consider every conceivable alternative to a project;
- An EIR should identify alternatives that were considered by the lead agency, but rejected as infeasible during the scoping process;
- Reasons for rejecting an alternative include:
- Failure to meet most of the basic project objectives
- Infeasibility

- Inability to avoid significant environmental effects

5.2.1 No Project Alternative

CEQA Guidelines require that the alternatives be compared to the project's environmental impacts and that the "no project" alternative be considered (CEQA Guidelines Section 15126.6(d)(e)). Section 15126.6(d)(e)(1) states:

> *The specific alternative of "no project" shall also be evaluated along with its impact. The purpose of describing and analyzing a no project alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project. The no project alternative analysis is not the baseline for determining whether the proposed project's environmental impacts may be significant, unless it is identical to the existing environmental setting analysis which does establish that baseline.*

The purpose of describing and analyzing a no project alternative is to allow decision-makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project.

5.2.2 Consistency with Project Objectives

A project's statement of objectives describes the purpose of the project and the reasons for undertaking the project. To be considered for detailed analysis in the EIR, an alternative must meet most of the project objectives. The following objectives have been identified for purposes of screening potential alternatives to the proposed project:

- Maximize development of medium-density housing in the City of Campbell while assisting the City in achieving its share of low-income and above-moderate-income housing under the 2023-2031 Regional Housing Needs Allocation.
- Facilitate development of a diversity of housing types and availability of housing units for a diversity of income levels, including market rate units and affordable units.
- Facilitate development of infill areas that have been previously paved and developed to promote preservation of existing open spaces within the City and location of residential uses proximate to public transit.

5.2.3 Feasibility

According to CEQA Guidelines (Section 15126.6(f)(1):

> *Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site (or the site is already owned by the proponent). No one of these factors establishes a fixed limit on the scope of reasonable alternatives.*

Based on CEQA Guidelines, “feasible” is defined as, “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors” (CEQA Guidelines Section 15364). CEQA does not require that an EIR determine the ultimate feasibility of a selected alternative, but rather that an alternative be potentially feasible.

For the screening analysis, the potential feasibility of potential alternatives was assessed using the following considerations:

Technological Feasibility: Is the alternative feasible from a technical perspective, considering available technology? Are there any construction, operation, or maintenance constraints that cannot be overcome?

Legal Feasibility: For example, do legal protections on lands or financing strategies preclude or substantially limit the feasibility of constructing the alternative?

Economic Feasibility: Is the alternative so costly that its costs would prohibit its implementation?

In determining what alternatives should be considered in the EIR, it is important to acknowledge the objectives of the project, the project’s significant effects, and unique project considerations. These factors are crucial to the development of alternatives that meet the criteria specified in Section 15126.6(a). Although, as noted above, an EIR must contain a discussion of “potentially feasible” alternatives, the ultimate determination whether an alternative is feasible or infeasible is made by the lead agency’s decision-making body (PRC Section 21081[a][3]).

5.3 METHODOLOGY AND SCREENING CRITERIA

A range of potential alternatives was developed and subjected to the screening criteria. Several representative alternatives were considered. There was no attempt to include every conceivable alternative. The following criteria were used to screen potential alternatives:

- Does the alternative meet most of the project objectives?
- Is the alternative potentially feasible?
- Would the alternative substantially reduce one or more of the significant impacts associated with the project?

5.4 ALTERNATIVES CONSIDERED AND REJECTED FROM FURTHER CONSIDERATION

As described above, state CEQA Guidelines Section 15126.6(c) provides that the range of potential alternatives for the project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects. Alternatives that fail to meet the fundamental project purpose need not be addressed in detail in an EIR. (*In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings (2008) 43 Cal.4th 1143, 1165-1167.)*

In determining what alternatives should be considered in the EIR, it is important to acknowledge the objectives of the project, the project's significant effects, and unique project considerations. These factors are crucial to the development of alternatives that meet the criteria specified in Section 15126.6(a). Although, as noted above, EIRs must contain a discussion of "potentially feasible" alternatives, the ultimate determination as to whether an alternative is feasible or infeasible is made by lead agency decision-makers. (See PRC, Section 21081[a][3]). At the time of action on the project, the decision-makers may consider evidence beyond that found in this EIR in addressing such determinations. The decision-makers, for example, may conclude that a particular alternative is infeasible (i.e., undesirable) from a policy standpoint, and may reject an alternative on that basis provided that the decision-makers adopt a finding, supported by substantial evidence, to that effect, and provided that such a finding reflects a reasonable balancing of the relevant economic, environmental, social, and other considerations supported by substantial evidence. (*City of Del Mar v. City of San Diego [1982] 133 Cal.App.3d 401, 417; California Native Plant Society v. City of Santa Cruz [2009] 177 Cal.App.4th 957, 998.)*

The EIR should also identify any alternatives that were considered by the lead agency but were rejected during the planning or scoping process and briefly explain the reasons underlying the lead agency's determination. The following alternatives were considered by the City but are not evaluated further in this Draft EIR for the reasons discussed below.

5.4.1 Mixed Use Alternative

Under the Mixed Use Alternative, the project site would be developed as a mixed-use community, integrating both commercial spaces and residential units. A portion of the residential units would be replaced with locally serving retail and commercial spaces designed to provide services to residents, and support local businesses. Under this Alternative, the overall residential density on the site would be reduced as the alternative footprint would be the same as the proposed project.

Increasing commercial density would likely result in greater impacts to transportation and noise relative to the proposed project as it could increase daily trips to the site from non-residents.

Furthermore, neighborhood concerns related to increase in the number of people in the area as a result of the proposed project and its resulting potential impacts to traffic and safety were received during the NOP Scoping Period for the proposed project. The addition of locally serving retail and commercial space to the area would further increase activity in the area and would not be fully responsive to the community concerns regarding the increase in use of the area, parking demand, traffic congestion, and safety. While the Alternative would provide residential units and meet the project objectives, the number of units would be reduced compared to the proposed project and therefore, the Alternative would meet the project objectives to a lesser degree than the proposed project. Furthermore, the project objectives do not include a commercial component. In addition, the project site's isolated location and limited surrounding residential and commercial base would constrain the ability of small-scale retail uses to operate viably, further reducing the practical feasibility of a mixed use program at this location. Therefore, the Mixed Use Alternative was determined to be infeasible and was rejected from further consideration.

5.5 ALTERNATIVES CONSIDERED

Section 15126 of CEQA Guidelines requires an EIR to identify and discuss a no project alternative, as well as a reasonable range of alternatives to the proposed project that would feasibly attain most of the basic objectives of the proposed project and would avoid or substantially lessen any of the significant environmental impacts.

Alternatives to the proposed project considered for analysis in this Draft EIR are:

- No Project No Development Alternative
- No Project Future Development Alternative

5.5.1 No Project No Development Alternative

The No Project No Development Alternative assumes that no additional development would occur on the project site. This alternative presents the traditional "no project" alternative required by Section 15126 of CEQA Guidelines. Under this alternative, the project site would remain developed with the existing R&D uses and structures. The project site's land use designation and zoning would default to the land use designation and zoning identified in the City's 2040 General Plan.

Impact Analysis

Air Quality

Under the No Project No Development Alternative, the existing uses would continue to operate on the project site, and there would be no change in air emissions. As discussed in Section 3.1, Air Quality, construction of the proposed project would result in emissions of regulated criteria pollutants and associated human health risks, primarily from particulate matter emissions from construction equipment exhaust, worker travel, and fugitive dust. However, with implementation of mitigation measures, no significant air quality impacts would occur during construction of the proposed project, including criteria pollutant emissions and health risks impacts. The No Project No Development Alternative would not involve construction or demolition activities. However, the No Project No Development Alternative would not develop housing near transit and would not construct more energy efficient structures and therefore, would not help to reduce future air quality emissions. Moreover, the operational emissions from the existing uses were calculated and determined to result in lower levels of ROG and particulate matter emissions but higher levels of NOx emissions than the proposed project. The existing land use would also be more likely to attract diesel vehicle trips from deliveries and exporting materials from the R&D facilities than a residential land use resulting in a higher potential health risk as compared to long-term project operation. Accordingly, impacts to air quality would be greater than the proposed project.

Cultural Resources

Under the No Project No Development Alternative, there would be no subsurface ground disturbance that could impact undiscovered cultural resources, and there would be no demolition. The No Project No Development Alternative would not have an impact on cultural resources. Accordingly, impacts to cultural resources would be less than the proposed project.

Energy

Under the No Project No Development Alternative, the existing R&D uses would continue to operate on the project site and there would be no change in energy usage at the site. However, the proposed project proposes the development of energy efficient homes that would have solar photovoltaic systems and EV charging installed and therefore, the No Project No Development Alternative would not help reduce future energy usage at the site. Accordingly, long-term impacts to energy usage may be greater than the proposed project.

Greenhouse Gas Emissions

Under the No Project No Development Alternative, the existing R&D uses would continue to operate on the project site, and there would be no change in GHG emissions. However, the No Project No Development Alternative would not construct more energy efficient structures and therefore, would not help to reduce future GHG emissions. As shown in Section 3.4, Greenhouse Gas Emissions, the existing R&D uses were modeled and found to result in higher GHG emissions than the proposed project. Accordingly, long-term impacts to GHG emissions may be greater than the proposed project.

Land Use and Planning

Under the No Project No Development Alternative, there would be no change to the existing land uses on the project site. However, the project site would default to the land use designation and zoning that was identified in the City's 2040 General Plan. Therefore, the existing R&D uses would be operating under non-conformance with the project site's land use and zoning designation on three of the four project site parcels. Additionally, the No Project No Development Alternative would not develop the site with residential uses as envisioned in the City's 6th Cycle Housing Element. Land use and planning impacts would be greater under the No Project Alternative.

Noise

Under the No Project No Development Alternative, the existing uses would continue to operate on the project site and there would be no change to the existing noise or vibration levels from construction or operation. While the proposed project would have some increase in noise and vibration during construction, the increases would be temporary and addressed through compliance with City requirements and standards. Operationally, the proposed project would shield the noise through building construction and mitigation by incorporating CalGreen building design requirements. Though the proposed project is not anticipated to significantly increase operational noise levels at the project site, development of the proposed project would result in increased people and traffic at the site compared to existing conditions. Therefore, noise impacts under the No Project No Development Alternative would be less compared to the proposed project.

Transportation

Under the No Project No Development Alternative, the existing uses would continue to operate on the project site. Under this Alternative, the pedestrian improvements required by Mitigation Measure TRANS-1 outlined in Section 3.7, Transportation, would not be necessary. However, under this Alternative, traffic conditions at the site and in the vicinity would not change from existing conditions and would not generate

any additional traffic or safety impacts. Under this Alternative, the VMT generated by the site does not change. As such, this Alternative would have no impact related to VMT. Therefore, impacts related to transportation would be less under the No Project No Development Alternative.

Tribal Cultural Resources

Under the No Project No Development Alternative, there would be no subsurface ground disturbance that could impact undiscovered tribal cultural resources. The No Project No Development Alternative would not have an impact on tribal cultural resources. Accordingly, impacts to tribal cultural resources would be less than the proposed project.

Utilities and Service Systems

Under the No Project No Development Alternative, there would be no construction of new utilities and service systems. Under the No Project No Development Alternative, the increased water and wastewater demand at the project site would not occur. The No Project No Development Alternative would have no effect on water and wastewater demand at the project site and the existing uses would continue to be adequately served by the existing utility infrastructure and system. Therefore, impacts related to utilities and service systems would be less than the proposed project under the No Project No Development Alternative.

Conclusion and Relationship to Project Objectives

The No Project No Development Alternative would result in greater impacts to air quality, energy, GHGs, and land use and planning. The No Project No Development Alternative would result in less impacts to cultural and tribal cultural resources, noise, transportation, and utilities and service systems. The No Project Alternative would not achieve any of the project objectives, assist the City in meetings its RHNA allocation and affordable housing needs, facilitate development of a diversity of housing types, or facilitate development of infill areas.

This Alternative would not meet any of the project objectives and therefore, would be infeasible.

5.5.2 No Project Future Development Alternative

Under the No Project Future Development Alternative, the proposed project would not be constructed. However, this alternative analyzes the potential impacts that could result if the project site was developed in accordance with the uses envisioned in the City's 6th Cycle Housing Element and 2040 General Plan. Under the recently adopted 6th Cycle Housing Element and 2040 General Plan, three of the project site parcels (APNs 412-29-015, 412-29-012, and 412-29-011) totaling 13.76 acres were redesignated as HD MU which has a density requirement of 34-45 units/acre; however, APN 412-29-010 was not redesignated and remained R&D. Therefore, under the No Project Future Development Alternative, the three parcels redesignated as HD MU would be redeveloped with residential uses and the remaining fourth parcel would remain R&D and the existing structure would remain on the site.

Under the No Project Future Development Alternative, the three redesignated parcels would be developed in accordance with the capacity assumptions utilized in the 6th Cycle Housing Element. The 6th Cycle Housing Element assumed the three sites would be developed at the low end of the required

density range of 34-45 units/acre and therefore, with a total acreage of 13.76 acres, the No Project Future Development Alternative would develop the three parcels with at least 467 total units.[19] As the No Project Future Development Alternative would require redevelopment of the three parcels, demolition of the existing structures on the three sites would be required. As the fourth parcel was not redesignated, the existing structure on the fourth parcel would remain and the existing R&D uses on the site would remain.

Impact Analysis

Air Quality

The No Project Future Development Alternative could result in an additional 177 housing units (61 percent increase) and a portion of the existing R&D facilities would remain. During construction, there would be less demolition associated with the removal of the existing R&D facilities, however building construction would increase to account for the additional uses. Once operational, the No Project Future Development Alternative would generate additional emissions from project vehicle trips, energy, and area uses. It can be assumed that 177 additional housing units would increase emissions by approximately 61 percent as the amount of operational emission increase compared to the proposed project would be comparable to the number of unit increase. As such, air quality impacts would be greater than the proposed project.

Cultural Resources

Under the No Project Future Development Alternative, there would be no subsurface ground disturbance that could impact undiscovered cultural resources, and there would be no demolition at this time. However, the site would be developed in the future in accordance with the capacity assumptions utilized in the 6th Cycle Housing Element and the No Project Future Development Alternative would require redevelopment of the three parcels and demolition of the existing structures on the three sites would be required. As the No Project Future Development Alternative would require demolition and subsurface construction activities, this alternative would be anticipated to result in the same level of impact as the proposed project and would require implementation of the same mitigation measures identified for the proposed project. Therefore, impacts on cultural resources would be equivalent to the proposed project.

Energy

The No Project Future Development Alternative could result in an additional 177 housing units (61 percent increase) and a portion of the existing R&D facilities would remain. The additional housing units would require additional electricity and petroleum fuel as compared to the proposed project. Therefore, the energy use would be greater than the proposed project.

Greenhouse Gas Emissions

Once operational, the No Project Future Development Alternative would generate additional emissions from project vehicle trips, energy, and area uses. It can be assumed that 177 additional housing units

[19] Under the 2040 General Plan, three parcels have an allowable density of 34 to 45 dwelling units per acre, which would allow for the construction of at least 467 units and up to 619 units, not including “bonus units” pursuant to State Density Bonus Law. For the purposes of this analysis, however, the lower end of the range was selected as the most likely alternative development scenario based on current economic challenges associated with constructing higher-density housing (see Terner Center for Housing Innovation at UC Berkeley, *The Hard Costs of Construction: Recent Trends in Labor and Materials Costs for Apartment Buildings in California* (March 2020).

would increase emissions by approximately 61 percent as the amount of operational emission increase compared to the proposed project would be comparable to the number of unit increase. A portion of the R&D facilities would continue to operate and continue to generate GHG emissions resulting in less offset from removed land uses. As this alternative would increase emissions at the site at a higher level compared to the proposed project, GHG impacts would be greater than the proposed project.

Land Use and Planning

The No Project Future Development Alternative could develop the project site with at least 467 housing units as was envisioned in the City's 6th Cycle Housing Element and consistent with the 2040 General Plan land use and zoning designation of the site. Under this alternative, it would be anticipated that 15 percent of the total units would be set aside as affordable housing to comply with the City's Inclusionary Housing Ordinance. Additionally, the remaining fourth parcel would continue to operate as it currently exists with R&D uses consistent with the 2040 General Plan land use and zoning designation of the site as was envisioned in the 2040 General Plan. The residential component of the No Project Future Development Alternative would be adequately buffered from the adjacent light industrial uses to the south by the R&D component and would not result in a conflict between the residential and light industrial uses. However, this alternative would still place residential uses in an area with light industrial uses and would be located within 1,000 feet of permitted stationary sources of emissions identified in Table 3.1-9 under Section 3.1, Air Quality. As such, this alternative would be anticipated to require similar measures to reduce potential air quality impacts such as requiring all proposed residential units to install MERV 13 filters or better. Though this alternative could still require measures to reduce potential impacts to the proposed development due to the proximity of light industrial uses, this alternative would develop the project site as was envisioned in the City's 6th Cycle Housing Element and consistent with the 2040 General Plan land use and zoning designation of the site. As such, impacts to land use and planning for the No Project Future Development Alternative would be less than compared to the proposed project.

Noise

The No Project Future Development Alternative could develop more residential units at the project site and would retain one of the existing R&D structures. During construction, the No Project Future Development Alternative would result in less demolition associated with the removal of the existing R&D facilities; however, building construction would increase to account for the additional units. However, the construction duration and equipment would be similar to the proposed project; therefore, construction noise and vibration levels would be similar to the proposed project. Operationally, the No Project Future Development Alternative would shield the noise through building construction and mitigation by incorporating CalGreen building design requirements similar to the proposed project. Though the No Project Future Development Alternative would not be anticipated to significantly increase operational noise levels at the project site to the extent that it would result in a change in the level of significance determination provided in Section 3.6, Noise, of this Draft EIR, development of the No Project Future Development Alternative would result in a larger increase in the number of people and traffic at the site compared to the proposed project as it would provide 177 more units than the proposed project and therefore, would generate more noise than the proposed project. Therefore, noise impacts under the No Project Future Development Alternative would be greater compared to the proposed project.

Transportation

The No Project Future Development Alternative could demolish the existing structures on the three of the project site parcels and would develop at least 467 housing units, the fourth parcel existing structure would remain and continue to be R&D use. With the addition of 177 new residential units, this Alternative would be anticipated to require similar pedestrian improvements as the proposed project, which is required by Mitigation Measure TRANS-1, to reduce potential safety related impacts.

The Alternative would be presumed to have a less than significant VMT impact based on meeting the screening criteria described in Section 3.7, Transportation, and described as follows:

- *Transit Screening - All land-use projects located within 0.5-mile of a light-rail station shall be presumed to have a less than significant transportation impact on VMT presuming these projects are consistent with the General Plan.*

Therefore, as this Alternative would be consistent with the General Plan, it meets the City's Transit Screening criteria and is presumed to have a less than significant VMT impact. Therefore, as this Alternative would have a less than significant impact related to VMT, transportation impacts under the No Project Future Development Alternative would equivalent to the proposed project.

Tribal Cultural Resources

Under the No Project Future Development Alternative, the project site would be developed in the future in accordance with the capacity assumptions utilized in the 6th Cycle Housing Element and the No Project Future Development Alternative would require redevelopment of the three parcels. As the No Project Future Development Alternative would require subsurface construction activities, this alternative would be anticipated to result in the same level of impact as the proposed project and would require implementation of the same mitigation measures and AB 130 tribal consultation process identified for the proposed project. Therefore, impacts on tribal cultural resources would be equivalent to the proposed project.

Utilities and Service Systems

The No Project Future Development Alternative would result in an increase in water demand and wastewater generation at the site. As identified in Section 3.9, Utilities and Service Systems, the City's 2022 General Plan EIR identified an average household size of 2.49 persons per household and the 2020 UWMP identified a projected daily per capita water use of 75 gpcd for new residential developments. Utilizing this data, the No Project Future Development Alternative's 467 residential units would result in a population growth of 1,163 residents and a resulting water demand of 87,225 gpd. The proposed project is anticipated to result in a water demand of 54,150 gpd and therefore, the No Project Future Development Alternative would result in a greater increase in water demand over the proposed project. Additionally, the existing demand from the R&D use on the fourth project site parcel not identified for residential uses would continue to exist. However, this increase in water demand would not be substantial and the No Project Future Development Alternative's water demand of 87,225 gpd (31.8 mgy) would represent approximately 0.07 percent of SJWC's total water demand for 2045, compared to the proposed project 0.04 percent. Additionally, the No Project Future Development Alternative's residential development would be required to include design features to reduce water use, similar to the proposed

project and there would be sufficient water supplies available to serve future development under the No Project Future Development Alternative.

Additionally, wastewater generation would increase under the No Project Future Development Alternative as this alternative would result in more residential units and residents compared to the proposed project resulting in an increased use of wastewater generating uses. However, as identified in Section 3.9, Utilities and Service Systems, the San Jose-Santa Clara RWF has over 70 mgd of remaining capacity to treat wastewater and WVSD has capacity remaining in its treatment allocation. As such, there is sufficient capacity remaining within WVSD's treatment capacity allocation and treatment capacity at the San Jose-Santa Clara RWF to treat wastewater generated at the site under the No Project Future Development Alternative. Though the No Project Future Development Alternative would result in greater water demand and wastewater generation compared to the proposed project, the water supplier and wastewater treatment plant would have sufficient capacity to serve the future development. Therefore, the impacts to utilities and service systems under the No Project Future Development Alternative would be equivalent to the proposed project.

Conclusion and Relationship to Project Objectives

The No Project Future Development Alternative would have greater impacts than the proposed project to air quality, energy, GHG, and noise. Land use would have less impacts while transportation, utilities and service systems, and cultural and tribal cultural resources would have an equivalent impact as the proposed project. However, the No Project Future Development Alternative would not meet the project's objectives listed below:

- Maximize development of medium-density housing in the City of Campbell while assisting the City in achieving its share of low-income and above-moderate-income housing under the 2023-2031 Regional Housing Needs Allocation.
- Facilitate development of a diversity of housing types and availability of housing units for a diversity of income levels, including market rate units and affordable units.

The No Project Future Development Alternative would provide high-density housing and would not meet the medium-density housing objective of the proposed project. This alternative would not provide a variety of housing types as specified in the project objectives as it would be assumed the development would be 100 percent multi-family units to accommodate the increased density. Additionally, retaining one of the existing R&D buildings onsite under this alternative may not be economically feasible due to declining occupancy at the existing site and high operating costs. This Alternative would only feasibly meet one out of the three project objectives and therefore, would not be preferable.

5.6 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

CEQA Guidelines Section 15126.6(e)(2) requires an EIR to identify an "environmentally superior alternative." The qualitative environmental effects of each alternative in relation to the proposed project are summarized in Table 5.6-1. To quantitatively identify an environmentally superior alternative a value has been applied to each environmental effect. Additionally, Table 5.6-2 provides a comparison of the alternatives with the project objectives. Accordingly, the alternative with the fewest amounts of impacts and the ability to achieve the most project objectives is the environmentally superior alternative.

Table 5.6-1: Project Alternative Impact Comparison

Environmental Resource Topic	Proposed Project	No Project No Development Alternative	No Project Future Development Alternative
Air Quality	Less Than Significant with Mitigation	Greater Impact than the proposed project	Greater Impact than the proposed project
Cultural Resources	Less Than Significant with Mitigation	Less Impact than the proposed project	Equivalent Impact to the proposed project
Energy	Less Than Significant Impact	Greater Impact than the proposed project	Greater Impact than the proposed project
Greenhouse Gases	Less Than Significant Impact	Greater Impact than the proposed project	Greater Impact than the proposed project
Land Use and Planning	Less Than Significant Impact with Mitigation	Greater Impact than the proposed project	Less Impact than the proposed project
Noise	Less Than Significant Impact	Less Impact than the proposed project	Greater Impact than the proposed project
Transportation	Less Than Significant Impact with Mitigation	Less Impact than the proposed project	Equivalent Impact to the proposed project
Tribal Cultural Resources	Less Than Significant with Mitigation	Less Impact than the proposed project	Equivalent Impact to the proposed project
Utilities and Service Systems	Less Than Significant Impact	Less Impact to the proposed project	Equivalent Impact to the proposed project

Table 5.6-2: Project Alternatives Comparison to Project Objectives

Project Objective	Proposed Project	No Project No Development Alternative	No Project Future Development Alternative
Maximize development of medium-density housing in the City of Campbell while assisting the City in achieving its share of low-income and above-moderate-income housing under the 2023-2031 Regional Housing Needs Allocation.	X		
Facilitate development of a diversity of housing types and available of housing units for a diversity of income levels, including market rate units and affordable units.	X		
Facilitate development of infill areas that have been previously paves and developed to promote preservation of existing open spaces within the City and location of residential uses proximate to public transit.	X		X

As shown above, the proposed project would be the environmentally superior alternative because it would meet all of the project objectives and would result in the least amount of impacts compared to the No Project No Development Alternative and the No Project Future Development Alternative. The proposed project would not result in any significant and unavoidable impact, and would meet all of the project objectives, would help the City in contributing to the City's RHNA requirements, and would provide market rate and affordable units while facilitating infill development.

As previously outlined in this Draft EIR, the Applicant submitted SB 330 (Housing Crisis Act) pre-application on April 18, 2023. At the time the pre-application was submitted, the City had not yet adopted the updated 6th Cycle Housing Element and 2040 General Plan, meaning the City was subject to the "Builder's Remedy" provision of the California Housing Accountability Act (ABAG 2022). The Applicant's submission of a pre-application under the Housing Crisis Act therefore conferred upon the Applicant's vested right to proceed under the standards in effect at the time of pre-application submittal and to apply the protections of the Builder's Remedy through its entitlement process. State law provides in these circumstances that a city may not deny the project based on inconsistency with these General Plan land use regulations. The legal constraints of the Builder's Remedy and the Housing Crisis Act prevents the lead agency of a proposed project from selecting alternatives that would substantially reduce the housing capacity or alter the proposed project's density.

For the reasons identified above, the proposed project would be the environmentally superior alternative.

6.0 OTHER CEQA CONSIDERATIONS

This section describes the other statutorily required topics including growth inducing impacts, significant and unavoidable impacts, significant irreversible environmental changes, and mandatory findings of significance.

6.1 GROWTH-INDUCING IMPACTS

Section 15126.2(d) of the CEQA Guidelines requires that an EIR evaluate the growth-inducing impacts of a proposed action:

> *Discuss the way in which a proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects that would remove obstacles to population growth (a major expansion of a wastewater treatment plant might, for example, allow for more construction in service areas). Increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. Also discuss the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment.*

The state CEQA Guidelines do not distinguish between planned and unplanned growth for purposes of considering whether a project would foster additional growth. Therefore, for purposes of this EIR, to reach the conclusion that a project is growth-inducing as defined by CEQA, the EIR must find that it would foster (i.e., promote, encourage, or allow) additional growth in economic activity, population, or housing, regardless of whether the growth is already approved by and consistent with local plans. The conclusion does not determine that induced growth is beneficial or detrimental, consistent with Section 15126.2(d) of the state CEQA Guidelines. If the analysis conducted for the EIR results in a determination that a project is growth-inducing, the next question is whether that growth may cause adverse effects on the environment. Environmental effects resulting from induced growth (i.e., growth-induced effects) fit the CEQA definition of “indirect” effects in Section 15358(a)(2) of the state CEQA Guidelines. These indirect or secondary effects of growth may result in significant environmental impacts. CEQA does not require that the EIR speculate unduly about the precise location and site-specific characteristics of significant, indirect effects caused by induced growth, but a good-faith effort is required to disclose what is feasible to assess. Growth-inducing impacts can occur when development of a project imposes new burdens on a community by directly inducing population growth, or by leading to the construction of additional development in the project area.

Also included in this category are projects that would remove physical obstacles to population growth, such as the construction of a new roadway into an undeveloped area or a wastewater treatment plant with excess capacity to serve additional new development. Construction of these types of infrastructure projects cannot be considered isolated from the immediate development that they facilitate and serve. Projects that physically remove obstacles to growth or projects that indirectly induce growth are those that may provide a catalyst for future unrelated development in the area (such as a new residential community that requires additional commercial uses to support residents). The growth-inducing potential of a project

could also be considered significant if it fosters growth in excess of what is assumed in the local master plans and land use plans, or in projections made by regional planning agencies.

6.1.1 Population Growth

The decision to allow/approve projects that result from induced growth (e.g., new commercial areas, new housing) is the subject of separate discretionary processes by individual lead agency (or agencies) responsible for considering such projects, in this case, the City Planning Commission or, on appeal, the City Council. Projects resulting from induced growth would themselves be discretionary and subject to CEQA. Therefore, the following discussion is intended to disclose the potential for environmental effects that could occur more generally because of the project rather than the site-specific impacts of induced growth. Its purpose is to inform the City decision-making body that additional environmental effects may be a possibility if growth-inducing projects are approved. However, the decision of whether projects are approved, and the impacts associated with them still rests with the City decision-making body at such times as complete applications for development are submitted.

The project site is currently occupied by an R&D campus and is not currently occupied by any existing residents. The proposed project would include the construction of single-family and multi-family developments with a total of 290 units that would increase the population at the project site. The City's 2022 General Plan EIR identifies an average household size of 2.49 persons per household (City of Campbell 2022). Assuming there are 2.49 people per unit, the proposed project is estimated to generate approximately 722 people at the project site. The City's 2022 General Plan EIR identified that the existing population of the City is 42,726 residents and is anticipated to grow to 64,929 residents by the year 2040 (City of Campbell 2022). The proposed project's 722 new residents would represent approximately 3.3 percent of the anticipated population growth between the existing population and projected population by 2040. Therefore, the increase in residents resulting from the proposed project would be within the projected population growth for the City and would not result in substantial unplanned population growth. The proposed project would also contribute to the City's RHNA by providing 290 total units with 53 of those units being reserved for affordable housing. While the proposed project would increase the City's population and affordable housing supply, the proposed project would not exceed the City's planned growth as identified in the 2040 General Plan.

6.1.2 Removal of Barrier to Growth

The proposed project involves the construction of a residential development on an urban infill site. The project site is located on a site that has been identified for future housing in the City's 6th Cycle Housing Element. As the proposed project would also involve the development of an urban infill site, the proposed project would not induce sprawl or dispersed land use development. As discussed in Section 3.5, Land Use and Planning, the proposed project would be consistent with the City's 6th Cycle Housing Element by developing the site with residential uses and the proposed project would promote the City's housing development goals by providing affordable housing.

Additionally, the proposed project would be served by existing water, sewer, and stormwater infrastructure and roadways. The proposed project would not include extension of utility infrastructure or roadways into areas that are not already highly developed with existing uses and would not result in indirect growth inducing impacts. The proposed project would require construction of new utility lines

throughout the site; however, they would connect to existing systems located along adjacent roadways. The proposed utility improvements would not be intended to serve development on lands other than the project site. Therefore, the proposed project would not result in the extension of urban infrastructure to an area that is currently not serviced. The proposed project would not result in significant indirect growth-inducing impacts.

6.2 SIGNIFICANT AND UNAVOIDABLE IMPACTS

CEQA Guidelines Section 15126(b) requires an EIR to "describe any significant impacts, including those which can be mitigated but not reduced to a level of insignificance. Where there are impacts that cannot be alleviated without imposing an alternative design, their implications and the reasons why the project is being proposed, notwithstanding their effect, should be described."

Section 3.0, Environmental Impact Analysis, provides a description of the potential environmental impacts of the proposed project and recommends mitigation measures to reduce impacts to a less than significant level, where possible. Section 4.0, Cumulative Effects, determines whether the incremental effects of this project are significant when viewed in connection with the effects of past projects, other current projects, and probable future projects.

6.3 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

As mandated by the CEQA Guidelines, the EIR must address any significant irreversible environmental change that would result from implementation of the proposed project. Specifically, pursuant to the CEQA Guidelines (Section 15126.2[c]), such an impact would occur if:

- The project would involve a large commitment of nonrenewable resources;
- Land area committed to new project facilities;
- Irreversible damage can result from environmental accidents associated with the project; and
- The proposed consumption of resources is not justified (e.g., the project results in the wasteful use of energy).

The proposed project involves the construction of single-family and multi-family development on an approximately 17.28 acre site that is currently developed with four structures that total approximately 280,864 square feet for R&D uses. The proposed project would demolish the existing structures to construct 290 residential units. The proposed project would not be consistent with the General Plan land use designation of the site and development of the site with residential uses would represent a considerable land use change.

As discussed in Section 3.3, Energy, during construction of the proposed project, energy resources would be consumed in the form of diesel and gasoline fuel from the use of off-road equipment (i.e., tractors, excavators, cranes) and on-road vehicles (i.e., construction employee commutes, haul trucks). Construction is not anticipated to require electricity. Overall, construction activities associated with the proposed project would result in the consumption of petroleum-based fuels. However, there are no unusual project characteristics that would necessitate the use of construction equipment or vehicles that

would be less energy efficient than at comparable construction sites in other parts of the state. Therefore, it is expected that construction fuel consumption associated with the proposed project would not be any more inefficient, wasteful, or unnecessary than at other construction sites in the region.

The proposed residences would require energy for normal operations, such as lighting and temperature controls. It is noted that the proposed project would be constructed in compliance with the energy efficiency standards set forth in the California Building Standards Code in effect at the time that building permits are issued. Additionally, the proposed project would involve redevelop of the site with newer buildings, which will inherently be more energy efficient than the older buildings that are currently onsite due to updated technologies and regulations. Therefore, the proposed project's total energy consumption would not result in the inefficient, wasteful, or unnecessary use of energy.

The proposed project would not result in irreversible damage from environmental accidents, such as an accidental spill of a hazardous material. As further discussed in Section 3.9, Hazards and Hazardous Materials, in the Initial Study (Appendix A), the proposed project would involve demolition and construction activities that could result in accidental release of hazardous materials into the environment. As part of the NPDES Construction General Permit, the proposed project would be required to prepare and implement a SWPPP that would include BMPs to prevent accidental spills of hazardous materials during construction. The proposed project would comply with all applicable federal, state, and local laws related to the transport, use, or disposal of hazardous materials, as overseen by the California Environmental Protection Agency and Department of Toxic Substances Control.

During operation of the proposed project, the use of hazardous materials would be limited to those commonly found at residential uses such as solvents, cleaners, paints, and pesticides for landscape maintenance activities. These common household hazardous materials would be used in limited quantities and would not create a substantial hazard to the public or the environment. As such, the proposed project would not have the potential to cause serious environmental accidents.

6.4 MANDATORY FINDINGS OF SIGNIFICANCE

PRC Section 21083 requires lead agencies to make a finding of a "significant effect on the environment" if one or more of the following conditions exist:

1. A proposed project has the potential to degrade the quality of environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife species to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare, or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory.

2. The possible effects of a project are individually limited but cumulatively considerable.

3. The environmental effects of a project will cause substantial adverse effects on human beings, either directly or indirectly.

Finding No. 1: The proposed project would not have the potential to significantly affect biological resources or cultural resources.

The proposed project would not substantially degrade the quality of the environment; substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; reduce the number or restrict the range of an endangered, rare, or threatened species; or eliminate important examples of the major periods of California history or prehistory. As discussed in Section 3.4, Biological Resources, in the Initial Study (Appendix A), the project site is currently developed with urban uses, is surrounded by development on all sides, and there are no special-status plant species that have the potential to occur within the project site. However, the portions of the project site not occupied by buildings, pavement, or lawns has the potential to provide extremely marginal habitat for Northern California legless lizards and the existing trees within the project site represent marginally suitable nesting habitat for Swainson's hawk and other more common migratory birds protected by the Migratory Bird Treaty Act. Additionally, these trees may also represent marginally suitable roosting habitat for pallid bat, hoary bat, and other more common foliage and cavity roosting bats. As required by Initial Study Mitigation Measures BIO-1 through BIO-3, the proposed project would conduct surveys for Northern California Legless Lizards, nesting birds, and roosting bats prior to the start of construction activities. Implementation of these mitigation measures were determined to reduce potential impacts. Therefore, impacts on special-status species would be less than significant. Furthermore, given the urban infill character of the project site, its location adjacent to a highway, and its marginally suitable habitat, redevelopment of the site would not qualify as a considerable contribution to any cumulative impact. Second, with respect to cumulative impacts and consistent with the City's 2022 General Plan EIR, Citywide development would not make for a significant cumulative impact to which any single project could contribute in any considerable manner.

As discussed in Section 3.2, Cultural Resources, and Section 3.8, Tribal Cultural Resources, of the Draft EIR, the proposed project would be required to implement Mitigation Measures CUL-1, CUL-2, and CUL-3 to reduce impacts on cultural and tribal cultural resources to a less than significant level.

Finding No. 2: The proposed project would have cumulatively considerable impacts.

As discussed in Section 4.0, Cumulative Effects, of this EIR, the proposed project, in conjunction with related projects, would not have a cumulatively considerable impacts on any resource topics analyzed in this EIR. Cumulative impacts resulting from resource topics analyzed in this EIR would be less than significant or the proposed project would result in a less than cumulatively considerable contribution to cumulative impacts.

Finding No. 3: The proposed project would not cause substantial adverse effects on human beings.

The proposed project would not directly or indirectly cause substantial adverse effects on human beings. As identified in Tables ES-1 and ES-2, impacts related to air quality, geology and soils, hazards and hazardous materials, hydrology and water quality, and noise would be reduced to a less than significant level with the implementation of applicable regulations and mitigation.

7.0 EFFECTS FOUND NOT TO BE SIGNIFICANT

Pursuant to CEQA and the CEQA Guidelines, the discussion of the potential effects on the physical environment is focused on those impacts that may be significant or potentially significant. CEQA allows a lead agency to limit the details of discussion of the environmental effects that are not considered potentially significant (CEQA Guidelines Section 15126.2[a] and 15128). CEQA requires that the discussion of any significant effects on the environment be limited to substantial or potentially substantial adverse changes in physical conditions that exist within the affected area, as defined in PRC Section 21060.5 (Statutory definition of "environment").

Effects determined to be insignificant or unlikely to occur need not be discussed further in the Draft EIR unless the lead agency subsequently receives information inconsistent with the finding (CEQA Guidelines Section 15143).

The NOP was circulated for public review between January 6, 2025 and February 14, 2025 and is contained in Appendix A of this Draft EIR. The Public Scoping Meeting on the Draft EIR for the proposed project was held on January 28, 2025. During the Public Scoping Meeting and through the comment letters received during the scooping period, potential impacts resulting from adjacent and nearby existing industrial uses was raised by community members. Additionally, potential impacts related to pedestrian and roadway safety, and emergency access was raised by community members. Therefore, the following potential impacts have been determined to require further analysis in this Draft EIR:

- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?
- Result in substantial increase in hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
- Result in inadequate emergency access?

For the remainder of the NOP, it was determined that implementation of the proposed project would result in no impact or less than significant environmental impacts with or without mitigation related to the resource topics listed below. Analyses supporting the conclusions for these resource topics is included in Appendix A as part of the NOP. The following resources are not discussed at further length in this Draft EIR.

Aesthetics

The project site constitutes a residential project that is located in an infill site and within one-half mile of a major transit stop and therefore, this EIR is not obligated to evaluate aesthetic impacts under PRC Section 21099(d).

Scenic Vistas

There are no officially designated scenic vistas within the City and significant visual resources and visual features are not visible from the project site. Existing developments in the project area obscure any

available views of ridgelines and mountain ranges that may be present for viewing at the site if the area was undeveloped. There are no scenic vistas in the project vicinity and due to the distance from any scenic resources and the nature of development in the project area, the proposed project's construction and operation would not have a substantial effect on a scenic vista. Therefore, the proposed project would have no impact on scenic vistas.

Scenic Resources within a State Scenic Highway

There are no state designated or eligible scenic highways located along or near the project site. Therefore, the proposed project would not substantially damage scenic resources within a state scenic highway and there would be no impact.

Visual Character and Scenic Quality

The proposed project would be required to comply with zoning and other regulations governing scenic quality within the City including the City's Single-Family Homes Design Guidelines and Low-Medium Density Residential Design Guidelines which would be applicable to the proposed project. The proposed project would be required to comply with these design standards, where objective, to ensure that there would be no potential impacts related to regulations governing scenic quality.

Additional zoning regulations that govern scenic quality include development standards described in the City's Zoning Code. As the proposed project submitted an SB 330 pre-application prior to adoption of the City's 6th Cycle Housing Element and 2040 General Plan, the City is subject to the "Builder's Remedy" provision of the California Housing Accountability Act. Therefore, the proposed project is able to apply the provisions of the Builder's Remedy through its entitlement process and state law provides that the City may not deny the proposed project based on consistency with the zoning district that existed on April 18, 2023, or the City's current zoning districts. As the proposed project is not required to be consistent with the zoning designation of the site, the proposed project's non-compliance with the development standards of the project site's zoning designation would not be allowed to be utilized as a basis for project denial by the City. However, implementation of applicable design standards described above would reduce potential conflicts with applicable regulations governing scenic quality. Design standards protect scenic quality by using zoning, building codes, and aesthetic guidelines to control a development's visual impact, ensuring new structures and activities blend with natural landscapes through rules on height, materials, colors, and placement, preserving views, and minimizing incompatible uses. Therefore, the proposed project would not result in significant conflicts with applicable zoning and regulations governing scenic quality and impacts would be less than significant.

Light and Glare

The project site and surrounding areas is currently developed and contain multiple sources of lighting and glare that are typical to developed areas. Due to the developed nature of the project site and surrounding area with similar uses, the proposed project is not anticipated to result in substantial new sources of light and glare. The proposed project proposes the use of cutoff or full cutoff lighting for illuminating outdoor spaces to control and limit light pollution and light trespass. The proposed project's lighting would be designed and constructed to comply with Campbell Municipal Code Section 21.18.090, Lighting Design Standards, which includes design standards for exterior and permanent lighting, shielding requirements, and other design criteria. Additionally, the proposed project's lighting would be designed and constructed

to comply with Campbell Municipal Code Section 21.160.060, Outdoor Light and Glare, which requires shielding or modification of reflective materials to prevent emission of light and glare beyond the property line. Compliance with the City's lighting and glare design standards would ensure the proposed project would not result in light and glare impacts to nearby developments. Therefore, the proposed project is not anticipated to create substantial new sources of light or glare, and impacts would be less than significant.

Agricultural and Forestry Resources

Conversion of Farmland

There are no areas within the City that are designated for agricultural use and there are no agricultural lands identified by the California Department of Conservation's Farmland Mapping and Monitoring Program within the City (City of Campbell 2001, DOC 2024). The California Department of Conservation's Farmland Mapping and Monitoring Program classifies the project site and the surrounding areas as Urban and Built-Up land (DOC 2024). Therefore, development of the proposed project would not result in the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses and there would be no impact.

Agricultural Zoning

Under the current 2040 General Plan, the project site is zoned P-D and HD MU. Additionally, prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan, the project site parcels were zoned P-D. The zoning designations do not allow for agricultural uses and the project site is not under a Williamson Act contract. Therefore, the proposed project would not conflict with existing zoning for agricultural use or with a Williamson Act contact, and there would be no impact.

Forest Land and Timberland Zoning

The City does not contain any forest land and there are no lands zoned for forest land or timberland uses in the City (City of Campbell 2001). Therefore, the proposed project would not conflict with existing zoning for, or cause rezoning of forest land or timberland. There would be no impact.

Loss or Conversion of Forest Land

There are no forest lands in the City and development of the proposed project would not result in the loss of forest land or convert forest land to non-forest uses. There would be no impact.

Change to Existing Environment

The project site and surrounding areas are not used for agricultural or forest land uses. Construction and operation of the proposed project would not involve changes in the existing environment which would result in the conversion of Farmland to non-agricultural uses or conversion of forest land to non-forest uses. Therefore, there would be no impact.

Biological Resources

Candidate, Sensitive, or Special-Status Species

As identified in the Initial Study (Appendix A), Madrone Ecological Consulting prepared a Biological Resources Analysis Memo for the proposed project in November 2024 which identified that as the project

site is currently developed with urban uses and is surrounded by development on all sides, there are no special-status plant species that have the potential to occur within the project site.

However, the portions of the project site not occupied by buildings, pavement, or lawns has the potential to provide extremely marginal habitat for Northern California legless lizards and the existing trees within the project site represent marginally suitable nesting habitat for Swainson's hawk and other more common migratory birds protected by the Migratory Bird Treaty Act. Additionally, these trees may also represent marginally suitable roosting habitat for pallid bat, hoary bat, and other more common foliage and cavity roosting bats. Therefore, the proposed project would be required to implement Mitigation Measures BIO-1 through BIO-3 which require pre-construction surveys for Northern California legless lizards, nesting birds, and roosting bats and outlines procedures to be followed if a species is identified to be onsite during the pre-construction survey. With implementation of Mitigation Measures BIO-1 through BIO-3, potential impacts to special-status and protected wildlife species would be reduced and impacts would be less than significant.

Riparian Habitat or Natural Community

The project site is located in a highly urbanized area and there are no riparian habitats or any other sensitive natural community within or in the vicinity of the project site. Therefore, the proposed project would not have a substantial adverse effect on any riparian habitat or any other sensitive natural community and there would be no impact.

Protected Wetlands

The project site does not contain any state or federally protected wetlands as the site is almost completely paved and developed with existing uses. Therefore, the proposed project would not have a substantial adverse effect on state or federally protected wetlands and there would be no impact.

Wildlife Movement

Extensive development and roadways surround the project site which minimizes the opportunity for wildlife to move freely across the site. In addition, the project site does not represent a corridor that links areas of open space lands. As such, the project site is not considered to support wildlife movement or native wildlife nursery sites, and there would be no impact from construction and operation of the proposed project.

Local Policies or Ordinances

The proposed project would include the removal of approximately 116 existing trees out of which 74 trees are considered Protected Trees as defined by the City's Tree Protection Ordinance. The proposed project would be required to implement Mitigation Measure BIO-4 which implements the City's Tree Protection Ordinance. The proposed project would be required to comply with City's Municipal Code Chapter 21.32, Tree Protection Regulations, which implements the City's Tree Protection Ordinance and outlines the City's tree protection requirements. The proposed project would comply with City requirements and would provide replacement trees at the ratio required by the City for removal of Protected Trees or would provide mitigation fees if required by the City. Implementation of Mitigation Measure BIO-4 and compliance with the City's tree protection requirements would ensure the proposed project does not

conflict with any local policies or ordinances protecting biological resources and the impacts would be less than significant.

Habitat Conservation Plan

The City is under jurisdiction of the Santa Clara Valley Habitat Plan; however, the plan only includes the Los Gatos Creek Trail and the Los Gatos Creek in the City and the remaining area of the City is excluded from the habitat plan permit area. The project site is not located within the Los Gatos Creek or Trail area. As the proposed project would not result in impacts to biological resources as identified above, the proposed project would not conflict with the provisions of the Santa Clara Valley Habitat Plan. Therefore, construction and operation of the proposed project would have no impact on or conflict with a habitat conservation plan.

Geology and Soils

Seismic Hazard

The project site is not located within an Alquist-Priolo Fault Zone and no major active faults run through the project site. Therefore, potential impacts from fault rupture of an earthquake fault are low and impacts would be less than significant. The topography of the project site is relatively flat and is not located in an area classified as being in a landslide area. Therefore, there would be no impact related to seismically induced landslides.

The potential for strong seismic ground shaking at the project site is high due to the City being located within a seismically active region. Additionally, the project site is identified by the City as having high liquefaction potential and moderate shrink-swell potential (City of Campbell 2022). As outlined in the City's 2001 General Plan Strategy HS-3.2a, new developments proposed within the City are required to comply with the provisions of the CBC regarding preparation of geotechnical investigations in accordance with state law, engineer improvements to address potential seismic and ground failure issues, and use earthquake resistant construction techniques to address potential earthquake loads when constructing buildings and improvements. The City requires the submission and review of geologic and soils reports for all development consistent with City Municipal Code Section 21.18.130, Seismic and Geologic Hazards, and Chapter 20.72, Soils Reports. Additionally, the City's 2001 General Plan Strategy HS-3.1a requires all new construction to be built in accordance with the most recent Building and Fire Codes.

A Preliminary Geotechnical Exploration Report (Geotech report) was prepared for the proposed project by ENGEO Incorporated in October 2023. The Geotech report includes preliminary recommendations for initial land planning; however, as noted in the Geotech report, the recommendations provided are preliminary in nature and final recommendations regarding site grading and foundation construction would be provided after future site-specific, design-level geotechnical exploration has been undertaken. Therefore, the proposed project would be required to prepare a site-specific, design-level geotechnical exploration and would be required to implement the recommendations included in the report, as required by Mitigation Measure GEO-1. With implementation of Mitigation Measure GEO-1 and compliance with CBC design guidelines and City requirements and standards, the proposed project would not result in substantial adverse effects involving strong seismic ground shaking or seismic related ground failure and impacts would be less than significant.

Erosion

Construction activities associated with the proposed project would involve demolition, grading, and excavation activities which would expose soils to sources of wind or water, resulting in the potential for erosion and sedimentation on and off the project site. The proposed project would be required to comply with the NPDES General Construction Permit and would be required to prepare and implement a SWPPP which would implement standard construction BMPs to minimize erosion and loss of topsoil. Additionally, as outlined in the City's Grading and Site Improvements Building Application Guide, an erosion control plan is required to be prepared and submitted as part of the grading and site improvements permit application and the City's 2001 General Plan Strategy OSP-9.1d requires new construction to utilize site preparation, grading, and foundation designs that provide erosion control to prevent sedimentation. Therefore, the proposed project would be required to prepare and submit to the City an erosion control plan that outlines the erosion control measures to be implemented during construction. With the implementation of BMPs and a SWPPP under the NPDES Permit, preparation of an erosion control plan, and utilization of designs that provide erosion control during construction, the proposed project would not result in substantial soil erosion or loss of topsoil and impacts would be less than significant.

Unstable Geologic Unit or Soil

The project site is not located within an area with potential for landslides and the Geotech report prepared for the proposed project identified that the risk of liquefaction at the site is low. However, the project site is identified by the City as having high liquefaction potential and moderate shrink-swell potential (City of Campbell 2022). Therefore, there is a potential that the proposed project would be located on unstable soils. As required by Mitigation Measure GEO-1, the proposed project would be required to prepare a site-specific, design-level geotechnical exploration and would be required to implement the recommendations included in the report. As required by City Municipal Code Section 21.18.130, Seismic and geologic hazards, and Chapter 20.72, Soils Reports, all geologic and soils reports prepared for the proposed project would be submitted to the City for review. Additionally, the proposed project would be required to be constructed in accordance with the provisions of the most recent CBC and Fire Codes as required by the City's 2001 General Plan Strategy HS-3.1a and HS-3.2a. With implementation of Mitigation Measure GEO-1 and compliance with CBC design guidelines and City requirements and standards, the proposed project would not result in substantial adverse effects involving unstable soils and impacts would be less than significant.

Expansive Soil

The Geotech report prepared for the proposed project identified that based on experience in the site vicinity, the near-surface soils are anticipated to have low to moderate expansive potential. Therefore, the proposed project could be located on expansive soil. As required by Mitigation Measure GEO-1, the proposed project would be required to prepare a site-specific, design-level geotechnical exploration and would be required to implement the recommendations included in the report. As required by City Municipal Code Section 21.18.130, Seismic and Geologic Hazards, and Chapter 20.72, Soils Reports, all geologic and soils reports prepared for the proposed project would be submitted to the City for review. Additionally, the proposed project would be required to be constructed in accordance with the provisions of the most recent CBC and Fire Codes as required by the City's 2001 General Plan Strategy HS-3.1a and HS-3.2a. With implementation of Mitigation Measure GEO-1 and compliance with CBC design

guidelines and City requirements and standards, the proposed project would not result in substantial adverse effects involving expansive soils and impacts would be less than significant.

Septic Tanks

The proposed project would connect to and be served by WVSD's existing sanitary sewer system that serves the City and would not require the installation and use of a septic tank or other alternative wastewater disposal systems. Therefore, no impact would occur.

Paleontological Resource or Geologic Feature

As identified in the City's 2001 General Plan EIR, there have been no significant paleontological resources recorded within the City and it is unlikely that undiscovered paleontological resources would be present at the site due to previous ground disturbing activities that have occurred within the project site. If undiscovered paleontological resources are encountered during construction activities, the proposed project would be required to comply with the City's 2001 General Plan Strategy CNR-1.1b which requires the discontinuation of all work in the immediate vicinity and the preparation of a resources mitigation plan and monitoring program by a licensed archaeologist if resources are found on any sites within the City. As it is unlikely that the proposed project would result in impacts to undiscovered resources and the proposed project would comply with General Plan policies and strategies if such resources were discovered during construction activities, the proposed project would not have the potential to destroy a unique paleontological resource onsite or unique geological feature and impacts would be less than significant.

Hazards and Hazardous Materials

Routine Transport, Use, or Disposal of Hazardous Materials

During the construction phase, limited amounts of hazardous materials would be used, including standard construction materials such as concrete, paints, solvents and heavy construction equipment which would contain diesel fuels and oils. The project's construction would be required to adhere to all applicable federal, state, and local regulations relating to the transport, use, and disposal of hazardous materials and as part of the NPDES Construction General Permit, the proposed project would be required to prepare and implement an SWPPP that would include BMPs to prevent accidental spills of hazardous materials during construction. A Phase I Environmental Site Assessment (ESA) was prepared for the proposed project by ENGEO Incorporated in October 2023. All concentration of potentially hazardous materials in onsite soils were detected below the corresponding residential screening levels and background concentration levels. Therefore, the trace concentrations detected in the project site soils would not potentially expose construction workers or the public to hazardous conditions during construction and operation and the Phase I ESA determined that there was no evidence of recognized environmental conditions (RECs), controlled RECs, or historical RECs identified onsite. Additionally, during operation of the proposed project, the use of hazardous materials would be limited to those commonly found at residential uses such as solvents, cleaners, paints, and pesticides for landscape maintenance activities. These common household hazardous materials would be used in limited quantities and would not create a substantial hazard to the public or the environment. Therefore, impacts related to the routine transport, use, and disposal of hazardous materials during project construction and operation would be less than significant.

Accidental Release of Hazardous Materials

Construction activities associated with the proposed project would include the demolition of existing structures and the construction of new buildings and associated infrastructure. During the construction phase, limited amounts of hazardous materials would be used, including standard construction materials such as concrete, paints, solvents and heavy construction equipment which would contain diesel fuels and oils, and construction activities could potentially cause accidental spills or releases of hazardous materials. As part of the NPDES Construction General Permit, the proposed project would be required to prepare and implement a SWPPP that would include BMPs to prevent accidental spills of hazardous materials during construction. With adherence to applicable federal, state, and local regulations, and implementations of BMPs in the SWPPP, the impact to the public or environment from accidental release of hazardous materials during project construction would be reduced. Additionally, as identified in the Phase I ESA prepared for the proposed project, trace concentrations of hazardous materials detected in the project site soils were detected below the corresponding residential screening levels and background concentration levels and therefore, would not potentially expose construction workers or the public to hazardous conditions during construction and operation.

Operation of the proposed project would not include any uses of hazardous materials outside of common household hazardous materials such as paints, solvents, and pesticides for landscaping uses. These hazardous materials would be used in limited quantities and would not result in the accidental release of hazardous materials into the environment. Therefore, impacts related to accidental release of hazardous materials through accident conditions during proposed project construction and operation would be less than significant.

Emission of Hazardous Materials near a School

The closest school to the project site is Old Orchard School, which is located approximately 0.85-mile northwest of the site. Therefore, the proposed project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25-mile of an existing or proposed school and there would be no impact.

Hazardous Materials Sites

A review of the SWRCB GeoTracker database and the DTSC EnviroStor database determined that the project site is not included on a list of hazardous materials sites complied pursuant to Government Code Section 65962.5 (SWRCB 2024, DTSC 2024). Therefore, the proposed project would not be located on a site included on a list of hazardous materials sites and would have no impact.

Nearby Airport Hazard

There are no airports located within the City and the closest airport to the project site is the San Jose International Airport, located more than five miles northeast of the project site. The project site is not located within an airport land use compatibility plan or within two miles of an airport and therefore, the proposed project would not result in safety hazards or excessive noise for people residing in the project area. There would be no impact.

Emergency Response or Evacuation Plan

The City has developed an Emergency Operations Plan (EOP) that establishes policy direction for emergency planning, mitigation, response, and recovery activities within the City. Additionally, the City is under jurisdiction of the Santa Clara Valley EOP. During the construction phase, all street/lane closures would conform to City requirements for construction and the proposed project would prepare a TCP to ensure there would be no impacts to surrounding roadways and emergency ingress/egress throughout the area. The proposed project would not modify any existing roadways in such a way that would impede emergency access or evacuation. The proposed project would be designed to provide adequate emergency access to the site for emergency vehicles. The proposed project design would be reviewed by the City's Fire and Police departments prior to approval to ensure that the proposed project has adequate ingress and egress, setbacks, clearances, turning radii, etc.; and does not impede emergency access. The SCCFD has reviewed the project plans and has provided AMMR approval ensuring that all three driveways and internal streets would be constructed in accordance with City standards for fire and emergency access and to allow for emergency vehicle egress/ingress. Therefore, the proposed project would not impair or interfere with an adopted emergency response plan or emergency evacuation plan and impacts would be less than significant.

Wildland Fires

As identified by California Department of Forestry and Fire Protection (CAL FIRE), the project site is not located in a State Responsibility Area (SRA) or a Very High Fire Hazard Severity Zone (VHFHSZ) (CAL FIRE 2023). Additionally, the U.S. Forest Service (USFS) Wildfire Hazard Potential map designated the project site and surrounding areas as non-burnable (USFS 2020). The proposed project would not be subject to special development controls related to heightened fire protection or vegetation management required to minimize the risk of wildland fires. However, new construction at the project site would be subject to standard fire code and building code requirements. The proposed project would not expose people or structures to significant risk of loss, injury, or death involving wildland fires and impacts would be less than significant.

Hydrology and Water Quality

Surface and Groundwater Quality

Construction activities associated with the proposed project would involve demolition, vegetation removal, grading, and excavation activities that could expose barren soils to sources of wind or water, resulting in the potential for erosion and sedimentation on and off the project site and degradation of water quality. Additionally, construction activities would have the potential to generate polluted runoff into the City's storm drain system. As required by the NPDES Construction General Permit program, the proposed project would be required to prepare and implement a SWPPP that would specify BMPs to avoid and minimize the discharge of pollutants from the project site which would substantially reduce potential sediment transport from the construction site. In addition to the SWPPP, an erosion control plan would be required to be prepared and submitted as part of the grading and site improvements permit application as outlined in the City's Grading and Site Improvements Building Application Guide. Preparation and implementation of a SWPPP and an erosion control plan would ensure that proposed project construction would not violate any water quality standards or waste discharge requirements.

The proposed project would be required to comply with Provision C.3 of the Municipal Regional Permit (MRP) which addresses post-construction stormwater requirements for new development and redevelopment projects that add and/or replace 10,000 square feet or more of impervious area. The proposed project would be designed to meet the Provision C.3 requirements of the MRP, including the construction of approximately 24,309 square feet of bioretention facilities that would collect and treat stormwater runoff prior to entering the City's storm drain facilities. Additionally, the project Applicant would be required to submit a Stormwater Management Plan (SWMP) to the City's Public Works Department. With the preparation of an erosion control plan, SWPPP, and the SWMP, and incorporation and compliance with requirements of Provision C.3 of the MRP, the proposed project would not violate any water quality standards or waste discharge requirements and there would be a less than significant impact during construction and operation.

Groundwater Management

The project site is underlain by the Santa Clara Subbasin which is a subbasin of the Santa Clara Valley groundwater basin. Most of the project site is paved and is not a major groundwater recharge area. The proposed project would increase the amount of impervious area by two percent on the project site from what currently exists. As the project site is not a major groundwater recharge area and most of the project site is already covered in impervious surfaces, the proposed project is not expected to substantially interfere with groundwater recharge.

San Jose Water provides municipal water services to the City and draws groundwater from the Santa Clara Subbasin, which is part of the larger Santa Clara Valley Basin. According to San Jose Water's 2020 UWMP, groundwater made up approximately 43 percent of the total water supply in 2020. As the proposed project's water demand would be supplied by San Jose Water which uses groundwater as a supply, the proposed project could decrease groundwater supplies. However, the proposed project would not result in substantial increases in water demand at the site that would require San Jose Water to increase its groundwater pumping. Therefore, the proposed project would not substantially decrease groundwater supplies or interfere with groundwater recharge such that the proposed project would impede sustainable groundwater management of the basin and impacts would be less than significant.

Drainage Pattern

As discussed above, the proposed project would be required to prepare and implement a SWPPP and an erosion control plan during construction activities to reduce the potential for erosion related impacts and polluted runoff. The proposed project would construct the storm drainage system at the site in accordance with Provision C.3 requirements of the MRP and City guidelines to properly manage runoff from the site. The proposed project would include post-construction stormwater management measures onsite and would treat runoff before being discharged into the City's systems. Additionally, a SWMP would be prepared and submitted to the City's public works department that outlines the proposed project's stormwater management plan post-construction. With implementation of the SWPPP, erosion control plan, and SWMP, compliance with Provision C.3 of the MRP, and implementation of post-construction stormwater management measures, the proposed project would not result in substantial alteration to the existing drainage pattern that would result in substantial erosion or siltation or result in substantial additional sources of polluted runoff and impacts would be less than significant.

The project site is currently almost entirely impervious and the proposed project would increase the impervious area at the site by two percent from existing conditions. Additionally, the proposed project's storm drainage facilities would be designed to meet Provision C.3 requirements of the MRP and would include bioretention facilities that would collect and treat stormwater runoff before being ultimately discharging to the existing storm drain mains which would control the volume of stormwater at the project site to minimize the potential for flooding. The proposed project would not substantially increase the rate or amount of surface runoff in a manner that would result in flooding and there would be a less than significant impact.

There are no waterways crossing the project site or nearby that would be impacted from proposed project construction and operation and the proposed project is not located in a flood hazard area. Onsite stormwater would be directed to the proposed bioretention areas prior to entering the City's storm drainage system. As such, the proposed project would not impede or redirect flood flows and impacts would be less than significant.

Project Inundation

The project site is classified as Zone X by the Federal Emergency Management Agency Flood Hazard Map, which are areas of minimal flood hazard (FEMA 2009). The project site is located more than 15 miles east of the Pacific Ocean and therefore, potential for tsunami is not anticipated. In addition, the City is not identified as being within a tsunami or seiche hazard area.

The project site identified as being located within an area that would be inundated if the Leniham Dam were to fail. However, this dam is regularly inspected by Santa Clara Valley Water District's Dam Safety program and maintained by the dam owners to ensure that the dam is kept in safe operating conditions. As such, failure of this dam is considered to have an extremely low probability of occurring. Therefore, the proposed project would have no impact related to project inundation due to being located in a flood hazard, tsunami, or seiche zone.

Water Quality Control Plan or Sustainable Groundwater Management Plan

The proposed project is located within the San Francisco Bay Water Quality Control Plan (Basin Plan) which is used to protect surface quality in the San Francisco Bay. The Basin Plan policies are primarily implemented through NPDES permits and the proposed project would comply with all NPDES permit requirements, including the preparation and implementation of an SWPPP to minimize impacts on water quality during construction. Additionally, the Santa Clara Valley Water District prepared and implemented a Groundwater Management Plan for the Santa Clara and Llagas Subbasins. As the proposed project would not result in impacts related to groundwater quality, supplies, source, or recharge, the proposed project would not conflict with or obstruct implementation of the Groundwater Management Plan. Therefore, the proposed project would not conflict with or obstruct implementation of a water quality control plan or groundwater management plan.

Land Use and Planning

Established Community

The proposed project consists of a residential development consisting of single-family and multi-family developments on a previously developed site. The proposed project would not create any new physical

divisions or permanently alter existing roadways in a manner that would result in division of an established community. Therefore, the proposed project would not introduce physical features that would create a barrier, divide, or separate adjacent uses; or impede circulation through the neighborhood and no impact would occur.

Mineral Resources

Loss of Resource

The City does not contain any known significant mineral resources that would be of value to the region and residents of the state. Therefore, the proposed project would not result in a loss of availability of a known mineral resource that would be of value and there would be no impact.

Resource Recovery Site

The City does not contain any known mineral extraction opportunities and does not contain sites designated as a local mineral resource recovery site. Therefore, the proposed project would not result in the loss of availability of a locally important mineral resource recovery site and there would be no impact.

Noise

Excessive Noise from Airport

There are no airports located within the City and the closest airport to the project site is the San Jose International Airport, located more than five miles northeast of the project site. The project site is not located within an airport land use compatibility plan or within two miles of an airport and is not within the noise contour areas for the airport. Therefore, the proposed project would not expose people residing in the area to excessive noise levels and there would be no impact.

Population and Housing

Unplanned Population Growth

Using the average household size of 2.49 residents per unit identified in the City's 2022 General Plan EIR, the proposed project's construction of 290 residential units would result in an increase of 722 new residents. The City's 2022 General Plan EIR identified that the existing population of the City is 42,726 residents and is anticipated to grow to 64,929 residents by the year 2040 (City of Campbell 2022). The proposed project's 722 new residents would represent approximately 3.3 percent of the anticipated population growth between the existing population and projected population by 2040. Therefore, the increase in residents resulting from the proposed project would be within the projected population growth for the City and would not result in substantial unplanned population growth. Additionally, the proposed project would not result in extension of roads or other infrastructure that could result in indirect unplanned population growth. Therefore, the proposed project would not directly or indirectly induce substantial population growth in the area and impacts would be less than significant.

Displacement of People

The project site does not currently contain any structures utilized for residential purposes and there are no existing people or housing onsite. Therefore, the proposed project would not displace existing people or housing and there would be no impact.

Public Services

Fire

As identified in SCCFD's 2024 Annual Report, SCCFD has a baseline performance goal of having a first unit arrive at a moderate risk fire incident in under 7 minutes and 40 seconds. The average response time to structure fires in urban areas within Campbell in 2024 was 4 minutes and 59 seconds (SCCFD 2024). The proposed project would increase demand for SCCFD fire protection services within the project area due to the increase in the number of residents in the area. Though the proposed project would increase demand for fire protection services due to the presence of more residents, the project site is already currently served by SCCFD as there are existing R&D uses and structures onsite and the project site is located in a highly urbanized area of the City surrounded by existing developments. As identified in SCCFD's 2024 Annual Report, SCCFD has a total of 339 employees and a service population of 223,043 residents (SCCFD 2024). This results in a SCCFD staff to residents ratio of 658 residents per staff. With the addition of the proposed project's 722 residents, this ratio would increase to 660 residents per SCCFD staff (0.3 percent increase). As such, the proposed project would not significantly increase the residents per SCCFD staff ratio from what currently exists or make a considerable contribution to any significant cumulative impact (and of the 15 related projects in the City identified in Table 4.4-1, 12 are redevelopments of existing uses that, previous to redevelopment, had existing demands for services. Additionally, the closest fire station to the project site is Campbell Fire Station, located approximately 0.4-mile northeast of the project site. As such, as an existing fire station is located in close proximity to the project site, SCCFD would be anticipated to meet their response time goals for emergencies occurring at the project site. The proposed project would be required to be constructed and operated in accordance with the California Fire Code requirements and City standards. Incorporation of all California Fire Code and City requirements into the proposed project design would minimize the dependence on SCCFD by reducing fire hazards. Due to the incorporation of design measures to minimize the risk of fire at the site, the proposed project would not affect SCCFD's service ratios, response times, or other performance objectives and would not require the construction of new or expansion of existing fire protection facilities. Impacts would be less than significant.

Police

The proposed project would increase the demand for Campbell Police Department (CPD) services in the area. According to CPD's 2025 Annual Report, CPD had a response time of less than five minutes for 92 percent of emergency calls in 2025, consistent with CPD's response time goals to respond to 90 percent of emergency calls within five minutes (City of Campbell 2025). For non-emergency calls, the CPD strives to respond to calls in 20 minutes or less 90 percent of the time and averaged a 92 percent success rate for non-emergency calls in 2025 (CPD 2025). As identified in the City's 2022 General Plan EIR, CPD has a total full-time staff of 70 employees (City of Campbell 2022). With an existing City population of 42,726 residents, this results in approximately 610 residents per CPD staff. With the addition of the proposed project's 722 residents, this ratio would increase to 621 residents per CPD staff (1.8 percent increase). As such, the proposed project would not significantly increase the residents per CPD staff ratio from what currently exists. Though the proposed project would increase demand for police protection services due to the presence of more residents, the project site is already currently served by CPD as there are existing R&D uses and structures onsite and nearby services and patrols are already available. The police station, moreover, recently has been upgraded and expanded through a $50 million obligation

bond measure to accommodate existing and future demand. Due to the project site being located in an area that is already served by CPD, the proposed project is not expected to affect CPD's response times or other performance objectives. Therefore, the proposed project would not result in or require the construction of new or expanded police protection facilities and impacts would be less than significant.

Schools

The development of 290 residential units is anticipated to generate approximately 63 TK-6 grade aged children, 18 7-8 grade aged children, and 29 9-12 grade aged children. Therefore, the proposed project would be anticipated to generate approximately 110 school aged children.

The 2026 Developer Fee Justification Study prepared for Cambrian School District identified the existing capacity of the school district's facilities is 3,515 students. The report included a comparison of the identified facility capacity with the space needed to determine if there is available space for new students from the projected developments. The space needed was determined by reviewing the historic enrollments over the past four years along with the projected enrollment in five years to determine the number of seats needed to house the students within the existing homes. The projected enrollment in the space needs analysis did not include the impact of any new housing units. The report identified that the district's space needed would be for 3,111 students which is less than the capacity of 3,515 students and as such, there was a difference of 404 students (Cambrian School District 2026). Note, of the 15 related projects identified in Table 4.4-1, only two - the 6 unit project at 300 Redding Road and the 16-unit project at 972 Michael Drive - are located in the Cambrian School District service area and there is sufficient capacity toa accommodate these projects. As such, the Cambrian School District would have adequate capacity available to serve the 81 K-8 grade aged students generated by the proposed project. Additionally, CUHSD's Facilities Master Plan identified that CUHSD has a total capacity of 10,707 students (CUHSD 2023). For the 2025-2026 school year, CUHSD had a total student enrollment of 8,500 students (CUHSD 2026). As such, CUHSD would have adequate capacity available to serve the 29 9-12 grade aged students generated by the proposed project and cumulative development. As identified in the Initial Study Section 3.15, Public Services, these school aged children would be anticipated to be served by the existing nearby schools and would not result in a significant impact.

Additionally, Cambrian School District and CUHSD collects developer fees on any new construction of residential and commercial buildings within the district boundaries. Under Senate Bill 50, school districts may collect fees to offset the costs associated with increasing school capacity as a result of residential development. Under the terms of this statute, payment of statutory fees by property owners or property developers is considered to mitigate in full, for the purposes of CEQA, any impacts to school facilities associated with a qualifying project. The proposed project would be required to pay these fees which would mitigate impacts to existing school facilities that would result from the increase in the number of students. As impacts to existing school facilities would be mitigated with the payment of impacts fees, the proposed project would not result in the need for construction of new or expanded school facilities and impacts would be less than significant.

Parks

The proposed project would result in increased demand for new parks as it would result in the generation of new residents. With an anticipated population of 722 residents, the proposed project would require 2.17 acres of parkland to meet the City's requirements of 3 acres per 1,000 residents. However, the

proposed project would include development of recreational opportunities onsite that would reduce demand for existing parks. In accordance with the City's 2001 General Plan Policy OSD-3.1 which requires provision of private open space or recreational facilities in residential projects, the proposed project includes development of public and private open space. The proposed project would include development of 125,943 square feet (2.89 acres) of usable open space throughout the site. Though the proposed project would not result in the development of a park facility that would contribute to the City's parkland requirement of 3 acres per 1,000 residents, the approximately 2.89 acres of usable open space provided onsite would be more than the parkland requirement for the proposed project's anticipated population of 722 residents.

The proposed project would include the development of new park space onsite; however, the proposed project would be required to comply with City Municipal Code Chapter 13.08, Park Impact Fees and Parkland Dedication Developments, which requires any developer who proposes to erect or construct any building or structure for which a building permit is required by the City, to dedicate land, pay a fee in lieu thereof, or both, at the option of the City for the establishment and rehabilitation of parks and recreation facilities within the City. Additionally, City Municipal Code Chapter 20.24, Park Impact Fees and Park Land Dedication Subdivision, requires as a condition of approval of a tentative subdivision map or parcel map, the subdivider to dedicate land, pay a fee in lieu thereof, or both, at the option of the City, for the establishment and rehabilitation of park and recreational facilities within the City. In accordance with the City's Municipal Code requirements, the proposed project would pay all required fees, or dedicate land, or both at the option of the City to contribute to the City's establishment and rehabilitation of parks and recreational facilities. Therefore, with the development of onsite usable open space and payment of all required fees in accordance with City Municipal Code requirements, the proposed project would result in a less than significant impact.

Other Facilities

The proposed project is not anticipated to result in a substantial increase in demand for other public facilities, such as libraries or other government services, that would result in the need for construction of new or expanded facilities. The City, in the 2022 General Plan EIR, public facility master plan (e.g., the Civic Center Master Plan), and elsewhere, has evaluated impacts related to 8,824 new housing units and 22,203 people, as well as 2.6 million square feet of commercial space, and has planned its public facilities accordingly. It also has adopted General Plan goals, policies, and actions that will ensure public services meet demand in the long-term.

The Campbell Library, which was recently renovated and modernized, and is expected to open in May 2026, is a member of the Santa Clara County Library District. The Santa Clara County Library District has a total of eight libraries with a service population of 459,922 residents (Santa Clara County Library District 2026). This results in an existing service ratio of one library facility per 57,490 residents. With the increase of the proposed project's 722 residents, this ratio would increase to 57,581 residents per library (0.16 percent increase). As such, the proposed project would not significantly increase the residents per library facility ratio from what currently exists nor make any considerable contribution to any significant cumulative impact. As the increase in residents at the site would be gradual with buildout of the proposed project and these residents would not be anticipated to utilize other public facilities such as libraries and other government services on a daily basis, the existing facilities are anticipated to adequately serve the future residents of the proposed project. The proposed project's residents would be anticipated to be

adequately served by existing public facilities and therefore, the proposed project would not result in or require the construction of new or expanded public facilities and impacts would be less than significant.

Recreation

Existing Parks

As discussed above, the proposed project would result in increased demand for new parks and with the anticipated population growth, the proposed project would require 2.17 acres of parkland to meet the City's requirements of 3 acres per 1,000 residents. However, the proposed project would include development of recreational opportunities onsite that would reduce demand for existing parks. In accordance with the City's 2001 General Plan Policy OSD-3.1 which requires provision of private open space or recreational facilities in residential projects, the proposed project would include development of public and private open space. The proposed project would include development of 125,943 square feet (2.89 acres) of usable open space throughout the site. Though the proposed project would not result in the development of a park facility that would contribute to the City's parkland requirement of 3 acres per 1,000 residents, the approximately 2.89 acres of usable open space provided onsite would be more than the parkland requirement for the proposed project's anticipated population of 722 residents.

The proposed project would include the development of new park space onsite; however, the proposed project would be required to comply with City Municipal Code Chapter 13.08, Park Impact Fees and Parkland Dedication Developments, which requires any developer who proposes to erect or construct any building or structure for which a building permit is required by the City, to dedicate land, pay a fee in lieu thereof, or both, at the option of the City for the establishment and rehabilitation of parks and recreation facilities within the City. Additionally, City Municipal Code Chapter 20.24, Park Impact Fees and Park Land Dedication Subdivision, requires as a condition of approval of a tentative subdivision map or parcel map, the subdivider to dedicate land, pay a fee in lieu thereof, or both, at the option of the City, for the establishment and rehabilitation of park and recreational facilities within the City. In accordance with the City's Municipal Code requirements, the proposed project would pay all required fees, or dedicate land, or both at the option of the City to contribute to the City's establishment and rehabilitation of parks and recreational facilities. Therefore, with the development of onsite usable open space and payment of all required fees in accordance with City Municipal Code requirements, the potential impacts to existing parks and recreational facilities would be reduced and the proposed project would result in a less than significant impact.

Recreational Facilities

As discussed above, the proposed project would include development of approximately 2.89 acres of usable open space onsite and the proposed project would be required to pay all required fees related to provision of parks and recreational facilities in accordance with City Municipal Code requirements. The proposed project would not include or require construction of new parks and recreational facilities which might have an adverse physical effect on the environment and impacts would be less than significant.

Utilities and Service Systems

Relocation or Construction of Utility Facilities

The project site is currently served by SJWC's water service, WVSD's wastewater service, and the City's stormwater system and the proposed project would connect to the applicable utility provider systems. The proposed project would include the installation of new water, sanitary sewer, and storm drain lines throughout the site that would connect to the existing potable water mains, sanitary sewer mains, and storm drain mains located within the project site, Campbell Technology Parkway and Paseo de Palomas Lane. Additionally, the proposed project would relocate the existing public sanitary sewer main and storm drain main that crosses the project site to be within the proposed streets which would be completed in accordance with City and applicable utility provider requirements related to construction of wastewater and stormwater infrastructure. The relocation of the existing sanitary sewer main and storm drain main would be completed during the project construction phase and would not result in construction activities that would result in a significant environmental effect. The proposed project does not propose to relocate any existing water mains and would not require upsizing of the water mains within Campbell Technology Parkway.

The proposed project would include connections to existing electrical lines within the area. Additionally, an existing electric pole and overhead line would require relocation to not conflict with the proposed site improvements. Relocation of the existing electric pole and overhead lines would be completed during project construction and would not cause a significant environmental effect. Additionally, the proposed project is proposed to be 100 percent electric and would not utilize natural gas. Therefore, the proposed project would not require relocation or construction of new natural gas facilities and there would be no impact.

All utility infrastructure improvements would be designed and constructed in accordance with the applicable utility provider's requirements and standards. The proposed project would construct new water, sanitary sewer, storm drainage, and electrical systems within the project site that would connect to and be served by the existing infrastructure within the area. Therefore, the proposed project would not require the relocation or construction of new water, sanitary sewer, storm drainage, or electrical system facilities that would result in a significant environmental effect and impacts would be less than significant.

Solid Waste

Construction of the proposed project would require the demolition of existing structures onsite which would generate solid waste. The proposed project would be required to comply with the City's Municipal Code Chapter 6.12, Recycling and Salvaging of Construction and Demolition Debris, to ensure proper disposal of demolition materials. Municipal Code Section 6.12.030, Requirement to divert C&D debris, requires construction and demolition debris be diverted from landfills by using recycling, reuse, salvage, and other diversion programs at the required rate set by California's Green Building Standards Code. Additionally, the proposed project would be required to comply with City Municipal Code Section 6.12.070, Reporting, which requires documentation certifying construction and demolition debris was recycled at the diversion rate set by California's Green Building Standards Code as a condition of final approval and for issuance of any certificate of occupancy. Compliance with these requirements would ensure the construction of the proposed project would not generate solid waste in excess of state or local standards and impacts created by construction would be less than significant.

Approximately 97 percent of the solid waste collected from the City is sent to the Guadalupe Sanitary Landfill and Monterey Peninsula Landfill, which have an estimated closure date of 2048 and 2107, respectively. With an estimated 722 new residents, the proposed project is anticipated to generate approximately 2,671.4 pounds of solid waste per day or 1.3 tons per day. The estimated 1.3 tons per day of solid waste generated by the proposed project would be less than one percent of the maximum permitted throughput received at either landfill. Therefore, there would be sufficient landfill capacity available to accommodate solid waste disposal needs for the proposed project. The proposed project would implement and comply with all solid waste reduction measures adopted by the City and incorporate recycling collection areas into the proposed project. Therefore, the proposed project would not generate waste in excess of state or local standards, capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals and the impacts would be less than significant.

Solid Waste Statutes and Regulations

The proposed project would comply with all federal, state, and local statutes and regulations related to solid waste including the California Integrated Waste Management Act (AB 939), which mandates local cities and counties divert 50 percent of waste from area landfills, and Chapter 6.12, Recycling and Salvaging of Construction and Demolition Debris, in the City Municipal Code. Therefore, impacts would be less than significant.

Wildfire

Emergency Response

Due to the urban nature and flat topography of the project site and surrounding area, the proposed project would not impair an adopted emergency response plan or evacuation plan pertaining to wildfires. The City has developed an EOP that establishes policy direction for emergency planning, mitigation, response, and recovery activities within the City. Additionally, the City is under jurisdiction of the Santa Clara Valley EOP. During the construction phase, all street/lane closures would conform to City requirements for construction and the proposed project would prepare a TCP to ensure there would be no impacts to surrounding roadways and emergency ingress/egress throughout the area. The proposed project would not modify any existing roadways in such a way that would impede emergency access or evacuation. The proposed project would be designed to provide adequate emergency access to the site for emergency vehicles. The SCCFD has reviewed the project plans and has provided AMMR approval ensuring that all three driveways and internal streets would be constructed in accordance with City standards for fire and emergency access and to allow for emergency vehicle egress/ingress. Therefore, the proposed project would not impair or interfere with an adopted emergency response plan or emergency evacuation plan, and no impact would occur.

Exacerbate Wildlife Risk

The project site and the adjacent areas are not located within an SRA or within a VHFHSZ as designated by CAL FIRE (CAL FIRE 2023). The USFS Fire Hazard Potential Map identifies the project site and surrounding area as “Urban and Built-Up Land” (USFS 2020). Due to the urban nature and flat topography of the project site and surrounding area, the proposed project would not, due to slope, prevailing wind, and other factors, exacerbate wildfire risk or expose project occupants to pollutant

concentrations from a wildlife or the uncontrollable spread of a wildfire. Therefore, there would be no impacts.

Associated Infrastructure

As discussed above, the project site is not located in an area with a risk of wildfires. The proposed project would not require the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment and there would be no impact.

Expose People or Structures

Due to the flat topography, urban environment, and very low risk of wildfire hazards at the project site, the proposed project would not expose people or structures to significant risk, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. Therefore, no impacts from wildfires would occur.

Appendix A
Notice of Preparation and Initial Study

City of Campbell

Notice of Preparation – Environmental Impact Report

Date: **JANUARY 6, 2025**

To: State Clearinghouse
State Responsible Agencies
State Trustee Agencies
Other Public Agencies
Interested Organizations

From: Daniel Fama, Senior Planner
City of Campbell
Community Development Department
70 North First Street
Campbell, CA 95008

Subject: **Notice of Preparation (NOP) of the Draft Environmental Impact Report (EIR) for the Campbell Tech Park Project**
Lead Agency: City of Campbell Community Development Department
Project Title: Campbell Tech Park Project
Project Location: City of Campbell (see Figure 1 – Project Site Parcels)

Notice is hereby given that the City of Campbell (City) will be the Lead Agency and will prepare a project-level focused Environmental Impact Report (EIR) for the Campbell Tech Park Project (proposed project) pursuant to the California Environmental Quality Act (CEQA) Guidelines (14 California Code of Regulations [CCR] Section 15060(d)). The focused EIR is being prepared by the City in accordance with applicable law, in particular, CEQA and the State of California CEQA Guidelines.

As shown on Figure 1, the 17.28-acre project site is located at 635, 655, 675, and 695 Campbell Technology Parkway and consists of four contiguous parcels identified as Assessor Parcel Numbers 412-29-015, 412-29-012, 412-29-011, and 412-29-010 in the City of Campbell. The project site is bounded by State Route 17 to the north and west, Campbell Technology Parkway and commercial uses to the south, and single-family development to the east. The project site is entirely developed with a research and development campus consisting of four buildings that total approximately 280,864 square feet, known as the Campbell Technology Park. The proposed project would demolish the existing buildings and entirely redevelop the project site with 290 residential units that would consist of a mix of single-family and multi-family developments (Figure 2 – Site Plan). The proposed project would also include related landscaping and site improvements. Further details of the proposed project may be found by reviewing the project plans available here at https://www.campbellca.gov/DocumentCenter/View/23379.

The focused EIR will evaluate the proposed project for potential impacts on the environment and determine the potential environmental consequences of future change. Based on the Initial Study, the proposed project could potentially affect the following environmental factors, each of which will be addressed in the focused EIR: air quality, cultural resources, energy, greenhouse gas emissions, land use and planning, noise, transportation and circulation, utilities and service systems, and tribal cultural resources. Cumulative impacts will consider impacts of relevant projects in and around the project area combined with those of the project. An evaluation of project alternatives that could reduce significant impacts will also be included in the focused EIR.

Additional details about the project's potential effects are included in the Initial Study. Environmental effects identified in the Initial Study prepared for the proposed project that are dismissed as less than significant and unlikely to occur need not be discussed further in the focused EIR, unless the lead agency subsequently receives information inconsistent with the finding in the Initial Study (CCR Section 15143). Environmental issue areas scoped out of the focused EIR will include an explanation of why these issues would not result in significant environmental effects and are not required to be evaluated further. Environmental issue areas that would be scoped out of the focused EIR include: aesthetics, agriculture and forestry resources, biological resources, geology and soils, hazards and hazardous materials, hydrology and water quality, mineral resources, population and housing, public services, recreation, and wildfire.

To ensure that the focused EIR for this proposed project is thorough and adequate and ensure that the issues of concern to the public and public agencies are addressed, the City is requesting comments and guidance on the scope and content of the focused EIR from interested public agencies, organizations, and individuals. Public comments on the scope of issues to be evaluated in the focused EIR are encouraged. With respect to the views of Responsible and Trustee Agencies as to significant environmental issues, the City needs to know the reasonable alternatives and mitigation measures that are germane to each agency's statutory responsibilities in connection with the project.

A public Scoping Meeting will be held at a regularly scheduled hearing of the Campbell Planning Commission on Tuesday, January 28, 2025 at 7:00 p.m. in the City Hall Council Chambers (70 North First Street, Campbell, CA 95008). Public agencies, organizations, and interested members of the public are invited to attend this meeting and provide verbal or written comments on the proposed project. The meeting may be attended in-person or remotely via ZOOM at https://campbellca.gov/PCSignup. Scoping meeting materials, including the Initial Study prepared for the project, are available online on the City's environmental notices webpage at https://www.campbellca.gov/Archive.aspx?AMID=48. A hard copy of these materials may be viewed at the Campbell Planning Division office located 70 North First Street, Campbell, CA 95008 during normal business hours (8:00 a.m. to 5:00 p.m., Monday through Friday).

If you wish to comment during the NOP comment period, or if you cannot attend the scoping meeting, we will accept written comments until the close of the NOP comment period. **Comments on the NOP are due no later than the close of the extended 30-day review period at 5:00 p.m. on Friday, February 14, 2025.**

Please send all written comments to Daniel Fama, Senior Planner, City of Campbell, at the address shown above or email to techparkproject@campbellca.gov with "Campbell Tech Park Project EIR" as the subject. Public agencies providing comments are asked to include a contact person for the agency. Please direct questions about the proposed project description to Daniel Fama, Senior Planner in the Community Development Department at techparkproject@campbellca.gov.

1. Project Title	Campbell Tech Park Project
2. Lead Agency Name and Address	City of Campbell – Community Development Department 70 N. First Street Campbell, CA 95008
3. Contact Person and Phone Number	Daniel Fama, Senior Planner Phone: (408) 866-2193
4. Project Location	635, 655, 675, 695 Campbell Technology Parkway, Campbell, CA
5. Project Sponsor's Name and Address	Campbell Technology Park, LLC 1960 The Alameda, San Jose, CA 95126
6. General Plan Designation	Research and Development
7. Zoning	Planned Development
8. Assessor Parcel Numbers	142-29-010; 412-29-011; 412-29-012; 412-29-015

2. PROJECT DESCRIPTION

This chapter describes the characteristics of the Campbell Tech Park Project (proposed project) that is evaluated in this Initial Study.

2.1 PROJECT SITE

The proposed project is located at 635, 655, 675, and 695 Campbell Technology Parkway in the City of Campbell (City) (Figure 2-1). The project site is approximately 17.28 acres and consists of four contiguous parcels identified as Assessor Parcel Numbers (APNs) 412-29-015, 412-29-012, 412-29-011, and 412-29-010 (Figure 2-2, Figure 2-3). The project site is bounded by State Route (SR) 17 to the north and west, Campbell Technology Parkway and commercial uses to the south, and single-family development to the east.

2.2 GENERAL PLAN LAND USE DESIGNATION AND ZONING

2.2.1 General Plan Land Use Designation

The City's 2001 General Plan Land Use Map designated the project site as Research and Development (R&D). Under the recently adopted 6th Cycle Housing Element and 2040 General Plan, three of the project site parcels (APNs 412-29-015, 412-29-012, and 412-29-011) were redesignated as High Density Mixed-Use (HD MU) (34-45 units/acre); however, APN 412-29-010 was not redesignated and remained R&D.

Notwithstanding these land use changes, the project Applicant submitted Senate Bill (SB) 330 (Housing Crisis Act) pre-application on April 18, 2023 for a 334-unit townhome development. At the time the pre-application was submitted, the City had not yet adopted the updated 6th Cycle Housing Element and 2040 General Plan, meaning the City was subject to the "Builder's Remedy" provision of the California Housing Accountability Act (ABAG 2024). The Applicant's submission of a pre-application under the Housing Crisis Act therefore conferred upon the Applicant's vested right to proceed under the standards in effect at the time of pre-application submittal and to apply the protections of the Builder's Remedy through its entitlement process. State law provides in these circumstances that a city may not deny the project based on inconsistency with these General Plan land use regulations. Therefore, the City may not deny the proposed project based on inconsistency with the 2001 General Plan R&D land use designation that applied on April 18, 2023 (or the current HD MU designation). However, other provisions and requirements of the 2001 General Plan remain applicable to the project, provided they do not render the proposed project infeasible.

2.2.2 Zoning

Under the current 2040 General Plan, APN 412-29-010 is zoned Planned Development (P-D) and APNs 412-29-015, 412-29-012, and 412-29-011 are zoned HD MU. However, prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan, the project site parcels were zoned P-D. However, as explained above, the Applicant submitted a Builder's Remedy application and SB 330 (Housing Crisis Act) pre-application prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan which included rezoning the project site. State law provides that the City may not deny the proposed project based on consistency with the zoning district that existed on April 18, 2023 or the City's current zoning districts.

2.3 EXISTING SITE CONDITIONS

The project site is located within a highly urbanized area. The project site is entirely developed with a research and development campus consisting of four buildings that total approximately 280,864 square feet, known as the Campbell Technology Park. Additionally, the project site is developed with paved surface parking stalls, drive-aisles, walkways, and landscaping throughout the site. The existing onsite buildings are one to two stories high and are developed with R&D uses that is currently 50 percent occupied with a mix of professional office tenants.

2.4 PROJECT CHARACTERISTICS

The proposed project consists of the development of 290 residential units, which is within the allowable 20 percent deviation from the SB-330 pre-app. The proposed development would consist of 27 two-story single-family detached homes, three-story townhome-style condominiums with 149 units across 28 buildings, and four-story townhome-style condominiums with 114 units across 15-buildings (Figure 2-4). Each unit would have a private two-car garage and balconies and decks would provide private outdoor space for each unit. The proposed project would have a density of 16.78 units per acre.

Pursuant to Government Code Section 65589.5(d), the proposed project would provide 20 percent of the proposed units for low-income households as required by the Builder's Remedy of the Housing Accountability Act.

2.4.1 Single-Family Homes

The proposed project proposes to construct 27 single-family detached homes. Figure 2-5 shows a rendering of the proposed single-family homes. The single-family homes would have four building types ranging from 2,505 square feet to 2,722 square feet. The single-family homes would range from three to four bedrooms and two to three bathrooms. One of the building types for the single-family homes would have an optional accessory dwelling unit (ADU).

The single-family homes would be provided along the eastern edge of the project site. The single-family homes would be separated from the existing residential developments located along the eastern edge of the project site by existing trees and fencing located within the project site's property line. The single-family homes would have a maximum height of 30 feet and 5 inches.

Single-Family Homes Rendering

Stantec

2.4.2 Three-Story Townhome-style Condominiums

The proposed project proposes to construct 28 three-story townhome-style condominiums that would have a combined unit count of 149 units. Figure 2-6 shows a rendering of the proposed three-story townhome-style condominiums. The three-story townhomes would have five building types that would range from three- to seven-plex constructions. The three-story townhomes would range from three to four bedrooms and 2.5 to 3.5 bathrooms. One of the building types for the three-story townhome would have an optional ADU. The three-story townhomes would have a maximum height of 44 feet.

2.4.3 Four-Story Townhome-style Condominiums

The proposed project proposes to construct 15 four-story townhome-style condominiums that would have a combined unit count of 114 units. Figure 2-7 shows a rendering of the proposed t four-story townhome-style condominiums. The four-story condominiums would have two building types identified as six- and eight-plex constructions. The four-story condominiums would range from two to three bedrooms and two to three bathrooms. The four-story condominiums would have a maximum height of 47 feet.

2.4.4 Affordable Housing

Pursuant to Government Code Section 65589.5(d), 20 percent of the proposed units would be provided to low-income households as required by the Builder's Remedy of the Housing Accountability Act.

The proposed project would reserve five of the single-family homes, 30 of the three-story townhome units, and 23 of the four-story condominium units as below market rate units for a total of 58 units provided as affordable housing. The affordable housing units would be dispersed throughout the project site (Figure 2-8).

2.4.5 Open Space and Landscaping

While the project site is fully paved and currently developed with R&D uses, the project site currently includes existing landscaping and trees located throughout the site. The proposed project would require removal of 116 existing trees onsite to complete construction of the proposed project. The removed trees would not be replaced or relocated onsite; however, the proposed project would be required to comply with Campbell Municipal Code Chapter 21.32 - Tree Protection Regulations which outlines standards and regulations related to removal of protected trees. In accordance with City requirements, the proposed project would obtain a Tree Removal Permit concurrent with the application proposal, which would include requirement for replacement trees to be planted Landscaping would be provided throughout the project site and internal streets and sidewalks would be planted with various street trees, placed to maximize solar exposure. Low-growing groundcover would enhance pedestrian connections to the public sidewalks. The proposed project proposes the use of native and drought tolerant landscaping to meet the City's Water Efficient Landscape Guidelines. Landscaping provided onsite would be designed and constructed in accordance with the requirements and standards outlined in City Municipal Code Chapter 21.26 - Landscaping Requirements and the State of California Model Water Efficient Landscape Ordinance.

Title
Affordable Housing Plan

Stantec

The proposed project would include development of 125,943 square feet of usable open space throughout the site (Figure 2-9). A linear open space area is programmed through the central portion of the project site. Amenities are located throughout this linear zone, including playground for children aged 2 through 12, seating areas that allow for passive recreation, shaded picnic areas for gathering, and a ping-pong table area. The linear open space is designed to be lined with trees and shade canopies to provide usable recreation space most of the year. Along the southern edge of the project site, a small pocket park would provide a shaded picnic and BBQ area. Additional usable open space areas located throughout the site would provide passive recreational areas.

Additionally, the single-family homes would be developed with a total of 17,415 square feet of private yard space. The townhome-style condominiums would also provide balconies, resulting in approximately 18,000 square feet of private open space. The single-family homes would be separated by fencing. Additionally, a concrete wall would separate the single-family homes from the common open space area located along the eastern boundary of the project site. A pre-cast wall would also be constructed along the western, eastern, northern, and southern boundaries of the project site to separate the proposed project from the surrounding developments and SR 17. The proposed fencing and concrete walls would range from 6 to 8 feet in height.

2.4.6 Lighting

Lighting is proposed to be developed throughout the site. Street lighting is proposed along the roadways and pedestrian level lighting are proposed throughout the common areas for security purposes. Additionally, each house would be designed to have a porch light and a light at the garage. The proposed project proposes the use of cutoff or full cutoff lighting for illuminating outdoor spaces to control and limit light pollution and light trespass. Lighting provided onsite would be designed and constructed in accordance with the requirements and standards outlined in City Municipal Code Section 21.18.090 - Lighting design standards and Section 21.16.060 - Outdoor light and glare.

2.4.7 Vehicular and Pedestrian Access

Primary access to the project site would be via three proposed driveways and street connections located off Campbell Technology Parkway (Figure 2-10). Internal streets would be constructed throughout the site for vehicular access. All three driveways and internal streets would be constructed in accordance with City standards for fire and emergency access and to allow for emergency vehicle egress/ingress, subject to an “alternative means and methods request” (AMMR) approved by the Santa Clara County Fire District (SCCFD) (Santa Clara County Fire District 2024). The driveways would all be 26 feet wide and the internal drive aisles would have a minimum width of 24 feet. Pedestrian walkways would also connect to the existing Campbell Technology Parkway. Emergency vehicle access (EVA) fire access would be provided via an existing EVA easement at the northern end of the project site from Paseo de Palomas Lane. The EVA fire access would have a minimum width of 20 feet.

Circulation Plan

Stantec

2.4.8 Parking

The project site is located within 0.5-mile of a major transit stop and therefore, is not subject to any minimum automobile parking requirements pursuant to Government Code Section 65863.2. However, a total of 718 parking spaces would be provided to accommodate the proposed residential developments. Of the total 718 parking spaces, 580 parking spaces would be provided as residential in-garage spaces and 138 spaces would be guest parking dispersed throughout the site. Of the total 138 guest parking spaces, the proposed project would provide 7 accessible spaces, 14 electric vehicle (EV) capable spaces, 35 EV ready spaces, and 7 EV charging spaces. The proposed project would also provide 12 bicycle racks throughout the site. Each bicycle rack would provide six bicycle spaces. Parking provided onsite would be designed and constructed in accordance with the dimensional requirements and standards outlined in City Municipal Code Chapter 21.28 – Parking and Loading.

2.4.9 Utilities

The project site is currently served by underground electric and communication lines, stormwater lines, sanitary sewer lines, and domestic water lines. As part of the proposed project, new sanitary sewer mains and laterals, new water mains and services, and storm drain infrastructure would be provided to serve the developments (Figure 2-11). Stormwater treatment bioretention areas would be provided for treatment of all runoff generated from the proposed project. Additionally, a new Joint Trench and private streetlights are proposed to service the project site. Existing and proposed utility connections are discussed is more detail below.

Water Supply

Water service at the project site is provided by the San Jose Water Company. The proposed project would include the installation of new 8-inch water lines throughout the site that would connect to the existing 8-inch potable water mains within Campbell Technology Parkway. The proposed project is anticipated to have an annual water usage of 30 million gallons per year.

Wastewater

Wastewater service at the project site is provided by West Valley Sanitation District (WVSD). The proposed project would connect to existing 8-inch sanitary sewer mains along Campbell Technology Parkway that enter and traverse the site in the northerly direction through a series of public sewer easements. The existing 8-inch sanitary sewer main ultimately leaves the site in the northeast corner of the project site at Paseo de Palomas Lane and drains east toward Union Avenue. The proposed project would relocate the existing public sanitary sewer main that crosses the project site to be within the proposed streets. The proposed project would utilize the existing 8-inch sanitary sewer lines that exists throughout the site and would include construction of new 8-inch sanitary sewer lines throughout the site to connect to each proposed building. The 8-inch sanitary sewer lines would connect to the existing 8-inch sanitary sewer main located along Campbell Technology Parkway and the existing 8-inch sewer main located along Paseo de Palomas Lane. The proposed project is anticipated to have an annual wastewater generation of 17.9 million gallons per year.

Utility Plan

Stantec

Stormwater

The proposed project would include approximately 24,309 square feet of bioretention facilities that would be constructed throughout the site (Figure 2-12). The proposed bioretention facilities would collect and treat stormwater runoff before being conveyed to the proposed storm drain lines throughout the site. Various sized storm drain lines ranging from 12-inch to 36-inch storm drain lines would be constructed throughout the site to convey stormwater runoff to the treatment areas and to the designated discharge points. Additionally, an existing storm drain main that crosses the project site would be relocated to be within the proposed streets. The stormwater runoff would eventually be discharged to the existing storm drain mains located in Campbell Technology Parkway, as well as existing storm drain mains located along the northern corner of the project site in Paseo de Palomas Lane. Proposed storm drainage facilities would conform to the C.3 Stormwater Technical guidelines and requirements.

Electricity, Gas, and Telecommunication

Electricity and gas service is provided to the project site by the Pacific Gas & Electric Company (PG&E). The proposed project would include connections to existing electrical lines within the area. Additionally, an existing electric pole and overhead line that is located in the northwest corner of the project site would require relocation to not conflict with the proposed site improvements.

All residential units and associated building systems and appliances/fixtures are proposed to be 100 percent electric, and the proposed project would not utilize natural gas. Additionally, all homes are proposed to have solar photovoltaic systems installed, either individually or for the larger condominium building as a whole. All homes are proposed to have a single dedicated Level 1 and a single dedicated Level 2 receptacle in the garage for EV charging and all homes would have the option of a battery backup located in the garage.

2.4.10 Offsite Improvements

The proposed project proposes several offsite improvements to support the development of the proposed project. The proposed project proposes to widen Campbell Technology Parkway and improvements along the Campbell Technology Parkway frontage is proposed which include new curb and gutters, sidewalks, and accessible curb ramps at all pedestrian road crossings. Additionally, new street trees, street lighting, and fire hydrants are proposed along the Campell Technology Parkway frontage. Stormwater bioretention areas would be provided to treat the stormwater from the roadway along the project frontage and new storm drain infrastructure would be provided to serve the stormwater treatment areas. Additionally, the proposed project would include sanitary sewer, water, and storm drain connections to the existing infrastructure within the Campbell Technology Parkway frontage.

2.5 PROJECT CONSTRUCTION

2.5.1 Schedule

Construction is anticipated to begin in January 2026 and would be completed by August 2030. Construction of the proposed project is anticipated to occur during normal business hours and no nighttime work is proposed.

Construction is proposed to be completed in four phases. Phase 1 would include demolition of the existing buildings and pavement and site preparation of the entire site. Phase 2 would include construction of the 27 single-family homes and 49 3-story townhome-style condominium. Phase 3 would include construction of the remaining 100 3-story townhome-style condominium. Lastly, Phase 4 would include construction of the 114 4-story townhome-style condominium. Each phase of construction would take place immediately following the ending of the prior phase.

Construction activities would occur Monday through Friday, between 8 AM and 5 PM, and Saturday 9 AM to 4 PM, consistent with the City's Municipal Code applicable to construction activities. Any work outside of the City's construction hours would require special permits. Table 2-1 through Table 2-4 shows the anticipated schedule with the assumption that the construction would begin in January 2026 and end in August 2030 with buildout taking place over four phases. This project schedule is dependent on market conditions, regulatory approvals, and other factors; therefore, it is subject to change.

Table 2-1: Phase 1 Construction Schedule

Task	Start Date	End Date	Workdays
Site Demolition	1/1/2026	2/1/2026	23
Grading	2/2/2026	3/1/2026	20
Site Preparation	3/2/2026	5/1/2026	43

Table 2-2: Phase 2 Construction Schedule

Task	Start Date	End Date	Workdays
Building Construction	4/1/2026	7/25/2027	343
Paving	7/26/2027	8/25/2027	22
Architectural Coating	8/26/2027	9/25/2027	22

Table 2-3: Phase 3 Construction Schedule

Task	Start Date	End Date	Workdays
Building Construction	9/26/2027	1/18/2029	343
Paving	1/19/2029	2/18/2029	22
Architectural Coating	2/19/2029	3/21/2029	22

Table 2-4: Phase 4 Construction Schedule

Task	Start Date	End Date	Workdays
Building Construction	3/22/2029	7/15/2030	343
Paving	7/16/2030	8/15/2030	22
Architectural Coating	8/16/2030	9/15/2030	22

2.5.2 Access and Staging

Construction staging would be located onsite, and workers would access the project site via gated vehicular entry points along Campbell Technology Parkway.

The proposed project is anticipated to require some temporary restrictions and closures for a portion of Campbell Technology Parkway along the project boundary to complete the frontage improvements and connect new utility lines to the existing utility mains located along Campbell Technology Parkway. For any temporary restrictions or closures required for adjacent roadways, the proposed project would prepare and implement a Traffic Control Plan (TCP).

2.5.3 Construction Equipment and Workers

Construction equipment anticipated onsite is listed in Table 2-5. Project construction would utilize Tier 4 construction equipment and construction is expected to require approximately 100 workers during peak construction stage (building construction).

Table 2-5: Proposed Construction Equipment

Phase Name	Equipment Type	Number of Equipment	Usage (hours/day)
Demolition	Concrete/Industrial Saw	1	8
	Excavators	3	8
	Rubber Tired Dozers	2	8
Site Preparation	Rubber Tired Dozers	3	8
	Tractors/Loaders/Backhoes	4	8
Grading	Excavators	2	8
	Graders	1	8
	Rubber Tired Dozers	1	8
	Scrapers	2	8
	Tractors/Loaders/Backhoes	2	8
Building Construction	Cranes	1	7
	Forklifts	3	8
	Generator Sets	1	8
	Tractors/Loaders/Backhoes	3	7
	Welders	1	8

Phase Name	Equipment Type	Number of Equipment	Usage (hours/day)
Paving	Pavers	2	8
	Paving Equipment	2	8
	Rollers	2	8
Architectural Coating	Air Compressors	1	6

2.5.4 Grading, Excavation, and Demolition

As the project site is currently developed with existing buildings and impervious surfaces, the proposed project would require demolition of existing onsite structures and surfaces prior to the start of construction activities. To meet the City's waste diversion requirements, 65 percent of construction debris would be diverted from landfills.

The proposed project is anticipated to require 18,000 cubic yards of cut and 23,000 cubic yards of fill for a net 5,000 cubic yards of fill. The project site is currently developed with approximately 13.01 acres of impervious area and 4.27 acres of pervious area. Post-construction, the proposed project is anticipated to result in 13.5 acres of impervious area and 3.78 acres of pervious area. It is anticipated that maximum depth of excavation for building pads would be approximately 5 feet, and the maximum depth of utility trenching would be approximately 15 feet.

2.6 REQUIRED PROJECT APPROVALS

The following approvals and permits are anticipated for the proposed project:

City of Campbell

- Entitlement Approvals
  - Planned Development Permit
  - Vesting Tentative Subdivision Map
  - Tree Removal Permit
- Post-Entitlement Approvals
  - Grading/Building Permits
  - Encroachment Permit
  - Street Improvement Agreement
  - Demolition Permit
  - Tract Map Approval
  - Street/Easement Vacation
  - Right of Way Dedication

Regional Water Quality Control Board

- Stormwater Pollution Prevention Plan/Construction General Permit

3. ENVIRONMENTAL CHECKLIST AND ENVIRONMENTAL EVALUATION

The environmental factors checked below would potentially be affected by this proposed project, involving at least one impact that is a "Potentially Significant Impact," as indicated by the checklist on the following pages.

- ☐ Aesthetics
- ☐ Agricultural and Forestry Resources
- ☒ Air Quality
- ☐ Biological Resources
- ☒ Cultural Resources
- ☒ Energy
- ☐ Geology and Soils
- ☒ Greenhouse Gas Emissions
- ☐ Hazards and Hazardous Materials
- ☐ Hydrology and Water Quality
- ☒ Land Use and Planning
- ☐ Mineral Resources
- ☒ Noise
- ☐ Population and Housing
- ☐ Public Services
- ☐ Recreation
- ☒ Transportation
- ☒ Tribal Cultural Resources
- ☒ Utilities and Service Systems
- ☐ Wildfire

Determination

Based on this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☒ I find that the proposed project MAY have a "Potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

Date

3.1 AESTHETICS

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
I. AESTHETICS — Except as provided in Public Resources Code Section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point.) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality??	☐	☐	☒	☐
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

Discussion of Impacts

a) Have a substantial adverse effect on a scenic vista?

No Impact. Scenic vistas are generally interpreted as long-range views of specific scenic features, such as open space lands, mountain ridges, or bodies of water. There are no officially designated scenic vistas within the City and significant visual resources and visual features are not visible from the project site. The surrounding development are one- to two- stories high and landscaping trees are planted throughout the area. Existing developments in the project area obscure any available views of ridgelines and mountain ranges that may be present for viewing at the site if the area was undeveloped. There are no scenic vistas in the project vicinity and due to the distance from any scenic resources and the nature of development in the project area, the proposed project's construction and operation would not have a substantial effect on a scenic vista. Therefore, the proposed project would have no impact on scenic vistas.

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact. According to a review of the California Department of Transportation's (Caltrans) State Scenic Highway System Map, there are no designated or eligible scenic highways located near the project area (Caltrans 2024). The closest officially designated scenic highway is SR 9, located approximately four miles southwest of the project site. Additionally, though not currently designated, Interstate 280 located approximately 2.5 miles northwest of the project site is identified as eligible for

listing. Therefore, proposed project construction and operation would not substantially damage scenic resources within a state scenic highway and there would be no impact.

c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point.) If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less than Significant Impact. The proposed project is located within a highly urbanized area of the City. As discussed in Section 2, Project Description, the proposed project would include demolition of all existing buildings onsite and development of 290 residential units. The proposed residential structures would range from two- to four-stories in height and would replace the existing development with new uses.

Zoning and other regulations governing scenic quality include Historical Design Guidelines, Single Family Homes Design Guidelines, SFR Additions Design Guidelines, Low-Medium Density Residential Design Guideines, and Street Design Standards. The Single Family Homes Design Guidelines, Low-Medium Density Residential Design Guideines, and Street Design Standards would be applicable to the proposed project. The proposed project would be required to comply with these design standards, where objective, to ensure that there would be no potential impacts related to regulations governing scenic quality.

Additional zoning regulations that govern scenic quality include development standards described in the City's Zoning Code. However, as explained in Section 2.2, General Plan Land Use Designation and Zoning, the Applicant submitted an SB 330 (Housing Crisis Act) pre-application prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan which included rezoning the project site, meaning the City was subject to the "Builder's Remedy" provision of the California Housing Accountability Act. The Applicant's submission of a pre-application under the Housing Crisis Act therefore conferred upon the Applicant's vested right to proceed under the standards in effect at the time of pre-application submittal and to apply the protections of the Builder's Remedy through its entitlement process. State law provides that the City may not deny the proposed project based on consistency with the zoning district that existed on April 18, 2023, or the City's current zoning districts. As the proposed project is not required to be consistent with the zoning designation of the site, the proposed project's non-compliance with the development standards of the project site's zoning designation would not be allowed to be utilized as a basis for project denial by the City. Implementation of applicable design standards described above would reduce potential conflicts with applicable regulations governing scenic quality. Therefore, the proposed project would not result in significant conflicts with applicable zoning and regulations governing scenic quality and impacts would be less than significant.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less than Significant Impact. The project site is currently developed and produces light and glare from existing lighting and windows. Areas adjacent to the project site contain multiple sources of lighting that are typical to developed areas including exterior lighting on residential and commercial buildings, parking lot lighting, street lights, and vehicle headlights. Glare from adjacent land uses emanates from parked cars, passing cars, and windows on nearby buildings. The proposed project would demolish the existing

structures and replace them with new two- to four-story buildings. Due to the developed nature of the project site and surrounding area with similar uses, the proposed project is not anticipated to result in substantial new sources of light and glare. The proposed project would be required to comply with Campbell Municipal Code Section 21.18.090, Lighting design standards, which includes design standards for exterior and permanent lighting, shielding requirements, and other design criteria. Additionally, the proposed project would be required to comply with Campbell Municipal Code Section 21.160.060, Outdoor light and glare, which requires shielding or modification of reflective materials to prevent emission of light and glare beyond the property line. Compliance with the City's lighting and glare design standards would ensure the proposed project would not result in light and glare impacts to nearby developments. Therefore, the proposed project is not anticipated to create substantial new sources of light or glare, and impacts would be less than significant.

3.2 AGRICULTURAL AND FORESTRY RESOURCES

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
II. AGRICULTURAL AND FOREST RESOURCES — In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined by Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production as defined by Government Code Section 51104(g))?	☐	☐	☐	☒
d) Result in loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment, which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use, or conversion of forest land to non-forest use?	☐	☐	☐	☒

Discussion of Impacts

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact. As identified in the City's 2001 General Plan, there are no areas within the City that are designated for agricultural use and there are no agricultural lands identified by the California Department of Conservation's (DOC) Farmland Mapping and Monitoring Program (FMMP) within the City (City of Campbell 2001b, DOC 2024). The DOC's FMMP classifies the project site and the surrounding areas as

Urban and Built-Up land (DOC 2024). Therefore, construction and operation of the proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Important to non-agricultural uses and there would be no impact.

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. Under the current 2040 General Plan, the project site is zoned P-D and HD MU. Additionally, prior to the adoption of the 6th Cycle Housing Element and 2040 General Plan, the project site parcels were zoned P-D. The zoning designations does not allow for agricultural uses and the project site is not under a Williamson Act contract. Therefore, construction and operation of the proposed project would not conflict with existing zoning for agricultural use or with a Williamson Act contract, and there would be no impact.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined by Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production as defined by Government Code Section 51104(g))?

d) Result in loss of forest land or conversion of forest land to non-forest use?

No Impact. The discussion below applies to significance threshold (c) and (d) as outlined above.

The City does not contain any forest land and there are no lands zoned for forest land or timberland uses in the City (City of Campbell 2001b). Therefore, construction and operation of the proposed project would not conflict with existing zoning or cause rezoning of forest land or timberland and would not result in loss of forest land or conversion of forest land to non-forest use. There would be no impact for Impact (c) or (d).

e) Involve other changes in the existing environment, which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use, or conversion of forest land to non-forest use?

No Impact. The project site and surrounding area are not used for agricultural or forest land uses. Construction and operation of the proposed project would not involve changes in the existing environment which would result in the conversion of Farmland to non-agricultural uses or conversion of forest land to non-forest uses. Therefore, there would be no impact.

3.3 AIR QUALITY

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
III. AIR QUALITY — Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☒	☐	☐	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

Discussion of Impacts

a) Conflict with or obstruct implementation of the applicable air quality plan?

Potentially Significant Impact. The proposed project's construction and operation could emit air pollutants that have the potential to conflict with or obstruct implementation of an applicable air quality plan, resulting in a potentially significant impact. An air quality analysis with an evaluation of construction emissions, new operational emissions and a qualitative construction health risk assessment will be prepared for the EIR. Therefore, proposed project's potential to conflict with an applicable air quality plan adopted for the purpose of reducing air quality impacts will be further analyzed in the EIR.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Potentially Significant Impact. The construction and operational emissions could exceed the threshold of significance for air pollutants and emissions and could be cumulatively considerable resulting in a potentially significant impact. The proposed project's potential to result in a cumulatively considerable net increase of pollutants will be further analyzed in the EIR.

c) Expose sensitive receptors to substantial pollutant concentrations?

Potentially Significant Impact. Sensitive receptors refer to those individuals of the population most susceptible to poor air quality including children, the elderly, and those with pre-existing health problems affected by air quality. Construction and operation emissions from the proposed project could expose sensitive receptors to substantially pollutant concentrations and result in a potentially significant impact.

The proposed project's potential to expose sensitive receptors to substantial pollutant concentrations will be further analyzed in the EIR.

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less than Significant Impact. The proposed project would develop residential uses. Construction and operation of the proposed project would not generate substantial odors that would affect substantial number of people. Land uses typically considered associated with odors include wastewater treatment facilities, waste-disposal facilities, or agricultural operations; and the proposed project does not contain any land uses typically associated with emitting odors. During operation, the residential development could generate odors from cooking or trash enclosures. However, these odors would not be substantial enough to be considered nuisance odors that would affect a substantial number of people. During project related construction activities, construction equipment exhaust, painting, and pacing activities would temporarily generate odors. Any construction-related odor emissions would be temporary and intermittent. Additionally, noxious odors would be confined to the immediate vicinity of the construction equipment. Therefore, proposed project's impacts from odors would be less than significant.

3.4 BIOLOGICAL RESOURCES

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
IV. BIOLOGICAL RESOURCES — Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☒	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☐	☒
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☒	☐	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒

Discussion of Impacts

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Less than Significant with Mitigation. Madrone Ecological Consulting (Madrone) prepared a Biological Resources Analysis Memo for the proposed project in November 2024 (Appendix A). The biological resources analysis included review of aerial photographs of the project site and surrounding areas as well

as database review. The project site is currently developed with urban uses and is surrounded by development on all sides and as outlined in the memo, there are no special-status plant species that have the potential to occur within the project site.

However, the portions of the project site not occupied by buildings, pavement, or lawns has the potential to provide extremely marginal habitat for Northern California legless lizards and the existing trees within the project site represent marginally suitable nesting habitat for Swainson's hawk and other more common migratory birds protected by the Migratory Bird Treaty Act. Additionally, these trees may also represent marginally suitable roosting habitat for pallid bat, hoary bat, and other more common foliage and cavity roosting bats. Therefore, to ensure no significant impacts would occur to these species identified to have potential suitable habitat onsite, the proposed project would be required to implement Mitigation Measures BIO-1 through BIO-3. Mitigation Measure BIO-1 requires pre-construction surveys for Northn California legless lizards, Mitigation Measure BIO-2 requires pre-construction nesting bird surveys, and Mitigation Measure BIO-3 required preconstruction roosting bat surveys. Mitigation Measures BIO-1 through BIO-3 would ensure that any potential wildlife species onsite are identified prior to the start of any construction activities and outlines procedures to be followed if a species is identified to be onsite during the pre-construction survey. With implementation of Mitigation Measures BIO-1 through BIO-3, potential impacts to special status and protected wildlife species would be reduced and impacts would be less than significant.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No Impact. The discussion below applies to significance threshold (b) and (c) as outlined above.

The project site is located in a highly urbanized area. The project site is developed with urban uses that preclude the possibility of containing any riparian habitat, or any other sensitive natural communities identified within a local or regional plan, policy, or regulation, or by the California Department of Fish and Wildlife and the United States Fish and Wildlife Service. Additionally, the project site does not contain any state or federally protected wetlands as the site is almost completely paved and developed with existing uses. Therefore, construction and operation of the proposed project would have no impact on sensitive habitats identified in Impact (b) or (c).

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

No Impact. Extensive development and roadways surround the project site which minimizes the opportunity for wildlife to move freely across the site. In addition, the project site does not represent a corridor that links areas of open space lands. As such, the site is not considered to support wildlife

movement or native wildlife nursery sites, and there would be no impact from construction and operation of the proposed project.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less than Significant with Mitigation. The proposed project would include the removal of 116 existing trees onsite, some of which are Protected Trees as defined by the City's Tree Protection Ordinance. However, the proposed project would plant new trees throughout the project site and street frontages as part of the landscaping plan. An arborist survey was conducted by Woodreeve Consulting in August 2023 of the entire project site. During this survey, metal tags were attached to all trees within the project site and data was collected including species, trunk diameter, condition, condition notes, and dripline measurements. A subsequent arborist survey was conducted by Stantec Consulting Services in November 2024 and an Arborist Report was prepared (Appendix B). The arborist survey conducted by Stantec Consulting Services did not conduct a full survey of the project site but did survey all trees proposed for removal. The Arborist Report outlined that of the 116 trees proposed for removal, 74 trees are considered Protected Trees as defined by the City's Tree Protection Ordinance. The proposed project would be required to implement Mitigation Measure BIO-4 which implements the City's Tree Protection Ordinance. The proposed project would be required to comply with City's Municipal Code Chapter 21.32, Tree Protection Regulations, which implements the City's Tree Protection Ordinance and outlines the City's tree protection requirements. The proposed project would be required to obtain a permit from the City's Community Development Department before removing any trees onsite and comply with the requirements under the municipal code including preparation and submittal of an Arborist Report. The Tree Removal Permit application will be considered by the Planning Commission and City Council during the development review process and the Arborist Report prepared for the proposed project is included as Appendix B to this Initial Study. The proposed project would comply with City requirements and would provide replacement trees at the ratio required by the City for removal of Protected Trees or would provide mitigation fees if required by the City. Implementation of Mitigation Measure BIO-4 and compliance with the City's tree protection requirements would ensure the proposed project does not conflict with any local policies or ordinances protecting biological resources and the impacts would be less than significant.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact. The City is under jurisdiction of the Santa Clara Valley Habitat Plan; however, the plan only includes the Los Gatos Creek Trail and the Los Gatos Creek in the City and the remaining area of the City is excluded from the habitat plan permit area. As the proposed project would not result in impacts to biological resources as identified above, the proposed project would not conflict with eh provisions of the Santa Clara Valley Habitat Plan. The proposed project would not redesignate any land designated for open space or habitat protection and would not conflict with any adopted plans. Therefore, construction and operation of the proposed project would have no impact on or conflict with a habitat conservation plan.

3.4.1 Mitigation Measures

MM BIO-1: **Northern California Legless Lizard Pre-Construction Surveys.** A comprehensive survey for Northern California legless lizard of all areas exclusive of buildings, pavement or lawn shall be conducted within the project area within 14 days prior to construction. If no Northern California legless lizards are found, no further mitigation is necessary. If a Northern California legless lizard is observed within the proposed impact area, a qualified biologist shall relocate the individual to other suitable habitat a sufficient distance outside of the project area to preclude its return to the project area prior to construction.

MM BIO-2: **Pre-Construction Nesting Bird Surveys.** If construction activities (including tree and building removal) are proposed during the bird nesting season (February 1 – August 31), a focused survey for nesting raptors (including Swainson's hawk) and migratory bird nests shall be conducted by a qualified biologist within 14 days prior to the beginning of construction activities in order to identify active nests. This survey shall be conducted within the proposed construction area and all accessible areas within 250 feet of the construction area. If active raptor nests are found, no construction activities shall take place within 500 feet of the nest until the young have fledged. If active songbird nests are found, a 100-foot no disturbance buffer will be established. These no-disturbance buffers may be reduced based on consultation and approval by the California Environmental Quality Act (CEQA) lead agency. The perimeter of the protected area shall be indicated by bright orange temporary fencing. No construction activities or personnel shall enter the protected area, except with approval of the biologist. If tree removal is necessary, trees containing nests, or burrows that must be removed as a result of project implementation shall be removed during the nonbreeding season (late September to March). If no active nests are found during the focused survey, no further mitigation will be required.

MM BIO-3: **Pre-Construction Roosting Bat Surveys.** A qualified biologist shall conduct a bat habitat assessment of all trees proposed for removal. This habitat assessment shall identify all potentially suitable roosting habitat and may be conducted up to one (1) year prior to the start of construction. If potential roosting habitat is identified (cavities in trees) within trees proposed for removal, the biologist shall survey the potential roosting habitat during the active season (generally April through October or from January through March on days with temperatures in excess of 50 degrees Fahrenheit) to determine presence of roosting bats. These surveys are recommended to be conducted utilizing methods that are considered acceptable by California Department of Fish and Wildlife and bat experts. Methods may include evening emergence surveys, acoustic surveys, inspecting potential roosting habitat with fiberoptic cameras or a combination thereof. If pre-construction surveys indicate that no roosts of special-status bats are present, or that roosts are inactive or potential habitat is unoccupied, no further mitigation is required. If roosting bats are identified within any of the trees planned for removal, or if presence is assumed, the trees shall be removed outside of pup season only on days with temperatures in excess of 50 degrees Fahrenheit. Pup season is generally during the months of May through August. Two-step tree removal shall be utilized under the supervision of the qualified biologist. Two-step tree removal involves removal of all branches of the tree that

do not provide roosting habitat on the first day, and then the next day cutting down the remaining portion of the tree. Once the bats have been excluded, tree removal may occur.

MM BIO-4: **Removal of Protected Trees.** In accordance with the City's Tree Protection Ordinance, the applicant shall prepare a tree survey plan and submit that along with a Tree Removal permit Application to the City. Mitigation for the tree removal may including panting of replacement trees (with the species, size, and location determined by the City), payment of in-lieu fee, or a combination of both options.

3.5 CULTURAL RESOURCES

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
V. CULTURAL RESOURCES — Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?	☒	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?	☒	☐	☐	☐
c) Disturb any human remains, including those interred outside of formal cemeteries?	☒	☐	☐	☐

Discussion of Impacts

a) Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?

Potentially Significant Impact. The proposed project site neither contains nor is adjacent to any built environment resource that qualifies as a historical resource for the purposes of CEQA. Therefore, new development on the proposed project site would not have the potential to cause a substantial adverse change to the significance of any built environment historical resource, as defined in Section 15064.5 of the CEQA Guidelines. However, it cannot entirely be ruled out that archaeological deposits that qualify as historical resources could be encountered during proposed project construction activities. Should such deposits be encountered during project ground disturbance, a substantial adverse change in the significance of a historical resource would occur from its demolition, destruction, relocation, or alteration such that the significance of the resource would be materially impaired (CEQA Guidelines Section 15064.5(b)(1)). Therefore, proposed project's potential to result in adverse changes in the significance of an historical resource or archaeological deposits that qualify as historical resources will be further analyzed in the EIR.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Potentially Significant Impact. Though the project site does not include any known archaeological resources, the proposed project site's potential for containing as-yet undocumented buried archaeological resources indicate sensitivity for buried precontact archaeological deposits. Therefore, the proposed project could result in substantially significant impacts to cultural resources if undiscovered archaeological resources are encountered during project construction. The proposed project's potential to result in adverse changes in the significance of an archaeological resources will be further analyzed in the EIR.

c) Disturb any human remains, including those interred outside of formal cemeteries?

Potentially Significant Impact. Based on the archaeological records search and map and literature review, there is a potential, albeit low, for the disturbance of human remains as a result of the proposed project. Therefore, proposed project's potential to disturb any human remains will be further analyzed in the EIR.

3.6 ENERGY

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
VI. ENERGY — Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☒	☐	☐	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☒	☐	☐	☐

Discussion of Impacts

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Potentially Significant Impact. The proposed project's construction and operation could result in wasteful, inefficient, or unnecessary consumption of energy resources, resulting in a potentially significant impact. Therefore, the proposed project's potential to result in environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources during construction and operation will be further analyzed in the EIR.

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Potentially Significant Impact. The proposed project's construction and operation could conflict with or obstruct a state or local plan for renewable energy or energy efficiency, resulting in a potentially significant impact. The proposed project's potential to conflict with or obstruct a state or local plan for renewable energy or energy efficiency will be further analyzed in the EIR.

3.7 GEOLOGY AND SOILS

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
VII. GEOLOGY AND SOILS — Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	☐	☐	☒	☐
ii) Strong seismic ground shaking?	☐	☒	☐	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☒	☐	☐
iv) Landslides?	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on strata or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	☐	☒	☐	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code, creating substantial direct or indirect risks to life or property?	☐	☒	☐	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☐	☒	☐

Discussion of Impacts

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologic for the area or based on other substantial evidence of a known fault?

Less than Significant Impact. As outlined in the City's 2001 General Plan EIR, there are numerous active faults that are located in the regional vicinity of the City; however, no active faults are located within the City's Planning Area. Additionally, there are no Alquist-Priolo Fault Zones located within the City (City of Campbell 2001a). Therefore, project site is not located within a Alquist-Priolo Fault Zone and no known major active faults run through the project site. Therefore, the potential for impact from the rupture of an earthquake fault is low and impacts would be less than significant.

ii) Strong seismic ground shaking?

iii) Seismic-related ground failure, including liquefaction?

Less than Significant with Mitigation. The discussion below applies to significance threshold (a.ii) and (a.iii) as outlined above.

The project site and the City is located within a seismically active region and the potential for impacts causing strong seismic ground shaking is high. Additionally, the project site is identified by the City as having high liquefaction potential and moderate shrink-swell potential (City of Campbell 2022). A Preliminary Geotechnical Exploration Report (Geotech report) was prepared for the proposed project by ENGEO Incorporated in October 2023 (Appendix C). The Geotech report performed preliminary analysis of the onsite soils to analyze potential liquefaction potential and identified that the risk of liquefaction at the site is low and estimated 0.25 to 0.5 inches of liquefaction induced settlement to occur. However, the Geotech report identified that this estimate is preliminary in nature and a design-level exploration should be completed to further evaluate the potential for liquefaction.

The Geotech report includes preliminary recommendations for initial land planning including recommendations for fill removal, expansive soil mitigation, fill compaction, and foundation recommendations. As noted in the Geotech report, the recommendations provided are preliminary in nature and final recommendations regarding site grading and foundation construction would be provided after future site-specific, design-level geotechnical exploration has been undertaken. Therefore, the proposed project would be required to prepare a site-specific, design-level geotechnical exploration and would be required to implement the recommendations included in the report, as required by Mitigation Measure GEO-1. With implementation of Mitigation Measure GEO-1, the proposed project would be designed and constructed in accordance with recommendations included in the Geotech report to reduce potential geotechnical impacts.

As outlined in the City's 2001 General Plan Strategy HS-3.2a, new developments proposed within the City are required to comply with the provisions of the California Building Code (CBC) and Uniform Building Code regarding preparation of geotechnical investigations in accordance with state law, engineer improvements to address potential seismic and ground failure issues and use earthquake resistant construction techniques to address potential earthquake loads when constructing buildings and improvements. The City requires the submission and review of geologic and soils reports for all development consistent with City Municipal Code Section 21.18.130, Seismic and geologic hazards, and Chapter 20.72, Soils Reports. Additionally, the City's 2001 General Plan Strategy HS-3.1a requires all

new construction to be built in accordance with the most recent Building and Fire Codes. With implementation of Mitigation Measure GEO-1 and compliance with CBC design guidelines and City requirements and standards, the proposed project would not result in substantial adverse effects involving strong seismic ground shaking or seismic related ground failure and impacts would be less than significant.

iv) Landslides?

No Impact. Given the relatively flat topography of the project site and because the site is not classified as being in a landslide area, the potential for impacts related to landslides is very low. Therefore, there would be no impact related to seismically induced landslides from proposed project construction and operation.

b) Result in substantial soil erosion or the loss of topsoil?

Less than Significant Impact. Construction activities associated with the proposed project would involve demolition, grading, and excavation activities which could expose soils to sources of wind or water, resulting in the potential for erosion and sedimentation on and off the project site. As discussed in Section 3.10, Hydrology and Water Quality, the proposed project would disturb greater than one acre and would require coverage under the National Pollutant Discharge Elimination System (NPDES) General Construction Permit. The NPDES Permit is obtained through State Water Resources Control Board (SWRCB) and requires the preparation and implementation of a Stormwater Pollution Prevention Plan (SWPPP) which requires implementation of standard construction best management practices (BMPs) to minimize erosion and loss of topsoil. As outlined in the City's Grading and Site Improvements Building Application Guide, an erosion control plan is required to be prepared and submitted as part of the grading and site improvements permit application (City of Campbell 2024). Therefore, the proposed project would be required to prepare and submit to the City an erosion control plan that outlines the erosion control measures to be implemented during construction. Additionally, the City's 2001 General Plan Strategy OSP-9.1d requires new construction to utilize site preparation, grading, and foundation designs that provide erosion control to prevent sedimentation. With implementation of BMPs required by the SWPPP under the NPDES Permit, preparation of an erosion control plan, and utilization of designs that provide erosion control during construction, the potential impacts related to soil erosion would be reduced and impacts would be less than significant during construction.

Once constructed, the proposed project would be landscaped and/or covered in buildings or hardscape features; and would not result in soil erosion or loss of topsoil. New pervious areas created as part of the proposed project would include landscaping areas, open space areas, and bioretention areas thereby, preventing soil erosion or loss of topsoil. There would be no impact related to erosion and topsoil loss from operation of the proposed project.

c) Be located on strata or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code, creating substantial direct or indirect risks to life or property?

Less than Significant with Mitigation. The discussion below applies to significance threshold (c) and (d) as outlined above.

The City's 2001 General Plan EIR identifies that alluvial fan deposits underlying most of the City are moderately susceptible to liquefaction (City of Campbell 2001a). However as identified above under Impact a.ii/a.iii, the Geotech report identified that the risk of liquefaction at the site is low. Additionally, the Geotech report identified that based on experience in the site vicinity, the near-surface soils are anticipated to have low to moderate expansive potential. Therefore, the proposed project could be located on unstable ad expansive soil, resulting in a potentially significant impact.

As required by Mitigation Measure GEO-1, the proposed project would be required to prepare a site-specific, design-level geotechnical exploration and would be required to implement the recommendations included in the report. Preparation of a site-specific, design-level geotechnical exploration report would ensure that the project site soils are analyzed for its potential to result in lateral spreading, subsidence, liquefaction, and collapse and would ensure that appropriate construction design guidelines and recommendations are followed to reduce any potential impacts. As outlined in the City's 2001 General Plan Strategy HS-3.2a, all projects proposed within the City are required to comply with the provisions of the CBC and Uniform Building Code, which requires development projects to perform geotechnical investigations in accordance with state law, engineer improvements to address potential seismic and ground failure issues and use earthquake resistant construction techniques to address potential earthquake loads when constructing buildings and improvements. The City requires the submission and review of geologic and soils reports for all development consistent with City Municipal Code Section 21.18.130, Seismic and geologic hazards, and Chapter 20.72, Soils Reports. Additionally, the City's 2001 General Plan Strategy HS-3.1a requires all new construction to be built in accordance with the most recent Building and Fire Codes. With implementation of Mitigation Measure GEO-1 and compliance with CBC design guidelines and City requirements and standards, the proposed project would not result in substantial adverse effects involving unstable or expansive soils and impacts would be less than significant.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

No Impact. The proposed project would connect to and be served by the City's existing sanitary sewer system and would not require the installation of septic or alternative wastewater disposal systems. Therefore, no impact would occur.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less than Significant Impact. As identified in the City's 2001 General Plan EIR, there have been no significant paleontological resources recorded within the City and as the entirety of the project site has already undergone ground disturbing activities during construction of the existing uses, it is unlikely that undiscovered paleontological resources would be present at the site. However, as the proposed project would require ground disturbing activities, there is some potential for undiscovered paleontological resources to be encountered during construction activities. The City's 2001 General Plan includes strategies that would reduce potential impacts to paleontological resources. If undiscovered paleontological resources are encountered during construction activities, the proposed project would be required to comply with the City's 2001 General Plan Strategy CNR-1.1b which requires the discontinuation of all work in the immediate vicinity and the preparation of a resources mitigation plan and monitoring program by a licensed archaeologist if resources are found on any sites within the City. The City's 2001 General Plan EIR identified that implementation of Strategy CNR-1.1b would reduce potential impacts to undocumented paleontological resources (City of Campbell 2001a). As it is unlikely that the proposed project would result in impacts to undiscovered resources and the proposed project would comply with General Plan policies and strategies, the proposed project would not have the potential to destroy a unique paleontological resource onsite or unique geological feature and impacts would be less than significant.

3.7.1 Mitigation Measures

MM GEO-1: **Preparation of a Design-Level Geotechnical Exploration Report**. Prior to the approval of a building permit, the project applicant shall prepare a site-specific, design-level geotechnical exploration report. All recommendations included in the report shall be incorporated into the project site plans and the proposed project shall be designed and constructed in accordance with all recommendations included in the report. The report and site plans with the recommendations incorporated shall be submitted and reviewed by the City to ensure compliance with City requirements and standards.

3.8 GREENHOUSE GAS EMISSIONS

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
VIII. GREENHOUSE GAS EMISSIONS — Would the proposed project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐
b) Conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐

Discussion of Impacts

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Potentially Significant Impact. The impacts associated with greenhouse gas (GHG) emissions generated by the proposed project are related to the emissions from construction and operation. Off-road equipment, materials transport, and worker commutes during construction of the proposed project would generate GHG emissions. Building operation, energy use, and mobile sources from vehicle trips by residents would also generate GHG emissions. The proposed project would have the potential to generate GHG emissions that could have a significant impact on the environment. Therefore, this impact is potentially significant, and GHG emissions from the proposed project will be further analyzed in the EIR.

b) Conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?

Potentially Significant Impact. The proposed project could conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, resulting in a potentially significant impact. The proposed project's potential to conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs will be further analyzed in the EIR.

3.9 HAZARDS AND HAZARDOUS MATERIALS

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
IX. HAZARDS AND HAZARDOUS MATERIALS — Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☒
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☐	☒
e) For a project located within an airport land use compatibility plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☒	☐

Discussion of Impacts

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less than Significant Impact. The discussion below applies to significance threshold (a) and (b) as outlined above.

The proposed project would involve the construction of a residential development which would include single-family and multi-family residential buildings. Construction activities would include the demolition of existing structures and the construction of new buildings and associated infrastructure. During the construction phase, limited amounts of hazardous materials would be used, including standard construction materials such as concrete, paints, solvents and heavy construction equipment which would contain diesel fuels and oils, and construction activities could potentially cause accidental spills or releases of hazardous materials. As part of the NPDES Construction General Permit, the proposed project would be required to prepare and implement an SWPPP that would include BMPs to prevent accidental spills of hazardous materials during construction. With adherence to applicable federal, state, and local regulations, and implementations of BMPs in the SWPPP, the impact to the public or environment from use or accidental release of hazardous materials during proposed project construction would be reduced. A Phase I Environmental Site Assessment (ESA) was prepared for the proposed project by ENGEO Incorporated in October 2023 (Appendix D). Soil sampling and laboratory analysis conducted for the Phase 1 ESA indicated there were trace levels of lead, arsenic, and organochlorine pesticides detected in the onsite soils. However, all concentration were detected below the corresponding residential screening levels and background concentration levels. Therefore, the trace concentrations detected in the project site soils would not potentially expose construction workers or the public to hazardous conditions during construction and operation and the Phase I ESA determined that there was no evidence of recognized environmental conditions (RECs), controlled RECs (CRECs), or historical RECs (HRECs) identified onsite (Appendix D). Therefore, the Phase I ESA determined no further environmental studies are required for the site at this time. Impacts related to the routine transport, use, and disposal of hazardous materials or accidental release of hazardous materials through accident condition during proposed project construction would be less than significant.

During operation of the proposed project, the use of hazardous materials would be limited to those commonly found at residential uses such as solvents, cleaners, paints, and pesticides for landscape maintenance activities. These common household hazardous materials would be used in limited quantities and would not create a substantial hazard to the public or the environment. Therefore, impacts related to the routine transport, use, and disposal of hazardous materials or accidental release of hazardous materials through accident condition during proposed project operation would be less than significant.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

No Impact. The closest school to the project site is Old Orchard School, which is located approximately 0.85-mile northwest of the site. Therefore, the proposed project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25-mile of an existing or proposed school and there would be no impact.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

No Impact. A review of the SWRCB GeoTracker database and the Department of Toxic Substances Control (DTSC) EnviroStor database determined that the project site is not included on a list of hazardous materials sites complied pursuant to Government Code Section 65962.5 (SWRCB 2024, DTSC 2024). Therefore, the proposed project would have no impact.

e) For a project located within an airport land use compatibility plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

No Impact. There are no airports located within the City and the closest airport to the project site is the San Jose International Airport, located more than five miles northeast of the project site. The project site is not located within an airport land use compatibility plan or within two miles of an airport and therefore, the proposed project would not result in safety hazards or excessive noise for people residing in the project area. There would be no impact.

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less than Significant Impact. The City has developed an Emergency Operations Plan (EOP) that establishes policy direction for emergency planning, mitigation, response, and recovery activities within the City. Additionally, the City is under jurisdiction of the Santa Clara Valley EOP. During the construction phase, partial street/lane closures may be required. All street/lane closures would conform to City requirements for construction and the proposed project would prepare a TCP to ensure there would be no impacts to surrounding roadways and emergency ingress/egress throughout the area during construction. Therefore, proposed project construction would not impair or interfere with an adopted emergency response plan or evacuation plan and impacts would be less than significant.

The proposed project operations would not modify any existing roadways in such a way that would impede emergency access or evacuation. Vehicular access to the site would be through three driveways located along Campbell Technology Parkway. The driveways and internal street networks would be designed and constructed to provide adequate access throughout the site for emergency vehicles. Additional EVA fire access would be provided via an existing EVA easement at the northern end of the project site from Paseo de Palomas Lane. The proposed project design would be reviewed by the City's Fire and Police departments prior to approval to ensure that the proposed project has adequate ingress and egress, setbacks, clearances, turning radii, etc.; and does not impede emergency access. The SCCFD has reviewed the project plans and has provided AMMR approval ensuring that all three driveways and internal streets would be constructed in accordance with City standards for fire and emergency access and to allow for emergency vehicle egress/ingress. Therefore, the potential impact related to emergency and evacuation plans would be less than significant.

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Less than Significant Impact. The California Department of Forestry and Fire Protection (CAL FIRE) has mapped areas of significant fire hazards in California. The project site is not located in a State Responsibility Area (SRA) or a Very High Fire Hazard Severity Zone (VHFHSZ) (CAL FIRE 2023). Additionally, the U.S. Forest Service (USFS) Wildfire Hazard Potential map designated the project site and surrounding areas as non-burnable (USFS 2020). Areas outside of the VHFHSZ are not subject to special development controls related to heightened fire protection or vegetation management required to minimize the risk of wildland fires. However, new construction at the project site would be subject to standard fire code and building code requirements. The project site is in a highly urbanized area and is served by the SCCFD, who has reviewed the proposed project design to ensure that adequate ingress and egress, setbacks, clearances, turning radii, etc. have been incorporated so that the proposed project does not impede emergency access. Therefore, the proposed project would not expose people or structures to significant risk of loss, injury or death involving wildland fires and impacts would be less than significant.

3.10 HYDROLOGY AND WATER RESOURCES

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
X. HYDROLOGY AND WATER QUALITY — Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would	☐	☐	☒	☐
i) result in substantial erosion or siltation on- or off-site;	☐	☐	☒	☐
ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;	☐	☐	☒	☐
iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
iv) impede or redirect flood flows?	☐	☐	☒	☐
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☒
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☐	☒

Discussion of Impacts

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less than Significant Impact. Construction activities associated with the proposed project would involve demolition, vegetation removal, grading, and excavation activities that could expose barren soils to sources of wind or water, resulting in the potential for erosion and sedimentation on and off the project site and degradation of water quality. Additionally, construction activities would have the potential to

generate polluted runoff into the City's storm drain system. The NPDES stormwater permitting program regulates stormwater quality from construction sites, which includes erosion and sedimentation. As required by the NPDES Construction General Permit program, the preparation of a SWPPP is required for construction activities that would disturb an area of more than one acre. The SWPPP would specify BMPs to avoid and minimize the discharge of pollutants from the project site through standard construction BMPs, such as installation of silt fences, which would substantially reduce potential sediment transport from the construction site. In addition to the SWPPP, an erosion control plan would be required to be prepared and submitted as part of the grading and site improvements permit application as outlined in the City's Grading and Site Improvements Building Application Guide. Therefore, the proposed project would be required to prepare and submit to the City an erosion control plan that outlines the erosion control measures to be implemented during construction to reduce potential erosion and sediment transport from the construction site. Preparation and implementation of a SWPPP and an erosion control plan would ensure that proposed project construction would not violate any water quality standards or waste discharge requirements.

The proposed project would create or replace more than 10,000 square feet of impervious surfaces at the site and would be required to comply with the requirements of the Bay Area Municipal Regional Permit, an NPDES permit issued by the San Francisco Bay Regional Water Quality Control Board (RWQCB). Provision C.3 of the Municipal Regional Stormwater NPDES Permit (MRP) addresses post-construction stormwater requirements for new development and redevelopment projects that add and/or replace 10,000 square feet or more of impervious area. Provision C.3 of the MRP also mandates that new development projects meet the following criteria: 1) incorporate site design, source control, and stormwater treatment measures into the project design; 2) minimize the discharge of pollutants in stormwater runoff and non-stormwater discharge; and 3) prevent increases in runoff flows as compared to pre-development conditions. The proposed project would be designed to meet the Provision C.3 requirements of the MRP, including the construction of approximately 24,309 square feet of bioretention facilities that would collect and treat stormwater runoff prior to entering the City's storm drain facilities. Additionally, the project Applicant would be required to submit a Stormwater Management Plan (SWMP) to the City's Public Works Department. Therefore, operation of the proposed project would not violate any water quality standards or discharge requirements and impacts would be less than significant.

With the preparation of an erosion control plan, SWPPP, and the SWMP, and incorporation and compliance with requirements of Provision C.3 of the MRP, the proposed project would not violate any water quality standards or waste discharge requirements and there would be a less than significant impact during construction and operation.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less than Significant Impact. The project site is underlain by the Santa Clara Subbasin which is a subbasin of the Santa Clara Valley groundwater basin. During construction, demand for water for dust control, concrete mixing, etc. would be short-term and met by existing service connections to municipal suppliers. Construction activities would not require new wells or substantial increases in pumping at regional municipal wells, nor would it interfere with groundwater recharge that could occur if the proposed project were converting pervious surfaces to impervious surfaces.

Most of the project site is paved and is not a major groundwater recharge area. The proposed project would increase the amount of impervious area by two percent on the project site from what currently exists. As the project site is not a major groundwater recharge area and most of the project site is already covered in impervious surfaces, the proposed project is not expected to substantially interfere with groundwater recharge.

San Jose Water provides municipal water services to the City and draws groundwater from the Santa Clara Subbasin, which is part of the larger Santa Clara Valley Basin. According to San Jose Water's 2020 UWMP, groundwater made up approximately 43 percent of the total water supply in 2020. As the proposed project's water demand would be supplied by San Jose Water which uses groundwater as a supply, the proposed project could decrease groundwater supplies. However, the proposed project would not result in substantial increases in water demand at the site that would require San Jose Water to increase its groundwater pumping. Therefore, the proposed project would not substantially decrease groundwater supplies or interfere with groundwater recharge such that the proposed project would impede sustainable groundwater management of the basin and impacts would be less than significant.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would?

i) result in substantial erosion or siltation on- or off-site;

Less than Significant Impact. Construction of the proposed project would include demolition and ground disturbing activities that could result in erosion related impacts. As discussed above in Impact (a), the proposed project would be required to prepare and implement a SWPPP in accordance with the NPDES General Construction Permit and an erosion control plan in accordance with the City's Grading and Site Improvements Building Application Guide. The SWPPP and erosion control plan would include BMPs and erosion control measures that would be implemented during construction activities to reduce the potential for erosion and impacts would be less than significant.

The existing drainage patterns would generally be maintained in post-project conditions. The proposed project would only increase the amount of impervious area by two percent from existing conditions. Additionally, the storm drainage system for the proposed project would discharge to the pre-project point of discharge at Paseo de Palomas Lane. The proposed project also proposes construction of approximately 24,309 square feet of bioretention areas. These areas would collect and treat stormwater runoff before ultimately discharging to the existing storm drain mains located in Campbell Technology Parkway, as well as the existing storm drain mains located along the northern corner of the project site in Paseo de Palomas Lane. Treatment of stormwater runoff prior to the runoff being discharged into the City's storm drain system would reduce potential erosion and siltation impacts. In order to comply with Provision C.3 of the MRP, the project Applicant would also be required to submit a SWMP to the City's Public Works Department. Therefore, with implementation of the erosion control plan, SWPPP, and SWMP, the proposed project would not result in substantial erosion or siltation during construction and operation and the impacts would be less than significant.

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;

Less than Significant Impact. As discussed, the proposed project would only increase impervious area on the site by two percent from existing conditions. The proposed project's storm drainage facilities would also discharge treated runoff to the pre-project point of discharge at Paseo de Palomas Lane. The proposed storm drainage facilities would be designed to meet Provision C.3 requirements of the MRP and would include approximately 24,309 square feet of bioretention facilities that would collect and treat stormwater runoff before being ultimately discharging to the existing storm drain mains. This would control the volume of stormwater at the project site to minimize the potential for flooding. Therefore, the proposed project would not substantially increase the rate or amount of surface runoff in a manner which would result in flooding and impacts would be less than significant.

iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

Less than Significant Impact. As described previously, construction activities would have the potential to generate polluted runoff, and therefore, the proposed project would be required to prepare and implement a SWPPP during construction to prevent, control, and reduce polluted runoff from entering the City's storm drain system. Stormwater generated at the site would be directed and treated in bioretention areas prior to entering the piped storm drain system. The storm drainage system at the site would be designed and constructed in accordance with requirements of Provision C.3 and City guidelines to properly manage runoff from the site. The proposed storm drainage system would control the rate of runoff from the site and ensure polluted runoff does not enter the City's storm drain system. Therefore, the proposed project would not create or contribute runoff water which would exceed the capacity of stormwater drainage systems or provide substantial additional sources of polluted runoff, and there would be a less than significant impact from proposed project construction and operation.

iv) impede or redirect flood flows?

Less than Significant Impact. There are no waterways crossing the project site or nearby that would be impacted from proposed project construction and operation. Onsite stormwater would be directed to the proposed bioretention areas prior to entering the City's storm drainage system. As such, the proposed project would not impede or redirect flood flows and impacts would be less than significant.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

No Impact. The project site is classified as Zone X by the Federal Emergency Management Agency (FEMA) Flood Hazard Map, which are areas of minimal flood hazard (FEMA 2009). The project site is located more than 15 miles east of the Pacific Ocean and therefore, potential for tsunami is not anticipated. In addition, the City is not identified as being within a tsunami or seiche hazard area. The project site is located within an area that would be inundated if the Leniham Dam were to fail. However, this dam is regularly inspected by Santa Clara Valley Water District's Dam Safety program and maintained by the dam owners to ensure that the dam is kept in safe operating conditions. As such, failure of this dam is considered to have an extremely low probability of occurring. The proposed project

would not be located in a flood hazard, tsunami, or seiche zone and would not risk release of pollutants due to inundation. Therefore, there would be no impact.

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

No Impact. The San Francisco Bay RWQCB implements the San Francisco Bay Water Quality Control Plan (Basin Plan) to protect surface quality in the San Francisco Bay. Basin Plan policies are primarily implemented through NPDES permits. The proposed project would comply with all NPDES permit requirements, including the preparation of a SWPPP that identifies BMPs to minimize impacts on water quality during construction. Additionally, the Santa Clara Valley Water District prepared and implemented a Groundwater Management Plan for the Santa Clara and Llagas Subbasins. As the proposed project would not result in impacts related to groundwater quality, supplies, source, or recharge, the proposed project would not conflict with or obstruct implementation of the Groundwater Management Plan. Therefore, the proposed project would not conflict with or obstruct implementation of a water quality control plan or groundwater management plan.

3.11 LAND USE AND PLANNING

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XI. LAND USE AND PLANNING — Would the project:				
a) Physically divide an established community?	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☒	☐	☐	☐

Discussion of Impacts

a) Physically divide an established community?

No Impact. The proposed project consists of a residential development consisting of single-family and multi-family developments on a previously developed site. The proposed project would not create any new physical divisions or permanently alter existing roadways in a manner that would result in division of an established community. Therefore, the proposed project would not introduce physical features that would create a barrier, divide, or separate adjacent uses; or impede circulation through the neighborhood and no impact would occur.

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Potentially Significant Impact. The project Applicant submitted a SB 330 pre-application on April 28, 2023. At the time the application was submitted, the City had not yet adopted the updated 6th Cycle Housing Element or 2040 General Plan, meaning the City was subject to the "Builder's Remedy" provision of the California Housing Accountability Act. The Applicant's submission of a preliminary application under SB 330 therefore conferred upon the Applicant's vested right to apply the protections of the Builder's Remedy to the proposed project through the remainder of its entitlement process. State law provides in these circumstances that a city may not deny the proposed project based on inconsistency with the General Plan land use designation or zoning regulations. Therefore, the City may not evaluate the proposed project's consistency with either the General Plan designation or the zoning district that applied on April 18, 2023 or the current General Plan and zoning designations, as a basis for denial. Though the proposed project is not required to be consistent with the General Plan land use designation or zoning for the project site, the proposed project is still required to be consistent with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, there is a potential for the proposed project to conflict with the existing land use plan. Therefore, this impact is potentially significant and will be further analyzed in the EIR.

3.12 MINERAL RESOURCES

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XII. MINERAL RESOURCES — Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

Discussion of Impacts

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No Impact. The discussion below applies to significance threshold (a) and (b) as outlined above.

The City does not contain any known significant mineral resources or mineral extraction opportunities and does not contain sites designated as a local mineral resource recovery site. Therefore, the proposed project would not result in a loss of availability of a known mineral resource that would be of value or result in the loss of availability of a locally important mineral resource recovery site, and there would be no impact for Impact (a) or (b).

3.13 NOISE

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XIII. NOISE — Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☒	☐	☐	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

Discussion of Impacts

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Potentially Significant Impact. The project site is located adjacent to residential uses and construction could result in a temporary increase in noise levels from equipment, workers, and vehicles onsite. Operation of the proposed project could result in increase in noise levels from existing conditions due to increased traffic along the roads and increased pedestrian traffic. In addition, the proposed development would be adjacent to SR 17. The proposed project's potential to generate temporary or permanent increase in ambient noise levels in the vicinity of the project site in excess of standards could result in potentially significant impacts and will be analyzed fully in the EIR.

b) Generation of excessive groundborne vibration or groundborne noise levels?

Potentially Significant Impact. The project site is located adjacent to residential uses and construction could result in excessive groundborne vibration or groundborne noise levels that result in potentially significant impacts. Therefore, this impact will be fully analyzed in the EIR.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

No Impact. There are no airports located within the City and the closest airport to the project site is the San Jose International Airport, located more than five miles northeast of the project site. The project site is not located within an airport land use compatibility plan or within two miles of an airport and is not within the noise contour areas for the airport. Therefore, the proposed project would not expose people residing in the area to excessive noise levels. The proposed project would not result in a safety hazard or excessive noise for people residing or working in the area and there would be no impact.

3.14 POPULATION AND HOUSING

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XIV. POPULATION AND HOUSING — Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

Discussion of Impacts

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less than Significant Impact. The proposed project would directly induce population growth in the City through residential development. At the time of preparation of the 2001 General Plan and its accompanying EIR, which this document analyzes the proposed project's consistency with, the City was identified to have a residential population of 38,138 residents and an average household size of 2.38 (City of Campbell 2001b). However, since the preparation of the 2001 General Plan, the residential population of the City has increased, and the average household size has fluctuated as a result of changing conditions. Therefore, to accurately estimate the resulting population of the proposed project and its impacts to the existing and projected population of the City, the population and average household size identified in the City's most recent 2022 General Plan EIR is utilized to calculate the anticipated population growth from implementation of the proposed project.

The project proposes construction of 290 new residential units. Using the average household size of 2.49 residents per unit identified in the City's 2022 General Plan EIR, the proposed project would result in an increase of 722 new residents. The City's 2022 General Plan EIR identified that the existing population of the City is 42,726 residents and is anticipated to grow to 64,929 residents by the year 2040 (City of Campbell 2022). The proposed project's 722 new residents would represent approximately 3.3 percent of the anticipated population growth between the existing population and projected population by 2040. Therefore, the increase in residents resulting from the proposed project would be within the projected population growth for the City and would not result in substantial unplanned population growth. Additionally, the proposed project would not result in extension of roads or other infrastructure that could result in indirect unplanned population growth. Therefore, the proposed project would not directly or indirectly induce substantial population growth in the area and impacts would be less than significant.

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

No Impact. The project site does not currently contain any structures utilized for residential purposes and there are no existing people or housing onsite. Therefore, the proposed project would not displace existing people or housing and there would be no impact.

3.15 PUBLIC SERVICES

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XV. PUBLIC SERVICES — Would the project:				
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
Fire protection?	☐	☐	☒	☐
Police protection?	☐	☐	☒	☐
Schools?	☐	☐	☒	☐
Parks?	☐	☐	☒	☐
Other public facilities?	☐	☐	☒	☐

Discussion of Impacts

a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

Fire protection?

Less than Significant Impact. The proposed project would consist of single-family and multi-family residential uses which would increase demand for SCCFD fire protection services and facilities. The closest fire station to the project site is Campbell Fire Station, located approximately 0.4-mile northeast of the project site. Though the proposed project would increase demand for fire protection services due to the presence of more residents, the project site is already currently served by SCCFD as there are existing R&D uses and structures onsite. Though the proposed project would increase the demand for fire protections services, it is not expected to affect SCCFD's response times and would not result in the need for new or altered fire protection facilities. The proposed project would be required to be constructed and operated in accordance with the California Fire Code requirements and City standards (automatic sprinkler systems, fire hydrants, etc.). Incorporation of all California Fire Code and City requirements into the proposed project design would minimize the dependence on SCCFD by reducing fire hazards.

Therefore, the proposed project would not result in or require the construction of new or expanded fire protection facilities and the impacts would be less than significant.

Police protection?

Less than Significant Impact. The proposed project would consist of single-family and multi-family developments which would increase the demand for Campbell Police Department (CPD) services in the area. CPD operates out of one station, located approximately 0.45-mile northwest of the project site. As stated above, though the proposed project would increase demand for police protection services due to the presence of more residents, the project site is already currently served by CPD as there are existing R&D uses and structures onsite. Due to the project site being located in an area that is already served by CPD, the proposed project is not expected to affect CPD's response times or other performance objectives. Therefore, the proposed project would not result in or require the construction of new or expanded police protection facilities and impacts would be less than significant.

Schools?

Less than Significant Impact. The proposed project would generate 722 new residents and therefore would also generate school aged children. Students living at the new development would be within the boundaries of the Cambrian School District (K-8) and Campbell Union High School District (CUHSD) (9-12 high school). Students living at the new development would be within the boundaries of Bagby Elementary School, Price Middle School, and Branham High School.

Cambrian School District utilizes a student generation factor of 0.21869 students per household for TK-6 grade and 0.06313 student per household for grades 7-8 (Cambrian School District 2024). CUHSD utilizes a student generation factor of 0.1004 students per household for high school students (CUHSD 2022). As the proposed project would result in the development of 290 residential units and utilizing the student generation factors of Cambrian School District and CUHSD, the proposed project would be anticipated to result in the generation of 63 TK-6 grade aged children, 18 7-8 grade aged children, and 29 9-12 grade aged children. Therefore, the proposed project would be anticipated to generate approximately 110 school aged children. These school aged children would be anticipated to be served by the existing nearby schools and would not result in a significant impact.

Additionally, Cambrian School District and CUHSD collects developer fees on any new construction of residential and commercial buildings within the district boundaries. Under Senate Bill 50, school districts may collect fees to offset the costs associated with increasing school capacity as a result of residential development. Under the terms of this statute, payment of statutory fees by property owners or property developers is considered to mitigate in full, for the purposes of CEQA, any impacts to school facilities associated with a qualifying project. As the proposed project would pay the school district's developers fees at the rate specified by each school district, the proposed project would not result in significant impacts to school facilities. Therefore, the proposed project would not result in or require the construction of new or expanded school facilities and impacts would be less than significant.

Parks?

Less than Significant Impact. As identified in the City's 2022 General Plan EIR, with an existing City population of 42,726 residents and a total of 82.6 acres of parkland, the City currently provides 1.9 acres

of parkland per 1,000 residents (City of Campbell 2022). The City has adopted the Quimby Act which sets a goal of providing 3 acres of parkland per 1,000 residents. Therefore, the City is at a deficiency for parkland and would require construction of new park facilities to reduce this existing impact. However, as identified in the City's General Plan EIR, the existing deficiency in parkland may be offset with the recreational opportunities available in private parks and other nearby regional parks. The proposed project would result in increased demand for new parks as it would result in the generation of new residents. With an anticipated population of 722 residents, the proposed project would require 2.17 acres of parkland to meet the City's requirements of 3 acres per 1,000 residents.

The closest park to the project site is Edith Morley Park, located directly south of the project site, across Campbell Technology Parkway. The proposed project would be anticipated to increase the use of this existing park; however, the proposed project would include development of recreational opportunities onsite that would reduce demand for existing parks. In accordance with the City's 2001 General Plan Policy OSD-3.1 which requires provision of private open space or recreational facilities in residential projects, the proposed project would include development of public and private open space. The proposed project would include development of 125,943 square feet (2.89 acres) of usable open space throughout the site. As described in Section 2.0, Project Description, a linear open space area is programmed through the central portion of the project site. Amenities are located throughout this linear zone, including playground for children aged 2 through 12, seating areas that allow for passive recreation, shaded picnic areas for gathering, and a ping-pong table area. The linear open space is designed to be lined with trees and shade canopies to provide usable recreation space most of the year. Along the southern edge of the project site, a small pocket park would provide a shaded picnic and BBQ area. Additional usable open space areas located throughout the site would provide passive recreational areas. Though the proposed project would not result in the development of a park facility that would contribute to the City's parkland requirement of 3 acres per 1,000 residents, the approximately 2.89 acres of usable open space provided onsite would be more than the parkland requirement for the proposed project's anticipated population of 722 residents.

As outlined by the City's 2001 General Plan Policy OSP-3.2, the City requires new residential development to pay park impact fees to use for the acquisition and development of park land and recreational facilities (City of Campbell 2001b). The City requires all new residential development to dedicate land and/or pay an in-lieu fee to meet the City's parkland standard of 3 acres of developed parkland per 1,000 residents. The proposed project would include the development of new park space onsite; however, the proposed project would be required to comply with City Municipal Code Chapter 13.08, Park Impact Fees and Parkland Dedication Developments, which requires any developer who proposes to erect or construct any building or structure for which a building permit is required by the City, to dedicate land, pay a fee in lieu thereof, or both, at the option of the City for the establishment and rehabilitation of parks and recreation facilities within the City. Additionally, City Municipal Code Chapter 20.24, Park Impact Fees and Park Land Dedication Subdivision, requires as a condition of approval of a tentative subdivision map or parcel map, the subdivider to dedicate land, pay a fee in lieu thereof, or both, at the option of the City, for the establishment and rehabilitation of park and recreational facilities within the City. In accordance with the City's Municipal Code requirements, the proposed project would pay all required fees, or dedicate land, or both at the option of the City to contribute to the City's establishment and rehabilitation of parks and recreational facilities.

As the proposed project would include development of usable open space onsite that would provide amenities similar to park facilities the proposed project would not be anticipated to create a substantial increase in the demand for nearby parks. Therefore, with the development of onsite usable open space and payment of all required fees in accordance with City Municipal Code requirements, the proposed project would result in a less than significant impact.

Other public facilities?

Less than Significant Impact. Other public facilities in the City include libraries and government facilities. Though the proposed project would be anticipated to result in increased demand to the public facilities such as libraries and government facilities, the proposed project is not anticipated to generate substantial demand that would result in the need for construction of new or expanded public facilities. The proposed project's residents would be anticipated to be adequately served by existing public facilities and therefore, the proposed project would not result in or require the construction of new or expanded public facilities and impacts would be less than significant.

3.16 RECREATION

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XVI. RECREATION — Would the project:				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☒	☐

Discussion of Impacts

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Less than Significant Impact. The discussion below applies to significance threshold (a) and (b) as outlined above.

As identified in the City's 2022 General Plan EIR, with an existing City population of 42,726 residents and a total of 82.6 acres of parkland, the City currently provides 1.9 acres of parkland per 1,000 residents (City of Campbell 2022). The City has adopted the Quimby Act which sets a goal of providing 3 acres of parkland per 1,000 residents. Therefore, the City is at a deficiency for parkland and would require construction of new park facilities to reduce this existing impact. However, as identified in the City's General Plan EIR, the existing deficiency in parkland may be offset with the recreational opportunities available in private parks and other nearby regional parks. The proposed project would result in increased demand for new parks as it would result in the generation of new residents. With an anticipated population of 722 residents, the proposed project would require 2.17 acres of parkland to meet the City's requirements of 3 acres per 1,000 residents.

The closest park to the project site is Edith Morley Park, located directly south of the project site, across Campbell Technology Parkway. The proposed project would be anticipated to increase the use of this existing park; however, the proposed project would include development of recreational opportunities onsite that would reduce demand for existing parks. The City's 2001 General Plan Policy OSD-3.1 requires provision of private open space or recreational facilities in residential projects (City of Campbell 2001b). As described in Section 2.0, Project Description, the proposed project would include development of 125,943 square feet (2.89 acres) of usable open space throughout the site that would provide amenities such as playgrounds, shaded picnic areas, and BBQ areas. Though the proposed project

would not result in the development of a park facility that would contribute to the City's parkland requirement of 3 acres per 1,000 residents, the approximately 2.89 acres of usable open space provided onsite would be more than the parkland requirement for the proposed project's anticipated population of 722 residents.

As outlined by the City's 2001 General Plan Policy OSP-3.2, the City requires new residential development to pay park impact fees to use for the acquisition and development of park land and recreational facilities (City of Campbell 2001b). The City requires all new residential development to dedicate land and/or pay an in-lieu fee to meet the City's parkland standard of 3 acres of developed parkland per 1,000 residents. The proposed project would be required to comply with City Municipal Code Chapter 13.08, Park Impact Fees and Parkland Dedication Developments, which requires any developer who proposes to erect or construct any building or structure for which a building permit is required by the City, to dedicate land, pay a fee in lieu thereof, or both, at the option of the City for the establishment and rehabilitation of parks and recreation facilities within the City. Additionally, City Municipal Code Chapter 20.24, Park Impact Fees and Park Land Dedication Subdivision, requires as a condition of approval of a tentative subdivision map or parcel map, the subdivider to dedicate land, pay a fee in lieu thereof, or both, at the option of the City, for the establishment and rehabilitation of park and recreational facilities within the City. In accordance with the City's Municipal Code requirements, the proposed project would pay all required fees, or dedicate land, or both at the option of the City to contribute to the City's establishment and rehabilitation of parks and recreational facilities.

The proposed project would be anticipated to increase use of existing nearby parks and recreational facilities. However, as the proposed project would include development of usable open space onsite that would provide amenities similar to park facilities, the proposed project would not be anticipated to create a substantial increase in the demand for nearby parks. The proposed project would not include or require construction of new parks and recreational facilities which might have an adverse physical effect on the environment. Therefore, with the development of onsite usable open space and payment of all required fees in accordance with City Municipal Code requirements, the proposed project would result in a less than significant impact.

3.17 TRANSPORTATION

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XVII. TRANSPORTATION — Would the project:				
a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	☒	☐	☐	☐
b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	☒	☐	☐	☐
c) Substantially increase hazards to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d) Result in inadequate emergency access?	☐	☐	☒	☐

Discussion of Impacts

a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Potentially Significant Impact. The proposed project would have the potential to conflict with a program plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities, resulting in a potentially significant impact, and will be further analyzed in the EIR.

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Potentially Significant Impact. CEQA Guidelines Section 15064.3, subdivision (b)(3) allows for a qualitative analysis of potential impacts related to vehicle miles traveled (VMT). Although the proposed project meets the criteria outlined in CEQA Section 15064.3 (b.1), which states that a project located within 0.5 mile of a major transit stop or along a high-quality transit corridor would generally be presumed to have a less than significant transportation impact, a project specific traffic impact assessment is required to be prepared, since in accordance with City's VMT policy such projects must be consistent with the General Plan. The assessment would analyze the proposed project's potential to increase VMT in the area above established thresholds. Therefore, for the purposes of this Initial Study, proposed project impacts are considered to be potentially significant and will be further analyzed in the EIR.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less than Significant Impact. The proposed project would include construction of new driveways and internal streets. All roadway improvements would be completed in accordance with City requirements to ensure the proposed project design does not substantially increase hazards or result in an incompatible

use. The proposed access point to the project site would be from three driveways along Campbell Technology Parkway. An additional access would be provided via an existing EVA easement at the northern end of the project site from Paseo de Palomas Lane. The proposed driveways and internal streets would be designed in accordance with City requirements and would be designed to ensure adequate turning radii is provided and City standards for fire and emergency access to allow for emergency vehicle egress/ingress would be incorporated into the proposed project design. Additionally, the proposed project would not result in any uses that would result in incompatible uses such as the use of farm equipment. The proposed project would not substantially increase hazards due to a geometric design feature or incompatible uses and impacts would be less than significant.

d) Result in inadequate emergency access?

Less than Significant Impact. Construction of the proposed project would generate traffic through the transport of workers, equipment, and materials to and from the project site. Travel routes for construction workers and material import would be determined in consultation with the City's Engineering and Transportation Division and included in the construction traffic management plan to be developed. All construction materials would be stored onsite. The proposed project is anticipated to require some temporary restrictions and closures for a portion of Campbell Technology Parkway along the project boundary to complete the frontage improvements and connect new utility lines to the existing utility mains located along Campbell Technology Parkway. For any temporary restrictions or closures required for adjacent roadways, the proposed project would prepare and implement a TCP. Therefore, the impact would be less than significant.

Post construction, proposed project operation would not result in new offsite access roads or result in changes to configuration of existing roadways and would not add so much congestion to surrounding roadways that response times are negatively impacted. The proposed driveways and internal streets would provide adequate access for emergency vehicles serving the development and would be designed to meet emergency vehicle access requirements. The SCCFD has reviewed the project plans and has provided AMMR approval ensuring that all three driveways and internal streets would be constructed in accordance with City standards for fire and emergency access and to allow for emergency vehicle egress/ingress. Proposed project access and emergency plans would require review and approval from the fire department. Therefore, the proposed project would not result in inadequate emergency access from operations and impacts would be less than significant.

3.18 TRIBAL CULTURAL RESOURCES

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XVIII. TRIBAL CULTURAL RESOURCES — Would the project: cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☒	☐	☐	☐
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☒	☐	☐	☐

Discussion of Impacts

Would the project: cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Potentially Significant Impact. The discussion below applies to significance threshold (a) and (b) as outlined above.

The City is located within the ethnographic territory of the Tamyen tribelet of Ohlone, who occupied a large area in the south bay. As identified in the City's 2001 General Plan EIR, the Ohlone were known to traditionally use creek banks for activities such as sweat house construction and other cultural practices (City of Campbell 2001a). The Los Gatos Creek is located approximately 0.1 mile west of the project site across SR 17. Due to the project site's close proximity to Los Gatos Creek, there is potential for tribal practices and activities to have occurred near or within the project site.

PRC Section 21080.3.1 requires that local agencies formally consult with recognized California Native American tribes during the CEQA process to discuss potential impacts on tribal cultural resources. Prior to the release of a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report, the agency must initiate consultation with tribes that are traditionally and culturally affiliated with the geographic area of a proposed project if (1) the tribe requested of the agency, in writing, to be informed through formal notification of proposed projects in the geographic area that is traditionally and culturally affiliated with the tribe; and (2) the tribe responds, in writing, within 30 days of receipt of the formal notification of a proposed project and requests consultation with the agency (PRC Section 21080.3.1(b)).

On October 30, 2024, Stantec Consulting Services, on behalf of the City, submitted a request to the NAHC to review its Sacred Lands File (SLF) for the project site. The NAHC is the official state repository of Native American sacred site location records in California. Stantec Consulting Services received a response on October 31, 2024, from the NAHC, stating that, “A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative.” A list of twenty-three tribal contacts from nine tribal groups was provided with the NAHC response.

The City is currently conducting consultation pursuant to PRC Section 21080.3.1(i.e., AB 52). The results of the consultation are not available at the time of preparing this Initial Study and therefore, the results of consultation will be analyzed in the Draft EIR. As such, the proposed project’s impacts to tribal cultural resources are considered to be potentially significant and will be further analyzed in the EIR.

3.19 UTILITIES AND SERVICE SYSTEMS

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XIX. UTILITIES AND SERVICE SYSTEMS — Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☒	☐	☐	☐
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☒	☐	☐	☐
d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

Discussion of Impacts

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Less than Significant Impact. The proposed project would require installation of new water, wastewater, stormwater, and electric lines to serve the proposed development which are discussed below.

Water

Water service at the project site is provided by the San Jose Water Company. The proposed project would include the installation of new 8-inch water lines throughout the site that would connect to the existing 8-inch potable water mains within Campbell Technology Parkway. The proposed project does not propose to relocate any existing water mains and would not require upsizing of the water mains within Campbell Technology Parkway. The proposed project is anticipated to be adequately served by the

existing water system infrastructure in the area. Therefore, the proposed project would not require the relocation or construction of new water system facilities that would result in a significant environmental effect and impacts would be less than significant.

Wastewater

Wastewater service at the project site is provided by WVSD. The proposed project would connect to existing 8-inch sanitary sewer mains along Campbell Technology Parkway that enter and traverse the site in the northerly direction through a series of public sewer easements. The existing 8-inch sanitary sewer main ultimately leaves the site in the northeast corner of the project site at Paseo de Palomas Lane and drains east toward Union Avenue. The proposed project would relocate the existing public sanitary sewer main that crosses the project site to be within the proposed streets. The proposed project would utilize the existing 8-inch sanitary sewer lines that exists throughout the site and would include construction of new 8-inch sanitary sewer lines throughout the site to connect to each proposed building. The 8-inch sanitary sewer lines would connect to the existing 8-inch sanitary sewer main located along Campbell Technology Parkway and the existing 8-inch sewer main located along Paseo de Palomas Lane.

As mentioned, the proposed project would require relocation of an existing sanitary sewer main that crosses the project site. However, the existing sanitary sewer main would be relocated to be within the proposed streets within the project site and would be completed in accordance with City requirements related to construction of wastewater infrastructure. The relocation of the existing sanitary sewer main would be completed during the project construction phase and would not result in construction activities that would result in a significant environmental effect. Therefore, the proposed project would not require the relocation or construction of new sanitary sewer system facilities that would result in a significant environmental effect and impacts would be less than significant.

Stormwater

The proposed project would include approximately 24,309 square feet of bioretention facilities that would be constructed throughout the site. The proposed bioretention facilities would collect and treat stormwater runoff before being conveyed to the proposed storm drain lines throughout the site. Various sized storm drain lines ranging from 12-inch to 36-inch storm drain lines would be constructed throughout the site to convey stormwater runoff to the treatment areas and to the designated discharge points. Additionally, an existing storm drain main that crosses the project site would be relocated to be within the proposed streets. The stormwater runoff would eventually be discharged to the existing storm drain mains located in Campbell Technology Parkway, as well as existing storm drain mains located along the northern corner of the project site in Paseo de Palomas Lane. Proposed storm drainage facilities would conform to the C.3 Stormwater Technical guidelines and requirements.

As mentioned, the proposed project would require relocation of an existing storm drain main that crosses the project site. However, the existing storm drain main would be relocated to be within the proposed streets within the project site and would be completed in accordance with City requirements related to construction of storm drainage infrastructure. The relocation of the existing storm drain main would be completed during the project construction phase and would not result in construction activities that would result in a significant environmental effect. The proposed project would construct a new storm drainage system within the project site that would connect to and be served by the existing storm drainage system within the area. Therefore, the proposed project would not require the relocation or construction of new

sanitary sewer system facilities that would result in a significant environmental effect and impacts would be less than significant.

Electric and Natural Gas

Electricity and gas service is provided to the project site by the PG&E. All residential units and associated building systems and appliances/fixtures are proposed to be 100 percent electric, and the proposed project would not utilize natural gas. Therefore, the proposed project would not require relocation or construction of new natural gas facilities and there would be no impact.

The proposed project would include connections to existing electrical lines within the area. Additionally, an existing electric pole and overhead line that is located in the northwest corner of the project site would require relocation to not conflict with the proposed site improvements. Relocation of the existing electric pole and overhead lines would be completed during project construction and would not cause a significant environmental effect. All homes are proposed to have solar photovoltaic systems installed, either individually or for the larger condominium building as a whole. All homes are proposed to have a single dedicated Level 1 and a single dedicated Level 2 receptacle in the garage for EV charging and all homes would have the option of a battery backup located in the garage. The proposed project is anticipated to be served by existing electric facilities in the area and would not require the relocation or construction of new electrical facilities that would result in a significant environmental effect and impacts would be less than significant.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Potentially Significant Impact. The proposed project would result in increased demand to water supply. The proposed project is anticipated to have an annual water usage of 30 million gallons per year. The proposed project may require a project specific water supply assessment to be prepared. Therefore, the availability of water supplies is considered to be potentially significant and will be further analyzed in the EIR.

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Potentially Significant Impact. The proposed project would result in an increased demand for wastewater treatment. The proposed project is anticipated to have an annual wastewater generation of 17.9 million gallons per year. The proposed project would require an analysis of the available treatment capacity of the wastewater treatment provider and therefore, the proposed project impact with regard to wastewater treatment capacity is considered to be potentially significant and will be further analyzed in the EIR.

d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less than Significant Impact. Construction of the proposed project would require the demolition of existing structures onsite which would generate solid waste. The proposed project would be required to

comply with the City's Municipal Code Chapter 6.12, Recycling and Salvaging of Construction and Demolition Debris, to ensure proper disposal of demolition materials. Municipal Code Section 6.12.030, Requirement to divert C&D debris, requires construction and demolition debris be diverted from landfills by using recycling, reuse, salvage, and other diversion programs at the required rate set by California's Green Building Standards Code. Additionally, the proposed project would be required to comply with City Municipal Code Section 6.12.070, Reporting, which requires documentation certifying construction and demolition debris was recycled at the diversion rate set by California's Green Building Standards Code as a condition of final approval and for issuance of any certificate of occupancy. Compliance with these requirements would ensure the construction of the proposed project would not generate solid waste in excess of state or local standards and impacts created by construction would be less than significant.

The City contracts with West Valley Collection and Recycling, LLC to provide and handle all residential and commercial solid waste collection for the City. Approximately 97 percent of the solid waste collected from the City is sent to the Guadalupe Sanitary Landfill and Monterey Peninsula Landfill, which have an estimated closure date of 2048 and 2107, respectively. According to CalRecycle, in 2023 the City had an annual disposal rate of 3.7 pounds per person per day for residents (CalRecycle 2024). With an estimated 722 new residents, the proposed project would generate 2,671.4 pounds of solid waste per day or 1.3 tons per day. The estimated 1.3 tons per day of solid waste generated by the proposed project would be less than one percent of the maximum permitted throughput received at either landfill. Therefore, there would be sufficient landfill capacity available to accommodate solid waste disposal needs for the proposed project. The proposed project would implement and comply with all solid waste reduction measures adopted by the City and incorporate recycling collection areas into the proposed project. Therefore, the proposed project would not generate waste in excess of state or local standards, capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals and the impacts would be less than significant.

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less than Significant Impact. The proposed project would comply with all federal, state, and local statutes and regulations related to solid waste including the California Integrated Waste Management Act (Assembly Bill 939), which mandates local cities and counties divert 50 percent of waste from area landfills, and Chapter 6.12, Recycling and Salvaging of Construction and Demolition Debris, in the City Municipal Code. Therefore, impacts would be less than significant.

3.20 WILDFIRE

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XX. WILDFIRE — If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

Discussion of Impacts

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact. The discussion below applies to Impacts (a), (b), (c), and (d) as outlined above.

The project site and the adjacent areas are not located within an SRA or within a VHFHSZ as designated by CAL FIRE (CAL FIRE 2023). The USFS Fire Hazard Potential Map identifies the project site and surrounding area as “Urban and Built-Up Land” (USFS 2020). Due to the urban nature and flat topography of the project site and surrounding area, the proposed project would not impair an adopted emergency response plan or evacuation plan pertaining to wildfires, nor would it exacerbate risks and

expose proposed project occupants to pollutant concentrations from a wildfire or uncontrolled spread of a wildfire. The proposed project would not require the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts. The proposed project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope stability, or drainage changes. No impacts from wildfires would occur.

3.21 MANDATORY FINDINGS OF SIGNIFICANCE

	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
XXI. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☒	☐	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

Discussion of Impacts

a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Potentially Significant Impact. Based on the analysis herein, the proposed project does not have the potential to substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten or eliminate a plan or animal community; or substantially reduce the number or restrict the range of a rare or endangered plant or animal. As discussed in Section 3.4, Biological Resources, the project site is developed and does not provide substantial habitat for wildlife species. However, the portions of the project site not occupied by buildings, pavement, or lawns has the potential to provide extremely marginal habitat for Northern California legless lizards and the existing trees within the project site represent marginally suitable nesting habitat for Swainson's hawk and other more common migratory birds protected by the Migratory Bird Treaty Act. Additionally, these trees may also represent marginally suitable roosting habitat for pallid bat, hoary bat, and other more common foliage and cavity roosting bats. Therefore, to ensure no significant impacts would occur to these species identified to have potential suitable habitat onsite, the proposed project identified Mitigation Measures

BIO-1 through BIO-3 to reduce impacts. With implementation of Mitigation Measures BIO-1 through BIO-3, potential impacts to special status and protected wildlife species would be reduced and impacts would be less than significant.

As discussed in Section 3.5, Cultural Resources, and Section 3.18, Tribal Cultural Resources, the proposed project could result in a significant impact on historical, archaeological, or tribal cultural resources that would eliminate important examples of California history or prehistory. Therefore, these impacts will be further analyzed in the EIR.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Potentially Significant Impact. The proposed project could have impacts that are individually limited but would be cumulatively considerable. Cumulative impacts related to the resource areas outlined above will be analyzed in the EIR.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Potentially Significant Impact. Based on the analysis herein, construction and operation of the proposed project could potentially cause substantial adverse effects on human beings in relation to air quality, GHG emissions, and noise. These impacts will be further analyzed in the EIR.

Appendix A
Biological Resources Analysis

MADRONE ECOLOGICAL CONSULTING

Memo

To: Anna Radonich, Stantec

From: Sarah VonderOhe, Principal

Date: 1 November 2024

Subject: Biological Resources Analysis for the Campbell Tech Park Project

At your request, Madrone Ecological Consulting (Madrone) completed an analysis of biological resources with potential to occur within and/or be impacted by the Campbell Tech Park Project (Project). The Project involves conversion of a developed business park into medium density residential housing. The biological resources analysis consisted of an aerial photograph review and database review. This memo summarizes the results of the reviews, as well as mitigation measures that are recommended to avoid impacts to special-status species and comply with local ordinances.

The 17.4-acre Project Area is located south and east of Highway 17, north of Campbell Technology Parkway, and west of La Paz Way in Campbell, Santa Clara County, California. The Project Area is located within a portion of Section 35, Township 7 South, Range 1 West (MDB&M) of the "San Jose West, California" 7.5-Minute Series USGS Topographic Quadrangle (USGS 1921) (**Figure 1**).

Project Description

The proposed Project consists of the development of 290 residential units. The proposed development would consist of 27 two-story single-family detached homes, three-story townhomes with 149 units, and four-story townhomes with 114 units. Each unit would have a private two-car garage and balconies and decks would provide private outdoor space for each unit. The proposed Project would have a density of 16.96 units per acre. The Project site currently has existing landscaping and trees located throughout the site. The proposed Project would require removal of 118 existing trees onsite, but would also include development of 125,943 square feet of usable open space throughout the site, including a linear park through the central area of the Project site lined with trees and shade canopies, a pocket park along the southern edge of the Project site, and additional usable open space areas throughout the site. The proposed Project would include construction of approximately 24,309 square feet of bioretention facilities throughout the site.

The proposed Project also proposes several offsite improvements to support the development of the proposed Project. The proposed Project proposes to widen Campbell Technology Parkway and improvements along the Campbell Technology Parkway frontage is proposed which include new curb and gutters, sidewalks, and accessible curb ramps at all pedestrian road crossings. Additionally, new street trees,

street lighting, and fire hydrants are proposed along the Campell Technology Parkway frontage. Stormwater bioretention areas would be provided to treat the stormwater from the roadway along the Project frontage and new storm drain infrastructure would be provided to serve the stormwater treatment areas. Additionally, the proposed Project would include sanitary sewer, water, and storm drain connections to the existing infrastructure within the Campbell Technology Parkway frontage.

Madrone has not been provided with the extents of the offsite improvements, but for the purposes of this analysis, we have assumed that they will occur within the existing paved Campell Technology Parkway roadway and immediately adjacent irrigated landscaped areas.

Methodology

Madrone senior biologist Daria Snider reviewed aerial photographs, "street view" photographs of the Project Area, the NRCS soils map of the Project Area (**Figure 2**), and queries of the following information sources:

- California Natural Diversity Database (CNDDB) (CNDDB 2024) query of the Project Area and all areas within 5 miles of the Project Area;
- USFWS Information for Planning and Conservation (IPaC) (USFWS 2024) query for the Project Area;
- California Native Plant Society (CNPS) Rare and Endangered Plant Inventory (CNPS 2023) query of the "San Jose West, California" USGS topo quadrangle, and the eight surrounding quadrangles;
- Verified records from Bumble Bee Watch (BBW 2024);
- Western Monarch Milkweed Mapper (WMMM 2024) and Western Monarch Overwintering Site Viewer (Xerxes Society 2024) records;
- Research grade observations from iNaturalist (iNaturalist 2024);
- Confirmed nesting records and observation records from Cornell Laboratory of Ornithology's eBird database (Cornell Lab 2024); and
- Western Bat Working Group (WBWG) Species Matrix (WBWG 2024).

Results

Existing Site Conditions

The Project Area consists of four large commercial buildings, associated parking lots, and maintained landscaping. The vast majority of the Project Area consists of buildings, pavement, and irrigated trees, shrubs, and lawn. Some areas including a narrow strip along the southern and western edge are relatively unvegetated and have been largely covered with shredded bark. These areas also appear to be regularly maintained. No potential aquatic resources were observed in the aerial or street view photograph review. The Project Area is at an elevation of approximately 200 feet above mean sea level. Surrounding properties are equally developed; Highway 17 to the west, residential apartments to the north, a high-density mobile home park to the east, and an industrial area, community park, and community vegetable gardens to the south. Stormwater detention ponds maintained by the Santa Clara Valley Water District occur within approximately 230 feet of the southern end of the Project Area, but the maintained community gardens and Edith Morely Park occur in between.

Two soil units have been mapped within the Project Area (NRCS 2024): (130) Urban Land-Still complex, 0-2 percent slopes and (169) Urban Land-Elder complex, 0 to 2 percent slopes, protected (**Figure 2**). Both of these soils are dominated by urban development; undeveloped areas are comprised of alluvial, relatively neutral soils derived from igneous and sedimentary sources.

Special-Status Species

A list of special-status species that have been documented in the vicinity in the CNDDB, CNPS Inventory, and IPaC is included in **Table 1**. Their potential to occur on-site based on the habitat present within the Study Area is also noted, along with their federal and state status. Those species with no federal or state status are not analyzed under CEQA and are not discussed here.

Table 1. Special-Status Species with Potential to Occur within the Project Area

Special-Status Species	Federal Status	State/Other Status	Potential for Occurrence
Plants			
Bent-flowered fiddleneck (*Amsinckia lunaris*)	-	CRPR List 1B.2	No Habitat Present
Bonny Doon manzanita (*Arctostaphylos silvicola*)	-	CRPR List 1B.2	No Habitat Present
Alkali milk-vetch (*Astragalus tener var. tener*)	-	CRPR List 1B.2	No Habitat Present
Brittlescale (*Atriplex depressa*)	-	CRPR List 1B.2	No Habitat Present
Lesser saltscale (*Atriplex minuscula*)	-	CRPR List 1B.1	No Habitat Present
Big-scale balsamroot (*Balsamorhiza macrolepis*)	-	CRPR List 1B.2	No Habitat Present
Santa Cruz Mountains pussypaws (*Calyptridium parryi var. hesseae*)	-	CRPR List 1B.1	No Habitat Present
Congdon's tarplant (*Centromadia parryi ssp. congdonii*)	-	CRPR List 1B.1	No Habitat Present
Dwarf soaproot (*Chlorogalum pomeridianum var. minus*)	-	CRPR List 1B.2	No Habitat Present
Point Reyes salty bird's-beak (*Chloropyron maritimum ssp. palustre*)	-	CRPR List 1B.2	No Habitat Present
Ben Lomond spineflower (*Chorizanthe pungens var. hartwegiana*)	FE	CRPR List 1B.1	No Habitat Present
Robust spineflower (*Chorizanthe robusta var. robusta*)	FE	CRPR List 1B.1	No Habitat Present
Mt. Hamilton thistle (*Cirsium fontinale var. campylon*)	-	CRPR List 1B.2	No Habitat Present
San Francisco collinsia (*Collinsia multicolor*)	-	CRPR List 1B.2	No Habitat Present
Western leatherwood (*Dirca occidentalis*)	-	CRPR List 1B.2	No Habitat Present
Santa Clara Valley dudleya (*Dudleya abramsii ssp. setchellii*)	FE	CRPR List 1B.1	No Habitat Present
Hoover's button-celery (*Eryngium aristulatum var. hooveri*)	-	CRPR List 1B.1	No Habitat Present
San Joaquin spearscale (*Extriplex joaquinana*)	-	CRPR List 1B.2	No Habitat Present
Fragrant fritillary (*Fritillaria liliacea*)	-	CRPR List 1B.2	No Habitat Present
San Francisco gumplant (*Grindelia hirsutula var. maritima*)	-	CRPR List 3.2	No Habitat Present
Loma Prieta hoita (*Hoita strobilina*)	-	CRPR List 1B.1	No Habitat Present
Contra Costa goldfields (*Lasthenia conjugens*)	FE	CRPR List 1B.1	No Habitat Present
Woolly-headed lessingia (*Lessingia hololeuca*)	-	CRPR List 3	No Habitat Present

Concern, WBWG H - Western Bat Working Group High Threat Rank, WBWG M - Western Bat Working Group Medium Threat Rank, CFP – CDFW Fully Protected Species.

A total of 43 special-status plant species have been documented in the vicinity of the Project Area. Seven of these species only occur over 400 feet in elevation. Twenty-nine of these species only occur on special soil types, such as serpentine or alkaline soils, or only occur within freshwater or coastal salt marshes, vernal pools, or maritime pine sandhills, which are not present within any of the Study Areas. The remaining seven plant species occur in chaparral, coastal scrub, forests, woodlands, and grasslands, none of which occur within this developed, highly maintained Project Area. No special-status plant species have the potential to occur within the Project Area.

A total of 19 special-status wildlife species have been documented in the vicinity of the Project Area or appear on the iPAC list. Nine of these species require creeks, ponds, or seasonal pools and (in some cases), adjacent areas with friable soils for burrowing, or cover in adjacent mesic forests and woodlands, none of which occurs within the Project Area. Two bee species and Monarch butterfly require abundant flowers with great variety and (for Monarch butterfly) milkweed plants, which do not occur within the highly maintained landscaping in the Project Area. California condor requires expansive open landscapes and carrion, which do not occur within the Project Area. California least tern occurs on coastal beaches and sometimes in detention ponds or small lakes, which do not occur within the Study Area. The trees within the Study Area are not of sufficient size to support Townsend's big-eared bat.

The portions of the Project Area not occupied by buildings, pavement, or lawns could provide extremely marginal habitat for Northern California legless lizard, especially where leaf litter and moisture have accumulated.

Numerous trees are present throughout the Project Area, which represent marginally suitable nesting habitat for Swainson's hawk and the trees and buildings could provide nesting habitat for other more common migratory birds protected by the Migratory Bird Treaty Act. These trees may also represent marginally suitable roosting habitat for pallid bat, hoary bat and other more common foliage and cavity roosting bats. The buildings are unlikely to support roosting bats (although they could be used as temporary resting locations during evening foraging bouts).

Protected Trees

Numerous trees are present within the Project Area, all of which appear to be planted and maintained as part of the landscaping. According to the City of Campbell Tree Protection Ordinance (Chapter 21.32 of the City Code), there are several categories of Protected Trees, one of which is "Any tree shown on an approved landscaping plan or required to be planted or retained as a condition of approval of a development application, a building permit, or a tree removal permit." Given that these trees all appear to be planted landscape trees, we assume that they were originally shown on an approved landscaping plan and would be considered Protected Trees.

Recommended Mitigation Measures

Northern California Legless Lizard Pre-Construction Surveys

A comprehensive survey for Northern California legless lizard of all areas exclusive of buildings, pavement or lawn shall be conducted within the Project Area within 14 days prior to construction. If no Northern California legless lizards are found, no further mitigation is necessary. If a Northern California legless lizard is observed within the proposed impact area, a qualified biologist shall relocate the individual to other suitable habitat a sufficient distance outside of the Project Area to preclude its return to the Project Area prior to construction.

Pre-Construction Nesting Bird Surveys

If construction activities (including tree and building removal) are proposed during the bird nesting season (February 1 – August 31), a focused survey for nesting raptors (including Swainson's hawk) and migratory bird nests shall be conducted by a qualified biologist within 14 days prior to the beginning of construction activities in order to identify active nests. This survey shall be conducted within the proposed construction area and all accessible areas within 250 feet of the construction area. If active raptor nests are found, no construction activities shall take place within 500 feet of the nest until the young have fledged. If active songbird nests are found, a 100-foot no disturbance buffer will be established. These no-disturbance buffers may be reduced based on consultation and approval by the CEQA lead agency. The perimeter of the protected area shall be indicated by bright orange temporary fencing. No construction activities or personnel shall enter the protected area, except with approval of the biologist. If tree removal is necessary, trees containing nests, or burrows that must be removed as a result of Project implementation shall be removed during the nonbreeding season (late September to March). If no active nests are found during the focused survey, no further mitigation will be required.

Pre-Construction Roosting Bat Surveys

A qualified biologist shall conduct a bat habitat assessment of all trees proposed for removal. This habitat assessment shall identify all potentially suitable roosting habitat and may be conducted up to one (1) year prior to the start of construction. If potential roosting habitat is identified (cavities in trees) within trees proposed for removal, the biologist shall survey the potential roosting habitat during the active season (generally April through October or from January through March on days with temperatures in excess of 50 degrees F) to determine presence of roosting bats. These surveys are recommended to be conducted utilizing methods that are considered acceptable by CDFW and bat experts. Methods may include evening emergence surveys, acoustic surveys, inspecting potential roosting habitat with fiberoptic cameras or a combination thereof. If pre-construction surveys indicate that no roosts of special-status bats are present, or that roosts are inactive or potential habitat is unoccupied, no further mitigation is required. If roosting bats are identified within any of the trees planned for removal, or if presence is assumed, the trees shall be removed outside of pup season only on days with temperatures in excess of 50 degrees F. Pup season is generally during the months of May through August. Two-step tree removal shall be utilized under the supervision of the qualified biologist. Two-step tree removal involves removal of all branches of the tree

that do not provide roosting habitat on the first day, and then the next day cutting down the remaining portion of the tree. Once the bats have been excluded, tree removal may occur.

Mitigation for Removal of Protected Trees

Project implementation will involve the removal of approximately 118 trees, all of which may be considered Protected Trees by the City of Campbell (City). In accordance with the City's Tree Protection Ordinance, the applicant shall prepare a tree survey plan and submit that along with a Tree Removal Permit Application to the City. Mitigation for the tree removals may include planting of replacement trees (with the species, size, and location determined by the City), payment of an in-lieu fee, or a combination of the two options.

Stantec Consulting Services Inc.

The conclusions in the Report titled Arborist Survey and Report are Stantec's professional opinion, as of the time of the Report, and concerning the scope described in the Report. The opinions in the document are based on conditions and information existing at the time the scope of work was conducted and do not take into account any subsequent changes. The Report relates solely to the specific project for which Stantec was retained and the stated purpose for which the Report was prepared. The Report is not to be used or relied on for any variation or extension of the project, or for any other project or purpose, and any unauthorized use or reliance is at the recipient's own risk.

Stantec has assumed all information received from City of Campbell (the "Client") and third parties in the preparation of the Report to be correct. While Stantec has exercised a customary level of judgment or due diligence in the use of such information, Stantec assumes no responsibility for the consequences of any error or omission contained therein.

This Report is intended solely for use by the Client in accordance with Stantec's contract with the Client. While the Report may be provided by the Client to applicable authorities having jurisdiction and to other third parties in connection with the project, Stantec disclaims any legal duty based upon warranty, reliance or any other theory to any third party, and will not be liable to such third party for any damages or losses of any kind that may result.

1 Introduction

1.1 Introduction

This Arborist Report documents the results of an arborist survey conducted on the Campbell Tech Park Project in the City of Campbell, within Santa Clara County, California. The survey was performed on November 7, 2024, by Stantec Biologist and International Society of Arboriculture (ISA) Certified Arborist Alexandra Topor (WE-11611A) with assistance from Stantec biologists Alexander Broskoff. The purpose of the survey was to collect updated data from all trees scheduled for removal. Data collected was diameter at breast height (DBH) and current condition of trees.

1.2 Arborist's Disclaimer

Trees are important living organisms that, as part of the natural and built environments, provide countless biological and aesthetic benefits. Arborists are tree specialists who use their education, knowledge, training and experience to examine trees, recommend measures to enhance the beauty and health of trees, and to attempt to reduce the risk of living near trees. Arborists cannot detect every condition that could possibly lead to structural failure of a tree or anticipate all environmental factors that could contribute to failure; as a living organism, a tree's condition may change at any time. Though trees can be managed, they cannot be controlled. This report does not include an assessment of the potential for branch falls or tree falls, although a recommendation for tree removal might be made where trees appear to be in imminent risk of failure.

1.3 City of Campbell Regulations

The City of Campbell Oak Tree Protection Regulations (the "Regulations") state every owner of private property within the city, and to every person responsible for undertaking the removal of a tree on private property, unless exempted herein:

"Arborist report" means a professional report prepared by a certified arborist that includes photographic documentation of each tree proposed to be removed and indicates the location(s), variety or species, size(s), and condition of all such tree(s). An arborist report also includes a visual examination of damage associated with the tree(s) and provides potential measures that may be taken to preserve the tree(s) or prevent further damage. The report shall conclude with a recommendation as to whether, in the professional judgment of the arborist, the tree(s) should be removed or preserved.

"Tree" means a woody perennial plant characterized by having a main stem or trunk or a multi-stemmed trunk system with a more or less definitely formed crown and is usually over ten feet high at maturity.

"Fruit tree" means any tree that has the characteristic of bearing edible fruit, common to commercial production varieties including, but not limited to, stone fruits (e.g., prunes, peaches, etc.), citrus (e.g., lemons, oranges), nut varieties (e.g., almonds, English walnut (except for California Black Walnut),

peppers (g. *Schinus*), and olives (g. Oleaceae). A "fruit tree" shall not mean any tree that bears a fruit or nut produced primarily as seed, (e.g., oaks, pines, etc.).

"Heritage tree" means any tree so designated by the historic preservation Board based on the finding that the tree has character, significant age and girth, interest or value as part of the development of, and/or exemplification of the cultural, educational, economic, agricultural, social, indigenous or historical heritage of the city and identified on the historic resources inventory.

The following trees are classified as protected trees and shall not be removed from private property without approval of a tree removal permit:

A. The following trees are protected on all properties in all zoning districts:

1. Heritage trees designated in compliance with Section 21.32.130, (Heritage tree designations); and

2. Any tree shown on an approved landscaping plan or required to be planted or retained as a condition of approval of a development application, a building permit, or a tree removal permit.

B. For trees on all commercial, industrial, multi-family residential, mixed-use, and undeveloped single-family residential properties in all zoning districts, any tree or multi-trunk tree with at least one trunk measuring twelve inches or greater in diameter (thirty-eight inches or greater in circumference), measured four feet above the adjacent grade.

2 Methodology

2.1 Previous Arborist Survey

A previous arborist survey was conducted by Woodreeve Consulting in August 2023 of the entire Project Area. During this survey, metal tags were affixed to all trees within the Project Area, GPS points were taken of all tree locations, and data was collected on each tree. Data collected included species, trunk diameter, condition, condition notes, and dripline measurements.

Due to the timing of the previous survey, Stantec did not complete a full arborist survey within the Project Area but did a check of all trees designated for removal.

2.2 Current Survey

Stantec performed a site visit on November 7, 2024, to check all the trees scheduled for removal to determine if the DBH increased and if conditions had changed. A total of 116 trees are proposed for removal. Updated data collected was DBH and current condition of trees.

3 Results

A total of 116 trees were visited within the Project Area and the updated DBH and Conditions are located in Appendix A. Two of these trees 108 (Tree of heaven) and 299 (Coast redwood) were observed to be nearly completely dead. Additionally, tree 07 (Monterey pine) that was not scheduled for removal was observed to be completely dead.

Table 1 Summary of Trees for Removal

Common Name	Scientific Name	Number of Trees
African sumac	*Rhus lancea*	16
Australian willow	*Geijera parviflora*	9
Callery pear	*Pyrus calleryana*	7
Chinese elm	*Ulmus parvifolia*	1
Coast live oak	*Quercus agrifolia*	7
Coast redwood	*Sequoia sempervirens*	51
Deodar cedar	*Cedrus deodara*	9
Fremont cottonwood	*Populus fremontii*	1
Hackberry	*Celtis occidentalis*	1
Holly oak	*Quercus ilex*	2
Little leaf linden	*Tilia cordata*	1
Monterey pine	*Pinus radiata*	1
Sweetgum	*Liquidambar styraciflua*	9
Tree of heaven	*Ailanthus altissima*	1

The complete Woodreeve Consulting arborist data is included in Appendix B. One error that was present within the Woodreeve data, two tag numbers 82 and a missing tag 84, were corrected by visiting each tree. Tree 62 (Coast redwood) was found to have an error in the old DBH where one trunk was reported to measure 29 inches, but new measurements determined that this was supposed to be 39.5 inches. The data was corrected in Appendix A.

4 Discussion and Mitigation

4.1 General Tree Removal

Of the 116 trees that are proposed for removal, 74 are considered protected trees that have at least one trunk twelve inches DBH or greater.

Table 2 Summary of Protected Trees for Removal

Common Name	Scientific Name	Number of Protected Trees
African sumac	*Rhus lancea*	11
Australian willow	*Geijera parviflora*	9
Callery pear	*Pyrus calleryana*	1
Coast live oak	*Quercus agrifolia*	5
Coast redwood	*Sequoia sempervirens*	40
Deodar cedar	*Cedrus deodara*	6
Little leaf linden	*Tilia cordata*	1
Monterey pine	*Pinus radiata*	1

Approval from the City of Campbell is required prior to removal of any protected trees. Replacement trees or mitigation fees are required to impact any protected trees. The species, number, size, and location of the replacement trees will be determined by the City of Campbell with input from the client. Below are the minimum guidelines for tree replacement:

Table 3 City of Campbell Minimum Tree Replacement Guidelines

Trunk Size of Removed Tree (measured at 4 feet above grade)		**Replacement Ratio Required (per tree removed)**	
Diameter (in inches)	Circumference (in inches)	Number of replacement trees	Minimum Size
12 to 24	38 to 75	1	24 inch box
greater than 24	greater than 75	1	36 inch box

4.2 Dead Tree Removal

Three dead trees were found to be completely or nearly completely dead within the Project Area. Below is a summary of these trees.

Table 4 Dead Trees within the Project Area

Tag Number	Common Name	DBH	Protected (≥12in DBH)	Scheduled for Removal	Condition
7	Monterey pine	35.5	Y	N	Totally dead
108	Tree of heaven	8,7,6,6,6,5,5	N	Y	Nearly completely dead
299	Coast redwood	13	Y	Y	Nearly completely dead

The City of Cambell requires a permit to remove trees that are dead or dying. Below is the guidance for removing dead of dying trees:

21.32.065 - Removal of dead or dying trees. Replacement required. In the event a protected tree shown on an approved landscaping plan or required to be planted or retained as a condition of approval of a development application, building permit, or tree removal permit is determined to be dying, the tree shall be subject to replacement in kind.

WOODREEVE CONSULTING

TREE No.	SPECIES	TRUNK DIAMETER (in inches)	PROTECTED	CONDITION 1=POOR 5=EXCELLENT	SUITABILITY FOR RETENTION	COMMENTS	DRIPLINE (ft.) N.	S.	E.	W.
1	African sumac	13	Yes	3	Moderate	Off-site; multiple attachments at 7'; one sided W.	10	10	12	8
2	African sumac	13	Yes	3	Moderate	Off-site; multiple attachments at 7'; one sided E.	10	8	12	8
3	Coast live oak	7	No	4	Moderate	Slight lean E.; close to fence; good young tree.	12	10	12	10
4	Water gum	12	Yes	4	Moderate	Multiple attachments at 5'; good, upright form.	10	8	12	12
5	Coast live oak	8	No	4	Moderate	Codominant trunks at 8'; leans E.; good young tree.	8	8	12	10
6	Water gum	10	No	5	High	Multiple attachments at 5'; good, upright form.	10	10	10	10
7	Monterey pine	35	Yes	3	Low	Fair form and structure; leans E.; long laterals S.	12	30	28	15
8	Monterey pine	23	Yes	3	Low	Fair form and structure; leans E.; crowded.	12	10	20	10
9	Coast live oak	6	No	3	Moderate	Suppressed; leans E.	5	5	10	5
10	Silver dollar gum	22	Yes	3	Moderate	Crowded; fair form and structure.	12	15	20	10
11	Silver dollar gum	27	Yes	3	Moderate	Codominant trunks at 7'; upright form; sparse crown.	12	10	22	8
12	Silver dollar gum	14,8	Yes	3	Moderate	Codominant trunks at 3' & 8'; upright form; sparse crown.	12	10	22	8
13	Coast live oak	20	Yes	3	Low	Suppressed; strong lean E.	15	18	30	10
14	Silver dollar gum	15	Yes	3	Low	Codominant trunks at 8'; poor form; sparse crown.	8	6	8	8
15	Sweetgum	6	No	3	Moderate	One sided E.; good form.	8	6	10	8
16	Sweetgum	8	No	3	Low	Codominant trunks at 5'; weak attachment; one sided R.; displaced sidewalk 2".	10	10	12	5
17	Silver dollar gum	25	Yes	3	Low	Codominant trunks at 10'; leans E.; poor form; sparse crown.	10	15	25	8
18	Silver dollar gum	22	Yes	3	Low	Codominant trunks at 10'; upright form; topped.	8	15	18	8
19	Sweetgum	9	No	4	Moderate	A little one sided E.; good young tree.	10	10	12	10
20	Monterey pine	24	Yes	3	Low	Fair form and structure; leans E.; crowded.	15	18	25	10
21	Silver dollar gum	22	Yes	3	Low	Codominant trunks at 15'; upright form; topped.	8	15	15	8
22	Sweetgum	10	No	4	Moderate	One sided E.; good young tree.	8	10	12	8
23	Coast live oak	23	Yes	3	Moderate	Crowded; one sided & leans E.; basal cankers.	15	15	20	10
24	Silver dollar gum	16	Yes	3	Low	Codominant trunks at 15'; poor form; topped.	8	10	20	8

PRELIMINARY GEOTECHNICAL EXPLORATION

Dear Mr. Pasquinelli:

We are pleased to present this preliminary geotechnical exploration for the proposed residential development, Campbell Technology Park, located at 635 – 695 Campbell Technology Parkway in Campbell, California. The accompanying report presents our findings, preliminary conclusions, and recommendations regarding the proposed development.

Based on our preliminary findings, it is our opinion from a geotechnical viewpoint that the proposed development is feasible from a geotechnical standpoint. The primary geotechnical concerns for the site development include the presence of existing fill, expansive soil, and seismic hazards. This report provides our preliminary conclusions and recommendations for planning.

A design-level geotechnical exploration should be conducted prior to site development once more detailed land plans and structural loads have been prepared.

We are pleased to have been of service on this project and are prepared to consult further with you and your design team as the project progresses. If you have any questions or comments regarding this preliminary report, please call and we will be glad to discuss them with you.

Sincerely,

ENGEO Incorporated

Alvaro Crisanto

1.0 INTRODUCTION

1.1 PURPOSE AND SCOPE

We prepared this preliminary geotechnical exploration report in support of your evaluation of the subject site located in Campbell, California, for a proposed residential development. As outlined in our executed agreement dated August 10, 2023, Campbell Technology Park, LLC authorized us to perform the following scope of services.

- Review available literature and geologic maps for the study area
- Subsurface exploration
- Data analysis and development of preliminary geotechnical recommendations
- Report preparation

We prepared this report for the exclusive use of Campbell Technology Park, LLC and their consultants for the project described in Section 1.3. This document may not be reproduced in whole or in part by any means whatsoever, nor may it be quoted or excerpted without our express written consent.

1.2 SITE LOCATION

The approximately 17.3-acre site is located near the eastern city limits of Campbell, California, in an area of mixed residential and commercial development, as shown in the Vicinity Map (Figure 1). The parcels are located at 635-695 Campbell Technology Parkway and are identified by Assessor Parcel Numbers (APN) 412-29-010, 412-29-011, 412-29-012, and 412-29-015. The site is generally bounded by Highway 17 to the north, Campbell Technology Parkway on the south, and a mobile home park on the east. Detention ponds are located approximately 200 feet southeast of the site and the Los Gatos Creek trends north to south approximately 200 feet west of the site on the western side of Highway 17. The site is currently developed with four 1- to 2-story office buildings with associated parking and landscaping.

1.3 PROPOSED DEVELOPMENT

We understand the proposed development will consist of at-grade multi-family, residential buildings up to three stories tall. Structural loading information is not available at the time of this report writing. We assume the structures will be conventional wood-frame construction. We assume building loads will be typical for the respective construction types. We anticipate associated improvements may include utilities, public and private roadways and sidewalks, and other landscaped areas.

2.0 FINDINGS

2.1 SITE HISTORY

We reviewed the following historical topographic maps and aerial photographs that we obtained from Environmental Data Resources during our concurrent phase I environmental site assessment.

DRAFT

TABLE 2.1-1: Historical Review Summary

HISTORICAL MAP/PHOTOGRAPH	YEARS
Topographic Maps	1889, 1897, 1899, 1953, 1961, 1968, 1973, 1980, 2012, 2015, 2018
Aerial Photographs	1939, 1948, 1950, 1956, 1963, 1968, 1974, 1982, 1993, 1998, 2006, 2009, 2012, 2016, 2020

The earliest available aerial photographs and topographic maps depict the site situated southwest of the presently recognized Paseo De Palomas Lane. In an 1889 topographic map, two structures can be seen in the northeastern portion of the site. The earliest available aerial imagery, from 1939, shows the site as part of a larger area occupied by orchards, with residential and commercial developments shown northwest of the site. The Coyote Creek floodplain can be seen towards the west of the site. In the 1950, 1956, and 1963 aerials, we see the construction of residential and commercial developments northwest and southeast of the site and several percolations ponds south of the site. Between 1956 and 1963, we see the construction of State Route 17 adjacent to the western site boundary. In the 1968 image, we see that the southern portion of the site has been converted into a drive-in movie theater and the eastern parcel has been developed into a residential mobile home park. In the 1974 image, the drive-in movie theater had extended to the north portion of the site and remained in similar conditions until 1993, where the image shows that the site is vacant and no longer used as a drive-in movie theater. In the 1998 image, we see the site begin to be developed to the present condition, and by 2006 construction had been completed.

2.2 FIELD EXPLORATION

We retained the services of ConeTec to advance cone penetration test (CPT) soundings at five locations, as shown in the Site Plan (Figure 2). The CPTs were advanced to a maximum depth of approximately 44½ feet below ground surface (bgs). We encountered shall refusal at Soundings 1-CPT1, -2, and -5 between 24 and 34 feet bgs on very dense sand and gravelly sand. Measurements include the tip resistance to penetration of the cone, resistance of the surface sleeve, and pore pressure (Robertson and Campanella, 1988); CPTs were performed in accordance with ASTM D-5778. Pore pressure dissipation testing was performed in five CPTs to interpret hydrostatic groundwater levels. We present the CPT logs in Appendix A.

2.3 GEOLOGY

Regional geologic maps locate the site in the broad, north-south trending, alluvial-filled Santa Clara Valley. A review of the geologic map prepared by Wentworth (1999), Figure 3, indicates the site is underlain by older Holocene-age alluvial fan (Qhf2). Similarly, Dibblee (2007) mapped the project site as Quaternary-age alluvium. The regional geologic mapping is shown in Figure 3.

2.4 FAULTING AND SEISMICITY

Northern California contains numerous active earthquake faults, as shown in Figure 4. The nearby active faults to the site include the San Andreas, Monte Vista-Shannon, Hayward, and Calaveras. An active fault is defined by the California Geologic Survey (CGS) as one that has had surface displacement within Holocene time (about the last 11,700 years) (CGS, 2018).

DRAFT

The site is not located within a currently designated Alquist-Priolo Earthquake Fault Zone and no known surface expression of active faults is believed to exist within the site. Fault rupture through the site, therefore, is not anticipated.

To evaluate nearby active faults that can generate strong seismic ground shaking at the site, we utilized the USGS Unified Hazard Tool and disaggregated the hazard at the peak ground acceleration (PGA) for a 2,475-year return period, with the resulting faults listed below in Table 2.4-1.

TABLE 2.4-1: Active Faults Capable of Producing Significant Ground Shaking at the Site (Latitude: 37.2803 Longitude: -121.9430)

SOURCE[a]	R_{RUP}[b]		MOMENT MAGNITUDE[c]
	(KM)	(miles)	M_W
Monte Vista-Shannon [5]	4.99	3.10	6.95
Monte Vista-Shannon [6]	7.02	4.36	6.41
San Andreas (Peninsula) [0]	11.64	7.23	7.86
San Andreas (Santa Cruz Mts) [0]	12.81	7.95	7.22
Hayward (So) [0]	18.16	11.28	7.21
Calaveras (Central) [8]	19.72	12.25	7.31

Notes: a. Fault System (Fault Section) [Fault Subsection assigned by UCERF3]
b. R_{RUP} = nearest fault-to-site rupture distance
c. Fault-to-site distances and maximum moment magnitude based on USGS Unified Hazard Tool - Edition: Dynamic Conterminous U.S. 2014 (update) (v4.2.0)

2.5 SURFACE CONDITIONS

At the time of our field exploration in August 2023, the site generally consisted of four 1- to 2-story office buildings with surface conditions consisting of existing paved parking areas and landscape areas throughout the site. Along the eastern bound of the site, there is an existing open-space area with an associated walking path, seating areas, and outdoor exercise equipment. Based on our review of Google Earth Imagery, the current topography of the site is relatively level with a gentle slope from the south portion of the site towards the northern portion, from Elevation 214 feet in the south to Elevation 202 feet in the north (Datum WGS-84).

2.6 SUBSURFACE CONDITIONS

Based on the results of the CPT interpretations, the subsurface conditions of the site can be characterized as a western and eastern portion of the site. The western portion is characterized by 1-CPT1, 1-CPT2, and 1-CPT3, and the eastern portion is characterized by 1-CPT4 and 1-CPT5 (Figure 2). We encountered shallow refusal in both portions of the site on very dense sand and gravelly sand. In the western portion, at 1-CPT1 and 1-CPT2, we encountered refusal at 33½ feet bgs. In the eastern portion, we encountered shallow refusal at 1-CPT5 at 24 feet bgs.

The western portion generally consists of medium stiff to very stiff silt and medium dense to dense sand and clayey sand in the upper 6 to 10 feet, underlain by interbedded layers medium dense to very dense sand and gravelly sand that extends to 33½ feet bgs for 1-CPT1 and 1-CPT2 and 44½ feet bgs for 1-CPT3. At 1-CPT2 and 1-CPT3, we encountered a 2-foot-thick layer of very stiff to hard clay and silt at depths of 23 feet and 35 feet bgs, respectively.

The eastern portion of the site generally consists of stiff to hard silt and sandy silt in the upper 6 to 11 feet. The silt is followed by medium dense to very dense sand and gravelly sand to depths ranging to the extent of our exploration for 1-CPT5 of 24 feet bgs and 27 feet bgs for 1-CPT4. Beneath the sand and gravelly sand at 1-CPT4, we encountered a layer of very stiff to hard silt

DRAFT

and clay from 27 feet bgs and extended to 33 feet bgs, we then encountered dense to very dense sand and gravelly sand to the extent of our exploration for 1-CPT4 of 44½ feet bgs.

The subsurface conditions encountered are generally consistent with the mapped regional geology.

2.7 GROUNDWATER CONDITIONS

As discussed in Section 2.2, we performed pore pressure dissipation tests at the five CPT locations to estimate static groundwater conditions. We were able to reach equilibrium for the pore pressure dissipation test readings at five CPT locations. We summarize our findings in Table 2.7-1.

TABLE 2.7-1: Pore Pressure Dissipation Test Results

EXPLORATION ID	INTERPRETED GROUNDWATER DEPTH (feet, bgs)
1-CPT1	23
1-CPT2	24
1-CPT3	23
1-CPT4	34
1-CPT5	23

Plate 1.2 of the Seismic Hazard Zone Report for the San Jose West Quadrangle (CDC-DMG, 2002) maps the highest historical groundwater within the site vicinity between approximately 30 and 40 feet bgs. Our review of groundwater data also included publicly available resources, including compiled well data presented in the State Water Data Library (California Department of Water Resources) and county groundwater database (Valley Water). The findings from the publicly available resources indicated that the groundwater nearby the site generally ranges between 41½ feet to 120 feet bgs.

For the purposes of our analyses and recommendations, we consider an appropriate groundwater depth of 23 feet bgs to be appropriate to use for initial planning. Fluctuations in groundwater levels should be expected during seasonal changes or over a period of years because of precipitation changes, perched zones, and changes in irrigation and drainage patterns.

3.0 PRELIMINARY CONCLUSIONS

Based on our preliminary findings, it is our opinion from a geotechnical viewpoint that the proposed development is feasible from a geotechnical standpoint. The primary geotechnical concerns for the site development include presence of existing fill, expansive soil, and seismic hazards.

DRAFT

3.1 EXISTING FILL AND LOOSE SURFICIAL SOIL

Existing fill may be encountered as a result of previous construction activities including the demolition of buildings and structures in the site and the construction of the existing buildings. Since no documentation exists related to the placement of fill, we recommend considering it to be non-engineered. The upper disturbed soil layer and areas with existing non-engineered fill may be subject to settlement that is not easily characterized. The extent and quality of existing fill should be evaluated at the time of the design-level study.

3.2 COMPRESSIBLE SOIL

Soil may be subject to settlement when loaded with a new structure or additional fill. This settlement may occur as elastic or consolidation settlement. Elastic settlement is a function of soil stiffness while consolidation settlement is highly dependent on the number of water-filled voids within the soil. The rate of settlement is highly dependent on the permeability of the soil and the presence of water. Consequently, sandy soil will settle almost immediately, whereas clayey soil below the water table will settle much more slowly. Based on the CPT data, we encountered very stiff to hard fine-grained soil below the interpreted groundwater table. For preliminary planning purposes for the proposed conditions, we anticipate long-term static consolidation settlement will be negligible.

3.3 EXPANSIVE SOIL

Based on our experience in the site vicinity, we anticipate the near-surface soil to have low to moderate expansive potential. Expansive soil will change in volume with changes in moisture. They can shrink or swell and cause heaving and cracking of slabs-on-grade, pavements, and structures founded on shallow foundations. Building damage due to volume changes associated with expansive soil can be reduced by: (1) using a rigid mat foundation that is designed to resist the settlement and heave of expansive soil, (2) deepening the foundations to below the zone of moisture fluctuation, i.e., by using deep footings or drilled piers, and/or (3) using lime treatment in the upper 18 inches of the building pad to reduce the expansion potential of the on-site soil.

Successful performance of structures on expansive soil requires special attention during construction. It is imperative that exposed soil be kept moist prior to placement of concrete for foundation construction. It can be difficult to remoisturize clayey soil without excavation, moisture conditioning, and recompaction.

During the design-level investigation, surface samples should be obtained and laboratory testing should be performed to develop foundation criteria.

3.4 SEISMIC HAZARDS

Potential seismic hazards resulting from a nearby moderate to major earthquake can generally be classified as primary and secondary. The primary effect is ground rupture, also called surface faulting and liquefaction. Common secondary seismic hazards include ground shaking, liquefaction, and lateral spreading. The following sections present a discussion of these and other hazards as they apply to the site. Based on topographic and lithologic data, the risk of regional subsidence or uplift, lurching, or landslides, is considered low to negligible at the site.

DRAFT

3.4.1 Ground Rupture

Since there are no known active faults that transverse the site, and the site is not located within an Alquist-Priolo Earthquake Fault Study Zone, it is our opinion that the risk of ground rupture is low.

3.4.2 Ground Shaking

An earthquake of moderate to high magnitude generated within the Bay Region could cause considerable ground shaking at the site, like that which has occurred in the past. Seismic design provisions of current building codes generally prescribe minimum lateral forces, applied statically to the structure, combined with the gravity forces of dead and live loads. The code-prescribed lateral forces are generally considered to be substantially smaller than the actual forces that would be associated with a major earthquake. Therefore, structures should be able to: (1) resist minor earthquakes without damage, (2) resist moderate earthquakes without structural damage but with some nonstructural damage, and (3) resist major earthquakes without collapse, but with some structural as well as nonstructural damage. Conformance to the current building code recommendations does not constitute any kind of guarantee that significant structural damage would not occur in the event of a maximum magnitude earthquake; however, it is reasonable to expect that a well-designed and well-constructed structure will not collapse or cause loss of life in a major earthquake (SEAOC, 1996). California Building Code (CBC, 2022) seismic design parameters are presented later in this report.

3.4.3 Liquefaction

Soil liquefaction results from loss of strength during cyclic loading, such as imposed by earthquakes. The soil considered most susceptible to liquefaction is clean, loose, saturated, uniformly graded fine sand below the groundwater table. Empirical evidence indicates that loose silty sand is also potentially liquefiable. When seismic ground shaking occurs, the soil is subjected to cyclic shear stresses that can cause excess hydrostatic pressures to develop. If excess hydrostatic pressures exceed the effective confining stress from the overlying soil, it is said to have liquefied. If the sand consolidates or vents to the surface during and following liquefaction, ground settlement and surface deformation may occur. In addition to liquefaction of sandy materials, clayey soil can also undergo “cyclic softening” or strength loss because of cyclic loading.

According to published maps under the Seismic Hazard Mapping Act (1990), the site is in an area where the risk of liquefaction has been evaluated by the California Geologic Survey and the southern portion and western boundary of the site is within a liquefaction zone, as shown in Figure 5. Similarly, the Santa Clara County Liquefaction Hazard Map has evaluated that the southern portion of the site is mapped within a liquefaction hazard zone (Santa Clara County, 2012). Regional mapping by the United States Geological Survey (Witter et al., 2006) indicates that the site is mapped in an area of moderate liquefaction susceptibility and the western site boundary is mapped in an area of very high susceptibility.

To evaluate the susceptibility of site-specific layers that may trigger during a seismic event, we performed a preliminary analysis using empirical data recorded during the CPT explorations. We analyzed potential liquefaction based on the CPT data and the computer software CLiq (Version 3.5.2.19) developed by GeoLogismiki. The software incorporates the procedure introduced by the 1996 National Center for Earthquake Engineering Research (NCEER) workshop and the 1998 NCEER/National Science Foundation (NSF) workshop. The workshops

DRAFT

are summarized by Youd et al. (2001) and updated by Robertson (2009). For our analysis, we utilized a Peak Ground Acceleration (PGA) of 0.89g consistent with the 2022 California Building Code (CBC) and maximum moment magnitude of 6.95, and a groundwater depth of 23 feet bgs, based on interpreted data from the pore pressure dissipation tests performed during our CPT exploration.

Based on our preliminary analysis, we estimate ¼ to ½ inches of liquefaction-induced settlement with the higher end estimated at 1-CPT 4 between 23 feet and 35 feet bgs. This estimate is preliminary in nature and should not be considered a recommendation for design. The potential for liquefaction of granular soil below the groundwater table should be further evaluated during design-level exploration based on blow counts and collection of soil samples.

3.4.4 Dynamic Densification Settlement

Dynamic densification settlement of loose granular soil above the groundwater table, also called dry sand settlement, can cause settlement of the ground surface due to earthquake-induced vibrations. We performed a preliminary CPT-based analysis of potential dynamic densification settlement for sand layers above the groundwater table using the method proposed by Robertson and Shao (2010).

Based on our preliminary analysis, we estimate soil in the upper 10 feet bgs to experience ½ to 3 inches of dry sand settlement during a design seismic event with the higher end of the estimate range associated with 1-CPT1 and 1-CPT2 along the south and central portions of the site. We consider this estimate conservative given the fines content of the triggering layers are on average 25 percent based on the CPT correlations at 1-CPT1 and 1-CPT2. This estimate is preliminary in nature and should not be considered a recommendation for design. The potential for dynamic densification of granular soil above the groundwater table should be further evaluated during design-level exploration based on blow counts and laboratory testing for fines content.

3.4.5 Preliminary Seismic Settlement

Based on our preliminary analysis, the total seismic-induced (liquefaction plus dry sand) settlement ranges between ¾ to 3½ inches.

3.4.6 Liquefaction-Induced Surface Rupture

For liquefaction-induced ground failure to occur, the pore water pressure generated within the liquefied strata must exert a force sufficient to break through the overlying soil and vent to the surface, resulting in sand boils or fissures. The risk of surface expression should be assessed based on the findings during the design-level liquefaction hazard evaluation. Based on our preliminary findings, it is our opinion that the risk of surface rupture is low.

3.4.7 Lateral Spreading

Lateral spreading is a failure within a nearly horizontal soil zone (possibly due to liquefaction) that causes the overlying soil mass to move toward a free face or down a gentle slope. Generally, the effects of lateral spreading are most significant at the free face or the crest of a slope and diminish with distance from the slope. As discussed in Section 1.2, detention ponds are located approximately 200 feet southeast of the site and the Los Gatos Creek trends north to south

DRAFT

approximately 200 feet west of the site on the western side of Highway 17. However, given the risk of liquefaction is low, it is our opinion that the risk of lateral spreading at the site is low.

3.5 2022 CBC DESIGN PARAMETERS

The 2022 CBC utilizes design criteria established in the ASCE/SEI Standard "Minimum Design Loads and Associated Criteria for Buildings and Other Structures," (ASCE 7-16). To evaluate the time-average shear wave velocity over the top 30 meters or 100 feet (V_{s30}), we used the shear-wave velocity in Upper 30m of Surficial Geology tool from the California Geological Survey (CGS, 2016). We obtained a mean V_{s30} value of 293.5 m/s, this classifies the site as Site Class D in accordance with the 2022 CBC. We provide the 2022 CBC seismic design parameters in Table 3.5-1 below, which include design spectral response acceleration parameters based on the mapped Risk Targeted Maximum Considered Earthquake (MCE_R) spectral response acceleration parameters.

TABLE 3.5-1: 2022 CBC Seismic Design Parameters, Latitude: 37.2803 - **Longitude:** -121.9430

PARAMETER	VALUE
Site Class	D-Default
Mapped MCE_R Spectral Response Acceleration at Short Periods, S_S (g)	1.82
Mapped MCE_R Spectral Response Acceleration at 1-second Period, S_1 (g)	0.65
Site Coefficient, F_A	1.2
Site Coefficient, F_V	See ASCE Section 11.4.8
MCE_R Spectral Response Acceleration at Short Periods, S_{MS} (g)	2.18
MCE_R Spectral Response Acceleration at 1-second Period, S_{M1} (g)	See ASCE Section 11.4.8
Design Spectral Response Acceleration at Short Periods, S_{DS} (g)	1.45
Design Spectral Response Acceleration at 1-second Period, S_{D1} (g)	See ASCE Section 11.4.8
Mapped MCE Geometric Mean (MCE_G) Peak Ground Acceleration, PGA (g)	0.75
Site Coefficient, F_{PGA}	1.2
MCE_G Peak Ground Acceleration adjusted for Site Class effects, PGA_M (g)	0.89

ASCE 7-16 requires a site-specific ground-motion hazard analysis for Site Class D sites with a mapped S_1 value greater than or equal to 0.2; however, Section 11.4.8 of ASCE 7-16 and Supplement No. 3 provide an exception to this requirement. A site-specific ground-motion hazard analysis is not required where the value of the parameter S_{M1} determined by Equation 11.4-2 and shown in Table 2.6-1 is increased by 50 percent for developing the mapped Risk-Targeted Maximum Considered Earthquake (MCE_R) spectral response, calculating S_{D1}, and evaluating C_s in accordance with Chapter 12 of ASCE 7-16.

During design-level studies, we recommend that we collaborate with the structural engineer of record to further evaluate the effects of taking the exception on the structural design and identify the need for performing a site-specific ground-motion hazard analysis. We can prepare a proposal for a site-specific ground-motion hazard analysis, if requested.

4.0 PRELIMINARY RECOMMENDATIONS

The following preliminary recommendations are for initial land planning and preliminary estimating purposes. Final recommendations regarding site grading and foundation construction will be provided after future site-specific, design-level geotechnical exploration has been undertaken.

4.1 GENERAL SITE CLEARING

After demolition of the existing buildings, paving, and associated improvements, the site should be cleared of all obstructions, including existing foundations, and debris. Any existing underground utilities within the proposed development area should be identified and removed entirely, including pipes and their backfill. Depressions resulting from the removal of underground obstructions extending below the proposed finish grades should be cleared and backfilled with suitable material compacted to the recommendations presented in Section 4.4.

Areas containing surface vegetation or organic laden topsoil within the areas to be improved should be stripped to an appropriate depth to remove these materials. The amount of actual stripping and tree root removal should be determined in the field by the geotechnical engineer at the time of construction. Subject to approval by the landscape architect, strippings and organically contaminated soil can be used in landscape areas. Otherwise, such soil should be removed from the project site. Any topsoil that will be retained for future use in landscape areas should be stockpiled in areas where it will not interfere with grading operations.

Stripping and demolition below design grades should be cleaned to a firm undisturbed soil surface determined by the geotechnical engineer. This surface should then be cleaned, scarified, moisture conditioned, and backfilled with suitable material compacted to the recommendations presented in the Fill Compaction section. No loose or uncontrolled backfilling of depressions resulting from demolition and stripping should be permitted.

4.2 EXISTING FILL REMOVAL

As described previously, existing non-engineered fill is expected to be present at the site. The non-engineered fill from previous construction activities should be subexcavated to expose underlying competent native soils that are approved by the geotechnical engineer. If in a fill area, the base of the excavations should be processed, moisture conditioned, as needed, and compacted in accordance with the recommendations for engineered fill.

4.3 EXPANSIVE SOIL MITIGATION

The presence of expansive soil may result in distress to site improvements if this soil is not properly mitigated. To mitigate the risk of expansive soil for the buildings we recommend the use of post-tensioned (PT) mat foundations in Section 4.8.1. Refer to Section 4.8.2 for additional recommendations to reduce water vapor from beneath the slab.

The soil expansion potential of the site soil should be evaluated further at the time of design-level study and mitigated during grading activities and through appropriate improvement design.

DRAFT

4.4 SELECTION OF MATERIALS

Except for construction debris (wood, brick, asphalt, concrete, metal, etc.), trees, high organic content soil (soil which contains more than 3 percent organic content by weight), and environmentally impacted soil (if any), we anticipate the site soil is suitable for use as engineered fill. Other material and debris, including trees with their root balls, should be removed from the project site.

4.5 FILL COMPACTION

We recommend removal of existing fill (if encountered during grading), stripping of organics, scarification, moisture conditioning, and compaction of the soil prior to fill placement. For land planning and cost estimating purposes, the following compaction control requirements should be anticipated for general fill areas:

- Test Procedures: ASTM D-1557.
- Required Moisture Content: Not less than 3 percentage points above optimum moisture content for PI > 12.
  Not less than 2 percentage points above optimum moisture content for PI ≤ 12.
- Minimum Relative Compaction: Not less than 90 percent for PI > 12.
  Not less than 95 percent for PI ≤ 12.

The pavement Caltrans Class 2 Aggregate Base section should be compacted to at least 95 percent relative compaction (ASTM D1557) at a moisture content at or above the optimum moisture content prior to compaction.

Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material. If imported fill material is characterized and following the design-level geotechnical report, the recommendations may change with respect to the soil type.

4.6 SURFACE DRAINAGE

The project civil engineer is responsible for designing surface drainage improvements. Regarding geotechnical engineering issues, we recommend that finish grades be sloped away from buildings and pavements to the maximum extent practical to reduce the potentially damaging effects of expansive soil. The latest California Building Code Section 1804.3 specifies minimum slopes of 5 percent away from foundations. As a minimum, we recommend the following.

1. Discharge roof downspouts into closed conduits and direct away from foundations to appropriate drainage devices.
2. Consider the use of surface drainage collection system to reduce ponding of water at the ground surface near the foundation, pavements, or exterior flatwork.
3. Discharge roof downspouts into closed conduits and direct away from foundations to appropriate drainage devices.

DRAFT

4. Consider the use of surface drainage collection system to reduce ponding of water at the ground surface near the foundation, pavements, or exterior flatwork.

4.7 SLOPE GRADIENTS

Construct final slope gradients to 2:1 (horizontal:vertical) or flatter. The contractor is responsible for constructing temporary construction slopes in accordance with Cal/OSHA requirements.

4.8 PRELIMINARY FOUNDATION RECOMMENDATIONS

Based on the potential for seismically induced settlement resulting from dynamic densification of sandy layers during a seismic event, we recommend use of post-tensioned (PT) mat foundation to support the proposed residential single-family structures. For planning purposes, the structural engineer should consider up to 3½ inches of total seismically induced settlement. Based on our preliminary analysis, we anticipate long-term static consolidation settlement will be negligible.

The differential settlement can be taken as one-half the total estimate over the width of the building, or a lateral distance of 40 feet, whichever is less. Settlement estimates are preliminary and should be refined during design-level study. The proposed development may be supported by a structural mat foundation, conventional footing system with slab-on-grade flooring, or a post-tension mat slab.

4.8.1 Post-Tension Mat Slab

Based on cost and constructability, the team may consider using post-tensioned mat foundations for the ground surface foundation elements. We recommend that structures supported on post-tensioned mat foundations be founded on properly moisture conditioned subgrades. An allowable bearing pressure of 1,000 psf can be used for this foundation type.

4.8.2 Slab Moisture Vapor Reduction

When buildings are constructed with mats, water vapor from beneath the mat will migrate through the foundation and into the building. This water vapor can be reduced but not eliminated. Vapor transmission can negatively affect floor coverings and lead to increased moisture within a building. Where water vapor migrating through the mat would be undesirable, we recommend the following measures to reduce water vapor transmission upward through the mat foundations.

1. Install a vapor retarder membrane directly beneath the mat. Seal the vapor retarder at all seams and pipe penetrations. Vapor retarders should conform to Class A vapor retarder in accordance with ASTM E1745 “Standard Specification for Plastic Water Vapor Retarders used in Contact with Soil or Granular Fill under Concrete Slabs.”
2. Concrete should have a concrete water-cement ratio of no more than 0.5.
3. Provide inspection and testing during concrete placement to check that the proper concrete and water-cement ratio are used.
4. Consider and implement adequate moist cure procedures for mat foundations.
5. Protect foundation subgrade soil from seepage by providing impermeable plugs within utility trenches.

DRAFT

The structural engineer may consider use of a layer of clean sand or pea gravel (less than 5 percent passing the U.S. Standard No. 200 Sieve) placed below the vapor retarder membrane to assist in concrete curing.

4.9 BIORETENTION IMPROVEMENTS CONSIDERATIONS

If bioretention areas are incorporated in design, the infiltration features should be planned a minimum of 5 feet away from surface improvements and structures, including pavement, flatwork, and slab-on-grade. When this setback distance is not practical, at a minimum, the designer of the infiltration improvements may consider the following.

1. Incorporate structural side walls capable of withstanding the loads from the adjacent improvements, or
2. Incorporate filter material compacted to between 85 and 90 percent relative compaction (ASTM D1557, latest edition) and a waterproofing system designed to reduce the potential for moisture transmission into the subgrade soil beneath the adjacent improvement.

We recommend that bioretention design incorporate a waterproofing system lining the bioswale excavation and a subdrain, or other storm drain system, to collect and convey water to an approved outlet. The waterproofing system should cover the bioretention area excavation in such a manner as to reduce the potential for moisture transmission beneath adjacent improvements.

4.10 PRELIMINARY PAVEMENT RECOMMENDATION

4.10.1 Flexible Pavements

For preliminary design, we assumed a Resistance (R-Value) of 5 for determination of pavement sections. The design sections may be reduced based on R-Value testing of site-specific samples collected from areas that are planned for pavement improvements. Using estimated traffic indices, we developed the following recommended pavement sections using Chapter 630 of the Caltrans Highway Design Manual (including the asphalt factor of safety), presented in Table 4.10.1-1 below. During a design-level study, the project civil engineer should provide suitable traffic indices for planned roadways.

TABLE 4.10.1-1: Recommended Asphalt Concrete Pavement Sections

TRAFFIC INDEX	SECTION BASED ON R-VALUE 5	
	ASPHALT CONCRETE (inches)	CLASS 2 AGGREGATE BASE (inches)
5	3	10
6	3½	13
7	4	16

Note: AB is Class 2 aggregate base material with a minimum R-value of 78

Pavement construction and all materials should comply with the requirements of the Standard Specifications of the State of California Department of Transportation, civil engineer, and appropriate public agency.

DRAFT

4.10.2 Rigid Pavements

Concrete pavement sections may be used to resist heavy loads and turning forces in areas such as fire lanes or trash enclosures. Final design of rigid pavement sections, and accompanying reinforcement, should be performed based on estimated traffic loads and frequencies. We recommend the following minimum design sections for rigid pavements.

- Use a minimum section of 6 inches of Portland Cement concrete over 6 inches of Caltrans Class 2 Aggregate Base.
- Concrete pavement should have a minimum 28-day compressive strength of 3,000 psi.
- Provide minimum control joint spacing in accordance with Portland Cement Association guidelines.

4.10.3 Subgrade and Aggregate Base Compaction

The contractor should compact finish subgrade and aggregate base in accordance with the design-level geotechnical report. In general, aggregate base (AB) materials should meet the requirements for ¾-inch maximum Class 2 AB in accordance with Section 26-1.02a of the latest Caltrans Standard Specifications.

5.0 DESIGN-LEVEL GEOTECHNICAL STUDY

As previously discussed, this report presents our preliminary geotechnical findings, conclusions and recommendations intended for planning purposes only. To support future proposed development, a design-level geotechnical exploration and assessment should be performed when development plans are available. The exploration will also allow for more detailed evaluations of the geotechnical issues discussed in this report and afford the opportunity to provide recommendations regarding techniques and procedures to be implemented during construction to mitigate potential geotechnical/geological hazards.

We recommend the design-level exploration and reporting include the following scope items.

- Borings, including matched-pair borings located immediately adjacent to CPTs performed as part of this study for characterization of subsurface conditions and groundwater conditions.
- Laboratory testing including but not limited to, moisture content, unit weight, gradation, Atterberg Limits, strength, and corrosivity testing.
- Design-level assessment of geologic and geotechnical hazards
- Design recommendations for foundation system design
- Foundation constructability recommendations
- Design-level earthwork and improvement design and construction recommendations

6.0 LIMITATIONS AND UNIFORMITY OF CONDITIONS

This report presents our preliminary geotechnical exploration for the site discussed in Section 1.2. If changes occur in the nature or design of the project, we should be allowed to review this report and provide additional recommendations. It is the responsibility of the owner to transmit the

DRAFT

information and recommendations of this report to the appropriate organizations or people involved in design of the project, including but not limited to developers, owners, buyers, architects, engineers, and designers. The conclusions and recommendations contained in this report are solely professional opinions and are valid for a period of no more than 2 years from the date of report issuance.

We strive to perform our professional services in accordance with generally accepted principles and practices currently employed in the area; there is no warranty, either express or implied. There are risks of earth movement and property damages inherent in building on or with earth materials. We are unable to eliminate all risks; therefore, we are unable to guarantee or warrant the results of our services.

Our services did not include excavation sloping or shoring, soil volume change factors, or flood potential. In addition, our geotechnical exploration did not include work to determine the existence of possible hazardous materials. If any hazardous materials are encountered during construction, the proper regulatory officials should be notified immediately.

This document must not be subject to unauthorized reuse, that is, reuse without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. Actual field or other conditions will necessitate clarifications, adjustments, modifications, or other changes to ENGEO's documents. Therefore, ENGEO must be engaged to prepare the necessary clarifications, adjustments, modifications, or other changes before construction activities commence or further activity proceeds. If ENGEO's scope of services does not include on-site construction observation, or if other persons or entities are retained to provide such services, ENGEO cannot be held responsible for any or all claims arising from or resulting from the performance of such services by other persons or entities, and from any or all claims arising from or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

We determined the lines designating the interface between layers on the exploration logs using visual observations. The transition between the materials may be abrupt or gradual. The exploration logs contain information concerning samples recovered, indications of the presence of various materials such as clay, sand, silt, rock, existing fill, etc., and observations of groundwater encountered. The field logs also contain our interpretation of the subsurface conditions between sample locations. Therefore, the logs contain both factual and interpretative information. Our recommendations are based on the contents of the final logs, which represent our interpretation of the field logs.

Test Types	CPTu
Additional Comments	None

Coordinates	
Collection Method	Consumer Grade GPS
EPSG Number	32610 (WGS 84 / UTM Zone 10N)
Additional Comments	None

Please refer to the list of attached documents following the text of this report. A test summary, location map, and plots are included. Thank you for the opportunity to work on this project.

PROJECT INFORMATION

Cone Penetration Test (CPTu)	
Depth reference	Depths are referenced to the existing ground surface at the time of each test.
Tip and sleeve data offset	0.1 Meters. This has been accounted for in the CPT data files.

Calculated Geotechnical Parameters	
Additional information	The Normalized Soil Behaviour Type Chart based on Q_{tn} (SBT Q_{tn}) (Robertson, 2009) was used to classify the soil for this project. A detailed set of calculated CPTu parameters have been generated and are provided in Excel format files in the release folder. The CPTu parameter calculations are based on values of corrected tip resistance (q_t) sleeve friction (f_s) and pore pressure (u_2). Effective stresses are calculated based on unit weights that have been assigned to the individual soil behaviour type zones and the assumed equilibrium pore pressure profile. Soils were classified as either drained or undrained based on the Q_{tn} Normalized Soil Behaviour Type Chart (Robertson, 2009). Calculations for both drained and undrained parameters were included for materials that classified as silt mixtures (zone 4).

CONE PENETRATION TEST SUMMARY

Sounding ID	File Name	Date	Rig	Cone	Cone Area (cm^2)	Assumed Phreatic Surface[1] (ft)	Final Depth (ft)	Northing[2] (m)	Easting[2] (m)	Surface Elevation[3] (ft)	Refer to Notation Number
CPT-1	23-56-26474_CP01	2023-09-06	C-15	934:T1500F15U35	15	22.98	33.79	4126555	593775	202	1
CPT-2	23-56-26474_CP02	2023-09-06	C-15	934:T1500F15U35	15	23.87	33.46	4126362	593576	207	
CPT-3	23-56-26474_CP03	2023-09-06	C-15	934:T1500F15U35	15	22.98	44.46	4126408	593708	206	
CPT-4	23-56-26474_CP04	2023-09-06	C-15	934:T1500F15U35	15	34.14	44.46	4126479	593885	203	
CPT-5	23-56-26474_CP05	2023-09-06	C-15	934:T1500F15U35	15	22.98	23.87	4126699	593893	199	1
Totals							180.03				

1. The assumed phreatic surface was based off the shallowest pore pressure dissipation tests performed within or nearest the sounding. Hydrostatic conditions were assumed for the calculated parameters.
2. The coordinates were collected using consumer grade GPS and have an accuracy of ±30 feet. EPSG number: 32610 (WGS84 / UTM 10N).
3. Elevations are referenced to the ground surface and were acquired from the Google Earth Elevation for the recorded coordinates.

CONETEC

METHODOLOGY STATEMENTS

CONE PENETRATION TEST (CPTu) - eSeries

Cone penetration tests (CPTu) are conducted using an integrated electronic piezocone penetrometer and data acquisition system manufactured by Adara Systems Ltd., a subsidiary of ConeTec.

ConeTec's piezocone penetrometers are compression type designs in which the tip and friction sleeve load cells are independent and have separate load capacities. The piezocones use strain gauged load cells for tip and sleeve friction and a strain gauged diaphragm type transducer for recording pore pressure. The piezocones also have a platinum resistive temperature device (RTD) for monitoring the temperature of the sensors, an accelerometer type dual axis inclinometer and two geophone sensors for recording seismic signals. All signals are amplified and measured with minimum sixteen-bit resolution down hole within the cone body, and the signals are sent to the surface using a high bandwidth, error corrected digital interface through a shielded cable.

ConeTec penetrometers are manufactured with various tip, friction and pore pressure capacities in both 10 cm^2 and 15 cm^2 tip base area configurations in order to maximize signal resolution for various soil conditions. The specific piezocone used for each test is described in the CPT summary table. The 15 cm^2 penetrometers do not require friction reducers as they have a diameter larger than the deployment rods. The 10 cm^2 piezocones use a friction reducer consisting of a rod adapter extension behind the main cone body with an enlarged cross sectional area (typically 44 millimeters diameter over a length of 32 millimeters with tapered leading and trailing edges) located at a distance of 585 millimeters above the cone tip.

The penetrometers are designed with equal end area friction sleeves, a net end area ratio of 0.8 and cone tips with a 60 degree apex angle.

All ConeTec piezocones can record pore pressure at various locations. Unless otherwise noted, the pore pressure filter is located directly behind the cone tip in the "u_2" position (ASTM Type 2). The filter is six millimeters thick, made of porous plastic (polyethylene) having an average pore size of 125 microns (90-160 microns). The function of the filter is to allow rapid movements of extremely small volumes of water needed to activate the pressure transducer while preventing soil ingress or blockage.

The piezocone penetrometers are manufactured with dimensions, tolerances and sensor characteristics that are in general accordance with the current ASTM D5778 standard. ConeTec's calibration criteria also meets or exceeds those of the current ASTM D5778 standard. An illustration of the piezocone penetrometer is presented in Figure CPTu.

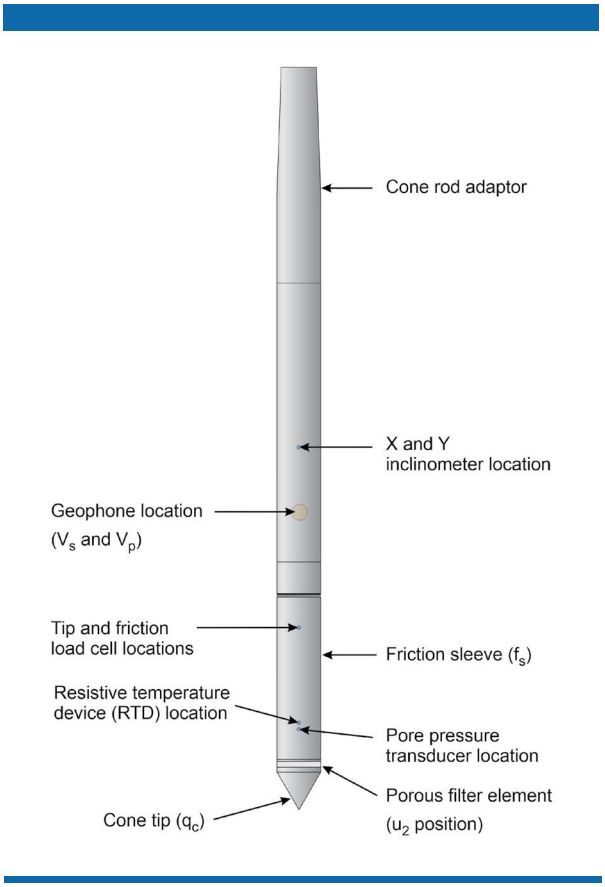

Figure CPTu. Piezocone Penetrometer (15 cm²)

The ConeTec data acquisition system consists of a Windows based computer, signal interface box, and power supply. The signal interface combines depth increment signals, seismic trigger signals and the downhole digital data. This combined data is then sent to the Windows based computer for collection and presentation. The data is recorded at fixed depth increments using a depth encoder that is either portable or integrated into the rig. The typical recording interval is 2.5 centimeters; custom recording intervals are possible.

The system displays the CPTu data in real time and records the following parameters to a storage media during penetration:

- Depth
- Uncorrected tip resistance (q_c)
- Sleeve friction (f_s)
- Dynamic pore pressure (u)
- Additional sensors such as resistivity, passive gamma, ultra violet induced fluorescence, if applicable

All testing is performed in accordance to ConeTec's CPTu operating procedures which are in general accordance with the current ASTM D5778 standard.

Prior to the start of a CPTu sounding a suitable cone is selected, the cone and data acquisition system are powered on, the pore pressure system is saturated with silicone oil and the baseline readings are recorded with the cone hanging freely in a vertical position.

The CPTu is conducted at a steady rate of two centimeters per second, within acceptable tolerances. Typically one meter length rods with an outer diameter of 1.5 inches are added to advance the cone to the sounding termination depth. After cone retraction final baselines are recorded.

Additional information pertaining to ConeTec's cone penetration testing procedures:

- Each filter is saturated in silicone oil under vacuum pressure prior to use
- Baseline readings are compared to previous readings
- Soundings are terminated at the client's target depth or at a depth where an obstruction is encountered, excessive rod flex occurs, excessive inclination occurs, equipment damage is likely to take place, or a dangerous working environment arises
- Differences between initial and final baselines are calculated to ensure zero load offsets have not occurred and to ensure compliance with ASTM standards

The interpretation of piezocone data for this report is based on the corrected tip resistance (q_t), sleeve friction (f_s) and pore water pressure (u). The interpretation of soil type is based on the correlations developed by Robertson, P.K., 2010. The Soil Behavior Type (SBT) classification chart developed by Robertson, P.K., 2010 is presented in Figure SBT. It should be noted that it is not always possible to accurately identify a soil behavior type based on these parameters. In these situations, experience, judgment and an assessment of other parameters may be used to infer soil behavior type.

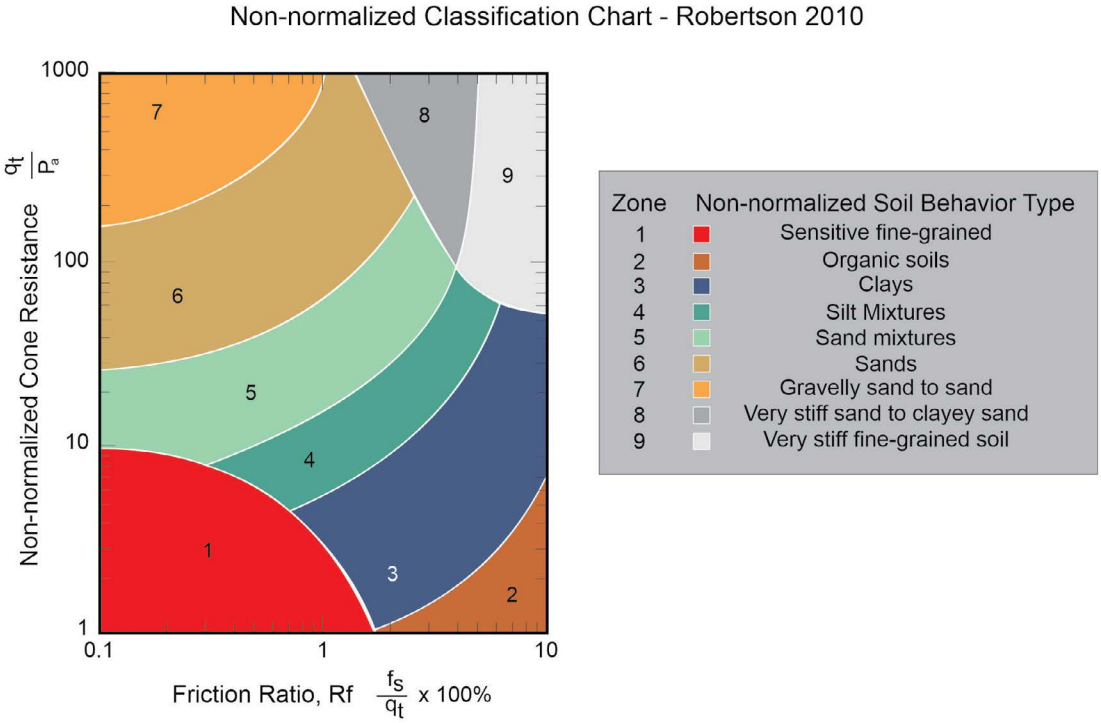

Figure SBT. Non-Normalized Soil Behavior Type Classification Chart (SBT)

The recorded tip resistance (q_c) is the total force acting on the piezocone tip divided by its base area. The tip resistance is corrected for pore pressure effects and termed corrected tip resistance (q_t) according to the following expression presented in Robertson et al. (1986):

$$q_t = q_c + (1-a) \bullet u_2$$

where: q_t is the corrected tip resistance
q_c is the recorded tip resistance
u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)
a is the Net Area Ratio for the piezocone (0.8 for ConeTec probes)

The sleeve friction (f_s) is the frictional force on the sleeve divided by its surface area. As all ConeTec piezocones have equal end area friction sleeves, pore pressure corrections to the sleeve data are not required.

The dynamic pore pressure (u) is a measure of the pore pressures generated during cone penetration. To record equilibrium pore pressure, the penetration must be stopped to allow the dynamic pore pressures to stabilize. The rate at which this occurs is predominantly a function of the permeability of the soil and the diameter of the cone.

The friction ratio (Rf) is a calculated parameter. It is defined as the ratio of sleeve friction to the tip resistance expressed as a percentage. Generally, saturated cohesive soils have low tip resistance, high friction ratios and generate large excess pore water pressures. Cohesionless soils have higher tip resistances, lower friction ratios and do not generate significant excess pore water pressure.

For additional information on CPTu interpretations and calculated geotechnical parameters, refer to Robertson et al. (1986), Lunne et al. (1997), Robertson (2009), Mayne (2013, 2014) and Mayne and Peuchen (2012).

PORE PRESSURE DISSIPATION TEST

The cone penetration test is halted at specific depths to carry out pore pressure dissipation (PPD) tests, shown in Figure PPD-1. For each dissipation test the cone and rods are decoupled from the rig and the data acquisition system measures and records the variation of the pore pressure (u) with time (t).

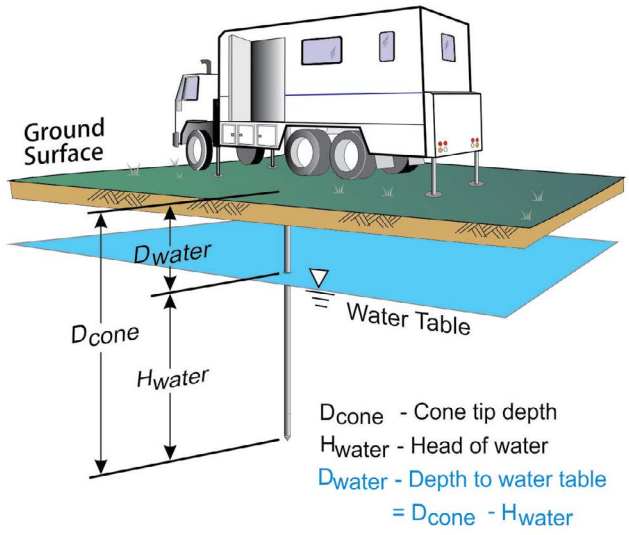

Figure PPD-1. Pore pressure dissipation test setup

Pore pressure dissipation data can be interpreted to provide estimates of ground water conditions, permeability, consolidation characteristics and soil behavior.

The typical shapes of dissipation curves shown in Figure PPD-2 are very useful in assessing soil type, drainage, in situ pore pressure and soil properties. A flat curve that stabilizes quickly is typical of a freely draining sand. Undrained soils such as clays will typically show positive excess pore pressure and have long dissipation times. Dilative soils will often exhibit dynamic pore pressures below equilibrium that then rise over time. Overconsolidated fine-grained soils will often exhibit an initial dilatory response where there is an initial rise in pore pressure before reaching a peak and dissipating.

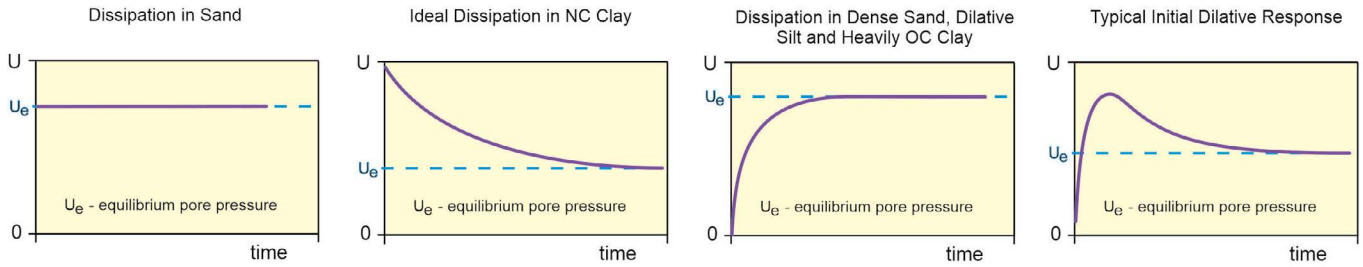

Figure PPD-2. Pore pressure dissipation curve examples

In order to interpret the equilibrium pore pressure (u_{eq}) and the apparent phreatic surface, the pore pressure should be monitored until such time as there is no variation in pore pressure with time as shown for each curve in Figure PPD-2.

CONE PENETRATION DIGITAL FILE FORMATS - eSeries

CPT Data Files (COR Extension)

ConeTec CPT data files are stored in ASCII text files that are readable by almost any text editor. ConeTec file names start with the job number (which includes the two digit year number) an underscore as a separating character, followed by two letters based on the type of test and the sounding ID. The last character position is reserved for an identifier letter (such as b, c, d etc) used to uniquely distinguish multiple soundings at the same location. The CPT sounding file has the extension COR. As an example, for job number 21-02-00001 the first CPT sounding will have file name 21-02-00001_CP01.COR

The sounding (COR) file consists of the following components:

1. Two lines of header information
2. Data records
3. End of data marker
4. Units information

Header Lines

Line 1: Columns 1-6 may be blank or may indicate the version number of the recording software
Columns 7-21 contain the sounding Date and Time (Date is MM:DD:YY)
Columns 23-38 contain the sounding Operator
Columns 51-100 contain extended Job Location information

Line 2: Columns 1-16 contain the Job Location
Columns 17-32 contain the Cone ID
Columns 33-47 contain the sounding number
Columns 51-100 may contain extended sounding ID information

Data Records

The data records contain 4 or more columns of data in floating point format. A comma and spaces separate each data item:

Column 1: Sounding Depth (meters)
Column 2: Tip (q_c), recorded in units selected by the operator
Column 3: Sleeve (f_s), recorded in units selected by the operator
Column 4: Dynamic pore pressure (u), recorded in units selected by the operator
Column 5: Empty or may contain other requested data such as Gamma, Resistivity or UVIF data

End of Data Marker

After the last line of data there is a line containing an ASCII 26 (CTL-Z) character (small rectangular shaped character) followed by a newline (carriage return / line feed). This is used to mark the end of data.

Units Information

The last section of the file contains information about the units that were selected for the sounding. A separator bar makes up the first line. The second line contains the type of units used for depth, q_c, f_s and u. The third line contains the conversion values required for ConeTec's software to convert the recorded data to an internal set of base units (bar for q_c, bar for f_s and meters for u). Additional lines intended for internal ConeTec use may appear following the conversion values.

CPT Data Files (XLS Extension)

Excel format files of ConeTec CPT data are also generated from corresponding COR files. The XLS files have the same base file name as the COR file with a -BSC suffix. The information in the file is presented in table format and contains additional information about the sounding such as coordinate information, and tip net area ratio.

The BSCI suffix is given to XLS files which are enhanced versions of the BSC files and include the same data records in addition to inclination data collected for each sounding.

CPT Dissipation Files (XLS Extension)

Pore pressure dissipation files are provided in Excel format and contain each dissipation trace that exceeds a minimum duration (selected during post-processing) formatted column wise within the spreadsheet. The first column (Column A) contains the time in seconds and the second column (Column B) contains the time in minutes. Subsequent columns contain the dissipation trace data. The columns extend to the longest trace of the data set.

Detailed header information is provided at the top of the worksheet. The test depth in meters and feet, the number of points in the trace and the particular units are all presented at the top of each trace column.

CPT Dissipation files have the same naming convention as the CPT sounding files with a "–PPD" suffix.

Data Records

Each file will contain dissipation traces that exceed a minimum duration (selected during post-processing) in a particular column. The dissipation pore pressure values are typically recorded at varying time intervals throughout the trace; rapidly to start and increasing as the duration of the test lengthens. The test depth in meters and feet, the number of points in the trace and the trace number are identified at the top of each trace column.

Cone Type Designations

Cone ID	Cone Description	Tip Cross Sect. Area (cm^2)	Tip Capacity (bar)	Sleeve Area (cm^2)**	Sleeve Capacity (bar)	Pore Pressure Capacity (bar)
EC###	A15T1500F15U35	15	1500	225	15	35

Description of Methods for Calculated CPT Geotechnical Parameters

CONETEC

CALCULATED CPT GEOTECHNICAL PARAMETERS

A Detailed Description of the Methods Used in ConeTec's CPT Geotechnical Parameter Calculation and Plotting Software

Revision SZW-Rev 18

Revised February 10, 2023

Prepared by Jim Greig, M.A.Sc, P.Eng (BC, AB, ON)

Limitations

The geotechnical parameter output was prepared specifically for the site and project named in the accompanying report subject to objectives, site conditions and criteria provided to ConeTec by the client. The output may not be relied upon by any other party or for any other site without the express written permission of ConeTec Group (ConeTec) or any of its affiliates. For this project, ConeTec has provided site investigation services, prepared factual data reporting and produced geotechnical parameter calculations consistent with current best practices. No other warranty, expressed or implied, is made.

To understand the calculations that have been performed and to be able to reproduce the calculated parameters the user is directed to the basic descriptions for the methods in this document and the detailed descriptions and their associated limitations and appropriateness in the technical references cited for each parameter.

ConeTec's Calculated CPT Geotechnical Parameters as of February 10, 2023.

ConeTec's CPT parameter calculation and plotting routine provides a tabular output of geotechnical parameters based on current published CPT correlations and is subject to change to reflect the current state of practice. Due to drainage conditions and the basic assumptions and limitations of the correlations, not all geotechnical parameters provided are considered applicable for all soil types. The results are presented only as a guide for geotechnical use and should be carefully examined for consideration in any geotechnical design. Reference to current literature is strongly recommended. ConeTec does not warranty the correctness or the applicability of any of the geotechnical parameters calculated by the program and does not assume liability for any use of the results in any design or review. For verification purposes we recommend that representative hand calculations be done for any parameter that is critical for design purposes. The end user of the parameter output should also be fully aware of the techniques and the limitations of any method used by the program. The purpose of this document is to inform the user as to which methods were used and to direct the end user to the appropriate technical papers and/or publications for further reference.

The geotechnical parameter output was prepared specifically for the site and project named in the accompanying report subject to objectives, site conditions and criteria provided to ConeTec by the client. The output may not be relied upon by any other party or for any other site without the express written permission of ConeTec Group (ConeTec) or any of its affiliates.

The CPT calculations are based on values of tip resistance, sleeve friction and pore pressures considered at each data point or averaged over a user specified layer thickness (e.g., 0.20 m). Note that q_t is the tip resistance corrected for pore pressure effects and q_c is the recorded tip resistance. The corrected tip resistance (corrected using u_2 pore pressure values) is used for all calculations. Since all ConeTec cones have equal end area friction sleeves pore pressure corrections to sleeve friction, f_s, are not performed.

Corrected tip resistance: $q_t = q_c + (1-a) \cdot u_2$ (consistent units are required)

where: q_t is the corrected tip resistance
q_c is the recorded tip resistance
u_2 is the recorded dynamic pore pressure from behind the tip (u_2 position)
a is the Net Area Ratio for the cone (typically 0.80 for ConeTec cones)

The total stress calculations are based on soil unit weight values that have been assigned to the Soil Behavior Type (SBT) zones, from a user defined unit weight profile, by using a single uniform value throughout the profile, through unit weight estimation techniques described in various technical papers or from a combination of these methods. The parameter output files indicate the method(s) used.

Effective vertical overburden stresses are calculated using the total stress and equilibrium pore pressure (u_{eq} or u_o) values derived from an assumed hydrostatic distribution of pore pressures below the water table or from a user defined equilibrium pore pressure profile (typically obtained from CPT dissipation tests) or a combination of the two. For over water projects the stress effects of the column of water above the mudline are taken into account as is the appropriate unit weight of water. How this is done depends on where the instruments are zeroed (i.e. on deck or at the mudline). The parameter output files indicate the method(s) used.

A majority of parameter calculations are derived from or driven by results based on material types as determined by the various soil behavior type charts depicted in Figures 1 through 6. The parameter output files indicate the method(s) used.

The Soil Behavior Type classification chart shown in Figure 1 is the classic non-normalized SBT Chart developed at the University of British Columbia and reported in Robertson, Campanella, Gillespie and Greig (1986). Figure 2 shows the original normalized (linear method) SBTn chart developed by Robertson (1990). The Bq classification charts

shown in Figures 3a and 3b incorporate pore pressures into the SBT classification and are based on the methods described in Robertson (1990). Many of these charts have been summarized in Lunne, Robertson and Powell (1997). The Jefferies and Davies SBT chart shown in Figure 3c is based on the techniques discussed in Jefferies and Davies (1993) which introduced the concept of the Soil Behavior Type Index parameter, I_c. Take note that the I_c parameter developed by Robertson and Fear (1995) and Robertson and Wride (1998) is similar in concept but uses a slightly different calculation method than that defined by Jefferies and Davies (1993) as the latter incorporates pore pressure in their technique through the use of the Bq parameter. The normalized Qtn SBT chart shown in Figure 4 is based on the work by Robertson (2009) utilizing a variable stress ratio exponent, n, for normalization based on a slightly modified redefinition and iterative approach for I_c. The boundary curves drawn on the chart are based on the work described in Robertson (2010).

Figure 5 shows a revised 1986 SBT Chart presented to CPT'10 by Robertson (2010b). It is known as the Updated non-normalized Soil Behavior Chart (also referred to as the Rev SBT Chart (PKR2010) in our output files). This chart was produced to be more in line with all post-1986 Robertson charts having the same 9 soil type zones, a $\log_{10}$ axis for friction ratio, R_f in this case, and a unitless tip resistance axis.

Figure 6 shows a revised behavior based chart by Robertson (2016) depicting contractive-dilative zones. As the zones represent material behavior rather than soil gradation ConeTec has chosen a set of zone colors that are less likely to be confused with material type colors from previous SBT charts. These colors differ from those used by Dr. Robertson. A green palette was selected for the dilative (desirable) side of the chart and a red palette for the contractive side of the chart.

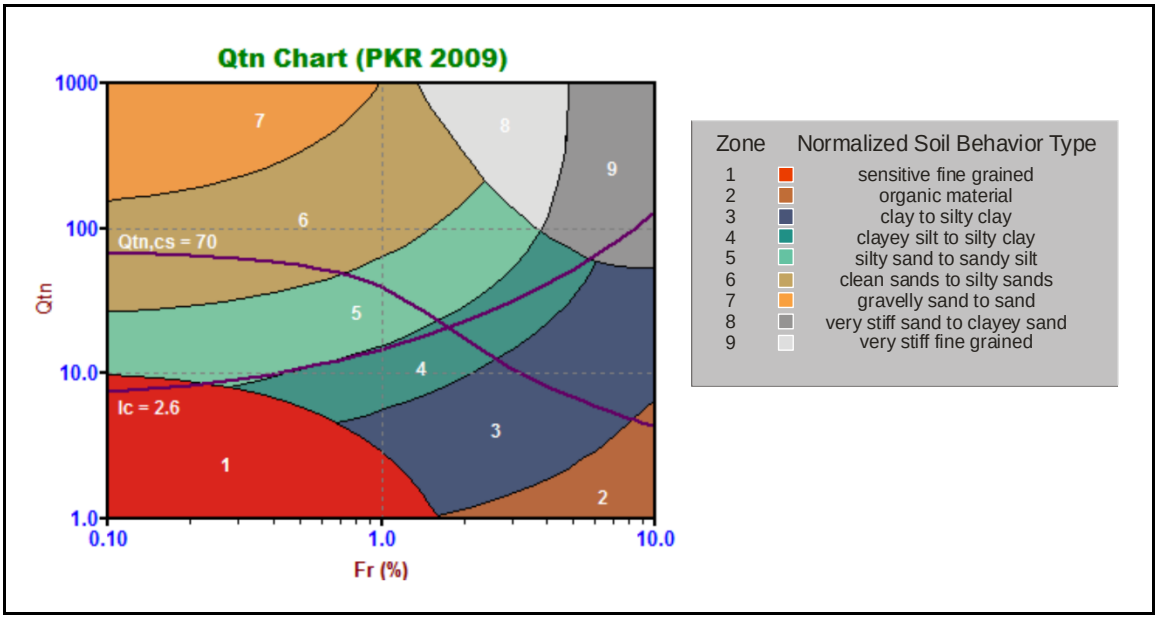

Figure 4. Normalized Soil Behavior Type Chart using Q_{tn} (SBT Qtn)

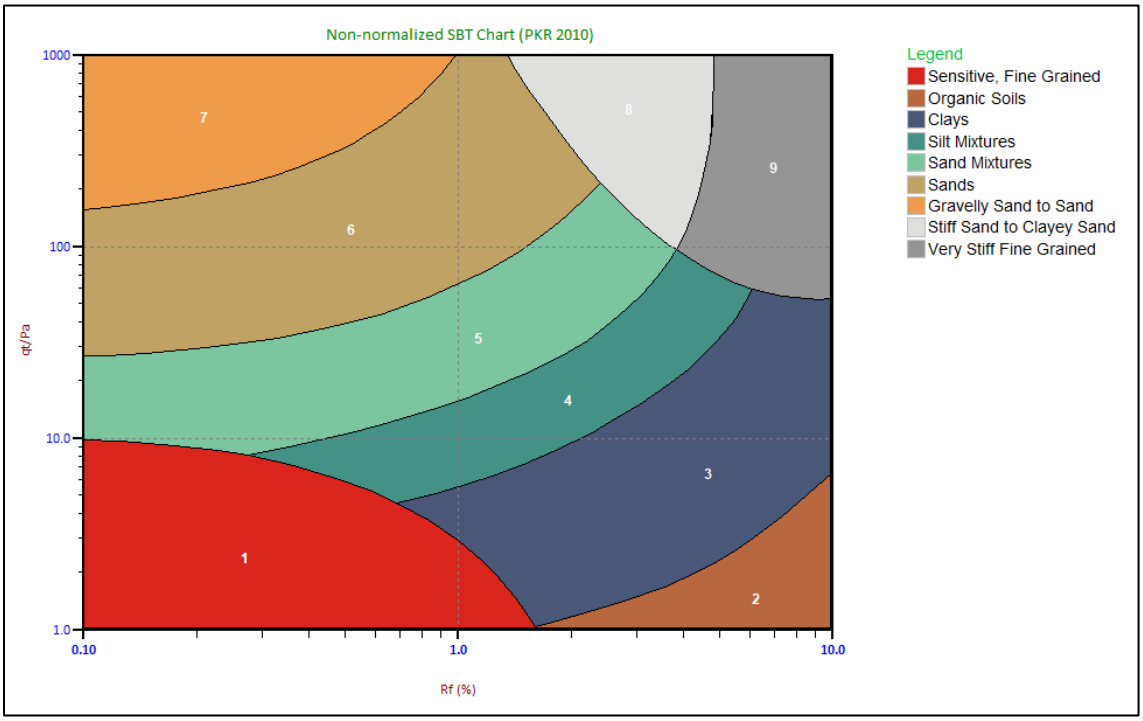

Figure 5. Non-normalized Soil Behavior Type Chart (2010)

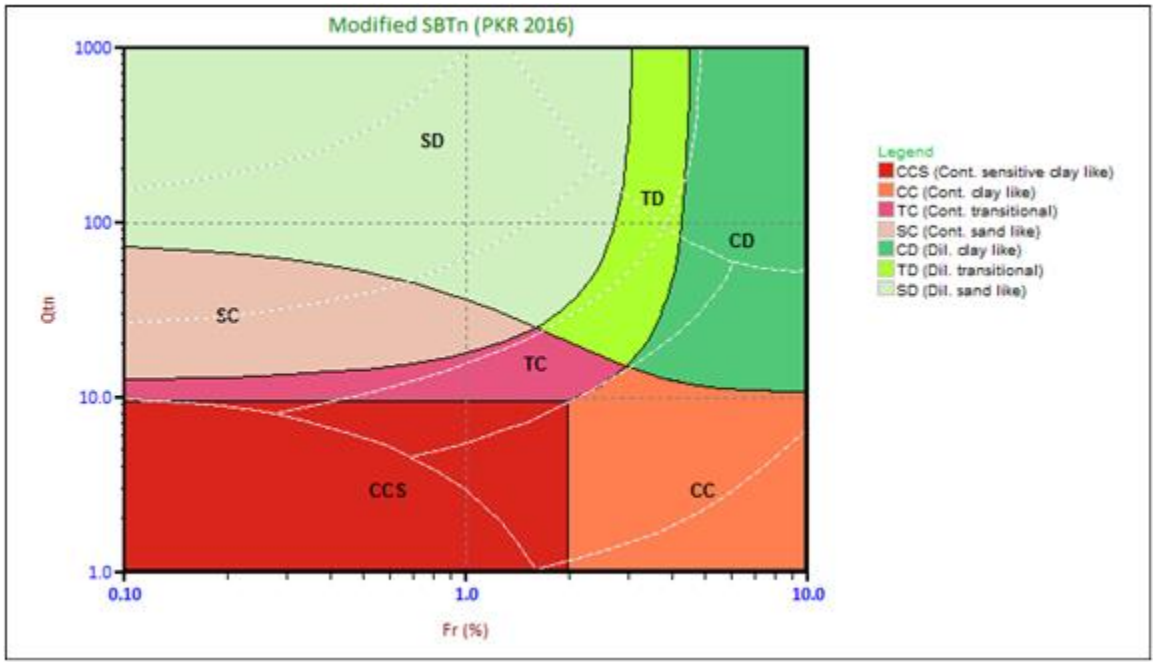

Figure 6. Modified SBTn Behavior Based Chart

Details regarding the geotechnical parameter calculations are provided in Tables 1a and 1b. The appropriate references cited are listed in Table 2. Non-liquefaction specific parameters are detailed in Table 1a and liquefaction specific parameters are detailed in Table 1b.

Where methods are based on charts or techniques that are too complex to describe in this summary, we recommend that the user refer to the cited material. Specific limitations for each method are described in the cited material.

Where the results of a calculation/correlation are deemed *'invalid'* the value will be represented by the text strings "-9999", "-9999.0", the value 0.0 (Zero) or an empty cell. Invalid results will occur because of (and not limited to) one or a combination of:

1. Invalid or undefined CPT data (e.g., drilled out section or data gap).

2. Where the calculation method is inappropriate, for example, drained parameters in a material behaving in an undrained manner (and vice versa).

3. Where input values are beyond the range of the referenced charts or specified limitations of the correlation method.

4. Where pre-requisite or intermediate parameter calculations are invalid.

The parameters selected for output from the program are often specific to a particular project. As such, not all of the calculated parameters listed in Tables 1and 1a may be included in the output files delivered with this report.

The output files are typically provided in Microsoft Excel XLS, XLSX or CSV format. The ConeTec software has several options for output depending on the number or types of calculated parameters desired or those specifically contracted for by the client. Each output file is named using the original file base name (from the .COR file) followed

by a three or four character indicator of the output set selected (e.g. BSC, TBL, NLI, NL2, IFI, IFI2, IFI3) and possibly followed by an operator selected suffix identifying the characteristics of the particular calculation run.

Table 1a. CPT Parameter Calculation Methods – Non liquefaction Parameters

Reference Notes: CK* - Common Knowledge, U* - Unpublished

Calculated Parameter	Description	Equation	Ref
Depth	Mid Layer Depth *(where calculations are done at each point then Mid Layer Depth = Recorded Depth)*	*[Depth (Layer Top) + Depth (Layer Bottom)]/ 2.0*	CK*
Elevation	Elevation of Mid Layer is based on the sounding collar elevation supplied by the client or through a site survey In Sweden a variation of elevation is used where the elevation increases with depth. We refer to this as inverse elevation.	Elevation = Collar Elevation – Depth InverseElevation = Collar Elevation + Depth	CK* N/A
Avg qc	Averaged recorded tip value (q_c)	$Avgqc = \frac{1}{n}\sum_{i=1}^{n} q_c$ *n=1 when calculations are done at each point*	CK*
Avg qt	Averaged corrected tip (q_t) where: $q_t = q_c + (1-a)\cdot u_2$ Averaged q_t is not calculated using the average q_c and averaged u values. Averaged q_t is based on the average of the q_t values calculated at each data point.	$Avgqt = \frac{1}{n}\sum_{i=1}^{n} q_t$ *n=1 when calculations are done at each point*	1
Avg fs	Averaged sleeve friction (f_s) No pore pressure corrections are applied to f_s.	$Avgfs = \frac{1}{n}\sum_{i=1}^{n} fs$ *n=1 when calculations are done at each point*	CK*
Avg Rf	Averaged friction ratio (R_f) where friction ratio is defined as: $R_f = 100\% \cdot \frac{fs}{q_t}$	$AvgRf = 100\% \cdot \frac{Avgfs}{Avgqt}$ *not an average of individual R_f values*	CK*
Avg u	Averaged dynamic pore pressure *(u)*	$Avgu = \frac{1}{n}\sum_{i=1}^{n} u_i$ *n=1 when calculations are done at each point*	CK*
Avg Res	Averaged Resistivity (this data is not always available since it is a specialized test requiring an additional module)	$AvgRes = \frac{1}{n}\sum_{i=1}^{n} Resistivity_i$ *n=1 when calculations are done at each point*	CK*
Avg UVIF	Averaged UVIF ultra-violet induced fluorescence (this data is not always available since it is a specialized test requiring an additional module)	$AvgUVIF = \frac{1}{n}\sum_{i=1}^{n} UVIF_i$ *n=1 when calculations are done at each point*	CK*
Avg Temp	Averaged Temperature (this data is not always available)	$AvgTemp = \frac{1}{n}\sum_{i=1}^{n} Temperature_i$ *n=1 when calculations are done at each point*	CK*
Avg Gamma	Averaged Gamma Counts (this data is not always available since it is a specialized test requiring an additional module)	$AvgGamma = \frac{1}{n}\sum_{i=1}^{n} Gamma_i$ *n=1 when calculations are done at each point*	CK*
SBT	Soil Behavior Type as defined by Robertson et al 1986 (often referred to as Robertson and Campanella, 1986)	See Figure 1	1, 5
SBTn	Normalized Soil Behavior Type as defined by Robertson 1990 (linear normalization using Q_t, now referred to as Q_{t1})	See Figure 2	2, 5

Calculated Parameter	Description	Equation	Ref
SBT-Bq	Non-normalized Soil Behavior type based on non-normalized tip resistance and the B_q parameter	See Figure 3a	1, 2, 5
SBT-Bqn	Normalized Soil Behavior type based on normalized tip resistance (Q_t, now called Q_{t1}) and the B_q parameter	See Figure 3b	2, 5
SBT-JandD	Soil Behavior Type as defined by Jeffries and Davies	See Figure 3c	7
SBT Qtn	Soil Behavior Type as defined by Robertson (2009) using a variable stress ratio exponent for normalization based on $I_{c\ (PKR\ 2009)}$	See Figure 4	15
Modified Non-normalized SBT Chart SBT (PKR2010)	This is a revised version of the simple 1986 non-normalized SBT chart (presented at CPT '10). The revised version has been reduced from 12 zones to 9 zones to be similar to the normalized Robertson charts. Other updates include a dimensionless tip resistance normalized to atmospheric pressure, q_t/P_a, on the vertical axis and a log scale for non-normalized friction ratio, R_f, along the horizontal axis.	See Figure 5	33
Modified SBTn (contractive /dilative)	Modified SBTn chart as defined by Robertson (2016) indicating zones of contractive/dilative behavior. Note that ConeTec displays the chart with colors different from Robertson. ConeTec's colors were chosen to avoid confusion with soil type descriptions.	See Figure 6	30
Unit Wt.	Unit Weight of soil determined from one of the following user selectable options: 1) uniform value 2) value assigned to each SBT zone 3) value assigned to each SBTn zone 4) value assigned to SBTn zone as determined from Robertson and Wride (1998) based on q_{c1n} 5) values assigned to SBT Qtn zones 6) values based on Robertson updated non-normalized Soil Behavior Type Chart (2010b) 6) Mayne f_s (sleeve friction) method 7) Robertson and Cabal 2010 method 8) user supplied unit weight profile The last option may co-exist with any of the other options.	See references	3, 5, 15, 21, 24, 29, 33

Calculated Parameter	Description	Equation	Ref
TStress σ_v	Total vertical overburden stress at Mid Layer Depth *A layer is defined as the averaging interval specified by the user where depths are reported at their respective mid-layer depth.* For data calculated at each point layers are defined using the recorded depth as the mid-point of the layer. Thus, a layer starts half-way between the previous depth and the current depth unless this is the first point in which case the layer start is at zero depth. The layer bottom is half-way from the current depth to the next depth unless it is the last data point. Defining layers affects how stresses are calculated since the unit weight attributed to a data point is used throughout the entire layer. This means that to calculate the stresses the total stress at the top and bottom of a layer are required. The stress at mid layer is determined by adding the incremental stress from the layer top to the mid-layer depth. The stress at the layer bottom becomes the stress at the top of the subsequent layer. Stresses are NOT calculated from mid-point to mid-point. For over-water work the total stress due to the column of water above the mid line is taken into account where appropriate.	$TStress = \sum_{i=1}^{n} \gamma_i h_i$ *where* γ_i is layer unit weight h_i is layer thickness 	CK*
EStress σ_v'	Effective vertical overburden stress at mid-layer depth.	$\sigma_v' = \sigma_v - u_{eq}$	CK*
Equil u u_{eq} or u_0	Equilibrium pore pressures are determined from one of the following user selectable options: 1) hydrostatic below the water table 2) user supplied profile 3) combination of those above When a user supplied profile is used/provided a linear interpolation is performed between equilibrium pore pressures defined at specific depths. If the profile values start below the water table then a linear transition from zero pressure at the water table to the first defined pointed is used. Equilibrium pore pressures may come from dissipation tests, adjacent piezometers or other sources. Occasionally, an extra equilibrium point ("assumed value") will be provided in the profile that does not come from a recorded value to smooth out any abrupt changes or to deal with material interfaces. These "assumed" values will be indicated on our plots and in tabular summaries.	For the hydrostatic option: $u_{eq} = \gamma_w \cdot (D - D_{wt})$ where u_{eq} is equilibrium pore pressure γ_w is the unit weight of water D is the current depth D_{wt} is the depth to the water table	CK*
K_0	Coefficient of earth pressure at rest, K_0.	$K_O = (1 - \sin\Phi') OCR^{\sin\Phi'}$	17
C_n	Overburden stress correction factor used for $(N_1)_{60}$ and older CPT parameters.	$C_n = (P_a/\sigma_v')^{0.5}$ where $0.0 < C_n < 2.0$ *(user adjustable, typically ranging from 1.7 to 2.0)* P_a *is atmospheric pressure (100 kPa)*	4, 12

Calculated Parameter	Description	Equation	Ref
C_q	Overburden stress normalizing factor.	$C_q = 1.8 / [0.8 + (\sigma_v'/P_a)]$ where *$0.0 < C_q < 2.0$ (user adjustable)* *P_a is atmospheric pressure (100 kPa)* *Robertson and Wride define C_q to be the same as C_n. The Olson definition above is used in the program.*	3, 12
N_{60}	SPT N value at 60% energy calculated from q_t/N ratios assigned to each SBT zone. This method has abrupt N value changes at zone boundaries.	*See Figure 1*	5
$(N_1)_{60}$	SPT N_{60} value corrected for overburden pressure.	*$(N_1)_{60} = C_n \bullet N_{60}$*	4
$N_{60}I_c$	SPT N_{60} values based on the I_c parameter, as defined by Robertson and Wride 1998 (3), or by Robertson 2009 (15).	$(q_t/P_a)/ N_{60} = 8.5 (1 – I_c/4.6)$ $(q_t/P_a)/ N_{60} = 10^{(1.1268 – 0.2817Ic)}$ P_a being atmospheric pressure	3, 5 15, 31
$(N_1)_{60}I_c$	SPT N_{60} value corrected for overburden pressure (using N_{60} I_c). User has 3 options.	*1) $(N_1)_{60}Ic = C_n \bullet (N_{60} I_c)$* 2) $q_{c1n}/ (N_1)_{60}I_c = 8.5 (1 – I_c/4.6)$ 3) $(Q_{tn})/ (N_1)_{60}I_c = 10^{(1.1268 – 0.2817Ic)}$	4 5 15, 31
S_u or S_u (N_{kt})	Undrained shear strength based on q_t S_u factor N_{kt} is user selectable.	$Su = \frac{qt - \sigma_v}{N_{kt}}$	1, 5
S_u or S_u (N_{du}) or S_u ($N_{\Delta u}$)	Undrained shear strength based on pore pressure S_u factor $N_{\Delta u}$ is user selectable.	$Su = \frac{u_2 - u_{eq}}{N_{\Delta u}}$	1, 5
D_r	Relative Density determined from one of the following user selectable options: 1) Ticino Sand 2) Hokksund Sand 3) Schmertmann (1978) 4) Jamiolkowski (1985) - All Sands 5) Jamiolkowski et al (2003) (various compressibilities, K_o)	See reference (methods 1 through 4) Jamiolkowski et al (2003) reference	5 14
PHI ϕ	Friction Angle determined from one of the following user selectable options (methods 1 through 4 are for sands and method 5 is for silts and clays): 1) Campanella and Robertson 2) Durgunoglu and Mitchel 3) Janbu 4) Kulhawy and Mayne 5) NTH method (clays and silts)	See appropriate reference	5 5 5 11 23
Delta U/q_t $\Delta u/q_t$ du/q_t	Differential pore pressure ratio (older parameter used before B_q was established)	$= \frac{\Delta u}{qt}$ *where:* $\Delta u = u - u_{eq}$ *and u = dynamic pore pressure* *u_{eq} = equilibrium pore pressure*	39

Calculated Parameter	Description	Equation	Ref
B_q	Pore pressure parameter	$Bq = \frac{\Delta u}{qt - \sigma_v}$ where: $\Delta u = u - u_{eq}$ *and* u *= dynamic pore pressure* u_{eq} *= equilibrium pore pressure*	1, 2, 5
Net q_t or qtNet	Net tip resistance (used in many subsequent correlations)	$qt - \sigma_v$	36
q_e or qE or q_E	Effective tip resistance (using the dynamic pore pressure u_2 and not equilibrium pore pressure)	$q_t - u_2$	36
qeNorm	Normalized effective tip resistance	$\frac{qt - u_2}{\sigma_v'}$	36
Q_t or Norm: Qt or Q_{t1}	Normalized q_t for Soil Behavior Type classification as defined by Robertson (1990) using a linear stress normalization. Note this is different from Q_{tn}. This parameter was renamed to Q_{t1} in Robertson, 2009. Without normalization limits this parameter calculates to very high unrealistic values at low stresses.	$Qt = \frac{qt - \sigma_v}{\sigma_v'}$	2, 5, 15
F_r or Norm: Fr	Normalized Friction Ratio for Soil Behavior Type classification as defined by Robertson (1990)	$Fr = 100\% \cdot \frac{fs}{qt - \sigma_v}$	2, 5
Q(1-B_q) Q(1-B_q) + 1	Q(1-B_q) grouping as suggested by Jefferies and Davies for their classification chart and the establishment of their I_c parameter. Later papers added the +1 term to the equation.	$Q \cdot (1 - Bq)$ $Q \cdot (1 - Bq) + 1$ *where Bq is defined as above and Q is the same as the normalized tip resistance,* Q_{t1}*, defined above*	6, 7, 34
q_{c1}	Normalized tip resistance, q_{c1}, using a fixed stress ratio exponent, n (this method has stress units)	$q_{c1} = q_t \cdot (Pa/\sigma_v')^{0.5}$ where: P_a = atmospheric pressure	21
q_{c1} (0.5)	Normalized tip resistance, q_{c1}, using a fixed stress ratio exponent, n (this method is unit-less)	$q_{c1}(0.5) = (q_t/P_a) \cdot (Pa/\sigma_v')^{0.5}$ where: P_a = atmospheric pressure	5
q_{c1} (C_n)	Normalized tip resistance, q_{c1}, based on C_n (this method has stress units)	$q_{c1}(Cn) = C_n * q_t$	5, 12
q_{c1} (C_q)	Normalized tip resistance, q_{c1}, based on C_q (this method has stress units)	$q_{c1}(Cq) = C_q * q_t$ (some papers use q_c)	5, 12
q_{c1n}	normalized tip resistance, q_{c1n}, using a variable stress ratio exponent, n (where n=0.0, 0.70, or 1.0) (this method is unit-less)	$q_{c1n} = (q_t / P_a)(P_a/\sigma_v')^n$ where: P_a = atm. Pressure and n varies as described below	3

Calculated Parameter	Description	Equation	Ref
I_c or Ic (RW1998)	Soil Behavior Type Index as defined by Robertson and Wride (1997, 1998) for estimating grain size characteristics and providing smooth gradational changes across the SBTn chart. Ic(RW1998) is different from that of Jefferies and Davies (7) and is different from Ic(PKR2009).	$I_c = [(3.47 - \log_{10}Q)^2 + (\log_{10} Fr + 1.22)^2]^{0.5}$ *Where:* $Q = \left(\frac{qt - \sigma_v}{P_a}\right)\left(\frac{P_a}{\sigma_v'}\right)^n$ *Or* $Q = q_{c1n} = \left(\frac{qt}{P_a}\right)\left(\frac{P_a}{\sigma_v'}\right)^n$ *depending on the iteration in determining I_c* *And Fr is in percent* *P_a = atmospheric pressure* *n has the following distinct values:* *0.5, 0.75 and 1.0* *and is determined in an iterative manner based on the resulting I_c in each iteration* *Note that NCEER replaced 0.75 with 0.70*	3, 4, 5 10
I_c (PKR 2009)	Soil Behavior Type Index, I_c (PKR 2009) is based on a variable stress ratio exponent n, which itself is based on I_c (PKR 2009). An iterative calculation is required to determine I_c (PKR 2009) and its corresponding n (PKR 2009).	*I_c (PKR 2009) =* *$[(3.47 - \log_{10}Q_{tn})^2 + (1.22 + \log_{10}F_r)^2]^{0.5}$*	15
n (PKR 2009)	Stress ratio exponent n, based on I_c (PKR 2009). An iterative calculation is required to determine n (PKR 2009) and its corresponding I_c (PKR 2009).	*n (PKR 2009) = 0.381 (I_c) + 0.05 (σ_v'/P_a) – 0.15*	15
Q_{tn} (PKR 2009)	Normalized tip resistance using a variable stress ratio exponent based on I_c (PKR 2009) and n (PKR 2009). An iterative calculation is required to determine Q_{tn} (PKR 2009).	*$Q_{tn} = [(qt - \sigma_v)/P_a](P_a/\sigma_v')^n$* *where P_a = atmospheric pressure (100 kPa)* *n = stress ratio exponent described above*	15
FC	Apparent fines content (%)	*FC=1.75($Ic^{3.25}$) - 3.7* *FC=100 for $I_c > 3.5$* *FC=0 for $I_c < 1.26$* *FC = 5% if 1.64 < I_c < 2.6 AND F_r<0.5*	3
I_c Zone	This parameter is the Soil Behavior Type zone based on the I_c parameter (valid for zones 2 through 7 on SBTn or SBT Qtn charts)	$I_c < 1.31$ Zone = 7 $1.31 < I_c < 2.05$ Zone = 6 $2.05 < I_c < 2.60$ Zone = 5 $2.60 < I_c < 2.95$ Zone = 4 $2.95 < I_c < 3.60$ Zone = 3 $I_c > 3.60$ Zone = 2	3
CD	The contractive / dilative boundary on Robertson's Modified SBTn (contractive/dilative) Chart shown in Figure 6 above. The boundary is marked as CD = 70 on the chart in the relevant paper. Similar to the $Q_{tn,cs}$ = 70 line in Figure 4.	CD = 70 = $(Q_{tn} - 11)(1 + 0.06F_r)^{17}$ lower bound of CD = 60: CD = 60 = $(Q_{tn} - 9.5)(1 + 0.06F_r)^{17}$	30

Calculated Parameter	Description	Equation	Ref
I_B	Hyberbolic fit defining the boundary between SBT soil types proposed by Schneider as a better fit than the I_c circles. I_B = 32 represents the boundary for most sand like soils. I_B = 22 represents the upper boundary for most clay like soils. The region between I_B=22 and I_B=32 is the "transitional soil" zone.	$I_B = 100\ (Q_{tn} + 10) / (70 + Q_{tn} F_r)$	30
State Param or State Parameter or ψ	The state parameter index, ψ, is defined as the difference between the current void ratio, e, and the critical void ratio, e_c. Positive ψ - contractive soil Negative ψ - dilative soil This is based on the work by Been and Jefferies (1985) and Plewes, Davies and Jefferies (1992) This method uses mean normal stresses based on a uniform value of K_0 or a calculated K_0 using methods described elsewhere in this document	See reference	6, 8
Yield Stress σ_p'	Yield stress is calculated using the following methods 1) General method 2) 1st order approximation using q_tNet (clays) 3) 1st order approximation using Δu_2 (clays) 4) 1st order approximation using q_e (clays) 5) Based on Vs	All stresses in kPa 1) $\sigma_p' = 0.33 \cdot (q_t - \sigma_v)^{m'} (\sigma_{atm}/100)^{1-m'}$ where $m' = 1 - \frac{0.28}{1 + (I_c / 2.65)^{25}}$ 2) $\sigma_p' = 0.33 \cdot (q_t - \sigma_v)$ 3) $\sigma_p' = 0.54 \cdot (\Delta u_2)$ $\Delta u_2 = u_2 - u_0$ 4) $\sigma_p' = 0.60 \cdot (q_t - u_2)$ 5) $\sigma_p' = (Vs/4.59)^{1.47}$	19 20 20 20 18
OCR OCR(JS1978) YSR(Mayne2014) YSR (qtNet) YSR (deltaU) YSR (qe) YSR (Vs) OCR (PKR2015)	Over Consolidation Ratio based on 1) Schmertmann (1978) method involving a plot plot of S_u/σ_v' /($S_u/\sigma_v')_{NC}$ and OCR  2) based on Yield stresses described above 3) approximate version based on qtNet 4) approximate version based on Δu 5) approximate version based on effective tip, q_e 6) approximate version based on shear wave velocity, V_s and σ_v' 7) based on Qt	1) requires a user defined value for NC Su/P_c' ratio 2 through 5) *based on yield stresses* 6) YSR (Vs) = $\sigma_p'(Vs) / \sigma_v'$ 7) OCR = $0.25 \cdot (Qt)^{1.25}$	9 19 20 20 20 18 32
Es/qt	Intermediate parameter for calculating Young's Modulus, E, in sands. It is the Y axis of the reference chart. Note that Figured 5.59 from reference 5, Lunne, Robertson and Powell, (LRP) has an error. The X axis values are too high by a factor of 10. The plot is based on Baldi's (not Bellotti as cited in	Based on Figure 5.59 in the reference	5, 37

Calculated Parameter	Description	Equation	Ref
	LRP) original Figure 3 where the X axis is: $\frac{q_c}{\sqrt{\sigma_v'}}$ (both in kPa) with a range of 200 to 3000. Figure 5.59 from LRP shows a dimensionless form of the equation, q_{c1}, displaying the same range of values. Figure 5.59's X axis uses $q_{c1} = \left(\frac{q_c}{P_a}\right)\left(\frac{P_a}{\sigma_v'}\right)^{0.5}$ The two expressions are not the same: they differ by a factor of $\frac{\sqrt{P_a}}{P_a}$. With P_a taken to be 100 kPa the factor is 1/10. Substituting typical values of 200 bar (20000 kPa) for q_c and 225 kPa for σ_v' one gets: 20000 / 15 = 1333.33 for Bellotti's axis and $(200/1)(100/225)^{0.5}$ = 200 * (10/15) = 133.3 for LRP's axis (noting that P_a = 1 bar) showing a factor of 10 difference.		
Es or E_s Young's Modulus E	Young's Modulus based on the work done in Italy. There are three types of sands considered in this technique. The user selects the appropriate type for the site from: a) OC Sands b) Aged NC Sands c) Recent NC Sands Each sand type has a family of curves that depend on mean normal stress. The program calculates mean normal stress and linearly interpolates between the two extremes provided in the E_s/q_t chart. E_s is evaluated for an axial strain of 0.1%.	Mean normal stress is evaluated from: $\sigma_m' = \frac{1}{3}(\sigma_v' + \sigma_h' + \sigma_h')$ where σ_v'= vertical effective stress σ_h'= horizontal effective stress *and* $\sigma_h = K_o \cdot \sigma_v'$ with K_o assumed to be 0.5	5
Delta U/TStress $\Delta u / \sigma_v$	Differential pore pressure ratio with respect to total stress	$= \frac{\Delta u}{\sigma_v}$ *where:* $\Delta u = u - u_{eq}$	39
Delta U/EStress, P Value, Excess Pore Pressure Ratio $\Delta u/\sigma_v'$	Differential pore pressure ratio with respect to effective stress. Key parameter (P, Normalized Pore Pressure Parameter, Excess Pore Pressure Ratio) in the Winckler et. al. static liquefaction method.	$= \frac{\Delta u}{\sigma_v'}$ *where:* $\Delta u = u - u_{eq}$	25, 25a
Su/EStress S_u/σ_v'	Undrained shear strength ratio with respect to vertical effective overburden stress using the S_u (N_{kt}) method	= *Su* (N_{kt}) / σ_v'	9, 23
Vs or V_s	Recorded shear wave velocities (not estimated). The shear wave velocities are typically collected over 1 m depth intervals. Each data point over the relevant depth range is assigned the same V_s value.	recorded data	27
Vp or V_p	Recorded compression wave (or P wave) velocities (not estimated). The P wave velocities are typically collected over 1 m depth intervals. Each data point over the relevant depth range is assigned the same V_p value.	recorded data	27

Calculated Parameter	Description	Equation	Ref
V_{s30} V_{s100}	The average shear wave velocity of the near surface materials to a depth of 30 m (100 ft). It is based on the sum of all travel times through all layers in the top 30m (100 ft). V_{s100} is the same calculation as V_{s30} except down to a depth of 100 feet.	$V_{s30} = \frac{total\ thickness\ of\ all\ layers\ to\ 30\ m}{\Sigma\left(\frac{layer\ thickness}{layer\ shear\ wave\ velocity}\right)}$ $V_{s30} = \frac{total\ thickness\ of\ all\ layers\ to\ 30\ m}{\Sigma\ (layer\ travel\ times)}$	38
G_{max}	G_{max} determined from SCPT shear wave velocities (not estimated values). Note that seismic data (V_s) is collected over set depth intervals (typically 1 meter). Each data point over the test segment is assigned the same V_s value. Since soil density changes with depth, slightly different G_{max} values may be calculated over the test depth interval.	$G_{max} = \rho V_s^2$ where ρ is the mass density of the soil determined from the estimated unit weights at each test depth	27
qtNet/G_{max}	Net tip resistance ratio with respect to the small strain modulus G_{max} determined from SCPT shear wave velocities (not estimated values)	$= (qt - \sigma_v) / G_{max}$ where $G_{max} = \rho V_s^2$ and ρ is the mass density of the soil determined from the estimated unit weights at each test depth	15, 28, 30
qUlt	A site specific and client specific parameter for estimating the limiting stress for "crane walk" accessibility	$q_{ult} = CraneWalkFactor \cdot S_u$ Where: *CraneWalkFactor* is client provided	U*
Estimated G_o	Estimated value for small strain shear modulus	$G_o = 0.0188[10^{(0.55Ic + 1,68)}](q_t - \sigma_v)$	15
Estimated E_{25}	Estimated value for Young's Modulus, E, at a 25% working load	$E_{25} = \alpha_E$ (qtNet) where $\alpha_E = 0.015[10^{(0.55Ic + 1,68)}]$	15
k_{SBT}	Estimated soil permeability derived from Soil Behavior Type (SBT) Chart I_c values.	For $1.0 < I_c \leq 3.27$: $k = 10^{(0.952 - 3.04Ic)}$ in m/s For $3.27 < Ic < 4.0$: $k = 10^{(-4.52 - 1.37Ic)}$ in m/s	35
M or D' Constrained Modulus	Constrained Modulus based on 1) Robertson, M 2) Mayne, D'	1) Robertson $M = \alpha_M (q_t - \sigma_v)$ $I_c > 2.2$ (fine grained) $\alpha_M = Qt$ when $Qt < 14$ $\alpha_M = 14$ when $Qt > 14$ $Ic < 2.2$ (coarse grained) $\alpha_M = 0.0188\ [10^{(0.55Ic + 1.68)}]$ $D' = \alpha_D (qt - \sigma_v)$ where $\alpha_D = 5$	32 23

Table 1b. CPT Parameter Calculation Methods – Liquefaction Parameters

Calculated Parameter	Description	Equation	Ref
K_{SPT} or K_s	Equivalent clean sand factor for $(N_1)60$	$K_{SPT} = 1 + ((0.75/30) \bullet (FC - 5))$	10
K_{CPT} or K_c (RW1998)	Equivalent clean sand correction for q_{c1N}	$K_{cpt} = 1.0$ for $I_c \leq 1.64$ $K_{cpt} = f(I_c)$ for $I_c > 1.64$ (see reference) $K_c = -0.403\ I_c^4 + 5.581\ I_c^3 - 21.63 I_c^2 + 33.75\ I_c - 17.88$	3, 10
K_c (PKR 2010)	Clean sand equivalent factor to be applied to Q_{tn}	$K_c = 1.0$ for $I_c \leq 1.64$ $K_c = -0.403\ I_c^4 + 5.581\ I_c^3 - 21.63 I_c^2 + 33.75\ I_c - 17.88$ for $I_c > 1.64$	16
$(N_1)_{60cs}I_C$	Clean sand equivalent SPT $(N_1)_{60}I_c$. User has 3 options.	1) $(N_1)_{60cs}Ic = \alpha + \beta((N_1)_{60}I_c)$ 2) $(N_1)_{60cs}Ic = K_{SPT} * ((N_1)_{60}I_c)$ 3) $(q_{c1ncs})/(N_1)_{60cs}I_c = 8.5\ (1 - I_c/4.6)$ FC ≤ 5%: $\alpha = 0,\ \beta = 1.0$ FC ≥ 35% $\alpha = 5.0,\ \beta = 1.2$ 5% < FC < 35% $\alpha = exp[1.76 - (190/FC^2)]$ $\beta = [0.99 + (FC^{1.5}/1000)]$	10 10 5
q_{c1ncs}	Clean sand equivalent q_{c1n}	$q_{c1ncs} = q_{c1n} \bullet K_{cpt}$	3
$Q_{tn,cs}$ (PKR 2010)	Clean sand equivalent for Q_{tn} described above - Q_{tn} being the normalized tip resistance based on a variable stress exponent as defined by Robertson (2009)	$Q_{tn,cs} = Q_{tn} \cdot K_c$ (PKR 2016)	16
Su(Liq)/ESv or $S_u(Liq)/\sigma_v'$	Liquefied shear strength ratio as defined by Olson and Stark	$\frac{S_u(Liq)}{\sigma_v'} = 0.03 + 0.0143(q_{c1})$ Note: σ_v' and s_v' are synonymous	13
Su(Liq)/ESv or $S_u(Liq)/\sigma_v'$ (PKR 2010)	Liquefied shear strength ratio as defined by Robertson (2010)	$\frac{S_u(Liq)}{\sigma_v'}$ Based on a function involving $Q_{tn,cs}$	16
S_u (Liq) (PKR 2010)	Liquefied shear strength derived from the liquefied shear strength ratio and effective overburden stress	$S_u(Liq) = \sigma_v' \cdot \left(\frac{S_u(Liq)}{\sigma_v'}\right)$	16
Cont/Dilat Tip	Contractive / Dilative q_{c1} Boundary based on $(N_1)_{60}$	$(\sigma_v')_{boundary} = 9.58 \times 10^{-4}\ [(N_1)_{60}]^{4.79}$ q_{c1} is calculated from specified q_t(MPa)/N ratio	13
CRR	Cyclic Resistance Ratio (for Magnitude 7.5)	$q_{c1ncs} < 50$: $CRR_{7.5} = 0.833\ [q_{c1ncs}/1000] + 0.05$ $50 \leq q_{c1ncs} < 160$: $CRR_{7.5} = 93\ [q_{c1ncs}/1000]^3 + 0.08$	10
Kg or K_g	Small strain Stiffness Ratio Factor, K_g	$[G_{max}/q_t]/[q_{c1n}{}^{-m}]$ m = empirical exponent, typically 0.75	26

Calculated Parameter	Description	Equation	Ref
K_g*	Revised K_g factor extended to fine grained soils (Robertson).	$K_g^* = (G_o / q_n)(Q_{tn})^{0.75}$ where q_n is the net tip resistance = $q_t - \sigma_v$	30
SP Distance	State Parameter Distance, Winckler static liquefaction method	Perpendicular distance on Q_{tn} chart from plotted point to state parameter Ψ = -0.05 curve	25
URS NP Fr	Normalized friction ratio point on Ψ = -0.05 curve used in SP distance calculation		25
URS NP Q_{tn}	Normalized tip resistance (Q_{tn}) point on Ψ = -0.05 curve used in SP Distance calculation		25

MODIFIED PHASE I ENVIRONMENTAL SITE ASSESSMENT

Dear Mr. Pasquinelli

ENGEO is pleased to present our modified phase I environmental site assessment of the subject property (Property), located in Campbell, California. The attached report includes a description of the site assessment activities, along with ENGEO's findings, opinions, and conclusions regarding the Property.

ENGEO has the specific qualifications based on education, training, and experience to assess the nature, history, and setting of the Property, and has developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312 and the American Society for Testing and Materials (ASTM) Practice E1527-21. We declare that, to the best of our professional knowledge and belief, the responsible charge for this study meets the definition of Environmental Professional as defined in Section 312.10 of 40 CFR Part 312 and ASTM E1527-21.

We are pleased to be of service to you on this project. If you have any questions concerning the contents of our report, please contact us.

Sincerely,

ENGEO Incorporated

William Hunsdale

EXECUTIVE SUMMARY

ENGEO conducted a modified phase I environmental site assessment for the subject property located at 635 – 695 Campbell Technology Parkway, Campbell, California (Property). The Property is approximately 17.3 acres in area and is identified by Assessor's Parcel Numbers (APNs) 412-29-010, 412-29-011, 412-29-012, and 412-29-015.

The Property is currently occupied by four 1- to 2-story office buildings with associated parking and landscaping. The existing office buildings were constructed in 2000 and range between approximately 30,100 square feet (sf) to 50,500 sf in area. The Property is bounded by Campbell Technology Parkway to the south, State Route 17 to the northwest, and multi-family residential developments to the east.

This assessment included a review of local, state, tribal, and federal environmental record sources, standard historical sources, aerial photographs, fire insurance maps and physical setting sources. A reconnaissance of the Property was completed to review site use and current conditions to check for the storage, use, production, or disposal of hazardous or potentially hazardous materials and to conduct written/oral interviews with persons knowledgeable about current and past site use.

The site reconnaissance and records review did not find documentation or physical evidence of soil, soil gas, or groundwater impairments associated with the use or past use of the Property. A review of regulatory databases maintained by county, state, tribal, and federal agencies found no documentation of hazardous materials violations or discharge on the Property and did not identify contaminated facilities within the appropriate ASTM search distances that would reasonably be expected to impact the Property.

Review of historical records indicates that the Property had been used as agricultural land since at least the 1940s. Since the Property was historically used for agricultural activities, an agrichemical assessment of the surface soil was conducted to evaluate the potential for residual concentrations of organochlorine pesticides (OCPs), arsenic, and lead. In general conformance Cal-EPA Department of Toxic Substances Control guidance, soil samples were collected on August 25, 2023, from 27 locations across the Property (Figure 2). Soil samples were collected from 6 to 12 inches, 18 to 24 inches, and 30 to 36 inches below the surface of the existing grade using a direct-push drill rig. Upon collection, samples were composited into six 4:1 samples and one 3:1 sample, and submitted to Torrent Laboratory for analysis of organochlorine pesticides (EPA Method 8081). A discrete sample from each composite (seven total) were analyzed for total arsenic and lead (EPA Method 6010). All samples collected at 18 to 24 inches and 30 to 36 inches bgs were held pending laboratory analysis of the samples collected from 6 to 12 inches bgs.

Review of laboratory analytical reports indicate the trace levels of lead and arsenic were detected in each of the discrete shallow soil samples. All reported concentrations of lead were between 12.9 and 36.3 mg/kg, which is below the corresponding residential screening level of 80 mg/kg. All reported concentrations of arsenic were between 2.65 and 8.43 mg/kg, which is below the expected background concentration of 11 mg/kg for the San Francisco Bay Area.

Trace concentrations of OCPs were detected in each of the shallow composite samples. 4,4'-DDD was detected at concentrations between 0.0132 and 0.0387 mg/kg in Composites SB-5,18,19,24, SB-11,12,13,14, and SB-8,9,10. 4,4'-DDE was detected at concentrations between 0.0144 and 0.112 mg/kg in each of the analyzed composite samples. 4,4'-DDT was detected at

DRAFT

concentrations between 0.204 and 0.0084 mg/kg in composites SB-3,4,20,23 and SB-11,12,13,14. All reported concentrations of OCPs were detected below the corresponding residential ESLs

Based on the findings of this assessment, no Recognized Environmental Conditions (RECs), no historical RECs, and no controlled RECs were identified for the Property.

Based on the review of regulatory databases and site reconnaissance, we present information on features of potential environmental concern or considered de minimis conditions that were either contained in the databases or observed on the Property. These features were not considered to be RECs. We briefly discuss each feature below.

We have performed a modified phase I environmental site assessment in general conformance with the scope and limitations of ASTM E1527-21 and the standards and practices of the All Appropriate Inquiry – Final Rule (40 Code of Federal Regulations Part 312). Any exception to, or deletions from this practice are described in Section 8.1 of the report.

It is our opinion that the findings of this study are based on a sufficient level of information obtained during our contracted scope of services to render a conclusion as to whether additional appropriate investigation is required to identify the presence or likely presence of a REC. The following data gap was identified.

- The interiors of the structures located on the Property were not observed during site reconnaissance.

The data gap identified during this process does not affect the conclusions as to the presence or lack of presence of RECs at the Property.

This assessment has revealed no evidence of RECs in connection with the Property. We recommend no further environmental studies at this time.

Please note, the findings from this report are valid until August 10, 2024, and updates of portions of the assessment may be necessary after February 10, 2024.

DRAFT

1.0 INTRODUCTION

1.1 PURPOSE OF PHASE I ENVIRONMENTAL SITE ASSESSMENT

This assessment was performed at the request of Mr. Tim Pasquinelli for the purpose of environmental due diligence during property acquisition. The objective of this modified phase I environmental site assessment is to identify Recognized Environmental Conditions (RECs) associated with the Property. As defined in the ASTM Standard Practice E1527-21, an REC is "(1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment."

1.2 DETAILED SCOPE OF SERVICES

The scope of services performed included the following.

- A review of publicly available and practicably reviewable standard local, state, tribal, and federal environmental record sources.
- A review of publicly available and practicably reviewable standard historical sources, aerial photographs, fire insurance maps and physical setting sources.
- A reconnaissance of the Property to review site use and current conditions. The reconnaissance was conducted to check for the storage, use, production or disposal of hazardous or potentially hazardous materials.
- Written/oral interviews with owners/occupants and public sector officials.
- An agrichemical impact assessment of soil at the Property.
- Preparation of this report with our findings, opinions, and conclusions.

DRAFT

1.3 SITE LOCATION AND DESCRIPTION

The Property is located at 635 – 695 Campbell Technology Parkway in Campbell, California (Figures 1 and 2). The approximately 17.3-acre Property is identified as by APN's 412-29-010, 412-29-011, 412-29-012, and 412-29-015 (Figure 3) and is currently occupied by four multi-story office buildings with associated parking and landscaping.

1.4 CURRENT USE OF PROPERTY AND ADJOINING PROPERTIES

The four multi-story office buildings at the Property were constructed in 2000 and range between approximately 30,100 square feet (sf) and 50,500 sf in footprint area. According to the City of Campbell, the Property is zoned as High Density Mixed Use (HD-MU) and Planned Development (P-D) for research and development purposes.

Based on a review of current records and our site reconnaissance, the adjoining site uses are summarized below.

TABLE 1.4-1: Adjoining Site Uses

DIRECTION	SITE USE
North	State Route 17; Multi-Family Residential Developments
South	Edith Morley Park; Commercial / Industrial Businesses
East	Single-Family Residential Developments
West	State Route 17; Los Gatos Creek Trail

1.5 SITE AND VICINITY CHARACTERISTICS

According to published topographic maps, site grades at the Property range from approximately Elevation 203 feet (WGS-84) in the north to approximately Elevation 214 feet to the southwest. Review of the Geologic Map of the Cupertino and San Jose West quadrangles, Santa Clara and Santa Cruz Counties (Dibblee, Minch, 2007) found that the Property is underlain by alluvial gravel, sand, silt, and clay from younger stream alluvium in fan deposits.

Geocheck – Physical Setting Source Summary of the Environmental Data Resources, Inc. (EDR) report (Appendix A) indicated eight federal United States Geological Survey (USGS) and 91 state wells located within 1 mile of the Property. Well Number 372767N1219439W001 is mapped approximately 0.15 mile south of the Property and consistent groundwater level measurements since 2004 are reported for this well.

We reviewed the Department of Water Resources On-line Water Data Library for depth to water in the vicinity of the Property. The website identified three wells within 1 mile of the Property.

We reviewed EnviroStor, a website maintained by the State of California Department of Toxic Substances Control, and GeoTracker, a website maintained by the State of California Water Resources Control Board, for nearby facilities with records that include depth-to-groundwater measurements. The following information was obtained regarding local groundwater conditions.

TABLE 1.5-1: Local Groundwater Conditions

PROXIMITY TO PROPERTY	REPORTED DEPTH TO GROUNDWATER	REPORTED GROUNDWATER FLOW DIRECTION
0.15 mile south	91	N/A
0.15 mile south	101	N/A
0.8 mile west	90	N/A

The site-specific depth to groundwater and direction of groundwater flow were not determined as part of this assessment. Fluctuations in groundwater levels may occur seasonally and over a period of years due to variations in precipitation, temperature, irrigation, and other factors.

We reviewed the Department of Conservation, Geologic Energy Management (CalGEM), website and map database to determine if any historical oil or gas wells were located within the Property. No oil or gas wells were mapped within 1 mile of the Property.

We reviewed the National Pipeline Mapping System (NPMS) public viewer website for information about petroleum, natural gas, or hazardous liquid storage, processing, or transmission facilities in the vicinity of the Property. No facilities or pipelines were mapped within ¼ mile of the Property.

DRAFT

1.6 INDOOR AIR QUALITY

An evaluation of indoor air quality, mold, or radon was not included as part of the contracted scope of services. The California Department of Public Health has conducted studies of radon risks throughout the state, sorted by zip code. Results of the studies indicate that 36 tests were conducted within the Property zip code, with 2 tests exceeding the current EPA action level of 4 picocuries per liter (pCi/L)[1].

In accordance with ASTM E2600-15 (Tier 1) (*Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions*); There are no potential petroleum hydrocarbon sources for vapor intrusion within 1/10 mile of the Property or volatile organic compound (VOCs) sources within 1/3 mile of the Property.

2.0 RECORDS REVIEW

2.1 PROPERTY RECORDS

2.1.1 Title Report/Ownership

The Title Report lists recorded land title detail, ownership fees, leases, land contracts, easements, liens, deficiencies, and other encumbrances attached to or recorded against a subject property. Laws and regulations pertaining to land trusts vary from state to state and the detail of information presented in a Title Report can vary greatly by jurisdiction. As a result, ENGEO utilizes a Title Report, when provided to us, as a supplement to other historical record sources. ENGEO assumes that any environmental lien, activity use limitations (AUL), and/or institutional controls for the Property are noted in the Preliminary Title Report.

A Preliminary Title Report for the Property, prepared by Chicago Title Company and dated August 4, 2023, was provided for our review. The Property title is vested in *Campbell Technology Park, LLC, a California limited liability company*.

No references to environmental liens, deed restrictions or other potential environmental issues were noted. This report is included in Appendix B.

2.1.2 Environmental Liens and Activity Use Limitations

Review of the Preliminary Title Report found No references to environmental liens, deed restrictions or other potential environmental issues. In addition, a questionnaire completed by the Client or authorized representative indicated that they are not aware of any environmental cleanup liens recorded against the Property.

We reviewed two engineering control (EC) and institutional control (IC) registries: EnviroStor, a website maintained by the State of California Department of Toxic Substances Control, and GeoTracker, a website maintained by the State of California Water Resources Control Board, for environmental liens or AULs associated with the Property. No records of environmental liens or AULs were noted.

DRAFT

2.2 HISTORICAL RECORD SOURCES

The purpose of the historical record review is to develop a history of the previous uses or occupancies of the Property and surrounding areas to identify those uses or occupancies that are likely to have led to recognized environmental conditions on the Property.

2.2.1 Historical Topographic Maps/Aerial Photographs/Sanborn Maps

Historical USGS topographic maps, aerial photographs, and Sanborn fire insurance maps were reviewed to determine if discernible changes pertaining to the Property had been recorded. EDR provided the following maps and photographs, presented in Appendices C and D. A Sanborn fire insurance map search did not identify maps for the Property; the search report is presented in Appendix E.

TABLE 2.2.1-1: Historical Review Summary

HISTORICAL MAP/PHOTOGRAPH	YEARS
Topographic Maps	2018, 2015, 2012, 1980, 1973, 1968, 1961, 1953, 1899, 1897, 1889
Aerial Photographs	2020, 2016, 2012, 2009, 2006, 1998, 1993, 1982, 1974, 1968, 1963, 1956, 1950, 1948, 1939
Sanborn Maps	N/A

The earliest available topographic maps depict the Property as part of a larger area predominantly used for agricultural purposes. Two structures, presumably used for residential purposes, can be seen in the northern portion of the Property as early as 1889. The earliest available aerial imagery depicts the Property as part of a larger area occupied by orchards. The Coyote Creek floodplain can be seen adjacently west of the Property. In 1939, neighborhood residential developments and commercial structures can be seen northwest of the Property. By 1961, topographic maps depict the development of the majority of the parcels surrounding the Property; however, the Property and adjacent parcels maintained agricultural land use. Several changes south of the Property occurred between 1956 and 1963 including the construction of residential developments, commercial/industrial warehouses, and several percolation ponds. Additionally, State Route 17 was constructed between 1956 and 1963 and ran adjacent to the western boundary of the Property. By 1968, the southern portion of the Property had been converted to a drive-in movie theatre while the northern portion of the Property remained as an orchard. By 1974, the drive-in movie theatre had extended to the northern portion of the Property. By 1993, the Property appears to no longer be in use as a drive-in movie theatre and no structures remain. The Property appears to remain vacant until it was developed to the present condition between 1998 and 2006.

2.2.2 City Directory

City Directories, published since the 18th century for major towns and cities, list the name of the resident or business associated with each address. A city directory search conducted by EDR is located in Appendix F.

Other listings in the vicinity of the Property are associated with residential, commercial, and light industrial uses.

DRAFT

2.3 ENVIRONMENTAL RECORD SOURCES

EDR performed a search of federal, tribal, state, and local databases regarding the Property and nearby properties. Details regarding the databases searched by EDR are provided in Appendix A. A list of the facilities documented by EDR within the approximate minimum search distance of the Property is provided below.

2.3.1 Environmental Records

2.3.1.1 Property

The Property is listed on the following Environmental Record source databases.

TABLE 2.3.1.1-1: Environmental Database Listings for the Property

FACILITY	STREET	DATABASES
QUALCOMM	675 CAMPBELL TECHN OLOGY PKWY	FINDS, EMI,CERS
QUALCOMM, RICOH AMERICAS	675 CAMPBELL TECHNOLOGY PKWY	HWTS,HAZNET, FINDS,ECHO
RICOH AMERICAS, RICOH AMERICAS HOLDINGS	675 CAMPBELL TECHNOLOGY PKWY # 200	RCRA NONGEN / NLR, HWTS,CUPA LISTINGS,HAZNET
RICOH	675 CAMPBELL TECHNOLOGY PKWY STE 200	FINDS
AOPTIX TECHNOLOGIES INC	695 CAMPBELL TECHNOLOGY PY	FINDS, CUPA LISTINGS

All listings for the Property are associated with waste generation and disposal associated with semiconductor manufacturing.

2.3.1.2 Other Properties

The following databases include facilities listed within the appropriate ASTM search distances of the Property on Environmental Records sources.

Several LUST sites were identified within a ¼ mile radius of the Property. Each of the LUST sites identified near the Property have received Case Closure Letters.

Based on the distances to the identified database sites, regional topographic gradient, and the EDR findings, it is unlikely that the above-stated database sites pose an environmental risk to the Property. Properties that are on the "Orphan Summary" list appear to be located beyond the ASTM recommended radius search criteria.

2.4 REGULATORY AGENCY FILES AND RECORDS

The following agencies were contacted pertaining to possible past development and/or activity at the Property.

TABLE 2.4-1: Regulatory Agency Records

NAME OF AGENCY	RECORDS REVIEWED
City of Campbell Planning Department	We contacted the City of Campbell Planning Department on September 11, 2023, regarding environmental records for the Property. The Building and Planning Departments provided several documents regarding land use and zoning ordinances for previously proposed uses at the Property. However, these files do not pertain to the environmental condition of the Property.
Santa Clara County Department of Environmental Health	We contacted the Santa Clara County Department of Environmental Health (SCCDEH) on September 11, 2023, regarding environmental records for the Property. The Santa Clara County Department of Environmental Health provided several files pertaining to inspections at the Property. Several inspections conducted by SCCDEH between 2013 and 2017 resulted in violations and failures to comply with waste disposal and recycling procedures associated with technology R&D and manufacturing. Based on files provided it appears the violations and failures to comply were addressed with waste generation labels and documentation of material disposal.
Santa Clara County Fire Department	We contacted the Santa Clara County Fire Department on September 26, 2023, regarding environmental records for the Property. No response from the Santa Clara County Fire Department had been received at the time of report publication.

DRAFT

NAME OF AGENCY	RECORDS REVIEWED
Santa Clara County Assessor's Office	We reviewed online parcel maps provided by the Santa Clara County Assessor's Office. The property boundary and APNs provided in the EDR radius map report are consistent with the online parcel maps.
California State Water Resources Control Board	We reviewed GeoTracker, the website maintained by the State Water Resources Control Board, for files pertaining to the Property. No listings were found for the Property.
Department of Toxic Substances Control (DTSC)	We reviewed EnviroStor, the website maintained by DTSC, for files pertaining to the Property. No listings were found for the Property.

3.0 SITE RECONNAISSANCE

3.1 METHODOLOGY

We conducted a reconnaissance of the Property on September 13, 2023. The reconnaissance was performed by William Hunsdale, a staff engineer of ENGEO. The Property was viewed for hazardous materials storage, superficial staining or discoloration, debris, stressed vegetation, or other conditions that may be indicative of potential sources of soil or groundwater contamination. The Property was also checked for evidence of fill/ventilation pipes, ground subsidence, or other evidence of existing or preexisting underground storage tanks. Photographs taken during the site reconnaissance are presented in Figure 4.

The interiors of the Property were not accessed at the time of site reconnaissance

3.2 GENERAL SITE SETTING

At the time of site reconnaissance, the Property was occupied by various tenants across the four commercial spaces. The landscaping and parking lot across the Property appeared to be well maintained and in good condition. A walking trail and exercise equipment were observed along the eastern boundary of the Property and a fenced off storage area contained several storage containers was observed along the northern boundary of the Property. At the time of site reconnaissance, the Property was bounded by State Route 17 to the west, residential developments to the north and east, with Edith Morley Park and auto shops to the south.

3.3 EXTERIOR OBSERVATIONS

The following table summarizes our observations during the reconnaissance.

TABLE 4.3-1: Exterior Site Observations

FEATURE TYPE	OBSERVATIONS
Structures	Four commercial structures were observed during the site reconnaissance.
Hazardous Substances and Petroleum Products in Connection with Identified Uses	No hazardous substances or petroleum products were observed within the Property during the site reconnaissance.
Storage Tanks (underground and above-ground)	No above-ground storage tanks or evidence of existing underground storage tanks were observed during the site reconnaissance.

DRAFT

FEATURE TYPE	OBSERVATIONS
Roads	There are three entrances to access the Property from Campbell Technology Parkway. The entrances are located along the southern boundary of the Property.
Strong, Pungent, or Noxious Odors and Their Sources	No odors indicative of hazardous materials or petroleum material impacts were noted at the time of the reconnaissance.
Standing Surface Water and Pools or Sumps Containing Liquids Likely to be Hazardous Substances or Petroleum Products	No pools of potentially hazardous liquid were observed within the Property at the time of our reconnaissance.
Drums, Totes, and Intermediate Bulk Containers	No drums were observed on the Property at the time of the reconnaissance.
Polychlorinated Biphenyls (PCBs) Containing Equipment	No potential PCB-containing equipment, including transformers, were observed within the Property during our site reconnaissance.
Hazardous Substances and Petroleum Product Containers	No hazardous substance or petroleum product containers were observed on the Property at the time of our reconnaissance.
Stains or Corrosion on Floors, Walls, or Ceilings (Except Water Staining)	No stains or corrosion on floors, walls, or ceilings were observed on the Property at the time of our reconnaissance.
Drains and Sumps	No drains or sumps were observed within the Property at the time of our reconnaissance.
Pits, Ponds, and Lagoons	No pits, ponds, or lagoons were observed within the Property at the time of our reconnaissance.
Stained Soil/Pavement	No stained soil or pavement were observed within the Property at the time of our reconnaissance.
Stressed Vegetation	No signs of stressed vegetation were observed on the Property at the time of our reconnaissance.
Solid Waste/Debris	No disposal of solid waste was observed at the Property.
Stockpiles/Fill Material	No stockpiles or fill material were observed on the Property during the reconnaissance.
Wastewater	No wastewater conveyance systems were observed at the Property during the reconnaissance.
Wells	No wells were found within the Property during our site reconnaissance.
Septic Systems	No septic systems were found within the Property during our site reconnaissance.

DRAFT

3.4 INTERIOR OBSERVATIONS

The interiors of the four commercial structures were not accessed at the time of site reconnaissance.

3.5 ASBESTOS, LEAD, AND PCB-CONTAINING MATERIALS

An asbestos, lead, and PCB-containing building material survey was not conducted as part of this assessment. Given the age of the existing structures, it is conceivable that asbestos, lead, and PCB-containing materials may exist within the structures.

4.0 INTERVIEWS

Mr. Stephen Randazzo completed a Client-based environmental site questionnaire pertaining to applicable environmental information regarding the Property on August 10, 2023. In the questionnaire, Mr. Randazzo did not identify potentially environmentally related issues with the Property. Mr. Randazzo is unaware of commonly known, reasonably ascertainable, or specialized knowledge indicative of releases or threatened releases that is material to the potential presence of RECs.

Mr. Randazzo has indicated that the purchase price of the Property is reflective of fair market value of the Property. The questionnaire is presented in its entirety in Appendix G.

Additionally, Mr. Randazzo completed a Key Site Manager-related environmental site questionnaire pertaining to applicable environmental information regarding the Property, on August 10, 2023. In the questionnaire, Mr. Randazzo did not identify potentially environmentally related issues with the Property.

Mr. Randazzo is unaware of commonly known, reasonably ascertainable, or specialized knowledge indicative of releases or threatened releases that is material to the potential presence of Recognized Environmental Conditions. The questionnaire is presented in its entirety in Appendix G.

5.0 AGRICHEMICAL SOIL ASSESSMENT

Review of historical records indicates that the Property has been used as agricultural land since at least the 1940's. Due to historical agricultural activities, an assessment of the surface soil was conducted to evaluate the potential for residual concentrations of OCPs, arsenic, and lead.

5.1 SOIL SAMPLING

Soil samples were collected on August 25, 2023, from 27 locations across the Property (Figure 2). Soil samples were collected from 6 to 12 inches, 18 to 24 inches, and 30 to 36 inches below the surface of the existing grade using a direct-push drill rig. Upon collection, samples were composited into six 4:1 samples and one 3:1 sample, and submitted to Torrent Laboratory for analysis of organochlorine pesticides (EPA Method 8081). A discrete sample from each composite (seven total) were analyzed for total arsenic and lead (EPA Method 6010). All samples collected at 18 to 24 inches and 30 to 36 inches bgs were held pending laboratory analysis of the samples collected from 6 to 12 inches bgs.

5.1 ANALYTICAL RESULTS

Review of laboratory analytical reports indicate trace levels of lead and arsenic were detected in each of the discrete shallow soil samples. All reported concentrations of lead were between 12.9 and 36.3 mg/kg, which is below the corresponding residential screening level of 80 mg/kg. All reported concentrations of arsenic were between 2.65 and 8.43 mg/kg, which is below the expected background concentration of 11 mg/kg for the San Francisco Bay Area.

DRAFT

Trace concentrations of OCPs were detected in each of the shallow composite samples. 4,4'-DDD was detected at concentrations between 0.0132 and 0.0387 mg/kg in composites SB-5,18,19,24, SB-11,12,13,14, and SB-8,9,10. 4,4'-DDE was detected at concentrations between 0.0144 and 0.112 mg/kg in each of the analyzed composite samples. 4,4'-DDT was detected at concentrations between 0.204 and 0.0084 mg/kg in composites SB-3,4,20,23 and SB-11,12,13,14. All reported concentrations of OCPs were detected below the corresponding residential ESLs

The laboratory report is presented in its entirety in Appendix H.

6.0 FINDINGS AND OPINIONS

This assessment included a review of local, state, tribal, and federal environmental record sources, standard historical sources, aerial photographs, fire insurance maps and physical setting sources. A reconnaissance of the Property was completed to review site use and current conditions to check for the storage, use, production, or disposal of hazardous or potentially hazardous materials and to conduct written/oral interviews with persons knowledgeable about current and past site use.

The site reconnaissance and records review did not find documentation or physical evidence of soil, soil gas, or groundwater impairments associated with the use or past use of the Property. A review of regulatory databases maintained by county, state, tribal, and federal agencies found no documentation of hazardous materials violations or discharge on the Property and did not identify contaminated facilities within the appropriate ASTM search distances that would reasonably be expected to impact the Property.

Based on the findings of this assessment, no RECs, no historical RECs, and no controlled RECs were identified for the Property.

Based on the review of regulatory databases and site reconnaissance, we present information on features of potential environmental concern that were either contained in the databases or observed on the Property. These features were not considered to be RECs. We briefly discuss each feature below.

6.1 SIGNIFICANT DATA GAPS

It is our opinion that the findings of this study are based on a sufficient level of information obtained during our contracted scope of services to render a conclusion as to whether additional appropriate investigation is required to identify the presence or likely presence of a REC. The following data gap was identified.

- The buildings were locked and inaccessible during the site reconnaissance.

The data gap identified during this process does not affect the conclusions as to the presence or lack of presence of RECs at the Property.

DRAFT

6.2 SIGNIFICANT ASSUMPTIONS OR DEVIATIONS FROM ASTM STANDARD PRACTICE

There were no significant deviations from ASTM Standard Practice E1527-21 in the preparation of this report.

7.0 CONCLUSIONS

It is our opinion that the findings of this study are based on a sufficient level of information obtained during our contracted scope of services to render a conclusion as to whether additional appropriate investigation is required to identify the presence or likely presence of a REC.

We have performed a modified phase I environmental site assessment in general conformance with the scope and limitations of ASTM E1527-21 and the standards and practices of the All Appropriate Inquiry – Final Rule (40 Code of Federal Regulations Part 312) of APNs 412-29-010, 412-29-011, 412-29-012, and 412-29-015, the Property. Any exception to, or deletions from this practice are described in Section 8.1 of the report.

This assessment has revealed no evidence of RECs in connection with the Property. We recommend no further environmental studies at this time.

8.0 LIMITATIONS

8.1 LIMITATIONS AND EXCEPTIONS OF ASSESSMENT

The professional staff at ENGEO strives to perform its services in a proper and professional manner with reasonable care and competence but is not infallible. The recommendations and conclusions presented in this report were based on the findings of our study, which were developed solely from the contracted services. The findings of the report are based in part on contracted database research, out-of-house reports, and personal communications. The opinions formed by ENGEO are based on the assumed accuracy of the relied upon data in conjunction with our relevant professional experience related to such data interpretation. We assume no liability for the validity of the materials relied upon in the preparation of this report.

This document must not be subject to unauthorized reuse; that is, reuse without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time. The findings from a phase I environmental site assessment are valid for 1 year after from the earliest date of the following components: records review, site reconnaissance, interviews, declaration by environmental professional. Updates of portions of the assessment may be necessary after a period of 180 days of the earliest date of the four components.

A more extensive assessment that would include a subsurface exploration with laboratory testing of soil, soil gas, and groundwater samples could provide more definitive information concerning site-specific conditions. If additional assessment activities are considered for the Property and if other entities are retained to provide such services, ENGEO cannot be held responsible for any and all claims arising from or resulting from the performance of such services by other persons or entities. ENGEO can also not be held responsible from any and all claims arising or resulting from clarifications, adjustments, modifications, discrepancies or other changes necessary to reflect changed field or other conditions.

DRAFT

8.2 SPECIAL TERMS AND CONDITIONS

We have prepared this report for the exclusive use of our client, Campbell Technology Park, LLC. It is recognized and agreed that ENGEO has assumed responsibility only for undertaking the study for the Client. The responsibility for disclosures or reports to a third party and for remedial or mitigative action shall be solely that of the Client.

This phase I environmental site assessment is not intended to represent a complete soil, soil gas, or groundwater characterization, nor define the depth or extent of soil, soil gas, or groundwater contamination. It is intended to provide an evaluation of potential environmental concerns associated with the use of the Property. Laboratory testing of soil, soil gas, or groundwater samples was not within the scope of the contracted services. The assessment did not include an asbestos survey, an evaluation of lead-based paint, an inspection of light ballasts for polychlorinated biphenyls (PCBs), or a mold survey. A radon evaluation was not performed.

This report is based upon field and other conditions discovered at the time of preparation of ENGEO's assessment. Visual observations referenced in this report are intended only to represent conditions at the time of the reconnaissance. We would not be aware of site contamination, such as dumping and/or accidental spillage, that occurred subsequent to the reconnaissance conducted by ENGEO personnel.

Notes:

Results are shown in milligrams per kilogram (mg/kg).

ND indicates analyte was not detected above laboratory reporting limits.

<x.xx indicates analyte was not detected above the laboratory reporting limit of x.xx mg/kg.

-- indicates analyte was not analyzed or screening level not established.

NA indicates analyte was not analyzed.

BOLD indicates the concentration was detected above laboratory reporting limits.

Highlighted values exceed residential screening criteria.

Highlighted values exceed commercial screening criteria.

Highlighted values exceed ten times the solubility threshold limit concentration (STLC) only.

1 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB); Environmental Screening Levels (ESLs); Direct Exposure Human Health Risk Levels: Residential Shallow Soil Exposure (Table S-1); 2019 (Rev. 2).

2 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB); Environmental Screening Levels (ESLs); Direct Exposure Human Health Risk Levels: Commercial/Industrial Shallow Soil Exposure (Table S-1); 2019 (Rev. 2).

3 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB); Environmental Screening Levels (ESLs); Direct Exposure Human Health Risk Levels: Construction Worker (Table S-1); 2019 (Rev. 2).

4 Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (HERO) Note 3; Screening Levels (SLs); Table 1: Soil; Residential Soil Exposure; June 2020, Revised May 2022.

5 Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (HERO) Note 3; Screening Levels (SLs); Table 1: Soil; Commercial/Industrial Soil Exposure; June 2020, Revised May 2022.

12 The commonly accepted naturally occurring background concentration for arsenic in the urbanized Bay Area is 11 mg/kg (Duverge, D.J., Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region, December 2011).

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 06/22/2023 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Lists of Federal RCRA generators

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 07/24/2023 has revealed that there are 13 RCRA-SQG sites within approximately 0.25 miles of the target property.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/24/2023 has revealed that there are 5 ENVIROSTOR sites within approximately 1 mile of the target property.

Lists of state and tribal leaking storage tanks

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 52 LUST sites within approximately 0.5 miles of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 10 CPS-SLIC sites within approximately 0.5 miles of the target property.

HIST LUST: A listing of open and closed leaking underground storage tanks. This listing is no longer updated by the county. Leaking underground storage tanks are now handled by the Department of Environmental Health.

A review of the HIST LUST list, as provided by EDR, and dated 03/29/2005 has revealed that there are 36 HIST LUST sites within approximately 0.5 miles of the target property.

Lists of state and tribal registered storage tanks

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 7 UST sites within approximately 0.25 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 20 SWEEPS UST sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

CERS TANKS: List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the Aboveground Petroleum Storage and Underground Storage Tank regulatory programs.

A review of the CERS TANKS list, as provided by EDR, and dated 04/17/2023 has revealed that there are 3 CERS TANKS sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 07/24/2023 has revealed that there are 74 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 05/04/2023 has revealed that there is 1 FINDS site within approximately 0.001 miles of the target property.

PFAS ECHO: Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. EPA has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

A review of the PFAS ECHO list, as provided by EDR, and dated 03/30/2023 has revealed that there are 3 PFAS ECHO sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

A review of the Cortese list, as provided by EDR, and dated 03/20/2023 has revealed that there are 37 Cortese sites within approximately 0.5 miles of the target property.

CUPA Listings: A listing of sites included in the county's Certified Unified Program Agency database. California's Secretary for Environmental Protection established the unified hazardous materials and hazardous waste regulatory program as required by chapter 6.11 of the California Health and Safety Code. The Unified Program consolidates the administration, permits, inspections, and enforcement activities.

A review of the CUPA Listings list, as provided by EDR, has revealed that there are 95 CUPA Listings sites within approximately 0.25 miles of the target property.

DRYCLEANERS: A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; drycleaning plants except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

A review of the DRYCLEANERS list, as provided by EDR, has revealed that there is 1 DRYCLEANERS site within approximately 0.25 miles of the target property.

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the HAZNET list, as provided by EDR, and dated 12/31/2021 has revealed that there is 1 HAZNET site within approximately 0.001 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories

reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Site ID: 102718
Site Name: CAMPBELL AUTO RESTORATION
Violation Date: 04-25-2016
Citation: HSC 6.5 Multiple Sections - California Health and Safety Code, Chapter 6.5, Section(s) Multiple Sections
Violation Description: Haz Waste Generator Program - Operations/Maintenance - General
Violation Notes: Returned to compliance on 06/15/2016. The following containers have exceeded their 1 year accumulation time limit: 1 x 15 gallon drum of waterborne paint waste has a start date of 9/8/14 1 x 15 gallon drum of solvent paint waste has a start date of 9/8/14
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Site ID: 102718
Site Name: CAMPBELL AUTO RESTORATION
Violation Date: 04-25-2016
Citation: 40 CFR 1 265.32 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.32
Violation Description: Failure of the facility to maintain the following emergency equipment or equivalents: 1) An internal communications or alarm system capable of providing immediate emergency instruction (voice or signal) to facility personnel; 2) A device, such as a telephone (immediately available at the scene of Operations/ Maintenance) or a hand-held two-way radio, capable of summoning emergency assistance from local police departments, fire departments, or State or local emergency response teams; 3) Portable fire extinguishers, fire control equipment (including special extinguishing equipment, such as that using foam, inert gas, or dry chemicals), spill control equipment, and decontamination equipment; and 4) Water at adequate volume and pressure to supply water hose streams, or foam producing equipment, or automatic sprinklers, or water spray systems.
Violation Notes: Facility does not have spill control on site.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Evaluation:

CAMPBELL AUTO RESTORATION (Continued) **S103954683**

Eval General Type: Compliance Evaluation Inspection
Eval Date: 04-25-2016
Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: On site to conduct a routine hazardous waste inspection. Facility is a specialty shop that works on uncommon vehicles. Body and service work are performed here sporadically. Facility has 3 service bays and an outdoor lot. Observed the following wastes on site: 1 x 55 gallon drum of used oil (point of generation) 1 x 55 gallon drum of used coolant (point of generation) 1 x 15 gallon drum of waterborne paint waste (point of generation) 1 x 15 gallon drum of solvent paint waste (point of generation) 1 x 55 gallons drum of used oil filters 1 x 15 gallon used oil roller 1 x 55 gallon drum of bead blasting media EPA ID# CAL000162214 is active Interstate manages battery cores Cintas manages rags Container areas are inspected weekly Employees have had hazardous waste management training Waste paint cups are rinsed with solvent and liquid waste is added to 1 x 15 gallon drum of solvent based waste. Cups are thrown into trash. Paint booth filters are managed by [Truncated]
Eval Division: Santa Clara County Environmental Health
Eval Program: HW
Eval Source: CERS,

Eval General Type: Other/Unknown
Eval Date: 06-15-2016
Violations Found: No
Eval Type: Other, not routine, done by local agency
Eval Notes: On site to conduct a follow up inspection. Walked through and confirmed the following violations have been corrected from the 4/25/16 inspection: G031: 1 x 15 gallon drum of waterborne paint waste and 1 x 15 gallon drum of solvent paint waste have been disposed of through a registered waste hauler. The following violations remain uncorrected: G112: Observed 3 x fire extinguishers that were serviced in 2012. Ensure that fire extinguishers are serviced and tested annually. G111: Facility does not have spill control on site. Ensure that spill control is available on site.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

CERS Description: Chemical Storage Facilities

Violations:
Site ID: 592862
Site Name: Midpeninsula Regional Open Space District
Violation Date: 06-06-2016
Citation: 22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Description: Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.
Violation Notes: Returned to compliance on 07/15/2016. Observed various automobile paint residues on paint strainers, sticks and cups in the paint touch

MIDPENINSULA REGIONAL OPEN SPACE (Continued) **S126099355**

up area. Per facility, these are disposed of in the trash. Make a hazardous waste determination for the strainers, cups and sticks and if determined to be hazardous, manage accordingly. Paint waste is presumed hazardous because it it listed in the California Code of Regulations, Appendix X.

Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Site ID: 592862
Site Name: Midpeninsula Regional Open Space District
Violation Date: 06-06-2016
Citation: HSC 6.5 Multiple - California Health and Safety Code, Chapter 6.5, Section(s) Multiple
Violation Description: Hazardous Waste Generator Program - Administration/Documentation - General
Violation Notes: Returned to compliance on 07/15/2016. Only 1 consolidated manifest for used oil and used coolant on 1/12/15 was available for review. Obtain copies of disposal receipts of used oil, used coolant, and used oil filters for 2014, 2015 and 2016 and submit them to HMCD for review.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Site ID: 592862
Site Name: Midpeninsula Regional Open Space District
Violation Date: 06-06-2016
Citation: 40 CFR 1 265.31 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.31
Violation Description: Failure to maintain and operate the facility to minimize the possibility of a fire, explosion, or any unplanned sudden or non-sudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water which could threaten human health or the environment.
Violation Notes: Returned to compliance on 07/15/2016. Observed free flowing amounts of used oil on top of 1 x 55 gallon drum of used oil. Observed free flowing oil in the secondary containment for used oil and used coolant. Observed saturated used textiles in the outdoor work area floor and secondary containment. Ensure that facility is maintained in a manner to prevent the possibility of an unplanned release of hazardous waste to the environment.

Evaluation:
Eval General Type: Other/Unknown
Eval Date: 01-16-2020
Violations Found: No
Eval Type: Other, not routine, done by local agency
Eval Notes: On site to perform a permit investigation due to a returned invoice for West Valley Charter Lines. Upon arrival, it was observed that 240 Cristich Lane is in the process of demolition. After speaking to Dipak Mody, the project's Superintendent, the facility is undergoing asbestos and lead removal. Mr. Mody stated that second phase of the project will consist of the removal of an underground storage tank. The rebuild of the property, will be an office building for Midpeninsula Open Space District. Currently, no permits are required with the Hazardous Materials Compliance Division. A copy of this report will be sent to the Project Manager Cesar Tomas to confirm this statement. Contact Information: Agbayani Construction Corp. Dipak Mody 650-888-7801 dipak.mody@agbayani.com Cesar Tomas cesar.tomas@agbayani.com

Environmental Interest/Information System:
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Evaluation:
Eval General Type: Other/Unknown
Eval Date: 02-23-2016
Violations Found: No
Eval Type: Other, not routine, done by local agency
Eval Notes: 216 Cristich Lane, Campbell, Images Auto Body to assess Hazardous Waste Generator Classification. Images Auto Body, < 100 Kg per month. The permit will be adjusted to reflect this as a 2202. The Hazardous Waste Inventory, Waste Solvent, is not in the CERS Inventory Submittal. Please include the hazardous waste as part of the haz mat inventory. The 5 gallon container in the gun cleaning unit is not waste as the container feed line is fixed between generation and collection stages. The 35 gallon container is marked correctly with an ccumulation start date in 2012. About 15 gallons are now within the container. Both of these containers are scheduled to be picked up within the next several weeks. The 5 gallon containers that are empty of solvent are being re-purposed as liquid condensation collection containers. Once theses solvent containers are empty and free of flammable vapors, and the labels are removed or obscured, they may be used for the purposes [Truncated]

CERS Description: Hazardous Waste Generator

Violations:

Site ID: 95974
Site Name: AUTHENTIC FINISHING
Violation Date: 07-20-2016
Citation: 22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Description: Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.
Violation Notes: Returned to compliance on 07/25/2016. 1. Observed the following solid absorptive materials contaminated with paints in the dumpster: 1 saturated paint roller and paper paint filters 2. Paint booth filters and dust from vacuuming paint booth filters are currently disposed of in trash. 3. Rags observed around shop in step can, drying on concrete, and rags that will be used for staining Determine if each waste above is a hazardous waste, describe the contaminants of each and the reason for its determination, and explain how each material will be managed.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Site ID: 95974
Site Name: AUTHENTIC FINISHING
Violation Date: 07-20-2016
Citation: 40 CFR 1 265.32 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.32
Violation Description: Failure of the facility to maintain the following emergency equipment or equivalents: 1) An internal communications or alarm system; 2) A device, such as a telephone (immediately available at the scene of Operations/ Maintenance) or a hand-held two-way radio, capable of summoning emergency assistance from local police departments, fire departments, or State or local emergency response teams; 3) Portable fire extinguishers, fire control equipment, spill control equipment, and decontamination equipment; and 4) Water at adequate volume and pressure to supply water hose streams, or foam producing equipment, or automatic sprinklers, or water spray systems.
Violation Notes: Returned to compliance on 07/25/2016. Facility does not have absorbent to clean up spills of solvent. Keep absorbent on-site at all times to clean up acetone spills when they occur.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Eval Source: CERS,

Eval General Type: Compliance Evaluation Inspection
Eval Date: 07-20-2016

AUTHENTIC FINISHING (Continued) **S112345382**

Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: Facility does wood finishing. Varnish is mixed with catalyst as needed to avoid left over waste, most stains are applied with reusable sponges, and Mr. Ortega states that some special color stains are applied with rags that are managed as hazardous waste. The last shipment for this waste stream was in 2009, no stained rags were observed at the time of inspection, and facility does not currently have a container for this waste. Painting is done in a spray booth and filters are vacuumed and reused. Mr. Ortega was advised that dust from spray booth and spray booth filters themselves may qualify as hazardous waste when disposed. Guns are cleaned with acetone and all acetone waste is collected in 1x55 gallon container in the mixing room, at the point of generation, that is picked up annually as hazardous waste. Inspection included walk-through of staining area, mixing room, facility perimeter, inspection of dumpster, and review of pickup manifests for waste acetone and waste [Truncated]

Citation:	22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Description:	Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.

CHARTER PLUMBING (Continued) **S100280526**

Violation Notes:	Returned to compliance on 09/21/2016. Determine if the following containers hold hazardous waste and manage them accordingly: 2x10 gallon white containers by waste storage area 1x5 gallon bucket at the back right corner of waste storage area 1x1 gallon paint container next to waste thinner 1x5 gallon container of oily rags by shop (determine if these will be commercially laundered or disposed of as hazardous waste) Facility also disposes of oily paper towels to trash. If facility will continue this practice, determine if these towels are hazardous waste.

Citation:	22 CCR 12 66262.34(d) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(d)
Violation Description:	Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.
Violation Notes:	Returned to compliance on 09/21/2016. Facility currently has the following wastes which have been accumulating for longer than 180 days: 1 half full 55 gallon container of antifreeze (last picked up on 12/28/16) 1x300 gallon used oil tank with 23 inches of oil inside

CHARTER PLUMBING (Continued) **S100280526**

	(last picked up on 12/28/16) 1x100 gallon used fuel tank with 21 inches of liquid inside (not picked up in the last 3 yeras) 2x4 gallon containers of waste thinner (no disposals for waste thinner in the last 3 years)

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Violations:
Site ID: 153245
Site Name: SHIRO'S AUTO BODY
Violation Date: 08-30-2022
Citation: 40 CFR 1 265.35 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.35
Violation Description: Failure to maintain aisle space to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment to any area of facility operation in an emergency, unless aisle space is not needed for any of these purposes.
Violation Notes: Returned to compliance on 11/07/2022. Unable to access a 55 gal steel drum of waste gasoline located in the back of the storage shed due to equipment blocking movement. Mr. Shiozawa was advised to remove equipment causing the obstruction
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Site ID: 153245
Site Name: SHIRO'S AUTO BODY
Violation Date: 08-30-2022
Citation: 22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Description: Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.
Violation Notes: Returned to compliance on 11/07/2022. Observed a paint cup with a substantial amount of dried paint in a trash can located inside the shop. Ensure that all paint cups with a pourable amount of paint are deemed non-hazardous before disposing in trash cans, or otherwise manage as hazardous waste.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Site ID: 153245
Site Name: SHIRO'S AUTO BODY
Violation Date: 04-25-2016
Citation: 40 CFR 1 265.174 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.174
Violation Description: Failure to inspect hazardous waste storage areas at least weekly.
Violation Notes: Returned to compliance on 06/15/2016. Per, facility, hazardous waste container areas are inspected once a month. Begin inspection hazardous waste container areas weekly.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Site ID: 153245
Site Name: SHIRO'S AUTO BODY

SHIRO'S AUTO BODY (Continued) **S121746871**

Violation Date:	04-25-2016
Citation:	22 CCR 12 66262.34(d) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(d)
Violation Description:	Failure to dispose of hazardous waste within 180 days (or 270 if waste is transported over 200 miles) for the generator who generates less than 1000 kilogram per month, but more than 100 kilograms per month.
Violation Notes:	Returned to compliance on 06/15/2016. Observed 1 x 30 gallon drum of used coolant with a start date of 6/11/14. Observed 1 x 30 gallon drum of used oil with a start date of 10/10/13 Observed 1 x 15 gallon drum of waterborne paint waste with a start date of 9/18/5 Observed 1 x 55 gallon drum of solvent paint waste with a start date of 9/27/15 As a small quantity generator your accumulation time limit is 180 days (6 months).
Violation Division:	Santa Clara County Environmental Health
Violation Program:	HW
Violation Source:	CERS,
Site ID:	153245
Site Name:	SHIRO'S AUTO BODY
Violation Date:	08-30-2022
Citation:	40 CFR 1 265.173 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.173
Violation Description:	Failure to meet the following container management requirements: (a) A container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste. (b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.
Violation Notes:	Returned to compliance on 11/07/2022. Observed 2 x 30 gal metal containers of used oil located in the outside waste storage area which were open when no waste was actively being added or removed
Violation Division:	Santa Clara County Environmental Health
Violation Program:	HW
Violation Source:	CERS,
Site ID:	153245
Site Name:	SHIRO'S AUTO BODY
Violation Date:	08-30-2022
Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 11/07/2022. The following hazardous waste containers in the paint prep area of the shop had missing or incomplete markings: - 1 x 20 gal poly drum of water based paint and water - 1 x 30 gal metal drum of solvent - 1 x 30 gal trash can of paint cups and waste solids Additionally, the following hazardous waste containers in the outside storage shed had missing or incomplete markings: - 2 x 30 gal metal drums of used oil had incomplete/illegible labels - 1 x 30 gal metal drum of waste coolant had no markings or label
Violation Division:	Santa Clara County Environmental Health

Evaluation:
Eval General Type: Other/Unknown
Eval Date: 03-12-2020
Violations Found: No
Eval Type: Other, not routine, done by local agency
Eval Notes: On-site at 599 E McGLincy Lane Campbell, CA to conduct a permit investigation. The old tenant, Cambrian Go Karts is no longer at this location, and the current tenant is West Valley Construction. Ron Ormonde, Tool & Facilities Manager gave a walk-through of the facility. West Valley Construction uses this facility to store construction equipment and parts. No hazardous materials were observed at this facility. Based on my observations, West Valley Construction will not require a permit from our office at this time. Contact: Ron Ormonde, Tool & Facilities Manager 408-968-8087 ROrmonde@wvcc.com

Environmental Interest/Information System:
The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS),EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), andToxic Release Inventory (TRI).
California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators,

WEST VALLEY CONSTRUCTION CO INC (Continued) **1000394251**

transporters, and treatment, storage, and disposal facilities.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

WEST VALLEY CONSTRUCTION CO (Continued) **S121749766**

Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 09/15/2017. Labeling on used absorbent and uncased oil filters is incomplete. Labels on these containers generally mirrored "drained used oil filters" type information.
Violation Division:	Santa Clara County Environmental Health
Violation Program:	HW
Violation Source:	CERS,
Site ID:	171092
Site Name:	WEST VALLEY CONSTRUCTION CO
Violation Date:	08-21-2017
Citation:	HSC 6.5 25160.2 - California Health and Safety Code, Chapter 6.5, Section(s) 25160.2
Violation Description:	Failure of a generator of hazardous waste that meets the conditions to be transported on a consolidated manifest to comply with one or more of the required consolidated manifesting procedures.
Violation Notes:	Returned to compliance on 09/15/2017. Receipts provided for the pick up of uncased used oil filters and oily absorbent is incomplete in that it does not provide the manifest number, EPA ID number of the generator, or the proper DOT shipping name. Additionally, the quantity shipped is generally marked only as "1" to indicate 1 unit/drum and the receipt does not have the generator waste reduction statement.
Violation Division:	Santa Clara County Environmental Health
Violation Program:	HW
Violation Source:	CERS,
Site ID:	171092
Site Name:	WEST VALLEY CONSTRUCTION CO
Violation Date:	11-16-2022
Citation:	HSC 6.7 25292.1(a) - California Health and Safety Code, Chapter 6.7, Section(s) 25292.1(a)
Violation Description:	Failure to operate the UST system to prevent unauthorized releases including leaks, spills, and/or overfills.
Violation Notes:	Returned to compliance on 11/16/2022. 87 Spill bucked failed on initial test and passed on retest.
Violation Division:	Santa Clara County Fire Department
Violation Program:	UST
Violation Source:	CERS,
Site ID:	171092
Site Name:	WEST VALLEY CONSTRUCTION CO
Violation Date:	08-21-2017
Citation:	HSC 6.5 Multiple - California Health and Safety Code, Chapter 6.5, Section(s) Multiple
Violation Description:	Hazardous Waste Generator Program - Administration/Documentation - General
Violation Notes:	Returned to compliance on 09/15/2017. Receipts for pick up of oil on 7/6/17 and 1/3/17 (dates indicated on oil tank) were not available. Receipt for pick up of antifreeze on 7/6/17 not available.

Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 07/17/2014. THE SHOP HAS LOW USED OIL COLLECTION ROLL-A-ROUNDS THAT ARE BLACK PLASTIC OPEN TOP CONTAINERS. THESE CONTAINERS ARE REQUIRED TO BE APPROPRIATELY LABELED, MARKED AS HAZARDOUS WASTE WITH AN ACCUMULATION START DATE SHOWING "EMPTY DAILY", OR THE START DATE IF BEING HELD FOR A LONGER TIME.

Violation Description:	"Failure to conduct secondary containment testing, or one or more of

WEST VALLEY CONSTRUCTION CO (Continued) **S121749766**

the following requirements: Perform the test of the secondary containment system upon installation, within six months of installation and every 36 months thereafter. Perform the test of a secondary containment component within 30 days of a repair or discontinuing vacuum, pressure or hydrostatic monitoring. Use a procedure that demonstrates the system works as well as at installation. Use applicable manufacturer guidelines, industry codes, engineering standard, or professional engineer approval. Performed by a certified service technician. Maintain records of secondary containment testing for 36 months."

Eval Notes: Site generates waste from routine vehicle maintenance and from clean out of four stage oily water clarifier. Oil to 350 gallon double walled tank. Antifreeze to approximately 80 gal container. All other wastes to 55 gal drums. Oil and antifreeze manged under consolidated manifest procedures, sludge/oil from clarifier manged as HW using manifest. G020C: Tank of used oil, 3x15 gal rolling oil collection carts marked with hazardous properties and physical state. BAtteries to Interstate, rags to Unifirst. Battery receipts reviewed. Rags all appears to be dirty, none saturated and no organic odor. Aerosols to trash or meal recycle. Personnel aware of requirement to fully empty prior to disposal. UW lamps sent back through Grainger pre-paid program. Most lighting has been replaced with LED, should generate no to minimal lamps from this point forward. Spill materials and

Eval Notes: Site is Conditionally Exempt - Specified Wastestream authorized for the separation of oily water. Utilize a 4 stage clarifier for separation of sludge and oil from wash rack. Wash area used to clean trucks and heavy equipment, including removal of asphalt and greases. Site has done testing of waste and has determined that waste (comingled) should be managed as hazardous waste, not used oil. Have procedure for removal of waste, generally isolate a section of clarifier, decant water and drain all free product oil and sludge to drums for disposal. System, as flow through, does not really have a operating instruction or log, and as underground flow through, does not lend itself to routine inspection. Site is SQG, so tank assessment standards do not apply outside of 40CFR270 requirements. Discharge permit in good standing.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

CERS Description:	Chemical Storage Facilities

Violations:

Site ID:	49686
Site Name:	Caliber Collision Centers - Campbell
Violation Date:	07-11-2016
Citation:	HSC 6.5 25160.2 - California Health and Safety Code, Chapter 6.5, Section(s) 25160.2
Violation Description:	Failure of a generator of hazardous waste that meets the conditions to be transported on a consolidated manifest to comply with one or more of the required consolidated manifesting procedures.
Violation Notes:	Returned to compliance on 08/02/2016. Facility owner states that antifreeze was disposed of on 4/18/16 but antifreeze is not listed separately from used oil on receipt. Ensure that all wastes are listed separately regardless of amounts shipped. Facility was missing the shipping document portion for the waste disposal receipt of aqueous waste shipped on 4/13/16 by SafetyKleen. Ensure that this portion of the receipt is retained in the future and obtain a copy for the date listed.
Violation Division:	Santa Clara County Environmental Health
Violation Program:	HW
Violation Source:	CERS,

Site ID:	49686
Site Name:	Caliber Collision Centers - Campbell
Violation Date:	10-03-2022
Citation:	22 CCR 12 66262.23(a) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.23(a)
Violation Description:	Failure to properly complete the Uniform Hazardous Waste Manifest.
Violation Notes:	Returned to compliance on 11/03/2022. Observed one generator copy of manifest 008312350 SKS (6/27/2022) that did not have the quantity of

CALIBER COLLISION CENTERS - CAMPBELL (Continued) **S121786852**

waste picked up filled out. Uniform Hazardous Waste Manifests must detail the quantity and type of waste picked up. TSDF-signed copy of the hazardous waste manifest properly indicated the quantity picked up. Ensure that a manifest correction letter is sent to DTSC Generator Information Services, PO Box 806, Sacramento CA 95812.

Violation Date: 07-11-2016
Citation: 22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Description: Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.
Violation Notes: Returned to compliance on 08/02/2016. Facility currently disposes of paint filters in trash. Filters are changed once a month. Determine if filters are hazardous waste using generator knowledge or by having the waste analyzed. Paints may contain one of 17 regulated metals that may make filters hazardous even when dry. Describe reasoning for hazardous waste determination.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS,

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 08-15-2013

Eval Program: HMRRP
Eval Source: CERS,

Eval General Type: Compliance Evaluation Inspection
Eval Date: 10-03-2022
Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: On-site to conduct a hazardous waste generator inspection. Also present during this inspection is Hunter Dang, Environmental Health Specialist Trainee with the Department of Environmental Health. Facility is an auto body shop that generates waste from paint and body shop operations, primarily waste solvent based and water based paint, paint thinners/cleaners, solids contaminated with paint, and bondo dust and solids contaminated with bondo dust. Facility also generates used oil and waste antifreeze when it is necessary to drain vehicle fluids prior to auto body work. Auto repair activities are not performed at this site. Facility generates waste aerosols and universal waste batteries. Waste aerosols are managed both as universal waste and hazardous waste. Paint shop consists of one paint mixing room, prep area, hazardous waste storage area and paint booth. Leftover paint is disposed of as hazardous waste and the paint liner is managed as hazardous waste. Thinner and [Truncated]

Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: Facility is an auto body shop that does auto body work but does not do auto repair. Facility generates the following wastes: spent batteries (core exchange), oily absorbent, non-empty aerosol cans, spent fluorescent tubes, solvent-based paint waste (sludge from distiller), waterborne paint waste, empty paint cans (scraped clean), and oily water from a clarifier. Facility generates irregular and small amounts of used oil, used antifreeze, and used oil filters (2 observed). Facility does not generate oily rags, brake fluid, parts washing solution, spent gasoline, or spent bead blast media. Facility does not use paper paint filters (mesh screen is built into paint cups) and paint cups and containers in trash were empty. Paint booth filters are changed monthly and disposed of to trash as non-hazardous. Inspection included walk-through of all work bays, storage area behind paint booth, waste storage area outside, parking lot perimeter, inspection of trashcans/dumpsters, and [Truncated]

SIC Code: 7532
Air District Name: BAY AREA AQMD
Community Health Air Pollution Info System: Not reported
Consolidated Emission Reporting Rule: Not reported
Total Organic Hydrocarbon Gases Tons/Yr: .806
Reactive Organic Gases Tons/Yr: .754033
Carbon Monoxide Emissions Tons/Yr: 0
NOX - Oxides of Nitrogen Tons/Yr: 0
SOX - Oxides of Sulphur Tons/Yr: 0
Particulate Matter Tons/Yr: 0
Part. Matter 10 Micrometers and Smllr Tons/Yr: 0

Name: MODERN BENCH OPERATIONS COLLIS
Address: 665 MCGLINCEY LANE
City,State,Zip: CAMPBELL, CA 95008
Year: 2009
County Code: 43
Air Basin: SF
Facility ID: 9557
Air District Name: BA
SIC Code: 7532
Air District Name: BAY AREA AQMD
Community Health Air Pollution Info System: Not reported
Consolidated Emission Reporting Rule: Not reported
Total Organic Hydrocarbon Gases Tons/Yr: 0.72699999999999998
Reactive Organic Gases Tons/Yr: 0.6810446
Carbon Monoxide Emissions Tons/Yr: 0
NOX - Oxides of Nitrogen Tons/Yr: 0
SOX - Oxides of Sulphur Tons/Yr: 0
Particulate Matter Tons/Yr: 0
Part. Matter 10 Micrometers and Smllr Tons/Yr: 0

Name: MODERN BENCH OPERATIONS COLLIS
Address: 665 MCGLINCEY LANE
City,State,Zip: CAMPBELL, CA 95008
Year: 2010
County Code: 43
Air Basin: SF
Facility ID: 9557
Air District Name: BA
SIC Code: 7532
