Executive Summary

The purpose of this technical report is to assess the potential air quality, greenhouse gas (GHG) and energy impacts associated with implementation of the Pacific Palmdale Center Project ("project" or "proposed project"). This assessment uses the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines.

Project Overview

The project proposes to develop a new, 1,000,000 square-foot industrial building on 67.07 acres of land covering five contiguous parcels. The project site is located in the north central area of the City of Palmdale (City), within northwestern Los Angeles County, California.

Air Quality

The air quality impact analysis evaluated the potential for adverse impacts under the applicable CEQA significance criteria related to air quality due to construction and operational emissions resulting from the project.

Air Quality Plan Consistency

The purpose of a consistency finding is to determine if a project is inconsistent with the assumptions and objectives of the regional air quality plan, and thus if it would interfere with the region's ability to comply with federal and state air quality standards. According to the Antelope Valley Air Quality Management District's (AVAQMD's) *CEQA Air and Federal Conformity Guidelines,* a project is conforming if it complies with all applicable AVAQMD rules and regulations, complies with all proposed control measures that are not yet adopted from the applicable plan(s), and is consistent with the growth forecasts in the applicable plan(s) (or is directly included in the applicable plan). Zoning changes, specific plans, general plan amendments and similar land use plan changes that do not increase dwelling unit density, do not increase vehicle trips, and do not increase vehicle-miles traveled (VMT) are also deemed to comply with the applicable air quality plan (AVAQMD 2016).

Based on the analysis herein, the project would comply with all applicable AVAQMD rules and regulations and would be consistent with the site's current General Plan land use designation and zoning classification; as such, implementation of the project would not increase growth demographics and would not conflict with existing population and employment projections or associated air quality expectations within the region. Accordingly, the project is consistent with the applicable air quality plan, which is the *AVAQMD Federal 70 ppb Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)* (AVAQMD 2023).

In addition, the project's construction and operational emissions would would not exceed applicable AVAQMD regional significance thresholds after implementation of Mitigation Measure (MM)-AQ-1 through MM-AQ-7. As such, the project would not have the potential to increase the frequency or severity of a violation in the federal or state ambient air quality after mitigation.

Based on the preceding considerations, impacts associated with the project's potential to conflict with the AVAQMD air quality plans would be less than significant after mitigation.

Criteria Air Pollutant Emissions

Impacts associated with criteria air pollutant emissions were evaluated for significance based on the AVAQMD mass daily criteria air pollutant thresholds of significance. Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards (criteria) for outdoor concentrations to protect public health. Criteria air pollutants include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and lead. Pollutants that are evaluated include volatile organic compounds (VOCs) (also referred to as reactive organic gases), oxides of nitrogen (NO_x), CO, sulfur oxides (SO_x), PM_{10}, and $PM_{2.5}$. VOCs and NO_x are important because they are precursors to O_3.

Construction Emissions

Project construction would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (i.e., on-road trucks and worker vehicle trips). Emissions resulting from the project construction would exceed criteria pollutant thresholds established by the AVAQMD for VOC and NO_x emissions, primarily associated with architectural coatings and off-road equipment, respectively. This impact would be potentially significant without mitigation. MM-AQ-1 is recommended herein to reduce the VOC impacts, which entails the required use of "Super-Compliant" low VOC paints which have been reformulated to exceed the regulatory VOC limits put forth by AVAQMD's Rule 1113. Super-Compliant low VOC paints shall be no more than 10 grams per liter (g/L) of VOC. Alternatively, the project applicant may utilize tilt-up concrete buildings that do not require the use of architectural coatings or limit the volume of Rule 1113 compliant interior and exterior building coatings to 126 gallons per day and 42 gallons per day, respectively. In addition, MM-AQ-2 is recommended to reduce project-generated equipment exhaust, primarily by requiring use of 75 horsepower (hp) or greater equipment that have Tier 4 Final compliant engines, which are the cleanest engines currently available. In addition, fugitive dust controls are included pursuant to AVAQMD requirements, as specified in MM-AQ-3.

After implementation of MM-AQ-1 through MM-AQ-3, regional construction emissions would not exceed the applicable AVAQMD thresholds of significance for any criteria pollutant. Therefore, with the incorporation of mitigation, short-term impacts associated with a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment would be less than significant.

Operational Emissions

The analysis herein used an operational year of 2027 for full build-out of the project based on the anticipated construction schedule. Operation of the project would generate criteria pollutant emissions from area sources (consumer products, architectural coatings, landscaping equipment), energy sources (natural gas combustion for space and water heating), mobile sources (vehicular traffic), off-road equipment (diesel-fueled forklifts), stationary sources (diesel-fueled emergency generator and fire pump), and transport refrigeration units (TRUs). The project would exceed the numerical thresholds of significance established by the AVAQMD for emissions of NO_x. Most criteria air pollutant emissions associated with the project operations are generated by diesel-fueled off-road forklifts, on-road vehicles, and stationary sources. MM-AQ-4 requires measures to minimize on-road vehicle emissions, including the provision of electric vehicle (EV) charging stations and electrical hook-ups for TRUs. MM-AQ-5 includes the requirement for all off-road forklifts and landscaping equipment to be zero-emission, which would

reduce the long-term criteria air pollutant emissions substantially. In addition, MM-AQ-6 requires the emergency generator and fire pump to each have Tier 4 Final compliant engines and MM-AQ-7 requires the warehouse building to be all-electric (i.e., no natural gas). After implementation of MM-AQ-4 through MM-AQ-7, regional operational emissions would not exceed the applicable AVAQMD thresholds of significance for any criteria pollutant. Therefore, long-term impacts associated with a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment would be less than significant with mitigation.

In addition to activity within the AVAQMD jurisdiction, the project's trucks emissions have the potential to occur in neighboring air districts based on the estimated trip lengths. However, as assessed herein, truck traffic associated with project operations would not result in exceedances of any adjacent air district thresholds.

Health Effects of Criteria Air Pollutants

The California Supreme Court's Sierra Club v. County of Fresno (2018) 6 Cal. 5th 502 decision (referred to herein as the Friant Ranch decision) (issued on December 24, 2018) addresses the need to correlate mass emission values for air pollutants to specific health consequences and contains the following direction from the California Supreme Court: "The Environmental Impact Report (EIR) must provide an adequate analysis to inform the public how its bare numbers translate to create potential adverse impacts or it must explain what the agency *does* know and why, given existing scientific constraints, it cannot translate potential health impacts further" (Italics in original) (Sierra Club v. County of Fresno 2018). As discussed herein, there are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days, and methods available to quantitatively evaluate health effects may not be appropriate to apply to emissions concentrations associated with the project, which cannot be estimated with a high-level of accuracy. Nonetheless, additional information is provided to support impact conclusions and to explain what is known and what is not given constraints. Overall, as the project would not result in exceedances of the AVAQMD significance thresholds after mitigation, and because the AVAQMD thresholds are based on levels that the MDAB can accommodate without affecting the attainment date for the AAQS and the AAQS are established to protect public health and welfare, the proposed project is not anticipated to result in health effects associated with NO_X, VOCs, CO, SO_x, PM_{10}, or $PM_{2.5}$. The potential health effects associated with criteria air pollutants are considered less than significant with implementation of MM-AQ-1 through MM-AQ-7.

Exposure of Sensitive Receptors

Local Carbon Monoxide Concentrations

In regard to localized impacts from CO, to verify that the proposed project would not cause or contribute to a violation of the CO standard, a screening evaluation was conducted comparing the highest hourly traffic volumes at any studied intersection in proximity to the project site to the 100,000 vehicles per day criterion from the South Coast Air Quality Management District's (SCAQMD's) AQMP (SCAQMD 2003). The highest average daily trips with project vehicles would be less than 60,000 daily trips (Sierra Highway and W Rancho Vista Blvd intersection) (Translutions, Inc. 2025), which would be substantially less than the 100,000 vehicles per day screening criterion applied. Therefore, impacts associated with CO hotspots would be less than significant.

Toxic Air Contaminant Exposure

A health risk assessment (HRA) was performed for the project's construction and operational sources to evaluate the risk from diesel particulate matter (DPM), which is a toxic air contaminant (TAC), on existing proximate sensitive receptors. the DPM emissions from short-term construction plus long-term operations of the project would result in a Maximum Individual Cancer Risk of about 105 in 1 million and a Chronic Hazard Index of 0.040 at the maximally exposed individual resident (MEIR). The Chronic Hazard Index would be below the 1.0 significance threshold; however, the project would exceed the cancer risk threshold of 10 in a million and would be potentially significant without mitigation. Mitigation measures are required to minimize construction and operational health risk impacts (MM-AQ-2, MM-AQ-4, MM-AQ-5, and MM-AQ-6). These mitigation measures would reduce DPM to the extent feasible, by requiring Tier 4 Final compliant engines for off-road equipment greater than 75 hp during construction (MM-AQ-2), all operational cargo handling equipment to be zero-emission (MM-AQ-5), and Tier 4 Final compliant engines for any emergency generators and fire pumps during operations (MM-AQ-6). In addition, although not quantified, MM-AQ-4 would also reduce DPM by requiring the installation of TRU electrical hook-ups at all cold storage loading docks, as well as supporting the future installation of heavy-duty truck charging stations.

The mitigated DPM emissions from short-term construction plus long-term operations of the project would result in a Maximum Individual Cancer Risk of about 4.41 in 1 million and a Chronic Hazard Index of 0.0030 at the MEIR, which would not exceed the respective AVAQMD thresholds of significance. The project health risk impacts would be less than significant after mitigation.

Valley Fever

Los Angeles County is not considered a highly endemic region for Valley Fever, with an incident rate of 15.7 cases per 100,000 people (CDPH 2023). In order to reduce fugitive dust from the project and minimize adverse air quality impacts, the project would employ measures that address dust in accordance with the AVAQMD Rules 401 and 403.2 and MM-AQ-3, which limit the amount of fugitive dust generated during construction. These requirements are consistent with California Department of Public Health recommendations for the implementation of dust control measures, including regular application of water during soil-disturbance activities, to reduce exposure to valley fever by minimizing the potential that the fungal spores become airborne (CDPH 2013). Further, regulations designed to minimize exposure to valley fever hazards are included in Title 8 of the California Code of Regulations and would be complied with during the project's construction phase (California Department of Industrial Relations 2022). Based on the preceding considerations, the project would not result in a significant impact attributable to valley fever exposure based on its geographic location and compliance with applicable regulatory standards and dust mitigation measures, which will serve to minimize the release of and exposure to fungal spores. Therefore, impacts associated with valley fever exposure for sensitive receptors would be less than significant.

Other Emissions

Land uses most commonly associated with odor complaints generally include agricultural uses (livestock and farming), wastewater treatment plants, food-processing plants, chemical plants, composting operations, refineries, landfills, dairies, and fiberglass molding facilities. The project does not include uses that would be substantive sources of objectionable odors. Potential temporary and intermittent odors may result from construction equipment exhaust, the application of asphalt, and architectural coatings. Such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Impacts associated with odors would be less than significant without mitigation.

Greenhouse Gas Emissions

Global climate change is a cumulative impact under CEQA. A project contributes to this cumulative impact through its incremental contribution of emissions combined with the cumulative increase of all other sources of GHG emissions. GHGs are gases that absorb infrared radiation in the atmosphere. Principal GHGs regulated under state and federal law and regulations include carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). GHG emissions are measured in metric tons (MT) of CO_2 equivalent (CO_2e), which account for weighted global warming potential (GWP) factors for CH_4 and N_2O.

Project-Generated Construction and Operational GHG Emissions

Construction of the project would result in GHG emissions primarily associated with the use of off-road construction equipment, on-road trucks, and worker vehicles. Operation of the project would generate GHG emissions from mobile sources (vehicular traffic), area sources (landscape maintenance equipment operation), energy use (natural gas combustion and utility generation of electricity consumed by the project), water supply, treatment, and distribution and wastewater treatment, solid waste disposal, refrigerants, off-road equipment, stationary sources, and TRUs. The project would result in approximately 19,723 MT CO_2e per year, including amortized construction emissions, which would exceed the applied GHG threshold of 3,000 MT CO_2e per year. Therefore, the project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, and this would represent a cumulatively considerable significant impact. Most GHGs associated with the project are generated by on-road vehicles, diesel-fueled off-road forklifts, and energy sources. MM-AQ-4 requires measures to minimize on-road vehicle emissions, including the provision of EV charging stations and electrical hook-ups for TRUs. MM-AQ-5 includes the requirement for all off-road forklifts and landscaping equipment to be zero-emission, which would reduce the long-term criteria air pollutant emissions substantially. MM-AQ-7 requires the warehouse building to be all-electric (i.e., no natural gas). Finally, implementation of MM-GHG-1 through MM-GHG-3 would reduce GHG emissions associated with the project's energy use, solid waste generation, and water use, respectively, by requiring renewable/energy efficiency features, solid waste disposal reduction practices, and water conservation features.

After mitigation, the project would result in approximately 13,991 MT CO_2e per year, which would still exceed the applied threshold of 3,000 MT CO_2e per year. Although mobile vehicles are the main source of GHG emissions associated with project operations, neither the project applicant nor the City can substantively or materially affect reductions in the project's on-road mobile source emissions beyond what is already required by federal and state regulations. No feasible mitigation measures beyond those already identified to address air quality emissions exist that would reduce these emissions to levels that are less than significant. Therefore, even with the incorporation of mitigation, long-term impacts associated with a cumulatively considerable increase in GHG emissions would be significant and unavoidable.

Consistency with Applicable GHG Reduction Plans

As demonstrated herein, the project would not conflict with the California Air Resources Board's (CARB's) Scoping Plan and would not conflict with other regulations regarding reductions to GHG emissions including Senate Bill (SB) 32 and Assembly Bill (AB) 1279. Additionally, the project would be consistent with the Southern California Association of Governments (SCAG) 2024–2050 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the Sustainability, Climate, and Resilience Element of the City's General Plan (*Palmdale 2045*),

which serves as the City's Climate Action Plan (CAP), with implementation of MM-AQ-4, MM-AQ-5, MM-AQ-7, and MM-GHG-1 through MM-GHG-3.

Energy

Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources

As the analysis herein demonstrates, the project's construction and operation would not result in wasteful, inefficient or unnecessary consumption of energy resources; therefore, potential impacts would be less than significant.

Conflict with Renewable Energy or Energy Efficiency Plans

The project would comply with all applicable California building code requirements for energy efficiency and would not conflict with the Sustainability, Climate, and Resilience Element of the City of Palmdale's General Plan (*Palmdale 2045*), which includes goals for the lowering of fossil fuel use. Accordingly, potential project impacts would be less than significant.

Summary of Findings

Table ES-1 provides a summary of impact determinations.

Table ES-1. Summary of Impact Determinations

Analysis	Report Section	CEQA Checklist Question	Significance Determinations	
			Unmitigated	Mitigated
Air Quality				
Air Quality Plan Consistency	2.4.1	AQ Threshold 1	**Potentially Significant**	Less than Significant with Mitigation
Cumulatively Considerable Net Increase of Any Criteria Pollutant	2.4.2	AQ Threshold 2	**Potentially Significant**	Less than Significant with Mitigation

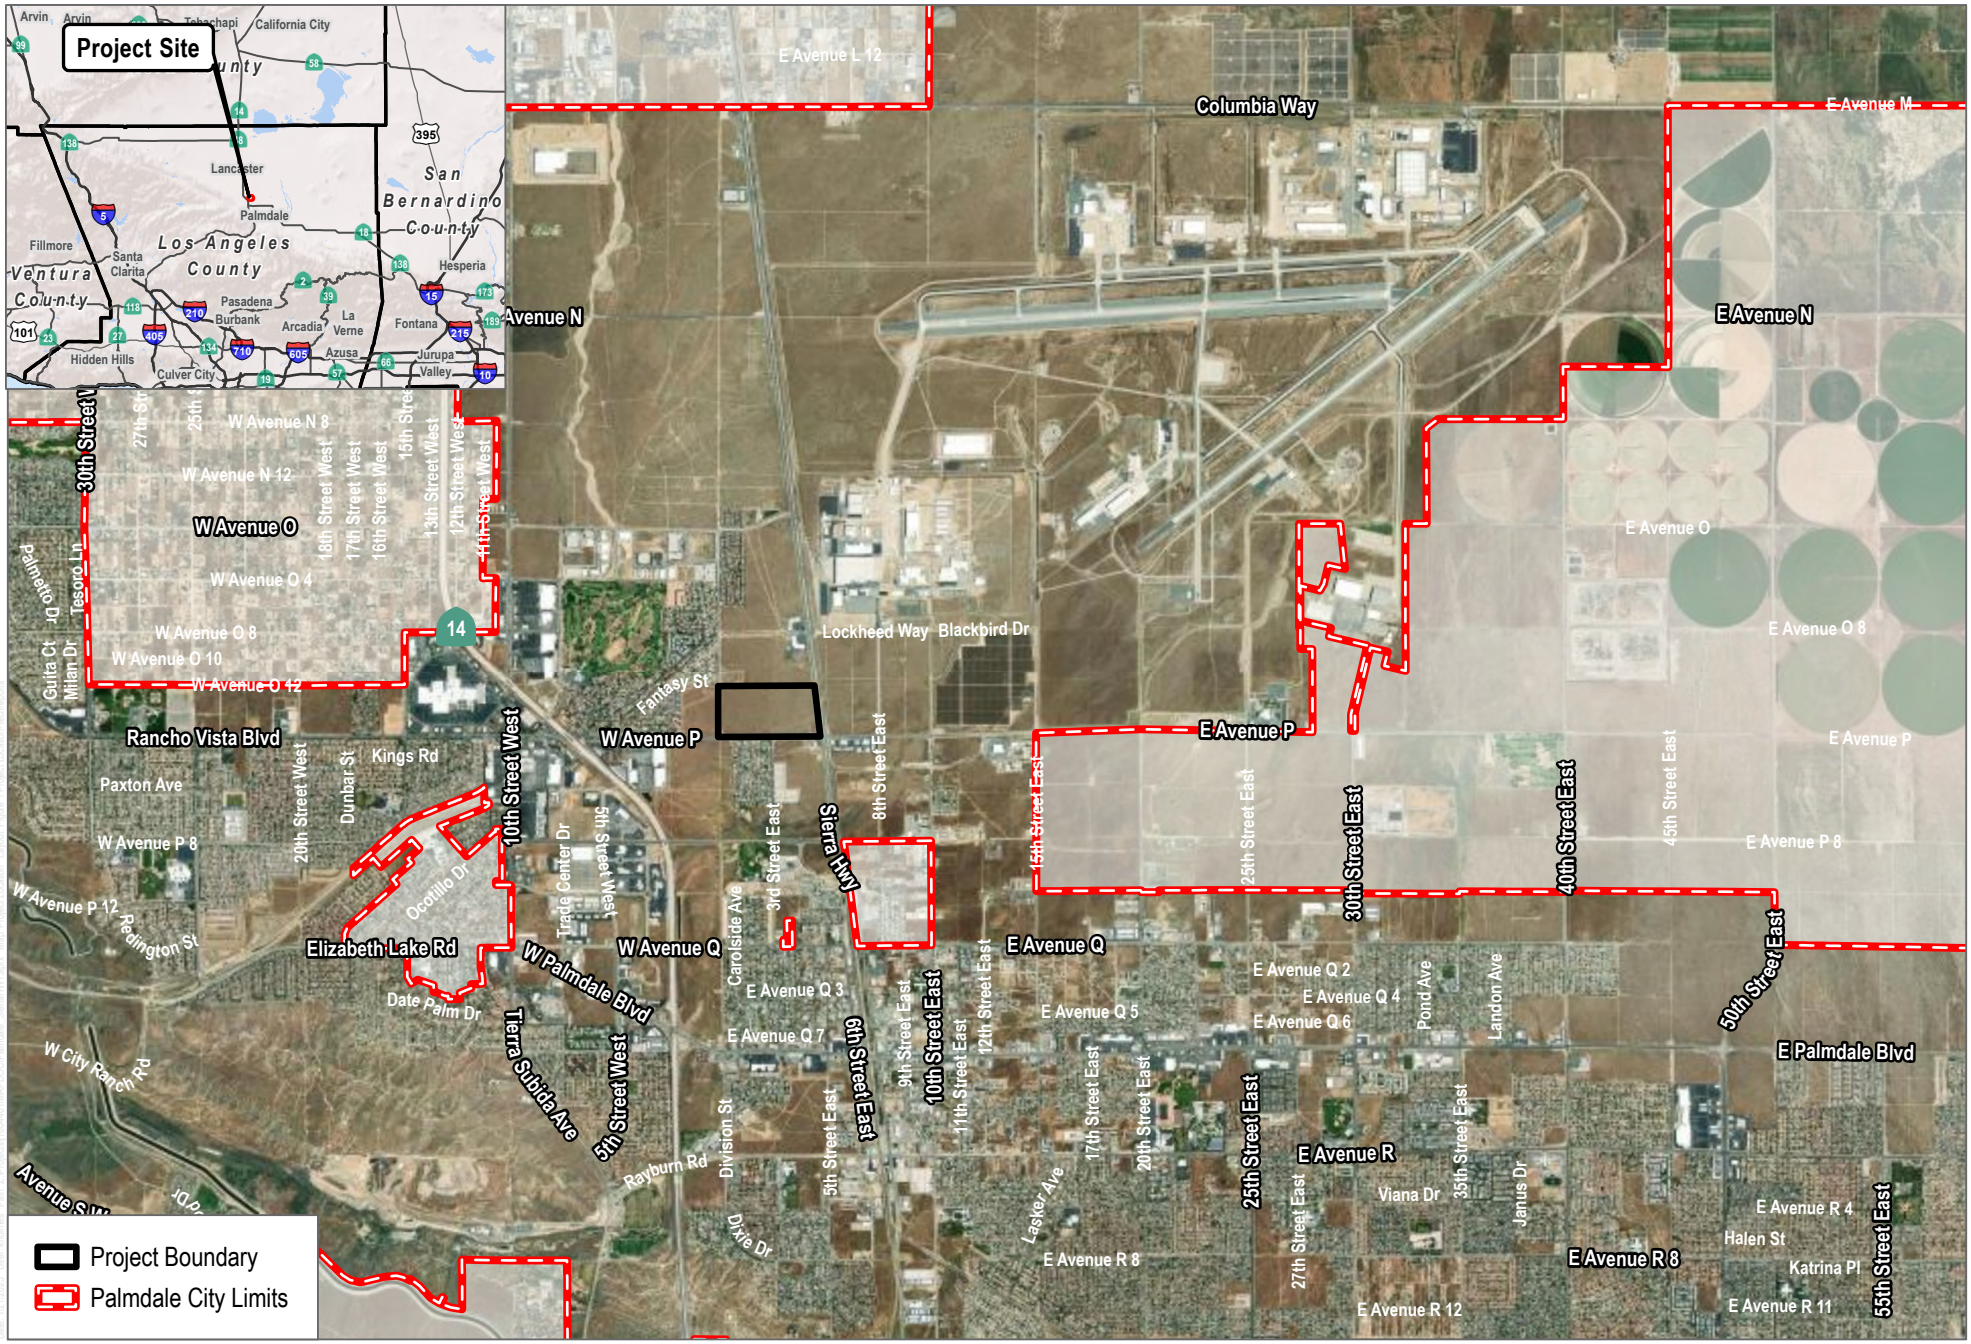
1 Introduction

1.1 Report Purpose and Scope

The purpose of this technical report is to assess the potential air quality, greenhouse gas (GHG) and energy impacts associated with construction and operation of the Pacific Palmdale Center Project ("project" or "proposed project"). This analysis uses the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and the emissions-based significance thresholds recommended by the Antelope Valley Air Quality Management District (AVAQMD) and other applicable thresholds of significance.

1.2 Project Description



The project proposes to develop a new, 1,000,000 square-foot industrial building on 67.1 acres of land covering five contiguous parcels. The project site is located in the north central area of the City of Palmdale (City), within northwestern Los Angeles County, California. The project site is vacant and undeveloped. The project area would be developed with one (1) new industrial building located in the central area of the project site. The building would be constructed with dock-high doors along the north and south building walls. A 10,000-square foot office space area would be located in the southwest corner of the building with another potential office space area located in the northeast corner of the building. A 12-foot-tall concrete screen wall would surround the truck court areas of the project site, with 8-foot-tall telescoping tube steel gates at the entry points. The proposed industrial building includes 74 dock-high stations on the north and south sides of the building, for a total of 148 dock-high stations. In addition to the dock-high stations, there would be 86 trailer stalls north of the northern side dock-high stations and 125 trailers stalls south of the southern side dock-high station. There would be 129 trailer stalls east of the building and 634 passenger car parking stalls west of the building. See Figure 1 and Figure 2 for the project location and site plan, respectively. Note that if the number of trailer or passenger car parking stalls change due to restriping of the parking areas, those minor revisions would not affect the analytical conclusions presented in this report, as the number of parking spaces is immaterial to the analyses.

The project would support a variety of activities associated with an industrial building, including the ingress and egress of passenger vehicles and trucks, the loading and unloading of trucks and trailers with designated truck courts/loading areas, and the movement of materials within the building by forklifts. The warehouse space would support cold storage in up to 25% of the warehouse space. In addition, the office space would support general internal office activities related to the industrial use. The project would employ approximately 1,180 employees.

In addition to on-site development, the project would also include improvements along the project's street frontages, including landscaping and street and sidewalk improvements. A variety of trees, shrubs, and groundcovers would be planted within the project frontages landscape setback area, within the landscape areas found around the parking lot areas and perimeter of the project site. Division Street would be widened along the property frontage. Avenue O-12 would be paved and developed into a full street with a center median, per City requirements. The project would connect to the existing sewer line along Sierra Highway from Avenue O-12. The tie-in to existing water infrastructure would require construction of approximately 2,500 feet of 12-inch diameter watermain in West Rancho Vista Blvd and approximately 2,200 feet of 16-inch diameter watermain in Sierra Highway.

The City's General Plan Land Use Map designates the project site as Employment Flex, and the project site is zoned as Light Industrial (City of Palmdale 2023a, City of Palmdale 2023b).

2 Air Quality

2.1 Environmental Setting

The project site is located within the Mojave Desert Air Basin (MDAB), which includes the desert portions of Los Angeles, Kern, San Bernardino, and Riverside Counties. The project is within the jurisdictional boundaries of AVAQMD, which covers the northern desert portion of Los Angeles County.

Air pollutants are emitted by a variety of sources, including off-road equipment, mobile sources (vehicles), area sources (hearths [fireplaces], consumer product use, architectural coatings, and landscape maintenance equipment), energy sources (natural gas), and stationary sources (generators or other stationary equipment). Some air pollutants need to be examined at the local level, and others are predominantly an issue at the regional level. For instance, ozone (O_3) is formed in the atmosphere in the presence of sunlight by a series of chemical reactions involving oxides of nitrogen (NO_x) and volatile organic compounds (VOCs) (also termed reactive organic gases [ROGs]). Because these reactions are broad scale in effects, O_3 is typically analyzed at the regional level (i.e., in the MDAB) rather than the local level. On the other hand, air pollutants such as coarse particulate matter (particulate matter with an aerodynamic diameter less than or equal to 10 microns, or PM_{10}), fine particulate matter (particulate matter with an aerodynamic diameter less than or equal to 2.5 microns, or $PM_{2.5}$), carbon monoxide (CO), and toxic air contaminants (TACs) are a potential concern in the immediate vicinity of the pollutant source because the pollutants are emitted directly by or are formed close to the source. Therefore, the study area for emissions of PM_{10}, $PM_{2.5}$, CO, and TACs is the local area near the source, such as in the vicinity of the project site, and the study area for regional pollutants such as NO_x and VOCs is the entire MDAB.

2.1.1 Meteorological and Topographical Conditions

Air quality is a function of the rate and location of pollutant emissions under the influence of meteorological conditions and topographic features that influence pollutant movement and dispersal. Atmospheric conditions such as wind speed, wind direction, atmospheric stability, and air temperature gradients interact with the physical features of the landscape to determine the movement and dispersal of air pollutants, and consequently affect air quality.

Most of the MDAB is commonly referred to as the “High Desert” because elevations range from approximately 2,000 to 5,000 feet above mean sea level. The MDAB is generally above the regional inversion layer and experiences relatively good dispersion conditions. The MDAB is separated from Southern California coastal regions and Central California valley regions by mountains extending up to 10,000 feet above mean sea level. As a result, the Mojave Desert is removed from the cooling effects of the Pacific Ocean and is characterized by extreme temperatures. The MDAB consists of an assemblage of mountain ranges interspersed with valleys that often contain dry lakes. Lower-elevation mountains scattered throughout the basin are generally 1,000 feet to 4,000 feet high. Mountain passes form channels for air masses flowing from the west and southwest, and the prevailing winds from the west and southwest are caused by the proximity of the MDAB to coastal and central regions and the blocking effect of the Sierra Nevada to the north.

This MDAB region is characterized by hot, dry summers and cool winters, with little precipitation. During the summer, the MDAB is generally influenced by a Pacific subtropical high-pressure cell that resides off the coast of California. This high-pressure cell prevents cloud formation and engenders daytime solar heating. The MDAB is rarely

influenced by the cold air masses that move south from Canada and Alaska, as these frontal systems diffuse by the time they reach the MDAB. Most moisture arrives in frequent warm, moist, unstable air masses from the south. The MDAB is classified as a dry–hot desert climate, with portions classified as dry–very hot desert, to indicate at least 3 months have maximum average temperatures over 100.4°F. In Palmdale, the annual average precipitation is 7.4 inches (AVAQMD 2016).

2.1.2 Pollutants and Effects

2.1.2.1 Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The national and California standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include O_3, nitrogen dioxide (NO_2), CO, sulfur dioxide (SO_2), PM_{10}, $PM_{2.5}$, and lead. In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants. These pollutants, as well as TACs, are discussed in the following paragraphs.[1]

Ozone. O_3 is a strong-smelling, pale blue, reactive, toxic chemical gas consisting of three oxygen atoms. It is a secondary pollutant formed in the atmosphere by a photochemical process involving the sun's energy and O_3 precursors. These precursors are mainly NO_x and VOCs. The maximum effects of precursor emissions on O_3 concentrations usually occur several hours after they are emitted and many miles from the source. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O_3 exists in the upper atmosphere ozone layer (stratospheric O_3) and at the Earth's surface in the troposphere (ground-level O_3).[2] The O_3 that the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) regulate as a criteria air pollutant is produced close to the ground level, where people live, exercise, and breathe. Ground-level O_3 is a harmful air pollutant that causes numerous adverse health effects and is thus considered "bad" O_3. Stratospheric, or "good," O_3 occurs naturally in the upper atmosphere, where it reduces the amount of ultraviolet light (i.e., solar radiation) entering the Earth's atmosphere. Without the protection of the beneficial stratospheric O_3 layer, plant and animal life would be seriously harmed.

O_3 in the troposphere causes numerous adverse health effects; short-term exposures (lasting for a few hours) to O_3 can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes (EPA 2020). Inhalation of O_3 causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms. Exposure to O_3 can reduce the volume of air that the lungs breathe in, thereby causing shortness of breath. O_3 in sufficient doses increases the permeability of lung cells, rendering them more susceptible to toxins and microorganisms. The occurrence and severity of health effects from O_3 exposure vary widely among individuals, even when the dose and the duration of exposure are the same. Research shows adults and children who spend more time outdoors participating in vigorous physical activities are at

1 The following descriptions of health effects for each of the criteria air pollutants associated with project construction and operations are based on the U.S. Environmental Protection Agency's "Criteria Air Pollutants" (EPA 2024a) and the California Air Resources Board's "Glossary of Air Pollutant Terms" (CARB 2024a) and CARB's "Common Air Pollutants" (CARB 2024b).

2 The troposphere is the layer of the Earth's atmosphere nearest to the surface of the Earth. The troposphere extends outward about 5 miles at the poles and about 10 miles at the equator.

greater risk from the harmful health effects of O_3 exposure. While there are relatively few studies on the effects of O_3 on children, the available studies show that children are no more or less likely to suffer harmful effects than adults. However, there are a number of reasons why children may be more susceptible to O_3 and other pollutants. Children and teens spend nearly twice as much time outdoors and engaged in vigorous activities as adults. Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults. Also, children are less likely than adults to notice their own symptoms and avoid harmful exposures. Further research may be able to better distinguish between health effects in children and adults. Children, adolescents and adults who exercise or work outdoors, where O_3 concentrations are the highest, are at the greatest risk of harm from this pollutant (CARB 2024c).

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas that is present in all urban atmospheres. The major mechanism for the formation of NO_2 in the atmosphere is the oxidation of the primary air pollutant nitric oxide (NO), which is a colorless, odorless gas. NO_x plays a major role, together with VOCs, in the atmospheric reactions that produce O_3. NO_x is formed from fuel combustion under high temperature or pressure. In addition, NO_x is an important precursor to acid rain and may affect both terrestrial and aquatic ecosystems. The two major emissions sources are transportation and stationary fuel combustion sources such as electric utility and industrial boilers. NO_2 can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections (EPA 2016).

A large body of health science literature indicates that exposure to NO_2 can induce adverse health effects. The strongest health evidence, and the health basis for the ambient air quality standards for NO_2, results from controlled human exposure studies that show that NO_2 exposure can intensify responses to allergens in allergic asthmatics. In addition, a number of epidemiological studies have demonstrated associations between NO_2 exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses. Infants and children are particularly at risk because they have disproportionately higher exposure to NO_2 than adults due to their faster breathing rate for their body weight and their typically greater outdoor exposure duration. Several studies have shown that long-term NO_2 exposure during childhood, the period of rapid lung growth, can lead to smaller lungs at maturity in children with higher levels of exposure compared to children with lower exposure levels. In addition, children with asthma have a greater degree of airway responsiveness compared with adult asthmatics. In adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease (CARB 2024d).

Carbon Monoxide. CO is a colorless, odorless gas formed by the incomplete combustion of hydrocarbon, or fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas, automobile exhaust accounts for the majority of CO emissions. CO is a non-reactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions—primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, which is a typical situation at dusk in urban areas from November to February. The highest levels of CO typically occur during the colder months of the year, when inversion conditions are more frequent.

CO is harmful because it binds to hemoglobin in the blood, reducing the ability of blood to carry oxygen. This interferes with oxygen delivery to the body's organs. The most common effects of CO exposure are fatigue, headaches, confusion and reduced mental alertness, light-headedness, and dizziness due to inadequate oxygen delivery to the brain. For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress.

Inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance. Unborn babies whose mothers experience high levels of CO exposure during pregnancy are at risk of adverse developmental effects. Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO (CARB 2024e).

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily from incomplete combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels.

Controlled human exposure and epidemiological studies show that children and adults with asthma are more likely to experience adverse responses with SO_2 exposure, compared with the non-asthmatic population. Effects at levels near the 1-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath, and chest tightness, especially during exercise or physical activity. Also, exposure at elevated levels of SO_2 (above 1 parts per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality. Older people and people with cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most likely to experience these adverse effects (CARB 2024f).

SO_2 is of concern both because it is a direct respiratory irritant and because it contributes to the formation of sulfate and sulfuric acid in particulate matter (NRC 2005). People with asthma are of particular concern, both because they have increased baseline airflow resistance and because their SO_2-induced increase in airflow resistance is greater than in healthy people, and it increases with the severity of their asthma (NRC 2005). SO_2 is thought to induce airway constriction via neural reflexes involving irritant receptors in the airways (NRC 2005).

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. Coarse particulate matter (PM_{10}) consists of particulate matter that is 10 microns or less in diameter and is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions. Fine particulate matter ($PM_{2.5}$) consists of particulate matter that is 2.5 microns or less in diameter and is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., from motor vehicles and power generation and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the blood stream, causing damage elsewhere in the body. Additionally, these substances can transport adsorbed gases such as chlorides or ammonium into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate

deeper into the lungs and damage lung tissue. Suspended particulates also damage and discolor surfaces on which they settle and produce haze and reduce regional visibility.

A number of adverse health effects have been associated with exposure to both $PM_{2.5}$ and PM_{10}. For $PM_{2.5}$, short-term exposures (up to 24-hour duration) have been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. These adverse health effects have been reported primarily in infants, children, and older adults with preexisting heart or lung diseases. In addition, of all of the common air pollutants, $PM_{2.5}$ is associated with the greatest proportion of adverse health effects related to air pollution, both in the United States and worldwide based on the World Health Organization's Global Burden of Disease Project. Short-term exposures to PM_{10} have been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits (CARB 2024g).

Long-term exposure (months to years) to $PM_{2.5}$ has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children. The effects of long-term exposure to PM_{10} are less clear, although several studies suggest a link between long-term PM_{10} exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer (CARB 2024g).

Lead. Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturing of batteries, paints, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phaseout of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phaseout of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emissions sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient performance, psychomotor performance, reaction time, and growth. Children are highly susceptible to the effects of lead.

Volatile Organic Compounds. Hydrocarbons are organic gases that are formed from hydrogen and carbon and sometimes other elements. Hydrocarbons that contribute to formation of O_3 are referred to and regulated as VOCs. Combustion engine exhaust, oil refineries, and fossil-fueled power plants are the main sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint.

The primary health effects of VOCs result from the formation of O_3 and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate health standards for VOCs as a group.

Sulfates. Sulfates are the fully oxidized form of sulfur, which typically occur in combination with metals or hydrogen ions. Sulfates are produced from reactions of SO_2 in the atmosphere and can result in respiratory impairment, as well as reduced visibility.

Vinyl Chloride. Vinyl chloride is a colorless gas with a mild, sweet odor, which has been detected near landfills, sewage plants, and hazardous waste sites, due to the microbial breakdown of chlorinated solvents. Short-term exposure to high levels of vinyl chloride in air can cause nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure through inhalation can cause liver damage, including liver cancer.

Hydrogen Sulfide. Hydrogen sulfide is a colorless and flammable gas that has a characteristic odor of rotten eggs. Sources of hydrogen sulfide include geothermal power plants, petroleum refineries, sewers, and sewage treatment plants. Exposure to hydrogen sulfide can result in nuisance odors, as well as headaches and breathing difficulties at higher concentrations.

Visibility-Reducing Particles. Visibility-reducing particles are any particles in the air that obstruct the range of visibility. Effects of reduced visibility can include obscuring the viewshed of natural scenery, reducing airport safety, and discouraging tourism. Sources of visibility-reducing particles are the same as for $PM_{2.5}$.

2.1.2.2 Non-Criteria Air Pollutants

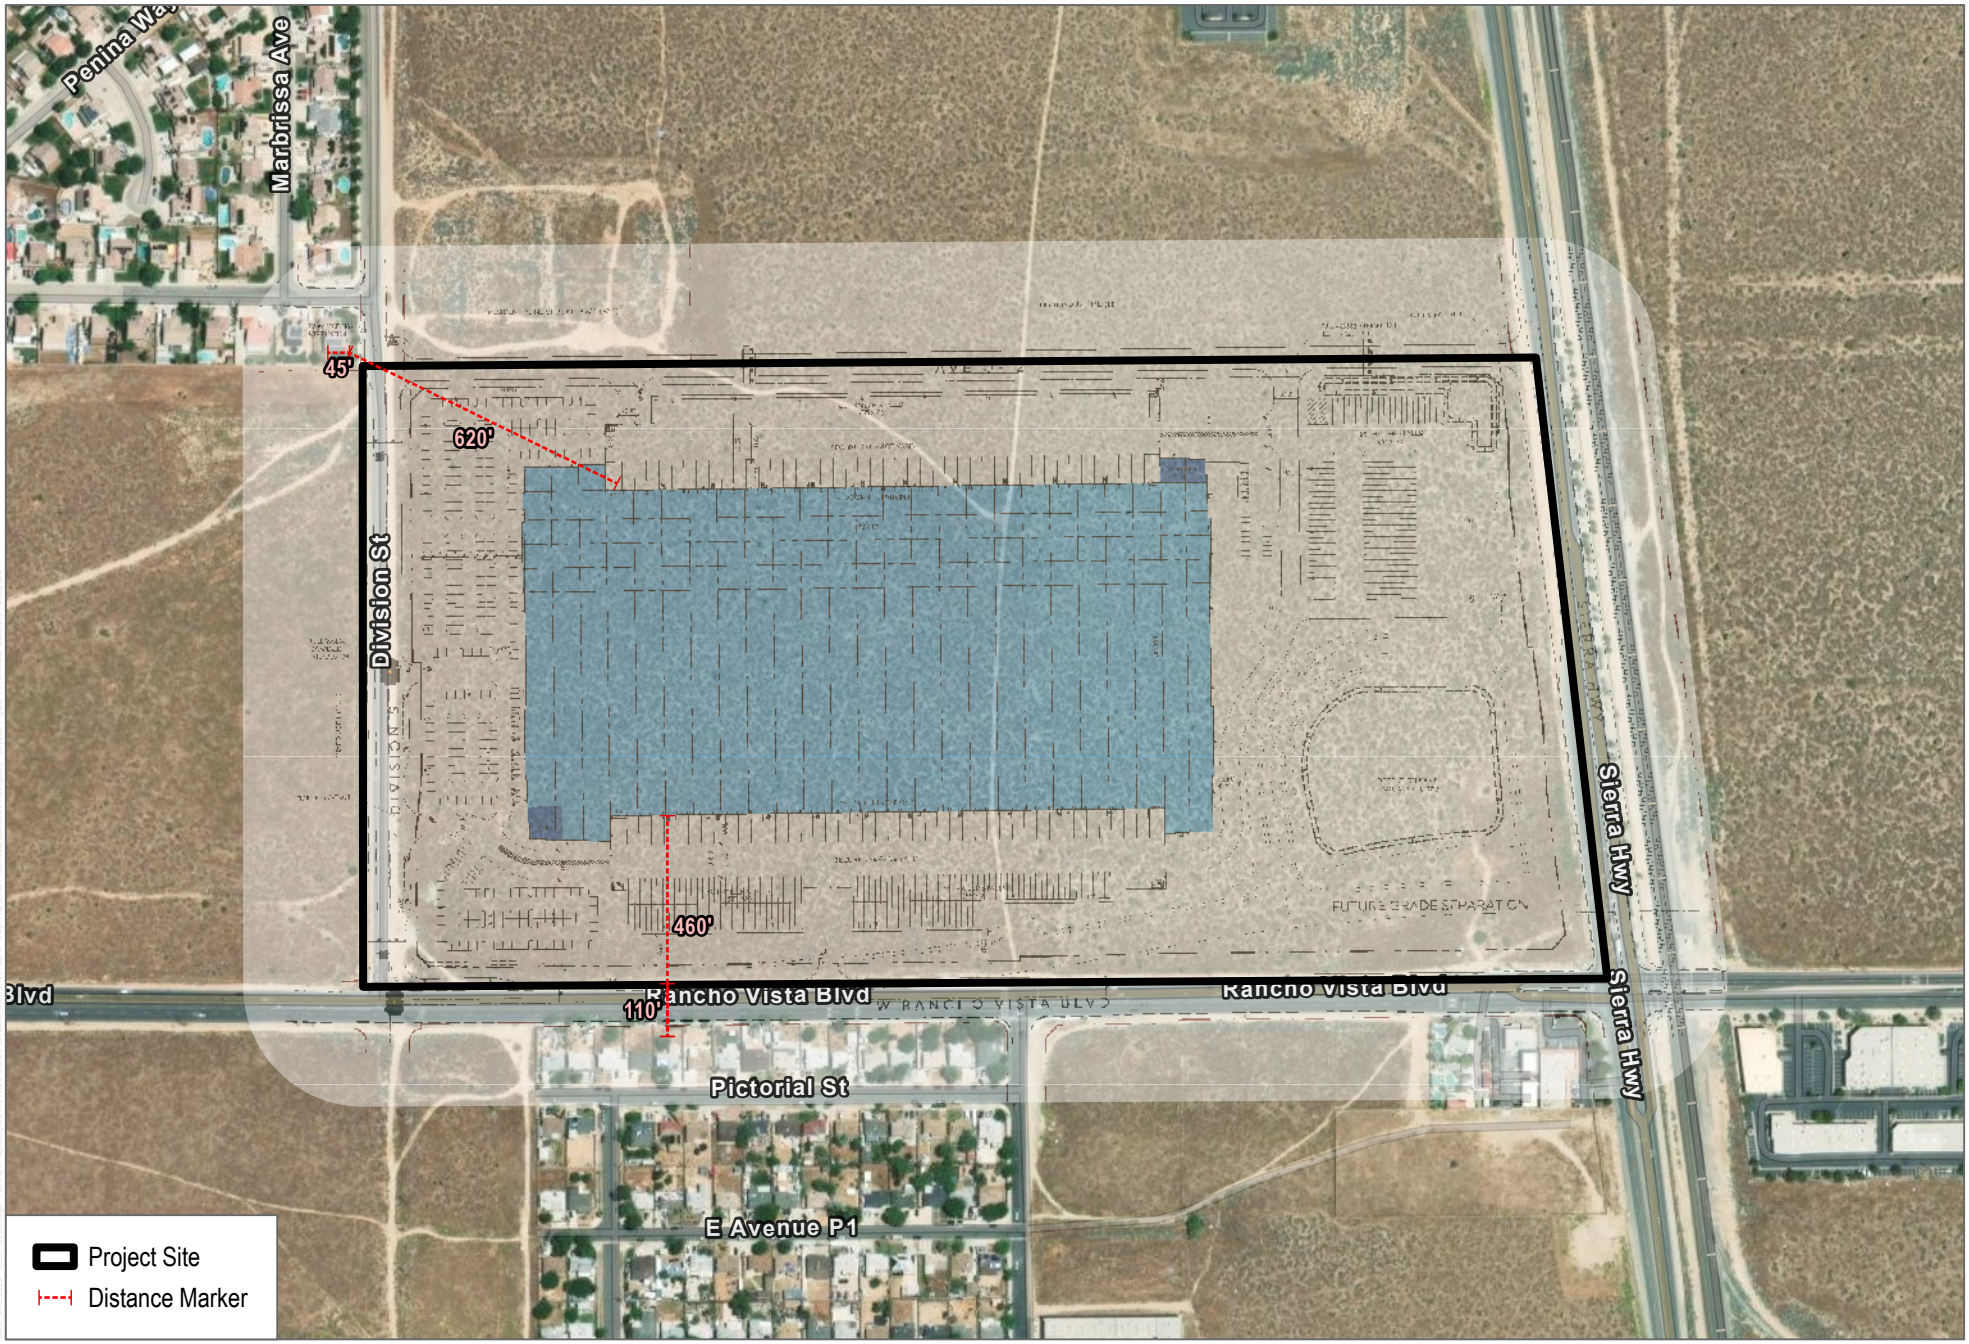
Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute and/or chronic noncancer health effects. A toxic substance released into the air is considered a TAC. TACs are identified by federal and state agencies based on a review of available scientific evidence. In the State of California, TACs are identified through a two-step process that was established in 1983 under the Toxic Air Contaminant Identification and Control Act. This two-step process of risk identification and risk management and reduction was designed to protect residents from the health effects of toxic substances in the air. In addition, the California Air Toxics “Hot Spots” Information and Assessment Act, Assembly Bill (AB) 2588, was enacted by the legislature in 1987 to address public concern over the release of TACs into the atmosphere. The law requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, to identify facilities having localized impacts, to ascertain health risks, to notify nearby residents of significant risks, and to reduce those significant risks to acceptable levels.

Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by several sources, including stationary sources such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources such as automobiles; and area sources such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and noncarcinogenic effects. Noncarcinogenic effects typically affect one or more target organ systems and may be experienced on either short-term (acute) or long-term (chronic) exposure to a given TAC.

Diesel Particulate Matter. Diesel particulate matter (DPM) is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. More than 90% of DPM is less than 1 micrometer in diameter (about 1/70th the diameter of a human hair), and thus is a subset of $PM_{2.5}$ (CARB 2024h). DPM is typically composed of carbon particles (“soot,” also called black carbon) and numerous organic compounds, including over 40 known cancer-causing organic substances. Examples of these chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene (CARB 2024h). CARB classified “particulate emissions from diesel-fueled engines” (i.e., DPM) as a TAC in August 1998 (17 CCR 93000). DPM is emitted from a broad range of diesel engines: on-road diesel engines of trucks, buses, and cars and off-road diesel engines including locomotives, marine vessels, and heavy-duty

construction equipment, among others. Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with DPM, California Air Resources Board (CARB) adopted a diesel risk reduction plan in 2000 (CARB 2000). Because it is part of $PM_{2.5}$, DPM also contributes to the same non-cancer health effects as $PM_{2.5}$ exposure. These effects include premature death; hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma; increased respiratory symptoms; and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies (CARB 2024h). Those most vulnerable to non-cancer health effects are children whose lungs are still developing and the elderly who often have chronic health problems.

Odorous Compounds. Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting and headache). The ability to detect odors varies considerably among the population and overall is quite subjective. People may have different reactions to the same odor. An odor that is offensive to one person may be perfectly acceptable to another (e.g., coffee roaster). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. In a phenomenon known as odor fatigue, a person can become desensitized to almost any odor, and recognition may only occur with an alteration in the intensity. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors.



Valley Fever. Coccidioidomycosis, more commonly known as "Valley Fever," is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern United States.

California Labor Code section 6709 defines "highly endemic" areas for valley fever as those areas where the annual incidence rate is greater than 20 cases per 100,000 persons per year. Los Angeles County is not considered a highly endemic region for Valley Fever, as the latest report from the California Department of Public Health (CDPH) indicated the County has 15.7 cases per 100,000 people (CDPH 2023). While cases are reported countywide, most cases have occurred in northern areas, with an approximate 9-fold higher rate of cases in Antelope Valley than in other areas of the county (Los Angeles County 2017). In contrast, in 2022 the statewide annual incident rate was 19.1 per 100,000 people. The California counties considered highly endemic for Valley Fever include Kern (264.9 per 100,000), Kings (111.0 per 100,000), Tulare (65.7 per 100,000), San Luis Obispo (51.5 per 100,000), Fresno (44.3 per 100,000), Madera (32.4 per 100,000), and Ventura (28.3 per 100,000), which accounted for 50.5% of the reported cases in 2022 (CDPH 2023).

2.1.3 Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution include children, the elderly, athletes, and people with cardiovascular and chronic respiratory diseases. Facilities and structures where these air pollution-sensitive people live or spend considerable amounts of time are known as sensitive receptors. The AVAQMD identifies sensitive receptors as residences, schools, playgrounds, childcare centers, and medical facilities (AVAQMD 2016). The nearest sensitive receptors to the project are existing residences as close as 45 feet to the west (along Division Road) of roadway configuration construction, about 110 feet to the south (across W Rancho Vista Boulevard) of the project boundary, and along the project's haul routes. Distances from these sensitive receptors to the project's nearest proposed project's loading docks are 620 feet northwest and 460 feet south, respectively. Figure 3 depicts the location of the nearest sensitive receptors to the proposed project.

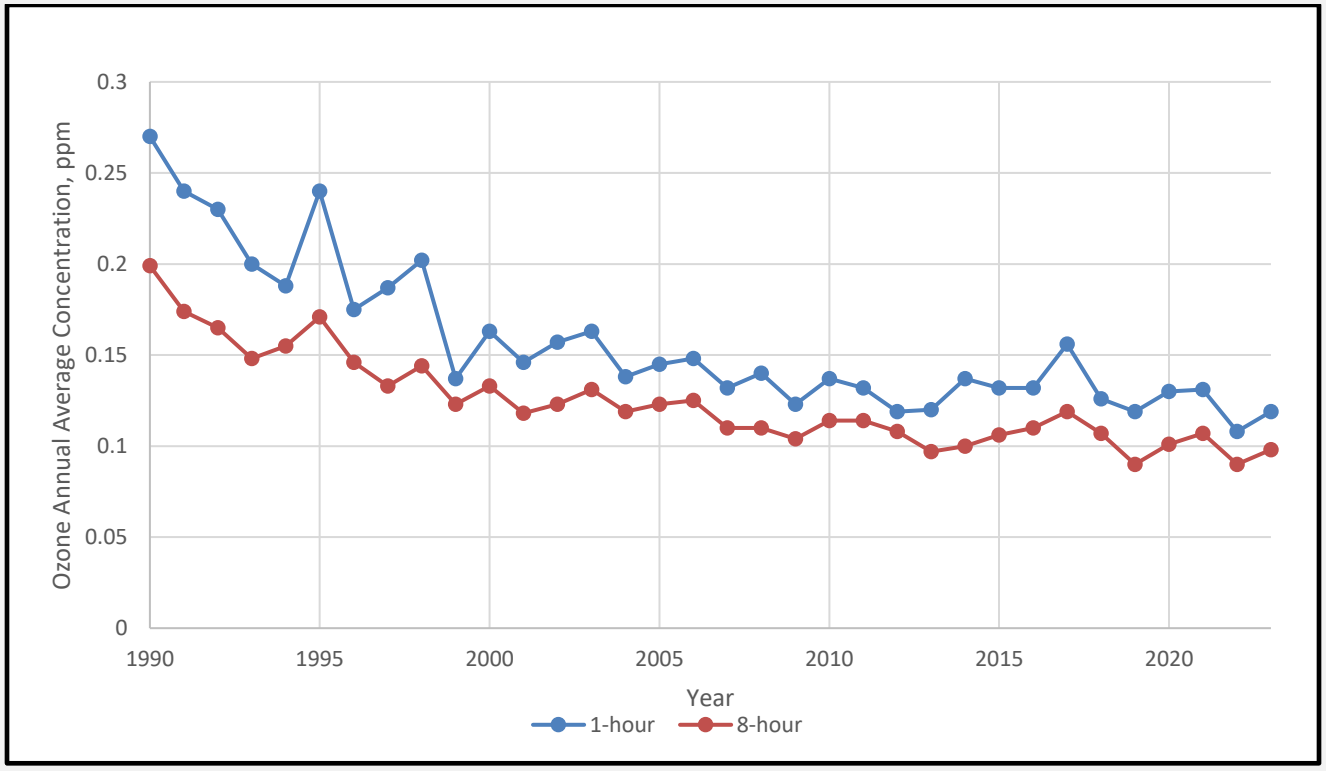
2.1.4 Local Ambient Air Quality

Los Angeles County Portion of Mojave Desert Air Basin Attainment Designation

Pursuant to the 1990 federal Clean Air Act (CAA) Amendments, the EPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for each criteria air pollutant, based on whether the National Ambient Air Quality Standards (NAAQS) have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as "attainment" for that pollutant. If an area exceeds the standard, the area is classified as "nonattainment" for that pollutant. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated as "unclassified" or "unclassifiable." The designation of "unclassifiable/attainment" means that the area meets the standard or is expected to meet the standard despite a lack of monitoring data. Areas that achieve the standards after a nonattainment designation are re-designated as maintenance areas and must have approved maintenance plans to ensure continued attainment of the standards. The California Clean Air Act, like its federal counterpart, called for the designation of areas as "attainment" or "nonattainment," but based on California Ambient Air Quality Standards (CAAQS) rather than the NAAQS. Table 1 depicts the current attainment status of the project area with respect to the NAAQS and CAAQS.

Table 1. Los Angeles County Portion of Mojave Desert Air Basin - Attainment Classification



Pollutant	Designation/Classification[a]	
	Federal Standards	State Standards
O_3 – 1 hour	No federal standard	**Nonattainment**
O_3 – 8 hours	**Severe nonattainment**	**Nonattainment**
NO_2	Unclassifiable/attainment	Attainment
CO	Unclassifiable/attainment	Attainment
SO_2	Unclassifiable/attainment	Attainment
PM_{10}	Unclassifiable	**Nonattainment**
$PM_{2.5}$	Unclassifiable/attainment	Attainment
Lead	Unclassifiable/attainment	Attainment
Hydrogen sulfide	No federal standard	Unclassified
Sulfates	No federal standard	Attainment
Visibility-reducing particles	No federal standard	Unclassified
Vinyl chloride	No federal standard	No designation

Sources: CARB 2023a (state); EPA 2025a (federal).
Definitions: attainment = meets the standards; attainment/maintenance = achieve the standards after a nonattainment designation; nonattainment = does not meet the standards; unclassified or unclassifiable = insufficient data to classify; unclassifiable/attainment = meets the standard or is expected to be meet the standard despite a lack of monitoring data.
Notes: O_3 = ozone; NO_2 = nitrogen dioxide; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.
[a] Designations/classifications in **bold** type indicate nonattainment.

In summary, the project site is located in an area of the MDAB that is designated as a nonattainment area for federal and state O_3 standards and the state PM_{10} standard, and unclassifiable/attainment for all other criteria air pollutants (CARB 2023a; EPA 2025a).

Despite the current nonattainment status for O_3 and PM_{10}, air quality in the MDAB has generally improved since the inception of air pollutant monitoring. This improvement is mainly a result of lower-polluting on-road motor vehicles, more stringent regulation of industrial sources, and the implementation of emission reduction strategies by the AVAQMD and nearby air districts including the Mojave Desert Air Quality Management District (MDAQMD) and the South Coast Air Quality Management District (SCAQMD), as well as CARB and EPA. This general trend toward cleaner air within the state, including the MDAB, has occurred in spite of continued population growth. **Error! Reference source not found.**Figure 4 and Figure 5 demonstrate the reduction in O_3 and PM_{10} over time, respectively.[3]

Ambient Air Quality Monitoring Data

CARB, air districts, and other agencies monitor ambient air quality at approximately 250 air quality monitoring stations across the state. The AVAQMD monitors local ambient air quality in the project area. Air quality monitoring stations usually measure pollutant concentrations 10 feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. The most recent background ambient air quality data from 2021 to 2023 are presented in Table 2. The Lancaster Division Street monitoring station, located at 43301 Division Street, Lancaster, California, is the nearest air quality monitoring station to the project site, and is located approximately 4.8 miles north of the project. However, monitoring at this station discontinued after 2022 and monitoring has since shifted to the Lancaster Fairgrounds monitoring station, located at 2551 W Avenue H, Lancaster, California, approximately 8.5 miles north of the project. The combined data available from these stations (year 2021 and 2022 from the Division Street station and year 2023 from the Fairgrounds station) are considered representative of the air quality experienced in the project vicinity. The number of days exceeding the AAQS is also shown in Table 2.

Table 2. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2021	2022	2023	2021	2022	2023

Sources: CARB 2025b; EPA 2025b.

Notes: ppm = parts per million by volume; — = not available; µg/m³ = micrograms per cubic meter; ND = insufficient data available to determine the value.

The Lancaster Division Street monitoring station is located at 43301 Division Street, Lancaster, California 93535.

The Lancaster Fairgrounds monitoring station is located at 2551 W Avenue H, Lancaster, California 93536.

Data taken from CARB represents the highest concentrations experienced over a given year.

Exceedances of national and California standards are only shown for O_3 and particulate matter. Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. There is no national standard for 1-hour O_3 or annual PM_{10}, nor is there a California 24-hour standard for $PM_{2.5}$.

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and every 1 to 3 days, respectively. Number of days exceeding the standards is a mathematical estimate of the number of days concentrations would have been greater than the level of the standard had each day been monitored. The numbers in parentheses are the measured number of samples that exceeded the standard.

2.2 Regulatory Setting

2.2.1 Federal

2.2.1.1 Criteria Pollutants

The federal CAA, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. The EPA is responsible for implementing most aspects of the CAA, including the setting of NAAQS for major air pollutants, hazardous air pollutant (HAP) standards, approval of state attainment plans, motor vehicle emission standards, stationary source emission standards and permits, acid rain control measures, stratospheric O_3 protection, and enforcement provisions.

NAAQS are established by the EPA for criteria pollutants under the CAA, which are O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead. The NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The CAA requires the EPA to reassess the NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare a state implementation plan (SIP) that demonstrates how those areas will attain the standards within mandated time frames.

2.2.1.2 Hazardous Air Pollutants

The 1977 CAA Amendments required the EPA to identify national emission standards for hazardous air pollutants to protect the public health and welfare. HAPs include certain volatile organic chemicals, pesticides, herbicides, and radionuclides that present a tangible hazard, based on scientific studies of exposure to humans and other mammals. Under the 1990 CAA Amendments, which expanded the control program for HAPs, 189 substances and chemical families were identified as HAPs.

2.2.2 State

2.2.2.1 Criteria Pollutants

The California Clean Air Act was adopted in 1988 and establishes the state's air quality goals, planning mechanisms, regulatory strategies, and standards of progress. Under the California Clean Air Act, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB is responsible for ensuring implementation of the California Clean Air Act, responding to the federal CAA, and regulating emissions from motor vehicles and consumer products. Pursuant to the authority granted to it, CARB has established CAAQS, which are generally more restrictive than the NAAQS.

The NAAQS and CAAQS are presented in Table 3.

Table 3. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	Primary[c,d]	Secondary[c,e]
O_3	1 hour	0.09 ppm (180 µg/m³)	—	Same as primary standard[f]
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	Same as primary standard
	Annual arithmetic mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None
	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)	
SO_2[h]	1 hour	0.25 ppm (655 µg/m³)	0.075 ppm (196 µg/m³)	—
	3 hours	—	—	0.5 ppm (1,300 µg/m³)
	24 hours	0.04 ppm (105 µg/m³)	0.14 ppm (for certain areas)[g]	—
	Annual	—	0.030 ppm (for certain areas)[g]	—
PM_{10}[i]	24 hours	50 µg/m³	150 µg/m³	Same as primary standard
	Annual arithmetic mean	20 µg/m³	—	
$PM_{2.5}$[i]	24 hours	—	35 µg/m³	Same as primary standard
	Annual arithmetic mean	12 µg/m³	9.0 µg/m³	15.0 µg/m³
Lead[j, k]	30-day average	1.5 µg/m³	—	—
	Calendar quarter	—	1.5 µg/m³ (for certain areas)[k]	Same as primary standard
	Rolling 3-month average	—	0.15 µg/m³	
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m³)	—	—
Vinyl chloride[j]	24 hours	0.01 ppm (26 µg/m³)	—	—
Sulfates	24- hours	25 µg/m³	—	—
Visibility reducing particles	8 hour (10:00 a.m. to 6:00 p.m. PST)	Insufficient amount to produce an extinction coefficient of 0.23 per kilometer due to the number of particles when the relative humidity is less than 70%	—	—

Source: CARB 2024i.

Notes: O_3 = ozone; ppm = parts per million by volume; μg/m³ = micrograms per cubic meter; NO_2 = nitrogen dioxide; CO = carbon monoxide; mg/m³= milligrams per cubic meter; SO_2 = sulfur dioxide; PM_{10} = particulate matter with an aerodynamic diameter less than or equal to 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter less than or equal to 2.5 microns.

[a] California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter (PM_{10}, $PM_{2.5}$), and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once per year. The O_3 standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 μg/m³ is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25°Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

[e] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[g] To attain the national 1-hour standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards, the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the national 1-hour standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[i] On February 7, 2024, the national annual $PM_{2.5}$ primary standard was lowered from 12.0 mg/m³ to 9.0 mg/m³. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 μg/m³, as was the annual secondary standard of 15 μg/m³. The existing 24-hour PM_{10} standards (primary and secondary) of 150 μg/m³ were also retained. The form of the annual primary and secondary standards is the annual mean averaged over 3 years.

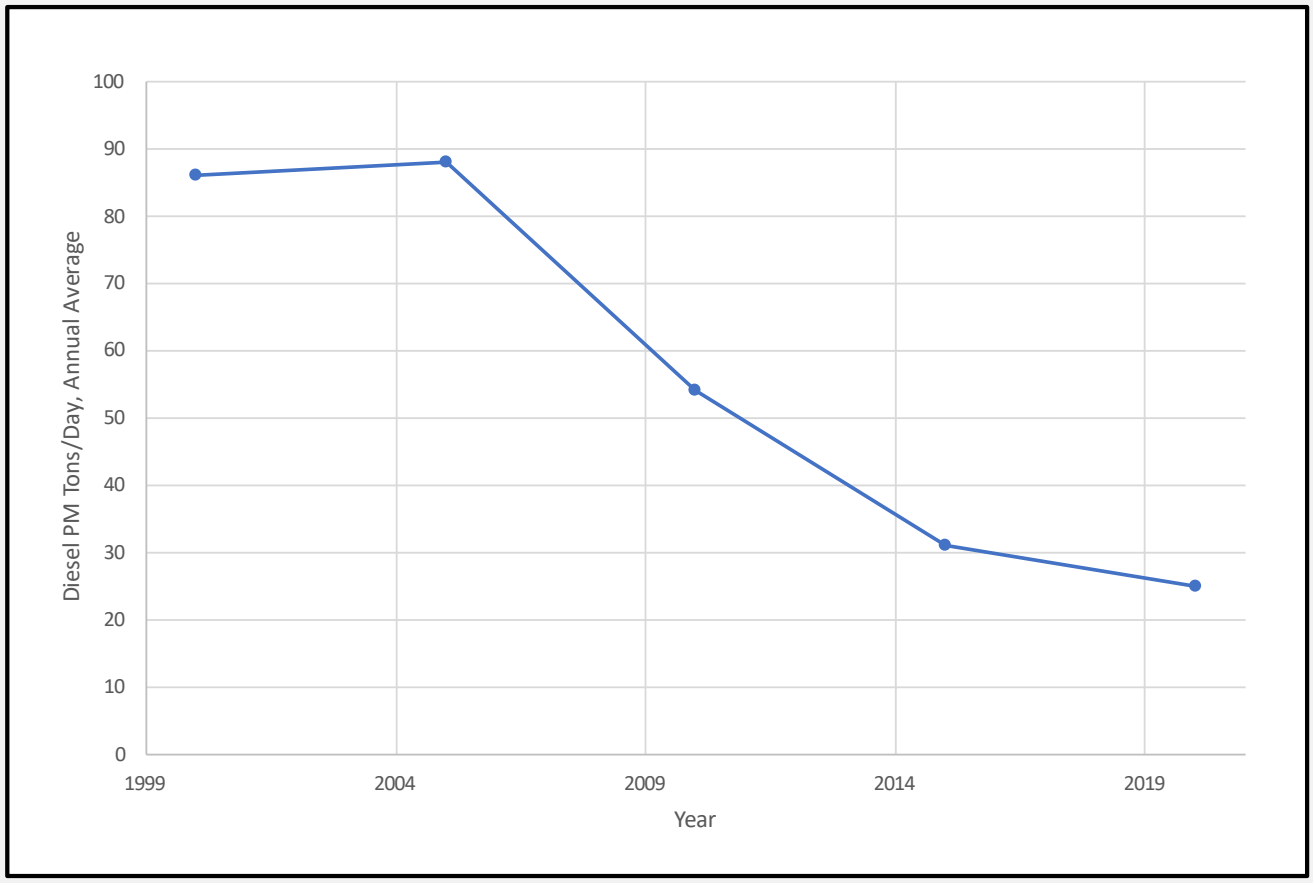
[j] CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[k] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 μg/m³ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

2.2.2.2 Toxic Air Contaminants

The state Air Toxics Program was established in 1983 under AB 1807 (Tanner). The California TAC list identifies more than 200 pollutants, of which carcinogenic and noncarcinogenic toxicity criteria have been established for a subset of these pollutants pursuant to the California Health and Safety Code. In accordance with AB 2728, the state list includes the (federal) HAPs. In 1987, the Legislature enacted the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) to address public concern over the release of TACs into the atmosphere. AB 2588 law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years. TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment (HRA), and if specific thresholds are exceeded, the facility operator is required to communicate the results to the public in the form of notices and public meetings.

In 2000, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines (CARB 2000). Additional regulations apply to new trucks and diesel fuel, including the On-Road Heavy Duty Diesel Vehicle (In-Use) Regulation, the On-Road Heavy Duty (New) Vehicle Program, the In-Use Off-Road Diesel Vehicle Regulation, and the New Off-Road Compression-Ignition (Diesel) Engines and Equipment program. These regulations and programs have timetables by which manufacturers must comply and existing operators must upgrade their diesel-powered equipment. CARB has adopted several Airborne Toxic Control Measures (ATCM) that reduce diesel emissions, including the following measures:



- Diesel Particulate Matter Control Measure for On-Road Heavy-Duty Diesel-Fueled Residential and Commercial Solid Waste Collection Vehicles (13 CCR 2020, 13 CCR 2021);
- ATCM for Diesel Particulate Matter from Portable Engines Rated 50 horsepower and greater (17 CCR 93116);
- ATCM for In-Use Diesel-Fueled Transport Refrigeration Units (TRU) and TRU Generator Sets, and Facilities where TRUs operate (13 CCR 2477 and Article 8);
- ATCM to limit diesel-fueled commercial motor vehicle idling (13 CCR 2485);
- ATCM for In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.);
- ATCM for In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

In 2013 CARB published the California Almanac of Emissions and Air Quality. The Almanac contains 20-year trend summaries of air quality and emissions data for five criteria pollutants: O_3, PM_{10}, CO, NO_2, and SO_2. Data are summarized for the State as a whole and for the five most populated air basins (South Coast, San Francisco Bay Area, San Joaquin Valley, San Diego, and Sacramento Valley). In addition to information on criteria pollutants, the Almanac provides information on air quality and emissions for DPM. Figure 6 provides a graphical depiction of the diesel particulate matter emissions trend for the State based on the CARB California Almanac of Emissions and Air Quality 2013 report (CARB 2013). As shown the trend of DPM is decreasing significantly since 2005 to year 2020, with 88 tons per day, annual average to 25 tons per day, annual average, respectively.

California Health and Safety Code Section 41700

This section of the Health and Safety Code states that a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or that endanger the comfort, repose, health, or safety of any of those persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property. This section also applies to sources of objectionable odors.

Figure 6. Statewide Diesel Particulate Matter Trends

Source: CARB 2013.

2.2.2.3 Assembly Bill 98

AB 98 (September 2024) imposes various statewide warehouse design and build standards for any proposed new or expanded logistics use developments, as specified, including, among other things, standards for building design and location, parking, truck loading bays, landscaping buffers, entry gates, and signage. The bill defines logistics use as a building in which cargo, goods, or products are moved or stored for later distribution to business or retail customers, or both, that does not predominantly serve retail customers for onsite purchases, and heavy-duty trucks are primarily involved in the movement of the cargo, goods, or products. AB 98 would prohibit a city or county from approving a logistics use development that does not meet or exceed the standards outlined in the bill. AB 98 will become effective on January 1, 2026. Notably, AB 98 will not apply to projects that have an application on file by September 30, 2024. Additionally, projects seeking approval between October 1, 2024 to January 1, 2026 and are on land that is already zoned industrial may be approved without having to meet AB 98 requirements. As the applicant submitted an application to the City of Palmdale before September 30, 2024, AB 98 does not apply to the proposed project.

2.2.3 Local

2.2.3.1 Antelope Valley Air Quality Management District

The AVAQMD is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in the Los Angeles County portion of the MDAB, where the project is located. The AVAQMD operates monitoring stations in the MDAB, develops rules and regulations for stationary sources and equipment, prepares emissions inventory and air quality management planning documents, and conducts source testing and inspections. The AVAQMD's air quality management plans include control measures and strategies to be implemented to attain state and federal AAQS in the MDAB. The AVAQMD then implements these control measures as regulations to control or reduce criteria pollutant emissions from stationary sources or equipment. The AVAQMD's most recent air quality plan is the *Federal 70 ppb Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)* (O_3 Attainment Plan) (AVAQMD 2023).

Applicable Rules. Emissions that would result from mobile, area, and stationary sources during construction and operation of the project are subject to the rules and regulations of the AVAQMD. The AVAQMD rules applicable to the project may include, but are not limited to, the following:

- **Rule 219 – Equipment Not Requiring a Permit:** The rule identifies equipment exempt from permit requirements of District Rules 201 and 203. District permit required for internal combustion engines with manufacturer's maximum continuous rating greater than or equal to 50 brake horsepower.
- **Rule 401 – Visible Emissions:** This rule establishes the limit for visible emissions from stationary sources.
- **Rule 402 – Nuisance:** This rule prohibits the discharge of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or that endanger the comfort, repose, health, or safety of any such persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property.
- **Rule 403 – Fugitive Dust:** Rule 403 includes requirements for a Dust Control Plan, signage, and fencing, as well as surface watering and stabilization with chemicals, gravel, and asphaltic pavement to minimize visible fugitive dust from vehicular travel, earthwork, and wind erosion.
- **Rule 442 – Usage of Solvents:** The purpose of this rule is to reduce VOC emissions from VOC-containing materials or equipment that is not subject to limits of any rule found in District Regulation XI – Source Specific Standards.
- **Rule 1113 – Architectural Coatings.** This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

2.2.3.2 Southern California Association of Governments

The Southern California Association of Governments (SCAG) is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SCAG serves as the federally designated metropolitan planning organization for the Southern California region and is the largest metropolitan planning organization in the United States.

With respect to air quality planning and other regional issues, SCAG has most recently developed Connect SoCal, the 2024–2050 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), which is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. Connect SoCal charts a path toward a more mobile, sustainable, and prosperous region by making connections between transportation networks, planning strategies, and the people whose collaboration can improve the quality of life for Southern Californians. Connect SoCal embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and interested parties within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. SCAG's 2024–2050 RTP/SCS was adopted on April 4, 2024 (SCAG 2024).

2.2.3.3 City of Palmdale General Plan

The Air Quality Element of the City's General Plan (*Palmdale 2045*) establishes goals and policies to protect and enhance air quality in the City. Additional goals and policies that would improve air quality are woven throughout the General Plan, including in the Circulation and Mobility, Equitable and Healthy Communities, Sustainability, Climate Action and Resilience Elements, among others (City of Palmdale 2023a). The following goals and policies from the Air Quality Element would be applicable to the project:

Circulation

Goal AQ-1. Minimize local air pollution caused by motor vehicles.

Policy AQ 1-1. **Reduced work-related trips**. Reduce the number and length of work-related trips through such means as providing a balance of jobs and housing in the community, promoting alternate work schedules, telecommuting, teleconferencing, company-sponsored ride-share and alternative fuel vehicle programs, use of commuter trains and other alternative modes of transportation to the workplace, creation of additional park and ride facilities, and improving the fiber optic network and connectivity.

Policy AQ 1-3. **Improve Traffic Flow**. Reduce vehicle emissions by maintaining and improving traffic flow per the Mobility Element.

Policy AQ 1-5. **Reduced Tailpipe Emissions**. As technology allows, reduce tailpipe emissions from City vehicles by replacing them with alternative fuel vehicles and encourage reduction of emissions from private vehicles through such means as reducing parking requirements and providing preferential parking for alternative fuel vehicles and bicycles.

Policy AQ 1-8. **Environmentally Review New Development**. Use the environmental review process for new development applications to assess and, as necessary, mitigate the impacts of new development related to increased vehicle miles traveled.

Policy AQ 1-9. **Encourage transit and bike use**. Provide incentives to residents who bike or use public transportation such as free or discounted public transit or employer-provided subsidies or reimbursements for residents willing to bike or use public transit.

Policy AQ 1-10. **Truck routes.** Restrict freight to certain routes and times by adopting rules and regulations that prohibit the use of trucks in certain areas within Palmdale.

Particulate Management

Goal AQ-2. Minimize particulates less than 10 microns in size (PM_{10}) and minimizes activities that generate dust.

Policy AQ 2-1. **Vegetative Stabilization.** Reduce roadway dust by requiring paving or vegetative stabilization of unpaved roads and parking lots.

Policy AQ 2-2. **Construction Site Requirements.** Require measures at construction sites to prevent deposition of soil onto public right-of-way.

Policy AQ 2-3. **Natural Contours.** Encourage developers to maintain natural contours to the greatest degree possible, to eliminate the need for extensive land clearing, blasting, ground excavation, grading and cut and fill operations.

Policy AQ 2-4. **Erosion and Dust Control Measures.** Require erosion and dust control measures for new construction, including covering soil with straw mats or use of chemical soil and dust binders during site grading, followed by hydroseeding and watering disturbed construction areas as soon as possible after grading to prevent fugitive dust.

Air Pollution Reduction

Goal AQ-3. Reduction and/or elimination of unnecessary sources of air pollution.

Policy AQ 3-1. **AVAQMD and Proven Technologies.** Promote the AVAQMD program to encourage local entities to install public electric vehicle charging stations to offer incentivize residents to purchase electric vehicles (e.g., vehicle buy-back program), and the Carl Moyer program, which aims to improve the local air quality by funding local, cost-effective projects to upgrade heavy-duty equipment (Gross Vehicle Weight Rating greater than 14,000 lbs.) using proven technologies.

Policy AQ 3-2. **Eliminate Emissions.** Promote the AVAQMD's efforts to eliminate emissions from such sources as excessive car dealership cold starts, excessive curb idling, emissions from advertising vehicles, and emissions from leaf blowers, among others, through assisting with implementation and enforcement of AVAQMD programs and rules.

Policy AQ 3-3. **Complete Streets.** Design a more effective street system by emphasizing complete streets which accommodate all modes of transportation.

Policy AQ 3-4. **Reduce Reactive Organic Gas.** Reduce reactive organic gas (ROG) and particulate emissions from building materials and construction methods, by promoting the use of nonsolvent-based, high-Solid, or water-based coatings, and requiring compliance with all pertinent AVAQMD rules.

Policy AQ 3-5. **Minimize Emissions.** Minimize emissions of toxic air contaminants that contribute to climate change and O_3 depletion, and that create potential health risks for residents, workers, and visitors.

Policy AQ 3-7. **Environmentally Review New Development Applications**. Through the environmental review process for new development applications, ensure that emissions of toxic air contaminants are minimized and that any significant health effects associated with such contaminants are appropriately mitigated.

Energy Consumption

Goal AQ-4. Reduce air pollution caused by energy consumption.

Policy AQ 4-1. **EPIC Participation**. Encourage residents and business owners to participate in Energy for Palmdale's Independent Choice (EPIC).

Policy AQ 4-2. **Energy Conservation**. Encourage energy conservation from all sectors of the community by promoting and/or requiring the use of energy efficient appliances, processes, and equipment, and promoting energy audits and retrofits of existing structures.

Policy AQ 4-3. **Recycling**. Require local government, Palmdale citizens, and local businesses and industries to recycle, as mandated by state law, and to otherwise recycle to the maximum extent possible in accordance with the requirements of the Palmdale Municipal Code.

Policy AQ 4-4. **Solar Energy**. Require new developments to minimize obstruction of direct sunlight for solar energy systems on adjacent properties.

2.3 Significance Criteria and Methodology

2.3.1 Thresholds of Significance

The State of California has developed guidelines to address the significance of air quality impacts based on Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.), which provides guidance that a project would have a significant environmental impact if it would:

A. Conflict with or obstruct implementation of the applicable air quality plan.
B. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
C. Expose sensitive receptors to substantial pollutant concentrations.
D. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Appendix G of the CEQA Guidelines indicates that, where available, the significance criteria established by the applicable air quality management district or pollution control district may be relied upon to determine whether the project would have a significant impact on air quality. As outlined in the AVAQMD *CEQA Air and Federal Conformity Guidelines* (CEQA Air Guidelines) (AVAQMD 2016), a project would result in a significant environmental impact if it:

1. Would generate total emissions (direct and indirect) in excess of the established significance thresholds (presented as Table 4)

2. Would generate a violation of any ambient air quality standard when added to the local background
3. Does not conform with the applicable attainment or maintenance plan[4]
4. Would expose sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a hazard index (non-cancerous) greater than or equal to 1

Residences, schools, daycare centers, playgrounds, and medical facilities are considered sensitive receptor land uses. The following project types proposed for sites within the specified distance to an existing or planned sensitive receptor land use must be evaluated using the AVAQMD Threshold 4 from above:

- any industrial project within 1,000 feet
- a distribution center (40 or more trucks per day) within 1,000 feet
- a major transportation project (50,000 or more vehicles per day) within 1,000 feet
- a dry cleaner using perchloroethylene within 500 feet
- a gasoline dispensing facility within 300 feet

The AVAQMD *CEQA Air and Federal Conformity Guidelines* sets forth quantitative emission significance thresholds for criteria air pollutants below which a project would not have a significant impact on ambient air quality (AVAQMD 2016). Project-related air quality emissions estimated in this environmental analysis would be considered significant if any of the applicable significance thresholds presented in Table 4 are exceeded. The emission-based thresholds for O_3 precursors are intended to serve as a surrogate for an "ozone significance threshold" (i.e., the potential for adverse O_3 impacts to occur) because O_3 itself is not emitted directly. AVAQMD recommends that its quantitative air pollution thresholds be used to determine the significance of project emissions.

Table 4. Antelope Valley Air Quality Management District Daily Air Quality Significance Thresholds

Pollutant	Daily Threshold (pounds per day)
VOC	137
NO_x	137
CO	548
SO_x	137
PM_{10}	82
$PM_{2.5}$	65
Hydrogen sulfide[a]	54
Lead[a]	3

Source: AVAQMD 2016.
Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.

[4] A project is deemed to not exceed this threshold, and hence not be significant, if it is consistent with the existing land use plan. Zoning changes, specific plans, general plan amendments and similar land use plan changes which do not increase dwelling unit density, do not increase vehicle trips, and do not increase vehicle miles traveled are also deemed to not exceed this threshold (AVAQMD 2016).

[a] The project includes typical equipment and on-road vehicles, which result in negligible (if any) emissions of hydrogen sulfide and lead. Therefore, these pollutants are not discussed in this analysis.

Regarding localized CO, although the AVAQMD does not have screening levels for intersection traffic that could result in potential CO hotspots, several other air districts have established these levels, which are described below to provide context of the magnitude of hourly volumes that could result in significant localized CO:

- The SCAQMD conducted CO modeling for its 2003 Air Quality Management Plan (SCAQMD 2003) for the four worst-case intersections in the South Coast Air Basin. At the time the 2003 Air Quality Management Plan was prepared, the intersection of Wilshire Boulevard and Veteran Avenue was the most congested intersection in Los Angeles County, with an average daily traffic volume of approximately 100,000 vehicles per day. Using CO emission factors for 2002, the peak modeled CO 1-hour concentration was estimated to be 4.6 ppm at the intersection of Wilshire Boulevard and Veteran Avenue. Accordingly, CO concentrations at congested intersections would not exceed the 1-hour or 8-hour CO CAAQS unless projected daily traffic would be at least more than 100,000 vehicles per day.
- The Bay Area Air Quality Management District (BAAQMD) determined that projects would result in a less-than-significant impact to localized CO concentrations if (1) project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour, or (2) project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway) (BAAQMD 2023).

Based on the project's proximity to the South Coast Air Basin, the SCAQMD screening criterion of 100,000 vehicles per day has been applied to this project as a metric to evaluate CO hotspots.

In addition to project-related emissions within the AVAQMD jurisdiction during operations, it is likely that a portion of the project's truck traffic would also traverse through neighboring air districts (i.e., those adjacent to AVAQMD), including San Joaquin Valley Air Pollution Control District (SJVAPCD), Eastern Kern Air Pollution Control District (EKAPCD), MDAQMD, and SCAQMD. As such, truck emissions within these neighboring districts were also considered and evaluated against the respective air district significance thresholds. Table 5 summarizes the thresholds of significance of the neighboring air districts for which the proportion of truck emissions during project operation was compared. Truck emissions above the respective air district thresholds would result in a potentially significant impact.

Table 5. Air Quality Significance Thresholds for Neighboring Air Districts

Pollutant	Threshold			
	SJVAPCD (tons per year)	EKAPCD (tons per year)	MDAQMD (pounds per day)	SCAQMD (pounds per day)
VOC	10	25	137	55
NO_x	10	25	137	55
CO	100	N/A	548	550
SO_x	27	N/A	137	150
PM_{10}	15	15	82	150
$PM_{2.5}$	15	N/A	65	55
Lead	N/A	N/A	3	3

Sources: SJVAPCD 2015a; EKAPCD 1999; MDAQMD 2020; SCAQMD 2023.
Notes: SJVAPCD = San Joaquin Valley Air Pollution Control District; EKAPCD = Eastern Kern Air Pollution Control District; MDAQMD = Mojave Desert Air Quality Management District; SCAQMD = South Coast Air Quality Management District; VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; N/A = not applicable because no threshold is established.

2.3.2 Approach and Methodology

The California Emissions Estimator Model (CalEEMod) Version 2022.1 was used to estimate emissions from construction and operation of the project (CAPCOA 2022). CalEEMod is a statewide computer model developed in cooperation with air districts throughout the state to quantify criteria air pollutant and GHG emissions associated with construction activities and operation of a variety of land use projects, such as residential, commercial, and industrial facilities. CalEEMod input parameters, including the land use type used to represent the project and its size, construction schedule, anticipated use of construction equipment, and on-road vehicles, were based on information provided by the project applicant and default model assumptions if project specifics were unavailable. Table 6 provides a summary of the land use inputs included in the CalEEMod modeling for construction and operation. See also Appendix A for detailed calculations.

Table 6. CalEEMod Land Use Development Summary for the Proposed Project

Project Component	CalEEMod Land Use Type	Land Use Amount (Size)	Land Use Size Metric	Building Square Footage	Landscaping Square Footage	Land Use Acreage
Unrefrigerated Warehouse	Unrefrigerated Warehouse – No Rail	750	ksf	750,000	298,043	34.09
Refrigerated Warehouse	Refrigerated Warehouse – No Rail	250	ksf	250,000	99,347	11.37
Parking Lot/ Circulation	Other Non-Asphalt Surfaces	21.64	ac	0	—	21.64
Off-Site Improvements	Other Asphalt Surfaces	8.03	ac	0	—	8.03

Source: Appendix A.
Notes: ac = acre, ksf = 1,000 square feet.

2.3.2.1 Construction

Emissions from the construction phase of the project were estimated using CalEEMod. As shown in Table 7, per preliminary project details, it is assumed that construction would begin in January 2026 and would be completed by June 2027. The construction schedule used in the analysis represents a "worst-case" analysis scenario since emission factors for construction equipment decrease as the analysis year increases due to improvements in technology and more stringent regulatory requirements. The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required pursuant to CEQA guidelines.

Table 7. Project Construction Schedule

Construction Phase	Start Date	End Date	Workdays
Site Preparation	1/1/2026	1/31/2026	22

Table 7. Project Construction Schedule

Construction Phase	Start Date	End Date	Workdays
Grading	2/1/2026	4/30/2026	64
Off-Site Improvements	4/1/2026	5/12/2026	30
Building Construction	5/1/2026	3/31/2027	239
On-Site Concrete	4/1/2027	5/31/2027	43
Architectural Coating	6/1/2027	6/30/2027	22

Source: Appendix A.

Table 8 provides the construction equipment mix and vehicle trips assumed for estimating project-generated construction emissions.

Table 8. Construction Scenario Assumptions

Construction Phase	Average Daily One-Way Vehicle Trips				Equipment		
	Workers	Vendors	Haul Trucks	On-Site Trucks	Equipment Type	Quantity	Daily Usage Hours
Site Preparation	20	10	20	30	Rubber Tired Dozers	3	8
					Tractors/Loaders/Backhoes	4	8
Grading	24	6	2	8	Excavators	2	8
					Graders	2	8

Table 8. Construction Scenario Assumptions

Construction Phase	Average Daily One-Way Vehicle Trips				Equipment		
	Workers	Vendors	Haul Trucks	On-Site Trucks	Equipment Type	Quantity	Daily Usage Hours
					Cement and Mortar Mixers	2	8
Architectural Coating	32	6	2	0	Air Compressors	2	8
					Aerial Lifts	2	8

Source: Appendix A.

Equipment horsepower, load factor, quantity, and usage hours, were based on CalEEMod default values when project specific information was not available. CalEEMod default trip length values were used for the distances for worker, vendor truck, and haul truck trips. The site would not require the import or export of earthwork materials as on-site material will be balanced during the grading phase. For the analysis, it was generally assumed that heavy-duty construction equipment would be operating at the site 5 days per week.

2.3.2.2 Operation

Project-generated operational criteria air pollutant emissions were estimated for mobile, area, energy, off-road, and stationary sources using CalEEMod. Operational year 2027 was assumed based on completion of construction.

Mobile Sources

The project would generate criteria pollutant emissions from mobile sources (vehicular traffic) as a result of the employee passenger vehicles (workers) and truck traffic associated with the operation of the warehouse.

Emissions from the mobile sources during operation of the proposed project were estimated in CalEEMod. The maximum daily trip rates, taken from the *Pacific Palmdale Center Traffic Impact Analysis* (TIA) (Translutions, Inc. 2025), were 1,581 primary trips per day (1,228 passenger vehicle trips and 353 truck trips), which were assumed 7 days per week. The truck breakdown by axle was also taken from the TIA prepared for the project.

To identify an appropriate trip length assumption for medium heavy-duty (MHDT) and heavy heavy-duty trucks (HHDT), the average truck trip length information was obtained from the StreetLight Data's Truck Volume Metrics for MHDTs (2 and 3 axle trucks) and HHDTs (4+ axle trucks), which were identified in a recent Environmental Impact Report (EIR) published for the *Antelope Valley Commerce Center Specific Plan Project* in Palmdale (City of Palmdale 2024). StreetLight Data's Truck Volume Metrics rely on five linked machine-learning models to estimate vehicle volume and trip length for various vehicle classes and total vehicles. As shown in Table 9, based on traffic monitoring available from StreetLight Data, the average weighted trip length was calculated as 65.05 miles.

Table 9. Streetlight-Based Operational Truck Trip Distance

Location	Average Trip Length by Vehicle Type				
	MHDT Avg Trip Length	MHDT% of Total	HHDT Avg Trip Length	HHDT% of Total	Weighted Average Trip Length
Palmdale	29.10	41.93%	91.00	58.07%	65.05

Source: City of Palmdale 2024.
Note: MHDT = medium heavy-duty truck; HHDT = heavy heavy-duty truck.
The truck trip lengths were based on data reported in the *Antelope Valley Commerce Center Specific Plan Project EIR* and weighted based on the proposed project's proportion of MHDT and HHDT to determine the weighted average trip length for the project.

Because StreetLight Data uses truck travel characteristics for a similar use in the same geographic area, the approximately 65-mile trip length is conservatively applied in this analysis to estimate truck emissions.

Project truck idling would be limited to 5 minutes in accordance with CARB's adopted Airborne Toxic Control Measure; however, for modeling purposes, it was conservatively assumed that the trucks would idle for a total of 15 minutes: 5 minutes at the entrance, 5 minutes at the loading dock, and 5 minutes at the exit of the project site.

Mobile Sources in Neighboring Air Districts

The analysis for the proposed project assumes all mobile source emissions are included in the project's criteria air pollutant emissions inventory prior to comparing emissions to the AVAQMD thresholds, which represents a conservative assumption because many of the heavy-duty trucks that CEQA forces the agency to assume are "caused" by the project are in fact already operating within the region due to existing goods movement patterns. Thus, in reality, speculative warehouse projects, such as the project, are not really causing the creation of all new truck trips but instead are diverting them to different points of distribution origin. Nevertheless, this analysis conservatively assumes that all truck trips assigned to the project are in fact "new" trips when in fact this is likely not the case. It is acknowledged that due to the conservative assumed trip length for project trucks that is set forth in this analysis, that portions of truck trips and associated mobile source emissions could possibly occur outside of the AVAQMD jurisdiction and within other air district jurisdictions and air basins. To provide a good faith analysis, an estimate of the proportion of potential traffic in the neighboring air district jurisdictions from the *Antelope Valley Commerce Center Specific Plan Project EIR* (City of Palmdale 2024) was also used for the proposed project. Table 10 shows the percentage of truck activity occurring in neighboring air districts. The truck activity percentage was applied to the mobile source emissions for trucks to estimate emissions within the other air districts and compared to their respective thresholds.

Table 10. Truck Activity by Air District

Air District	Truck Activity
Eastern Kern County Air Pollution Control District	13%
San Joaquin Valley Air Pollution Control District	12%
Mojave Desert Air Quality Management District	25%
South Coast Air Quality Management District	68%

Source: City of Palmdale 2024.

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating and water heating are calculated in the building energy use module of CalEEMod, as described in the following text.

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Other paint products, furniture coatings, or architectural coatings are not considered consumer products (CAPCOA 2022). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of nonresidential buildings and on the default factor of pounds of VOC per building square foot per day. For the asphalt surface land use, CalEEMod estimates VOC emissions associated with use of parking surface degreasers based on a square footage of parking surface area and pounds of VOC per square foot per day.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers using during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of nonresidential surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings, and AVAQMD's Rule 1113 (Architectural Coatings) governs the VOC content for interior and exterior coatings. The model default reapplication rate of 10% of area per year is assumed. Consistent with CalEEMod defaults, it is assumed that the nonresidential surface area for painting equals 2.0 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating (CAPCOA 2022).

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers. The emissions associated from landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of nonresidential building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days.

Energy Source Emissions

As represented in CalEEMod, energy sources include emissions associated with building electricity and natural gas usage. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for greenhouse gas emissions in CalEEMod, since criteria pollutant emissions would occur at the site of power plants, which are not on the project site. However, natural gas combustion would occur at the project site itself, in association with equipment that uses natural gas. Natural gas use is assumed per CalEEMod default values for warehouses.

Off-Road Equipment

It is common for industrial buildings to require cargo handling equipment to move empty containers and empty chassis to and from the various pieces of cargo handling equipment that receive and distribute containers. The most common type of cargo handling equipment are forklifts, pallet jacks, and yard trucks, which are designed for moving cargo containers. Yard trucks are also known as yard goats, utility tractors, hustlers, yard hostlers,

and yard tractors. Based on applicant provided input about reasonably foreseeable worst-case operating characteristics, on-site modeled operational diesel-fueled equipment includes a total of 50 forklifts operating at 24 hours a day for 365 days of the year.

Stationary Sources

The project would potentially operate one diesel-fueled 1,000-horsepower (hp) generator and one diesel-fueled 300-hp fire pump for emergency use. These stationary sources were assumed to operate two-hours a day for up to 50-hours a year for routine testing and maintenance.

Transport Refrigeration Units

The project's proposed warehouse is assumed to include up to 25% of cold storage warehouse space. Transport refrigeration units (TRUs) are designed to maintain the temperature inside delivery truck trailers. The emissions associated with TRU operation were estimated in a spreadsheet model using emission factors from CARB's OFFROAD2021 model. Each TRU was assumed to operate for a total of 4.84 hours per the OFFROAD average activity. Based on data from the project's TIA (Translutions, Inc. 2025), the project would generate 188 truck delivery trips per day[5] to the High-Cube Cold Storage building space, all of which were assumed be served by trucks with TRUs.

2.3.2.3 Health Risk Assessment

A quantitative HRA was performed to evaluate potential health risk at proximate sensitive receptors from the exposure to DPM emitted by off-road equipment and trucks during project construction and diesel-fueled forklifts, trucks, TRUs, and stationary sources during project operations. The following discussion summarizes the dispersion modeling and HRA methodology; supporting HRA documentation, including detailed assumptions, is presented in Appendix B.

As described previously, the AVAQMD has adopted a cancer risk threshold of 10 in a million (AVAQMD 2016), which indicates that a person has an additional risk of 10 chances in a million (0.001%) of developing cancer during their lifetime as a result of the air pollution scenario being evaluated. For context, the National Cancer Institute estimates that approximately 40.5% of people will be diagnosed with cancer during their lifetimes (National Cancer Institute 2024). A cancer risk of 10 in a million indicates that a person has an additional risk of 10 chances in a million (0.001%) of developing cancer during their lifetime as a result of the air pollution scenario being evaluated, which is minimal and defined as the "No Significant Risk Level" for carcinogens in Proposition 65. Additionally, some TACs increase noncancer health risk due to long-term (chronic) or short-term (acute) exposures. The Hazard Index is the sum of the individual substance chronic or acute hazard indices for all TACs affecting the same target organ system. The AVAQMD has also adopted a hazard index less than 1.0, below which indicates that people are not likely to experience any non-cancer health effects (AVAQMD 2016).

The HRA applies the methodologies prescribed in the Office of Environmental Health Hazard Assessment (OEHHA) document, *Air Toxics Hot Spots Program Risk Assessment Guidelines – Guidance Manual for Preparation of Health Risk Assessments* (OEHHA Guidance Manual) (OEHHA 2015). Cancer risk parameters, such as age-sensitivity

[5] TRUs were assumed for all trucks (LHDT1, LHDT2, MHDT, and HHDT) that transport cargo to the cold storage building portion of the project.

factors, daily breathing rates, exposure period, fraction of time at home, and cancer potency factors were based on the values and data recommended by OEHHA and are implemented in CARB's Hotspots Analysis and Reporting Program Version 2 (HARP2), which was used to estimate risk from project construction and operational activities.

The exhaust from diesel engines is a complex mixture of gases, vapors, and particles, many of which are known human carcinogens. For risk assessment purposes, PM_{10} in diesel exhaust is considered a proxy for DPM.[6] DPM has established cancer risk factors and relative exposure values for long-term chronic health hazard impacts. No short-term, acute relative exposure level has been established for DPM; therefore, acute impacts of DPM are not addressed in this assessment.

A dispersion modeling analysis was conducted of DPM from project construction and operations for the HRA to assess the health risk impacts on proximate existing off-site sensitive receptors. The dispersion modeling was performed using the American Meteorological Society/EPA Regulatory Model (AERMOD), which is the model AVAQMD requires for atmospheric dispersion of emissions. AERMOD is a steady-state Gaussian plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of surface and elevated sources, building downwash, and simple and complex terrain. Principal parameters of this modeling are presented in Table 11, with complete model results included as Appendix B.

Table 11. AERMOD Principal Parameters

Parameter	Details
Dispersion Model	The air dispersion model used was AERMOD Version 24142, with the Lakes Environmental Software implementation/user interface, AERMOD View, Version 13.0.0. Unit emission rates (1 gram per second [g/s]) were normalized for the sources input into the AERMOD run to obtain the X/Q values. X/Q is a dispersion factor that is the average effluent concentration normalized by source strength. It is used as a way to simplify the representation of emissions from many sources. The maximum concentrations were determined for the 1-hour and PERIOD averaging periods.
Meteorological Data	The latest 5-year meteorological data for the Palmdale Regional Airport station were obtained from CARB and used in the analysis as the most representative data set, based on surrounding terrain and proximity to the project.
Urban versus Rural Option	Urban areas typically have more surface roughness, as well as structures and low-albedo surfaces that absorb more sunlight—and thus more heat—relative to rural areas. Based on the land use procedure from 4.4.1 of the OEHHA Guidance Manual, the rural dispersion was appropriate for the project site (OEHHA 2015).
Terrain Characteristics and Elevation Data	Digital elevation model files were imported into AERMOD so that complex terrain features were evaluated as appropriate, and elevations were assigned to the emission sources and receptors. Digital elevation data were obtained through AERMOD View in the U.S. Geological Survey's National Elevation Dataset format with an approximately 1 arc-second resolution.
Emission Sources and Release Parameters	The following release parameters were based on the best information available at the time of analysis. <u>Construction:</u>

[6] Under California regulatory guidelines, DPM is used as a surrogate measure of carcinogen exposure for the mixture of chemicals that make up diesel exhaust as a whole. The California EPA is a proponent of using the surrogate approach to quantifying cancer risks associated with diesel exhaust over a component-based approach, which involves estimating risks for each of the individual components of a mixture. The California EPA has concluded that "potential cancer risk from inhalation exposure to whole diesel exhaust will outweigh the multi-pathway cancer risk from the speciated components" (OEHHA 2003).

Table 11. AERMOD Principal Parameters

Parameter	Details
	• Off-road equipment and trucks were modeled as a line of adjacent volume sources across the project site with a release height of 5 meters, a plume height of 10 meters, and plume width of 10 meters (SCAQMD 2008a). Operations: • Trucks were modeled as lines of adjacent volume sources along the anticipated haul routes and loading docks with a release height of 3.4 meters, a plume height of 6.8 meters, and plume width of 9 meters (EPA 2021). • For truck idling, line sources were placed at the loading docks with a release height of 3.4 meters, a plume height of 6.8 meters, and plume width of 3 meters (EPA 2021). • TRU operations were modeled as a line of adjacent volume sources along each side of the warehouse building with loading docks, with a release height of 3.9 meters, a plume height of 7.8 meters, and plume width of 3 meters (SJVAPCD 2007). • Diesel forklifts were modeled as a line of adjacent volume sources along each side of the warehouse building with loading docks, with a release height of 3.4 meters, a plume height of 6.8 meters, and plume width of 9 meters. • The 1,000-hp diesel generator was modeled as a point source with a capped vertical stack height of 3.08 meters, inside stack diameter of 0.19 meters, gas exhaust temperature of 747.59 Kelvin, and gas exhaust velocity of 1.68 cubic meters per second (SBCAPCD 2023). • The 300-hp diesel fuel pump was modeled as a point source with a capped vertical stack height of 2.50 meters, inside stack diameter of 0.13 meters, gas exhaust temperature of 772.59 Kelvin, and gas exhaust velocity of 0.86 cubic meters per second (SBCAPCD 2023).
Variable Emissions	Emissions were assumed to occur 8 hours per day, 5 days per week during construction. For operations, no variable emissions were accounted for (i.e., operations could occur 24 hours per day, 365 days per year).
Receptors	To evaluate off-site receptor exposure to DPM from project construction and operations, a nested grid was input with the following parameters: 20-meter spacing from 0 to 500 meters from the project site; 50-meter spacing from 500 to 1,000 meters from the project site; 100-meter spacing from 1,000 to 2,000 meters from the project site.

Source: EPA 2021; OEHHA 2015; SBCAPCD 2023; SCAQMD 2008a; SJVAPCD 2007. See also Attachment B for model outputs and parameters.
Notes: AERMOD = American Meteorological Society/EPA Regulatory Model; CARB = California Air Resources Board; OEHHA = Office of Environmental Health Hazard Assessment; DPM = diesel particulate matter; EPA = Environmental Protection Agency; hp = horsepower; SCAQMD = South Coast Air Quality Management District; SBCAPCD = Santa Barbara County Air Pollution Control District.
See Appendix B for complete model parameter inputs.

Dispersion model plotfiles from AERMOD and the corresponding emissions inventory were then imported into CARB's HARP2 to determine health risk from exposure to TAC emissions using the OEHHA Derived Method. Regarding pathways evaluated in HARP2, the mandatory minimum pathways were selected, which includes inhalation and additional pathways; however, inhalation is the only applicable pathway for DPM. Exposure was assumed to start during the 3rd trimester of pregnancy for residential uses, per OEHHA guidance (OEHHA 2015). The project's potential cancer and noncancer health impacts at the maximally exposed individual resident (MEIR) from the project sources were summed based on the following exposure parameters:

- On-Site Equipment and Trucks for Construction: exposure was assumed to begin in the 3rd trimester of pregnancy (assumed to be the worst-case scenario for cancer risk) for a duration of 1.5 years.
- All Operational Sources: exposure was assumed to begin at year 1.5 for a duration of 30 years, per the OEHHA Guidance Manual.

The following equations were used in HARP2 to calculate the cancer risk using the model output data and estimated TAC emissions (OEHHA 2015):

$$Cancer\ risk = DOSE * CPF * ASF * ED/AT * FAH,$$

$$DOSE = (C_{air} * DBR * A * EF * 10^{-6}),$$

$$C_{air} = ER * X/Q,$$

Where:

DOSE = daily inhalation dose (mg/kg-day),
CPF = cancer potency factor $(mg/kg\text{-}day)^{-1}$,
ASF = age sensitivity factor for a specified age group (unitless),
ED = exposure duration (in years) for a specified age group,
AT = averaging time for lifetime cancer risk (years),
FAH = Fraction of time spent at home (unitless),
C_{air} = average air concentration of TAC from the air dispersion model ($\mu g/m^3$),
DBR = daily breathing rate (L/kg body weight-day),
EF = exposure frequency (unitless), days/365 days,
A = inhalation absorption factor (unitless),
10^{-6} = micrograms to milligrams conversion, liters to cubic meters conversion,
ER = emission rates (grams/second),
X/Q = model output data $(\mu g/m^3)/(grams/second)$.

The chronic hazard quotients were calculated for TACs using the following equations as assumed in HARP2 (OEHHA 2015):

$$HQ_C = (C_{air} / REL),$$

Where:

HQ_C = chronic hazard quotient,
C_{air} = annual average concentration ($\mu g/m^3$),
REL = chronic reference exposure level ($\mu g/m^3$).

2.4 Impact Analysis

2.4.1 Would the project conflict with or obstruct implementation of the applicable air quality plan?

The AVAQMD develops and administers air quality plans to outline air pollution control programs for attaining all CAAQS and NAAQS. Currently, the most recent approved AVAQMD air quality plan is the *AVAQMD Federal 70 ppb Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)* (AVAQMD 2023). The AVAQMD Ozone Attainment Plan was developed to address the attainment of the 2015 national 8-hour O_3 ambient air quality standard (70 parts per billion). The AVAQMD Ozone Attainment Plan provides actions, strategies, and steps needed to reduce air pollutant emissions and meet the O_3 standard by 2033.

The purpose of a consistency finding is to determine if a project is inconsistent with the assumptions and objectives of the regional air quality plans, and thus if it would interfere with the region's ability to comply with federal and state air quality standards. A project is non-conforming with an air quality plan if it conflicts with or delays implementation of any applicable attainment or maintenance plan. A project is conforming if it complies with all applicable AVAQMD rules and regulations, complies with all proposed control measures that are not yet adopted from the applicable plan(s), and is consistent with the growth forecasts in the applicable plan(s) (or is directly included in the applicable plan). Zoning changes, specific plans, general plan amendments and similar land use plan changes that do not increase dwelling unit density, do not increase vehicle trips, and do not increase vehicle-miles traveled (VMT) are also deemed to comply with the applicable air quality plan (AVAQMD 2016).

The AVAQMD primarily uses demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by the SCAG for its RTP/SCS. This document is based on general plans for cities and counties within the SCAG jurisdiction, is used by AVAQMD to develop the air quality plan emissions inventory (AVAQMD 2023).[7] Connect SoCal and the associated Regional Growth Forecast are generally consistent with the local plans; therefore, the AVAQMD air quality plan is generally consistent with local government plans.

The project would be required to comply with all applicable AVAQMD Rules and Regulations, including, but not limited to Rules 401 (Visibile Emissions), 402 (Nuisance), and 403 (Fugitive Dust). The City's Zoning Map designates the project site as Light Industrial (LI) (City of Palmdale 2023b). According to Section 17.61 of the Palmdale Municipal Code, the primary purpose of the LI zone is to permit a variety of light industrial uses such as warehousing and distribution, sound stage/film production, storage, research and development, and the like. Table 17.65.020-1 in Section 17.65.020 of the Palmdale Municipal Code identifies indoor warehousing, storage, wholesaling, and distribution as permitted. As part of the City's site-plan review process, the City would thoroughly review all plans for the proposed project to ensure compliance with all applicable development standards set forth in the Municipal Code and other relevant land use plans, policies, and regulations. In addition, the City's General Plan Land Use Map designates the project site as Employment Flex (City of Palmdale 2023a). The Employment Flex land use is a transition zone intended to permit mixed development of lighter industrial uses and more intensive service, retail,

[7] Information necessary to produce the emissions inventory for the MDAB is obtained from AVAQMD and other governmental agencies, including the CARB, California Department of Transportation (Caltrans), and SCAG. Each of these agencies is responsible for collecting data (e.g., industry growth factors, socioeconomic projections, travel activity levels, emission factors, emission speciation profile, and emissions) and developing methodologies (e.g., model and demographic forecast improvements) required to generate a comprehensive emissions inventory. SCAG incorporates these data into its Travel Demand Model for estimating/projecting vehicle miles traveled and driving speeds.

and commercial uses. The maximum floor area ratio permitted within the Employment Flex designation is 1.0 (City of Palmdale 2023a). The proposed project would include construction of an industrial warehouse with a floor area ratio of 0.41. As such, the proposed project is consistent with the permitted land use and maximum density permitted by the City. Therefore, the project would be consistent with the current land use designation and General Plan and implementation of the project would not generate an increase in growth demographics that would conflict with existing projections within the region. Accordingly, the project is consistent with the SCAG RTP/SCS forecasts used in the AVAQMD air quality plan development.

Finally, as discussed below, the project's construction and operational emissions would would not exceed applicable AVAQMD regional thresholds after implementation of Mitigation Measure (MM)-AQ-1 through MM-AQ-7. As such, the project would not have the potential to increase the frequency or severity of a violation in the federal or state ambient air quality. The health effects of criteria air pollutants are discussed further under the next impact criterion.

Based on the preceding considerations, impacts associated with the conflicting with the AVAQMD air quality plans would be less than significant after mitigation.

Mitigation Measures

Implement MM-AQ-1 through MM-AQ-7.

Level of Significance After Mitigation

Impacts would be less than significant after mitigation.

2.4.2 Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development, and AVAQMD develops and implements plans for future attainment of ambient air quality standards. Based on these considerations, project-level thresholds of significance for criteria pollutants are relevant in the determination of whether a project's individual emissions would have a cumulatively significant impact on air quality.

Construction Emissions

Construction of the project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment and soil disturbance) and off-site sources (i.e., on-road haul trucks, vendor trucks, and worker vehicle trips). Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. Therefore, such emission levels can only be approximately estimated with a corresponding uncertainty in precise ambient air quality impacts.

Implementation of the project would generate criteria air pollutant emissions from entrained dust, off-road equipment, vehicle emissions, architectural coatings, and asphalt pavement application. Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. Internal combustion engines used by construction equipment, haul trucks, vendor trucks (i.e., delivery trucks), and worker vehicles would result in emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$. The application of architectural coatings, such as exterior application/interior paint and other finishes, and application of asphalt pavement would also produce VOC emissions.

As discussed in the Section 2.3.2.1, criteria air pollutant emissions associated with temporary construction activity were quantified using CalEEMod. CalEEMod calculates maximum daily emissions for summer and winter periods. The estimated maximum daily construction emissions without mitigation are summarized in Table 12. Detailed construction model outputs are presented in Appendix A.

Table 12. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions – Unmitigated

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
Summer						
2026	15.78	137.78	138.05	0.36	41.33	14.37
2027	280.33	14.59	18.42	0.02	4.80	1.21
Winter						
2026	14.71	129.02	124.13	0.34	38.97	13.78
2027	6.65	74.70	88.19	0.18	19.71	3.49
Maximum Daily Emissions	**280.33**	**137.78**	**138.05**	**0.36**	**41.33**	**14.37**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; AVAQMD= Antelope Valley Air Quality Management District.

As depicted in Table 12, emissions resulting from the project construction would exceed criteria pollutant thresholds established by the AVAQMD for VOC and NO_x emissions. This impact would be potentially significant without mitigation.

The estimated maximum daily construction emissions with mitigation are summarized in Table 13. Detailed construction model outputs are presented in Appendix A. MM-AQ-1 would be implemented to reduce the VOC impacts, which requires that the project shall utilize "Super-Compliant" low VOC paints which have been reformulated to exceed the regulatory VOC limits put forth by AVAQMD's Rule 1113. Super-Compliant low VOC paints shall be no more than 10 grams per liter (g/L) of VOC. Alternatively, the project applicant may utilize tilt-up concrete buildings that do not require the use of architectural coatings or limit the volume of Rule 1113 compliant interior and exterior building coatings to 126 gallons per day and 42 gallons per day, respectively. In addition, MM-AQ-2 would be implemented to reduce project-generated equipment exhaust, primarily by requiring use of 75 horsepower (hp) or greater equipment to have Tier 4 Final compliant engines, which are the cleanest engines currently available.

In addition, fugitive dust controls are included pursuant to AVAQMD requirements, as specified in MM-AQ-3. The effectiveness of MM-AQ-1 through MM-AQ-3 are quantified in the mitigated emissions estimate in Table 13.

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; AVAQMD= Antelope Valley Air Quality Management District.
Includes implementation of MM-AQ-1 through MM-AQ-3.

After implementation of MM-AQ-1 through MM-AQ-3, regional construction emissions would not exceed the applicable AVAQMD thresholds of significance for any criteria pollutant. Therefore, with the incorporation of mitigation, short-term impacts associated with a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment would be less than significant.

Long-Term Operational Impacts

Operation of the project would generate criteria pollutant emissions from area sources (consumer products, architectural coatings, landscaping equipment), energy sources (natural gas combustion for space and water heating), mobile sources (vehicular traffic), off-road equipment (diesel-fueled forklifts), stationary sources (diesel-fueled emergency generator and fire pump), and TRUs. Table 14 summarizes the unmitigated maximum daily operational emissions associated with the project. Detailed operational model outputs are presented in Appendix A.

As shown in Table 14, the project would exceed the numerical thresholds of significance established by the AVAQMD for emissions of NO_x. This impact would be potentially significant without mitigation.

Mitigation measures are required to minimize operational-related air quality impacts (MM-AQ-4 through MM-AQ-7). Most criteria air pollutants associated with the project operations are generated by diesel-fueled off-road forklifts, on-road vehicles, and stationary sources. MM-AQ-4 requires measures to minimize on-road vehicle emissions, including the provision of electric vehicle (EV) charging stations and electrical hook-ups for TRUs. MM-AQ-5 includes the requirement for all off-road forklifts and landscaping equipment to be zero-emission, which would reduce the long-term criteria air pollutant emissions substantially. In addition, MM-AQ-6 requires the emergency generator and fire pump to each have Tier 4 Final compliant engines and MM-AQ-7 requires the warehouse building to be all-electric (i.e., no natural gas). Table 15 summarizes the mitigated maximum daily operational emissions associated with the project. Detailed operational model outputs are presented in Appendix A.

AVAQMD Threshold	137	137	548	137	82	65
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Appendix A.
Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; AVAQMD = Antelope Valley Air Quality Management District; <0.01 = reported value less than 0.01.
Includes implementation of MM-AQ-4 through MM-AQ-7.

After implementation of MM-AQ-4 through MM-AQ-7, regional operational emissions would not exceed the applicable AVAQMD thresholds of significance for any criteria pollutant. Therefore, long-term impacts associated with a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment would be less than significant with mitigation.

Mobile Source Emissions in Neighboring Air Districts

As noted above in Section 2.3.2.2, the project's truck emissions have the potential to occur in neighboring air districts. Table 10, Truck Activity by Air District, provided the estimated truck activity by air district. The activity percentage was applied to the truck mobile source emissions to estimate potential air impacts within those air districts. Table 16 provides an estimate of the mobile source emissions within the neighboring air districts and compares those emissions to the respective district thresholds to determine the project's air quality impact.

As shown in Table 16, truck traffic associated with project operations would not result in exceedances of any air district thresholds.

Health Effects of Criteria Air Pollutants

The California Supreme Court's Sierra Club v. County of Fresno (2018) 6 Cal. 5th 502 decision (referred to herein as the Friant Ranch decision) (issued on December 24, 2018) addresses the need to correlate mass emission values for air pollutants to specific health consequences and contains the following direction from the California Supreme Court: "The Environmental Impact Report (EIR) must provide an adequate analysis to inform the public how its bare numbers translate to create potential adverse impacts or it must explain what the agency *does* know and why, given existing scientific constraints, it cannot translate potential health impacts further" (Italics in original) (Sierra Club v. County of Fresno 2018). The following discussion summarizes the detailed information within Appendix C, Health Effects of Criteria Air Pollutants.

There are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days. Currently, CARB and EPA have not approved a quantitative method to reliably, meaningfully, and consistently translate the mass emission estimates for the criteria air pollutants resulting from the project to specific health effects. Within the state, currently, only the Sacramento Metropolitan Air Quality Management District (SMAQMD) has established quantitative guidance (SMAQMD 2020); however, application of the SMAQMD screening analysis is not appropriate for the project because the project and associated emissions occur outside of the 5-Air-District Region evaluated in the SMAQMD screening analysis.

In connection with the judicial proceedings culminating in issuance of the Friant Ranch decision, the SCAQMD and the SJVAPCD filed amicus briefs attesting to the extreme difficulty of correlating an individual project's criteria air pollutant emissions to specific health impacts. Both SJVAPCD and SCAQMD have among the most sophisticated air quality modeling and health impact evaluation capabilities of the air districts in California. The key, relevant points from the SCAQMD and SJVAPCD briefs are summarized herein.

In requiring a health impact type of analysis for criteria air pollutants, it is important to understand how O_3 and PM are formed, dispersed, and regulated. The formation of O_3 and PM in the atmosphere, as secondary pollutants,[8] involves complex chemical and physical interactions of multiple pollutants from natural and anthropogenic sources. The O_3 reaction is self-perpetuating (or catalytic) in the presence of sunlight because NO_2 is photochemically reformed from nitric oxide. In this way, O_3 is controlled by both NO_x and VOC emissions (NRC 2005). The complexity of these interacting cycles of pollutants means that incremental decreases in one emission may not result in proportional decreases in O_3 (NRC 2005). Although these reactions and interactions are well understood, variability in emission source operations and meteorology creates uncertainty in the modeled O_3 concentrations to which downwind populations may be exposed (NRC 2005). Once formed, O_3 can be transported long distances by wind and due to atmospheric transport; contributions of precursors from the surrounding region can also be important (EPA 2008). Because of the complexity of O_3 formation, a specific tonnage amount of VOCs or NO_x emitted in a particular area does not equate to a particular concentration of O_3 in that area (SJVAPCD 2015b). PM can be divided into two categories: directly emitted PM and secondary PM. Secondary PM, like O_3, is formed via complex chemical reactions in the atmosphere between precursor chemicals such as SO_x and NO_x (SJVAPCD 2015b). Because of the complexity of secondary PM formation, including the potential to be transported long distances by wind, the tonnage of PM-forming precursor emissions in an area does not necessarily result in an equivalent concentration of secondary PM in that area (SJVAPCD 2015b). This is especially true for individual projects, like the project, where

[8] Air pollutants formed through chemical reactions in the atmosphere are referred to as secondary pollutants.

project-generated criteria air pollutant emissions are not derived from a single "point source," but from construction equipment and mobile sources (passenger cars and trucks) driving to, from, and around the project sites.

Another important technical nuance is that health effects from air pollutants are related to the concentration of the air pollutant that an individual is exposed to, not necessarily the individual mass quantity of emissions associated with an individual project. For example, health effects from O_3 are correlated with increases in the ambient level of O_3 in the air a person breathes (SCAQMD 2015). However, it takes a large amount of additional precursor emissions to cause a modeled increase in ambient O_3 levels over an entire region (SCAQMD 2015). The lack of link between the tonnage of precursor pollutants and the concentration of O_3 and $PM_{2.5}$ formed is important because it is not necessarily the tonnage of precursor pollutants that causes human health effects; rather, it is the concentration of resulting O_3 that causes these effects (SJVAPCD 2015b). Indeed, the ambient air quality standards, which are statutorily required to be set by EPA at levels that are requisite to protect the public health, are established as concentrations of O_3 and $PM_{2.5}$ and not as tonnages of their precursor pollutants (SJVAPCD 2015b). Because the ambient air quality standards are focused on achieving a particular concentration region-wide, the tools and plans for attaining the ambient air quality standards are regional in nature. For CEQA analyses, project-generated emissions are typically estimated in pounds per day or tons per year and compared to mass daily or annual emission thresholds. While CEQA thresholds are established at levels that the air basin can accommodate without affecting the attainment date for the ambient air quality standards, even if a project exceeds established CEQA significance thresholds, this does not mean that one can easily determine the concentration of O_3 or PM that will be created at or near the project site on a particular day or month of the year, or what specific health impacts will occur (SJVAPCD 2015b).

In regard to regional concentrations and air basin attainment, SJVAPCD emphasized that attempting to identify a change in background pollutant concentrations that can be attributed to a single project, even one as large as the entire Friant Ranch Specific Plan,[9] is a theoretical exercise. The SJVAPCD brief noted that it "would be extremely difficult to model the impact on NAAQS attainment that the emissions from the Friant Ranch project may have" (SJVAPCD 2015b). The situation is further complicated by the fact that background concentrations of regional pollutants are not uniform either temporally or geographically throughout an air basin but are constantly fluctuating based upon meteorology and other environmental factors. SJVAPCD noted that the currently available modeling tools are equipped to model the impact of all emission sources in the San Joaquin Valley Air Basin on attainment (SJVAPCD 2015b). The SJVAPCD brief then indicated that "[r]unning the photochemical grid model used for predicting O_3 attainment with the emissions solely from the Friant Ranch project (which equate to less than one-tenth of one percent of the total NO_x and VOC in the Valley) is not likely to yield valid information given the relative scale involved" (SJVAPCD 2015b).

SCAQMD and SJVAPCD have indicated that it is not feasible to quantify project-level health impacts based on existing modeling (SCAQMD 2015; SJVAPCD 2015b). Even if a metric could be calculated, it would not be reliable because the models are equipped to model the impact of all emission sources in an air basin on attainment and would likely not yield valid information or a measurable increase in O_3 concentrations sufficient to accurately quantify O_3-related health impacts for an individual project.

[9] The Friant Ranch Specific Plan proposed 2,683 single-family age-restricted units, 83 multifamily age-restricted units, 180 non-age-restricted multifamily units, and 250,000 square feet of commercial village within a Village Core that also provides for up to 50 residential units on approximately 942 acres.

Nonetheless, following the Supreme Court's Friant Ranch decision, some EIRs where estimated criteria air pollutant emissions exceeded applicable air district thresholds have included a quantitative analysis of potential project-generated health effects using a combination of a regional photochemical grid model[10] and the EPA Benefits Mapping and Analysis Program (BenMAP or BenMAP–Community Edition [CE]).[11] The publicly available health impact assessments (HIAs) typically present results in terms of an increase in health incidences and/or the increase in background health incidence for various health outcomes resulting from the project's estimated increase in concentrations of O_3 and $PM_{2.5}$.[12] To date, the six publicly available HIAs reviewed herein have concluded that the evaluated project's health effects associated with the estimated project-generated increase in concentrations of O_3 and $PM_{2.5}$ represent a small increase in incidences and a very small percent of the number of background incidences, indicating that these health impacts are negligible and potentially within the models' margin of error. It is also important to note that while the results of the six available HIAs conclude that the project emissions do not result in a substantial increase in health incidences, the estimated emissions and assumed toxicity is also conservatively inputted into the HIA and thus, overestimate health incidences, particularly for $PM_{2.5}$.

The SMAQMD's Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District (SMAQMD 2020) included an approach for analyzing individual projects in addition to the screening tools for minor projects and strategic area project. The analysis of individual projects guidance states that "In order to estimate the health effects of the increases of criteria pollutants for a proposed project, practitioners should apply a PGM to estimate the increases in concentrations of ozone and $PM_{2.5}$ in the region as a result of the emissions of criteria and precursor pollutants from a project. Next apply the U.S. EPA-authored program, the Benefits Mapping and Analysis Program (BenMAP2), to estimate the resulting health effects from the increases in concentration" (SMAQMD 2020). The SMAQMD guidance outlines the same or similar approach taken in the six available HIAs noted above, which as explained herein, has not produced meaningful information for the public.

The BAAQMD released qualitative health effects assessment for criteria air pollutants guidance to address the Friant Ranch case as part of their 2022 CEQA Guidelines. The Bay Area AQMD guidance states that, "use of these [photochemical grid-based] models is typically beyond the resources available for air quality analysis prepared pursuant to CEQA, and even if such an analysis was to be completed consideration would need be given to ensure the results would be meaningful based on modeling and data limitations" (BAAQMD 2023). The BAAQMD guidance also states that, "data applicability should be considered to determine whether the model [BenMAP] may be

10 The first step in the publicly available HIAs includes running a regional photochemical grid model, such as the Community Multiscale Air Quality model or the Comprehensive Air Quality Model with extensions to estimate the increase in concentrations of O_3 and $PM_{2.5}$ as a result of project-generated emissions of criteria and precursor pollutants. Air districts, such as SCAQMD, use photochemical air quality models for regional air quality planning. These photochemical models are large-scale air quality models that simulate the changes of pollutant concentrations in the atmosphere using a set of mathematical equations characterizing the chemical and physical processes in the atmosphere (EPA 2024b).

11 After estimating the increase in concentrations of O_3 and $PM_{2.5}$, the second step in the six examples includes use of BenMAP or BenMAP-CE to estimate the resulting associated health effects. BenMAP estimates the number of health incidences resulting from changes in air pollution concentrations (EPA 2023). The health impact function in BenMAP-CE incorporates four key sources of data: (i) modeled or monitored air quality changes, (ii) population, (iii) baseline incidence rates, and (iv) an effect estimate. All of the five example HIAs focused on O_3 and $PM_{2.5}$.

12 The following CEQA documents included a quantitative HIA to address Friant Ranch: (1) World Logistics Center Revised Final EIR (City of Moreno Valley 2019), (2) March Joint Powers Association K4 Warehouse and Cactus Channel Improvements EIR (March JPA 2019), (3) Mineta San Jose Airport Amendment to the Airport Master Plan EIR (City of San Jose 2019), (4) City of Inglewood Basketball and Entertainment Center Project EIR (City of Inglewood 2019), (5) San Diego State University Mission Valley Campus Master Plan EIR (SDSU 2019), and (6) California State University Dominguez Hills 2018 Campus Master Plan EIR (CSU Dominguez Hills 2019).

appropriate for an air quality analysis prepared pursuant to CEQA and if such an analysis would provide meaningful results based on modeling and data limitations" (BAAQMD 2023).

As explained in the SJVAPCD brief and noted previously, running the photochemical grid model used for predicting O_3 attainment with the emissions solely from an individual project like the Friant Ranch project or the proposed project is not likely to yield valid information given the relative scale involved. The six examples reviewed support the SJVAPCD brief's contention that consistent, reliable, and meaningful results may not be provided by methods applied at this time and BAAQMD's caution to provide meaningful information to the public. Accordingly, additional work in the industry and more importantly, air district participation, is needed to develop a more meaningful analysis to correlate project-level mass criteria air pollutant emissions and health effects for decision makers and the public. Furthermore, at the time of writing, no HIA has concluded that health effects estimated using the photochemical grid model and BenMAP approach are substantial provided that the estimated project-generated incidences represent a very small percent of the number of background incidences, potentially within the models' margin of error. In addition, as depicted in Table 17 below, the mitigated project would result in substantially fewer daily emissions than any of the projects with HIA analyses, and would, therefore, likely result in even fewer potential health effects than the minimal increase in health incidences of these other projects. Nonetheless, further evaluation of project-generated criteria air pollutant emissions and associated health effects is provided below.

Table 17. Emission Comparison – Proposed Project versus Projects with Health Impact Assessments

Analysis	VOC	NO_x	SO_x	$PM_{2.5}$
	Pounds per Day			
Pacific Palmdale Center Project	29.13	59.93	0.67	8.89
California State University Dominguez Hills 2018 Campus Master Plan EIR	482.6	240.1	2.7	79.5
World Logistics Center Revised Final EIR	495	1,459	10	133
March Joint Powers Association K4 Warehouse and Cactus Channel Improvements EIR	41	253	1.4	30.3
San Diego State University Mission Valley Campus Master Plan EIR	314.1	1,120.7	6.5	205.9
Mineta San Jose Airport Amendment to the Airport Master Plan EIR	57.3	5,643.0	N/A	51.6
City of Inglewood Basketball and Entertainment Center Project EIR	94	99	3	89

Notes: EIR = Environmental Impact Report; VOC = volatile organic compound; NO_x = oxides of nitrogen; SO_x = sulfur oxides; $PM_{2.5}$ = fine particulate matter; N/A = not available.

As discussed in Section 2.1.2.1, health effects associated with O_3 include respiratory symptoms, worsening of lung disease leading to premature death, and damage to lung tissue. VOCs and NO_x are precursors to O_3 and the contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations due to O_3 precursor emissions tend to be found downwind of the source location because of the time required for the photochemical reactions to occur. Further, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur, because exceedances of the O_3 NAAQS and CAAQS tend to occur between April and October when solar radiation is highest. As described above, due to the lack of quantitative methods to assess this complex photochemistry, determining the holistic effect of a single project's emissions of O_3 precursors is not scientifically possible at this time. ("[I]f it is not scientifically possible to do more than has already been done to connect air quality effects with potential human health impacts, the EIR itself must explain why, in a manner reasonably calculated to inform the public of the scope

of what is and is not yet known about the project's impacts." Sierra Club v. County of Fresno 2018.). That being said, the proposed project would not exceed the MDAQMD thresholds of VOC or NO_x during construction or operations after implementation of mitigation. Therefore, implementation of the project would contribute minimally to regional O_3 concentrations and the associated health effects.

Health effects associated with NO_x and NO_2 (which is a constituent of NO_x) include lung irritation and enhanced allergic responses (see Section 2.1.2.1). Because the project would not exceed the AVAQMD NO_x thresholds after mitigation, the project would not contribute to significant health effects associated with NO_x and NO_2.

Health effects associated with CO include chest pain in patients with heart disease, headache, light-headedness, and reduced mental alertness (see Section 2.1.2.1). CO tends to be a localized impact associated with congested intersections. The potential for CO hotspots is discussed under Section 2.4.3 below and determined to be less than significant. Thus, the project's CO emissions would not contribute to significant health effects associated with CO.

Health effects associated with PM_{10} and $PM_{2.5}$ include premature death and hospitalization, primarily for worsening of respiratory disease (see Section 2.1.2.1). Construction and operation of the proposed project would not exceed the AVAQMD threshold for PM_{10}. As such, the project would not contribute to exceedances of the NAAQS and CAAQS for particulate matter and obstruct the MDAB from coming into attainment for these pollutants or result in associated health effects.

While the above scientific and technological constraints present considerable doubt that quantifying health effects for individual CEQA projects may not accurately and meaningfully inform the public of how proposed project-generated bare numbers (i.e., estimated criteria air pollutant emissions) translate to create potential adverse health effects, additional analysis is presented below.

The EPA CO–Benefits Risk Assessment (COBRA) screening model was used to estimate the potential health effects of the project based on the emissions of air pollutants (EPA 2024c). The analysis year of 2023 was selected in COBRA as the closest baseline year to project operations. In addition, Los Angeles County was selected based on the project location. To support this CEQA evaluation, the national level change in incidents rate was not included. A discount rate of 2% was selected as it is the default.[13] COBRA assumes changes in adult mortality and non-fatal heart attacks occur over a 20-year period.

Annual emissions are input into COBRA, and the emissions estimated using the methodologies described in Section 3.3.2 above. Specifically, as depicted in Appendix A, the mitigated proposed project increase in operational emissions would be 5.12 tons per year of VOC, 10.61 tons per year of NO_x, 0.12 tons per year of SO_x, and 1.59 tons per year of $PM_{2.5}$. O_3 and $PM_{2.5}$ related health outcomes attributed to project-related increases in ambient air concentrations included asthma-related emergency room visits (0.000 incidences per year), lung cancer incidence (0.006 incidences per year), all cardiovascular-related emergency room visits (0.022 incidences per year), all respiratory-related hospital admissions (0.013 incidences per year), nonfatal heart attacks (0.052 incidences per year), and total mortality (up to 0.086 incidences). Notably, COBRA's incidence values refer to the number of new cases of a health outcome over a specified time period. For context, between 2020-2022, the CDPH reported that

[13] The discount rate applies to the monetary implications, rather than health effects, evaluated in COBRA. COBRA uses a discount rate to express future economic values in present terms because not all health effects and associated economic values occur in the year of analysis.

Los Angeles County had an annual average of approximately 79,820 mortalities from all causes and an age-adjusted death rate of 650.5 mortalities per 100,000 population (CDPH 2024).

In summary, there are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days, and methods available to quantitatively evaluate health effects may not be appropriate to apply to emissions concentrations associated with the project, which cannot be estimated with a high-level of accuracy. Nonetheless, additional information is provided to support impact conclusions and to explain what is known and what is not given constraints. Overall, as the project would not result in exceedances of the AVAQMD significance thresholds after mitigation, and because the AVAQMD thresholds are based on levels that the MDAB can accommodate without affecting the attainment date for the AAQS and the AAQS are established to protect public health and welfare, the proposed project is not anticipated to result in health effects associated with NO_X, VOCs, CO, SO_X, PM_{10}, or $PM_{2.5}$. The potential health effects associated with criteria air pollutants are considered less than significant with mitigation.

See also Appendix C for a detailed discussion of health effects of project-generated criteria air pollutant emissions.

Mitigation Measures

Construction

MM-AQ-1 **Architectural Coating Requirements.** The project shall utilize "Super-Compliant" low-volatile organic compound (VOC) paints which have been reformulated to exceed the regulatory VOC limits put forth by Antelope Valley Air Quality Management District's (AVAQMD's) Rule 1113. Super-Compliant low VOC paints shall be no more than 10 grams per liter (g/L) of VOC. Alternatively, the project applicant shall utilize tilt-up concrete buildings that do not require the use of architectural coatings or limit the volume of Rule 1113 compliant interior and exterior building coatings to 126 gallons per day and 42 gallons per day, respectively.

MM-AQ-2 **Heavy-Duty Off-Road Construction Equipment Requirements/Restrictions.** The following measures shall be implemented to reduce off-road equipment exhaust during construction:

- During project construction, all internal combustion engines/construction equipment greater than 75 horsepower operating on the project site shall meet U.S. Environmental Protection Agency (EPA)-compliant Tier 4 Final emissions standards. The project applicant or successor in interest shall include this requirement in applicable bid documents, purchase orders, and contracts with successful contractors. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground-disturbing and construction activities. An exemption from these requirements may be granted by the City of Palmdale in the event that the project applicant or successor in interest documents that equipment with the required tier is not reasonably available and corresponding reductions in criteria air pollutant emissions and diesel particulate matter emissions are achieved from other means, such as using construction equipment with a combination of different tier ratings and/or by making adjustments in the number of pieces of simultaneously operating equipment or the duration of daily use, to ensure that AVAPCD daily emission thresholds are not exceeded. Before an exemption may be considered by the City of Palmdale, the project applicant or successor in interest shall be required to demonstrate that at least two construction fleet

owners/operators in the air basin were contacted and that those owners/operators confirmed Tier 4 Final compliant equipment could not be feasibly obtained within the air basin for use on the project site.

- After the grading phase of project construction, and pursuant to permission from the utlity provider, the project applicant or successor in interest shall provide temporary electrical hook ups to the power grid, rather than diesel-fueled generators, for contractors' electric construction tools, such as saws, drills and compressors. The use of diesel-fueled generators for on-site construction activities shall be prohibited unless electrical infrastructure is not yet available on the project site. Diesel-fueled generators may be used for off-site construction work. All off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers) used during project construction must be electric-powered. The project applicant or successor in interest shall include these requirements in applicable bid documents, purchase orders, and contracts with successful contractors.
- The idling of heavy construction equipment for more than 5 minutes shall be prohibited. Signage shall be posted throughout the construction site informing construction personnel of the idling time limit. Idling time limits shall be noted in construction specifications.

MM-AQ-3 **Dust Control Measures.** In compliance with all applicable Rules and Regulations of the AVAQMD, including, but not limited to Rules 401 (Visible Emissions), 402 (Nuisance), and 403 (Fugitive Dust). To ensure compliance with these Rules and Regulations, the project applicant or successor in interest shall prepare and submit a Dust Control Plan to the AVAQMD for approval. The Dust Control Plan shall document the best management practices (BMPs) that will be implemented during project construction to prevent, to the maximum extent practicable, wind and soil erosion. BMPs that will be included in the Dust Control Plan shall include, but are not limited to, covering soil stockpiles when not in use, application of water or soil stabilizers to all disturbed areas so that no visible fugitive dust leaves the property line, and limiting vehicle speeds on unpaved roads to 25 miles per hour or less. On days when the hourly average wind speed for the project site exceeds 20 miles per hour, additional dust control measures shall be implemented, such as increased surface watering. Grading and excavation shall be prohibited when sustained wind speed exceeds 30 miles per hour.

Operations

MM-AQ-4 **Mobile Source Emission Minimization.** The project applicant or successor in interest shall implement the following measures to reduce operational mobile source air pollutant emissions to the extent feasible:

- Prior to issuance of a Certificate of Occupancy, Level 2 (or faster) electric vehicle (EV) charging stations shall be installed on-site for employees for the percentage of employee parking spaces commensurate with Title 24 requirements in effect at the time of building permit application. In addition, the building shall include accommodations for electrical infrastructure sufficiently sized to facilitate the potential installation of additional auto and truck EV charging stations in the future.

- Conduit shall be installed to tractor trailer parking areas in logical locations determined by the project applicant during construction document plan check, for the purpose of accommodating the future installation of EV truck charging stations.
- All loading docks serving cold and/or refrigerated space shall have electrical hook-ups for transport refrigeration units (TRUs).
- Provide tenants with information regarding funding opportunities that provide incentives for using cleaner-than-required engines and equipment, such as the Carl Moyer Program and Voucher Incentive Program, as well as the EPA SmartWay Program, which assists freight shippers, carriers, logistics companies, and other stakeholder partner with the EPA to measure, benchmark, and improve logistics operations and reduce air pollutant emissions from the transport of cargo.
- For occupants with more than 250 employees, a Transportation Demand management (TDM) Program to reduce employee commute vehicle emissions shall be established, subject to review and approval by the City of Palmdale. The Transportation Demand Management Plan shall apply to project tenants through tenant leases. The TDM plan shall discourage single-occupancy vehicle trips and encourage alternative modes of transportation such as carpooling, taking transit, walking, and biking.
- Upon commencement of operations, the tenant/operator of the project shall be required to post signs restricting truck idling onsite to a maximum of three (3) minutes, subject to exceptions defined by the California Air Resources Board's commercial vehicle idling requirements. The building manager or their designee shall be responsible for enforcing this requirement.

MM-AQ-5 **Zero-Emission Equipment.** The following measure shall be implemented during all ongoing business operations and shall be included as part of contractual lease agreement language to ensure that tenants and operators of the project are informed of the following operational responsibility:

- All equipment and appliances operating on the project site other than emergency generators and pumps shall be zero-emission equipment. This requirement shall apply to indoor and outdoor equipment such as forklifts, handheld landscaping equipment, yard trucks, and office appliances. The building shall include the necessary charging stations or other necessary infrastructure for cargo handling equipment and shall be equipped with outdoor electric outlets in appropriate locations to facilitate use of electrical lawn and garden equipment The building manager or their designee shall be responsible for enforcing these requirements.

MM-AQ-6 **Stationary Source Emission Minimization.** Any diesel-fueled emergency generators and fire pumps to be installed at the project site shall be equipped with Tier 4 Final compliant engines.

MM-AQ-7 **All-Electric Building.** The building shall be 100% electric powered and the use of natural gas for building operations shall be prohibited.

Level of Significance After Mitigation

Impacts would be less than significant after implementation of mitigation.

2.4.3 Would the project expose sensitive receptors to substantial pollutant concentrations?

The potential impact of project-generated air pollutant emissions at sensitive receptors has been considered. As described in Section 2.1.3, the nearest sensitive receptors to the project are existing residences as close as 45 feet to the west (along Division Road) of roadway configuration construction, about 110 feet to the south (across W Rancho Vista Boulevard) of the project boundary, and along the project's haul routes. Distances from these sensitive receptors to the project's nearest proposed project's loading docks are 620 feet northwest and 460 feet south, respectively.

Local Carbon Monoxide Concentrations

Mobile source impacts occur on two scales of motion. Regionally, project-related travel would add to regional trip generation and increase VMT within the local airshed and the MDAB. Locally, project-generated traffic would be added to the roadway system near the project site. If such traffic occurs during periods of poor atmospheric ventilation, is composed of a large number of vehicles "cold-started" and operating at pollution-inefficient speeds, and operates on roadways already crowded with non-project traffic, there is a potential for the formation of microscale CO hotspots in the area immediately around points of congested traffic. However, because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the MDAB is steadily decreasing.

The AVAQMD thresholds of significance for local CO emissions is the 1-hour and 8-hour CAAQS of 20 ppm and 9 ppm, respectively. By definition, these represent levels that are protective of public health. As noted previously, the MDAB is currently designated attainment for both state and national CO ambient air quality standards, and the City of Palmdale typically experiences low background CO concentrations.

As described in Section 2.3.1, to verify that the proposed project would not cause or contribute to a violation of the CO standard, a screening evaluation was conducted comparing the highest hourly traffic volumes at any studied intersection in proximity to the project site to the 100,000 vehicles per day criterion from the SCAQMD Air Quality Management Plan (SCAQMD 2003). The highest average daily trips with project vehicles would be less than 60,000 daily trips (Sierra Highway and W Rancho Vista Blvd intersection) (Translutions, Inc. 2025), which would be substantially less than the 100,000 vehicles per day screening criterion applied. Therefore, impacts associated with CO hotspots would be less than significant.

Toxic Air Contaminant Exposure

As discussed in Section 2.3.2.3, an HRA was performed to estimate the Maximum Individual Cancer Risk and the Chronic Hazard Index for existing residential receptors as a result of project construction and operations. Results of the construction HRA without mitigation are presented in Table 18 at the MEIR, which would be located directly south, across W Rancho Vista Boulevard, of the project site.

Table 18. Health Risk Assessment Results – Unmitigated

Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Maximum Individual Cancer Risk – MEIR	Per Million	105.01	10	**Potentially Significant**
Chronic Hazard Index – MEIR	Index Value	0.040	1.0	Less than Significant

Source: Appendix B.
Note: CEQA = California Environmental Quality Act; MEIR = maximally exposed individual resident.

As shown in Table 18, the DPM emissions from short-term construction plus long-term operations of the project would result in a Maximum Individual Cancer Risk of about 105 in 1 million and a Chronic Hazard Index of 0.040 at the MEIR. The Chronic Hazard Index would be below the 1.0 significance threshold; however, the project would exceed the cancer risk threshold of 10 in a million and would be potentially significant without mitigation.

Mitigation measures are required to minimize construction and operational health risk impacts (MM-AQ-2, MM-AQ-4, MM-AQ-5, and MM-AQ-6). These mitigation measures would reduce DPM to the extent feasible, by requiring Tier 4 Final compliant engines for off-road equipment greater than 75 hp during construction (MM-AQ-2), all operational cargo handling equipment to be zero-emission (MM-AQ-5), and Tier 4 Final compliant engines for any emergency generators and fire pumps during operations (MM-AQ-6). In addition, although not quantified, MM-AQ-4 would also reduce DPM by requiring the installation of TRU electrical hook-ups at all cold storage loading docks, as well as supporting the future installation of heavy-duty truck charging stations. Table 19 summarizes the mitigated health risk levels associated with the project.

Table 19. Health Risk Assessment Results - Mitigated

Impact Parameter	Units	Impact Level	CEQA Threshold	Level of Significance
Maximum Individual Cancer Risk – MEIR	Per Million	4.41	10	Less than Significant
Chronic Hazard Index – MEIR	Index Value	0.0030	1.0	Less than Significant

Source: Appendix B.
Notes: CEQA = California Environmental Quality Act; MEIR = maximally exposed individual resident.
Includes implementation of MM-AQ-2, MM-AQ-5, MM-AQ-6.

As shown in Table 19, the mitigated DPM emissions from short-term construction plus long-term operations of the project would result in a Maximum Individual Cancer Risk of about 4.41 in 1 million and a Chronic Hazard Index of 0.0030 at the MEIR, which would not exceed the respective AVAQMD thresholds of significance. The project health risk impacts would be less than significant after mitigation.

Valley Fever

As discussed in Section 2.1.2.2, Los Angeles County is not considered a highly endemic region for Valley Fever, with an incident rate of 15.7 cases per 100,000 people (CDPH 2023). In contrast, in 2022 the statewide annual incident rate was 19.1 per 100,000 people. The California counties considered highly endemic for Valley Fever include Kern (264.9 per 100,000), Kings (111.0 per 100,000), Tulare (65.7 per 100,000), San Luis Obispo (51.5 per 100,000),

Fresno (44.3 per 100,000), Madera (32.4 per 100,000), and Ventura (28.3 per 100,000), which accounted for 50.5% of the reported cases in 2022 (CDPH 2023).

Even if present at the site, construction activities may not result in increased incidence of valley fever. Propagation of valley fever is dependent on climatic conditions, with the potential for growth and surface exposure highest following early seasonal rains and long dry spells. Valley fever spores can be released when filaments are disturbed by earth-moving activities, although receptors must be exposed to and inhale the spores to be at increased risk of developing valley fever. Moreover, exposure to valley fever does not guarantee that an individual will become ill—approximately 60% of people exposed to the fungal spores are asymptomatic and show no signs of an infection (USGS 2000).

In order to reduce fugitive dust from the project and minimize adverse air quality impacts, the project would employ measures that address dust in accordance with the AVAQMD Rules 401 and 403.2 and MM-AQ-3, which limit the amount of fugitive dust generated during construction. These requirements are consistent with California Department of Public Health recommendations for the implementation of dust control measures, including regular application of water during soil-disturbance activities, to reduce exposure to valley fever by minimizing the potential that the fungal spores become airborne (CDPH 2013). Further, regulations designed to minimize exposure to valley fever hazards are included in Title 8 of the California Code of Regulations and would be complied with during the project's construction phase (California Department of Industrial Relations 2022).

In summary, the project would not result in a significant impact attributable to valley fever exposure based on its geographic location and compliance with the applicable regulatory standards listed above and dust mitigation measures given in MM-AQ-3, which will serve to minimize the release of and exposure to fungal spores. Therefore, impacts associated with valley fever exposure for sensitive receptors would be less than significant.

Mitigation Measures

Implement MM-AQ-2 and MM-AQ-3 through MM-AQ-6.

Level of Significance After Mitigation

Impacts would be less than significant after implementation of mitigation.

2.4.4 Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Based on available information, the project is not anticipated to result in other emissions that have not been addressed under Section 24.1 through 2.4.3, above. As such, this analysis focuses on the potential for the project to generate odors.

The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source; the wind speeds and direction; and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying and cause distress among the public and generate citizen complaints.

Land uses most commonly associated with odor complaints generally include agricultural uses (livestock and farming), wastewater treatment plants, food-processing plants, chemical plants, composting operations, refineries, landfills, dairies, and fiberglass molding facilities. The project does not include uses that would be substantive sources of objectionable odors. Potential temporary and intermittent odors may result from construction equipment exhaust, the application of asphalt, and architectural coatings. Such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people.

The project would also be required to comply with AVAQMD Rule 402 (Nuisance). Rule 402 provides that "[a] person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property" (AVAQMD 2002). Based on the preceding, the potential for the project to create objectionable odors affecting a substantial number of people would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

INTENTIONALLY LEFT BLANK

3 Greenhouse Gas Emissions

3.1 Environmental Setting

3.1.1 Climate Change Overview

Climate change refers to any significant change in measures of climate—such as temperature, precipitation, or wind patterns—lasting for an extended period (decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the sun's energy reaching the Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2024d).

The greenhouse effect is the trapping and buildup of heat in the atmosphere near the Earth's surface (troposphere). The greenhouse effect traps heat in the troposphere through a threefold process, as follows: short-wave radiation emitted by the Sun is absorbed by the Earth, the Earth emits a portion of this energy in the form of long-wave radiation, and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on the Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise.

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales and that, in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes, such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. However, recent climate changes, in particular the warming observed over the past century, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of warming since the mid-twentieth century and are the most significant driver of observed climate change (EPA 2024d; IPCC 2013). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013). Continued emissions of GHGs will cause further warming and changes in all components of the climate system, which is discussed further in Section 3.1.5, Potential Effects of Climate Change.

3.1.2 Greenhouse Gases

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. As defined in California Health and Safety Code, Section 38505(g), for purposes of administering many of the state's primary GHG emission reduction programs, GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3). (See also CEQA Guidelines, Section 15364.5.) Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted into the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-

absorption potential than CO_2, include fluorinated gases, such as HFCs, PFCs, and SF_6, which are associated with certain industrial products and processes. The following paragraphs provide a summary of the most common GHGs and their sources.[14]

Carbon Dioxide. CO_2 is a naturally occurring gas and a by-product of human activities and is the principal anthropogenic (i.e., caused by human activity) GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 are the combustion of fuels such as coal, oil, natural gas, and wood and changes in land use.

Methane. CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. CH_4 is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

Nitrous Oxide. N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers, manure management, industrial processes (such as in nitric acid production, nylon production, and fossil-fuel-fired power plants), vehicle emissions, and using N_2O as a propellant (e.g., rockets, racecars, and aerosol sprays).

Fluorinated Gases. Fluorinated gases (also referred to as F-gases) are synthetic powerful GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric O_3-depleting substances (e.g., chlorofluorocarbons [CFCs], hydrochlorofluorocarbons [HCFCs], and halons). The most prevalent fluorinated gases include the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to O_3-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, with HFCs, to the O_3-depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Since PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.
- **Sulfur Hexafluoride:** SF_6 is a colorless gas soluble in alcohol and ether and slightly soluble in water. SF_6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.
- **Nitrogen Trifluoride:** NF_3 is used in the manufacture of a variety of electronics, including semiconductors and flat panel displays.

[14] The descriptions of GHGs are summarized from the IPCC Fourth Assessment Report (2007), CARB's "Glossary of Terms Used in GHG Inventories" (CARB 2025c), and EPA's "Basics of Climate Change" (EPA 2024d).

Chlorofluorocarbons. CFCs are synthetic chemicals that have been used as cleaning solvents, refrigerants, and aerosol propellants. CFCs are chemically unreactive in the lower atmosphere (troposphere) and the production of CFCs was prohibited in 1987 due to the chemical destruction of stratospheric O_3.

Hydrochlorofluorocarbons. HCFCs are a large group of compounds, whose structure is very close to that of CFCs—containing hydrogen, fluorine, chlorine, and carbon atoms—but including one or more hydrogen atoms. Like HFCs, HCFCs are used in refrigerants and propellants. HCFCs were also used in place of CFCs for some applications; however, their use in general is being phased out.

Black Carbon. Black carbon is a component of fine particulate matter, which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and forest fires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Black carbon is a short-lived species that varies spatially, which makes it difficult to quantify the global warming potential (GWP). DPM emissions are a major source of black carbon and are TACs that have been regulated and controlled in California for several decades to protect public health.

Water Vapor. The primary source of water vapor is evaporation from the ocean, with additional vapor generated by sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves. Water vapor is the most important, abundant, and variable GHG in the atmosphere and maintains a climate necessary for life.

Ozone. Tropospheric O_3, which is created by photochemical reactions involving gases from both natural sources and human activities, acts as a GHG. Stratospheric O_3, which is created by the interaction between solar ultraviolet radiation and molecular oxygen (O_2), plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric O_3, due to chemical reactions that may be enhanced by climate change, results in an increased ground-level flux of ultraviolet-B radiation.

Aerosols. Aerosols are suspensions of PM in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light.

3.1.3 Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (e.g., affect cloud formation or albedo) (EPA 2024d). The Intergovernmental Panel on Climate Change (IPCC) developed the GWP concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram of a trace substance relative to that of 1 kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of CO_2 equivalent (CO_2e).

The current version of CalEEMod (version 2022.1) assumes that the GWP for CH_4 is 25 (so emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the IPCC Fourth Assessment Report (IPCC 2007). The GWP values identified in CalEEMod were applied to the project.

3.1.4 Sources of Greenhouse Gas Emissions

Global Inventory

Anthropogenic GHG emissions worldwide in 2020 (the most recent year for which data is available) totaled approximately 49,800 million metric tons (MMT) of CO_2e, excluding land use change and forestry (PBL 2022). The top six GHG emitters include China, the United States, the Russian Federation, India, Japan, and the European Union, which accounted for approximately 60% of the total global emissions, or approximately 30,270 MMT CO_2e (PBL 2022). Table 20 presents the top GHG-emissions-producing countries.

Table 20. Top Greenhouse-Gas-Producer Entities

Country	2020 GHG Emissions (MMT $CO2^e$)[a]
China	14,300
United States	5,640
European Union	3,440
India	3,520
Russian Federation	2,210
Japan	1,160
Total	**30,270**

Source: PBL 2022.
Notes: GHG = greenhouse gas; MMT CO_2e = million metric tons of carbon dioxide equivalent.
[a] Column may not add due to rounding.

National Inventory

Per the EPA's Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2022, total United States GHG emissions were approximately 6,343.2 million MT CO_2e (MMT CO_2e) in 2022 (EPA 2024e). Total U.S. emissions have decreased by 3.0% from 1990 to 2022, down from a high of 15.2% above 1990 levels in 2007. Gross emissions increased from 2021 to 2022 by 0.2% (14.4 MMT CO_2e). Net emissions (i.e., including sinks) were 5,489.0 MMT CO_2e in 2022. Overall, net emissions increased 1.3% from 2021 to 2022 and decreased 16.7% from 2005 levels Between 2021 and 2022, the increase in total GHG emissions was driven largely by an increase in CO_2 emissions from fossil fuel combustion due to the continued economic activity rebounding after the height of the COVID-19 pandemic. The CO_2 emissions from fossil fuel combustion increased by 1.0% from 2021 to 2022, including a 5.0% increase in residential sector emissions, 8.9% increase in commercial sector emissions, 2.6% increase in industrial emissions, a 0.1% decrease in transportation sector emissions and a 0.6% decrease in electric power sector emissions. Carbon sequestration in the Land Use, Land-Use Change, and Forestry sector offset 14.5% of total emissions in 2022 (EPA 2024e).

State Inventory

According to California's 2000–2022 GHG emissions inventory (2024 edition), California emitted approximately 371.1 MMT CO_2e in 2022, including emissions resulting from out-of-state electrical generation (CARB 2024j). The sources of GHG emissions in California include transportation, industry, electric power production from both in-state and out-of-state sources, residential and commercial activities, agriculture, high-GWP substances, and recycling and waste. Table 21 presents California GHG emission source categories and their relative contributions to the emissions inventory. In 2014, statewide GHG emissions dropped below the 2020 GHG limit of 431 MMT CO_2e and have remained below that level since that time (CARB 2024j).

Table 21. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total
Transportation	139.9	37.69%
Industrial uses	72.7	19.59%
Electricity generation[a]	59.8	16.11%
Residential and commercial uses	39.5	10.64%
Agriculture and forestry	29.8	8.03%
High-GWP substances	21.3	5.74%
Recycling and waste	8.2	2.21%
Totals	**371.1**	**100%**

Source: CARB 2024j.
Notes: GHG = greenhouse gas; GWP = global warming potential; MMT = million metric tons; CO_2e = carbon dioxide equivalent. Emissions reflect 2022 California GHG inventory.
Totals may not sum due to rounding.
[a] Includes emissions associated with imported electricity, which account for 17.5 MMT CO_2e.

Local Inventories

According to the GHG inventory data compiled in the Sustainability, Climate Action, and Resilience chapter of the City's General Plan (*Palmdale 2045*) the City emitted approximately 1,042,284 MT CO_2e in year 2017 (City of Palmdale 2023a). As outlined in Table 22, on-road transportation generated about 59% of these emissions.

Table 22. City of Palmdale GHG Emissions by Sectors

Source Category	Annual GHG Emissions (MT CO_2e per Year)	Percent of Total
Residential Energy - Electricity	90,470	8.68%
Residential Energy – Natural Gas	107,180	10.28%
Nonresidential Energy - Electricity	119,700	11.48%
Nonresidential Energy – Natural Gas	42,310	4.06%
Transportation – On-Road	615,601	59.06%
Solid Waste	30,490	2.93%
Off-Road	8,634	0.83%
Water	27,900	2.68%
Total	**1,042,284**	**100%**

Notes: GHG = greenhouse gas; MT CO_2e = metric tons of carbon dioxide equivalent.

3.1.5 Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources through uncertain impacts related to future air temperatures and precipitation patterns. The 2014 IPCC Synthesis Report (IPCC 2014) indicated that warming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia. Signs that global climate change has occurred include warming of the atmosphere and ocean, diminished amounts of snow and ice, rising sea levels, and ocean acidification (IPCC 2014).

In California, climate change impacts have the potential to affect sea-level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, frequency of severe weather events, and electricity demand and supply. The primary effect of global climate change has been a rise in average global tropospheric temperature. Global surface temperature in the first two decades of the twenty-first century (2001–2020) was 0.99 [0.84 to 1.10]°C higher than 1850–1900 (IPCC 2023). Global surface temperature has increased faster since 1970 than in any other 50-year period over at least the last 2000 years (IPCC 2023). Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the twenty-first century than were observed during the twentieth century. Human activities, principally through emissions of GHGs, have unequivocally caused global warming, with global surface temperature reaching 1.1°C above 1850-1900 in 2011-2020 (IPCC 2023).

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. OEHHA identified various indicators of climate change in California, which are scientifically based measurements that track trends in various aspects of climate change. Many indicators reveal discernible evidence that climate change is occurring in California and is having significant, measurable impacts in the state. Changes in the state's climate have been observed including an increase in annual average air temperature, more frequent extreme heat events, more extreme drought, a decline in winter chill, an increase in cooling degree days and a decrease in heating degree days, and an increase in variability of statewide precipitation (OEHHA 2022).

Warming temperatures and changing precipitation patterns have altered California's physical systems—the ocean, lakes, rivers and snowpack—upon which the state depends. Winter snowpack and spring snowmelt runoff from the Sierra Nevada and southern Cascade Mountains provide approximately one-third of the state's annual water supply. Impacts of climate on physical systems have been observed such as high variability of snow-water content (i.e., amount of water stored in snowpack), decrease in spring snowmelt runoff, glacier change (loss in area), rise in sea levels, increase in average lake water temperature and coastal ocean temperature, and a decrease in dissolved oxygen in coastal waters (OEHHA 2022).

Impacts of climate change on biological systems, including humans, wildlife, and vegetation, have also been observed including climate change impacts on terrestrial, marine, and freshwater ecosystems. As with global observations, species responses include those consistent with warming: elevational or latitudinal shifts in range, changes in the timing of key plant and animal life cycle events, and changes in the abundance of species and in community composition. Humans are better able to adapt to a changing climate than plants and animals in natural ecosystems. Nevertheless, climate change poses a threat to public health as warming temperatures and changes in precipitation can affect vector-borne pathogen transmission and disease patterns in California as well as the

variability of heat-related deaths and illnesses. In addition, since 1950, the area burned by wildfires each year has been increasing.

CNRA has released four California Climate Change Assessments (in 2006, 2009, 2012, and 2018), which have addressed the following: acceleration of warming across the state, more intense and frequent heat waves, greater riverine flows, accelerating sea level rise, more intense and frequent drought, more severe and frequent wildfires, more severe storms and extreme weather events, shrinking snowpack and less overall precipitation, and ocean acidification, hypoxia, and warming. To address local and regional governments' need for information to support action in their communities, the Fourth Assessment includes reports for nine regions of the state. Key highlights for the Los Angeles Region, where the project is located, include the following (CNRA 2018):

- Continued future warming over the Los Angeles region. Across the region, average maximum temperatures are projected to increase around 4°F to 5°F by the mid-century, and 5°F to 8°F by the late-century.
- Extreme temperatures are also expected to increase. The hottest day of the year may be up to 10°F warmer for many locations across the Los Angeles region by the late-century under certain model scenarios. The number of extremely hot days is also expected to increase across the region.
- Despite small changes in average precipitation, dry and wet extremes are both expected to increase. By the late 21st century, the wettest day of the year is expected to increase across most of the Los Angeles region, with some locations experiencing 25% to 30% increases under certain model scenarios. Increased frequency and severity of atmospheric river events are also projected to occur for this region.
- Sea levels are projected to continue to rise in the future, but there is a large range based on emissions scenario and uncertainty in feedbacks in the climate system. Roughly 1 feet to 2 feet of sea level rise is projected by the mid-century, and the most extreme projections lead to 8 feet to 10 feet of sea level rise by the end of the century.
- Projections indicate that wildfire may increase over southern California, but there remains uncertainty in quantifying future changes of burned area over the Los Angeles region.

3.2 Regulatory Setting

3.2.1 International Regulations

In 1988, the United Nations and the World Meteorological Organization established the IPCC to assess the scientific, technical, and socioeconomic information relevant to understanding the scientific basis for human-induced climate change, its potential impacts, and options for adaptation and mitigation. The most recent reports of the IPCC have emphasized the scientific consensus that real and measurable changes to the climate are occurring, that they are caused by human activity, and that significant adverse impacts on the environment, the economy, and human health and welfare are unavoidable.

On March 21, 1994, the United States joined a number of countries around the world in signing the United Nations Framework Convention on Climate Change. Under the Convention, governments agreed to gather and share information on GHG emissions, national policies, and best practices; launch national strategies for addressing GHG emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries; and cooperate in preparing for adaptation to the impacts of global climate change.

3.2.2 Federal

Massachusetts v. U.S. Environmental Protection Agency

In Massachusetts v. EPA (April 2007), the U.S. Supreme Court ruled that CO_2 was a pollutant and directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In making these decisions, the EPA administrator is required to follow the language of CAA Section 202(a). On December 7, 2009, the administrator signed a final rule with two distinct findings regarding GHGs under CAA Section 202(a):

- **Endangerment Finding:** The elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is referred to as the "endangerment finding."
- **Cause or Contribute Finding:** The combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is referred to as the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the CAA.

Energy Independence and Security Act

The Energy Independence and Security Act of 2007 (Public Law 110-140), among other key measures, did the following to aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel by 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020, and direct National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy-efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Federal Vehicle Standards

In 2007, in response to the *Massachusetts v. EPA* U.S. Supreme Court ruling discussed above, the Bush Administration issued Executive Order (EO) 13432 directing the EPA, the U.S. Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011; and, in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012 through 2016 (75 Federal Register [FR] 25324–25728).

In 2019, the EPA and NHTSA published the Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program (SAFE-1) (84 FR 51310), which revoked California's authority to set its own GHG emissions standards and set zero-emission vehicle (ZEV) mandates in California. In March 2020, Part Two was issued, which set CO_2 emissions standards and corporate average fuel economy standards for passenger vehicles and light-duty trucks for model years 2021 through 2026.

On December 21, 2021, the NHTSA finalized the Corporate Average Fuel Economy Preemption rulemaking to withdraw its portions of the Part One Rule. The final rule concluded that the Part One Rule overstepped the agency's legal authority and established overly broad prohibitions that did not account for a variety of important state and local interests. Then, in March 2022, the NHTSA established new fuel economy standards that would require an industry-wide fleet average of approximately 49 miles per gallon for passenger cars and light trucks by model year 2026 by increasing fuel efficiency by 8% annually for model years 2024 and 2025, and 10% annually for model year 2026.

The Inflation Reduction Act of 2022

The Inflation Reduction Act was signed into law by President Biden in August 2022. The Act includes specific investment in energy and climate reform and is projected to reduce GHG emissions in the United States by 40% compared to 2005 levels by 2030. The Act allocates funds to boost renewable energy infrastructure (e.g., solar panels and wind turbines), includes tax credits for the purchase of electric vehicles, and includes measures that will make homes more energy efficient. The Inflation Reduction Act confirms that reduction of GHGs is a core goal of the CAA and that the funding provided should allow the EPA to increase the scope of its CAA rulemakings. The Act also confirms applicability of the Inflation Reduction Act to GHGs in three specific areas: (1) California's ability to regulate GHG emissions from vehicles, (2) the EPA's authority to regulate CH_4 emissions from oil and gas facilities, and (3) the EPA's authority to regulate GHG emissions from power plants.

3.2.3 State Regulations

The statewide GHG emissions regulatory framework is summarized below by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, solid waste, water, and other state regulations and goals. The following text describes EOs, legislation, regulations, and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues.

3.2.3.1 State Climate Change Targets

The state has taken a number of actions to address climate change. These actions are summarized below, and include EOs, legislation, and CARB plans and requirements.

Executive Order S-3-05

EO S-3-05 (June 2005) identified GHG emissions-reduction targets and laid out responsibilities among the state agencies for implementing the EO and for reporting on progress toward the targets. This EO identified the following targets:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.

- By 2050, reduce GHG emissions to 80% below 1990 levels.

EO S-3-05 also directed the California Environmental Protection Agency to report biannually on progress made toward meeting the GHG targets and the impacts to California due to global warming, including impacts to water supply, public health, agriculture, the coastline, and forestry.

Assembly Bill 32

In furtherance of the goals identified in EO S-3-05, the Legislature enacted AB 32, the California Global Warming Solutions Act of 2006 (California Health and Safety Code Sections 38500–38599). AB 32 provided initial direction on creating a comprehensive multiyear program to limit California's GHG emissions at 1990 levels by 2020, and initiate the transformations required to achieve the state's long-range climate objectives.

Executive Order B-30-15

EO B-30-15 (April 2015) identified an interim GHG-reduction target in support of targets previously identified under EO S-3-05 and AB 32. EO B-30-15 set an interim target goal of reducing GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050, as set forth in EO S-3-05. To facilitate achieving this goal, EO B-30-15 called for CARB to update the Climate Change Scoping Plan (Scoping Plan) to express the 2030 target in terms of millions of metric tons of CO_2e. The EO also called for state agencies to continue to develop and implement GHG emissions-reduction programs in support of the reduction targets.

Senate Bill 32 and Assembly Bill 197

SB 32 and AB 197 (enacted in 2016) are companion bills. SB 32 codified the 2030 emissions-reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to the Board as nonvoting members; requires CARB to make available and update (at least annually via its website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and requires CARB to identify specific information for GHG emissions-reduction measures when updating the Scoping Plan.

Executive Order B-55-18

EO B-55-18 (September 2018) identified a policy for the state to achieve carbon neutrality as soon as possible (no later than 2045) and achieve and maintain net-negative emissions thereafter. The goal is in addition to the existing statewide targets of reducing the state's GHG emissions. CARB will work with relevant state agencies to ensure that future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal.

Assembly Bill 1279

The Legislature enacted AB 1279, the California Climate Crisis Act, in September 2022. The bill declares the policy of the state to achieve net-zero GHG emissions as soon as possible, but no later than 2045, and achieve and

maintain net-negative GHG emissions thereafter. Additionally, the bill requires that by 2045, statewide anthropogenic GHG emissions be reduced to at least 85% below 1990 levels.

Although AB 1279 establishes an overall policy to achieve net-zero GHG emissions as soon as possible, but no later than 2045, recognizing the need to implement CO_2 removal and carbon capture, and utilization and storage technologies, the Legislature established a specific target of 85% below 1990 levels by 2045 for anthropogenic GHG emissions. Therefore, the net-zero target does not directly apply to development projects, but the 2045 target of 85% below 1990 levels represents the reductions required to contribute to accomplishing the state's overall net-zero policy.

California Air Resources Board's Climate Change Scoping Plan

One specific requirement of AB 32 is for CARB to prepare a scoping plan to help achieve the maximum technologically feasible and cost-effective GHG emission reductions by 2020 (California Health and Safety Code Section 38561[a]), and to update the scoping plan at least once every 5 years. In 2008, CARB approved the first scoping plan: The Climate Change Proposed Scoping Plan: A Framework for Change (Scoping Plan) (CARB 2008). The Scoping Plan included a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emissions-reduction programs calculated to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the state's long-range climate objectives.

In 2014, CARB approved the first update to the Scoping Plan. The First Update to the Climate Change Scoping Plan: Building on the Framework (2014 Scoping Plan) defined the state's GHG emissions-reduction priorities for the next 5 years and laid the groundwork to start the transition to the post-2020 goals set forth in EO S-3-05 and EO B-16-2012 (CARB 2014). The 2014 Scoping Plan concluded that California was on track to meet the 2020 target, but recommended that a 2030 mid-term GHG reduction target be established to ensure a continuum of action to reduce emissions. The 2014 Scoping Plan recommended a mix of technologies in key economic sectors to reduce emissions through 2050, including energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies.

In December 2017, CARB released the 2017 Climate Change Scoping Plan (2017 Scoping Plan) for public review and comment (CARB 2017a). The 2017 Scoping Plan builds on the successful framework established in the initial Scoping Plan and 2014 Scoping Plan while identifying new technologically feasible and cost-effective strategies that will serve as the framework to achieve the 2030 GHG target and define the state's climate change priorities to 2030 and beyond. Commitments include implementing renewable energy and energy efficiency (including the mandates of SB 350), increased stringency of the Low Carbon Fuel Standard, measures identified in the Mobile Source and Freight Strategies, measures identified in the proposed Short-Lived Climate Pollutant (SLCP) Plan, and increased stringency of SB 375 targets. To fill the gap in additional reductions needed to achieve the 2030 target, the 2017 Scoping Plan recommends continuing the Cap-and-Trade Program and a measure to reduce GHGs from refineries by 20%.

CARB adopted the 2022 Scoping Plan in December 2022. The 2022 CARB Scoping Plan outlines the state's plan to reach carbon neutrality by 2045 or earlier, while also assessing the progress the state is making toward achieving GHG reduction goals by 2030. Per the Legislative Analyst's Office, the 2022 CARB Scoping Plan identifies a more aggressive 2030 GHG goal. As it relates to the 2030 goal, perhaps the most significant change in the 2022 plan

(compared to previous Scoping Plans) is that it identifies a new GHG target of 48% below the 1990 level, compared to the current statutory goal of 40% below. Current law requires the state to reduce GHG emissions by at least 40% below the 1990 level by 2030, but it does not specify an alternative goal. According to CARB, a focus on the lower target is needed to put the state on a path to meeting the newly established 2045 goal, consistent with the overall path to 2045 carbon neutrality. The carbon neutrality goal requires CARB to expand proposed actions from only the reduction of anthropogenic sources of GHG emissions to also include those that capture and store carbon (e.g., through natural and working lands, or mechanical technologies). The carbon reduction programs build on and accelerate those currently in place, including moving to zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel-fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options, such as green hydrogen (CARB 2022).

The 2022 CARB Scoping Plan also emphasizes that there is no realistic path to carbon neutrality without carbon removal and sequestration, and to achieve the state's carbon neutrality goal, carbon reduction programs must be supplemented by strategies to remove and sequester carbon. Strategies for carbon removal and sequestration include carbon capture and storage from anthropogenic point sources, where CO_2 is captured as it leaves a facility's smokestack and is injected into geologic formations or used in industrial materials (e.g., concrete), and CO_2 removal from ambient air through mechanical (e.g., direct air capture with sequestration) or nature-based (e.g., management of natural and working lands) applications (CARB 2022).

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32, SB 32, and the EOs; it also establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. A project is considered consistent with the statutes and EOs if it would meet the general policies in reducing GHG emissions to facilitate the achievement of the state's goals and would not impede attainment of those goals. Lead agencies under CEQA can make a significance determination based on whether the project would result in net-zero GHG emissions and whether the project is consistent with a significance determination/threshold recommended by the applicable air district or other lead agencies (CARB 2022). The 2022 CARB Scoping Plan acknowledges, however, that net zero may not be feasible or appropriate for every project (CARB 2022).

Executive Order B-18-12

EO B-18-12 (April 2012) directed state agencies, departments, and other entities under the Governor's executive authority to take action to reduce entity-wide GHG emissions by at least 10% by 2015 and 20% by 2020, as measured against a 2010 baseline. EO B-18-12 also identified goals for existing state buildings for reducing grid-based energy purchases and water use.

Senate Bill 605 and Senate Bill 1383

SB 605 (2014) requires CARB to complete a comprehensive strategy to reduce emissions of SLCPs in the state (California Health and Safety Code Section 39730) and SB 1383 (2016) requires CARB to approve and implement that strategy by January 1, 2018 (California Public Resources Code [PRC] Sections 42652–43654). SB 1383 also establishes specific targets for the reduction of SLCPs (40% below 2013 levels by 2030 for CH_4 and HFCs, and 50% below 2013 levels by 2030 for anthropogenic black carbon), and provides direction for reductions from dairy and livestock operations and landfills. Accordingly, CARB adopted its SLCP Reduction Strategy in March 2017. The SLCP

Reduction Strategy establishes a framework for the statewide reduction of emissions of black carbon, CH_4, and fluorinated gases (CARB 2017b).

Assembly Bill 1757

AB 1757 (September 2022) requires the CNRA to determine a range of targets for natural carbon sequestration and for nature-based climate solutions that reduce GHG emissions for future years 2030, 2038, and 2045. These targets are established to support the state's goals to achieve carbon neutrality and foster climate adaptation and resilience.

3.2.3.2 Building Energy

California Code of Regulations, Title 24, Part 6 and Part 11

The California Building Standards Code was established in 1978 and serves to enhance and regulate California's building standards. Although not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically established Building Energy Efficiency Standards that are designed to ensure that new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed every 3 years by the Building Standards Commission and the CEC, and revised if necessary (PRC Section 25402[b][1]). The regulations receive input from members of industry and the public to "reduce the wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (PRC Section 25402). These regulations are scrutinized and analyzed for technological and economic feasibility (PRC Section 25402[d]) and cost effectiveness (PRC Section 25402[b][2–3]). As a result, these standards save energy, increase electricity supply reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment.

In addition to CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24), which is commonly referred to as California's Green Building Standards (CALGreen), establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. For example, mandatory standards in CALGreen 2022 that would be applicable to the proposed project are listed below, and CALGreen 2025 will include additional measures that would become effective on January 1, 2026.

- Short-Term Bicycle Parking. If the new project or an addition or alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5% of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (CALGreen Code Section 5.106.4.1.1).
- Long-Term Bicycle Parking. For new buildings with tenant spaces that have 10 or more tenant-occupants, secure bicycle parking for 5% of the tenant-occupant vehicular parking spaces with a minimum of one bicycle parking facility (CALGreen Code Section 5.106.4.1.2).
- EV Charging Stations. New construction shall facilitate the future installation of EV supply equipment. The compliance requires empty raceways for future conduit and documentation that the electrical system has adequate capacity for the future load. The number of EV capable spaces and spaces provided with EV charging stations is contained in CALGreen Code Table 5.106.5.3.1. Additionally, CALGreen Code Table

5.106.5.5.1 specifies requirements for the installation of raceway conduit and panel power requirements for medium- and heavy-duty electric vehicle supply equipment for warehouses, grocery stores, office buildings, manufacturing facilities, and retail stores with off-street loading spaces (CALGreen Code Section 5.106.5.5).

- Outdoor Light Pollution Reduction. Outdoor lighting systems shall be designed to meet the backlight, uplight and glare ratings (CALGreen Code Table 5.106.8).
- Shade Trees. Shade trees shall be planted to comply with Sections 5.106.12.1, 5.106.12.2, and 5.106.12.3. Percentages shown shall be measured at noon on the summer solstice. Landscape irrigation necessary to establish and maintain tree health shall comply with Section 5.304.6 (CALGreen Code 5.106.12).
  - Surface Parking Areas. Shade tree plantings, minimum #10 container size or equal, shall be installed to provide shade over 50% of the parking area within 15 years. An exception to this requirement is if the surface parking area covered by solar photovoltaic shade structures with roofing materials that comply with Table A5.106.11.2.2 in Appendix A5 shall be permitted in whole or in part in lieu of shade tree planting (CALGreen Code Section 5.106.12.1).
  - Landscape Areas. Shade tree plantings, minimum #10 container size or equal shall be installed to provide shade of 20% of the landscape area within 15 years (CALGreen Code Section 5.106.12.2).
  - Hardscape Areas. Shade tree plantings, minimum #10 container size or equal shall be installed to provide shade over 20% of the hardscape area within 15 years. An exception to this requirement is if hardscape areas covered by solar photovoltaic shade structures or shade structures with roofing materials that comply with Table A5.106.11.2.2 in Appendix A5 shall be permitted in whole or in part in lieu of shade tree planting (CALGreen Code Section 5.106.12.3).
- Indoor Water Use. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:
  - Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (CALGreen Code Section 5.303.3.1)
  - Urinals. The effective flush volume of 1) wall-mounted urinals shall not exceed 0.125 gallons per flush (CALGreen Code Section 5.303.3.2.1) and 2) floor-mounted or other urinals shall not exceed 0.5 gallons per flush (CALGreen Code Section 5.303.3.2.2).
  - Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gallons per minute and 80 per square inch (psi) (CALGreen Code Section 5.303.3.3.1). When a shower is served by more than one showerhead, the combine flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gallons per minute at 80 psi (CALGreen Code Section 5.303.3.3.2).
  - Faucets and Fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gallons per minute at 60 psi. Kitchen faucets shall have a maximum flow rate of not more than 1.8 gallons per minute of 60 pounds psi. Wash fountains shall have a maximum flow rate of not more than 1.8 gallons per minute. Metering faucets shall not deliver more than 0.20 gallons per cycle. Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (CALGreen Code Sections 5.303.3.4.1 through 5.303.3.4.5).

- **Outdoor Potable Water Uses in Landscaped Areas.** Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO), whichever is more stringent (CALGreen Code Section 5.304.1).
- **Water Meters.** Separate submeters or metering devices shall be installed for new buildings or additions in excess of 50,000 square feet or for excess consumption where any tenant within a new building or within an addition that is project to consume more than 1,000 gallons per day (CALGreen Code Sections 5.303.1.1 and 5.303.1.2).
- **Outdoor Water Uses in Rehabilitated Landscape Projects Equal or Greater than 2,500 square feet.** Rehabilitated landscape projects with an aggregate landscape area equal to or greater than 2,500 square feet requiring a building or landscape permit (CALGreen Code Section 5.304.3).
- **Construction Waste Management**. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with CALGreen Code Section 5.408.1.1. 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (CALGreen Code Section 5.408.1).
- **Excavated Soil and Land Clearing Debris**. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (CALGreen Code Section 5.408.3).
- **Recycling By Occupants**. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (CALGreen Code Section 5.410.1).
- **Commissioning**. For new buildings 10,000 square feet and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (CALGreen Code Section 5.410.2).

Assembly Bill 1109

Enacted in 2007, AB 1109 required the CEC to adopt minimum energy efficiency standards for general-purpose lighting to reduce electricity consumption by 50% for indoor residential lighting and by 25% for indoor commercial lighting (PRC Section 25402.5.4).

3.2.3.3 Renewable Energy and Energy Procurement

Senate Bill 1078, Senate Bill 1368, Executive Order S-14-08, Executive Order S-21-09, Senate Bill X1-2, and Senate Bill 1020

SB 1078 (2002) (California Public Utilities Code Section 399.11 et seq.) established the Renewables Portfolio Standard program, which required an annual increase in renewable generation by the utilities equivalent to at least 1% of sales, with an aggregate goal of 20% by 2017. This goal was subsequently accelerated, requiring utilities to obtain 20% of their power from renewable sources by 2010 (see SB 107, EO S-14-08, and EO S-21-09).

SB 1368 (2006), required the CEC to develop and adopt regulations for GHG emissions performance standards for the long-term procurement of electricity by local publicly owned utilities (California Public Utilities Code Section

8340–8341). These standards must be consistent with the standards adopted by the California Public Utilities Commission.

EO S-14-08 (2008) focused on the contribution of renewable energy sources to meet the electrical needs of California while reducing the GHG emissions from the electrical sector. This EO required that all retail suppliers of electricity in California serve 33% of their load with renewable energy by 2020. Furthermore, the EO directed state agencies to take appropriate actions to facilitate reaching this target.

EO S-21-09 (2009) directed CARB to adopt a regulation consistent with the goal of EO S-14-08 by July 31, 2010. CARB was further directed to work with the California Public Utilities Commission and CEC to ensure that the regulation builds upon the Renewables Portfolio Standard program and was applicable to investor-owned utilities, publicly owned utilities, direct access providers, and community choice providers. Under this order, CARB was to give the highest priority to those renewable resources that provide the greatest environmental benefits with the least environmental costs and impacts on public health, and those that can be developed the most quickly in support of reliable, efficient, cost-effective electricity system operations. On September 23, 2010, CARB initially approved regulations to implement a Renewable Electricity Standard; however, this regulation was not finalized because of subsequent legislation (SB X1-2) signed by Governor Brown in April 2011.

SB X1-2 (April 2011) expanded the Renewables Portfolio Standard by establishing a renewable energy target of 20% of the total electricity sold to retail customers in California per year by December 31, 2013, and 33% by December 31, 2020, and in subsequent years. Under the bill, a renewable electrical generation facility is one that uses biomass, solar thermal, solar photovoltaic, wind, geothermal, fuel cells using renewable fuels, small hydroelectric generation (30 megawatts or less), digester gas, municipal solid waste conversion, landfill gas, ocean wave, ocean thermal, or tidal current, and that meets other specified requirements with respect to its location.

SB 350 (2015) further expanded the Renewables Portfolio Standard program by establishing a goal of 50% of the total electricity sold to retail customers in California per year by December 31, 2030. In addition, SB 350 included the goal to double the energy efficiency savings in electricity and natural gas final end uses (such as heating, cooling, lighting, or class of energy uses on which an energy-efficiency program is focused) of retail customers through energy conservation and efficiency.

SB 100 (2018) increased the standards set forth in SB 350, establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024; 52% by December 31, 2027; and 60% by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. This bill requires that the achievement of 100% zero-carbon electricity resources do not increase the carbon emissions elsewhere in the western grid, and that the achievement not be achieved through resource shuffling.

SB 1020 (September 2022) revises the standards from SB 100, requiring the following percentage of retail sales of electricity to California end-use customers to come from eligible renewable energy resources and zero-carbon resources: 90% by December 31, 2035; 95% by December 31, 2040; and 100% by December 31, 2045.

3.2.3.4 Mobile Sources

State Vehicle Standards (Assembly Bill 1493 and Executive Order B-16-12)

AB 1493 (July 2002) was enacted in response to the transportation sector accounting for a large share of California's CO_2 emissions. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by CARB to be vehicles that are primarily used for noncommercial personal transportation in the state. The bill required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004. EO B-16-12 (March 2012) required that state entities under the governor's direction and control support and facilitate the rapid commercialization of ZEVs. It ordered CARB, the CEC, the California Public Utilities Commission, and other relevant agencies to work with the Plug-In Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve benchmark goals by 2015, 2020, and 2025. On a statewide basis, EO B-16-12 identified a target reduction of GHG emissions from the transportation sector equaling 80% less than 1990 levels by 2050. This directive did not apply to vehicles that have special performance requirements necessary for the protection of the public safety and welfare. As explained under the "Federal Vehicle Standards" subheading in Section 3.2.2, Federal, EPA and NHTSA approved the SAFE Vehicles Rule Part One and Two, which revoked California's authority to set its own GHG emissions standards and set ZEV mandates in California.

As also explained in Section 3.2.2, in March 2022, EPA reinstated California's authority under the CAA to implement its own GHG emissions standards and ZEV sales mandate. EPA's action concludes its reconsideration of the 2019 SAFE-1 rule by finding that the actions taken under the previous administration as a part of SAFE-1 were decided in error and are now entirely rescinded.

Heavy-Duty Diesel

CARB adopted the final Heavy-Duty Truck and Bus Regulation on December 31, 2014, to reduce DPM, a major source of black carbon, and NO_x emissions from heavy-duty diesel vehicles (13 CCR 2025). The rule requires that DPM filters be applied to newer heavier trucks and buses by January 1, 2012, with older vehicles required to comply by January 1, 2015. The rule required nearly all diesel trucks and buses to be compliant with the 2010 model year engine requirement by January 1, 2023. On December 12, 2013, CARB adopted an Airborne Toxics Control Measure to limit idling of diesel-fueled commercial vehicles. This rule requires diesel-fueled vehicles with gross vehicle weights greater than 10,000 pounds to idle no more than 5 minutes at any location (13 CCR 2485).

Executive Order S-1-07

EO S-1-07 (January 2007, implementing regulation adopted in April 2009) sets a declining Low Carbon Fuel Standard for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The target of the Low Carbon Fuel Standard was to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020 (17 CCR 95480 et seq.). The carbon intensity measures the amount of GHG emissions in the lifecycle of a fuel—including extraction/feedstock production, processing, transportation, and final consumption—per unit of energy delivered.

Senate Bill 375

SB 375 (California Government Code Section 65080) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 requires CARB to adopt regional GHG-reduction targets for the automobile and light-truck sector for 2020 and 2035, and to update those targets every 8 years. SB 375 requires the state's 18 regional Metropolitan Planning Organizations (MPOs) to prepare a Sustainable Communities Strategy (SCS) as part of their Regional Transportation Plan (RTP) that will achieve the GHG-reduction targets set by CARB. If an MPO is unable to devise an SCS to achieve the GHG-reduction target, the MPO must prepare an alternative planning strategy demonstrating how the GHG-reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

An SCS does not (1) regulate the use of land; (2) supersede the land use authority of cities and counties; or (3) require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it (California Government Code Section 65080[b][2][K]). Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated housing element process.

Advanced Clean Cars Program and Zero-Emissions Vehicle Program

The Advanced Clean Cars I program (January 2012) is an emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package of regulations: the Low-Emission Vehicle regulation for criteria air pollutant and GHG emissions and a technology forcing regulation for ZEVs that contributes to both types of emission reductions (CARB 2025d). The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. To improve air quality, CARB has implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that by 2025, cars will emit 75% less smog-forming pollution than the average new car sold in 2015. The ZEV program will act as the focused technology of the Advanced Clean Cars I program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018 to 2025 model years.

The Advanced Clean Cars II program, which was adopted in August 2022, established the next set of low-emission vehicle and ZEV requirements for model years after 2025 to contribute to meeting federal ambient air quality O_3 standards and California's carbon neutrality standards. The main objectives of Advanced Clean Cars II are as follows (CARB 2025d):

- Maximize criteria and GHG emission reductions through increased stringency and real-world reductions.
- Accelerate the transition to ZEVs through both increased stringency of requirements and associated actions to support wide-scale adoption and use.

The Advanced Clean Cars II rulemaking package also considers technological feasibility, environmental impacts, equity, economic impacts, and consumer impacts.

Executive Order N-79-20

EO N-79-20 (September 2020) requires CARB to develop regulations as follows: (1) passenger vehicle and truck regulations requiring increasing volumes of new ZEVs sold in the state toward the target of 100% of in-state sales

by 2035; (2) medium- and heavy-duty vehicle regulations requiring increasing volumes of new zero-emission trucks and buses sold and operated in the state toward the target of 100% of the fleet transitioning to ZEVs by 2045 everywhere feasible, and for all drayage trucks to be zero emission by 2035; and (3) strategies, in coordination with other state agencies, the EPA, and local air districts, to achieve 100% zero emissions from off-road vehicles and equipment operations in the state by 2035. EO N-79-20 called for the development of a ZEV Market Development Strategy, which was released in February 2021, to be updated every 3 years, that ensures coordination and implementation of the EO, and outlines actions to support new and used ZEV markets. In addition, the EO specifies identification of near-term actions and investment strategies to improve clean transportation, sustainable freight, and transit options, and calls for development of strategies, recommendations, and actions by July 15, 2021, to manage and expedite the responsible closure and remediation of former oil extraction sites as the state transitions to a carbon-neutral economy.

Advanced Clean Trucks Regulation

The Advanced Clean Trucks Regulation was also approved by CARB in 2020. The purpose of the Advanced Clean Trucks Regulation is to accelerate the market for ZEVs in the medium- and heavy-duty truck sector and to reduce air pollutant emissions generated from on-road mobile sources (CARB 2021). The regulation has two components, (1) a manufacturer sales requirement and (2) a reporting requirement:

- **Zero-emission truck sales:** Manufacturers who certify Class 2b–8 chassis or complete vehicles with combustion engines will be required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales would need to be 55% of Class 2b–3 truck sales, 75% of Class 4–8 straight truck sales, and 40% of truck tractor sales.
- **Company and fleet reporting:** Large employers, including retailers, manufacturers, brokers, and others, will be required to report information about shipments and shuttle services. Fleet owners with 50 or more trucks will be required to report about their existing fleet operations. This information will help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

3.2.3.5 Water

Executive Order B-29-15

In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have become permanent water-efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

Executive Order N-10-21

In response to a state of emergency due to severe drought conditions, EO N-10-21 (July 2021) called on all Californians to voluntarily reduce their water use by 15% from their 2020 levels. Actions suggested in EO N-10-21

include reducing landscape irrigation, running dishwashers and washing machines only when full, finding and fixing leaks, installing water-efficient showerheads, taking shorter showers, using a shut-off nozzle on hoses, and taking cars to commercial car washes that use recycled water.

3.2.3.6 Solid Waste

Assembly Bill 939, Assembly Bill 341, Assembly Bill 1826, and Senate Bill 1383

In 1989, AB 939, known as the Integrated Waste Management Act (PRC Section 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board (replaced in 2010 by the California Department of Resources Recycling and Recovery, or CalRecycle), which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed of where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by 2000.

AB 341 (2011) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by 2020, and annually thereafter. In addition, AB 341 required CalRecycle to develop strategies to achieve the state's policy goal.

AB 1826 (Chapter 727, Statutes of 2014, effective 2016) requires businesses to recycle their organic waste (i.e., food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste) depending on the amount of waste they generate per week. This law also requires local jurisdictions across the state to implement an organic waste recycling program to divert organic waste generated by businesses, including multi-family residential dwellings that consist of five or more units. The minimum threshold of organic waste generation by businesses decreases over time, which means an increasingly greater proportion of the commercial sector will be required to comply.

SB 1383 (2016) requires a 50% reduction in organic waste disposal from 2014 levels by 2020 and a 75% reduction by 2025—essentially requiring the diversion of up to 27 million tons of organic waste—to reduce GHG emissions. SB 1383 also requires that not less than 20% of edible food that is currently disposed of be recovered for human consumption by 2025.

3.2.3.7 Other State Actions

Senate Bill 97

SB 97 (2007) directed the Governor's Office of Planning and Research and CNRA to develop guidelines under CEQA for the mitigation of GHG emissions. CNRA adopted the CEQA Guidelines amendments in December 2009, which became effective in March 2010.

Under the amended CEQA Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4[a]). The CEQA Guidelines require a lead agency to consider the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]). The CEQA Guidelines also allow a lead

agency to consider feasible means of mitigating the significant effects of GHG emissions, including reductions in emissions through the implementation of project features or off-site measures (14 CCR 15126.4[c]). The adopted amendments do not establish a GHG emission threshold, instead allowing a lead agency to develop, adopt, and apply its own thresholds of significance or those developed by other agencies or experts. CNRA also acknowledged that a lead agency could consider compliance with regulations or requirements implementing AB 32 in determining the significance of a project's GHG emissions (CNRA 2009).

With respect to GHG emissions, CEQA Guidelines Section 15064.4(a), as subsequently amended in 2018, states that lead agencies "shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines now note that an agency "shall have discretion to determine, in the context of a particular project, whether to: (1) Quantify greenhouse gas emissions resulting from a project; and/or (2) Rely on a qualitative analysis or performance-based standards" (14 CCR 15064.4[a]). Section 15064.4(b) states that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment: (1) the extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]).

3.2.4 Local

3.2.4.1 Antelope Valley Air Quality Management District

The AVAQMD has adopted GHG emissions thresholds in its CEQA Guidelines but has not adopted a comprehensive strategy for reducing GHG emissions. The AVAQMD threshold is 100,000 tons of CO_2e per year, or approximately 90,718 MT CO_2e per year (AVAQMD 2016).

3.2.4.2 Southern California Association of Governments

As noted above, California's 18 MPOs have been tasked with creating SCSs in an effort to reduce the region's VMT in order to help meet AB 32 targets through integrated transportation, land use, housing, and environmental planning. Pursuant to SB 375, CARB set per-capita GHG emissions reduction targets from passenger vehicles for each of the state's 18 MPOs. For the SCAG, the state's initial mandated reductions were set at 8% by 2020 and 13% by 2035. In March 2018, CARB updated the SB 375 targets for SCAG to require 8% reduction by 2020 and a 19% reduction by 2035 in per-capita passenger vehicle GHG emissions.

Pursuant to Government Code Section 65080(b)(2)(B), the SCS must "set forth forecasted development pattern for the region which when integrated with the transportation network, and other transportation measures and policies, will reduce the GHG emissions from automobiles and light trucks to achieve the GHG reduction targets." To that end, SCAG has developed the 2024–2050 RTP/SCS, also referred to as Connect SoCal 2024, which complies with CARB's updated emissions reduction targets and meets the requirements of SB 375 by achieving per-capita GHG emissions reductions relative to 2005 of 8% by 2020 and 19% by 2035 (SCAG 2024). The 2024–2050 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, and charts a path toward a more mobile, sustainable and prosperous region by making connections between transportation networks, between planning strategies, and between the people whose

collaboration can improve the quality of life for Southern Californians. Connect SoCal embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura (SCAG 2024).

3.2.4.3 City of Palmdale General Plan

The Sustainability, Climate Action, and Resilience Element of the City's *Palmdale 2045* General Plan establishes goals and policies to reduce GHGs in the City and serves as the City's Climate Action Plan (CAP) (City of Palmdale 2023a). Pursuant to CEQA Guidelines Section 15183.5, the CAP would meet the requirements of a qualified CAP, and future residential and nonresidential projects developed would be able to tier from the CAP for analysis purposes. The following goals and policies from the CAP would be applicable to the project:

Clean Energy

Goal SCR-2. Utilize a fossil fuel free energy system (SB 100).

Policy SCR-2.1. **Carbon free energy**. Direct EPIC to provide 75% carbon-free or renewable electricity to residents and businesses by 2030, achieving 100% carbon-free electricity by 2045.

Policy SCR-2.3. **Battery permitting**. Establish a streamlined approval process for battery storage systems.

Buildings

Goal SCR-3. Green and decarbonized buildings for new construction and major renovations.

Policy SCR-3.1. **Energy efficient new construction**. Integrate CALGreen Tier 1 and Tier 2 green building and energy efficiency standards into new construction and major remodels.

Policy SCR-3.3. **Solar and storage**. Require installation of photovoltaic panels and battery storage on all residential new construction and nonresidential new construction over 5,000 sq. ft.

Transportation

Goal SCR-4. Reduced GHG emissions from transportation (SB 379, EO N-79-20).

Policy SCR-4.1. **Bike facilities**. Promote bicycle use with new private development projects through requirements for bicycle parking, lockers and showers, bike share facilities, and when feasible, connections to City bike lanes.

Policy SCR-4.4. **EV reach code**. Adopt EV requirements beyond CALGreen in both number of chargers and charger capacity.

Solid Waste

Goal SCR-5. Increased resource capture and reduced waste sent to landfills (SB 1383).

Policy SCR-5.2. **Organic waste diversion.** Establish programs to comply with State-established requirements for organics and food waste diversion.

Policy SCR-5.4. **Nonresidential collection efficiency**. Continue to review waste franchise agreements to establish rate structures that encourage less frequent nonresidential collection.

Water and Wastewater

Goal SCR-6. Safe and secure water supply.

Policy SCR-6.2. **Water efficiency standards.** Establish water efficiency standards that are more stringent than CALGreen and model water efficient landscape ordinance (MWELO).

Policy SCR-6.3. **Low-water use plant list**. Implement the City's landscape plant list and use of low-water plants in new or renovated landscaped areas.

Policy SCR-6.4. **Rainwater capture.** Encourage rainwater capture and use of cisterns for outdoor watering purposes.

Ecosystems

Goal SCR-7. Open spaces designed to provide multiple climate and sustainability functions.

Policy SCR-7.1. **Tree planting in public spaces.** Plant additional trees on streets, parks, and other public spaces to sequester carbon, provide shade, contribute to stormwater management, provide habitat, and enhance community character.

Policy SCR-7.3. **Tree planting on private property**. Adopt a tree preservation ordinance to encourage tree preservation and additional planting on private property as appropriate.

Policy SCR-7.4. **Green infrastructure.** Integrate green infrastructure stormwater management practices into the design of open spaces and public rights-of-way.

Policy SCR-7.5. **Cool pavement.** Incorporate cool pavement practices into street maintenance activities to reduce the urban heat island effect.

3.3 Significance Criteria and Methodology

3.3.1 Thresholds of Significance

California has developed guidelines to address the significance of GHG emissions impacts that are contained in Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.). Appendix G provides that a project would have a significant environmental impact if it would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment

2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

In addition, the CEQA Guidelines specify that "[w]hen adopting or using thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence" (14 CCR 15064.7[c]).

The extent to which a project increases or decreases GHG emissions in the existing environmental setting should be estimated in accordance with CEQA Guidelines Section 15064.4, Determining the Significance of Impacts from Greenhouse Gas Emissions. The CEQA Guidelines indicate that when calculating GHG emissions resulting from a project, lead agencies shall make a good-faith effort based on scientific and factual data (Section 15064.4[a]), and lead agencies have discretion to select the model or methodology deemed most appropriate for enabling decision makers to intelligently assess the project's incremental contribution to climate change (Section 15064.4 [c]).

The CEQA Guidelines do not indicate an amount of GHG emissions that constitutes a significant impact on the environment. Instead, they authorize the lead agency to consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence (CEQA Guidelines Sections 15064.4[a] and 15064.7[c]).

The Governor's Office of Planning and Research (OPR) technical advisory titled CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review, states that "public agencies are encouraged but not required to adopt thresholds of significance for environmental impacts. Even in the absence of clearly defined thresholds for GHG emissions, the law requires that such emissions from CEQA projects must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact" (OPR 2018). Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,' individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice" (OPR 2008).

Approach to Determining Significance

The City has not adopted a numeric significance threshold for determining significant impacts associated with GHG emissions. Air districts typically act in an advisory capacity to local governments in establishing the framework for environmental review of air pollution impacts under CEQA. This may include recommendations regarding significance thresholds, analytical tools to estimate emissions and assess impacts, and mitigations for potentially significant impacts. Although air districts will also address some of these issues on a project-specific basis as responsible agencies, they may provide general guidance to local governments on these issues (SCAQMD 2008b). While the project is located within the jurisdiction of the AVAQMD, both AVAQMD and the SCAQMD recommended thresholds are discussed below. Because SCAQMD's thresholds are more stringent and are backed by substantial evidence from an expert agency, the SCAQMD's recommended thresholds are used for determining the potential significance of impacts for the project, as discussed below.

On May 13, 2010, EPA finalized the GHG Tailoring Rule (75 FR 31514, June 3, 2010). The Tailoring Rule sets major source emissions thresholds that define when federal operating permits under Prevention of Significant Deterioration or Title V are required. The Tailoring Rule establishes a threshold of 100,000 tons per year or

90,719 MT per year of GHGs from new sources above which sources are considered major sources requiring a federal operating permit. As such, the AVAQMD has adopted a significance threshold for GHGs of 100,000 tons per year. More specifically, 100,000 tons per year of GHG emissions from a single facility constitutes major sources that require a federal operating permit. Similarly, the AVAQMDs NO_x significance threshold of 25 tons per year is equal to the major source threshold applicable to areas designated severe non-attainment for O_3. As such, use of the EPA's determination of whether a project is a major source and consequently establishing a threshold based on that is supported by substantial evidence.

The SCAQMD, which oversees the adjacent South Coast Air Basin, has recommended more stringent numeric CEQA significance thresholds for GHG emissions for lead agencies to use in assessing GHG impacts of residential and commercial development projects; however, these thresholds were not adopted. The SCAQMD formed a GHG CEQA Significance Threshold Working Group to work with SCAQMD staff on developing GHG CEQA significance thresholds until statewide significance thresholds or guidelines are established. From December 2008 to September 2010, the SCAQMD hosted working group meetings and revised the draft threshold proposal several times, although it did not officially provide these proposals in a subsequent document. The SCAQMD has continued to consider adoption of significance thresholds for residential and general land use development projects. The most recent proposal, issued in September 2010, uses the following tiered approach to evaluate potential GHG impacts from various uses (SCAQMD 2010):

- **Tier 1.** Determine if CEQA categorical exemptions are applicable. If not, move to Tier 2.
- **Tier 2.** Consider whether or not the proposed project is consistent with a locally adopted GHG reduction plan that has gone through public hearing and CEQA review, that has an approved inventory, includes monitoring, etc. If not, move to Tier 3.
- **Tier 3.** Consider whether the project generates GHG emissions in excess of screening thresholds for individual land uses. The 10,000 MT CO2e per year threshold for industrial uses and stationary projects would be recommended for use by all lead agencies. Under option 1, separate screening thresholds are proposed for residential projects (3,500 MT CO2e per year), commercial projects (1,400 MT CO2e per year), and mixed-use projects (3,000 MT CO2e per year). Under option 2, a single numerical screening threshold of 3,000 MT CO_2e per year would be used for all non-industrial projects. If the project generates emissions in excess of the applicable screening threshold, move to Tier 4.
- **Tier 4.** Consider whether the project generates GHG emissions in excess of applicable performance standards for the project service population (population plus employment). The efficiency targets were established based on the goal of AB 32 to reduce statewide GHG emissions to 1990 levels by 2020. The 2020 efficiency targets are 4.8 MT CO2e per service population for project level analyses and 6.6 MT CO2e per service population for plan level analyses. If the project generates emissions in excess of the applicable efficiency targets, move to Tier 5.
- **Tier 5.** Consider the implementation of CEQA mitigation (including the purchase of GHG offsets) to reduce the project efficiency target to Tier 4 levels.

Based on the supporting analysis outlined in SCAQMD's draft GHG guidance and meeting notes, the 3,000 MT CO_2e per year level would capture 90% of GHG emissions from new residential or commercial projects in the region (SCAQMD 2008b). This type of market capture analysis captures a substantial fraction of the GHG emissions from future development to accommodate for future population and job growth and excludes small development projects that would contibute a relatively small fraction of the cumulative statewide GHG emissions.

While the City has not adopted a numeric significance threshold, the City has previously relied on use of the 3,000 MT CO_2e per year threshold to evaluate the potential for a project to resut in a signficant GHG emissions impact under CEQA because it has been recommended by SCAQMD and SCAQMD is an expert agency in the Southern California region. Further, the SCAQMD provides substantial evidence that the thresholds are consistent with policy goals and 2050 GHG emissions reduction targets set by the state. Specifically, the thresholds were set at levels that capture 90% of the GHG emissions from the above-described uses, consistent with EO S-3-05 target of reducing GHGs to 80% below 1990 levels by 2050. Finally, the SCAQMD specifically recommended that the 3,000 MT CO_2e per year threshold be used by lead agencies for not only residential and commercial projects, but also industrial parks and warehouses as well (SCAQMD 2008b).

In addition, the project was evaluated for its potential to conflict with SB 32 (2017 Scoping Plan) and AB 1279 (2022 Scoping Plan), the City's CAP, and SCAG's RTP/SCS.

3.3.2 Approach and Methodology

3.3.2.1 Construction

Construction of the project would result in emissions of GHG emissions primarily associated with use of off-road construction equipment, on-road truck trips, and worker vehicle trips. As discussed previously in Section 2.3.2.1, emissions from the construction phase of project components were estimated using the CalEEMod Version 2022.1. Per preliminary project details, it is assumed that construction of the project would begin in January 2026 and would be completed by June 2027. A detailed depiction of the construction schedule—including information regarding phasing, equipment used during each phase, trucks, and worker vehicles—is included in Section 2.3.2.1 above, and complete details of the emissions calculations are provided in Appendix A.

3.3.2.2 Operation

As with the air quality analysis, emissions from the operational phase of the project were estimated primarily using CalEEMod Version 2022.1. An operational year of 2027 was assumed consistent with completion of project construction.

Mobile Sources (Motor Vehicles)

All details for criteria air pollutants discussed previously in Section 2.3.2.2 are also applicable for the estimation of operational-related GHG emissions are also applicable for the estimation of operational mobile source GHG emissions. Regulatory measures related to mobile sources include AB 1493 (Pavley) and related federal standards. AB 1493 required that CARB establish GHG emission standards for automobiles, light-duty trucks, and other vehicles that are primarily used for noncommercial personal transportation in the state. In addition, the NHTSA and EPA have established corporate fuel economy standards and GHG emission standards, respectively, for automobiles and light-, medium-, and heavy-duty vehicles. Implementation of these standards and fleet turnover (replacement of older vehicles with newer ones) will gradually reduce emissions from the project's motor vehicles. The effectiveness of fuel economy improvements was evaluated using the CalEEMod emission factors for motor vehicles in 2027 to the extent it was captured in CalEEMod 2022.1, which is based on the Emission FACtor (EMFAC) 2021 model.

Area Sources

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, roto tillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers, as well as air compressors, generators, and pumps. The emissions associated from landscape equipment use were estimated using CalEEMod defaults.

Energy

GHGs are emitted from buildings as a result of activities for which electricity and natural gas are typically used as energy sources. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building. GHGs are also emitted during the generation of electricity from fossil fuels; these emissions are considered to be indirect emissions. GHG emissions associated with the natural gas and electricity usage associated with the project were calculated by CalEEMod using default parameters.

The CalEEMod default energy intensity factor (CO_2, CH_4, and N_2O mass emissions per kilowatt-hour) for Southern California Edison (SCE) was applied, which is based on the projected value for SCE's energy mix in 2027 (CAPCOA 2022). As explained in Section 3.2.3.3, SB 100 and SB 1020 call for further development of renewable energy, with targets of 52% by December 31, 2027; 60% by December 31, 2030; 90% by December 31, 2035; 95% by December 31, 2040; and 100% by December 31, 2045. As such, GHG emissions associated with project electricity demand would continue to decrease over time.

Water and Wastewater

Indirect GHG emissions result from the production of electricity used to convey, treat and distribute water and wastewater. The amount of electricity required to convey, treat and distribute water depends on the volume of water as well as the sources of the water. GHG emissions associated with project water consumption were calculated using CalEEMod using default parameters.

Solid Waste

The project would generate solid waste. A large percentage of this waste will be diverted from landfills by a variety of means, such as reducing the amount of waste generated, recycling, and/or composting. The remainder of the waste not diverted will be disposed of at a landfill. GHG emissions from landfills are associated with the anaerobic breakdown of material. GHG emissions associated with the disposal of solid waste associated with the project were calculated by CalEEMod using default parameters.

Refrigerants

Refrigerants are substances used in equipment for air conditioning (A/C) and refrigeration. Most of the refrigerants used today are hydrofluorocarbons or blends thereof, which can have high GWP values. All equipment that uses refrigerants has a charge size (i.e., quantity of refrigerant the equipment contains), and an operational refrigerant leak rate, and each refrigerant has a GWP that is specific to that refrigerant. CalEEMod default values were applied, which quantify refrigerant emissions from leaks during regular operation and routine servicing over the equipment lifetime, and then derives average annual emissions from the lifetime estimate (CAPCOA 2022).

Off-Road Equipment

Regarding cargo handling equipment, as described in Section 2.3.2.2, on-site modeled operational diesel-fueled equipment would include a total of 50 forklifts operating at 24 hours a day for 365 days of the year.

Stationary Sources

As described in Section 2.3.2.2, the project would potentially operate one diesel-fueled 1,000-hp generator and one diesel-fueled 300-hp fire pump for emergency use. These stationary sources were assumed to operate for up to 50-hours a year for routine testing and maintenance.

Transport Refrigeration Units

All details for TRU-related criteria air pollutants discussed previously in Section 2.3.2.2 are also applicable for the estimation of operational-related GHG emissions. Based on data from the project's TIA (Translutions, Inc. 2025), the project would generate 188 truck delivery trips per day to the High-Cube Cold Storage warehouse space of the building (25% of the building space), all of which were assumed be equipped with TRUs.

3.4 Impact Analysis

3.4.1 Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction of the project would result in GHG emissions, which are primarily associated with the use of off-road construction equipment, haul trucks, on-road vendor trucks, and worker vehicles. AVAQMD follows the SCAQMD recommendation in calculating the total GHG emissions for construction activities by amortizing the emissions over the life of a project. This is done by dividing construction-period GHG emissions by a 30-year project life then adding that number to the annual operational phase GHG emissions. As such, project construction emissions were amortized over a 30-year period and added to the annual operational phase GHG emissions. The amortized construction emissions are presented in Table 23.

Table 23. Estimated Annual Construction GHG Emissions

Year	CO_2	CH_4	N_2O	R	CO_2e
	metric tons per year				
2026	2,555.64	0.09	0.06	0.35	2,576.39
2027	581.68	0.02	0.02	0.13	588.26
Total for All Years of Construction	**3,137.32**	**0.11**	**0.08**	**0.49**	**3,164.65**
				Amortized Over 30-Years	*105.49*

Source: Appendix A.
Notes: GHG = greenhouse gas; CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; R = Refrigerants; CO_2e = carbon dioxide equivalent.
Totals may not sum due to rounding.

As shown in Table 23, total estimated GHG emissions generated during construction of the project are approximately 3,165 MT CO_2e. Estimated project-generated construction emissions amortized over 30 years would be approximately 105 MT CO_2e per year.

Operation of the project would generate GHG emissions from mobile sources (vehicular traffic), area sources (landscape maintenance equipment operation), energy use (natural gas combustion and utility generation of electricity consumed by the project), water supply, treatment, and distribution and wastewater treatment, solid waste disposal, refrigerants, off-road equipment, stationary sources, and TRUs. The estimated unmitigated operational GHG emissions are shown in Table 24. Detailed operational model outputs are presented in Appendix A.

Table 24. Estimated Annual Operational Greenhouse Gas Emissions - Unmitigated

Emission Source	CO_2	CH_4	N_2O	R	CO_2e
	metric tons per year				
Mobile	10,987.84	0.08	1.40	15.05	11,423.03
Area	14.60	<0.01	<0.01	0.00	14.65
Energy	2,409.84	0.22	0.02	0.00	2,420.52
Water	286.74	7.54	0.18	0.00	529.31
Waste	83.87	8.38	0.00	0.00	293.45
Refrigerants	0.00	0.00	0.00	1,103.06	1,103.06
Off-Road Equipment	3,786.05	0.15	0.03	0.00	3,799.05
Stationary	33.91	<0.01	<0.01	0.00	34.02
Transport Refrigeration Units	0.62	0.00	0.00	0.00	0.62
Total	**17,603.47**	**16.38**	**1.63**	**1,118.12**	**19,617.71**
				Amortized Construction Emissions	*105.49*
				Operational Emissions plus Amortized Construction Emissions	**19,723.20**

Source: Appendix A.
Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; R=refrigerants; CO_2e = carbon dioxide equivalent.
Values of "<0.01" indicate that the estimated emissions are less than 0.01 metric tons per year. Totals may not sum due to rounding.

As shown in Table 24, the project would result in approximately 19,723 MT CO_2e per year, including amortized construction emissions, which would exceed the applied GHG threshold of 3,000 MT CO_2e per year. Therefore, the project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, and this would represent a cumulatively potentially significant impact.

Mitigation measures are required to minimize operational-related GHG impacts. Most GHGs associated with the project are generated by on-road vehicles, diesel-fueled off-road forklifts, and energy sources. MM-AQ-4 requires measures to minimize on-road vehicle emissions, including the provision of EV charging stations and electrical hook-ups for TRUs. MM-AQ-5 includes the requirement for all off-road forklifts and landscaping equipment to be zero-emission, which would reduce the long-term criteria air pollutant emissions substantially. MM-AQ-7 requires the warehouse building to be all-electric (i.e., no natural gas). Finally, implementation of MM-GHG-1 through MM-GHG-3 would reduce GHG emissions associated with renewable/energy efficiency, solid waste disposal, and water conservation. Table 25 summarizes the mitigated annual operational emissions associated with the project. Detailed operational model outputs are presented in Appendix A.

Table 25. Estimated Annual Operational Greenhouse Gas Emissions - Mitigated

Emission Source	CO_2	CH_4	N_2O	R	CO_2e
	metric tons per year				
Mobile	10,987.84	0.08	1.40	15.05	11,423.03
Area	0.00	0.00	0.00	0.00	0.00
Energy	749.89	0.07	0.01	0.00	754.26
Water	229.39	6.03	0.14	0.00	423.45
Waste	41.94	4.19	0.00	0.00	146.72
Refrigerants	0.00	0.00	0.00	1,103.06	1,103.06
Off-Road Equipment	0.00	0.00	0.00	0.00	0.00
Stationary	33.91	<0.01	<0.01	0.00	34.02
Transport Refrigeration Units	0.62	0.00	0.00	0.00	0.62
Total	**12,043.58**	**10.38**	**1.56**	**1,118.12**	**13,885.16**
				Amortized Construction Emissions	*105.49*
				Operational Emissions plus Amortized Construction Emissions	**13,990.65**

Source: Appendix A.
Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; R=refrigerants; CO_2e = carbon dioxide equivalent; <0.01 = reported value less than 0.01.
Includes implementation of MM-AQ-4, MM-AQ-6, MM-AQ-7, and MM-GHG-1 through MM-GHG-3.

As depicted in Table 25, the project would still exceed the applied threshold of 3,000 MT CO_2e per year after mitigation. Although mobile vehicles are the main source of GHG emissions associated with project operations, neither the project applicant nor the City can substantively or materially affect reductions in the project's on-road mobile source emissions beyond what is already required by federal and state regulation. No feasible mitigation measures beyond those already identified exist that would reduce these emissions to levels that are less than significant. Therefore, even with the incorporation of mitigation, long-term impacts associated with a cumulatively considerable increase in GHG emissions would be significant and unavoidable.

Mitigation Measures

Implement MM-AQ-4, MM-AQ-6, MM-AQ-7, which would reduce operational off-road equipment and on-road GHG emissions to the extent feasible, as well as GHGs from the elimination of natural gas for building operation. In addition, the following mitigation measures would also reduce GHG emissions associated with energy, solid waste, and water conservation:

MM-GHG-1 **Energy Demand Minimization.** The project shall implement the following measure to reduce operational energy source GHG emissions to the extent feasible:

- The proposed building shall offset at least 75 percent of its operational energy demand within the building envelope through renewable energy generation, demonstrated to the City of Palmdale prior to issuance of a Certificate of Occupancy. To achieve all or part of this requirement, the roof of the building shall be outfitted with a solar photovoltaic system of the maximum size feasible given building tenant electrical demands, applicable Building Code requirements, clearance requirements around skylights and roof-mounted equipment, utility company interconnection regulations, transformer capacity, and other applicable code compliance constraints. Prior to issuance of a certificate of occupancy for the tenant, the City

shall verify that the roof-mounted solar photovoltaic systems are either installed, or that the systems have been ordered and are scheduled to be installed within 12 months of tenant occupancy. The number of solar panels shall not exceed the total available roof space and the available total Kilovolt-Amperes (kVA) used to service the building by a Southern California Edison (SCE) final approved drawing showing the transformer size and capacity.

- All heating, cooling, lighting, and appliance fixtures shall be Energy Star-rated.

MM-GHG-2 **Solid Waste Diversion**. To reduce the amount of waste disposed at landfills, the project would implement solid waste program that would divert at least 50% of the project's solid waste. Prior to the issuance of building permits for the project, the project applicant shall provide building plans that include the following solid waste reduction measures:

- Provide storage areas for recyclables and green waste in new construction, and food waste storage, if a pick-up service is available.
- Evaluate the potential for on-site composting and implement composting if it is determined to be feasible.

MM-GHG-3 **Water Conservation**. To reduce water demands and associated energy use, a Water Conservation Strategy shall be implemented that achieves a minimum 20% reduction in indoor and outdoor water usage when compared to baseline water demand (total expected water demand without implementation of the Water Conservation Strategy). Prior to the issuance of building permits for the project, the project applicant shall provide building plans that include, but not limited to, the following water conservation measures:

- The project's landscape plan shall emphasize drought-tolerant plants and use water-efficient irrigation techniques
- All fixtures installed in restrooms and employee break areas would be U.S. Environmental Protection Agency WaterSense Certified or equivalent
- Install dual-flush toilets
- Install rainwater collection systems where feasible.

Level of Significance After Mitigation

Impacts would remain significant and unavoidable.

3.4.2 Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Potential to Conflict with the City's General Plan

As previously stated, the Sustainability, Climate, and Resilience Element of the City's *Palmdale 2045* serves as the City's CAP and presents a number of strategies that make it possible for the City to meet California's GHG emissions

targets (City of Palmdale 2023a). As described below, the project would generally be consistent with these reduction strategies and would support the City's CAP.

- **Clean Energy.** The project would require measures that would support renewable energy generation and energy efficiency, as specified in MM-GHG-1 (Energy Demand Minimization). These would include, but not limited to, installation of rooftop solar of the maximum size feasible to meet a least 75% of the building's anticipated total operational electricity requirements and the installation of Energy Star-rated heating, cooling, lighting, and appliances.
- **Buildings.** The project would support the green building strategies of the City's CAP by through the provision of an all-electric building (MM-AQ-7), as well as the installation of a solar photovoltaic system and energy efficient appliances (MM-GHG-1).
- **Transportation.** The project would require measures that would support reducing GHGs through the transportation sector. Specifically, implementation of MM-AQ-4 requires the installation of Level 2 (or faster) EV chargers and electrical conduit and infrastructure accommodations for future auto and truck charging stations. In addition, MM-AQ-4 also requires electrical hook-ups for TRUs, stringent anti-idling restrictions, and the establishment of transportation demand management programs for occupants with more than 250 employees in order to reduce employee commute vehicle emissions. Finally, although the requirement for all cargo handling and landscaping equipment to be zero-emission (MM-AQ-5) would not specifically be in the transportation sector, it would also substantially reduce GHG emissions.
- **Solid Waste.** The project would be consistent with the solid waste strategies of the CAP, which requires waste diversion to reduce the amount of waste disposed at landfills through the provision of storage areas for recyclables, green waste, and food waste (MM-GHG-2).
- **Water and Wastewater.** The project would implement MM-GHG-3, which requires water efficient landscaping and low-flow indoor fixtures to reduce outdoor and indoor water usage when compared to baseline water demand. As water conveyance and treatment generates GHGs indirectly due to the electricity involved in the process, reducing water demand would also reduce the amount of electricity required.
- **Ecosystems.** A variety of trees, shrubs, and groundcovers would be planted within the project frontage's landscape setback area, within the landscape areas found around the parking lot areas and perimeter of the project site, pursuant to City requirements.

Potential to Conflict with SCAG's RTP/SCS

On April 4, 2024, SCAG adopted the 2024–2050 RTP/SCS, also referred to as Connect SoCal 2024. Connect SoCal 2024 builds on the prior RTP/SCS and identifies the following strategy areas to support its environmental goals: Sustainable Development, Air Quality, Clean Transportation, Natural and Agricultural Lands Preservation, and Climate Resilience (SCAG 2024). The primary objective of the RTP/SCS is to provide guidance for future regional growth (i.e., the location of new residential and non-residential land uses) and transportation patterns throughout the region, as stipulated under SB 375. The project's potential to conflict with the 2024–2050 RTP/SCS strategies is presented below.

- **Sustainable Development.** The 2024–2050 RTP/SCS identifies sustainable development, including water and energy-efficient building practices and green infrastructure, as a strategy to reduce GHG emissions. The project would support this strategy by requiring an all-electric building (MM-AQ-7) and including rooftop

solar and energy star appliances into the project design (MM-GHG-1), as well as water conservation measures (MM-GHG-3).

- Air Quality. The 2024–2050 RTP/SCS identifies air quality as an environmental strategy because the transportation sector is the predominant source of criteria air pollutant emissions in the region. The 2024–2050 RTP/SCS states that a comprehensive and coordinated regional solution with integrated land use and transportation planning from all levels of governments will be required to achieve the needed emission reductions (SCAG 2024). According to the SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy, the region will run out of suitably zoned vacant land designated for warehouse facilities in or around 2028. Thus, the project would meet the growing demand for warehousing space and would do so in an area that is proximate to regional highways (State Route 14 and State Route 138), thereby reducing the need for longer distance trips, which could result in additional air pollutant and GHG emissions. Additionally, the project would employ approximately 1,180 workers, helping the City better meet its jobs/housing balance, which should shorten commute distances of City residents who choose to work on the project site, which would have a direct positive effect on tailpipe GHG and air contaminant emissions.
- Clean Transportation. One of the technology innovations identified in the 2024–2050 RTP/SCS that would apply to the project is the promotion and support of low emission technologies for transportation, such as alternative fueled vehicles to reduce per capita GHG emissions. For this particular project, MM-AQ-4 would require the installation of Level 2 (or faster) EV chargers and conduit in tractor trailer parking areas to support future truck charging stations, as well as MM-AQ-5, which would require that all cargo handling and landscaping equipment to be zero-emission.
- Natural and Agricultural Lands Preservation. The 2024–2050 RTP/SCS promotes the conservation and restoration of natural and agricultural lands through several policies, such as quantifying the carbon sequestration potential of natural and agricultural lands and prioritizing sensitive habitat and wildlife corridors for permanent protection. The project would be located on an area zoned for industrial and business uses. The project site does not support agriculture.
- Climate Resilience. The 2024–2050 RTP/SCS promotes regional coordination and solutions for effective emergency response for climate-related hazards. Additionally, in the category of climate resilience, SCAG has established the following policies: prioritize the most vulnerable populations and communities subject to climate hazards, support local and regional climate and hazard planning, support nature-based solutions to increase regional resilience, promote sustainable water use planning, and support an integrated planning approach to help jurisdictions meet housing needs in a drier environment. While the project does not directly pertain to these regional coordination efforts for climate resilience, the project would not interfere with this strategy.

Based on the analysis above, the project would be consistent with the SCAG 2024–2050 RTP/SCS.

Project Potential to Conflict with State Reduction Targets and CARB's Scoping Plan

As discussed in Section 3.2.3, the California State Legislature passed AB 32 to provide initial direction to limit California's GHG emissions to 1990 levels by 2020 and initiate the state's long-range climate objectives. Since the passage of AB 32, the state has adopted GHG emissions reduction targets for future years beyond the initial 2020 horizon year. CARB is required to develop a Scoping Plan, which provides the framework for actions to achieve the state's GHG emission targets. While the Scoping Plan is not directly applicable to specific projects, nor is it intended to be used as the sole basis for project-level evaluations, it is the official framework for the measures and

regulations that will be implemented to reduce California's GHG emissions in alignment with the adopted targets. Therefore, a project would be found to not conflict with the statutes if it meets the Scoping Plan policies and would not impede attainment of the goals therein.

For the project, the relevant GHG emissions reduction targets include those established by SB 32 and AB 1279, which require GHG emissions be reduced to 40% below 1990 levels by 2030, and 85% below 1990 levels by 2045, respectively. In addition, AB 1279 requires the state achieve net zero GHG emissions by no later than 2045 and achieve and maintain net negative GHG emissions thereafter. CARB's 2017 Scoping Plan update was the first to address the state's strategy for achieving the 2030 GHG reduction target set forth in SB 32 (CARB 2017a), and the most recent CARB 2022 Scoping Plan update outlines the state's plan to reduce emissions and achieve carbon neutrality by 2045 in alignment with AB 1279 and assesses progress is making toward the 2030 SB 32 target (CARB 2022). As such, given that SB 32 and AB 1279 are the relevant GHG emission targets, the 2017 and 2022 Scoping Plan updates that outline the strategy to achieve those targets, are the most applicable to the project.

The 2017 Scoping Plan included measures to promote renewable energy and energy efficiency (including the mandates of SB 350), increase stringency of the low-carbon fuel standard, measures identified in the Mobile Source and Freight Strategies, measures identified in the proposed SLCP Plan, and increase stringency of SB 375 targets. The 2022 Scoping Plan builds upon and accelerates programs currently in place, including moving to zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; and displacement of fossil-fuel fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines) (CARB 2022). Many of the measures and programs included in the Scoping Plan would result in the reduction of project-related GHG emissions with no action required at the project level, including GHG emission reductions through increased energy efficiency and renewable energy production (SB 350), reduction in carbon intensity of transportation fuels (low-carbon fuel standard), and the accelerated efficiency and electrification of the statewide vehicle fleet (Mobile Source Strategy). Table 26 summarizes the project's potential to conflict with the applicable 2017 Scoping Plan.

Table 26. Project Potential to Conflict with 2017 Scoping Plan

Action	Responsible Parties	Potential to Conflict
Implement SB 350 by 2030		
Increase the Renewables Portfolio Standard to 50% of retail sales by 2030 and ensure grid reliability.	CPUC, CEC, CARB	*No conflict*. The project would use energy from Southern California Edison (SCE). SCE has committed to diversify its portfolio of energy sources by increasing energy from wind and solar sources. The project would not interfere with or obstruct SCE energy source diversification efforts.
Establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030.		*No conflict*. The project would be constructed in compliance with the current California Building Code requirements at the time of construction. Currently, new buildings must achieve compliance with the applicable 2022

Table 26. Project Potential to Conflict with 2017 Scoping Plan

Action	Responsible Parties	Potential to Conflict
Reduce GHG emissions in the electricity sector through the implementation of the above measures and other actions as modeled in Integrated Resource Planning (IRP) to meet GHG emissions reductions planning targets in the IRP process. Load-serving entities and publicly- owned utilities meet GHG emissions reductions planning targets through a combination of measures as described in IRPs.		Building and Energy Efficiency Standards and the 2022 California Green Building Standards requirements. In addition, the project would implement MM-AQ-7, which requires an all-electric building (i.e., no natural gas), as well as MM-GHG-1, which specifies that the project would commit to renewable energy sufficient to meet at least 75% of the project's total operational energy requirements from within the building envelope, as well as install Energy Star-rated heating, cooling, lighting, and appliances.
Implement Mobile Source Strategy (Cleaner Technology and Fuels)		
At least 1.5 million zero emission and plug-in hybrid light-duty EVs by 2025.	CARB, California State Transportation Agency (CalSTA), Strategic Growth Council (SGC), California Department of Transportation (Caltrans), CEC, OPR, Local Agencies	*No conflict*. This is a CARB Mobile Source Strategy. The project would not obstruct or interfere with CARB zero emission and plug-in hybrid light-duty EV 2025 targets. As this is a CARB enforced standard, vehicles that access the project are required to comply with the standards and will therefore comply with the strategy.
At least 4.2 million zero emission and plug-in hybrid light-duty EVs by 2030.		*No conflict*. This is a CARB Mobile Source Strategy. The project would not obstruct or interfere with CARB zero emission and plug-in hybrid light-duty EV 2030 targets. As this is a CARB enforced standard, vehicles that access the project are required to comply with the standards and will therefore comply with the strategy.
Further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean cars regulations.		*No conflict*. This is a CARB Mobile Source Strategy. The project would not obstruct or interfere with CARB efforts to further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean cars regulations. As this is a CARB enforced standard, vehicles that access the project are required to comply with the standards and will therefore comply with the strategy.

Table 26. Project Potential to Conflict with 2017 Scoping Plan

Action	Responsible Parties	Potential to Conflict
Medium- and Heavy-Duty GHG Phase 2.		***No conflict***. This is a CARB Mobile Source Strategy. The project would not obstruct or interfere with CARB efforts to implement Medium- and Heavy-Duty GHG Phase 2. As this is a CARB enforced standard, vehicles that access the project are required to comply with the standards and will therefore comply with the strategy.
Last Mile Delivery: New regulation that would result in the use of low NO_X or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for class 3-7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5% of new Class 3–7 truck sales in local fleets starting in 2020, increasing to 10% in 2025 and remaining flat through 2030.		***No conflict***. This is a CARB Mobile Source Strategy. The project would not obstruct or interfere with CARB cleaner last mile delivery trucks in California. As this is a CARB enforced standard, vehicles that access the project are required to comply with the standards and will therefore comply with the strategy. In addition, MM-AQ-4 requires the project to install conduit to support future electric truck charging stations.
Harmonize project performance with emissions reductions and increase competitiveness of transit and active transportation modes (e.g. via guideline documents, funding programs, project selection, etc.).	CalSTA, SGC, OPR, CARB, Governor's Office of Business and Economic Development (GO-Biz), California Infrastructure and Economic Development Bank (IBank), Department of Finance (DOF), California Transportation Commission (CTC), Caltrans	***No conflict***. The project would not obstruct or interfere with agency efforts to harmonize transportation facility project performance with emissions reductions and increase competitiveness of transit and active transportation modes.
By 2019, develop pricing policies to support low-GHG transportation (e.g. low-emission vehicle zones for heavy duty, road user, parking pricing, transit discounts).	CalSTA, Caltrans, CTC, OPR, SGC, CARB	***No conflict***. The project would not obstruct or interfere with agency efforts to develop pricing policies to support low-GHG transportation.
Implement California Sustainable Freight Action Plan		

Table 26. Project Potential to Conflict with 2017 Scoping Plan

Action	Responsible Parties	Potential to Conflict
Improve freight system efficiency.	CalSTA, CalEPA, CNRA, CARB, Caltrans, CEC, GO-Biz	*No conflict*. This measure would apply to all trucks accessing the project site, including existing trucks or new trucks that are part of the statewide goods movement sector. The project would not obstruct or interfere with agency efforts to improve freight system efficiency.
Adopt a Low Carbon Fuel Standard with a Carbon Intensity reduction of 18%.	CARB	*No conflict*. This measure, which was increased to 20% reduction in carbon intensity by 2030, applies to all fuel purchased and used by the project vehicles in the state. The project would not obstruct or interfere with agency efforts to implement a Low Carbon Fuel Standard.
By 2018, develop Integrated Natural and Working Lands Implementation Plan to secure California's land base as a net carbon sink		
Utilize wood and agricultural products to increase the amount of carbon stored in the natural and built environments		*No conflict*. To the extent appropriate for the proposed industrial buildings, wood products would be used in construction.

Source: CARB 2017a.

Table 27 highlights the measures from the 2022 Scoping Plan that are relevant to the project.

Table 27. Project Potential to Conflict with 2022 Scoping Plan

Sector	Action	Potential to Conflict
GHG Emissions Reductions Relative to the SB 32 Target	40% below 1990 levels by 2030	*No conflict*. While the SB 32 GHG emissions reduction target is not an Action that is analyzed independently, it is included in Table 2-1 of the 2022 Scoping Plan for reference. The project would not obstruct or interfere with agency efforts to meet the SB 32 reduction goal.
Smart Growth / VMT	VMT per capita reduced 25% below 2019 levels by 2030, and 30% below 2019 levels by 2045	*No conflict*. The project would not obstruct or interfere with agency efforts to meet this regional VMT reduction goal, including through implementation of SB 375. As detailed below, the project would be consistent with the SCAG 2024–2050 RTP/SCS, which is the regional growth management strategy that targets per capita GHG reduction from passenger vehicles and light trucks in the Southern California Region pursuant to SB 375.

Table 27. Project Potential to Conflict with 2022 Scoping Plan

Sector	Action	Potential to Conflict
Light-duty Vehicle (LDV) Zero Emission Vehicles (ZEVs)	100% of LDV sales are ZEV by 2035	***No conflict***. As this action pertains to LDV sales within California, the project would not obstruct or interfere with its implementation. Furthermore, the project would support the transition from fossil fuel LDV to ZEV through its provision of Level 2 (or faster) EV chargers (MM-AQ-4).
Truck ZEVs	100% of medium-duty vehicle (MDV)/ heavy-duty vehicle (HDV) sales are ZEV by 2040	***No conflict***. As this action pertains to MDV and HDV sales within California, the project would not obstruct or interfere with its implementation. Furthermore, the project would support the transition from fossil fuel MDV and HDV to ZEV through its installation of conduit at or near dock doors and electrical rooms of sufficient size to accommodate the upsizing of electrical equipment for future electrical loads, such as for truck EV charging stations (MM-AQ-4).
Electricity Generation	Sector GHG target of 38 million metric tons of carbon dioxide equivalent (MMTC02e) in 2030 and 30 MMTC02e in 2035 Retail sales load coverage1 20 gigawatts (GW) of offshore wind by 2045 Meet increased demand for electrification without new fossil gas-fired resources	***No conflict***. As this Action pertains to the statewide procurement of renewably generated electricity, the project would not obstruct or interfere with its implementation. However, the project would support increased usage of renewable electricity through the installation of on-site solar panels and/or other means sufficient to meet at least 75% of the building's anticipated total operational electricity requirements (MM-GHG-1).
New Residential and Commercial Buildings	All electric appliances beginning 2026 (residential) and 2029 (commercial), contributing to 6 million heat pumps installed statewide by 2030	***No conflict***. The project would support agency efforts to meet the all-electric appliance and heat pump goals by requiring an all-electric building (i.e., no natural gas) (MM-AQ-7).
Construction Equipment	25% of energy demand electrified by 2030 and 75% electrified by 2045	***No conflict***. As this Action pertains to the electrification of off-road equipment across California, the project would not obstruct or interfere with its implementation. However, the project would support the Action through the requirement that all cargo handling and landscaping equipment to be zero-emission (MM-AQ-5).

Table 27. Project Potential to Conflict with 2022 Scoping Plan

Sector	Action	Potential to Conflict
Low Carbon Fuels for Transportation	Biomass supply is used to produce conventional and advanced biofuels, as well as hydrogen	*No conflict*. The project would not obstruct or interfere with agency efforts to increase the provision of low carbon fuels for transportation.
Low Carbon Fuels for Buildings and Industry	In 2030s biomethane blended in pipeline Renewable hydrogen blended in fossil gas pipeline at 7% energy (~20% by volume), ramping up between 2030 and 2040 In 2030s, dedicated hydrogen pipelines constructed to serve certain industrial clusters	*No conflict*. The project would not obstruct or interfere with agency efforts to increase the provision of low carbon fuels for use in buildings and industry.
High GWP Potential Emissions	Low GWP refrigerants introduced as building electrification increases, mitigating HFC emissions	*No conflict*. The project would not obstruct or interfere with agency efforts to introduce low GWP refrigerants.

Source: CARB 2022.
Notes:
1 As noted in Table 2-1 of the 2022 Scoping Plan, SB 100 speaks only to retail sales and state agency procurement of electricity (i.e., wholesale or non-retail sales and losses from storage and transmission and distribution lines are not subject to the law).

Based on the analysis in Table 26 and Table 27, the project would be consistent with the applicable strategies and measures in the 2017 Scoping Plan and 2022 Scoping Plan, respectively.

The 2045 carbon neutrality goal required CARB to expand proposed actions in the 2022 Scoping Plan to include those that capture and store carbon in addition to those that reduce only anthropogenic sources of GHG emissions. However, the 2022 Scoping Plan emphasizes that reliance on carbon sequestration in the state's natural and working lands will not be sufficient to address residual GHG emissions, and achieving carbon neutrality will require research, development, and deployment of additional methods to capture atmospheric GHG emissions (e.g., mechanical direct air capture). Given that the specific path to neutrality will require development of technologies and programs that are not currently known or available, the project's role in supporting the statewide goal would be speculative and cannot be wholly identified at this time.

Overall, the project would comply will all regulations adopted in furtherance of the Scoping Plan to the extent applicable and required by law. As demonstrated above, the project would not conflict with CARB's 2017 or 2022 Scoping Plan updates and with the state's ability to achieve the 2030 and 2045 GHG reduction and carbon neutrality goals.

Summary

The project demonstrates consistency with the CARB's Scoping Plan and would not conflict with other regulations regarding reductions to GHG emissions including SB 32 and AB 1279. Additionally, the project would be consistent with the SCAG 2024–2050 RTP/SCS and the City's CAP with implementation of MM-AQ-4, MM-AQ-5, MM-AQ-7, and MM-GHG-1 through MM-GHG-3.

Mitigation Measures

MM-AQ-4, MM-AQ-5, MM-AQ-7, and MM-GHG-1 through MM-GHG-3.

Level of Significance After Mitigation

Impacts would be less than significant with mitigation.

INTENTIONALLY LEFT BLANK

4 Energy

4.1 Environmental Setting

4.1.1 Electricity

The production of electricity requires the consumption or conversion of energy resources, including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources, into electrical energy. The delivery of electricity involves a number of system components, including power generation facilities, transmission and distribution lines, substations and transformers that lower transmission line power (voltage) to a level appropriate for on-site distribution and use. The electricity generated is distributed through a network of transmission and distribution lines commonly called a power grid. Production of electricity and its conveyance through the power grid occur in response to market demand.

Energy capacity, or electrical power, is generally measured in watts while energy use is measured in watt-hours (Wh). For example, if a light bulb has a capacity rating of 100 watts, the energy required to keep the bulb on for one (1) hour would be 100 Wh. If ten (10) 100-watt bulbs were on for one (1) hour, the energy required would be 1,000 Wh or 1 kilowatt-hour (kWh). On a utility scale, a generator's capacity is typically rated in megawatts, which is one (1) million watts, while energy usage is measured in megawatt-hours (1 million watt-hours) or gigawatt-hours (1 billion watt-hours).

According to the U.S. Energy Information Administration (EIA), California used approximately 239,480,452 megawatt hours of electricity in 2023 (EIA 2024a). Electricity usage in California for different land uses varies substantially by the types of uses in a building, type of construction materials used in a building, and the efficiency of all electricity-consuming devices within a building. Although California consumes more electricity than any other state except Texas and Florida, it uses less electricity per capita than any other state but Hawaii, due to the state's energy efficiency building standards and efficiency and conservation programs (EIA 2024b).

Residences and businesses within the City of Palmdale, including the project site, receive electricity from SCE. SCE, a subsidiary of Edison International, serves approximately 180 cities in 11 counties across Central and Southern California. SCE administers various energy efficiency and conservation programs that may be available to residents, businesses, and other organizations within the region. In Los Angeles County, SCE reported an annual electrical consumption of approximately 68.5 billion kWh in 2022 (CEC 2025a).

SCE receives electric power from a variety of sources. According to the 2022 SCE Power Content Label, eligible renewable energy accounts for 33.2% of SCE's overall energy resources, with biomass and biowaste at 0.1%, geothermal resources at 5.7%, wind power at 9.8%, eligible hydroelectric sources at 0.5%, and solar energy at 17.0% (CEC 2023).

4.1.2 Natural Gas

Natural gas is a combustible mixture of simple hydrocarbon compounds (primarily methane) that is used as a fuel source. Natural gas consumed in California is obtained from naturally occurring reservoirs, mainly located outside the state, and delivered through high-pressure transmission pipelines. The natural gas transportation system is a

nationwide network, and therefore, resource availability is typically not an issue. Natural gas provides almost one-third of the state's total energy requirements and is used in electricity generation, space heating, cooking, water heating, industrial processes, and as a transportation fuel. Natural gas is measured in terms of cubic feet.

The CPUC regulates natural gas utility service for approximately 10.8 million customers who receive natural gas from PG&E, Southern California Gas, San Diego Gas and Electric Company, Southwest Gas, and several smaller natural gas utilities. According to the EIA, California used approximately 2,087 billion cubic feet of natural gas in 2023 (EIA 2025). The majority of California's natural gas customers are residential and small commercial customers (core customers). These customers account for approximately 35% of the natural gas delivered by California utilities (CPUC 2025). Large consumers, such as electric generators and industrial customers (noncore customers), account for approximately 65% of the natural gas delivered by California utilities (CPUC 2025). CPUC regulates California natural gas rates and natural gas services, including in-state transportation over transmission and distribution pipeline systems, storage, procurement, metering, and billing. Most of the natural gas used in California comes from out-of-state natural gas basins. Biogas (e.g., from wastewater treatment facilities or dairy farms) is just beginning to be delivered into the gas utility pipeline systems; however, the State has adopted regulations requiring its development to reduce statewide emissions of methane by 40% below 2013 levels by 2030 (CPUC 2022).

The Southern California Gas Company (SoCalGas) provides Los Angeles County (including the City) with natural gas service. SoCalGas' service territory encompasses approximately 20,000 square miles and more than 500 communities. In the California Energy Demand mid-energy demand scenario, natural gas demand is projected to have an annual growth rate of 0.03% in SoCalGas's service territory. In 2022, SoCalGas delivered approximately 2,820 million therms (282.0 billion thousand British thermal units [kBTU]) to Los Angeles County (CEC 2025b).

4.1.3 Petroleum

According to the EIA, California used approximately 628 million barrels of petroleum in 2022, with the majority (534 million barrels) used for the transportation sector (EIA 2024c). There are 42 U.S. gallons in a barrel, so this equates to a total daily use of approximately 14.9 million gallons of petroleum among all sectors and 12.7 million gallons for the transportation sector. Petroleum usage in California includes petroleum products such as motor gasoline, distillate fuel, liquefied petroleum gases, and jet fuel. At the federal and state levels, various policies, rules, and regulations have been enacted to improve vehicle fuel efficiency, promote the development and use of alternative fuels, reduce transportation - source air pollutants and GHG emissions, and reduce VMT. Market forces have driven the price of petroleum products steadily upward over time, and technological advances have made use of other energy resources or alternative transportation modes increasingly feasible.

Largely as a result of and in response to these multiple factors, gasoline consumption within the state has declined in recent years, and availability of other alternative fuels/energy sources has increased. The quantity, availability, and reliability of transportation energy resources have increased in recent years, and this trend will likely continue and accelerate. Increasingly available and diversified transportation energy resources act to promote continuing reliable and affordable means to support vehicular transportation within the state. According to CARB's Emission Factor (EMFAC) Web Database, Los Angeles County on-road transportation sources are projected to consume about 4.3 billion gallons of petroleum in 2027 (CARB 2025e), which is analyzed as the first year of project operations herein.

4.2 Regulatory Setting

Although the focus of many of the federal and state regulations is on the reduction of air pollutants and GHG emissions, one co-benefit of implementation of these standards is a reduced demand for energy resources. As such, this section only presents regulations that pertain to energy that are not included in either Section 2 (Air Quality) or Chapter 3 (Greenhouse Gas Emissions) of this report.

4.2.1 Federal

Energy Policy Act of 1992 and 2005

The Energy Policy Act of 1992 was passed to reduce the country's dependence on foreign petroleum and improve air quality. The act includes several parts intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. The act requires certain federal, state, and local government and private fleets to purchase a percentage of light-duty AFVs capable of running on alternative fuels each year. In addition, financial incentives are also included in the act. Federal tax deductions are allowed for businesses and individuals to cover the incremental cost of AFVs. The Energy Policy Act also requires states to consider a variety of incentive programs to help promote AFVs. The Energy Policy Act provides renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a federal purchase requirement for renewable energy.

In January 2005, the new Energy Policy Act was signed into law. It addresses energy production in the United States, including energy efficiency, renewable energy, oil and gas, coal, Tribal energy, nuclear matters and security, vehicles and motor fuels, including ethanol, hydrogen, electricity, energy tax incentives, hydropower and geothermal energy, and climate change technology. The Energy Policy Act provides loan guarantees for entities that develop or use innovative technologies that avoid the by-production of GHGs. Another provision of the Energy Policy Act is the Renewable Fuel Standard (RFS), which increases the amount of biofuel that must be mixed with gasoline sold in the United States.

Energy Independence and Security Act of 2007

On December 19, 2007, the Energy Independence and Security Act of 2007 (EISA) was signed into law. In addition to setting increased CAFE standards for motor vehicles, the EISA facilitates the reduction of national GHG emissions by requiring the following:

- Increasing the supply of alternative fuel sources by setting a mandatory RFS that requires fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.
- Requiring approximately 25% greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200% greater efficiency for light bulbs, or similar energy savings, by 2020.

- While superseded by the EPA and NHTSA actions described previously, establishing miles per gallon targets for cars and light trucks and directing the NHTSA to establish a fuel economy program for medium-and heavy-duty trucks and create a separate fuel economy standard for trucks.

This federal legislation requires ever-increasing levels of renewable fuels (the RFS) to replace petroleum (EPA 2024f). EPA is responsible for developing and implementing regulations to ensure that transportation fuel sold in the United States contains at least a minimum volume of renewable fuel.

The RFS program was created under the Energy Policy Act and established the first renewable fuel volume mandate in the United States. As required under the Energy Policy Act, the original RFS program required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. Under the EISA, the RFS program was expanded in several ways that laid the foundation for achieving significant reductions in GHG emissions from the use of renewable fuels, reducing imported petroleum, and encouraging the development and expansion of the renewable fuels sector in the United States. The updated program is referred to as "RFS2" and includes the following:

- The EISA expanded the RFS program to include diesel, in addition to gasoline.
- The EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.
- The EISA established new categories of renewable fuel and set separate volume requirements for each one.
- The EISA required EPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

Additional provisions of the EISA address energy savings in government and public institutions, research for alternative energy, additional research in carbon capture, international energy programs, and the creation of green (environmentally beneficial) jobs.

Intermodal Surface Transportation Efficiency Act of 1991

The Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 promoted the development of intermodal transportation systems to maximize mobility and address national and local interests in air quality and energy. ISTEA contained factors for metropolitan planning organizations to address in developing transportation plans and programs, including some energy-related factors. To meet the new ISTEA requirements, MPOs adopted policies defining the social, economic, energy, and environmental values guiding transportation decisions.

Transportation Equity Act for the 21st Century

The Transportation Equity Act for the 21st Century was signed into law in 1998 and builds on the initiatives established in the ISTEA legislation (previously discussed). The Transportation Equity Act authorizes highway, highway safety, transit, and other efficient surface transportation programs. The act continues the program structure established for highways and transit under ISTEA, such as flexibility in the use of funds, emphasis on measures to improve the environment, and focus on a strong planning process as the foundation of transportation decisions. The Transportation Equity Act also provides for investment in research and its application to maximize the performance of the transportation system through, for example, deployment of intelligent transportation systems to help improve operations and management of transportation systems and vehicle safety.

Infrastructure Investment and Jobs Act

The Infrastructure Investment and Jobs Act (Infrastructure Deal) was signed into law November 15, 2021. The legislation includes $39 billion of new investment to modernize transit, in addition to continuing the existing transit programs for five years as part of surface transportation reauthorization. The Infrastructure Deal would also invest $7.5 billion to build out a national network of EV chargers. The Infrastructure Deal would provide funding for deployment of EV chargers along highway corridors to facilitate long-distance travel and within communities to provide convenient charging where people live, work, and shop to support a goal of building a nationwide network of 500,000 EV chargers. This would accelerate the adoption of EVs, which would help reduce emissions and improve air quality. In addition, the Infrastructure Deal would include more than $65 billion of investments in clean energy transmission including upgrading existing power infrastructure through expanding transmission lines to facilitate the expansion of renewables and clean energy.

4.2.2 State

Warren-Alquist Act

The California legislature passed the Warren-Alquist Act in 1974. The Warren-Alquist Act created the CEC. The legislation also incorporated the following three key provisions designed to address the demand side of the energy equation:

- The act directed the CEC to formulate and adopt the nation's first energy conservation standards for buildings constructed and appliances sold in California.
- The act removed the responsibility of electricity demand forecasting from the utilities, which had a financial interest in high-demand projections, and transferred it to a more impartial CEC.
- The CEC was directed to embark on an ambitious research and development program, with a particular focus on fostering what were characterized as non-conventional energy sources.

Assembly Bill 1007

AB 1007 (2005) required the CEC to prepare a statewide plan to increase the use of alternative fuels in California (State Alternative Fuels Plan). The CEC prepared the plan in partnership with the CARB and in consultation with other state agencies, plus federal and local agencies. The State Alternative Fuels Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality.

Integrated Energy Policy Report

The CEC is responsible for preparing integrated energy policy reports that identify emerging trends related to energy supply, demand, and conservation; public health and safety; and maintenance of a healthy economy. The CEC's 2023 Integrated Energy Policy Report discusses the state's policy goals of decarbonizing buildings, ensuring energy reliability, decarbonizing the state's gas system, the state's energy demand forecast, and quantifying the benefits of the clean transportation program (CEC 2024). SB 100 calls for California's electricity system to become 100% zero-carbon by 2045. CEC, CPUC, and CARB are working together to identify pathways to deeply decarbonize the state's electricity system in response to SB 100. The aim is to leverage California's clean electricity system to decarbonize,

or remove carbon from, other portions of the state's energy system. Over time these policies and trends would serve to beneficially reduce the project's GHG emissions profile and energy consumption as they are implemented.

4.2.3 Local

4.2.3.1 City of Palmdale General Plan

Goals and policies pertaining to reducing energy are primarily addressed in the Sustainability, Climate Action, and Resilience Element and Air Quality Element of the City's *Palmdale 2045* General Plan (City of Palmdale 2023a). See Section 2.2.3.3 and Section 3.2.4.3 above for policies that would improve air quality and reduce GHGs, many of which would also pertain to energy demand.

4.3 Significance Criteria and Methodology

4.3.1 Thresholds of Significance

The significance criteria used to evaluate the project impacts to energy are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to energy would occur if the project would:

1. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
2. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

4.3.2 Approach and Methodology

CalEEMod Version 2022.1 was used to estimate the potential project-energy consumption during construction and operation. Construction of the project would result in petroleum consumption primarily associated with use of off-road construction equipment, on-road vendor (material delivery) trucks, and worker vehicles. All details specific to construction and operation are discussed in Section 2.3.2 and Section 3.3.2, which are also applicable for the estimation of construction-related and operations-related energy consumption. An energy estimate summary is also provided in Appendix A.

4.4 Impact Analysis

4.4.1 Would the project result in potentially significant environmental impact due to wasteful, inefficient, or

unnecessary consumption of energy resources, during project construction or operation?

Construction

Electricity Usage

Temporary electric power for as-necessary lighting and electronic equipment, such as computers inside temporary construction trailers, would be provided by SCE. The electricity used for such activities would be temporary, would be substantially less than that required for project operation, and would therefore have a negligible contribution to the project's overall energy consumption.

Natural Gas Usage

Natural gas is not anticipated to be required during construction of the project. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed under the subsection "Petroleum Usage," below. Any minor amounts of natural gas that may be consumed as a result of project construction would be temporary and negligible and would not have an adverse effect.

Petroleum Usage

Petroleum would be consumed throughout construction of the project. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction, and VMT associated with the transportation of construction materials and construction worker commutes would also result in petroleum consumption. Heavy-duty construction equipment and trucks associated with construction activities are assumed to use diesel fuel. Construction workers would travel to and from the project site throughout the duration of construction. It is assumed that construction workers would travel to and from the project site in gasoline-powered vehicles. Fuel consumption was estimated by converting the total CO_2 emissions from each construction phase to gallons of gasoline or diesel using conversion factors for CO_2. The conversion factor for gasoline is 8.78 kilograms per metric ton of CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton of CO_2 per gallon (The Climate Registry 2023). The estimated petroleum usage during construction is shown in Table 28.

Table 28. Construction Petroleum Demand

Project	Off-road Equipment (diesel)	Vendor Trucks (diesel)	Haul Trucks (diesel)	On-Site Trucks (diesel)	Worker Vehicles (gasoline)
	Gallons				
Construction Total	263,320	10,836	23,060	1,764	9,716
				Total Petroleum	308,697

Source: Appendix A.

In summary, construction of the project is conservatively anticipated to consume a total of approximately 308,697 gallons of petroleum. There are no unusual project characteristics or construction processes that would require the use of equipment that would be more energy intensive than is used for comparable activities, or equipment that would not conform to current emissions standards (and related fuel efficiencies). Equipment employed in

construction of the proposed project would therefore not result in inefficient, wasteful, or unnecessary consumption of fuel. Construction contractors would be required to comply with applicable CARB regulations regarding retrofitting, repowering, or replacement of diesel off-road construction equipment. Compliance with anti-idling and emissions regulations would result in a more efficient use of construction-related energy and the minimization or elimination of wasteful or unnecessary consumption of energy. Idling restrictions and the use of newer engines and equipment would result in less fuel combustion and energy consumption.

Project construction would represent a single-event petroleum demand and would not require on-going or permanent commitment of petroleum resources for this purpose. Overall, construction of the project would not result in the wasteful or inefficient use of petroleum fuel, and the project would result in less-than-significant impacts during project construction regarding the potential for wasteful, inefficient, or unnecessary consumption of energy resources.

Operations

Electricity Usage

The operational phase would require electricity for multiple purposes, including building heating and cooling, lighting, electronics, and electric pumps, as described above. CalEEMod was used to estimate project emissions from electricity uses (see Appendix A). The project is anticipated to consume approximately 8,344,788 kWh of electricity per year. For context, the most recent energy data from the CEC shows that Los Angeles County consumed approximately 68.5 billion kWh hours in 2022. The project would represent a 0.01% increase in the total demand for electricity. The project would not represent a significant demand on electricity supplies that would require additional capacity. The project proposes conventional industrial uses reflecting contemporary energy efficient/energy conserving designs and operational programs. Notably, although not necessitated by an energy use impact, the project would also implement measures that would further reduce electricity demand, such as MM-GHG-1, whereby the project would commit to renewable energy generation sufficient to meet at least 75% of the building envelope's anticipated total operational energy requirements. Finally, the project would be required to comply with the applicable Title 24 standards applicable at that time of building permit application, which would further ensure that the project energy demands would not be inefficient, wasteful, or otherwise unnecessary and impacts would be less than significant.

Natural Gas Usage

Natural gas consumption during operation would be required for various purposes, including, but not limited to, building heating and cooling. CalEEMod was used to estimate project emissions from natural gas consumption (see Appendix A). The project is anticipated to consume approximately 20,720,620 kBtu per year. For context, the most recent energy data from the CEC shows that Los Angeles County consumed approximately 282 billion kBtu in 2022. The project would represent a less than 0.01% increase in the total demand for natural gas. The project would not represent a significant demand on natural gas supplies that would require additional capacity. The project's natural gas demand would also not result in peak and base period demands that would affect energy supplies or require additional capacity. Although not necessitated for this impact, the project would also implement MM-AQ-7, whereby the project would incorporate an all-electric building and thereby eliminate natural gas demand. Thus, the natural gas consumption of the project would not be considered inefficient or wasteful, and impacts would be less than significant.

Petroleum Usage

During operations, the majority of fuel consumption resulting from the project would involve the use of motor vehicles traveling to and from the project site, as well as diesel-fueled cargo handling equipment, a diesel-fueled emergency generator and fire pump, TRUs, and landscaping equipment. Fuel demand estimates for the project are provided in Table 29.

Table 29. Operational Petroleum Demand - Unmitigated

	Employee Vehicles (gasoline)	Haul Trucks (diesel)	Off-Road Equipment (diesel)	Stationary Sources (diesel)	Transport Refrigeration Units (diesel)	Landscaping Equipment (gasoline)
Project	Gallons					
Operations	972,041	240,287	370,818	3,321	61	1,663
					Total Petroleum	1,588,190

Source: Appendix A.

As summarized on Table 29, the project would result in an estimated annual fuel demand of 1,588,190 gallons of fuel. Fuel would be provided by current and future commercial vendors. For context, as Los Angeles County is estimated to consume approximately 4.3 billion gallons of petroleum in 2027 from on-road vehicles, the project would represent less than a 0.04% increase in fuel demand. Trip generation, VMT, cargo handling and landscaping equipment required for the project are consistent with other industrial uses of similar scale and configuration. That is, the project does not propose uses or operations that would inherently result in excessive and wasteful activities, nor associated excess and wasteful vehicle energy consumption. In addition, although not accounted for in Table 29, the project would also implement measures that would further reduce petroleum demand, such as MM-AQ-1, which establishes anti-idling measures, requires electric hook-ups for TRUs, and specifies EV charging stations for passenger vehicles and conduit for future charging stations for heavy-duty trucks. In addition, MM-AQ-5 would require zero-emission cargo handling and landscaping equipment. Finally, enhanced fuel economies realized pursuant to federal and state regulatory actions, and related transition of vehicles to alternative energy sources (e.g., electricity, natural gas, biofuels, hydrogen cells) would likely decrease future gasoline fuel demands per VMT. Location of the project proximate to regional and local roadway systems tends to reduce VMT within the region, acting to reduce regional vehicle energy demands. As supported by the preceding discussions, project operational energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary and impacts would be less than significant.

Renewable Energy Potential

As part of the project's design process, the project applicant considered how the project could potentially increase its reliance on renewable energy sources to meet the project's energy demand. Renewable energy sources that were considered for their potential to be used to power the project, consistent with the CEC's definition of eligible renewables, include biomass, geothermal, solar, wind, and small hydroelectric facilities.

Given the project's location and the nature of the project, there are considerable site constraints including incompatibility with surrounding land uses for large scale power generation facilities, unknown interconnection feasibility, compatibility with utility provider systems, and no known water or geothermal resources to harness, that would eliminate the potential for biomass, geothermal, hydroelectric renewable energy to be installed on site.

Regarding wind power, first, due to the location of the site and surrounding land uses, wind turbines are generally not feasible because they would represent an incompatible use. Specifically, a general rule of thumb is to install a wind turbine on a tower with the bottom of the rotor blades at least 30 feet above anything within a 500-foot horizontal radius and to be sited upwind of buildings and trees (APA 2011; NREL 2015), which the project site cannot accommodate. As such, wind power was determined not to be feasible for the project.

The project would comply with all applicable Title 24 code provisions, such as the solar ready building mandatory requirements. Beyond that, as stated in MM-GHG-1, the project would commit to on-site renewable energy generation produced by rooftop solar panels sufficient to meet at least 75% of the building envelope's anticipated total operational electricity requirements. While the project does not propose battery storage at the time, the project does not preclude installation of battery storage in the future if determined to be a feasible and compatible land use of the site.

In summary, the project includes the on-site renewable energy source (i.e., solar) that was determined to be feasible for the site and does not include the on-site renewable energy sources that were determined to be infeasible.

Summary

As supported by the preceding analyses, project construction and operations would not result in the inefficient, wasteful or unnecessary consumption of energy. Impacts would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

4.4.2 Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

The project would be subject to and would comply with, at a minimum, the California Building Energy Efficiency Standards (24 CCR Part 6 and Part 11). Part 6 of Title 24 establishes energy efficiency standards for non-residential buildings, including warehouses, constructed in California to reduce energy demand and consumption. Part 11 of Title 24 sets forth voluntary and mandatory energy measures that are applicable to the project under CALGreen. For nonresidential projects, some of the key mandatory CALGreen standards involve requirements related to bicycle parking, designated parking for clean air vehicles, EV charging stations for passenger vehicles, shade trees, water conserving plumbing fixtures and fittings, outdoor potable water use in landscaped areas, and construction waste management (24 CCR, Part 11). The project would comply with all applicable California code requirements for energy efficiency.

Regarding local plans, the Sustainability, Climate Action, and Resilience Element of the City's General Plan presents strategies to reduce energy demand. The project's consistency with the City's strategies and policies that pertain to energy demand were assessed in Section 3.4.2 above. As described therein, the project would generally be consistent with the applicable reduction strategies in the City's General Plan.

Based on the preceding considerations, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. This impact would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant without mitigation.

Pacific Palmdale Center Project - Unmitigated Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

3. Construction Emissions Details

3.1. Site Preparation (2026) - Unmitigated

3.3. Grading (2026) - Unmitigated

3.5. Building Construction (2026) - Unmitigated

3.7. Building Construction (2027) - Unmitigated

3.9. On-Site Concrete (2027) - Unmitigated

3.11. Off-Site Improvements (2026) - Unmitigated

3.13. Architectural Coating (2027) - Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Pacific Palmdale Center Project - Unmitigated
Construction Start Date	1/1/2026
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	4.50
Precipitation (days)	13.0
Location	Sierra Hwy & W Rancho Vista Blvd, Palmdale, CA 93550, USA
County	Los Angeles-Mojave Desert
City	Palmdale
Air District	Antelope Valley AQMD
Air Basin	Mojave Desert
TAZ	3646
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description

Unrefrigerated Warehouse-No Rail	750	1000sqft	34.1	750,000	298,043	—	—	Unrefrigerated land use used to represent passenger vehicle trips.
Refrigerated Warehouse-No Rail	250	1000sqft	11.4	250,000	99,347	—	—	Refrigerated land use used to represent truck trips.
Other Non-Asphalt Surfaces	21.6	Acre	21.6	0.00	0.00	—	—	Parking/circulation
Other Asphalt Surfaces	8.03	Acre	8.03	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	30.3	annual days of extreme heat
Extreme Precipitation	1.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.96	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A

Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	88.7
AQ-PM	7.74
AQ-DPM	44.9
Drinking Water	61.8
Lead Risk Housing	49.3
Pesticides	0.00
Toxic Releases	99.8
Traffic	69.2
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	10.6
Haz Waste Facilities/Generators	70.9
Impaired Water Bodies	0.00
Solid Waste	52.9
Sensitive Population	—
Asthma	72.9
Cardio-vascular	59.5
Low Birth Weights	14.2
Socioeconomic Factor Indicators	—
Education	75.1
Housing	30.6
Linguistic	58.6
Poverty	63.2
Unemployment	84.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	32.76016938
Employed	15.32144232
Median HI	40.66469909
Education	—
Bachelor's or higher	26.08751444

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	66.0
Healthy Places Index Score for Project Location (b)	25.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Project includes 1,000,000 SF warehouse with 634 parking spaces and 150 loading docks, on about 67.10 acres. The "Unrefrigerated Warehouse-No Rail" and "Refrigerated Warehouse-No Rail" uses are included to separately split out passenger vehicles and trucks, respectively. In addition, proximate off-site improvements (roadway/curbs) would be part of the project, which were assumed to be an additional 8.03 acres.
Construction: Trips and VMT	Adjusted default trips based on applicant input. All truck trips also assumed to include 1,000 feet of travel on unpaved roads, except for the architectural coating phase which would occur after concrete laydown and off-site improvements phases.
Construction: Construction Phases	Revised default schedule based on applicant input
Construction: Off-Road Equipment	Revised default equipment based on applicant input.
Operations: Vehicle Data	Adjusted trip rates based on project-specific estimates. Increased truck trip lengths to 65.05 miles based on Streetlight Data and increased trip length of passenger vehicles to 11.6 miles based on VMT memo prepared for project.
Operations: Fleet Mix	Adjusted fleetmix to match traffic report with Refrigerated Warehouse used to model trucks and Unrefrigerated Warehouse used to model worker passenger vehicles
Operations: Water and Waste Water	—
Operations: Off-Road Equipment	50 forklifts assumed per applicant input

5. Activity Data

5.1. Construction Schedule

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase	Phase Description
Site Preparation	Site Preparation	1/1/2026	1/31/2026	5.00	22.0	—
Grading	Grading	2/1/2026	4/30/2026	5.00	64.0	—
Building Construction	Building Construction	5/1/2026	3/31/2027	5.00	239	—
On-Site Concrete	Paving	4/1/2027	5/31/2027	5.00	43.0	On-Site Parking/Circulation
Off-Site Improvements	Paving	4/1/2026	5/12/2026	5.00	30.0	Off-Site Improvements
Architectural Coating	Architectural Coating	6/1/2027	6/30/2027	5.00	22.0	—

5.2. Off-Road Equipment

5.2.1. Unmitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Site Preparation	Rubber Tired Dozers	Diesel	Tier 4 Final	3.00	8.00	367	0.40
Site Preparation	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	4.00	8.00	84.0	0.37
Grading	Excavators	Diesel	Tier 4 Final	2.00	8.00	150	0.38
Grading	Graders	Diesel	Tier 4 Final	2.00	8.00	148	0.41
Grading	Rubber Tired Dozers	Diesel	Tier 4 Final	2.00	8.00	367	0.40
Grading	Scrapers	Diesel	Tier 4 Final	16.0	8.00	423	0.48
Grading	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	2.00	8.00	84.0	0.37
Grading	Trenchers	Diesel	Average	2.00	8.00	40.0	0.50
Building Construction	Cranes	Diesel	Tier 4 Final	1.00	8.00	367	0.29
Building Construction	Forklifts	Diesel	Tier 4 Final	15.0	8.00	82.0	0.20
Building Construction	Generator Sets	Diesel	Average	20.0	8.00	45.0	0.74
Building Construction	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	2.00	8.00	84.0	0.37

Building Construction	Welders	Diesel	Average	1.00	8.00	46.0	0.45
Building Construction	Aerial Lifts	Diesel	Average	20.0	8.00	46.0	0.31
Building Construction	Cement and Mortar Mixers	Diesel	Average	4.00	8.00	10.0	0.56
On-Site Concrete	Pavers	Diesel	Tier 4 Final	2.00	8.00	81.0	0.42
On-Site Concrete	Paving Equipment	Diesel	Tier 4 Final	2.00	8.00	89.0	0.36
On-Site Concrete	Rollers	Diesel	Average	2.00	8.00	36.0	0.38
On-Site Concrete	Other Construction Equipment	Diesel	Average	1.00	8.00	65.0	0.42
On-Site Concrete	Surfacing Equipment	Diesel	Tier 4 Final	1.00	8.00	107	0.30
On-Site Concrete	Cement and Mortar Mixers	Diesel	Average	2.00	8.00	10.0	0.56
Off-Site Improvements	Pavers	Diesel	Tier 4 Final	2.00	8.00	81.0	0.42
Off-Site Improvements	Paving Equipment	Diesel	Tier 4 Final	2.00	8.00	89.0	0.36
Off-Site Improvements	Rollers	Diesel	Average	2.00	8.00	36.0	0.38
Off-Site Improvements	Trenchers	Diesel	Average	1.00	8.00	40.0	0.50
Architectural Coating	Air Compressors	Diesel	Average	2.00	8.00	37.0	0.48
Architectural Coating	Aerial Lifts	Diesel	Average	2.00	8.00	46.0	0.31

5.2.2. Mitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Site Preparation	Rubber Tired Dozers	Diesel	Tier 4 Final	3.00	8.00	367	0.40
Site Preparation	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	4.00	8.00	84.0	0.37

Off-Site Improvements	Onsite truck	6.00	0.19	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	1,500,000	500,000	77,546

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Ton of Debris)	Material Exported (Ton of Debris)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Site Preparation	—	—	33.0	0.00	—
Grading	—	—	1,152	0.00	—
On-Site Concrete	0.00	0.00	0.00	0.00	29.7
Off-Site Improvements	0.00	0.00	0.00	0.00	29.7

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Unrefrigerated Warehouse-No Rail	0.00	0%
Refrigerated Warehouse-No Rail	0.00	0%
Other Non-Asphalt Surfaces	21.6	0%
Other Asphalt Surfaces	8.03	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2026	0.00	532	0.03	< 0.005
2027	0.00	532	0.03	< 0.005

5.9. Operational Mobile Sources

5.9.1. Unmitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Unrefrigerated Warehouse-No Rail	1,228	1,228	1,228	448,211	14,245	14,245	14,245	5,199,246
Refrigerated Warehouse-No Rail	353	353	353	128,845	22,963	22,963	22,963	8,381,367
Other Non-Asphalt Surfaces	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

Other Asphalt Surfaces	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

5.9.2. Mitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Unrefrigerated Warehouse-No Rail	1,228	1,228	1,228	448,211	14,245	14,245	14,245	5,199,246

Other Asphalt Surfaces	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.1.2. Mitigated

5.10.2. Architectural Coatings

Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
0	0.00	1,500,000	500,000	77,546

5.10.3. Landscape Equipment

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	180

5.10.4. Landscape Equipment - Mitigated

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	180

5.11. Operational Energy Consumption

5.11.1. Unmitigated

Electricity (kWh/yr) and CO2 and CH4 and N2O and Natural Gas (kBTU/yr)

Land Use	Electricity (kWh/yr)	CO2	CH4	N2O	Natural Gas (kBTU/yr)
Unrefrigerated Warehouse-No Rail	2,814,220	346	0.0330	0.0040	0.00
Refrigerated Warehouse-No Rail	1,947,330	346	0.0330	0.0040	0.00
Other Non-Asphalt Surfaces	0.00	346	0.0330	0.0040	0.00
Other Asphalt Surfaces	0.00	346	0.0330	0.0040	0.00

5.11.2. Mitigated

Electricity (kWh/yr) and CO2 and CH4 and N2O and Natural Gas (kBTU/yr)

Land Use	Electricity (kWh/yr)	CO2	CH4	N2O	Natural Gas (kBTU/yr)
Unrefrigerated Warehouse-No Rail	2,814,220	346	0.0330	0.0040	0.00
Refrigerated Warehouse-No Rail	1,947,330	346	0.0330	0.0040	0.00
Other Non-Asphalt Surfaces	0.00	346	0.0330	0.0040	0.00
Other Asphalt Surfaces	0.00	346	0.0330	0.0040	0.00

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

Land Use	Indoor Water (gal/year)	Outdoor Water (gal/year)
Unrefrigerated Warehouse-No Rail	138,750,000	3,858,893
Refrigerated Warehouse-No Rail	46,250,000	1,286,289
Other Non-Asphalt Surfaces	0.00	0.00
Other Asphalt Surfaces	0.00	0.00

5.12.2. Mitigated

Land Use	Indoor Water (gal/year)	Outdoor Water (gal/year)
Unrefrigerated Warehouse-No Rail	138,750,000	3,858,893
Refrigerated Warehouse-No Rail	46,250,000	1,286,289
Other Non-Asphalt Surfaces	0.00	0.00
Other Asphalt Surfaces	0.00	0.00

5.13. Operational Waste Generation

5.13.1. Unmitigated

Land Use	Waste (ton/year)	Cogeneration (kWh/year)
Unrefrigerated Warehouse-No Rail	353	—
Refrigerated Warehouse-No Rail	118	—
Other Non-Asphalt Surfaces	0.00	—
Other Asphalt Surfaces	0.00	—

5.13.2. Mitigated

Land Use	Waste (ton/year)	Cogeneration (kWh/year)
Unrefrigerated Warehouse-No Rail	353	—
Refrigerated Warehouse-No Rail	118	—

Other Non-Asphalt Surfaces	0.00	—
Other Asphalt Surfaces	0.00	—

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

Land Use Type	Equipment Type	Refrigerant	GWP	Quantity (kg)	Operations Leak Rate	Service Leak Rate	Times Serviced
Refrigerated Warehouse-No Rail	Cold storage	R-404A	3,922	7.50	7.50	7.50	25.0

5.14.2. Mitigated

Land Use Type	Equipment Type	Refrigerant	GWP	Quantity (kg)	Operations Leak Rate	Service Leak Rate	Times Serviced
Refrigerated Warehouse-No Rail	Cold storage	R-404A	3,922	7.50	7.50	7.50	25.0

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor

5.15.2. Mitigated

Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

Equipment Type	Fuel Type	Number per Day	Hours per Day	Hours per Year	Horsepower	Load Factor
Emergency Generator	Diesel	1.00	2.00	50.0	1,000	1.00

Fire Pump	Diesel	1.00	2.00	50.0	300	1.00

5.16.2. Process Boilers

Equipment Type	Fuel Type	Number	Boiler Rating (MMBtu/hr)	Daily Heat Input (MMBtu/day)	Annual Heat Input (MMBtu/yr)

5.17. User Defined

Equipment Type	Fuel Type

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1.2. Mitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.1.2. Mitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	30.3	annual days of extreme heat
Extreme Precipitation	1.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.96	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	4	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	88.7
AQ-PM	7.74
AQ-DPM	44.9
Drinking Water	61.8
Lead Risk Housing	49.3
Pesticides	0.00
Toxic Releases	99.8
Traffic	69.2
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	10.6
Haz Waste Facilities/Generators	70.9
Impaired Water Bodies	0.00
Solid Waste	52.9
Sensitive Population	—
Asthma	72.9
Cardio-vascular	59.5
Low Birth Weights	14.2
Socioeconomic Factor Indicators	—

Education	75.1
Housing	30.6
Linguistic	58.6
Poverty	63.2
Unemployment	84.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	32.76016938
Employed	15.32144232
Median HI	40.66469909
Education	—
Bachelor's or higher	26.08751444
High school enrollment	100
Preschool enrollment	5.081483383
Transportation	—
Auto Access	12.8576928
Active commuting	67.72744771

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	66.0
Healthy Places Index Score for Project Location (b)	25.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Project includes 1,000,000 SF warehouse with 634 parking spaces and 150 loading docks, on about 67.10 acres. The "Unrefrigerated Warehouse-No Rail" and "Refrigerated Warehouse-No Rail" uses are included to separately split out passenger vehicles and trucks, respectively. In addition, proximate off-site improvements (roadway/curbs) would be part of the project, which were assumed to be an additional 8.03 acres.
Construction: Trips and VMT	Adjusted default trips based on applicant input. All truck trips also assumed to include 1,000 feet of travel on unpaved roads, except for the architectural coating phase which would occur after concrete laydown and off-site improvements phases.
Construction: Construction Phases	Revised default schedule based on applicant input
Construction: Off-Road Equipment	Revised default equipment based on applicant input. Mitigation = Tier 4 Final equipment with engines >75 hp
Operations: Vehicle Data	Adjusted trip rates based on project-specific estimates. Increased truck trip lengths to 65.05 miles based on Streetlight Data and increased trip length of passenger vehicles to 11.6 miles based on VMT memo prepared for project.
Operations: Fleet Mix	Adjusted fleetmix to match traffic report with Refrigerated Warehouse used to model trucks and Unrefrigerated Warehouse used to model worker passenger vehicles
Operations: Water and Waste Water	Mitigated = 20% indoor/outdoor water reduction compared to baseline demand
Operations: Off-Road Equipment	Mitigated = all-electric cargo handling equipment. This was accounted for in the Energy module.
Construction: Architectural Coatings	Mitigated = super compliant low VOC coatings of 10 g/L used for building coatings during construction

Operations: Energy Use	Mitigated = all-electric buildings (no natural gas) and 75% solar offset. Note that the kWh/year in this module also accounts for electric cargo handling equipment.
Operations: Solid Waste	Mitigated = 50% waste diversion
Operations: Generators + Pumps EF	Mitigated = Tier 4 Final emergency generator and Tier 4 Final fire pump. Adjusted emission factors accordingly.
Construction: Dust From Material Movement	Mitigated = water exposed area 2x/day

Pacific Palmdale Center Project

Cargo Handling Equipment - Electrification

Equation from CalEEMod 2022.1

EC = Activity x Pop x (hp x UC) x Load x D

Where:	EC =	annual electricity consumption (kWh/yr)
	Activity =	hours of daily operation of off-road equipment (hr/day/number)
	Pop =	population, number of pieces of equipment (number/day)
	hp =	horsepower
	UC =	conversion from hp to kW
	Load =	load factor
	D =	days per year of operation

For this project, 50 forklifts would be electrified per mitigation. Thus:

Activity =	24	hrs/day
Pop =	50	lifts
hp =	82	hp
UC =	0.745701	kW/hp
Load =	0.2	unitless
D =	365	days

EC = 5,356,519.42 kWh/year
