Arroyo Seco Canyon Project Areas 2 and 3 Draft Environmental Impact Report

Modification to Conditional Use Permit No. 6222

State Clearinghouse No. 2014101022

Prepared for:

City of Pasadena Department of Water and Power
150 South Los Robles Avenue, Suite 200
Pasadena California 91101

Prepared by:

DUDEK

38 North Marengo Avenue
Pasadena, California 91101

JUNE 15, 2020

Printed on 30% post-consumer recycled material.

ACRONYMS AND ABBREVIATIONS

Acronym/Abbreviation	Definition
AB	Assembly Bill
ACHP	Advisory Council on Historic Preservation
ACM	asbestos-containing material
ADT	average daily traffic
AGR	Agricultural Supply
ANF	Angeles National Forest
APE	Area of Potential Effect
APN	Assessor Parcel Numbers
AQMP	Air Quality Management Plan
ARR	Archaeological Reconnaissance Report
ASCP	Arroyo Seco Canyon Project
BMP	best management practices
BRTR	Biological Resources Technical Report
CAAQS	California Ambient Air Quality Standards
Cal-EPA	California Environmental Protection Agency
CAP	Climate Action Plan
CARB	California Air Resources Board
CCC	Civilian Conservation Corps
CDFW	California Department of Fish and Wildlife
CEQA	California Environmental Quality Act
CESA	California Endangered Species Act
CFC	chlorofluorocarbon
CFR	Code of Federal Regulations
CGP	Construction General Permit
CH_4	methane
CHRID	California Historical Resources Inventory Database
CHRIS	California Historic Resources Information System
CIP	Capital Improvement Program
CMP	Congestion Management Program
CNDDB	California Natural Diversity Database
CNEL	Community Noise Exposure
CNRA	California Natural Resources Agency
CO	carbon monoxide
CO_2	carbon dioxide
COLD	Cold Freshwater Habitat
CRHR	California Register of Historic Resources
CUP	Conditional Use Permit
CUPA	Certified Unified Program Agency
CWC	California Water Code

Acronym/Abbreviation	Definition
DEIR	Draft Environmental Impact Report
DOT	U.S. Department of Transportation Federal Transit Administration
DPM	diesel particulate matter
DTSC	Department of Toxic Substances Control
DWR	Department of Water Resources
EIR	Environmental Impact Report
EO	Executive Order
EPA	Environmental Protection Agency
ESM	engineered streambed material
FEIR	Final Environmental Impact Report
FEMA	Federal Emergency Management Agency
FESA	federal Endangered Species Act
FHWA	Federal Highway Administration
GHG	greenhouse gas
GSA	groundwater sustainability agency
GSP	groundwater sustainability plan
GWP	global warming potential
GWR	Ground Water Recharge
HA	Hydrologic Area
HAER	Historic American Engineering Record
HAP	hazardous air pollutant
HCFC	hydrochlorofluorocarbon
HEC-RAS	Hydrologic Engineering Center River Analysis System
HFC	hydrofluorocarbon
HRA	health risk assessment
HSA	Hydrologic Sub-Area
HU	Hydrologic Unit
HUC	hydrologic unit code
HWP	Hahamongna Watershed Park
IND	Industrial Service Supply
IS/MND	Initial Study/Mitigated Negative Declaration
ITE	Institute of Transportation Engineers
JPL	Jet Propulsion Laboratory
LACDPW	Los Angeles County Department of Public Works
LACFCD	Los Angeles County Flood Control District
LACM	Natural History Museum of Los Angeles County
LARWQCB	Los Angeles Regional Water Quality Control Board
LCFS	Low Carbon Fuel Standard
LID	low impact development

Acronym/Abbreviation	Definition
LMP	Land Management Plan
LOS	Level of Service
LST	localized significance threshold
MBTA	Migratory Bird Treaty Act
MCL	maximum contaminant level
MCY	million cubic yards
MHTS	Monk Hill Treatment System
MMRP	Mitigation Monitoring and Reporting Program
MMT	million metric tons
MS4	Municipal Separate Storm Sewer Systems
MT	metric tons
MUN	Municipal and Domestic Supply
MWD	Metropolitan Water District of Southern California
N_2O	nitrous oxide
NAAQS	National Ambient Air Quality Standards

ES EXECUTIVE SUMMARY

In accordance with the California Environmental Quality Act (CEQA) Guidelines Section 15123, this section provides a summary of the Environmental Impact Report (EIR) for the proposed Arroyo Seco Canyon Project Areas 2 and 3 (Project or proposed Project) and its environmental effects. Included in this summary are areas of known controversy and issues to be resolved, a summary of Project alternatives, a summary of all Project impacts and associated mitigation measures, and a statement of the ultimate level of significance after mitigation is applied.

ES.1 Document Purpose

This Draft EIR was prepared by the City of Pasadena (City), as lead agency, to inform decision makers and the public of the potential significant environmental effects associated with the Project. This Draft EIR has been prepared in accordance with CEQA (California Public Resources Code, Section 21000 et seq.) and the CEQA Guidelines for Implementation of the California Environmental Quality Act (CEQA Guidelines; 14 CCR 15000 et seq.) published by the Public Resources Agency of the State of California.

As described in Section 15121 (a) and 15362 of the State CEQA Guidelines,[1] an EIR is an informational document which will inform public agency decision-makers and the public of the potentially significant environmental effects of a project, identify possible ways to mitigate any significant environmental effects, and identify and evaluate a reasonable range of alternatives to the Project that have the potential to reduce or avoid the project's potential significant environmental effects, while feasibly accomplishing most of the Project' basic objectives.

ES.2 Project Location

The Project site is located in the City of Pasadena within and at the base of the Arroyo Seco Canyon at 3420 and 3500 North Arroyo Boulevard[2], City of Pasadena. The proposed Project consists of two primary areas, as shown on Figure 2-1, Local Vicinity and Regional Location, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements. These areas are connected by the North Arroyo Boulevard (i.e. Gabrielino Trail/Access Road), which serves as a recreational trail and the access road for City of Pasadena and U.S. Forest Service (USFS) vehicles heading into the Arroyo Seco Canyon. The Arroyo Seco is a natural drainage that conveys flows from the Angeles National Forest (ANF) and other adjacent lands into the downstream Devil's Gate Dam and Reservoir.

Regional access to the Project site is via Interstate (I) 210, exiting Windsor Avenue and traveling northward for approximately 0.8-mile to the intersection of Windsor Avenue and Ventura Street. From this intersection, the Project site can be accessed via either Explorer Road, which is a publicly accessible roadway that leads to the City's open area (i.e., former Jet Propulsion Laboratory [JPL] East Parking Lot), or via a locked/gated entrance to North Arroyo Boulevard (i.e. Gabrielino Trail/Access Road), which is only accessible to the public for non-motorized use, and occasional vehicle use by the City.

[1] California Code of Regulations Title 14, Chapter 3, Sections 15000-15387.

[2] Also known as "Arroyo Seco Road".

ES.3 Background

Settlement Agreement

On October 9, 2014, the City circulated the Arroyo Seco Canyon Project (ASCP) Initial Study/Mitigated Negative Declaration (IS/MND), State Clearinghouse (SCH) Number 2014101022, for a 30-day public review period from October 9, 2014, to November 8, 2014. The City was seeking approval of a Conditional Use Permit (CUP) No. 6222 for the ASCP, which involved improvements to three areas: Area 1, Arroyo Seco Headworks; Area 2, Arroyo Seco Intake; and Area 3, Jet Propulsion Laboratory (JPL) East Parking Lot.

The ASCP and associated IS/MND were approved at a public hearing held by the City's Hearing Officer on January 7, 2015. The approval was upheld by the Board of Zoning Appeals on March 4, 2015, and again at City Council on June 1, 2015 by unanimous vote. On July 2, 2015, a lawsuit (Court Case No. BS156207) was filed against the City by petitioners Spirit of the Sage Council and Project Soliton challenging the approval. On March 20, 2017, the Los Angeles Superior Court issued its decision and on June 26, 2017, entered a Judgment that partially favored the petitioners. The Court found that the elements of the ASCP related to increased diversions of surface water (i.e., greater taking of stream water from the Arroyo Seco beyond its current withdrawal) required evaluation through the preparation of an EIR. The Court also ruled that the elements of the ASCP that did not relate to increased diversions were severable from the remainder of the ASCP and the ASCP IS/MND shall remain intact for these components, allowing them to move forward without any additional environmental review pursuant to CEQA.

As such, this Draft EIR is being prepared by the City in accordance with the terms and provisions of the Judgment and Peremptory Writ of Mandate, the City's Declaration in Support of the Judgment, the Statement of Decision on Petition for Writ of Mandate, and the Settlement Agreement (see Appendix A-2 of this Draft EIR). Because several components of the ASCP were allowed to proceed without any additional environmental review pursuant to CEQA, the proposed Project boundaries of Area 2 and Area 3 have been refined from those shown in the 2015 ASCP IS/MND to reflect the activities subject to review under this Draft EIR.

ES.4 Project Objectives

Section 15124 of the State CEQA Guidelines requires the Project Description of an EIR to include a statement of the objectives sought by the proposed Project, which is intended to help the Lead Agency to develop a reasonable range of alternatives to evaluate in the EIR and the preparation of Findings of Fact and a Statement of Overriding Considerations, if necessary. The statement of objectives may include the Project benefits. The objectives that have been established for the proposed project are listed below.

Objective 1: Fully divert and utilize the City's 25 cubic feet per second surface water rights while operating in a manner objectively consistent with the Raymond Basin Judgment.

Objective 2: Increase the capacity and functionality of the spreading basins to increase PWP's ability to recharge the groundwater basin, as envisioned by the 2011 Water Integrated Resources Plan with its recommendation to maximize the value of the groundwater basin and non-potable supplies.

Objective 3: Provide opportunities for increased aquatic biological functions within the Arroyo Seco by: (1) protecting aquatic animals from passing into the conveyance system, and (2) reducing existing impediments to fish passage at the diversion weir structure.

Objective 4: Increase PWP's ability to rely upon local water for its potable water supply to reduce reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD).

ES.5 Project Description Summary

The proposed Project includes improvements in two primary areas: Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements. These areas are connected by the Gabrielino Trail/Access Road, which includes three bridge crossings over the Arroyo Seco in the vicinity of the Project site. The proposed Project involves construction activity and water infrastructure facility improvements in both areas, as well as construction truck traffic along portions of the Gabrielino Trail/Access Road.

The Project is being proposed to repair and replace water infrastructure facilities in the Upper Arroyo Seco that were damaged by debris flows caused by storms following the 2009 Station Fire. Damage to these structures has greatly reduced the City's capacity to divert water from the Arroyo Seco for spreading and pumping credits. The proposed improvements would allow for increased utilization of the City's pre-1914 surface water rights from the Arroyo Seco and maximize the beneficial uses of this important local water resource. The proposed Project would also improve biological functions within the Arroyo Seco. For any future fish populations that may establish in the Arroyo Seco, the new intake would include a fish screening feature to prevent fish populations from passing into the intake and conveyance system, and a roughened channel would be constructed directly downstream of the new weir to allow for future fish passage upstream during certain conditions (See Section 3, Project Description for additional details).

In Area 2, the proposed Project would demolish and remove the following structures: (1) existing concrete diversion weir, associated masonry abutments, and rock wall built over concrete dam that extends under the trail; (2) intake structure, metal ladder and platform, and trash racks; (3) concrete slab adjacent to the Gabrielino Trail/Access Road, and (4) excavations of soil/sediment, rocks, debris, and vegetation within the upstream diversion pool, downstream streambed, and on the adjacent slopes on the downstream side of the diversion weir.

The Project involves the construction of a new diversion weir and intake in the same location within the Arroyo Seco as the current facility. The proposed reinforced concrete diversion control structure would span the entire width of the existing channel and a 30-foot long operable weir crest gate would be located in a notched section of the structure and would be mechanically operated. Operation of the crest gate would be controlled by water depth measurements from a transducer located immediately upstream of the diversion. The crest gate would be raised to create a pool of water for diversion to the intake structure, and lowered to bypass diversions. During high flow conditions, the weir would be lowered to move sediment downstream and periodically restore the streambed elevation to the crest of the notch. The new intake would be equipped with a trash rack and fish screens to prevent future fish from entering the conveyance system to the spreading basins in Area 3. The proposed Project would also be protective of the potential for future fish populations in the Arroyo Seco with the inclusion of an engineered roughened channel downstream of the diversion structure that would allow return passage upstream when the weir crest gate is lowered.

In Area 3, the proposed Project includes the reconfiguration and expansion of the spreading basins in order to accommodate the increased diversion of stream flows for infiltration into the Raymond Basin. Existing Ponds 1 and 2, and Basins 1 and 2, would be replaced with Basin A and six new/expanded spreading basins. Stream flows from the existing conveyance system would outlet to the new sedimentation basin (Basin A) or to new spreading Basin E located over the existing Pasadena Pond 1. Basin F would be adjacent to mature trees to be preserved and would be located at the site of the existing Pasadena Pond 2. Basins G, H, and I would be located at the site of the existing Basins 1 and 2 and a portion of the City's open area (i.e., former JPL East Parking Lot). Each new basin would have an access ramp for maintenance. The new basins would remain connected to the remaining existing downstream basins within the City's spreading basin system.

A structural evaluation of Bridge No. 3 was conducted in 2018, subsequent to the placement of the temporary structural bridge overlay, which determined that the condition of Bridge No. 3 continues to deteriorate and is no longer safe for use (TJC 2018). Upon completion of the proposed Project, the City intends to keep the Bridge No. 3 overlay structures as-is, with the understanding that the reconstruction/replacement of Bridge No. 3 will eventually be required if the City wishes to maintain the bridge. The temporary structural bridge overlay allows for the safe passage of vehicles and pedestrians along the Gabrielino Trail/Access Road and to the USFS facilities and allows access to large vehicles, including fire trucks, that were previously restricted due to the loading limitations of the original bridge even before it was damaged. Since the temporary structure is constructed of steel elements and concrete, and will experience relatively light traffic, its expected service life is estimated to exceed 50 years. There may be safety risks associated with the continued deterioration of Bridge No. 3 if structural members fail and fall, and therefore the City may need to remove dangerous elements to protect public safety. Because there are no plans for the future reconstruction/replacement of the Bridge No. 3 at the time of the preparation of this Draft EIR, it is anticipated that the existing bridge may continue to deteriorate, and although not anticipated at this point, may even be removed to protect public safety.

During construction of the proposed Project, there may be times when portions of the Altadena Crest Trail, Gabrielino Trail/Access Road, Arroyo Seco Trail, and the unnamed trails/maintenance roads would be partially or fully closed to the public due to construction activities. Upon completion of the proposed Project, the temporarily disrupted trail network would be restored.

Long-term operations in Areas 2 and 3 would not be substantively different than the current conditions. No new employees or operations would be required to continue maintenance on the proposed facilities.

ES.6 Areas of Known Controversy

Section 15123(b) (2) of the CEQA Guidelines requires that areas of controversy known to the lead agency must be stated in the EIR summary. Issues of interest to the public and public agencies were identified during the 30-day public comment period of the Initial Study and NOP, which began on November 4, 2019 and concluded on December 6, 2019. Comments were received from public agencies and interested parties in response to the circulated Notice of Preparation (NOP). The City received nine comment letters in response to the Initial Study/NOP. Table 1, Notice of Preparation and Scoping Comment Letter Summary provides a brief overview of the NOP comments received by the City on environmental issues and identifies the appropriate section of the Draft EIR that addresses the topic. In compliance with CEQA Guidelines, the City held a scoping meeting on Thursday, November 21, 2019, at Robinson Park Recreation Center (1081 North Fair Oaks Avenue, Pasadena) from 6:00 PM to 8:00 PM. Comments received during the public review period were considered during preparation of this Draft EIR. The Initial Study/NOP is included as Appendix A-1 and NOP comment letters are included as Appendix A-2 of this Draft

EIR. In summary, known areas of concern include, but are not limited to: impacts to biological resources, including downstream resources that may be affected due to the diversion of additional flows from the Arroyo Seco into the spreading basins; cumulative impacts related to the ongoing sediment removal project being conducted by the County of Los Angeles Flood Control District at the adjacent Devil's Gate Reservoir; and consideration of alternatives that would rely more on the natural stream hydrology.

ES.7 Summary of Project Alternatives

Section 15126.6 of the CEQA Guidelines identifies the parameters within which consideration and discussion of alternatives to the Project should occur. As stated in this section of the guidelines, alternatives must focus on those that are reasonably feasible and that attain most of the basic objectives of the Project. Each alternative should be capable of avoiding or substantially lessening any significant effects of the Project. The rationale for selecting the alternatives to be evaluated and a discussion of the No Project Alternative are also required, per Section 15126.6.

ES.7.1 Alternatives Considered and Eliminated

Two alternatives for the Project were considered, but ultimately rejected from further analysis in the Draft EIR, consistent with Section 15126.6(c) of the CEQA Guidelines. A brief summary of the potential alternatives considered, but not carried forward, is provided below (see Section 6, Alternatives for additional details).

Reduced Diversion with In-Stream Spreading

Several of the letters received during the NOP public review period suggested that the proposed Project not be implemented in favor of an alternative approach that involves in-stream spreading and percolation. This proposed alternative set forth in the NOP comment letters was for the City to consider either: (1) leaving the flows in the "natural stream" and allowing them to be naturally absorbed within the stream, with the City taking credit for up to the calculated natural stream percolation capacity, and diverting the remainder into the spreading basins to achieve the 25 cfs surface water rights; or (2) installing a low berm facility within the Arroyo Seco near Johnson Field that would "spread" the flows within the stream bed and slow water to allow percolation.

Consolidated Facility Below JPL Bridge

A version of this potential alternative was preliminarily evaluated in the Upper Arroyo Seco Watershed Integrated Spreading Grounds Concept Report prepared by CDM Smith in 2012. This potential alternative would demolish the existing facilities in Area 2 and abandon the conveyance system and would restore that portion of the Arroyo Seco in Area 2. Stream flows would be captured behind the new consolidated diversion dam located just downstream of the JPL Bridge adjacent to Area 3 and diverted into the expanded spreading basins, as set forth in the proposed Project.

ES.7.2 Alternatives Evaluated in this EIR

This Draft EIR includes an evaluation of the following alternatives:

- Alternative A- No Project/No Action
- Alternative B- Redesigned Spreading Basins in Area 3
- Alternative C- Historic Bridge Rehabilitation

Alternative A – No Project/No Action

Under Alternative A, the proposed Project would not be implemented as discussed in Section 3 of this Draft EIR. The Areas 2 and 3 of the Project site would remain unchanged, and no development activity would occur.

Alternative B – Redesigned Spreading Basins in Area 3

Under Alternative B, all activities proposed within Area 2 would continue to be implemented, as set forth in the proposed Project. The alternative design of Area 3 would mimic the primary design objectives and operational characteristics of the proposed Project; however, Alternative B would provide an improved design for the spreading basins with more appeal for recreational users. The alternative would eliminate the rectangular shapes of the existing condition, as well as the proposed Project design, in favor of curvilinear basin features that more closely resemble natural channel and stream functions. The recreational amenities would be further improved through selective plantings around the basins. The Alternative B basin layout and landscaping would have the added benefit of enhancing the proposed trail network for pedestrians and equestrian usage, with incorporation of benches, interpretive signage, and shade structures adjacent to the spreading basins along the proposed pedestrian trails/maintenance roads. Alternative B would also include a slight realignment of Explorer Road to reflect the more curvilinear contours of the spreading basins and to allow for the future Explorer Well site to be east of the recreational trail amenities. Relocating the well site to the east would make it less prominent when viewing the area from the Gabrielino Trail above.

Alternative C – Historic Bridge Rehabilitation

Under Alternative C, all activities proposed within Areas 2 and 3 would continue to be implemented, as set forth in the proposed Project. Alternative C also includes the implementation of the recommendations of the Arroyo Seco Bridge (B3) Assessment Deterioration Comparison prepared by TJC Associates Inc. in 2018 (TJC 2018) as they relate to the reconstruction or replacement of primary structural features on historic Bridge No. 3, which is located within the Project's study area along the Gabrielino Trail/Access Road. All of the primary structural elements of the bridge; specifically, the joists below the bridge deck, the heavy timber support element at mid-span, the A-frame trusses on the east and west sides of the bridge, and the steel elements of the bridge are deteriorated and subject to failure, and would be replaced.

ES.7.3 Environmentally Superior Alternative

Alternative C would result in slightly increased short-term construction impacts to most environmental topics. For long-term impacts, Alternative C would not provide the protections related to wildfire preparedness as it pertains to the City's ability to accommodate firefighting equipment into and out of the Arroyo Seco Canyon and the ANF. However, this Alternative would eliminate the significant unavoidable impact related to historic resources and would be considered to be the environmentally superior alternative to the proposed Project.

ES.8 Discretionary Actions

The City of Pasadena, as lead agency, must consider the following discretionary actions:

- Project Approval and Certification of the Environmental Impact Report
- Modification to Conditional Use Permit No. 6222 to allow for utility improvements within the Open Space Zone
- Tree Removal Authorization

The following additional permits, approvals, and discretionary actions may be necessary as part of Project approval:

- U.S. Army Corps of Engineers – A Section 404 Nationwide Permit would be needed in order to allow the proposed project to discharge dredge and fill material into a "water of the United States."
- Regional Water Quality Control Board, Los Angeles Region – 401 Water Quality Certification – Any discharge from the Project will be required to comply with applicable provisions of the Clean Water Act and regulated under the State's Waste Discharge Requirement order.
- California Department of Fish and Wildlife (CDFW) – Section 1600 Streambed Alteration Agreement to authorize changes to the natural flow or the bed, channel, or bank of any river, stream, or lake and associated impacts to biological resources (needed for temporary and permanent disturbance of Arroyo Seco in Area 2 and for temporary impacts due to spreading basin expansion in Area 3).
- Los Angeles County Flood Control District – Encroachment Permit to authorize construction activities within the Altadena Storm Drain Easement.

ES.9 Summary of Environmental Impacts and Mitigation Measures

Table ES-1, Summary of Environmental Impacts and Mitigation Measures, provides a summary of the impact analysis related to the proposed Project and identifies the significant environmental impacts resulting from the Project pursuant to the CEQA Guidelines Section 15123(b)(1). For more detailed discussion, please see Sections 4.1 through 4.9 of this Draft EIR.

Table ES-1 also lists the applicable mitigation measures related to identified significant impacts, as well as the level of significance after mitigation is incorporated. As stated in Section 3, Project Description, of this Draft EIR, the Initial Study (IS) prepared and circulated with the NOP for public review on the Project (see Appendix A-1, Notice of Preparation and Initial Study) concluded that the Project would not result in significant impacts to Aesthetics, Agricultural and Mineral Resources, Energy, Geology and Soils (with the exception of impacts to paleontological resources, which is assessed under Cultural Resources for the purposes of this Draft EIR), Hazards and Hazardous Materials, Land Use and Planning, Mineral Resources, Population and Housing, Public Services, Utilities and Service Systems, and Wildfire. Therefore, these topics are not addressed in this Draft EIR and not summarized in Table ES-1.

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
Air Quality			
4.1a. Would the project conflict with or obstruct implementation of the applicable air quality plan?	Less Than Significant	None	Not Applicable.
4.1b. Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard	Less Than Significant	None	Not Applicable.
4.1c. Would the project expose sensitive receptors to substantial pollutant concentrations?	Less Than Significant	None	Not Applicable.
Biological Resources			
4.2a. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Potentially Significant	**MM-BIO-1** Prior to commencement of any earthmoving activities or the pre-construction staging of equipment on the Project site, the City shall develop a Preconstruction Survey and Relocation Plan for terrestrial reptiles, including the California newt, two-striped gartersnake, Southern California legless lizard, and coastal whiptail. The Preconstruction Survey and Relocation Plan shall be submitted to the California Department of Fish and Wildlife (CDFW) for review prior to any ground-disturbing activities within potentially occupied habitat. The Plan shall include at a minimum, the following: (1) protocols for pre-construction surveys to flush out and/or move identified special status wildlife within the study area, as feasible; (2) the timing, frequency, and locations where surveys should be conducted; (3)	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		the habitat and conditions in the proposed relocation site(s); (4) the methods that would be used for trapping and relocating identified species; (5) protocols for documentation/recordation of the species and number of animals relocated; and (6) protocols for notifying CDFW in the event that identified species cannot be relocated. The Plan shall require that a Biological Monitor be present during initial vegetation clearing activities within Areas 2 and 3, as well as twice weekly until ground disturbing activities are completed. The Biological Monitor shall also be familiar with least Bell's vireo and shall conduct pre-clearing non-protocol surveys for this species while onsite. If a least Bell's vireo or other State of federally listed species is detected, work activity within 200 feet of the detected occupied habitat will be temporarily halted and the City will consult with the appropriate wildlife agencies. With authorization from these agencies, which may include a 'take' permit, the project will proceed in accordance with conditions developed in the consultation. Conditions will include avoidance and minimization measures to prevent or minimize impacts on the listed species(s) occurring on or adjacent to the site. The Plan shall require that any individual special-status terrestrial wildlife species observed within the study area during the pre-construction survey(s) shall be flushed out and/or moved out of harm's way to avoid direct impacts to these species, and if special-status species are detected, the Biological Monitor shall capture and relocate individuals to nearby undisturbed areas with suitable habitat outside of	

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		the construction area, but as close to their origin as possible. The final recordation/documentation of any wildlife relocated during Project activities shall be made available to CDFW for confirmation that construction activities were executed in compliance with the approved Preconstruction Survey and Relocation Plan.	
	Potentially Significant	**MM-BIO-2** Project construction shall be conducted in compliance with the conditions set forth in the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code with methods approved by the California Department of Fish and Wildlife (CDFW) to protect active bird/raptor nests. To the maximum extent feasible, vegetation removal shall occur during the non-breeding season for nesting birds (generally late September to early March) and nesting raptors (generally early July to late January) to avoid impacts to nesting birds and raptors. If the Project requires that work be initiated during the breeding season for nesting birds (March 1–September 30) and nesting raptors (February 1–June 30), in order to avoid direct impacts on active nests, a pre-construction survey shall be conducted by a qualified Biologist for nesting birds and/or raptors within 3 days prior to clearing of any vegetation and/or any work near existing structures (i.e., within 300 feet for nesting birds and within 500 feet for nesting raptors). If the Biologist does not find any active nests within or immediately adjacent to the impact areas, the vegetation clearing/construction work shall be allowed to proceed. If the Biologist finds an active nest within or immediately adjacent to the construction area and determines that the nest may be	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		impacted or breeding activities substantially disrupted, the Biologist shall delineate an appropriate buffer zone around the nest depending on the sensitivity of the species and the nature of the construction activity. Any nest found during survey efforts shall be mapped on the construction plans. The active nest shall be protected until nesting activity has ended. To protect any nest site, the following restrictions to construction activities shall be required until nests are no longer active, as determined by a qualified Biologist: (1) clearing limits shall be established within a buffer around any occupied nest (the buffer shall be 100–300 feet for nesting birds and 300–500 feet for nesting raptors), unless otherwise determined by a qualified Biologist and (2) access and surveying shall be restricted within the buffer of any occupied nest, unless otherwise determined by a qualified Biologist. Encroachment into the buffer area around a known nest shall only be allowed if the Biologist determines that the proposed activity would not disturb the nest occupants. Construction can proceed when the qualified Biologist has determined that fledglings have left the nest or the nest has failed.	
	Potentially Significant	**MM-BIO-3** A Biological Monitor shall conduct a pre-construction bat habitat assessment of buildings and trees marked for potential removal. Potential for roosting shall be categorized by 1) potential for solitary roost sites, 2) potential for colonial roost sites (10 bats or more). If the potential for colonial roosting is determined, those trees shall not be removed during the bat maternity roost season (March 1 – July 31). Trees potentially supporting colonial roosts outside of	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		maternity roost season, and trees potentially supporting solitary roosts may be removed via a two-step removal process, whereby some level of disturbance (such as trimming of lower branches) (at the direction of Biological Monitor) is applied to the tree on day one to allow bats to escape during the darker hours, and the roost tree shall be removed two days later (i.e., there shall be no less or more than two nights between initial disturbance and the grading or tree removal). When feasible, trees will be dropped slowly and a Biological Monitor will monitor the activity. If buildings are determined to be occupied, one-way exclusionary devices will be placed over bat access points and left in place for two nights prior to building removal.	
4.2b. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Potentially Significant	**MM-BIO-4** Direct impacts to sensitive vegetation communities white alder–California sycamore woodland association and California sycamore woodlands alliance shall be mitigated through a combination of on-site and/or off-site measures. Mitigation for impacts to sensitive vegetation communities shall consider and overlap with compensation for jurisdictional waters (MM-BIO-6) since the sensitive vegetation is associated with the jurisdictional limits of Arroyo Seco. Mitigation for direct impacts to sensitive vegetation communities shall be implemented through on-site creation/enhancement, program funding, mitigation bank credits, and/or creation/enhancement of native vegetation communities on City lands. Mitigation acreages shall be implemented as shown in the Table below.	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

On-site Mitigation. Prior to the issuance of a grading permit or any earthwork on the Project site, PWP shall prepare a Habitat Mitigation and Monitoring Plan (HMMP) for habitat enhancement and creation activities. The HMMP shall at a minimum include a feasible implementation structure, salvage/seeding details, invasive species eradication methods, irrigation system and schedule, a monitoring schedule, performance standard of success, estimated costs, and identification of responsible entities. The HMMP shall include restoration of the following habitats:

Riparian Woodlands. Impacted areas of (white alder–California sycamore woodland association and California sycamore woodlands alliance) shall be created/restored within and adjacent to the same on-site areas that the woodland currently existed prior to Project implementation, as well as other areas deemed to have appropriate soils and topography for successful establishment. Understory areas shall be revegetated with a diversity of locally-collected seeds.
</td><td></td></tr>
</table>

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		Temporary irrigation shall be established and maintained, with irrigation suspensions in times of rainfall. Successful establishment of the woodland shall be determined only after removal of irrigation system and confirmed ability of the woodland to survive in the absence of irrigation. It is anticipated that a one-time restoration effort followed by monitoring and invasive weed removal for a minimum of five (5) years would be required. The HMMP shall be submitted to the City, CDFW, USACE, and RWQCB for review and comment, and revised to the satisfaction of the City and the three agencies. **Off-site Mitigation.** If mitigation is implemented through mitigation program funding and/or mitigation bank credits, the Project Applicant shall work with the City, CDFW, USACE, and RWQCB to ensure the mitigation program funding and/or mitigation bank credits are appropriate to offset permanent impacts. Mitigation lands shall be comprised of similar or higher quality riparian woodland and preferably located in the vicinity of the site or watershed. If mitigation is implemented through offsite enhancement of City-owned lands, PWP shall prepare a HMMP that details the location and existing conditions of the offsite lands. The HMMP shall at a minimum include a feasible implementation structure, salvage/seeding details, invasive species eradication methods, irrigation system and schedule, a monitoring schedule, performance standard of success, estimated costs, and identification of responsible entities. It is anticipated that a one-time restoration

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		effort followed by monitoring and invasive weed removal for a minimum of five (5) years would be required. The HMMP shall be submitted to the City, CDFW, USACE, and RWQCB for review and comment, and revised to the satisfaction of the City and the three agencies.	
		MM-BIO-5 To prevent inadvertent disturbance to sensitive vegetation communities outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary high visibility construction fence) prior to ground disturbance activities. All construction activities including equipment staging and maintenance shall be conducted within the marked disturbance limits. A qualified biologist shall be present during initial ground-disturbing activities within the Project site to ensure that Project activities stay within the demarcated limits.	Mitigated to Less Than Significant
		MM-BIO-6 Mitigation for direct impacts to jurisdictional waters shall be implemented through on-site enhancement of remaining jurisdictional waters and/or off-site acquisition, program funding, and/or mitigation bank credits. Mitigation ratios for each type of jurisdictional waters is shown in the Table below. Mitigation for temporary and permanent impacts to jurisdictional wetlands and waters shall consider and overlap with compensation for sensitive vegetation communities (MM-BIO-4).	Mitigated to Less Than Significant

Jurisdictional Waters Type	Direct Impacts (acres)	Mitigation Ratio	Mitigation (acres)a
USACE waters of the United States	0.20	1:1	0.20
RWQCB waters of the state	2.58	1:1	2.58
CDFW streambed and bank, with riparian vegetation[b]	0.49	3:1	1.47
CDFW streambed and bank, with non-riparian habitat[c]	2.41	1:1	2.41

Notes:

[a] Mitigation areas for each jurisdictional type may overlap

[b] white alder–California sycamore woodland (0.48 acres) and coast live oak woodland (<0.01 acres)

[c] California sagebrush–California buckwheat–laurel sumac scrub (<0.001 acres); urban/developed (0.03 acres); disturbed habitat (2.38 acres); laurel sumac scrub (<0.01 acres)

On-site Mitigation. Prior to the issuance of a grading permit or any earthwork on the Project site, PWP shall prepare a HMMP for habitat enhancement and creation activities. The HMMP shall at a minimum include a feasible implementation structure, salvage/seeding details, invasive species eradication methods, irrigation system and schedule, a monitoring schedule, performance standard of success, estimated costs, and identification of responsible entities. The HMMP shall include restoration of the following habitats:

Riparian Woodlands. Impacted areas of (white alder–California sycamore woodland association and coast live oak woodland) shall be created/restored within and adjacent to the same on-site areas that the woodland currently existed prior to Project implementation, as well as other areas deemed to have appropriate soils and topography for successful establishment. Understory areas shall be revegetated with a diversity of locally-collected seeds. Temporary irrigation shall be established and maintained, with irrigation suspensions in times of rainfall. Successful establishment of the woodland shall be determined

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		only after removal of irrigation system and confirmed ability of the woodland to survive in the absence of irrigation. It is anticipated that a one-time restoration effort followed by monitoring and invasive weed removal for a minimum of five (5) years would be required. The HMMP shall be submitted to the CDFW, USACE, and RWQCB for review and comment, and revised to the satisfaction of the three agencies. **Off-site Mitigation.** If mitigation is implemented through mitigation program funding and/or mitigation bank credits, PWP shall work with the CDFW, USACE, and RWQCB to ensure the mitigation program funding and/or mitigation bank credits are appropriate to offset permanent impacts. Mitigation lands shall be comprised of similar or higher quality riparian woodland and preferably located in the vicinity of the site or watershed. If mitigation is implemented through offsite enhancement of City-owned lands, PWP shall prepare a HMMP that details the location and existing conditions of the offsite lands. The HMMP shall at a minimum include a feasible implementation structure, salvage/seeding details, invasive species eradication methods, irrigation system and schedule, a monitoring schedule, performance standard of success, estimated costs, and identification of responsible entities. It is anticipated that a one-time restoration effort followed by monitoring and invasive weed removal for a minimum of five (5) years would be required. The HMMP shall be submitted to the CDFW, USACE, and RWQCB for review and comment, and revised to the satisfaction of the three agencies.	

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
4.2c. Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	Potentially Significant	See MM-BIO-5 and MM-BIO-6	Mitigated to Less Than Significant
4.2d. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Less Than Significant	**MM-BIO-7** Prior to the commencement of earthmoving within Area 2 for the demolition of the existing diversion/weir structure, the City shall develop a Native Resident and Migratory Fish Monitoring Plan (Monitoring Plan), in consultation with CDFW. This Monitoring Plan shall set forth annual monitoring requirements to determine if native fish species or migratory fish populations are present within an approximate 3,500-foot section of the stream (about 1,500 feet upstream of the diversion/weir structure to the abandoned headworks (Area 1) and 2,000 feet downstream to the JPL Bridge at the mouth of the canyon). Annual survey protocols shall be established to the satisfaction of CDFW and set forth in the Monitoring Plan. If the results of the annual surveys reveal a positive presence of native fish, the Monitoring Plan shall set forth thresholds for determining the permanency of the population, and whether or not connectivity both upstream and downstream of the diversion structure is appropriate and in the best interest of the long-term survival of an established native or migratory fish population, given hazards associated with stranding downstream. Until passage for steelhead is restored to the Arroyo Seco, the City shall implement a program to rescue fish between the diversion	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		structure and the JPL Bridge. If rescue is determined to be ineffective or impractical, then the City shall modify its operations to accommodate passage. At such time as steelhead passage is restored, the City shall alter either the design of the diversion/weir structure, the operational methods of the diversion/weir structure, or both to satisfy Fish and Game Code Sections 5901 and 5937.	
4.2e. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	Potentially Significant	**MM-BIO-8** A qualified biologist shall be present during initial ground-disturbing activities within the Project site to ensure that Project activities stay within the demarcated limits, as required in MM-BIO-5. This qualified biologist shall identify the number of City-protected trees that are removed as a result of Project construction activities, as well as trees that would be encroached upon. This inventory of trees shall be used to determine an appropriate tree replacement program that shall be, at a minimum, consistent with the City's Tree Ordinance (Chapter 8.52 of the Pasadena Municipal Code) and the Ordinance's administrative guideline replacement matrix, as it relates to tree replacement of protected trees. Trees within approximately 15 feet of proposed construction activity shall be temporarily fenced with chain-link fencing in accordance with the City's Tree Ordinance and Tree Protection Guidelines. The fencing shall be installed to the extent of the tree's dripline plus four (4) radial feet and be minimum six (6) feet high with an access gate of minimal width. The fenced area shall be considered the Tree Protection Zone (TPZ) unless proximate construction required temporary removal.	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		All trees that have been substantially root pruned (30% or more of their root zone) during construction within the TPZ shall be monitored by an International Society of Arboriculture Certified arborist for the first five years after construction completion. The arborist shall submit an annual report, photograph each tree and compare tree health and condition to the original, pre-construction baseline. For trees that do not survive the five-year monitoring period, such trees shall be replaced in accordance with the requirements of this measure.	
Cultural Resources			
4.3a. Would the project cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5?	Potentially Significant	**MM-CUL-1** Prior to the commencement of construction vehicle and truck traffic along the Gabrielino Trail/Access Road north of the JPL Bridge, the City shall ensure that Bridge No. 2 and all identified arroyo stone wall features along the affected portions of the Gabrielino Trail/Access Road are properly protected for the duration of construction activities. The City shall install temporary protective barriers in the form of concrete k-rails along the decorative railings of Bridge No. 2 on both sides of the road to protect the railings from further deterioration and damage from vehicles. The concrete k-rails shall be removed once the Project is completed leaving Bridge No. 2 intact. The concrete k-rails shall be installed parallel to the Bridge's existing baluster railings, with approximately 2 feet of separation between the k-rail and the resource. The k-rails shall be positioned to ensure that the Bridge railings are protected from daily construction traffic. The k-rails shall not be permanently attached to	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		the bridge. All arroyo stone wall features adjacent to the Gabrielino Trail/Access Road shall be protected by concrete k-rails wherever feasible; however, in areas where k-rails would create an impassable or bottleneck situation for vehicles, the City shall utilize other reasonable protections, including cones and flagging, to ensure that the arroyo stone walls are not inadvertently damaged during construction vehicle movement and equipment transport. The plans for the temporary barriers shall be reviewed by a qualified architectural historian prior to Project implementation. In order to ensure that the bridge and stone walls are adequately protected during Project activities, the City shall ensure completion of pre-construction and post-construction surveys by a qualified historic preservation consultant to ensure that adverse effects or significant impacts have not occurred to Bridge No. 2. If the pre-construction survey identifies deficiencies in the protections for Bridge No. 2 or the stone walls, recommendations for additional physical barriers or visual warnings shall be provided and implemented prior to initiation of construction activities. The installation/construction methodology and post-construction survey shall be submitted to the City of Pasadena Department of Planning – Historic Preservation for review and approval.	
	Potentially Significant	**MM-CUL-2** Prior to construction completion, the City shall ensure preparation of Historic American Engineering Record (HAER) documentation for Bridge No. 3 in accordance with the Secretary of the Interior's Standards for Architectural and Engineering Documentation. Documentation shall be completed by a qualified historic preservation professional who meets the	Significant and Unavoidable

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		Secretary of the Interior's Professional Qualifications Standards for architectural history. The documentation shall capture the physical description of the existing bridge with: 1) existing as-builts/drawings (where/if available); 2) a written narrative that includes a detailed history and architectural description of the bridge and a discussion of its historical significance; 3) photographs of the bridge with large format negatives to demonstrate its current condition; and 4) provide other photographs of the bridge prior to installation of the current overlay. Upon approval of the final HAER package, the City shall offer one original copy of the final HAER package to the City of Pasadena Historic Preservation Program, the South Central Coastal Information Center at California State University, Fullerton, and the Angeles National Forest Administrative Office. Prior to construction completion, the City shall conduct a review of the bridge overlay design on Bridge No. 3 and construction materials used in the bridge overlay to determine improvements that can be made to conform with the City's Arroyo Seco Design Guidelines. Examples of potential improvements include, but are not limited to, evaluation of appropriate paint colors that reflect the natural character of the Arroyo Seco, and replacement of components with more natural materials (e.g. wood, concrete, brick, arroyo stone piers, unpainted weathering steel or other natural materials, such as copper and wrought iron). The proposed design improvements shall be submitted to the City of Pasadena Department of Planning – Historic Preservation for review and approval.	

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
	Potentially Significant	**MM-CUL-3** Prior to commencement of Project construction activities that would require equipment staging at the Behner Water Treatment Plant (WTP), the City shall ensure that the exterior of the WTP building is adequately protected from equipment and vehicle staging activities. The northwest and southwest exterior elevations of the WTP shall, at a minimum, be protected by construction fencing and signage to ensure that none of the major exterior character-defining features of the building are inadvertently damaged. Fencing shall be placed at a minimum distance of five (5) feet from the exterior of the building, and crews working in the immediate vicinity should be alerted to the presence of an historical resource and instructed to avoid it. The City shall ensure that Project-related equipment and materials are not in contact with the exterior or the building, including absolute avoidance of leaning materials and equipment against exterior walls. The temporary fencing, signage, and barriers shall be removed at the conclusion of construction activities.	Mitigated to Less Than Significant
4.3b. Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5?	Potentially Significant	**MM CUL-4** Prior to commencement of earthmoving activities, the City shall retain a qualified Archaeologist meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology. The Archaeologist shall be present at the pre-grade conference; shall establish procedures for archaeological resource surveillance; and shall establish, in cooperation with the Contractor, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts, as appropriate. At a minimum, in the event archaeological resources are exposed during construction activities, all construction work occurring within 100	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		feet of the find shall immediately stop until a qualified archaeologist can evaluate the significance of the find and determine whether or not additional study is warranted. The Archaeologist shall first determine whether it is a "unique archaeological resource" pursuant to the California Environmental Quality Act (CEQA, i.e., Section 21083.2[g] of the California Public Resources Code) or a "historical resource" pursuant to Section 15064.5(a) of the State CEQA Guidelines. If the archaeological resource is determined to be a "unique archaeological resource" or a "historical resource", the Archaeologist shall formulate a mitigation plan in consultation with the City of Pasadena that satisfies the requirements of the above-referenced sections. The Archaeologist shall prepare a report of the results of any study prepared as part of a testing or mitigation plan, following guidelines of the California Office of Historic Preservation, and s/he shall record the site and submit the recordation form to the City of Pasadena and the California Historic Resources Information System (CHRIS) at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. Work may proceed in other areas of the site, subject to the direction of the Archaeologist.	
4.3d. Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Potentially Significant	**MM-PALEO-1** Prior to commencement of any grading activity on-site, the City shall retain a qualified Paleontologist per the Society of Vertebrate Paleontology (SVP) (2010) guidelines. The paleontologist shall prepare a Paleontological Resources Impact Mitigation Program (PRIMP) for the Project. The PRIMP shall be consistent with the SVP (2010) guidelines. Minimum requirements to be set forth in the PRIMP include: (1) attendance at the preconstruction meeting and	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		worker environmental awareness training, where monitoring is required within the proposed Project site based on construction plans and/or geotechnical reports; (2) procedures for adequate paleontological monitoring and discoveries treatment, and paleontological methods, including sediment sampling for microvertebrate fossils, reporting, and collections management; (3) mandatory monitoring on-site during all rough grading and other significant ground-disturbing activities, including augering in previously undisturbed, fine-grained Pleistocene alluvial deposits; (4) mandatory actions in the event that paleontological resources (e.g., fossils) are unearthed during grading, including the requirement for the paleontological monitor to temporarily halt and/or divert grading activity to allow recovery of paleontological resources, and roping/fencing off of the discovery with a 50-foot radius buffer; and (5) if resources are discovered, methods for coordination between the qualified paleontologist and the City for appropriate exploration and/or salvage, as well as final disposition of the resources in an accredited institution or museum, such as the Natural History Museum of Los Angeles County.	
Greenhouse Gas Emissions			
4.4a. Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	Less than Significant Impact	None	Not Applicable

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
4.4b. Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	Less than Significant Impact	None	Not Applicable
Hydrology and Water Quality			
4.5b. Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	Less than Significant Impact	None	Not Applicable
4.5c. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces in a manner which would: (i) result in substantial erosion or siltation on- or off-site; (ii) substantially increase the rate or amount of surface the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; (iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or (iv) impede or redirect flood flows?	Less than Significant Impact	None	Not Applicable

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
Noise			
4.6a. Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?		**MM-NOI-1** The City and/or their Construction Contractor shall implement the following noise reduction measures during all construction activities: • Equip all construction equipment (fixed or mobile) with properly operating and maintained mufflers, consistent with or exceeding manufacturers' standards. • Ensure that construction equipment engine enclosures and covers as provided by manufacturers shall be in place during operation. • Place all stationary construction equipment so that the equipment is as far as feasible from noise-sensitive receptors and so that the emitted noise is directed away from the noise-sensitive receptors. • Locate equipment and materials staging in areas that will create the greatest distance between staging area noise sources and noise-sensitive receptors during Project construction. • Ensure that construction equipment is shut down when not in use. • Limit haul truck deliveries to the same hours specified for the operation of construction equipment.	Mitigated to Less Than Significant
4.6b. Would the project result in generation of excessive groundborne vibration or groundborne noise levels?	Less than Significant Impact	None	Not Applicable

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
Recreation			
4.7a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	Potentially Significant	**MM-REC-1** Prior to the closure of recreational trails for public use, the City of Pasadena shall post signs providing at least one week of advanced notice of the dates and times of planned trail closures at the following locations: • Intersection of Ventura Street and Windsor Avenue • Sunset Overlook • Altadena Crest Trail (adjacent to the North Arroyo Boulevard) • Arroyo Seco Trail • West Rim Trail/East Rim Trail In addition to the closure notice signage, the City shall provide the locations of nearby trails and recreational facilities in the surrounding area that would be open for public use at the times when the trails are closed. This information shall also be posted on the City's Parks, Recreation and Community Services website.	Mitigated to Less Than Significant
Transportation			
4.8a. Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	Potentially Significant	**MM TRA-1** During the peak phase of construction activities (i.e. during the demolition phase requiring haul truck trips) in Area 3, all Construction Contractors shall schedule the arrival and departure of the sediment export haul trucks to be outside the AM peak hours of 7:30 AM to 8:30 AM and the PM peak hours of 4:30 PM to 5:30 PM.	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
	Potentially Significant	**MM TRA-2** During construction activities in Areas 2 and 3, use of the North Arroyo Boulevard or Gabrielino Trail/Access Road by hikers, bicyclists and equestrians shall be limited or prohibited when temporary partial or full closures of the Gabrielino Trail/ Access Road, Explorer Road, hiking trails or maintenance roads is necessary. In addition to the requirements for notification set forth in the City's Supplements and Modifications to the Greenbook, flagpersons and/or other safety procedures shall be used as necessary to ensure the safety of recreational users.	Mitigated to Less Than Significant
	Potentially Significant	**MM TRA-3** Prior to the start of construction, the City and/or their Construction Contractor shall provide written notice to the USFS and residences at the Ranger Station of the anticipated construction schedule, stating that access may be temporarily obstructed on an intermittent basis and providing a schedule of anticipated closures. In order to ensure that emergency vehicles would not be obstructed at any time, any temporary obstructions to the Gabrielino Trail/Access Road that could hinder emergency vehicular access shall be mobile and able to be removed from the roadway immediately upon notice from emergency responders.	Mitigated to Less Than Significant
Cumulative 4.8a. Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	Potentially Significant Cumulative Impact	**MM CUML-1** The City and/or their Construction Contractor shall coordinate with the Los Angeles County Department of Public Works and/or their contractor for the sediment removal activities at Devil's Gate Reservoir regarding the schedule of trucks to and from landfills that would require the use of Interstate 210 eastbound ramps/Arroyo Boulevard intersection. If it is determined that activities would overlap and Project traffic and cumulative traffic including the Devil's Gate project traffic would have vehicle queues at Caltrans facilities that exceed available storage	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		lengths, then the City and/or their contractor shall implement construction vehicle/hauling restrictions that disallow the proposed Project's truck traffic during the AM and PM peak hours of 7:30 AM to 8:30 AM and 4:30 PM to 5:30 PM.	
Tribal Cultural Resources			
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)? b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set	Potentially Significant	**MM-TCR-1** Prior to commencement of any ground-disturbing activities, the City of Pasadena shall retain a Native American Monitor approved by the Gabrieleño Band of Mission Indians-Kizh Nation – the tribe that consulted on this project pursuant to Assembly Bill AB 52 (the "Tribe" or the "Consulting Tribe"). The Tribal monitor shall only be present on the Project site during the construction phases that involve ground-disturbing activities. Ground disturbing activities may include, but may not be limited to, pavement removal, potholing or auguring, grubbing, tree removals, boring, grading, excavation, drilling, and trenching within the Project area. The Tribal Monitor shall complete daily monitoring logs that provide descriptions of the day's activities, including construction activities, locations, soil, and any cultural materials identified. The on-site monitoring shall end when all ground-disturbing activities on the Project site are completed, or when the Tribal Representatives and Tribal Monitor have indicated that all upcoming ground disturbing activities at the Project site have little to no potential for impacting Tribal Cultural Resources. Upon discovery of any Tribal Cultural Resources, construction activities shall cease in the immediate vicinity of the find (not less than the surrounding 100 feet) until the find can be assessed. All Tribal Cultural Resources unearthed by Project activities shall be evaluated by	Mitigated to Less Than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)		Level of Significance After Mitigation
forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?			the qualified archaeologist (as required in MM-CUL-4) and the Tribal Monitor approved by the Consulting Tribe. If the resources are Native American in origin, the Consulting Tribe will retain it/them in the form and/or manner the Tribe deems appropriate, for educational, cultural and/or historic purposes.	
	Potentially Significant	MM-TCR-2	If human remains and/or grave goods are discovered or recognized at the Project Site, all ground disturbance shall immediately cease, and the county coroner shall be notified per Public Resources Code Section 5097.98, and Health & Safety Code Section 7050.5. Human remains and grave/burial goods shall be treated alike per California Public Resources Code section 5097.98(d)(1) and (2). Work may continue on other parts of the Project site while evaluation and, if necessary, mitigation takes place (CEQA Guidelines Section 15064.5[f]). If a non-Native American resource is determined by the qualified archaeologist to constitute a "historical resource" or "unique archaeological resource," time allotment and funding sufficient to allow for implementation of avoidance measures, or appropriate mitigation, must be available. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and PRC Sections 21083.2(b) for unique archaeological resources. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. Any historic archaeological	Less than Significant

Table ES-1. Summary of Environmental Impacts and Mitigation Measures

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		material that is not Native American in origin shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes.

TJC (TJC and Associates Inc.). 2018. *Arroyo Seco Bridge (B3) Assessment Deterioration Comparison*. Final version. Prepared for Pasadena Water and Power. March 16, 2018.

INTENTIONALLY LEFT BLANK

1 INTRODUCTION

The purpose of this Section is to introduce the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project), the applicable environmental review procedures, and the organization of the Draft Environmental Impact Report (EIR).

1.1 Purpose and Scope

The purpose of this Draft EIR is to evaluate and disclose the potential environmental consequences of the proposed Arroyo Seco Canyon Project Areas 2 and 3 (Project/proposed Project). The proposed Project constitutes a "project" as defined in the California Environmental Quality Act (CEQA) Guidelines Section 15378. Pursuant to Section 15367 of the State CEQA Guidelines, the City of Pasadena (City) is the Lead Agency for the Project. This Project is being implemented by the City of Pasadena Department of Water and Power (PWP). However, the City of Pasadena is serving as the Lead Agency, as it has the principal responsibility for carrying out the Project and has the authority for approving the Project and its accompanying environmental documentation.

The City owns the right to divert up to 25 cubic feet per second (cfs) of surface water from the Arroyo Seco for direct use or to spread for percolation into spreading basins for groundwater pumping credits from the Raymond Basin. Of the total amount of water that is infiltrated into the groundwater through the existing spreading basins, PWP has the right to pump between 60- to 80% of that amount for beneficial use in the City's water supply. The City has historically diverted its 25 cfs surface water right; however, in the two storm seasons following the 2009 Station Fire[1], excessive amounts of sediment washed down from the watershed. The debris flows damaged City structures, greatly reducing the City's capacity to divert water for spreading. As a result, PWP proposes to repair and replace damaged facilities in the Arroyo Seco Canyon as a part of the proposed Project. The improvements would allow for increased utilization of the City's surface water rights from the Arroyo Seco and maximize the beneficial uses of this important local water resource. The proposed Project would implement a multi-benefit approach to the repair and replacement of damaged infrastructure in the Arroyo Seco, with the overall Project objective of increasing the beneficial use of the surface water rights held by the City and improving biological functions within the Arroyo Seco. (See Section 3, Project Description for additional details).

EIRs are informational documents "which will inform public agency decision-makers and the public generally of the significant environmental effect of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project." (14 CCR 15121). The purpose of this Draft EIR is to present the evaluation of the anticipated environmental effects of the proposed Project.

[1] In 2009, the Station Fire burned 160,000 acres in the San Gabriel Mountains including the Project site.

1.2 CEQA Requirements

CEQA requires the preparation of an EIR for any project that a lead agency determines may have a significant impact on the environment. According to Section 21002.1(a) of CEQA:

> *"The purpose of an environmental impact report is to identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided."*

CEQA also establishes mechanisms whereby the public and decision makers can be informed about the nature of the project being proposed and the extent and types of impacts that the project and its alternatives would have on the environment if they were to be implemented.

The basic purposes of CEQA are to:

1. Inform governmental decision makers and the public about the potential, significant environmental effects of proposed activities;
2. Identify the ways that impacts to the environment can be avoided or significantly reduced;
3. Prevent significant, avoidable impacts to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible; and
4. Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved (14 CCR 15002).

When applicable, the Draft EIR recommends feasible mitigation measures that can reduce or avoid significant environmental impacts. This Draft EIR was prepared in accordance with Section 15151 of the State CEQA Guidelines, which defines the standards for EIR adequacy as follows:

> *"An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure."*

The EIR process typically consists of three parts: (1) the Initial Study and Notice of Preparation (NOP), (2) the Draft EIR, and (3) the Final EIR, which includes the comment letters and the responses to the public comments on the Draft EIR. The Initial Study/NOP is intended to encourage interagency communication concerning the proposed action and to provide sufficient background information about the proposed action so that agencies, organizations, and members of the public can respond with specific comments and questions on the scope and content of the EIR. The City prepared an Initial Study in order to determine which of those environmental considerations under CEQA the Project would either have no impact or a less than significant impact on and, as such, would not need to

be further analyzed within this EIR. Conversely, those CEQA topics addressed in the Initial Study that could result in significant impacts to the environment as a result of Project implementation are further analyzed within this EIR.

An Initial Study and NOP were distributed on November 4, 2019, to federal, State, regional, and local agencies and interested parties for a 30-day review period to solicit comments and to inform agencies and the public of the proposed Project. Hardcopies of the Initial Study/NOP were made available for review at the PWP office located at 150 South Los Robles Avenue, Suite 200, Pasadena, and online at https://ww5.cityofpasadena.net/planning/category/environmentalnotices/ and/or PWPweb.com/Arroyo. A scoping meeting was held on Thursday, November 21, 2019, at Robinson Park Recreation Center (1081 North Fair Oaks Avenue, Pasadena) from 6:00 PM to 8:00 PM. The purpose of this meeting was to seek input from public agencies and the general public regarding the environmental issues and concerns that may potentially result from the proposed Project. In compliance with Section 15201 of the State CEQA Guidelines, the City conducted outreach efforts for public participation in the environmental process, prior to the scoping meeting. Public outreach efforts included flyer print outs at community centers and senior centers (including, Jackie Robinson & Robinson Park, Victory Park, Villa Parke); notifications in the Pasadena Star-News, Pasadena In Focus, PWP Watts Current Newsletter, PWP Website/Events Page, and PWP Facebook and Twitter pages; on-air notification at KPCC public radio; e-mails to approximately 1,500 addresses on the Public Works, Parks & Natural Resources distribution list; certified mailings to environmental document distribution list from the City Planning Department; and postal service mailings to property owners within a 500-foot radius of the Project boundary.

The 30-day Initial Study/NOP public review period ended December 6, 2019. The City received nine comment letters in response to the Initial Study/NOP. Table 1-1, Notice of Preparation and Scoping Comment Letter Summary provides a brief summary overview of the NOP comments received by the City that address the environmental issues and identifies the appropriate section of the Draft EIR that addresses the topic. These comments were considered during preparation of this Draft EIR. The Initial Study/NOP is included as Appendix A-1, the Appendices to the IS/MND are included as Appendix A-2, NOP comment letters are included as Appendix A-3, and the Final IS/MND is included as Appendix A-4 of this Draft EIR.

Table 1-1. Notice of Preparation and Scoping Comment Letters Summary

Sender of Comments	Date Received	General Summary of Comments	Addressed In Section(s)
State Agency			
California Department of Fish and Wildlife (CDFW)	December 3, 2019	This letter provides the CDFW's comments and suggestions as a Responsible Agency under CEQA. Comments predominantly pertain to necessary considerations that the CDFW require the EIR to consider, including: required permits; impacts to biological resources including sensitive vegetation communities, wetlands, nesting birds, aquatic and riparian habitats; recommendations for biological surveying; fuel modification; water quality; Project alternatives; direct, indirect, and cumulative impacts of the Project; and project mitigation.	Section 4.2

Table 1-1. Notice of Preparation and Scoping Comment Letters Summary

Sender of Comments	Date Received	General Summary of Comments	Addressed In Section(s)
California Department of Transportation (Caltrans)	December 6, 2019	This letter requests an evaluation of impacts to State facilities (roadways), including a queuing analysis for off-ramps. The letter encourages reduction of vehicle miles traveled generated by construction trucks, and identifies the need for an oversized-transport vehicle permit.	Section 4.8
Governor's Office of Planning and Research; State Clearinghouse and Planning Unit	November 1, 2019	This letter provides proof of receipt of the Notice of Preparation and Notice of Completion, and identifies the State agencies that received the NOP and Initial Study for review. The State Clearinghouse (SCH) Number is 2014101022.	N/A
Regional/Local Agency			
South Coast Air Quality Management District (SCAQMD)	December 3, 2019	The SCAQMD identifies what air quality impacts should be addressed and mitigation measures identified. The SCAQMD provides sources of information related to the air quality and greenhouse gas emissions analyses to be used to meet its requirements, and appropriate mitigation measures to be considered.	Section 4.1 and Section 4.4
Organizations/Individuals			
Arroyo Seco Foundation	December 6, 2019	This letter expresses concern with the environmental and recreational benefits of the proposed Project and requests that the EIR evaluate stream flow requirements to support wildlife; impacts to biological resources and habitat, and alternatives that would rely more on the natural stream hydrology.	Section 4.2, Section 4.5, Section 4.7, and Section 6
Friends of Hahamongna	December 4, 2019	This letter requests evaluation of: cumulative impacts due to other nearby projects; the need for habitat preservation in the Hahamongna; potential for impacts to the Central and Lower Arroyo; and review for the chapter topics identified in the Initial Study.	Sections 4.1 through 4.9; Section 6
Gabrieleno Band of Mission Indians – Kizh Nation	November 11, 2019	This letter requests tribal consultation pursuant to Assembly Bill 52.	Section 4.9
Bill Christian	December 6, 2019	This letter requests evaluation of: alternatives to the Project; evaluation of cumulative impacts related to the Devil's Gate sediment removal project; assessment using the best available information related to percolation rates in spreading basins; and requests decreased diversions and reliance more on the natural stream hydrology.	Section 4.2, Section 4.5, and Section 6

Table 1-1. Notice of Preparation and Scoping Comment Letters Summary

Sender of Comments	Date Received	General Summary of Comments	Addressed In Section(s)
Hugh Bowles	December 4, 2019	This letter focuses on the CEQA requirement to explore alternatives that will have less impact on the environment and achieve the project objectives. The comment requests the restoration of natural flows to the Arroyo Seco rather than increasing stream diversion and the need to consider the cumulative impacts of the projects currently underway in the Hahamongna basin including Devil's Gate sediment removal project.	Section 4.2, Section 4.5, and Section 6
Laura Solomon	December 6, 2019	This email requests that the EIR evaluates restoration of habitat and alternatives to the proposed Project.	Section 4.2 and Section 6

This Draft EIR focuses on the environmental impacts identified as potentially significant during the Initial Study and scoping process. The following issues were determined to be potentially significant and are therefore addressed in Section 4, Environmental Analysis of this Draft EIR:

4.1 Air Quality
4.2 Biological Resources
4.3 Cultural Resources
4.4 Greenhouse Gas Emissions
4.5 Hydrology and Water Quality
4.6 Noise
4.7 Recreation
4.8 Transportation
4.9 Tribal Cultural Resources

The Draft EIR will be made available for review to the public and public agencies for a minimum of 45 days to enable them to provide comments on the "sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated" (14 CCR 15204). The timeframe of the public review period is identified in the Notice of Availability for this Draft EIR. During this period, a hardcopy of the Draft EIR will be made available for review at the PWP office located at 150 South Los Robles Avenue, Suite 200, Pasadena, and electronic files will be available for viewing online at https://ww5.cityofpasadena.net/planning/category/environmentalnotices/ and/or PWPweb.com/Arroyo.

During this period, comments from the general public, organizations, and agencies regarding environmental issues analyzed in the Draft EIR and the Draft EIR's accuracy and completeness may be submitted to the lead agency at the following address:

ATTN: Elisa Ventura, P.E.
City of Pasadena Department of Water and Power
150 South Los Robles Avenue, Suite 200
Pasadena, California 91101
Email: eventura@cityofpasadena.net

As the lead agency for the proposed Project, the City has assumed responsibility for preparing this document. The City's Planning Commission will act in an advisory role, and the City Council has final decision-making authority over the proposed Project and associated discretionary actions. The City will use the information included in this Draft EIR to consider potential impacts to the physical environment associated with the proposed Project when considering approval. As set forth in Section 15021 of the State CEQA Guidelines, the City, as lead agency, has the duty to avoid or minimize environmental damage where feasible. Specifically, 14 CCR 15021(d) states that:

> *"CEQA recognizes that in determining whether and how a project should be approved, a public agency has an obligation to balance a variety of public objectives, including economic, environmental, and social factors and in particular the goal of providing a decent home and satisfying living environment for every Californian. An agency shall prepare a statement of overriding considerations as described in Section 15093 to reflect the ultimate balancing of competing public objectives when the agency decides to approve a project that will cause one or more significant effects on the environment."*

Prior to approval of the proposed Project or an alternative to the proposed Project, the City, as the lead agency and decision-making entity, is required to certify that the Final EIR has been completed in accordance with CEQA, that the proposed Project has been reviewed and the information in the Final EIR has been considered, and that the Final EIR reflects the independent judgment of the City. CEQA also requires the City to adopt "findings" with respect to each significant environmental effect identified in the Final EIR (California Public Resources Code, Section 21081; 14 CCR 15091). For each significant effect, CEQA requires the approving agency to make one or more of the following findings:

- The proposed project has been altered to avoid or substantially lessen significant impacts identified in the Final EIR.
- The responsibility to carry out such changes or alterations is under the jurisdiction of another agency.
- There are specific economic, legal, social, technological, or other considerations, which make infeasible the mitigation measures or alternatives identified in the Final EIR.

If the City concludes that the proposed Project will result in significant effects that cannot be substantially lessened or avoided by feasible mitigation measures and alternatives, the City must adopt a "statement of overriding considerations" prior to approval of the proposed Project (California Resources Code, Section 21081(b)). Such statements are intended under CEQA to provide a written means by which the lead agency balances in writing the benefits of the proposed Project and the significant and unavoidable environmental

impacts. Where the lead agency concludes that the economic, legal, social, technological, or other benefits outweigh the unavoidable environmental impacts, the lead agency may find such impacts "acceptable" and approve the proposed Project.

As discussed in more detail in Section 2, Environmental Setting, the Arroyo Seco Canyon Project was subject to environmental review under an Initial Study/Mitigated Negative Declaration in 2015, and a corresponding Mitigation Monitoring and Reporting Program (MMRP) was approved by the City. Table 2-1, in Section 2 of this Draft EIR includes the mitigation measures included within that MMRP and summarizes whether those measures remain applicable, are altered/revised, or are no longer applicable, when considering the implementation of the proposed Project. Therefore, the City must also adopt a revised MMRP describing the changes that were incorporated into the proposed Project or made a condition of Project approval in order to mitigate or avoid significant effects on the environment (California Public Resources Code, Section 21081.6). The MMRP is adopted at the time of Project approval and is designed to ensure compliance during Project implementation. Upon approval of the proposed Project, the City will be responsible for implementation of the MMRP, which will be attached to the Final EIR.

1.3 EIR Document Organization

This Draft EIR is organized as follows:

Executive Summary - Outlines the conclusions of the environmental analysis and provides a summary of the proposed Project and the Project alternatives analyzed in the EIR. This section also includes a table summarizing all environmental impacts identified in the EIR along with the associated mitigation measures proposed to reduce or avoid each impact.

Section 1: Introduction - Serves as a forward to the EIR, introducing the Project, the applicable environmental review procedures, and the organization of the EIR.

Section 2: Environmental Setting - Describes the environmental setting of the Project and provides an overview of the Project history and planning context.

Section 3: Project Description - Provides a detailed description of the setting, objectives, characteristics, construction and operation of the proposed Project and required discretionary approvals. Additionally, this section describes the approach to the cumulative impacts analysis, and cumulative projects.

Section 4: Environmental Impact Analysis - Describes the potential environmental impacts of the proposed Project, as well as proposed mitigation measures to reduce or avoid any potentially significant impacts. The discussion in Section 4 is organized by the 9 environmental issue areas as outlined above (Sections 4.1 through 4.9)

Section 5: Mandatory CEQA Topics – Provides a discussion of potential environmental impacts as a result of the proposed Project, including those that can be reduced to a less-than-significant level and those significant environmental effects that cannot be avoided if the Project is implemented. These include impacts that can be mitigated, but cannot be reduced to a less than significant level. This Section also includes a discussion on growth-inducing impacts.

Section 6: Alternatives - Discusses alternatives to the proposed Project, including a No Project Alternative. This Section describes the rationale for selecting the range of alternatives discussed in the EIR and identifies the alternatives considered by the City that were rejected from further discussion as infeasible during the scoping process. Lastly, Section 4 includes a discussion of the environmental impacts of the alternatives that were carried forward for analysis and identifies the environmentally superior alternative.

Section 7: List of Preparers - Gives names and contact information of those responsible for writing this EIR.

Appendices include various technical studies prepared for the proposed Project, as listed in the Table of Contents.

2 ENVIRONMENTAL SETTING

This section describes the environmental setting of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) and provides an overview of the Project history and planning context. This section provides a general overview of the Arroyo Seco Canyon, with a focus on the environmental setting within Area 2, Area 3, and the Gabrielino Trail/Access Road, as well as temporary staging areas. The environmental impacts of the proposed Project are evaluated in Section 4, Environmental Impact Analysis, through Section 6, Alternatives, of this Draft Environmental Impact Report (EIR).

2.1 Project Location

The Project site is located in the City of Pasadena within and at the base of the Arroyo Seco Canyon at 3420 and 3500 Arroyo Seco Road, City of Pasadena. The Project site is located within Township 1 and 2 North, Range 12 West, of the Pasadena, California 7.5-minute USGS quadrangle. The Project site encompasses portions of two separate parcels, specifically Assessor Parcel Numbers (APNs) 5830-001-906 and 5823-015-902. The proposed Project consists of two primary areas, as shown on Figure 2-1, Local Vicinity and Regional Location, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements. These areas are connected by the North Arroyo Boulevard[1] (i.e. Gabrielino Trail/Access Road), which serves as a recreational trail and the access road for City of Pasadena and U.S. Forest Service (USFS) vehicles heading into the Arroyo Seco Canyon.

Regional access to the Project site is via Interstate (I) 210, exiting Windsor Avenue and traveling northward for approximately 0.8-mile to the intersection of Windsor Avenue and Ventura Street. From this intersection, the Project site can be accessed via either Explorer Road, which is a publicly accessible roadway that leads to the City's open area (i.e., former Jet Propulsion Laboratory [JPL] East Parking Lot), or via a locked/gated entrance to North Arroyo Boulevard (i.e. Gabrielino Trail/Access Road), which is only accessible to the public for non-motorized use, and occasional vehicle use by the City.

- Explorer Road provides vehicular access to the southernmost boundary of Area 3 (approximately 0.3-mile from the intersection of Windsor Avenue and Ventura Street) and continues northward along the eastern boundary of Area 3, terminating at the JPL Bridge, which crosses over the Arroyo Seco and provides access to the JPL campus in the City of La Cañada Flintridge.
- During the Project's construction activities, North Arroyo Boulevard would be made available for construction-related vehicles. North Arroyo Boulevard would provide vehicular access to the Behner Water Treatment Plant (WTP), the northernmost portion of Area 3 near the JPL Bridge, and northward along the Gabrielino Trail/Access Road to Area 2.

The proposed Project involves construction activity and facility improvements in Areas 2 and 3, as well as construction truck traffic along portions of the Gabrielino Trail/Access Road. The former Travelling Screen and Chlorine Building (Screen Building) adjacent to Area 2 and the Behner WTP adjacent to Area 3 would be used for temporary construction materials and equipment staging only.

[1] Also known as "Arroyo Seco Road".

The Arroyo Seco passes through three distinct recreational areas within the City: (1) Upper Arroyo Seco, containing the Hahamongna Watershed Park (HWP) and Devil's Gate Reservoir and Dam; (2) Central Arroyo Seco, extending south of the Devil's Gate Dam to the Colorado Street Bridge; and (3) Lower Arroyo Seco, from the Colorado Street Bridge to the southern boundary of the City. The Project proposes new facilities and improvements only in the Upper Arroyo Seco, as shown on Figure 2-1. A small portion of the Arroyo Seco streambed is located within the boundaries of Area 2 and also located along the western edge of Area 3. The study area for the Gabrielino Trail/Access Road also includes portions of the Arroyo Seco streambed; however, the Gabrielino Trail/Access Road study area would not include any Project-related construction activity that could result in direct physical impacts to the Arroyo Seco.

2.2 Project Background

2.2.1 Settlement Agreement

On October 9, 2014, the City circulated the ASCP Initial Study/Mitigated Negative Declaration (IS/MND), State Clearinghouse (SCH) Number 2014101022, for a 30-day public review period from October 9, 2014, to November 8, 2014. The City was seeking approval of a Conditional Use Permit (CUP) No. 6222 for the ASCP, which involved improvements to three areas: Area 1, Arroyo Seco Headworks; Area 2, Arroyo Seco Intake; and Area 3, Jet Propulsion Laboratory (JPL) East Parking Lot. The Final 2015 ASCP IS/MND is available for viewing online at https://ww5.cityofpasadena.net/planning/category/environmental-notices/ and/or PWPweb.com/Arroyo and a hardcopy of the Final 2015 ASCP IS/MND can be viewed during normal business hours at the City of Pasadena Department of Water and Power, 150 South Los Robles Avenue, Suite 200, Pasadena, California 91101.

On January 7, 2015, the City's Hearing Officer held a public hearing regarding the requested CUP and made the findings to approve the ASCP IS/MND for CUP No. 6222. On January 20, 2015, Spirit of the Sage Council, Project Soliton, and Hugh Bowles submitted an appeal of the Hearing Officer's decision to the Board of Zoning Appeals. The Board of Zoning Appeals hearing took place on March 4, 2015, and upheld the Hearing Officer's decision by a unanimous vote. The approval was again appealed to the City Council, and on June 1, 2015, the City Council voted to uphold the Board of Zoning Appeals decision by unanimous vote.

The City of Pasadena filed a Notice of Determination (NOD) for the ASCP IS/MND on January 13, 2015, after the Hearing Officer approval, and filed an additional NOD on March 6, 2015, after the Board of Zoning Appeals approval. On July 2, 2015, a lawsuit (Court Case No. BS156207) was filed against the City by petitioners Spirit of the Sage Council and Project Soliton challenging the approval. On March 20, 2017, the Los Angeles Superior Court issued its decision and on June 26, 2017, entered a Judgment that partially favored the petitioners. The Court found that the elements of the ASCP that related to increased diversions of surface water (i.e., greater taking of stream water from the Arroyo Seco beyond its current withdrawal) required evaluation through the preparation of an EIR. The Court also ruled that the elements of the ASCP that did not relate to increased diversions were severable from the remainder of the ASCP and complied with the California Environmental Quality Act (CEQA). As such, the Court determined that CUP No. 6222 and its related findings and conditions of approval, and the ASCP IS/MND shall remain intact for these components, allowing them to move forward without any additional environmental review pursuant to CEQA (Spirit of the Sage Council v. City of Pasadena 2017). These approved components include:

- Area 1, Arroyo Seco Headworks: All ASCP elements.
- Area 2, Arroyo Seco Intake: Access road improvements and related slope reconstruction and protective riprap elements.

- Area 3, JPL East Parking Lot: All ASCP elements, except the expansion of 4 existing spreading basins and the construction of 2 new spreading basins. Specifically, the components of the ASCP IS/MND allowed to proceed include the parking lot, access road, sedimentation basin, demolition of existing structures and pipelines, new pipelines, new public restroom, new security booth and associated utility services (water, sewer, power, and communication lines), and topics related to the existing groundwater contamination associated with the JPL site listing on hazardous materials sites compiled pursuant to Government Code Section 65962.5.

In addition, after the Courts ruling, the petitioners and the City came to an agreement to resolve remaining issues and obtain certain assurances as to future actions of the parties. Through this Settlement Agreement, it was agreed that the City shall have the right to perform maintenance activities, including tilling and grading of the existing spreading basins to re-establish historical percolation rates and maintenance activities that involve negligible or no expansion of use as described in CEQA Guidelines Section 15301 for a Class 1 Categorical Exemption. The Settlement Agreement further clarified that the City may perform excavation and grading necessary for the temporary bridges as described in the ASCP IS/MND.

As such, this Draft EIR is being prepared by the City in accordance with the terms and provisions of the Judgment and Peremptory Writ of Mandate, the City's Declaration in Support of the Judgment, the Statement of Decision on Petition for Writ of Mandate, and the Settlement Agreement (see Appendix A-2 of this Draft EIR). Because several components of the ASCP were allowed to proceed without any additional environmental review pursuant to CEQA, the proposed Project boundaries of Area 2 and Area 3 have been refined from those shown in the 2015 ASCP IS/MND to reflect the activities subject to review under this Draft EIR, as described below.

2.3 Environmental Setting Overview

2.3.1 Arroyo Seco Canyon

The Arroyo Seco is a major tributary of the Los Angeles River, flowing from the San Gabriel Mountains in the Angeles National Forest (ANF). The Canyon has a north-south alignment with steep east- and west-facing slopes. The Arroyo Seco originates in the San Gabriel Mountains, with waters flowing south through the cities of Pasadena, South Pasadena and Los Angeles, before joining the Los Angeles River just east of Elysian Park and west of the Interstate (I) 5/I-110 Interchange. Within the City of Pasadena, the Arroyo Seco passes through three distinct recreational areas: (1) Upper Arroyo Seco, containing HWP and Devil's Gate Dam; (2) Central Arroyo Seco, containing the Brookside Golf Course and Rose Bowl; and (3) Lower Arroyo Seco, containing an archery range, casting pond, and Memorial Grove. The Project proposes improvements in the Upper Arroyo Seco in the City of Pasadena on land owned by the City.

The Hahamongna Watershed Park (HWP) Master Plan describes the rocky streambed as containing an ephemeral stream, which is the source of its given Spanish name "arroyo seco" meaning "dry wash" (City of Pasadena 2003). However, the Arroyo Seco north (upstream) of the JPL Bridge has been classified by the U.S. Fish and Wildlife Service as having a seasonally flooded water regime, which means surface water is typically present for extended periods, especially in the winter and early spring, but is absent by the end of the spring or early summer in most years (USFWS 2019).

The HWP is bound on the south by the Devil's Gate Dam and Oak Grove Drive. Oak Grove Drive and the JPL of the California Institute of Technology bound the HWP to the west in the City of La Cañada-Flintridge. To the east, HWP

is bound by the residential neighborhoods of Pasadena and Altadena. The HWP extends northward into the San Gabriel Mountains and includes approximately 1,300 acres of open spaces and recreational amenities, including the Gabrielino Trail that is heavily used for hiking/bicycling and equestrian activities.

Upstream of the JPL Bridge, vegetation communities in the Project study area include California sagebrush-California buckwheat-laurel sumac scrub, coast live oak woodland, and white alder-California sycamore woodland. Downstream of the JPL Bridge, the Arroyo Seco fans out into the alluvial system of the Devil's Gate Reservoir. Vegetation communities in this portion of the Project study area include California sagebrush-California buckwheat-laurel sumac scrub, coast live oak woodland, and a small area of arroyo willow-mulefat scrub; however, the majority of the study area below the JPL Bridge is disturbed/graded land and ornamental vegetation associated with the spreading basins and the City's open space area (see Section 4.2, Biological Resources for more information).

In November 2018, the Los Angeles County Flood Control District (LACFCD) began the removal of 1.7 million cubic yards of accumulated sediment located within 42 acres of the Devil's Gate Reservoir. Sediment removal activities would occur adjacent to existing Spreading Basin No. 14. Approximately 70 acres of habitat restoration would occur in the remaining portions of the Reservoir, including along the sloped areas between the Arroyo Seco and the spreading basins as well as within the southernmost Spreading Basin No. 17. Sediment removal activities are anticipated to continue through 2022 with habitat restoration activities occurring through 2023 (Los Angeles County Public Works 2018).

2.3.2 Area 2 Existing Conditions

The proposed Project's Area 2 study area includes approximately 1.4 acres. Figure 2-2A, Area 2 Existing Conditions, identifies the locations of the primary features and structures in Area 2, including the concrete diversion weir and intake structure, the Gabrielino Trail/Access Road, and the Arroyo Seco. Figure 2-2A also identifies the locations of the primary features and structures within the Gabrielino Trail/Access Road study area in the proximity of Area 2, including the Bridge No. 3 and the former Travelling Screen and Chlorine Building (Screen Building). Figure 2-2B, Area 2 Existing Conditions Photographs, includes four photographs taken in and around Area 2.

- **Photo 1** depicts views northward and upstream of the Arroyo Seco from the top of the intake structure, which is fenced and not publicly accessible. This photograph was taken in April 2019 and depicts the streamflows approaching the existing diversion/intake structure during springtime water conditions, as well as the rocky streambed and heavily vegetated adjacent streambed.
- **Photo 2** depicts a view from the edge of the intake structure near the chainlink fence, looking down towards the trash rack at the intake to the conveyance system, the concrete diversion and weir structure, and the diversion pool (a pool created behind the weir to allow for an appropriate water elevation to flow into the diversion intake).
- **Photo 3** depicts the view from the Gabrielino Trail/Access Road looking northward, near the diversion/ intake structure. The existing chain-link fencing and K-rails can be seen, as well as the mature trees and vegetation that line the trail.
- **Photo 4** depicts the view from the Gabrielino Trail/Access Road looking southward, near the diversion/intake structure. The existing chain-link fencing that blocks public access to the concrete top of the intake structure can be seen, as well as the mature trees and vegetation that line the trail.

As shown in Photos 3 and 4, public access to the diversion/intake structure is prohibited, and views of the facility from the Gabrielino Trail/Access Road are limited because the structure is located to the east of the trail, below the grade of the trail behind chain-link fencing, and is obscured by existing mature vegetation.

The diversion weir directs water into the intake structure by obstructing the stream flow and creating a small pool of water behind the weir that flows into the intake. When water enters the intake, it is conveyed downstream through the conveyance pipeline system to the PWP's spreading basins in Area 3. The existing intake/diversion system consists of an approximate 9-foot-high reinforced concrete training wall and intake structure with a trash rack on the east bank of the stream, and a reinforced concrete weir with stop logs in slots. Under current conditions, the weir crest is approximately 2 feet above the streambed on the downstream side.

Under current conditions, the diversion/intake structure cannot handle debris and sediment loads carried in stream flows during storm events and is shut down during these times. The former headworks facility and sedimentation basins located upstream of Area 2 were designed to remove sediment from the stream flows prior to reaching the diversion structure, but those facilities were destroyed by the debris flows that occurred during the storm events following the 2009 Station Fire (Carollo Engineers 2013), and the system's ability to settle out sediment and debris prior to entering the intake and conveyance system to the spreading basins was eliminated. Also, sediment has collected behind the weir, limiting the capacity of the diversion pool. As such, the existing diversion/intake structure is not functioning as designed for moderate to high flows due to its inability to accommodate the amount of sediment that accompanies this range of flows; therefore, PWP is not currently able to divert its 25 cfs water rights during all the times these flows are available in the stream.

2.3.3 Area 3 Existing Conditions

As shown in Figure 2-3A, Area 3 Existing Conditions, Area 3 is located approximately 0.3-mile downstream from Area 2 and includes two existing spreading basins that are known as Pasadena Ponds 1 and 2 (formerly used as sludge ponds for the Behner WTP) and Spreading Basins No. 1 through 4, the former JPL Parking Lot and adjacent Explorer Road, and the North Arroyo Boulevard (i.e. Gabrielino Trail/Access Road), which would provide construction vehicle access to Area 2 of the Project site. After NASA's completion of a new parking structure on the JPL campus in 2016, they vacated the former parking lot (which was previously leased by the City to JPL), and removed the paving for the specific purpose of accommodating PWP's planned expansion of the spreading basins. The former JPL Parking Lot is currently unpaved, with the exception of the temporary alignment of Explorer Road.

Figure 2-3A identifies the primary structures and facilities in Area 3, as well as two easements. The LACFCD easement overlies a stormdrain that conveys flows in a subterranean pipe from the residential neighborhood to the east to the Arroyo Seco. The Southern California Edison (SCE) easement is for the transmission lines that cross east to west across the Project site and includes a tower near Pond 2 that supports the electrical lines. Figure 2-3B, Area 3 Existing Conditions Photographs, includes four photographs taken within and adjacent to Area 3.

- **Photo 1** depicts views eastward near Pond 1 and shows the graded and unpaved surfaces and vegetation surrounding the pond. Also shown is a woodshed, pipes and valves, chainlink fencing, and corrugated metal pipe, as well as the SCE electrical transmission lines associated with the easement.
- **Photo 2** depicts surface flows into the Spreading Basin No.1 and associated adjacent vegetation.

- **Photo 3** depicts Spreading Basin No. 2 and the graded slopes and engineered spreading floor area, as well as adjacent vegetation. The infrastructure that connects the basins together is shown at the northeastern corner of the basin, as are the San Gabriel Mountains in the distance.
- **Photo 4** depicts views southward in the vicinity of Pond 2, outside of the Area 3 study area and within the streambed of the Arroyo Seco. As shown, this portion of the stream includes rocky and sandy soils, steep slopes, and is often dry in this area. Also shown are the SCE electrical transmission lines.

The proposed Project's Area 3 study area includes approximately 23.3 acres. The surface area of the spreading basins within Area 3 include approximately 13 acres. According to PWP, the current spreading basins reach an equilibrium during recharge events of 18 cubic feet per second (cfs), meaning that diversions equaling 18 cfs would fill the basins to capacity, with water percolating at generally the same rate as entering the basins; however, higher flows beyond 18 cfs would not be able to be infiltrated due to capacity constraints. It is estimated that the existing spreading basins are capable of recharging a maximum of about 35 acre-ft per day (Carollo Engineers 2013). The existing spreading basin capacity limits PWP's ability to divert a sustained 25 cfs.

2.3.4 Gabrielino Trail, Bridges, and Staging Areas

Gabrielino Trail/Access Road and Bridges

The proposed Project's Gabrielino Trail/Access Road study area includes approximately 11.8 acres. The Gabrielino Trail (i.e., North Arroyo Boulevard) runs generally parallel to the Arroyo Seco and along the eastern side of the former JPL East Parking Lot and serves as a recreation trail for hikers, bikers, and equestrian uses. It also serves as a maintenance access road that leads to the Behner WTP and into the Arroyo Seco Canyon area to provide access for PWP and the USFS. During construction activities, the Gabrielino Trail/Access Road would provide for vehicular access to and from Area 2, and sometimes Area 3 (Explorer Road will be its primary access road).

As shown on Figure 2-4A, Gabrielino Trail and Bridge Crossings, along the Gabrielino Trail/Access Road, three bridges cross portions of the Arroyo Seco. Bridge Nos. 1, 2, and 3 are located between Areas 2 and 3, respectively.

Figure 2-4B, Gabrielino Trail Existing Conditions Photographs, includes four photographs taken along the Gabrielino Trail/Access Road study area. For more detailed information, see Section 4.3, Cultural Resources.

- **Photo 1** depicts a view of the temporary crossing over Bridge No. 1 near Millard Creek, looking southward towards the JPL Bridge. Bridge No. 1 is a two-span box culvert bridge with the bridge deck supported by a metal plate(s) set upon cobblestone walls, constructed either during a Civilian Conservation Corps (CCC) repair campaign in 1939 or as part of the 1941 Arroyo Seco Program. A temporary bridge deck (i.e. structural overlay bridge) with concrete access ramps and yellow railings is located on top of Bridge No. 1.

  Bridge No. 1 is approximately 0.13-mile north of the JPL Bridge. A July 2015 Bridge Condition Assessment found that the bridge abutments were being undermined due to scouring and that the Gabrielino Trail/Access Road had sloughed off in sections (TJC 2015). The structural overlay bridge spanning the length of this bridge was constructed in 2017 to provide additional support for large/heavy vehicle travel and to protect the structure from further damage.

- **Photo 2** depicts a view of Bridge No. 2, looking upward from the Arroyo Seco streambed. Bridge No. 2 was constructed circa 1920 and it exhibits classical design elements in the rows of single balusters resembling the form of a flower bud from a pomegranate tree, as well as the four-point shape of the arch. The bridge

also displays the pattern of board-formed concrete, a method of construction popular for civil works during the early 19th Century.

Bridge No. 2 is located approximately 130 feet north of Bridge No. 1 and was likely constructed to provide a formal entrance to the Upper Arroyo Seco and the ANF. Bridge No. 2 meets the required criteria to be listed as a historical resource in the California Register of Historic Resources (CRHR) and in the City of Pasadena as a landmark.

- Photo 3 depicts a view of Bridge No. 3 looking upward from the Arroyo Seco streambed. Bridge No. 3 is a wooden kingpost truss bridge with heavy timber supports braced by a vertical metal rod and angled wood beam braced on a cantilevered timber girder, constructed in 1939 by the CCC. Timber railings line both side of the bridge deck, and board-formed concrete retaining walls support either end of the bridge.
- Photo 4 depicts a view of Bridge No. 3 from the Gabrielino Trail/Access Road, looking northward. The structural overlay bridge spanning the entire length of Bridge 3 was constructed in 2017 to provide additional support for large/heavy vehicle travel and to protect the structure from further damage. As shown, a temporary bridge deck is positioned directly above the original wood bridge, isolating traffic weight and movement from affecting the older wood bridge. The temporary bridge deck is built with anti-skid steel decking supported by steel I-beam girders. Sloped, poured-in-place concrete ramps provide access to the structural overlay bridge at either end. Yellow tubular metal railings line each side of the temporary bridge deck and concrete access ramps. A structural evaluation of Bridge 3 subsequent to the structural overlay; however, shows that the condition of Bridge 3 continues to deteriorate (TJC 2018).

  Bridge No. 3 is located approximately 0.34-mile north of the JPL Bridge and is associated with events that made a significant contribution to the history of the United States and California. Bridge No. 3 meets the required criteria to be listed as a historical resource in the National Register of Historic Place (NRHP) and in the CRHR. The bridge was heavily damaged by the 2010 storms.

As shown on Figure 2-4A, stone masonry walls line the east side of the Arroyo Seco near Bridge No. 2 and continue upstream to Bridge No. 3, largely outside of the Gabrielino Trail/Access Road study area. Additionally, short segments of the pipeline conveyance system that connects the intake structure in Area 2 to the spreading basins in Area 3 is visible on Figure 2-4A, although the majority of the conveyance system is underground.

Staging Areas

The Screen Building and the Behner WTP are depicted in Figure 2-4C, Staging Areas Existing Conditions Photographs. The Screen Building includes approximately 0.1-acre and the Behner WTP includes approximately 0.8-acre. The Screen Building is a fully fenced area that is accessed via a short gravel driveway from the Gabrielino Trail/Access Road. This facility was likely constructed by the CCC during their Arroyo Seco improvements campaign in the 1930s. The Screen Building allows access to the subterranean conveyance system and previously provided a means of chlorinating the Arroyo Seco stream flows when it was used as a surface water source of drinking water supplies, although it is now vacant and no longer used by PWP except for periodic maintenance of the conveyance system.

The John L. Behner WTP is a one-story Brutalist-style civic building, rectangular in shape with a flat roof, built in 1970. Exterior walls are exposed concrete with strong vertical accents, and the entire facility is surrounded

by a chainlink fence. The external water treatment facilities comprise a series of open concrete tanks that were originally used to treat surface water from the Arroyo Seco for potable water supplies. The Behner WTP is no longer in operation.

2.3.5 Planning Context

Water Integrated Resources Plan, Urban Water Management Plan, and Water System Resources Plan

In 2011, PWP completed the Water Integrated Resources Plan (WIRP) which provided a long-term water resources strategy through the year 2035. It recommended a portfolio of supply and conservation options that was determined to be the best strategy for meeting current and future water needs. Among the benefits listed for the recommended strategy were 1) improved groundwater levels, 2) improved local environment and surface water quality, and 3) consistency with MWD's regional water strategy of increasing conservation and local water supplies.

The WIRP served as the primary source document for preparing the 2010 and 2015 state-mandated Urban Water Management Plans (UWMP). Among other topics, the UWMP contains information describing the supply service area, water supplies and demands, and water supply reliability over a twenty-year planning horizon. The 2015 UWMP identified the Arroyo Seco Canyon Project as a planned source of water that would increase the diversion of stream water for groundwater augmentation. A resolution approving the 2015 UWMP was adopted by the City in June 2016.

Even though many of the WIRP's objectives, strategies and recommended projects remain relevant, changing conditions since 2011 warranted a reevaluation of the plan. As a result, in 2018 PWP embarked on an update to the WIRP called the Water System and Resources Plan (WSRP). A draft WSRP has been prepared after a year-long process with stakeholder involvement, and adoption of the final document by City Council is scheduled for summer 2020. The WSRP serves as a roadmap for PWP's long-term capital and water resource planning by addressing its aging infrastructure, future water demands, existing water resources, and opportunities for new water supplies. The Arroyo Seco Canyon Project is included in the WSRP's preferred portfolio of projects which emphasizes the Raymond Basin as an asset for recharge and potable water production, and as a source of non-potable supply. The portfolio maximizes the use of local surface water as a non-potable source which includes not only the Arroyo Seco, but tunnel water and high nitrate groundwater for irrigation and recharge.

Hahamongna Watershed Park Master Plan

The HWP is almost entirely designated and zoned as Open Space in the City of Pasadena's General Plan Land Use Element and Zoning Map, including Areas 2 and 3 (City of Pasadena 2019). The Open Space designation and zone applies to City-owned land with active and passive public recreational facilities and natural open space. A Modification to the Conditional Use Permit (CUP) No. 6222 is required for any parkland and recreational improvements within the OS Zoning District.

The Arroyo Seco Master Plan is a park/facility planning document that consists of four elements: (1) Hahamongna Watershed Park Master Plan, (2) Central Arroyo Seco Master Plan, (3) Lower Arroyo Seco Master Plan, and (4) Design Guidelines for the Arroyo Seco. The Hahamongna Watershed Park Master Plan (HWP Master Plan) and the Arroyo Seco Design Guidelines are applicable documents that address select components of the proposed Project.

The HWP Master Plan sets forth objectives for the future use and development of HWP, which includes approximately 1,300 acres of open space that extends up the Arroyo Seco Canyon from the Devil's Gate Dam. The lower watershed, the 330 acres roughly defined as the floodplain and basin behind the Dam, is the focus of the

HWP Master Plan. The HWP Master Plan establishes a framework for flood management, water conservation, habitat restoration, recreation, and cultural resources protection in this area. The HWP Master Plan was adopted in 2003 and an amendment approved in 2010 (City of Pasadena 2010).

The projects specified in the HWP Master Plan that are within the Project's boundaries include the expansion of the existing spreading grounds through the creation of new spreading basins on the central and southern portions of the former JPL East Parking Lot. The HWP Master Plan also calls for habitat restoration around the spreading basins. Other improvements are planned in the HWP Master Plan that were covered and approved under the ASCP IS/MND, including parking lot improvements and a new restroom (see Section 3, Project Description and Table 3-1).

Raymond Basin Judgement

PWP's water supplies consist of local groundwater from the Raymond Basin (approximately 40%) and purchases of imported water (approximately 60%). Of the local supplies, PWP receives its water supply from two sources: direct pumping from the Raymond Basin (groundwater) and diverted surface water, which is spread into spreading basins, allowing for groundwater pumping credits. Allocations for the extraction of groundwater supplies are detailed in the Raymond Basin Judgement. The City's Urban Water Management Plan provides a summary of the Raymond Basin Judgement (Pasadena Water and Power 2016). The City's Urban Water Management Plan (UWMP; Pasadena Water and Power 2016) provides a summary of the Raymond Basin Judgement.

In order to alleviate overdraft conditions in the Raymond Basin, the Raymond Basin Judgment (Judgment) was signed on December 23, 1944. The Judgment assigns each pumper a "present unadjusted right" corresponding to the average amount of water that they pumped in the five years prior to 1937. Pasadena's present unadjusted right is 12,946 AFY. Each pumper's present unadjusted right was scaled down to create the "decreed right" such that the sum of all pumpers' decreed rights is equal to the estimated operating yield of the basin. In the original Judgment, the operating yield was determined to be 21,900 AFY for the entire Raymond Basin. However, according to the first modification of the Judgment in 1955, the operating yield was increased to 5,290 AFY in the Eastern Unit and 25,480 AFY in the Western Unit. This resulted in a total operating yield of 30,770 AFY in the Raymond Basin. Therefore, the sum of all water that is pumped—excluding water pumped from individual storage accounts or as a result of spreading or injection credits—is regulated so as not to exceed the total operating yield of the basin. Based on the new operating yield, PWP's decreed right was calculated to be 12,807 AFY from the Western Unit (Monk Hill and Pasadena subareas); PWP has no water right in the Eastern Unit (Santa Anita subarea). In 2009, the Raymond Basin Management Board (RBMB) implemented a resolution to the 1955 decreed rights to slow declining water levels in the Western Unit of Raymond Basin.

This resolution called for a cooperative pumping reduction for parties with water rights in the Pasadena subarea effective July 1, 2009, where RBMB seeks to reduce water production incrementally over five years until a 30% reduction is achieved. Hence, PWP's water right was decreased by 2,503 AF over 5 years to a final right of 10,304 AFY beginning in 2014.

A 1974 modification to the Raymond Basin Judgment allows each pumper with surface runoff diversion rights to recharge the Raymond Basin with surface water, and to then pump a portion of the recharged volume in addition to their decreed right water right. 60% to 80% of the recharged volume may be pumped depending on the spreading basin in the Arroyo Seco used for recharge of the Monk Hills subbasin. The ability to spread surface runoff provides benefits associated with natural water treatment because the alluvium can function as a filter to remove certain

constituents from the water. In addition, the ability to spread surface runoff provides storage benefits, because surface water that is diverted and spread during the wet season can be stored in the basin for use in periods of higher demand (Pasadena Water and Power 2016).

The Judgement states that PWP, which diverts surface water for beneficial use from a source contributing to the supply of groundwater in the Raymond Basin area (i.e. the Arroyo Seco), has the right to continue to divert a maximum amount of 25 cfs of water (City of Pasadena v. City of Alhambra, 1984). As stated in the Judgement, the water "shall be spread for percolation into the underground in the existing water conservation facilities of the Los Angeles County Flood Control District, or in such additional spreading grounds as the parties may acquire or construct, or in any natural stream channels leading to such existing or future spreading grounds, provided that all such spreading locations shall be within the Monk Hill Basin or Pasadena Subarea hydrologic subdivision of the Western Unit of the Raymond Basin Area" (City of Pasadena v. City of Alhambra, 1984).

2.4 Effects Found Not to be Significant

Per Section 15143, the CEQA Guidelines require that an EIR focus on the significant effects on the environment, discussing the effects with emphasis in proportion to their severity and probability of occurrence. Effects dismissed in an Initial Study (Environmental Checklist) as clearly insignificant and unlikely to occur do not need to be discussed further in the EIR unless information inconsistent with the finding in the Initial Study is subsequently received.

Section 21100 (c) of the Public Resources Code (PRC) states that an EIR shall contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were, therefore, not discussed in detail in the EIR (PRC, Section 21000 et seq.). Section 15128 of the CEQA Guidelines adds, "Such a statement may be contained in an attached copy of an Initial Study" (14 CCR 15000 et seq.).

An Initial Study was prepared and circulated with the Notice of Preparation (NOP) for the proposed Project for public review on November 4, 2019. The NOP and Initial Study are included in Appendix A-1 and the Appendices to the Initial Study are included in Appendix A-2 of this Draft EIR. Comment letters received by the City during the NOP public review period are included in Appendix A-3 of this Draft EIR. The Initial Study for the Arroyo Seco Canyon Project Areas 2 and 3 concluded that the proposed Project would result in no impacts, result in less than significant impacts, or result in no new/different impacts than what was analyzed in the 2015 IS/MND, to the following areas:

- Aesthetics
  a) Have a substantial adverse effect on a scenic vista;
  b) Substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
  c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality;
  d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.
- Agricultural and Forestry Resources

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract;

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g));

d) Result in the loss of forest land or conversion of forest land to non-forest use;

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

- Energy
  a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation;
  b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.
- Geology and Soils
  a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
     i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.
     ii. Strong seismic ground shaking
     iii. Seismic-related ground failure, including liquefaction
     iv. Landslides
  b) Result in substantial soil erosion or the loss of topsoil;
  c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse;
  d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property;
  e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water;
- Hazards and Hazardous Materials
  a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
  b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
  c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;

d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment;

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area;

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan;

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

- Land Use and Planning
  a) Physically divide an established community;
  b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.
- Mineral Resources
  a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state;
  b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.
- Population/Housing
  a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure);
  b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.
- Public Services
  a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:
     i. Fire Protection
     ii. Police Protection
     iii. Schools
     iv. Parks
     v. Other Public Facilities
- Utilities and Service Systems
  a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects;

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years;

c) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments;

d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals;

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

- Wildfire
  a) Substantially impair an adopted emergency response plan or emergency evacuation plan;
  b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire;
  c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment;
  d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

2.5 2015 ASCP Mitigated Negative Declaration Summary

The City, as the designated lead agency for the proposed Project, is responsible for enforcing and verifying that each mitigation measure is implemented as required. The 2015 Arroyo Seco Canyon Project Initial Study/MND and corresponding Mitigation Monitoring and Reporting Program (MMRP) were adopted on June 1, 2015. Table 2-1 includes the mitigation measures within the 2015 MMRP and summarizes whether those measures remain applicable, are altered/revised, or are no longer applicable, when considering the implementation of the proposed Project. Therefore, the City must also adopt a revised MMRP describing the changes that were incorporated into the proposed Project or made a condition of Project approval in order to mitigate or avoid significant effects on the environment (Pub. Resources Code Section 21081.6). The 2015 IS/MND is included in Appendix A-4, 2015 Final ASCP Initial Study/Mitigated Negative Declaration of this Draft EIR.

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
Aesthetics	None	Topic scoped-out through the Initial Study.
Agricultural and Forestry Resources	None	Topic scoped-out through the Initial Study.

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
Air Quality	None	Topic scoped-out through the Initial Study.
Biological Resources	**MM BIO-1** A Biological Monitor shall be on site during vegetation clearing activities in Project work areas (i.e., areas of disturbance). Prior to the start of activities, the Biological Monitor shall confirm that the limits of Project work areas are clearly marked. In addition, the Biological Monitor shall conduct a pre-clearing sweep of the Project work area and shall flush and/or move common and unlisted special status wildlife to nearby suitable habitat outside the Project work area to the extent practicable. The Biological Monitor shall also be familiar with least Bell's vireo and shall conduct pre-clearing non-protocol surveys for this species while onsite. If a least Bell's vireo or other State of federally listed species is detected, work activity within 200 feet of the occupied habitat detected will be temporarily halted and the City will consult with the USFWS and CDFW. With authorization from these agencies, which may include a 'take' permit, the project will proceed in accordance with conditions developed in the consultation. Conditions will include avoidance and minimization measures to prevent or minimize impacts on the listed species(s) occurring on or adjacent to the site.	**Replaced with MM-BIO-1** See Executive Summary and Section 4.2, Biological Resources for revised mitigation.
Biological Resources	**MM BIO-2** Project construction shall be conducted in compliance with the conditions set forth in the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code with methods approved by the ~~U.S. Fish and Wildlife Service (USFWS)~~ and California Department of Fish and Wildlife (CDFW) to protect active bird/raptor nests. To the maximum extent feasible, vegetation removal shall occur during the non-breeding season for nesting birds (generally late September to early March) and nesting raptors (generally early July to late January) to avoid impacts to nesting birds and raptors. If the Project requires that work be initiated during the breeding season for nesting birds (March 1–September 30) and nesting raptors (February 1–June 30), in order to avoid direct impacts on active nests, a pre-construction survey shall be conducted by a qualified Biologist for nesting birds and/or raptors within 3 days prior to clearing of any vegetation and/or any work near existing structures (i.e., within 300 feet for nesting birds and within 500 feet for nesting raptors). If the Biologist does not find any active nests within or immediately adjacent to the impact areas, the vegetation clearing/construction work shall be allowed to proceed.	With minor modification, **MM BIO-2** remains applicable. (Text in **bold** is added; Text in ~~strikeout~~ is deleted).

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
	If the Biologist finds an active nest within or immediately adjacent to the construction area and determines that the nest may be impacted or breeding activities substantially disrupted, the Biologist shall delineate an appropriate buffer zone around the nest depending on the sensitivity of the species and the nature of the construction activity. Any nest found during survey efforts shall be mapped on the construction plans. The active nest shall be protected until nesting activity has ended. To protect any nest site, the following restrictions to construction activities shall be required until nests are no longer active, as determined by a qualified Biologist: (1) clearing limits shall be established within a buffer around any occupied nest (the buffer shall be 100–300 feet for nesting birds and 300–500 feet for nesting raptors), unless otherwise determined by a qualified Biologist and (2) access and surveying shall be restricted within the buffer of any occupied nest, unless otherwise determined by a qualified Biologist. Encroachment into the buffer area around a known nest shall only be allowed if the Biologist determines that the proposed activity would not disturb the nest occupants. Construction can proceed when the qualified Biologist has determined that fledglings have left the nest or the nest has failed.	
Biological Resources	**MM BIO-3** A Biological Monitor shall conduct a pre-construction bat habitat assessment of buildings and trees marked for potential removal. Potential for roosting shall be categorized by 1) potential for solitary roost sites, 2) potential for colonial roost sites (10 bats or more). If the potential for colonial roosting is determined, those trees shall not be removed during the bat maternity roost season (March 1 – July 31). Trees potentially supporting colonial roosts outside of maternity roost season, and trees potentially supporting solitary roosts may be removed via a two-step removal process, whereby some level of disturbance (such as trimming of lower branches) (at the direction of Biological Monitor) is applied to the tree on day one to allow bats to escape during the darker hours, and the roost tree shall be removed two days later (i.e., there shall be no less or more than two nights between initial disturbance and the grading or tree removal). When feasible, trees will be dropped slowly and a Biological Monitor will monitor the activity. If buildings are determined to be occupied, one-way exclusionary devices will be placed over bat access points and left in place for two nights prior to building removal.	No Change. **MM-BIO-3** remains applicable, as set forth in the MMRP.
Biological Resources	**MM BIO-4** Prior to habitat disturbing activities of any Project component, a detailed restoration program shall be developed and	**Replaced with MM-BIO-4 and MM-BIO-6**

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
	implemented for any special status vegetation type identified within the Project disturbance limits that is removed. These special status vegetation types shall be restored within the project disturbance limits at a ratio of not less than 1:1, or as agreed to by the City of Pasadena in consultation with the CDFW. If the 1:1 ratio cannot be achieved within the project disturbance limits, then the balance shall be achieved by identifying additional areas for restoration or conservation within the Arroyo Seco or adjacent watersheds. Restoration shall consist of seeding and container plantings of appropriate species. A Restoration Program shall be submitted to the City of Pasadena for review by a qualified Biologist and approval by the resource agencies (USACE, RWQCB, CDFW) prior to issuance of grading permits. The Restoration Program shall include, at a minimum, the following elements: a. Responsibilities and qualifications of the personnel to implement and supervise the plan. The responsibilities of the landowner, specialists, and maintenance personnel that will supervise and implement the plan shall be specified. b. Site selection. The site(s) for mitigation shall be determined in coordination with the City of Pasadena and the resource agencies. Restoration required outside the Project disturbance limits shall be located in dedicated open space areas (i.e. preserved in perpetuity as open space) and shall be contiguous with other natural open space areas. c. Site preparation and planting implementation. The site preparation shall include (1) protection of existing native species; (2) trash and invasive non-natives removal; (3) native species salvage and reuse (i.e., duff); (4) soil treatments (i.e., imprinting, decompacting); (5) erosion-control measures (i.e., rice or willow wattles); and (6) native seed mix application and plantings. d. Schedule. Establishment of restoration/revegetation sites shall be conducted between October 1 and January 30. Seeding and planting of container plants shall take place immediately after preparation of the restoration sites. e. Maintenance plan/guidelines. The maintenance plan shall include (1) invasive non-natives control, (2) herbivory control, (3) trash removal, (4) irrigation system maintenance, (5) maintenance training, and (6) replacement seeding and/or planting.	See Executive Summary and Section 4.2, Biological Resources for revised mitigation.

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
	f. Monitoring Plan. The monitoring plan shall include (1) site preparation and implementation activities; (2) performance criteria as approved by the City of Pasadena and resource agencies; (3) long-term monitoring requirements and methods to determine compliance with performance criteria; (4) goals and methods of site maintenance (e.g., weed removal, erosion control); (5) preparation of regular progress reports to document site progress; and (6) preparation of annual reports which shall be submitted to the City of Pasadena and resource agencies for three to five years. The monitoring shall be conducted for three to five years, depending upon the performance standard requirements for the vegetation type at the mitigation site. g. Long-term preservation. Long-term preservation of the restoration site shall be outlined in the conceptual mitigation plan to ensure the mitigation site is not impacted by future development. h. Performance standards will be identified and will apply for each special status vegetation type. Revegetation shall be considered successful at three years if the percent cover and species diversity of the restored and/or created habitat areas are similar to percent cover and species diversity of adjacent existing habitats, as determined by quantitative testing of existing, restored, and created habitat areas. In addition, earth-moving equipment shall avoid maneuvering in areas outside the construction limits in order to avoid disturbing adjacent habitats. Prior to grading, the construction limits shall be identified on the grading plan and established at the Project site with appropriate staking and flagging materials. The Contractor shall submit a letter to the City of Pasadena verifying that the construction limits have been staked and flagged at the Project site.	
Biological Resources	**MM BIO-5** Mitigation for the loss of jurisdictional resources shall be negotiated with the resource agencies during the regulatory permitting process (see RR BIO-1) and shall ensure that mitigation to compensate for permanent impacts on jurisdictional resources is equivalent or superior to biological functions and values impacted by the Project. Potential mitigation options may include: (1) removal of exotic species from the Arroyo Seco Canyon or Hahamongna Watershed Park or elsewhere within the Arroyo Seco or adjacent watersheds; (2) payment to a mitigation bank or regional riparian enhancement program (e.g., invasive plant or wildlife species	**Replaced with MM-BIO-6** See Executive Summary and Section 4.2, Biological Resources for revised mitigation.

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
	removal); and/or (3) restoration of riparian habitat, including qualifying vegetation and trees, either on site or off site at a ratio of no less than 1:1, determined through consultation with the USACE, the RWQCB, and the CDFW. The restoration plan shall detail the methodology and performance standards, which shall be prepared in accordance with requirements specified in permits/agreements issued by the USACE, the RWQCB, and the CDFW.	

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
Biological Resources	**MM BIO-6** A team of qualified specialists in hydrology and plant and wildlife biology will monitor the Arroyo Seco stream and associated riparian habitat from the intake structure (i.e. diversion point) downstream to Devil's Gate Dam. The extent of the riparian habitat, including aquatic habitat, will be defined based on field observations during the initial site visit. Monitoring will begin with an initial baseline assessment to be conducted within six months prior to start of increased diversions. Thereafter, monitoring shall continue quarterly for a duration of five years. Data will be gathered at fixed points along the stream, and general descriptive notes and photos will be taken of the entire stretch. Data will include surface flow measurements; subsurface hydrology; surface water extent mapping; vegetation mapping; a vegetation health assessment; active channel location mapping; and a plant and wildlife habitat suitability assessment (including protocol surveys if warranted and necessary to determine presence or absence of species). Data from four quarterly visits will be compiled in an annual report. The initial report will include a summary of available biological and hydrological historic data for the site. Annual reports will also include U.S. Geological Survey (USGS) stream gauge data from the Arroyo Seco (upstream of the Project site) and City of Pasadena data on diversion amounts within the year. These reports will consider all potential contributing factors, including precipitation and hydrologic conditions, flows from other managed tributaries, as well as potential maintenance and sediment removal activities behind the Devil's Gate Dam, and focus the reports on that which is attributable to the project to the maximum extent feasible. Annual reports will conclude with an assessment on the effects of increased diversion and will provide recommendations for corrective actions, if deemed necessary to avoid or reduce downstream impacts attributable to the Project. Reports will be submitted to the City of Pasadena for review and approval of recommended corrective measures, if any. Alternatively, if the City chooses not to take corrective measures, the City may mitigate for any loss of vegetation at a minimum 1:1 replacement ratio. The City shall only be required to mitigate for those impacts attributable to the City's increased diversions. Replacement vegetation shall be in kind; shall be equal to or greater than biological value prior to diversion; and shall be located within the Arroyo Seco watershed. Vegetation replacement shall mitigate for plant and wildlife impacts of the impacted community. Re-vegetated riparian communities within Area 1 established as part of the Project may	This mitigation is no longer necessary and is eliminated from the MMRP, as substantiated in Section 4.2, Biological Resources.

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
	potentially qualify towards credit for reduced flow impacts, if credit is available.	
Biological Resources	**MM BIO-7** Prior to commencement of construction activities, trees not expected to be impacted by construction shall be enclosed by barriers such as chain-link fencing or orange snow fencing. At a minimum, the barriers will be placed at the outer canopy of each tree to be protected in place, and no grade changes will be made within the barriers without prior approval by the City. During Project construction, a biological monitor will be periodically present to record the number of trees actually impacted. If project construction can avoid impacting oak trees, the number of replacement trees will be reduced accordingly.	**Replaced with MM-BIO-8** See Executive Summary and Section 4.2, Biological Resources for revised mitigation.
Cultural Resources	**MM CUL-1** Prior to the start of construction activities in Areas 1 and 2, the cast concrete baluster railing of Bridge No. 2 shall be protected from construction activities that include the movement of heavy and large motor vehicles and machinery over it to gain access to Areas 1 and 2. Each baluster railing, from the bridge deck to the top of the railing, shall be clad with solid plywood panels, with a minimum thickness of ¾ inches (or equally effective measures shall be installed) to protect against unintentional impacts from passing over the bridge. The plywood barriers shall be secured without damaging the balusters or railing. The design and construction (and eventual removal) of the protective barriers at Bridge No. 2 shall be prepared in accordance with the Secretary of the Interior's Standards for the Treatment of Historic Properties. The plans for the temporary barriers shall be reviewed by an architectural historian, historic architect, and structural or civil engineer who has experience with the physical components of historic bridges. A qualified architectural historian (who meets the Secretary of Interior's Professional Qualification Standards) shall be retained to monitor the proposed installation and removal of the protective barriers on Bridge No. 2, prior to construction. An installation/construction/repair methodology to protect the historic resources shall be developed prior to construction activities to ensure that the protective measures adequately safeguard Bridge No. 2. A pre-construction and a post-construction survey shall be prepared to ensure that adverse effects or significant impacts have not occurred to the bridge. The installation/construction methodology and post-construction survey shall be submitted to the City of Pasadena Department of Planning – Historic Preservation.	**Replaced with MM-CUL-1** See Executive Summary and Section 4.3, Cultural Resources for the revised mitigation.

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
Cultural Resources	**MM CUL-2** Prior to commencement of construction activities within Areas 1 and 2, the design and construction (and eventual removal) of the temporary bridge over Bridge No. 3 shall be prepared in accordance with the Secretary of the Interior's Standards for the Treatment of Historic Properties. The plans for temporary bridge shall be reviewed by an architectural historian, historic architect, and structural or civil engineer who has experience with the physical components of historic bridges and stone walls. A qualified architectural historian (who meets the Secretary of Interior's Professional Qualification Standards) shall be retained to monitor the proposed installation/construction and removal plan documents for the temporary bridge on Bridge No. 3, prior to the start of construction activities. A pre-construction and a post-construction survey shall be prepared to ensure that adverse effects or significant impacts have not occurred to the bridge. The installation/construction methodology and post-construction survey shall be submitted to the City of Pasadena Department of Planning and Community Development, Design and Historic Preservation	**Replaced with MM-CUL-2** See Executive Summary and Section 4.3, Cultural Resources for the revised mitigation.
Cultural Resources	**MM CUL-3** Prior to commencement of earthmoving activities, the City shall retain a qualified Archaeologist to observe grading activities. The Archaeologist shall be present at the pre-grade conference; shall establish procedures for archaeological resource surveillance; and shall establish, in cooperation with the Contractor, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts, as appropriate. Should archaeological resources be found during ground-disturbing activities for the Project, the Archaeologist shall first determine whether it is a "unique archaeological resource" pursuant to the California Environmental Quality Act (CEQA, i.e., Section 21083.2[g] of the California Public Resources Code) or a "historical resource" pursuant to Section 15064.5(a) of the State CEQA Guidelines. If the archaeological resource is determined to be a "unique archaeological resource" or a "historical resource", the Archaeologist shall formulate a mitigation plan in consultation with the City of Pasadena that satisfies the requirements of the above-referenced sections. The Archaeologist shall prepare a report of the results of any study prepared as part of a testing or mitigation plan, following guidelines of the California Office of Historic Preservation, and s/he shall record the site and submit the recordation form to the City of Pasadena and the California Historic Resources Information System (CHRIS) at the	**Replaced with MM-CUL-4** See Executive Summary and Section 4.3, Cultural Resources for the revised mitigation.

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
	South Central Coastal Information Center (SCCIC) at California State University, Fullerton. Work may proceed in other areas of the site, subject to the direction of the Archaeologist.	
Cultural Resources	**MM CUL-4** Prior to commencement of earthmoving activities, a qualified Paleontologist shall be retained to observe grading activities in native soils that are 5 feet below the ground surface or deeper, in paleontologically sensitive sediments, and to conduct salvage excavation of paleontological resources, as necessary. The Paleontologist shall be present at the pre-grading conference; shall establish procedures for paleontological resources surveillance; and shall establish, in cooperation with the Contractor, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of any fossils discovered, as appropriate. If paleontological resources are discovered, the Paleontologist shall report such findings to the City of Pasadena. If paleontological resources are found to be significant, the Paleontologist shall determine appropriate actions, in cooperation with the City, for exploration and/or salvage. These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the City. All recovered fossils shall be deposited in an accredited institution or museum, such as the Natural History Museum of Los Angeles County.	**Replaced with MM-PALEO-1** See Executive Summary and Section 4.3, Cultural Resources for the revised mitigation.
Energy	None	Topic scoped-out through the Initial Study.
Geology and Soils	None	Topic scoped-out through the Initial Study.
Greenhouse Gas Emissions	None	Topic scoped-out through the Initial Study.
Hydrology and Water Quality	None	Topic scoped-out through the Initial Study.
Hazards and Hazardous Materials	**MM HAZ-1** The City shall require Construction Contractors to implement the following measures: • Trucks and equipment entering the site shall be inspected to be free from oil, gasoline, or other vehicle fluid leaks. • Equipment fueling areas shall be located outside jurisdictional waters as identified by the USACE and CDFW. • Hazardous materials shall not be stored within the 50-year floodplain for the Arroyo Seco. Instead, hazardous materials shall be stored within staging areas located away from the	No Change. **MM HAZ-1** remains applicable, as set forth in the MMRP.

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
	Arroyo Seco and shall be removed prior to the start of the storm season. • All hazardous material spills and contaminated soils shall be excavated immediately upon discovery to minimize soil and water contamination and the potential of wildlife being poisoned or otherwise harmed. • The Contractor shall maintain hazardous materials spill control, containment, and cleanup kits of adequate size and materials for potential accidental instream spills and releases.	
Hazards and Hazardous Materials	**MM HAZ-2** Should discolored or odorous soils be encountered during grading and excavation activities in Area 3, the Contractor shall have a sample of the soils analyzed for the presence of contamination. If the results of the testing show that chemical levels are present below regulatory levels, grading and excavation activities may proceed accordingly. Otherwise, remediation and/or removal of the contaminated soils shall be completed prior to continued ground disturbance if chemical levels are above regulatory standards. Remediation and/or disposal shall be conducted with the oversight of applicable regulatory agencies such as the Los Angeles County Fire Department, the South Coast Air Quality Management District (SCAQMD), the California Department of Toxic Substances Control (DTSC), and/or the U.S. Environmental Protection Agency in compliance with established maximum contaminant levels (MCLs).	No Change. **MM HAZ-2** remains applicable, as set forth in the MMRP.
Hazards and Hazardous Materials	**MM HAZ-3** The Contractor shall schedule ~~the temporary bridge construction and~~ the access road reconstruction in Area 2 so as to shorten the necessary closures of the ~~bridges and~~ access road to the extent feasible. The Contractor shall also inform the Pasadena Department of Water and Power (PWP), the Pasadena Fire Department, the Pasadena Police Department, the Los Angeles County Fire Department, and the United States Forest Service (USFS) at least one week in advance of the start of construction of the times when work on ~~Bridge No. 1/temporary bridge; Bridge No. 3/temporary bridge; and~~ the Gabrielino Trail/access road are planned. Any major changes to the schedule shall be forwarded to these agencies at least one week prior to ~~the bridge or~~ trail closures.	The temporary bridges are currently in place and operational. With minor modification, **MM HAZ-3** remains applicable.
Hazards and Hazardous Materials	**MM HAZ-4** The Contractor shall not use, operate, or cause to be operated any internal combustion engine that uses hydrocarbon fuel, unless the engine is equipped with a spark arrestor and is maintained in effective working order, or the engine is constructed, equipped and maintained for the prevention of fire.	No change. **MM HAZ-3** remains applicable, as set forth in the MMRP.

Land Use and Planning	None	Topic scoped-out through the Initial Study.
Mineral Resources	None	Topic scoped-out through the Initial Study.
Noise	**MM NOI-1** The **City and/or their Construction** Contractor shall implement the following noise-reduction measures during all construction activities: • Equip all construction equipment (fixed or mobile) with properly, operating and maintained mufflers, consistent with or exceeding manufacturers' standards. • Ensure that construction equipment engine enclosures and covers, as provided by manufacturers, shall be in place during operation. • Place all stationary construction equipment so that the equipment is as far as feasible from noise-sensitive receptors and so that the emitted noise is directed away from the noise-sensitive receptors. • Locate equipment and materials staging in areas that will create the greatest distance between staging area noise sources and noise-sensitive receptors during Project construction. • Ensure that construction equipment is shut down when not in use. • Limit haul truck deliveries to the same hours specified for the operation of construction equipment.	With minor modification, **MM NOI-3** remains applicable. (Text in **bold** is added; Text in ~~strikeout~~ is deleted).
Population and Housing	None	Topic scoped-out through the Initial Study.
Public Services	None	Topic scoped-out through the Initial Study.
Recreation	**MM REC-1** Prior to the closure of recreational trails for public use, the Construction Contractor shall post signs at the parking lots and trail entrances providing at least one week of advanced notice of the dates and times of planned trail closures. The trails shall be closed no more than 5 consecutive days in non-emergency circumstances. In addition to the closure notice, the Contractor shall provide directions to the nearest trails in the surrounding areas that would be open for public use at the times when the trails are closed.	**Replaced with MM-REC-1.** See Executive Summary and Section 4.7, Recreation for the revised mitigation.
Transportation	**MM TRA-1** During construction activities in Areas 1, 2 and 3, all Contractors shall schedule the arrival and departure of the construction equipment, and construction trucks outside the AM peak hours of 7:30	**Replaced with MM-TRA-1.**

Table 2-1. 2015 IS/MND Mitigation Monitoring and Reporting Program

Initial Study Topic	2015 MMRP: Mitigation Measure	Applicability to the ASCP Areas 2 and 3 EIR
	AM to 8:30 AM and the PM peak hours of 4:30 PM to 5:30 PM. In addition, trucks transporting sediment and debris from the site shall travel to and from the site outside the AM and PM peak hours.	See Executive Summary and Section 4.8, Transportation for the revised mitigation.
Transportation	**MM TRA-2** During construction activities in Areas 1 and 2, use of Bridge No. 1, Bridge No. 3, and the Gabrielino Trail/access road by hikers, bicyclists and equestrians shall be limited or prohibited when work on the temporary bridges and Gabrielino Trail/access road is ongoing. Flagpersons and/or other safety procedures shall be used as necessary to ensure the safety of recreational users.	**Replaced with MM-TRA-2.** See Executive Summary and Section 4.8, Transportation for the revised mitigation.
Transportation	**MM TRA-3** Prior to the start of construction, the **City and/or their** Construction Contractor shall provide written notice to the USFS and residences at the Ranger Station of the anticipated construction schedule, stating that access may be temporarily obstructed on an intermittent basis and providing a schedule of anticipated closures. In order to ensure that emergency vehicles would not be obstructed at any time, any temporary obstructions to the Gabrielino Trail/Access Road that could hinder emergency vehicular access shall be mobile and able to be removed from the roadway immediately upon notice from emergency responders.	With minor modification, **MM TRA-3** remains applicable. (Text in **bold** is added; Text in ~~strikeout~~ is deleted).
Transportation	**MM CUM-1** The Contractor for the Arroyo Seco Canyon Project shall coordinate with the Los Angeles County Department of Public Works and their contractor for the sediment removal activities at Devil's Gate Reservoir on the schedule of trucks coming to and from Scholl Canyon Landfill, such that the Project's truck traffic avoids the AM and PM peak hours to reduce conflict with local traffic so that truck arrival times are staggered between the two projects to avoid queuing on Figueroa Street and on the State Route 134 on-and off-ramps.	**Replaced with MM-CUML-1.** See Executive Summary and Section 4.8, Transportation for the revised mitigation.
Tribal Cultural Resources	None	**New MM-TCR-1 and TCR-2.** See Executive Summary and Section 4.9, Tribal Cultural Resources
Utilities and Service Systems	None	Topic scoped-out through the Initial Study.
Wildfire	None	Topic scoped-out through the Initial Study.

3 PROJECT DESCRIPTION

This section describes the objectives of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) and provides a detailed description of Project characteristics. This section includes: (1) the precise location and boundaries of the proposed Project; (2) the Project Objectives, including the underlying purpose of the Project; (3) a general description of the Project's technical, economic, and environmental characteristics, including an overview of the engineering plans and supporting public infrastructure/facilities; and (4) a statement of the intended uses of the EIR, including responsible agencies and entitlements required. The environmental impacts of the proposed Project are evaluated in Section 4, Environmental Impact Analysis, through Section 6, Alternatives, of this Draft Environmental Impact Report (EIR).

3.1 Project Components

As described in Section 2, Environmental Setting, the Project site consists of two primary areas, as shown on Figure 2-1, Local Vicinity and Regional Location, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements, which are connected by the North Arroyo Boulevard[1] (i.e. Gabrielino Trail/Access Road). The proposed Project involves construction activity and facility improvements in Areas 2 and 3, as well as construction truck traffic along portions of the Gabrielino Trail/Access Road. The former Travelling Screen and Chlorine Building (Screen Building) adjacent to Area 2 and the Behner Water Treatment Plant (WTP) adjacent to Area 3 would be used for temporary construction materials and equipment staging only.

3.1.1 Area 2: Diversion and Intake Replacement

Short-Term Construction Activities

Replacement of the existing diversion and intake structure would require site preparation, including demolition and grading. Prior to commencement of grading within Area 2, a temporary coffer dam would be installed in the Arroyo Seco upstream and downstream of the intake replacement area within Area 2, which would provide a dry area for construction activities within the streambed. The coffer dam would capture the stream flows and allow them to be contained, pumped into a flexible pipeline that would bypass the construction area, and then outlet downstream of the construction area. The Project would involve the removal of sediment and debris that has accumulated upstream and downstream of the existing weir, and demolition would commence.

Improvements in Area 2 include the demolition and removal of the following structures: (1) existing concrete diversion weir, associated masonry abutments, and rock wall built over concrete dam that extends under the trail; (2) intake structure, metal ladder and platform, and trash racks; (3) 10-foot by 15-foot concrete slab adjacent to the Gabrielino Trail/Access Road, and (4) excavations of soil/sediment, rocks, debris, and vegetation within the upstream diversion pool, downstream streambed, and on the adjacent slopes on the downstream side of the diversion weir.

The Project involves the construction of a new diversion weir and intake in the same location within the Arroyo Seco as the current facility. The existing elevation at the top of the weir is approximately 1,183 feet amsl and the bottom

[1] Also known as "Arroyo Seco Road".

of the weir is approximately 1,179 feet amsl. Excavations in the Arroyo Seco would extend to approximately 1,171 feet amsl (approximately 8 feet deep) and extend approximately 60 feet upstream and approximately 150 feet downstream of the diversion weir, across the full width of the Arroyo Seco streambed, as shown in Figure 3-1, Area 2 Conceptual Design Overview. The engineering design plans are included as Figure 3-2, Area 2 Preliminary Engineering Designs. Additional preliminary engineering plans for Area 2 are included in Appendix B-1 of this Draft EIR, which includes the Arroyo Seco Canyon Project- Intake/Diversion Design (Area 2) Draft Basis of Design Report prepared by Northwest Hydraulic Consultants, Inc., dated March 2, 2020.

The proposed reinforced concrete diversion control structure would span the entire width of the existing channel (approximately 55 feet) in the same general location as the existing structure. A 30-foot long operable weir crest gate would be located in a notched section of the structure and would be mechanically operated. The structure section would be approximately 7.5 feet wide in the stream longitudinal direction with a top elevation that would match the existing top of weir. The crest of the notch would be flush with the streambed. Operation of the crest gate would be controlled by water depth measurements from a transducer located immediately upstream of the diversion. The new diversion intake would be constructed of reinforced concrete in the same location as the existing structure on the left bank of the stream immediately upstream of the diversion weir. The intake would be equipped with a trash rack mounted parallel to the stream flow and a bulkhead allowing the intake structure to be fully isolated during flood flows with the manual installation of flashboards.

The proposed Project's design for the new diversion weir/intake structure would be protective of future fish while taking into account the Project's existing setting, including conditions that are currently unfavorable to fish and their survivability. Specifically, if fish were present in the Arroyo Seco, downstream fish passage during current diversion operations would result in fish being transported to the downstream reach and Devil's Gate Reservoir area in low flows. Under current conditions, fish may perish in this reach due to isolation or stranding in low or zero flow periods. As such, the proposed Project features include (1) a fish screen to prevent future fish from entering the intake, and (2) an engineered roughened channel downstream of the new diversion structure and operable weir to allow return passage upstream should fish pass during periods of high flows.

The intake approach channel would be angled and taper to an off-channel screen bay, allowing for: 1) sediment to be flushed through the bay, 2) protection of the screens, and 3) potential adaptability in future conditions for downstream fish passage. The tapered bay would end at a 12-inch diameter slide gate and flushing pipe for removing sediment and small debris build-up in front of the screens. Design of a drum screen or a vertical screen with automatic brush cleaning system would follow CDFW published design criteria to prevent future fish populations from entering into the conveyance system and becoming stranded in the spreading basins. A second slide-gated cleanout pipe would be located at the back of the fish screens to further remove sediment build-up. The final component of the intake structure would be an 8-foot long outlet weir, located behind the screens and fitted with an adjustable weir plate. The purpose of the outlet weir is to create the necessary hydraulic conditions for proper operation of the drum screens, Flow would spill over the weir to a small vault and a 30-inch diameter outlet pipe that conveys the diverted flow to the existing conveyance system and spreading basins downstream.

Additionally, the roughened channel would be constructed to allow passage when the weir crest gate is lowered. Roughened channels are an accepted method of providing passage for steelhead trout in CDFW's Salmonid Stream Restoration Manual (CDFG 2010), requiring site specific design and review. The roughened channel configuration proposed is a channel approximately the width of the active channel in adjacent stream segments (upstream and downstream), with an asymmetric v-shaped cross section to concentrate lower flows and provide adequate depth. Compared to other potential types of upstream passage features, the roughened channel type has the advantage of

providing a range of velocities and depths at a given flow rate. Thus smaller or weaker swimming native fish and other aquatic organisms could pass along the margins of the channel or near the bottom, using spaces in the bed material for hydraulic cover. Construction of the streambed shoulder and bank, including the roughened channel, downstream of the new diversion structure and operable weir would be with permeable engineered streambed material (ESM). The ESM selected for the Project would consist of a well-graded mixture of rock, gravel and sand similar to natural streambed material, and would not add any new impervious surfaces within the Arroyo Seco streambed.

The proposed roughened channel profile slope downstream of the diversion weir would be 4%, or approximately twice the average bed slope; therefore, the profile slope would be reasonably similar to a natural steep section or chute in the adjacent reaches of channel. The roughened channel would be designed to allow operational changes that could accommodate low- and high-flow fish passage and would include a small cushion pool at the crest to prevent injury and an asymmetric cross-section to provide appropriate depths and velocities across the range of design flows.

An existing concrete slab that previously supported an equipment building located adjacent to the Gabrielino Trail/Access Road would be demolished. A new 106-square-foot (11 feet 4 inches by 9 feet 4 inches) intake Service Building would be constructed to house the electrical and controls for the diversion structure. Electric power for the operation of the diversion structure and control equipment enclosure would be supplied by an existing power line at the screen building (southeast of the intake structure).

Upon completion of construction activities, all temporary fencing, flagging, signage, soil stockpiles, and/or mobile and stationary construction equipment would be removed from the Area 2.

Long-Term Operational Activities

The proposed new diversion/intake structure would capture flows up to PWP's 25 cfs surface water rights into the existing conveyance system, while additional flows beyond 25 cfs would continue downstream. The system would be operated to divert all flows during small storm events and dry weather flows in the Arroyo Seco, and a portion of flows during large storm events. During larger storms when the water is too turbid with suspended sediments (e.g., flows generally above 100 cfs), the weir would be lowered to allow the stream flows with its associated sediment load to bypass the diversion/intake structure and continue downstream towards Devil's Gate Reservoir.

Under the current conditions, no diversions from the existing intake can occur when stream flows are greater than 25 cfs; therefore, the City can divert an average of 2,045 acre-ft/yr. Under the proposed Project conditions (i.e. diverting up to 25 cfs for storm flows <100 cfs), the City could divert approximately 3,080 acre-ft/yr; therefore, the Project would add approximately 1,035 acre-ft/yr of diverted flows into the spreading basins. This number is based on historic data, which is the best available information related to the future flows within the Arroyo Seco, and future flows would continue to be subject to various factors such as number, intensity, and duration of rainfall events, as well as drought conditions. Prior to the use of the City's spreading basins, when water was diverted for direct use from the Arroyo Seco directly into the water treatment facility for potable use, the conditions for diversion were not limited to the same considerations related to managing sediment for spreading, and records show diversions exceeding 5,000 acre-ft/yr. Therefore, the Project's goal of increasing the beneficial use of the City's water rights, can also be seen as restoring a portion of its historic use.

As further discussed in Section 4.2, Biological Resources, this EIR includes an assessment of fish conditions within the Arroyo Seco and determined that there are currently no fish inhabiting the Arroyo Seco above Devil's Gate Dam,

including the Project area. However, in coordination with the California Department of Fish and Wildlife (CDFW), PWP's proposed diversion weir/intake design would incorporate features that minimize potential adverse effects of diversion should there be a reoccurrence of one of the likely species for the area, the steelhead/rainbow trout (*Oncorhynchus mykiss)*.

Under existing conditions, the diversion weir structure is a barrier to the movement of small aquatic animals due to an approximate 4-foot elevation drop downstream of the structure. The new diversion/intake structure would improve biological functions in the Arroyo Seco by allowing for fish passage in the event that fish populations are established in the Upper Arroyo Seco in the future.

Under current conditions, if fish were to be present, they may perish downstream of the diversion structure due to isolation or stranding in low or zero flow periods. The proposed Project design in Area 2 focuses on excluding fish from the diversion and downstream reach while considering potential for future downstream passage during diversions if connectivity is re-established for passage through Devil's Gate Dam and downstream channels to the ocean. The diversion weir would be lowered during periods of higher flows, and some passage of fish downstream may occur during these periods. Operation of the weir in combination with the roughened channel would allow upstream passage for future fish populations during periods when the diversion is not operating (the weir is lowered) and flows are adequate to allow for passage.

No new employees would be required for the long-term operation or maintenance of the Project components in Area 2. No operational changes would occur, and may be reduced with the automated function of the crest gate to control diversions. Similarly, PWP's future schedule of maintenance activities would not substantively differ from the current maintenance routine and procedures. City personnel would continue to provide maintenance of the diversion and intake structures as occurs under the existing conditions. It is possible that maintenance would be reduced in Area 2 because less sediment would accumulate within the pool behind the diversion weir with the improved intake structure.

3.1.2 Area 3: Spreading Basin Improvements

Short-Term Construction Activities

As shown in Figure 3-3, Area 3 Conceptual Design Overview, improvements in Area 3 include the reconfiguration and expansion of the spreading basins in order to accommodate the increased diversion of stream flows for infiltration into the Raymond Basin. Figure 3-3 depicts the proposed configuration of the spreading basin improvements, while Figure 3-4A, Area 3 Basin Grading Plan (Basins A, E, and F), Figure 3-4B, Area 3 Basin Grading Plan (Basins F, G, H, and I), and Figure 3-4C, Area 3 Basin Grading Plan (Basins I and J) identify the grading contours of the proposed basins and provide the engineering design plans. Additional detailed engineering plans for Area 3 are included in Appendix B-2 of this Draft EIR, which includes the Arroyo Seco Canyon Project 100% Submittal (Area 3 and Area 2 Service Building), prepared by Carollo Engineers in 2017.

In Area 3, the proposed Project includes the reconfiguration and expansion of the spreading basins in order to accommodate the increased diversion of stream flows for infiltration into the Raymond Basin. Existing Ponds 1 and 2, and Basins 1 and 2, would be replaced with Basin A and six new/expanded spreading basins. Stream flows from the existing conveyance system would outlet to the new sedimentation basin (Basin A) or to new spreading Basin E located over the existing Pasadena Pond 1. Basin F would be adjacent to mature trees to be preserved and would be located at the site of the existing Pasadena Pond 2. Basins G, H, and I would be located at the site of the existing Basins 1 and 2 and a portion of the City's open area (i.e., former JPL East Parking Lot). Each new basin would have

an access ramp for maintenance. Rock boulders would be placed along the western edge of Explorer Road to separate the roadway from the adjacent basins. With the area's sloping terrain, depths of the basins would range from 3 feet to 7 feet. When spreading water, the water depth in the basins would be approximately 1 foot. All basins would include inlets/outlets with 24-inch interconnection pipelines. Spillways, pipelines, culverts, and valves would be provided to connect the basins to each other. Basin J would be the last newly constructed basin located entirely within the former JPL East Parking Lot, which would include interconnection pipelines into the existing Basin 3. Other basins downstream of Basin 3 are not a part of the proposed Project, although Basin 4 may be temporarily impacted during construction.

Area 3 construction would begin with the removal of existing pipelines and structures in proximity to Pond 1, including the inlet/outlet structures, concrete dry vaults, woodsheds, flow meter, gauging station, aluminum pipe tank and pad, connecting pipes and valves, PWP light poles, and chainlink fencing. Removal of these structures and facilities was fully evaluated and approved through the 2015 IS/MND. The SCE electrical transmission tower would not be impacted by construction activities, although construction activities would occur within the SCE easement.

The existing 30-inch-diameter conveyance system pipeline would be connected to a new 24-inch-diameter pipeline to Basin A (sedimentation basin). A 12-inch pipeline would also be constructed from a tee on the 24-inch line to bypass Basin A when maintenance of the basin is needed. Downstream of Basin A, the 24-inch pipeline would daylight to an open channel with a Parshall Flume that would be used to meter flows entering the spreading basins starting at Basin E. Each basin would include a 48-inch inlet structure connected via 24-inch outlet pipeline, which would connect Basins E to F to G to H to I to J, and then connect to existing Basin 6. Riprap made of quarry stones (not cobbles) would be constructed at the location where the 24-inch pipeline outlets into each spreading basin (see Appendix B-2).

As the pipeline construction is completed, excavations for the new spreading basins would begin, especially in the areas abutting the new Explorer Road alignment. The amount of excavated soils (from the spreading basin construction) to be hauled off-site would be minimized by raising the elevation of the access road and the new parking lot. After the pipeline work, the new Explorer Road alignment, which was fully evaluated and approved through the 2015 IS/MND, would be built along the eastern edge of Area 3. When this road is completed, the existing temporary access road would be removed and construction of the spreading basins would continue. During these improvements, JPL employees and their visitors would have access through Area 3 to enter JPL using the existing temporary access road or the new Explorer Road alignment in Area 3.

Upon completion of construction activities, all temporary fencing, flagging, signage, soil stockpiles, and/or mobile and stationary construction equipment would be removed from Area 3.

Long-Term Operational Activities

No new employees are required for the long-term operation or maintenance of the Project components in Area 3. Upon completion of construction activities, the long-term maintenance of the spreading basins would be dependent upon the amount of diversion from Area 2 and the need to restore percolation rates due to the amount of sediment that accompanies these flows. PWP typically scrapes and tills the existing spreading basins about once per year, which is anticipated to generally reflect the proposed ongoing maintenance schedule. When necessary, cleaning of the spreading basins in Area 3 would continue to be accomplished by mechanically scraping the top layer of soil using front-end loaders, graders, or scrapers. Following removal, the surface would be disked or harrowed to loosen any soil compaction caused by cleaning. An estimated 100 truckloads of soil from the existing and proposed

spreading basins would have to be disposed of off-site approximately every 5 years (approximately 20 trucks per year), which is reflective of current maintenance activities.

As described in Section 2, Environmental Setting, through the Settlement Agreement, it was agreed that the City shall have the right to perform maintenance activities, including tilling and grading of the existing spreading basins to re-establish historical percolation rates and maintenance activities that involve negligible or no expansion of use. As discussed, the construction and operation of the sedimentation basin (Basin A) was also approved through the 2015 IS/MND. Currently, PWP operates and maintains approximately 13 acres of spreading basins in Area 3. With the proposed Project, the approximate area of spreading basins would be increased to 15.7 acres, or an additional 2.7 acres of spreading basins to be maintained. The periodic scraping and tilling of these additional acres beyond the current condition is expected to be offset by the reduced need to scrape and till the basins overall, as sediment deposition within the basins would be reduced with the proposed Project due to the new design and Basin A, which would capture and settle out the majority of the sediment from the diverted Arroyo Seco flows prior to entering the spreading basins.

As discussed above, the City can divert an average of 2,045 acre-ft/yr under current conditions. Under the proposed Project conditions (i.e. diverting up to 25 cfs for storm flows <100 cfs), the City could divert approximately 3,080 acre-ft/yr; therefore, the Project would add approximately 1,035 acre-ft/yr of diverted flows into the spreading basins for the beneficial use of the City's water rights.

All proposed spreading basins within Area 3 would be operated by gravity and would not require any new pumps or facilities that require the use of electricity or natural gas. As such, no substantive changes to ongoing operations and/or maintenance activities are anticipated.

3.1.3 Gabrielino Trail and Bridge Crossings

Short-Term Construction Activities

The Gabrielino Trail (i.e., North Arroyo Boulevard) runs generally parallel to the Arroyo Seco and along the eastern side of the former JPL East Parking Lot and serves as a recreation trail for hikers and equestrian uses. It also serves as a maintenance access road that leads to the Behner WTP and into the Arroyo Seco Canyon area to provide access for PWP and the USFS. During construction activities, the Gabrielino Trail/Access Road would provide for vehicular access to and from Area 2, and sometimes Area 3, although Explorer Road would be the primary access road for Area 3. As shown in Section 2, Environmental Setting, on Figure 2-4A, three bridges along the Gabrielino Trail/Access Road cross portions of the Arroyo Seco. Bridge Nos. 1, 2, and 3 are located between Areas 2 and 3, respectively.

Bridge No. 1 is a culvert-style bridge with concrete slab deck over Millard Creek, approximately 0.13-mile north of the JPL Bridge. As previously discussed, the 2015 Bridge Condition Assessment found that the bridge abutments were being undermined due to scouring and that the Gabrielino Trail/Access Road had sloughed off in sections and that a temporary bridge was required (TJC 2015). Therefore, a temporary structural overlay bridge spanning the length of Bridge No. 1 was constructed in 2017 to accommodate the loading from heavy equipment needed during construction of the Arroyo Seco Canyon Project that would be beyond the capacity of the original bridge. This temporary structural overlay bridge would remain in place throughout construction activities in Area 2. Upon completion of the ASCP construction activities, the temporary structural overlay bridge would be removed from Bridge No. 1.

Bridge No. 2 is located approximately 130 feet north of Bridge No. 1 and is a reinforced concrete arch bridge with decorative cast-concrete railing. The July 2015 Bridge Condition Assessment found that Bridge No. 2 was in good condition and that no significant cracks that would be detrimental to the structural integrity of the bridge were identified. This bridge was determined to be able to support a 52,000-pound load (e.g. 8-cubic yard concrete truck) and no temporary bridge would be required (TJC 2015).

Bridge No. 3 is located approximately 0.34-mile north of the JPL Bridge just south of the boundary of Area 2. The 2015 Bridge Condition Assessment found that several members of Bridge No. 3 are damaged including the bridge timbers stringers, lateral bracing steel rods, and handrail posts. For Bridge No. 3, the Assessment determined that the existing 4 x 18-inch bridge stringers would not be able to carry construction equipment without permanent shoring of the bridge, and that a temporary bridge was required (TJC 2015). Therefore, a temporary structural overlay bridge spanning the length of Bridge No. 3 was constructed in 2017 to accommodate the loading from heavy equipment needed during construction of the Arroyo Seco Canyon Project. This temporary structural overlay bridge would remain in place throughout construction activities in Area 2.

Additionally, stone masonry walls line the east side of the Arroyo Seco at Bridge No. 2 and continue upstream to Bridge No. 3. The stone masonry walls would not be altered by Project activities. As previously discussed, the Screen Building adjacent to Area 2 and the Behner WTP adjacent to Area 3 would be used for temporary construction materials and equipment staging only. No impacts or construction activities would occur at these facilities.

During construction of the proposed Project, there may be times when portions of the Altadena Crest Trail, Gabrielino Trail/Access Road, Arroyo Seco Trail, and the unnamed trails/maintenance roads would be partially or fully closed to the public due to construction activities.

- North Arroyo Boulevard, which is a gated maintenance road that leads from the intersection of Ventura Street and Windsor Road northward to the JPL Bridge, would be a primary corridor for construction truck traveling to and from Area 2, and may also be used for activities within Area 3. Portions of this roadway may be closed during construction to minimize the proximity of construction trucks and equipment movement with recreational users.
- The Gabrielino Trail/Access Road, which is the northward the extension of North Arroyo Boulevard, would be a primary corridor for construction equipment and haul trucks to access Area 2. Portions of this access road may be closed during construction to minimize the proximity of construction trucks and equipment movement with recreational users, as well as during construction on the roadway associated with Arroyo Seco Canyon Project (ASCP) improvements, as described further in Section 4.7.6 below.
- The Arroyo Seco Trail and unnamed trails located adjacent to the existing spreading basins would be temporarily closed during construction of the new basin configuration and would also permanently realigned around the perimeter of the new basins and along the realignment of Explorer Road, as discussed further below. The portions of the unnamed trails within the construction footprint in Area 3 would be fully closed during short-term construction activities, and would not reopen until the completion of construction in Area 3, as described further below under “Long-Term Operational Impacts”.

While the trails would be kept open during construction to the extent possible, there would be days when construction equipment and haul trucks would be on and/or near the trails. Upon completion of construction activities, all temporary fencing, flagging, signage, soil stockpiles, and/or mobile and stationary construction equipment would be removed from the staging areas.

Long-Term Operational Activities

A structural evaluation of Bridge No. 3 was conducted in 2018, subsequent to the placement of the temporary structural bridge overlay, which determined that the condition of Bridge No. 3 continues to deteriorate and is no longer safe for use (TJC 2018). Upon completion of the proposed Project, the City intends to keep the Bridge No. 3 overlay structures as-is, with the understanding that the reconstruction/replacement of Bridge No. 3 may eventually be required if the City wishes to maintain the bridge. The temporary structural bridge overlay was constructed to allow transport of heavy equipment and materials during the ASCP construction; however, its continued presence provides for the safe passage of vehicles and pedestrians along the Gabrielino Trail/Access Road and to the USFS facilities. Additionally, the temporary structure allows access to large vehicles, including fire trucks, that were previously restricted due to the loading limitations of the original bridge even before it was damaged. The temporary structure spans the existing bridge abutments; therefore, its structural integrity is not impacted by the deteriorating structural integrity of Bridge No. 3. Since the temporary structure is constructed of steel elements and concrete, and will experience relatively light traffic, its expected service life is estimated to exceed 50 years. There may be safety risks associated with the continued deterioration of Bridge No. 3 if structural members fail and fall, and therefore the City may need to remove dangerous elements to protect public safety.

Because there are no plans for the future reconstruction/replacement of the Bridge No. 3 at the time of the preparation of this Draft EIR, it is anticipated that the existing bridge may continue to deteriorate, and although not anticipated at this point, may even be removed to protect public safety. Therefore, this Draft EIR anticipates the impacts of the continued use of the temporary bridge structure over Bridge No. 3, and the continued deterioration of the existing Bridge No. 3, into the foreseeable future, and perhaps even its eventual removal or potential removal of dangerous elements. Whether and when reconstruction/replacement of Bridge No. 3 would take place is unknown, and it is unknown whether the new bridge would be constructed in such a manner that would allow for its preservation as a historical resource. The retention of the bridge overlay deck into the foreseeable future would not require any additional construction activities, as the structure is currently fully functional and secured.

Given the history of wildfires in the region, and specifically within the San Gabriel Mountains and Arroyo Seco subwatershed that leads to the Project site, PWP will keep in place the current overlay bridge and will not repair or rehabilitate the historic Bridge No. 3, because the current overlay bridge can accommodate firefighting equipment and large fire trucks into the Arroyo Seco Canyon and the ANF. It is anticipated that the historic Bridge will continue to deteriorate, and as a result PWP will need to remove dangerous elements of the historic Bridge (rotting timbers failed joists, for example) and even partially or fully demolished to protect public safety as it continues to deteriorate.

Upon completion of the proposed Project, the temporarily disrupted trail network would be restored. The proposed Project would restore connections with the alignments of the Altadena Crest Trail and the Arroyo Seco Trail. These trail connections are discussed in Section 4.7, Recreation.

No new employees would be required and no long-term operational changes would occur related to the maintenance of the Gabrielino Trail/Access Road or the existing bridges.

3.2 Project Purpose and Objectives

As described above, the City owns the right to divert up to 25 cubic feet per second (cfs) of surface water from the Arroyo Seco for direct use or for spreading into its existing spreading basins for groundwater pumping credits from the Raymond Basin. Of the total amount of water that is infiltrated into the groundwater through the existing spreading basins, PWP has the right to pump between 60- to 80% of that amount for beneficial use in the City's water supply. According to PWP, the current spreading basins reach an equilibrium during recharge events of 18 cfs, meaning that sustained diversions equaling 18 cfs would fill the basins to capacity, with water percolating at generally the same rate as entering the basins; however, higher flows beyond 18 cfs would not be able to be infiltrated due to capacity constraints (Carollo Engineers 2013). Dividing this 18 cfs recharge capacity by the surface area of the existing spreading basins (approximately 13 acres), the basins exhibit an average percolation rate of 2.72 feet per day (ft/d), or 1.4 cfs/acre.

Improvements in the intake structure, however, would allow for diversion of PWP's right to 25 cfs during high flows, which would be an improvement upon the current structure that requires high flows to bypass the diversion/intake structure because of the previous damage to the facility and the inability to remove sediment and debris prior to entering the spreading basins. The proposed Project's Area 3 configuration includes a maintainable sedimentation basin (Basin A) located prior to the entry of flows into the spreading basins. This improvement upon the current design would substantively reduce sediments in the spreading basins that settle on the ground surface of the basin and decrease infiltration rates.

Based on the data gathered from the USGS gaging station from 1990 through 2019, the average in-stream flows are 6,890 acre-ft/yr. Using these years of data to represent the current condition of diverting when stream flows are 25 cfs or less, the City diverts an average of 2,045 acre-ft/yr. As previously discussed, the City would be able to divert approximately 3,080 acre-ft/yr, resulting in approximately 1,035 acre-ft/yr of additional diverted flows into the spreading basins. These proposed increased diversions would result in a measurable increase in diversion only during larger wet-weather flows. There would be little to no difference in diversions between the current condition and the proposed Project during the drier periods of the year. In summary, the proposed Project elements would increase Arroyo Seco diversion almost exclusively during wet winter months with high stream flows because the threshold for diverting is increased.

3.2.1 Increase Reliability of Local Water Supplies

In the two storm seasons following the 2009 Station Fire[2], excessive amounts of sediment washed down from the watershed. The debris flows damaged City structures, greatly reducing the City's capacity to divert water for spreading. As a result, PWP proposes to repair and replace damaged facilities in the Upper Arroyo Seco Canyon as a part of the proposed Project. The proposed Project's improvements would allow for increased utilization of the City's surface water rights from the Arroyo Seco and maximize the beneficial uses of this important local water resource. The proposed Project would implement a multi-benefit approach to the repair and replacement of damaged infrastructure in the Arroyo Seco, with the overall Project objective of increasing the beneficial use of the surface water rights held by the City and improving biological functions within the Arroyo Seco. For any future fish populations that may establish

[2] In 2009, the Station Fire burned 160,000 acres in the San Gabriel Mountains including the Project site.

in the Arroyo Seco, the new intake would include a fish screening feature to prevent fish populations from passing into the intake and conveyance system, and a roughened channel would be constructed directly downstream of the new weir to allow for future fish passage upstream during moderate flow periods.

The City's General Plan Open Space and Conservation Element sets forth objectives related to the use of water resources in the City (City of Pasadena 2012). The proposed Project supports these objectives, as follows:

- Increase the efficiency of water use among Pasadena residents, and commercial and industrial organizations.

The proposed Project would facilitate the efficient use of water in the Arroyo Seco by allowing for the full utilization of the City's surface water rights and reducing reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD). PWP has a longstanding right to divert up to 25 cfs from this source. MWD imports water from the Sacramento-San Joaquin Delta via the State Water Project, and from the Colorado River. In recent years, MWD has imposed allocation limits on its water supply deliveries to its member agencies, and the future reliability of imported water will continue to face uncertainties from climate change, environmental regulations, and droughts. Another important issue associated with imported water is cost, which has increased substantially in the past few years (City of Pasadena 2012). Achieving water supply reliability will depend on a number of key water policy and management decisions on a regional and local level, including implementation of projects such as the proposed Arroyo Seco Canyon Project Areas 2 and 3.

- Protect local water supply sources and plant trees and vegetation that are consistent with habitat and water conservation policies.

The proposed Project would facilitate the protection of local water supply sources by improving the ability of the diversion weir and intake structure to capture water during high-flow storm events. It has been PWP's practice in the past (more so after floods following the Station Fire damaged the upstream settling basins) to bypass water from high-flow storm events when the water is sediment-laden and turbid in order to protect the existing infrastructure from damage. The proposed Project would include improvements to the diversion weir and intake structure to better accommodate turbid waters in high-flow events, as well as improvements to the capacity of the spreading basins, both of which would facilitate increased availability and use of local water supply sources.

- Improve surface permeability and recharge aquifers/enhance storm water quality to prevent pollution/trash from entering Los Angeles and San Gabriel Rivers and ocean.

The proposed Project would improve the functionality and efficiency of the facilities responsible for the diversion and infiltration of water into the Raymond Basin. PWP has in the past forfeited available water due to the lack of spreading capacity within the spreading basins (Carollo Engineers 2013). The increased capacity and efficiency of the spreading basin improvements in Area 3 (which includes a new sedimentation basin for sediment to settle out before water is directed to the spreading basins) would maximize capacity and infiltration rates, thereby improving the recharge of groundwater supplies.

3.2.2 Implementation of Components of Hahamongna Watershed Park Master Plan

The proposed Project would either implement or not hinder the implementation of improvements set forth in the Hahamongna Watershed Park (HWP) Master Plan within the Project area. The study area for the HWP Master Plan includes the area below the JPL Bridge, which includes Area 3 of the proposed Project (City of Pasadena 2003, 2010).

Table 3-1, Hahamongna Watershed Park Area 5A Water Resource and Associated Improvements, identifies the proposed Project's consistency with the HWP Master Plan Improvements identified for the proposed Project Area 3.

Table 3-1. Hahamongna Watershed Park Area 5A: Water Resource and Associated Improvements

HWP Master Plan Improvements for Area 5A	Arroyo Seco Canyon Project Areas 2 and 3 (Proposed Project)
Remove the southern ¾ of the east JPL parking lot.	Not Applicable. The parking lot was removed in 2016.
Relocate and improve water conservation distribution system (diverted and pumped-back storm water).	Not Applicable. However, implementation of the proposed Project would not conflict with, or hinder implementation, of this improvement.
Construct the Eastside Spreading Basins Project including expanded spreading basins 1 through 4, two new basins, and relocated sludge ponds 1 and 2.	Applicable. The proposed Project would implement this proposed improvement.
Complete the pump-back system from the dam area to the spreading basins.	Not Applicable. However, implementation of the proposed Project would not conflict with, or hinder implementation, of this improvement.
Construct the overall storm drain modification improvements, including the Altacrest Drain improvements and drainage improvements in the Interpretive Area.	Not Applicable. However, implementation of the proposed Project would not conflict with, or hinder implementation, of this improvement.
Implement the Habitat Establishment Project at the eastside spreading basins from the remaining northern parking lot south to Johnson Field.	Not Applicable. However, implementation of the proposed Project would not conflict with, or hinder implementation, of this improvement.
Convert the northern ¼ of the east JPL parking lot to public parking and restore and establish habitat in this area.	Not Applicable. However, this improvement has already been approved under the previous ASCP 2015 IS/MND.
Construct a sewer lift station and force main across the JPL bridge to JPL's sewer system and underground the power to the site for the new public restroom.	Not Applicable. However, this improvement has already been approved under the previous ASCP 2015 IS/MND.
Construct a new public restroom at the north end of the east lot; install eastside picnic amenities on the west side of the Stream Corridor Alignment Habitat Project and at the new public restroom. These improvements will be made when specific need and locations are identified.	Not Applicable. However, the restroom improvement has already been approved under the previous ASCP 2015 IS/MND. Although the remaining improvements are not applicable to the proposed Project, implementation of the proposed Project would not conflict with, or hinder implementation, of this improvement.

Source: City of Pasadena 2003

3.2.3 Project Objectives

Section 15124 of the State CEQA Guidelines requires the Project Description of an EIR to include a statement of the objectives sought by the proposed Project, which is intended to help the Lead Agency to develop a reasonable range of alternatives to evaluate in the EIR and the preparation of Findings of Fact and a Statement of Overriding Considerations, if necessary. The statement of objectives may include the Project benefits. The objectives that have been established for the proposed project are listed below.

1. Fully divert and utilize the City's 25 cubic feet per second surface water rights while operating in a manner objectively consistent with the Raymond Basin Agreement and the 1984 Judgment.
2. Increase the capacity and functionality of the spreading basins to increase PWP's ability to recharge the groundwater basin, as envisioned by the 2011 Water Integrated Resources Plan with its recommendation to maximize the value of the groundwater basin and non-potable supplies.
3. Provide opportunities for increased aquatic biological functions within the Arroyo Seco by: (1) protecting fish and eliminating the unimpeded passage of stream flows that could carry aquatic animals into the conveyance system, and (2) reducing existing impediments to fish passage at the diversion weir structure.
4. Increase PWP's ability to rely upon local water for its potable water supply to reduce reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD).

3.3 Project Construction

Construction of the Project improvements would be phased, with construction in Area 2 requiring approximately 3 months (August 2021 through October 2021), and construction in Area 3 requiring approximately 9 months (March 2022 through November 2022). In the interest of minimizing the export of excavated materials from the Project site, the City may implement a mechanical shaker to sort and sift through excavated soils to separate finer soils from larger rocks, thereby allowing for the beneficial reuse of some excavated materials as engineered fill during the construction of the spreading basins. Rock materials may be used on-site for decorative/landscaping purposes throughout the Project study area, added to an existing stockpile that has been created by the City in an area along the west bank of the Arroyo Seco for future uses, or may be exported off-site. For the purposes of assessing a conservative construction scenario, this Draft EIR assumes that all excavated materials would be exported off-site and also accounts for the possible noise generated by use of a mechanical shaker (see Section 5.6, Noise).

Construction trucks hauling soils and debris generated by construction activities are anticipated to drive to and from Vulcan Materials Company landfill located at 13000 East Los Angeles Street in the City of Irwindale, which is approximately 18 miles from the Project site. Haul trucks and equipment deliveries are expected to come to the Project site from I-210 at the Windsor Avenue westbound off-ramp and head north on Windsor Avenue to the intersection with Ventura Street. At this intersection is a fork in the road, one leading to Explorer Road into Area 3 and the other leading to the gated North Arroyo Boulevard, which passes adjacent to residential properties and the Behner WTP. North of the JPL Bridge, North Arroyo Boulevard (the Gabrielino Trail/Access Road) would be used for construction vehicles and equipment transport to and from Area 2. Explorer Road and potentially North Arroyo Boulevard would be used to access Area 3.

For the disposal of excavated soils, it is expected that haul trucks from the Project site would head eastbound on I-210 via eastbound ramps at Windsor Avenue; exit at the I-605 southbound off ramp at Lower Azusa Road/Los

Angeles Street; head east towards the Vulcan Materials Company landfill. Trucks would come back from the landfill entering the northbound on-ramp on the I-605 at Los Angeles Street and head north; trucks would then go west on I-210 to Windsor Avenue to Explorer Road and then to the Project site. As shown in Table 3-2, Estimated Construction Schedule, construction of the proposed Project would be phased.

Table 3-2. Estimated Construction Schedule

	2021				2022			
	Quarters per Year							
Year/Quarter	*1*	*2*	*3*	*4*	*1*	*2*	*3*	*4*
Area 2

Area 3								
Site Prep and Demolition					♦	♦		
Grading and Excavations						♦	♦	
Building Construction							♦	
Paving/Architectural Coating							♦	♦

As previously described in Section 2, Environmental Setting, all activities within Area 1, Headworks, were entirely evaluated within the 2015 IS/MND and allowed to proceed without additional environmental review pursuant to the Settlement Agreement. As such, the construction of planned improvements within Area 1 is not a part of this proposed Project, as evaluated in this Draft EIR. Improvements in Area 1 are considered to be a cumulative project, as discussed in Section 3-5 below.

3.4 Discretionary Actions

Table 3-3 lists all the agencies that are known or expected to have permit or approval authority over the proposed Project. This Initial Study covers all federal, state, local government, and quasi-government approvals that may be needed to construct, implement, or operate the Project, whether or not they are specifically identified in Table 3-3 or elsewhere in this Draft EIR.

Table 3-3. Agency Approvals and Requirements

Agency	Approval/Permit Required	Purpose	Notes
Lead Agency			
City of Pasadena	Project Approval	Approve the proposed Project and allocate City funds.	--
	Conditional Use Permit No. 6222 Modification	Allow for utility improvements in the Open Space zone	In compliance with the City's Zoning Code
	Tree Removal Authorization	Allow removal of trees in areas to be disturbed	In compliance with City's Trees and Tree Protection Ordinance
Responsible Agencies			
U.S. Army Corps of Engineers (USACE)	Section 404 Nationwide Permit	Allow the discharge of dredge and fill material into "waters of the United States."	Nationwide Permit (NWP) required for temporary and permanent disturbance of Arroyo Seco in Area 2
Los Angeles Regional Water Quality Control Board (RWQCB)	Section 401 Water Quality Certification	Protect water quality within "waters of the United States."	Water Quality Certification required for temporary and permanent disturbance of Arroyo Seco in Area 2 and for temporary impacts due to spreading basin expansion in Area 3
California Department of Fish and Wildlife (CDFW)	Section 1600 Streambed Alteration Agreement	Authorize changes to the natural flow or the bed, channel, or bank of any river, stream, or lake and associated impacts to biological resources.	Streambed Alteration Agreement required for temporary and permanent disturbance of Arroyo Seco in Area 2 and for temporary impacts due to spreading basin expansion in Area 3
Los Angeles County Flood Control District	Encroachment Permit	Authorize construction activities within the Altadena Storm Drain Easement	--

3.5 Cumulative Impacts

3.5.1 Cumulative Approach

The CEQA Guidelines require that an EIR discuss cumulative impacts of a project, taken together with other past, present, and probable future projects producing related impacts. The goal of this analysis is twofold: first, to determine whether the impacts of all such projects would be cumulatively significant; and, second, to determine whether the project would itself cause a "cumulatively considerable" (and thus significant) incremental contribution to any such cumulatively significant impacts. The definition of cumulatively considerable is provided in Section 15065(a)(3) of the CEQA Guidelines: "'Cumulatively considerable' means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects."

CEQA Guidelines Section 15130(b) provides the following parameters relative to cumulative impact analysis:

> The discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. The discussion should be guided by standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified related projects contribute, rather than the attributes of other projects which do not contribute to the cumulative impact.

CEQA Guidelines Section 15130 allows for the use of two alternative methods to determine the scope of projects to analyze cumulative impacts.

- List Method: A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or
- Projection Method: A summary of projects contained in an adopted general plan or related planning document, or in a prior environmental document, that have been adopted or certified, which describe or evaluate regional or area-wide conditions contributing to the cumulative impact.

This Project proposes to use both the list method and the projection method, as applicable for each environmental topic as presented in this Draft EIR.

The geographic area that could be affected by implementation of a proposed project in combination with other projects varies depending on the type of environmental resource being considered. For instance, cumulative noise impacts are more localized; whereas, cumulative air quality and greenhouse gas emissions impacts occur on a broader regional or global scale. Table 3-4 describes the geographic scope of cumulative impact analysis for each environmental resource category, as well as the method of evaluation for each category.

Table 3-4. Geographic Scope and Method of Evaluation for Cumulative Impacts

Environmental Resource		Geographic Area	Method of Evaluation
Air Quality	Toxic Air Contaminants; Odors	Immediate vicinity	List and Projections
	Construction/Mobile Sources	South Coast Air Basin	
Biological Resources		Regional	List and Projections

Table 3-4. Geographic Scope and Method of Evaluation for Cumulative Impacts

Environmental Resource		Geographic Area	Method of Evaluation
Cultural Resources		Regional	List
Greenhouse Gas Emissions		South Coast Air Basin	Projections
Hydrology and Water Quality		Arroyo Seco Sub-Watershed	List and Projections
		Raymond Groundwater Basin	
Noise	On-Site Construction Noise	Immediate vicinity	List and Projections
	Off-Site Truck Noise	Immediate vicinity	
Recreation		Immediate vicinity	List
Transportation		Regional	List and Projections
Tribal Cultural Resources		Regional	List and Projections

For the purposes of this Draft EIR, the proposed Project would have a significant cumulative effect if:

1. The cumulative effects of related projects (past, current, and probable future projects) are already significant and implementation of the proposed Project makes a considerable contribution to the effect; or
2. The cumulative effects of related projects (past, current, and probable future projects) are not significant but the incremental impact of implementing the proposed Project is substantial enough, when added to the cumulative effects of related projects, that a new a new cumulatively significant impact occurs.

The analysis in Sections 4.1 through 4.9 of this Draft EIR addresses whether, after adoption of Project-specific mitigation, the residual impacts of the proposed Project would (1) contribute considerably to an existing/anticipated (without the project) cumulatively significant effect or (2) cause a new cumulatively significant impact. A cumulative impact is not considered significant if the impact can be mitigated to below the level of significance through mitigation. The EIR must examine "reasonable options for mitigating or avoiding any significant cumulative effects of a proposed project" (14 CCR 15130(a)(3) and 15130(b)(5)).

3.5.2 List of Cumulative Projects

The cumulative projects outlined below were chosen based on direction from the City. The cumulative project list was developed for the purposes of this EIR analysis through consultation with planning and engineering staff from the City of Pasadena to include key projects in their respective jurisdictions. Figure 3-5, Cumulative Projects, shows geographically where the cumulative projects are located in comparison to the proposed Project. The cumulative projects listed below serve as the foundation on which the cumulative analysis approach has been based in Sections 4.1 through 4.9 of this Draft EIR. The five (5) cumulative projects are summarized below:

Previously Approved Components of Arroyo Seco Canyon Project (ASCP). The Final IS/MND for the ASCP (January 2015) analyzed environmental impacts as a result of the proposed three areas of improvements along the upper Arroyo Seco, which involve restoration of a portion of the Arroyo Seco, reconstruction of surface water diversion facilities, expansion of spreading basins, and construction of recreational and educational amenities (Areas 1 through 3). PDFs were proposed to minimize or avoid environmental impacts to aesthetics, air quality, geology and

soils, greenhouse gas emissions, hydrology and water quality, land use and planning, mineral resources, noise, public services, and utilities and service systems. In the Final IS/MND, mitigation measures were proposed for potentially significant project impacts to biological resources, cultural resources, hazards and hazardous materials, recreation, and transportation/traffic. The Final IS/MND determined that implementation of proposed mitigation would reduce all potentially significant impact to less than significant levels.

This project was challenged in July 2015, and in June 2017 the Los Angeles Superior Court found that elements of the ASCP that related to increased diversions of surface water (proposed Areas 2 and 3) required evaluation through the preparation of an EIR. The Court ruled that the elements of the ASCP that did not relate to increased diversions were severable from the remainder of the ASCP, complied with CEQA, and did not require further environmental review. These approved components include:

- Area 1, Arroyo Seco Headworks: All ASCP elements.
- Area 2, Arroyo Seco Intake: Access road improvements and related slope reconstruction and protective riprap elements.
- Area 3, JPL East Parking Lot: All ASCP elements, except the expansion of 4 existing spreading basins and the construction of 2 new spreading basins. Specifically, the components of the ASCP IS/MND allowed to proceed include the parking lot, access road, sedimentation basin, demolition of existing structures and pipelines, new pipelines, new public restroom, new security booth and associated utility services (water, sewer, power, and communication lines), and topics related to the existing groundwater contamination associated with the JPL site listing on hazardous materials sites compiled pursuant to Government Code Section 65962.5.

Additional details related to these non-Project components are included in Appendix A-4, 2015 Final ASCP Initial Study/Mitigated Negative Declaration.

Devil's Gate Reservoir Sediment Removal and Management Project. The goal of this project is to restore and maintain flood capacity at Devil's Gate Reservoir to meet its intended level of flood protection for the communities downstream. This project involves a sediment removal plan to restore flood capacity and establish a reservoir management system to maintain the flood control capacity of the reservoir. The project is located within Hahamongna Watershed Park in the City of Pasadena. The Final EIR for the project was adopted by the County of Los Angeles Board of Supervisors on November 12, 2014. The Los Angeles County Flood Control District (LACFCD) began sediment removal activities in the Devil's Gate Reservoir in 2019, and sediment removal and placement is expected to continue through Fall 2022. Habitat restoration is scheduled to occur over a 5-year period between Fall 2018 and Fall 2023, with ongoing reservoir and habitat maintenance after 2023 (Los Angeles County Department of Public Works 2020).

In the analysis undertaken for the Initial Study for this project, several issue areas pursuant to CEQA were determined not significant, including agricultural and forest resources, population and housing, and public services. The analysis undertaken for the Draft EIR for this project determined that impacts to geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, public services, recreation, and utilities and service systems were less than significant. The analysis undertaken for the Final EIR for this project determined that impacts to air quality, biological resources, cultural resources, land use and planning, and noise could be mitigated to a level of less than significant. Unmitigable significant impacts as a result of the project include significant unavoidable impacts to aesthetics, and temporary significant impacts to traffic/transportation. For aesthetics, there is no feasible mitigation to reduce impacts

to scenic vistas and impacts to visual characteristics as a result of sediment removal activities during the sediment removal phase. For impacts to transportation and traffic, implementation of proposed mitigation would reduce impacts to haul route intersections, intersection level of service, public transportation using the existing roadway network, and cumulative transportation impacts; but not to a level of less than significant (Los Angeles County Department of Public Works 2014).

Oak Grove Area Improvements (OGAI) Project. The OGAI project geographically includes the western portion of Hahamongna Watershed Park from the Flint Wash Bridge, north, to the southern edge of the Hahamongna Annex area. There are five projects in the current Capital Improvement Program (CIP) with funding and that are located within the OGAI project area, including (1) Oak Grove Area Improvements, (2) Trail Development, (3) Berkshire Creek Area Improvements, (4) Habitat Restoration, and (5) Oak Grove Disc Golf Course Improvements (City of Pasadena Department of Public Works 2020). The Oak Grove Area Improvements was adopted as part of the Hahamongna Watershed Park Master Plan approval and is currently funded for the planning and design phase. The project will improve the area of the existing Oak Grove field, and may include a new restroom, improvements to vehicular and pedestrian circulation, rehabilitation of a drain, assessment of the disc golf course layout and improvements to the outdoor amphitheater. The City has not budgeted for the project beyond FY 2020, but should funding become available construction could occur as early as 2021, concurrent with the proposed Project.

In May 2019, an IS/MND was prepared for the Berkshire Creek Area Improvements project (project No. 3 of the CIP projects listed above under the OGAI project). Currently, there are no CEQA environmental documents prepared for the other OGAI projects. The Berkshire Creek Area Improvements project includes approximately 4.7 acres within the Oak Grove area, located at 4550 Oak Grove Drive. The primary goal of this project is to improve the ecological, hydrological, and recreational conditions throughout the lower third of the Oak Grove area. The IS/MND found that impacts to aesthetics, agriculture and forestry resources, air quality, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, traffic and transportation, utilities and service systems, and wildfire, would be less than significant with no mitigation required. The IS/MND found that impacts to biological resources, cultural resources, recreation, tribal cultural resources, would be less than significant with implementation of proposed mitigation. No impacts would be significant and unavoidable as a result of the Berkshire Creek Area Improvements project. This cumulative project was approved, construction began in September 2019, and was substantially completed in March 2020 (Arroyo Seco Foundation 2020).

LACFCD Pump back/Intake at Devil's Gate to Eaton Canyon. The LACFCD is planning a water conservation project at Devil's Gate Dam that involves the installation of a pump and intake structure at the upstream face of the Dam. The main objective of this project is to conserve stormwater by holding a reservoir pool behind Devil's Gate Dam and pumping the water to fill Arroyo Seco Spreading Grounds first prior to filling Eaton Wash Dam and Eaton Wash Spreading Grounds for post-storm groundwater recharge into the Raymond Basin. The portion of the project that included a five-mile pipeline from the pump easterly to Eaton Wash in order to divert water from the Dam for recharge at Eaton Wash was put on indefinite hold in 2017; however, the feasibility of maximizing stormwater capture and groundwater replenishment through a pipeline to the Arroyo Seco spreading grounds is being assessed. The concept for conveying water from Devil's Gate Dam upstream to the Arroyo Seco Spreading Grounds for recharge was included in the Devil's Gate Dam to Eaton Water Conservation Pipeline Study, Feasibility Report (March 2017), but a timeline for its implementation has not been identified. It is assumed that if the LACFCD moves forward with the project, it would be after the Devil's Gate Sediment Removal Project has been completed at the end of 2022 and, consequently, after completion of the ASCP Areas 2 and 3 (proposed Project). No environmental

documents under CEQA have been prepared for this cumulative project. However, it is stated in the Feasibility Study that no significant environmental impacts are anticipated for construction of the proposed pipeline alignments, as all construction would be within paved right-of-way. Each pipeline alignment alternative proposed would have temporary impacts related to noise, air quality, greenhouse gas emissions, traffic and public services during construction, and a more detailed environmental impact analysis would be required to develop mitigation measures to ensure these impacts are not significant, and in compliance with regulatory codes (County of Los Angeles 2017).

Explorer Groundwater Well. City of Pasadena Department of Water and Power continues to plan for the construction of a new groundwater well that would augment the existing municipal production wells in the area owned by the City of Pasadena (i.e. Arroyo Well, Well 52, Windsor Well, and Ventura Well) and utilize the Monk Hill Treatment System (MHTS) to remove target chemicals (e.g. perchlorate and volatile organic compounds [VOCs]) from the aquifer. Project activities are likely to include drilling and completion of a new groundwater well located just east of the spreading basins in Area 3 near the SCE Easement, new pipelines connections for transmitting well water to the MHTS, and the potential renovation of the Behner WTP to augment the water treatment capacity. This project could potentially be concurrent with ASCP Area 3 (proposed Project) construction in 2022. Currently, there is no CEQA environmental document prepared for this project.

4 ENVIRONMENTAL IMPACT ANALYSIS

This Section provides an overview of the subsections format found in Section 4 of this Draft Environmental Impact Report (EIR) (Sections 4.1 through 4.9). For the purpose of this Environmental Impact Report (EIR), the Appendix G Guidelines of the California Environmental Quality Act have been used as the basis for the environmental issue area analyses.

Impact Analysis Format

The purpose of this Draft EIR is to evaluate the potential environmental effects of the proposed Project. Environmental topic areas outlined in Sections 4.1 through 4.9 of the Draft EIR were determined to be the applicable and appropriate topics to analyze in the Draft EIR, as identified through the Initial Study, which was prepared and circulated with the Notice of Preparation (NOP) and included in Appendix A-1 of this Draft EIR. Section 2.4 in Section 2 of this Draft EIR, discusses the environmental effects found not to be significant as a result of the Project. The Initial Study for the Arroyo Seco Canyon Project Areas 2 and 3 concluded that the proposed Project would result in no environmental impacts or less than significant impacts to the topics of Aesthetics, Agricultural and Mineral Resources, Energy, Geology and Soils, Hazards and Hazardous Materials, Land Use and Planning, Mineral Resources, Population and Housing, Public Services, Utilities and Service Systems, and Wildfire. These environmental topics are analyzed as part of the 2015 IS/MND, and/or the 2019 Initial Study prepared for the Project and are not analyzed as part of this Draft EIR.

Topics that are brought forth for analysis in this Draft EIR include:

4.1 Air Quality
4.2 Biological Resources
4.3 Cultural Resources
4.4 Greenhouse Gas Emissions
4.5 Hydrology and Water Quality
4.6 Noise
4.7 Recreation
4.8 Transportation
4.9 Tribal Cultural Resources

The Draft EIR assesses how the Project would impact each of these issue areas, and the mitigation required to reduce potential impacts. Each environmental issue addressed in Sections 4.1 through 4.9 is presented in terms of the following subsections:

- **Methodology** – This subsection describes the methodology used in preparation of the impacts analysis, including existing resources, technical data, applicable laws and guidelines, or specific technical reports prepared for the Project.
- **Existing Conditions** – This subsection describes the physical environmental conditions in the vicinity of the proposed Project at the time of publication of the NOP. The existing conditions establishes the baseline conditions by which the City will determine whether specific Project-related impacts are significant.

- **Relevant Plans, Policies, and Ordinances** - This subsection describes the laws, regulations, ordinances, plans, and policies applicable to the environmental issue area and the proposed Project.
- **Thresholds of Significance** – This subsection identifies a set of thresholds by which the level of impact is determined.
- **Environmental Impacts Analysis** – This subsection provides a detailed analysis regarding the environmental effects of the proposed Project, and whether the impacts of the Project would meet or exceed the thresholds of significance.
- **Cumulative Impacts** – Provides an evaluation of the potential cumulative impacts of the Project in combination with identified related projects.
- **Mitigation Measures** – This subsection identifies potentially feasible mitigation measures that would avoid or substantially reduce significant adverse project impacts.
- **Level of Significance After Mitigation** – This subsection discusses whether Project-related impacts would be reduced to below a level of significance with implementation of the mitigation measures identified in the Draft EIR. If applicable, this subsection also identifies any residual significant and unavoidable adverse impacts of the proposed Project that would result even with implementation of any feasible mitigation measures.
- **References** – This subsection outlines all references cited throughout the EIR Section.

4.1 Air Quality

4.1.1 Methodology

This section describes the existing conditions of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Project. The analysis of the Project impacts related to air quality is based on:

Appendix C CalEEMod Data, February 2020.

Although not a part of the proposed Project, there are specific components in Area 2 that are approved to move forward without additional environmental review that are included in this EIR section and in the California Emissions Estimator Model (CalEEMod) construction assumptions. The improvements to be conducted in Area 2, which have been previously approved to proceed in accordance with the 2015 ASCP MND, include:

1. Removal of existing K-rails along an approximate 150-foot-long segment of the Gabrielino Trail/Access Road between Bridge No. 3 and the intake structure;
2. Stabilization and repaving of the Gabrielino Trail/Access Road with asphalt and would be sloped to direct surface runoff away from the stream towards the hillside; and,

These non-Project improvements are included in the CalEEMod assumptions because their construction is anticipated to occur simultaneously with the proposed Project improvements, likely using the same equipment. As such, it was determined to be unrealistic to parse out the short-term construction activities of the various Project components; therefore, the air quality impacts of constructing all improvements within Area 2 are considered in this section.

Similarly, although not a part of the proposed Project, there are specific components in Area 3 that are approved to move forward without additional environmental review that are included in this EIR section and in the CalEEMod construction assumptions. The improvements to be conducted in Area 3, which have been previously approved to proceed in accordance with the 2015 ASCP MND, include:

1. Demolition of various facilities, including inlet/outlet structures, dry vaults, woodsheds, utility light pole, pipes and valves, chainlink fencing, corrugated metal pipes, and other small appurtenant structures, to allow for the reconstructed basins;
2. Construction and operation of new pre-fabricated restroom, new sewer lift station, and associated pipelines, including a new 12-inch-diameter potable water pipeline and a new sewer line within the JPL Bridge;
3. Construction and operation of new pipelines, including a 12-inch-diameter well line, 16-inch-diameter utility service line, and 12-inch-diameter booster line;
4. Removal of the Behner WTP's influent and effluent lines and removal of the 8-inch-diameter sludge line from the Behner WTP;
5. Construction and operation of the recreational parking lot at the northern end of Area 3;

6. Construction/realignment and operation of Explorer Road; and
7. Construction of new fencing, gates, a roundabout, a guard station, a trail pathway, and signs at the northern end of the parking lot.

Additional details related to these non-Project components are included in Appendix A-3, 2015 ASCP Initial Study/Mitigated Negative Declaration.

The non-Project components within Areas 2 and 3 listed above were previously approved for both short-term construction and long-term operations. Only the short-term construction activities for these non-Project components are modeled in the CalEEMod analysis, as all operational aspects were approved through the 2015 IS/MND and there would be no changes associated with the long-term operations of the proposed Project when compared to the 2015 IS/MND, as further described in Section 3, Project Description, of this Draft EIR.

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, and the comment letters received in response to the NOP are included in Appendix A-2 of this Draft EIR.

4.1.2 Existing Conditions

The Project site is located within the South Coast Air Basin (SCAB). SCAB is a 6,745-square-mile area bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. SCAB includes Orange County, Los Angeles County (except the Antelope Valley portion), and the western, non-desert portions of San Bernardino and Riverside Counties.

Meteorological and Topographical Conditions

The primary factors that determine air quality are the locations of air pollutant sources and the amount of pollutants emitted. Meteorological and topographical conditions, however, are also important. Factors such as wind speed and direction, air temperature gradients and sunlight, and precipitation and humidity interact with physical landscape features to determine the movement and dispersal of air pollutants. SCAB's air pollution problems are a consequence of the combination of emissions from the nation's second largest urban area, meteorological conditions discouraging dispersion of those emissions, and mountainous terrain surrounding SCAB that traps pollutants as they are pushed inland by the sea breeze (SCAQMD 2017a). The meteorological and topographical factors affecting air quality in SCAB are described in the following subsections.[1]

Climate

SCAB is characterized as having a Mediterranean climate (typified as semiarid with mild winters, warm summers, and moderate rainfall). The general region lies in the semi-permanent high-pressure zone of the eastern Pacific; as a result, the climate is mild and tempered by cool sea breezes. The usually mild climatological pattern is interrupted

[1] The discussion of meteorological and topographical conditions of SCAB is based on information provided in the Final 2016 Air Quality Management Plan (SCAQMD 2017a).

infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds. The extent and severity of the air pollution problem in SCAB is a function of the area's natural physical characteristics (e.g., weather and topography) and of manufactured influences (e.g., development patterns and lifestyle). Moderate temperatures, comfortable humidity, and limited precipitation characterize the climate in SCAB. The average annual temperature varies little, averaging 75°F; however, with a less-pronounced oceanic influence, the eastern inland portions of SCAB show greater variability in annual minimum and maximum temperatures, and all portions have recorded temperatures over 100°F in recent years. Although SCAB has a semiarid climate, the air near the surface is moist because of the presence of a shallow marine layer. Except for infrequent periods when dry air is brought into SCAB by offshore winds, the ocean effect is dominant. Periods with heavy fog are frequent, and low stratus clouds, occasionally referred to as "high fog," are a characteristic climate feature. Annual average relative humidity is 70% at the coast and 57% in the eastern part of SCAB. Precipitation is typically 9–14 inches annually and is rarely in the form of snow or hail because of typically warm weather. The frequency and amount of rainfall is greater in the coastal areas of SCAB.

The greatest precipitation in the City occurs from November to March, during which time the rainfall averages 2–4 inches per month. The average annual precipitation is 20.24 inches. The City has a mild climate with an annual average temperature of 72°F. The coolest months of the year are typically January and February, with an annual average low of 38.8°F. The warmest months are typically July through September, with an annual average high of 78°F. Prevailing wind direction in the City (as measured in Pasadena approximately 4.3 miles southwest of the site) is from the west and north (WRCC 2016).

Sunlight

The presence and intensity of sunlight are necessary prerequisites for the formation of photochemical smog. Under the influence of the ultraviolet radiation of sunlight, certain "primary" pollutants (mainly reactive hydrocarbons and oxides of nitrogen (NO_x)[2]) react to form "secondary" pollutants (primarily oxidants). Since this process is time dependent, secondary pollutants can be formed many miles downwind of the emission sources. Southern California also has abundant sunshine, which drives the photochemical reactions that form pollutants such as ozone (O_3) and a substantial portion of fine particulate matter (particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$)). In SCAB, high concentrations of O_3 are normally recorded during the late spring, summer, and early autumn months, when more intense sunlight drives enhanced photochemical reactions. Due to the prevailing daytime winds and time-delayed nature of photochemical smog, oxidant concentrations are highest in the inland areas of Southern California.

Temperature Inversions

Under ideal meteorological conditions and irrespective of topography, pollutants emitted into the air mix and disperse into the upper atmosphere. However, the Southern California region frequently experiences temperature inversions in which pollutants are trapped and accumulate close to the ground. The inversion, a layer of warm, dry air overlaying cool, moist marine air, is a normal condition in coastal Southern California. The cool, damp, and hazy sea air capped by coastal clouds is heavier than the warm, clear air, which acts as a lid through which the cooler marine layer cannot rise. The height of the inversion is important in determining pollutant concentration. When the inversion is

[2] NO_x is a general term pertaining to compounds of nitric oxide (NO), nitrogen dioxide (NO_2) and other oxides of nitrogen.

approximately 2,500 feet above mean sea level, the sea breezes carry the pollutants inland to escape over the mountain slopes or through the passes. At a height of 1,200 feet above mean sea level, the terrain prevents the pollutants from entering the upper atmosphere, resulting in the pollutants settling in the foothill communities. Below 1,200 feet above mean sea level, the inversion puts a tight lid on pollutants, concentrating them in a shallow layer over the entire coastal basin. Usually, inversions are lower before sunrise than during the daylight hours.

Mixing heights for inversions are lower in the summer, and inversions are more persistent, being partly responsible for the high levels of O_3 observed during summer months in SCAB. Smog in Southern California is generally the result of these temperature inversions combining with coastal day winds and local mountains to contain the pollutants for long periods, allowing them to form secondary pollutants by reacting in the presence of sunlight. SCAB has a limited ability to disperse these pollutants due to typically low wind speeds and the surrounding mountain ranges.

As with other cities within SCAB, the City of Los Angeles is susceptible to air inversions, which trap a layer of stagnant air near the ground where pollutants are further concentrated. These inversions produce haziness, which is caused by moisture, suspended dust, and a variety of chemical aerosols emitted by trucks, automobiles, furnaces, and other sources. Elevated particulate matter less than or equal to 10 microns in diameter (PM_{10}) and $PM_{2.5}$ concentrations can occur in SCAB throughout the year, but occur most frequently in fall and winter. Although there are some changes in emissions by day-of-week and season, the observed variations in pollutant concentrations are primarily the result of seasonal differences in weather conditions.

Pollutants and Effects

Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The federal and state standards have been set (pursuant to the federal and state Clean Air Acts, which are discussed in the following pages), with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include O_3, nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), PM_{10}, $PM_{2.5}$, and lead (Pb). These pollutants, as well as toxic air contaminants (TACs), are discussed in the following paragraphs.[3] In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants. A more detailed discussion of health effects of criteria air pollutants is provided in Appendix C.

Ozone. O_3 is a strong-smelling, pale blue, reactive, toxic chemical gas consisting of three oxygen atoms. It is a secondary pollutant formed in the atmosphere by a photochemical process involving the sun's energy and O_3 precursors. These precursors are mainly NO_X and volatile organic compounds (VOCs). The maximum effects of precursor emissions on O_3 concentrations usually occur several hours after they are emitted and many miles from the source. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during

[3] The descriptions of each of the criteria air pollutants and associated health effects are based on the EPA's Criteria Air Pollutants (2016a) and the CARB Glossary of Air Pollutant Terms (2016a).

summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O_3 exists in the upper atmosphere O_3 layer (stratospheric ozone) and at Earth's surface in the lower atmosphere (tropospheric ozone).[4] The O_3 that the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) regulate as a criteria air pollutant is produced close to the ground level, where people live, exercise, and breathe. Ground-level O_3 is a harmful air pollutant that causes numerous adverse health effects and is thus considered "bad" O_3. Stratospheric, or "good," O_3 occurs naturally in the upper atmosphere, where it reduces the amount of ultraviolet light (i.e., solar radiation) entering Earth's atmosphere. Without the protection of the beneficial stratospheric O_3 layer, plant and animal life would be seriously harmed.

O_3 in the troposphere causes numerous adverse health effects; short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes (EPA 2013). These health problems are particularly acute in sensitive receptors such as the sick, the elderly, and young children.

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas that is present in all urban atmospheres. The major mechanism for the formation of NO_2 in the atmosphere is the oxidation of the primary air pollutant nitric oxide (NO), which is a colorless, odorless gas. NO_x plays a major role, together with VOCs, in the atmospheric reactions that produce O_3. NO_x is formed from fuel combustion under high temperature or pressure. In addition, NO_x is an important precursor to acid rain and may affect both terrestrial and aquatic ecosystems. The two major emissions sources are transportation and stationary fuel combustion sources such as electric utility and industrial boilers.

NO_2 can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections (EPA 2016).

Carbon Monoxide. CO is a colorless, odorless gas formed by the incomplete combustion of hydrocarbon, or fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas such as the City of Los Angeles, transportation accounts for the majority of CO emissions. CO is a nonreactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions—primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, which is a typical situation at dusk in urban areas from November to February. The highest levels of CO typically occur during the colder months of the year, when inversion conditions are more frequent.

In terms of adverse health effects, CO competes with oxygen, often replacing it in the blood, reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can include dizziness, fatigue, and impairment of central nervous system functions.

[4] The troposphere is the layer of Earth's atmosphere nearest to the surface of Earth, extending outward approximately 5 miles at the poles and approximately 10 miles at the equator.

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily from incomplete combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels.

SO_2 is an irritant gas that attacks the throat and lungs and can cause acute respiratory symptoms and diminished ventilator function in children. When combined with particulate matter, SO_2 can injure lung tissue and reduce visibility and the level of sunlight. SO_2 can also yellow plant leaves and erode iron and steel.

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. Coarse particulate matter (PM_{10}) is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions. Fine particulate matter ($PM_{2.5}$) is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., from motor vehicles and power generation and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the blood stream, causing damage elsewhere in the body. Additionally, these substances can transport adsorbed gases such as chlorides or ammonium into the lungs, also causing injury. PM_{10} tends to collect in the upper portion of the respiratory system, whereas $PM_{2.5}$ is small enough to penetrate deeper into the lungs and damage lung tissue. Suspended particulates also produce haze and reduce regional visibility and damage and discolor surfaces on which they settle.

People with influenza, people with chronic respiratory and cardiovascular diseases, and the elderly may suffer worsening illness and premature death as a result of breathing particulate matter. People with bronchitis can expect aggravated symptoms from breathing in particulate matter. Children may experience a decline in lung function due to breathing in PM_{10} and $PM_{2.5}$ (EPA 2009).

Lead. Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturing of batteries, paints, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phaseout of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phaseout of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emissions sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and, in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient performance, psychomotor performance, reaction time, and growth. Children are highly susceptible to the effects of lead.

Volatile Organic Compounds. Hydrocarbons are organic gases that are formed from hydrogen and carbon and sometimes other elements. Hydrocarbons that contribute to formation of O_3 are referred to and regulated as VOCs (also referred to as reactive organic gases). Combustion engine exhaust, oil refineries, and fossil-fueled power plants are the sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint.

The primary health effects of VOCs result from the formation of O_3 and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate health standards for VOCs as a group.

Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute and/or chronic non-cancer health effects. A toxic substance released into the air is considered a TAC. TACs are identified by federal and state agencies based on a review of available scientific evidence. In the State of California, TACs are identified through a two-step process that was established in 1983 under the Toxic Air Contaminant Identification and Control Act. This two-step process of risk identification and risk management and reduction was designed to protect residents from the health effects of toxic substances in the air. In addition, the California Air Toxics "Hot Spots" Information and Assessment Act, Assembly Bill (AB) 2588, was enacted by the Legislature in 1987 to address public concern over the release of TACs into the atmosphere. The law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years.

Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by a number of sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and noncarcinogenic effects. Noncarcinogenic effects typically affect one or more target organ systems and may be experienced on either short-term (acute) or long-term (chronic) exposure to a given TAC, such as diesel particulate matter (DPM).

Diesel Particulate Matter. DPM, which is the predominant TAC, is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. More than 90% of DPM is less than 1 micrometer in diameter (about 1/70 the diameter of a human hair) and, thus, is a subset of $PM_{2.5}$ (CARB 2016). DPM is typically composed of carbon particles ("soot," also called black carbon) and numerous organic compounds, including over 40 known cancer-causing organic substances. Examples of these

chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene (CARB 2016). CARB classified "particulate emissions from diesel-fueled engines" (i.e., DPM; 17 CCR 93000) as a TAC in August 1998. DPM is emitted from a broad range of diesel engines: on-road diesel engines of trucks, buses, and cars and off-road diesel engines, including locomotives, marine vessels, and heavy-duty construction equipment, among others. Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with DPM, CARB adopted a diesel risk reduction plan in 2000 (CARB 2000). Because it is part of $PM_{2.5}$, DPM also contributes to the same non-cancer health effects as $PM_{2.5}$ exposure. These effects include premature death; hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma; increased respiratory symptoms; and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies (CARB 2016). Those most vulnerable to non-cancer health effects are children whose lungs are still developing and the elderly who often have chronic health problems.

Odorous Compounds

Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache). The ability to detect odors varies considerably among the population and overall is quite subjective. People may have different reactions to the same odor. An odor that is offensive to one person may be perfectly acceptable to another (e.g., coffee roaster). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. Known as odor fatigue, a person can become desensitized to almost any odor, and recognition may only occur with an alteration in the intensity. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors.

Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution include children, the elderly, athletes, and people with cardiovascular and chronic respiratory diseases. Facilities and structures where these air-pollution-sensitive people live or spend considerable amounts of time are known as sensitive receptors. Land uses where air-pollution-sensitive individuals are most likely to spend time include schools and schoolyards, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential communities (sensitive sites or sensitive land uses) (CARB 2005). The South Coast Air Quality Management District (SCAQMD) identifies sensitive receptors as residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes (SCAQMD 1993).

The nearest off-site sensitive receptors to Area 2 of the proposed Project are residences approximately 800 feet to the east on Canyon Dell Drive in Altadena, part of unincorporated Los Angeles County. Residential neighborhoods to the west in the City of La Cañada Flintridge are more than 1,700 feet from Area 2. Single-family residential neighborhoods exist to the east of Area 3. Some homes are in the City of Pasadena and others are in Altadena. The closest off-site sensitive receptors to Area 3 are on Ridgeview Drive in Altadena and Crestford Drive in Pasadena, approximately 250 feet from the Project site. All other air quality sensitive receptors are located at greater distances from the Project site and would be less impacted by emissions generated by the proposed Project. Impacts are quantified in Section 4.2.4, Impacts Analysis, for the above sensitive receptors.

Regional and Local Air Quality Conditions

South Coast Air Basin Attainment Designation

Pursuant to the 1990 federal Clean Air Act amendments, the EPA classifies air basins (or portions thereof) as "attainment" or "non-attainment" for each criteria air pollutant, based on whether the National Ambient Air Quality Standards (NAAQS) have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as "attainment" for that pollutant. If an area exceeds the standard, the area is classified as "non-attainment" for that pollutant. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated as "unclassified" or "unclassifiable." The designation of "unclassifiable/attainment" means that the area meets the standard or is expected to be meet the standard despite a lack of monitoring data. Areas that achieve the standards after a non-attainment designation are re-designated as maintenance areas and must have approved Maintenance Plans to ensure continued attainment of the standards. The California Clean Air Act, like its federal counterpart, called for the designation of areas as "attainment" or "non-attainment," but based on California Ambient Air Quality Standards (CAAQS) rather than the NAAQS. Table 4.1-1 depicts the current attainment status of the Project site with respect to the NAAQS and CAAQS as well as the attainment classifications for the criteria pollutants.

Table 4.1-1. South Coast Air Basin Attainment Classification

Pollutant	Designation/Classification	
	Federal Standards[a]	*State Standards*[b]
Ozone (O_3) – 1 hour	No federal standard	**Non-attainment**
Ozone (O_3) – 8 hour	**Extreme non-attainment**	**Non-attainment**
Nitrogen dioxide (NO_2)	Unclassifiable/attainment	Attainment
Carbon monoxide (CO)	Attainment/maintenance	Attainment
Sulfur dioxide (SO_2)	Unclassifiable/attainment	Attainment
Coarse particulate matter (PM_{10})	Attainment/maintenance	**Non-attainment**
Fine particulate matter ($PM_{2.5}$)	**Serious non-attainment**	**Non-attainment**
Lead (Pb)	Nonattainment	Attainment
Hydrogen sulfide	No federal standard	Unclassified
Sulfates	No federal standard	Attainment
Visibility-reducing particles	No federal standard	Unclassified
Vinyl chloride	No federal standard	No designation

Notes: bold text = not in attainment; attainment = meets the standards; attainment/maintenance = achieve the standards after a non-attainment designation; non-attainment = does not meet the standards; unclassified or unclassifiable = insufficient data to classify; unclassifiable/attainment = meets the standard or is expected to be meet the standard despite a lack of monitoring data.

[a] EPA 2018.

[b] CARB 2018.

In summary, SCAB is designated as a non-attainment area for federal and state O_3 standards and federal and state $PM_{2.5}$ standards. SCAB is designated as a non-attainment area for state PM_{10} standards; however, it is designated as an attainment area for federal PM_{10} standards. SCAB is designated as an attainment area for

federal and state CO standards, federal and state NO_2 standards, and federal and state SO_2 standards. While SCAB has been designated as non-attainment for the federal rolling 3-month average lead standard, it is designated attainment for the state lead standard (EPA 2018; CARB 2018).

Despite the current non-attainment status, air quality within SCAB has generally improved since the inception of air pollutant monitoring in 1976. This improvement is mainly due to lower-polluting on-road motor vehicles, more stringent regulation of industrial sources, and the implementation of emission reduction strategies by the SCAQMD. This trend toward cleaner air has occurred in spite of continued population growth. Despite this growth, air quality has improved significantly over the years, primarily due to the impacts of the region's air quality control program. PM_{10} levels have declined almost 50% since 1990, and $PM_{2.5}$ levels have also declined 50% since measurements began in 1999 (SCAQMD 2013). Similar improvements are observed with O_3, although the rate of O_3 decline has slowed in recent years.

California air districts have based their thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the air basin can accommodate without affecting the attainment date for the NAAQS or CAAQS. Since an ambient air quality standard is based on maximum pollutant levels in outdoor air that would not harm the public's health, and air district thresholds pertain to attainment of the ambient air quality standard, this means that the thresholds established by air districts are also protective of human health. The NAAQS and CAAQS are presented in Table 4.1-2.

Table 4.1-2. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	*Primary*[c,d]	*Secondary*[c,e]
O_3	1 hour	0.09 ppm (180 µg/m³)	—	Same as Primary Standard[f]
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	Same as Primary Standard
	annual arithmetic mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None
	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)	
SO_2[h]	1 hour	0.25 ppm (655 µg/m³)	0.075 ppm (196 µg/m³)	—
	3 hours	—	—	0.5 ppm (1,300 µg/m³)
	24 hours	0.04 ppm (105 µg/m³)	0.14 ppm (for certain areas)[g]	—
	annual	—	0.030 ppm (for certain areas)[g]	—
PM_{10}[i]	24 hours	50 µg/m³	150 µg/m³	Same as Primary Standard
	annual arithmetic mean	20 µg/m³	—	

Table 4.1-2. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standardsa	National Standardsb	
		Concentration[c]	*Primary[c,d]*	*Secondary[c,e]*
$PM_{2.5}$[i]	24 hours	—	35 µg/m³	Same as Primary Standard
	annual arithmetic mean	12 µg/m³	12.0 µg/m³	15.0 µg/m³

Visibility-reducing particles	8 hour (10:00 a.m. to 6:00 p.m. PST)	Insufficient amount to produce an extinction coefficient of 0.23 per kilometer due to the number of particles when the relative humidity is less than 70%	—	—

Source: CARB 2019a.

Notes: µg/m³ = micrograms per cubic meter; mg/m³= milligrams per cubic meter; ppm = parts per million by volume; O_3 = ozone; NO_2 = nitrogen dioxide; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = particulate matter with an aerodynamic diameter less than or equal to 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter less than or equal to 2.5 microns.

a California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter (PM_{10}, $PM_{2.5}$), and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

b National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once per year. The O_3 standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

c Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25 °C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25 °C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

d National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

[e] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] On October 1, 2015, the national 8-hour O_3 primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[g] To attain the national 1-hour standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards, the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the national 1-hour standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated non-attainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 $\mu g/m^3$ to 12.0 $\mu g/m^3$. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 $\mu g/m^3$, as was the annual secondary standard of 15 $\mu g/m^3$. The existing 24-hour PM_{10} standards (primary and secondary) of 150 $\mu g/m^3$ were also retained. The form of the annual primary and secondary standards is the annual mean averaged over 3 years.

[j] CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[k] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated non-attainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

Local Ambient Air Quality

CARB, air districts, and other agencies monitor ambient air quality at approximately 250 air quality monitoring stations across the state. Air quality monitoring stations usually measure pollutant concentrations 10 feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. The most recent background ambient air quality data from 2016 to 2018 are presented in Table 4.1-3. The Pasadena monitoring station, located at 752 S. Wilson Avenue, Pasadena, California 91106, is the nearest air quality monitoring station to the Project site, located approximately 2 miles northeast from the Project site. Air quality data for O_3, NO_2, CO, and $PM_{2.5}$ from the Pasadena monitoring station are provided in Table 4.1-3. Because SO_2 and CO are not monitored at the Pasadena monitoring station, these measurements were taken from the Los Angeles North Main Street monitoring station (1630 North Main Street, California 90012, approximately 15 miles south of the Project site). The data collected at these stations are considered representative of the air quality experienced in the Project vicinity. The number of days exceeding the ambient air quality standards is also shown in Table 4.1-3.

Table 4.1-3. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2016	*2017*	*2018*	*2016*	*2017*	*2018*
Ozone (O3) – Pasadena									
Maximum 1-hour Concentration	ppm	State	0.09	0.126	0.126	0.139	0.112	1	2
Maximum 8-hour Concentration	ppm	State	0.070	0.070	0.090	0.100	0.090	*17*	*36*
		Federal	0.070	0.070	0.091	0.100	0.091	*19*	*38*

Maximum 24-hour Concentration	µg/m^3	Federal	35	29.2	22.8	32.5	0	0	0
Annual Concentration	µg/m^3	State	12	9.5	10	10	0	0	0
		Federal	12.0	9.5	9.6	10.2	0	0	0

Sources: CARB 2019b; EPA 2019.

Notes: ppm = parts per million; µg/m3 = micrograms per cubic meter; — = not available.

Data taken from CARB iADAM (http://www.arb.ca.gov/adam) and Environmental Protection Agency AirData (http://www.epa.gov/airdata/) represent the highest concentrations experienced over a given year.

Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. All other criteria pollutants did not exceed federal or state standards during the years shown. There is no federal standard for 1-hour O_3, annual PM_{10}, or 24-hour SO_2, nor is there a state 24-hour standard for $PM_{2.5}$.

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every six days and every one to three days, respectively. Number of days exceeding the standards is a mathematical estimate of the number of days concentrations would have been greater than the level of the standard had each day been monitored. The numbers in parentheses are the measured number of samples that exceeded the standard.

4.1.3 Relevant Plans, Policies, and Ordinances

Federal

Clean Air Act

The federal Clean Air Act, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. The EPA is responsible for implementing most aspects of the Clean Air Act, including setting NAAQS for major air pollutants; setting hazardous air pollutant (HAP) standards; approving state attainment plans; setting motor vehicle emission standards; issuing stationary source emission standards and permits; and establishing acid rain control measures, stratospheric O_3 protection measures, and enforcement provisions. Under the Clean Air Act, NAAQS are established for the following criteria pollutants: O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

The NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The NAAQS (other than for O_3, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. NAAQS for O_3, NO_2, SO_2, PM_{10}, and $PM_{2.5}$ are based on statistical calculations over 1- to 3-year periods, depending on the pollutant. The Clean Air Act requires the EPA to reassess the NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare a state implementation plan that demonstrates how those areas will attain the standards within mandated timeframes.

The 1977 federal Clean Air Act amendments required the EPA to identify National Emission Standards for Hazardous Air Pollutants to protect public health and welfare. HAPs include certain VOCs, pesticides, herbicides, and radionuclides that present a tangible hazard, based on scientific studies of exposure to humans and other mammals. Under the 1990 federal Clean Air Act amendments, which expanded the control program for HAPs, 189 substances and chemical families were identified as HAPs.

State/Regional

California Ambient Air Quality Standards

The federal Clean Air Act delegates the regulation of air pollution control and the enforcement of the NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for ensuring implementation of the California Clean Air Act of 1988, responding to the federal Clean Air Act, and regulating emissions from motor vehicles and consumer products.

CARB has established CAAQS, which are generally more restrictive than the NAAQS. As stated previously, an ambient air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without harm to the public's health. The CAAQS describe adverse conditions; that is, pollution levels must be below these standards before a basin can attain the standard. Air quality is considered "in attainment" if pollutant levels are continuously below the CAAQS and violate the standards no more than once each year. The CAAQS for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, PM_{10}, and $PM_{2.5}$ and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded.

California air districts have based their thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the air basin can accommodate without affecting the attainment date for the NAAQS or CAAQS. Since an ambient air quality standard is based on maximum pollutant levels in outdoor air that would not harm the public's health, and air district thresholds pertain to attainment of the ambient air quality standard, this means that the thresholds established by air districts are also protective of human health.

AB 1809 - Air Toxics Program

The state Air Toxics Program was established in 1983 under AB 1807 (Tanner). The California TAC list identifies more than 700 pollutants, a subset of which have carcinogenic and noncarcinogenic toxicity criteria established pursuant to the California Health and Safety Code. In accordance with AB 2728, the state list includes the (federal) HAPs. The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) was enacted by the legislature in 1987 to address public concern over the release of TACs into the atmosphere. AB 2588 law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years. TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment (HRA), and if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

In 2000, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines (CARB 2000). The regulation is anticipated to result in an 80% decrease in statewide diesel health risk in 2020 compared with the diesel risk in 2000. Additional regulations apply to new trucks and diesel fuel, including the On-Road Heavy Duty Diesel Vehicle (In-Use) Regulation (CARB 2014), On-Road Heavy Duty (New) Vehicle Program (CARB 2005), In-Use Off-Road Diesel Vehicle Regulation (CARB 2011), and New Off-Road Compression-Ignition (Diesel) Engines and Equipment program (CARB 2008). These regulations and programs have timetables to which manufacturers must comply and existing operators must upgrade their diesel-powered equipment. There are several Airborne Toxic Control Measures that reduce diesel emissions, including In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.) and In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

California Health and Safety Code Section 41700

This section of the Health and Safety Code states that a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; or that endanger the comfort, repose, health, or safety of any of those persons or the public; or that cause, or have a natural tendency to cause, injury or damage to business or property. This section also applies to sources of objectionable odors.

Local

Air Quality Management Plan

The SCAQMD is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in SCAB, where the proposed Project is located. The SCAQMD operates monitoring stations in SCAB, develops rules and regulations for stationary sources and equipment, prepares emissions inventory and air quality management planning documents, and conducts source testing and inspections. The SCAQMD's Air Quality Management Plans (AQMPs) include control measures and strategies to be implemented to attain state and federal ambient air quality standards in SCAB. The SCAQMD then implements these control measures as regulations to control or reduce criteria pollutant emissions from stationary sources or equipment.

The 2012 AQMP proposed policies and measures to achieve federal and state standards for improved air quality in SCAB and portions of the Salton Sea Air Basin (formerly named the Southeast Desert Air Basin) that are under SCAQMD jurisdiction. The 2012 AQMP is designed to meet applicable federal and state requirements for O_3 and particulate matter. The 2012 AQMP stated that attainment of the federal 24-hour $PM_{2.5}$ standard was impracticable by 2015 and that SCAB should be classified as a serious non-attainment area along with the appropriate federal requirements. The 2012 AQMP included the planning requirements to meet the 1-hour O_3 standard. The 2012 AQMP demonstrated a plan for attainment of the federal 24-hour $PM_{2.5}$ standard by 2014 in SCAB through adoption of all feasible measures. Finally, the 2012 AQMP updated the EPA-approved 8-hour O_3 control plan with new measures designed to reduce reliance on the Clean Air Act Section 182(e)(5) long-term measures for NO_x and VOC reductions. The 2012 AQMP reduction and control measures, which are outlined to mitigate emissions, are based on existing and projected land use and development. The EPA, with a final ruling on April 14, 2016, approved the Clean Air Act planning requirements for the 24-hour $PM_{2.5}$ standard portion and on September 3, 2014, approved the 1-hour O_3 Clean Air Act planning requirements. The 2012 AQMP was updated in 2016 (approved March 2017); this AQMP accounts for updates to CARB's and SCAQMD's emission reductions resulting from adopted rules and regulations since the 2012 AQMP, growth factors, and demographic trends.

The 2016 AQMP is a regional blueprint for achieving air quality standards and healthful air. The 2016 AQMP represents a new approach, focusing on available, proven, and cost-effective alternatives to traditional strategies, while seeking to achieve multiple goals in partnership with other entities promoting reductions in greenhouse gas emissions and toxic risk, as well as efficiencies in energy use, transportation, and goods movement (SCAQMD 2017a). Because mobile sources are the principal contributor to SCAB's air quality challenges, SCAQMD has been and will continue to be closely engaged with CARB and the EPA, who have primary responsibility for these sources. The 2016 AQMP recognizes the critical importance of working with other agencies to develop funding and other incentives that encourage the accelerated transition of vehicles, buildings, and industrial facilities to cleaner technologies in a manner that benefits not only air quality but also local businesses and the regional economy. These "win-win" scenarios are key to implementation of this 2016 AQMP with broad support from a wide range of stakeholders.

While striving to achieve the NAAQS for O_3 and $PM_{2.5}$ and the CAAQS for O_3, PM_{10}, and $PM_{2.5}$ through a variety of air quality control measures, the 2016 AQMP also accommodates planned growth in SCAB. Projects are considered consistent with, and would not conflict with or obstruct, implementation of the AQMP if growth in

socioeconomic factors (e.g., population, employment) is consistent with the underlying regional plans used to develop the AQMP. The demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by the Southern California Association of Governments (SCAG) based on general plans for cities and counties in SCAB were used in the 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) (SCAG 2016) to estimate future emissions in the 2016 AQMP (SCAQMD 2017a).

SCAQMD Rules

Emissions that would result from mobile, area, and stationary sources during maintenance activities of the proposed program are subject to the rules and regulations of SCAQMD (2017b), which include the following:

- **Rule 401 – Visible Emissions:**[5] This rule establishes the limit for visible emissions from stationary sources.
- **Rule 402 – Nuisance:**[6] This rule prohibits the discharge of air pollutants from a facility that cause injury, detriment, nuisance, or annoyance to the public or damage to business or property.
- **Rule 403 – Fugitive Dust:**[7] This rule requires fugitive dust sources to implement best available control measures for all sources and prohibits all forms of visible particulate matter from crossing any property line. Rule 403 applies to any activity or human-made condition capable of generating fugitive dust, and identifies measures to reduce fugitive dust. This includes soil treatment for exposed soil areas. Treatment shall include, but not necessarily be limited to, periodic watering, application of environmentally safe soil stabilization materials, and/or roll compaction as appropriate.
- **Rule 431.2 – Sulfur Content of Liquid Fuels:**[8] The purpose of this rule is to limit the sulfur content in diesel and other liquid fuels for the purpose of reducing the formation of sulfur oxides (SO_x) and particulates during combustion and of enabling the use of add-on control devices for diesel-fueled internal combustion engines. The rule applies to all refiners, importers, and other fuel suppliers such as distributors, marketers, and retailers, as well as to users of diesel, low-sulfur diesel, and other liquid fuels for stationary-source applications in the SCAQMD. The rule also affects diesel fuel supplied for mobile sources.
- **Rule 1110.2 – Emissions from Gaseous- and Liquid-Fueled Engines:**[9] This rule applies to stationary and portable engines rated at greater than 50 horsepower. The purpose of Rule 1110.2 is to reduce NO_x, VOC, and CO emissions from engines. Emergency engines, including those powering standby generators, are generally exempt from the emissions and monitoring requirements of this rule because they have permit conditions that limit operation to 200 hours or less per year as determined by an elapsed operating time meter.

---

6 Rule 402 Nuisance: http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-402.pdf?sfvrsn=4.

7 Rule 403 Fugitive Dust: http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf?sfvrsn=4.

8 Rule 431.2 Sulfur Content of Liquid Fuels: http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-431-2.pdf?sfvrsn=4.

9 Rule 1110.2 Emissions from Gaseous and Liquid-Fueled Engines: http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/rule-1110-2.pdf.

- **Rule 1113 – Architectural Coatings:**[10] This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.
- **Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities:**[11] This rule specifies work practices to limit asbestos emissions from building demolition and renovation activities, including removal and associated disturbance of asbestos-containing material (ACM).

Regional Transportation Plan/Sustainable Communities Strategy

The SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SCAG serves as the federally designated metropolitan planning organization for the Southern California region and is the largest metropolitan planning organization in the United States.

With respect to air quality planning and other regional issues, SCAG has prepared the *Final 2008 Regional Comprehensive Plan: Helping Communities Achieve a Sustainable Future* (2008 RCP) for the region (SCAG 2008). The 2008 RCP sets the policy context in which SCAG participates in and responds to the SCAQMD air quality plans and builds off the SCAMQD AQMP processes that are designed to meet health-based criteria pollutant standards in several ways (SCAG 2008). First, it complements AQMPs by providing guidance and incentives for public agencies to consider best practices that support the technology-based control measures in AQMPs. Second, the 2008 RCP emphasizes the need for local initiatives that can reduce the region's GHG emissions that contribute to climate change, an issue that is largely outside the focus of local attainment plans, which it assessed in Section 3 of the plan. Third, the 2008 RCP emphasizes the need for better coordination of land use and transportation planning, which heavily influences the emissions inventory from the transportation sectors of the economy. This also minimizes land use conflicts, such as residential development near freeways, industrial areas, or other sources of air pollution.

On April 7, 2016, SCAG's Regional Council adopted the 2016 RTP/SCS. The 2016 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The 2016 RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The 2016 RTP/SCS was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders within the Counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. In June 2016, SCAG received its conformity determination from the Federal Highway Administration and the Federal Transit Administration indicating that all air quality conformity requirements for the 2016 RTP/SCS and associated 2015 Federal Transportation Improvement Program Consistency Amendment through Amendment 15-12 have been met (SCAG 2016). As previously noted, SCAQMD's 2016 AQMP applies the updated SCAG growth forecasts assumed in the 2016 RTP/SCS.

4.1.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to hazards and hazardous materials are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to hazards and hazardous material would occur if the project would:

a) Conflict with or obstruct implementation of the applicable air quality plan.
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
c) Expose sensitive receptors to substantial pollutant concentrations.
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Through the analysis in the Initial Study (see Appendix A-1), it was determined that the proposed Project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people (i.e., Threshold d). Accordingly, this issue is not further analyzed in the EIR. Based on the remaining thresholds, a significant impact related to air quality would occur if the project would:

a) Conflict with or obstruct implementation of the applicable air quality plan.
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
c) Expose sensitive receptors to substantial pollutant concentrations.

Pursuant to the State CEQA Guidelines (Section 15064.7), a lead agency may consider using, when available, the significance criteria established by the applicable air quality management district or air pollution control district when making determinations of significance. The City of Los Angeles uses the SCAQMD's thresholds to evaluate proposed development projects and assess the significance of quantifiable impacts. The potential air quality impacts of a project are, therefore, evaluated according to the thresholds adopted by the SCAQMD in connection with its CEQA Air Quality Handbook, Air Quality Analysis Guidance Handbook, and subsequent SCAQMD guidance as discussed previously.

Threshold 1: Consistency with Air Quality Management Plan. The evaluation of whether the proposed Project would conflict with or obstruct implementation of the applicable air quality plan is based on the SCAQMD CEQA Air Quality Handbook (SCAQMD 1993), Chapter 12, Section 12.2 (Consistency Criterion No. 1), which asks whether the proposed Project would result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay the timely attainment of air quality standards of the interim emissions reductions specified in the AQMP. This issue is addressed in detail under Threshold 1 in Section 4.1.4, Impacts Analysis. Consistency Criterion No. 2 in the SCAQMD CEQA Air Quality Handbook, Chapter 12, Section 12.3, asks whether the proposed Project would exceed the assumptions in the AQMP or increments based on the year of proposed Project buildout and phase, as discussed further in Section 4.2.4.

Threshold 2: Cumulative Impacts on Air Quality. Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) indicates that, where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied on to determine whether the proposed Project would have a significant impact on air quality.

The SCAQMD has established Air Quality Significance Thresholds, as revised in March 2015, which set forth quantitative emission significance thresholds below which a project would not have a significant impact on ambient air quality under existing and cumulative conditions. The quantitative air quality analysis provided herein applies the SCAQMD thresholds identified in Table 4.1-4 to determine the potential for the proposed Project to result in a significant impact under CEQA.

Table 4.1-4. South Coast Air Quality Management District Air Quality Significance Thresholds

Criteria Pollutants Mass Daily Thresholds		
Pollutant	*Construction (pounds per day)*	*Operation (pounds per day)*
VOCs	75	55
NO_x	100	55
CO	550	550
SO_x	150	150
PM_{10}	150	150
$PM_{2.5}$	55	55
Lead[a]	3	3
TACs and Odor Thresholds		
TACs[b]	Maximum incremental cancer risk ≥10 in 1 million Cancer Burden > 0.5 excess cancer cases (in areas ≥1 in 1 million) Chronic and acute hazard index ≥1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	
Ambient Air Quality Standards for Criteria Pollutants[c]		
NO_2 1-hour average NO_2 annual arithmetic mean	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.18 ppm (state) 0.030 ppm (state) and 0.0534 ppm (federal)	
CO 1-hour average CO 8-hour average	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) and 35 ppm (federal) 9.0 ppm (state/federal)	
PM_{10} 24-hour average PM_{10} annual average	10.4 μg/m³ (construction)[d] 2.5 μg/m³ (operation) 1.0 μg/m³	
$PM_{2.5}$ 24-hour average	10.4 μg/m³ (construction)[d] 2.5 μg/m³ (operation)	

Source: SCAQMD 2015.

Notes: SCAQMD = South Coast Air Quality Management District; VOC = volatile organic compounds; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; TAC = toxic air contaminant; NO_2 = nitrogen dioxide; ppm = parts per million; μg/m³ = micrograms per cubic meter.

GHG emissions thresholds for industrial projects, as added in the March 2015 revision to the SCAQMD Air Quality Significance Thresholds, were not include included in Table 4.1-4 because they are addressed within the GHG emissions analysis and not the air quality study.

[a] The phaseout of leaded gasoline started in 1976. Since gasoline no longer contains lead, the proposed Project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.

[b] TACs include carcinogens and noncarcinogens.

[c] Ambient air quality standards for criteria pollutants are based on SCAQMD Rule 1303, Table A-2, unless otherwise stated.

[d] Ambient air quality threshold are based on SCAQMD Rule 403.

A project would result in a substantial contribution to an existing air quality violation of the NAAQS or CAAQS for O_3, which is a non-attainment pollutant, if the project's construction or operational emissions would exceed the SCAQMD VOC or NO_x thresholds shown in Table 4.1-4. These emissions-based thresholds for O_3 precursors are intended to serve as a surrogate for an "ozone significance threshold" (i.e., the potential for adverse O_3 impacts to occur). This approach is used because O_3 is not emitted directly (see the discussion of O_3 and its sources in Section 4.1.1, Existing Conditions) and the effects of an individual project's emissions of O_3 precursors (VOC and NO_x) on O_3 levels in ambient air cannot be determined through air quality models or other quantitative methods.

Regarding cumulative impacts for non-attainment pollutants, if emissions exceed the thresholds shown in Table 4.1-4, the proposed Project could have the potential to result in a cumulatively considerable net increase in these pollutants and, thus, could have a significant impact on ambient air quality.

Threshold 3: Sensitive Receptors. The assessment of the proposed Project's potential to expose sensitive receptors to substantial pollutant concentrations (threshold criterion 4) includes a localized significance threshold (LST) analysis, as recommended by the SCAQMD, to evaluate the potential of localized air quality impacts to sensitive receptors in the immediate vicinity of the proposed Project. A LST analysis was performed to evaluate potential localized impacts associated with construction activities. For project sites of 5 acres or less the SCAQMD LST Methodology (2009) includes lookup tables that can be used to determine the maximum allowable daily emissions that would satisfy the localized significance criteria (i.e., the emissions would not cause an exceedance of the applicable concentration limits for NO_2, CO, PM_{10}, and $PM_{2.5}$) without performing project-specific dispersion modeling.

The LST significance thresholds for NO_2 and CO represent the allowable increase in concentrations above background levels in the vicinity of a project that would not cause or contribute to an exceedance of the relevant ambient air quality standards, while the threshold for PM_{10} represents compliance with Rule 403 (Fugitive Dust). The LST significance threshold for $PM_{2.5}$ is intended to ensure that construction emissions do not contribute substantially to existing exceedances of the $PM_{2.5}$ ambient air quality standards. The allowable emission rates depend on the following parameters:

- Source receptor area (SRA) in which the project is located
- Size of the project site
- Distance between the project site and the nearest sensitive receptor (e.g., residences, schools, hospitals)

The Project site is within SRA, 8 (West San Gabriel Valley). The SCAQMD provides guidance for applying California Emissions Estimator Model (CalEEMod) to the LSTs. LST pollutant screening level concentration data is currently published for 1-, 2-, and 5-acre sites for varying distances. The maximum number of acres disturbed on the peak day was estimated using the "Fact Sheet for Applying CalEEMod to Localized Significance Thresholds" (SCAQMD 2011), which provides estimated acres per 8-hour day for crawler tractors, graders, rubber tired dozers, and scrapers. The proposed Project would disturb approximately 1.5 based on the most intense construction equipment load. Therefore, using the LST for a 1-acre site was utilized as the thresholds are more conservative than using the 2-acre LST.

As described in Section 2, Environmental Setting, the Project site consists of two primary areas, as shown on Figure 2-1, Local Vicinity and Regional Location, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements, which are connected by the North Arroyo Boulevard (i.e. Gabrielino Trail/Access Road). The proposed Project involves construction activity and facility improvements in Areas 2 and 3, as well as construction truck traffic along portions of the Gabrielino Trail/Access Road. The former Travelling Screen and Chlorine Building (Screen Building) adjacent to Area 2 and the Behner WTP adjacent to Area 3 would be used for temporary construction materials and equipment staging only.

Area 2. The nearest homes to Area 2 are approximately 800 feet to the east on Canyon Dell Drive in Altadena, part of unincorporated Los Angeles County. Residential neighborhoods to the west in the City of La Cañada Flintridge are more than 1,700 feet from Area 2.

Area 3. Single-family residential neighborhoods exist to the east of Area 3. Some homes are in the City of Pasadena and others are in Altadena. The closest homes to Area 3 are on Ridgeview Drive in Altadena and Crestford Drive in Pasadena, approximately 250 feet from the Project site. North Windsor Avenue, between the I-210 freeway and Explorer Drive, would be used by traffic generated by the proposed Project. There are homes adjacent to North Windsor Avenue in the City of Pasadena and in the community of Altadena. Passive and active recreational areas, including the Gabrielino Trail, are near all Project areas and are described in Section 4.7, Recreation.

Because the nearest sensitive-receptor is located approximately 250 feet from the Project site, the LST receptor distance was assumed to be 164 feet (50 meters), which is the closest available distance provided by the SCAQMD lookup tables. The construction LST values from the SCAQMD lookup tables for Source Receptor Area (SRA) 8, West San Gabriel Valley, for a 1-acre construction site and a receptor distance of 50 meters are shown in Table 4.1-5.

Table 4.1-5. Localized Significance Thresholds for Source Receptor Area 8 (West San Gabriel Valley)

Pollutant	Threshold (pounds per day)
NO_2	69
CO	783
PM_{10}	11
$PM_{2.5}$	4

Source: SCAQMD 2008.

Notes: NO_2 = nitrogen dioxide; CO = carbon monoxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.

LST thresholds were determined based on the values for 1-acre site at a distance of 50 meters from the nearest sensitive receptor.

The assessment of the proposed Project's potential to expose sensitive receptors to substantial pollutant concentrations (threshold criterion 3) also includes an evaluation of CO hotspots, and an assessment of the potential health effects of criteria air pollutants.

4.1.5 Environmental Impacts Analysis

Threshold 4.1a. Would the project conflict with or obstruct implementation of the applicable air quality plan?

As previously discussed, the Project site is located within the SCAB under the jurisdiction of the SCAQMD, which is the local agency responsible for administration and enforcement of air quality regulations for the area. The SCAQMD has established criteria for determining consistency with the AQMP, currently the 2016 AQMP, in Chapter 12, Sections 12.2 and 12.3, in the SCAQMD CEQA Air Quality Handbook (SCAQMD 1993). The criteria are as follows (SCAQMD 1993):

- **Consistency Criterion No. 1:** The proposed Project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay the timely attainment of air quality standards of the interim emissions reductions specified in the AQMP.
- **Consistency Criterion No. 2:** The proposed Project will not exceed the assumptions in the AQMP or increments based on the year of project buildout and phase.

Consistency Criterion No. 1

Threshold 4.1b evaluates the Project's potential to violate air quality standards or contribute substantially to an existing or projected air quality violation impact analysis. As discussed under Threshold 4.1b , the proposed Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the region is non-attainment under an applicable federal or state ambient air quality standard. Because the Project would not result in an increase in the frequency and severity of existing air quality violations, the Project would not conflict with Consistency Criterion No. 1 of the SCAQMD CEQA Air Quality Handbook.

Consistency Criterion No. 2

While striving to achieve the NAAQS for O_3 and $PM_{2.5}$ and the CAAQS for O_3, PM_{10}, and $PM_{2.5}$ through a variety of air quality control measures, the 2016 AQMP also accommodates planned growth in the SCAB. Projects are considered consistent with, and would not conflict with or obstruct implementation of, the AQMP if the growth in socioeconomic factors (e.g., population, employment) is consistent with the underlying regional plans used to develop the AQMP (per Consistency Criterion No. 2 of the SCAQMD CEQA Air Quality Handbook).

The SCAQMD primarily uses demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by the SCAG for its RTP/SCS (SCAG 2016), which is based on general plans for cities and counties in the SCAB, for the development of the AQMP emissions inventory (SCAQMD 2017a).[12] The SCAG 2016 RTP/SCS, and associated Regional Growth Forecast, are

[12] Information necessary to produce the emission inventory for the SCAB is obtained from the SCAQMD and other governmental agencies, including CARB, Caltrans, and SCAG. Each of these agencies is responsible for collecting data (e.g., industry growth factors, socioeconomic projections, travel activity levels, emission factors, emission speciation profile, and emissions) and developing methodologies (e.g., model and demographic forecast improvements) required to generate a comprehensive emissions inventory. SCAG incorporates these data into their Travel Demand Model for estimating/projecting vehicle miles

generally consistent with the local plans; therefore, the 2016 AQMP is generally consistent with local government plans. The proposed Project site is zoned for open space use within the Pasadena General Plan. Therefore, the Project would be consistent with the current zoning and land use designation. Accordingly, the Project would meet Consistency Criterion No. 2 of the SCAQMD CEQA Air Quality Handbook.

Therefore, implementation of the Project would not result in a conflict with, or obstruct implementation of, the applicable air quality plan (i.e., the 2016 AQMP). Accordingly, the Project would meet Consistency Criterion No. 2 of the SCAQMD CEQA Air Quality Handbook.

Summary

As described previously, the proposed Project would not result in a significant increase in the frequency and severity of existing air quality violations and would not conflict with Consistency Criterion No. 1. Additionally, implementation of the Project would not exceed the demographic growth forecasts in the SCAG 2016 RTP/SCS; therefore, the Project would be consistent with the SCAQMD 2016 AQMP, which based future emission estimates on the SCAG 2016 RTP/SCS. Thus, the Project would not conflict with Consistency Criterion No. 2. Based on these considerations, impacts related to the Project's potential to conflict with or obstruct implementation of the applicable air quality plan would be less than significant.

Threshold 4.1b Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Construction of the proposed Project would result in emissions of criteria air pollutants from mobile, area, and/or stationary sources, which may cause exceedances of federal and state ambient air quality standards or contribute to existing non-attainment of ambient air quality standards. The following discussion identifies potential short-term construction impacts that would result from implementation of the Project.

Short-Term Construction Impacts

Construction of the Project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (i.e., vendor trucks and worker vehicle trips). Construction emissions can vary substantially from day to day depending on the level of activity, the specific type of operation, and for dust, and the prevailing weather conditions. Therefore, such emission levels can only be approximately estimated with a corresponding uncertainty in precise ambient air quality impacts.

Construction criteria air pollutant emissions associated with temporary construction activity were quantified using CalEEMod (CAPCOA 2017). Construction emissions were calculated for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2021, and 2022). Construction schedule assumptions, including phase type, duration,

traveled (VMT) and driving speeds. SCAG's socioeconomic and transportation activities projections in their 2016 RTP/SCS are integrated in the 2016 AQMP (SCAQMD 2017a).

and sequencing, were based on information provided by the City and default values provided in CalEEMod and are intended to represent a reasonable scenario based on the best information available.

To estimate Project emissions, and based on information provided by the City, it is assumed that construction in Area 2 would begin in August 2021 and would last approximately 3 months, ending in October 2021. Construction in Area 3 would begin in March 2022 and would last approximately 9 months. The inputs into CalEEMod include the following assumptions (duration of phases is approximate):

- Area 2
  - Site preparation: 1 Week (August 2021 – August 2021)
  - Dewatering: 2 Months (August 2021 – September 2021)
  - Demolition: 1 Week (August 2021)
  - Grading/Excavation: 2 Months (July 2021 – December 2021)
  - Building Construction: 2 Months (August 2021 – October 2021)
  - Paving: 1 Week (October 2021)
- Area 3
  - Site Preparation: 1 Week (March 2022)
  - Demolition: 2 Weeks (March 2022 – April 2022)
  - Grading/Excavation 6 Months (April 2022 – August 2022)
  - Building Construction 2 Months (August 2022 – October 2022)
  - Paving: 2 Months (August 2022 – October 2022)
  - Architectural Coating 1 Week (November 2022)

Construction of the Project would commence with site preparation, grading and earthwork excavation. It is anticipated that approximately 1,608 cubic yards of earthwork material would be exported to support the construction of Area 2. Additionally, it is anticipated that approximately 11,000 cubic yards and 37,000 cubic yards of earthwork material would be required to be exported and imported respectively during Area 3 construction. The material is assumed to be transported during the grading and excavation phases. Upon completion of these phases, vertical building construction and paving/concrete installation would commence. Construction activity is assumed to occur at the site for approximately 8 hours per day, 5 days per week (22 days a month), during Project construction. CalEEMod default trip length values were used for all worker and vendor trips and earthwork import trips. Demolition and exported material will be disposed of at the Vulcan Durbin landfill in Irwindale which is approximately 18 miles from the Project. Therefore, an 18-mile trip distance was used for exported material and demolition haul truck trips. The construction equipment mix and vehicle trips used for estimating the Project-generated construction emissions are shown in Table 4.1-6.

Table 4.1-6. Construction Scenario Assumptions

Notes: See Appendix C.

Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. The Project would be required to comply with SCAQMD Rule 403 to control dust emissions generated during the grading activities. Standard construction practices that would be employed to reduce fugitive dust emissions include watering of the active sites three times per day, depending on weather conditions. Internal-combustion engines used by construction equipment, vendor trucks (i.e., delivery trucks), and worker vehicles would result in emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$. The application of architectural coatings, such as exterior application and other finishes, and asphalt pavement would also produce VOC emissions; however, the contractor is required to procure architectural coatings from a supplier in compliance with the requirements of SCAQMD's Rule 1113 (Architectural Coatings).

Table 4.1-7 presents the estimated maximum daily construction emissions generated during construction of the Project. The values shown are the maximum summer or winter daily emissions results from CalEEMod. Details of the emissions are provided in Appendix C.

Table 4.1-7. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
2021	5.02	45.17	38.88	0.08	5.10	3.36
2022	3.62	26.20	19.68	0.06	3.71	2.05
Maximum	*5.02*	*45.17*	*38.88*	*0.08*	*5.10*	*2.36*
SCAQMD threshold	*75*	*100*	*550*	*150*	*150*	*55*
Threshold exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District.

See Appendix C for complete results.

The values shown are the maximum summer or winter daily emissions results from CalEEMod. The PM_{10} and $PM_{2.5}$ emissions reflect CalEEMod "mitigated" output, which accounts for compliance with SCAQMD Rule 403 (Fugitive Dust).

As shown in Table 4.1-7, construction activities would not generate emissions in excess of the SCAQMD daily construction emissions thresholds for VOCs, NO_x, CO SO_x, PM_{10}, and $PM_{2.5}$.

Air pollution is largely a cumulative impact. The non-attainment status of regional pollutants is a result of past and present development, and the SCAQMD develops and implements plans for future attainment of ambient air quality standards. A cumulative analysis must evaluate a project's contribution to the cumulative increase in pollutants for which the SCAB is designated as non-attainment for the CAAQS and NAAQS. As discussed in Section 2.3.1, South Coast Air Basin Attainment Designation, the SCAB has been designated as a national non-attainment area for O_3 and $PM_{2.5}$ and a California non-attainment area for O_3, PM_{10}, and $PM_{2.5}$. Of these non-attainment pollutants, construction of the Project would generate VOC and NO_x emissions (which are precursors to O_3) and emissions of PM_{10} and $PM_{2.5}$.

If a project's emissions would not exceed the SCAQMD significance thresholds for criteria pollutants, it would be expected to not have a cumulatively considerable contribution to the non-attainment status in the SCAB. As indicated in Table 4.1-7, Project-generated construction emissions, would not exceed the SCAQMD emission-based significance thresholds for any criteria air pollutant, and no mitigation is required. Additionally, the Project would not conflict with or obstruct implementation of the SCAQMD 2016 AQMP.

However, even if a project does not exceed thresholds, it may still contribute to a significant cumulative impact on air quality, depending on whether the project's contribution accounts for a significant proportion of the cumulative total emissions (i.e., it represents a "cumulatively considerable contribution" to the cumulative air quality impact) and whether it is consistent with the SCAQMD 2016 AQMP, which addresses the cumulative emissions in the SCAB.

Cumulative localized impacts would potentially occur if a construction project were to occur concurrently with another off-site but nearby project. The geographic scope of the area potentially affected by cumulative air quality impacts from construction and operation consists of sensitive receptor locations that could be exposed to localized air pollution from the proposed Project and from related projects. In general, air quality emissions attenuate over distance, with emissions levels dropping back to background levels within approximately 200

meters (656 feet) when upwind from a source and within approximately 500 meters (1,640 feet) (WHO 2013) As discussed in greater detail in Section 4, Environmental Impact Analysis of this Draft EIR, the cumulative projects were chosen based on direction from the City. ASCP Area 1 construction, while relatively near Area 2, is anticipated to begin in 2023 (and thus, after the completion of the proposed Project). The Devil's Gate Reservoir Sediment Removal and Management Project is located to the southwest of Area 3; sediment removal and placement is ongoing and expected to conclude in Fall 2022, with habitat restoration continuing through Fall 2023; the Oak Grove Area Improvements Projects could begin construction as early as 2021 if funds become available, but is located over 2,218 feet from the Project site. The LACFCD Pumpback/Intake at Devil's Gate (Devil's Gate Dam to Eaton) project would begin after the Devil's Gate and the proposed Project; and the Explorer Groundwater Well construction could potentially be concurrent with proposed Project Area 3, although no CEQA documentation has yet been prepared. Of the projects identified and described in Section 4, Environmental Impact Analysis, the Devil's Gate Reservoir Sediment Removal and Management Project is the one nearest to the Project site[13] and with a potential overlap in construction activities. Therefore, the Devil's Gate project is the one with the greatest potential to result in localized cumulative air quality impacts with regards to the proposed Project.

Localized construction air pollution emissions are assessed under Threshold 4.1c below. It was determined that at sensitive receptors nearest to Area 3 (the portion of the Project site nearest to the Devil's Gate project), during the more intensive phases of construction, the estimated pollutant emissions of NO_x, CO, PM_{10}, and $PM_{2.5}$ would not exceed the SCAQMD LSTs and localized construction air quality impacts would be less than significant. The Devil's Gate project's localized construction emissions were also deemed to be less than significant; furthermore, the closest portion of the Project site representing an active work area (Basin J) is located approximately 500 feet from the Devil's Gate project site to the southwest. Therefore, it is unlikely that construction emissions from the two projects would combine in a measurable fashion at nearby receptors receivers, which are located approximately 250 feet or more further to the east of the Project site and approximately 1,000 from the northern boundary of the Devil's Gate project. This is considered to be a less than significant impact, and not cumulatively considerable.

Otherwise, construction schedules from other potential future projects near the Project site are currently unknown; therefore, potential construction impacts associated with future projects would be considered speculative.[14] However, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation if the project would exceed SCAQMD thresholds. Criteria air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by the SCAQMD. Cumulative PM_{10} and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SCAQMD Rule 403 (Fugitive Dust), which sets forth general and specific requirements for all construction sites in the SCAQMD.

---

13 Note that construction equipment assumptions associated with specific components in Areas 2 and 3 that are approved to move forward without additional environmental review have been incorporated as part of the construction noise analysis addressed in Section 4.6.5, and are thus not considered as part of this cumulative impacts discussion.

14 The CEQA Guidelines state that if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145). This discussion is nonetheless provided in an effort to show good-faith analysis and comply with CEQA's information disclosure requirements.

Based on the Project-generated construction emissions of criteria air pollutants, which did not exceed the SCAQMD daily thresholds, the Project would not result in generation of a cumulatively considerable net increase of any criteria pollutant for which the region is non-attainment under an applicable federal or state ambient air quality standard due to short-term construction. Impacts would be less than significant and no mitigation is required.

Long-Term Operational Impacts

As described in Section 3, Project Description, PWP's future schedule of operation and maintenance activities for Project-related facilities would not substantively differ from the current maintenance routine and procedures. No new employees are required for the long-term operation of the Project components. The proposed Project would include new hydraulic motors and winches are part of the design for Area 2 but they would be electrically powered. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for greenhouse gases in CalEEMod, since criteria pollutant emissions occur at the site of the power plant, which is typically off site. As such, the Project not result in generation of a cumulatively considerable net increase of any criteria pollutant for which the region is non-attainment under an applicable federal or state ambient air quality standard due to long-term operations. Impacts would be less than significant and no mitigation is required.

Threshold 4.1c Would the project expose sensitive receptors to substantial pollutant concentrations?

As discussed under Sensitive Receptors in Section 4.1.2, sensitive receptors are those individuals more susceptible to the effects of air pollution than the population at large. According to SCAQMD, sensitive receptors include residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes (SCAQMD 1993). The nearest off-site sensitive receptors would be single-family homes approximately 250 feet east from Area 3.

Short-Term Construction Impacts

Localized Significance Thresholds Analysis

LST analysis has been prepared to determine potential impacts to nearby sensitive receptors during construction of the Project. As indicated in Section 4.1.4, Thresholds of Significance, the SCAQMD recommends the evaluation of localized NO_2, CO, PM_{10}, and $PM_{2.5}$ impacts to sensitive receptors in the immediate vicinity of the Project site that would occur as a result of construction activities. The impacts were analyzed using methods consistent with those in the SCAQMD's Final LST Methodology (2008). According to the Final LST Methodology, "off-site mobile emissions from the project should not be included in the emissions compared to the LSTs" (SCAQMD 2008). Hauling of construction materials associated with Project construction is not expected to cause substantial air quality impacts to sensitive receptors along off-site roadways. Emissions from the trucks would be relatively brief in nature and would cease once the trucks pass through the main streets.

Construction activities associated with the Project would result in temporary sources of on-site fugitive dust and construction equipment emissions. Off-site emissions from vendor trucks and worker vehicle trips are not included in the LST analysis. The maximum allowable daily emissions that would satisfy the SCAQMD LSTs for SRA 8 are presented in Table 4.1-8 and compared with the maximum daily on-site construction emissions generated during the Project.

Table 4.1-8. Localized Significance Thresholds Analysis for Project Construction

Pollutant	Project Construction Emissions (Pounds per Day)	LST Criteria (Pounds per Day)	Exceeds LST?
NO_2	37.12	69	No
CO	22.05	783	No
PM_{10}	4.41	11	No
$PM_{2.5}$	3.00	4	No

Source: SCAQMD 2008.

Notes: LST = localized significance threshold; NO_2 = nitrogen dioxide; CO = carbon monoxide; PM_{10} = particulate matter; $PM_{2.5}$ = fine particulate matter.

See Appendix C for detailed results.

Localized significance thresholds are shown for 1-acre Project sites corresponding to a distance to a sensitive receptor of 50 meters.

These estimates reflect control of fugitive dust required by Rule 403.

Greatest on-site NO_x, CO, PM_{10}, and $PM_{2.5}$ emissions are associated with the overlap of the Area 2 Building Construction and Grading phases.

As shown in Table 4.1-8, construction activities would not exceed the SCAQMD daily LSTs for NO_2, Co PM_{10} and $PM_{2.5}$ emissions in excess of site-specific LSTs; therefore, site-specific construction impacts during construction of the Project would be less than significant.

CO Hotspots

Traffic-congested roadways and intersections have the potential to generate localized high levels of CO. Localized areas where ambient concentrations exceed federal and/or state standards for CO are termed CO "hotspots." CO transport is extremely limited, because CO disperses rapidly with distance from the source. Under certain extreme meteorological conditions, however, CO concentrations near a congested roadway or intersection may reach unhealthy levels, affecting sensitive receptors. Typically, high CO concentrations are associated with severely congested intersections. Projects contributing to adverse traffic impacts may result in the formation of a CO hotspot. Additional analysis of CO hotspot impacts would be conducted if a project would result in a significant impact or contribute to an adverse traffic impact at a signalized intersection that would potentially subject sensitive receptors to CO hotspots.

During construction of the Project, construction traffic would affect the intersections near the Project site. However, the proposed Project would be temporary and would not be a source of daily, long-term mobile-source emissions. In addition, due to continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SCAB is steadily decreasing. Finally, as discussed in Section 4.8 of this Draft EIR, transportation impacts would be less than significant with mitigation.

Toxic Air Contaminants

Toxic air contaminants (TACs) are defined as substances that may cause or contribute to an increase in deaths or in serious illness, or that may pose a present or potential hazard to human health. As discussed under the LST analysis, the nearest sensitive receptors to the proposed Project are residences located adjacent to the Project as it passes through residential neighborhoods.

Health effects from carcinogenic air toxics are usually described in terms of cancer risk. The SCAQMD recommends an incremental cancer risk threshold of 10 in 1 million. "Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 9-, 30-, and 70-year exposure period will contract cancer based on the use of standard Office of Environmental Health Hazard Assessment risk-assessment methodology (OEHHA 2015). In addition, some TACs have non-carcinogenic effects. The SCAQMD recommends a Hazard Index of 1 or more for acute (short-term) and chronic (long-term) non-carcinogenic effects. [15] TACs that would potentially be emitted during construction activities associated with the proposed Project would be diesel particulate matter.

Diesel particulate matter emissions would be emitted from heavy equipment operations and heavy-duty trucks. Heavy-duty construction equipment is subject to a CARB Airborne Toxics Control Measure for in-use diesel construction equipment to reduce diesel particulate emissions. As described for the LST analysis, PM10 and PM2.5 (representative of diesel particulate matter) exposure would be minimal. According to the Office of Environmental Health Hazard Assessment, health risk assessments (which determine the exposure of sensitive receptors to toxic emissions) should be based on a 30-year exposure period for the maximally exposed individual resident; however, such assessments should also be limited to the period/duration of activities associated with the Project. The duration of the proposed construction activities would constitute a small percentage of the total 30-year exposure period. The construction period for the proposed Project would be approximately 16 months, after which construction-related TAC emissions would cease. However, because of the nature of the proposed Project, emissions would not be concentrated in any one work area for the entire construction duration. Project construction would not generally remain in a single location for more than a few weeks. Due to this relatively short period of exposure and minimal particulate emissions on-site, TACs generated during construction would not be expected to result in concentrations causing significant health risks.

Health Effects of Criteria Air Pollutants

Construction emissions of the Project would not exceed the SCAQMD thresholds for any criteria air pollutants, including VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$.

Health effects associated with O_3 include respiratory symptoms, worsening of lung disease leading to premature death, and damage to lung tissue (CARB 2019c). VOCs and NO_x are precursors to O_3, for which the SCAB is designated as non-attainment with respect to the NAAQS and CAAQS. The contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SCAB due to O_3 precursor emissions tend to be found downwind of the source location because of the time required for the photochemical reactions to occur. Further, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur, because exceedances of the O_3 NAAQS and CAAQS tend to occur between April and October when solar radiation is highest. Due to the lack of quantitative methods to assess this complex photochemistry, the holistic effect of a single project's emissions of O_3 precursors is speculative. That being said, because the proposed Project would not exceed the SCAQMD thresholds, the proposed Project would not contribute to health effects associated with O_3.

[15] Non-cancer adverse health risks are measured against a hazard index, which is defined as the ratio of the predicted incremental exposure concentrations of the various non-carcinogens from the project to published reference exposure levels that can cause adverse health effects.

Health effects associated with NO_x include lung irritation and enhanced allergic responses (CARB 2019c). Because Project-related NO_x emissions would not exceed the SCAQMD mass daily thresholds, and because the SCAB is a designated attainment area for NO_2 and the existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards, it is not anticipated that the proposed Project would cause an exceedance of the NAAQS and CAAQS for NO_2 or result in potential health effects associated with NO_2 and NO_x.

Health effects associated with CO include chest pain in patients with heart disease, headache, light-headedness, and reduced mental alertness (CARB 2019c). CO tends to be a localized impact associated with congested intersections. The associated potential for CO hotspots was discussed previously and determined to be less than significant. Thus, the Project's CO emissions would not contribute to significant health effects associated with CO.

Health effects associated with PM_{10} include premature death and hospitalization, primarily for worsening of respiratory disease (CARB 2019c). Construction of the Project would not exceed thresholds for PM_{10} or $PM_{2.5}$, would not contribute to exceedances of the NAAQS and CAAQS for particulate matter, and would not obstruct the SCAB from coming into attainment for these pollutants. The Project would also not result in substantial diesel particulate matter emissions during construction. Additionally, the Project would be required to comply with SCAQMD Rule 403, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction, the Project is not anticipated to result in health effects associated with PM_{10} or $PM_{2.5}$.

In summary, construction of the proposed Project would not result in exceedances of the SCAQMD significance thresholds for certain criteria pollutants. Therefore, the Project would not expose sensitive receptors to substantial pollutant concentrations or potential health effects associated with criteria air pollutants due to short-term construction. Impacts would be less than significant and no mitigation is required.

Long-Term Operational Impacts

As described in Section 3, Project Description, PWP's future schedule of operation and maintenance activities for Project-related facilities would not substantively differ from the current maintenance routine and procedures. No new employees are required for the long-term operation of the Project components; therefore, no long-term operational air quality impacts from traffic would result. No new emissions-generating land uses are proposed; therefore, no long-term operational air quality emissions from mobile equipment or stationary machinery would result. As such, the Project would not expose sensitive receptors to substantial pollutant concentrations or potential health effects associated with criteria air pollutants due to long-term operations. Impacts would be less than significant and no mitigation is required.

4.1.6 Cumulative Impacts

Because of the cumulative nature of air quality impacts, cumulative impacts to air quality are addressed in Section 4.1 under Threshold 4.1b. As discussed in Threshold 4.1b, impacts resulting from the proposed Project air pollutant emissions would not be cumulatively considerable and no mitigation is required.

4.1.7 Mitigation Measures

No mitigation measures are required.

4.1.8 Level of Significance After Mitigation

The proposed Project would not result in any potentially significant impacts related to Air Quality, and all impacts would be less than significant with Project implementation.

4.2 Biological Resources

4.2.1 Methodology

This section describes the existing conditions of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Project. The analysis of the Project impacts related to biological resources is based on:

Appendix D Biological Resources Technical Report, prepared by Dudek, dated May 2020.

Information contained in this section is based on the findings of the biological surveys conducted at the Project site by Dudek, including a general biological reconnaissance survey conducted on April 23, 2019, focused special-status plant surveys conducted in May and July 2019, focused amphibian survey in May 3, 2019, focused special-status bird surveys from April to July 2019, focused fish survey conducted on October 14, 2019, jurisdictional delineation update on July 5, 2019, and tree survey on April 2 and 3, 2020. Other documentation reviewed and incorporated where noted, for this analysis include the following:

- Fish and Fish Passage Related to Pasadena Water and Power Department Diversion on Arroyo Seco above Pasadena, dated October 29, 2019 (Swift 2019)
- Draft Basis of Design Report, Arroyo Seco Canyon Project – Intake/Diversion Design, dated May 2020 (Northwest Hydraulics Consultants 2020)
- Arroyo Seco Canyon Diversions Biological Impacts Memorandum, dated November 8, 2018 (Psomas 2018)
- Biological Technical Report, Arroyo Seco Canyon Project, dated September 2014 (BonTerra Psomas 2014a)
- Special Status Botanical Surveys for the Arroyo Seco Canyon Project, dated January 20, 2014 (BonTerra Psomas 2014b)
- Native Tree Survey, Arroyo Seco Canyon Project, dated September 2014 (BonTerra Psomas 2014c)
- Jurisdictional Delineation Report, Arroyo Seco Canyon Project, dated May 2014 (BonTerra Psomas 2014d)
- Jurisdictional Delineation Report, Arroyo Seco Canyon Project, dated April 2016 (BonTerra Psomas 2016a)
- Results of the 2013 Amphibian Surveys for the Arroyo Seco Canyon Project, dated February 4, 2014 (BonTerra Psomas 2014e)
- Results of the 2013 Least Bell's Vireo/Southwestern Willow Flycatcher Survey for the Arroyo Seco Canyon Project Dated September 2013 (BonTerra Consulting 2013)
- Results of the 2016 Least Bell's Vireo/Southwestern Willow Flycatcher Survey for the Arroyo Seco Canyon Project Dated August 2016 (BonTerra Psomas 2016b)
- Biological Technical Report for the Devil's Gate Reservoir Project Site in the City of Pasadena, Los Angeles County, California, dated November 2010, and appendices (Chambers Group 2010)
- IS/MND for Berkshire Creek Area Improvements, dated May 2019 (Psomas 2019a)
- Upper Arroyo Seco Habitat Enhancement Plan, dated July 2019 (Psomas 2019b)

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, the Appendices to the Initial Study are included in Appendix A-2, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

4.2.2 Existing Conditions

The following discussion summarizes the existing biological resources present within the proposed Project area, and includes a description of the vegetation communities, special-status species, wildlife corridors and movement, and jurisdictional waters, including wetlands. For the purposes of analyzing existing biological resources conditions and the impacts resulting from the proposed Project, the study area has been defined as follows:

- The construction footprint of proposed improvements within Area 2 and Area 3, including a minimum 50-foot buffer around each component;
- A 100-foot wide study area along North Arroyo Boulevard[1] (i.e. Gabrielino Trail/Access Road), as measured 50-feet from the centerline; and,
- The fence line of the two staging areas (i.e. Screen Building and Behner Water Treatment Plant [WTP]).

Vegetation Communities, Land Covers, and Floral Diversity

Ten vegetation communities and land cover types are identified within the study area during the biological resource evaluation: California sagebrush–California buckwheat scrub–laurel sumac scrub association, coast live oak woodland alliance, white alder–California sycamore woodland association, California sycamore woodlands alliance, arroyo willow–mulefat scrub association, laurel sumac scrub alliance, California sagebrush–California buckwheat scrub alliance, urban/developed, disturbed habitat, and parks and ornamental plantings. These vegetation communities and land cover types are described below, their acreages tabulated in Table 4.2-1, Vegetation Types, and their spatial distributions depicted on Figure 4.2-1, Vegetation Types (Sheets 1 and 2).

Table 4.2-1. Vegetation Communities and Land Covers within the Study Area

Notes: Numbers may not sum due to rounding.

[a] Unique codes assigned to alliances and associations.

[b] NatureServe Global and State rarity ranks per Faber-Langendoen et al. (2012). Natural communities with global or state ranks of 1–3 are considered Sensitive Natural Communities by CDFW and are to be addressed in the environmental review processes of CEQA (CDFW).

[c] Sensitive community

California Sagebrush–California Buckwheat–Laurel Sumac Scrub Association (32.110.06)

The California sagebrush–California buckwheat–laurel sumac scrub association consists of a codominance of California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), and laurel sumac (*Malosma laurina*). The association is part of the California Sagebrush–California Buckwheat scrub alliance (32.110.00) but is not considered a sensitive natural community (CDFW 2019a). Laurel sumac is a large, large-leaved sclerophyllous shrub that grows to 16 feet in height. California sagebrush is a much-

branched shrub up to 8 feet tall with shallow roots. California buckwheat is a semi-woody, multi-branched shrub with woody, many-branched roots. Many additional shrubs may be present in the community and the herbaceous layer is seasonally present (CNPS 2019).

In the study area, California sagebrush–California buckwheat–laurel sumac scrub is found along North Arroyo Boulevard, on the slope adjacent to the eastern side of Area 3, and on the slopes above the riparian corridor within the canyon. Additional common shrubs found in the community in the study area include blue elderberry (*Sambucus nigra*), lemonade berry (*Rhus integrifolia*), deerweed (*Acmispon glaber*), white sage (*Salvia apiana*), black sage (*Salvia mellifera*), bush monkeyflower (*Diplacus aurantiacus*), hoary leaf ceanothus (*Ceanothus crassifolius*), and California coffee berry (*Frangula californica*). Common native herbaceous species included yellow pincushion (*Chaenactis glabriuscula*), small wirelettuce (*Stephanomeria exigua*), Clearwater cryptantha (*Cryptantha intermedia*), caterpillar phacelia (*Phacelia cicutaria*), and miniature lupine (*Lupinus bicolor*). Non-native species present include tree tobacco (*Nicotiana glauca*), Spanish broom (*Spartium junceum*), shortpod mustard (*Hirschfeldia incana*), and various grasses (*Avena* spp. and *Bromes* spp.).

Coast Live Oak Woodland Alliance (71.060.00)

Coast live oak woodland alliance is dominated by coast live oak (*Quercus agrifolia*), but it may include other tree species with less frequency. Coast live oak is a drought-resistant evergreen tree that grows to 80 feet in height. The canopy structure can be open to continuous and the shrub and herbaceous layers are sparse to intermittent. Coast live oak woodland are found on alluvial terraces, canyon bottoms, stream banks, slopes, flats. Soils are typically deep, sandy, or loamy with high organic matter (CNPS 2019).

In the study area, coast live oak woodland is found along Gabrielino Trail/Access Road and Arroyo Boulevard. Additional tree species found in the community include canyon live oak (*Quercus chrysolepis*), California sycamore (*Platanus racemosa*), and bigleaf maple (*Acer macrophyllum*). The shrub component is sparse and consists of species also found in California sagebrush–California buckwheat–laurel sumac scrub. The understory was also sparse and common native herbaceous species include poison oak (*Toxicodendron diversilobum*), American black nightshade (*Solanum americanum*), golden currant (*Ribes aureum*), miner's lettuce (*Claytonia perfoliata*), and California polypody (*Polypodium californicum*).

White Alder–California Sycamore Woodland Association (61.420.11)

White alder–California sycamore woodland association is dominated by white alder (*Alnus rhombifolia*) and California sycamore. The association is part of the white alder groves alliance (61.420.00). White alder is a deciduous hardwood that attains 115 feet in height. California sycamore is a fast-growing, deciduous tree that attains 80 feet in height and is well adapted to intermittent flooding conditions. The community typically occurs in inland foothills and lower montane zones, usually as narrow strips along perennial stream courses throughout cismontane California. It is well adapted to many flood regimes. White alder–California sycamore woodland is considered a sensitive vegetation community by CDFW (2019a).

In the study area, white alder–California sycamore woodland is found in Area 2. The understory was very sparse and native herbaceous species include California blackberry (*Rubus ursinus*), and scarlet monkeyflower (*Erythranthe cardinalis*).

California Sycamore Woodlands Alliance (61.310.00)

California sycamore woodlands alliance is dominated by California sycamore, but it may include other tree species with less frequency. California sycamore is a fast-growing, deciduous tree that attains 80 feet in height and is well adapted to intermittent flooding conditions. The canopy structure can be open to continuous, the shrub layer is sparse to continuous, and the herbaceous layers is variable. California sycamore woodlands are found in gullies, intermittent streams, springs, seeps, stream banks, and terraces adjacent to floodplains that are subject to high-intensity flooding. Soils are typically rocky or cobbly alluvium with permanent moisture at depth (CNPS 2019). California sycamore woodlands is considered a sensitive vegetation community by CDFW (CDFW 2019a).

In the study area, California sycamore woodlands are found within the Area 2 portion of the study area, on the west side of the Gabrielino Trail/Access Road and at the base of a steep slope. The understory consisted of poison oak and the non-native English ivy (*Hedera helix*).

Arroyo Willow–Mulefat Scrub Association (61.201.06)

Arroyo willow–mulefat scrub association is dominated by arroyo willow (*Salix lasiolepis*) and mulefat (*Baccharis salicifolia*). The association is part of the arroyo willow thickets alliance (61.201.00). Arroyo willow is a riparian tall shrub or tree that grows up to 26 feet in height. Mulefat is an evergreen shrub with willow-like leaves that have widely spaced, fine teeth and shiny upper surfaces. The canopy is open to continuous and the herbaceous layer is variable. The community is typically found on stream banks and benches, slope seeps, and stringers along drainages.

In the study area, arroyo willow–mulefat scrub association is located within the wash of the Arroyo Seco, adjacent to Area 3. Additional species present are similar to those found in the California sagebrush–California buckwheat–laurel sumac scrub association.

Laurel Sumac Scrub Alliance (45.455.00)

Laurel sumac scrub alliance is dominated by laurel sumac, but may include other shrub species. Laurel sumac is a large, large-leaved sclerophyllous shrub that grows to 16 feet in height. The canopy of Laurel sumac scrub is open or continuous and the herbaceous layer is sparse or grassy. The community is typically found on steep slopes and soils are shallow and fine textured (CNPS 2019).

In the study area, laurel sumac scrub is found in only one location on the western edge of Area 3. No other substantial shrub species are present. The understory is composed primarily of non-native vegetation that was dominated by shortpod mustard (*Hirschfeldia incana*) and various grasses (primarily *Avena* spp. and *Bromes* spp.).

California sagebrush–California Buckwheat Scrub Alliance (32.110.00)

California sagebrush–California buckwheat scrub alliance is dominated by California sagebrush and California buckwheat. California sagebrush is a much-branched shrub up to eight feet tall with shallow roots. California buckwheat is a semi-woody, multi-branched shrub with woody, many-branched roots. The herbaceous layer is seasonally present. The community is typically found on slopes that are steep and occurs on fine-textured soils developed from granitic or sedimentary rocks (CNPS 2019). California sagebrush–California buckwheat scrub is considered a sensitive vegetation community by CDFW (CDFW 2019a).

In the study area, California sagebrush–California buckwheat scrub is found on the eastern slope adjacent to Area 2. Other species present are similar to those found in the California sagebrush–California buckwheat–laurel sumac scrub association.

Urban/Developed

Urban/developed land refers to areas that have been constructed upon or disturbed so severely that native vegetation is no longer supported (Holland 1986). Developed land includes areas with permanent or semi-permanent structures, pavement or hardscape, landscaped areas, and areas with a large amount of debris or other materials (Holland 1986). Developed areas are generally graded and compacted, sometimes covered with gravel road base or built, and have little to no vegetation present. Developed land dominates the majority of the study area for the project and refers to those areas supporting manmade structures or features including paved/compacted roadways, driveways, parking lots, residences, and commercial or industrial buildings. These areas support limited natural ecological processes, native vegetation, or habitat for wildlife species and thus are not considered sensitive by local, state, and/or federal agencies.

In the study area, the urban/developed land is primarily found in Area 3 and the Gabrielino Trail/Access Road. Non-native herbaceous species are present scattered throughout. Common species include redstem stork's bill (*Erodium cicutarium*), puncturevine (*Tribulus terrestris*), and various grasses (primarily *Avena* spp. and *Bromes* spp.).

Disturbed Habitat

Disturbed habitat refers to areas that are not developed yet, lack vegetation, and generally are the result of severe or repeated mechanical perturbation. Areas mapped as disturbed land may include unpaved roads, trails, and graded areas. Vegetation in these areas, if present at all, is usually sparse and dominated by non-native weedy herbaceous species (Jones & Stokes 1993).

In the study area, disturbed habitat is found within Area 3 and is primarily associated with the existing spreading basins. Routine maintenance of the basins keeps a vegetation community from becoming established. Dominant species found in disturbed habitat are non-native and include prickly lettuce (*Lactuca serriola*), shortpod mustard, wild radish (*Raphanus sativa*), tocalote (*Centaurea melitensis*), and various grasses (*Avena* spp. and *Bromes* spp.). Common native species include Canadian horseweed (*Erigeron canadensis*), common sunflower (*Helianthus annuus*), and telegraph weed (*Heterotheca grandiflora*). Components of California sagebrush–California buckwheat scrub are present, but native shrub cover is present in low abundance and density (i.e., less than 20% cover within minimum mapping units of 0.1 acres or more).

Parks and Ornamental Plantings

Parks and ornamental plantings consist of introduced trees, shrubs, flowers, and turf grass. Ornamental landscaping occurs in greenbelts, parks, and horticultural plantings throughout the county (Jones & Stokes 1993). In the study area, ornamental landscaping occurs at the southern end of North Arroyo Boulevard.

Special-Status Plants

Prior to conducting focused surveys for special-status plants, Dudek performed an extensive desktop review of literature, existing documentation, and GIS data to evaluate the potential for special-status plant species to occur

within the proposed program area. Each special-status plant species was assigned a rating of "not expected," "low," "moderate," or "high" potential to occur based on relative location to known occurrences, vegetation community, soil, and elevation. Based on the results of the literature review and database searches, 44 special-status plant species were identified as having recorded occurrences within the region of the study area and were the focus of the focused surveys for special-status plants. Based upon the results of the habitat assessment and focused surveys, no plant species observed and none were determined to have either moderate or high potential to occur within the study area based on the focused plant surveys and the existing soils, vegetation communities (habitat) present, elevation range, and previous known locations based on the CNDDB (CDFW 2019b); CNPS Rare Plant Inventory of Rare, Threatened, and Endangered Plants of California (2019b); and Calflora (2019).

Special-Status Wildlife

Dudek performed an extensive desktop review of literature, existing documentation, and GIS data to evaluate the potential for special-status wildlife species to occur within the study area. Each special-status wildlife species was given a rating of not expected, low, medium, or high based on relative location to known occurrences, vegetation communities, soils, and elevation. Based on the results of the literature review and database searches, 41 special-status wildlife species were identified as having recorded occurrences within the study area. Of these, one species was observed (yellow warbler, *Setophaga petechia*), four others are assumed to be present based upon previous observation within or adjacent to the study area (California newt, *Taricha torosa*; two-striped gartersnake, *Thamnophis hammondii*; southern California legless lizard, *Anniella stebbinsi*; and coastal whiptail, *Aspidoscelis tigris stejnegeri*), and one species (hoary bat, *Lasiurus cinereus*) that has a moderate potential to occur within the study area based on the vegetation communities (habitat) present and previous known locations based on the CNDDB and USFWS occurrence data. Table 4.2-2 includes the special-status wildlife species that are present or have a moderate potential to occur. Appendix H of the BRTR (included as Appendix D of this Draft EIR) lists the 41 special-status wildlife species identified as occurring within the region of the study area and their potential to occur rating.

Table 4.2-2. Special-Status Wildlife Species Present or with Medium or High Potential to Occur within the Study Area

Scientific Name	Common Name	Status Federal/State	Habitat	Potential to Occur
Amphibians				
Taricha torosa	California newt	None/SSC	Wet forests, oak forests, chaparral, and rolling grassland	Previously observed and assumed to be present. The species was observed during surveys for the study area in 2013 in the Arroyo Seco, but was not observed in 2019. Suitable habitat is present within Area 2, and the species could be encountered on the Gabrielino Trail/Access Road to Area 2.

Table 4.2-2. Special-Status Wildlife Species Present or with Medium or High Potential to Occur within the Study Area

Scientific Name	Common Name	Status Federal/State	Habitat	Potential to Occur
Reptiles				
Anniella stebbinsi	Southern California legless lizard	None/SSC	Coastal dunes, stabilized dunes, beaches, dry washes, valley–foothill, chaparral, and scrubs; pine, oak, and riparian woodlands; associated with sparse vegetation and moist sandy or loose, loamy soils	Previously observed and assumed to be present. There are five recent (2017 and 2018) records from study area and adjacent areas of Hahamonga Park. Suitable habitat is present within Area 2 and Area 3, and it could be encountered on the Gabrielino Trail/Access Road to Area 2.
Aspidoscelis tigris stejnegeri	coastal whiptail	None/SSC	Hot and dry areas with sparse foliage, including chaparral, woodland, and riparian areas	Previously observed and assumed to be present. The species was observed during the 2013 surveys for the study area and suitable habitat for the species occurs throughout the study area and surrounding area.
Thamnophis hammondii	two-striped gartersnake	None/SSC	Streams, creeks, pools, streams with rocky beds, ponds, lakes, vernal pools	Previously observed and assumed to be present. The species was observed during the 2013 surveys for the study area and suitable habitat for the species occurs throughout the study area and surrounding area.
Birds				
Setophaga petechia (nesting)	yellow warbler	None/SSC	Riparian plant associations in close proximity to water; frequently found nesting and foraging in willow shrubs and thickets, and in other riparian plants including cottonwoods, sycamores, ash, and alders	Present. Observed during the 2019 surveys in the study area near Area 2.

Table 4.2-2. Special-Status Wildlife Species Present or with Medium or High Potential to Occur within the Study Area

Scientific Name	Common Name	Status Federal/State	Habitat	Potential to Occur
Mammals				
Lasiurus cinereus	hoary bat	None/None	Forest, woodland riparian, and wetland habitats; also juniper scrub, riparian forest, and desert scrub in arid areas; generally roosts in dense foliage of medium to large trees; preferred sites are hidden from above, with few branches below, and have ground cover of low reflectivity; females and young tend to roost at higher sites in trees	Medium potential to occur. Suitable associated day/night roosting, maternity roosts, and foraging habitat for the individuals of the species occurs within the study area, and there are records of the species from other watersheds within the San Gabriel Mountains that have similar habitat to Arroyo Seco.

SSC = Species of Special Concern

Special-Status Species Protocol/Focused Survey Results

Based upon the results of the literature review and habitat assessment for special-status wildlife, protocol surveys were conducted for least Bell's vireo (*Vireo bellii pusillus*) and southwestern flycatcher (*Empidonax traillii extimus*) and focused surveys were conducted for arroyo toad (*Anaxyrus californicus*), California red-legged frog (*Rana draytonii*), arroyo chub (*Gila orcuttii*), and rainbow trout/southern steelhead (*Oncorhynchus mykiss irideus* pop. 10). None of the focal species were observed. Table 4.2-3, Protocol/Focused Survey Special-Status Wildlife Species, summarizes the species status, habitat, and potential to occur.

Table 4.2-3. Protocol/Focused Survey Special-Status Wildlife Species

Scientific Name	Common Name	Status Federal/State	Habitat	Potential to Occur
Fish				
Gila orcuttii	arroyo chub	None/SSC	Warm, fluctuating streams with slow-moving or backwater sections of warm to cool streams at depths >40 centimeters (16 inches); substrates of sand or mud	Focused surveys for the species were negative in 2019. Not expected to occur in the study area or upstream and downstream from the study area. Habitat for the species is marginal in the study area. The species is considered to be extirpated from the Arroyo Seco.
Oncorhynchus mykiss irideus pop. 10	steelhead – Southern California DPS	FE/None	Clean, clear, cool, well-oxygenated streams; needs relatively deep pools in migration and gravelly substrate to spawn	Focused surveys for the species were negative in 2019. Not expected to occur in the study area or downstream from the study area. Population within Arroyo Seco are from historic stocking of hatchery-raised rainbow trout by CDFW. Access to the study area from downstream waters is blocked by Devil's Gate Dam.
Amphibians				
Anaxyrus californicus	arroyo toad	FE/SSC	Semi-arid areas near washes, sandy riverbanks, riparian areas, palm oasis, Joshua tree, mixed chaparral and sagebrush; stream channels for breeding (typically third order); adjacent stream terraces and uplands for foraging and wintering	Focused surveys for the species were negative in 2019. Not expected to occur on the study area or upstream and downstream from the study area. Habitat for the species is marginal in the study area. Historically occurred at this location are considered extirpated due to the loss of habitat and the introduction of predators and competitors Protocol surveys for the species conducted in 2013 for the study area were negative.

Table 4.2-3. Protocol/Focused Survey Special-Status Wildlife Species

Scientific Name	Common Name	Status Federal/State	Habitat	Potential to Occur
Rana draytonii	California red-legged frog	FT/SSC	Lowland streams, wetlands, riparian woodlands, livestock ponds; dense, shrubby or emergent vegetation associated with deep, still or slow-moving water; uses adjacent uplands	Focused surveys for the species were negative in 2019. Not expected to occur on the study area or upstream and downstream from the study area. Habitat for the species is marginal in the study area. The species is considered extirpated from the system due to the loss of habitat and the introduction of predators and competitors. Protocol surveys for the species conducted in 2013 for the study area were negative.
Birds				
Empidonax traillii extimus (nesting)	southwestern willow flycatcher	FE/SE	Nests in dense riparian habitats along streams, reservoirs, or wetlands; uses variety of riparian and shrubland habitats during migration	Low potential to occur. Protocol surveys for the species were negative in 2019. Marginal nesting habitat for the species does occur in the study area.
Vireo bellii pusillus (nesting)	least Bell's vireo	FE/SE	Nests and forages in low, dense riparian thickets along water or along dry parts of intermittent streams; forages in riparian and adjacent shrubland late in nesting season	Low potential to occur. Protocol surveys for the species were negative in 2019. Suitable nesting habitat for the species does occur in the study area.

Potential Jurisdictional Waters

With respect to USACE-jurisdictional waters of the U.S., including wetlands, the USACE makes the jurisdictional determination. The USACE issues two types of jurisdictional determinations: preliminary and approved.[2] Both types of determinations require a submittal of a formal jurisdiction delineation report. CDFW and RWQCB also may request a site visit to review the jurisdictional delineation and may potentially change the limits of delineation. Therefore, the jurisdiction determinations provided are preliminary and only identify the potential for jurisdictional areas to be affected by the Project in accordance with the CEQA thresholds.

As shown in Figure 4.2-2, Potential Jurisdictional Waters (Sheets 1 and 2), no wetlands were identified within the study area. Potential non-wetland jurisdictional waters identified in the study area include the Arroyo Seco, Millard Canyon Stream (a tributary to Arroyo Seco), and the spreading basins. The delineation of the study area identified a total of 0.79 acres of waters of the United States; 4.65 acres under RWQCB jurisdiction; and 6.44 acres under the jurisdiction of the CDFW present in the study area. Table 4.2-4, Potential Jurisdictional Waters Delineated within the Study Area, summarizes the acreage of jurisdictional waters by regulatory agency.

Table 4.2-4. Potential Jurisdictional Waters Delineated within the Study Area

Area	USACE Jurisdiction Non- Wetland Waters of the U.S. (acres)	RWQCB Jurisdiction (acres)	CDFW Jurisdiction (acres)
Area 2	0.25	0.25	0.79
Area 3	0.42	4.29	4.64
Gabrielino Trail/Access Road	0.11	0.11	1.01
Screen Building Staging Area	—	—	<0.01
Behner Treatment Plant Staging Area	—	—	—
Total	**0.79**	**4.66**	**6.44**

Source: Appendix D

Notes: Numbers may not sum due to rounding.

Non-wetland waters of the U.S. regulated by the USACE are drainage features that conduct water at some point during the year, evidenced by the presence of an OHWM, but do not satisfy the criteria to be considered a wetland (wetland soils and/or vegetation is absent). In the study area, there were areas of waters of the U.S. that had open water during the surveys and delineations. The limits of non-wetland waters of the U.S. are defined by the presence of the OHWM. Evidence of the OHWM in the survey area includes surface relief, scour lines, flowing water, and breaks in bank slopes.

[2] The USACE issues two types of JDs—preliminary and approved. A preliminary JD is an expedited process typically initiated at the time that a 404 permit is requested for impacts to federal jurisdictional waters; the preliminary JD is non-binding and does not involve USACE review. This process is used when the permittee does not wish to request a determination that some or all of the potentially jurisdictional waters on the Project site are isolated (under the Rapanos decision) or otherwise not subject to federal jurisdiction. An approved JD is requested through submittal of a JD report and the accompanying form. It requires USACE review of the report and application of the criteria used to request a non-federal JD.

The RWQCB jurisdictional boundaries are defined as those determined for the USACE under waters of the U.S. However, the RWQCB takes jurisdiction over both connected and isolated waters. Isolated features (those that do not have a direct connection to an already determined waters of the U.S.) are under the jurisdiction of the RWQCB, but not the USACE. The spreading basins in Area 3 are considered isolated waters since they have no downstream connection with the Arroyo Seco; therefore, they are under the jurisdiction of the RWQCB, but not the USACE.

The CDFW jurisdiction extends from the top of the bank to the top of the bank, except where there is adjacent riparian vegetation. CDFW jurisdictional areas include the Arroyo Seco and the spreading basins in Area 3. Riparian habitats in the study area under CDFW jurisdiction include white alder–California sycamore woodland Area 2 and along the norther portions of the Gabrielino Trail/Access Road and arroyo willow–mulefat scrub associated with the Arroyo Seco adjacent to Area 3. Additionally, the portions of the coast live oak woodlands and California sycamore woodlands in Area 2 and along the northern portions of the Gabrielino Trail/Access Road that contain the top of banks of the Arroyo Seco are also included under CDFW jurisdiction. The spreading basins in Area 3 are primarily devoid of native vegetation.

Wildlife Corridors and Habitat Linkages

Wildlife corridors are linear features that connect large patches of natural open space and provide avenues for dispersal or migration of animals and dispersal of plants (e.g., through wildlife vectors). Wildlife corridors contribute to population viability by assuring continual exchange of genes between populations, which helps maintain genetic diversity; providing access to adjacent habitat areas representing additional territory for foraging and mating; allowing for a greater carrying capacity; and providing routes for colonization of habitat lands following local population extinctions or habitat recovery from ecological catastrophes (i.e., the rescue effect).

Habitat linkages are small patches that join larger blocks of habitat and help reduce the adverse effects of habitat fragmentation. They serve as connections between habitat patches and help reduce the adverse effects of habitat fragmentation. Although individual animals may not move through a habitat linkage, the linkage is a potential route for gene flow and long-term dispersal. Habitat linkages may serve as both habitat and avenues of gene flow for small animals such as reptiles, amphibians, and rodents. Habitat linkages may be represented by continuous patches of habitat or by nearby habitat “islands” that function as stepping stones for dispersal and movement (especially for birds and flying insects). Wildlife corridors and habitat linkages provide avenues for dispersal or migration of animals that also contribute to population viability in several ways, including (1) ensuring continual exchange of genes between populations to aid in maintaining genetic diversity, (2) providing habitat for some species, (3) providing access to adjacent habitat areas representing additional territory for foraging and mating, (4) allowing for a greater carrying capacity, and (5) providing routes for colonization of habitat lands following local population extinctions or habitat recovery from ecological catastrophes.

The study area does not reside within any designated wildlife corridors and/or habitat linkages identified in the South Coast Missing Linkages analysis project (South Coast Wildlands 2008) or California Essential Habitat Connectivity project (Spencer et al. 2010). On a regional level, the study area and Hahamongna Watershed Park form an open space area that is located just south of the ANF, which has large, continuous natural habitats. Urban development is located to the east, west, and south of this area, which includes the artificial channelization of Arroyo Seco.

Terrestrial Species

Larger, urban-adapted terrestrial wildlife (e.g., coyotes [*Canis latrans*]) are expected to pass through the study area and Hahamongna Watershed Park to the urban environment, but the study area is not part of a regional corridor or habitat linkage between another large open space. On a local level, terrestrial wildlife would be expected to move between the ANF and the Hahamongna Watershed Park using the study area and the portions of the Arroyo Seco outside of the study area and downstream of the JPL bridge.

Aquatic Species

The Arroyo Seco historically provided habitat for seven species of native freshwater fish, namely Pacific brook lamprey (*Lampetra spp*.), Pacific lamprey (*Entosphenus tridentata*), rainbow trout/steelhead, arroyo chub, Santa Ana speckled dace (*Rhinichthys osculus*), Santa Ana sucker (*Catostomus santaanae*), and unarmored threespine stickleback (*Gasterosteus aculeatus williamsoni*). All occurred in Arroyo Seco and were recorded by Culver and Hubbs (1917). None, except rainbow trout, have been recorded as present in Arroyo Seco upstream of Devil's Gate Dam for at least 50 years (Swift and Seigel 1993; Moyle 2002) and probably much longer. Rainbow trout that have been observed in upper Arroyo Seco are believed to be present at least partly due to fish planting over the years. Rainbow trout were present in upper Arroyo Seco (upstream of the diversion) prior to the 2009 Station Fire but have not been detected there since (Scauzillo 2017).

For potential aquatic species, the study area is in between two impassable barriers: Devil's Gate Dam downstream and Brown Mountain Dam upstream, which prohibits regional movement of fish in the Arroyo Seco. The majority of the Arroyo Seco Channel and Los Angeles River downstream of the Devil's Gate Dam consists of a concrete-lined channel and the majority of it does not provide suitable habitat for fish or other sensitive species (Chambers Group 2013). On a local level, the portion of the Arroyo Seco between the two dams, including Area 2, does provide habitat for fish, and if occupied by fish (no fish were detected during the focused fish survey conducted in 2019), it would be expected that there would be local movement between the two dams; however, the current diversion structure in Area 2, an abandoned stream gage at Bridge 3, and several concrete structures upstream of Area 2 would inhibit upstream movement.

Semi-Aquatic Species

Semi-aquatic species (e.g., western toad [*Anaxyrus boreas*], California treefrog [*Pseudacris cadaverina*], Baja California treefrog [*Pseudacris hypochondriaca*], and California newts) can move overland, traveling in the uplands in upstream and downstream directions, as juveniles and adults after an aquatic larval phase. Downstream drift due to the stream current is the primary movement during the larval stage of amphibians. The existing artificial barriers within the study area are not expected to impede movement for these amphibian species. During normal diversion operations in the current conditions, when the weir is fully raised, it is expected that adult and juvenile amphibians use overland routes on the eastern and western slopes to move both up and downstream.

Protected Trees

A total of 93 trees were inventoried within Area 2 and Area 3 of the Study Area, of which 49 are in Area 2, and 44 in Area 3. Figure 4.2-3, Protected Trees (Sheet 1 and 2), presents the location of the individual trees mapped and assessed for the proposed Project. Overall, the trees exhibit growth and structural conditions that are typical of

their location in a native riparian watershed setting prone to drought and wildfires. The trees include various trunk and branch maladies and health and structural conditions. As presented in Appendix D of this Draft EIR, the Protected Tree Report, 34% of the individually mapped trees (32 trees) exhibit good health; 64% (59 trees) are in fair health; 2% (2 trees) are in poor health. Structurally, 5% (5 trees) of the individually mapped trees are considered to exhibit good structure, 88% (82 trees) exhibit fair structure, 7% (6 trees) poor structure. The trees in good condition exhibit acceptable vigor, healthy foliage, and adequate structure, and lack any major maladies. Trees in fair condition are typical, with few maladies but declining vigor. Trees in poor condition exhibit declining vigor, unhealthy foliage, poor branch structure, and excessive lean. No pests or pathogens were observed on site.

4.2.3 Relevant Plans, Policies, and Ordinances

Federal

Federal Endangered Species Act

The federal Endangered Species Act (FESA) of 1973 (16 USC 1531 et seq.), as amended, is administered by the U.S. Fish and Wildlife Service (USFWS) for most plant and animal species and by the National Oceanic and Atmospheric Administration National Marine Fisheries Service for certain marine species. This legislation is intended to provide a means to conserve the ecosystems upon which endangered and threatened species depend and provide programs for the conservation of those species, thus preventing the extinction of plants and wildlife. The FESA defines an endangered species as "any species that is in danger of extinction throughout all or a significant portion of its range." A threatened species is defined as "any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." Under FESA, it is unlawful to "take" any listed species, and "take" is defined as, "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct."

FESA allows for the issuance of incidental take permits for listed species under Section 7, which is generally available for projects that also require other federal agency permits or other approvals, and under Section 10, which provides for the approval of habitat conservation plans on private property without any other federal agency involvement.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (16 USC 703 et seq.), as amended, prohibits the intentional take of any migratory bird or any part, nest, or eggs of any such bird. Under the Migratory Bird Treaty Act, "take" is defined as pursuing, hunting, shooting, capturing, collecting, or killing, or attempting to do so. In December 2017, Department of the Interior Principal Deputy Solicitor Jorjani issued a memorandum (M-37050) that interprets the Migratory Bird Treaty Act's "take" prohibition to apply only to affirmative actions that have as their purpose the taking or killing of migratory birds, their nests, or their eggs. Unintentional or accidental take is not prohibited (DOI 2017). Additionally, Executive Order 13186, Responsibilities of Federal Agencies to Protect Migratory Birds, requires that any project with federal involvement address impacts of federal actions on migratory birds with the purpose of promoting conservation of migratory bird populations (66 FR 3853–3856). The Executive Order requires federal agencies to work with USFWS to develop a memorandum of understanding. USFWS reviews actions that might affect these species.

Clean Water Act

The Clean Water Act provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters. Section 401 requires a project operator for a federal license or permit that allows activities resulting in a discharge to waters of the United States to obtain state certification, thereby ensuring that the discharge will comply with provisions of the Clean Water Act. The RWQCBs administer the certification program in California. Section 402 establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the United States. Section 404 establishes a permit program administered by USACE that regulates the discharge of dredged or fill material into waters of the United States, including wetlands. USACE implementing regulations are found at 33 CFR 320 and 330. Guidelines for implementation are referred to as the Section 404(b)(1) Guidelines, which were developed by the U.S. Environmental Protection Agency in conjunction with USACE (40 CFR 230). The guidelines allow the discharge of dredged or fill material into the aquatic system only if there is no practicable alternative that would have less adverse impacts.

Wetlands and Other Waters of the United States

Aquatic resources, including riparian areas, wetlands, and certain aquatic vegetation communities, are considered sensitive biological resources and can fall under the jurisdiction of several regulatory agencies. USACE exerts jurisdiction over waters of the United States, including all waters that are subject to the ebb and flow of the tide; wetlands and other waters such as lakes, rivers, streams (including intermittent or ephemeral streams), mudflats, sandflats, sloughs, prairie potholes, vernal pools, wet meadows, playa lakes, or natural ponds; and tributaries of the above features.

The extent of waters of the United States is generally defined as that portion that falls within the limits of an ordinary high-water mark (OHWM). Typically, the OHWM corresponds to the water surface elevation of a 2-year flood event (USACE 2008). In addition, waters of the United States may include wetlands, including swamps, bogs, seasonal wetlands, seeps, marshes, and similar areas, defined by USACE as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR 328.3[b]; 40 CFR 230.3[t]). Indicators of three wetland parameters (i.e., hydric soils, hydrophytic vegetation, and wetlands hydrology), as determined by field investigation, must be present for a site to be classified as a wetland by USACE (USACE 1987).

State/Regional

California Endangered Species Act

The California Endangered Species Act (CESA) (California Fish and Game Code, Section 2050-2068) provides protection and prohibits the take of plant, fish, and wildlife species listed by the State of California. Unlike FESA, under CESA state-listed plants have the same degree of protection as wildlife, but insects and other invertebrates may not be listed. Take is defined similarly to FESA and is prohibited for both listed and candidate species. Take authorization may be obtained by the project applicant from CDFW under CESA Section 2081, which allows take of a listed species for educational, scientific, or management purposes. In this case, private developers consult with CDFW to develop a set of measures and standards for managing the listed species, including full mitigation for impacts, funding of implementation, and monitoring of mitigation measures.

California Fish and Game Code

Fully Protected Species

Sections 3511, 4700, 5050, and 5515 of the California Fish and Game Code outline protection for fully protected species of mammals, birds, reptiles, amphibians, and fish. Species that are fully protected by these sections may not be taken or possessed at any time. CDFW cannot issue permits or licenses that authorize the "take" of any fully protected species, except under certain circumstances, such as scientific research and live capture and relocation of such species pursuant to a permit for the protection of livestock. Furthermore, it is the responsibility of the CDFW to maintain viable populations of all native species. Toward that end, the CDFW has designated certain vertebrate species as Species of Special Concern (SSC), because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction.

Section 5901

Section 5901 makes it unlawful to construct or maintain any device or contrivance that prevents, impedes, or tends to prevent or impede, the passing of fish up and down stream. Fish are defined in Section 45 as a wild fish, mollusk, crustacean, invertebrate, amphibian, or part, spawn, or ovum of any of those animals.

Section 5937

Section 5937 requires that the owner of any dam shall allow sufficient water at all times to pass through a fishway, or in the absence of a fishway, allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or exist below the dam. During the minimum flow of water in any river or stream, permission may be granted by the department to the owner of any dam to allow sufficient water to pass through a culvert, waste gate, or over or around the dam, to keep in good condition any fish that may be planted or exist below the dam, when, in the judgment of the department, it is impracticable or detrimental to the owner to pass the water through the fishway.

Section 1602

Under Section 1602 of the California Fish and Game Code, a project operator is required to notify CDFW prior to any project that would divert, obstruct, or change the natural flow, bed, channel, or bank of any river, stream, or lake. Pursuant to the code, a "stream" is defined as a body of water that flows at least periodically, or intermittently, through a bed or channel having banks and supporting fish or other aquatic life. Based on this definition, a watercourse with surface or subsurface flows that supports or has supported riparian vegetation is a stream and is subject to CDFW jurisdiction. Altered or artificial watercourses valuable to fish and wildlife are subject to CDFW jurisdiction. CDFW also has jurisdiction over dry washes that carry water during storm events.

Preliminary notification and project review generally occur during the environmental process. When an existing fish or wildlife resource may be substantially adversely affected, CDFW is required to propose reasonable project changes to protect the resource. These modifications are formalized in a Streambed Alteration Agreement, which becomes part of the plans, specifications, and bid documents for the project.

California Native Plant Protection Act

The Native Plant Protection Act of 1977 (see Section 1900 et seq. of the California Fish and Game Code) directed CDFW to carry out the Legislature's intent to "preserve, protect and enhance rare and endangered plants in this State." The Native Plant Protection Act gave the California Fish and Game Commission the power to designate native plants as "endangered" or "rare" and protect endangered and rare plants from take. CESA expanded on the original Native Plant Protection Act and enhanced legal protection for plants, but the Native Plant Protection Act remains part of the California Fish and Game Code. To align with federal regulations, CESA created the categories of "threatened" and "endangered" species. It converted all "rare" animals into the act as threatened species but did not do so for rare plants. Thus, there are three listing categories for plants in California: rare, threatened, and endangered. Because rare plants are not included in CESA, mitigation measures for impacts to rare plants are specified in a formal agreement between CDFW and the project proponent.

Nesting Birds

Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nests or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. Section 3503.5 protects all birds of prey (raptors) and their eggs and nests. Section 3511 states that fully protected birds or parts thereof may not be taken or possessed at any time. Section 3513 states that it is unlawful to take or possess any migratory non-game bird as designated in the MBTA.

Local

Municipal Code Chapter 8.52.020 – City Trees and Tree Protection

For this proposed Project, trees subject to City permit requirements include those defined by municipal code Chapter 8.52.020 (City of Pasadena 2010), as follows:

- "Public tree" means a tree located in a place or area under ownership or control of the city including but without limitation streets, parkways, open space, parkland and including city owned property under the operational control of another entity by virtue of a lease, license, operating or other agreement.
- "Protected tree" means a native, specimen, landmark, landmark-eligible, mature (except for the trees in RS or RM-12 zones), or public tree.

All surveyed trees are located in a City owned property, and therefore meet the definition of a "Public tree", which are considered a "Protected tree" by the City Municipal Code.

Tree replacement ratios are determined based on the size of the tree to be removed (i.e., larger trees require a higher replacement ratio). Tree replacement guidelines as specified in the City Tree Ordinance are provided in Table 4.2-5, City of Pasadena Protected Tree Replacement Matrix.

Table 4.2-5. City of Pasadena Protected Tree Replacement Matrix

Trunk Diameter of Removed Tree	Replacement Ratio	Container Replacement Size
8.0–12.9 inches	6:1	15 gallons
	3:1	24-inch box
13.0–18.9 inches	8:1	15 gallons
	4:1	24-inch box
	2:1	36-inch box
19.0–36.9 inches	8:1	24-inch box
	4:1	36-inch box
>37 inches	12:1	24-inch box
	8:1	36-inch box

Source: City of Pasadena 2010

4.2.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to biological resources are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to Biological Resources would occur if the project would:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

Through the analysis in the Initial Study (see Appendix A-1), it was determined that the proposed Project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan. (i.e., Threshold f).

f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Accordingly, this issue is not further analyzed in the Draft EIR and the pertinent impact analysis can be reviewed in the Initial Study.

4.2.5 Environmental Impacts Analysis

Threshold 4.2a **Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?**

Short-Term Construction Impacts

One special-status amphibian (California newt) and three reptiles (two-striped gartersnake, Southern California legless lizard, and coastal whiptail) have occurred in the study area. These species are all designated as CDFW SSC. Due to the presence of suitable habitat, and/or documented occurrences for these species within the vicinity of the Project site, there is potential for these species to occur on site. If these species are determined to occur on the Project site prior to construction, Project-related impacts could be considered significant if the impact causes the greater population of either species to drop below self-sustaining levels. These species are vulnerable to mortality or injury if struck by moving vehicles or equipment if present on-site during construction, and also during vegetation and ground disturbing activities associated because they tend to be cryptic, slow moving, and below ground or under rocks or debris during cooler periods.

It is unlikely that short-term construction activities could cause the greater population of these special-status species to drop below self-sustaining levels due to the relatively small area of construction activity and the short-term nature of the construction schedule. However, in order to ensure that potential impacts to special status species are reduced to the extent feasible, MM-BIO-1 requires the preparation of a Pre-Construction Survey and Relocation Plan, which would set forth protocols and procedures for surveying, identifying, and relocating wildlife that may be within the construction impact area. Project implementation of MM-BIO-1 would reduce potential direct impacts to special-status reptile wildlife (i.e. California newt, two-striped gartersnake, Southern California legless lizard, and coastal whiptail) to a level less than significant.

One special-status bird species, the yellow warbler has a moderate potential to nest and forage within the open shrublands throughout the Project site. This species is a CDFW SSC and there is a potential for this species to nest and/or forage within or immediately adjacent to the construction and staging areas. Project-related direct impacts would occur if construction would result in direct or indirect impacts to nesting and foraging habitat for yellow warbler. Additionally, the trees and shrubs within the Project site provides suitable nesting habitat for bird species and/or raptors protected under the Migratory Bird Treaty Act (MBTA; 16 USC 703-712) and California Fish and Game Code Sections 3503.5, 3503, and 3513. Trimming, pruning, and/or removal of trees and shrubs would occur as a result of construction activities, and could disrupt breeding activity if nesting birds/raptors are present.

Therefore, the Project could result in direct impacts to nesting birds (i.e., direct impacts to individuals, active nests, eggs, or young), particularly during the general nesting season of February 1 through August 31. Construction activities that could result in direct impacts to nesting birds include vegetation and tree removal during grading activities. Project implementation of MM-BIO-2 (i.e., seasonal recommendations, pre-construction survey, avoidance buffers, and monitoring) would reduce potential direct impacts to a less-than-significant level.

One special-status bat species (hoary bat) has a moderate potential for day/night roosting, maternity roosts, and foraging habitat within the study area. If this species is determined to occur on the Project site prior to construction, it is highly unlikely that short-term construction activities could cause the greater population of this special-status species to drop below self-sustaining levels due to the relatively small area of construction activity and the short-term nature of the construction schedule. No direct temporary impacts would occur; however, because habitat loss and/or mortality or injury to individual species is a reasonable possibility, direct permanent impacts would be considered potentially significant. Project implementation of MM-BIO-3 (i.e., seasonal recommendations, pre-construction survey, avoidance buffers, and monitoring) would reduce potential direct impacts to a less-than-significant level. Direct impacts to day roosts occupied by individual special-status bat species would be less than significant as the impact would not be expected to reduce populations to below self-sustaining levels.

Long-Term Operational Impacts

City personnel would continue to provide maintenance of the diversion and intake structures in Area 2 as occurs under existing conditions. When necessary, cleaning of the spreading basins in Area 3 would continue to be accomplished by mechanically scraping the top layer of soil using front-end loaders, graders, or scrapers. Regular maintenance of these areas to maintain the function of each facility will limit the growth of vegetation that could provide habitat for special-status species. As such, no long-term operational impacts are expected to special-status species.

Threshold 4.2b Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Short-Term Construction Impacts

The proposed Project would have direct permanent impacts to two CDFW sensitive vegetation communities—white alder-California sycamore woodland association (0.39 acres) and California sycamore woodlands alliance (0.01 acres)—due to the construction of the diversion and intake replacement in Area 2. The Project would have direct temporary impacts to two CDFW sensitive vegetation communities—white alder-California sycamore woodland association (0.11 acres) and California sycamore woodlands alliance (0.01 acres)—due to the construction of the diversion and intake replacement in Area 2. This is due to potential encroachment into the dripline of the woodland without removal of the trees. Direct permanent and temporary impacts to sensitive vegetation communities within the study area are summarized in Table 4.2-5 and illustrated on Figure 4.2-4, Impacts to Vegetation Types (Sheets 1 and 2).

Table 4.2-5. Permanent and Temporary Direct Impacts to Sensitive Vegetation Communities

Vegetation Community	Direct Permanent Impacts (acres)	Direct Temporary Impacts (acres)	Not Impacted (acres)	Total (acres)
White alder–California sycamore woodland association[a]	0.39	0.11	0.38	0.88
California sycamore woodlands alliance[a]	0.01	0.01	0.23	0.24

Table 4.2-5. Permanent and Temporary Direct Impacts to Sensitive Vegetation Communities

Vegetation Community	Direct Permanent Impacts (acres)	Direct Temporary Impacts (acres)	Not Impacted (acres)	Total (acres)
Arroyo willow–mulefat scrub association[a]	—	—	0.10	0.10
California sagebrush–California buckwheat scrub alliance[a]	—	—	0.09	0.09
Grand Total	**0.39**	**0.12**	**0.81**	**1.31**

Source: Appendix D

Note: Numbers may not sum due to rounding.

[a] NatureServe Global and State rarity ranks per Faber-Langendoen et al. (2012). Natural communities with global or state ranks of 1–3 are considered Sensitive Natural Communities by CDFW and are to be addressed in the environmental review processes of CEQA (CDFW).

The white alder–California sycamore woodland and California sycamore woodlands alliance vegetation communities are considered sensitive by CDFW due to their relative rarity and therefore, the loss of these vegetation communities (both permanent and temporary) would be considered significant, absent mitigation. Project implementation of MM-BIO-4 (i.e., compensation for direct impacts to sensitive vegetation communities) would reduce potential direct impacts to a less-than-significant level.

Potential short-term or temporary indirect impacts to sensitive vegetation communities in the study area would primarily result from construction activities and include impacts related to or resulting from the generation of fugitive dust, increased human activity, and the introduction of pollutants from construction equipment. Excessive dust can decrease the vigor and productivity of vegetation through effects on light, penetration, photosynthesis, respiration, transpiration, increased penetration of phytotoxic gaseous pollutants, and increased incidence of pests and diseases. Erosion and chemical pollution (releases of fuel, oil, lubricants, paints, release agents, and other project-related materials) may affect sensitive vegetation communities. The use of chemical pollutants can decrease the number of plant pollinators, increase the existence of non-native plants, and cause damage to and destruction of native plants. These potential short-term, construction-related indirect impacts could affect the sensitive vegetation communities in the study area. Potential construction-related indirect impacts to sensitive vegetation communities would be less than significant with the implementation of MM-BIO-5 (i.e., demarcation of disturbance limits) and MM-BIO-6 (biological monitoring during construction).

Other vegetation communities and land cover types (California sagebrush–California buckwheat–laurel sumac scrub association, laurel sumac scrub alliance, urban/developed, and disturbed habitat) are not considered sensitive by CDFW because they are relatively common; therefore, the loss of these additional vegetation communities (both permanent and temporary) would be less than significant.

Long-Term Operational Impacts

The current operation of the diversion weir and intake allows for moderate flows in the stream to be diverted during the wet season; however, operations bypass the diversion of surface water during storm events where flows are generally greater than approximately 25 cfs to prevent excessive sediment from entering the spreading basins. During dry summer months, surface flows in the upper Arroyo Seco are sufficiently low to allow the City to divert virtually all surface flows in the stream.

Psomas conducted an analysis (Psomas 2018) (provided as Appendix J, Arroyo Seco Canyon Diversions Biological Impacts Memorandum [Memorandum] to the BRTR, which is Appendix D of this Draft EIR), analyzed the indirect Project impacts to downstream habitats due to the increase in the amount of water diverted into the spreading basins. The study took the conservative approach of analyzing project impacts by comparing it to a "without diversion" scenario, rather than the current diversion operations. This approach reflects the maximum possible change from existing conditions. This Memorandum included a hydraulics, sediment transport, and groundwater analysis, which provided the baseline for an analysis of potential ecological effects of flow diversions on downstream willow habitat (potential habitat occupied by least Bell's vireo) conducted by the Southern California Coastal Water Research Project (SCCWRP).

The study area for the analysis includes a portion of the upper Arroyo Seco from Devil's Gate Dam extending upstream to Area 2 (see Appendix D of this Draft EIR in Appendix J: Exhibit 1, study area). As the Arroyo Seco flows in a southerly direction past the existing diversion weir and past the JPL Bridge, the channel morphology changes from a narrow canyon to a wide alluvial plain. During high flow periods, surface flows can reach the Devil's Gate Reservoir, but at other times, water quickly infiltrates into the sandy sediment at the uppermost portion of the Reservoir. Therefore, a lack of observed surface water doesn't necessarily correlate to insufficient moisture within the substrate for the riparian vegetation in the Reservoir (Psomas 2018).

During the wet periods or during episodic storms, surface water will flow from the upper Arroyo Seco into the Reservoir. Ongoing surface flows from the Arroyo Seco will result in standing water in the Reservoir. A review of historic aerial photos from Google Earth shows at least some surface water in the lower portion of the Reservoir in May 2003, January 2005, November 2005, March 2006, October 2007, January 2008, November 2009, and March 2011. Surface water is not observed in aerial photos subsequent to 2011, which corresponds to the severe drought conditions experienced in California from 2011 through 2016 (Psomas 2018).

The dominant vegetation community in the Devil's Gate Reservoir is Black Willow Series (Sawyer et al. 2009), in which Goodding's black willow (Salix gooddingii) is the dominant species (Chambers Group 2010). This vegetation type occurs throughout the lower portion of Devil's Gate Reservoir, correlated with the wettest conditions observed in an aerial photo analysis conducted. In general, the spatial distribution of vegetation in Psomas' study area is correlated to the hydrology of the area. Modest dry season surface flows occur immediately downstream of the diversion weir, which encourages establishment of facultative wetland species such as California sycamore and white alder. As less water is available further downstream in the dry season, the vegetation is dominated by upland-riparian transitional species, such as mule fat and coast live oak. The greatest density and extent of facultative wetland species such as Goodding's black willow occurs in the downstream portion of Devil's Gate Reservoir, where Devil's Gate Dam blocks surface and subsurface flows, resulting in more available water to vegetation behind the Dam (Psomas 2018).

Hydraulics, Sediment Transport, and Groundwater Analysis

A Hydraulics, Sediment Transport, and Groundwater Analysis (Hydraulics Analysis) was prepared for the study area and is included as Appendix F to this Draft EIR. The purpose of the Hydraulics Analysis was to evaluate the relative impact of the City's proposed management of diversions from the Arroyo Seco on riparian resources located downstream of the diversion structure. Hydraulic modeling assumed 100 percent efficiency in diversions in order to reflect the maximum reduced flow and thereby the maximum potential downstream habitat impacts (Psomas 2018).

The maximum depth of the pooled water within the Reservoir pool for the with-diversion scenario is reduced by approximately 1.3 feet in a dry year in comparison to the without-diversion scenario (Appendix F, Exhibit 7). A review of Exhibit 5 of Appendix F indicates that the cause of the decrease in maximum depth is likely due to the fact that the total runoff for the representative dry year without-diversions is approximately 2,480 acre-feet (af), while the hydrograph with diversions for the representative dry year is approximately 550 af. Therefore, the difference in runoff volume accounts for the difference in maximum depths shown in Exhibit 7 of the Hydraulics Analysis. It is important to note that the area of inundation is approximately the same between the two scenarios owing largely to the shape of the Reservoir upstream of the Dam (Psomas 2018).

The maximum Reservoir pool water surface elevation for the representative average year without-diversion and representative average year with-diversions are approximately equal, with the WSE (water surface elevation) = 1,035 feet (Appendix F, Exhibit 9). In these scenarios, the factor that controls the depth and WSE is the operation of Devil's Gate Dam. Despite the same maximum depths, the with-diversion scenario has greater inundation durations at the Reservoir fringes because the depth reaches the operational curve elevation more slowly than does the without-diversion scenario (Psomas 2018).

Like the representative average year scenarios, the representative wet year maximum depth is the same in the with- and the without-diversion scenarios because the Dam operational curve is controlling the maximum depth in the Reservoir, approximately WSE=1,035 feet (Appendix F, Exhibit 11). Like the average year scenarios, the with-diversion scenario has greater inundation durations at the Reservoir fringes because the with-diversion scenario Reservoir depth reaches the operational curve elevation more slowly than does the without-diversion scenario (Psomas 2018).

A review of regional groundwater data indicates that the distance to groundwater within the Reservoir area is substantially greater than the depth of the tree root zones and consequently would not be expected to have an effect on rootzones of the riparian habitat within the Reservoir. Studies associated with the Devil's Gate Sediment Removal Project support the reported groundwater elevation with measured average depth to ground water of over 100 feet and depth to a subsection of a perched aquifer greater than 20 feet (Psomas 2018).

Within the upstream section of Psomas' study area, between the diversion point and the JPL bridge, the model showed little or no measurable change in hydraulic conditions (such as depth, velocity, inundation area, and shear) with project diversions. However, factors influencing the hydraulics are markedly different in this high gradient mountainous section versus the low gradient downstream areas. The stream is much narrower and does not expand with increasing flows due to the constrictions of the hardened canyon walls and granite boulders in the mountainous section. Increasing volume of water from storms have a greater effect on flow velocity as water exits the mountains and less of an effect on increasing area of pooling or the duration of pooling. This is consistent with the model findings showing little change with project diversions in the upstream segment (Psomas 2018).

The upstream area also behaves differently during low flows. The hydraulic model assumptions limit the lowest modeled flow to 1 cfs. Therefore, flows below 1 cfs are not included in the modeling analysis, but are considered here. During times of low flow, the role of groundwater is substantially different between the low gradient downstream area and the high gradient upstream area. Within the upstream section of the Arroyo Seco, subsurface water (i.e. groundwater) is very shallow and often just below the streambed surface, even in areas that appear dry on the surface. Due to the steep gradient, this groundwater moves downstream through the substrate as a subsurface flow beneath the streambed. Furthermore, this section of the Arroyo Seco is considered a "gaining"

stream indicating that surface flows increase moving downstream due to upwelling of subsurface flows. Upwelling occurs when subsurface flows move around less permeable sections of substrate and reach the surface to become surface pools or flows for segments of the stream and may penetrate more permeable substrate further downstream and return to subsurface flow or continue downstream as surface flow for long distances. Evidence of the intermingling of surface and subsurface flowing can often be seen from just below the diversion point downstream to an A-frame bridge (Bridge No. 3) where subsurface upwelling occurs at low points in the stream (Psomas 2018).

Groundwater within the low gradient portion of the Psomas' study area, downstream of the JPL bridge, is very deep. The extensive alluvial deposits allow water to readily migrate through and downward until reaching the water table approximately 100 feet below the surface. Low flows that make it downstream and past the JPL bridge are only visible on the surface for short distances before penetrating the sediment to become subsurface flow and quickly dropping vertically. Consequently, low flow in the lower study area is not expected to be influenced by groundwater to any measurable degree due to the distance between surface flows and the groundwater table (Psomas 2018).

Ecological Modeling Study

The Arroyo Seco Canyon Diversions Biological Impacts Memorandum included an Ecological Modeling Study that assessed the ecological effects of flow diversions based on modeled relationships between hydraulic changes described in the Hydraulic Analysis and the probability that the resultant physical conditions can support southern willow riparian habitat conditions conducive to occupancy by least Bell's vireo.

All hydraulic variables tested showed significant statistical differences (p value <0.001) in willow occurrence between predicted future conditions and historic flow characteristics. However, given the small sample size of vegetation polygons, inherent to the relatively small size of the Project (see Appendix J: Exhibit 2, Excavation Limits of the LACDPW Devil's Gate Sediment Removal Project), and the high number of hydraulic observations (over 18,000), it is believed the significance estimates may be overestimated. The significant overlap in distributions of occurrence and the large AIC3 value substantiate this suspicion (Psomas 2018).

As described in the Ecological Modeling Study, the model predicts a negative correlation between increasing velocity and willow habitat presence. Expected changes in velocity are illustrated in Exhibits 3a-3f, Modeled Change in Maximum Velocity Due to Proposed Project, of the Memorandum (Appendix D of this Draft EIR, Appendix J). This is because willow habitat favors areas where water infiltrates the soil; higher velocities mean lower infiltration, and thus do not favor willow presence. A similar result is predicted for shear stress, so that as shear stress increases, the model predicts a decreased probability in willow occurrence. Depth shows an increase in willow probability as water depth increases. Due to implementation of the Project, willows may increase in the channel (narrow linear flow upstream of the Reservoir pool) and decrease in the Reservoir pool as water recedes and depth decreases. This translates into an increase in the probability of willow occurrence in areas where occurrence was high and a decrease in the probability of willow occurrence where the occurrence was low. The most pronounced decrease

[3] The Akaike Information Criterion [AIC] is an estimator of the relative quality of statistical models and provides a measure of the relative information not well represented by the model. It represents the balance between goodness of fit and model complexity (Psomas 2018).

predicted is a 13.8% decline in probability of occurrence in the lower basin, near the spillway, associated with a slight decrease in depth and duration of inundation. This is offset by a 6.6% increase in probability of occurrence at the margins of the basin, also associated with change in depth and duration of inundation. This gives a net change in the probability of willow occurrence of less than 10% (Psomas 2018).

Impact of Diversions on Vegetation/Habitat

Changes in the hydrological regime of stream systems have been shown to result in changes in vegetation structure and composition. The shifts in vegetation related to changes in hydrology is based upon: (1) the degree of fluctuations in groundwater levels; (2) the depth of root systems of existing vegetation; and (3) the resulting potential of invasive species establishment to displace native vegetation. The concept behind this relationship is that minor fluctuations in groundwater levels will not affect the presence of phreatophytic vegetation if the root systems of those plants are deep enough to access water in the phreatic zone (zone of saturation) or the capillary fringe (zone above the saturation area where water fills soil pore spaces through capillary motion and is available for plant uptake). However, if groundwater levels drop below the maximum depth of the root zone for a sufficient amount of time, then those plants are susceptible to be displaced by other species. Factors that affect the depth of roots include the genetic ability of each plant to produce deep roots, the soil type and the depth to which gas exchange is possible, and available water and nutrients. Additionally, root depth has been shown to be affected by fluctuations in the water table as significant fluctuations encourage species to elongate deep roots to access waters (Psomas 2018).

Therefore, the principal question is whether the proposed Project's diversions would cause an increase in the depth to groundwater that is available for willows and cottonwoods. As shown in Exhibit 4, Baseline Hydrology Example, of the Memorandum (see Appendix D of this Draft EIR, Appendix J), changes to groundwater levels should not extend beyond the maximum depths to groundwater within the root zone of phreatophytic species to maintain their presence (Psomas 2018).

Willow habitat in the Reservoir is characterized by persistent coverage of mature willow trees, though aerial photo analysis indicates that the extent of willow coverage varies over time, likely in response to annual variability in precipitation and inflows from the upper Arroyo Seco. Little change is observed in the lowest portions of the Reservoir (downstream end) while coverage appears to vary slightly at the upper portions of the Reservoir. Because the accumulated sediment in the Reservoir is mainly comprised of sandy material, the willow tree rhizosphere likely reaches the maximum root depth of approximately seven feet below grade. The lack of a persistent herbaceous understory suggests that the depth to groundwater for much of the year is at least two feet, since herbaceous species roots generally extend less than two feet below grade. Therefore, the depth to groundwater likely fluctuates in the range of two to seven feet in the lower end of the Reservoir. It should be noted that the groundwater at these elevations does not represent the upper limit of the groundwater aquifer, which occurs approximately 300 feet below the surface in the Reservoir riparian areas as described previously. Based on topography, the shallower groundwater is expected to result from subsurface flows from the San Gabriel Mountains, which flow south off the mountains and on to the Montrose/La Canada valley floor then to the east flowing downhill, towards the Arroyo Seco, until eventually reaching the deposited sediments within the Reservoir (Psomas 2018).

Generally, surface flows will reach the Reservoir area during and after significant rain events during the winter months. Vegetation in the Reservoir will utilize this water as it ponds and saturates the uppermost soil layers. The presence of Devil's Gate Dam is the dominant influence to the hydrology of Psomas' study area because it blocks

surface and subsurface flows to downstream areas thus increasing the time that subsurface water is available to trees in the Reservoir. Additionally, the Reservoir is a collection area for subsurface water that flows from the upper Arroyo Seco area, as well as from the Montrose/La Canada slope to the west. Some of these inflows support the riparian tree species that occupy the Reservoir area (Psomas 2018).

Due to the highly variable precipitation in the region and the resulting variability in surface flows in the upper Arroyo Seco, identifying the typical flow regime is difficult. As discussed above, surface flow rates in the wet season can range from approximately 1 cfs to more than 200 cfs. The Hydraulic Analysis categorizes precipitation data for the Psomas' study area as either wet, average, or dry years. The maximum inundation zone in the Reservoir was shown to minimally fluctuate during wet, average, or dry years. The maximum flood zone for the Reservoir is determined by the management of Devil's Gate Dam, as any water that would exceed the maximum surface elevation of 1,035 feet is released downstream. Areas that would not be flooded during maximum inundation levels consist of a narrow band along the margins of the inundation footprint that measures 2.1 acres. As discussed in the Hydraulics Analysis, while the footprint of the inundated area during dry years is less than average or wet years, the duration of inundation along these fringes is increased in the with-diversions scenario. Inundation duration in dry years is increased by diversions because the amount of runoff required to initiate dam operations is increased. Overall, the hydraulics model indicates that any reduction to the inundation footprint is infrequent (occurring only during dry years) and duration period is slightly increased on the fringes (Psomas 2018).

The Hydraulic Analysis also discusses the effect on water velocities. The Ecological Modeling Study indicates that increasing water velocities result in lower water infiltration into the soil, and this reduces the probability of willow establishment. However, the Hydraulic Analysis indicates that the effects of water diversion on velocity are small overall and in some cases the change in velocity from diversions is a decrease from existing conditions. Therefore, no changes to the extent of willow habitat is expected to occur from modelled velocity changes (Psomas 2018).

The Hydraulic Analysis also indicates that proposed stream diversions are expected to be an unimportant factor to overall sediment transport potential because the controlling elements of sediment transport are geologic factors. Large runoff events typically drive sediment movement in southern California streams; since no diversions are proposed during peak events, the Project is not expected to affect stream sediment yield to the Reservoir. In fact, the design of the proposed crest gate diversion weir is expected to enhance sediment transport because the gate will be placed in the down position during peak flow events to prevent impediments to sediment transport, which occur presently by the diversion weir (Psomas 2018).

As described above, the hydrology of the Arroyo Seco is highly variable. The Ecological Modeling Study indicates that water depth and duration of inundation correlate most highly with changes in the extent of willow riparian habitat in the Reservoir. Because the rainfall and resulting stream flows can vary so dramatically in the Arroyo Seco and because willow riparian habitat is dependent on available water, it stands to reason that the extent of willow habitat would mirror the dynamics of the site hydrology. Therefore, changes in the willow habitat that may result from proposed diversion changes during dry year conditions would likely be temporary (due to the high growth rate of the species and the likelihood that dry year conditions would be followed by average or wet year conditions) and within the normal range of variability of the system (Psomas 2018).

Changing Existing Conditions

The Memorandum considered the change in existing conditions downstream due to the LACDPW Devil's Gate Dam Sediment Removal Project, which began after the completion of the study. A large portion of the riparian vegetation within areas potentially affected by the Project is not expected to exist when hydraulic changes resulting from the proposed Project diversions would occur. Additionally, the surface elevation of a large portion of the Reservoir area will be lowered as the LACDPW's sediment removal project excavates accumulated sediments over the course of the coming years. As a result, a much greater volume of water will be contained within a deeper pool in a smaller area of the Devil's Gate Dam Reservoir. It is expected that pool margins will recess accordingly towards the center of the pool and away from riparian habitat occurring at and beyond current maximum pool margins. Therefore, small changes in hydraulics at the margins of the pooled areas of the Reservoir resulting from Project diversions are not likely to occur within or adjacent to existing riparian woodland habitat at pool margins. In summary, the minimal potential effects on riparian habitat resulting from future Project diversions, as described in previous sections, are further reduced due to changing existing conditions that would occur due to the Devil's Gate Sediment Removal Project (Psomas 2018).

Conclusion

Downstream reduced flows associated with Project diversions are not expected to result in any measurable effects on downstream riparian habitat. Project studies examining existing conditions within Psomas' study area and potential changes in hydraulics, sediment transport, and groundwater coupled with ecological modeling and habitat requirements all provide support of this conclusion (Psomas 2018). Additionally, changing current and future conditions associated with the Devil's Gate sediment removal further reduce potential Project effects. Mitigation would therefore not be required because there would be no significant impacts to hydrology or biological resources in the context of the CEQA.

Threshold 4.2c Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Short-Term Construction Impacts

There are no potential jurisdictional wetlands on the Project site. Arroyo Seco and the spreading basins are potentially regulated by the USACE, RWQCB, and/or CDFW. The proposed Project would result in direct temporary and/or permanent impacts to these potentially jurisdictional waters, as summarized below. Direct impacts include discharge of fill (i.e., grading and construction/reconstruction of structures) to potentially jurisdictional waters, which would alter the size, scope, and character of these aquatic resources and therefore would be significant, absent mitigation. Table 4.2-6, Permanent and Temporary Direct Impacts to Jurisdictional Waters, includes the acres of permanent and temporary impact, which are illustrated in Figure 4.2-5, Impacts to Jurisdictional Resources (Sheets 1 and 2).

Table 4.2-6. Permanent and Temporary Direct Impacts to Potential Jurisdictional Waters

Jurisdictional Waters	Direct Permanent Impacts (acres)	Direct Temporary Impacts (acres)

Source: Appendix D

Note: Numbers may not sum due to rounding.

[a] white alder–California sycamore woodland (0.45 acres) and coast live oak woodland (<0.01 acres)

Direct impacts to Area 3 as tabulated above include the existing spreading basins. However, the proposed Project design in Area 3 includes the reconfiguration and expansion of the spreading basins in order to accommodate the increased diversion of stream flows for infiltration. The new spreading basins are expected to have the same function as the basins being impacted. As such, the Project would result in a net increase of 3.64 acres for in-kind waters of the State and a net increase of 3.61 acres for in-kind CDFW jurisdictional areas in Area 3, as shown in Table 4.2-7, Jurisdictional Waters Created by Project in Area 3. Maintenance of the new spreading basins would

continue to be accomplished by mechanically removing the top layer of soil and disking or harrowing the exposed surface to loosen any soil compaction caused by cleaning, which is reflective of current maintenance activities.

Table 4.2-7. Jurisdictional Waters Created by Project in Area 3

Jurisdictional Waters	Direct Permanent Impacts (acres)	Direct Temporary Impacts (acres)	Total Impacts (acres)	Created Jurisdictional Waters (acres)	Net Difference (acres)
Area 3					
USACE waters of the United States	—	—	—	—	—
RWQCB waters of the State	1.79	0.59	2.38	6.02	+3.64
CDFW streambed, bank, and riparian vegetation	1.81	0.60	2.41	6.02	+3.61

Potential permanent and/or temporary direct impacts to potential jurisdictional waters would be reduced to less than significant with the implementation of MM-BIO-5 and MM-BIO-6 (i.e., on-site restoration and/or land acquisition, mitigation program funding, and/or mitigation bank credits). Consultation with, and permit issuance from, USACE, RWQCB, and CDFW may result in higher mitigation ratios and specific criteria for restoration beyond the minimum standards presented in this mitigation.

Potential temporary indirect impacts to potential jurisdictional waters in the study area would primarily result from construction activities and would include impacts from the generation of fugitive dust and the introduction of chemical pollutants (including herbicides). Excessive dust can decrease the vigor and productivity of vegetation through effects on light, penetration, photosynthesis, respiration, transpiration, increased penetration of phytotoxic gaseous pollutants, and increased incidence of pests and diseases. Erosion and chemical pollution (releases of fuel, oil, lubricants, paints, release agents, and other construction materials) may affect wetlands/jurisdictional waters. The release of chemical pollutants can reduce the water quality downstream and degrade adjacent habitats. However, during construction, erosion-control measures would be implemented as part of the Storm Water Pollution Prevention Plan (SWPPP) for the Project. Prior to the start of construction activities, the Contractor is required to file a Permit Registration Document (PRD) with the State Water Resources Control Board (SWRCB) in order to obtain coverage under the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with the Construction and Land Disturbance Activities (Order No 2009-009-DWQ, NPDES No. CAS000002) or the latest approved general permit. This permit is required for earthwork that results in the disturbance of one acre or more of total land area. The required SWPPP will mandate the implementation of best management practices (BMPs) to reduce or eliminate construction-related pollutants in the runoff, including sediment. Therefore, temporary indirect impacts would be less than significant due to compliance with regulations.

Long-Term Operational Impacts

Downstream reduced flows associated with Project diversions are not expected to result in any measurable effects on downstream riparian habitat. Project studies examining existing conditions within Psomas' study area and potential changes in hydraulics, sediment transport, and ground water coupled with ecological modeling and habitat requirements all provide support of this conclusion (Psomas 2018). Additionally, changing current and future conditions associated with the Devil's Gate Reservoir sediment removal further reduce the potential for Project effects. Mitigation would therefore not be required because there would be no significant impacts to hydrology or biological resources in the context of the CEQA.

Threshold 4.2d Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.?

Short-Term Construction Impacts

The proposed Project could potentially cause temporary direct and indirect impacts to the use of the Study Area by terrestrial wildlife moving from the ANF to the Hahamonga Watershed Park due to construction within Area 2 and Area 3. However, the impact would be less than significant since there are currently no fish within Arroyo Seco (see Appendix D: Section 5.3.1), and semi-aquatic (amphibians) and terrestrial wildlife (reptiles and mammals) would still be able to use adjacent natural sloped areas along the Arroyo Seco and the Gabrielino Trail/Access Road to avoid construction areas. The Arroyo Seco wash would not be obstructed from Area 2 to Hahamonga Watershed Park, which would allow existing wildlife species to utilize the streambed and avoid the spreading basin construction in Area 3.

Long-Term Operational Impacts

Potential long-term operational impacts to movement of native resident or migratory fish or wildlife species or the use of native wildlife nursery sites may occur if the proposed Project includes substantial adverse effects, compared to current conditions, in one of the following areas:

- Terrestrial species movement around the proposed diversion structure (in both upstream and downstream directions)
- Aquatic and semi-aquatic movement over the diversion structure (in both upstream and downstream directions)
- Aquatic and semi-aquatic movement through the diversion intake (in a downstream direction)

The proposed Project would not result in a substantial change to existing movement conditions for terrestrial wildlife, given that the proposed structures and other improvements are substantially similar in size and location to the existing condition.

Given that the current diversion structure does not include screens and the proposed Project includes a drum screen or vertical screen with automatic brush cleaning system at the intake structure, which would follow CDFW published design criteria to prevent aquatic and semi-aquatic wildlife from entering into the conveyance system, the proposed Project would not have an adverse effect on aquatic and semi-aquatic movement through the diversion intake.

Therefore, potential long-term operational impacts are related to aquatic and semi-aquatic movement over the diversion structure. Factors that affect suitability for movement include existing natural and proposed Project features such as, channel bank slope gradients, vegetative cover, surface flow conditions, subsurface (i.e., groundwater) conditions, the height of the diversion structure relative to stream elevations upstream and downstream of the diversion, and presence/absence of fish screens in the diversion intake.

Based on the data gathered from the USGS gaging station from 1990 through 2019, the average in-stream flows are 6,890 acre-feet/year (ft/yr). Using these years of data to represent the current condition of diverting when stream flows are 25 cubic feet per second (cfs) or less, the City diverts an average of 2,045 acre-ft/yr. Under the proposed Project, the City would be able to divert approximately 3,080 acre-ft/yr, resulting in approximately 1,035 acre-ft/yr of additional diverted flows into the spreading basins. These proposed increased diversions would result in a measurable increase in diversion only during larger wet-weather flows. There would be little to no difference in diversions between the current condition and the proposed Project during the drier periods of the year. Aquatic and semi-aquatic movement within surface waters would therefore only be affected during larger wet-weather flows. This impact is less than significant because the decreased wet-weather flow would remain sufficient to allow upstream and downstream movement by species currently occupying the Project Area (see additional discussion below regarding existing and future fish and amphibian species).

With regards to subsurface flows (i.e., groundwater) (see Appendix D: Section 6.3.2), within the upstream section of the Arroyo Seco, subsurface water is very shallow and often just below the streambed surface, even in areas that appear dry on the surface. Due to the steep gradient, this groundwater moves downstream through the substrate as a subsurface flow beneath the streambed. As such, although surface flows are not always present, subsurface flows can be assumed present. The present condition of subsurface flow below the diversion weir would be maintained by constructing a modified structure at similar depth to the current structure. Therefore, the proposed Project would not affect suitability of habitat for movement due to the lack of change the project would have to groundwater.

In addition, the current aged and ineffective diversion weir structure results in negligible seepage (or "weeping") of flows through the flashboards. During the drier periods of the year when low stream flows are fully diverted, the seepage has been estimated to be 0.1 to 0.2 cfs. While the current seepage is not sufficient to establish habitat for aquatic or semi-aquatic wildlife movement, the Project will allow for a similar release of flows through a valved bypass pipe from the intake structure. Therefore, there would be no change to this condition.

Fish Movement (Current Conditions)

There are no fish present in the Arroyo Seco Canyon in the current condition (see Appendix D: Section 5.3.1). No fish were observed during the 2019 surveys for the Project, including the focused fish survey (see Appendix C) that included all waters from the surface water terminus at the southern end in the Arroyo Seco wash adjacent to Area 3 to the Brown Mountain Dam. There was an incidental sighting of rainbow trout during the focused amphibian surveys conducted in 2013, but its provenance was not determined (BonTerra Psomas 2014e). Therefore, the proposed Project replacement of the existing diversion structure and intake facility would not result in a substantial impediment to the movement of native resident or migratory fish species, because of the absence of fish in the current condition, and impacts would be less than significant.

If fish were present in the Study Area in the current condition, the current diversion operations which lacks a fish screen, would result in fish being transported downstream to be potentially stranded in isolated pools of water (the

spreading basins or in the reach between the diversion and the JPL Bridge), or lost when passed into Devil's Gate Reservoir where flows spread out and habitat is unsuitable. The loss of connectivity and isolation of pools occurs primarily during the late summer/early fall months when there are periods of low to zero flows in the stream above the diversion (stream flows are below 1 cfs 35% of the year, and drop to zero about 10% of the time). This lack of water is the primary barrier for fish movement from about the JPL Bridge upstream where substrate and cover is good, but water is lacking. Below the JPL Bridge the flatter sediment load of the reservoir is open to solar heating, is dominated by finer substrates, and cover and pools are rare or absent. Also, the stream is subject to frequent dry conditions due to loss of aboveground flow as the channel emerges from the canyon into the alluvium, where water flow is primarily subterranean. During moderate flows, partial temporal barriers may be present in the canyon segment of the stream due to steep channel segments and step-pool or bedrock drops preventing upstream fish passage. Therefore, if fish were to be present, their movement would be restricted and they may perish due to isolation or stranding. The proposed Project will include fish screens to prevent isolation in the spreading basins and can be operated in a manner that excludes fish from the downstream reaches during diversion. The effects of the proposed Project related to downstream drift/movement are beneficial (i.e., no significant impact) due to inclusion of fish screens and proposed operations.

CDFW Coordination

The CDFW submitted a comment letter on the scope and content of the Draft EIR during the Notice of Preparation (NOP) public review period for this proposed Project and requested an evaluation to determine whether the Project would prevent or impede fish passage during low flow conditions. The cited Fish and Game Code section 5901 makes it unlawful to construct or maintain in any streams any device that prevents, impedes, or tends to prevent or impede the passing of fish up and downstream. In addition Fish and Game Code section 5937 is cited and requires the owner of any dam to allow sufficient water at all times to pass through a fishway or in the absence of a fishway, allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or existing below the dam.

While no fish are currently present, the City's general approach to the proposed Project is to plan for future conditions with the ability to operate the Project based on present conditions for fish. Under present conditions, an in-stream flow of about 0.5 cfs would be released to match the estimated leakage from the existing weir, and flows above this, up to the full 25 cfs water right, would be diverted when possible. The operation will exclude fish from the downstream reach under most conditions and from the diversion using fish screens designed to meet CDFW criteria for salmonid fry. Because, flows will pass over the crest gates when streamflow is greater than about 25 cfs and when the gates are lowered at higher flows, the City proposes that a monitoring program be developed to confirm that fish are not present in the reach downstream of the diversion after these conditions occur.

For a future condition where fish return or are reintroduced to the Arroyo Seco under present channel conditions, there are still several barriers to fish migration and survival that influence proposed operations. As such, operations would not be altered from those proposed under the present condition, i.e. fish would continue to be excluded from passing downstream the diversion and no minimum in-stream flows would be proposed. Under these conditions, the monitoring program would continue and would include a program to rescue fish between the diversion and JPL Bridge. During high flows when the gate is lowered, a roughened channel section downstream will allow upstream passage of future fish. Roughened channels are an accepted method of providing passage for steelhead trout in CDFW's Salmonid Stream Restoration Manual (CDFG 2010), requiring site specific design and review. The roughened channel configuration proposed is a channel approximately the width of the active channel in adjacent

stream segments (upstream and downstream), with an asymmetric v-shaped cross section to concentrate lower flows and provide adequate depth. Compared to other potential types of upstream passage features, the roughened channel type has the advantage of providing a range of velocities and depths at a given flow rate. Thus, smaller or weaker swimming native fish and other aquatic organisms could pass along the margins of the channel or near the bottom, using spaces in the bed material for hydraulic cover. Additionally, revegetation for the Project would include biotechnical stabilization and riparian planting on the west and east banks along the roughened channel providing coverage for wildlife. The combination of screening and monitoring/rescue would significantly reduce risk for any resident populations compared to existing diversion operations and would assist in maintaining populations upstream of the diversion

Under a future condition with restored anadromy, the City proposes to significantly alter diversion operations to allow for upstream and downstream fish passage (see Future Conditions for Fish section below).

Until such time, however, the proposed Project would result in an improvement to the existing condition and impacts related to potential aquatic and semi-aquatic species movement are less than significant.

Amphibian Movement (Current Conditions)

There are several amphibian species present in the Arroyo Seco (see Appendix D: Section 5.3.2), including western toad (Anaxyrus boreas), California treefrog (Pseudacris cadaverina), and Baja California treefrog (Pseudacris hypochondriaca). These amphibian species are primarily terrestrial and would not be hindered beyond the current condition with the implementation of the proposed Project. Importantly, amphibian populations would potentially benefit from the proposed Project due to the inclusion of the drum screen or a vertical screen with automatic brush cleaning system at the intake structure, which would follow CDFW published design criteria to prevent aquatic and semi-aquatic wildlife from entering into the conveyance system and becoming stranded in the spreading basins.

When the diversion is in operation during periods of low flow, downstream drift for larval amphibians would be prohibited and would prevent larva from being stranded downstream. When high flows spill over the raised gate, adult, juvenile, and larval amphibians would pass downstream and adults and juveniles would be expected to move upstream along the western slope. The limits of the roughened channel would extend to the edge of the diversion structure to allow amphibians to pass along the side without leaving the stream corridor. When the weir is completely lowered its sill elevation will follow the stream's general profile, creating a smooth transition to the roughened channel section downstream and allowing for upstream passage. The maximum elevation of the weir when raised would not be higher in elevation than the existing diversion structure, and the elevation of the pool of water at the intake would not exceed existing levels. Therefore, the Project would not affect existing overland routes for semi-aquatic species in either upstream or downstream directions. Amphibians would continue to have the same routes for passage as in the existing condition.

Therefore, replacement of the existing diversion structure and intake facility with an enhanced facility in the same location would not result in a substantial change from existing conditions and would not substantially impede the movement of amphibians beyond the current pre-Project condition and impacts would be less than significant.

Future Conditions for Fish

The proposed Project has been designed in consideration of a future condition where fish are re-established in the Arroyo Seco. However, it is the City's position that under present conditions that includes periods of low to zero

flows, the unsuitability of Devil's Gate Dam habitat and lack of passage, and barriers to upstream passage, downstream fish passage is undesirable. With the goal of excluding fish from the downstream reaches during diversions under present conditions, the proposed new diversion structure would be designed for the possibility that some future fish may pass downstream when the diversion is not operating (i.e., during periods of higher flows when the gate is lowered to allow flows to continue downstream without diversion) or when the diversion is operating and flows are high enough to spill over the crest gate. The roughened channel would allow for upstream passage when the weir crest gate is lowered.

A further condition for the future will occur when connectivity is re-established for passage through Devil's Gate Dam (i.e. removal of the dam or construction of a fish-ladder), connecting the upper and lower Arroyo Seco to the Los Angeles River and ultimately, the Pacific Ocean. This circumstance would potentially allow for the reintroduction of the southern steelhead (Oncorhynchus mykiss irideus), which is federally listed as endangered. In streams, the species uses habitat consisting of relatively cool, well-oxygenated water with adequate depth and cover. Steelhead require relatively clean unconsolidated gravel and cobble for spawning. Steelhead have an ecological or migratory life cycle called anadromy, in which adults mature in the ocean and must return to freshwater to spawn. However, until such time as safe connection to suitable downstream habitat or to the ocean can be provided, a bypass fishway is not proposed as part of the Project. If access for steelhead is re-established, however, the Project can accommodate a future bypass fishway and maintenance of minimum flow conditions to allow for upstream passage while the diversion is in operation.

As previously discussed, the Southern California Steelhead Recovery Plan (NOAA 2012) describes priority actions for recovery of steelhead in the region, including the Los Angeles River basin. The Arroyo Seco watershed has a low ranking in relative viability for recovery. The Recovery Plan lists removal of barriers at dams, diversions, roads, and other structures as a priority action in the biogeographic region (NOAA 2012). Southern steelhead recovery in Arroyo Seco would involve modification of multiple flood control facilities and removal of multiple barriers between the Project area and the ocean. Importantly, the removal of Devil's Gate Dam or modifications to allow fish passage both up and downstream would be a major undertaking.

Nevertheless, in this potential future scenario, the proposed Project design may not comply with Fish and Game Codes 5901 and/or 5937. Therefore, MM-BIO-7 (Native Resident and Migratory Fish Monitoring Plan preparation and implementation) is recommended to be responsive to the CDFW comment letter received during the NOP review period for this Project to allow for the future use of the Study Area as a movement corridor for native resident or migratory fish species.

Threshold 4.2e. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Short-Term Construction Impacts

Direct impacts to trees can be classified as a removal or encroachment. Trees are identified for removal when they are located within the permanent impact boundary. Trees are identified as encroachment if the tree canopy is within 5 feet of the permanent impact boundary, or if the tree trunk is within 15 feet of the permanent impact boundary. Direct impacts to encroachment trees include root damage, soil excavation and compaction, grade changes, loss of canopy, and trunk wounds, among others.

Direct tree impacts would result in the removal of 19 protected trees in total, of which all are located in Area 2. A total of 15 protected trees are expected to be encroached upon (11 trees in Area 2 and 4 trees in Area 3). No trees

are anticipated to be removed in Area 3. See Table 4.2-8, Area 2 - Protected Trees Direct Permanent Impacts, and Table 4.2-9, Area 3 - Protected Trees Direct Permanent Impacts, and Figure 4.2-6, Impacts to Protected Trees (Sheets 1 and 2) for direct permanent impacted protected tree locations. These direct permanent impacts would be potentially significant.

Table 4.2-8. Area 2 - Protected Trees Direct Permanent Impacts

Native Tree Species		Number of Trees	
Scientific Name	*Common Name*	*Removal*	*Encroachment*
Alnus rhombifolia	white alder	15	5
Platanus racemosa	California sycamore	0	2
Populus trichocarpa	*black cottonwood*	0	1
Quercus agrifolia	coast live oak	3	2
Quercus chrysolepis	canyon live oak	0	1
Salix nigra	black willow	1	0
	Total	**19**	**11**

Table 4.2-9. Area 3 - Protected Trees Direct Permanent Impacts

Native Tree Species		Number of Trees	
Scientific Name	*Common Name*	*Removal*	*Encroachment*
Platanus racemosa	California sycamore	0	1
Quercus agrifolia	coast live oak	0	3
	Total	**0**	**4**

Source: Appendix D

Impacts to these trees would be significant, absent mitigation, in accordance with the City's Tree Ordinance (Chapter 8.52 of the Pasadena Municipal Code). Project implementation of MM-BIO-8 (i.e., tree replacement and protection) would reduce potential direct impacts to a less-than-significant level. Impacts to these trees would be significant, absent mitigation, in accordance with the City's Tree Ordinance (Chapter 8.52 of the Pasadena Municipal Code). Additionally, the City will follow the City's Tree Protection Guidelines established for projects subject to Chapter 8.52 and prepared by the City Manager (City of Pasadena 2019). Applicable mandatory measures from the Guidelines that would be applied to construction of the proposed Project are generally summarized below to include, but not be limited to:

> P-313-1.5 Protection of Trees on City Property
>
> (1) A tree protection zone (TPZ) shall be defined as the drip line of the tree plus four (4) radial feet;
>
> (2) Protective (6-foot high minimum) chain-link fencing with an access gate of minimal width should be installed around the TPZ to the extent practicable subject to approval by staff prior

to the commencement of any grading, construction, or demolition. Fencing must also include 8 ½" x 11" (minimum) signage that includes the following information: Tree Protection Zone; name and contact information of project owner or authorized representative; and "Please contact the Pasadena Citizen Service Center to report any concerns (626) 744-7311".

(3) All work conducted in the ground within the TPZ of any protected tree should be accomplished with hand tools, unless an air spade is utilized. Trenches in the TPZ should be tunneled or completed with an air spade to avoid damage to roots within the TPZ.

(4) Any required trenching should be routed in such a manner as to minimize root damage. Radial trenching (radial to the tree trunk) is preferred as it is less harmful than tangential trenching. Construction activity should be diverted from the TPZ. Cutting of roots should be avoided (i.e. place pipes and cables below uncut roots). Wherever possible and in accordance with applicable code requirements, the same trench should be used for multiple utilities.

(5) No construction staging or disposal of construction materials or byproducts including but not limited to paint, plaster, or chemical solutions is allowed in the TPZ.

Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Site-wide changes affecting trees include diverting runoff and stormwater, creating retention and detention ponds, relocating streams or making improvements to streams, lowering or raising water tables, altering the capacity for soil moisture recharge, removing vegetation, or damming underground water flow (Matheny and Clark 1998). Indirect tree impacts may potentially occur to 13 additional protected trees. Indirect impacts could potentially result in tree mortality adjacent to the Project work areas, which would be significant, absent mitigation, under the City's Tree Ordinance. Project implementation of MM-BIO-8 would reduce potential indirect impacts to a less-than-significant level.

Long-Term Operational Impacts

Impacts to protected trees are not anticipated during the maintenance of the diversion and intake structures in Area 2 or the cleaning of the spreading basins in Area 3. Maintenance will be confined to areas that have previously been cleared of vegetation during Project construction. Regular maintenance activities within the operational areas of Area 2 and Area 3 would ensure that no protected trees will grow within these areas.

4.2.6 Cumulative Impacts

The proposed Project is upstream of the Devil's Gate Reservoir. In November 2018, the Los Angeles County Flood Control District began the removal of 1.7 million cubic yards of accumulated sediment located within 42 acres of the Devil's Gate Reservoir. Sediment removal activities are anticipated to continue through 2022 with habitat restoration activities occurring through 2023 (Los Angeles County Public Works 2018). Least Bell's vireo was documented within riparian habitat that will be removed during the sediment removal project. There were also significant impacts to sensitive vegetation communities, jurisdictional waters, and protected trees. To mitigate for the impacts, approximately 70 acres of habitat restoration would occur in the remaining portions of the Reservoir, including along the sloped areas between the Arroyo Seco and the spreading basins as well as within the southernmost Spreading Basin No. 17.

The Project's impacts on the downstream ecological and hydrological systems with the Devil's Gate Dam Sediment Removal Project and its subsequent habitat restoration is described in the long-term operational impacts to sensitive vegetation communities. Downstream reduced flows associated with Project diversions are not expected to result in any measurable effects on downstream riparian habitat. Section 4.5, Hydrology and Water Quality, which includes information presented in the Hydraulics, Sediment Transport, and Groundwater Analysis (see Appendix F) and summarizes potential changes in hydraulics, sediment transport, and groundwater coupled with ecological modeling and habitat requirements all provide support of this conclusion (Psomas 2018). Mitigation would therefore not be required because there would be no impacts to hydrology or biological resources in the context of the CEQA.

The previously approved components of the Arroyo Seco Canyon Project (Area 1), located approximately 630 feet upstream of Area 2, includes habitat restoration along the stream channel, a new nature trail, and a rest area/picnic area, along with demolition of the existing Headworks structure on the Arroyo Seco. Significant impacts associated with the Project were to sensitive vegetation communities, jurisdictional waters, and protected trees. To mitigate for the impacts, habitat restoration would occur that would create and enhance riparian habitat using protected trees.

Oak Grove Area Improvements Project is located approximately 2,200 feet southwest of the Project. It geographically includes the western portion of Hahamongna Watershed Park from the Flint Wash Bridge, north, to the southern edge of the Hahamongna Annex area. There are five projects in the current Capital Improvement Program (CIP) with funding and that are located within the OGAI project area, including (1) Oak Grove Area Improvements, (2) Trail Development, (3) Berkshire Creek Area Improvements, (4) Habitat Restoration, and (5) Oak Grove Disc Golf Course Improvements (City of Pasadena Department of Public Works 2020). The Oak Grove Area Improvements were adopted as part of the Hahamongna Watershed Park Master Plan approval. The Berkshire Creek Area Improvements project was substantially completed in March 2020. The remaining OGAI projects are currently funded for the planning and design phase. The projects will improve the area of the existing Oak Grove field, and may include a new restroom, improvements to vehicular and pedestrian circulation, assessment of the disc golf course layout and improvements to the outdoor amphitheater. The City has not budgeted for the project beyond FY 2020, but should funding become available construction could occur as early as 2021, concurrent with the proposed Project.

The Los Angeles Flood Control District's Pump Back /Intake at Devil's Gate (also known as the Devil's Gate Water Conservation Project) is located approximately 4,200 feet south of the Project. The project includes installing a pump and intake on the upstream face of Devil's Gate Dam. A 5-mile pipeline to be constructed from the pump easterly to transfer water to Eaton Wash is on hold; however, the feasibility of maximizing stormwater capture and groundwater replenishment through a pipeline to the Arroyo Seco spreading grounds is being assessed. It is assumed that if the LACFCD moves forward with the project, it would be after the Devil's Gate Sediment Removal Project has been completed at the end of 2022 and, consequently, after completion of the ASCP Areas 2 and 3 (proposed Project). Impacts to biological resources by the project have not been evaluated. However, it is stated in the Feasibility Study that no significant environmental impacts are anticipated for construction of the proposed pipeline alignments, as all construction would be within paved right-of-way. Each pipeline alignment alternative proposed would have temporary impacts related to noise, air quality, greenhouse gas emissions, traffic and public services during construction, and a more detailed environmental impact analysis would be required to develop mitigation measures to ensure these impacts are not significant, and in compliance with regulatory codes (County of Los Angeles 2017).

The Project's contribution to cumulative impacts would be reduced to less than significant or avoided through the mitigation measures identified in Section 4.2.6. Therefore, with implementation of MM-BIO-1 through MM-BIO-8, impacts would not be cumulatively considerable.

4.2.7 Mitigation Measures

Special-Status Wildlife Species

MM-BIO-1 Prior to commencement of any earthmoving activities or the pre-construction staging of equipment on the Project site, the City shall develop a Preconstruction Survey and Relocation Plan for terrestrial reptiles, including the California newt, two-striped gartersnake, Southern California legless lizard, and coastal whiptail. The Preconstruction Survey and Relocation Plan shall be submitted to the California Department of Fish and Wildlife (CDFW) for review prior to any ground-disturbing activities within potentially occupied habitat.

The Plan shall include at a minimum, the following: (1) protocols for pre-construction surveys to flush out and/or move identified special status wildlife within the study area, as feasible; (2) the timing, frequency, and locations where surveys should be conducted; (3) the habitat and conditions in the proposed relocation site(s); (4) the methods that would be used for trapping and relocating identified species; (5) protocols for documentation/recordation of the species and number of animals relocated; and (6) protocols for notifying CDFW in the event that identified species cannot be relocated.

The Plan shall require that a Biological Monitor be present during initial vegetation clearing activities within Areas 2 and 3, as well as twice weekly until ground disturbing activities are completed. The Biological Monitor shall also be familiar with least Bell's vireo and shall conduct pre-clearing non-protocol surveys for this species while onsite. If a least Bell's vireo or other State of federally listed species is detected, work activity within 200 feet of the detected occupied habitat will be temporarily halted and the City will consult with the appropriate wildlife agencies. With authorization from these agencies, which may include a 'take' permit, the project will proceed in accordance with conditions developed in the consultation. Conditions will include avoidance and minimization measures to prevent or minimize impacts on the listed species(s) occurring on or adjacent to the site.

The Plan shall require that any individual special-status terrestrial wildlife species observed within the study area during the pre-construction survey(s) shall be flushed out and/or moved out of harm's way to avoid direct impacts to these species, and if special-status species are detected, the Biological Monitor shall capture and relocate individuals to nearby undisturbed areas with suitable habitat outside of the construction area, but as close to their origin as possible. The final recordation/documentation of any wildlife relocated during Project activities shall be made available to CDFW for confirmation that construction activities were executed in compliance with the approved Preconstruction Survey and Relocation Plan.

MM-BIO-2 Project construction shall be conducted in compliance with the conditions set forth in the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code with methods approved by the California Department of Fish and Wildlife (CDFW) to protect active bird/raptor nests. To the maximum extent feasible, vegetation removal shall occur during the non-breeding season for nesting birds (generally late September to early March) and nesting raptors (generally early July to late January) to avoid impacts to nesting birds and raptors. If the Project requires that work be initiated during the breeding season for nesting birds (March 1–September 30) and nesting raptors (February 1–June 30), in order to avoid direct impacts on active nests, a pre-construction survey shall be conducted by a qualified Biologist for nesting birds and/or raptors within 3 days prior to clearing of any vegetation and/or any work near existing structures (i.e., within 300 feet for nesting birds and within 500 feet for nesting raptors). If the Biologist does not find any active nests within or immediately adjacent to the impact areas, the vegetation clearing/construction work shall be allowed to proceed.

If the Biologist finds an active nest within or immediately adjacent to the construction area and determines that the nest may be impacted or breeding activities substantially disrupted, the Biologist shall delineate an appropriate buffer zone around the nest depending on the sensitivity of the species and the nature of the construction activity. Any nest found during survey efforts shall be mapped on the construction plans. The active nest shall be protected until nesting activity has ended. To protect any nest site, the following restrictions to construction activities shall be required until nests are no longer active, as determined by a qualified Biologist: (1) clearing limits shall be established within a buffer around any occupied nest (the buffer shall be 100–300 feet for nesting birds and 300–500 feet for nesting raptors), unless otherwise determined by a qualified Biologist and (2) access and surveying shall be restricted within the buffer of any occupied nest, unless otherwise determined by a qualified Biologist. Encroachment into the buffer area around a known nest shall only be allowed if the Biologist determines that the proposed activity would not disturb the nest occupants. Construction can proceed when the qualified Biologist has determined that fledglings have left the nest or the nest has failed.

MM-BIO-3 A Biological Monitor shall conduct a pre-construction bat habitat assessment of buildings and trees marked for potential removal. Potential for roosting shall be categorized by 1) potential for solitary roost sites, 2) potential for colonial roost sites (10 bats or more). If the potential for colonial roosting is determined, those trees shall not be removed during the bat maternity roost season (March 1 – July 31). Trees potentially supporting colonial roosts outside of maternity roost season, and trees potentially supporting solitary roosts may be removed via a two-step removal process, whereby some level of disturbance (such as trimming of lower branches) (at the direction of Biological Monitor) is applied to the tree on day one to allow bats to escape during the darker hours, and the roost tree shall be removed two days later (i.e., there shall be no less or more than two nights between initial disturbance and the grading or tree removal). When feasible, trees will be dropped slowly and a Biological Monitor will monitor the activity. If buildings are determined to be occupied, one-way exclusionary devices will be placed over bat access points and left in place for two nights prior to building removal.

Sensitive Vegetation Communities

MM-BIO-4 Direct impacts to sensitive vegetation communities (white alder–California sycamore woodland association and California sycamore woodlands alliance) shall be mitigated through a combination of on-site and/or off-site measures. Mitigation for impacts to sensitive vegetation communities shall consider and overlap with compensation for jurisdictional waters (MM-BIO-6) since the sensitive vegetation is associated with the jurisdictional limits of Arroyo Seco. Mitigation for direct impacts to sensitive vegetation communities shall be implemented through on-site creation/enhancement, program funding, mitigation bank credits, and/or creation/enhancement of native vegetation communities on City lands. Mitigation acreages shall be implemented as shown in the Table below.

Sensitive Vegetation Community	Direct Impacts (acres)	Mitigation Ratio	Mitigation (acres)
white alder–California sycamore woodland association	0.47	3:1	1.41
California sycamore woodlands alliance	0.04	3:1	0.12
Totals:	**0.51**	**—**	**1.53**

On-site Mitigation. Prior to the issuance of a grading permit or any earthwork on the Project site, PWP shall prepare a Habitat Mitigation and Monitoring Plan (HMMP) for habitat enhancement and creation activities. The HMMP shall at a minimum include a feasible implementation structure, salvage/seeding details, invasive species eradication methods, irrigation system and schedule, a monitoring schedule, performance standard of success, estimated costs, and identification of responsible entities. The HMMP shall include restoration of the following habitats:

Riparian Woodlands. Impacted areas of (white alder–California sycamore woodland association and California sycamore woodlands alliance) shall be created/restored within and adjacent to the same on-site areas that the woodland currently existed prior to Project implementation, as well as other areas deemed to have appropriate soils and topography for successful establishment. Understory areas shall be revegetated with a diversity of locally collected seeds. Temporary irrigation shall be established and maintained, with irrigation suspensions in times of rainfall. Successful establishment of the woodland shall be determined only after removal of irrigation system and confirmed ability of the woodland to survive in the absence of irrigation.

It is anticipated that a one-time restoration effort followed by monitoring and invasive weed removal for a minimum of five (5) years would be required. The HMMP shall be submitted to the City, CDFW, USACE, and RWQCB for review and comment, and revised to the satisfaction of the City and the three agencies.

Off-site Mitigation. If mitigation is implemented through mitigation program funding and/or mitigation bank credits, the Project Applicant shall work with the City, CDFW, USACE, and RWQCB to ensure the mitigation program funding and/or mitigation bank credits are appropriate to offset permanent impacts. Mitigation lands shall be comprised of similar or higher quality riparian woodland and preferably located in the vicinity of the site or watershed.

If mitigation is implemented through offsite enhancement of City-owned lands, PWP shall prepare a HMMP that details the location and existing conditions of the offsite lands. The HMMP shall at a minimum include a feasible implementation structure, salvage/seeding details, invasive species eradication methods, irrigation system and schedule, a monitoring schedule, performance standard of success, estimated costs, and identification of responsible entities. It is anticipated that a one-time restoration effort followed by monitoring and invasive weed removal for a minimum of five (5) years would be required. The HMMP shall be submitted to the City, CDFW, USACE, and RWQCB for review and comment, and revised to the satisfaction of the City and the three agencies.

MM-BIO-5 To prevent inadvertent disturbance to sensitive vegetation communities outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary high visibility construction fence) prior to ground disturbance activities. All construction activities including equipment staging and maintenance shall be conducted within the marked disturbance limits. A qualified biologist shall be present during initial ground-disturbing activities within the Project site to ensure that Project activities stay within the demarcated limits.

Jurisdictional Waters

Significant direct and indirect impacts to jurisdictional waters can be mitigated to less than significant with implementation of MM-BIO-5 and the following measures:

MM-BIO-6 Mitigation for direct impacts to jurisdictional waters shall be implemented through on-site enhancement of remaining jurisdictional waters and/or off-site acquisition, program funding, and/or mitigation bank credits. Mitigation ratios for each type of jurisdictional waters is shown in the Table below. Mitigation for temporary and permanent impacts to jurisdictional wetlands and waters shall consider and overlap with compensation for sensitive vegetation communities (MM-BIO-4).

Jurisdictional Waters Type	Direct Impacts (acres)	Mitigation Ratio	Mitigation (acres)[a]
USACE waters of the United States	0.20	1:1	0.20
RWQCB waters of the state	2.58	1:1	2.58
CDFW streambed and bank, with riparian vegetation[b]	0.49	3:1	1.47
CDFW streambed and bank, with non-riparian habitat[c]	2.41	1:1	2.41

Notes:

[a] Mitigation areas for each jurisdictional type may overlap

[b] white alder–California sycamore woodland (0.48 acres) and coast live oak woodland (<0.01 acres)

[c] California sagebrush–California buckwheat–laurel sumac scrub (<0.001 acres); urban/developed (0.03 acres); disturbed habitat (2.38 acres); laurel sumac scrub (<0.01 acres)

On-site Mitigation. Prior to the issuance of a grading permit or any earthwork on the Project site, PWP shall prepare a HMMP for habitat enhancement and creation activities. The HMMP shall at a minimum include a feasible implementation structure, salvage/seeding details, invasive species eradication methods, irrigation system and schedule, a monitoring schedule, performance standard of success, estimated costs, and identification of responsible entities. The HMMP shall include restoration of the following habitats:

Riparian Woodlands. Impacted areas of (white alder–California sycamore woodland association and coast live oak woodland) shall be created/restored within and adjacent to the same on-site areas that the woodland currently existed prior to Project implementation, as well as other areas deemed to have appropriate soils and topography for successful establishment. Understory areas shall be revegetated with a diversity of locally collected seeds. Temporary irrigation shall be established and maintained, with irrigation suspensions in times of rainfall. Successful establishment of the woodland shall be determined only after removal of irrigation system and confirmed ability of the woodland to survive in the absence of irrigation.

It is anticipated that a one-time restoration effort followed by monitoring and invasive weed removal for a minimum of five (5) years would be required. The HMMP shall be submitted to the CDFW, USACE, and RWQCB for review and comment, and revised to the satisfaction of the three agencies.

Off-site Mitigation. If mitigation is implemented through mitigation program funding and/or mitigation bank credits, PWP shall work with the CDFW, USACE, and RWQCB to ensure the mitigation program funding and/or mitigation bank credits are appropriate to offset permanent impacts. Mitigation lands shall be comprised of similar or higher quality riparian woodland and preferably located in the vicinity of the site or watershed.

If mitigation is implemented through offsite enhancement of City-owned lands, PWP shall prepare a HMMP that details the location and existing conditions of the offsite lands. The HMMP shall at a minimum include a feasible implementation structure, salvage/seeding details, invasive species eradication methods, irrigation system and schedule, a monitoring schedule, performance standard of success, estimated costs, and identification of responsible entities. It is anticipated that a one-time restoration effort followed by monitoring and invasive weed removal for a minimum of five (5) years would be required. The HMMP shall be submitted to the CDFW, USACE, and RWQCB for review and comment, and revised to the satisfaction of the three agencies.

Habitat Linkages and Wildlife Corridors

MM-BIO-7 Prior to the commencement of earthmoving within Area 2 for the demolition of the existing diversion/weir structure, the City shall develop a Native Resident and Migratory Fish Monitoring Plan (Monitoring Plan), in consultation with CDFW. This Monitoring Plan shall set forth annual monitoring requirements to determine if native fish species or migratory fish populations are present within an approximate 3,500-foot section of the stream (about 1,500 feet upstream of the diversion/weir structure to the abandoned headworks (Area 1) and 2,000 feet downstream to the JPL Bridge at the mouth of the canyon). Annual survey protocols shall be established to the satisfaction of CDFW and set forth in the Monitoring Plan. If the results of the annual surveys reveal a positive presence of native fish, the Monitoring Plan shall set forth thresholds for determining the permanency of the population, and whether or not connectivity both upstream and downstream of the diversion structure is appropriate and in the best interest of the long-term survival of an established native or migratory fish population, given hazards associated with stranding downstream. Until passage for steelhead is restored to the Arroyo Seco, the City shall implement a program to rescue fish between the diversion structure and the JPL Bridge. If rescue is determined to be ineffective or impractical, then the City shall modify its operations to

accommodate passage. At such time as steelhead passage is restored, the City shall alter either the design of the diversion/weir structure, the operational methods of the diversion/weir structure, or both to satisfy Fish and Game Code Sections 5901 and 5937.

City of Pasadena Protected Trees

MM-BIO-8 A qualified biologist shall be present during initial ground-disturbing activities within the Project site to ensure that Project activities stay within the demarcated limits, as required in MM-BIO-5. This qualified biologist shall identify the number of City-protected trees that are removed as a result of Project construction activities, as well as trees that would be encroached upon. This inventory of trees shall be used to determine an appropriate tree replacement program that shall be, at a minimum, consistent with the administrative guideline tree replacement matrix of the City's Tree Ordinance (Chapter 8.52 of the Pasadena Municipal Code), and the Ordinance's administrative guideline replacement matrix, as it relates to tree replacement of protected trees.

Trees within approximately 15 feet of proposed construction activity shall be temporarily fenced with chain-link fencing in accordance with the City's Tree Ordinance and Tree Protection Guidelines. The fencing shall be installed to the extent of the tree's dripline plus four (4) radial feet and be minimum six (6) feet high with an access gate of minimal width. The fenced area shall be considered the Tree Protection Zone (TPZ) unless proximate construction required temporary removal.

All trees that have been substantially root pruned (30% or more of their root zone) during construction within the TPZ shall be monitored by an International Society of Arboriculture Certified arborist for the first five years after construction completion. The arborist shall submit an annual report, photograph each tree and compare tree health and condition to the original, pre-construction baseline. For trees that do not survive the five-year monitoring period, such trees shall be replaced in accordance with the requirements of this measure.

4.2.8 Level of Significance After Mitigation

Implementation of MM-BIO-1 through MM-BIO-8 would reduce potentially significant impacts to biological resources a level less than significant.

4.3 Cultural Resources

4.3.1 Methodology

This section describes the existing conditions of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) site and vicinity, identifies associated regulatory requirements, evaluates potential environmental impacts, and identifies mitigation measures related to implementation of the proposed Project. The analysis of the Project impacts related to cultural resources is based on a review of existing resources and applicable laws, regulations, and guidelines, as well as the following:

Appendix E-1 Cultural Resources Technical Report for the Arroyo Seco Canyon Project Areas 2 and 3, prepared by Dudek, dated June 2020.

Appendix E-2 Vertebrate Paleontology Records Check, prepared by the Natural History Museum of Los Angeles County, dated October 2020.

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, the Appendices to the Initial Study are included in Appendix A-2, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

4.3.2 Existing Conditions

The Project site is located at 3420 to 3500 North Arroyo Boulevard within the Arroyo Seco Canyon adjacent to North Arroyo Boulevard and the Gabrielino Trail, located in Township 1 North, Range 12 West on the Pasadena, California 7.5′ USGS quadrangle map. Figure 4.3-1, Records Search Study Area, depicts the 0.5-mile records search radius overlaid on the USGS quadrangle map.

Project Site History

A complete discussion of the prehistory period, ethnographic period, and historical period may be found in Appendix E-1 of this Draft EIR. The Report includes a California Historical Resources Information System (CHRIS) records search; coordination with the California Native American Heritage Commission (NAHC) and tribal contacts; he results of a pedestrian survey of the Project site by a qualified architectural historian; building development and archival research, development of an appropriate historic context for the Project site; and recordation and evaluation of five commercial properties over 45 years old for historical significance and integrity in consideration of National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), and City of Pasadena designation criteria and integrity requirements.

Building development and archival research were conducted for the Project site in an effort to establish a thorough and accurate historic context for the significance evaluations, and to confirm the building development history of the Project site and associated parcels. Archival research included historic aerial photographs, historical newspapers, reviewing Los Angeles County Assessor records, Pasadena Digital History Collection, and the City of Pasadena's California Historical Resources Inventory Database (CHRID).

Arroyo Seco Canyon Developments (1887-present)

The Project site is located within the Hahamongna Watershed Master Plan Area, within the larger Arroyo Seco which also includes the Central and Lower Arroyo Seco Master Plan Areas. The Arroyo Seco Canyon was used as a prehistoric through-route for the Hahamong'nas (a band of native Tongva people), connecting the area that is now Hahamongna Watershed Park to trade partners to the north. The canyon continued to be a source of water, recreation, and travel route well into the nineteenth century. As early as 1887, the City of Pasadena and citizens were recognizing the Arroyo Seco as a whole for its benefits as a park. At the turn of the twentieth century, Arroyo Seco enjoyed a long period of recreational development, such as at Camp Oakwilde, a rustic resort constructed in 1911, and several private and public cabins throughout the canyon. In 1911, the City of Pasadena annexed the lower and middle sections of the Arroyo Seco, and in 1919, the area now known as Hahamongna Watershed Park was annexed to the city (City of Pasadena 2019).

With the recreation movement taking hold in the Arroyo Seco, and the Arts and Crafts Movement (1895-1920) influencing building and landscape architecture at large in southern California, the area within and around the Arroyo Seco developed several unifying features that were consistently used throughout the Arroyo Seco canyon area, including parks, trails, landscaping features, neighborhoods, and civic structures. These included the emphasis on the natural environment and use of native cobblestone in walls, gates, and fences, especially as accents to pedestrian walkways and roads that might otherwise have a utilitarian appearance. Native rock cobblestone walls also complemented the larger Arts and Crafts-style residential architecture of Pasadena (Bricker et al. 1992; City of Pasadena 2003a).

A road through Arroyo Seco Canyon has been visible on maps since the 1894 "Los Angeles, Calif." topographical map of the area. This earliest topographical map of the area shows the road extending between the Los Angeles Terminal Railroad Line and a mountain hamlet called Las Casitas before looping back west and south to La Cañada, following an older trail forged by the native Gabrielinos. Arroyo Seco Canyon Road, also known as Arroyo Boulevard, was paved for use as a county highway c. 1920, during which time Bridge No. 2 was constructed as a necessary improvement along the Arroyo Boulevard/Gabrielino Trail. Bridge No. 2 appears on the very first available aerial map from 1927, as well as other smaller bridges along the road and at the mouth of the canyon. A secondary spur road, leading east from the Bridge No. 1 crossing location, is also present on aerial photos as early as 1927. At the end of this spur road was a square-plan, river cobble-clad building on a concrete platform and a small, concrete diversion dam. Both of these structures are located outside of the Project site (LAT 1919; USGS 2019).

The Arroyo Seco road appears improved by bridges in the earliest available aerial photograph from 1927; however, subsequent floods in 1934 and 1938 appear to obliterate the road and bridges in the canyon, with the exception of Bridge No. 2. The road between Devil's Gate Dam and Oak Wilde, a forest community some 4 miles up Arroyo Seco Road, remained closed until 1939, the same year local Civilian Conservation Corps (CCC) Company 903 constructed Bridge No. 3. Despite the CCC improvements, the City of Pasadena road section outside of U. S. Forest Service lands was not officially repaired until 1941 (LAT 1938, 1940a, 1940b; Pasadena Star News 1939).

Local CCC Company 903 was assigned to the USFS in 1933 to work on projects within Arroyo Seco Canyon and San Gabriel Mountains. One of Roosevelt's more successful New Deal programs, the CCC was a work relief program focused on environmental projects, providing employment to young men during the Great

Depression. By June 1, 1933, over 1,400 working camps were established, employing more than 300,000 men, representing the most rapid peace-time mobilization in U.S history. Working on projects for the U.S. Forest Service, the National Park Service, and the Departments of Agriculture and Interior, CCC workers fought forest fires, planted trees, cleaned and maintained access roads, re-seeded grazing lands, implemented soil erosion controls, and built wildlife refuges, fish-rearing facilities, animal shelters, and water storage basins. Roosevelt also authorized the CCC to build bridges and campground facilities in an effort to encourage people to go enjoy America's natural resources.

The CCC planted more than three billion trees and constructed facilities in more than 800 parks nationwide during the nine years which the group was in existence, helping shape our modern national and state park systems (History.com 2010). In 1941, the Arroyo Seco Project, part of a Los Angeles River watershed upstream work project, began with the Millard Canyon channel and road improvement project. A joint effort between USFS and the City of Pasadena engineers, the improvements in Millard Canyon entailed channel improvements and creating a new road cut above the channel bed with a "seven foot wall of native rock" (Pasadena Post 1941a:17). The stretch of road to be improved by the retaining walls and barriers was described as above Devil's Gate Dam, and below the Brown Mountain truck trail turn off. The road improvements were in support of the larger goal of the watershed upstream work project: to build the Brown Mountain Dam near Arroyo Seco headwaters as a means of flood control. When the upstream project was completed, the City entered into a contract with the USFS to share costs of maintenance and patrols for the sections of Arroyo Seco and Millard Canyon that were in City of Pasadena Land, but adjacent to USFS land. Improvements are also visible in aerial photographs between 1938 and 1944, such as the construction of Bridge No. 1, road pavement, and the construction of native rock retaining walls and barriers (Pasadena Post, 1941a, 1941b; Pasadena Star News 1941, 1944; UCSB 2019).

Screen Building Complex (c. 1932-1944)

The Screen Building Complex consists of the screen building (formerly known as the Chlorine Plant, per as-built drawings), intake structure, and a flashboard dam/weir. The screen building is identified on 1932 as-built plans for the Arroyo Seco Headworks (Work Order 2802, Pasadena Water Department 1932), indicating that it was constructed around this time. As such, it is likely that these components were constructed by the CCC during their Arroyo Seco improvements campaign in the 1930s. A flashboard dam/weir was also part of this as-built drawing set, and was constructed at this location in 1932. It is possible that an earlier weir, dam, or pipeline preceded its construction, but this could not be verified in archival research, including aerial photographs or historical maps. An image of the weir from March 5, 1937, shows that there was a modest concrete structure with angled buttresses and a paved horizontal surface downstream, leading to a short drop off to the natural streambed. The drop off aligns with retaining walls on either end. A concrete wing wall lines the cut bank side of the stream where the weir meets it, and a small concrete platform (the top deck of the intake structure) rests adjacent to the wing wall on mounded soil. The 1938 historic aerial image shows the devastation wrought by flooding that year; the screen building is visible, but the c. 1932 weir appears to have been destroyed. In the next 1944 historic aerial image clearly shows the screen building, intake structure, and a new weir. The new weir, visible in the 1944 aerial photograph, is of a different design than the 1932 weir, and a cobblestone wall is visible rising from the original retaining wall on the right (east or cutbank) side of the weir. The cobblestone wall supports a concrete platform, of which the original rectangular concrete platform is incorporated, indicating extensive repairs and/or additional damage during later flood events.

Debris Basins and Flood Control Infrastructure (1948)

Flood control in Arroyo Seco began after the especially costly 1914 and 1916 floods damaged large portions of Los Angeles County farmland and urban areas. In 1915, the LACFCD was established in response to the in 1914 flood, and would protect an area of 2,760 square miles. Investment was initially delayed by the onset of World War I, but the first flood control feature built in the Arroyo Seco was the Devil's Gate Dam: designed in 1916, funded by bonds in 1917, and erected by Los Angeles County Department of Public Works by 1920 (Brick 2011; Pasadena Star News 1916; SB&C 1919; Van Wormer 1991).

The City of Pasadena, which had water rights to Arroyo Seco, began a spreading program in Arroyo Seco in 1914 to replenish the Raymond Basin aquifer; however, the program was abandoned in 1924 due to drought. The remnants of the 1914 spreading basins were washed out in 1936 when the Arroyo Seco stream changed its course to the east side of the Arroyo. Historic aerial photographs and maps indicate that the LACFCD-owned spreading grounds were installed in 1948, as a result of a 1940 push to build upstream flood control features in the Angeles National Forest. $1.17 million was used towards the establishment of silt and debris check dams on the upstream side of the Devil's Gate reservoir and the Brown Mountain Dam. The first funding installment was approved in 1941 and another in 1944, resulting from the 1944 storm and subsequent flood. Federal funds also went to the channelization of Arroyo Seco Canyon further downstream of Devil's Gate Dam By 1952, the Los Angeles County-owned Altadena Storm Drain and sheds were completed as well. The PWP-owned sludge basins were added in the 1970s, after the construction of the Behner Water Treatment Plant (Brown and Taylor 1982; City of Pasadena 2003b; ETA 1941; LAT 1940c, 1946; SCPR 2016; UCSB 2019; Van Wormer 1991).

John L. Behner Water Treatment Plant (1971)

The John L. Behner Water Treatment Plant (Behner WTP) was named after the first General Manager of the consolidated Pasadena Water and Power Department (PWP). Located in the Arroyo Seco Canyon east of JPL, the plant had a capacity of 5 million gallons per day. The project, which began as the result of a PWP feasibility study in 1967 decided on the current location. Originally, the Metropolitan Water District (MWD) identified the Upper Arroyo Seco as a location for their new MWD water treatment plant; however, they received backlash from Pasadena citizens using the area as a park. As a result, the City of Pasadena moved forward with their plan for a smaller water treatment plant facility, and a county regional park at the same time. The push was successful, and the PWP's plant was designed by Pasadena-based engineering firm James M. Montgomery, Consulting Engineers Inc. and constructed by the Margate Construction Company in 1970 and dedicated in 1971. However, new water treatment regulations imposed as a result of the Surface Water Treatment Rule meant that the treatment plant was shut down in June 1993. Another feasibility study on the potential for upgrading the facility was conducted in 1995, but the Behner WTP remains offline to this day (City of Pasadena 2010, 2012; LAT 1968; PI 1971).

Architectural Style- Brutalism

Only one resource within the Project site was designed in a clear architectural style: the Behner WTP, which exhibits numerous character-defining features of the Brutalist style.

The term "Brutalism" derives from the French *béton brut*, which translates as raw concrete, and describes concrete that displays the patterns, seams, and bug holes caused by formwork and concrete emplacement. The Brutalist architectural style is characterized by its use of raw building materials in a very direct and imposing way, emphasizing bulky forms and sharp angles with limited visible glass surfaces. A popular style between the 1950s and 1970s, Brutalism favored heavy, solid shapes cast with highly detailed and textured reinforced concrete. Often associated with High Modernism, a style emphasizing austere and abstract forms rooted in science and technology, the bold, unapologetic design and monumentality of Brutalism makes it an easy target for criticism, and it is thought to be one of the most divisive styles of architecture to emerge since the beginning of the twentieth century (Lowder 2013; McAlester 2015; Mindel 2016).

Brutalism was a popular style of architecture for educational buildings, particularly university buildings, but was relatively rare for corporate and single-family residential projects. It was also favored for civic projects, high-rise apartments, and shopping centers, as the style emulated strength, functionality, and an appreciation for material simplicity (Brutalism Online 2016). Character-defining features of Brutalism include (City of San Diego 2007; HRG & PH 2007):

- Exposed, expressive structural system
- Rough, unadorned concrete construction
- Monumental massing
- Heavy blockish shapes
- Angular and rectilinear forms
- Prefabricated concrete panels with exposed joinery
- Windows as voids in an otherwise solid volume
- Repetitive patterns
- Avoidance of traditional elements or ornament
- Raised plazas and base articulation

Engineer: James M. Montgomery, Consulting Engineers, Inc. (1945-1990)

The Behner WTP was designed by engineer James M. Montgomery (1896-1969). Montgomery was born in Ohio in 1896, and moved to Los Angeles California by 1910. He briefly served in the military during World War I, and was honorably discharged in October 1918. Montgomery returned to Newark, Ohio for a few years, but eventually moved back to Los Angeles Between 1935 and 1940. Montgomery launched his engineering firm in 1941, after having some success in helping design the F.E. Weymouth Memorial Water Softening and Filtration Plant in 1936 with MWD. This early connection with water infrastructure led to a career of consulting, studies, reports, and designing water infrastructure systems for Southern California and the greater West Coast of the United States for the next five decades. The firm was based in Pasadena for the first few decades. James Montgomery himself passed away in 1969, but his firm continued consulting work focused on water infrastructure. In 1990, the James M. Montgomery, Consulting Engineers, Inc. firm merged with Watson Hawksley, Ltd of the United Kingdom to become Montgomery-Watson. In 2001, Montgomery Watson merged with Harza Engineering and became Montgomery Watson Harza. This name was shortened to MWH Global in 2003. In 2016, MWH was acquired by Stantec Consulting, Inc. (Ancestry 2019).

Built Environment Resources Identified in the Project Site

Dudek Architectural Historian Kate Kaiser, MSHP and Nicole Frank, MSHP, conducted a pedestrian survey of the Project site for historic built environment resources on October 23, 2019. The survey entailed walking to each affected property in the Project area: the PWP spreading basins, the LACFCD flood control infrastructure, Southern California Edison (SCE) transmission line route, Behner WTP, the Arroyo Seco Road bed within and between all proposed Project areas, the three bridge sites, the screen building, and the intake structure and weir. Below is a discussion of the identified historic-age resources.

John L. Behner Water Treatment Plant

The Behner WTP is a one-story Brutalist-style civic building, rectangular in shape, with a flat roof, designed by James M. Montgomery, Consulting Engineer, Inc. of Pasadena, and built in 1971. Exterior walls are exposed concrete with limited fenestration. The design emphasizes horizontality in form, but with strong vertical accents: simple, unadorned, rectangular concrete pilasters flank each narrow window/panel; broad concrete pilasters flank the entry door; and repetitive patterns of vertically-oriented rectilinear forms. A tall, monolithic concrete wall, with a broad band of vertically-oriented rectilinear forms creating a repetitive pattern, blocks view of the southern portion of external water treatment facilities to the east of and adjacent to the building. The external water treatment facilities comprise a series of open concrete tanks, with water flow controlled by a pair of wood flood gates, and a pair of moderately-sized, cylindrical above-ground tanks.

Screen Building Complex

The Screen Building Complex (formerly known as the Chlorination Plant) consists of the screen building built c. 1932, a weir built c. 1938, and an intake structure built c. 1938. The screen building is an L-shaped, flat-roofed concrete building of utilitarian design. A narrow drip edge runs along the walls below what appears to be a short parapet wall. Fenestration includes two flush single-leaf entry doors, a roll-up garage door, and five windows obscured by metal screens. A vertical metal ladder attached near one of the entry doors provides access to the roof. An elevated rectangular concrete open-air tank structure, with a large piece of mechanical equipment bolted over half of the structure and accessed by three metal steps, sits to the left of and slightly in front of the screen building. A rectangular arch constructed from metal I-beams, with the two uprights supported with angled I-beams on the front and back of the arch, is located in front of the garage door. The weir is a combination of mortared stone and poured-in-place concrete with at least one wood sluice gate, although access was limited during survey due to vegetation and debris. A cobblestone wall rises from the original retaining wall on the right (east or cutbank) side of the weir and supports a concrete platform, the top deck of the intake structure, into which the original rectangular concrete platform is incorporated and expanded.

Bridge No. 1

Bridge No. 1 is depicted in Figure 2-4B, Gabrielino Trail/Access Road Existing Conditions Photographs in Section 2, Environmental Setting of this Draft EIR. Bridge No. 1 appears to be a two-span box culvert bridge, with the bridge supported on either end by a cobblestone abutment wall and in the middle by a cobblestone wall. The abutments and center wall may be concrete clad with mortared cobblestones, or built as load-bearing cobblestone masonry walls. The bridge deck appears to be supported by a metal plate(s) that rests upon the cobblestone walls. An approximately 18-inches-tall band of mortared cobblestone rests on the upstream and

downstream edges of the metal plate(s), with the bridge deck coated in tarmac. A new temporary bridge with concrete access ramps passes across the deck of Bridge No.1. Aerial images indicate a bridge crossing over Millard Canyon existed at the same location prior to 1927. Archival research indicates that the original bridge was either damaged or destroyed by the 1938 floods, and replaced with the existing two-span box culvert bridge either during a CCC repair campaign in 1939 or as part of the 1941 Arroyo Seco Program. A previous report identified the bridge deck as being replaced with a "similar reinforced concrete span" in 1979, and that river rock was applied to both sides of the deck at the time to "visually integrate it with the existing river rock-clad bridge components" (Daly 2014). Comparison of photographs taken in 2019 during the site visit with those included in a 2015 report indicate that the bridge deck was coated with a layer of tarmac c. 2017, prior to installing the temporary bridge (TJC & Associates 2015).

Bridge No. 2

Bridge No. 2 is depicted in Figure 2-4B and is a board-formed concrete arch bridge, with board-formed concrete abutments and a subtle four-point arch, spanning the Arroyo Seco, constructed circa 1920. Rectangular concrete railings border the upstream and downstream edges of the bridge deck, with openings between upper and lower rails sporting a row of classically shaped single balusters resembling the form of a flower bud from a pomegranate tree. The bridge deck is covered with tarmac.

Bridge No. 3

Bridge No. 3 is depicted in Figure 2-4B and is a wooden kingpost truss bridge, with heavy timber supports braced by a vertical metal rod and angled wood beam braced on a cantilevered timber girder. Timber railings line both side of the bridge deck, and board-formed concrete retaining walls support either end of the bridge. A metal plaque attached to one end of the southern retaining wall indicates the wood bridge was erected in 1939 by "C.C.C. Company 903 – U.S.F.S. in cooperation with Pasadena Water Department." A temporary bridge deck is positioned directly above the original wood bridge. The temporary bridge was initially installed to accommodate the loading from heavy equipment needed during construction of the Arroyo Seco Canyon Project that would be beyond the capacity of the original Bridge No. 3. However, as the condition of the original bridge has continued to deteriorate and is no longer safe for use, the temporary structure allows for continued passage into the canyon and access to the USFS compound by isolating traffic weight and movement from affecting the older wood bridge. The temporary bridge deck is built with anti-skid steel decking supported by steel I-beam girders, and is bolted through wood sill plates into the top of the original bridge's concrete retaining walls. Sloped, poured-in-place concrete ramps provide access to the temporary bridge deck at either end. Tubular metal railings line each side of the temporary bridge deck and concrete access ramps.

Flood Control Infrastructure

Flood control infrastructure at the upstream end of the spreading basins consists of two LACFCD-owned sheds to either side of a County-owned concrete storm drain box structure, called the Altadena Storm Drain, with pulley operated components and a concrete and metal check dam. Each shed is a square plan gable fronted building, with horizontal wood board cladding, and rolled composition roofing, on a concrete slab foundation. The doors are both located on the south elevations and consist of vertical wood board doors, braced on the interior. Other fenestration consists of screened window openings and a louvered vent in the gable end. The two sheds are to either side of the storm drain box structure with three openings on the top side, and letting out via culvert into the Arroyo Seco.

The PWP spreading basins consist of, two spreading basins (Pasadena Ponds 1 and 2) formerly used as sludge ponds during operation of the Behner WTP, and 14 additional spreading basins (originally developed by

LACFCD) separated by check dams completed between 1948 and 1952. Spreading basin features are engineered earthen ponds separated by soil embankments and small wood and concrete flow control dams. Each basin varies in total size and depth (Figure 34). The Pasadena Ponds 1 and 2 also have buried concrete culverts between them and the Parshall Flume, as well as chain link fence surrounding them.

A flow control dam is located west of the westernmost shed. Situated in a naturalized channel, west of the Altadena Storm Drain, the flow control dam consists of two walls of wood cribbing, and a wood board dam in the center, with removable boards in a metal track in order to control flow in the narrow channel. The downstream side of the channel has had a gunite mixture applied to the channel walls. On the east side of the dam, is a concrete platform, stair and metal handrail. On the west side of the dam, are two corrugated metal canisters, one lidded with flat metal and the other with conical metal.

Finally, downstream of the flow control dam, there is a culvert and vehicle bridge through which water is measured (via a Parshall Flume) before it flows into the spreading basins. The culvert has two 18-inch openings in the channel basin. The roadbed is filled with gravel, but the culvert is constructed of board-formed concrete, with metal lining, and metal guard rails on top for safety. There is also a corrugated galvanized steel tank with a conical lid placed on a concrete platform on the upstream side of the culvert. The tank is currently used to house the controls for the Parshall Flume's metering device.

CHRIS Records Search

A CHRIS records search was conducted for the Project site and surrounding 0.5-mile records search area at the South Central Coastal Information Center (SCCIC), located on the campus of California State University, Fullerton on October 3, 2019. This search included their collections of mapped prehistoric, historic, and built environment resources, Department of Parks and Recreation Site Records, technical reports, and ethnographic references. Additional consulted sources include historical maps of the study area, the NRHP, the CRHR, the California Historic Property Data File, the lists of California State Historical Landmarks, California Points of Historical Interest, and the Archaeological Determinations of Eligibility.

Previously Conducted Cultural Resources Studies

The SCCIC records indicate that 35 cultural resources investigations have been conducted within 0.5-mile of the Project site. Of these, six studies were conducted within a portion of the Project site, (LA-01903, LA-06948, LA-08927, LA-11042, LA-11193, and LA-11194), and one study (LA-01312) was adjacent to the Project site. Table 4.3-1, below, summarizes the six previous cultural resources studies that overlap or were adjacent to the Project site, followed by a brief summary of each study that overlaps or is adjacent to the Project.

Table 4.3-1. Previous Cultural Resources Investigations Within 0.5-Mile of the Project site

SCCIC Report Number	Title	Author	Year	Proximity to Project site
LA-01312	Archaeological Reconnaissance Report: Fuel Break System for the Crest-Millard Fuel Management Unit	Bridgewater, John W.	1976	Adjacent
LA-01903	Preliminary Assessment of the Prehistoric Cultural Resources of the Devil's Gate Reservoir, Pasadena, California	Blodgett, Leslie M	1987	Overlaps

Table 4.3-1. Previous Cultural Resources Investigations Within 0.5-Mile of the Project site

SCCIC Report Number	Title	Author	Year	Proximity to Project site

Source: Appendix E-1

LA-01312

In 1976, John Bridgewater of the Saugus Ranger District conducted an Archaeological Reconnaissance Report (ARR) for Crest-Millard Fuel Management Unit on locations in Arroyo Seco and Tujunga Districts. The resulting report, *Fuel Break System for the Crest-Millard Fuel Management System*, studied dispersed sections of the Angeles National Forest potentially affected by the maintenance and expansion of a fuel break system. The study area included an Area of Potential Effect (APE) that extended to the first major ridge in the San Gabriel Mountain north of the area between the foothill cities of Tujunga and Pasadena, roughly adjacent to the current Project site. One prehistoric site was identified within the vicinity of the APE (P-19-000342) as a result of the records search and field survey, however, it was determined that it would only be impacted if future plans pushed construction north of the Vasquez Break. A site survey record from 1965 for P-19-000342 was attached to Mr. Bridgewater's report which included surface survey of a general village site, identification of a cogstone, milling stones, and interviews of the property owners who attested to a purported village having existed according to the local cultural memory.

LA-01903

In 1987, Leslie Blodgett was contracted by Cotton/Beland and Associates to prepare an Archaeological Survey Report in support of repair and reuse of the Devil's Gate Reservoir, in the City of Pasadena. The study area consisted of the reservoir property located directly north of the I-210 Foothill Freeway and directly south of the Cal Tech Jet Propulsion Laboratory. The study area overlapped a portion of the current Project site at Area 3. The resulting report, *Preliminary Assessment of the Prehistoric Cultural Resources of the Devil's Gate Reservoir, Pasadena, California* (Blodgett 1987), consisted of a records search and pedestrian survey. No prehistoric cultural resources were identified within the study area as a result of the archival review and field

inspection. However, the records search identified two prehistoric sites within 1-mile of the study area: the aforementioned P-19-000342 purported village site, and P-19-000026, known as the Sheldon Reservoir site, which consists of a multi-level prehistoric graveyard. As a result of these findings, the study area was determined archaeologically sensitive given the close proximity of these sites to the study area.

LA-06948

In 2002, Southern California Edison Company (SCE) retained Compass Rose Archaeological, Inc. to conduct a Phase I Inventory in support of the proposed replacement and relocation of two deteriorated H-frame structures on the Seco 16 kV circuit. One structure location is within the current Project site. The study impact areas consisted of individual structure locations and a 30-meter diameter surrounding each structure. No prehistoric or historic-age cultural resources were identified within the impact areas as a result of the CHRIS records search and pedestrian survey. The resulting letter report, *Southern California Edison Seco 16 kV Circuit Edison Company Circuit Deteriorated Pole Replacement Project*, stated that no further cultural resources considerations were warranted for the project aside from standard management recommendations for the unanticipated discovery of cultural resources uncovered during construction activities.

LA-08927

In 2007, Willdan retained McKenna et. al. to conduct a cultural resources study in support of the Arroyo Seco Master Plan Project with improvements to the Sunset Overlook Trailhead area located at Windsor Avenue within the Hahamongna Watershed Park in the City of Pasadena. The project consisted of improvements to the parking lot, as well as the widening of the trailhead, extending to where the Gabrieleno Trail meets the Sunset Overlook, overlapping the southern portion of the current Project site. The study consisted of a CHRIS records search, Native American coordination, and a pedestrian survey. No cultural resources were identified within the study area as a result of the records search and pedestrian survey. However, based on communications with the Gabrielino/Tongva Tribe, the Tribe considers the area of Arroyo Seco sensitive for the presence of cultural resources of Native American origin. The resulting letter report, *A Phase I (CEQA) and Class III (NEPA) Cultural Resources Investigation for the Sunset Overlook Trailhead Area of the Hahamongna Watershed Park in the City of Pasadena, Los Angeles County, California*, stated that the study area should be considered moderately sensitive for the presence of prehistoric archaeological resources and provided recommendations for archaeological monitoring during construction.

LA-11042

In 2009, Willdan retained McKenna et. al. to conduct a cultural resources study in support of the Eastside Neighborhood and JPL Connector Trail Project with improvements to all trail-ways north of Devil's Gate Reservoir in the Arroyo Seco area west of the City of Pasadena. Specifically, the study area included approximately 1619 linear feet of trail improvements between the City of Altadena (from the terminus of Altadena Drive) and Hahamongna Watershed Park, overlapping a portion of Area 3 within the current Project site. The study consisted of a CHRIS records search, Native American coordination, and a pedestrian survey. No cultural resources were identified within the study area as a result of the records search and pedestrian survey. However, based on communications with the Gabrielino/Tongva Tribe, the Tribe considers the area of Arroyo Seco sensitive for the presence of cultural resources of Native American origin. The resulting letter report, *A Phase I (CEQA) and Class III (NEPA) Cultural Resources Investigation for the Eastside Neighborhood and JPL Connector Trail Improvements Project Area in the*

Hahamongna Watershed Park, City of Pasadena, Los Angeles County, California, stated that the study area should be considered moderately sensitive for the presence of prehistoric archaeological resources and provided recommendations for archaeological monitoring during construction.

LA-11193

In 2007, the City of Pasadena, Parks and Natural Resources Division prepared a Master EIR Initial Study in support of the Sunset Overlook Trailhead Area in Hahamongna Watershed Park. Details of this project were discussed above in SCCIC report LA-08927. The Initial Study published the results of the McKenna et.al. 2007 study, which determined that the study area is sensitive for the presence of Native American cultural resources, and provided mitigations for archaeological monitoring.

LA-11194

In 2002, the City of Pasadena, Parks and Natural Resources Division prepared the Hahamongna Watershed Park Master Plan. The Hahamongna Watershed Park overlaps the southern portion of the current Project site. The document referenced the Blodgett (1987) study discussed above in SCCIC report LA-01903, which stated that although no prehistoric cultural resources were identified within the Hahamongna Watershed Park as a result of a records search and pedestrian survey, the presence of two known prehistoric sites within the vicinity of the park suggests that the area is sensitive for the presence of prehistoric cultural resources.

Previously Recorded Cultural Resources

The CHRIS records indicate that one previously recorded resource (P-19-189942) overlaps the Project site, and one resource (P-19-186535) is adjacent to the Project site. Resource P-19-189942 consists of the Hahamongna Watershed Park and associated recreational facilities. The resource was previously determined ineligible for the CRHR, and is therefore not considered an historical resource. Resource P-19-186535 consists of the Angeles National Forest, a registered California Historical Landmark. The Project is not anticipated to impact this resource.

Thirteen additional previously recorded cultural resources are within 0.5-mile of the Project site. Of these, two consist of prehistoric archaeological resources, including P-19-000342, the purported village site discussed above in SCCIC report LA-01312, and an isolated granitic discoidal recovered from fill material. There is one multi-component resource consisting of multiple loci of sparse prehistoric lithic scatters, as well as a historic-era domestic refuse scatter and purported historic-era burial from the late 1800s. There are two historic-era archaeological resources consisting of a granite headstone fragment from 1865, which is associated with the multi-component site, and the remnants of an early twentieth century campground known as Teddy's Outpost. None of these prehistoric or historic-era archaeological resources have been evaluated for the NRHP or CRHR.

Additionally, there are eight built environment resources within 0.5-mile of the Project site. These resources include the Jet Propulsion Laboratory campus, the registered National Historic Landmark Space Flight Operations Facility and the NRHP eligible Space Simulator, which are both within the Jet Propulsion Laboratory campus; the USDA Forest Service Oak Grove administrative site; two individual buildings within the Arroyo Seco Ranger Station administration site; a USDA Forest Service Road; and the CRHR listed single-family property built in 1924 known as the Buffum House.

Native American Coordination

Dudek contacted the NAHC on September 16, 2019 to request a search of the SLF. Results of the SLF (received October 7, 2019) were positive. The NAHC recommended contacting the Gabrieleño Band of Mission Indians – Kizh Nation for specific information regarding the positive findings. The NAHC also provided contact information for an additional four Native American individuals and/or tribal organizations who may have direct knowledge of cultural resources in or near the Project site; however, the additional four Native American individuals and/or tribal organizations have not, as of the submission of this Draft EIR, contacted the City requesting that the lead agency (City) provide notification to the tribe of projects in the tribe's area of traditional and cultural affiliation. In compliance with Assembly Bill (AB) 52, the City has contacted tribal representatives that have requested to be notified of projects in Pasadena. These efforts are summarized in Section 4.9, Tribal Cultural Resources of this Draft EIR.

Paleontological Resources Setting

The proposed Project site lies within the Transverse Ranges Geomorphic Province (Norris and Webb 1990; California Geological Survey 2002). This geomorphic province structure is east-west trending and is oblique to the normal northwest trend of coastal California. Regionally, the Transverse Ranges extend offshore in the west to include the continental shelf and offshore islands (Santa Cruz, Santa Rosa, and San Miguel) (Norris and Webb 1990; California Geological Survey 2002). Regional mountain ranges in the Transverse Ranges geomorphic province include the San Bernardino Mountains in the east, which have been displaced to the south along the San Andreas Fault. Geologically, these mountains are dominated by Cenozoic sedimentary and Mesozoic igneous rocks that have been folded and faulted by north-south compression that is squeezing the Transverse Ranges (Norris and Webb 1990; CGS 2002).

Dudek requested a paleontological records search though the Natural History Museum of Los Angeles County (LACM) of the proposed Project site and a one-half mile radius buffer on September 17, 2019, and the results were received on October 1, 2019. According to the LACM records search (Appendix E-2; McLeod 2019) and surficial geological mapping by Dibblee and Ehrenspeck (1989) at a scale of 1:24,000, Area 2 of the proposed Project site is underlain by Cretaceous (~ 145 – 65 million years ago) plutonic igneous rocks and Holocene gravel deposits (map unit Qg), and Area 3 is underlain by Pleistocene (~ 2.58 million years ago – 11,700 years ago) alluvial fan deposits (map unit Qof) and Holocene gravel deposits (map unit Qg). The Pleistocene alluvial fan deposits crop out within the eastern extension of Area 3.

The records search results indicated that the LACM has no vertebrate fossil localities from within the proposed Project site boundaries or within the one-half mile radius buffer; however, they do have localities nearby from the same geological units underlying the proposed Project (Appendix E-2; McLeod 2019). LACM 2027, which is the closest vertebrate locality, situated near the Washington Boulevard and Allen Avenue intersection southeast of the proposed Project, yielded a fossil mastodon (*Mammut*) from an unknown depth below the surface. Further southeast, LACM (CIT) 342 produced fossil specimens of turkey (*Parapavo californicus*) and mammoth (*Mammuthus*) from a depth of 14 feet below the ground surface (Appendix E-2; McLeod 2019). Both specimens were documented in the scientific literature: the turkey by Miller (1942) and the rare, nearly complete mammoth by Roth (1984).

4.3.3 Relevant Plans, Policies, and Ordinances

Federal

The National Historic Preservation Act

The NHPA established the National Register of Historic Places (NRHP) and the President's Advisory Council on Historic Preservation (ACHP), and provided that states may establish State Historic Preservation Officers (SHPOs) to carry out some of the functions of the NHPA. Most significantly for federal agencies responsible for managing cultural resources, Section 106 of the NHPA directs that

> [t]he head of any Federal agency having direct or indirect jurisdiction over a proposed Federal or federally assisted undertaking in any State and the head of any Federal department or independent agency having authority to license any undertaking shall, prior to the approval of the expenditure of any Federal funds on the undertaking or prior to the issuance of any license, as the case may be, take into account the effect of the undertaking on any district, site, building, structure, or object that is included in or eligible for inclusion in the NRHP.

Section 106 also affords the ACHP a reasonable opportunity to comment on the undertaking (16 U.S.C. 470f).

36 Code of Federal Regulations, Part 800 (36 CFR 800) implements Section 106 of the NHPA. It defines the steps necessary to identify historic properties (those cultural resources listed in or eligible for listing in the NRHP), including consultation with federally recognized Native American tribes to identify resources with important cultural values; to determine whether or not they may be adversely affected by a proposed undertaking; and the process for eliminating, reducing, or mitigating the adverse effects.

The content of 36 CFR 60.4 defines criteria for determining eligibility for listing in the NRHP. The significance of cultural resources identified during an inventory must be formally evaluated for historic significance in consultation with the ACHP and the California SHPO to determine if the resources are eligible for inclusion in the NRHP. Cultural resources may be considered eligible for listing if they possess integrity of location, design, setting, materials, workmanship, feeling, and association.

Regarding criteria A through D of Section 106, the quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, cultural resources, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and that:

A. Are associated with events that have made a significant contribution to the broad patterns of our history; or
B. Are associated with the lives of persons significant in our past; or
C. Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D. Have yielded or may be likely to yield, information important in prehistory or history [36 CFR 60.4].

The 1992 amendments to the NHPA enhance the recognition of tribal governments' roles in the national historic preservation program, including adding a member of an Indian tribe or Native Hawaiian organization to the ACHP.

The NHPA amendments:

- Clarify that properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization may be determined eligible for inclusion in the National Register
- Reinforce the provisions of the Council's regulations that require the federal agency to consult on properties of religious and cultural importance.

The 1992 amendments also specify that the ACHP can enter into agreement with tribes that permit undertakings on tribal land and that are reviewed under tribal regulations governing Section 106. Regulations implementing the NHPA state that a federal agency must consult with any Indian tribe that attaches religious and cultural significance to historic properties that may be affected by an undertaking.

State/Regional

California Register of Historical Resources

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated below. According to California Public Resources Code Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history.

In order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historical resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

California Environmental Quality Act

Cultural Resources

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- California Public Resources Code Section 21083.2(g) defines "unique archaeological resource."
- California Public Resources Code Section 21084.1 and CEQA Guidelines Section 15064.5(a) define "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource." It also defines the circumstances when a project would materially impair the significance of an historical resource.
- California Public Resources Code Section 21074(a) defines "tribal cultural resources."
- California Public Resources Code Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- California Public Resources Code Sections 21083.2(b)-(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historical resources, including examples of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(b).) If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historical resources or identified as significant in an historical resources survey (meeting the requirements of California Public Resources Code Section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is an historical resource even if it does not fall within this presumption (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); California Public Resources Code Section 5020.1(q)). In turn, CEQA Guidelines section 15064.5(b)(2) states the significance of an historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a Project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of an historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (California Public Resources Code Section 21083.2[a], [b], and [c]).

California Public Resources Code Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Impacts to non-unique archaeological resources are generally not considered a significant environmental impact (California Public Resources Code section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as tribal cultural resource (California Public Resources Code Section 21074(c), 21083.2(h)), further consideration of significant impacts is required. CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in California Public Resources Code Section 5097.98.

Paleontological Resources

Paleontological resources are limited, nonrenewable resources of scientific, cultural, and educational value and are afforded protection under state laws and regulations (CEQA). This report satisfies project requirements in accordance with CEQA (PRC Section 21000 et seq.) and PRC Section 5097.5. This analysis also complies with guidelines and significance criteria specified by the Society of Vertebrate Paleontology (SVP 2010).

Paleontological resources are explicitly afforded protection by CEQA, specifically in Section VII(f) of CEQA Guidelines Appendix G, the Environmental Checklist Form, which addresses the potential for adverse impacts to "unique paleontological resource[s] or site[s] or … unique geological feature[s]" (14 CCR 15000 et seq.). This provision covers fossils of signal importance—remains of species or genera new to science, for example, or fossils exhibiting features not previously recognized for a given animal group—as well as localities that yield fossils significant in their abundance, diversity, preservation, and so forth. Further, CEQA provides that, generally, a resource shall be considered "historically significant" if it has yielded or may be likely to yield information important in prehistory (14 CCR 15064.5 [a][3][D]). Paleontological resources would fall within this category. The California Public Resources Code, Chapter 1.7, Sections 5097.5 and 30244, also regulates removal of paleontological resources from state lands, defines unauthorized removal of fossil resources as a misdemeanor, and requires mitigation of disturbed sites.

California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains can occur until the county coroner has examined the remains (Health and Safety Code Section 7050.5(b)). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Health and Safety Code Section 7050.5(c)). The NAHC will notify the "most likely descendant." With the permission of the landowner, the most likely descendant may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the most likely descendant by the NAHC. The most likely descendant may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

Local

City of Pasadena Historic Preservation Ordinance (Chapter 17.62)

This study was completed in consideration of all sections of the Pasadena Historic Preservation Ordinance (Chapter 17.62). Sections most relevant to this study are provided below.

17.62.010 - Purpose of Chapter

The purpose of this Chapter is to specify significance criteria for the designation of historical resources, procedures for designation, and review procedures to:

A. Encourage and promote the adaptive reuse of the City's historical resources;
B. Enhance, perpetuate, and preserve architecturally and historically significant structures and promote revitalization of historic neighborhoods and commercial areas;
C. Ensure that the rights of the owners of historical resources and owners of properties adjacent to historical resources are safeguarded;
D. Foster civic pride in the beauty and noble accomplishments of the past by promoting private stewardship of historical resources that represent these accomplishments;
E. Fulfill the City's responsibilities:
    1. As a Certified Local Government under Federal preservation laws; and
    2. For Federal Section 106 reviews and for the California Environmental Quality Act regarding historical resources.
F. Promote the identification, documentation, and evaluation of the significance of individual historical resources and districts;
G. Implement the historic preservation goals, policies, and programs of the General Plan;
H. Promote the City as a destination for tourists and as a desirable location for business;
I. Promote public awareness of the value of rehabilitation, restoration, and maintenance of the existing building stock as a means to conserve reusable material and energy resources;
J. Recognize the City's historical resources as economic assets; and
K. Stabilize and improve property values, and enhance the aesthetic and visual character and environmental amenities of the City's historic properties and areas.

17.62.040 - Criteria for Designation of Historic Resources

Evaluation of Historic Resources

When considering applications to designate a historic monument, landmark, historic sign, landmark tree or landmark district, the Historic Preservation Commission shall apply the criteria below according to applicable National Register of Historic Places Bulletins for evaluating historic properties, including the seven aspects of integrity: location, design, setting, materials, workmanship, feeling and association (National Register of Historic Places Bulletin #15: "How to Apply the National Register Criteria for Evaluation").

Historic Monuments

1. A historic monument shall include all historical resources previously designated as historic treasures before adoption of this Chapter, historical resources that are listed in the National Register at the State-wide or Federal level of significance (including National Historic Landmarks) and any historical resource that is significant at a regional, State, or Federal level, and is an exemplary representation of a particular type of historical resource and meets one or more of the following criteria:
   a. It is associated with events that have made a significant contribution to the broad patterns of the history of the region, State, or nation.
   b. It is associated with the lives of persons who are significant in the history of the region, State, or nation.
   c. It is exceptional in the embodiment of the distinctive characteristics of an historical resource property type, period, architectural style, or method of construction, or that is an exceptional representation of the work of an architect, designer, engineer, or builder whose work is significant to the region, State, or nation, or that possesses high artistic values that are of regional, State-wide or national significance.
   d. It has yielded, or may be likely to yield, information important in prehistory or history of the region, State, or nation.
2. A historic monument designation may include significant public or semi-public interior spaces and features.

Landmarks

1. A landmark shall include all properties previously designated a landmark before adoption of this Chapter and any historical resource that is of a local level of significance and meets one or more of the criteria listed in Subparagraph 2., below.
2. A landmark may be the best representation in the City of a type of historical resource or it may be one of several historical resources in the City that have common architectural attributes that represent a particular type of historical resource. A landmark shall meet one or more of the following criteria:
   a. It is associated with events that have made a significant contribution to the broad patterns of the history of the City, region, or State.
   b. It is associated with the lives of persons who are significant in the history of the City, region, or State.
   c. It embodies the distinctive characteristics of a type, architectural style, period, or method of construction, or represents the work of an architect, designer, engineer, or builder whose work is of significance to the City or, to the region or possesses artistic values of significance to the City or to the region.
   d. It has yielded, or may be likely to yield, information important locally in prehistory or history.

Historic Signs

1. A historic sign shall include all signs in the sign inventory as of the date of adoption of this Zoning Code and any sign subsequently designated historically significant by the Historic Preservation Commission that possesses high artistic values. A historic sign shall meet one or more or the following criteria:
   a. The sign is exemplary of technology, craftsmanship or design of the period when it was constructed, uses historic sign materials and means of illumination, and is not significantly altered from its historic period. Historic sign materials shall include metal or wood facings, or paint directly on the façade of a building. Historic

means of illumination shall include incandescent light fixtures or neon tubing on the exterior of the sign. If the sign has been altered, it must be restorable to its historic function and appearance.

b. The sign is integrated with the architecture of the building.

c. A sign not meeting criteria a or b above may be considered for inclusion in the inventory if it demonstrates extraordinary aesthetic quality, creativity, or innovation.

2. All other regulations relating to signs shall comply with Chapter 17.48 (Signs).

Landmark Trees

A tree shall qualify to be of historic or cultural significance and of importance to the community if it meets any one of the following criteria:

1. It is one of the largest or oldest trees of the species located in the City;
2. It has historical significance due to an association with a historic event, person, site, street, or structure; or
3. It is a defining landmark or significant outstanding feature of a neighborhood.

Landmark Districts

1. A landmark district shall include all landmark districts previously designated before adoption of this Chapter and any grouping of contiguous properties that also meet the following criteria:
   a. Within its boundaries, a minimum of 60 percent of the properties qualify as contributing; and
   b. The grouping represents a significant and distinguishable entity of Citywide importance and one or more of a defined historic, cultural, development and/or architectural context(s) (e.g., 1991 Citywide historic context, as amended, historic context prepared in an intensive-level survey or historic context prepared specifically for the nominated landmark district).
2. When determining the boundaries of a landmark district, the Historic Preservation Commission shall use the National Register of Historic Places Bulletin #21: "Defining Boundaries for National Register Properties".

Arroyo Seco Master Plan

The Arroyo Seco Master Plans are a set of documents defining the community vision for the Arroyo Seco Natural Park. The set is comprised of four separate planning documents: the Lower Arroyo Master plan, Central Arroyo Master Plan, Hahamongna Watershed Park Master Plan, and Design Guidelines. The Hahamongna Watershed Park Master Plan and Design Guidelines are both relevant to this report.

The Hahamongna Watershed Park Master Plan (City of Pasadena 2003b) illustrates a vision for the 300-acres of open space that extends from Devil's Gate Dam north and into the Arroyo Seco Canyon, on the northwestern edge of the city. The Hahamongna Watershed Park Master Plan was adopted to establish a framework for recreation, water resources, flood management, habitat restoration, and cultural resources in this area. The Hahamongna Watershed Park Master Plan promotes the use of decorative Arroyo stone walls, gates, and fences, reflecting the historic heritage of the Arroyo Seco in Pasadena. They are established in this Master Plan as major enhancing and contributing to the unique setting of the natural habitats that are focal areas throughout the park.

Arroyo Seco Design Guidelines

The Arroyo Seco Design Guidelines (City of Pasadena 2003a) provide a unifying set of criteria for the site development improvements set forth in the Arroyo Seco Master Plan for on-going, long-range improvements for the Arroyo Seco. These guidelines will lead to a unified park design that reflects the heritage of the Arroyo Seco and its relationship to the tradition of the City of Pasadena. The Arroyo Seco Design Guidelines provide specific site design solutions that are consistent with the existing Arroyo Seco Ordinance and a vehicle by which practical inputs for ongoing improvements can take place. The Design Guidelines document gives more specific instances dictating how decorative cobblestone walls, gates, and fences should be utilized.

In the Architectural Design Concepts section guidelines, the "use of natural materials" and "arroyo stone" should be incorporated whenever appropriate. The guidelines also call for the preservation of stone walls in the Arroyo, when culturally significant. The arroyo stone walls and steps throughout the City of Pasadena and especially in the Arroyo Seco are considered an historical resource because many of them were built during the WPA years and in some locations designed by notable architects (City of Pasadena 2003a). See below:

7.2 General Guidelines

7.2.1 Walls

1. Where appropriate, vines and/or shrubs can be located against walls in areas where vandalism (graffiti) is a problem.
2. The stone walls in the Arroyo are culturally significant and shall be preserved.
3. Wall improvements in the Arroyo Seco shall primarily consist of walls that are faced in arroyo stone.
4. Walls constructed of split-faced block may be allowed in appropriate situations as determined by the Design Commission.
5. Wall improvements shall use the historic masonry style of the Arroyo by using a variety of sizes of stone, with large stones and boulders at the base of the wall including dry-stack techniques.
6. See the Wall Restoration Standards in Appendix E for improvements being considered to an existing stone wall or the construction of a new arroyo stone wall.
7. Where an existing stone retaining wall is in need of repair and posing a threat to the further degradation of the wall or to the public, the wall will be improved to ensure structural stability. See Appendix E, Wall Restoration Standards.
8. Wall improvements will consider drainage patterns immediate to the wall and provide weep holes at regular intervals and/or the appropriate drainage solution to protect the longevity of the wall.
9. Improvements to arroyo stone walls will be made by a qualified craftsman in the masonry trade with demonstrable experience with similar work.
10. Low stone walls will be finished so that the top of the wall is smooth, flat, and comfortable enough to be used as seating.

11. A well-crafted and proportionately sized cantilevered concrete cap atop an arroyo stone wall or pilaster is an acceptable design.
12. All construction and repair of the arroyo stone walls and steps shall be done in accordance with the current City of Pasadena's "Standard Specifications for Public Works Construction" (popularly known as the "Greenbook").
13. Arroyo stone walls along neighborhood trails shall be restored.

4.3.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to cultural resources are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to cultural resources would occur if the project would:

a) Cause a substantial adverse change in the significance of an historical resource pursuant to §15064.5.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5.

Through the analysis in the Initial Study (see Appendix A-1), it was determined that the proposed Project would not disturb any human remains, including those interred outside of dedicated cemeteries. (i.e., Threshold c).

c) Disturb any human remains, including those interred outside of dedicated cemeteries.

Accordingly, this issue is not further analyzed in this Draft EIR and the pertinent impact analysis can be reviewed in the Initial Study

Additionally, because Project-related impacts to Geology and Soils were found to be less than significant in the Initial Study (see Appendix A-1), with the exception of potential impacts to paleontological resources, this cultural resources section of this Draft EIR also includes an analysis of the proposed Project's potential impacts to paleontological resources. According to Appendix G of the CEQA Guidelines, a significant impact related to paleontological resources would occur if the Project would:

d) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

4.3.5 Environmental Impacts Analysis

Threshold 4.3a. Would the project cause a substantial adverse change in the significance of an historical resource pursuant to §15064.5.?

Table 4.3-2 provides a summary of all resources evaluated for historical significance within the Project site. Six built environment resources were identified as a result of the background research and pedestrian survey. Of these, three resources (the Behner WTP, Bridge No. 2, and Bridge No. 3) were found eligible for NRHP, CRHR and local designation. The remaining three resources (the Screen Building Complex, Bridge No. 1, and the flood control infrastructure) were found not eligible under all designation criteria due to a lack of historical associations and integrity. Below the table is a significance evaluation for each resource.

Table 4.3-2. Summary of Resource Evaluation Findings

Resource Name	Description	Built Date	Evaluation Findings
John L. Behner WTP	Brutalist-style water treatment plant building and related infrastructure	1971	Appears eligible under NRHP/CRHR Criteria C/3 at local level, and City Criterion 2c (3S/3CS/5S3)
Screen Building Complex	Complex consisting of screen building, a weir, and two pipelines	c. 1932	Appears not eligible under all designation criteria (6Z)
Bridge No. 1	Two-span box culvert bridge spanning Millard Canyon tributary stream	c. 1938-1941	Appears not eligible under all designation criteria (6Z)
Bridge No. 2	Concrete arch bridge spanning the Arroyo Seco	c. 1920	Appears eligible under NRHP/CRHR Criteria C/3 at local level, and City Criterion 2c (3S/3CS/5S3)
Bridge No. 3	King truss bridge spanning the Arroyo Seco erected by the CCC	1939	Appears eligible under NRHP/CRHR Criteria A/1 and C/3, and City Criteria 2a and 2c (3S/3CS/5S3)
Flood Control Structures (PWP/LACFCD)	Complex of utilitarian sheds, Altadena Storm Drain, culvert, flow control dam, Pasadena Ponds 1 and 2, and 14 spreading basins	c. 1948-1952	Appears not eligible under all designation criteria (6Z)

John L. Behner Water Treatment Plant

NRHP/CRHR Statement of Significance

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not find any associations with events that have made a significant contribution to the broad patterns of our history. The subject property was completed in 1971, during a period of economic downturn that that began in the late 1960s, and taken offline in 1993 after passage of the Surface Water Treatment Rule. Although the property is generally representative of the City's mid-century growth, it has no direct association with events that made a significant contribution to the history of the City of Pasadena, the State of California, or the Nation. Therefore, the property does not appear eligible under Criterion A of the NRHP or Criterion 1 of the CRHR.

Criterion B/2: That are associated with the lives of persons significant in our past.

Archival research did not indicate that any previous property owners or people who have worked at this property are known to be historically significant figures at the national, state, or local level. As such, this

property is not known to have any historical associations with people important to the nation's or state's past. Furthermore, to be found eligible under B/2 the property has to be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. This property does not appear to be associated with any individual's important historic work and does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

The Behner WTP is a good example of Brutalist civic architecture as expressed in the context of a utilitarian building designed for practicality. Designed by local Pasadena engineering firm James M. Montgomery, Consulting Engineer Inc. and built in 1971, the building displays several character-defining features of the Brutalist architectural style, including an exposed, expressive structural system; rough, unadorned concrete construction; monumental massing; heavy blockish shapes; angular and rectilinear forms; prefabricated concrete panels with exposed joinery; windows as voids in an otherwise solid volume; repetitive patterns; and avoidance of traditional elements or ornament. While smaller in scale than the more monumental, hulking Brutalist buildings often seen in civic centers and on college campuses, the building still conveys the essential character-defining features of the Brutalist design aesthetic and exhibits a high level of integrity. The designing engineering firm, James M. Montgomery, Consulting Engineer, Inc., is a local, Pasadena-based firm that regularly constructed water infrastructure projects for local cities and water districts, such as MWD, Santa Monica, and Huntington Beach. There are no known alterations to the exterior of the building. Although the engineer does not rise to the level of a "master," the building embodies the distinctive characteristics of the Brutalist architectural style and possesses artistic values of significance to the City or to the region. Consideration was also given to the fact that Brutalism is a relatively rare architectural style in Pasadena, with few noteworthy examples. The Pasadena CHRID lists only two eligible Brutalist properties: a public library and a private residence. According to the Los Angeles Conservancy, "The Lamanda Park Branch of the Pasadena Public Library is a rare Brutalist building in an area of modest suburban homes in east Pasadena" (LAC 2019). The same may be said of the Behner WTP, as it remains relatively hidden from view, tucked away behind a suburban neighborhood. As such, the property appears eligible for the NRHP under Criterion C and CRHR under Criterion 3 at the local level of significance.

Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.

The property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

Pasadena Statement of Significance

The City of Pasadena's landmark designation criteria is based on the NRHP/CRHR designation criteria and integrity requirements. Therefore, for all of the reasons identified in the discussion of NRHP and CRHR eligibility, the subject property appears eligible as a landmark under local designation criteria 2c.

Integrity Discussion

The Behner WTP maintains integrity of location, as it remains in its original location. The building retains integrity of design as it has not undergone any large-scale exterior alterations since its construction and maintains the essential features of form, plan, space, structure, and style. The building retains integrity of setting, as upon its construction, the Arroyo Seco Canyon area had already attained the majority of JPL-related development, residential suburban development, and undeveloped Forest Service and parkland observed today. The building maintains integrity of materials and workmanship due to the retention of the physical elements that date from its construction. The windows sport metal security screens, but the majority of the building's original materials are extant. The building retains integrity of feeling and association, as the property retains the ability to express itself as a water treatment plant. In summary, the building retains the requisite integrity for designation, and appears eligible for listing under NRHP Criterion C, CRHR Criterion 3, and City of Pasadena Landmark criterion 2c at the local level of significance.

Screen Building Complex

NRHP/CRHR Statement of Significance

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not find any associations with events that have made a significant contribution to the broad patterns of our history. The complex was completed c. 1932, most likely by the CCC during their improvements campaign in the Arroyo Seco Canyon. The extant weir was replaced after a major flooding event in the 1940s, and a newer cobblestone wall rises from the original retaining wall on the right (east or cutbank) side of the weir. The cobblestone wall supports a concrete platform, into which the original rectangular concrete platform is incorporated. indicating extensive repairs and/or additional damage during later flood events. The Screen Building Complex is no longer visibly recognizable as dating to its original c. 1932 construction date due to the extensive damage and subsequent repairs. Further, it does not have a direct association with events that made a significant contribution to the history of the City of Pasadena, the State of California, or the Nation. Therefore, the property does not appear eligible under Criterion A of the NRHP or Criterion 1 of the CRHR.

Criterion B/2: That are associated with the lives of persons significant in our past.

Archival research did not indicate that any previous property owners or people who have worked at this property are known to be historically significant figures at the national, state, or local level. As such, this property is not known to have any historical associations with people important to the nation's or state's past. Furthermore, to be found eligible under B/2 the property has to be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. This property does not appear to be associated with any individual's important historic work and does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

The Screen Building Complex comprises a screen building, a weir, an intake structure, and two pipelines. The individual components are modest utilitarian structures built with common materials using common techniques and with no artistic value. They do not embody the distinctive characteristics of a type, period, or method of construction, nor do they represent the work of a master, nor does the complex represent a significant and distinguishable entity whose components may lack individual distinction. Furthermore, the Screen Building Complex is no longer visibly recognizable as dating to its original c. 1932 construction date due to the extensive damage and subsequent repairs. For these reasons, the Screen Building Complex does not appear eligible for listing in the NRHP under Criterion C or CRHR under Criterion 3.

Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.

The property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

Pasadena Statement of Significance

The City of Pasadena's landmark designation criteria is based on the NRHP/CRHR designation criteria and integrity requirements, Therefore, for all of the reasons identified in the discussion of NRHP and CRHR eligibility, the subject property does not appear eligible under any local designation criteria, either individually or as part of a district.

Integrity Discussion

The Screen Building Complex retains integrity of location, as it remains in its original location. The Complex lacks integrity of design as it was subjected to large-scale exterior alterations since its original construction in 1932 and no longer maintains the essential features of form, plan, space, structure, and style. The Complex retains integrity of setting, as it still rests within a natural environment along the Arroyo Seco. The Complex lacks integrity of materials and workmanship due to the extensive damage and subsequent repairs to the physical elements that date from its construction. The Complex retains integrity of feeling, as it is still nestled within the Arroyo Seco surrounded by a mixture of natural environment and water infrastructure. Finally, while the screen building still reads as a grouping of structures related to water infrastructure in Pasadena, this association is not significant. In summary, the Screen Building Complex does not retain the requisite integrity for designation, nor does it rise to the level of significance required for designation at the national, state or local levels.

Bridge No. 1

NRHP/CRHR Statement of Significance

Bridge No. 1 does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of an existing historic district.

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not find any associations with events that have made a significant contribution to the broad patterns of our history. Archival research indicates that the original bridge was either damaged or destroyed by the 1938 floods, and replaced with the existing two-span box culvert bridge either during a CCC repair campaign in 1939 or as part of the 1941 Arroyo Seco Program. Bridge No. 1 was completed c. 1940, replacing the original bridge, and is a simple utilitarian design. Even if the bridge was constructed as part of the CCC repair campaign in 1939, it does not maintain any significant physical features that convey this association. Further, evidence suggests that the bridge deck was replaced in 1979 (Daly 2014). It has no direct association with events that have made a significant contribution to the history of the City of Pasadena, the State of California, or the Nation. Therefore, the property does not appear eligible under Criterion A of the NRHP or Criterion 1 of the CRHR.

Criterion B/2: That are associated with the lives of persons significant in our past.

Archival research did not indicate that any previous property owners or people who have worked at this property are known to be historically significant figures at the national, state, or local level. As such, this property is not known to have any historical associations with people important to the nation's or state's past. Furthermore, to be found eligible under B/2 the property has to be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. This property does not appear to be associated with any individual's important historic work and does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Bridge No. 1 is a two-span box culvert bridge of simple utilitarian design completed c. 1940, replacing an older bridge damaged or destroyed by the 1938 floods. Although parts of it are cobblestone, the material was popular during the early 20th C. due to the influence of Greene and Greene and the Arts & Crafts style, and it was inexpensive and readily available from the Arroyo Seco stream bed. Additionally, a previous evaluation of the bridge (Daly 2014) indicates that the bridge deck was replaced in 1979 with reinforced concrete, and subsequently topped with at least one layer of tarmac (c. 2017). The bridge itself is not characteristic of a type, period, or method of construction, nor does it represent the work of a master, nor does it possess high artistic values, and it is not part of a significant and distinguishable entity whose components may lack individual distinction. For these reasons, Bridge No. 1 does not appear eligible for listing in the NRHP under Criterion C or CRHR under Criterion 3.

Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.

The property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

Pasadena Statement of Significance

The City of Pasadena's landmark designation criteria is based on the NRHP/CRHR designation criteria and integrity requirements, Therefore, for all of the reasons identified in the discussion of NRHP and CRHR eligibility, the subject property does not appear eligible under any local designation criteria, either individually or as part of a district.

Integrity Discussion

Bridge No. 1 maintains integrity of location, as it remains in its original location. The bridge does not retain integrity of design as its deck was replaced in 1979. The bridge retains diminished integrity of setting, as it still rests within a natural environment along the Arroyo Seco. The bridge also lacks integrity of materials and workmanship due to replacement of the bridge deck and other features. The bridge's simple design does not convey the feeling or association with a CCC-built bridge as it lacks major visible character-defining features and associated materials. In summary, Bridge No. 1 does not retain the requisite integrity for designation, nor does it rise to the level of significance required for designation at the national, state or local levels..

Bridge No. 2

NRHP/CRHR Statement of Significance

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not find any associations with events that have made a significant contribution to the broad patterns of our history. Bridge No. 2 was constructed c. 1920 as a necessary improvement along the Arroyo Boulevard/Gabrielino Trail, around the time Arroyo Boulevard was paved for use as a county highway. However, the road no longer functions as a county highway or a major thoroughfare, and has no direct association with events that made a significant contribution to the history of the City of Pasadena, the State of California, or the Nation. Therefore, Bridge No.2 does not appear eligible under Criterion A of the NRHP or Criterion 1 of the CRHR.

Criterion B/2: That are associated with the lives of persons significant in our past.

Archival research did not indicate that any previous property owners or people who have worked at this property are known to be historically significant figures at the national, state, or local level. As such, this property is not known to have any historical associations with people important to the nation's or state's past. Furthermore, to be found eligible under B/2 the property has to be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. This property does not appear to be associated with any individual's important historic work and does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Built c. 1920, around the time Arroyo Boulevard was paved for use as a county highway, Bridge No. 2 exhibits classical design elements in the rows of classically shaped single balusters resembling the form of a flower bud from a pomegranate tree, as well as the subtle four-point shape of the arch. The bridge also displays the pattern of board-formed concrete, a method of construction popular for civil works during the early 20th Century. The designed structure successfully relied on massed reinforced concrete with a broad arched opening to withstand the destructive forces of periodic floods down Arroyo Seco. As such, the bridge embodies distinctive characteristics of a type, period, and method of construction. Therefore, Bridge No. 2 appears eligible for listing under Criterion C of the NRHP and Criterion 3 of the CRHR at the local level of significance.

Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.

The property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

Pasadena Statement of Significance

The City of Pasadena's landmark designation criteria is based on the NRHP/CRHR designation criteria and integrity requirements, Therefore, for all of the reasons identified in the discussion of NRHP and CRHR eligibility, the subject property appears eligible as a landmark under local designation criterion 2c.

Integrity Discussion

Bridge No. 2 maintains integrity of location, as it remains in its original location. The bridge retains integrity of design as it has not undergone any large-scale exterior alterations since its construction and maintains the essential features of form, plan, space, structure, and style. The bridge retains integrity of setting, as it still rests within a natural environment along the Arroyo Seco. The bridge retains integrity of materials and workmanship due to the retention of the physical elements that date from its construction. The bridge no longer retains integrity of feeling and association, since Arroyo Boulevard/Gabrielino Trail no longer serves as an important thoroughfare. In summary, Bridge No. 2 retains the requisite integrity for designation, and appears eligible for listing under NRHP Criterion C, CRHR Criterion 3, and City of Pasadena Landmark criterion 2c.

Bridge No. 3

NRHP/CRHR Statement of Significance

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research indicates that Bridge No. 3 was constructed in 1939 by the CCC, after the 1938 flood destroyed the original bridge. Local CCC Company 903 was assigned to the USFS in 1933 to work on projects within Arroyo Seco Canyon and San Gabriel Mountains. One of Roosevelt's more successful New Deal

programs, the CCC was a work relief program focused on environmental projects, providing employment to young men during the Great Depression. They planted more than three billion trees and constructed facilities in more than 800 parks nationwide during the nine years which the group was in existence, helping shape our modern national and state park systems. As such, Bridge No. 3 was constructed by a group associated with events that made a significant contribution to the broad patterns of our history. Therefore, Bridge No. 3 appears eligible under Criterion A of the NRHP and Criterion 1 of the CRHR.

Criterion B/2: That are associated with the lives of persons significant in our past.

Archival research did not indicate that any previous property owners or people who have worked at this property are known to be historically significant figures at the national, state, or local level. As such, this property is not known to have any historical associations with people important to the nation's or state's past. Furthermore, to be found eligible under B/2 the property has to be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. This property does not appear to be associated with any individual's important historic work and does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Bridge No. 3 is a wooden kingpost truss bridge, with heavy timber supports braced by a vertical metal rod and angled wood beam braced on a cantilevered timber girder. Timber railings line both side of the bridge deck, and board-formed concrete retaining walls support either end of the bridge. The kingpost design harkens back to timber-framed roof construction in Roman buildings, and was common in medieval architecture. The kingpost made its way into timber bridge design via Palladio, the first known personage to promote timber trusses for bridge design, and is the oldest timber truss design used for bridges. The kingpost truss is comprised of a stringer, a kingpost (vertical beam), and two diagonal beams designed primarily for short spans of approximately 20 to 30 feet. As such, the bridge embodies the distinctive characteristics of a type and method of construction. Therefore, Bridge No. 3 appears eligible under Criterion C of the NRHP and Criterion 3 of the CRHR.

Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.

The property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

Pasadena Statement of Significance

The City of Pasadena's landmark designation criteria is based on the NRHP/CRHR designation criteria and integrity requirements, Therefore, for all of the reasons identified in the discussion of NRHP and CRHR eligibility, the subject property appears eligible as a landmark under local designation criteria 2a and 2c.

Integrity Discussion

Bridge No. 3 maintains integrity of location, as it remains in its original location. The bridge retains integrity of design as it has not undergone any large-scale exterior alterations since its construction and maintains the essential features of form, plan, space, structure, and style. The bridge retains integrity of setting, as it still

rests within a natural environment along the Arroyo Seco. The bridge retains integrity of materials and workmanship due to the retention of the physical elements that date from its construction. Finally, the bridge retains the feeling of an early 20th century timber bridge constructed by the CCC and it maintains its essential character-defining features to convey its association with the CCC building campaign in the 1930s. In summary, Bridge No. 3 retains the requisite integrity for designation, and appears eligible for listing under NRHP Criteria A and C, CRHR Criteria 1 and 3, and City of Pasadena Landmark Criteria 2a and 2c.

Flood Control Infrastructure

NRHP/CRHR Statement of Significance

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research did not find any associations with events that have made a significant contribution to the broad patterns of our history. The spreading basins were completed in 1948, and the Altadena Storm Drain, sheds, culverts, and check dams completed between 1948 and 1952. These date have no bearing on the industrial, commercial, and institutional growth of Pasadena nor is it directly related to a historical natural disaster such as a specific flood. The flood control infrastructure appears to have no direct association with events that have made a significant contribution to the history of the City of Pasadena, or Los Angeles County, the State of California, or the Nation. Therefore, the property does not appear eligible under Criterion A of the NRHP or Criterion 1 of the CRHR.

Criterion B/2: That are associated with the lives of persons significant in our past.

Archival research did not indicate that any previous property owners or people who have worked on these structures are known to be historically significant figures at the national, state, or local level. The structures have been owned by PWP or LACFCD since construction, and as such is not associated with the life of a specific person significant to the past. Furthermore, to be found eligible under B/2 the property has to be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. The structures do not appear to be associated with any individual's important historic work and does not appear eligible for the NRHP under Criterion B or CRHR under Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

The flood control structures, including spreading basins completed in 1948, and the Altadena Storm Drain, sheds, culverts and checkdams completed between 1948 and 1952, are utilitarian in construction and lack association to a specific architectural style or method of construction. They have no specific character-defining features, do not represent the work of a master engineer, do not possess high artistic value and are not significant as contributing features of an entity whose components may lack individual distinction. Therefore the structures do not appear eligible for listing in the NRHP under Criterion C or CRHR under Criterion 3.

Criterion D/4: That have yielded, or may be likely to yield, information important in prehistory or history.

The structures are not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

Pasadena Statement of Significance

The City of Pasadena's landmark designation criteria is based on the NRHP/CRHR designation criteria and integrity requirements, Therefore, for all of the reasons identified in the discussion of NRHP and CRHR eligibility, the flood control structures do not appear eligible under any local designation criteria, either individually or as part of a district.

Integrity Discussion

The spreading basins, Altadena Storm Drain, checkdams, culverts, and sheds, as a collective engineered structure retain integrity of location and have not been moved since their construction in 1948. They maintain integrity of design as it has not undergone any large-scale exterior alterations since its construction and maintains the essential features of form, structure, and function. The structures retain integrity of setting, as they remain in the Arroyo Seco floodplain north of the Devil's Gate Dam, structures retain between a steep hillside and the campus of JPL. The structures retain integrity of materials and workmanship due to the retention of the physical elements that date from its construction. The structures retain integrity of feeling and association, as they can still express their purpose as water and flood related infrastructure. In summary, while the structures retain the requisite integrity, it does not rise to the level of significance required for designation at the national, state or local levels.

Historic Resources Impacts Summary

The following historical resources/historic properties were identified within the Project APE as a result of the property significance evaluations:

- John L. Behner Water Treatment Plant (3S/3CS/5S3)
- Bridge No. 2 (3S/3CS/5S3)
- Bridge No. 3 (3S/3CS/5S3)

Additionally, five features were identified within the APE that are considered character-defining features of the larger Arroyo Seco and should be avoided/protected as part of the current Project. The Arroyo Seco is considered "a unique environmental, recreational and cultural resource of the city surrounded by residential neighborhoods" and "must be preserved, protected and properly maintained." (Arroyo Seco Public Lands Ordinance 3.32.020). The arroyo stone walls and steps throughout the City of Pasadena and especially in the Arroyo Seco are considered an historical resource because many of them were built during the WPA years and in some locations designed by notable architects. Rehabilitation, including maintenance and repair, shall be focused on conservation of this historical resource (City of Pasadena 2003a). Contributing design features of the Arroyo Seco identified in the Project APE include cobblestone and concrete retaining walls that date between 1938 and 1940:

- rock retaining wall for on northeast side of Arroyo Seco Canyon roadbed;

- rock retaining wall supporting the east-most canyon wall;
- rock retaining wall near screen building;
- rock wall barrier on side of road near intake/weir structure;
- rock wall barrier on south side of Bridge No. 2.

These walls vary in length and height, but are typically constructed of smooth, round river cobbles, in semi-coursed layers, with a thick Portland cement mortar. The use of semi-coursed, smooth river cobble in concrete mortar is a common feature seen throughout Pasadena and the Arroyo Seco. The Arroyo Seco Design Guidelines (City of Pasadena 2003a) document is one of four separate planning documents produced as part of The Arroyo Seco Master Plans. The design guidelines provide a unifying set of criteria for the site development improvements set forth in the Arroyo Seco Master Plan for on-going, long-range improvements for the Arroyo Seco. The purpose of these guidelines is to maintain a unified park design that reflects the heritage of the Arroyo Seco and its relationship to the tradition of the City of Pasadena. The Arroyo Seco Design Guidelines provide specific site design solutions that are consistent with the existing Arroyo Seco Ordinance and a vehicle by which practical inputs for ongoing improvements can take place ((City of Pasadena 2003).

Area 2 Impacts

No historical resources were identified in Area 2. As previously described, the Screen Building Complex and related infrastructure (including the weir and intake structure) were found ineligible and are not an historical resource. Additionally, construction and operation of a new diversion structure would not directly impact or indirectly alter the setting or character of any adjacent resources. All proposed Project activities associated with the Area 2 Diversion and Intake Replacement would be less than significant and no mitigation is required.

Area 3 Impacts

No historical resources were identified in Area 3. Although the proposed Project's construction activities would intersect the existing SCE Easement, all associated SCE infrastructure (i.e., poles and wires) would be avoided by the Project and protected in coordination with SCE. As previously described, all PWP/LACFCD flood control infrastructure, including the spreading basins, were found ineligible and are not historical resources. The proposed Project includes placement of rock boulders along the western edge of Explorer Road to separate the roadway from the adjacent basins. There are no historical resources that would be impacted by the placement of rock boulders along the western edge of Explorer Road; further, the use of natural materials as a barrier is in conformance with the existing Arroyo Seco Design Guidelines:

> "Boulders are preferred in establishing perimeter barriers. Typically, they are placed to keep motorized vehicles out of an area." (City of Pasadena 2003a)

All proposed Project activities associated with the Area 3 Spreading Basin Improvements would be less than significant and no mitigation is required.

Gabrielino Trail and Bridges Nos. 1, 2 and 3

During construction, the Gabrielino Trail/Access Road would provide for vehicular access to and from Area 2, and sometimes Area 3. Activity along the Gabrielino Trail/Access Road has the potential to impact the concrete railings of Bridge No. 2 and the adjacent Arroyo Seco stone wall features. These are design features of the larger Arroyo Seco and should be protected from inadvertent damage during construction activities. Therefore,

MM-CUL-1 is required. MM-CUL-1 recommends protection from construction and vehicle damage measures for Bridge No. 2 during construction and pre-construction/post-construction surveys by a qualified historic preservation consultant to ensure that adverse effects or significant impacts have not occurred due to short-term construction activities at Bridge No. 2. With incorporation of MM-CUL-1, short-term impacts to Bridge No. 2 would be less than significant.

The structural overlay bridges spanning the entire length of Bridge Nos. 1 and 3 would remain in place throughout the construction activities for the proposed Project. These structural overlays are already in-place and have been determined essential to safely support vehicles during construction. No new construction is required to keep the bridge overlay structures in place. The structural overlay for Bridge No. 1 would be removed after completion of construction activities for the ASCP. Bridge No. 1 is not an historical resource under CEQA and continued use of the overlay structure would not result in a significant impact to an historical resource. Therefore, impacts to Bridge No. 1 would be less than significant and no mitigation is required.

With regard to short-term use of the overlay on Bridge No. 3 during construction, an historical resources impact assessment was prepared for the temporary bridge overlays in conformance with the required 2015 IS/MND mitigation requirements. The analysis states that "although temporary protective measures would be installed for 1-2 years, these protective measures are removable and reversible" (Jerabek 2015). Therefore, short-term construction activities would not result in a significant impact due to the presence of the overlay and no mitigation would be required.

The structural overlay bridge installed in 2017 that spans the entire length of Bridge No. 3 is not in conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties in consideration of its proposed permanency. The overlay structure, characterized by a steel deck supported by steel I-beam girders, poured-in-place concrete ramps, and tubular metal railings, does not conform to the Secretary of the Interior's Standards for Rehabilitation of a 1930s timber bridge built by the CCC. Nor does the current bridge overlay conform to the City's Arroyo Seco Design Guidelines for Open Structures and Bridges. Now that the overlay is proposed to remain on Bridge No. 3 into the foreseeable future, the existing bridge overlay should be reviewed for conformance with the Arroyo Seco Design Guidelines. As a potentially permanent design feature, the continued presence of the overlay structure on Bridge No. 3 is considered a significant impact to historical resources, as the overlay detracts from nearly all of its important character-defining features and introduces incompatible, highly visible, modern materials. It is anticipated that Bridge No. 3 will continue to deteriorate, and as a result, PWP will need to remove dangerous elements of the bridge (damaged joists, for example) and even partially or fully demolish the bridge to protect public safety as it continues to deteriorate. Whether and when reconstruction/replacement of Bridge No. 3 will take place is unknown, and it is unknown whether the new bridge would be constructed in such a manner that would allow for its preservation as a historical resource.

Therefore, MM-CUL-2 is required. MM-CUL-2, which requires preparation of Historic American Engineering Record (HAER) documentation for Bridge No. 3 in accordance with the Secretary of the Interior's Standards, and sharing documentation with the City of Pasadena, the SCCIC, and the Angeles National Forest, as well as implementing adjustments to bring the bridge overlay components into compliance with the Arroyo Seco Design Guidelines, to the extent feasible. Implementation of MM-CUL-2 would lessen impacts but would not reduce impacts to Bridge No. 3 below a level of significance. Therefore, impacts would remain significant and unavoidable, even after incorporation of MM-CUL-2.

Construction Staging Areas

During construction activities, the Screen Building adjacent to Area 2 would be used for temporary construction materials and equipment staging. The Screen Building Complex and related infrastructure is not an historical resource and impacts would be less than significant.

During construction activities, the Behner WTP adjacent to Area 3 would be used for temporary construction materials and equipment staging. The Behner WTP appears eligible under NRHP/CRHR Criteria C/3 at local level, and City Criterion 2c (3S/3CS/5S3) and is considered an historical resource under CEQA/historic property under Section 106 of the NHPA. Short-term construction activities have the potential to inadvertently damage the Behner WTP by construction equipment and materials staging in proximity to the building. Therefore, MM-CUL-3 is required. MM-CUL-3 requires protection from equipment staging activities, vehicle staging activities, and fence placement for the exterior of the Behner WTP. With incorporation of MM-CUL-3, potential short-term impacts to Behner WTP would be less than significant.

Threshold 4.3b Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Short-Term Construction Impacts

As previously discussed, Dudek conducted a CHRIS records search at the SCCIC on October 3, 2019. The records search identified 35 previously conducted cultural resources technical investigations within the records search area. Of these, six overlap and one is adjacent to the Project site.

Additionally, the SCCIC records indicate that 14 previously recorded cultural resources exist within the surrounding 0.5-mile search radius. The CHRIS records indicate that one previously recorded cultural resource (P-19-189942) overlaps the Project site, and one resource (P-19-186535) is adjacent to the Project site. Resource P-19-189942 consists of the Hahamongna Watershed Park and associated recreational facilities. The resource was previously determined ineligible for the CRHR, and is therefore not considered an historical resource. Resource P-19-186535 consists of the Angeles National Forest, a registered California Historical Landmark.

Thirteen additional previously recorded cultural resources are within 0.5-mile of the Project site. Of these, two consist of prehistoric archaeological resources, including P-19-000342, the purported village site discussed in SCCIC report LA-01312, and an isolated granitic discoidal recovered from fill material. There is one multi-component resource consisting of multiple loci of sparse prehistoric lithic scatters, as well as a historic-era domestic refuse scatter and purported historic-era burial from the late 1800s. There are two historic-era archaeological resources consisting of a granite headstone fragment from 1865, which is associated with the multi-component site, and the remnants of an early twentieth century campground known as Teddy's Outpost. Resource (P-19-001599) is a multi-component site – meaning it consists of both prehistoric and historic-era resources and includes a possible historic-era burial. This site is located 0.5-miles northeast of the Project site. None of these prehistoric or historic-era archaeological resources have been evaluated for the NRHP or CRHR. The remaining eight resources are built environment resources that are within 0.5-mile of the Project site.

No archaeological resources were identified within the Project site as a result of the CHRIS records search or Native American outreach and three previously recorded prehistoric or historic-era archaeological resources

were identified within 0.5-mile of the Project. In compliance with Assembly Bill (AB) 52, the City has contacted tribal representatives that have requested to be notified of projects in Pasadena. These efforts are summarized in Section 4.9, Tribal Cultural Resources of this Draft EIR.

Based on the results provided above, the potential of encountering and impacting unknown archaeological resources during Project implementation is low; however, it is always possible that unanticipated discoveries could be encountered during ground-disturbing activities associated with the proposed Project. If such unanticipated discoveries were encountered, impacts to encountered resources could be potentially significant. However, with implementation of MM-CUL-4, which requires that all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology, can evaluate the significance of the find, potentially significant impacts to archaeological resources would be reduced to less-than-significant levels. With incorporation of MM-CUL-4, the Project's potential to cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5 would be reduced to a level less than significant.

Long-Term Operational Impacts

Earthmoving activities would cease at the completion of construction activities. No long-term operational earthwork would occur that could disturb or cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5. Therefore, long-term operation of the Project would result in no impacts associated with archaeological resources, and no mitigation is required.

Threshold 4.3d Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Short-Term Construction Impacts

No paleontological resources were identified within the proposed Project site as a result of the institutional records search or desktop geological review. Based on surficial geological mapping reviewed for the proposed Project, the Project site does not contain exposed unique geologic features and is not anticipated to be underlain by unique geologic features. Areas of the proposed Project underlain by plutonic igneous rocks (portions of Area 2) have no paleontological sensitivity. The portions of Areas 2 and 3 underlain by Holocene gravel deposits (within the Arroyo Seco Drainage) have low paleontological sensitivity increasing to moderate or high sensitivity with depth, and the Pleistocene alluvial fan deposits within the northeastern portion of the Area 3 have moderate to high paleontological sensitivity. If intact paleontological resources are located onsite, ground-disturbing activities associated with construction of the proposed Project, such as earthwork/excavation and trenching for pipeline connections, have the potential to destroy a unique paleontological resource on site. As such, the proposed Project site is considered to be potentially sensitive for paleontological resources, and without mitigation, the potential damage to paleontological resources during construction associated with the proposed Project is considered a significant impact. Given the proximity of past fossil discoveries in the surrounding area within Pleistocene alluvial deposits, the proposed Project site is highly sensitive for supporting paleontological resources below the depth of fill and weathered, Pleistocene alluvial deposits. With implementation of MM-PALEO-1, which requires preparation of a Paleontological Resources Impact Mitigation Program (PRIMP) for the Project, the proposed Project's potential to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature would be reduced to less than significant.

Long-Term Operational Impacts

Earthmoving activities would cease at the completion of construction. No long-term operational earthwork would occur that could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature. Therefore, long-term operation of the Project would result in no impacts to paleontological resources, and no mitigation is required.

4.3.6 Cumulative Impacts

Cumulative impacts on cultural resources consider whether impacts of the proposed Project together with other related projects, when taken as a whole, substantially diminish the number of historical or archeological resources within the same or similar context or property type. However, impacts to cultural resources, if any exist, tend to be site-specific. The cumulative projects below were chosen based on direction from the City. A map depicting the locations of all cumulative projects can be found in Section 4, Environmental Impacts Analysis (refer to Section 3.5 Cumulative Impacts, Figure 3-5, Cumulative Projects).

- Previously Approved Components of Arroyo Seco Canyon Project (ASCP)
- Devil's Gate Reservoir Sediment Removal and Management Project
- Oak Grove Area Improvements (OGAI) Project
- LACFCD Pump back/Intake at Devil's Gate to Eaton Canyon
- Explorer Groundwater Well

Historic Resources

Previously Approved Components of Arroyo Seco Canyon Project (ASCP)

As described above, the proposed Project would have one impact that cannot be mitigated to a less than significant level: the impacts to Bridge No. 3. The APE of this cumulative project directly overlaps that of the proposed Project, with an additional "Area 1" in the Angeles National Forest (ANF) lands. Expected impacts from this project include earthmoving, vehicle and equipment staging, and vehicle use of the road and bridges. The Previously Approved Components of ASCP originally provided mitigation measures, including a bridge overlay for Bridge No. 3, as long as the bridge overlay placed on Bridge No. 3 would be temporary and reversible. For the cumulative project, it would only involve the use of Bridge No. 3 during short-term construction activities, likely at the same time as the proposed Project. Temporary placement of the bridge overlay was not determined to result in a significant impact, as described above. Therefore, the potential for both the proposed Project and this cumulative project to use the Bridge No. 3 at the same time would not result in cumulatively considerable impacts.

The proposed Project's mitigation for Bridge No. 2, which is also an historical resource for the purposes of CEQA, requires placement of temporary k-rails, or other feasible protections, along the balustrade section of the bridge to protect it from vehicle and equipment damage. As long as these protective rails are removed at the end of the proposed Project, there would not be cumulative impacts to Bridge No. 2.

Since the bridge overlay on historic Bridge No. 3 is assumed to remain into the foreseeable future, implementation of MM-CUL-2, recommends preparation of Historic American Engineering Record (HAER) documentation for Bridge No. 3 in accordance with the Secretary of the Interior's Standards to address long-term impacts to the bridge. However, this mitigation would not reduce impacts below a level of significance. While the proposed Project would significantly impact Bridge No. 3, no cumulative impacts to historical resources pursuant to §15064.5 are expected from this proposed Project.

Devil's Gate Reservoir Sediment Removal and Management Project

Records search results for the proposed Project indicate that the Hahamongna Watershed Park was found ineligible for designation and is not considered an historical resource for the purposes of CEQA. The Devil's Gate Dam was outside of the proposed Project's record search radius, so the status of the dam as an historical resource was not reviewed or considered as part of the proposed Project. This cumulative project proposed to remove sediment and restore habitat at the Devil's Gate Reservoir and not upstream where historical resources pursuant to §15064.5 have been identified by the proposed Project, and no upstream issues were identified. Therefore, no cumulative impacts to historical resources pursuant to §15064.5 are expected from this cumulative project.

Oak Grove Area Improvements (OGAI) Project

The OGAI project is located west of the proposed Project area, in the Hahamongna Watershed Park, Oak Grove Disc Golf Course, Oak Grove Area, and Berkshire Creek Area. This area does not overlap the proposed Project site, but does overlap an historical resource identified in this cumulative project's record search: the Oak Grove Administrative Site constructed in 1941. This building has been identified but not formally evaluated in consideration of federal, state, or local designation criteria. This site would need to be formally evaluated to determine if it is an historical resource under CEQA that would be affected by the cumulative impacts of all ongoing projects in its vicinity. Therefore, potential impacts from the OGAI Project to any evaluated historical resources identified in this EIR (i.e. Bridge No. 2, Bridge No. 3, Behner WTP) would only potentially affect their integrity of setting. Because this cumulative project would be visually removed and physically distant from all historical resource pursuant to §15064.5 identified for the proposed Project, there would be no impacts to the settings of these identified historical resources. Therefore, no cumulative impacts to historical resources pursuant to §15064.5 are expected from this cumulative project.

LACFCD Pump back/Intake at Devil's Gate to Eaton Canyon

This cumulative project is also located at the Devil's Gate Dam and involves the installation of a pump and intake structure at the upstream face of the Dam, with the objective to conserve stormwater by holding a reservoir pool behind Devil's Gate Dam and pumping the water into the Arroyo Seco Spreading Grounds for groundwater recharge. This area overlaps a portion of proposed Project Area 3, but does not overlap any of the historical resources identified as part of this project. Therefore, potential impacts to historical resources would only potentially affect their integrity of setting. If the cumulative project were to be implemented, having these water features filled and fully operational would not impact the settings of any nearby historical resources. Therefore, no cumulative impacts to historical resources pursuant to §15064.5 are expected from this project.

Explorer Groundwater Well

PWP plans to construct a groundwater well that would augment the existing municipal production wells. Project activities would include drilling and completion of a new groundwater well located just east of the spreading basins in Area 3, near the SCE Easement. Additionally, the Explorer Groundwater Well Project includes the potential renovation of the Behner WTP to augment the water treatment capacity. The proposed Project activity would have a temporary impact to the integrity setting of the Behner WTP during construction. The result of the significance evaluation included as part of the proposed Project indicate that Behner WTP, constructed in 1971, appears eligible under NRHP/CRHR Criteria C/3 at local level, and City of Pasadena Criterion 2c for being an excellent, rare, and unaltered example of Brutalist architecture applied to a municipal utility building and retains a high level of integrity. Because the building appears eligible, it is considered an historical resource pursuant to §15064.5. Cumulative impacts could be mitigated provided that the renovation of Behner WTP under this cumulative project adheres to Secretary of Interior Standards for Rehabilitation. However, if the proposed changes would occur on the building's interior and would not impact any of the building's exterior character-defining features, the cumulative project would likely result in a less than significant impacts to historical resources. Therefore, this cumulative project has the potential to result in impacts to the Behner WTP historical resource pursuant to §15064.5 if not adequately mitigated. However, since the proposed Project would not result in long-term impacts to Behner WTP, and mitigation would adequately address any short-term impacts from staging, the proposed Project would not result in cumulatively considerable impacts to Behner WTP.

Cumulative Impacts for Archaeology and Paleontological

Direct impacts to cultural resources are generally site specific. As defined in Section 15130 of the CEQA Guidelines, a cumulative impact consists of an impact that is created as a result of the incremental effects of a proposed Project, together with the effects of other projects, causing related impacts. Although a project, in conjunction with the effects of past, current, and reasonably foreseeable future projects may result in the disturbance of archaeological resource sites throughout the region, the City requires the mitigation of impacts to these resources. Therefore, despite the site-specific nature of the resources, in the event that unknown or undocumented archaeological resources are discovered, implementation of MM-CUL-1 would reduce the potential for cumulative impacts. Additionally, it is anticipated that cultural resources that are potentially affected by related projects would also be subject to the same requirements of CEQA as the proposed Project and any impacts would be mitigated, as applicable. These determinations would be made on a case-by-case basis, and the effects of cumulative development on cultural resources would be mitigated to the extent feasible in accordance with CEQA and other applicable legal requirements.

Cumulative paleontological impacts related to nearby development projects in the area that involve ground disturbance. The paleontological impacts on each project site are specific to that site and its users and would not be in common or contribute to (or shared with, in an additive sense) the paleontological impacts on other project sites. In addition, development on nearby project sites is subject to uniform site development and construction standards, including impacts to paleontological and unique geological resources analyzed in CEQA documents required for each project. Each paleontological analysis would include recommendations that would mitigate any potential effects related to paleontological resources, in accordance with CEQA. Therefore, the Project's contribution to paleontological impacts would not be cumulatively significant Therefore, cumulative impacts are considered to be less than significant.

4.3.7 Mitigation Measures

MM-CUL-1 Prior to the commencement of construction vehicle and truck traffic along the Gabrielino Trail/Access Road north of the JPL Bridge, the City shall ensure that Bridge No. 2 and all identified arroyo stone wall features along the affected portions of the Gabrielino Trail/Access Road are properly protected for the duration of construction activities. The City shall install temporary protective barriers in the form of concrete k-rails along the decorative railings of Bridge No. 2 on both sides of the road to protect the railings from further deterioration and damage from vehicles. The concrete k-rails shall be removed once the Project is completed leaving Bridge No. 2 intact. The concrete k-rails shall be installed parallel to the Bridge's existing baluster railings, with approximately 2 feet of separation between the k-rail and the resource. The k-rails shall be positioned to ensure that the Bridge railings are protected from daily construction traffic. The k-rails shall not be permanently attached to the bridge. All arroyo stone wall features adjacent to the Gabrielino Trail/Access Road shall be protected by concrete k-rails wherever feasible; however, in areas where k-rails would create an impassable or bottleneck situation for vehicles, the City shall utilize other reasonable protections, including cones and flagging, to ensure that the arroyo stone walls are not inadvertently damaged during construction vehicle movement and equipment transport. The plans for the temporary barriers shall be reviewed by a qualified architectural historian prior to Project implementation. In order to ensure that the bridge and stone walls are adequately protected during Project activities, the City shall ensure completion of pre-construction and post-construction surveys by a qualified historic preservation consultant to ensure that adverse effects or significant impacts have not occurred to Bridge No. 2. If the pre-construction survey identifies deficiencies in the protections for Bridge No. 2 or the stone walls, recommendations for additional physical barriers or visual warnings shall be provided and implemented prior to initiation of construction activities. The installation/construction methodology and post-construction survey shall be submitted to the City of Pasadena Department of Planning – Historic Preservation for review and approval.

MM-CUL-2 Prior to construction completion, the City shall ensure preparation of Historic American Engineering Record (HAER) documentation for Bridge No. 3 in accordance with the *Secretary of the Interior's Standards for Architectural and Engineering Documentation*. Documentation shall be completed by a qualified historic preservation professional who meets the Secretary of the Interior's Professional Qualifications Standards for architectural history. The documentation shall capture the physical description of the existing bridge with: 1) existing as-builts/drawings (where/if available); 2) a written narrative that includes a detailed history and architectural description of the bridge and a discussion of its historical significance; 3) photographs of the bridge with large format negatives to demonstrate its current condition; and 4) provide other photographs of the bridge prior to installation of the current overlay. Upon approval of the final HAER package, the City shall offer one original copy of the final HAER package to the City of Pasadena Historic Preservation Program, the South Central Coastal Information Center at California State University, Fullerton, and the Angeles National Forest Administrative Office.

Prior to project construction completion, the City shall conduct a review of the bridge overlay design on Bridge No. 3 and construction materials used in the bridge overlay to determine improvements that can be made to conform with the City's Arroyo Seco Design Guidelines. Examples of potential improvements include, but are not limited to, evaluation of appropriate paint colors that reflect the natural character of the Arroyo Seco, and replacement of components with more natural materials (e.g. wood, concrete, brick, arroyo stone piers, unpainted weathering steel or other natural materials, such as copper and wrought iron). The proposed design improvements shall be submitted to the City of Pasadena Department of Planning – Historic Preservation for review and approval.

MM-CUL-3 Prior to commencement of Project construction activities that would require equipment staging at the Behner Water Treatment Plant (WTP), the City shall ensure that the exterior of the WTP building is adequately protected from equipment and vehicle staging activities. The northwest and southwest exterior elevations of the WTP shall, at a minimum, be protected by construction fencing and signage to ensure that none of the major exterior character-defining features of the building are inadvertently damaged. Fencing shall be placed at a minimum distance of five (5) feet from the exterior of the building, and crews working in the immediate vicinity should be alerted to the presence of an historical resource and instructed to avoid it. The City shall ensure that Project-related equipment and materials are not in contact with the exterior or the building, including absolute avoidance of leaning materials and equipment against exterior walls. The temporary fencing, signage, and barriers shall be removed at the conclusion of construction activities.

MM CUL-4 Prior to commencement of earthmoving activities, the City shall retain a qualified Archaeologist meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology. The Archaeologist shall be present at the pre-grade conference; shall establish procedures for archaeological resource surveillance; and shall establish, in cooperation with the Contractor, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts, as appropriate. At a minimum, in the event archaeological resources are exposed during construction activities, all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist can evaluate the significance of the find and determine whether or not additional study is warranted. The Archaeologist shall first determine whether it is a "unique archaeological resource" pursuant to the California Environmental Quality Act (CEQA, i.e., Section 21083.2[g] of the California Public Resources Code) or a "historical resource" pursuant to Section 15064.5(a) of the State CEQA Guidelines. If the archaeological resource is determined to be a "unique archaeological resource" or a "historical resource", the Archaeologist shall formulate a mitigation plan in consultation with the City of Pasadena that satisfies the requirements of the above-referenced sections. The Archaeologist shall prepare a report of the results of any study prepared as part of a testing or mitigation plan, following guidelines of the California Office of Historic Preservation, and s/he shall record the site and submit the recordation form to the City of Pasadena and the California Historic Resources Information System (CHRIS) at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. Work may proceed in other areas of the site, subject to the direction of the Archaeologist.

MM-PALEO-1 Prior to commencement of any grading activity on-site, the City shall retain a qualified Paleontologist per the Society of Vertebrate Paleontology (SVP) (2010) guidelines. The paleontologist shall prepare a Paleontological Resources Impact Mitigation Program (PRIMP) for the Project. The PRIMP shall be consistent with the SVP (2010) guidelines. Minimum requirements to be set forth in the PRIMP include: (1) attendance at the preconstruction meeting and worker environmental awareness training, where monitoring is required within the proposed Project site based on construction plans and/or geotechnical reports; (2) procedures for adequate paleontological monitoring and discoveries treatment, and paleontological methods, including sediment sampling for microvertebrate fossils, reporting, and collections management; (3) mandatory monitoring on-site during all rough grading and other significant ground-disturbing activities, including augering in previously undisturbed, fine-grained Pleistocene alluvial deposits; (4) mandatory actions in the event that paleontological resources (e.g., fossils) are unearthed during grading, including the requirement for the paleontological monitor to temporarily halt and/or divert grading activity to allow recovery of paleontological resources, and roping/fencing off of the discovery with a 50-foot radius buffer; and (5) if resources are discovered, methods for coordination between the qualified paleontologist and the City for appropriate exploration and/or salvage, as well as final disposition of the resources in an accredited institution or museum, such as the Natural History Museum of Los Angeles County.

4.3.8 Level of Significance After Mitigation

Implementation of MM-CUL-1 and MM-CUL-3 would reduce the short-term construction impacts to two historical resources (the Behner WTP and Bridge No. 2) to a less than significant level.

Implementation of MM-CUL-2 would lessen impacts but would not reduce impacts to Bridge No. 3 below a level of significance. Therefore, impacts to cultural resources under CEQA are considered significant and unavoidable, even with implementation of MM-CUL-2.

Implementation of MM-CUL-4 and MM-PALEO-1 would reduce impacts to archaeological resources and paleontological resources to less than significant.

4.4 Greenhouse Gas Emissions

4.4.1 Methodology

This section describes the existing conditions of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) site and vicinity, identifies associated regulatory requirements, evaluates potential environmental impacts, and identifies mitigation measures related to implementation of the proposed Project. The analysis of the Project impacts related to greenhouse gases (GHGs) is based on:

Appendix C CalEEMod Data, dated February 2020.

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, the Appendices to the Initial Study are included in Appendix A-2, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

Although not a part of the proposed Project, there are specific components in Area 2 that are approved to move forward without additional environmental review that are included in this EIR section and in the California Emissions Estimator Model (CalEEMod) construction assumptions. The improvements to be conducted in Area 2, which have been previously approved to proceed in accordance with the 2015 ASCP MND, include:

1. Removal of existing K-rails along an approximate 150-foot-long segment of the Gabrielino Trail/Access Road between Bridge No. 3 and the intake structure;
2. Stabilization and repaving of the Gabrielino Trail/Access Road with asphalt and would be sloped to direct surface runoff away from the stream towards the hillside; and,

These non-Project improvements are included in the CalEEMod assumptions because their construction is anticipated to occur simultaneously with the proposed Project improvements, likely using the same equipment. As such, it was determined to be unrealistic to parse out the short-term construction activities of the various Project components; therefore, the GHG impacts of constructing all improvements within Area 2 are considered in this section.

Similarly, although not a part of the proposed Project, there are specific components in Area 3 that are approved to move forward without additional environmental review that are included in this EIR section and in the CalEEMod construction assumptions. The improvements to be conducted in Area 3, which have been previously approved to proceed in accordance with the 2015 ASCP MND, include:

1. Demolition of various facilities, including inlet/outlet structures, dry vaults, woodsheds, utility light pole, pipes and valves, chainlink fencing, corrugated metal pipes, and other small appurtenant structures, to allow for the reconstructed basins;
2. Construction and operation of new pre-fabricated restroom, new sewer lift station, and associated pipelines, including a new 12-inch-diameter potable water pipeline and a new sewer line within the JPL Bridge;

3. Construction and operation of new pipelines, including a 12-inch-diameter well line, 16-inch-diameter utility service line, and 12-inch-diameter booster line;
4. Removal of the Behner WTP's influent and effluent lines and removal of the 8-inch-diameter sludge line from the Behner WTP;
5. Construction and operation of the recreational parking lot at the northern end of Area 3;
6. Construction/realignment and operation of Explorer Road; and
7. Construction of new fencing, gates, a roundabout, a guard station, a trail pathway, and signs at the northern end of the parking lot.

Additional details related to these non-Project components are included in Appendix A-4, 2015 ASCP Initial Study/Mitigated Negative Declaration.

The non-Project components within Areas 2 and 3 listed above were previously approved for both short-term construction and long-term operations. Only the short-term construction activities for these non-Project components are modeled in the CalEEMod analysis, as all operational aspects were approved through the 2015 IS/MND and there would be no changes associated with the long-term operations of the proposed Project when compared to the 2015 IS/MND, as further described in Section 3, Project Description, of this Draft EIR.

4.4.2 Existing Conditions

Climate Change Overview

Climate change refers to any significant change in measures of climate, such as temperature, precipitation, or wind patterns, lasting for an extended period of time (decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the sun's energy reaching Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2017a).

The greenhouse effect is the trapping and build-up of heat in the atmosphere (troposphere) near the Earth's surface. The greenhouse effect traps heat in the troposphere through a threefold process as follows: Short-wave radiation emitted by the Sun is absorbed by the Earth, the Earth emits a portion of this energy in the form of long-wave radiation, and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on the Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise.

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales and that, in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes, such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. Recent climate changes, in particular the warming observed over the past century, however, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of that warming since the mid-twentieth century and is the most significant driver of observed

climate change (EPA 2017a; IPCC 2013). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013).

Greenhouse Gases

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. As defined in California Health and Safety Code Section 38505(g), for purposes of administering many of the state's primary GHG emissions reduction programs, GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3). (See also California Environmental Quality Act (CEQA) Guidelines Section 15364.5.)[1] Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted into the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-absorption potential than CO_2, include fluorinated gases, such as HFCs, PFCs, and SF_6, which are associated with certain industrial products and processes. The following paragraphs provide a summary of the most common GHGs and their sources.[2]

Carbon Dioxide

CO_2 is a naturally occurring gas and a by-product of human activities and is the principal anthropogenic GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 are from the combustion of fuels such as coal, oil, natural gas, and wood and changes in land use.

Methane

CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. Methane is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

---

1 Climate-forcing substances include GHGs and other substances such as black carbon and aerosols. This discussion focuses on the seven GHGs identified in California Health and Safety Code Section 38505 as impacts associated with other climate-forcing substances are not evaluated herein.

2 The descriptions of GHGs are summarized from the Intergovernmental Panel on Climate Change's (IPCC) Second Assessment Report (1995), IPCC's Fourth Assessment Report (2007), CARB's "Glossary of Climate Change Terms" (2016), and EPA's "Glossary of Climate Change Terms" (2016).

Nitrous Oxide

N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers, manure management, industrial processes (such as in nitric acid production, nylon production, and fossil-fuel-fired power plants), vehicle emissions, and using N_2O as a propellant (e.g., rockets, racecars, and aerosol sprays).

Fluorinated Gases

Fluorinated gases (also referred to as F-gases) are synthetic powerful GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric ozone-depleting substances (e.g., chlorofluorocarbons (CFCs), hydrochlorofluorocarbons (HCFCs), and halons). The most prevalent fluorinated gases include the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to ozone-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, with HFCs, to the ozone depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Since PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.
- **Sulfur Hexafluoride:** SF_6 is a colorless gas soluble in alcohol and ether and slightly soluble in water. SF_6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.
- **Nitrogen Trifluoride:** NF_3 is used in the manufacture of a variety of electronics, including semiconductors and flat panel displays.

Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (e.g., affect cloud formation or albedo) (EPA 2016). The Intergovernmental Panel on Climate Change developed the global warming potential (GWP) concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram of a trace substance relative to that of 1 kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of CO_2 equivalent (CO_2e).

The current version of the California Emissions Estimator Model (CalEEMod) (Version 2016.3.2) assumes that the GWP for CH_4 is 25 (so emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the Intergovernmental Panel on Climate Change's Fourth Assessment Report (IPCC 2007). The GWP values identified in CalEEMod were applied to the proposed Project.

Sources of Greenhouse Gas Emissions

Per the U.S. Environmental Protection Agency's (EPA) Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2016 (EPA 2018), total United States GHG emissions were approximately 6,511.3 million metric tons (MMT) CO_2e in 2016. The primary GHG emitted by human activities in the United States was CO_2, which represented approximately 81.6% of total GHG emissions (5,310.9 MMT CO_2e). The largest source of CO_2, and of overall GHG emissions, was fossil-fuel combustion, which accounted for approximately 93.5% of CO_2 emissions in 2016 (4,966.0 MMT CO_2e). Relative to 1990, gross United States GHG emissions in 2016 are higher by 2.4%; down from a high of 15.7% above 1990 levels in 2007. GHG emissions decreased from 2015 to 2016 by 1.9% (126.8 MMT CO_2e) and overall, net emissions in 2016 were 11.1% below 2005 levels (EPA 2018).

According to California's 2000–2016 GHG emissions inventory (2018 edition), California emitted 429.4 MMT CO_2e in 2016, including emissions resulting from out-of-state electrical generation (CARB 2018a). The sources of GHG emissions in California include transportation, industrial uses, electric power production from both in-state and out-of-state sources, commercial and residential uses, agriculture, high GWP substances, and recycling and waste. The California GHG emission source categories (as defined in California Air Resources Board's (CARB) 2018 GHG emissions inventory) and their relative contributions in 2016 are presented in Table 4.4-1.

Table 4.4-1. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total[a]
Transportation	169.38	41%
Industrial	89.61	23%
Electricity generation[b]	68.58	16%
Residential and commercial uses	39.36	12%
Agriculture	33.84	8%
High GWP substances	19.78	4%
Recycling and waste	8.81	2%
Totals	**429.40**	**100%**

Source: CARB 2018a.

Notes: GHG = greenhouse gas; MMT CO_2e = million metric tons of carbon dioxide equivalent; GWP = global warming potential. Emissions reflect 2016 California GHG inventory.

[a] Percentage of total has been rounded and total may not sum due to rounding.

[b] Includes emissions associated with imported electricity, which account for 26.28 MMT CO_2e.

Between 2000 and 2016, per-capita GHG emissions in California have dropped from a peak of 14.0 MT per person in 2001 to 10.8 MT per person in 2016, representing a 23% decrease. In addition, total GHG emissions in 2016 were approximately 12 MMT CO_2e less than 2015 emissions. The declining trend in GHG emissions,

coupled with programs that will continue to provide additional GHG reductions going forward, demonstrates that California will continue to reduce emissions below the 2020 target of 431 MT CO_2e (CARB 2018).

Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources through uncertain impacts related to future air temperatures and precipitation patterns. The 2014 Intergovernmental Panel on Climate Change Synthesis Report (IPCC 2014) indicated that warming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia. Signs that global climate change has occurred include warming of the atmosphere and ocean, diminished amounts of snow and ice, and rising sea levels (IPCC 2014).

In California, climate change impacts have the potential to affect sea-level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, and electricity demand and supply (CCCC 2012). The primary effect of global climate change has been a 0.2 degrees Celsius (°C) (0.36 degrees Fahrenheit (°F)) rise in average global tropospheric temperature per decade, determined from meteorological measurements worldwide between 1990 and 2005. Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the twenty-first century than were observed during the twentieth century. A warming of about 0.2°C (0.36°F) per decade is projected, and there are identifiable signs that global warming could be taking place.

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The average temperatures in California have increased, leading to more extreme hot days and fewer cold nights. Shifts in the water cycle have been observed, with less winter precipitation falling as snow, and both snowmelt and rainwater running off earlier in the year. Sea levels have risen, and wildland fires are becoming more frequent and intense due to dry seasons that start earlier and end later (CAT 2010).

An increase in annual average temperature is a reasonably foreseeable effect of climate change. Observed changes over the last several decades across the western United States reveal clear signals of climate change. Statewide average temperatures increased by about 1.7°F from 1895 to 2011, and warming has been greatest in the Sierra Nevada (CCCC 2012). By 2050, California is projected to warm by approximately 2.7°F above 2000 averages, a threefold increase in the rate of warming over the last century. By 2100, average temperatures could increase by 4.1°F to 8.6°F, depending on emissions levels. Springtime warming—a critical influence on snowmelt—will be particularly pronounced. Summer temperatures will rise more than winter temperatures, and the increases will be greater in inland California, compared to the coast. Heat waves will be more frequent, hotter, and longer. There will be fewer extremely cold nights (CCCC 2012). A decline of Sierra Nevada snowpack, which accounts for approximately half of the surface water storage in California, by 30% to as much as 90% is predicted over the next 100 years (CAT 2006).

Model projections for precipitation over California continue to show the Mediterranean pattern of wet winters and dry summers with seasonal, year-to-year, and decade-to-decade variability. For the first time, however, several of the improved climate models shift toward drier conditions by the mid-to-late twenty-first century in central, and most notably, Southern California. By the late century, all projections show

drying, and half of them suggest 30-year average precipitation will decline by more than 10% below the historical average (CCCC 2012).

A summary of current and future climate change impacts to resource areas in California, as discussed in the Safeguarding California: Reducing Climate Risk (CNRA 2014), is provided below.

Agriculture. Some of the specific challenges faced by the agricultural sector and farmers include more drastic and unpredictable precipitation and weather patterns; extreme weather events that range from severe flooding to extreme drought, to destructive storm events; significant shifts in water availably and water quality; changes in pollinator lifecycles; temperature fluctuations, including extreme heat stress and decreased chill hours; increased risks from invasive species and weeds, agricultural pests and plant diseases; and disruptions to the transportation and energy infrastructure supporting agricultural production.

Biodiversity and Habitat. Specific climate change challenges to biodiversity and habitat include species migration in response to climatic changes, range shift and novel combinations of species; pathogens, parasites and disease; invasive species; extinction risks; changes in the timing of seasonal life-cycle events; food web disruptions; threshold effects (i.e., a change in the ecosystem that results in a "tipping point" beyond which irreversible damage or loss has occurred).

Energy. Specific climate change challenges for the energy sector include temperature, fluctuating precipitation patterns, increasing extreme weather events, and sea-level rise.

Forestry. The most significant climate change related risk to forests is accelerated risk of wildfire and more frequent and severe droughts. Droughts have resulted in more large-scale mortalities and combined with increasing temperatures have led to an overall increase in wildfire risks. Increased wildfire intensity subsequently increases public safety risks, property damage, fire suppression and emergency response costs, watershed and water quality impacts, and vegetation conversions.

Ocean and Coastal Ecosystems and Resources. Sea-level rise, changing ocean conditions, and other climate change stressors are likely to exacerbate long-standing challenges related to ocean and coastal ecosystems in addition to threatening people and infrastructure located along the California coastline and in coastal communities. Sea-level rise, in addition to more frequent and severe coastal storms and erosion, are threatening vital infrastructure such as roads, bridges, power plants, ports and airports, gasoline pipes, and emergency facilities, as well as negatively impacting the coastal recreational assets such as beaches and tidal wetlands.

Public Health. Climate change can impact public health through various environmental changes and is the largest threat to human health in the twenty-first century. Changes in precipitation patterns affect public health primarily through potential for altered water supplies, and extreme events such as heat, floods, droughts, and wildfires. Increased frequency, intensity, and duration of extreme heat and heat waves are likely to increase the risk of mortality due to heat-related illness, as well as exacerbate existing chronic health conditions. Other extreme weather events are likely to negatively impact air quality and increase or intensify respiratory illness, such as asthma and allergies.

Transportation. Although the transportation industry is a source of GHG emissions, it is also vulnerable to climate change risks. Increasing temperatures and extended periods of extreme heat threaten the integrity of the roadways and rail lines. High temperatures cause the road surfaces to expand, which leads to increased pressure and pavement buckling. High temperatures can also cause rail breakages, which could lead to train derailment. Other forms of extreme weather events, such as extreme storm events, can negatively impact infrastructure, which can impair movement of peoples and goods, or potentially block evacuation routes and emergency access roads. Increased wildfires, flooding, erosion risks, landslides, mudslides, and rockslides can all profoundly impact the transportation system and pose a serious risk to public safety.

Water. Climate change could seriously impact the timing, form, amount of precipitation, runoff patterns, and frequency and severity of precipitation events. Higher temperatures reduce the amount of snowpack and lead to earlier snowmelt, which can impact water supply availability, natural ecosystems, and winter recreation. Water supply availability during the intense dry summer months is heavily dependent on the snowpack accumulated during the winter time. Increased risk of flooding has a variety of public health concerns, including water quality, public safety, property damage, displacement, and post-disaster mental health problems. Prolonged and intensified droughts can also negatively groundwater reserves and result in increased overdraft and subsidence. The higher risk of wildfires can lead to increased erosion, which can negatively impact watersheds and result in poor water quality.

In March 2016, the California Natural Resources Agency (CNRA) released Safeguarding California: Implementation Action Plans, a document that shows how California is acting to convert the recommendations contained in the 2014 Safeguarding California plan into action (CNRA 2016). Additionally, in May 2017, the CNRA released the draft Safeguarding California Plan: 2017 Update, which is a survey of current programmatic responses for climate change and contains recommendations for further actions (CNRA 2017).

The CNRA released Safeguarding California Plan: 2018 Update in January 2018, which provides a roadmap for state agencies to protect communities, infrastructure, services, and the natural environment from climate change impacts. The 2018 Safeguarding California Plan includes 69 recommendations across 11 sectors and more than 1,000 ongoing actions and next steps developed by scientific and policy experts across 38 state agencies (CNRA 2018). As with previous state adaptation plans, the 2018 Update addresses acceleration of warming across the state; more intense and frequent heat waves; greater riverine flows; accelerating sea-level rise; more intense and frequent drought; more severe and frequent wildfires; more severe storms and extreme weather events; shrinking snowpack and less overall precipitation; and ocean acidification, hypoxia, and warming.

4.4.3 Relevant Plans, Policies, and Ordinances

Federal

Massachusetts v. EPA

In *Massachusetts v. EPA* (April 2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under Section 202(a) of the federal Clean Air Act:

- The Administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."
- The Administrator further found the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the Clean Air Act.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, would do the following, which would aid in the reduction of national GHG emissions (EPA 2007):

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and directs National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy-efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Federal Vehicle Standards

In response to the U.S. Supreme Court ruling previously discussed, the Bush Administration issued Executive Order (EO) 13432 in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016 (75 FR 25324–25728).

In 2010, President Barack Obama issued a memorandum directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021 (77 FR 62624–63200). On January 12, 2017, the EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks (EPA 2017b).

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018 (76 FR 57106–57513). The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6%–23% over the 2010 baselines.

In August 2016, the EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion MT and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program (EPA and NHTSA 2016).

Clean Power Plan and New Source Performance Standards for Electric Generating Units.

On October 23, 2015, the EPA published a final rule (effective December 22, 2015) establishing the Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units (80 FR 64510–64660), also known as the Clean Power Plan. These guidelines prescribe how states must develop plans to reduce GHG emissions from existing fossil-fuel-fired electric generating units. The guidelines establish CO_2 emission performance rates representing the best system of emission reduction for two subcategories of existing fossil-fuel-fired electric generating units: (1) fossil-fuel-fired electric utility steam-generating units, and (2) stationary combustion turbines. Concurrently, the EPA published a final rule (effective October 23, 2015) establishing Standards of Performance for Greenhouse Gas Emissions from New, Modified, and Reconstructed Stationary Sources: Electric Utility Generating Units (80 FR 64661–65120). The rule prescribes CO_2 emission standards for newly constructed, modified, and reconstructed affected fossil-fuel-fired electric utility generating units. The U.S. Supreme Court stayed implementation of the Clean Power Plan pending resolution of several lawsuits.

State/Regional

The statewide GHG emissions regulatory framework is summarized below by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, solid waste, water, and other state regulations and goals. The following text describes EOs, legislation, regulations, and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues

State Climate Change Targets

EO S-3-05

EO S-3-05 (June 2005) established California's GHG emissions reduction targets and laid out responsibilities among the state agencies for implementing the EO and for reporting on progress toward the targets. This EO established the following targets:

- By 2010, reduce GHG emissions to 2000 levels
- By 2020, reduce GHG emissions to 1990 levels
- By 2050, reduce GHG emissions to 80% below 1990 levels

EO S-3-05 also directed the California Environmental Protection Agency to report biannually on progress made toward meeting the GHG targets and the impacts to California due to global warming, including impacts to water supply, public health, agriculture, the coastline, and forestry. The Climate Action Team was formed, which subsequently issued reports from 2006 to 2010 (CAT 2016).

Assembly Bill 32

In furtherance of the goals established in EO S-3-05, the Legislature enacted Assembly Bill (AB) 32 (Núñez and Pavley). The bill is referred to as the California Global Warming Solutions Act of 2006 (September 27, 2006). AB 32 provided initial direction on creating a comprehensive multiyear program to limit California's GHG emissions at 1990 levels by 2020 and initiate the transformations required to achieve the state's long-range climate objectives.

Senate Bill 32 and AB 197.

Senate Bill (SB) 32 and AB 197 (enacted in 2016) are companion bills. SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to CARB as nonvoting members; requires CARB to make available and update (at least annually via its website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and requires CARB to identify specific information for GHG emissions reduction measures when updating the Scoping Plan.

CARB's 2007 Statewide Limit.

In 2007, in accordance with California Health and Safety Code Section 38550, CARB approved a statewide limit on the GHG emissions level for 2020, consistent with the determined 1990 baseline (427 MMT CO_2e).

CARB's Climate Change Scoping Plan

One specific requirement of AB 32 is for CARB to prepare a "scoping plan" for achieving the maximum technologically feasible and cost-effective GHG emission reductions by 2020 (Health and Safety Code Section 38561(a)), and to update the plan at least once every 5 years. In 2008, CARB approved the first Scoping Plan. The Climate Change Scoping Plan: A Framework for Change (Scoping Plan) included a mix of recommended

strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the state's long-range climate objectives. The key elements of the Scoping Plan include the following (CARB 2008):

1. Expanding and strengthening existing energy efficiency programs as well as building and appliance standards
2. Achieving a statewide renewable energy mix of 33%
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85% of California's GHG emissions
4. Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets
5. Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard (LCFS) (17 CCR, Section 95480 et seq.)
6. Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation

The Scoping Plan also identified local governments as essential partners in achieving California's goals to reduce GHG emissions because they have broad influence and, in some cases, exclusive authority over activities that contribute to significant direct and indirect GHG emissions through their planning and permitting processes, local ordinances, outreach and education efforts, and municipal operations. Specifically, the Scoping Plan encouraged local governments to adopt a reduction goal for municipal operations and for community emissions to reduce GHGs by approximately 15% from then levels (2008) by 2020. Many local governments developed community-scale local GHG reduction plans based on this Scoping Plan recommendation.

In 2014, CARB approved the first update to the Scoping Plan. The First Update to the Climate Change Scoping Plan: Building on the Framework (First Update) defined the state's GHG emission reduction priorities for the next 5 years and laid the groundwork to start the transition to the post-2020 goals set forth in EOs S-3-05 and B-16-2012. The First Update concluded that California is on track to meet the 2020 target, but recommended a 2030 mid-term GHG reduction target be established to ensure a continuum of action to reduce emissions. The First Update recommended a mix of technologies in key economic sectors to reduce emissions through 2050, including energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies. As part of the First Update, CARB recalculated the state's 1990 emissions level using more recent GWPs identified by the Intergovernmental Panel on Climate Change, from 427 MMT CO_2e to 431 MMT CO_2e (CARB 2014).

In 2015, as directed by EO B-30-15, CARB began working on an update to the Scoping Plan to incorporate the 2030 target of 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050 as set forth in S-3-05. The Governor called on California to pursue a new and ambitious set of strategies, in line with the five climate

change pillars from his inaugural address, to reduce GHG emissions and prepare for the unavoidable impacts of climate change. In the summer of 2016, the Legislature affirmed the importance of addressing climate change through passage of SB 32 (Pavley, Chapter 249, Statutes of 2016).

In January 2017, CARB released the 2017 Climate Change Scoping Plan Update (2030 Scoping Plan) for public review and comment (CARB 2017). The 2030 Scoping Plan builds on the successful framework established in the initial Scoping Plan and First Update while identifying new, technologically feasible and cost-effective strategies that will serve as the framework to achieve the 2030 GHG target and define the state's climate change priorities to 2030 and beyond. The strategies' "known commitments" include implementing renewable energy and energy efficiency (including the mandates of SB 350), increased stringency of the LCFS, measures identified in the Mobile Source and Freight Strategies, measures identified in the proposed Short-Lived Climate Pollutant Plan, and increased stringency of SB 375 targets. To fill the gap in additional reductions needed to achieve the 2030 target, it recommends continuing the Cap-and-Trade Program and a measure to reduce GHGs from refineries by 20%.

For local governments, the 2030 Scoping Plan replaced the initial Scoping Plan's 15% reduction goal with a recommendation to aim for a community-wide goal of no more than 6 MT CO_2e per capita by 2030 and no more than 2 MT CO_2e per capita by 2050, which are consistent with the state's long-term goals. These goals are also consistent with the Global Climate Leadership Memorandum of Understanding (Under 2 MOU) (Under 2 2016) and the Paris Agreement, which were developed around the scientifically based levels necessary to limit global warming below 2°C. The 2030 Scoping Plan recognized the benefits of local government GHG planning (e.g., through Climate Action Plans (CAPs)) and provide more information regarding tools CARB is working on to support those efforts. It also recognizes the CEQA streamlining provisions for project-level review where there is a legally adequate CAP.[3] The Second Update was approved by CARB's Governing Board on December 14, 2017.

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32, SB 32, and the EOs, and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. A project is considered consistent with the statutes and EOs if it meets the general policies in reducing GHG emissions to facilitate the achievement of the state's goals and does not impede attainment of those goals. As discussed in several cases, a given project need not be in perfect conformity with each and every planning policy or goals to be consistent. A project would be consistent if it will further the objectives and not obstruct their attainment.

CARB's Regulations for the Mandatory Reporting of Greenhouse Gas Emissions.

CARB's Regulation for the Mandatory Reporting of Greenhouse Gas Emissions (17 CCR 95100–95157) incorporated by reference certain requirements that the EPA promulgated in its Final Rule on Mandatory Reporting of Greenhouse Gases (Title 40, CFR, Part 98). Specifically, Section 95100(c) of the Mandatory

[3] *Sierra Club v. County of Napa* (2004) 121 Cal.App.4th 1490; *San Francisco Tomorrow et al. v. City and County of San Francisco* (2015) 229 Cal.App.4th 498; *San Franciscans Upholding the Downtown Specific Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656; *Sequoyah Hills Homeowners Assn. V. City of Oakland* (1993) 23 Cal.App.4th 704, 719.

Reporting Regulation incorporated those requirements that the EPA promulgated in the Federal Register on October 30, 2009; July 12, 2010; September 22, 2010; October 28, 2010; November 30, 2010; December 17, 2010; and April 25, 2011. In general, entities subject to the Mandatory Reporting Regulation that emit more than 10,000 MT CO_2e per year are required to report annual GHGs through the California Electronic GHG Reporting Tool. Certain sectors, such as refineries and cement plants, are required to report regardless of emission levels. Entities that emit more than the 25,000 MT CO_2e per year threshold are required to have their GHG emissions report verified by a CARB-accredited third party.

Executive Order B-18-12

EO B-18-12 (April 2012) directed state agencies, departments, and other entities under the governor's executive authority to take action to reduce entity-wide GHG emissions by at least 10% by 2015 and 20% by 2020, as measured against a 2010 baseline. EO B-18-12 also established goals for existing state buildings for reducing grid-based energy purchases and water use.

Executive Order B-30-15

EO B-30-15 (April 2015) identified an interim GHG reduction target in support of targets previously identified under S-3-05 and AB 32. EO B-30-15 set an interim target goal of reducing GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050 as set forth in S-3-05. To facilitate achieving this goal, EO B-30-15 called for CARB to update the Scoping Plan to express the 2030 target in terms of MMT CO_2e. The EO also called for state agencies to continue to develop and implement GHG emission reduction programs in support of the reduction targets.

Senate Bill (SB) 605 and SB 1383

SB 605 (2014) requires CARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants in the state, and SB 1383 (2016) requires CARB to approve and implement that strategy by January 1, 2018. SB 1383 also establishes specific targets for the reduction of short-lived climate pollutants (40% below 2013 levels by 2030 for methane and HFCs, and 50% below 2013 levels by 2030 for anthropogenic black carbon), and provides direction for reductions from dairy and livestock operations and landfills. Accordingly, and as mentioned above, CARB adopted its Short-Lived Climate Pollutant Reduction Strategy in March 2017. The Short-Lived Climate Pollutant Reduction Strategy establishes a framework for the statewide reduction of emissions of black carbon, methane, and fluorinated gases.

Executive Order B-55-18

EO B-55-18 (September 2018) establishes a statewide policy for the state to achieve carbon neutrality no later than 2045 and achieve and maintain net negative emissions thereafter. The goal is an addition to the existing statewide targets of reducing the state's GHG emissions. CARB will work with relevant state agencies to ensure that future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal.

Mobile Sources

Assembly Bill 1493

AB 1493 (Pavley) (July 2002) was enacted in a response to the transportation sector accounting for more than half of California's CO_2 emissions. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be vehicles that are primarily used for noncommercial personal transportation in the state. The bill required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004. The near-term (2009–2012) standards resulted in a reduction of approximately 22% in GHG emissions compared to the emissions from the 2002 fleet, and the mid-term (2013–2016) standards resulted in a reduction of approximately 30%.

Heavy Duty Diesel

CARB adopted the final Heavy Duty Truck and Bus Regulation, Title 13, Division 3, Chapter 1, Section 2025, on December 31, 2014, to reduce particulate matter and nitrogen oxides emissions from heavy-duty diesel vehicles. The rule requires particulate matter filters be applied to newer heavier trucks and buses by January 1, 2012, with older vehicles required to comply by January 1, 2015. The rule will require nearly all diesel trucks and buses to be compliant with the 2010 model year engine requirement by January 1, 2023. CARB also adopted an Airborne Toxic Control Measure to limit idling of diesel-fueled commercial vehicles on December 12, 2013. This rule requires diesel-fueled vehicles with gross vehicle weights greater than 10,000 pounds to idle no more than 5 minutes at any location (13 CCR 2485).

Executive Order S-1-07

EO S-1-07 (January 2007, implementing regulation adopted in April 2009) sets a declining LCFS for GHG emissions measured in CO2e grams per unit of fuel energy sold in California. The target of the LCFS is to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020 (17 CCR 95480 et seq.). The carbon intensity measures the amount of GHG emissions in the lifecycle of a fuel, including extraction/ feedstock production, processing, transportation, and final consumption, per unit of energy delivered.

Senate Bill 375

SB 375 (Steinberg) (September 2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 requires CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035 and to update those targets every 8 years. SB 375 requires the state's 18 regional metropolitan planning organizations to prepare a Sustainable Communities Strategy (SCS) as part of their Regional Transportation Plan (RTP) that will achieve the GHG reduction targets set by CARB. If a metropolitan planning organization is unable to devise an SCS to achieve the GHG reduction target, the metropolitan planning organization must prepare an Alternative Planning Strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

Pursuant to Government Code, Section 65080(b)(2)(K), an SCS does not (i) regulate the use of land; (ii) supersede the land use authority of cities and counties; or (iii) require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it. Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated housing element process.

In September 2010, CARB adopted the first SB 375 targets for the regional metropolitan planning organizations. The targets for the Southern California Association of Governments (SCAG) are an 8% reduction in emissions per capita by 2020 and a 13% reduction by 2035. Achieving these goals through adoption of an SCS is the responsibility of the metropolitan planning organizations. SCAG adopted its first RTP/SCS in April 2012. The plan quantified a 9% reduction by 2020 and a 16% reduction by 2035 (SCAG 2012). In June 2012, CARB accepted SCAG's quantification of GHG reductions and its determination the SCS, if implemented, would achieve SCAG targets. On April 4, 2016, the SCAG Regional Council adopted the 2016 RTP/SCS. The 2016 RTP/SCS quantified an 8% reduction by 2020 and an 18% reduction by 2030 (SCAG 2016). In June 2016, CARB accepted SCAG's quantification of GHG reductions and its determination that the SCS would achieve SCAG targets. On May 7, 2020, the SCAG Regional Council Adopted the 2020 RTP/SCS, which continues the progress made on previous plans and quantified a 19% reduction by 2035. At the time of writing CARB's approval of the GHG reduction quantitation is pending (SCAG 2020).

Advanced Clean Cars Program and Zero-Emissions Vehicle Program

The Advanced Clean Cars program (January 2012) is a new emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package. The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars (CARB 2012). To improve air quality, CARB implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that, by 2025, cars will emit 75% less smog-forming pollution than the average new car sold today. To reduce GHG emissions, CARB, in conjunction with the EPA and the NHTSA, adopted new GHG standards for model year 2017 to 2025 vehicles; the new standards are estimated to reduce GHG emissions by 34% in 2025. The zero-emission vehicle program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of zero-emission vehicles and plug-in hybrid electric vehicles in the 2018 to 2025 model years.

Executive Order B-16-12

EO B-16-12 (March 2012) required that state entities under the governor's direction and control support and facilitate the rapid commercialization of zero-emission vehicles. It ordered CARB, CEC, the California Public Utilities Commission, and other relevant agencies to work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve benchmark goals by 2015, 2020, and 2025. On a statewide basis, EO B-16-12 established a target reduction of GHG emissions from the transportation sector equaling 80% less than 1990 levels by 2050. This directive did not apply to vehicles that have special performance requirements necessary for the protection of the public safety and welfare.

Water

Executive Order B-29-15

In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have become permanent water-efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

Solid Waste

Assembly Bill (AB) 939 and AB 341

In 1989, AB 939, known as the Integrated Waste Management Act (PRC Sections 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board, which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by 2000.

AB 341 (Chapter 476, Statutes of 2011 (Chesbro)) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by 2020, and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the state's policy goal. CalRecycle conducted several general stakeholder workshops and several focused workshops, and in August 2015 published a discussion document titled AB 341 Report to the Legislature, which identifies five priority strategies that CalRecycle believes would assist the state in reaching the 75% goal by 2020, legislative and regulatory recommendations, and an evaluation of program effectiveness (CalRecycle 2012).

Local

City of Pasadena Climate Action Plan.

The City's Final Climate Action Plan (CAP) was adopted on March 5, 2018. The City's CAP quantifies existing GHG emissions as well as projected emissions for the years 2020, 2030, 2035 and 2050 resulting from activities within the City's jurisdiction. The CAP also identifies City target emissions levels, below which Citywide GHG impacts would be less than significant. The CAP and the accompanying adopted Initial Study/Negative Declaration (IS/ND) also identify and analyze the GHG emissions that would result from the BAU scenario for the years 2020, 2030, 2035 and 2050. The CAP includes a monitoring and reporting program to ensure its progress toward achieving the specified GHG emissions reductions, and specifies 21 measures that, if implemented, would achieve the specified GHG emissions reductions targets. The CAP was adopted in a public process following adoption of the IS/ND. Subsequent to the adoption of the CAP, the City has also established additional specific measures that if implemented on a project-by-project basis, would further ensure that the City as a whole achieves the specified GHG emissions reduction targets in the CAP (City of Pasadena 2018a).

4.4.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to greenhouse gas emissions are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to greenhouse gas emissions would occur if the project would:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
b) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Through the analysis in the Initial Study (see Appendix A-1), it was determined that the proposed project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment, or conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gasses (i.e., Thresholds a and b). However, both of these thresholds are re-evaluated in this EIR using the latest construction assumptions and modeling methods.

As discussed in Section 4.4.3, the CAP was adopted in a public process following adoption of the IS/ND. Along with the adoption of the CAP, the City has also established additional specific measures that if implemented on a project-by-project basis, would further ensure that the City as a whole achieves the specified GHG emissions reduction targets in the CAP. The CAP Consistency Checklist is the primary document used by the City of Pasadena to verify project-by-project consistency with the underlying assumptions in the CAP and ensure that the City would achieve its emissions reduction targets. The CAP Checklist includes a three-step process to determine project consistency (City of Pasadena 2018b). Step 1 consists of a Master Land Use Application form, which provides relevant information about the proposed project. Step 2 consists of an evaluation to determine the project's consistency with existing General Plan. If the proposed project is able to answer "yes" to Step 2 and demonstrate the proposed project would be consistent with existing General Plan, for the site, or the proposed project can demonstrate consistency with existing land uses by comparing the proposed project's GHG emissions with those that would be generated under existing land uses, then the proposed project may proceed to Step 3. Step 3 provides three options to evaluate consistency of with the CAP:

- **Option A:** Sustainable Development Actions–Demonstrate that the proposed project is consistent with the Pasadena CAP by incorporating applicable actions intended to ensure that the project contributes its fair share to the City's cumulative GHG reduction goals
- **Option B:** GHG Efficiency -Demonstrate that the proposed project is consistent with Pasadena's per person GHG efficiency threshold
- **Option C:** Net Zero GHG Emissions–Demonstrate that the proposed project would not result in a net increase in GHG emissions

As the proposed Project is construction-focused in nature and would not include residential, commercial or industrial land uses that would generate a service population, Option A was selected to determine consistency with City's CAP and the significance of impacts related to GHG emissions.

4.4.5 Environmental Impacts Analysis

Threshold 4.4a. Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Short-Term Construction Impacts

CalEEMod Version 2016.3.2 was used to estimate potential Project-generated GHG emissions during construction. Construction of the proposed Project would result in GHG emissions primarily associated with use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in Section 4.1, Air Quality are also applicable for the estimation of construction-related GHG emissions. As such, see Section 4.1 of this Draft EIR for a discussion of construction emissions calculation methodology and assumptions.

Construction of the proposed Project would result in GHG emissions, primarily associated with the use of off-road construction equipment, haul trucks, on-road vendor trucks, and worker vehicles. SCAQMD's Draft Guidance Document – Interim CEQA Greenhouse Gas Significance Threshold (SCAQMD 2008) recommends that "construction emissions be amortized over a 30-year Project lifetime, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies." Thus, the total construction GHG emissions were calculated, amortized over 30 years, and added to the total operational emissions.

Table 4.4-2 shows the estimated annual GHG construction emissions associated with the proposed Project, as well as the amortized construction emissions over a 30-year Project life.

Table 4.4-2. Estimated Annual Construction GHG Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
2021	148.91	0.03	0.00	149.65
2022	371.26	0.06	0.00	372.86
			Total	522.51
			Amortized Emissions	**17.41**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix C for complete results.

As shown in Table 4.4-2, total construction emissions for the proposed Project were estimated to be 523 MT CO_2e. Estimated amortized Project-generated construction emissions over 30 years would be approximately 17 MT CO_2e per year. As with Project-generated construction air quality pollutant emissions, GHG emissions generated during construction of the proposed Project would be short-term in nature, lasting only for the duration of the construction period for each phase, and would not represent a long-term source of GHG emissions. Because there is no separate GHG threshold for construction, the evaluation of significance is discussed in the operational emissions analysis below.

Long-Term Operational Impacts

As described in Section 3, Project Description, PWP's future schedule of operation and maintenance activities for Project-related facilities would not substantively differ from the current maintenance routine and procedures. No new employees are required for the long-term operation of the Project components; therefore, no long-term operational GHG emissions from mobile sources would result. However, the project would include new hydraulic motors and winches as part of the design for Area 2, which would be electrically powered. Energy demand for the hydraulic motors and winches are estimated to be 4,800 kilowatt hours per year. Table 4.4-3 shows the estimated annual GHG operational emissions associated with the proposed Project, as well as the amortized construction emissions over a 30-year Project life.

Table 4.4-3. Estimated Annual Construction GHG Emissions

Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Area	0	0	0	0
Energy	3.68	<0.01	<0.01	3.69
Mobile	0	0	0	0
			Amortized Construction Emissions	17.41
			Total	**21.10**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix C for complete results.

As shown in Table 4.4-3, the total proposed Project emissions during operation were estimated to be approximately 3 MT CO2e per year which includes amortized construction emissions of 20 MT CO2e per year. As discussed in Section 4.4.4, the significance determination is based on consistency with the City's CAP using its CAP Consistency Checklist. This CAP Consistency Checklist and the proposed Project's GHG impacts are discussed in Threshold GHG-2.

Although not quantified, the proposed Project would further reduce City's reliance upon purchased imported water supplies from the Metropolitan Water District of Southern California (MWD). The City is a member agency of MWD, which serves wholesale treated water to the City imported from the Colorado River Aqueduct and the State Water Project (SWP). Because the Project would increase the supply of local groundwater in replacement of imported water, there would be a reduction in electricity associated with the water source. For imported water, electricity is needed to supply and transport the water from sources in other parts of California, which is a very energy-intensive process to pump the water across the State through topographical elevation changes. However, for local groundwater, electricity is only needed for pumping. Accordingly, electricity associated with supply of water from MWD is avoided as a result of replacing some of the City's reliance on imported water source with local groundwater supplies.

Threshold 4.4b Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Consistency with the City's CAP

As discussed in Section 4.4.4, the City of Pasadena evaluates GHG significance based on a Project's consistency with the City's CAP using the CAP Consistency Checklist. Step 2 of the Checklist determines the Project's consistency with the land use assumptions used in the CAP. The proposed Project is currently designated as Open Space. As the Project proposed would continue to serve as open space once construction is complete, it is consistent with the existing land use designation. Therefore, the Project would respond Yes to Step 2 of the CAP Checklist and can proceed to Step 3 of the Cap Checklist. Step 3 of the checklist provides 3 options to determine consistency with the CAP. Given that the Project is primarily a construction project, Option A: Sustainable Development Actions was used to determine consistency with the CAP. Table 4.4-4 shows the Project's consistency with each action within the CAP Consistency Checklist.

Table 4.4-4. Climate Action Plan Consistency Checklist

GHG Reduction Strategy	Sustainable Development Actions	Project Compliance
Mandatory Actions		
T-1.2: Continue to improve bicycle and pedestrian safety	*Bicycle Storage*: Does the project provide bicycle storage lockers, racks, or other bicycle storage facilities for residents/employees?	**Not Applicable**. The Project is construction focused and result in water utility infrastructure surrounded by open space. Therefore, the Project would not result in new employees or residents
T-3.1: Decrease annual commuter miles traveled by single occupancy vehicles	*Transportation Demand Management (TDM):* Does the project include a TDM plan? A TDM plan is required for the following projects: multifamily residential development that are 100 or more units; mixed-use developments with 50 or more residential units or 50,000 square feet or more of non-residential development; or non-residential projects which exceed 75,000 square feet. If applicable, please submit the TDM plan for review.	**Not Applicable**. The Project is construction focused and result in water utility infrastructure surrounded by open space similar to existing conditions. Employee trips to and from the Project from maintenance activities would be similar to existing conditions.
T-4.1: Expand the availability and use of alternative fuel vehicles and fueling infrastructure	*Alternative Vehicle Fueling Wiring:* For projects with more than three parking spaces, does the project provide wiring for at least one 240V Type II electric car charger?	**Not Applicable**. The Project is construction focused and would result in water utility infrastructure surrounded by open space and would not add new parking.
E-1.2: Encourage the use of energy conservation devices and passive design concepts that make use of the natural climate to increase energy efficiency	*Passive Design Features*: Does the project utilize passive design techniques such as awnings or overhangs on the east, west, and south facing windows which block the high summer sun but allow in lower winter sun?	**Not Applicable**. The Project is construction focused and would result in water utility infrastructure surrounded by open space after completion of construction activities. Residential or commercial structures would not be built as part of the Project.

Table 4.4-4. Climate Action Plan Consistency Checklist

GHG Reduction Strategy	Sustainable Development Actions	Project Compliance
WC-1.1:Reduce potable water usage throughout Pasadena	*Irrigation Efficiency*: Will the project utilize drought tolerant landscaping and/or drip irrigation and/or weather controllers to reduce outdoor water use?	**Not Applicable.** The Project is construction focused and would result in water utility infrastructure surrounded by open space after completion of construction activities. The Project site would not require irrigation.
WR-1.1: Continue to reduce solid waste and landfill GHG emissions	*Facilitate Recycling*: Does the project include a space for separate trash and recycling bins as well as provide informational signage/handouts for residents/employees outlining materials to be recycled?	**Not Applicable.** The Project is construction focused and would result in water utility infrastructure surrounded by open space after completion of construction activities.
Selective Actions		
WC-2.1: Increase access to and use of non-potable water	*Rainwater Capture and Reuse*: Does the project utilize a rainwater capture and reuse system to reduce the amount of potable water consumed on site?	**Consistent.** The Project is a water utility infrastructure that would add approximately 1,035 acre-ft/yr of diverted flows into the spreading basins for the beneficial use of the City's water rights.
WC-3.1: Improve storm water to slow, sink, and treat water run-off, recharge groundwater, and improve water quality	*Permeable Surfaces:* Is at least 30% of the hardscape (e.g., surface parking lots, walkways, patios, etc.) permeable to allow infiltration? Please include these specifications on the project plans	**Consistent.** The Project would replace existing utility infrastructure. Construction of the streambed shoulder and bank, including the roughened channel, downstream of the new diversion structure and operable weir would be with permeable engineered streambed material (ESM). The ESM selected for the Project would consist of a well-graded mixture of rock, gravel and sand similar to natural streambed material, and would not add any new impervious surfaces within the Arroyo Seco streambed.
WC-3.1: Improve storm water to slow, sink, and treat water run-off, recharge groundwater, and improve water quality	*Stormwater Capture:* Is the project designed to retain stormwater resulting from the 95th percentile, 24-hour rain event as defined by the Los Angeles County 95th percentile precipitation isohyetal map?	**Consistent.** The Project is a water utility infrastructure that would add approximately 1,035 acre-ft/yr of diverted flows into the spreading groundwater basins from the capture of stormwater events within the Arroyo Seco.
UG-1.1: Continue to preserve, enhance, and acquire additional green space throughout Pasadena to improve carbon sequestration, reduce the urban heat-island effect, and increase opportunities for active recreation	*Greenspace:* Does the project include at least 500 sq. ft. of public use greenspace (landscaped yards, parklets, rooftop garden, etc.)? At a minimum, 50% of the required greenspace must include softscape landscaping (e.g., trees, plants, grass, etc.).	**Consistent.** The Project would result in water utility infrastructure surrounded by open space after completion of construction activities. Areas currently available for public use would not be permanently impacted by the Project implementation.

Table 4.4-4. Climate Action Plan Consistency Checklist

GHG Reduction Strategy	Sustainable Development Actions	Project Compliance
UG-2.1: Continue to protect existing trees and plant new ones to improve and ensure viability of Pasadena's urban forest	*Trees:* Does the project result in a net gain of trees?	**Consistent.** As discussed in Section 4.2, Biological Resources, the Project would result in the removal of 19 protected trees in total, of which all are located in Area 2. A total of 15 protected trees are expected to be encroached upon. The City's replacement requirements range from 2:1 to 12:1, depending on the diameter of the removed tree.

Source: City of Pasadena 2018b

As shown in Table 4.4-4 above, the Project would be consistent with the necessary applicable GHG reduction actions found within the CAP Consistency Checklist. Additionally, the Project would not result in a change in land use that would generate GHG emissions in excess of the Project site's existing land use designation (CAP Checklist Step 2). Therefore, the Project would be consistent with the City's CAP.

Consistency with CARB's Scoping Plan

The CARB Scoping Plan, approved by CARB in 2008 and updated in 2014 and 2017, provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other initiatives to reduce GHGs. The Scoping Plan is not directly applicable to specific Projects, nor is it intended to be used for Project-level evaluations.4 Under the Scoping Plan, however, there are several state regulatory measures aimed at the identification and reduction of GHG emissions. CARB and other state agencies have adopted many of the measures identified in the Scoping Plan. Most of these measures focus on area source emissions (e.g., energy usage, high-GWP GHGs in consumer products) and changes to the vehicle fleet (i.e., hybrid, electric, and more fuel-efficient vehicles) and associated fuels (e.g., Low Carbon Fuel Standard), among others. The proposed Project would not conflict with implementation of the measures identified in the Scoping Plan.

Consistency with the Southern California Association of Governments 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy

On May 7, 2020, SCAG's Regional Council adopted Connect SoCal (2020 - 2045 Regional Transportation Plan/Sustainable Communities Strategy) for federal transportation conformity purposes only. In light of the COVID-19 pandemic, the Regional Council will consider approval of Connect SoCal in its entirety and for all other purposes within 120 days from May 7, 2020.

4 The Final Statement of Reasons for the amendments to the CEQA Guidelines reiterates the statement in the Initial Statement of Reasons that "[t]he Scoping Plan may not be appropriate for use in determining the significance of individual projects because it is conceptual at this stage and relies on the future development of regulations to implement the strategies identified in the Scoping Plan" (CNRA 2009b).

Connect SoCal is a long-range visioning plan that builds upon and expands land use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern. It charts a path toward a more mobile, sustainable and prosperous region by making connections between transportation networks, between planning strategies and between the people whose collaboration can improve the quality of life for Southern Californians. Because the Project is not growth inducing, this type of consistency analysis does not apply. However, the major goals of the Connect SoCal are outlined in Table 4.4-5, along with the Project's consistency with them.

Table 4.4-5 Project Consistency with the SCAG Connect SoCal RTP/SCS

RTP/SCS Measure	Proposed Project Consistency
Encourage regional economic prosperity and global competitiveness.	*Not applicable.* The Project would not inhibit SCAG from encouraging regional economic prosperity and global competitiveness.
Improve mobility, accessibility, reliability, and travel safety for people and goods.	*Not applicable.* The Project would not inhibit SCAG from strengthening the regional transportation network for goods movement.
Enhance the preservation, security, and resilience of the regional transportation system.	*Not applicable.* The Project would not inhibit SCAG from enhancing the resilience of the regional transportation system.
Increase person and goods movement and travel choices within the transportation system.	*Not applicable.* The Project would not inhibit SCAG from increasing person and goods movement and travel choices within the transportation system.
Reduce greenhouse gas emissions and improve air quality.	*Consistent*. The Project would result in criteria air pollutant and GHG emissions during construction and operation. However, emissions would not exceed the SCAQMD significance thresholds and would be consistent with the City's CAP. The project would also support the use of local water supplies in place of more energy intensive imported water.
Support healthy and equitable communities.	*Not applicable.* The Project would not inhibit SCAG from supporting healthy and equitable communities.
Adapt to a changing climate and support an integrated regional development pattern and transportation network.	*Consistent*. The Project would facilitate adaption to climate change and would allow for increased utilization of the City's surface water rights from the Arroyo Seco and maximize the beneficial uses of this important local water resource. The Project would reducing reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD).
Leverage new transportation technologies and data-driven solutions that result in more efficient travel.	*Not applicable.* The Project would not inhibit SCAG from leveraging technology for the transportation system.
Encourage development of diverse housing types in areas that are supported by multiple transportation options.	*Not applicable.* The Project would not inhibit SCAG from encouraging development of diverse housing types.
Promote conservation of natural and agricultural lands and restoration of habitats.	*Consistent*. The Project would provide opportunities for increased aquatic biological functions within the Arroyo Seco by: (1) protecting fish and eliminating the unimpeded passage of stream flows that could carry aquatic animals into the conveyance system, and (2) reducing existing impediments to fish passage at the diversion weir structure.

Source: SCAG 2020.

As shown in Table 4-4.5, the project would be consistent with all applicable measures within the SCAG Connect SoCal RTP/SCS.

Consistency with Senate Bill 32 and Executive Order S-3-05

The Project would not impede the attainment of the GHG reduction goals for 2030 or 2050 identified in Senate Bill (SB) 32 and Executive Order S-3-05, respectively. Executive Order S-3-05 establishes the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050. SB 32 establishes a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030. While there are no established protocols or thresholds of significance for that future year analysis, CARB forecasts that compliance with the current Scoping Plan puts the state on a trajectory of meeting these long-term GHG goals, although the specific path to compliance is unknown (CARB 2014).

CARB has expressed optimism with regard to both the 2030 and 2050 goals. It states in the First Update to the Climate Change Scoping Plan that "California is on track to meet the near-term 2020 GHG emissions limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" (CARB 2014). With regard to the 2050 target for reducing GHG emissions to 80% below 1990 levels, the First Update to the Climate Change Scoping Plan states that the level of reduction is achievable in California (CARB 2014). CARB believes that the state is on a trajectory to meet the 2030 and 2050 GHG reduction targets set forth in AB 32, SB 32, and Executive Order S-3-05. This is confirmed in the *2017 Scoping Plan*, which states (CARB 2017):

> The Scoping Plan builds upon the successful framework established by the Initial Scoping Plan and First Update, while identifying new, technologically feasible and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities.

The Project would not interfere with implementation of any of the previously described GHG reduction goals for 2030 or 2050 because the Project would be consistent with the City's CAP. Because the Project would be consistent with the City's CAP, this analysis provides support for the conclusion that the Project would not impede the state's trajectory toward the previously described statewide GHG reduction goals for 2030 or 2050.

The Project's consistency with the state's Scoping Plan would assist in meeting the City's contribution to GHG emission reduction targets in California. With respect to future GHG targets under SB 32 and Executive Order S-3-05, CARB has also made clear its legal interpretation that it has the requisite authority to adopt whatever regulations are necessary, beyond the AB 32 horizon year of 2020, to meet the SB 32 40% reduction target by 2030 and the Executive Order S-3-05 80% reduction target by 2050. This legal interpretation by an expert agency provides evidence that future regulations will be adopted to continue the trajectory toward meeting these future GHG targets.

Based on the considerations previously outlined, the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. This impact would be less than significant.

4.4.6 Cumulative Impacts

As explained earlier, the analysis of a Project's GHG emissions is inherently a cumulative analysis because climate change is a global issue and the emissions from individual Projects are negligible in a global context. Accordingly, the analysis above takes into account the potential for the proposed Project to contribute to a cumulative impact of global climate change, which was determined to be less than significant. The analysis shows that the proposed Project is consistent with the City's CAP reduction measures and SCAG RTP/SCS goals to reduce regional GHG emissions from the land use and transportation sectors by 2020 and 2035. The proposed Project is also consistent with CARB's Scoping Plan. Given the proposed Project's consistency with local, statewide and regional plans adopted for the purpose of reducing GHG emissions, it is concluded that the proposed Project's incremental contribution to GHG emissions and their effects on climate change would not be cumulatively considerable. For these reasons, the proposed Project's cumulative contribution to global climate change is less than significant.

4.4.7 Mitigation Measures

No mitigation measures are required.

4.4.8 Level of Significance After Mitigation

The proposed Project would not result in any potentially significant impacts related to GHG, and all impacts would be less than significant with Project implementation.

4.5 Hydrology and Water Quality

4.5.1 Methodology

This section describes the existing conditions of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) site and vicinity, identifies associated regulatory requirements, evaluates potential environmental impacts, and identifies mitigation measures related to implementation of the proposed Project. The analysis of Project impacts related to hydrology and water quality is based on a review of existing resources and applicable laws, regulations, and guidelines, as well as the following:

Appendix F Hydraulics, Sediment Transport, and Groundwater Analysis, Arroyo Seco Canyon Project Diversion, prepared by Psomas, dated August 2018

Appendix A-2 Geotechnical Feasibility Study Report, Proposed Public Restroom, Roadway Improvement, and Stormwater Sediment Basin Project, prepared by Converse Consultants, dated August 23, 2013. (Appendix B to the 2015 Initial Study/Mitigated Negative Declaration)

Appendix B-1 Arroyo Seco Canyon Project- Intake/Diversion Design (Area 2) Draft Basis of Design Report, Prepared by Northwest Hydraulic Consultants, Inc., dated March 2, 2020

Appendix B-2 Arroyo Seco Canyon Project 100% Submittal (Area 3), prepared by Carollo Engineers, dated 2017

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, the Appendices to the Initial Study are included in Appendix A-2, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

4.5.2 Existing Conditions

Regional Watershed

The proposed Project is located within the jurisdiction of the Los Angeles Regional Water Quality Control Board (LARWQCB), which administers the Basin Plan and other water quality programs within the coastal watersheds of Los Angeles and Ventura Counties. The LARWQCB jurisdiction covers a 5,600-square-mile area that encompasses all coastal drainages flowing to the Pacific Ocean between Rincon Point (on the coast of western Ventura County) and the eastern Los Angeles County line. The boundaries of the Los Angeles River Basin are demarcated partly by physical watershed divides and partly by administrative boundaries (i.e., Orange County/Los Angeles County line).

Figure 4.5-1, United States Geological Survey (USGS) Watersheds, graphically depicts the watersheds that encompass the Project site. Similarly, Figure 4.5-2, Los Angeles Regional Water Quality Control Board Hydrologic Areas depicts the basin plan watershed and subwatersheds. Information presented in these figures is listed in Table 4.5-1. The USGS Watershed Boundary Dataset delineates watersheds according to hydrologic units, which are nested within one another according to the scale of interest. USGS identifies hydrologic units by name and by

hydrologic unit code (HUC), which gets longer as the watershed boundaries get more detailed. The LARWQCB Basin Plan identifies watersheds in a hierarchical system similar to the USGS Watershed Boundary Dataset, but with somewhat different watershed names and boundaries. These geographic boundaries are likewise watershed-based, but are typically referred to as hydrologic units, areas, and sub-areas. These generally constitute the geographic basis around which many surface water quality problems and goals/objectives are defined in the Basin Plan. The proposed Project is located within the Los Angeles – San Gabriel River hydrologic unit (No. 405), and more specifically within the Raymond hydrologic area (No. 405.3) and Monk Hill hydrologic sub-area (No. 405.32), within the LARWQCB (LARWQCB 2014). The USGS Watershed Boundary Dataset indicates the Project site lies within the 45.6 square-mile Arroyo Seco sub-watershed of the 407.6-square-mile Upper Los Angeles River watershed within the Los Angeles River sub-basin in the Ventura/San Gabriel basin (USGS 2020a).

Table 4.5-1. Watershed Designations by Agency/Source

Agency/Source	HUC/ Basin No.	Analysis Scale	Name	Size (Sq. Mi.)
USGS Watershed Boundary Dataset	180701	Basin	Ventura/San Gabriel	5,606
	18070105	Sub-basin	Los Angeles River	831
	1807010502	Watershed	Upper Los Angeles River	408
	180701050209	Sub-watershed	Arroyo Seco	46
LARWQCB Basin Plan	400	RWQCB Region	Los Angeles	4,412
	405	Hydrologic Unit (HU)	Los Angeles – San Gabriel River	1742
	405.3	Hydrologic Area (HA)	Raymond	92
	405.32	Hydrologic Sub-Area (HSA)	Monk Hill	37

Sources: USGS 2020a; LARWQCB 2014.

Notes: HUC = hydrologic unit code; sq. mi = square miles

Groundwater Basin

As illustrated in Figure 4.5-3, Raymond Basin and Subareas, the Project overlies and recharges the Monk Hill Subarea of the Raymond Basin, which is bordered on the north by the San Gabriel Mountains, on the west by the San Rafael Hills, and on the south and east by the Raymond Fault (DWR 2016). The Monk Hill Subarea is an important source of potable groundwater for many communities in the area including Pasadena, La Cañada-Flintridge and Altadena. The aquifer in the Monk Hill Subarea is generally considered to be an unconfined aquifer, although the presence of relatively thin, silt-rich layers throughout the alluvial aquifer inhibit the vertical flow of groundwater. The aquifer can be divided into four aquifer zones above the crystalline basement complex including the upper and lower sections of the Older Fanglomerate Series (Zones 1 and 2), the Pacoima Formation (Zone 3), and the Saugus Formation (Zone 4) (NASA 2004).

In the Raymond Basin, groundwater generally flows southerly from areas of recharge at the base of the San Gabriel Mountains to areas of discharge along the Raymond Fault. A confluence of groundwater flow regimes occurs within the Monk Hill Subarea; at the western end of the Subarea the flow is predominantly to the southeast which at the eastern end (near the Project area) flow is predominantly to the south (NASA 2004).

The groundwater surface has been measured in the Jet Propulsion Laboratories (JPL) monitoring wells at depths ranging from approximately 22 ft to 270 ft below ground surface. This wide range of depths to groundwater can primarily be contributed to the relatively steep topography present at the JPL facility and local groundwater mounding. It also can be accounted for by seasonal groundwater recharge from the existing spreading grounds and the extraction of groundwater from nearby municipal production wells. Based on monitoring data collected since 1996, groundwater elevations have fluctuated up to 75 ft each year, primarily as a result of these influences (NASA 2004).

Topography and Drainage

The topography in Area 2 ranges from 1,170 to 1,200 ft above mean sea level (amsl) and ranges in Area 3 from 1,100 to 1,130 ft amsl. Existing site drainage generally follows the course of the Arroyo Seco, which flows in a principally southward direction towards the Devil's Gate Dam. Therefore, the "receiving waters" for the Project (i.e., all waters within the flow network downstream of the Project site) include Arroyo Seco, the Los Angeles River and the Pacific Ocean (Carollo Engineers 2013).

In the larger vicinity, stormwater runoff is collected in streets through inlets, catch basins and underground storm drains maintained by the Los Angeles County Flood Control District. Stormwater is then conveyed through the storm drain system to the Arroyo Seco via the Altadena Drain (which discharges near the Behner Water Treatment Plant), the Altcrest Drain (which discharges at the end of W. Altadena Dr.), and BI 0710 – Unit 1 (which discharges at the end of Ventura Street) (County of Los Angeles 2018). These waters then follow Arroyo Seco to the Devil's Gate Dam (Carollo Engineers 2013).

Surface Water Quality

Several water bodies within and adjacent to the watershed are designated as "water quality-limited" for water quality impairments under the federal Clean Water Act's (CWA's) Section 303(d) (Table 4.5-2). Being "water quality-limited" means that a water body is "not reasonably expected to attain or maintain water quality standards" without additional regulation. The law requires that the U.S. Environmental Protection Agency develop total maximum daily loads (TMDLs) for each impaired water body in the nation. The TMDLs specify the maximum amount of a pollutant a water body can receive and still meet water quality standards. A TMDL may also include a plan for bringing an impaired water body back within standards. Table 4.5-2 lists the most recently approved Section 303(d) List of Water Quality Limited Segments located downstream of the Project, as listed in the 2014-2016 Integrated Report, which lists Arroyo Seco from below Devil's Gate Dam to the confluence with the Los Angeles River, the Los Angeles River and Estuary, and San Pedro Bay as impaired water bodies under Section 303(d) of the CWA.

Table 4.5-2. CWA Section 303(d) Impairments

Name	Pollutant/ Stressor	Potential Sources	TMDL Status	Year
Arroyo Seco Reach 2 (West Holly Ave. to Devils Gate Dam)	Indicator Bacteria	Source Unknown	Approved	2012
	Trash	Nonpoint Source /Surface Runoff / Urban Runoff / Storm Sewers	Approved	2008

Source: SWRCB 2017

Pursuant to listing, the LARWQCB has been tasked with developing TMDLs for the listed impairments currently lacking USEPA-approved TMDLs in at least one receiving water body, which include cyanide, oil, PCBs and toxicity. There are currently TMDLs approved by the U.S. Environmental Protection Agency that apply to the receiving waters for the Project for the following constituents: ammonia, cadmium, chlordane, copper, DDT, indicator bacteria, lead, nutrients

(algae), PCBs, pH, toxicity, trash and zinc. These impairments are relevant to the proposed Project because runoff from the site (along with runoff from the whole watershed) eventually discharges into or adjacent to these 303(d) impaired waters, including Arroyo Seco, the Los Angeles River and Estuary, and San Pedro Bay.

The LARWQCB implements the *Water Quality Control Plan Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (Basin Plan), which designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan (California Water Code Sections 13240-13247). The Basin Plan provides quantitative and narrative criteria for a range of water quality constituents applicable to certain receiving water bodies and groundwater basins within the Los Angeles Basin. Specific criteria are provided for the larger, designated water bodies within the region, as well as general criteria or guidelines for surface waters and groundwaters. In general, the narrative criteria require that degradation of water quality does not occur due to increases in pollutant loads that will adversely affect the designated beneficial uses of a water body. Surface waters within the Raymond Hydrologic Area and Monk Hill Hydrologic Sub-Area (405.3 and 405.32, designated as the Arroyo Seco Reach 3 in the Basin Plan) have been assigned the following beneficial uses in the Los Angeles Basin Plan as shown in Table 4.5-3. Beneficial uses of groundwaters within the Raymond Basin (DWR Basin No. 4-23) are also listed below in Table 4.5-3.

Table 4.5-3. Beneficial Uses for Surface and Coastal Waters

Surface or Groundwater Body	Hydrologic Unit Basin Number	Beneficial Use										
		MUN	*IND*	*PROC*	*GWR*	*WARM*	*COLD*	*WILD*	*WET*	*REC1*	*REC2*	*AGR*
Arroyo Seco Reach 3 (above Devils Gate Dam)	405.32	●	●	●	●	●	●	●	●	P	●	
Raymond Basin	4-23	●	●	●								●

Notes:

● = Existing Beneficial Uses

P = Access Prohibited by Los Angeles County Department in the concrete-channelized areas.

The beneficial uses identified in Table 4.5-3 for the surface and groundwater bodies in the Monk Hill Hydrologic Sub-Area/Arroyo Seco Reach 3 Watershed and the groundwaters of the Raymond Basin are defined below:

- **Municipal and Domestic Supply (MUN) –** Includes uses of water for community, military, or individual water supply systems including, but not limited to, drinking water supply.
- **Industrial Service Supply (IND)** – Includes uses of water for industrial activities that do not depend primarily on water quality including, but not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection, or oil well re-pressurization.
- **Industrial Process Supply (PROC)** – Includes uses of water for industrial activities that depend primarily on water quality.
- **Ground Water Recharge (GWR)** – Includes uses of water for natural or artificial recharge of ground water for purposes of future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers.

- Warm Freshwater Habitat (WARM) – Includes uses of water that support warm water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish or wildlife, including invertebrates.
- Cold Freshwater Habitat (COLD) – Includes uses of water that support cold water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.
- Wildlife Habitat (WILD) – Includes uses of water that support terrestrial or wetland ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats or wetlands, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources.
- Wetland Habitat (WET) – Includes uses of water that support wetland ecosystems, including, but not limited to, preservation or enhancement of wetland habitats, vegetation, fish, shellfish, or wildlife, and other unique wetland functions which enhance water quality, such as providing flood and erosion control, stream bank stabilization, and filtration and purification of naturally occurring contaminants.
- Contact Water Recreation (REC-1) – Includes uses of water for recreational activities involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, swimming, wading, water-skiing, skin and SCUBA diving, surfing, white water activities, fishing, or use of natural hot springs.
- Non-contact Water Recreation (REC-2) – Includes the uses of water for recreational activities involving proximity to water, but not where there is generally no body contact with water, nor any likelihood of ingestion of water. These uses include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing, or aesthetic enjoyment in conjunction with the above activities.
- Agricultural Supply (AGR) – Includes uses of water for farming, horticulture, or ranching including, but not limited to, irrigation, stock watering, or support of vegetation for range grazing.

Hydrology and Sediment Transport

As described in the Flood Hazard, Sediment Management, and Water Feature Analyses Report prepared in 2000 by Philip Williams and Associates, active geomorphic processes within the Arroyo Seco watershed include floods, fire, debris flows, and dry ravel. Floods, fires, and debris flows are events that change the physical condition and function of a watershed over a relatively short time scale. Floods and fire thus play an important role in the frequency and magnitude of sediment transport and net sediment yield. Dry ravel processes are critical to the sediment supply of the alluvial fan environment. The Arroyo Seco watershed has experienced numerous wildfires, including the Woodwardia Fire of 1959, which burned 10,729 acres (or 71% of the watershed), and the more recent Station Fire, which consumed a total of 160,557 acres of land in September of 2009, which equates to approximately 25% of the Angeles National Forest (PWA 2000; NOAA 2009).

Debris flows commonly occur in the San Gabriel Mountains where thick deposits of fine-grained alluvium become saturated during storms. The occurrence of fire in a watershed may encourage soil movement, and thus the entrainment of material by debris flows. In the mountains, debris flows can scour away all hillslope material from soil to boulders and even erode into the underlying bedrock. Debris flows transport material through mountainous terrain and can fill up channels and contribute to the filling of reservoirs and the development of alluvial fans (PWA 2000). In the case of the Arroyo Seco, as previously discussed, in the two

storm seasons following the 2009 Station Fire, excessive amounts of sediment washed down from the watershed and the debris flows damaged City structures, greatly reducing the City's capacity to divert water at the intake structure for spreading within the basins in Area 2.

A Hydraulics, Sediment Transport, and Groundwater Analysis prepared by Psomas in 2018, included in Appendix F of this Draft EIR, includes a hydraulic model based on USGS daily gage data at stream gage #11098000, located upstream of the existing and proposed diversion structures. Daily average discharge data was utilized for the period 1989 to 2014, which was the vetted stream gage data available at the time of the report, and was not strongly influenced by drought. The hydrologic record of flows at the gage station for an updated period is shown in Figure 4.5-4, USGS Stream Gage Station Flow Data for 1989 to 2019 (USGS 2020b). This Figure demonstrates the extremely high variability of flows within the Arroyo Seco over time. As shown, the majority of years experienced average daily flows of less than 300 cubic feet per second (cfs) and peak discharges of less than 600 cubic feet per second (cfs). The highest stream flows occurred in the winter of 2009-2010 when instantaneous peak flows exceeded 4,500 cfs, and in 2004-2005 when average daily flow exceeded 2,000 cfs (USGS 2020b).

As shown in Appendix F, individual water year hydrographs were modeled, which represent typical dry, average and wet years during this study period. To develop representations of wet, average and dry years, the relative deviation percent was calculated for each year by comparing the average annual runoff volume to the annual runoff volume for each year. Years where annual runoff was less than the average were considered dry, while years where the annual runoff was greater than the average were considered wet. Approximately 28% and 72% of annual runoff volumes were determined to be wet years and dry years, respectively. The 1994-1995 water year represents a typical wet year's runoff volume (i.e. 17,957 acre-feet per year [acre-ft/yr]), the 2007-2008 water year represents a typical average year's runoff volume (7,702 acre-ft/yr), and the 2002- 2003 water year represents a typical dry year's runoff volume (2,314 acre-ft/yr).

Evaporation and Percolation Rates

Evaporation rates are relatively high in the Project area due to the arid nature of southern California. Evaporation is the process where liquid becomes a vapor when it is below the boiling point, which takes place at the surface of the liquid. An evaporation pan can be used to determine the rate at which water evaporates, which takes into account various weather factors, such as wind, heat, humidity, etc. Table 4.5-4 below shows the average pan evaporation data for a nearby monitoring station located at the Descanso Gardens located approximately 2.5 miles west of the Area 2 spreading basins.

Table 4.5-4. Typical Monthly Evaporation Rates

Month	Average Pan Evaporation (inches)	Average Pan Evaporation (feet/day)
January	2.06	0.0055
February	2.21	0.0063
March	3.06	0.0082
April	3.88	0.0108
May	4.46	0.0120
June	5.43	0.0151
July	7.13	0.0192

Table 4.5-4. Typical Monthly Evaporation Rates

Month	Average Pan Evaporation (inches)	Average Pan Evaporation (feet/day)
August	6.94	0.0187
September	5.83	0.0162
October	4.39	0.0118
November	3.09	0.0085
December	2.29	0.0062
Annual	**50.77**	**0.0116**

Source: PWA 2000

According to PWP, the current spreading basins reach an equilibrium during recharge events of 18 cfs, meaning that diversions equaling 18 cfs would fill the basins to capacity, with water percolating at generally the same rate as entering the basins; however, higher flows beyond 18 cfs would not be able to be infiltrated due to capacity constraints (Carollo Engineers 2013). Dividing this 18 cfs recharge capacity by the surface area of the spreading basins (approximately 13 acres), the basins currently exhibit an average percolation rate of 2.7 ft/day, or 1.4 cfs/acre.

Percolation testing conducted in 2013 by Converse Consultants, included in Appendix A-2 of this Draft EIR, included three borings within the existing spreading basins (BH-12 in Pond 2; BH-13 in Basin 8; and BH-14 in Basin 13) and three borings within the City's open area, formerly the JPL parking lot (BH-9, BH-10, and BH-11). Tests were performed using the falling head test method in accordance with the Los Angeles County "Low Impact Development Best Management Practice Guideline for Design, Investigation, and Reporting." The reported percolation rates are shown in Table 4.5-5 below.

Table 4.5-5. Percolation Results

Boring Number	Location	Lowest Percolation Rate		Average Percolation Rate	
		inches/hour	*ft/day*	*inches/hour*	*ft/day*
BH-9	Former Parking Lot	6.58	13.16	7.87	15.74
BH-10	Former Parking Lot	11.52	23.04	15.90	31.80
BH-11	Former Parking Lot	4.50	9.00	6.65	13.30
BH-12	Pond 2	4.70	9.40	24.09	48.18
BH-13	Basin 8	27.51	55.02	58.65	117.30
BH-14	Basin 13	16.96	33.92	28.07	56.14

Source: Appendix A-2

According to Converse, test results for the upper five feet of soils within Area 3 show high to very high percolation rates. Typical permeability rates of gravelly sands range from 2.8 to 280 ft/day; however, the percentage of fine sediments accumulated in soil will reduce the permeability down to 0.2 to 3 ft/day. This places the estimated current percolation rate of the spreading basins of 2.7 ft/day within an expected range, even though this rate is lower than tested. Converse explains some reasons for the high percolation test results as follows: 1) the percolation test holes did not have fine sediments, 2) clean water was used for percolation tests, and 3) soils surrounding the test holes may have been disturbed and loosened during drilling. In summary, the soil borings taken within the existing spreading

basins demonstrate good percolation capacity of the on-site soils without considering fine sediment clogging. Converse recommends that the lowest percolation rates be considered for design purposes, and that fine sediment clogging be considered for the design and maintenance plan (Appendix A-2).

Diversions of Arroyo Seco Surface Water

Historic Diversions

The City has both groundwater rights and surface water rights in the Monk Hill and Pasadena Subareas of the Raymond Basin. The City's surface water rights in the Arroyo Seco overlay the Monk Hill Subarea. The City has surface water rights in the Arroyo Seco and tributaries that pre-date 1914, including the right to take surface water from the stream up to and including 25 cfs. Historically, PWP has either taken the stream water by diverting it at the intake structure (Area 2) for direct use for drinking with the addition of disinfectant (prior to 1972); for treatment at the Behner Water treatment Plant (1972 to 1994); or by recharging the aquifer in the Arroyo Seco spreading grounds (1974 to present).

Due to concerns by water diverters in the early 1970s that the California Department of Health Services (predecessor to California's Division of Drinking Water) would impose tougher water quality standards, thereby preventing the direct take of surface water if diverters lacked adequate treatment, alternative sources were evaluated. Under the direction of the Raymond Basin Management Board, a study on alternative uses for surface water was proposed, and an agreement was signed in 1972 that a study would be undertaken by the California Department of Water Resources. The underlying intent of the study was to determine the effects if parties with surface water rights were allowed to spread and recapture the groundwater in lieu of direct take. The conclusion of the study was the recommendation to revise the Judgment and incorporate a spreading provision.

The Judgment is a legal order that governs the activities of water purveyors in the Raymond Basin, as discussed further below in Section 4.5.3. On January 17, 1974, the Judgment was revised to allow parties that have surface water rights the option to spread the water, as an alternative to direct take, and to recapture a percentage thereof by pumping. Since 1974, PWP has been actively participating in spreading operations, and since 1994, PWP has exclusively spread its diversions. Spreading of the City's surface water right in the spreading basins is prescribed in the Judgment and is a necessary process in order for the City (1) to claim credit for additional pumping rights and (2) to ensure its credit is protected against pumping by other members in the basin.

The amount of pumping credit the City receives after spreading is less than 100%, (between 60% and 80%), meaning that for every 1 acre-foot (325.8 million gallons) of the City's surface water right that is diverted, metered, and spread in the spreading basins, the City receives between 0.6 to 0.8 acre-feet in additional pumping credit, leaving 0.2 to 0.4 acre-feet in the aquifer for protection of the groundwater table (general benefit). No party to the Raymond Basin, including the City, is allowed to pump the remaining amount of City-owned water that is left in the Monk Hill Subarea.

Recent/Current Diversions

PWP has historically diverted up to their allocated surface water rights of 25 cfs, when possible. Under current conditions, the diversion/intake structure and spreading basins in Area 3cannot handle debris and sediment loads carried in stream flows during storm events and operations are shut down during these times. The former headworks facility and sedimentation basins located upstream of Area 2 were designed to remove sediment from the stream flows prior to reaching the diversion structure, but those facilities were destroyed by the debris flows that occurred during the storm events following the 2009 Station Fire (Carollo Engineers 2013), and the system's

ability to settle out sediment and debris prior to entering the intake and conveyance system to the spreading basins was eliminated. Also, sediment has collected behind the weir, limiting the capacity of the diversion pool. As such, the existing diversion/intake structure is not functioning as designed for moderate to high flows due to its inability to accommodate the amount of sediment that accompanies this range of flows; therefore, PWP is not currently able to regularly divert its 25 cfs water rights during the times these flows are available in the stream.

The existing diversion system allows PWP to divert low flows and, thus, the City captures nearly all of the low flows during the dry season (summer to mid-fall), which is typically 0 to 3 cfs (USGS 2020b), and a portion of flows when stream flows are higher, typically around 25 to 30 cfs. However, if higher volume flows with suspended sediment (e.g., the turbidity) in the waters are used for recharge, the ground surface in the spreading basins can become plugged by fine material, such as clays and silts, which reduce percolation and groundwater recharge rates. This results in a need for more maintenance to remove the top layer of fine materials at the spreading basins in order to recover the original recharge rates. During moderate to larger storm events when Arroyo Seco flows are sediment-laden, the stream with its associated sediment load bypasses the diversion structure and continues downstream to Devil's Gate Reservoir.

4.5.3 Relevant Plans, Policies, and Ordinances

Federal

Clean Water Act

The Clean Water Act or CWA (33 U.S.C. 1251 et seq.), as amended by the Water Quality Act of 1987, is the major federal legislation governing water quality. The objective of the CWA is "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." Key sections of the act are as follows:

- Sections 303 and 304 provide for water quality standards, criteria, and guidelines. Under Section 303(d) of the CWA, the State of California is required to develop a list of impaired water bodies that do not meet water quality standards and objectives and establish Total Maximum Daily Loads (TMDLs) for each pollutant/stressor. The water quality impairments of the Project's receiving waters are shown in Table 4.5-2 above.
- Section 401 (Water Quality Certification) requires an applicant for any federal permit that proposes an activity which may result in a discharge to waters of the United States to obtain certification from the state that the discharge will comply with other provisions of the act. As the Arroyo Seco is considered federal jurisdictional waters, water quality certification under CWA Section 401 would be required.
- Section 402 establishes the National Pollutant Discharge Elimination System (NPDES), a permitting system for the discharge of any pollutant (except for dredged or fill material) into waters of the United States. This permit program is administered by the State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCB), which have several programs that implement individual and general permits related to construction activities, municipal stormwater discharges, and various kinds of non-stormwater discharges. State and regional water quality related permits and approvals, including through NPDES, are shown in Table 4.5-6.
- Section 404 establishes a permit program for the discharge of dredged or fill material into waters of the United States. This permit program is jointly administered by the U.S. Army Corps of Engineers and the EPA. As the Arroyo Seco is considered federal jurisdictional waters, the Project would require a permit under CWA Section 404.

Numerous agencies have responsibilities for administration and enforcement of the CWA. At the federal level, this includes the EPA and the U.S. Army Corps of Engineers. At the state level, with the exception of tribal lands, the California EPA and its sub-agencies, including the SWRCB, have been delegated primary responsibility for administering and enforcing the CWA in California.

Federal Antidegradation Policy

The Federal Antidegradation Policy (40 CFR 131.12) requires states to develop statewide antidegradation policies and identify methods for implementing them. Pursuant to the Code of Federal Regulations (CFR), state antidegradation policies and implementation methods shall, at a minimum, protect and maintain: 1. existing in-stream water uses; 2. existing water quality where the quality of the waters exceeds levels necessary to support existing beneficial uses, unless the state finds that allowing lower water quality is necessary to accommodate economic and social development in the area; and 3. water quality in waters considered an outstanding national resource.

State/Regional

Poster-Cologne Water Quality Act (California Water Code)

The Porter–Cologne Act (codified in the California Water Code, Section 13000 et seq.) is the primary water quality control law for California. Whereas the CWA applies to all waters of the United States, the Porter–Cologne Act applies to waters of the state, which includes isolated wetlands and groundwater in addition to federal waters. The California Water Code (CWC) authorizes the State Water Resources Control Board (SWRCB) to implement the provisions of the CWA, including the authority to regulate waste disposal and require cleanup of discharges of hazardous materials and other pollutants.

Under the CWC, the State of California is divided into nine Regional Water Quality Control Boards (RWQCBs), which govern the implementation and enforcement of the CWC and the CWA. The Project Site is located within Region 4, also known as the Los Angeles Region (LARWQCB). The RWQCBs develop and enforce water quality objectives and implement plans that will best protect California's waters, acknowledging areas of different climate, topography, geology, and hydrology. Each RWQCB is required to formulate and adopt a Water Quality Control Plan or Basin Plan for its region. The Basin Plan must adhere to the policies set forth in the CWC and established by the SWRCB. In this regard, the LARWQCB issued the Los Angeles Basin Plan on August 29, 2014 for the Coastal Watersheds of Los Angeles and Ventura Counties, with subsequent amendments. The RWQCB is also given authority to issue waste discharge requirements, enforce actions against stormwater discharge violators, and monitor water quality. In California, the NPDES stormwater permitting program is administered by the SWRCB.

In addition to other regulatory responsibilities, the RWQCBs have the authority to conduct, order, and oversee investigation and cleanup where discharges or threatened discharges of waste to waters of the state could cause pollution or nuisance, including impacts to public health and the environment. The act requires a "Report of Waste Discharge" for any discharge of waste (liquid, solid, or otherwise) to land or surface waters that may impair a beneficial use of surface or groundwater of the state. California Water Code Section 13260 subdivision (a) requires that any person discharging waste or proposing to discharge waste, other than to a community sewer system that could affect the quality of the waters of the state, to file a Report of Waste Discharge with the applicable RWQCB. For discharges directly to surface water (waters of the United States), an NPDES permit is required, which is issued under both state and federal law; for other types of discharges, such as waste discharges to land (e.g., spoils disposal and storage), erosion from soil disturbance, or discharges to waters of the state (such as groundwater and

isolated wetlands), Waste Discharge Requirements (WDRs) are required and are issued exclusively under state law. WDRs typically require many of the same best management practices (BMPs) and pollution control technologies as required by NPDES-derived permits.

California Antidegradation Policy

The California Antidegradation Policy, otherwise known as the *Statement of Policy with Respect to Maintaining High Quality Water in California*, was adopted by the SWRCB (State Board Resolution No. 68-16) in 1968. Unlike the Federal Antidegradation Policy, the California Antidegradation Policy applied to all waters of the state (e.g., isolated wetlands and groundwater), not just the surface waters. The policy states that whenever the existing quality of a water body is better than the quality established in individual Basin Plans, such high quality shall be maintained, and discharge to that water body shall not unreasonably affect present or anticipated beneficial use of such water resource.

California Toxics Rule

In 2000, the California Environmental Protection Agency (Cal-EPA) promulgated the California Toxics Rule, which establishes water quality criteria for certain toxic substances to be applied to waters in the State. Cal-EPA promulgated this rule based on Cal-EPA's determination that the numeric criteria are necessary in the State to protect human health and the environment. The California Toxics Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water such as inland surface waters and enclosed bays and estuaries that are designated by the LARWQCB as having beneficial uses protective of aquatic life or human health.

Sustainable Groundwater Management Act of 2014

The Sustainable Groundwater Management Act of 2014 (SGMA) requires the designation of groundwater sustainability agencies (GSAs) by one or more local agencies and the adoption of groundwater sustainability plans (GSPs) for basins designated as medium- or high-priority by the California Department of Water Resources (DWR). SGMA grants new powers to GSAs, including the power to adopt rules, regulations, ordinances, and resolutions; regulate groundwater extractions; and to impose fees and assessments. SGMA requires that groundwater resources be managed sustainably for long-term reliability and multiple benefits for current and future beneficial uses and also allows the SWRCB to intervene if local agencies will not or do not meet the SGMA requirements. SGMA applies to all California groundwater basins and requires the DWR to prioritize California's 517 groundwater basins and subbasins as either high, medium, low, or very low (DWR 2019). The Raymond Basin, which underlies the City of Pasadena, was determined by DWR to be "Very Low" priority and is a fully adjudicated basin; therefore, not subject to the requirements to form a GSA or to develop a Groundwater Sustainability Plan.

Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties

The California legislature has assigned the primary responsibility to administer and enforce statutes for the protection and enhancement of water quality, including the Porter–Cologne Act and portions of the CWA, to the SWRCB and its nine RWQCBs. The SWRCB provides state-level coordination of the water quality control program by establishing statewide policies and plans for implementation of state and federal regulations. The nine RWQCBs throughout California adopt and implement Basin Plans that recognize the unique characteristics of each region with regard to natural water quality, actual and potential beneficial uses, and water quality problems. The LARWQCB is responsible for the protection of the beneficial uses of waters within the coastal watersheds of Los Angeles and Ventura counties, including the Project area.

The *Water Quality Control Plan Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (Basin Plan) designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan (California Water Code Sections 13240–13247) (LARWQCB 2014). The LARWQCB Basin Plan must conform to the policies set forth in the Porter-Cologne Act as established by the SWRCB in its state water policy. The Porter-Cologne Act also provides the RWQCBs with authority to include within their basin plan water discharge prohibitions applicable to particular conditions, areas, or types of waste. The Basin Plan is continually being updated to include amendments related to implementation of Total Maximum Daily Loads (TMDLs) of potential pollutants or water quality stressors, revisions of programs and policies within the LARWQCB region, and changes to beneficial use designations and associated water quality objectives.

Construction General Permit (SWRCB Order 2009-0009-DWQ, as amended)

For stormwater discharges associated with construction activity in the State of California, the SWRCB has adopted the *General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities* (Construction General Permit) to avoid and minimize water quality impacts attributable to such activities. The Construction General Permit applies to all projects in which construction activity disturbs one acre or more of soil. Construction activity subject to this permit includes clearing, grading, and disturbances to the ground, such as stockpiling and excavation. The Construction General Permit requires the development and implementation of a stormwater pollution prevention plan (SWPPP), which would include and specify water quality BMPs designed to prevent pollutants from contacting stormwater and keep all products of erosion from moving off site into receiving waters. The SWPPP is also required to include a discussion of the proposed program to inspect and maintain all BMPs.

A site-specific SWPPP could include, but not be limited to the following BMPs:

- Erosion Control BMPs – to protect the soil surface and prevent soil particles from detaching. Selection of the appropriate erosion control BMPs would be based on minimizing areas of disturbance, stabilizing disturbed areas, and protecting slopes/channels. Such BMPs may include, but would not be limited to, use of geotextiles and mats, earth dikes, drainage swales, and slope drains.
- Sediment Control BMPs – are treatment controls that trap soil particles that have been detached by water or wind. Selection of the appropriate sediment control BMPs would be based on keeping sediments on-site and controlling the site boundaries. Such BMPs may include, but would not be limited, to use of silt fences, sediment traps, and sandbag barriers, street sweeping and vacuuming, and storm drain inlet protection.
- Wind Erosion Control BMPs – consist of applying water to prevent or minimize dust nuisance.
- Tracking Control BMPs – consist of preventing or reducing the tracking of sediment off-site by vehicles leaving the construction area. These BMPs include street sweeping and vacuuming. Project sites are required to maintain a stabilized construction entrance to prevent off-site tracking of sediment and debris.
- Non-Stormwater Management BMPs – also referred to as "good housekeeping practices," involve keeping a clean, orderly construction site. • Waste Management and Materials Pollution Control BMPs – consist of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project to prevent the release of waste materials into stormwater runoff or discharges through the proper management of construction waste.

The SWRCB adopted a General Permit for Stormwater Discharges from Construction Activities on September 2, 2009 and most recently amended on July 17, 2012 (Order No. 2012-0006-DWQ, General NPDES Permit No.

CAS000002). The Construction General Permit regulates construction activity including clearing, grading, and excavation of areas one acre or more in size and prohibits the discharge of materials other than stormwater, authorized non-stormwater discharges, and all discharges that contain a hazardous substance, unless a separate NPDES permit has been issued for those discharges.

To obtain coverage under the Construction General Permit, a developer is required to file a Notice of Intent (NOI) with the appropriate RWQCB and provide proof of the NOI prior to applying for a grading or building permit from the local jurisdiction, and must prepare a State SWPPP that incorporates the minimum BMPs required under the permit as well as appropriate project-specific BMPs. The SWPPP must be completed and certified by the developer and BMPs implemented prior to the commencement of construction, and may require modification during the course of construction as conditions warrant. When project construction is complete, the developer is required to file a Notice of Termination with the RWQCB certifying that all the conditions of the Construction General permit, including conditions necessary for termination, have been met. Because more than one acre would need to be disturbed for construction activity, the proposed Project would require coverage under the Construction General Permit.

Waste Discharge Requirements for the Discharge of Groundwater from Construction and Project Dewatering to Surface Waters in the Coastal Watersheds of Los Angeles and Ventura Counties (LARWQCB Order No. R4-2018-0125)

This general order is intended to authorize discharges of treated or untreated groundwater generated from permanent or temporary dewatering operations or other applicable wastewater discharges not specifically covered in other general or individual NPDES permits. Discharges from facilities to waters of the United States that do not cause, have the reasonable potential to cause, or contribute to an in-stream excursion above any applicable state or federal water quality objectives/criteria or cause acute or chronic toxicity in the receiving water are authorized discharges in accordance with the conditions set forth in this Order. To demonstrate coverage under the order, dischargers must submit documentation to show that the discharge would not cause or contribute to a violation of any applicable water quality objective/criteria for the receiving waters, or any other discharge prohibition listed in the order. In addition, discharges must perform reasonable potential analysis using a representative sample of groundwater or wastewater to be discharged. The sample shall be analyzed and the data compared to the water quality screening criteria for the constituents listed in the order, and if results show exceedance of water quality screening criteria, the discharge will be required to treat the wastewater to acceptable standards prior to discharge.

NPDES Permit for Discharges of Groundwater from Construction and Project Dewatering

An NPDES Permit for dewatering discharges was adopted by the LARWQCB on September 13, 2018 (Order No. R4-2018-0125, General NPDES Permit No. CAG994004. Similar to the Construction General Permit, to be authorized to discharge under this Permit, a NOI to discharge groundwater generated from dewatering operations during construction must be submitted, and dewatering must be conducted in accordance with the requirements of this Permit. In accordance with the NOI, among other requirements and actions, the discharges shall not cause or contribute to a violation of any applicable water quality objective/criteria for the receiving waters.

California Water Plan

Required by the California Water Code Section 10005(a), the California Water Plan, prepared by the State Department of Water Resources, is the state government's strategic plan for managing and developing water

resources statewide for current and future generations and provides a framework for water managers, legislators, and the public to consider options and make decisions regarding California's water future. The California Water Plan, which is updated every five years, presents basic data and information on California's water resources, including water supply evaluations and assessments of agricultural, urban, and environmental water uses to quantify the gap between water supplies and uses. The California Water Plan also identifies and evaluates existing and proposed statewide demand management and water supply augmentation programs and projects to address the state's water needs.

The goal for the California Water Plan Update is to meet California Water Code requirements, received broad support among those participating in California's water planning, and is a useful document for the public, water planners throughout the state, legislators, and other decision-makers.

NPDES and WDR Permits

The USEPA NPDES Program requires NPDES permits for: (1) Municipal Separate Storm Sewer Systems (MS4) Permit generally serving, or located in, incorporated cities with 100,000 or more people (referred to as municipal permits); (2) 11 specific categories of industrial activity (including landfills); and (3) construction activity that disturbs five acres or more of land. NPDES and WDR programs regulate construction, municipal, and industrial stormwater and non-stormwater discharges under the requirements of the CWA and the Porter–Cologne Water Quality Control Act. The construction stormwater program is administered by the SWRCB, while the municipal stormwater program and other WDRs are administered by the LARWQCB. Table 4.5-6 lists the water-quality-related permits that would apply directly or indirectly (through implementing City ordinances) to the Project, each of which is further described below.

Table 4.5-6. State and Regional Water Quality-Related Permits and Approvals

Program/ Activity	Order Number/ NPDES Number	Permit Name	Affected Area
Construction Stormwater Program	2009-0009-DWQ/ CAS000002, as amended	NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit)	Statewide
Municipal Stormwater Program	LARWQCB Order No. R4-2012-0175-A01 / CAS004001	Waste Discharge Requirements for the Municipal Separate Storm Sewer System (MS4) Discharges (Los Angeles County MS4 Permit)	Coastal Watersheds of Los Angeles County, Except those discharges originating from the City of Long Beach MS4
Discharge of Groundwater from Construction and Project Dewatering to Surface Waters	LARWQCB Order No. Order No. R4-2018-0125	Waste Discharge Requirements for the Discharge of Groundwater from Construction and Project Dewatering to Surface Waters in the Coastal Watersheds of Los Angeles and Ventura Counties	Coastal Watersheds of Los Angeles and Ventura Counties

Notes: NPDES = National Pollutant Discharge Elimination System; MS4 = Municipal Separate Storm Sewer System; WDR = Waste Discharge Requirement

Local

Stormwater Management and Discharge Control Ordinance

The Pasadena Municipal Code, Chapter 8.70, Stormwater Management and Discharge Control, sets forth requirements to regulate non-stormwater discharges to the municipal stormwater system, provides for the control of accidental spills into the stormwater system, and reduce pollutants in stormwater and urban runoff to the maximum extent practicable; The intent of this chapter is to protect and enhance water quality of our watercourses, water bodies, and wetlands in a manner pursuant to and consistent with the Federal Clean Water Act, and pursuant to National Pollutant Discharge Elimination System Permit No. CA0061654, as amended. Specifically, construction activities near a natural water course must (1) maintain that part of the watercourse reasonably free of pollutants and obstacles which would enter, or retard the flow of water through the municipal stormwater system; and (2) must maintain existing structures within or adjacent to such a watercourse so that those structures will not become a hazard to the use, function, or physical integrity of the municipal stormwater system; and (3) not remove healthy bank vegetation in such a manner as to increase the vulnerability of the watercourse to erosion.

Raymond Basin Judgment and 1974 Amendment

PWP's water supplies consist of local groundwater from the Raymond Basin (approximately 40%) and purchases of imported water (approximately 60%). Of the local supplies, PWP receives its water supply from two sources: direct pumping from the Raymond Basin (groundwater) and diverted surface water, which is spread into spreading basins, allowing for groundwater pumping credits. Allocations for the extraction of groundwater supplies are detailed in the Raymond Basin Judgment (Pasadena Water and Power 2016). The City's Urban Water Management Plan (UWMP; Pasadena Water and Power 2016) provides a summary of the Raymond Basin Judgment.

> In order to alleviate overdraft conditions in the Raymond Basin, the Raymond Basin Judgment (Judgment) was signed on December 23, 1944. The Judgment assigns each pumper a "present unadjusted right" corresponding to the average amount of water that they pumped in the five years prior to 1937. Pasadena's present unadjusted right is 12,946 acre-ft/yr. Each pumper's present unadjusted right was scaled down to create the "decreed right" such that the sum of all pumpers' decreed rights is equal to the estimated operating yield of the basin. In the original Judgment, the operating yield was determined to be 21,900 acre-ft/yr for the entire Raymond Basin. However, according to the first modification of the Judgment in 1955, the operating yield was increased to 5,290 acre-ft/yr in the Eastern Unit and 25,480 acre-ft/yr in the Western Unit. This resulted in a total operating yield of 30,770 acre-ft/yr in the Raymond Basin. Therefore, the sum of all water that is pumped—excluding water pumped from individual storage accounts or as a result of spreading or injection credits—is regulated so as not to exceed the total operating yield of the basin. Based on the new operating yield, PWP's decreed right was calculated to be 12,807 acre-ft/yr from the Western Unit (Monk Hill and Pasadena Subareas); PWP has no water right in the Eastern Unit (Santa Anita Subarea). In 2009, the Raymond Basin Management Board (RBMB) implemented a resolution to the 1955 decreed rights to slow declining water levels in the Western Unit of Raymond Basin.
>
> This resolution called for a cooperative pumping reduction for parties with water rights in the Pasadena Subarea effective July 1, 2009, where RBMB seeks to reduce water production incrementally over five years until a 30% reduction is achieved. Hence, PWP's water right was decreased by 2,503 AF over 5 years to a final right of 10,304 acre-ft/yr beginning in 2014.

A 1974 modification to the Raymond Basin Judgment allows each pumper with surface runoff diversion rights to recharge the Raymond Basin with surface water, and to then pump a portion of the recharged volume in addition to their decreed right water right. 60% to 80% of the recharged volume may be pumped depending on the spreading basin used for recharge. The ability to spread surface runoff provides benefits associated with natural water treatment because the alluvium can function as a filter to remove certain constituents from the water. In addition, the ability to spread surface runoff provides storage benefits, because surface water that is diverted and spread during the wet season can be stored in the basin for use in periods of higher demand. Pumping credits from the spreading of diverted surface runoff provided an average of 1,850 acre-ft/yr of additional groundwater over the 2001-2015 period, ranging from approximately 300 acre-feet in dry years to 5,000 acre-feet in wet years.

The Judgment states that PWP, which diverts surface water for beneficial use from a source contributing to the supply of groundwater in the Raymond Basin area (i.e. the Arroyo Seco), has the right to continue to divert a maximum amount of 25 cfs of water (City of Pasadena v. City of Alhambra 1984). As stated in the Judgment, the water "shall be spread for percolation into the underground in the existing water conservation facilities of the Los Angeles County Flood Control District, or in such additional spreading grounds as the parties may acquire or construct, or in any natural stream channels leading to such existing or future spreading grounds, provided that all such spreading locations shall be within the Monk Hill Basin or Pasadena Subarea hydrologic subdivision of the Western Unit of the Raymond Basin Area" (City of Pasadena v. City of Alhambra 1984).

4.5.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to hydrology and water quality are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to hydrology and water quality would occur if the project would:

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

   i) result in substantial erosion or siltation on or off site;

   ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;

   iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

   iv) impede or redirect flood flows.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Through the analysis in the Initial Study (see Appendix A-1), it was determined that the proposed Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality; substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin; conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan; or, in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation. (i.e., Thresholds a, b, d, and e). Accordingly, with the exception of threshold b, these issues are not further analyzed in the EIR. Threshold b, addressing the potential to deplete groundwater supplies or interfere with groundwater recharge, was brought up as a concern during public comments on the Initial Study and thus will be further analyzes in the EIR. Based on the remaining thresholds, a significant impact related to hydrology and water quality would occur if the project would:

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
    i) result in substantial erosion or siltation on or off site;
    ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;
    iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
    iv) impede or redirect flood flows.

4.5.5 Environmental Impacts Analysis

Threshold 4.5b Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Short-Term Construction Impacts

Construction activities that involve earthwork/grading would require water for dust suppression to comply with South Coast Air Quality Management District (SCAQMD) Rule 403 related to mandatory dust control measures during activities that are capable of generating fugitive dust (see Section 4.1, Air Quality). In Area 3, the earthwork/grading activities are expected to require approximately 4,000 gallons per day (gpd) of water, delivered via water truck. One water truck operating each Monday-Friday of construction activities at Area 3, from approximately April 2022 through October 2022, would equate to 145 days of water use, resulting in approximately 580,000 gallons [1.78 acre-foot] of water. Regular use of a water truck is not expected to be necessary in Area 2 due to the damp soils associated with the Arroyo Seco.

The use of 580,000 gallons of water over the course of construction activities for the proposed Project is not expected to have an impact on groundwater supplies. According to the City's Urban Water Management Plan (UWMP), PWP's projected water supplies, including purchased Metropolitan Water District (MWD) water and groundwater, are 33,618 acre-ft/yr for 2020 and 33,670 acre-ft/yr for 2025 (Pasadena Water and Power 2016). Proposed construction activities would total approximately 0.0053% of the annual available water supply in the

PWP service area, which is a negligible amount. As mentioned, this water would either be brought to the Project site by water trucks or would be provided via a temporary metered connection off of the PWP distribution system, whereby the water trucks would fill up onsite. Temporary use of water for dust control would not directly withdraw or otherwise substantially deplete groundwater supplies in the Raymond Basin.

As described in Section 3.0, construction activities at Area 2 would require the diversion of surface flows away from the construction area by installing a temporary coffer dam and pumping the water around construction activities in Area 2, to be released further downstream in the Arroyo Seco. Because no water would be diverted into the intake/conveyance system during this time, the spreading basins would not be operational during construction within Area 2. Additionally, during construction in Area 3, groundwater recharge at the existing spreading basins would be suspended as the Arroyo Seco flows would not be diverted into the spreading basins and PWP would not be able to claim pumping credits for groundwater because the water would not be infiltrated into the groundwater basin via the spreading basins. Therefore, for approximately 3 months of 2021 and for approximately 9 months of 2022, the stream flows would remain in the Arroyo Seco without diversion. Since construction is scheduled for the drier months of the year, there would be little likelihood of operating the Devil's Gate Dam and losing the water downstream.

It is expected that the lack of diversion during these construction periods, which avoid the peak wet season months to the extent feasible, when high stream flows are more likely, would not substantively affect groundwater supplies. As further described below, the spreading basins are most efficient at augmenting groundwater infiltration during high-flow events, when the majority of flows would otherwise wash downstream to Devil's Gate Reservoir. Taking the spreading basins offline during two dry seasons in a row would not substantially deplete groundwater supplies. First, the stream flows would continue to percolate in the Arroyo Seco streambed during drier months, which would still allow those flows to enter the Monk Hill Subarea (a sub-aquifer of the Raymond Basin). Second, the lack of pumping credits available to PWP due to temporary loss of spreading would ultimately be recaptured through the long-term operational increase in capacity for percolation at the spreading basins in Area 3.

As described above, disrupted infiltration of surface water into the Monk Hill Subarea would result in a negligible impact to groundwater supplies due to the short-term nature of the disruption and the capacity of the adjacent Arroyo Seco streambed to continue to percolate water into the groundwater basin. Additionally, this negligible disruption would be entirely off-set over time by the increased percolation associated with the expanded spreading basins during long-term operations of Area 3, as discussed below. Similarly, temporary demands for potable water during construction would represent approximately 0.0053% of the annual available water supply in the PWP service area, which is a negligible amount. Therefore, short-term construction activities would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, and impacts would be less than significant.

Long-Term Operational Impacts

As previously described, the 1974 Amendment to the Raymond Basin Judgment allows for surface water rights holders to recharge the groundwater with their assigned surface water flows by spreading for percolation in spreading grounds, and to later extract a percentage of the recharged water (60-80% depending on where the recharge occurs). The remaining portion of the water recharged in spreading basins may not be pumped from the aquifer. According to the Judgment and reaffirmed in the 1974 Amendment, PWP has surface water rights to 25 cfs flowing in Arroyo Seco.

Proposed facilities in Areas 2 and 3 would allow PWP to more fully utilize its 25 cfs right when compared to the current conditions that require moderate to high flows to bypass the diversion/intake structure due to the previous damage to the facility and the inability to remove sediment and debris prior to entering the spreading basins. The proposed Project's Area 3 configuration includes a maintainable sedimentation basin (Basin A) located prior to the entry of flows into the spreading basins. This improvement upon the current design would substantively reduce sediments in the spreading basins that settle on the ground surface of the basin and decrease infiltration rates.

The current spreading basins are observed by PWP to reach an equilibrium during recharge events of 18 cfs. This means that the spreading basins will fill at a sustained rate of 18 cfs and maintain their capacity without overflowing because inflow equals the rate of percolation (outflow). The percolation rate is calculated by dividing the 18 cfs recharge capacity by the surface area of the spreading basins (approximately 13 acres) and yields an average of 2.7 ft/day, or 1.4 cfs/acre. Historically, flows up to approximately 25 cfs have been diverted to the spreading basins, but not at a sustained rate and not when stream flows exceed 25 cfs. In these situations, PWP has ceased diversions and the entirety of the Arroyo Seco flows are allowed to bypass the spreading basins completely.

As previously discussed, typical permeability rates of gravelly sands range from 2.8 to 280 ft/day; however, the percentage of fine sediments accumulated in soil will reduce the permeability down to 0.2 to 3 ft/day. This places the estimated current percolation rate of the spreading basins of 2.7 ft/day within an expected range, even though this rate is lower than tested. As shown in Table 4.5-5, according to the results of the soil borings conducted for the project, the upper five feet of soils within Area 3 have high to very high percolation rates. In summary, the soil borings taken within the existing spreading basins demonstrate good percolation capacity of the on-site soils without considering fine sediment clogging. Converse recommends that the lowest percolation rates be considered for design purposes, and that fine sediment clogging be considered for the design and maintenance plan (Appendix A-2).

With the proposed diversion of 25 cfs, at infiltration rates currently observed in the existing spreading basins (2.7 ft/day), approximately 18 acres of effective recharge area in the Project basins would be required to maximize the utilization of PWP's surface water rights. At higher percolation rates, such as those observed during the Geotechnical Feasibility Study (Appendix A-2), less basin acreage would be required to accommodate the full 25 cfs. In addition to the approximately 13 acres of spreading basins that currently exist in the Arroyo Seco, PWP proposes the construction of approximately 4.5 acres of spreading within Basins E through J, which includes replacement of 1.6 existing acres and expansion of 3 new acres. This total, 16 acres, would be large enough to percolate approximately 22 cfs at a percolation rate of 2.7 ft/day. A percolation rate of 3.1 ft/day would be required to accommodate the full 25 cfs within this 16 acres of spreading basins, which is anticipated to be achievable. With regrading, construction and operation of Basin A, and proper annual maintenance to remove fine sediments accumulating in the basins, percolation rates are anticipated to be adequate to achieve the allocated 25 cfs.

Regarding the amount of water that is anticipated to be percolated into the groundwater basin with the proposed Project, a review of the baseline conditions within the Arroyo Seco was performed. The high variability in stream flows from month to month and year to year are demonstrated in Figure 4.5-4, USGS Stream Gage Station Flow Data for 1989 through 2019. Based on the data gathered from the USGS gaging station from 1989 through 2019, the average in-stream flows are 6,890 acre-ft/yr (USGS 2020b).

In order to project the increase in diversions as a result of the Project, a comparison is made to existing conditions. The existing condition is represented by analyzing 1989 through 2019 stream flow data and assumes diversions of up to 25 cfs for stream flows up to 25 cfs. Under the current conditions, no diversions from the existing intake

can occur when stream flows are greater than 25 cfs; therefore, the City can divert an average of 2,045 acre-ft/yr. Under the proposed Project conditions (i.e. diverting up to 25 cfs for storm flows <100 cfs), the City could divert approximately 3,080 acre-ft/yr; therefore, the Project would add approximately 1,035 acre-ft/yr of diverted flows into the spreading basins. This number is based on historic data, which is the best available information related to the future flows within the Arroyo Seco, and future flows would continue to be subject to various factors such as number, intensity, and duration of rainfall events, as well as drought conditions. Prior to the use of the City's spreading basins, when water was diverted for direct use from the Arroyo Seco directly into the water treatment facility for potable use, the conditions for diversion were not limited to the same considerations related to managing sediment for spreading, and records show diversions exceeding 5,000 acre-ft/yr. Therefore, the Project's goal of increasing the beneficial use of the City's water rights, can also be seen as restoring a portion of its historic use.

Figure 4.5-5, Estimated Project Contribution to Average Monthly Distribution of Stream Flow Volume, graphically illustrates the following: (1) shown in red, the amount of Arroyo Seco flow that is typically within the streambed each month (as measured from 1989 through 2019); (2) shown in blue, the amount that is typically diverted under existing conditions (i.e. diverting up to 25 cfs and bypassing all flows in the storm event >25 cfs); and (3) as shown in green, the anticipated amount of increased diversion given proposed Project improvements (i.e. diverting up to 25 cfs for storm flows <100 cfs). As shown, the proposed Project would result in no changes to flows during dry months, as low flows are diverted in the current condition. However, the proposed Project would allow the City to divert more water from the higher-flow storm events. In summary, the proposed Project elements would increase Arroyo Seco diversion almost exclusively during wet winter months with high stream flows.

The proposed expansion of the spreading basins in Area 3 would increase annual percolation into the Monk Hill Subarea beyond the current condition, and therefore would result in a beneficial effect on groundwater supplies. Of this annual average amount of additional diverted water, some would be lost to evapotranspiration, as diverted stream flows would be spread out over a wider surface area in the proposed basins (approximately 16 acres) when compared to the current basins (approximately 13 acres). Assuming no improvement upon the presently observed percolation rate of 2.7 feet per day (ft/day), the average pan evaporation of 0.01 ft/day observed at the LACDPW Descanso Gardens Station would be negligible (PWA 2000). Although the proposed Project might slightly increase total evaporation, the contribution to groundwater recharge significantly exceeds this amount.

In summary, the proposed Project would allow higher flow storm events to be diverted at Area 2 because of the improved intake design and because more sediment-laden flows could be conveyed to and settled in Basin A, thereby capturing more of the high flows for infiltration into the groundwater basin. Additionally, the expanded basin size and potentially increased percolation rates would allow for PWP to divert and recharge its 25 cfs surface water rights to a fuller extent. Because more surface area available for spreading and percolation, combined with more water available for spreading, directly results in more groundwater recharge, the proposed Project would result in a net benefit for groundwater supplies within the Raymond Basin.

The increase in spreading basin surface area leading to greater recharge potential, improvements in the intake structure which would allow for continued diversion of PWP surface water rights during high flows, and the inclusion of an improved sedimentation basin to maintain higher infiltration rates, would all contribute to increased groundwater recharge in the Arroyo Seco Spreading Grounds as compared with the existing condition. Therefore, long-term operational activities would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, and impacts would be less than significant.

Threshold 4.5c Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) result in substantial erosion or siltation on or off site?

Short-Term Construction Impacts

Prior to commencement of grading within Area 2, a temporary coffer dam would be installed in the Arroyo Seco upstream and downstream of the intake replacement area within Area 2, which would provide a dry area for construction activities within the streambed. The coffer dam would capture the streamflows and allow them to be contained, pumped into a flexible pipeline that would bypass the construction area, and then outlet downstream of the construction area. The Project would involve the removal of sediment and debris that has accumulated upstream and downstream of the existing weir, and demolition would commence.

Improvements in Area 2 include the demolition and removal of the following structures: (1) existing concrete diversion weir, associated masonry abutments, and rock wall built over concrete dam that extends under the trail; (2) intake structure, metal ladder and platform, and trash racks; (3) 10-foot by 15-foot concrete slab adjacent to the Gabrielino Trail/Access Road, and (4) excavations of soil/sediment, rocks, debris, and vegetation within the upstream diversion pool, downstream streambed, and on the adjacent slopes on the downstream side of the diversion weir.

During construction, erosion control measures would be implemented per the requirements of the Project's SWPPP, as required by the Construction General Permit, which is discussed further below under Threshold 4.5cii, which would address water quality impacts. Additionally, construction activities have the potential to disturb sediment within the streambed, thereby potentially increasing sediment-laden flows downstream during construction and silt deposits. Therefore, in order for these construction activities to occur within and adjacent to the streambed, dewatering must be controlled in compliance with the Waste Discharge Requirements for the Discharge of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties (Order No. R4-2018-0125, NPDES No. CAG994004). This permit requires permittees to conduct monitoring of dewatering discharges and adhere to effluent and receiving water limitations contained within the permit so that the water quality of surface waters is protected. Application for the permit would involve collecting and analyzing groundwater samples to determine its constituents. In the event that contamination is identified, the permit would include specific types of treatment requirements to ensure compliance with the discharge standards. The permit also establishes requirements for initial and continuous groundwater testing throughout the dewatering process to ensure that the water remains suitable for discharge and that the impacts of dewatering discharges do not constitute a significant and adverse impact to drainages.

The Arroyo Seco flows are relatively clear during non-storm events, and the Project's construction activities are scheduled to generally occur outside of the rainy season, when storm events would be more likely to occur and carry heavy sediment loads. Therefore, dewatering activities are anticipated to temporarily divert relatively clear flows, if water is present.

Construction activities within Area 3 would not require the diversion of any flows or otherwise require dewatering, as the earthwork would be above the water table and outside of the streambed of the Arroyo Seco. Therefore,

compliance with the requirements of the Project Dewatering to Surface Waters Permit would ensure that the temporary diversion of the Arroyo Seco to allow for construction within the streambed would not result in substantial erosion or siltation, and impacts would be less than significant.

Long-Term Operational Impacts

The proposed improved spreading basins would allow the City to capture high volume flows (up to 25 cfs), allowing for additional diversions during major storm events, which typically occur in the wet season when water levels are generally not a limiting factor for the downstream natural system. Conversely, during dry season low flows, the Project would have very little change (i.e., immeasurable, if any) to current diversions within the Arroyo Seco or contribution to any existing limiting factors. As described above, the Hydraulics, Sediment Transport, and Groundwater Analysis prepared by Psomas in 2018 (Report), included in Appendix F of this Draft EIR, includes a hydraulic model based on USGS daily gage data for the period 1989 to 2014, which was the vetted stream gage data available at the time of the report, and was not strongly influenced by drought. To develop representations of wet, average and dry years, the relative deviation percent was calculated for each year by comparing the average annual runoff volume to the annual runoff volume for each year. Years where annual runoff was less than the average were considered dry, while years where the annual runoff was greater than the average were considered wet. Approximately 28% and 72% of annual runoff volumes were determined to be wet years and dry years, respectively. For modeling purposes, the 1994-1995 water year was used to represent a wet year's runoff volume (i.e. 17,957 acre-feet per year [acre-ft/yr]), the 2007-2008 water year was used to represent an average year's runoff volume (7,702 acre-ft/yr), and the 2002- 2003 water year is used to represent a dry year's runoff volume (2,311 acre-ft/yr).

The Report modeled the proposed Project management conditions (i.e. the "with-diversion" scenario) to divert all flows up to 25 cfs, while additionally diverting the first 25 cfs from higher stream flows up to 100 cfs. When stream flows are above 100 cfs, no diversions would occur, (i.e. flows would completely bypass the diversion structure, as even the proposed intake/diversion structure would not be capable of regularly diverting during such high-flow events). The Report took the most conservative approach to assess the impacts of the Project by modeling the "without-diversion" scenario to represent the baseline in the comparison for possible change in conditions. The City currently diverts stream flows, although not to the extent allowed by the Judgment or by available conditions. Furthermore, the modeling of the "with-diversion" scenario is conservative because it represents flows without consideration to evaporation, infiltration, evapotranspiration or other forms of loss besides friction. Therefore, the impacts of increased diversions resulting from the Project as addressed through the Hydraulics, Sediment Transport, and Groundwater Analysis, reflect the maximum possible changes from existing conditions.

A USACE Hydrologic Engineering Center River Analysis System (HEC-RAS) model was run for each of the three representative water years (i.e. wet, dry, and average), with and without the proposed Project diversions, to determine the impact of the Project on maximum depth of flows and maximum velocity (Psomas 2018).

Dry Year Velocity and Depth. The maximum velocity in the "with-diversion" scenario was determined to be higher than in the "without-diversion" scenario in some locations immediately upstream of the Dam. In the primary stream channel upstream of the Dam, the maximum velocity doubles from approximately 2.5 feet per second (fps) in the without-diversion scenario to approximately 4.2 fps in the with-diversion scenario. In addition, there is an approximate doubling of velocity in some portions of the backwater area upstream and to the west of the Dam from approximately 0.3 fps in the without-diversion scenario to approximately 0.6 fps in the with-diversion scenario (Psomas 2018).

The driver for the increased velocity in the without-diversion scenario is because small discharge events (Q<25 cfs) begin to fill the reservoir prior to a significant event (Q>>25 cfs). When the smaller events pond upstream of the Dam, the larger event's maximum velocity is lower because of backwatering from the Dam due to ponding. In contrast, when water has not ponded upstream of the Dam, no backwatering will occur during a more significant event and velocities will be higher in the main stream and in some of the backwatering areas. It is important to note that these higher velocities can occur in a dry, average or wet year regardless of whether diversions occur if an early runoff event in the season is relatively large and little or no backwatering has occurred prior to the runoff event. It is also important to note that the total change in velocity is relatively low and occurs well below (v=0.6 fps) or just below (v=4.0 fps) a typical velocity (i.e. 4.5 fps) for initiation of sediment transport in sandy bed, vegetated streams (Psomas 2018).

The representative dry year without-diversions and with-diversions maximum depth drops by approximately 1.3 feet. In the without-diversion scenario, the total runoff for the representative dry year is approximately 2,480 acre-feet (af), while the with-diversions for the representative dry year is approximately 550 af. Therefore, the difference in runoff volume accounts for the difference in maximum depths. It is important to note that the area of inundation is approximately the same between the two scenarios, owing largely to the shape of the reservoir upstream of the Dam (Psomas 2018).

Average Year Velocity and Depth. Unlike the dry year scenarios, the maximum velocity in the without-diversion scenario is higher than in the with-diversion scenario in some locations immediately upstream of the Dam. In the primary stream channel upstream of the Dam, the maximum velocity doubles from approximately 2.5 fps in the with-diversion scenario to approximately 5.5 fps in the without-diversion scenario. This is an approximate doubling of velocity in some portions of the backwater area upstream of the Dam from approximately 0.6 fps in the with-diversion scenario to approximately 1.0 fps in the without-diversion scenario (Psomas 2018).

The reason for these differences is similar to the dry year scenarios, except that the reservoir has relatively high ponding in the with-diversion scenario compared to the without-diversion scenario before a significant (Q>>25 cfs) event occurs. In the representative average year scenario, the resulting maximum velocities are relatively higher than in the representative dry year scenario (5.5 fps vs. 4.2 cfs, respectively). It appears that the difference in modeled maximum velocity is a function of hydrograph shape (i.e. rate of flow versus time) as opposed to other hydraulic or hydrologic factors (Psomas 2018).

The representative average year without-diversion and with-diversions maximum depth are indistinguishable from one another because the maximum water surface elevation (WSE) is the same (approximate WSE of 1,035 feet). The factor that controls the depth and WSE is the operation of Devil's Gate Dam. Despite the same maximum depths, the with-diversion scenario has greater inundation durations at the reservoir fringes because the with-diversion scenario reservoir depth reaches the operational curve elevation more slowly than does the without-diversion scenario (Psomas 2018).

Wet Year Velocity and Depth. Like the other representative scenarios, there are differences in maximum velocity upstream of the reservoir. The difference between the representative wet year without-diversion and with-diversion maximum velocity is lower in magnitude than in the similar representative dry and average scenarios. This appears to be a function of the rate at which the reservoir fills in the represented wet year scenarios. In the wet year scenarios, the difference in maximum velocity in the channel upstream of the reservoir is approximately 3.0 cfs and 1.5 cfs for the with-diversion and without-diversion scenarios, respectively. One difference between the

representative wet year scenarios and other scenarios is how far upstream the differences are observed. In the case of the wet year scenarios, the differences in velocity are observed in the channel upstream of the ponded reservoir, while in the representative average scenarios the differences are confined to downstream of the infiltration basins on the east bank. The difference in extent of impacts is a function of the extent of ponding and ponded elevation in the reservoir, which alters the backwatering further upstream than in the average scenario conditions. The difference is not attributable to change in hydrology resulting from Project-related diversions since the largest discharges (Q>100 cfs) are not impacted by the diversions (Psomas 2018).

Like the representative average year scenarios, the representative wet year maximum depths are indistinguishable because the Dam operational curve is controlling the maximum depth in the reservoir (approximate WSE of 1,035 feet). Like the average year scenarios, the with-diversion scenario has greater inundation durations at the reservoir fringes because the with-diversion scenario reservoir depth reaches the operational curve elevation more slowly than does the without diversion scenario (Psomas 2018).

In summary, the results of HEC-RAS modeling indicated relatively small, and in some cases negligible, effects on maximum velocity and depth of flows within the Arroyo Seco when comparing the with-diversion (proposed Project conditions) to the without-diversions (baseline conditions). The effects of the proposed Project were limited to the stream channel within the lower Devil's Gate Reservoir and the backwater area immediately upstream of the Devil's Gate Dam. It was determined that these effects would be a function of both Dam operations (i.e. timing of releases, extent of reservoir filling) as well as increased stream diversions resulting from this proposed Project, and their individual effects were not distinguished (Psomas 2018).

Sediment Transport. The 2018 Report included a USACE Sediment Analysis Methods (SAM) model, which was used to calculate sediment transport potential within Arroyo Seco with and without the proposed Project. The SAM Sediment Hydraulic Package is an integrated system of programs developed through the Flood Damage Reduction and Stream Restoration Research Program to aid in the analyses associated with designing, operating, and maintaining flood control channels and stream restoration projects. SAM combines the hydraulic information and the bed material gradation information to compute the sediment transport capacity for a given channel or floodplain hydraulic cross-section for a given discharge at a single point in time (Psomas 2018).

For the analysis, sediment sampling was conducted by R. T. Frankian & Associates at a total of 6 locations, approximately every 2,000 feet within the Arroyo Seco streambed from 200 feet upstream of the existing diversion structure to 200 feet upstream of the Devil's Gate Dam face, which is a distance of approximately two miles. Since SAM is a single point model, two specific locations were chosen for modeling. The first model location is approximately 200 feet upstream of the JPL Bridge; the second model location is approximately 1,100 feet downstream from the JPL Bridge. Both locations are relatively distant from the influence of confluences and structures, and neither is located in the reservoir, which would not be appropriate for modeling with SAM. These two locations are representative of the two primary stream morphologies found in the Project's study area (Psomas 2018).

The SAM model was run at Sample Location No. 2 and No. 3 for 25 cfs. The SAM runs were intended to indicate the possible change in sediment transport potential at the two locations resulting from implementation of the proposed Project. The analysis identified a disparity in the sediment transport potential between the two locations. The difference was attributed to the hydraulics at each location. The steeper, narrower Location No. 2 has higher velocity, steeper slope and narrower top width relative to Location No. 3, which is below the channel's grade break. This finding matches the finding of Phillip Williams Associates Report (PWA 2000) that significant sediment deposition occurs in what is referred to as the "upper reservoir." The implication for this finding is that the lower portion of the Arroyo Seco

study area behaves in a similar way to an alluvial fan whereby sediment is deposited in patterns associated with flow path uncertainty, and sediment transport below the grade break is strongly a function of local hydraulics.

In dry, average, and wet representative years, modeled diversions from Arroyo Seco have an effect on velocity in select areas of the reservoir upstream of Devil's Gate Dam. The effects on velocity are small in absolute terms. In cases where diversions do not effect early-season large runoff events, differences in maximum velocity would be negligible between the with-diversion and without-diversion scenarios for any representative year. In contrast, the extent which the reservoir is full in either the with-diversion and without-diversion scenarios may affect the change in velocity by creating a backwater condition in the reservoir. Because the dominant driver of runoff in coastal southern California is large winter storms, only in years where the primary source of water to the Devil's Gate Reservoir is runoff events near or below 25 cfs are velocities expected to be affected by diversions. It should be noted that the representative dry year is only minimally affected in this manner.

Effects on maximum depth in dry, average, and wet representative years in Arroyo Seco are largely mediated by the amount of ponding in Devil's Gate Reservoir. Ultimately, the ponding in the reservoir is a function of the rate, frequency and volume of inflow, and the dam operation outflow. In representative average and wet years, the modeled extent of ponding is a function primarily of Dam operations for both the with-diversion and without-diversion scenarios. In dry years, numerical modeling indicates that maximum depth is primarily driven by the volume of water entering the reservoir in the absence of reaching the Dam operational curve elevation. In dry years, diversions may have an effect on maximum water depth in the reservoir, and modeling indicates that maximum depth in these years is partially a function of when in the season the largest runoff events occur. That is, representative dry years with diversions and a few relatively large runoff events will have a similar maximum depth in the reservoir compared to representative dry years without diversions. In contrast, in dry years without a few relatively large events, modeling predicts that the difference in reservoir maximum depth will be greater. Finally, in representative wet and average years the duration of inundation can be impacted on the fringes of the reservoir by diversions. Diversions in these years appear to increase the inundation duration somewhat by increasing the volume of runoff required to initiate Dam operations.

The numerical modeling presented here indicates that relatively small effects on maximum velocity and maximum depth would occur from the proposed Project. These effects (e.g. change in velocity) are limited generally to the stream channel within the lower reservoir and the backwater area immediately upstream and to the west of the Dam. Additional minor effects (e.g. change in duration of inundation) are indicated at the reservoir edge and appear to be strongly a function of Dam operations as well as diversions. SAM modeling of two locations within the Project's study area indicates that there is greater sediment transport potential at 25 cfs in upper portions of Arroyo Seco, which are steep and narrow, compared to portions below the topographic break, which are wider and flatter. This finding echoes that of PWA (2000) that found that significant sediment deposition occurs in the "upper reservoir." The implication for the proposed Project is that for low discharges in Arroyo Seco, the diversion of 25 cfs from the Arroyo Seco is expected to be unimportant to overall sediment transport potential because the controlling elements of sediment transport are geologic factors. Moreover, in large runoff events that are typically the dominant delivery mechanism of sediment in southern California (Inman and Jenkins 1999) no diversions are proposed; therefore, high flow events would bypass the intake within Area 2.

In summary, an increase in the surface water diversions at Area 2 are intended to increase the amount of surface water flow entering the spreading basins in Area 3. These proposed increased diversions, however, would be a continuation of current diversion practices during dry weather flows, and would result in a measurable increase in diversion only during larger flows. Therefore, the proposed Project would not change drainage patterns, but would merely redirect additional surface flows. The spreading basins in Area 3 would be similar in type and structure to

the existing spreading basins and thus would not increase the potential for erosion above that of the existing condition. As discussed above, flows up to 25 cfs would be diverted to the spreading basins for infiltration, and the diversion of 25 cfs from the Arroyo Seco is expected to be insignificant to overall sediment transport potential. As demonstrated through the Sediment Analysis Methods (SAM) modeling and the conclusions of the Hydraulics, Sediment Transport, and Groundwater Analysis, the proposed Project would not measurably alter the course of the Arroyo Seco, impact overall sediment transport, or result in substantial erosion or siltation on-site or off-site, and impacts would be less than significant.

Threshold 4.5c **Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:**

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

Short-Term Construction Impacts

As discussed under Threshold 4.5ci above, construction of the diversion structure in Area 2 would require temporary diversion of Arroyo Seco Creek flows through the installation of a coffer dam upstream of the construction activity area. Stream flows would temporarily pool upstream of this coffer dam and would be pumped beyond the Area 2 construction back into the Arroyo Seco channel. Construction of the diversion structure would be scheduled to avoid the wet/rainy season that might lead to increased stream flows that could cause flooding upstream of the coffer dam. Ponded water and stream flow shall be monitored during the diversion structure construction to ensure that pumping is sufficient to prevent upstream flooding.

Under current practices, low flows are diverted year-round, as feasible, into the intake structure and conveyed downstream into the Area 3 spreading basins. During construction activities, no diversion would occur. Therefore, low-flows would remain in the streambed throughout the duration of construction activities. As depicted in Figure 4.5-4, stream flows are highly variable from month to month and from year to year; therefore, the presence of low flows within the Arroyo Seco just downstream of the construction area would not result in a substantial increase in the rate or amount of surface runoff in a manner which would result in flooding because the Arroyo Seco is capable of accommodating a high variation in flows throughout the year. The coffer dam would not be present during the wet/rainy season. Even with completion of the new diversion weir and intake structure there would be no diversions the following year during construction of Area 3 improvements. Flows would continue downstream within the Arroyo Seco streambed during construction, which would include a portion of the 2021-22 rainy season. However, the lack of diversion during short-term construction activities in Area 3 would also fall within the range of conditions regularly experienced by the highly variable flows within the Arroyo Seco, as illustrated by Figure 4.5-4. Additionally, there are no habitable structures that would be subject to damage downstream of Area 2, as all flows are eventually impounded behind the Devil's Gate Dam, if they aren't diverted into the spreading basins. Because the Arroyo Seco flows are ultimately held back at the Dam, which is designed to contain the high variability of storm flows, any variations in in-stream flows due to short-term construction activities that would result in the temporary lack of diversions into the spreading basins would be well within the natural variation of flows in the Arroyo Seco and would not increase the rate or amount of surface runoff in a manner which would result in flooding on or off site. Impacts would be less than significant and no mitigation is required.

Long-Term Operational Impacts

The proposed improvements within Area 2 would be in the same location as the existing infrastructure. Construction of the streambed shoulder and bank, including the roughened channel, downstream of the new diversion structure and operable weir would be with permeable engineered streambed material (ESM). The ESM selected for the Project would consist of a well-graded mixture of rock, gravel and sand similar to natural streambed material, and would not add any new impervious surfaces within the Arroyo Seco streambed.

The expanded spreading basins within Area 3 would also be in the same location of the existing basins and would not substantially alter the existing drainage pattern of the site or alter of the course of a stream or through the addition of impervious surfaces. The Basin A is a new sedimentation basin that would be constructed of concrete to allow for the turbid flows to settle before entering into the basins. This minor amount of impervious surface has been calculated into the design of the spreading basins, which would be enlarged under the proposed Project. As previously described, approximately 13 acres of existing spreading basins currently exist in the Arroyo Seco, and PWP has planned the construction of approximately 4.5 acres of spreading within Basins E through J, which includes replacement of 1.6 existing acres and expansion of 3 acres. The total of 16 acres would allow for the percolation of the estimated additional 1,035 acre-ft/yr in diversions from the Project. Flows from the new/expanded spreading basins would retain connectivity to the existing basins further to the south and would continue to function in the same manner as the existing condition, which allows any flows that cannot be accommodated within the basins to outlet into the Devil's Gate Reservoir.

In summary, the proposed improvements in the diversion structure and spreading basins would not change drainage patterns nor involve the addition of impervious cover that would impede infiltration of stormwater. Alterations in the diversion structure would increase water spreading within the basins during high flows, but would not result in the flooding of any structures. The diversion structure would be designed to divert up to the City's 25 cfs surface water right, and by design, it would not be capable of flooding other structures due to the outlet design at the terminus of the spreading basins. Rehabilitation of existing spreading basins and the grading/excavation of additional basins would increase infiltration capacity by removing less permeable materials, thus decreasing the potential for flooding and surface flows. Impacts would be less than significant and no mitigation is required.

Threshold 4.5c **Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:**

iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Short-Term Construction Impacts

Under the current conditions, all stormwater flows are conveyed within the Project study area via sheetflows into the Arroyo Seco. There are no constructed storm drain facilities within the Project study area, other than the existing subterranean Altadena Storm Drain, the Altacrest Drain and BI 0710 – Unit 1. No realignments are proposed for these drains as part of the Project and these drains do not receive stormwater from the Project area. Therefore, the Project would have no impact on the capacity of "existing or planned stormwater drainage systems" and as discussed under Threshold 4.5cii, the proposed Project have a less than significant impact on the capacity of the Arroyo Seco to accommodate additional flows during construction activities.

Regarding the potential for sources of polluted runoff, construction activities could result in short-term erosion and associated siltation of the Arroyo Seco. Erosion-induced sedimentation affects water quality and interferes with photosynthesis; oxygen exchange; and the respiration, growth, and reproduction of aquatic species. Additionally, other pollutants, such as nutrients, trace metals, and hydrocarbons, can attach to sediment and be transported to the Devil's Gate Reservoir, which could contribute to the degradation of water quality. Furthermore, during grading and temporary stockpiling of soil in Area 3, there is the potential for soil migration off-site via wind.

Non-sediment-related pollutants that are also of concern during construction relate to accidental spills and leaks of construction-related pollutants, such as: petroleum products from construction vehicles chemicals; concrete-related pollutants; lubricants and degreasers; and paints, glues and/or solvents.

However, the proposed Project would comply with the provisions of the Construction General Permit (CGP), which is NPDES General Permit for Storm Water Associated with Construction Activities (Order No 2009-009-DWQ as amended by 2010-0014-DWQ and 2012-0006-DWQ, NPDES No. CAS000002). Because the proposed Project is greater than 1 acre in size, the Applicant would be required to submit a Notice of Intent to the LARWQCB in order to obtain approval to complete construction activities under the CGP. This permit would include a number of design, management, and monitoring requirements for the protection of water quality and the reduction of construction phase impacts related to stormwater (and some non-stormwater) discharges. Permit requirements would include the preparation of a SWPPP, implementation and monitoring of BMPs, implementation of best available technology for toxic and non-conventional pollutants, implementation of best conventional technology for conventional pollutants, and periodic submittal of performance summaries and reports to the LARWQCB. The SWPPP would apply to the Project as a whole and would include reference to the major construction areas, materials staging areas, and haul roads. Typical BMPs that could be incorporated into the SWPPP include the following:

- Diverting off-site runoff away from the construction site
- Vegetating landscaped/vegetated swale areas as soon as feasible following grading activities
- Placing perimeter straw wattles to prevent off-site transport of sediment
- Using drop inlet protection (filters and sand bags or straw wattles), with sandbag check dams within paved areas
- Regular watering of exposed soils to control dust during demolition and construction
- Implementing specifications for demolition/construction waste handling and disposal
- Using contained equipment wash-out and vehicle maintenance areas
- Maintaining erosion and sedimentation control measures throughout the construction period
- Stabilizing construction entrances to avoid trucks from imprinting soil and debris onto City roadways
- Training, including for subcontractors, on general site housekeeping

Incorporation of required BMPs for materials and waste storage and handling, and equipment and vehicle maintenance and fueling would reduce the potential discharge of polluted runoff from construction sites, consistent with the State NPDES General Construction Permit. Compliance with existing regulations would prevent violation of water quality standards and minimize the potential for contributing sources of polluted runoff. Therefore, compliance with existing regulations would ensure that the Project would not add substantial sources of polluted runoff or otherwise substantially degrade surface quality from demolition and construction activities. Impacts would be less than significant and no mitigation is required.

Long-Term Operational Impacts

Area 2 does not currently contain a stormwater drainage system; stormwater drains naturally along the Arroyo Seco channel. Area 3 receives stormwater from three storm drains that discharge into the Arroyo Seco and bypass the Project basins, the Altadena Storm Drain, the Altacrest Drain and BI 0710 – Unit 1. No realignments are proposed for these drains as part of the Project and these drains do not receive stormwater from the Project area. Project components, both in Areas 2 and 3, would not be substantively different in type or function from the existing structures and materials. Thus, the proposed Project would not contribute additional sources of polluted runoff and impacts would be less than significant.

Threshold 4.5c Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

iv) impede or redirect flood flows?

Short-Term Construction Impacts

As stated above under Threshold 4.5ci above, stormwater drainage in Area 2 currently follows the natural flow of the Arroyo Seco channel and thus would be temporarily altered during construction in this Area using a coffer dam and sump pump; however, these diversions would be temporary and would be scheduled so as to avoid wet/rainy season where heavy rainfall is more likely. No flows would be diverted into Area 3 during construction and thus any potential flooding would not be impeded by construction in this area but would flow parallel to Project construction activities. Impacts related to the temporary diversion of flows around the construction within Area 2 would be less than significant and no mitigation is required.

Long-Term Operational Impacts

An Arroyo Seco Canyon Diversions Biological Impacts Memorandum (provided as Appendix I to the Biological Resources Technical Report [Appendix D of this Draft EIR]), analyzed the indirect Project impacts to downstream habitats due to the increase in the amount of water diverted into the spreading basins. The Memorandum considered impacts of the maximum possible change in diversion from existing conditions. The Memorandum concluded that the proposed additional diversions would not impact habitat in the downstream reach of the Arroyo Seco as long as the flow of groundwater remains unobstructed within the Arroyo Seco consistent with the current conditions (Psomas, 2018). The present condition of subsurface seepage below the diversion weir would be maintained by constructing a modified structure at similar depth to the current structure. No instream flow release criteria have been used in the preliminary design, but the diversion design includes gates and piping that would allow for release of surface water for instream flow in the future, if such requirements are developed. Instream flow releases would not, however, prevent flows from becoming very low or zero when natural inflows are low, which occurs during most years in the summer and fall (Appendix F).

As stated above under Threshold 4.5c(i) above, the expanded spreading basins within Area 3 would provide additional capacity to accommodate diversions from the Arroyo Seco. This would be an expansion of an existing condition and would not otherwise impede or redirect flood flows in a manner that is substantively different from current conditions. The proposed diversion structure would divert low and intermediate flows of up to 25 cfs to the

spreading basins, and the diversion structure would be bypassed during large storm events to avoid any potential debris damage. Area 3 is not proposed in an existing flood plain as identified by the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps. Thus, any flows that are not diverted to the spreading basins (i.e. flows above 25 cubic feet per second), would not be affected by Project improvements. Impacts would be less than significant and no mitigation is required.

4.5.6 Cumulative Impacts

Groundwater Supplies/Recharge

The geographic context for the analysis of cumulative impacts related to groundwater supplies and recharge is the Raymond Basin, as identified in Figure 4.5-3. Of the cumulative projects listed in Section 3.5, Cumulative Impacts and on Figure 3-5, Cumulative Projects, the Devil's Gate Reservoir Sediment Removal and Management Project and the LACFCD Pump back/Intake at Devil's Gate to Eaton Canyon both have potential to directly impact groundwater recharge, as they both relate to impounded water behind the Devil's Gate Dam. The general area of these projects is identified in Figure 3-5, Cumulative Projects, in Section 3, Project Description. Impacts related to hydrology and water quality for the Devil's Gate project was evaluated through CEQA documentation, as described in Section 4 of this Draft EIR, and was determined to be less than significant, with no mitigation required.

The Devil's Gate project would remove accumulated sediment and associated vegetation within the reservoir. Reductions in sediment as a result of the project would allow for more capacity to retain water behind the Dam for longer periods of time, or as determined appropriate by the LACFCD. It is LACFCD opinion that percolation rates behind the dam are not high. As stated in the PWA report, Section 8.1.1 Percolation, "From their (LACFCD) experience managing other reservoirs and deep pit spreading basins, the LACDPW has raised questions as to whether or not ponding behind Devil's Gate Dam would actually increase percolation rates to groundwater over the long-term. They have noted that percolation rates may be very high initially at such facilities but tend to decrease if water is stored for extended period."

The LACFCD Pump back/Intake at Devil's Gate to Eaton Canyon project would pump impounded water from Devil's Gate Reservoir into the spreading basins at Area 3 or convey it cross town into spreading basins at Eaton Canyon when not in use. This project would also increase opportunities for groundwater recharge in the Raymond Basin, as increased spreading equates to increased groundwater percolation. An average of over 6,900 acre-feet of stormwater passes through Devil's Gate Dam annually and is lost to the ocean. While the Devil's Gate Sediment Removal project would restore reservoir capacity, the pump-back project would draw from this reservoir and add an estimated additional average annual recharge of 1,700 AF by utilizing the existing and expanded spreading basins. In the current condition, these portions of the spreading basins are dry, and therefore, are not contributing to the beneficial recharge of the groundwater basin. Increases in the amount of time that the basins contain water would result in maximizing the recharge of the basin.

Therefore, when considering these two projects in combination with the proposed Project, which is estimated to result in an additional 1,035 acre-feet/yr of infiltration, of which only 60% to 80% would be reused in the potable water supply system (i.e. 20% to 40% would remain in the Monk Hill Subarea, less any evaporation), the results of these two cumulative projects are anticipated to result in beneficial impacts to the Raymond Basin.

The Explorer Groundwater Well project would result in additional treatment of groundwater to remove target chemicals (e.g. perchlorate and volatile organic compounds [VOCs]) from the aquifer and then treat the water

through an expanded treatment train at the Monk Hill Treatment System (MHTS), thereby providing more water for potable supplies. It is not anticipated that this project would result in more pumping from the Monk Hill Subarea, as the Raymond Basin is adjudicated and must be managed in compliance with its sustainable yield. As such, groundwater supplies and sustainability is not anticipated to be negatively affected by this project.

None of the cumulative projects listed in Section 4.2.2, List of Cumulative Projects would result in substantive amounts of new impervious surfaces that could hinder recharge efforts or otherwise substantially interfere with groundwater recharge. Similarly, these cumulative projects are not developing new land uses that could create new demands for potable water supplies that could otherwise impede sustainable management of the basin.

Development of other cumulative projects beyond those identified in Section 4.2.2, List of Cumulative Projects, may affect groundwater supply by (1) increased land use intensities resulting in increased water usage and/or (2) increased land use intensities resulting in increased impervious surfaces, to the extent that groundwater recharge is affected. The majority of projects within the Los Angeles River Watershed are located in urbanized, built-out communities in which many development projects are located on sites that are already fully covered or partially covered with impervious surfaces. Overall development of cumulative projects is not anticipated to have a substantial, adverse effect on groundwater recharge in the Raymond Basin, to the extent that a net deficit in aquifer volume or a lowering of the local groundwater level would occur. Regionally, land use changes are anticipated and accounted for through the City's UWMP, which is updated every 5 years and accounts for population and employment growth set forth in the City's General Plan. UWMPs calculate water demand projections and show how anticipated future water demand will be fulfilled, and also include drought planning to ensure a reliable supply in the event of a drought, as well as analyses and evaluations of groundwater supplies in accordance with the sustainable yield of the groundwater basin. As such, to the extent that other cumulative projects are generally consistent with regional growth patterns and projections, the projects would not be expected to result in increased water usage causing a net deficit in aquifer volume or a lowering of the local groundwater level. Further, compliance with the California Green Building Code would be required for new development. For redevelopment projects, this generally indicates that newly installed appliances and plumbing would be more efficient than those used within the structures originally located on the redevelopment sites. This ensures that development projects do not result in wasteful or inefficient use of limited water resources.

Because the proposed Project and cumulative projects would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that they could cumulatively impede sustainable groundwater management of the basin, cumulative impacts to groundwater resources during construction and operation of the proposed Project and related projects would not be cumulatively considerable, and would not result in significant cumulative impacts.

Hydrology/Water Quality

The geographic context for the analysis of cumulative impacts related to hydrology and water quality is the Arroyo Seco Sub-watershed boundary, as identified on Figure 4.5-1. Of the cumulative projects listed in Section 4.2.2, List of Cumulative Projects, the Previously Approved Components of Arroyo Seco Canyon Project (Area 1 improvements); Devil's Gate Reservoir Sediment Removal and Management Project; and Oak Grove Area Improvements (OGAI) Project have the potential to directly impact hydrology and water quality in the Arroyo Seco Sub-watershed boundary. Impacts related to hydrology and water quality for these cumulative projects were evaluated through CEQA documentation, as described in Section 4 of this Draft EIR and were determined to be less than significant, with no mitigation required.

Cumulative hydrology impacts could result from other cumulative projects that collectively alter the course of surface water flow or increase flood hazards within the Arroyo Seco Sub-watershed boundary, either through diverting floodways or constructing structures within the floodways. The proposed Project and other cumulative projects (i.e. both listed projects and regional projects) in the areas discharging within the Los Angeles River watershed would be subject to state and regional water quality permit requirements, including the Construction General Permit and the Los Angeles County NPDES permit requirements.

Each of the cumulative projects would be required to comply with RWQCB standards for water discharge during construction and operation phases. Each cumulative project would be required to employ site design features, treatment control, and source control best management practices, as necessary, to control for drainage. For projects that would be located on vacant land, proposed surface conditions must mimic existing patterns to the extent feasible. Adherence to the Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175 as amended by State Water Board Order WQ 2015-0075, NPDES Permit No. CAS004001), as well as requirements for low impact development (LID), would be required for all cumulative projects to minimize adverse effects to hydrology and water quality.

Cumulative water quality impacts can result from projects that combine to either pollute or increase the turbidity of water. In the absence of regulatory controls, the primary potential cumulative effect would be alterations to the natural hydrology of the Arroyo Seco Sub-watershed by land use changes through increased potential for the release of non-point-source pollutants (i.e., motor fuels, trash, and sediment). Each of the cumulative projects would be required to comply with RWQCB standards for water discharge during construction and operation phases. Each cumulative project would employ site design features, treatment control, and source control best management practices, as necessary, to control for erosion and stormwater pollution, and compliance with the MS4 permit and LID would be required.

Because the proposed Project and cumulative projects would not alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in such a manner that could cause substantial erosion, siltation, flooding or polluted runoff, cumulative impacts to hydrology and water quality during construction and operation of the proposed Project and related projects would not be cumulatively considerable, and would not result in significant cumulative impacts.

4.5.7 Mitigation Measures

No mitigation measures are required.

4.5.8 Level of Significance After Mitigation

The proposed Project would not result in any potentially significant impacts related to Hydrology and Water Quality, and all impacts would remain less than significant with Project implementation.

4.6 Noise

4.6.1 Methodology

This section describes the existing conditions of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Project. The analysis of the Project impacts related to noise and vibration is based on:

Appendix G: Field Noise Measurement Data, December 2019; Construction Noise Modeling Input/Output, February 2020; and Traffic Noise Modeling Input/Output (during Construction), February 2020

Although not a part of the proposed Project, there are specific components in Area 2 that are approved to move forward without additional environmental review that are included in the equipment and activity assumptions that constitute the basis for the noise analysis and this section. The improvements to be conducted in Area 2, which have been previously approved to proceed in accordance with the 2015 ASCP MND, include:

1. Removal of existing *K*-rails along an approximate 150-foot-long segment of the Gabrielino Trail/Access Road between Bridge No. 3 and the intake structure, and
2. Stabilization and repaving of a portion of the Gabrielino Trail/Access Road with asphalt.

These non-Project improvements are included in the noise analysis assumptions because their construction is anticipated to occur simultaneously with the proposed Project improvements, likely using the same equipment. As such, it was determined to be unrealistic to parse out the short-term construction activities of the various Project components; therefore, the noise impacts of constructing all improvements within Area 2 are considered in this section.

Similarly, although not a part of the proposed Project, there are specific components in Area 3 that are approved to move forward without additional environmental review that are included in this section and in the construction noise assumptions. The improvements to be conducted in Area 3, which have been previously approved to proceed in accordance with the 2015 ASCP MND, include:

1. Demolition of various facilities, including inlet/outlet structures, dry vaults, woodsheds, utility light pole, pipes and valves, chainlink fencing, corrugated metal pipes, and other small appurtenant structures, to allow for the reconstructed basins;
2. Construction and operation of new pre-fabricated restroom, new sewer lift station, and associated pipelines, including a new 12-inch-diameter potable water pipeline and a new sewer line within the JPL Bridge;
3. Construction and operation of new pipelines, including a 12-inch-diameter well line, 16-inch-diameter utility service line, and 12-inch-diameter booster line;
4. Removal of the Behner WTP's influent and effluent lines and removal of the 8-inch-diameter sludge line from the Behner WTP;
5. Construction and operation of the recreational parking lot at the northern end of Area 3;

6. Construction/realignment and operation of Explorer Road; and
7. Construction of new fencing, gates, a roundabout, a guard station, a trail pathway, and signs at the northern end of the parking lot.

Additional details related to these non-Project components are included in Appendix A-3, 2015 ASCP Initial Study/Mitigated Negative Declaration.

The non-Project components within Areas 2 and 3 listed above were previously approved for both short-term construction and long-term operations. Only the short-term construction activities for these non-Project components are modeled in the noise analysis, as all operational aspects were approved through the 2015 IS/MND and there would be no changes associated with the long-term operations of the proposed Project when compared to the 2015 IS/MND, as further described in Section 3, Project Description, of this Draft EIR.

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, the Appendices to the Initial Study are included in Appendix A-2, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

4.6.2 Existing Conditions

Noise-Sensitive Receptors

Noise-sensitive receptors include land uses where an excessive amount of noise would interfere with normal operations or activities and where a high degree of noise control may be necessary. Examples include schools, hospitals, and residential areas. Recreational areas may be considered noise-sensitive where quiet and solitude may be an important aspect of the specific recreational experience (City of Pasadena 2002).

As described in Section 2, Environmental Setting, the Project site consists of two primary areas, as shown on Figure 2-1, Local Vicinity and Regional Location, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements, which are connected by the North Arroyo Boulevard (i.e., Gabrielino Trail/Access Road). The proposed Project involves construction activity and facility improvements in Areas 2 and 3, as well as construction truck traffic along portions of the Gabrielino Trail/Access Road. The former Travelling Screen and Chlorine Building (Screen Building) adjacent to Area 2 and the Behner WTP adjacent to Area 3 would be used for temporary construction materials and equipment staging only.

Area 2. The nearest homes to Area 2 are approximately 800 feet to the east on Canyon Dell Drive in Altadena, part of unincorporated Los Angeles County. A U.S. Forest Service (USFS) compound (which includes a residence) is located approximately 870 feet to the northwest, in the City of Pasadena. Residential neighborhoods to the west in the City of La Cañada Flintridge are more than 1,700 feet from Area 2.

Area 3. Single-family residential neighborhoods exist to the east of Area 3. Some homes are in the City of Pasadena and others are in Altadena. The closest homes to Area 3 are on Ridgeview Drive in Altadena and Crestford Drive in Pasadena, approximately 250 feet from the Project site. North Windsor Avenue, between the I-210 freeway and Explorer Drive, would be used by traffic generated by the proposed Project. There are homes adjacent to North Windsor Avenue in the City of Pasadena and in the community of Altadena. Passive and active recreational areas, including the Gabrielino Trail, are near all Project areas and are described in Section 4.7, Recreation.

Existing Noise Levels

Area 2 is located in a rural setting approximately 800 feet from suburban development. Local noise sources include occasional vehicles, recreational visitors, wind, and other natural sounds. Average hourly daytime noise levels (Leq) are estimated to be 40 to 45 A-weighted decibels (dBA) Leq.

Area 3 is located within a developed area and includes the City's open space area (i.e., former JPL East Parking Lot). The principal local noise sources in the surrounding area are (1) industrial activities, including material handling equipment at the JPL campus to the west and (2) vehicles coming to, using, and leaving the parking lot. Average hourly daytime noise levels are estimated to be 50 to 55 dBA Leq.

Ambient noise level measurements were conducted on December 3, 2019 near the residential receptors east and southeast of Area 3, including along North Windsor Avenue. Table 4.6-1 provides the location, date, and time the noise measurements were taken. The noise measurements were taken using a Soft-DB Piccolo sound level meter equipped with a 0.5-inch, pre-polarized condenser microphone with pre-amplifier. The sound level meter meets the current American National Standards Institute standard for a Type 2 (General Purpose) sound level meter. The accuracy of the sound level meter was verified using a field calibrator before and after the measurements, and the measurements were conducted with the microphone positioned approximately five feet above the ground.

Five short-term noise measurement locations (ST) that represent existing sensitive receivers were selected near the Project Site. These locations are depicted as receivers ST1–ST6 on Figure 4.6-1, Noise Measurement Locations. The measured energy-averaged (L_{eq}), minimum (L_{min}) and maximum (L_{max}) noise levels are provided in Table 4.6-1. The field noise data sheets are included in Appendix G. The primary noise sources at the sites identified in Table 4.6-1 consisted of traffic along adjacent and distant roadways; distant landscaping activities noise, distant barking dogs, and birdsong represented secondary noise sources. As shown in Table 4.6-1, the measured sound levels ranged from approximately 57 dBA L_{eq} at ST4 to 66 dBA L_{eq} at ST5.

Table 4.6-1. Measured Noise Levels

Receptors	Location	Date	Time	L_{eq} (Dba)	L_{min} (Dba)	L_{max} (Dba)
ST1	East of Project Site, adjacent to residence at 898 W. Altadena Drive	12/3/2019	9:42 a.m.–9:57 a.m.	62.2	50.7	80.7
ST2	East of Project Site, adjacent to residence at 892 W. Mariposa Street	12/3/2019	10:11 a.m.–10:26 a.m.	62.8	53	82.7
ST3	Southeast of Project Site, at western edge of Sunset Overlook Park, along Windsor Avenue	12/3/2019	10:41 a.m.–10:56 a.m.	62.6	54.5	75.2
ST4	Southeast of Project Site, adjacent to residence at 978 Kent Street	12/3/2019	11:04 a.m.–11:20 a.m.	57.2	50.9	74
ST5	Southeast of Project Site, adjacent to residence at 2245 North Windsor Avenue	12/3/2019	11:29 a.m.–11:44 a.m.	66.4	52.5	80.4

Source: Appendix G
Notes: L_{eq} = equivalent continuous sound level (time-averaged sound level); L_{max} = maximum sound level during the measurement interval; dBA = A-weighted decibels.

4.6.3 Relevant Plans, Policies, and Ordinances

Federal

There are no federal noise standards that would directly regulate environmental noise during construction and operation of the proposed Project. The following is provided because guidance summarized herein is used or pertains to the analysis.

Federal Transit Administration

Though not regulatory in nature, the U.S. Department of Transportation Federal Transit Administration (DOT) has established vibration guidance for various land uses based on their potential for human annoyance and activity disruption. In general, and according to DOT guidelines, groundborne vibration of 75 velocity decibels (VdB) or greater would be considered potentially annoying. Vibration of 85 VdB or greater would likely be highly annoying and disruptive for most land uses (DOT 2018). (VdB is a unit used to measure and describe vibration.) These guidelines are generally used to evaluate the significance of operational effects from transit projects. However, these guidelines are referenced in this EIR for the purposes of quantitatively describing the levels of vibration that are typically considered disruptive.

Typically, potential building and structural damages are the foremost concern when evaluating the impacts of construction-related vibration. Table 4.6-2 summarizes the DOT's vibration guidelines for building and structural damage.

Table 4.6-2. Groundborne Vibration Damage Potential

Building Category	Vibration Damage (in/sec PPV)
I. Reinforced-concrete, steel or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Source: DOT 2018.

Notes: PPV = peak particle velocity

State

Government Code Section 65302(g)

California Government Code Section 65302(g) requires the preparation of a noise element in a general plan, which must identify and appraise the noise problems in the community. The noise element must recognize the guidelines adopted by the Office of Noise Control in the State Department of Health Services and shall quantify, to the extent practicable, current and projected noise levels for the following sources in the general plan's planning area:

- Highways and freeways
- Primary arterials and major local streets

- Passenger and freight on-line railroad operations and ground rapid transit systems
- Aviation and airport-related operations
- Local industrial plants
- Other ground stationary noise sources contributing to the community noise environment

California General Plan Guidelines

The California General Plan Guidelines, published by the Governor's Office of Planning and Research (OPR), provides guidance for the acceptability of specific land use types within areas of specific noise exposure. Table 4.6-3 presents guidelines for determining acceptable and unacceptable community noise exposure limits for various land use categories. The guidelines also present adjustment factors that may be used to arrive at noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution. OPR guidelines are advisory in nature. Local jurisdictions, including the City of Pasadena, have the responsibility to set specific noise standards based on local conditions.

Table 4.6-3. Land Use Compatibility for Community Noise Environments

Land Use	Community Noise Exposure (CNEL)			
	Normally Acceptable[1]	*Conditionally Acceptable*[2]	*Normally Unacceptable*[3]	*Clearly Unacceptable*[4]
Residential-low density, single-family, duplex, mobile homes	50–60	55–70	70–75	75–85
Residential – multiple-family	50–65	60–70	70–75	70–85
Transit lodging – motel, hotels	50–65	60–70	70–80	80–85
Schools, libraries, churches, hospitals, nursing homes	50–70	60–70	70–80	80–85
Auditoriums, concert halls, amphitheaters	NA	50–70	NA	65–85
Sports arenas, outdoor spectators sports	NA	50–75	NA	70–85
Playgrounds, neighborhood parks	50–70	NA	67.5–77.5	72.5–85
Golf courses, riding stables, water recreation, cemeteries	50–70	NA	70–80	80–85
Office buildings, business commercial and professional	50–70	67.5–77.5	75–85	NA
Industrial, manufacturing, utilities, agriculture	50–75	70–80	75–85	NA

Source: OPR 2003

Notes: CNEL = community noise equivalent level; NA = not applicable

1 Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

[2] Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features have been included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning, will normally suffice.

[3] Normally Unacceptable: New construction or development should be discouraged. If new construction of development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise-insulation features must be included in the design.

[4] Clearly Unacceptable: New construction or development should generally not be undertaken.

Local

While the proposed Project would be located in the City of Pasadena, there are nearby noise-sensitive receptors in the cities of Pasadena and La Cañada Flintridge, as well as the unincorporated community of Altadena. The applicable noise standards of all three jurisdictions are provided below.

City of Pasadena

The City of Pasadena has established guidelines and standards in its General Plan and Municipal Code. The Noise Element recognizes that construction activity is a source of occasional temporary nuisance noise throughout the City and that these and other such nuisance noises are common to cities and, because of their unpredictable nature, must be addressed on a case-by-case basis.

The following policies are applicable to the Project:

> **Policy 7b:** The City will encourage limitations on construction activities adjacent to sensitive noise receptors.
>
> **Policy 7c:** The City will encourage construction and landscaping activities that employ techniques to minimize noise.

The City Municipal Code (Title 9, article IV, Chapter 9.36, Noise Restrictions) is the City's Noise Ordinance. It is the City's policy ". . . to prohibit unnecessary, excessive and annoying noises from all sources . . . Noise at certain levels is detrimental to the health and welfare of the general public". The following sections of the Noise Ordinance are applicable to the Project:

Section 9.36.050 – General Noise Sources

This is applicable for long-term, operational noise and states "It is unlawful for any person to create, cause, make or continue to make or permit to be made or continued any noise or sound which exceeds the ambient noise level at the property line of any property by more than 5 decibels". In accordance with Section 9.36.040, adjustments are made to the allowable noise level for steady audible tones, repeated impulsive noise, and noise occurring for limited time periods.

Section 9.36.070 – Construction Projects

This section is applicable for Construction Projects and states:

A. No person shall operate any pile driver, power shovel, pneumatic hammer, derrick power hoist, forklift, cement mixer or any other similar construction equipment within a residential district or within a radius of 500 feet therefrom at any time other than as listed below:
   1. From 7:00 AM to 7:00 PM Monday through Friday;
   2. From 8:00 AM to 5:00 PM on Saturday; and

3. Operation of any of the listed construction equipment is prohibited on Sundays and holidays.

B. No person shall perform any construction or repair work on buildings, structures or projects within a residential district or within a radius of 500 feet there from in such a manner that a reasonable person of normal sensitiveness residing in the area is caused discomfort or annoyance at any time other than as listed below:
   1. From 7:00 AM to 7:00 PM Monday through Friday;
   2. From 8:00 AM to 5:00 PM on Saturday; and
   3. Performance of construction or repair work is prohibited on Sundays and holidays.

C. For purposes of this section, holidays are New Year's Day, Martin Luther King Jr. Day, Lincoln's Birthday, Washington's Birthday, Memorial Day, Independence Day, Labor Day, Veterans Day, Thanksgiving Day, Day after Thanksgiving, and Christmas.

Section 9.36.080 – Construction Equipment.

This section states that "It is unlawful for any person to operate any powered construction equipment if the operation of such equipment emits noise at a level in excess of 85 dBA when measured within a radius of 100 feet from such equipment".

Los Angeles County

The Los Angeles County noise restrictions are applicable to the properties within the Altadena community. Section 12.08 of the County of Los Angeles Code (County Code) contains the County Noise Ordinance. The County sets maximum construction noise levels "at residential structures." As shown in Table 4.6-5 below, the daytime noise level limit at single-family residences for mobile construction equipment is 75 dBA. The County's Noise Ordinance requirements are not applicable to mobile noise sources such as automobiles or heavy trucks when traveling in a legal manner on public roadways or on private property. Mobile noise source control is preempted by federal and State laws.

Table 4.6-4. County of Los Angeles Construction Noise Limits

Time Interval	Single-Family Residential (dBA)	Multi-Family Residential (dBA)	Semi-Residential or Commercial (dBA)
Mobile Equipment			
Daily, except Sundays and legal holidays, 7:00 AM to 8:00 PM	75	80	85
Daily, 8:00 PM to 7:00 AM, and all day Sunday and legal holidays	60	64	70
Stationary Equipment			
Daily, except Sundays and legal holidays, 7:00 AM to 8:00 PM	60	65	70
Daily, 8:00 PM to 7:00 AM, and all day Sunday and legal holidays	50	55	60

Source: County of Los Angeles 2013

City of La Cañada Flintridge

The City of La Cañada Flintridge does not have quantitative standards for construction noise.

Applicable Vibration Standards

Neither the City of Pasadena nor the City of La Cañada Flintridge has vibration standards. Section 12.08.560 of the Los Angeles County Code states, "Operating or permitting the operation of any device that creates vibration which is above the vibration perception threshold of any individual at or beyond the property boundary of the source if on private property, or at 150 feet (46 meters) from the source if on a public space or public right-of-way is prohibited. The perception threshold shall be a motion velocity of 0.01 in/sec over the range of 1 to 100 Hertz".

4.6.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to noise are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to noise would occur if the project would:

a) Result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
b) Result in generation of excessive groundborne vibration or groundborne noise levels.
c) For a project located in the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Through the analysis in the Initial Study (see Appendix A-1), it was determined that the proposed Project would not expose people residing or working in the Project area to excessive noise levels as a result of the Project being located in the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport. (i.e., Threshold c). Accordingly, this issue is not further analyzed in the EIR. Based on the remaining thresholds, a significant impact related to noise would occur if the project would:

a) Result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
b) Result in generation of excessive groundborne vibration or groundborne noise levels.

4.6.5 Environmental Impacts Analysis

Threshold 4.6a. Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction of the Project improvements would be phased, with construction in Area 2 requiring approximately 3 months (August 2021 through October 2021), and construction in Area 3 requiring approximately 9 months (March 2022 through November 2022). During construction of the proposed Project, activities would include demolition of existing structures, site preparation, grading/excavation, construction of structures, paving, dewatering, and application of architectural coating. Construction-related noise would also be generated on local roadways, from worker vehicles and trucks accessing the Project site.

On-Site Construction Noise

Construction activities would require the use of standard construction equipment such as loaders, dozers, backhoes, dump trucks, graders, pumps, rollers, and cranes. Construction equipment with substantially higher noise-generation characteristics (such as pile drivers, rock drills, blasting equipment) would not be necessary for the proposed Project, although the use of a hoe ram (i.e., a percussive hammer-type device) is anticipated during demolition. Additionally, in the interest of minimizing the export of excavated materials from the Project site, the City may implement a mechanical shaker to sort and sift through excavated soils to separate finer soils from larger rocks. These devices have been accounted for in the construction noise analysis.

The range of maximum noise levels for various types of construction equipment at a distance of 50 feet is depicted in Table 4.6-6. The noise values represent maximum noise generation, or full-power operation of the equipment. Simultaneous operation of more than one piece of equipment would increase the sound level of the equipment operating individually. As an example, a loader and two dozers, all operating at full power and relatively close together, would generate a maximum sound level of approximately 90 dBA at 50 feet from their operating locations. As one increases the distance between equipment, and/or the separation of areas with simultaneous construction activity, dispersion and distance attenuation reduce the effects of separate noise sources added together. In addition, typical operating cycles may involve 2 minutes of full-power operation, followed by 3 or 4 minutes at lower levels. The average noise level during construction activity is generally lower, since maximum noise generation may only occur up to 50% of the time.

Table 4.6-6. Construction Equipment Maximum Noise Emission Levels

Equipment	Maximum Sound Level (dBA) 50 Feet from Source
Roller	74
Concrete vibrator	76
Pump	76
Saw	76

Source: DOT 2018.

The nearest sensitive receptors to Area 2 are the residential land uses approximately 800 feet to the east in Altadena, part of unincorporated Los Angeles County, the USFS compound approximately 870 feet to the northwest in Pasadena, and residential land uses approximately 1,700 feet to the west in the City of La Cañada Flintridge[1]. The nearest sensitive receptors to Area 3 are the residential land uses approximately 250 feet to the east in Altadena and in Pasadena. Whereas the Area 2 active Project construction area is quite small, the construction area constituting Area 3 is relatively large. While the nearest work within Area 3 would take place within 250 feet of the nearest residences, construction activities would more typically take place approximately 400 feet from the nearest residences[2].

The Federal Highway Administration's (FHWA) Roadway Construction Noise Model (RCNM) (FHWA 2008) was used to estimate construction noise levels at the nearest noise-sensitive land uses. Although the model was funded and promulgated by the Federal Highway Administration, the RCNM is often used for non-roadway projects because the

1 Pedestrians, hikers, bicyclists, and equestrians could come near construction activities in Areas 2 and 3 while using the Gabrielino Trail/Access Road. These recreational users are not considered noise-sensitive receptors because they are mobile and a temporary presence, like pedestrians on a residential street, or bicyclists on a bike path. Nearby recreational users would have the option of modifying their activities to avoid exposure to undesirable noise levels. Additionally, because the users of the trail are by definition mobile, the duration of noise exposure of any one individual to noise from construction would be brief.

2 Because proposed construction activities would take place both near and far relative to any one noise-sensitive receiver, the concept of the "acoustic center" is used for providing typical noise levels. The acoustic center is the idealized point from which the energy sum of all activity noise, near and far, would be centered. The acoustic center is derived by taking the square root of the product of the nearest and the farthest equipment noise–receiver distances.

same types of equipment used for roadway projects are also used for other project types. Input variables for the RCNM consist of the receiver/land use types, the equipment type and number of each (e.g., two graders, a loader, a tractor), the duty cycle for each piece of equipment (e.g., percentage of hours the equipment typically works per day), and the distance from the noise-sensitive receiver. No topographical or structural shielding was assumed in the modeling. The RCNM has default duty-cycle values for the various pieces of equipment, which were derived from an extensive study of typical demolition activity patterns (FHWA 2008). Those default duty-cycle values were used for this noise analysis.

Using the Federal Highway Administration's RCNM construction noise model and construction information (types and number of construction equipment by phase), the estimated noise levels from construction were calculated (summarized in Table 4.6-7). At Area 2, noise levels were estimated at the residential areas to the east and to the west, and the USFS compound to the northwest; at Area 3, noise levels were estimated at the nearest residences (located to the east) for both the relatively brief periods of time during which construction would take place at the nearest source-receiver distances, and during the longer periods of time when construction would take place both near and far from adjacent receivers. The RCNM inputs and outputs are provided in Appendix G. Note that these estimates are conservative, as they do not account for any potential reduction in noise levels from topographical shielding, ground absorption effects, or atmospheric absorption.

Table 4.6-7 Construction Noise Modeling Results

Project Phase	Noise-Sensitive Receiver	Nearest or Typical Construction Activity Distance (feet)	L_{eq} (dBA)
Area 2 Construction Phases			
Area 2 - Demolition	Residences to the east of Project Site	Nearest / Typical Construction Work (800')	63
	USFS Compound to the northwest of Project Site	Nearest / Typical Construction Work (870')	62
	Residences to the west of Project Site	Nearest / Typical Construction Work (1,700')	56
Area 2 - Site Preparation	Residences to the east of Project Site	Nearest / Typical Construction Work (800')	59
	USFS Compound to the northwest of Project Site	Nearest / Typical Construction Work (870')	58

Source: Appendix G

As shown in Table 4.6-7, the highest noise levels from Area 2 construction are predicted to occur at residences located to the east of the work (located in Altadena, in unincorporated Los Angeles County) during the demolition phase, when noise levels are estimated to be approximately 63 dBA L_{eq}. This would be less than the Los Angeles County noise standard for construction of 75 dBA. At the USFS compound (located within the City of Pasadena), the highest estimated noise levels are estimated to be approximately 62 dBA $L_{eq.}$ This level would be less than the noise limit of 85 dBA set forth in Section 9.36.080 of the City of Pasadena Municipal Code. At residences located to the west (located in the City of La Cañada Flintridge), the highest estimated noise levels are estimated to occur during demolition and grading / excavation, when noise levels are estimated to be approximately 56 dBA L_{eq}. This noise level is relatively low, by community noise standards; construction work may be audible at times, but would not be considered to be intrusive by a person of average sensibilities. Thus, the construction noise impacts from Area 2 would be less than significant, and no mitigation is required. Additionally, the construction work within Area 2 must be conducted in accordance with Section 9.36.070 of the City of Pasadena Municipal Code, which limits

noise-generating construction activities to between the hours of 7:00 AM and 7:00 PM Monday through Friday and between the hours of 8:00 AM and 5:00 PM Saturday in or within 500 feet of a residential district. No noise-generating construction activities would be conducted on Sundays and federal holidays.

At noise-sensitive areas adjacent to Area 3 (residents within Altadena and the City of Pasadena), the highest construction noise levels at the nearby residences located are predicted to occur during the demolition phase and grading/excavation phases, when noise levels are estimated to be approximately 67 dBA L_{eq} and 68 dBA L_{eq}, respectively, when construction occurs near the eastern Project boundary. More typically, when construction activities occur throughout Area 3, noise levels would range from approximately 51 to 63 dBA L_{eq}. These levels are below the noise limits of 75 dBA set by Section 12.08 of the County Code (i.e., County Noise Ordinance) and of the limit of 85 dBA set forth in Section 9.36.080 of the City of Pasadena Municipal Code. Therefore, impacts would be less than significant.

During the louder phases of construction, the estimated noise levels would be approximately 5 decibels above measured ambient noise levels; the noise would be audible and could interfere with the typical/normal volumes of speech of persons outside. Pedestrians, hikers, bicyclists, and equestrians could come near construction activities in Areas 2 and 3 while using the Gabrielino Trail/Access Road. These recreational users are not considered sensitive receptors to noise because they are mobile and a temporary presence, similar to pedestrians on a residential street. Although there is an expectation for noise in natural open space areas, such as the Arroyo Seco, to be minimal, the proposed Project's construction activities would be temporary and not unusual in duration or intensity. Recreational users of the Gabrielino Trail/Access Road would have the option of modifying their activities to avoid exposure to undesirable noise levels. Additionally, because the users of the trail are by definition mobile, the duration of noise exposure of any one individual to noise from construction would be brief.

As previously discussed in Section 2, Environmental Setting, of this Draft EIR and presented in Table 2-1, the City is committed to implementing noise mitigation, as repeated below in MM-NOI-1, through the implementation of the adopted Mitigation Monitoring and Reporting Program (MMRP) associated with the 2015 IS/MND. Therefore, MM-NOI-1 would be incorporated into the Project without alterations from the MMRP, in order to further reduce noise from construction within Area 3 and to support Policies 7b and 7c of the Pasadena Comprehensive General Plan's Noise Element. MM-NOI-1 specifies noise-control measures to minimize noise effects upon sensitive receptors. In addition, the Project would be conducted in accordance with the City's Municipal Code requirements regarding limitations on noise-generating construction activities to the specified hours.

The effectiveness of MM-NOI-1 would vary from several decibels, which in general is a relatively small change, to ten or more decibels, which subjectively would be perceived as a substantial change, depending upon the specific equipment and the original condition of that equipment, the specific locations of the noise sources and the receivers, etc. Installation of more effective silencers could range from several decibels to well over 10 decibels. Reduction of idling equipment could reduce overall noise levels from barely any reduction to several decibels.

Implementation of MM-NOI-1 and compliance with applicable municipal code restrictions related to construction activities would ensure that short-term construction noise generated by on-site construction activity would not result in substantial temporary increases in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Off-Site Roadway Construction Noise

The Project would result in local, short-term increases in roadway noise as a result of construction traffic. Project-related traffic would include workers commuting to and from Areas 2 and 3; vendors bringing materials; and haul trucks removing demolished structural materials, vegetative materials, and excavated soils from the Project site, as well as trucks entering the Project area to deliver materials, concrete, etc. Construction trucks hauling soils and debris to and from off-site disposal facilities are expected to come to the site from I-210 at the Windsor Avenue off-ramp and head north on Windsor Avenue to the intersection with Ventura Street. At this intersection is a fork in the road, one leading to Explorer Road into Area 3 and the other leading to the gated North Arroyo Boulevard, which passes adjacent to residential properties and the Behner WTP. North of the JPL Bridge, North Arroyo Boulevard (the Gabrielino Trail/Access Road) would be used for construction vehicles and equipment transport to and from Area 2. Explorer Road and potentially North Arroyo Boulevard would be used to access Area 3.

Construction worker estimates and vendor truck trips by construction phase were based on information provided by the City. These include:

- 26 daily worker trips during Area 2 and Area 3 construction work;
- 2 daily vendor trucks during most of the construction work (both Areas 2 and 3);
- An average of 14 haul truck trips per day during Area 2 work;
- A peak of 86 daily haul truck trips during Area 2 work for approximately 5 working days,
- An average of 84 haul truck trips per day during Area 3 work; and,
- A peak of 475 daily haul truck trips during Area 3 demolition work, for approximately 10 working days.

Using the construction trip estimates and the FHWA traffic noise prediction model (TNM 2.5) (FHWA 2004), traffic noise level modeling was performed in order to estimate the temporary increase in noise from construction worker and heavy truck trips, when added to the existing traffic volumes. Based upon a review of average daily traffic volumes (ADT) for weekday counts conducted by the Los Angeles County Department of Public Works (LACDPW), the most recent available ADTs were selected. On North Windsor Avenue between Woodbury Road/Oak Grove Drive and Figueroa Drive, the most recent ADT (conducted in 2017) was 12,128 vehicles per day. On North Windsor Avenue between Figueroa Drive and Ventura Street the most recent ADT (conducted in 2019) was 8,121 vehicles per day. The existing average daily weekday ADT for Explorer Road north of Windsor Avenue (in 2017) was 3,492 (County of Los Angeles 2020). Typically, a growth factor would be applied to traffic volume years not occurring in the baseline year (2019); however, based upon a review of historic ADT counts in the area (which seemed to trend both slightly positive and slightly negative in recent years), it was deemed inappropriate to assume a growth rate.

The ADT volumes cited above for North Windsor Avenue and Explorer Road were used as the basis to which the typical and peak-period construction vehicles were added, for the purpose of estimating the resulting traffic noise increase during Project construction. As shown in Table 4.6-8, during both typical and peak-period Area 2 work, the increase in average hourly traffic noise levels would be approximately 1 dB, when rounded to whole decibels. Although individual truck pass-bys would be clearly audible, the change in traffic noise level on an hourly average basis would be negligible.

Table 4.6-8. Construction Traffic Noise Modeling Results

Receiver	Existing (L_{eq} (dBA)	Existing plus Area 2 Work (Typical) (L_{eq} (dBA)	Existing plus Area 2 Work (Peak) (L_{eq} (dBA)	Increase (Typical) (dB)	Increase (Peak) (L_{eq}) (dB)	Existing plus Area 3 Work (Typical) (L_{eq} (dBA)	Existing plus Area 3 Work (Peak) (L_{eq} (dBA)	Increase (Typical) (L_{eq}) (dB)	Increase (Peak) (L_{eq}) (dB)
Receiver 1 - North Windsor Avenue - Woodbury Road / Oak Grove Drive to Figueroa Drive	65	66	66	1	1	66	68	1	3
Receiver 2 - North Windsor Avenue - Figueroa Drive to Ventura Street	64	64	65	0	1	64	67	0	3
Receiver 3 - Explorer Road - North of North Windsor Avenue	51	n/a	n/a	n/a	n/a	53	57	2	6

Source: Appendix G

Note: Traffic noise modeling receivers located at a receiver distance of 50 feet from roadway centerline for North Windsor Avenue and 150 feet for Explorer Road, based on typical source-receiver distances in these areas.

n/a – no truck traffic anticipated on Explorer Road during Area 2 work.

As shown in Table 4.6-8, during typical Area 3 work, the increase in average hourly traffic noise levels would range from approximately 0 dB (when rounded to whole numbers) to 1 dB along North Windsor Avenue and approximately 2 dB along Explorer Road. Again, individual truck pass-bys would be audible; however, because a change in noise level of 3 dB or less is typically not readily perceptible to the average listener, these short-term noise increases would be less than significant.

During peak-period construction work in Area 3, an increase of approximately 3 dB is predicted along North Windsor Avenue, and an increase of approximately 6 dB is predicted along Explorer Road. Because a change in noise level of 3 dB or less is typically not readily perceptible to the average listener, the increase along North Windsor Avenue is not considered significant. The short-term noise increase along Explorer Road would be perceptible; however, the predicted noise level from Area 3 peak-period traffic would be quite low and would be less than existing measured ambient noise levels in the vicinity (i.e., ambient noise levels of approximately 62 to 63 dBA dBA L_{eq}).

Therefore, construction traffic, including haul/dump trucks related to construction activities, would not result in substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Impacts would be less than significant and no mitigation is required.

Long-Term Operational Impacts

As described in Section 3, Project Description, PWP's future schedule of operation and maintenance activities for Project-related facilities would not substantively differ from the current maintenance routine and procedures. No new employees are required for the long-term operation of the Project components; therefore, no long-term operational noise or vibration from traffic would result. At Area 2, there would be the addition of two new hydraulic motors and two hydraulically operated winches. The motors, which would be relatively small (approximately 5.5 inches in length) would be used to actuate the slide gate and screen at the intake (outside of the service building). The hydraulically operated winch would be located at the crest gate, but the equipment to control the winch would be located within the proposed approximately 106-square foot Service Building, and thus completely enclosed. The operation of this equipment would be generally limited to during storm events. Typically, the crest gate would be in either the up or down position and there would be no mechanical noise. The crest gate would only modulate a small percentage of the time (approximately 15 days out of an average year, at which time where there would be intermittent operation). In all, it is estimated that the crest gate would be repositioned up or down approximately 10 times in an average year during the winter/wet season, with each change taking a few minutes. In summary, mechanical equipment noise would be infrequent and relatively low in noise level, and therefore would result in a less than significant noise impact. Therefore, at Area 3, no long-term operational noise or vibration from mobile equipment or stationary machinery would result. As such, the Project not result in generation of a substantial permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Impacts would be less than significant and no mitigation is required.

Threshold 4.6b Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Short-Term Construction Impacts

Construction activities that might expose persons to excessive ground-borne vibration or ground-borne noise could cause a potentially significant impact. Ground-borne vibration information related to construction activities (including demolition) has been collected by the California Department of Transportation (Caltrans 2013). Information from Caltrans indicates that continuous vibrations with a peak particle velocity of approximately 0.1 inches per second begin to annoy people. The heavier pieces of construction equipment, such as bulldozers, would have peak particle velocities of approximately 0.089 inches per second or less at a distance of 25 feet. The same vibration level (0.089 inches per second PPV at a distance of 25 feet) is cited for a hoe ram (DOT 2018).

Ground-borne vibration is typically attenuated over short distances. At the distance from the nearest vibration-sensitive receivers near Area 2 (residences located approximately 800 feet to the east) to where demolition / construction activity would be occurring on the Project site, and with the anticipated construction equipment, the peak particle velocity vibration level would be approximately 0.0005 inches per second. These vibration levels would be well below the vibration threshold of potential annoyance of 0.1 inches per second, as well as Los Angeles County's threshold of perception standard of 0.01 inches per second.

At the distance from the nearest vibration-sensitive receivers near Area 3 (residences located approximately 250 feet to the east) to where demolition/construction activity would be occurring on the Project site, and with the anticipated construction equipment, the peak particle velocity vibration level would be approximately 0.0028 inches per second. These vibration levels would also be well below the vibration threshold of potential annoyance of 0.1 inches per second, as well as Los Angeles County's threshold of perception standard of 0.01 inches per second.

The major concern with regards to construction vibration is related to building damage, which typically occurs at vibration levels of 0.5 inches per second or greater for buildings of reinforced-concrete, steel or timber construction. As discussed above, the anticipated vibration levels associated with on-site Project construction and at Areas 2 and 3 would be approximately 0.0005 and 0.0028 inches per second respectively, which are well below the threshold of 0.5 inches per second for building damage. Therefore, short-term construction activities of the proposed Project would not result in generation of excessive short-term groundborne vibration or groundborne noise levels. Impacts would be less than significant and no mitigation is required.

Long-Term Operational Impacts

As described in Section 3, Project Description, PWP's future schedule of operation and maintenance activities for Project-related facilities would not substantively differ from the current maintenance routine and procedures. No new employees are required for the long-term operation of the Project components; therefore, no long-term operational vibration from traffic would result. As discussed previously, Area 2 would include the installation of several pieces of mechanical equipment (motors and winches). However, these items would be relatively small, would not produce substantial levels of groundborne vibration and would operate infrequently. At Area 3, no new noise-generating land uses are proposed; therefore, no long-term operational vibration from mobile equipment or stationary machinery would result. As such, the Project will not result in generation of excessive long-term groundborne vibration or groundborne noise levels. Impacts would be less than significant and no mitigation is required.

4.6.6 Cumulative Impacts

The cumulative projects listed in Section 4.2.2, List of Cumulative Projects, summarizes the potential for overlapping short-term construction activities between the proposed Project and cumulative projects. The general area of these projects is identified in Figure 3-5, Cumulative Projects, in Section 3, Project Description. The geographic scope of the area potentially affected by cumulative noise impacts from construction and operation consists of receptor locations that could be exposed to noise and/or vibration from the proposed Project and from related projects. Because both noise and vibration attenuate with distance, the geographic scope consists of the Project study area and related projects within approximately 0.25-mile. Additionally, both noise and groundborne vibration are relatively ephemeral in nature; thus, Project timing is an important consideration.

As discussed in greater detail in Section 4, Environmental Impact Analysis of this Draft EIR, the cumulative projects were chosen based on direction from the City. ASCP Area 1 construction, while relatively near Area 2, is anticipated to begin in 2023 (and thus, after the completion of the proposed Project). The Devil's Gate Reservoir Sediment Removal and Management Project is located to the southwest of Area 3; sediment removal and placement is ongoing and expected to conclude in Fall 2022, with habitat restoration continuing through Fall 2023; the OGAI projects could begin construction as early as 2021 if funds become available, but

is located over 0.42-mile from the Project site. The LACFCD Pumpback/Intake at Devil's Gate (Devil's Gate Dam to Eaton) project would begin sometime after the completion of Devil's Gate and the proposed Project; and the Explorer Groundwater Well construction could potentially be concurrent with proposed Project Area 3, although no CEQA documentation has yet been prepared. Of the projects identified and described in Section 4, Environmental Impact Analysis, the Devil's Gate Reservoir Sediment Removal and Management Project is the one nearest to the Project site[3] and with a potential overlap in construction activities. Therefore, the Devil's Gate project is the one with the greatest potential to result in cumulative noise impacts with regards to the proposed Project.

On-Site Construction Noise

As discussed above, the analysis of on-site construction noise determined that at noise-sensitive areas adjacent to Area 3 (the portion of the Project site nearest to the Devil's Gate project), the highest construction noise levels at the nearby residences are predicted to occur during the demolition phase and grading / excavation phases, when noise levels are estimated to be approximately 67 dBA L_{eq} and 68 dBA L_{eq}, respectively, when construction occurs near the eastern Project boundary. These noise levels were below the limits set by the City and County Code requirements and were less than significant. MM-NOI-1 would be implemented to further reduce noise from construction within Area 3 and to support Policies 7b and 7c of the Pasadena Comprehensive General Plan's Noise Element.

The Project would also comply with Section 9.36.070 of the City of Pasadena Municipal Code, which limits noise-generating construction activities to between the hours of 7:00 AM and 7:00 PM Monday through Friday and between the hours of 8:00 AM and 5:00 PM Saturday in or within 500 feet of a residential district. The Devil's Gate project's construction equipment noise emissions were determined in that project's EIR to be less than significant; furthermore, the portion of the Project site representing an active work area (Basin J) is located approximately 500 feet from the Devil's Gate project site to the southwest. Therefore, it is unlikely that construction noise from the two projects would combine in a measurable fashion at nearby noise-sensitive receivers, located approximately 250 feet or more further to the east (at 750 feet from the Devil's Gate work, the noise level would be diminished by approximately 10 dB compared to the same noise level at 250 feet). Therefore, with implementation of MM-NOI-1 and compliance with applicable municipal code restrictions related to construction activities for the Project and cumulative projects, short-term construction noise generated by on-site construction activity would not result in cumulatively considerable substantial temporary increases in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

[3] Note that construction equipment assumptions associated with specific components in Areas 2 and 3 that are approved to move forward without additional environmental review have been incorporated as part of the construction noise analysis addressed in Section 4.6.5, and are thus not considered as part of this cumulative impacts discussion.

Off-Site Roadway Construction Noise

As discussed above, the analysis of off-site construction noise determined that the short-term noise level increase from the Project along North Windsor Avenue would be 1 dB or less; along Explorer Road, the short-term noise level increase would be 2 dB or less. Explorer Road (and the receivers near Explorer Road) are located approximately 0.7-mile or further from the construction route associated with the Devil's Gate project (North Windsor Avenue, Oak Grove Drive, Berkshire Place). The portion of the Project's construction route that would be in proximity to and partially coincident with the Devil's Gate project is limited to the area of North Windsor Avenue at Oak Grove Drive and adjacent to the I-210 freeway. As shown in Table 4.6-8, the predicted noise level increase in this area would be 1 dB or less. Similarly, the predicted noise level increase in this area from the Devil's Gate project is 0 dB[4]. Thus, while individual truck pass-by noise would be clearly audible to nearby noise-sensitive receivers located near North Windsor Avenue and Oak Grove Drive, the cumulative increase would be negligible, less than significant and not cumulatively considerable.

Vibration

The proposed Project and related projects may generate vibration during construction processes. Ground vibration generated by construction equipment spreads through the ground and diminishes greatly in magnitude with increases in distance. As described above, vibration produced during construction of the Project would be well below thresholds of perception, annoyance or building damage. The Devil's Gate project EIR determined that there could be an exceedance of the Los Angeles County threshold of perception; a mitigation measure was required, restricting the use of large bulldozers and other large equipment within 180 feet of residential uses. With implementation of this mitigation measure, it was determined that the resultant vibration would be less than significant. Additionally, the closest portion of the Project site representing an active work area (Basin J) is located approximately 500 feet from the Devil's Gate Project site to the southwest[5]. Therefore, construction vibration from the two projects are not expected to combine at nearby noise-sensitive receivers. Cumulative impacts related to construction vibration would therefore be less than significant.

Long-Term Operational Impacts

Once operational, the proposed Project would not generate new sources of noise or groundborne vibration. As such, it would not have the potential to contribute to any long-term, cumulatively considerable impacts related to operational noise or vibration.

---

4 As shown in Table 3.14-6, Final EIR Devil's Gate Reservoir Sediment Removal and Management Project. Los Angeles County. Accessed 02/19/2020. https://dpw.lacounty.gov/wrd/Projects/DevilGate/FEIR/Devils_Gate_FEIR_2014_10_20_Vol_1_Section_3.pdf. October 2014

5 At 500 feet, and with the anticipated construction equipment, the peak particle velocity vibration level would be approximately 0.001 inches per second, which would be well below the vibration threshold of potential annoyance of 0.1 inches per second, as well as Los Angeles County's threshold of perception standard of 0.01 inches per second.

4.6.7 Mitigation Measures

MM-NOI-1 The City and/or their Construction Contractor shall implement the following noise reduction measures during all construction activities:

- Equip all construction equipment (fixed or mobile) with properly operating and maintained mufflers, consistent with or exceeding manufacturers' standards.
- Ensure that construction equipment engine enclosures and covers as provided by manufacturers shall be in place during operation.
- Place all stationary construction equipment so that the equipment is as far as feasible from noise-sensitive receptors and so that the emitted noise is directed away from the noise-sensitive receptors.
- Locate equipment and materials staging in areas that will create the greatest distance between staging area noise sources and noise-sensitive receptors during Project construction.
- Ensure that construction equipment is shut down when not in use.
- Limit haul truck deliveries to the same hours specified for the operation of construction equipment.

4.6.8 Level of Significance After Mitigation

With implementation of MM-NOI-1, temporary noise increases from construction activities would be less than significant.

No mitigation is required for short-term construction vibration, or long-term operational noise or vibration impacts.

4.7 Recreation

4.7.1 Methodology

This section describes the existing conditions of recreational resources of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts to recreational resources, and identifies mitigation measures related to implementation of the proposed Project. Recreational resources include facilities developed for recreation, such as (but not limited to) designated parks, trails, and picnic areas, as well as land where dispersed recreational activities exist, such as hiking, biking, horseback riding, and bird-watching/nature walks.

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, the Appendices to the Initial Study are included in Appendix A-2, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

4.7.2 Existing Conditions

Regional Recreational Facilities

Angeles National Forest

The Angeles National Forest includes 662,983 acres located within Los Angeles, San Bernardino and Ventura Counties. According to the Land Management Plan (LMP) for the Southern California National Forests, including the Angeles National Forest (ANF), national forests offer an escape from busy urban life by providing open space and a wide variety of recreation opportunities. They serve as an outdoor classroom, a 'living laboratory,' for learning about our natural and cultural heritage and the importance of conservation.

Land use zones set forth in the LMP were used to map the ANF for the purpose of identifying appropriate management types of 'uses' that help demonstrate the United States Forest Service's (USFS) intent regarding the anticipated level of public land use in all areas of the national forest. As identified in the 2014 Amendment to the LMP, the areas within the Arroyo Seco watershed within the ANF are identified as "Non-Forest System Land", "Developed Area Interface", "Back Country", "Back Country, Motorized Use Restricted" and "Back Country, Non-Motorized" (USFS 2005).

The Developed Area Interface zone includes a broad range of higher intensity uses, with a management intent to limit development to a slow increase of carefully designed facilities to help direct use into the most suitable areas and concentrating on improving existing facilities before developing new ones. The Back Country zone allows a broad range of uses, with a management intent to retain the natural character inherent in this zone and limit the amount and type of development. The Back Country, Motorized Use Restricted zone allows a range of low-intensity uses, with a management intent to retain the natural character of the zone and limit development to new road construction and maintenance and no increase or a very low level of increase in development. The Back Country, Non-Motorized zone allows for a range of non-motorized public uses, with a management intent to typically retain the undeveloped character and natural appearance of this zone and to limit the level of development. Facility construction except trails is generally not allowed, but may occur in remote locations where road access is not needed for maintenance (USFS 2005).

The proposed Project is not located within the boundaries of the ANF; however, Area 2 is located just south of the USFS boundary. Recreational users of the Gabrielino Trail/Access Road regularly enter into the ANF and are within the portion of the San Gabriel Mountains managed by the Los Angeles Gateway Ranger District, which is not located within the designated National Monument (USFS 2005).

Rim of the Valley Corridor

The National Parks Service (NPS) recommended to the United States Congress in 2016 that a 170,000-acre boundary adjustment be made to include the Rim of the Valley Corridor into the Santa Monica Mountains National Recreation Area (SMMNRA). The Rim of the Valley Corridor is the area generally including the mountains encircling the San Fernando, La Crescenta, Santa Clarita, Simi, and Conejo Valleys in southern California. The NPS stated in its "Rim of the Valley Corridor Special Resource Study" that the SMMNRA boundary adjustment would increase recreational opportunities to a range of southern California urban communities. Figure 4.7-1, Recreational Areas and Proposed Boundary of the Rim of the Valley Corridor, identifies the proposed Rim of the Valley Trail and its associated boundary adjustment area, as well as other lands designated for recreation within southwestern Los Angeles County (NPS 2015).

The proposed boundary adjustment would add portions of the Los Angeles River and Arroyo Seco corridors, the Verdugo Mountains-San Rafael Hills, the San Gabriel Mountains foothills, the Simi Hills, the Santa Susana Mountains, and the Conejo Mountain area to SMMNRA. Existing parks such as Griffith Park, Hansen Dam Recreation Area, Sepulveda Basin (recreation areas and wildlife reserve), Los Encinos State Historic Park, Debs Park, El Pueblo de Los Angeles Historical Monument, and Los Angeles State Historic Park would serve as major portals into the Rim of the Valley Corridor area. The boundary adjustment would include cultural resources related to space exploration (i.e., NASA Jet Propulsion Laboratory [JPL]) and the Cold War that are located in the Arroyo Seco corridor and Simi Hills (NPS 2015).

As shown on Figure 4.7-1, the proposed Rim of the Valley Trail alignment would utilize the existing Gabrielino Trail/Access Road in the Angeles National Forest, connecting to the Arroyo Seco Trail at the JPL Bridge, which continues southerly adjacent to the NASA JPL campus and Oak Grove Sports Fields on the east side of the Devil's Gate Reservoir within the Hahamongna Watershed Park. The proposed Rim of the Valley Trail alignment would continue to use existing trails in the Central Arroyo Seco adjacent to Brookside Golf Course and the Rose Bowl, through the Lower Arroyo Seco, and into the City of Los Angeles (NPS 2016).

Local Recreational Facilities

City of Pasadena Recreational Facilities

The Arroyo Seco is the City's largest natural open space and is described as a deeply cut canyon linking the San Gabriel Mountains to the Los Angeles River. The Arroyo extends eight miles in Pasadena and includes three distinct geographic areas which are also citywide parks – Hahamongna Watershed Park (HWP) in the Upper Arroyo Seco, the Central Arroyo Seco, and the Lower Arroyo Seco. All three parks have a system of trails that connect the three areas to each other and to the larger regional trail system for horses and hikers (City of Pasadena 2012). Bicycles are permitted on existing paved surfaces within the HWP, although they are not allowed on the trails in the Arroyo Seco to keep horses and bicycles separate (City of Pasadena 2003). In addition to the HWP, Central Arroyo Seco, and Lower Arroyo Seco, the City of Pasadena and the County of Los Angeles have numerous other recreational opportunities in the vicinity of the Project, as shown on Figure 4.7-2, Recreational Facilities in the Project Vicinity.

A listing of the recreational facilities owned and operated by the City of Pasadena are listed in Table 4.7-1.

Arroyo Seco Master Plans

The importance of the Arroyo Seco as a valued resource to the City as a whole, prompted the need for the Arroyo Seco Master Plans. The Arroyo Seco provides opportunities for recreation as well as a rich ecosystem of natural flora and fauna within the Pasadena city limits. The Plans address development of recreational, educational and interpretive opportunities and protection and restoration of the ecosystem, while recognizing the important existing water supply and flood control functions of the area. The four planning documents that make up the Arroyo Seco Master Plans are, Design Guidelines for the Arroyo Seco (2003); Hahamongna Watershed Park Master Plan (2003); Lower Arroyo Master Plan (2003); and Central Arroyo Master Plan (2005) (City of Pasadena 2012).

Hahamongna Watershed Park (HWP) represents the lower 320 acres of the total 1,330 acres of the Upper Arroyo Seco. Hahamongna contains 90 acres of dedicated parkland known as the Oak Grove Area. This citywide park is largely natural open space area that provides passive recreational uses that coexist with the flood management operations of the Los Angeles County Flood Control District. The City of Pasadena established Hahamongna Watershed Park in 1993. Recreational uses in the park include hiking, bicycling, horseback riding, picnicking, soccer, baseball, softball, and disc golf.

The HWP/Upper Arroyo Seco provides recreational opportunities for area residents and visitors. Area 3 of the Project site is located within HWP, which has numerous trails that provide opportunities for hiking and equestrian activity in the area, including the Gabrielino Trail that provides access up the Arroyo Seco Canyon and into the ANF. Additionally, the Arroyo Seco Trail runs along both sides of the Arroyo Seco and is part of the Rim of the Valley Trail Corridor that connects the Santa Monica Mountains and the San Gabriel Mountains through trails in the San Fernando and La Crescenta Valleys (see Figure 4.7-1). This trail also continues south along the Central and Lower Arroyo Seco to connect with the Los Angeles River Trail. North of Devil's Gate Dam, there are several local trails on both sides of the Arroyo Seco, including the East Rim Trail, the West Rim Trail, the Mountain View Trail, the Flint Wash Trail, the Gould Canyon Trail, the Altadena Crest Trail, and the Gabrielino Trail.

The Central Arroyo Seco contains a total of 254 acres of parkland and open space. The developed public parkland in the Central Arroyo, Brookside Park and Area H, is 81 acres in size. The Central Arroyo Seco is the most developed of the three sections of the Arroyo. Both the Rose Bowl Stadium and Brookside Park are in the Central Arroyo. The Rose Bowl loop provides a 3-mile circuit around the periphery of the stadium and the golf courses and provides the most active outdoor gym in the city. The Central Arroyo is a popular location for large-scale events, primarily due to abundant parking and its proximity to the Rose Bowl.

The Lower Arroyo Seco contains a total of 150 acres of parkland and open space. The 51-acre developed parkland in the Lower Arroyo includes the casting pond, archery range, and the low-flow project area. The Pasadena Municipal Code designates it a Natural Preservation Area as indicated by its largely open space character (PMC 3.32.100). Prominent vistas of cultural landmarks such as the historic Colorado Street Bridge and the ribbon of historic arroyo stonewalls give this portion of the Arroyo Seco its distinction and contribute to the individual's recreational experience.

Trails

There are numerous recreational trails located in the Project area that provide recreational opportunities for pedestrians and equestrians. These trails are described below.

Gabrielino Trail/Access Road. The Gabrielino Trail is a regional trail that begins at the intersection of Windsor Avenue and Ventura Street. The trail lies along the east boundary of HWP north of Ventura Street. The Gabrielino Trail also functions as the vehicular access road that runs along the eastern boundary of Area 3 of the proposed Project and continues northward through Area 2 and into the ANF.

West Rim Trail. The West Rim Trail runs at the upper western edge of the Hahamongna Watershed (Oak Grove) Park, the West Rim Trail leads north from the Flint Wash trailhead connection to the Equestrian Staging Area and the upper terrace picnic area. The trail is currently restricted to equestrian and hiking use only. The northernmost portion of the trail is located within Area 3 of the proposed Project.

East Rim Trail. The East Rim Trail runs at the upper eastern edge of the HWP and connects with the West Rim Trail and provides a circular loop of connectivity from Oak Grove Park to the eastern side of the spreading basins, continuing southward on the east side of the Devil's Gate Reservoir. This trail follows the alignment of the Explorer Road, which traverses adjacent to the eastern edge of Area 3

Arroyo Seco (Rim of the Valley) Trail. The Arroyo Seco Trail, which is a portion of the Rim of the Valley Trail, links all three sections of the Arroyo Seco together. The Arroyo Seco Trail runs lower and below the East Rim and West Rim trails.

Altadena Crest Trail. The Altadena Crest Trail is located in the northern part of HWP and provides access to the Gabrielino Trail from the community of Altadena. This trail is currently restricted to equestrian and hiking use only.

Flint Wash Trail. The Flint Wash Trail is a County-maintained trail that begins at the southwest corner of HWP at the confluence of Flint Wash and Devil's Gate Reservoir. This Trail is located approximately 1-mile southwest of Area 3 of the Project site.

Gould Canyon Trail. The Gould Canyon trailhead is located just west of HWP and connects to the La Cañada Flintridge trail system. This trail is located approximately 0.57-mile southwest of Area 3 of the Project site.

Maintenance Roads/Unnamed Trails. In addition to designated trails, there is a network of informal trails (i.e., City-owned maintenance roads and LACFCD/Southern California Edison [SCE] easements) that are interconnected within the City's spreading basins that allow for connection between the Hahamongna Watershed (Oak Grove) Park and West Rim Trail on the west of Devil's Gate Reservoir to the East Rim Trail, Gabrielino Trail on the east of Devil's Gate Reservoir, and the Arroyo Seco Trail. These maintenance roads are often used as unofficial trails when reservoir water levels within the Devil's Gate Reservoir and conditions permit (County of Los Angeles 2013).

4.7.3 Relevant Plans, Policies, and Ordinances

Federal

There are no applicable federal regulations related to recreation.

State/Regional

There are no applicable state regulations related to recreation.

Local

City of Pasadena General Plan

The Project site has a General Plan Land Use designation of Open Space. "Open Space" is defined as, "…a variety of active and passive public recreational facilities and for City-owned open space facilities. This includes natural open spaces and areas which have been designated as environmentally and ecologically significant. This category also applies to land which is publicly owned, though in some instances public access may be restricted. Most importantly, this designation only applies to lands owned by the City" (City of Pasadena 2015).

The City of Pasadena's General Plan includes eight guiding principles that cumulatively represent the community's vision for the future. The guiding principles were developed through an extensive program of community outreach and input conducted over a six-year period. The guiding principles include, Land Use; Mobility; Housing; Green Space, Recreation and Parks; Open space and Conservation; Noise; Safety; and

Updates to the General Plan. The Green Space, Recreation and Parks; and Open space and Conservation Elements include goals, objectives and policies related to recreation, which pertain to the proposed Project. Applicable General Plan goals, objectives and policies are outlined below.

The Green Space, Recreation and Parks Element and Master Plan

The Green Space, Recreation and Parks Element and Master Plan of the City's General Plan (adopted November 2007) serves as a framework of the community's goals and objectives for open space, parks, and recreation facilities and programs. The Element and Master Plan work together to identify existing facilities and programs, assess how they are used, identify where additional park facilities or recreation programs are needed, and recommend how to best meet these needs (City of Pasadena 2015). The following objectives and policies are applicable to recreational facilities as they relate to the proposed Project (City of Pasadena 2007):

> Objective 1 – *Stewardship of the natural environment*: encourage and promote the stewardship of Pasadena's natural environment, including water conservation, clean air, natural open space protection, and recycling.
>
> > *Policy 1.2 – Protect Open Spaces:* Protect natural open areas, watersheds, and environmentally sensitive areas such as Hahamongna, Eaton Canyon, riparian areas, and other open spaces.
>
> Objective 2 – *Preservation and protection of the Arroyo Seco and adjacent open space areas*: recognize the importance to Pasadena of the history, cultural resources, and unique character of the Arroyo Seco, and conserve and enhance these assets.
>
> > *Policy 2.3 – Balance recreation with environmental protection*: Implement the Arroyo Seco Master Plans by balancing recreational opportunities with protection and restoration of the ecosystem, while recognizing the important existing water resources and flood management functions of the area.
> >
> > *Policy 2.4 – Promote multi-faceted use of the Arroyo*: Through implementation of the Arroyo Seco Master Plans, continue to maintain and enhance the area as a prime resource for quality of life of Pasadena residents.
>
> Objective 7 – Provide access to Parks: New projects should be planned so that neighborhood recreational needs of its future citizens are largely met on site or nearby and so that future facilities are integrated with, provide support for, and enhance the effectiveness of the overall recreation system in Pasadena. Growth and expansion in a particular area should be accompanied by commensurate growth and expansion in recreation facility, programming capacity, and natural open space capacity.
>
> > *Policy 7.2 – Access to open spaces within projects:* Projects should be connected to the public realm through vistas, physical access, and/or sightlines. Provide an adequate total quantity and equitable distribution of public or publicly accessible open spaces throughout the City.

Objective 17 – Facilitate ongoing community dialogue to ensure that residents' open space, parkland, and recreation needs are met.

Policy 17.1 - Community Input and Feedback: Provide methods for community members to offer ongoing information on their experiences with recreation and parks management, programs, and facilities. Surveys, questionnaires, website forms, and targeted outreach methods will provide feedback on areas in need of improvement and areas where goals are being met.

Open Space and Conservation Element

The Open Space and Conservation Element of the General Plan was adopted by the City Council on January 23, 2012. The Open Space and Conservation Element provides a blueprint for natural open space and conservation. Together with the Green Space, recreation and Park Element and Master Plan, the Open Space and Conservation Element serves as a framework of goals and policies to assure efficient stewardship of the City's green spaces, recreation facilities, and natural resources (City of Pasadena 2015). The following goals and objectives are applicable to recreational facilities as they relate to the proposed Project (City of Pasadena 2012):

Open Space Goal – Preserve, Acquire and Create Open Space

Objective: Preserve currently zoned open spaces, natural open spaces, hillsides, viewsheds, watersheds and recreational areas.

Open Space Goal – Develop Access & Connectivity for Wildlife and People

Objective: Ensure that all Pasadena residents have access to information about where open spaces are located and the transportation opportunities and options for getting to them.

Open Space Goal – Preserve, Restore and Maintain the Eaton Canyon Corridor and the Arroyo Seco

Objective: Preserve, restore and maintain the natural character of the Eaton Canyon Corridor and the Arroyo Seco as self-sustaining healthy ecosystems of plants and animals. Their natural character will continue to inspire people, as it has throughout time.

Objective: Promote responsible human interfaces with these unique natural environments in open space planning.

Open Space Goal – Welcome and Value the Importance of Citizen Participation

Objective: Citizen participation shall play a major role in all phases of open space planning.

Objective: The City shall provide the public with timely information regarding open space planning and decision making.

City of Pasadena Zoning Code

The proposed Project site is zoned as Open Space (OS). Zones are designated to implement the General Plan be ensuring those who live and work in the City that the stability and character of the community will be

preserved. As described in Section 17.26.020(A) of the City's Zoning Code, "The OS district is applied to sites with open space, parks, and recreational facilities of a landscaped, open character having a minimum contiguous site area of two acres. The OS zoning district is consistent with and implements the Open Space land use designation of the General Plan." Section 17.26.030 of the Code specifies that public safety facilities uses meet the intent of the OS zone and are conditionally allowed uses in the OS zone.

Arroyo Seco Master Plans

The Arroyo Seco Master Plans are a set of documents defining the community vision for the Arroyo Seco Natural Park. The set is comprised of the HWPMP; the Central Arroyo Master Plan, the Lower Arroyo Master Plan; the Rose Bowl Use Plan; and the Arroyo Seco Design Guidelines (City of Pasadena 2020b). The Arroyo Seco Master Plans were developed by the combined efforts of the Planning and Development Department and the Department of Public Works. The implementing department for the completed Arroyo Seco Master Plans is the Department of Public Works. Area 3 of the proposed Project is located within the HWPMP area; this Master Plan is described below.

Hahamongna Watershed Park Master Plan

The HWPMP illustrates a vision for the 300-acres of open space that extends from Devil's Gate Dam north and into the Arroyo Seco Canyon, on the northwestern edge of the City. The HWPMP was adopted to establish a visionary framework for recreation, water resources, flood management, habitat restoration and cultural resources in this area. Additionally, the HWPMP has been completed in response to the policies and principles set forth in the City's General Plan. The Final HWPMP includes the following goals and objectives related to recreation and the proposed Project (City of Pasadena 2003):

Goal 3: Provide diverse recreation opportunities for the Pasadena community

Objectives:

- Balance the recreation needs for active, passive, and educational activities in HWP
- Develop a grading plan that allows habitat restoration and recreational activities to co-exist with flood management and water conservation.
- Maintain the historic recreational uses within HWP.

Goal 5: Enrich and promote the unique history and culture of Hahamongna Watershed Park

Objectives:

- Develop design guidelines to ensure aesthetic compatibility and quality construction for any improvements made with Hahamongna Watershed Park.

Goal 6: Provide a safe and secure park

Objectives:

- Develop guidelines and delegate agency responsibility for recreation, flood management, and water conservation liabilities.

4.7.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to recreation are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to recreation would occur if the Project would:

a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

b) Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment.

Through the analysis in the Initial Study (see Appendix A-1), it was determined that the proposed Project would not include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment. (i.e., Threshold b). Accordingly, this issue is not further analyzed in the EIR. Based on the remaining thresholds, a significant impact related to recreation would occur if the Project would:

a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

4.7.5 Environmental Impacts Analysis

Threshold 4.7a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Short-Term Construction Impacts

The proposed Project consists of two primary areas, as shown in Section 2, Figure 2-1, Local Vicinity and Regional Location. The two primary Project areas include Area 2, Diversion and Intake Replacement, and Area 3, Spreading Basin Improvements. These areas are connected by the North Arroyo Boulevard (i.e., Gabrielino Trail/Access Road), which serves as a public recreational trail and the access road for City of Pasadena and U.S. Forest Service (USFS) vehicles heading into the Arroyo Seco Canyon. The proposed Project involves construction activity and facility improvements in Areas 2 and 3, as well as construction truck traffic along portions of the Gabrielino Trail/Access Road. During the Project's construction activities, North Arroyo Boulevard (Gabrielino Trail/Access Road) would be made available for construction-related vehicles. North Arroyo Boulevard would provide vehicular access to the Behner Water Treatment Plant (WTP), the northernmost portion of Area 3 near the JPL Bridge, and northward along the Gabrielino Trail/Access Road to Area 2. Construction of the Project would result in temporary restricted access to portions of designated trails that could result in indirect and temporary impacts to existing recreation uses and could increase the use of other recreational facilities in the Project area.

Figure 4.7-3, Project Impacts to Designated Trails, shows the areas that may be subject to temporary trail closures due to Project construction activities, as well as areas of permanent trail realignment. During construction of the proposed Project, there may be times when portions of the Altadena Crest Trail, Gabrielino

Trail/Access Road, Arroyo Seco Trail, and the unnamed trails/maintenance roads would be partially or fully closed to the public due to construction activities.

- North Arroyo Boulevard, which is a gated maintenance road that leads from the intersection of Ventura Street and Windsor Road northward to the JPL Bridge, would be a primary corridor for construction truck traveling to and from Area 2, and may also be used for activities within Area 3. Portions of this roadway may be closed during construction to minimize the proximity of construction trucks and equipment movement with recreational users.
- The Gabrielino Trail/Access Road, which is the northward the extension of North Arroyo Boulevard, would be a primary corridor for construction equipment and haul trucks to access Area 2. Portions of this access road may be closed during construction to minimize the proximity of construction trucks and equipment movement with recreational users, as well as during construction on the roadway associated with Arroyo Seco Canyon Project (ASCP) improvements, as described further in Section 4.7.6 below.
- The Arroyo Seco Trail and unnamed trails located adjacent to the existing spreading basins would be temporarily closed during construction of the new basin configuration and would also permanently realigned around the perimeter of the new basins and along the realignment of Explorer Road, as discussed further below. The portions of the unnamed trails within the construction footprint in Area 3 would be fully closed during short-term construction activities, and would not reopen until the completion of construction in Area 3, as described further below under "Long-Term Operational Impacts".

While the trails would be kept open during construction to the extent possible, there would be days when construction equipment and haul trucks would be on and/or near the trails. Use of these trails may be less desirable due to temporary construction-related emissions, noise, dust, and traffic impacts. These temporary, indirect impacts could reduce the quality of the recreational experience for some visitors. However, numerous recreational facilities, including Hahamongna Watershed Park facilities, the Oak Grove Disc Golf Course, Loma Alta County Park, the Flint Wash Trail, Gould Canyon Trail, Arroyo Seco Trail/West Rim Trail, and Arroyo Seco Trail/East Rim Trail are in the vicinity of the proposed Project and would be available for use during the entirety of Project construction. Additionally, some portions of the Mountain View Trail, Altadena Crest Trail, and Gabrielino Trail/Access Road would remain open to the public during construction. Beyond the recreational uses in the immediate Project area, numerous recreational opportunities exist within Pasadena as well as surrounding jurisdictions, as illustrated in Figures 4.7-1 and 4.7-2 and as listed in Table 4.7-1.

Recreational users may choose to visit these other area parks, recreational facilities, or trails due to the temporary access restrictions or the indirect effects of construction-related activities. Due to the number of other recreational facilities and trails in the vicinity, it is anticipated that these visitors would be dispersed throughout the area and that no single park or facility would experience a substantial increase in use. Additionally, Project-related construction activity is anticipated to occur in Area 2 beginning in August 2021 and would last approximately 3 months, ending in October 2021. Construction in Area 3 would begin in March 2022 and would last approximately 9 months. This short duration of construction activity would not result in substantial disruption to recreational activities in the Project area. During this time, recreational access to the Arroyo Seco Trail/East Rim and Arroyo Seco Trail/West Rim, as well as the majority of the unnamed trails along the existing spreading basins, would remain open and would continue to provide connectivity around the Devil's Gate Reservoir.

Although Project construction would result in temporary restricted access to portions of existing recreational trails, the Project would not substantially increase use of other existing parks or recreation facilities such that substantial physical deterioration of these facilities will occur or be accelerated. Impacts to existing trails as a result of Project construction would be temporary, and upon completion of construction activities, all temporary fencing, flagging, signage, soil stockpiles, and/or mobile and stationary construction equipment would be removed from Areas 2 and 3. Although substantial impacts to recreational facilities are not anticipated; implementation of MM-REC-1 would ensure adequate notification to the public of trail closures due to short-term Project construction impacts. Therefore, impacts would be less than significant with mitigation incorporated.

Long-Term Operational Impacts

As described above, the proposed Project would not result in the construction of new residences or indirectly facilitate the development of residences that could result in an increase in area population. Therefore, operation of the Project would not result in an increase in the long-term use, or the physical deterioration, associated with the increased use of neighborhood or regional parks or other recreational facilities. However, due to the proposed Project, the currently unnamed trail system that traverses through the spreading basins would be permanently altered. As shown in Figure 4.7-4, the proposed Project would restore connections with the alignments of the temporarily impacted trail system in Area 3. The proposed Project would restore the local trails in a manner consistent with the adopted Hahamongna Watershed Park Master Plan (see Exhibit 2-12 "Hiking & Equestrian Trails"; page 2-53), and no long-term loss of trails or connectivity would occur. Therefore, the proposed Project is consistent with the Goals and Objectives of applicable planning documents, as outlined in Section 4.7.3 (City of Pasadena 2003).

As described in Section 2.2, Project Background, of this Draft EIR, elements of the ASCP that did not relate to increased diversions were severable from the remainder of the ASCP and complied with the California Environmental Quality Act (CEQA). As such, CUP No. 6222 and its related findings and conditions of approval, and the ASCP IS/MND remains intact for these components and is allowed to move forward without any additional environmental review pursuant to CEQA. Regarding Area 3, the components related to the parking lot and the access road are allowed to proceed without additional CEQA review. The alignment of the Arroyo Seco Trail, as identified on Figure 4.7-4, would be constructed at the time of the realignment of the Explorer Road, which has been previously approved through the ASCP IS/MND. The reconnection of the Altadena Crest Trail, as identified on Figure 4.7-4, would be configured at the same time as the construction of the proposed spreading basins within Area 3. Upon completion of the spreading basins, the trail connection would be restored between Area 3 and the existing trails to the south and across Devil's Gate Reservoir on the west.

Impacts to recreational uses are not anticipated during the ongoing maintenance of the diversion and intake structures in Area 2 or the cleaning of the spreading basins in Area 3. Maintenance will be confined to areas that have previously been associated with ASCP facilities and would not permanently alter any existing trails or access roads. Once construction activities are complete, all temporary restricted access to the trails within Area 3 as a result of Project construction would be lifted, and all realigned trails would be operational. There would be no long-term impacts to recreational facilities as a result of the proposed Project, and therefore, no mitigation is required.

4.7.6 Cumulative Impacts

Cumulative projects outlined in Section 3, Project Description of this Draft EIR would not result in the construction of new residences or facilitate the development of residences and, therefore, would not result in increased population or the associated increased demand for neighborhood or regional parks or other recreational facilities. However, the construction of some cumulative projects would likely be concurrent with the proposed Project, or be initiated upon Project completion, which could result in cumulative impacts to recreational facilities in the area.

Construction activities associated with the Devil's Gate Reservoir Sediment Removal project are ongoing, with completion scheduled for Fall 2023. Figure 4.7-5, Cumulative Impacts to Designated Trails, includes the areas of temporary trail closures for both the proposed Project and for the Devil's Gate Reservoir Sediment Removal project. Throughout sediment removal activities, portions of the Arroyo Seco Trail/East Rim, Arroyo Seco Trail/West Rim, and unnamed trails will be closed when sediment removal activities are under way and/or are near the trail. Flint Wash Trail, Gabrielino Trail, and Gould Canyon Trail remain open for use during sediment removal of this cumulative project. Additionally, the Oak Grove area of Hahamongna Watershed Park and the associated facilities including Oak Grove Disk Golf Course remain open during construction of the Devil's Gate Reservoir Sediment Removal Project and continue to provide active recreational facilities to the area (County of Los Angeles 2013). The Devil's Gate Reservoir Sediment Removal project is expected to overlap with construction of the proposed Project; and therefore, either concurrent or extended temporary closure of portions of the trails in the vicinity of Area 3 is anticipated, as identified in Figure 4.7-5. Although temporary closure to portions of trails in the area would result from concurrent construction of the proposed Project and the Devil's Gate Reservoir Sediment Removal project, the majority of the Arroyo Seco Trail/East Rim, Arroyo Seco Trail/West Rim, Mountain View Trail, Flint Wash Trail, Gould Canyon Trail, and several unnamed trails, as well as Oak Grove Area recreational facilities would remain open for use.

Projects under the cumulative Oak Grove Area Improvements project include improvements in the area of the existing Oak Grove field, and may include a new restroom, improvements to vehicular and pedestrian circulation/trails, rehabilitation of a drain, assessment of the disc golf course layout and improvements to the outdoor amphitheater. Other future improvements may include Trail Development, Berkshire Creek Area Improvements, Habitat Restoration, and Oak Grove Disc Golf Course Improvements. These planned improvements would enhance the existing recreational facilities within the Oak Grove Area, including trails. Construction of these CIP projects could occur as funding is available, as early as 2021, potentially concurrent with proposed Project construction activities. However, it is not expected that all CIP projects under the Oak Grove Area Improvements project would occur at any one time, thus not restricting access to all recreational facilities within the Oak Grove Area at once.

Construction of the LACFCD Pump back/Intake at Devil's Gate cumulative project is expected to start after completion of the proposed Project, and the Explorer Groundwater Well cumulative project could potentially be concurrent with the proposed Project, starting in 2022. However, both of these cumulative projects are not expected to result in significant impacts to recreational uses due to location and nature of the projects.

ASCP Area 1 construction, while relatively near Area 2, is anticipated to begin after 2023; and thus, after the completion of the proposed Project. Construction of Area 1 would likely result in the temporary closure of the Gabrielino Trail/Access Road, similar to the proposed Project, but would not result in impacts to Oak Grove Area recreational facilities, nor the Altadena Crest Trail, Arroyo Seco Trail, Flint Wash Trail, or Gould Canyon Trail. Additionally, the proposed Project's construction would be completed by this time, and trails within Area 3 would be open and operational.

Although construction of cumulative projects, in addition to the proposed Project, could temporarily limit access or result in construction-related emissions, noise, dust, visual, and traffic impacts; recreational users may choose to visit other parks, trails or recreation facilities in the area that would remain accessible during construction of cumulative projects. It is anticipated that visitors would disperse throughout the area during construction of cumulative projects, and that there would not be a substantial increase in use of any one park or facility. In addition to the trails and recreational facilities in the immediate Project area, parks including Charles White Park, Loma Alta County Park, Angeles National Forest, Olberz Park, and Memorial Park, among others, as illustrated in Figures 4.7-1 and 4.7-2 and as listed in Table 4.7-1, would be accessible during Project construction and construction of cumulative projects. Additionally, implementation of mitigation measure MM-REC-1 outlined below, would ensure that use of existing neighborhood and regional parks or other recreational facilities would not be increased in such a manner that substantial physical deterioration of the facility would occur or be accelerated. Therefore, as impacts to recreational uses as a result of the Project and cumulative project construction would be temporary, and surrounding recreational opportunities would remain accessible, and impacts would be less than cumulatively considerable.

4.7.7 Mitigation Measures

MM-REC-1 Prior to the closure of recreational trails for public use, the City of Pasadena shall post signs providing at least one week of advanced notice of the dates and times of planned trail closures at the following locations:

- Intersection of Ventura Street and Windsor Avenue
- Sunset Overlook
- Altadena Crest Trail (adjacent to the North Arroyo Boulevard)
- Arroyo Seco Trail
- West Rim Trail/East Rim Trail

In addition to the closure notice signage, the City shall provide the locations of nearby trails and recreational facilities in the surrounding area that would be open for public use at the times when the trails are closed. This information shall also be posted on the City's Parks, Recreation and Community Services website.

4.7.8 Level of Significance After Mitigation

With implementation of MM-REC-1, impacts to recreational facilities as a result of Project construction would be reduced to less than significant.

4.8 Transportation

4.8.1 Methodology

This section describes the existing conditions of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project/proposed Project) site and vicinity, identifies associated regulatory requirements, evaluates potential environmental impacts, and identifies mitigation measures related to implementation of the proposed Project. The analysis of Project impacts related to transportation is based on a review of existing resources and applicable laws, regulations, and guidelines.

Comments received in response to the Notice of Preparation (NOP) for this Draft EIR included a comment from the California Department of Transportation (Caltrans) regarding their request to provide additional transportation impact analysis such as queuing analysis (to identify potential for traffic conflicts) at ramp locations where the Project-related construction activities would occur in combination with the ongoing sediment removal activities associated with the Devil's Gate Reservoir Project. A queuing analysis for the proposed Project's peak construction traffic along with construction traffic from other cumulative projects in the area, primarily Devil's Gate Reservoir Project was conducted. The queuing analysis is summarized in the Cumulative Impacts section and the traffic data and analysis worksheet are provided as follows:

Appendix H Transportation Technical Data and Analysis Worksheets, Dudek May 2020

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, the Appendices to the Initial Study are included in Appendix A-2, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

4.8.2 Existing Conditions

Regional Access

Interstate-210 or Foothill Freeway

Interstate (I) 210 provides regional access to the proposed Project site. The Foothill Freeway starts at the Interstate (I) -5 in the northern portion of the San Fernando Valley and generally runs in a southeasterly and easterly direction near the southern base of the San Gabriel and San Bernardino Mountains to the I-10 in Redlands. The I-210 has eight travel lanes as it passes along the southern edge of Devil's Gate Dam and provides access to the Project site via its interchange with Arroyo Boulevard/Windsor Avenue. Per Caltrans estimates, the 2018 traffic volumes on the I-210 between the Berkshire Place and Arroyo Boulevard/Windsor Avenue exits during the AM peak hour included 13,300 vehicles, with a peak month volume of 128,000 vehicles per day and an annual average daily traffic volume of 125,000 vehicles per day.

Interstate (I)-605

I-605 provides regional access to the landfill site for the proposed Project. The freeway runs generally in a north-south direction and extends from I-210 in the north to I-405 to the south. It provides eight travel lanes, with four lanes in each direction and provides access to the landfill site via its interchange with Rivergrade

Road/Los Angeles Street. Per Caltrans estimates, the 2018 traffic volumes on the I-605 near Lower Azusa Road/Los Angeles Street exits during the AM peak hour included 13,800 vehicles, with a peak month volume of 194,000 vehicles per day and an annual average daily traffic volume of 190,000 vehicles per day.

Local Access

Los Angeles Street

Los Angeles Street provides local access to the landfill site (Vulcan Materials Company, Durbin Inert Debris Engineered Fill Site). Los Angeles Street is a four-lane roadway with a two-way-left-turn lane. The roadway generally is built with sidewalks on either side. The posted speed limit on Los Angeles Street is 45 miles per hour. The access to the landfill site is located on Los Angeles Street via an approximately 140 foot right turn lane, approximately 850 feet east of the I-605/Los Angeles Street northbound off ramp.

Windsor Avenue

Windsor Avenue provides local access to Arroyo Seco Canyon and the proposed Project site from the I-210 on- and off-ramps. Windsor Avenue is generally a north-south roadway between I-210 northbound ramps and its intersection with Ventura Street and Explorer Road. Windsor Avenue is functionally classified as Connector-Neighborhood in the City of Pasadena's Street Plan (City of Pasadena 2015a) and serves as a Collector street that is generally a two-lane roadway with intermittent two-way-left turn lane along this stretch that terminates at the Ventura Street/Explorer Road intersection. The average daily traffic (ADT) volumes on North Windsor Avenue near the Project site just south of Ventura Street was approximately 8,409 vehicles in the year 2017 on a weekday (County of Los Angeles 2020).

Oak Grove Drive

Oak Grove Drive is a four-lane road from west of Windsor Avenue to just north of the I-210 and passing along Devil's Gate Dam and the southwest edge of the reservoir, to Foothill Boulevard before turning north toward the JPL campus. Oak Grove Drive is functionally classified as Connector-City in the City of Pasadena's Street Plan (City of Pasadena 2015a).

Explorer Road

Explorer Road is two-lane roadway that leads to the JPL entrance from the Windsor Avenue/Ventura Street intersection and turns west across the Arroyo Seco (onto the JPL Bridge) and southwesterly onto the JPL campus. Explorer Road would provide access to construction activities in the Area 3.

North Arroyo Boulevard (Gabrielino Trail/Access Road)

North Arroyo Boulevard is a paved road that runs on top of the slope east of the former JPL Parking Lot and goes into the Arroyo Seco Canyon, crossing the Arroyo Seco at several locations as it heads into the Angeles National Forest (ANF). This trail is used by hikers, bicyclists, and equestrians going into Arroyo Seco Canyon; it is also used by City, County, and U. S. Forest Service (USFS) inspection and maintenance vehicles. This trail would be used for construction activities in the northernmost portion of Area 3 near the JPL Bridge and also Area 2.

Some of the existing vehicle trips on Windsor Avenue and Explorer Road in Area 3 are associated with recreational users of the Gabrielino Trail/Access Road, although most use is attributed to NASA JPL employees that formerly utilized the JPL East Parking Lot. After NASA's completion of a new parking structure on the JPL campus in 2016, they vacated the former parking lot (which was previously leased by the City to JPL), and removed the paving for the specific purpose of accommodating PWP's planned expansion of the spreading basins. The former JPL Parking Lot is currently unpaved, with the exception of the temporary alignment of Explorer Road. In addition, there are paved and unpaved access roads that are also used by recreational visitors and maintenance workers to access the spreading basins, reservoir, and dam.

Transit Services

The Los Angeles County Metropolitan Transportation Authority (Metro) provides regional bus and passenger train services in the County. Metro Bus routes 177 and 268 run along Oak Grove Avenue and into the JPL campus, south and west of Area 3. The Glendale Beeline Route 3 also runs from Downtown Glendale to JPL (Metro 2010). The Pasadena Transit provides local bus services within the City. Route 52 goes into the JPL campus four times daily on weekdays from Glenarm Street and Raymond Avenue intersection and terminates at Art Center N. Campus (City of Pasadena 2020).

4.8.3 Relevant Plans, Policies, and Ordinances

Federal

There is no applicable federal policy or program related to transportation for the proposed Project.

State/Regional

Senate Bill (SB) 743

A change to transportation analysis in CEQA environmental review occurred when Governor Jerry Brown signed Senate Bill (SB) 743 on September 27, 2013 into a law that required an update in the metric of transportation impact from Level of Service (LOS) and automobile delay to one that promotes the reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses for transit priority areas. On November 3, 2014, the City of Pasadena City Council adopted a resolution to replace the City's transportation performance measures with five new Transportation Performance Measures and new thresholds of significance to determine transportation and traffic impacts under CEQA. The new performance measures and CEQA thresholds are consistent with the City's adopted General Plan and Senate Bill (SB) 743 and include VMT per capita, vehicle trips (VT) per capita, proximity and quality of bicycle network, proximity and quality of transit network, and pedestrian accessibility. The new measures support the City's vision of creating a community where people can circulate without cars, which relies upon an integrated multimodal transportation system that provides choices and accessibility for everyone in the City.

The City established the Transportation Impact Analysis Current Practice and Guidelines (City of Pasadena 2015b) to implement the Transportation Performance Measures and for use in CEQA analysis. These guidelines identify separate approaches for three categories of projects—exempt projects, Category 1: Below Communitywide Significance and Category 2: Communitywide Significance. Per the Transportation Impact

Analysis Current Practice and Guidelines, Table 1: Thresholds for Determining Transportation Review of Projects, any non-residential project which is expected to generate fewer than 300 daily trips is considered exempt, is not expected to generate any impacts, and does not require a full traffic analysis. Also, the City does not require analysis of construction traffic. Therefore, no Project level analysis of CEQA impacts is required. However, an assessment of construction trip generation was conducted for Area 2 and Area 3, and consideration was given to construction traffic associated with the other cumulative projects including County's Devil's Gate Reservoir Project that would be occurring at the same time under cumulative conditions.

Local

General Plan Mobility Element, 2015

Pasadena's General Plan Mobility Element guides the continuing development of the transportation system to support planned growth. The Mobility Element sets forth goals and policies to improve overall transportation in Pasadena. The Mobility Element's objective is to promote a livable community where people can circulate without cars and non-auto travel modes are emphasized in order to recognize their role in improving the City's environment and quality of life. Consequently, performance measures related to the per capita length and number of trips associated with changes in land use have been adopted for evaluating the transportation system in lieu of levels of service measures. As discussed above, these new performance measures and CEQA thresholds are consistent with the City's adopted General Plan.

Supplements and Modifications to the Greenbook

The City's Department of Public Works (Department) has the responsibility for and control over the construction, modification, and maintenance of facilities within the public rights of way of the City of Pasadena. The Department established guidelines, monitors, inspects, and finally approves or rejects all such construction, including operations, materials, methods, and finished facilities. The Department adopted the Standard Specifications for Public Works Construction[1] (known as the Greenbook), which was supplemented and modified to meet the needs of the City. It is the responsibility of all contractors to comply with the requirements of the City's Greenbook Supplements and Modifications during construction activities.

4.8.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to transportation are based on Appendix H of the CEQA Guidelines. According to Appendix H of the CEQA Guidelines, a significant impact related to transportation would occur if the project would:

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).

[1] The Standards Specifications for Public Works Construction was written and promulgated by the Joint Cooperative Committee of the Southern California Chapter American Public Works Association and Southern California Districts Associated General Contractors of California.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

d) Result in inadequate emergency access.

Through the analysis in the Initial Study (see Appendix A), it was determined that the proposed Project would not conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b); substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment); or, result in inadequate emergency access (i.e., Thresholds b, c, and d). Accordingly, these issue are not further analyzed in the EIR. Based on the remaining thresholds, a significant impact related to transportation would occur if the project would:

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.

4.8.5 Environmental Impacts Analysis

Threshold 4.8a. Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

The proposed Project would require construction activities that would involve the transport of workers to and from the Project site, as well as construction equipment and construction vehicles. The primary vehicular activity would occur during construction activities in Area 3, which would require the export of soils to create the redesigned spreading basins. Construction trucks hauling soils and debris generated by construction activities are anticipated to drive to and from Vulcan Materials Company landfill located at 13000 East Los Angeles Street in the City of Irwindale, which is approximately 18 miles from the Project site.

Haul trucks and equipment deliveries are expected to come to the Project site from I-210 at the Windsor Avenue westbound off-ramp and head north on Windsor Avenue to the intersection with Ventura Street. At this intersection is a fork in the road, one leading to Explorer Road into Area 3 and the other leading to the gated North Arroyo Boulevard, which passes adjacent to residential properties and the Behner WTP. North of the JPL Bridge, North Arroyo Boulevard (the Gabrielino Trail/Access Road) would be used for construction vehicles and equipment transport to and from Area 2. Explorer Road and potentially North Arroyo Boulevard would be used to access Area 3.

For the disposal of excavated soils, it is expected that haul trucks from the Project site would head eastbound on I-210 via eastbound ramps at Windsor Avenue; exit at the I-605 southbound off ramp at Lower Azusa Road/Los Angeles Street; head east towards the Vulcan Materials Company landfill. Trucks would come back from the landfill entering the northbound on-ramp on the I-605 at Los Angeles Street and head north; trucks would then go west on I-210 to Windsor Avenue to Explorer Road and then to the Project site.

Construction of the proposed Project would result in a temporary increase in local traffic on Windsor Avenue, I-210 freeway and other streets as a result of construction-related workforce traffic, material deliveries, and construction activities. The primary off-site impacts from the movement of construction trucks would include short-term and intermittent effects on traffic operations because of slower movements and larger turning radii of delivery and haul trucks compared to passenger vehicles. Occasional partial closures for the Gabrielino

Trail/Access Road would be required for construction truck and equipment access. However, Windsor Avenue would be open to traffic at all times during the construction period.

The Institute of Transportation Engineers' (ITE) Trip Generation Manual does not contain trip rates for construction-related activities associated with the proposed Project. Trip generation for construction projects is based on average or peak number of workers and trucks that would be required for the proposed construction activities. Construction traffic includes the number of workers and the amount of delivery (vendor) and haul truck traffic that would be generated to and from the site daily and during the AM and PM peak hours.

Area 2: Short-Term Construction Impacts

As discussed in Section 3.1 of this Draft EIR, construction activities in the Area 2 Diversion and Intake Replacement would include the demolition and removal of the existing weir and intake structure after the removal of sediment and debris that has accumulated behind the existing weir. The construction of Area 2 would last approximately 3 months from August 2021 through October 2021.

Per construction phasing and schedule for Area 2, approximately 7 workers, 1 delivery (vendor) truck, and 7 haul trucks would be required per day on average for construction-related activities during the 3-month period. However, during peak construction phase (i.e. during overlap of demolition and dewatering) which would last approximately 5 days, approximately 12 workers, 2 delivery (vendor) trucks, and 43 haul trucks would be required per day for construction-related activities. The construction activities would occur between 7:00 AM and 4:00 PM over the weekdays, Monday through Friday. All workers and trucks were assumed to make two daily trips (one inbound and one outbound) to the Project site. Although workers may not travel during the AM or the PM peak periods, to be conservative all workers were assumed to arrive during the AM peak hour and leave the site during the PM peak hour. Passenger Car Equivalency (PCE) factors were used to account for the Project's truck traffic and provide a more realistic measurement in terms of the impact of Project-related truck traffic. All truck trips were converted to PCE trips using a factor of 2.0 or 3.0. All truck trips were averaged over an 8-hour workday to estimate peak hour trips with 50% inbound and 50% outbound travel.

Construction trip generation estimates for Area 2 are shown in Table 4.8-1 below.

Table 4.8-1. Area 2 - Construction Trip Generation

Vehicle Type	Daily Quantity	Daily Trips	AM Peak Hour			PM Peak Hour		
			In	*Out*	*Total*	*In*	*Out*	*Total*
Average (All Construction Phases)								
Workers[1]	7	14	7	0	7	0	7	7
Vendor Trucks[2]	1	2	1	0	1	0	1	1
Haul Trucks[3]	7	14	1	1	2	1	1	2
	Total Trips	**30**	**9**	**1**	**10**	**1**	**9**	**10**
Average (All Construction Phases with PCE)								
Workers (1 PCE)	7	14	7	0	7	0	7	7
Vendor Trucks (2 PCE)	1	4	2	0	2	0	2	2

Table 4.8-1. Area 2 - Construction Trip Generation

Vehicle Type	Daily Quantity	Daily Trips	AM Peak Hour			PM Peak Hour		
			In	*Out*	*Total*	*In*	*Out*	*Total*
Haul Trucks (3 PCE)	7	42	3	3	6	3	3	6
Total Trips (with PCE)		**60**	**12**	**3**	**15**	**3**	**12**	**15**
Peak (Demolition and Dewatering)								
Workers[1]	12	24	12	0	12	0	12	12
Vendor Trucks[2]	2	4	1	0	1	0	1	1
Haul Trucks[3]	43	86	5	6	11	6	5	11
Total Trips		**114**	**18**	**6**	**24**	**6**	**18**	**24**
Peak (Demolition and Dewatering with PCE)								
Workers (1 PCE)	12	24	12	0	12	0	12	12
Vendor Trucks (2 PCE)	2	8	2	0	2	0	2	2
Haul Trucks (3 PCE)	43	257	15	18	33	18	15	33
Total Trips (with PCE)		**289**	**29**	**18**	**47**	**18**	**29**	**47**

Notes: PCE – Passenger Car Equivalent

1 Workers as assumed to utilize passenger cars and no carpooling is assumed. All of the workers were conservatively assumed to arrive and depart during the AM and PM peak hour.

2 A nominal number of vendor trucks are required for the Project, therefore one vendor truck was assumed to arrive and depart during the AM and PM peak hour, respectively.

3 Haul truck trips are distributed evenly over the duration of construction phase to estimate daily haul truck trips and across the 8-hour work shift to estimate AM and PM peak hour trips.

As shown in Table 4.8-1, on average, the Project would generate 30 daily trips, 10 trips during the AM peak hour (9 inbound and 1 outbound), and 10 trips during the PM peak hour (1 inbound and 9 outbound). During the peak construction phase, for a short period of time, the Project would generate 114 daily trips, 24 trips during the AM peak hour (18 inbound and 6 outbound), and 24 trips during the PM peak hour (6 inbound and 18 outbound).

With the application of PCE factors to truck trips, on average the Project would generate 60 total PCE daily trips, and 15 PCE trips during the AM peak hour (12 inbound and 3 outbound) and 15 PCE trips during the PM peak hour (3 inbound and 12 outbound). With the application of PCE factors to truck trips, during the peak, for a short period, the Project would generate 289 total PCE daily trips, and 47 PCE trips during the AM peak hour (29 inbound and 18 outbound) and 47 PCE trips during the PM peak hour (18 inbound and 29 outbound).

As shown in Table 4.8-1, the proposed Project would generate less than 500 ADT, and hence would not require a traffic impact analysis per County of Los Angeles Department of Public Works (LACDPW) Transportation Impact Analysis Report Guidelines (County of Los Angeles 2013). Similarly, the City of Pasadena does not require analysis of construction traffic and considers any non-residential project which is expected to generate fewer than 300 ADT exempt from conducting a transportation impact analysis. Therefore, no significant impacts to the roadway facilities due to short-term construction of Area 2 would occur.

Area 3: Short-Term Construction Impacts

Improvements in Area 3 include the reconfiguration and expansion of the spreading basins. The construction of Area 3 would last approximately 9 months from March 2022 through November 2022.

Per construction phasing and schedule for Area 3, approximately 6 workers, 1 delivery (vendor) truck, and 42 haul trucks would be required per day on an average for construction-related activities during the 9-month period. However, during the peak construction phase (i.e. during demolition), which would last approximately 10 days, approximately 5 workers, 1 delivery (vendor) trucks, and 237 haul trucks would be required per day for construction-related activities. The construction activities would occur between 7:00 AM and 4:00 PM over the weekdays, Monday through Friday. All workers and trucks were assumed to make two daily trips (one inbound and one outbound) to the Project site. Although workers may not travel during the AM or the PM peak periods, to be conservative all workers were assumed to arrive during the AM peak hour and leave the site during the PM peak hour. PCE factors were used to account for the Project's truck traffic and provide a more realistic measurement in terms of the impact of Project-related truck traffic. All truck trips were converted to PCE trips using a factor of 2.0 or 3.0. All truck trips were averaged over the 8-hour workday to estimate peak hour trips with 50% inbound and 50% outbound.

Construction trip generation estimates for Area 3 are shown in Table 4.8-2 below.

Table 4.8-2. Area 3 - Construction Trip Generation

Vehicle Type	Daily Quantity	Daily Trips	AM Peak Hour			PM Peak Hour		
			In	*Out*	*Total*	*In*	*Out*	*Total*
Average (All Construction Phases)								
Workers[1]	6 workers	12	6	0	6	0	6	6
Vendor Trucks[2]	1 trucks	1	1	0	1	0	1	1
Haul Trucks[3]	42 trucks	84	5	6	11	6	5	11
Total Trips		**97**	**12**	**6**	**18**	**6**	**12**	**18**
Average (All Construction Phases with PCE)								
Workers (1 PCE)	6 workers	12	6	0	6	0	6	6
Vendor Trucks (2 PCE)	1 trucks	3	2	0	2	0	2	2

Table 4.8-2. Area 3 - Construction Trip Generation

Vehicle Type	Daily Quantity	Daily Trips	AM Peak Hour			PM Peak Hour		
			In	*Out*	*Total*	*In*	*Out*	*Total*
Peak (Demolition with PCE)								
Workers (1 PCE)	5 workers	10	5	0	5	0	5	5
Vendor Trucks (2 PCE)	1 truck	4	2	0	2	0	2	2
Haul Trucks (3 PCE)	237 trucks	1,422	90	90	180	90	90	180
Total Trips with PCE		**1,436**	**97**	**90**	**187**	**90**	**97**	**187**

Notes:

1 Workers as assumed to utilize passenger cars and no carpooling is assumed. All of the workers were conservatively assumed to arrive and depart during the AM and PM peak hour.

2 A nominal number of vendor trucks are required for the Project, therefore one vendor truck was assumed to arrive and depart during the AM and PM peak hour, respectively.

3 Haul truck trips are distributed evenly over the duration of construction phase to estimate daily haul truck trips and across the 8-hour work shift to estimate AM and PM peak hour trips.

As shown in Table 4.8-2, on an average, the Project would generate 97 daily trips, 18 trips during the AM peak hour (12 inbound and 6 outbound), and 18 trips during the PM peak hour (6 inbound and 12 outbound). During the peak construction phase, for a short period of time, the Project would generate 486 daily trips, 66 trips during the AM peak hour (36 inbound and 30 outbound), and 66 trips during the PM peak hour (30 inbound and 36 outbound).

With the application of PCE factors to truck trips, on average the Project would generate 266 total PCE daily trips, and 41 PCE trips during the AM peak hour (23 inbound and 18 outbound) and 41 PCE trips during the PM peak hour (18 inbound and 23 outbound). With the application of PCE factors to truck trips, during the peak, for a short period, the Project would generate 1,436 total PCE daily trips, and 187 PCE trips during the AM peak hour (97 inbound and 90 outbound) and 187 PCE trips during the PM peak hour (90 inbound and 97 outbound).

As shown in Table 4.8-2, under average conditions the proposed Project would generate less than 500 ADT, and hence would not require a traffic impact analysis per County of LACDPW Transportation Impact Analysis Report Guidelines (County of Los Angeles 2013). Similarly, the City of Pasadena does not require analysis of construction traffic and considers any non-residential project which is expected to generate fewer than 300 daily trips exempt from conducting a transportation impact analysis. The peak phase of Area 3 constructions would cause an increase in the average daily traffic greater than 500 ADT. Although this threshold is applicable to long-term operational activities and not applicable to construction traffic, it is possible that roadway facilities could be impacted during these approximately 10 days during construction in Area 3.

Additionally, the 2015 IS/MND included mitigation measures that have been incorporated into the Mitigation Monitoring and Reporting Program (MMRP) for the previously approved ASCP, as discussed in detail in Section 2.2, Project Background and in Table 2-1 in Section 2, Environmental Setting of this Draft EIR. MM-TRA-1 would reduce construction trips that could potentially increase congestion on freeways and arterial roadways during the peak hour; therefore, MM-TRA-1 (modified from the MMRP), would be implemented. During construction activities, the Contractor shall schedule the arrival and departure of the construction equipment

and trucks outside the AM peak hours of 7:30 AM to 8:30 AM and the PM peak hours of 4:30 PM to 5:30 PM. In addition, trucks transporting sediment and debris from the site shall travel to and from the site outside the AM and PM peak hours. MM-TRA-1 as modified is still appropriate for inclusion in the proposed Project and would reduce traffic congestion associated with the 500 ADT during the peak phase of construction in Area 3.

Long-Term Operational Impacts

No new employees are required for the long-term operation of the proposed Area 2 and Area 3. Future schedules of operation and maintenance activities would not substantively differ from the current maintenance routine and procedures required for the sedimentation basin. An estimated 100 truckloads or 200 truck trips of trucks carrying soil from the existing and proposed spreading basins would have to be disposed of off-site approximately every 5 years (approximately 20 trucks per year), which is reflective of current maintenance activities. As such no long-term operational impacts related to transportation are anticipated with the proposed Project.

Impacts to Transit, Bicycles and Pedestrian Facilities

There would be no impact on the use of transit since the proposed Project is not directly served by a public transportation system and would not likely encourage bicycle use or walking to the site by construction workers.

During construction of Area 2, however, there would be periods where sections of the trail would need to be partially or fully closed, mainly during excavations, construction of the new intake, trenching for the new intake service structure, and hauling in materials/equipment. The portion of Gabrielino Trail/Access Road along the construction zone may also need to be reduced in width for the duration of the construction period during work hours to allow for parked construction vehicles (e.g., pickup trucks).

Access to Area 2 (and the USFS Ranger Station in the ANF) would be made available during construction activities, but short-term partial closures may occur. Additionally, bicyclists, hikers, and users of the Gabrielino Trail/Access Road would be prohibited from using portions of the trail, as further described in Section 4.7, Recreation of this Draft EIR. Temporary closure of the Gabrielino Trail/Access Road and any other public roads (e.g. Explorer Road) that may be impacted during short-term construction activities would be executed in a manner that ensured compliance with applicable plans and policies addressing the circulation system, including roadway, bicycle, and pedestrian facilities.

The City will follow the Supplements and Modifications to the Greenbook regarding notifications to residents and businesses affected by the temporary closures of the Gabrielino Trail/Access Road (City of Pasadena 2006). Applicable mandatory measures from the Supplements and Modifications to the Greenbook that would be applied to construction of the proposed Project are generally summarized below to include, but not be limited to:

P-7-10.2 Storage of Equipment and Materials in Public Streets

> Requires that construction materials shall not be stored in streets, roads or highways overnight, and all materials or equipment not installed or used in construction shall be stored elsewhere, unless approved by the City Engineer.

P-7-10.3 Street Closure, Detours, Barricades

All streets without specific traffic requirements may be closed to through traffic from 7:00 AM to 5:00 PM if approved in writing by the Engineer. The contractor shall obtain the approval of the Engineer before any partial or total closure of any street. During a street closure, the following requirements shall apply:

A. Where long sections are encountered on a particular street, only that portion which can be repaved in one day shall be closed to through traffic unless otherwise directed by the City Engineer.
B. Both local and emergency access must be maintained at all times.
C. Street closure signing shall be provided and maintained on the closed street and at all intersecting streets within the closure limits. "ROAD CLOSED AHEAD" signs shall also be provided and maintained on each of the first intersecting streets on each end of the closed street. This signing shall conform to the requirements of these Specifications, the "WATCH" handbook, and the City Engineer. These signs shall be placed at locations approved by the City Engineer, for optimum visibility to traffic and in a non-hazardous location to pedestrians.

P-7-10.1.2 Notifications to Residents/Businesses

A project general information letter and sufficient copies thereof will be prepared by City staff for Contractor distribution to all residents, business establishments, and institutions fronting on or directly affected by the project. Distribution shall be accomplished in a manner acceptable to the Engineer and shall be completed at least 48 hours prior to the beginning of construction operations in the immediate vicinity. In addition to the above, the Contractor shall be fully responsible for such other notifications as may be required related to necessary closures of streets, alleys, driveways, etc., or to unavoidable access or parking restrictions. Such "additional notifications" shall be given in writing to all affected parties and premises at least five (5) working days prior to such closure or restriction. These notifications shall apply where the closures and access or parking restrictions required in the performance of any work under this contract preclude any resident, tenant, or property owner from utilizing the premises or conducting business thereon in a reasonable and customary manner.

P-7-10.1.3 Notification of Utilities

In order for the utilities to have continuous access to their facilities, the Contractor shall be required to notify the Underground Service Alert-South (U.S.A.) no less than two working days in advance of the construction work.

As such, implementation of the proposed Project would require notification of utility agencies with facilities in the area; the USFS Ranger Station; Pasadena Fire and Police Departments; and other emergency service providers. Although not required by the Greenbook, it is anticipated that the Gabrielino Trail/Access Road would be made passable at the end of each workday.

The 2015 IS/MND included mitigation measures that have been incorporated into the MMRP for the previously approved ASCP, as discussed in detail in Section 2.2, Project Background and in Table 2-1 in Section 2, Environmental Setting of this Draft EIR. MM-TRA-2 (modified from the MMRP) requires use of flagpersons and/or other safety procedures to be used as necessary to ensure the safety of recreational users along the Gabrielino Trail/Access Road during construction activities that could involve partial road closures.

4.8.6 Cumulative Impacts

As discussed, no long-term impacts to traffic would be generated by the proposed Project; therefore, there would be no long-term operational cumulative impacts.

Based on review of cumulative projects in the area, during construction of the proposed Project Areas 2 and 3, sediment removal activities at the Devil's Gate Reservoir and construction of the Explorer Groundwater Well would most likely be ongoing. Other cumulative projects in the area are either not likely to overlap with the construction of the proposed Project or no environmental documentation is available at this time.

To address the Caltrans comment letter dated December 6, 2019 regarding queuing at Caltrans ramp intersections, a queuing analysis at selected nearby ramp intersections was conducted to determine if the construction-related traffic of the proposed Project and its overlap with other cumulative projects (primarily, the Devil's Gate Reservoir Project) would significantly impact those Caltrans facilities under cumulative conditions. The I-210 ramps at Windsor Avenue and the segment of Windsor Avenue to Oak Grove Drive would be used by construction equipment and trucks for the Devil's Gate Reservoir sediment removal and the proposed Project throughout the work day and therefore, cumulative traffic impacts from the Project could potentially occur at those locations.

Based on the proposed haul route of the Project (from Project site to landfill site) and its overlap with haul routes of other cumulative projects in the area, the following intersections were selected for evaluation:

Intersection #1 I-210 westbound ramp/Windsor Avenue

Intersection #2 I-210 eastbound ramp/Arroyo Boulevard

Intersection #3 I-605 southbound ramp- Rivergrade Road/Lower Azusa Road

Intersection #4 I-605 northbound ramp- Rivergrade Road/Los Angeles Street

Figure 4.8-1, Proposed Haul Route and Study Intersections, illustrates the locations of the study area intersections and proposed haul route near the Project site and the Vulcan Materials Company landfill.

Due to the ongoing shelter in place orders from the COVID-19 situation, collection of new traffic counts was not recommended since it would not be representative of the typical traffic conditions in the area. Therefore, in consultation with Caltrans[2], the existing traffic counts for the above mentioned intersections for year 2019 were estimated using historic count data and applying appropriate traffic growth factors. Appendix H includes historic traffic counts (year 2014) for the above mentioned intersections and a compilation of ramp volumes from Caltrans Performance Measurement System (PeMS) data source (version 9.0.0) and the annual daily and peak hour traffic volumes published by Caltrans Division of Traffic Operations (Caltrans 2020). As shown In Table 1, in Appendix H to this Draft EIR, the peak hour ramp volumes from PeMS were available for a limited period and locations and further showed inconsistent variation during the AM and PM peak hours including

[2] Correspondence with Caltrans District 7, Emily Gibson and other Traffic Operations staff, via e-mail correspondence in March, 2020.

negative growth for certain ramps in the period between the years 2012 to 2019. The data from Division of Traffic Operations showed an increase in daily and peak hour ramp volumes during similar period, however the increase was in the range of 3%-13% per year. Therefore, due to these significant data inconsistencies, it was determined that the historical Caltrans data was not an appropriate method to obtain traffic growth factors for the study area intersections.

Instead, traffic growth factors in the "General Traffic Volume Growth Factors" for the respective Regional Statistical Area (RSA) #25 - Pasadena for intersections 1 and 2 and #26 - West Covina for intersections 3 and 4 in the Exhibit D-1 of the Los Angeles County Congestion Management Program (CMP) (Metro 2010) were used. The growth factors for the RSAs in the CMP were reviewed and found to be a better approximation of traffic growth compared to the Caltrans data. Since both the RSAs #25 (Pasadena) and #26 (West Covina), are adjacent to each other, the higher traffic growth factor of the two was applied to all the intersections to provide a conservative estimate. Therefore, a growth rate of 0.82% per year from year 2014-2019 and 0.40% per year from year 2019-2022 was utilized to estimate Existing Year 2019 and Cumulative Year 2022 baseline traffic volumes, respectively (see Appendix H). The AM and PM peak hour traffic volumes estimated using these growth rates was utilized for the queuing analysis of the intersections under Existing Year 2019 and Cumulative Year 2022 conditions. The queuing analysis was conducted using the Synchro 10/SimTraffic (version 10) software.

Table 4.8-3 provides a summary of the queuing analysis for the study area ramp intersections under Existing Year 2019 and Cumulative Year 2022 conditions, a future baseline condition without Project traffic or Devil's Gate Reservoir's construction traffic. As shown in the table, the following intersections have vehicle queues that exceed available storage lengths i.e. the length (in feet) available for vehicles to stack in a turn lane at an intersection. Note that off-ramp queues are evaluated by comparing these to 85% of the lane's storage capacity, per Caltrans District 7 requirements:

- **Intersection #1, I-210 westbound ramps/Windsor Avenue:** Vehicle queues on the single northbound left turn lane on Windsor Avenue would exceed its storage length of 110 feet in the PM peak hour of the Cumulative condition. There would be no queueing impacts to the off-ramp because AM and PM peak hour queues would meet Caltrans requirements.
- **Intersection #2, I-210 eastbound ramps/Arroyo Boulevard:** Vehicle queues on the dual southbound left turn lanes on Arroyo Boulevard would exceed their storage lengths. The combined storage length is 380 feet (two 190-foot lanes). The AM and PM peak hour queues in the Existing and Cumulative conditions exceed the dual left turn storage capacity. There would be no queueing impacts to the off-ramp because AM and PM peak hour queues would meet Caltrans requirements.
- **Intersection #3, I-605 southbound ramps – Rivergrade Road/Lower Azusa Road:** Vehicle queues on the single westbound left turn lane on Lower Azusa Road would exceed its storage length of 230 feet. The AM peak hour queues in the Existing and Cumulative conditions currently, and would, exceed the left turn storage capacity. There would be no queueing impacts to the off-ramp because AM and PM peak hour queues would meet Caltrans requirements.

Notes:

1 Per Caltrans District 7, queuing impacts at freeway off-ramps are based on the queues that exceed 85% of the off-ramp's storage capacity.

2 Based on 95th percentile (design) queue length (in feet) in SimTraffic 10.

3 Approximate length of storage lane measured from intersection (stop bar) to freeway mainline (at gore point).

4 Storage length based on lane distance from intersection to adjacent, upstream intersection.

5 Queue not reported in SimTraffic, therefore queue is assumed to be zero feet.

Movement is utiized by Project traffic as part of the proposed haul route

Cumulative Projects Trip Generation

Dudek reviewed the Traffic Impact Study for the Devil's Gate Reservoir Sediment Removal and Management Project prepared by Hall & Foreman, Inc. dated October 18, 2013 and updated information regarding the project activities available on the County's website[3]. Based on the review of Devil's Gate project's hauling schedule, it is anticipated that approximately 95 trucks would be used to make a maximum of 425 daily trips over the period of April 2020 to November 2022. The Devil's Gate project would have varying haul routes and timing and would also utilize I-210 westbound ramps/Windsor Avenue and I-210 eastbound ramps/Arroyo Boulevard intersections from approximately 7:00 AM to 3:30 PM with some peak hour restrictions. However, to present a worst-case scenario under cumulative conditions, Devil's Gate truck traffic (approximately 50 inbound truck trips and 50 outbound truck trips) was added to the proposed Project's peak hour construction truck traffic (approximately 30 inbound truck trips and 30 outbound truck trips) when analyzing the potential queues at the I-210 ramps at Windsor Avenue and Arroyo Boulevard. The truck trips were converted to passenger car equivalent trips by utilizing a factor of 3 PCE. Therefore, Devil's Gate Project was estimated to generate 150 inbound PCE trips and 150 outbound trips during both AM and PM peak hours.

Since specific trip generation for other cumulative projects such as Explorer Groundwater Well was not available, to account for traffic from those projects and any background growth in the study area, a growth factor was applied to the estimated Existing Year 2019 peak hour traffic volumes for a period of 3 years to estimate Cumulative Year 2022 peak hour traffic volumes.

Assumptions for Queuing Analysis

In order to account for the maximum truck traffic that would occur with the overlap of construction activities of the proposed Project and cumulative projects (primarily Devil's' Gate Project) the following assumptions were used in the analysis:

1. The peak Project traffic would be generated from improvements in Area 3 which would last approximately 9 months from March 2022 through November 2022. The peak phase of construction of Area 3 would be during demolition activities which would occur for approximately 10 days. As mentioned above this phase would generate 90 inbound PCE trips and 90 outbound trips during both the AM and PM peak hours. The worker trips are nominal and could potentially use other routes in the study area. Therefore, only PCE trips representing truck trips were assigned to the appropriate movements at the ramp intersections for the haul route from the Project site to the landfill. It is assumed that the truck trips would be distributed evenly over the 8-hour period.
2. The Traffic Impact Analysis (TIA) for the Devil's Gate project analyzed multiple haul routes (approximately 26 routes) from the reservoir to eight different landfill sites spread across the County. Devil's Gate truck traffic could utilize ramps located along Berkshire Place or Windsor Avenue to access I-210. However, it is not possible to determine accurately which route and what percentage of the trucks removing sediment from Devil's Gate Reservoir would overlap with Area 3 peak construction

[3] Devil's Gate Reservoir Sediment Removal and Management Project website: https://pw.lacounty.gov/swe/devilsgate/docs/DevilsGateReservoirRestorationProjectPresentation-January2020.pdf

phase. Therefore, two most conservative scenarios of overlap between the truck traffic from the proposed Project and Devil's Gate project were considered for the queuing analysis:

a. **Scenario 1** – All haul trucks (150 inbound PCE trips and 150 PCE outbound trips) from Devil's Gate Project would be traveling west along I-210 via Windsor Avenue ramps.
b. **Scenario 2** – All haul trucks (150 inbound PCE trips and 150 PCE outbound trips) from Devil's Gate Project would be traveling east along I-210 via Arroyo Boulevard ramps.

3. The ramps at I-210 and Windsor Avenue and Arroyo Boulevard (Intersections 1 and 2) were analyzed with peak truck traffic from proposed Project from Area 3 and Devil's Gate project for the two scenarios explained above. However, the ramps at I-605 and Lower Azusa Road- Los Angeles Street (Intersections 3 and 4) near the landfill site were analyzed only with peak Project traffic from Area 3, since that specific Vulcan Material landfill site would not be utilized by the Devil's Gate project.

Summary of Queuing Analysis for Cumulative Conditions

Table 4.8-4 provides a summary of queuing analysis for the intersections under Cumulative Year 2022 conditions with Area 3 Project traffic and cumulative traffic including Devil's Gate project traffic for under Scenario 1 and Scenario 2 conditions. As shown in the table, the following intersections would have vehicle queues that exceed available storage lengths:

- **Intersection #1, I-210 westbound ramps/Windsor Avenue:** Vehicle queues on the single northbound left turn lane on Windsor Avenue are forecast to exceed its storage length of 110 feet in the PM peak hour of both Cumulative Scenarios 1 and 2. However, the proposed Project would not contribute traffic to this northbound left movement. Also, it should be noted that the off-ramp's AM and PM peak hour queues would continue to be within 85% of the off-ramp's storage capacity (per Caltrans District 7 requirements) under both Cumulative Scenarios 1 and 2.
- **Intersection #2, I-210 eastbound ramps/Arroyo Boulevard:** Vehicle queues on the dual southbound left turn lanes on Arroyo Boulevard would continue to exceed their storage lengths in both peak hours of both Cumulative Scenarios 1 and 2. The combined storage length is 380 feet (two 190-foot lanes). The AM and PM peak hour queues in both Cumulative Scenarios 1 and 2 are forecast to continue to exceed the dual left turn storage capacity. The proposed Project would contribute traffic to this southbound left turn movement and therefore would have a cumulative impact to this intersection. Also, it should be noted that the off-ramp's AM and PM peak hour queues would continue to be within 85% of the off-ramp's storage capacity (per Caltrans District 7 requirements) under both Cumulative Scenarios 1 and 2.
- **Intersection #3, I-605 southbound ramps** – Rivergrade Road/Lower Azusa Road: Vehicle queues on the single westbound left turn lane on Lower Azusa Road would continue to exceed its storage length of 230 feet in the AM peak hour under both Cumulative Scenario 1 and 2 conditions. However, the proposed Project would not contribute traffic to this westbound left movement. Also, it should be noted that the off-ramp's AM and PM peak hour queues would continue to be within 85% of the off-ramp's storage capacity (per Caltrans District 7 requirements) under both Cumulative Scenarios 1 and 2.

Notes:

1 Per Caltrans District 7, queuing impacts at freeway off-ramps are based on the queues that exceed 85% of the off-ramp's storage capacity.

2 Based on 95th percentile (design) queue length (in feet) in SimTraffic 10.

3 Approximate length of storage lane measured from intersection (stop bar) to freeway mainline (at gore point).

4 Storage length based on lane distance from intersection to adjacent, upstream intersection.

* The Project would not add traffic to the movement.

Movement is utiized by Project traffic as part of the proposed haul route

Conclusion of Queuing Analysis for Cumulative Conditions

Based on the queuing analysis of cumulative conditions provided above, the proposed Project would have a potentially significant queuing impact at the I-210 eastbound ramps/Arroyo Boulevard intersection. Therefore, the project would contribute to a cumulatively significant impact to the Caltrans ramp intersection during short-term construction of Area 3. Therefore MM-CUML-1 is proposed, which requires that the City shall coordinate with the contractor for Devil's Gate Reservoir to avoid potential queuing impacts at the I-210 eastbound ramps/Arroyo Boulevard intersection during peak phase of Area 3 construction under cumulative conditions.

4.8.7 Mitigation Measures

MM TRA-1 During the peak phase of construction activities (i.e. during the demolition phase requiring haul truck trips) in Area 3, all Construction Contractors shall schedule the arrival and departure of the sediment export haul trucks to be outside the AM peak hours of 7:30 AM to 8:30 AM and the PM peak hours of 4:30 PM to 5:30 PM.

MM TRA-2 During construction activities in Areas 2 and 3, use of the North Arroyo Boulevard or Gabrielino Trail/Access Road by hikers, bicyclists and equestrians shall be limited or prohibited when temporary partial or full closures of the Gabrielino Trail/ Access Road, Explorer Road, hiking trails or maintenance roads is necessary. In addition to the requirements for notification set forth in the City's Supplements and Modifications to the Greenbook, flagpersons and/or other safety procedures shall be used as necessary to ensure the safety of recreational users.

MM TRA-3 Prior to the start of construction, the City and/or their Construction Contractor shall provide written notice to the USFS and residences at the Ranger Station of the anticipated construction schedule, stating that access may be temporarily obstructed on an intermittent basis and providing a schedule of anticipated closures. In order to ensure that emergency vehicles would not be obstructed at any time, any temporary obstructions to the Gabrielino Trail/Access Road that could hinder emergency vehicular access shall be mobile and able to be removed from the roadway immediately upon notice from emergency responders.

MM CUML-1 The City and/or their Construction Contractor shall coordinate with the Los Angeles County Department of Public Works and/or their contractor for the sediment removal activities at Devil's Gate Reservoir regarding the schedule of trucks to and from landfills that would require the use of Interstate 210 eastbound ramps/Arroyo Boulevard intersection. If it is determined that activities would overlap and Project traffic and cumulative traffic including the Devil's Gate project traffic would have vehicle queues at Caltrans facilities that exceed available storage lengths, then the City and/or their contractor shall implement construction vehicle/hauling restrictions that disallow the proposed Project's truck traffic during the AM and PM peak hours of 7:30 AM to 8:30 AM and 4:30 PM to 5:30 PM.

4.8.8 Level of Significance After Mitigation

With implementation of MM-TRA-1, MM-TRA-2, MM-TRA-3, and MM-CUML-1, short-term construction traffic impacts would be reduced to levels less than significant. There would be no impacts and no mitigation required for long-term operational transportation.

4.9 Tribal Cultural Resources

4.9.1 Methodology

This section describes the existing tribal cultural resource conditions of the project site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Arroyo Seco Canyon Project Areas 2 and 3 (Project or proposed Project). As such, analysis within this section identifies associated regulatory requirements, evaluates potential impacts to tribal cultural resources, and identifies mitigation measures related to implementation of the proposed Project. This analysis is based, in part, on a review of existing resources and applicable laws, regulations, and guidelines, as well as the following:

Appendix I- 1 Native American Heritage Commission Sacred Lands File Results for the Arroyo Seco Canyon Project Areas 2 and 3, dated October 7, 2019.

Appendix I- 2 Confidential AB-52 Consultation Documentation.

Appendix E-1 Cultural Resources Technical Report for the Arroyo Seco Canyon Project Areas 2 and 3, prepared by Dudek, dated April 2020.

The Cultural Resources Technical Report includes a review of the results of a South Central Coastal Information Center (SCCIC) records search, a search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF), and tribal consultation completed by the lead agency, the City of Pasadena, pursuant to California Assembly Bill (AB) 52. Communication from the NAHC and Tribal entities in response to the Notice of Preparation (NOP) included instructions for complying with Assembly Bill 52 (tribal consultation processes), and recommendations for cultural resources assessments. These concerns are addressed and summarized in this section. A copy of the tribal responses received by the City are included in Confidential Appendix I-2.

Comments received in response to the Notice of Preparation (NOP) are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, the Appendices to the Initial Study are included in Appendix A-2, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

4.9.2 Existing Conditions

South Central Coast Information Center Records Search

As previously discussed, in Section 4.3 for this DEIR for Cultural Resources, Dudek conducted a CHRIS records search at the SCCIC on October 3, 2019. No prehistoric or historic-era archaeological resources were identified within the Project site as a result. The records search identified 35 previously conducted cultural resources technical investigations within the 0.5-mile radius records search area. Of these, six overlap and one is adjacent to the Project site. Additionally, the SCCIC records indicate that 14 previously recorded cultural resources exist within the surrounding 0.5-mile search radius. One built environment resource, P-19-189942, overlaps the Project site and consists of the Hahamongna Watershed Park and associated recreational facilities. Two consist of prehistoric archaeological resources, including P-19-000342, the purported village site located approximately 686 meters

(2,250 feet) north of the Project site, and an isolated granitic discoidal recovered from a disturbed context within fill material. One multi-component resource consisting of multiple loci of sparse prehistoric lithic scatters, as well as a historic-era domestic refuse scatter and purported historic-era burial from the late 1800s is located approximately 914 meters (3,000 feet) northeast of the Project site.

Native American Coordination

Sacred Lands File Search and Tribal Outreach

Dudek contacted the NAHC on September 16, 2019 to request a search of the SLF. Results of the SLF (received October 7, 2019) were positive. The NAHC recommended contacting the Gabrieleño Band of Mission Indians – Kizh Nation for specific information regarding the positive findings. The NAHC also provided contact information for an additional four Native American individuals and/or tribal organizations who may have direct knowledge of cultural resources in or near the Project site; however, the additional four Native American individuals and/or tribal organizations have not, as of the submission of this Draft EIR, contacted the City requesting that the lead agency (City) provide notification to the tribe of projects in the tribe's area of traditional and cultural affiliation. In compliance with Assembly Bill (AB) 52, the City has contacted tribal representatives that have requested to be notified of projects in Pasadena. These efforts are summarized in the following section.

Assembly Bill 52

A project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource (TCR) is a project that may have a significant effect on the environment (PRC Section 21084.2). Under AB 52, a TCR must have tangible, geographically defined properties that can be impacted by project implementation. The proposed project is subject to compliance with AB 52.

The City sent notification of the proposed Project, pursuant to AB 52 on November 7, 2019, to all California Native American tribal representatives that have requested to be notified of projects within the City. The notification letter included a Project map and description inquiring if the tribe entities would like to request formal consultation in order to discuss the Project and the potential to impact any TCRs. AB 52 allows tribes 30 days after receiving notification to request consultation. If a response is not received within the allotted 30 days, it is assumed that consultation is declined. To date, one response to the City's notification letters has been received and one formal consultation has been requested. In a letter from Andrew Salas, Chairperson of the Gabrieleño Band of Mission Indians – Kizh Nation (Tribe) received by the City on November 15, 2019, Mr. Salas stated that the Project site is located within the Tribe's ancestral territory and that formal consultation was requested of the City by the Tribe.

Formal consultation was conducted over the phone on April 2, 2020 with three representatives from the City and two representatives from the Tribe present. After a description of the Project, history of water improvements and the nature of soils in the Project area were provided by the City, the Tribal representatives presented their knowledge of cultural resources in the area as well as their concerns regarding what the Tribe believes to be potential impacts to unknown cultural resources as a result of the proposed Project. The Tribal representatives stated that they request monitoring of soils during ground disturbing activities and that the Tribe is not requesting any Project alternatives or avoidance. The City contacted the Tribe via email on April 29, 2020 and provided proposed mitigation language developed based on the Tribe's input during the April 2, 2020 consultation. Within the email, the City stated that the consultation process will be considered complete absent of further communication to the contrary from the Tribe on or before May 15, 2020. On May 12, 2020, the Tribe emailed the

City and provided further language and documentation supporting their request for mitigation measures stating, "we have provided to the Lead Agency substantial evidence that the proposed project may have a significant impact on our TCRs." The Tribe attached to the email specific mitigation language approved by their Tribal Government and requested the mitigation measures be incorporated into the EIR. Table 4.9-1 summarizes the results of the AB 52 process for the proposed Project. Complete documentation of the AB-52 process can be found in Appendix I-1 and Confidential Appendix I-2.

Table 4.9-1 Assembly Bill 52 Native American Tribal Outreach Results

Native American Tribal Representatives	Method of Notification/Date	Response Received
Andrew Salas, Chairperson Gabrieleño Band of Mission Indians – Kizh Nation	Certified Mail; November 7, 2019	Tribe requested formal consultation, via email, regarding the proposed Project on November 15, 2019. Consultation meeting between the City and the Tribe occurred on April 2, 2020. The Tribe requested monitoring of ground disturbance during the April 2, 2020 consultation meeting. The City contacted the Tribe via email on April 29, 2020 and provided proposed mitigation language. On May 12, 2020 the Tribe emailed the City and provided further language supporting their request for mitigation measures as well as specific mitigation language approved by their Tribal Government. In response to the Tribe's request, the City revised the mitigation language to be consistent with the Tribe's requested mitigation measures via email on June 8, 2020. The Tribe responded to this email on the same day and proposed a different revised measure. This revised language is set forth in MM-TCR-1 and MM-TCR-2 of this Draft EIR. This email signifies the conclusion of the consultation pursuant to AB-52.
Sam Dunlap Gabrielino – Tongva Tribe	Certified Mail; November 7, 2019	No response received

4.9.3 Relevant Plans, Policies, and Ordinances

Federal

No federal requirements related to TCRs are applicable to the proposed Project.

State/Regional

California Register of Historical Resources

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural

annals of California" (California Public Resources Code Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated below. According to California Public Resources Code Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

(2) Is associated with the lives of persons important in our past.

(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

(4) Has yielded, or may be likely to yield, information important in prehistory or history.

In order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- California Public Resources Code Section 21083.2(g) defines "unique archaeological resource."
- California Public Resources Code Section 21084.1 and CEQA Guidelines Section 15064.5(a) define "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource." It also defines the circumstances when a project would materially impair the significance of an historical resource.
- California Public Resources Code Section 21074(a) defines "tribal cultural resources."
- California Public Resources Code Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- California Public Resources Code Sections 21083.2(b)-(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures; preservation-in-place is the

preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(b).) If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code Section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); California Public Resources Code Section 5020.1(q)). In turn, CEQA Guidelines section 15064.5(b)(2) states the significance of an historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (California Public Resources Code Section 21083.2[a], [b], and [c]).

California Public Resources Code Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Impacts to non-unique archaeological resources are generally not considered a significant environmental impact (California Public Resources Code section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as tribal cultural resource (California Public Resources Code Section 21074(c), 21083.2(h)), further consideration of significant impacts is required. CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in California Public Resources Code Section 5097.98.

California State Assembly Bill 52

AB 52 of 2014 amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 established that TCRs must be considered under CEQA and also provided for additional Native American consultation requirements for the lead agency. Section 21074 describes a TCR as a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American tribe and that is either:

- On or determined to be eligible for the California Register of Historical Resources or a local historic register; or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1.

AB 52 formalizes the lead agency–tribal consultation process, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with the project site, including tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a TCR has a significant effect on the environment." Effects on TCRs should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a TCR or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to TCRs, the consultation shall include those topics (PRC Section 21080.3.2(a)). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted through the approval of the environmental document (PRC Section 21082.3(a)).

California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to

contain human remains can occur until the county coroner has examined the remains (Health and Safety Code Section 7050.5(b)). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Health and Safety Code Section 7050.5(c)). The NAHC will notify the "most likely descendant." With the permission of the landowner, the most likely descendant may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the most likely descendant by the NAHC. The most likely descendant may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

Local

Hahamongna Watershed Park Master Plan

The Arroyo Seco Master Plans are a set of documents defining the community vision for the Arroyo Seco Natural Park. The set is comprised of four separate planning documents: the Lower Arroyo Master plan, Central Arroyo Master Plan, Hahamongna Watershed Park Master Plan, and Design Guidelines. The Hahamongna Watershed Park Master Plan is relevant to this report. The Hahamongna Watershed Park Master Plan illustrates a vision for the 300-acres of open space that extends from Devil's Gate Dam north and into the Arroyo Seco Canyon, on the northwestern edge of the City (City of Pasadena 2003). The Master Plan was adopted to establish a framework for recreation, water resources, flood management, habitat restoration, and cultural resources in this area. Applicable goals and objectives from this Master Plan related to tribal cultural resources are listed below.

Goal 5: Enrich and promote the unique history and culture of Hahamongna Watershed Park.

Objectives:

- Develop HWP as a "living laboratory" for local schools and environmental education programs.
- Preserve and encourage Native American use of HWP as a cultural resource.
- Develop passive viewing areas with unique vantage points.

4.9.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts related to tribal cultural resources are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to tribal cultural resources would occur if the project would:

> Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
>
> a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

4.9.5 Environmental Impacts Analysis

Threshold 4.9a **Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:**

Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k).

Short-Term Construction Impacts

As described above and under Section 4.3, Cultural Resources, no archaeological resources were identified within the Project site as a result of the CHRIS records search or Native American outreach and three previously recorded prehistoric or historic-era archaeological resources that were identified within 0.5-mile of the Project. No previously recorded TCRs listed in the CRHR or a local register were identified within the Project site. During the AB 52 notification and consultation process, the consulting Tribe provided documentation for their belief that TCRs affiliated with the Tribe do exist within and surrounding the proposed Project site and stated, "we have provided to the Lead Agency substantial evidence that the proposed project may have a significant impact on our TCRs." A short-term impact to a TCR can be defined as an impact that would prevent potential use of or access to a tribal cultural resource, such as for ceremonial purposes. No TCRs have been identified on the Project site that meet this criteria of use. Therefore, there are no Project-related conditions that would cause a short-term impact, regardless of presence of any archaeological or tribal cultural resources. Therefore, short-term construction impacts related to a site, feature, place, cultural landscape, sacred place, or object with cultural value to a California Native American tribe, and that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources would be less than significant, and no mitigation is required.

Long-Term Operational Impacts

Based on the results of the archaeological records search, the NAHC Sacred Land Files search and AB 52 consultation impacts to tribal cultural resources would be less than significant. Therefore, no mitigation measures are required. However, in response to the AB 52 consultation, the City has developed mitigation measures to ensure the proper treatment of unknown Tribal Cultural Resources that could potentially be encountered during ground disturbing activities, as described under Threshold 4.9b.

Threshold 4.9b **Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:**

A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Short-Term Construction Impacts

Pursuant to AB 52, the City sent notification letters on November 7, 2019 to two tribes that have requested notification of Pasadena projects (see Table 4.9-1). As of the timing of the preparation of this Draft EIR, the Gabrieleño Band of Mission Indians – Kizh Nation is the only Native American individual or tribal organization to have responded to the City's notification letter dated November 7, 2019. Andrew Salas, Chairperson of the Gabrieleño Band of Mission Indians – Kizh Nation (Tribe) provided a response that was received by the City on November 15, 2019. Mr. Salas stated that the Project site is located within the Tribe's ancestral territory and that formal consultation was requested of the City by the Tribe. Formal consultation was conducted over the phone on April 2, 2020 with three representatives from the City and two representatives from the Tribe present. After a description of the Project, history of water improvements and the nature of soils in the Project area provided by the City, the Tribal representatives presented their knowledge of cultural resources in the area as well as their concerns regarding what the Tribe believes to be potential impacts to cultural resources as a result of the proposed Project. As stated under Threshold 4.9a above, no previously recorded TCRs listed in the CRHR or a local register were identified within the Project site. During the AB 52 notification and consultation process, the consulting Tribe provided documentation for their belief that TCRs affiliated with the Tribe do exist within and surrounding the proposed Project site and stated, "we have provided to the Lead Agency substantial evidence that the proposed project may have a significant impact on our TCRs."

The Tribal representatives stated that they request monitoring of soils during ground disturbing activities and that the Tribe is not requesting any Project alternatives or avoidance. The City contacted the Tribe via email on April 29, 2020 and provided proposed mitigation language developed based on the Tribe's input during the April 2, 2020 consultation. Within the email, the City stated that the consultation process will be considered complete absent of further communication to the contrary from the Tribe on or before May 15, 2020. On May 12, 2020, the Tribe emailed the City and provided further language and documentation supporting their request for mitigation measures stating, "we have provided to the Lead Agency substantial evidence that the proposed project may have a significant impact on our TCRs." The Tribe attached to the email specific mitigation language approved by their Tribal Government and requested the mitigation measures be incorporated into the Draft EIR.

Although no TCRs have been identified as present within the Project site as a result of the NAHC SLF and a review of the CRHR and local register, information gathered during tribal consultation demonstrates a potential for unknown subsurface TCRs to be impacted by the Project, which could result in a significant impact.

Therefore, mitigation measures have been included to provide for tribal monitoring of ground disturbing activities (MM-TCR-1), and inadvertent discovery of TCRs (MM-TCR-2). Implementation of MM-TCR-1 and MM-TCR-2 would ensure that potential short-term construction impacts related to an unknown site, feature, place, cultural landscape, sacred place, or object with cultural value to a California Native American tribe, would be reduced to a level less than significant.

Long-Term Operational Impacts

Long-term operational impacts are consistent with the short-term construction impacts and as such, no additional mitigation measures are required.

4.9.6 Cumulative Impacts

The cumulative impacts analysis on TCRs considers whether impacts of the proposed Project together with other projects identified within the vicinity of the Project site, when taken as a whole, substantially diminish the number of TCRs within the same or similar context. Sufficient evidence of existing TCRs within or surrounding the Project site has not been identified through various records searches or AB 52 consultation and as such, the Project site is not part of an existing or known grouping of TCRs that would be impacted as part of the cumulative impacts of other projects. The Devil's Gate Sediment Removal Project, as discussed in Section 3.5, Cumulative Impacts of this Draft EIR, is located to the south and west of the proposed Project site. Since the Devil's Gate project EIR was completed prior to the enactment of AB 52, no formal tribal consultation was conducted (Los Angeles County Department of Public Works 2014). However, the project EIR did include mitigation measures, including archaeological monitoring of native sediments, to address any potential impacts to known or unknown cultural resources. It is anticipated that TCRs that are potentially affected by related projects would also be subject to the same requirements of CEQA and AB 52 as the proposed Project and any impacts would be mitigated, as applicable. These determinations would be made on a case-by-case basis, and the effects of cumulative development on TCRs would be mitigated to the extent feasible in accordance with CEQA and other applicable legal requirements. Therefore, the proposed Project would not cumulatively contribute to a significant impact associated with TCRs and impacts would be less than significant.

4.9.7 Mitigation Measures

MM-TCR-1 Prior to commencement of any ground-disturbing activities, the City of Pasadena shall retain a Native American Monitor approved by the Gabrieleño Band of Mission Indians-Kizh Nation – the tribe that consulted on this project pursuant to Assembly Bill AB 52 (the "Tribe" or the "Consulting Tribe"). The Tribal monitor shall only be present on the Project site during the construction phases that involve ground-disturbing activities. Ground disturbing activities may include, but may not be limited to, pavement removal, potholing or auguring, grubbing, tree removals, boring, grading, excavation, drilling, and trenching within the Project area. The Tribal Monitor shall complete daily monitoring logs that provide descriptions of the day's activities, including construction activities, locations, soil, and any cultural materials identified. The on-site monitoring shall end when all ground-disturbing activities on the Project site are completed, or when the Tribal Representatives and Tribal Monitor have indicated that all upcoming ground disturbing activities at the Project site have little to no potential for impacting

Tribal Cultural Resources. Upon discovery of any Tribal Cultural Resources, construction activities shall cease in the immediate vicinity of the find (not less than the surrounding 100 feet) until the find can be assessed. All Tribal Cultural Resources unearthed by Project activities shall be evaluated by the qualified archaeologist (as required in MM-CUL-4) and the Tribal Monitor approved by the Consulting Tribe. If the resources are Native American in origin, the Consulting Tribe will retain it/them in the form and/or manner the Tribe deems appropriate, for educational, cultural and/or historic purposes.

MM-TCR-2 If human remains and/or grave goods are discovered or recognized at the Project Site, all ground disturbance shall immediately cease, and the county coroner shall be notified per Public Resources Code Section 5097.98, and Health & Safety Code Section 7050.5. Human remains and grave/burial goods shall be treated alike per California Public Resources Code section 5097.98(d)(1) and (2). Work may continue on other parts of the Project site while evaluation and, if necessary, mitigation takes place (CEQA Guidelines Section 15064.5[f]). If a non-Native American resource is determined by the qualified archaeologist to constitute a "historical resource" or "unique archaeological resource," time allotment and funding sufficient to allow for implementation of avoidance measures, or appropriate mitigation, must be available. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and PRC Sections 21083.2(b) for unique archaeological resources. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. Any historic archaeological material that is not Native American in origin shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes.

4.9.8 Level of Significance After Mitigation

With adherence to MM-TCR-1 and MM-TCR-2, the potential for impacts to TCRs as a result of the proposed Project would be less than significant.

INTENTIONALLY LEFT BLANK

5 MANDATORY CEQA TOPICS

This Section discusses other issues for which the California Environmental Quality Act (CEQA) requires analysis in addition to the specific issue areas discussed in Chapter 4, Environmental Analysis. These additional issues include (1) significant effects that cannot be avoided, (2) significant irreversible environmental changes that would be caused by the proposed Project should it be implemented, and (3) growth-inducing impacts.

5.1 Significant Unavoidable Environmental Effects

Section 15126.2(c) of the CEQA Guidelines requires an Environmental Impact Report (EIR) to identify significant environmental effects that cannot be avoided if the project is implemented (14 CCR 15000 et seq.). As discussed in Sections 4.1 through 4.9 of this Draft EIR, implementation of the proposed Project would result in potentially significant impacts to Biological Resources, Cultural Resources, Noise, Recreation, Transportation, and Tribal Cultural Resources. All of the proposed Project's environmental impacts to these environmental topics would be mitigated to less-than-significant levels with the incorporation of mitigation measures, with the exception of impacts to historic resources (Section 4.3, Cultural Resources).

As discussed in Section 4.3, there are no plans for the future rehabilitation or replacement of the historic Bridge No. 3 at the time of the preparation of this Draft EIR. Because the timing of the ultimate rehabilitation or replacement of Bridge No. 3 is unknown, it is unknown whether the new permanent bridge would be constructed in such a manner that would allow for its preservation as a historical resource. As such, it is reasonably foreseeable that implementation of the proposed Project, which would retain the temporary bridge structure until funding is available for the design and construction of a new permanent bridge: (1) would allow for the continued deterioration of the existing Bridge No. 3, and (2) would not guarantee its future rehabilitation or replacement in accordance with the U.S. Department of the Interior Standards for the Treatment of Historic Properties. Therefore, even with implementation of mitigation measures, the Project-related impacts to cultural resources would be significant and unavoidable.

Section 15128 of the CEQA Guidelines states that an EIR shall contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the EIR, and that such a statement may be contained in an attached copy of an Initial Study. A copy of the Notice of Preparation (NOP) and Initial Study for the Arroyo Seco Canyon Project Areas 2 and 3 (proposed Project) is included in Appendix A-1 of this Draft EIR, and the appendices to the Initial Study are included in Appendix A-2. Table 5-1 identifies the following: (1) the significance conclusions in the Initial Study for each environmental topic, (2) which topics were determined to not require additional analysis in the Draft EIR, (3) which topics were brought forward into the Draft EIR for further analysis, and (4) the significance conclusions of the Draft EIR. Refer to the Initial Study for the analysis that supports the conclusions included in Table 5-1.

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
Aesthetics ***Except as provided in Public Resources Code Section 21099, would the project:***		
a) Have a substantial adverse effect on a scenic vista?	Less Than Significant Impact	Refer to Initial Study
b) Substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	No Impact	
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	Less Than Significant Impact	
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	No Impact	
Agriculture and Forestry Resources ***Would the project:***		
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	No Impact	Refer to Initial Study
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	No Impact	
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	No Impact	
d) Result in the loss of forest land or conversion of forest land to non-forest use?	No Impact	
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	No Impact	

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
Air Quality ***Would the project:***		
a) Conflict with or obstruct implementation of the applicable air quality plan?	Potentially Significant: See Section 4.1	Less Than Significant Impact
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?		
c) Expose sensitive receptors to substantial pollutant concentrations?		
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?		
Biological Resources ***Would the project:***		
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Potentially Significant: See Section 4.2	Less Than Significant Impact With Mitigation Incorporated
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?		
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?		
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?		
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?		
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	No Impact	Refer to Initial Study

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
Cultural Resources ***Would the project:***		
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	Potentially Significant: See Section 4.3	Significant and Unavoidable Impact
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?		Less Than Significant Impact With Mitigation Incorporated
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	Less Than Significant Impact	Refer to Initial Study
Energy ***Would the project:***		
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	Less Than Significant Impact	Refer to Initial Study
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	No Impact	
Geology and Soils ***Would the project:***		
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:	Less Than Significant Impact	Refer to Initial Study
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.		
ii) Strong seismic ground shaking?		
iii) Seismic-related ground failure, including liquefaction?		
iv) Landslides?		
b) Result in substantial soil erosion or the loss of topsoil?		
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?		

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?		
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	No Impact	
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?1	Potentially Significant: See Section 4.3	Less Than Significant Impact With Mitigation Incorporated
Greenhouse Gas Emissions ***Would the project:***		
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	Less Than Significant Impact: See Section 4.4	Less Than Significant Impact
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?		
Hazards and Hazardous Materials ***Would the project:***		
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	Less Than Significant Impact	Refer to Initial Study
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?		
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?		
d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?		
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	No Impact	
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	Less Than	

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	Significant Impact	
Hydrology and Water Quality ***Would the project:***		
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	Less Than Significant Impact	Refer to Initial Study
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?		Less Than Significant Impact
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:	Potentially Significant Impact: See Section 4.5	Less Than Significant Impact
i. result in substantial erosion or siltation on or off site;		
ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;		
iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or		
iv. impede or redirect flood flows?		
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	No Impact	Refer to Initial Study
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	Less Than Significant Impact	
Land Use and Planning ***Would the project:***		
a) Physically divide an established community?	No Impact	Refer to Initial Study
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	Less Than Significant Impact	

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
Mineral Resources ***Would the project:***		
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	Less Than Significant Impact	Refer to Initial Study
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?		
Noise ***Would the project result in:***		
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Potentially Significant Impact: See Section 4.6	Less Than Significant Impact With Mitigation Incorporated
b) Generation of excessive groundborne vibration or groundborne noise levels?		Less Than Significant Impact
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	No Impact	Refer to Initial Study
Population and Housing ***Would the project:***		
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	No Impact	Refer to Initial Study
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?		
Public Services		
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:	No Impact	Refer to Initial Study
Fire protection?		
Police protection?		

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
Schools?		
Parks?		
Other public facilities?		
Recreation		
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	Potentially Significant Impact: See Section 4.7	Less Than Significant Impact With Mitigation Incorporated
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	No Impact	Refer to Initial Study
Transportation ***Would the project:***		
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	Potentially Significant Impact: See Section 4.8	Less Than Significant Impact With Mitigation Incorporated
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	Less Than Significant Impact	Refer to Initial Study
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?		
d) Result in inadequate emergency access?		

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
Tribal Cultural Resources ***Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:***		
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	Potentially Significant Impact: See Section 4.9	Less Than Significant Impact With Mitigation Incorporated
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?		
Utilities and Service Systems ***Would the project:***		
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	Less Than Significant Impact	Refer to Initial Study
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?		
c) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	No Impact	
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	Less Than Significant Impact	
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?		

Table 5-1. Initial Study Conclusion Summary

CEQA Threshold	Initial Study Conclusion	Draft EIR Conclusion
Wildfire ***If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:***		
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	Less Than Significant Impact	Refer to Initial Study
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?		
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	No Impact	
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	Less Than Significant Impact	

Source: Appendix A-1.

5.2 Significant Irreversible Changes

CEQA Guidelines Section 15126.2(d) requires the evaluation of (14 CCR 15000 et seq.):

> Uses of nonrenewable resources during the initial and continued phases of the project [that] may be irreversible since a large commitment of such resources makes removal or non-use thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as a highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

Renewable resources are those that are generally unlimited in supply, such as solar, hydro, or wind energy, and those that can be readily replenished, such as biomass materials that can be grown (e.g. wood products, agricultural commodities). As such, the vast majority of materials used to construct and operate projects are considered to be non-renewable, or those with a finite supply that cannot be readily replenished. Such non-renewable resources include, but are not limited to, fossil fuels, natural gas, metals (e.g. steel, copper, aluminum), plastics, and cement.

Construction Materials Use

Fossil fuel would be used during construction activities in Area 2 and 3 and would include gasoline/diesel for construction equipment, material deliveries, demolition waste disposal, and construction crew travel. No natural gas is required. Petroleum consumed by construction equipment, transport of construction materials, and worker trips would be the primary energy resource expended over the course of construction activities. Construction workers would likely travel to and from the Project area in gasoline- or diesel-powered vehicles. Construction is expected to require approximately one year. However, once construction activities cease, petroleum use from off-road equipment and transportation vehicles would not differ from the operations at the Project site in the current existing condition. Because of the short-term nature of construction and relatively small scale of the construction activities required for the Project, the petroleum consumption would be negligible when compared to California's daily total use of approximately 1.8 million barrels of petroleum. Project impacts related to consumption of nonrenewable resources are considered to be less than significant because the Project would not use unusual or wasteful amounts of energy or construction materials.

In addition to fossil fuel use, a variety of resource materials would be used during the construction process, including steel, wood, concrete, electrical wiring, and fabricated materials. Upon completion of the construction activities, the commitment of such materials is considered irreversible because it is unlikely that the facilities would ever be decommissioned, and if they were decommissioned in the future, it is unlikely that the materials would be reused. Construction and demolition (C&D) waste is required to be diverted from landfills by the CALGreen Code, which requires a minimum 50 percent of diversion; however, for the purposes of this analysis, the use of such resources is considered a permanent and irreversible use.

Construction materials used in Area 2 include the concrete, metal, and rocks for the diversion and intake structure as well as the engineered roughened channel. Additionally, concrete, cinderblocks, roofing materials, and electrical components and wiring would be used for the intake service building, which would house the electrical and hydraulic controls for the diversion structure. Construction materials used in Area 3 would include pipes and valves, as well as engineered fill materials (e.g. sands and gravel) to construct the bermed walls of the spreading basins.

These construction materials would likely be committed to other similar projects in the region if not used for this Project. Resources used for the Project would be typical of similar water infrastructure projects in the region and would require a relatively minimal amount of resources when compared to land use development projects with habitable structures. Therefore, although irretrievable commitments of resources would result from the proposed Project, such changes would be less than significant.

Irreversible changes may occur from environmental damage, such as spill or release of hazardous materials due to failure of human-made structures, or accidental fire resulting from mechanical or electrical failure. While there are many other types of accidents possible, those listed above represent the key sources for irreversible damage that can be associated with water infrastructure projects. As discussed in the Initial Study, construction activities would utilize hazardous materials on a short-term basis, and compliance with existing federal, state, and local regulations regarding hazardous material use, storage, disposal, and transport would prevent risks to public health and safety. Construction wastes that meet hazardous waste criteria would be stored, manifested, transported, and disposed of in accordance with the California Code of Regulations (Title 22) and to the satisfaction of the Los Angeles County Fire Department, which serves as the local Certified Unified Program Agency (CUPA). Therefore, with compliance with applicable state and local regulations, the proposed Project would not result in irreversible damage from environmental accidents associated with the Project.

Operational Use of Resources

Once operational, the Area 2 components would consume more energy on a daily basis than is currently consumed, given the addition of the intake service building that would house the electrical and hydraulic controls for the diversion structure. Electric power for the operation of the diversion structure and control equipment enclosure would be supplied by an existing power line at the Screen Building (southeast of the intake structure). A portion of the energy used would be provided by non-renewable sources, which would be an irreversible commitment of such resources.

The Pasadena Water and Power would service the Project, and the design of the proposed Project are all subject to regulations that are working to reduce the amount of non-renewable resources from development projects. The electrical demand associated with the Area 2 activities is a minor energy consumer compared to other local and regional users that have long-term operations.

No new employees are required for the long-term operation or maintenance of the Project components in Area 2. No operational changes would occur, and may be potentially reduced with the automation of the weir to control flows in the intake. Similarly, PWP's future schedule of maintenance activities would not substantively differ from the current maintenance routine and procedures. City personnel would continue to provide maintenance of the diversion and intake structures as occurs under the existing conditions. Similarly, no new employees are required for the long-term operation or maintenance of the Project components in Area 3. PWP typically scrapes and tills the existing spreading basins about once per year, which is anticipated to generally reflect the proposed ongoing maintenance schedule. An estimated 100 truckloads of soil from the existing and proposed spreading basins would have to be disposed of off-site approximately every 5 years (approximately 20 trucks per year), which is reflective of current maintenance activities. Therefore, the long-term use of non-renewable fossil fuel resources would not be substantively different than in the current condition, and impacts would be less than significant. Therefore, the operation of the proposed Project would not be considered a significant irreversible environmental effect or cause irreversible environmental damage.

5.3 Growth-Inducing Impacts

Section 15126.2(e) of the CEQA Guidelines defines growth-inducement as the ways in which a project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. A project can induce growth by removing obstacles to population growth (e.g. a major expansion of a wastewater treatment plant); providing new transportation infrastructure that reaches previously undeveloped areas; building infrastructure sized beyond the needs to serve the existing region; or otherwise attracting growth to the project area that is not assumed in a General Plan or the regional growth projections. Growth-inducing impacts could be significant if they increase the population or require the construction of new regional-serving facilities that could cause significant environmental effects; and/or facilitate other activities that could significantly affect the environment, either individually or cumulatively.

The proposed Project would not directly foster economic or population growth. The Project does not involve the construction of any habitable structures that could support any occupiable land uses; no commercial or residential activity would result from Project implementation. As discussed above, no new employees would be required for the long-term operation and maintenance of the proposed Project.

The proposed Project would not indirectly foster economic or population growth, or otherwise remove a barrier to growth. The Project would allow for the additional recharge of an average 1,000 acre-feet/yr into the groundwater basin, which would supplement the PWP's local water supplies. The proposed Project would facilitate the efficient use of water in the Arroyo Seco by allowing for the increased utilization of the City's surface water rights and reducing reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD). Importantly, PWP is able to pump between 60 to 80 of the water that is infiltrated through the spreading basins, which would result in a net augmentation of groundwater in storage as a benefit to the basin. The proposed Project would not change the sustainable yield of the groundwater basin or otherwise alter the anticipated water supply projections set forth in the City's Urban Water Management Plan (UWMP). Therefore, the Project would not increase the available water supply such that population growth could be indirectly induced. Because there would be no direct or indirect impact related to fostering economic or population growth, or otherwise remove a barrier to growth, there would be no cumulative impacts related to growth-inducing impacts.

Additionally, the Project would not propose any physical or regulatory changes that would remove a restriction to or encourage population growth in the Project area, such as regulatory changes including General Plan Amendments encouraging population growth, specific plan amendments, zone reclassifications, sewer or water annexations; Local Agency Formation Commission annexation; or other similar actions. The Project is intended to increase water supply reliability and water system resiliency through an increase in local water supplies and would not encourage housing growth or result in growth-inducing impacts.

INTENTIONALLY LEFT BLANK

6 ALTERNATIVES

This section of the Draft EIR describes and evaluates alternatives to the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3 (Project). This section implements the requirements set forth in the CEQA Guidelines (14 CCR 15000 et seq.), and identifies the Environmentally Superior Project Alternative, as required by California Environmental Quality Act (CEQA) Guidelines Section 15126.6(e)(2).

6.1 Introduction

Pursuant to Section 15126.6(a) of the CEQA Guidelines, an Environmental Impact Report (EIR) "shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation."

Pursuant to Section 15126.6(b) of the CEQA Guidelines, an alternatives discussion must focus on "alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly."

Pursuant to Section 15126.6(c) of the CEQA Guidelines, "the range of potential alternatives to the proposed Project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects. The EIR should briefly describe the rationale for selecting the alternatives to be discussed. The EIR should also identify any alternatives that were considered by the lead agency but were rejected as infeasible during the scoping process and briefly explain the reasons underlying the lead agency's determination."

The inclusion of an alternative in an EIR does not constitute definitive evidence that the alternative is in fact "feasible." The final decision regarding the feasibility of alternatives lies with the decision maker(s) for a given project, who must make the necessary findings addressing the potential feasibility of an alternative, including whether it meets most of the basic project objectives or reduces the severity of significant environmental effects pursuant to CEQA (California Public Resources Code, Section 21081; see also 14 CCR 15091).

This Draft EIR includes the analysis of three alternatives to the proposed Project:

- Alternative A- No Project/No Action
- Alternative B- Redesigned Spreading Basins in Area 3
- Alternative C- Historic Bridge Rehabilitation

6.2 Project Overview and Objectives

As described in Section 3, Project Description, the City owns the right to divert up to 25 cubic feet per second (cfs) of surface water from the Arroyo Seco for direct use or for spreading into its existing spreading basins for groundwater pumping credits from the Raymond Basin. Of the total amount of water that is infiltrated into the groundwater through the existing spreading basins, PWP has the right to pump between 60 and 80% of that amount for beneficial use in the City's water supply. According to PWP, the current spreading basins reach an

equilibrium during recharge events of 18 cfs, meaning that sustained diversions equaling 18 cfs would fill the basins to capacity, with water percolating at generally the same rate as entering the basins; however, higher flows beyond 18 cfs would not be able to be infiltrated due to capacity constraints (Carollo Engineers 2013). However, improvements in the diversion weir and intake structure in Area 2 and the expansion of the spreading basins in Area 3 would allow for diversion of PWP's right to up to 25 cfs during high storm flow events, which would allow for the diversion, spreading and infiltration of approximately 1,035 acre feet per year (acre-ft/yr) of additional diverted flows into the spreading basins beyond the current condition.

These proposed increased diversions would result in a measurable increase beyond existing conditions only during larger wet-weather flows. There would be little to no difference in the amount of diversions between the current condition and the proposed Project during the drier periods of the year, as discussed in detail in Section 4.5, Hydrology and Water Quality. In summary, the proposed Project would increase diversion of flows from the Arroyo Seco almost exclusively during wet winter months when high stream flows occur because the new diversion/intake structure would be able to better manage the higher flows without damaging the infrastructure.

The Project Objectives include the following:

Objective 1: Fully divert and utilize the City's 25 cubic feet per second surface water rights while operating in a manner objectively consistent with the Raymond Basin Judgment.

Objective 2: Increase the capacity and functionality of the spreading basins to increase PWP's ability to recharge the groundwater basin, as envisioned by the 2011 Water Integrated Resources Plan with its recommendation to maximize the value of the groundwater basin and non-potable supplies.

Objective 3: Provide opportunities for increased aquatic biological functions within the Arroyo Seco by: (1) protecting aquatic animals from passing into the conveyance system, and (2) reducing existing impediments to fish passage at the diversion weir structure.

Objective 4: Increase PWP's ability to rely upon local water for its potable water supply to reduce reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD).

6.3 Alternatives Considered But Not Carried Forward

CEQA Guidelines Section 15126.6(c) recommends that an EIR identify alternatives that were considered for analysis but rejected as infeasible and briefly explain the reasons for their rejection. According to the CEQA Guidelines, among the factors that may be used to eliminate alternatives from detailed consideration in an EIR are (i) failure to meet most of the basic project objectives, (ii) infeasibility, or (iii) inability to avoid significant environmental impacts. With regard to feasibility, Section 15126.6(f)(1) states, "among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plan or regulatory limitations, jurisdictional boundaries, and whether the applicant can reasonably acquire, control, or otherwise have access to the alternative site." Two alternatives for the Project were considered, but ultimately rejected from further analysis in the Draft EIR, consistent with Section 15126.6(c) of the CEQA Guidelines. A description of the potential alternatives considered, but not carried forward, and the rationale for rejection is provided below.

- Reduced Diversion with In-Stream Spreading
- Consolidated Facility Below JPL Bridge

6.3.1 Reduced Diversion with In-Stream Spreading

As discussed in Section 1, Introduction of this Draft EIR, an Initial Study and Notice of Preparation (NOP) for the proposed Project were distributed on November 4, 2019, to federal, State, regional, and local agencies and interested parties for a 30-day review period to solicit comments and to inform agencies and the public of the proposed Project. The 30-day Initial Study/NOP public review period ended December 6, 2019. The City received nine comment letters in response to the Initial Study/NOP. Comments received in response to the NOP are summarized in Table 1, Notice of Preparation and Scoping Comment Letters Summary, included in Section 1, Introduction of this Draft EIR. A copy of the NOP and Initial Study is included in Appendix A-1, and the comment letters received in response to the NOP are included in Appendix A-3 of this Draft EIR.

Several of the letters received during the NOP public review period suggested that the proposed Project not be implemented in favor of an alternative approach that involves in-stream spreading and percolation. The "Public Comment on Initial Study for Arroyo Seco Canyon Project" submitted on December 4, 2019 (see comment letter included in Appendix A-3), provides a thorough articulation of this proposed alternative, which was similarly suggested by several comment letters. The alternative suggested in the December 4, 2019 comment letter is excerpted and summarized as follows:

1. Measure percolation capacity of the stream from the USGS gauging station down to the dam. RBMB *[Raymond Basin Management Board]* then allows PWP to claim credit for the full percolation of water in the "natural stream channel" before it hits the dam. Flows not absorbed by the stream up to PWP's surface water right (25 cfs) are diverted into the existing spreading basins. E.g. if the stream can absorb 15 cfs before water hits the dam, PWP diverts the remaining 10 cfs into the existing spreading basins.
2. If there is an issue with "natural stream channels" not leading to "existing or new spreading grounds", calculate the percolation rate for the natural stream up to the last of the spreading ponds, Johnson Field. All flows in the natural stream channel up to Johnson Field provide for PWP pumping credit. Most of the year flows, if left in the stream, will not reach Johnson Field.
3. Use the Prop 84 funds to construct new "spreading grounds" that allow for maximization of the high percolation provided by the stream. This includes engaging LACFD to ensure they maximize the percolation capacity of the stream under their clean-out project.
4. If "the law" proves inflexible, challenge the ongoing use of a 75 year old document that dictates an out-dated mechanism of water conservation — science and public attitudes have moved on. The environment and our fragile water supply require better. It is unreasonable to believe that the stakeholders in our local aquifer are not interested in replenishing the same as efficiently as possible.

In summary, this proposed alternative set forth in the NOP comment letter was for the City to consider either: (1) leaving the flows in the "natural stream" and allowing them to be naturally absorbed within the stream, with the City taking credit for up to the calculated natural stream percolation capacity, and diverting the remainder into the spreading basins to achieve the 25 cfs; or (2) installing a low berm facility within the Arroyo Seco near Johnson Field that would "spread" the flows within the stream bed and slow water to allow percolation.

The City took the suggested alternative into consideration, analyzing its feasibility from legal, administrative and technical standpoints. It appears that the suggestion for this alternative comes from the language in the Raymond Basin Judgment, which is attached in Appendix A-2 of this Draft EIR. In relevant part, the Judgment reads:

> "(1) The water shall be spread for percolation into the underground in the existing water conservation facilities of the Los Angeles County Flood Control District, or in such additional spreading grounds as the parties may acquire or construct, or in any natural stream channels leading to such existing or future spreading grounds, provided that all such spreading locations shall be located within the Monk Hill Basin or Pasadena Subarea hydrologic subdivisions of the Western Unit of the Raymond Basin Area."

Regarding the potential "natural stream" approach, it is important to note that the "natural stream channels" noted above are only those "leading to such existing or future spreading grounds", and do not include the existing natural stream in isolation. The Judgment distinguishes between water taken for pumping credit, and water taken directly from the stream as follows:

> "(8) The right to divert for spreading and recapture is an alternative, in whole or in part, to the right to make direct use of such diversions, and does not preclude the direct use of such water, provided that the total amount of water diverted, either for spreading or direct use, does not exceed the respective rights of the parties set forth above."

In other words, in the absence of direct use of the water (i.e. diversion into a treatment plant rather than infiltration into the groundwater basin), the only way for the City to earn pumping credit is by diversion from the natural stream, and for that diverted water to end up in spreading grounds. As such, leaving the flows in the "natural stream" is not an option set forth in the Raymond Basin Judgment and is therefore infeasible.

This scenario would require a re-negotiation of the adjudicated agreement, as there is no ability in the Judgment for the City to take pumping credit for water left in the stream. This interpretation and conclusion has been determined by the PWP as well as the City Attorney. This is similarly concluded by the Flood *Hazard, Sediment Management, and Water Feature Analyses, Hahamongna Watershed Park*, prepared by Phillip Williams & Associates (PWA), which is referenced several times in the comment letter. As stated in that report, leaving the flows in the "natural stream" would require a "significant adjustment to the adjudication of water rights for the City of Pasadena," and "should be understood that any recommended significant changes to the way the City uses this water right and gains groundwater credit may necessitate a re-negotiation of the City's original adjudicated agreement, which could be a lengthy and difficult process" (PWA 2000). The Raymond Basin and its producers are governed by a stipulated Judgment. The process for changing any of the components of the Judgment would require legal action beginning with a petition to the Court. All parties to the Judgment would have an opportunity to remark, including on any other aspects of the Judgment. For these reasons, the City has been consistent in its rejection of this potential alternative in the past, and therefore has eliminated it as a potential alternative to the proposed Project.

Much of the rationale for the alternative project set forth in the NOP comment letter is based on findings from the PWA report. However, it should be noted that PWA's stated objective was to preliminarily examine the feasibility of implementing and maintaining a recreational water feature in the Hahamongna Watershed Park, and they acknowledged "conflicting resource management objectives" such as those of the City's for groundwater recharge.

While the report suggests that restoring natural flows to the park would increase groundwater recharge, it does not address the practical matter of implementing the recommendations for water supply.

In addition to the administrative and legal challenges to implementing the alternative project set forth in the NOP comment letter, there are practical/technical challenges as follows:

1. Even in the hypothetical scenario in which the Judgment is amended to allow pumping credit for water not diverted from a stream, the alternative project would require measurement of the stream's percolation capacity in order calculate the corresponding pumping credits the City should receive. Hydraulic conductivity, (i.e., percolation), is a soil property that can be quantified for a general soil type, or tested for a specific soil location, but its true value will vary spatially as well as over time. Additionally, percolation potential varies with the channel discharge (PWA 2000), (i.e. percolation decreases with lower stream flows and vice versa). Because of these variables, any quantification of percolation in the natural stream would, therefore, only be an estimate for a specific stream flow, and therefore not accurate enough to be defensible in terms of the requirements of the Judgment.

   In contrast, the proposed Project would measure the volume of water diverted for groundwater recharge through a flow metering device. Also, the proponent suggests that the boundaries for the alternative project would be the natural stream from the USGS gauging station to the dam. It is assumed that this reach is suggested because of the current ability to measure stream flows at the gauging station. However, the boundaries of the Monk Hill sub-basin do not extend this far north. Therefore, a measurement of surface flows as they enter the northern boundary of the sub-basin would require a new gauging station at this location, or another estimate for flows.

   The alternative project approach also does not account for other sources of water, including surface run-off and discharge from storm drains that contribute to the stream flows and either percolate in the natural stream or collect behind Devil's Gate Dam. In other words, these other waters are either consuming fully or in part the streambed's capacity for natural recharge. So, while these flows could be estimated (although there are no measuring devices on the several storm drain outlets) they would need to be discounted from the stream's estimated percolation capacity to ascertain the remaining capacity for percolating the City's water rights. The Raymond Basin Judgment does not include provisions for the City to take credit for stormwater flows percolating in the basin. With so many variables, and the inability to obtain any actual measurements, "measuring the percolation capacity of the stream" to claim credit for water "spread in the natural stream" would be a guess at best, and therefore not accurate enough to be defensible in terms of the requirements of the Judgment. Additionally, leaving flows in the natural stream reduces overall recharge of the basin under the conditions that the Project seeks to benefit from. Under the alternative project, stream flows that are not diverted to spreading basins "compete" for the stream's limited capacity for natural percolation and would displace flows from other sources that would otherwise percolate into the groundwater basin via the streambed. Flows that are not able to percolate in the streambed collect in the Devil's Gate Reservoir. As the water level in the reservoir rises, the Los Angeles County Flood Control District (LACFCD) follows a dam operation plan to release water. By not diverting to spreading basins this outflow would increase and overall recharge of the basin would be diminished.
2. Since the percolation capacity of the natural streambed is variable, excess flows up to the City's 25 cfs water right that are diverted into the spreading grounds would also vary. However, there is no feasible way to control the diversion and limit the flows so that the aggregate recharge does not exceed 25 cfs without a new diversion and intake structure in the stream. It is not uncommon to insert a

barrier in a channel for the purpose of diverting water elsewhere, but this type of operation requires infrastructure that would seem contrary to the goals of the alternative project. The Project's diversion and intake structure in Area 2 is further example of the infrastructure that is required for controlling flows left in the stream and diverted to spreading basins, although its goal is to first allow for intake of the stream flows with flows in excess of the City's water rights remaining in the stream.

3. The LACFCD's Devil's Gate Reservoir Sediment Removal and Management Project will remove 1.7 million cubic yards (MCY) of sediment for flood control. The amount of sediment to be removed includes 1.3 MCY brought into Devil's Gate Reservoir by storms following the 2009 Station Fire, and helps LACFCD prepare for a future major debris storm event. While percolation rates may be higher initially following the sediment removal project, the LACFCD has questioned an actual long-term increase in percolation rates to groundwater from ponding behind Devil's Gate Dam based on their experience from managing other reservoirs and deep pit spreading basins (PWA 2000). In line with this experience and as part of their mission to conserve as much stormwater as practicable, LACFCD has developed a concept for conserving the water behind the dam by diverting it elsewhere for spreading (and not by retaining it behind the dam). The LACFCD has built dams and spreading ground facilities to store and conserve stormwater throughout Los Angeles County. This common practice of spreading stormwater has typically allowed over 270,000 AFY of recharge into various groundwater basins. The LACFCD's analysis of 63 years of historical records shows that Devil's Gate Reservoir has an average annual outflow of 6,900 acre-feet which passes through the dam and is currently wasted to the ocean. The LACFCD conservation concept for Devil's Gate Dam would redirect a portion of the outflow to spreading basins. Therefore, it is unreasonable to expect that engagement with LACFCD would "ensure they maximize the percolation capacity of the stream under their clean-out project"; LACFCD is already thinking of how best to conserve water and their answer is through spreading. Also, for the record, Proposition 84 funds that were once available to the City to partially fund the Project, had to be forfeited as a result of the lawsuit.
4. Regarding the potential "seasonal low-berm near Johnson Fields" approach, the intent set forth in the NOP comment letter would be to "spread" the flows and slow the water to allow percolation within the Arroyo Seco stream bed. A seasonal berm at the lower end of Johnson Field, or anywhere before the Devil's Gate Dam, would be considered a new "spreading ground," allowing PWP to claim credit for all natural flows up to that berm. However, this potential scenario is also infeasible for the following reasons.

   It is not clear that such a seasonal berm would be considered a "spreading basin" in a manner that would satisfy the Raymond Basin Judgment. The construction of a "seasonal" berm would not provide for a permanent facility that could reliably serve to capture PWP's 25 cfs. The highly dynamic alluvial soils within the Arroyo Seco and Devil's Gate Reservoir are subject to sedimentation and scour activity as the active channel alignment migrates across the alluvial fan area and where sediment is regularly changing the channel capacity. The combination of flash flood conditions and high volumes of sediment create a highly dynamic flow condition that could cause extensive damage to development located within the alluvial fan flood inundation zones. The evaluation of a permanent structure within the stream bed of the Arroyo Seco is discussed under 6.3.3 below.

   Importantly, such a berm would be within the limits of the LACFCD Devil's Gate Sediment Removal Project's Phase I Restoration area as well as within the limits of the 42-acre Annual Maintenance Area that is subject to regular sediment removal/maintenance, as identified in Figure 3-5, Cumulative Projects, in Section 3, Project Description of this Draft EIR. As shown, the land between the alluvial streambed of the Arroyo Seco and the western edge of the spreading basins within

Area 3 have been revegetated as a part of the LACFCD's required restoration efforts from approximately Basin 2 to Basin 12. As of January 2020, the LACFCD has conducted weed abatement, installed irrigation facilities, and has seeded the area and planted a combination of container plants and coast live oak acorns (LACFCD 2020).

This potential alternative would require construction of facilities within the stream, where infrastructure currently does not exist, and where the LACFCD has jurisdiction to conduct their flood control operations associated with Devil's Gate Dam. Similar to the proposed Project, the alternative would be subject to the California Fish and Game Code, including the requirement to not prevent or impede the passing of fish. Further, this alternative would have potentially significant biological impacts greater than the proposed Project given the construction within the streambed that it would necessitate. For these reasons, the City has eliminated it as a potential alternative to the proposed Project.

Additionally, the proposed Project's only unavoidably significant environmental impact is related to impacts to the historic Bridge No. 3, and these potential alternative scenarios would have the same impacts as the proposed Project thereon.

6.3.2 Consolidated Facility Below JPL Bridge

A version of this potential alternative was preliminarily evaluated in the Upper Arroyo Seco Watershed Integrated Spreading Grounds Concept Report prepared by CDM Smith in 2012. A portion of the alternative considered in 2012 included restoration of Area 1, which as discussed in Section 2, Environmental Setting of this Draft EIR, has been approved to proceed through the 2015 Initial Study/Mitigated Negative Declaration and associated Settlement Agreement. Therefore, this potential alternative considers implementation of most of the remaining portions of 2012 design recommendation.

This potential alternative includes relocating the diversion capabilities of the diversion weir and intake structure within Area 2 and the sedimentation function of the former settlement ponds in Area 1 to a consolidated facility downstream of the JPL Bridge. The potential location of this combined facility is illustrated on Figure 6-1, Consolidated Facility Below JPL Bridge, and is at the site of the former "breakaway" dam used by the LACFCD when they operated the spreading basins for water conservation. The consolidated facility would include a diversion structure and a sediment forebay to simplify sediment management and maintenance activities by replacing scattered diversion and sedimentation facilities, presently located within the Arroyo Seco Canyon and accessed by canyon roads, which are difficult to navigate and maintain, to a consolidated facility downstream of the mouth of the canyon (CDM Smith 2012).

This potential alternative would demolish the existing facilities in Area 2 and abandon the conveyance system, and would restore that portion of the Arroyo Seco. Stream flows would be captured behind the new consolidated diversion dam located just downstream of the JPL Bridge adjacent to Area 3 and diverted into the expanded spreading basins, as set forth in the proposed Project. The impoundment area created by the dam would be much larger than the pooling of water at the intake in Area 2 of the Project, where grading would be limited to the immediate area of the diversion.

Although this alternative would satisfy the proposed Project Objectives, this alternative does not avoid any significant environmental impacts of the proposed Project and would increase the environmental impacts in comparison to the proposed Project. This potential alternative would create a new engineered facility within the Arroyo Seco where none currently exists, rather than replacement in-kind of an existing facility within largely the same footprint as the current facility (i.e. proposed Project Area 2).

Impacts related to the recreational setting would be substantial due to the creation of a new structure within the Arroyo Seco at a location that would be much more visible to recreational users than the proposed replacement of the existing structure in Area 2. New permanent impacts would result to the topics of biological resources, cultural and tribal cultural resources, geology and soils, and hydrology due to the creation of a new structure that requires permanent alterations to a previously undisturbed area. A new dam at this location would also have the potential to disturb the downstream alluvial and sediment transport dynamics because the facility would retain sediment behind its fixed crest. The accumulation of sediment would have to be routinely addressed in order to maintain the intended diversion capacity, presumably by removing the sediment from the streambed, thereby altering the natural morphology of the stream. In comparison, the proposed Project with its operable weir concept would have the advantage of managing sediment and minimizing effects on the channel morphology. All environmental topics would have increased impacts, rather than reduced environmental impacts, with is contrary to the intent of an alternatives analysis pursuant to Section 15126.6(a) of the CEQA Guidelines.

Additionally, creation of a new dam structure that would span the width of the Arroyo Seco would involve a more complex set of regulatory permitting requirements, not only for the construction but for the routine maintenance that would be required for operation of the project. A new permanent engineered structure would require permanent vegetation removal and annual maintenance requirements in the streambed, including the removal of sediment in the water impoundment area; whereas, the proposed Project would not require additional permitting for routine maintenance. The permitting requirements for the potential alternative would include but not be limited to application to and permitting by the U.S. Army Corps of Engineers (USACE), California Department of Fish and Wildlife (CDFW), and Regional Water Quality Control Board (RWQCB), and possibly by the California Department of Water Resources (DWR), Division of Safety of Dams (DSOD), if the structure would be more than 6 feet tall and impound 50 acre-feet or more of water. DSOD oversight, for example, would require detailed design review and approval in conformance with the agency's standards, and subsequent periodic inspections, fees and permissions for work within their jurisdiction. Likewise, CDFW's permission and the payment of fees would be required beyond initial construction for on-going maintenance, likely imposing restrictions on timeframes for the work, and the allowable scope of work in the streambed. The new structure would also need to incorporate a fish screen facility, as required for the proposed Project, and considerations for future fish passage. For these reasons, this alternative was considered but not carried forward for further analysis. Additionally, the proposed Project's only unavoidably significant environmental impact is related to impacts to the historic Bridge No. 3, and this potential alternative scenario would have the same impacts as the proposed Project thereon.

6.4 Alternatives to the Proposed Project

This section discusses the alternatives to the Project, including the No Project Alternative, under consideration. However, the range of alternatives analyzed is limited, as discussed above, based upon the Project site's location and purpose. The No Project/No Action Alternative, which is a required element of an EIR pursuant to Section 15126.6(e) of the CEQA Guidelines, examines the environmental effects that would occur if the Project were not to proceed and no development activities were to occur. The other alternatives are discussed as part of the "reasonable range of alternatives" selected by the City, as Lead Agency, that would attain most of the basic objectives of the Project, would be potentially feasible to implement, and would avoid or substantially lessen one or more of the significant effects of the Project. Accordingly, the following alternatives to the Project were selected for consideration in this Draft EIR:

- Alternative A- No Project/No Action

- Alternative B- Redesigned Spreading Basins in Area 3
- Alternative C- Historic Bridge Rehabilitation

Pursuant to Section 15126.6(d) of the CEQA Guidelines, each alternative is evaluated in sufficient detail to determine whether the overall environmental impacts would be less than, similar to, or greater than the corresponding impacts of the Project. Each alternative is also evaluated to determine whether the Project objectives would be substantially attained.

6.4.1 Alternative A – No Project/No Action

Under Alternative A, the proposed Project would not be implemented as discussed in Section 3 of this Draft EIR. The Areas 2 and 3 of the Project site would remain unchanged, and no development activity would occur. Operations and maintenance activities would continue to occur into the future, as in the current condition.

Ability to Meet Project Objectives

Objective 1: Fully divert and utilize the City's 25 cubic feet per second surface water rights while operating in a manner objectively consistent with the Raymond Basin Judgment.).

Alternative A would partially satisfy this Project Objective. Alternative A would maintain the current condition in which the existing facilities in Area 2 are damaged, regularly clogged with sediment, and incapable of efficiently diverting the City's full surface water rights. Similarly, with no expansion of the existing spreading basins in Area 3, the 18 cfs capacity for spreading and infiltration would remain unchanged. However, the current system does operate in compliance with the Raymond Basin Judgment and would continue to do so in the No Project/No Action Alternative.

Objective 2: Increase the capacity and functionality of the spreading basins to increase PWP's ability to recharge the groundwater basin, as envisioned by the 2011 Water Integrated Resources Plan with its recommendation to maximize the value of the groundwater basin and non-potable supplies.

Alternative A would not satisfy this Project Objective. Alternative A would not expand the existing spreading basins in Area 3, and the 18 cfs capacity for spreading and infiltration would remain unchanged. This would be inconsistent with the Water System and Resources Plan's objective for enhancing local water supplies for sustainable and reliable water service.

Objective 3: Provide opportunities for increased aquatic biological functions within the Arroyo Seco by: (1) protecting aquatic animals from passing into the conveyance system, and (2) reducing existing impediments to fish passage at the diversion weir structure.

Alternative A would not satisfy this Project Objective. Alternative A would maintain the current damaged condition of the existing facilities in Area 2. These existing facilities do not contain any fish screen mechanism or ability to protect future fish populations from being stranded in the conveyance system and spreading basins. Additionally, the existing diversion dam is a barrier to both upstream and downstream fish migration.

Objective 4: Increase PWP's ability to rely upon local water for its potable water supply to reduce reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD).

Alternative A would not satisfy this Project Objective. Alternative A would not allow for the local water supplies to be augmented and the City would not be able to off-set the use of imported MWD water with the additional local water supply.

Comparison of the Effects of Alternative A to the Project

Air Quality

Short-Term Impacts: Alternative A would not alter the existing condition of the Project site or require any construction activities, and, therefore, would not result in any construction emissions associated with construction worker and construction truck traffic, or the use of heavy-duty construction equipment. As such, construction-related regional and localized air quality impacts would not occur. Even though no significant impacts would result and no mitigation was required for the proposed Project, because Alternative A would result in no short-term impacts to air quality, impacts under Alternative A would be ***less than*** those anticipated from the proposed Project.

Long-Term Impacts: Under Alternative A, operations and operational emissions would remain in the current condition. The proposed Project would not generate any additional air emissions of criteria pollutants when compared to the current condition. Therefore, operational impacts on air quality under this alternative would be ***the same as*** those anticipated from the proposed Project.

Biological Resources

Short-Term Impacts: Under Alternative A, the Project site would remain in its existing condition and potential temporary impacts to biological resources would not occur. Implementation of the proposed Project would result in significant direct and indirect temporary impacts to biological resources prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant under the proposed Project. Because Alternative A would result in no impacts to biological resources, short-term impacts under Alternative A would be ***less than*** anticipated under the Project. None of the mitigation measures set forth in Section 4.2, Biological Resources, would be required under Alternative A.

Long-Term Impacts: Under Alternative A, the Project site would remain in its existing condition and the potential benefits of the proposed Project related to implementation of fish protections would not occur. Under current conditions, there is no potential for future fish migration because of the fixed barrier at the diversion/weir structure, and there is no screening for fish protection to prevent future fish populations from entering the conveyance system and being stranded in the spreading basins. Additionally, there is no capacity for managing sediment and minimizing the effects on the channel morphology. In contrast, the proposed Project would minimize the drop to the downstream channel and provide a roughened channel for future fish passage (if present), would provide screens for future fish protection, and would reduce the structure's effects on hydraulic and sediment transport in the stream. Implementation of the proposed Project would result in significant direct and indirect permanent impacts to biological resources prior to mitigation; however, all Project-related impacts

would be mitigated to levels less than significant under the proposed Project and the proposed Project would be beneficial for future fish populations within the Arroyo Seco.

Because Alternative A would be more impactful to biological resources, specifically due to the potential to sustain future fish populations when compared to the benefits of the proposed Project, long-term impacts under Alternative A would be ***greater than*** anticipated under the Project. None of the mitigation measures set forth in Section 4.2, Biological Resources, would be required under Alternative A.

Cultural Resources

Short-Term Impacts: Alternative A would not impact culturally significant resources because no ground disturbance would occur on the Project site. The Project site would remain as is and potential construction impacts (including ground-disturbing activities such as grading or other earthwork) that could risk potential disturbance of previously unknown resources, would not occur. However, Alternative A would be similar to the proposed Project regarding the historic Bridge No. 3. As discussed in Section 4.3, there are no plans for the future rehabilitation or replacement of the historic Bridge No. 3 at the time of the preparation of this Draft EIR. The timing of the ultimate rehabilitation or replacement of Bridge No. 3 is unknown, and it is unknown whether the new permanent bridge would be constructed in such a manner that would allow for its preservation as a historical resource. As such, it is reasonably foreseeable that implementation of the proposed Project as well as Alternative A (No Project/No Action), which would retain the bridge overlay structure until funding is available for the design and construction of a new permanent bridge: (1) would allow for the continued deterioration of the existing Bridge No. 3, and (2) would not guarantee its future rehabilitation or replacement in accordance with the U.S. Department of the Interior Standards for the Treatment of Historic Properties. Therefore, even with implementation of mitigation measures, the Project-related impacts to cultural resources would be significant and unavoidable. Both the No Project Alternative and the proposed Project would keep the existing structural bridge overlay on top of Bridge No. 3 into the foreseeable future, and short-term impacts to historic resources would be ***the same as*** the proposed Project. For archaeological and paleontological resources, impacts under this alternative would be ***less than*** those anticipated from the proposed Project. None of the mitigation measures set forth in Section 4.3, Cultural Resources, related to archaeological or paleontological resources would be required under Alternative A.

Long-Term Impacts: Under Alternative A, operations would remain in the current condition, and would not have any long-term impacts on archaeological or paleontological resources. However, due to potential significant impacts to historic Bridge No. 3 under both Alternative A and the proposed Project, even after the inclusion of mitigation measures, impacts on historic resources (a subset of "cultural resources") under this alternative would remain because the bridge overlay structure is anticipated to remain in place for the foreseeable future. Therefore, impacts to historic resources under Alternative A would be ***the same as*** those anticipated from the proposed Project.

Greenhouse Gas Emissions

Short-Term Impacts: Alternative A would not alter the existing condition of the Project site or require any construction activities, and, therefore, would not generate any short-term construction-related GHG emissions, nor result in an increase in construction-related energy use. Even though no significant impacts would result and no mitigation was required for the proposed Project, because Alternative A

would result in no short-term impacts to greenhouse gas emission, impacts under Alternative A would be ***less than*** those anticipated from the proposed Project.

Long-Term Impacts: Under Alternative A, operations and operational emissions would remain the same as in the current condition. Under the proposed Project, operational conditions would be similar to that of existing conditions, with the exception of the new intake service building, which would be constructed in Area 2 to house the electrical controls for the diversion structure. However, the proposed Project would further reduce City's reliance upon purchased imported water supplies from the Metropolitan Water District of Southern California (MWD). The City is a member agency of MWD, which serves wholesale treated water to the City imported from the Colorado River Aqueduct and the State Water Project (SWP). Because the Project would increase the supply of local groundwater in replacement of imported water, there would be a reduction in electricity associated with the water source. For imported water, electricity is needed to supply and transport the water from sources in other parts of California, which is a very energy-intensive process to pump the water across the State through topographical elevation changes. However, for local groundwater, electricity is only needed for pumping. Accordingly, electricity associated with supply of water from MWD is avoided as a result of replacing the some of the City's reliance on imported water source with local groundwater supplies. Under Alternative A, the Project site would remain in its existing condition and the potential benefits of the proposed Project related to reductions in greenhouse gas emissions would not occur. No significant impacts would result and no mitigation was required for the proposed Project. Although Alternative A would have no long-term impact on GHG emissions, impacts under Alternative A would be ***greater than*** those anticipated from the proposed Project.

Hydrology and Water Quality

Short-Term Impacts: Alternative A would not alter the existing condition of the Project site or require any construction activities, and, therefore, would not generate any short-term construction-related hydrology or water quality impacts, including no need for temporary diversion coffer dams or other activities that could generate construction-related pollutants. Even though no significant impacts would result and no mitigation was required for the proposed Project, because Alternative A would result in no short-term impacts to hydrology and water quality, impacts under Alternative A would be ***less than*** those anticipated from the proposed Project.

Long-Term Impacts: Under Alternative A, the operational state would remain the same as in existing conditions and no additional diversions from the Arroyo Seco would occur. Even though no significant impacts would result and no mitigation was required for the proposed Project, because Alternative A would result in no long-term impacts to hydrology or water quality, impacts under Alternative A would be ***less than*** those anticipated from the proposed Project.

Noise

Short-Term Impacts: Alternative A would not involve construction that could result in noise from the temporary use of heavy-duty construction equipment or generation of construction traffic, including worker and haul truck trips to the Project site. Because Alternative A would result in no long-term impacts to noise, impacts under Alternative A would be ***less than*** those anticipated from

the proposed Project. None of the mitigation measures set forth in Section 4.6, Noise, would be required under Alternative A.

Long-Term Impacts: Under Alternative A, the operational state would remain the same as in existing conditions. Under the proposed Project, there would be no new sources of operational noise. Therefore, operational impacts on noise under this alternative would be ***the same as*** those anticipated from the proposed Project.

Recreation

Short-Term Impacts: Alternative A would not require temporary closure of portions of surrounding trails due to construction activities. Because Alternative A would not affect recreational activities or facilities in the Arroyo Seco, short-term impacts to recreation under this alternative would be ***less than*** those anticipated from the proposed Project. None of the mitigation measures set forth in Section 4.7, Recreation, would be required under Alternative A.

Long-Term Impacts: Alternative A would not result in permanent changes to recreational activities or the use of trails within the Arroyo Seco. However, upon completion of the proposed Project, all temporarily impacted trail connections would be restored and there would be no long-term impacts to recreation. Therefore, long-term impacts to recreation under this alternative would be ***the same as*** those anticipated from the proposed Project.

Transportation

Short-Term Impacts: Alternative A would not generate short-term traffic or transportation impacts because no construction would occur. Because Alternative A would not generate construction traffic in the Arroyo Seco, short-term impacts to transportation under this alternative would be ***less than*** those anticipated from the proposed Project. None of the mitigation measures set forth in Section 4.8, Transportation, would be required under Alternative A.

Long-Term Impacts: Under Alternative A, the operational state would remain the same as in existing conditions. Under the proposed Project, there would be no new sources of operational traffic. Therefore, operational impacts on transportation under this alternative would be ***the same as*** those anticipated from the proposed Project.

Tribal Cultural Resources

Short-Term Impacts: Alternative A would not impact culturally significant tribal cultural resources because there would be no ground-disturbing activities. Because this alternative would not affect tribal resources in the Arroyo Seco, short-term impacts under this alternative would be ***less than*** those anticipated from the proposed Project. None of the mitigation measures set forth in Section 4.9, Tribal Cultural Resources, would be required under Alternative A.

Long-Term Impacts: Under Alternative A, operations would remain in the current condition, and would not have any long-term impacts on tribal cultural resources. The proposed Project, once in operation, would not involve additional ground-disturbing activities that could impact potential unknown tribal cultural resources. Therefore, operational impacts on tribal cultural resources under this alternative would be ***the same as*** those anticipated from the proposed Project.

6.4.2 Alternative B – Redesigned Spreading Basins in Area 3

Under Alternative B, all activities proposed within Area 2 would continue to be implemented, as set forth in the proposed Project. The alternative design of Area 3 would mimic the primary design objectives and operational characteristics of the Project, including: use of a settling basin to facilitate removal of debris and sediment from water prior to conveyance to the spreading basins, use of a concrete flume to meter flow into the infiltration basins, and use of stepped basins with gravity flow interconnection pipes. Figure 6-2A, Alternative B, Redesigned Spreading Basins and Figure 6-2B, Alternative B, Landscaping Palette depict a conceptual design for Alternative B.

The infiltration capacity of the alternative would maintain the full 25 cfs capacity, utilizing a total of 5 infiltration basins with a total basin bottom square footage of approximately 4.5 acres. This alternative would relocate some of the parking stalls from the future recreational parking lot located just south of the JPL Bridge to the eastern edge of Area 3 near the Explorer Well site to provide for the altered configuration of the spreading basin design. The relocated parking stalls would be intermittent angled along the Explorer Road.

The objective of Alternative B would be to provide an improved design with more appeal for recreational users by eliminating the rectangular shapes of the existing condition, as well as the proposed Project design, through use of curvilinear basin features that more closely resemble natural channel and stream functions. The recreational amenities would be further improved through the use of native, drought-tolerant landscape plantings around the basins, as shown in Figure 6-2B. The Alternative B basin layout and landscaping would have the added benefit of enhancing the proposed trail network for pedestrians and equestrian usage, with incorporation of educational kiosks, benches, interpretive signage, and shade structures adjacent to the spreading basins along the proposed pedestrian trails/maintenance roads. Alternative B would replace the enclosed concrete sedimentation basin (Basin A) with an open settlement pond. Alternative B would also include a slight realignment of Explorer Road to reflect the more curvilinear contours of the spreading basins and to allow for the future Explorer Well site to be east of the recreational trail amenities. Relocating the well site to the east would make it less prominent when viewing the area from the Gabrielino Trail above.

Ability to Meet Project Objectives

Objective 1: Fully divert and utilize the City's 25 cubic feet per second surface water rights while operating in a manner objectively consistent with the Raymond Basin Judgment.

Alternative B would satisfy this Project Objective. Alternative B would be designed to include the same capacity as the proposed Project, thereby allowing for the same anticipated spreading and infiltration into the Raymond Basin as the proposed Project. This Alternative would not alter the City's ability to operate in compliance with the Raymond Basin Agreement and the 1984 Judgment.

Objective 2: Increase the capacity and functionality of the spreading basins to increase PWP's ability to recharge the groundwater basin, as envisioned by the 2011 Water Integrated Resources Plan with its recommendation to maximize the value of the groundwater basin and non-potable supplies.

Alternative B would satisfy this Project Objective. Alternative B would be designed to include the same capacity as the proposed Project, thereby allowing for the same anticipated spreading and infiltration into the Raymond Basin as the proposed Project, which is consistent with the Water System and Resources Plan.

Objective 3: Provide opportunities for increased aquatic biological functions within the Arroyo Seco by: (1) protecting aquatic animals from passing into the conveyance system, and (2) reducing existing impediments to fish passage at the diversion weir structure.

Alternative B would satisfy this Project Objective. Alternative B does not involve any changes to the proposed facilities in Area 2. Therefore, the design of Area 2 would continue to include: (1) a fish screen to prevent future fish from entering the intake, and (2) an engineered roughened channel downstream of the new diversion structure and operable weir to allow return passage upstream should fish pass during periods of high flows.

Objective 4: Increase PWP's ability to rely upon local water for its potable water supply to reduce reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD).

Alternative B would satisfy this Project Objective. Alternative B would allow for the local water supplies to be augmented and the City would be able to off-set the use of imported MWD water with the additional local water supply.

Comparison of the Effects of Alternative B to the Project

Air Quality

Construction: The design of Alternative B is anticipated to require a similar amount of earthwork because the spreading basins would be within the same construction footprint and would be designed to obtain the same spreading capacity. It is possible that less export of sediment would be required due to the jetties (earthen projections) into the spreading basins that facilitate the more organic and curvilinear design. However, for the purposes of comparison to the proposed Project, it is anticipated that construction-related impacts on air quality under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Operation: Neither the proposed Project nor Alternative B would generate any additional air emissions of criteria pollutants when compared to the current condition. Therefore, operational impacts on air quality under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Biological Resources

Short-Term Impacts: Under Alternative B, the components in Area 3 would be implemented within the same construction footprint and would not result in any additional impacts to biological resources that were not already considered and analyzed in this Draft EIR. Implementation of the proposed Project would result in significant direct and indirect temporary impacts to biological resources prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant. All of the mitigation measures set forth in Section 4.2, Biological Resources, would still be required under Alternative B. Therefore, short-term impacts on biological resources under Alternative B would be ***the same as*** those anticipated under the Project.

Long-Term Impacts: Under Alternative B, the operational conditions would be similar to that of the proposed Project. Implementation of the proposed Project would result in significant direct and indirect permanent impacts to biological resources prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant. All mitigation measures set forth in Section 4.2, Biological Resources, would still be required under Alternative B. Therefore, long-term operational impacts on biological resources under Alternative B would be ***the same as*** those anticipated under the Project.

However, Alternative B includes various landscape plantings, including native vegetation plants, trees, and seed mixes, which would contribute to the biological resources and habitat in the area. Therefore, long-term benefits to biological resources of Alternative B would not occur under the Project.

Cultural Resources

Short-Term Impacts: Under Alternative B, the components in Area 3 would be implemented within the same construction footprint and would not result in any additional impacts to cultural resources that were not already considered and analyzed in this Draft EIR. Implementation of the proposed Project would result in significant impacts to cultural resources prior to mitigation. All Project-related impacts would be mitigated to levels less than significant, with the exception of impacts to the historic Bridge No. 3, which would remain significant and unavoidable. All of the mitigation measures set forth in Section 4.3, Cultural Resources, would still be required under Alternative B. Therefore, impacts on cultural resources (i.e. historic, archaeological and paleontological resources) under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Long-Term Impacts: Under Alternative B, the operational state would be similar to that of the proposed Project. The proposed Project, once in operation, does not propose any long-term operational earthwork that could disturb or cause a substantial adverse change in the significance of a cultural resource. All of the mitigation measures set forth in Section 4.3, Cultural Resources, would still be required under Alternative B, and the significant unavoidable impact associated with the proposed Project would also result from implementation of Alternative B. Therefore, operational impacts to cultural resources (i.e. historic, archaeological and paleontological resources) under this Alternative B would be ***the same as*** those anticipated from the proposed Project.

Greenhouse Gas Emissions

Short-Term Impacts: The design of the Alternative B is anticipated to require a similar amount of earthwork because the spreading basins would be within the same construction footprint and would be designed to obtain the same spreading capacity. It is possible that less export of sediment would be required due to the jetties (earthen projections) into the spreading basins that facilitate the more organic and curvilinear design. However, for the purposes of comparison to the proposed Project, it is anticipated that construction-related impacts on greenhouse gas emissions under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Long-Term Impacts: Under Alternative B, operations and operational emissions would be the same as under the proposed Project. Therefore, operational impacts on greenhouse gas emissions under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Hydrology and Water Quality

Short-Term Impacts: Alternative B would require a similar amount of construction activities as the proposed Project, and would be located within the same impact areas as the proposed Project. Under Alternative B, short-term construction-related earthmoving and operation of heavy construction equipment would be required in comparable intensity and duration as the proposed Project, and the same regulatory requirements for construction-related best management practices for sediment and pollution control would be required to address potential hydrology or water quality impacts, including the need for a temporary diversion coffer dam and coverage under appropriate National Pollutant Discharge Elimination System (NPDES) permits to maintain water quality standards. Neither the proposed Project nor Alternative B would require mitigation for short-term impacts to hydrology or water quality. Therefore, construction impacts on hydrology or water quality under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Long-Term Impacts: Operations under Alternative B would be the same as under the proposed Project conditions (i.e. diverting up to 25 cfs for storm flows <100 cfs), which would add approximately 1,035 acre-ft/yr of diverted flows into the spreading basins. The new spreading basin design under Alternative B would accommodate the proposed diversion of 25 cfs. At infiltration rates currently observed in the existing spreading basins (2.7 ft/day), approximately 18 acres of effective recharge area in the Project basins would be required to maximize the utilization of PWP's surface water rights. At higher percolation rates, such as those observed during the Geotechnical Feasibility Study (Converse 2013), less basin acreage would be required to accommodate the full 25 cfs. In addition to the approximately 13 acres of spreading basins that currently exist in the Arroyo Seco, both the proposed Project and Alternative B would construct approximately 4.5 acres of spreading, which includes replacement of 1.6 existing acres and expansion of 3 new acres. This total, 16 acres, would be large enough to percolate approximately 22 cfs at a percolation rate of 2.7 ft/day. A percolation rate of 3.1 ft/day would be required to accommodate the full 25 cfs within this 16 acres of spreading basins, which is anticipated to be achievable under both the proposed Project and Alternative B. Therefore, operational impacts on hydrology and water quality under this alternative would be ***the same as*** those anticipated from the proposed Project.

Noise

Short-Term Impacts: The design of the Alternative B is anticipated to require a similar amount of earthwork because the spreading basins would be within the same construction footprint and would be designed to obtain the same spreading capacity. It is possible that less export of sediment would be required due to the jetties (earthen projections) into the spreading basins that facilitate the more organic and curvilinear design. All of the mitigation measures set forth in Section 4.6, Noise, would still be required under Alternative B. For the purposes of comparison to the proposed Project, it is anticipated that construction-related noise impacts under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Long-Term Impacts: Neither the proposed Project nor Alternative B would generate any additional sources of long-term noise when compared to the current condition. Therefore, operational impacts on noise under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Recreation

Short-Term Impacts: Alternative B would require a similar amount of construction activities as the proposed Project and would be located within the same impact areas as the proposed Project. Under Alternative B, short-term construction-related heavy construction equipment and haul trucks would be required in comparable intensity and duration as the proposed Project and would require use of the Gabrielino Trail/Access Road. Similarly, during construction, trail closures around the spreading basins would be required. All of the mitigation measures set forth in Section 4.7, Recreation, would still be required under Alternative B. Therefore, impacts on recreation under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Long-Term Impacts: Under Alternative B, the operational conditions would be similar to that of the proposed Project because trail connectivity in Area 3 would be re-established through the spreading basins under Alternative B. Implementation of the proposed Project would result in less than significant impacts to recreation. Therefore, long-term operational impacts on recreation under Alternative B would be ***the same as*** those anticipated under the Project.

However, Alternative B includes various landscape plantings, including native vegetation plants, trees, and seed mixes, which would contribute to the biological resources and habitat in the area. Alternative B would incorporate a network of trails through the spreading basins and would incorporate interpretive overlooks within the basins, including benches, interpretive signage, and/or shade structures to enhance the recreational experience. As shown on Figure 6-2a, Alternative B includes a broader network of trails and recreational amenities that also connect to the Altadena Crest Trail and allow for improved connectivity from the east to the west sides of the spreading basins. Additionally, native vegetation plantings would enhance the recreational experience for pedestrians, bicyclists, and equestrians through Area 3. These proposed amenities would expand recreational opportunities beyond the proposed Project, which consist of one trail connection to the Altadena Crest Trail as shown in Figure 4.7-4 in Section 4.7, Recreation of this Draft EIR. The long-term benefits to recreation from Alternative B would not occur under the Project.

Transportation

Short-Term Impacts: Alternative B would require a similar amount of construction activities as the proposed Project and would be located within the same impact areas as the proposed Project. Under Alternative B, short-term construction-related earthmoving and operation of heavy construction equipment would be required in comparable intensity and duration as the proposed Project and would require a similar number of workers commuting to and from the worksite. All of the mitigation measures set forth in Section 4.8, Transportation, would be required under Alternative B. Therefore, construction impacts related to transportation under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Long-Term Impacts: Neither the proposed Project nor Alternative B would generate any additional sources of long-term traffic when compared to the current condition. Therefore, operational impacts on transportation under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Tribal Cultural Resources

Short-Term Impacts: Under Alternative B, the components in Area 3 would be implemented within the same construction footprint and would not result in any additional impacts to tribal cultural resources that were not already considered and analyzed in this Draft EIR. Implementation of the proposed Project would result in significant impacts to cultural resources prior to mitigation. All of the mitigation measures set forth in Section 4.9, Tribal Cultural Resources, would still be required under Alternative B. Therefore, short-term impacts on tribal cultural resources under Alternative B would be ***the same as*** those anticipated from the proposed Project.

Long-Term Impacts: Under Alternative B, the operational state would be similar to that of the proposed Project. The proposed Project, once in operation, does not propose any long-term operational earthwork that could disturb or cause a substantial adverse change in the significance of an unknown tribal cultural resource. Therefore, operational impacts to tribal cultural resources under this alternative would be ***the same as*** those anticipated from the proposed Project.

Utilities and Service Systems (see Initial Study)

Short-Term Impacts: The topic of Utilities and Service Systems was scoped out of the Draft EIR through the Initial Study (see Appendix A-1). However, Alternative B includes various landscape plantings, including native wetland vegetation plants, trees, and seed mixes, which would contribute to the biological diversity in the area and would require irrigation water until established. The proposed vegetation would require an additional approximately 1.4 acre-feet per year of temporary water use until the vegetation is established, which is anticipated to require approximately 3 to 5 years. Irrigation would be designed in compliance with the City's guidelines and standards for landscape planting and irrigation plans and the State's Model Water Efficient Landscape Ordinance. This temporary use of water for landscape irrigation would not negatively impact the City's ability to maintain sufficient water supplies during normal, dry, and multiple dry years. Under the proposed Project, there would be no landscaping and, therefore, no temporary irrigation required. Therefore, short-term impacts related to utilities and service systems (i.e. water supplies) would be ***greater than*** those anticipated from the proposed Project, but would remain less than significant.

Long-Term Impacts: Under Alternative B, the operational state would be similar to that of the proposed Project. The proposed Project, once in operation, does not require the use of any potable water supplies. Therefore, operational impacts to utilities and service systems under this alternative would be ***the same as*** those anticipated from the proposed Project.

6.4.3 Alternative C – Historic Bridge Preservation

Under Alternative C, all activities proposed within Areas 2 and 3 would continue to be implemented, as set forth in the proposed Project. Alternative C also includes the implementation of the recommendations of the Arroyo Seco Bridge (B3) Assessment Deterioration Comparison prepared by TJC Associates Inc. in 2018 (TJC 2018) as they relate to the reconstruction or replacement of primary structural features on historic Bridge No. 3, which is located within the Project's study area along the Gabrielino Trail/Access Road. The location of Bridge No. 3 is identified on Figure 2-4A within Section 2, Environmental Setting, of this Draft EIR. Alternative C would remove the bridge overlay deck on historic Bridge No. 3 and repair or replace the structural elements of the bridge in accordance with the U.S. Department of the Interior Standards for the Treatment of Historic Properties.

All of the primary structural elements of the bridge--specifically, the joists below the bridge deck, the heavy timber support element at mid-span, the A-frame trusses on the east and west sides of the bridge, and the steel elements of the bridge--are deteriorated and subject to fail, and would be replaced under Alternative C. The heavy timber mid-span member that is the primary structural element of the bridge appear to have significant bearing failure under the supported members. If the mid-span support continues to deteriorate and fail, catastrophic failure of the bridge will occur; therefore, replacement of the heavy timber mid-span support beam(s) would be a priority. Replacement of the center support member would require temporary supports to be placed in the Arroyo Seco to relieve the load on the beam while the deteriorated beam was replaced. Additionally, portions or all of the joists would be removed.

Ability to Meet Project Objectives

Objective 1: Fully divert and utilize the City's 25 cubic feet per second surface water rights while operating in a manner objectively consistent with the Raymond Basin Judgment.

Alternative C would satisfy this Project Objective. Alternative C would be designed to include the same capacity as the proposed Project, thereby allowing for the same anticipated spreading and infiltration into the Raymond Basin as the proposed Project. This Alternative would not alter the City's ability to operate in compliance with the Raymond Basin Agreement and the 1984 Judgment.

Objective 2: Increase the capacity and functionality of the spreading basins to increase PWP's ability to recharge the groundwater basin, as envisioned by the 2011 Water Integrated Resources Plan with its recommendation to maximize the value of the groundwater basin and non-potable supplies.

Alternative C would satisfy this Project Objective. Alternative C would be designed to include the same capacity as the proposed Project, thereby allowing for the same anticipated spreading and infiltration into the Raymond Basin as the proposed Project, which is consistent with the Water System and Resources Plan.

Objective 3: Provide opportunities for increased aquatic biological functions within the Arroyo Seco by: (1) protecting aquatic animals from passing into the conveyance system, and (2) reducing existing impediments to fish passage at the diversion weir structure.

Alternative C would satisfy this Project Objective. Alternative C does not involve any changes to the proposed facilities in Area 2 or Area 3. Therefore, the design of Area 2 would continue to include: (1) a fish screen to prevent future fish from entering the intake, and (2) an engineered roughened channel downstream of the new diversion structure and operable weir to allow return passage upstream should fish pass during periods of high flows.

Objective 4: Increase PWP's ability to rely upon local water for its potable water supply to reduce reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD).

Alternative C would satisfy this Project Objective. Alternative C would allow for the local water supplies to be augmented and the City would be able to off-set the use of imported MWD water with the additional local water supply.

Comparison of the Effects of Alternative C to the Project

Air Quality

Short-Term Impact: Alternative C would require additional short-term construction activities to remove the existing bridge overlay deck and to repair or replace components of the historic Bridge No. 3. Additional equipment would be required, although no substantial grading or earthwork would be anticipated to replace the existing structure. As shown in Table 4.2-7 in Section 4.1, Air Quality, the estimated maximum daily construction emissions of criteria air pollutants would be well below the thresholds of significance.

The addition of equipment required to conduct bridge rehabilitation would not be expected to increase emissions such that thresholds would be exceeded due to the relatively minimal amount of emissions when compared to the significance thresholds (see Table 4.2-7 in Section 4.1, Air Quality). Additionally, construction activity overlap is unlikely given that the bridge structure would be required to remain intact for the transport of construction equipment and materials until the completion of construction, and additional bridge-related construction activities would not occur simultaneously on the peak day with other Project components. Therefore, short-term construction impacts on air quality under Alternative C would be ***slightly greater than*** those anticipated from the proposed Project, but would be less than significant.

Long-Term Impact: Neither the proposed Project nor Alternative C would generate any additional air emissions of criteria pollutants when compared to the current condition. Therefore, operational impacts on air quality under Alternative C would be ***the same as*** those anticipated from the proposed Project.

Biological Resources

Short-Term Impact: Under Alternative C, in addition to the impacts assessed in Section 4.2, Biological Resources for the proposed Project, additional short-term impacts within the Arroyo Seco streambed would occur to allow for construction of bridge components, equipment access, and equipment staging. This would result in additional impacts to vegetation communities beneath and adjacent to Bridge No. 3. This would also result in additional impacts to agency jurisdictional resources to be covered under the regulatory permits, including the USACE, CDFW, and RWQCB. Implementation of the proposed Project would result in significant direct and indirect temporary impacts to biological resources prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant. All of the mitigation measures set forth in Section 4.2, Biological Resources, would still be required under Alternative C. Therefore, impacts on biological resources under Alternative C would be ***slightly greater than*** anticipated under the Project, but would be less than significant after mitigation.

Long-Term Impact: Under Alternative C, the operational state would be similar to that of the proposed Project. The proposed Project, once in operation, does not propose any long-term earthwork or other new operational and maintenance activities beyond the current condition that could disturb or cause a substantial adverse change in the significance of biological resources. All of the mitigation measures set forth in Section 4.2, Biological Resources, would still be required under Alternative C. Therefore, impacts on biological resources under Alternative C would be ***the same as*** anticipated under the Project.

Cultural Resources

Short-Term Impact: Under Alternative C, in addition to the impacts assessed in Section 4.3, Cultural Resources for the proposed Project, additional temporary and/or permanent impacts within the Arroyo Seco streambed would occur to allow for construction of bridge components, equipment access, and equipment staging. This could result in additional impacts to previously unknown archaeological and paleontological resources. Implementation of the proposed Project would result in significant impacts to cultural resources (i.e. archaeological resources) and paleontological resources prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant. All of the mitigation measures set forth in Section 4.3, Cultural Resources, would still be required under Alternative C. Therefore, impacts on archaeological and paleontological resources under Alternative C would be ***slightly greater than*** anticipated under the Project, but would be less than significant after mitigation. Short-term impacts to historic resources would be ***the same as*** the proposed Project.

Long-Term Impacts: Under Alternative C, the operational state would be similar to that of the proposed Project. The proposed Project, once in operation, does not propose any long-term operational earthwork that could disturb or cause a substantial adverse change in the significance of an unknown cultural resource. Therefore, operational impacts to cultural resources under this alternative would be ***the same as*** those anticipated from the proposed Project.

However, Alternative C would eliminate the significant and unavoidable impact associated with the proposed Project. The historic Bridge No. 3 would be restored in accordance with the U.S. Department of the Interior Standards for the Treatment of Historic Properties, which would mitigate potential impacts to less than significant. Therefore, Alternative C would ***eliminate the significant unavoidable impact*** anticipated under the proposed Project and impacts to historic resources would be less than significant.

Greenhouse Gas Emissions

Short-Term Impacts: Alternative C would require additional short-term construction activities to remove the existing bridge overlay deck and to repair or replace components of the historic Bridge No. 3. Additional equipment would be required, although no substantial grading or earthwork would be anticipated to replace the existing structure. As shown in Table 4.4-2, Climate Action Plan Consistency Checklist in Section 4.2, Greenhouse Gas Emissions, the Project is consistent with the City's Climate Action Plan (CAP) and would therefore not interfere with implementation of GHG reduction goals for 2030 or 2050 identified in Senate Bill (SB) 32 and Executive Order S-3-05. It is assumed that replacement of the Bridge No. 3 would also be consistent with the CAP. Therefore, short-term construction impacts on greenhouse gas emissions under Alternative C would be ***the same as*** those anticipated from the proposed Project.

Long-Term Impacts: Under Alternative C, operations and operational emissions would be the same as under the proposed Project. Therefore, operational impacts on greenhouse gas emissions under Alternative C would be ***the same as*** those anticipated from the proposed Project.

Hydrology and Water Quality

Short-Term Impacts: Under Alternative C, in addition to the impacts assessed in Section 4.5, Hydrology and Water Quality for the proposed Project, additional temporary and/or permanent impacts within the Arroyo Seco stream bed would occur to allow for construction of bridge components, equipment access, and equipment staging. Additional short-term construction-related earthmoving and operation of heavy construction equipment would be required within the Arroyo Seco stream bed, and the same regulatory requirements for construction-related best management practices for sediment and pollution control would be required to address potential hydrology or water quality impacts. An additional temporary diversion coffer dam may be required, including coverage of impacts under appropriate National Pollutant Discharge Elimination System (NPDES) permits to maintain water quality standards. Therefore, impacts on hydrology and water quality under Alternative C would be ***slightly greater than*** anticipated under the Project, but would be less than significant.

Long-Term Impacts: Under Alternative C, the operational components of the proposed Project that involve the diversion, spreading and infiltration of flows from the Arroyo Seco would be unchanged. Operation of a bridge at the same location as an existing bridge would not result in any additional long-term impacts to hydrology or water quality. Therefore, operational impacts on hydrology and water quality under Alternative C would be ***the same as*** those anticipated from the proposed Project.

Noise

Short-Term Impacts: Alternative C would require additional short-term construction activities to remove the existing bridge overlay deck and to repair or replace components of the historic Bridge No. 3. Additional equipment would be required, although no substantial grading or earthwork would be anticipated to replace the existing structure. The addition of equipment required to conduct bridge rehabilitation would not be expected to increase noise such that thresholds would be further exceeded, even if they were to occur simultaneously during other construction activity within Area 2. Such overlap is unlikely given that the bridge structure would be required to remain intact for the transport of construction equipment and materials until the completion of construction. Implementation of the proposed Project would result in significant temporary impacts to noise prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant. All of the mitigation measures set forth in Section 4.6, Noise, would still be required under Alternative C. Therefore, short-term construction impacts on noise under Alternative C would be ***slightly greater than*** those anticipated from the proposed Project, but would be less than significant after mitigation.

Long-Term Impacts: Neither the proposed Project nor Alternative C would generate any additional sources of long-term noise when compared to the current condition. Therefore, operational impacts on noise under Alternative C would be ***the same as*** those anticipated from the proposed Project.

Recreation

Short-Term Impacts: Alternative C would require additional short-term construction activities to remove the existing bridge overlay deck and to repair or replace components of the historic Bridge No. 3, which would require extended closure of the Gabrielino Trail/Access Road during bridge replacement. It is unlikely that construction in Area 2 and the bridge construction would occur at the same time given that the bridge structure would be required to remain intact for the transport of construction equipment and materials

until the completion of construction. Therefore, trail closures would likely be extended under Alternative C. Implementation of the proposed Project would result in significant temporary impacts to recreation prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant. All of the mitigation measures set forth in Section 4.7, Recreation, would still be required under Alternative C. Therefore, short-term construction impacts on recreation under Alternative C would be ***slightly greater than*** those anticipated from the proposed Project, but would be less than significant after mitigation.

Long-Term Impacts: Upon completion of the repair or replacement of historic Bridge No. 3, Alternative C would have no impacts on long-term recreational activities or facilities. Therefore, operational impacts on recreation under Alternative C would be ***the same as*** those anticipated from the proposed Project.

Transportation

Short-Term Impacts: Alternative C would require additional short-term construction activities to remove the existing bridge overlay deck and to repair or replace components of the historic Bridge No. 3, which would require additional workers and equipment transport to the Area 2. It is unlikely that construction in Area 2 and the bridge construction would occur at the same time given that the bridge structure would be required to remain intact for the transport of construction equipment and materials until the completion of construction, therefore, the peak day of traffic activity would be unlikely to change. Implementation of the proposed Project would result in significant temporary impacts to transportation prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant. All of the mitigation measures set forth in Section 4.8, Transportation, would still be required under Alternative C. Therefore, short-term construction impacts on transportation under Alternative C would be ***slightly greater than*** those anticipated from the proposed Project, but would be less than significant after mitigation.

Long-Term Impacts: Neither the proposed Project nor Alternative C would generate any additional sources of long-term traffic when compared to the current condition. Therefore, operational impacts on transportation under Alternative C would be ***the same as*** those anticipated from the proposed Project.

Tribal Cultural Resources

Short-Term Impacts. Under Alternative C, additional temporary and/or permanent impacts within the Arroyo Seco stream bed would occur to allow for construction of bridge components, equipment access, and equipment staging. This could result in additional impacts to previously unknown tribal cultural resources. Implementation of the proposed Project would result in significant impacts to tribal cultural resources prior to mitigation; however, all Project-related impacts would be mitigated to levels less than significant. All of the mitigation measures set forth in Section 4.9, Tribal Cultural Resources, would still be required under Alternative C. Therefore, impacts on tribal cultural resources under Alternative C would be ***slightly greater than*** anticipated under the Project, but would be less than significant after mitigation.

Long-Term Impacts. Under Alternative C, the operational state would be similar to that of the proposed Project. The proposed Project, once in operation, does not propose any long-term operational earthwork that could disturb or cause a substantial adverse change in the significance of an unknown tribal cultural resource. Therefore, operational impacts to tribal cultural resources under this alternative would be ***the same as*** those anticipated from the proposed Project.

Wildfire (see Initial Study)

Short-Term Impacts. The topic of Wildfire was scoped out of the Draft EIR through the Initial Study (see Appendix A-1). Reconstruction of the existing bridge under Alternative C would not result in increased impacts related to wildfire. Therefore, wildfire impacts under Alternative C would be ***the same as*** anticipated under the Project.

Long-Term Impacts. Replacement of the historic Bridge No. 3 to the U.S. Department of the Interior Standards for the Treatment of Historic Properties is not currently planned, designed, or funded. Because there are no plans for the future reconstruction/replacement of the Bridge No. 3 at the time of the preparation of this Draft EIR, it is anticipated that the existing Bridge No. 3 may continue to deteriorate, and although not anticipated at this point, may even be removed to protect public safety. Further, restoration of the wooden-timber bridge would not be as protective of public safety as retaining the bridge overlay deck, which is designed to accommodate heavy loads. The temporary structural overlay bridge spanning the length of Bridge No. 3 was constructed in 2017 to accommodate the loading from heavy equipment needed during construction of the Arroyo Seco Canyon Project.

Decreased precipitation and droughts that are anticipated to be exacerbated by climate change may result in increased numbers of wildfires through drier natural landscapes in close proximity to communities nearby the ANF. Given the history of wildfires in the region, and specifically within the San Gabriel Mountains and Arroyo Seco subwatershed that leads to the Project site, PWP will keep in place the current overlay bridge and will not repair or rehabilitate the historic Bridge No. 3, because the current overlay bridge can accommodate firefighting equipment and large fire trucks into the Arroyo Seco Canyon and the ANF. It is anticipated that the historic Bridge will continue to deteriorate, and as a result PWP will need to remove dangerous elements of the historic Bridge (rotting timbers failed joists, for example) and even partially or fully demolished to protect public safety as it continues to deteriorate. Reconstruction of a narrow and wooden bridge structure would not facilitate the City's objective to create climate change resilient infrastructure. This concept is especially important given the location of Bridge No. 3 at the interface with the ANF and within the Very High Fire Hazard Severity Zone. Furthermore, a concrete and steel bridge to the north of Bridge No. 3 was constructed in 2008 to replace another A-frame bridge (Bridge No. 4) after it collapsed. Its utility for accommodating firefighting equipment in the long term is limited if Bridge No. 3 does not have the same load-bearing capacity.

In summary, under Alternative C, the re-creation of a timber bridge structure would not provide the protections related to wildfire preparedness to the extent that the proposed Project would allow for the possible future construction of an all-weather concrete bridge. Therefore, operational impacts to wildfire under this alternative would be ***greater than*** those anticipated from the proposed Project, but would be less than significant.

6.5 Summary of Alternatives to the Proposed Project

Pursuant to the CEQA Guidelines stated above, as well as the Project objectives, a range of alternatives to the Project are considered and evaluated in this Draft EIR. To summarize these Project alternatives, as suggested in CEQA Section 15126.6(d), a matrix was prepared to summarize and compare the impacts of each Project alternative (see Table 6-1).

Table 6-1. Comparison of Project and Alternatives Impacts

Environmental Issue Area	Proposed Project	Alternative A - No Project		Alternative B - Redesigned Spreading Basins in Area 3		Alternative C - Historic Bridge Preservation	
		Short-Term Temporary	*Long-Term Permanent*	*Short-Term Temporary*	*Long-Term Permanent*	*Short-Term Temporary*	*Long-Term Permanent*
Air Quality	LTS	▼	–	–	–	▲	–
Biological Resources	LTS-MM	▼	▲	–	– / +	▲	–
Cultural Resources (historic)	LTS-MM and SU (historic)	▼	–	–	–	▲	–
		–	–	–	–	–	▼
Greenhouse Gas Emissions	LTS	▼	▲	–	–	–	–
Hydrology and Water Quality	LTS	▼	▼	–	–	▲	–
Noise	LTS-MM	▼	–	–	–	▲	–
Recreation	LTS-MM	▼	–	–	– / +	▲	–
Transportation	LTS-MM	▼	–	–	–	▲	–
Tribal Cultural Resources	LTS-MM	▼	–	–	–	▲	–
Utilities and Service Systems (water supply)	(Initial Study)	N/A	N/A	▲	–	N/A	N/A
Wildfire	(Initial Study)	N/A	N/A	N/A	N/A	–	▲
Meets Most Project Objectives?	Yes	No		Yes		Yes	

– Alternative is likely to result in similar impacts when compared to Project.

▼ Alternative is likely to result in reduced impacts when compared to Project.

▲ Alternative is likely to result in greater impacts when compared to Project.

\+ Alternative is likely to result in greater environmental benefits when compared to Project.

LTS = less than significant impact; LTS-MM= less than significant impact with mitigation; SU = significant, unavoidable impact

6.6 Environmentally Superior Alternative

Table 6-1 above compares the environmental impacts of each alternative to those of the proposed Project. As shown, Alternative A would result in reduced environmental impacts to almost all environmental topics in the short-term because construction activity would not occur. Alternative A would also result in reductions to impacts associated with long-term Hydrology. However, Alternative A would not avoid or reduce the Project's significant impact on historical resources. Additionally, the proposed Project would result in benefits to the topics of Biological Resources and Greenhouse Gas Emissions that would not occur under Alternative A, such that maintaining the current condition would be more impactful to the environment in the long-term to these two topics. Therefore, Alternative A would not be the environmentally superior alternative.

Alternative B would result in similar short-term construction-related impacts when compared to the proposed Project for all environmental topics with the exception of a temporary increase in water supply for landscaping irrigation. For long-term operational impacts, all environmental factors would have similar impacts under Alternative B to the proposed Project. However, Alternative B would result in benefits to the environment that would not occur under the proposed Project. Alternative B would develop curvilinear grading contours at the spreading basins to facilitate a more naturalized appearance consistent with a park setting, improved recreational amenities, such as connective trails and interpretive signage, and natural native landscaping to enhance the recreational experience. Alternative B would not increase any new long-term environmental impacts and would increase long-term benefits to Biological Resources and Recreation. However, Alternative B would not eliminate the significant unavoidable impact to cultural resources.

Alternative C would result in slightly increased short-term construction impacts to most environmental topics. For long-term impacts, Alternative C would not provide the protections related to wildfire preparedness as it pertains to the City's ability to accommodate firefighting equipment into and out of the Arroyo Seco Canyon and the ANF and would result in increased long-term wildfire risks when compared to the proposed Project. However, this Alternative would eliminate the significant unavoidable impact related to historic resources and would be considered to be the environmentally superior alternative to the proposed Project.

In summary, Alternative C, Historic Bridge Preservation in Area 3, is considered the environmentally superior alternative.

PLANTING NOTES:

1. LANDSCAPE PLANTINGS AND IRRIGATION HAVE BEEN DESIGNED IN COMPLIANCE WITH THE CITY OF PASADENA GUIDELINES AND STANDARDS FOR LANDSCAPE PLANTING AND IRRIGATION PLANS AND THE STATE'S MODEL WATER EFFICIENT LANDSCAPE ORDINANCE.
2. ALL UPLAND PLANING AND SEEDING AREAS WILL BE TOP-DRESSED WITH WALK-ON-FIR BARK MULCH AND WILL BE IRRIGATED FOR 3 TO 5 YEARS BY WAY OF A WATER EFFICIENT ABOVE-GROUND TEMPORARY IRRIGATION SYSTEM.
3. ALL DISTURBED AREAS WILL BE SEEDED WITH AN EROSION CONTROL MIX FOLLOWING CONSTRUCTION.
4. DETAILED PLANTING AND IRRIGATION PLANS ARE ANTICIPATED TO BE ON 22" X 34" SHEETS AT A SCALE OF 1" = 20'.

IRRIGATION CONCEPT SUMMARY:

PLANTINGS ARE COMPRISED OF SOUTHERN CALIFORNIA NATIVES OR CULTIVARS OF NATIVES THAT ARE EXPECTED TO SURVIVE WITH MINIMAL SUPPLEMENTAL IRRIGATION ONCE ESTABLISHED. THE IRRIGATION SYSTEM WILL BE A TEMPORARY ABOVE-GROUND IRRIGATION SYSTEM INSTALLED TO HELP ESTABLISH THE PLANT MATERIALS. SUPPLEMENTAL WATER WILL BE PROVIDED DURING THE DRY SEASON FOR THREE TO FIVE YEARS UNTIL PLANT ROOT SYSTEMS ARE SUFFICIENT TO SUPPORT PLANTS WITHOUT REGULAR WATER. TO WEAN PLANTS FROM SUPPLEMENTAL WATER BY THE END OF YEAR 3, IRRIGATION WILL BE SCALED BACK AFTER THE FIRST YEAR FOLLOWING CONSTRUCTION. ONCE ESTABLISHED, PLANTINGS WILL ONLY BE WATERED DURING EXCEPTIONALLY HOT AND DRY WEATHER AS NEEDED FOR PLANT SURVIVAL. THE IRRIGATION SYSTEM WILL BE REMOVED ONCE THE PLANTINGS ARE DEEMED SELF-SUSTAINABLE.

7 LIST OF PREPARERS

This Environmental Impact Report was prepared by the City of Pasadena, as the lead agency. The following professional staff participated in its preparation.

Pasadena Water and Power

Elisa Ventura, P.E., Project Manager
Brad Boman, P.E., Engineering Manager
John Bellas, City of Pasadena Contract Planner

Dudek

Kristin Starbird, Senior Project Manager
Vanessa Currie, Environmental Planner
Vipul Joshi, Senior Biologist
Michael Cady, Biologist
Melissa Blundell, Biologist
Ryan Allen, Urban Forestry Specialist
Christopher LaCroix, Urban Forestry Specialist
Mike Greene, Noise Specialist
Nicholas Lorenzen, Air Quality Specialist
Samantha Murray, Senior Architectural Historian
Heather McDevitt, Archaeologist
Katheryn Kaiser, Architectural Historian
Linda Kry, Cultural Archaeologist
Michael Williams, Senior Paleontologist
Steve Stuart P.E., Principal Hydrogeologist
Christian Hunter PhD, Water Resource Engineer
Dennis Pascua, Senior Traffic Specialist
Sabita Tewani, Traffic Specialist
Mladen Popovic, Transportation Planner
Chelsea Ringenback, Publications Specialist
Corinne Price, Technical Editor
Laurel Porter, Technical Editor
Christopher Starbird, GIS Specialist

Appendix A-1

Notice of Preparation and Initial Study, October 2019

Notice of Preparation

TO:
Responsible and Trustee Agencies,
Organizations, and Interested Parties

FROM:
City of Pasadena
100 North Garfield Avenue
Pasadena, California 91101

SUBJECT:	Notice of Preparation of an Environmental Impact Report and Public Scoping Meeting
PROJECT TITLE:	Arroyo Seco Canyon Project Areas 2 and 3
PROJECT APPLICANT:	City of Pasadena Department of Water and Power
PUBLIC REVIEW PERIOD:	November 4, 2019 through December 6, 2019
SCOPING MEETING:	Thursday, November 21, 2019 from 6:00 P.M. to 8:00 P.M. Robinson Park Recreation Center 1081 N. Fair Oaks Avenue, Pasadena, CA 91103

Pursuant to Section 21165 of the California Public Resources Code and Section 15050 of the California Environmental Quality Act (CEQA) Guidelines, the City of Pasadena (City) is the Lead Agency for the preparation of an Environmental Impact Report (EIR) for the proposed Arroyo Seco Canyon Project Areas 2 and 3 (Project). The Project would be implemented by the Pasadena Department of Water and Power (PWP). In accordance with CEQA Guidelines Section 15082, the City has prepared this Notice of Preparation (NOP) to provide responsible and trustee agencies, the Office of Planning and Research, and the County Clerk with sufficient information describing the Project and its potential environmental effects to enable the responsible agencies to make a meaningful response to this NOP.

The City is requesting specific and detailed input regarding the scope and content of the environmental information related to your agency's statutory responsibility that must be included in the Draft EIR. Pursuant to CEQA Guidelines Section 15083, this NOP also serves to facilitate consultation with any persons or organizations that may be concerned with the environmental effects of the Project. Additionally, this NOP also serves as a notice for the public Scoping Meeting, which is held to expedite and facilitate the consultation process. An Initial Study has been prepared for the proposed Project pursuant to CEQA Guidelines Section 15063 and is available for viewing online at https://ww5.cityofpasadena.net/planning/category/environmental-notices/ and/or PWPweb.com/Arroyo and hardcopies are available for viewing at the PWP office located at 150 South Los Robles Avenue, Suite 200, in Pasadena.

PROJECT LOCATION: The Project site is located within the Arroyo Seco Canyon adjacent to North Arroyo Boulevard (i.e Gabrielino Trail/Access Road), located in Township 1 North, Range 12 West on the Pasadena, California 7.5′ USGS quadrangle map. The proposed Project consists of two primary areas, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements. (See Figure 1)

PROJECT BACKGROUND: In October 2014, the City circulated the Arroyo Seco Canyon Project (ASCP) Initial Study/Mitigated Negative Declaration (IS/MND), State Clearinghouse (SCH)

Number 2014101022, for a 30-day public review period from October 9, 2014 to November 8, 2014. The ASCP required approval of a Conditional Use Permit (CUP) #6222, which involved improvements to three areas, including Area 1, Arroyo Seco Headworks; Area 2, Arroyo Seco Intake; and Area 3, JPL East Parking Lot. The ASCP and IS/MND were approved by the City in 2015. In July 2015, a lawsuit (Court Case No. BS156207) was filed against the City challenging the approval. In June 2017, the Los Angeles Superior Court entered a Judgment that partially favored the petitioners. The Court found that the elements of the ASCP that related to increased diversions of water required the preparation of an EIR. The Court also ruled that the elements of the ASCP that did not relate to increased diversions were severable from the remainder of the ASCP and complied with CEQA and could proceed without additional CEQA review.

In accordance with the terms and provisions of the Judgment, as modified by a Settlement Agreement between the City and the petitioners, the City is preparing an EIR for the proposed Project. Because several components of the ASCP were allowed to proceed without any additional environmental review pursuant to CEQA, the proposed Project boundaries of Area 2 and Area 3 have been refined from those shown in the 2015 ASCP IS/MND.

PROJECT SUMMARY: The Project involves a requested modification to CUP #6222 in order to construct and operate proposed water infrastructure improvements in Areas 2 and 3. A description of the proposed Project is included in the Initial Study, and a brief summary of proposed Project components is provided below.

Area 2: Diversion and Intake Replacement- Improvements in Area 2 include the removal of the existing diversion/weir structure and the intake structure, which would be replaced with a new diversion/weir structure that could be operated to divert up to 25 cfs of creek flows through the new intake structure and into the existing conveyance system (a combination of tunnels and pipelines). The new intake would include a fish screening feature to prevent future fish populations from passing into the intake and conveyance system. A roughened channel would be constructed directly downstream of the new weir to allow for future fish passage upstream during moderate flow periods. Other improvements include a new service building to house the electrical and hydraulic controls for the diversion structure and new engineered streambed material along the eastern creek slope to prevent erosion adjacent to the Gabrielino Trail/Access Road. (See Figure 2)

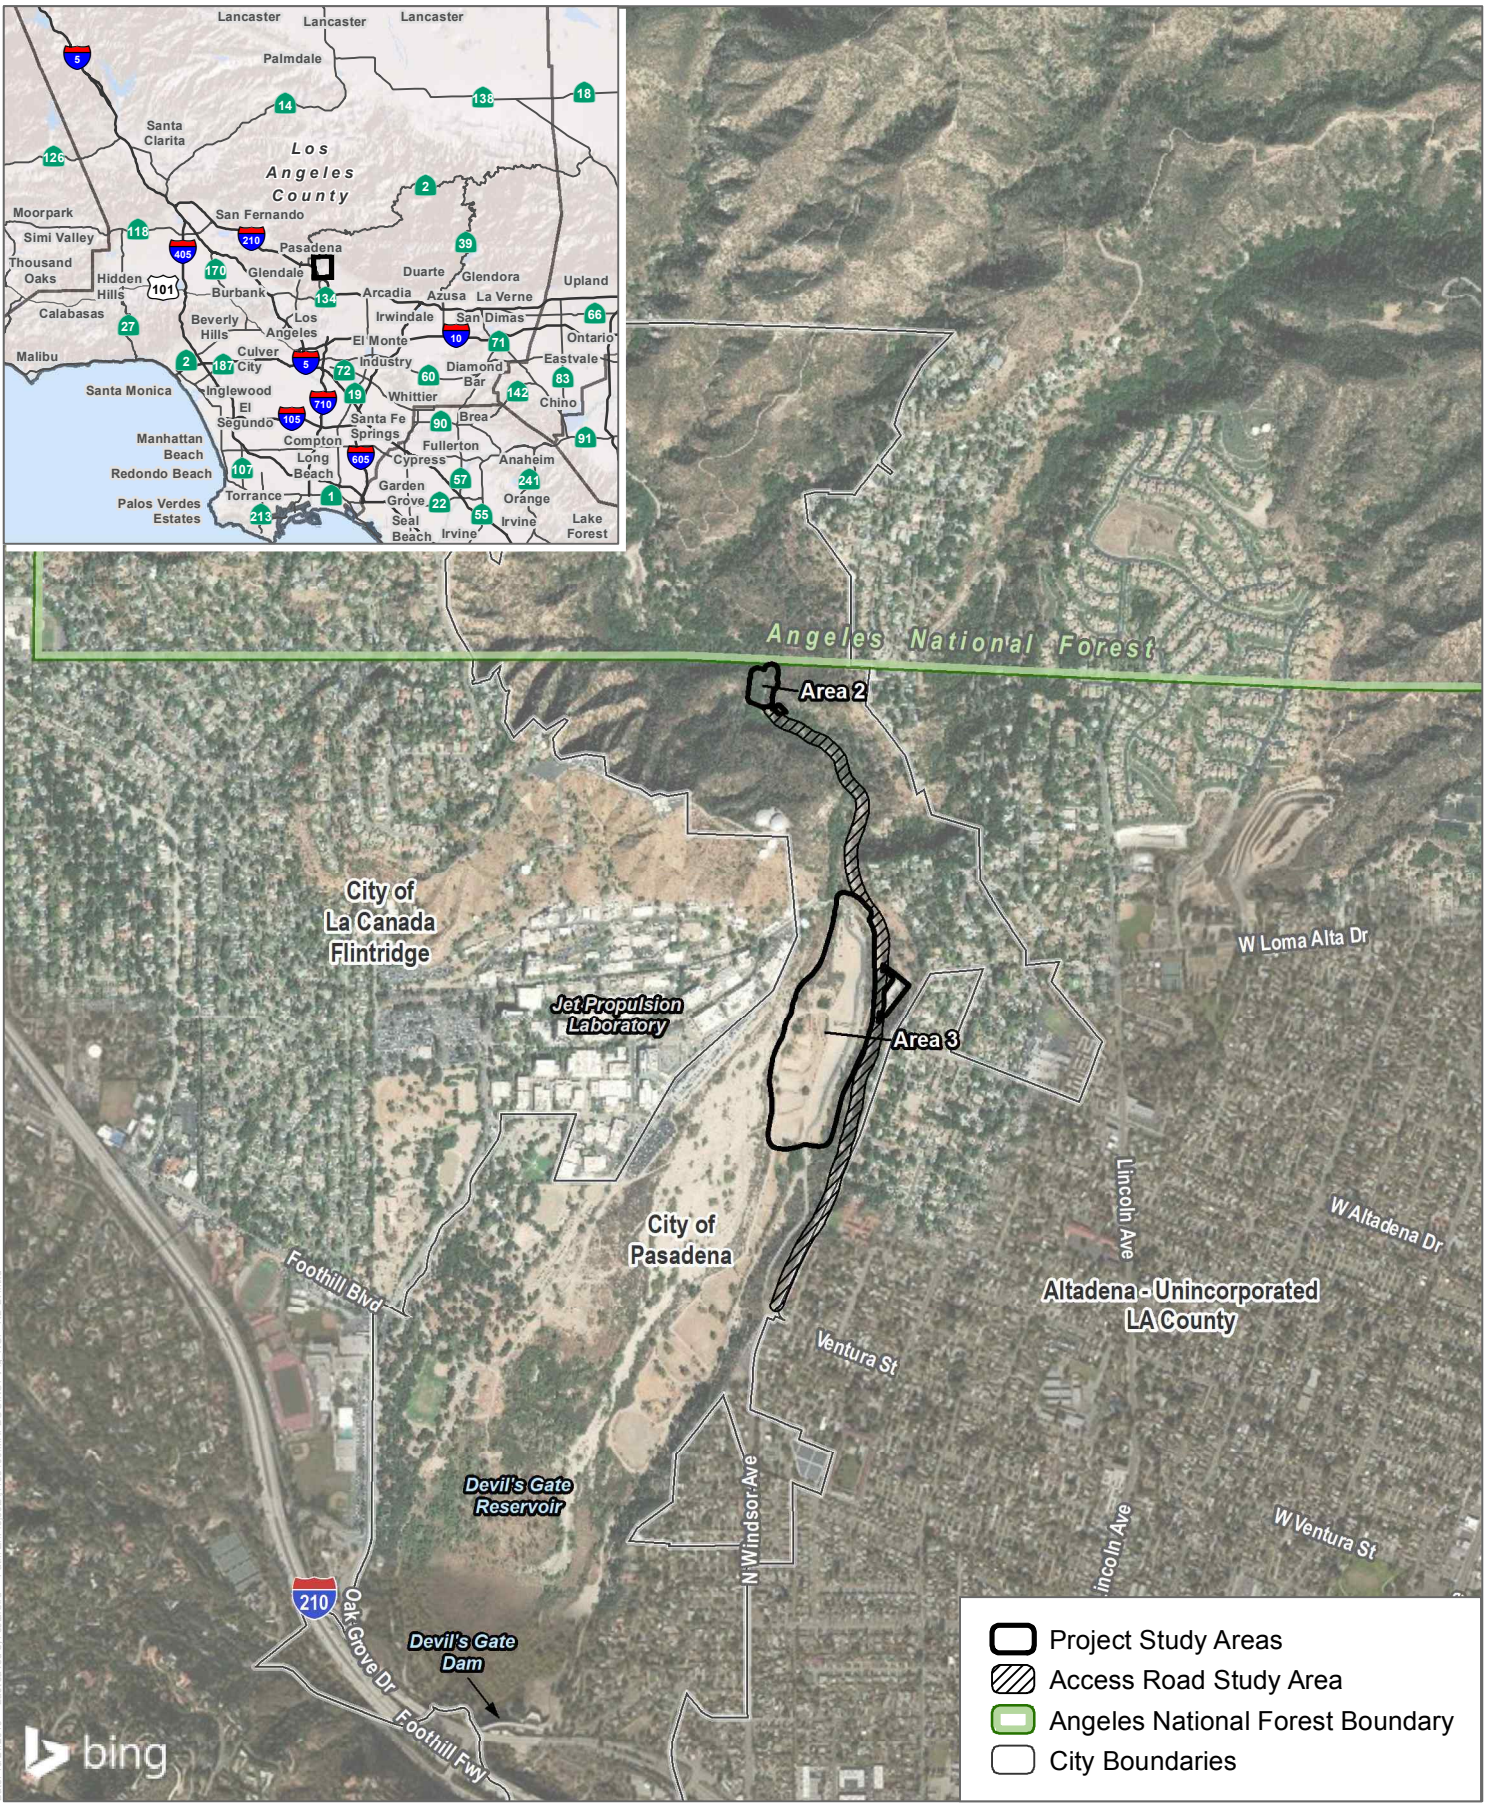
Area 3: Spreading Basin Improvements- Improvements in Area 3 include the reconfiguration and expansion of the spreading basins in order to accommodate the increased flows for infiltration into the Raymond Basin. Various facilities would be demolished, including inlet/outlet structures, pipes and valves, fencing, and other small appurtenant structures, to allow for the reconstructed basins. Creek flows from the existing conveyance system would outlet to the new sedimentation basin or to new spreading Basin E located at the site of the existing Pasadena Pond 1. Basin F would be adjacent to mature trees to be preserved and would be located at the site of the existing Pasadena Pond 2. Basins G, H, and I would be located at the site of the existing Basins 1 and 2 and a portion of the City's open area (i.e. former JPL East Parking Lot). New Basin J would be located between existing Basins 3 and 4, and Explorer Road. (See Figure 3)

During construction activities, the existing Gabrielino Trail/Access Road would provide for vehicular access to and from Areas 2 and 3, and Explorer Road would provide for vehicular access to and from Area 3. The former Travelling Screen and Chlorine Building adjacent to Area 2 and the Behner Water Treatment Plant adjacent to Area 3 would be used for temporary

construction materials and equipment staging. No new habitable structures would be constructed, and no new employees would be generated by the proposed Project.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED: As identified in the Initial Study, the following topical areas have the potential to result in significant impacts and will be analyzed in the EIR: Air Quality, Biological Resources, Cultural Resources/Paleontological Resources, Hydrology and Water Quality, Noise, Recreation, Transportation, and Tribal Cultural Resources. Other topical areas have been assessed through the Initial Study, were determined to have no impacts or less than significant impacts, and will not be further evaluated in the EIR.

PUBLIC SCOPING MEETING DATE AND LOCATION: A public Scoping Meeting will be held to share information regarding the proposed Project and the environmental review process and to receive written comments about the scope and content of the environmental analysis to be addressed in the Draft EIR. The Scoping Meeting is an information-gathering meeting, not a public hearing, and no public testimony or recordation of the meeting will occur. Attendees are encouraged to submit all comments in writing, which will be reviewed and considered by PWP as part of the environmental analysis of the proposed Project. No decisions about the Project will be made at the Scoping Meeting. A separate public hearing for entitlement requests will be scheduled after the completion of the EIR. The date, time, and location of the public Scoping Meeting are as follows:



Date: Thursday, November 21, 2019
Time: 6:00 to 8:00 P.M.
Location: Robinson Park Recreation Center
1081 N. Fair Oaks Avenue
Pasadena, CA 91103
(626) 744-7330

SUBMITTING COMMENTS: A copy of this NOP and the Initial Study may be viewed online at PWPweb.com/Arroyo and/or https://ww5.cityofpasadena.net/planning/category/environmental-notices/. The City will consider all written comments regarding the potential environmental effects of the Project received during the public review period. Written comments must be submitted in writing by 5:00 P.M., December 6, 2019. This public review period includes a 2-day courtesy extension to account for overlap with holidays. Written comments will also be accepted at the Scoping Meeting described above. Due to the time limits mandated by State law, your response must be sent at the earliest possible date but not later than 30 days after receipt of this NOP.

Please direct your written comments via email and/or postal service to:

2 Agency Approvals and Requirements 14

1 Environmental Checklist Form

1. Project Title:	Arroyo Seco Canyon Project Areas 2 and 3
2. Lead agency name and address:	City of Pasadena 150 South Los Robles Avenue, Suite 200 Pasadena, California 91101
3. Contact person and phone number:	Elisa Ventura, PE, Principal Engineer 626.744.4465
4. Project location:	3420 and 3500 North Arroyo Boulevard, City of Pasadena. The Project site includes portions of Assessor Parcel Numbers 5830-001-906 and 5823-015-902. Area 3 begins approximately 0.3-mile north of the intersection of Windsor Avenue and Ventura Street along Explorer Road. The Project site continues northward along the North Arroyo Boulevard (i.e. Gabrielino Trail/Access Road) to the top of Area 2 ending approximately 1 mile north of the intersection of Windsor Avenue and Ventura Street.
5. Project sponsor's name and address:	City of Pasadena Department of Water and Power 150 South Los Robles Avenue, Suite 200 Pasadena, California 91101
6. General plan designation:	Open Space
7. Zoning:	Open Space
8. Description of project:	The proposed Project includes demolition and replacement of surface water diversion facilities and the expansion of spreading basins. See Section 2 for details.
9. Surrounding land uses and setting:	The areas included in the Arroyo Seco Canyon Project are surrounded by residential uses in Pasadena and the unincorporated community of Altadena to the east and south; open spaces in the Angeles National Forest to the north; Devil's Gate Dam and Reservoir to the south; and the Arroyo Seco stream corridor, Oak Grove Park, the NASA-JPL campus, and residential areas in the City of La Cañada Flintridge to the west.
10. Other public agencies whose approval is required:	U.S. Army Corps of Engineers (Section 404 Nationwide Permit); California Department of Fish and Wildlife (Section 1600 Streambed Alteration Agreement); Los Angeles Regional Water Quality Control Board (Section 401 Water Quality Certification); Los Angeles County Flood Control District (Encroachment Permit)
11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1?	Consultation will begin upon issuance of the Notice of Preparation (NOP).

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact," as indicated by the checklist on the following pages.

☐ Aesthetics	☐ Agriculture and Forestry Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☐ Energy
☐ Geology and Soils	☐ Greenhouse Gas Emissions	☐ Hazards/Hazardous Materials
☒ Hydrology and Water Quality	☐ Land Use and Planning	☐ Mineral Resources
☒ Noise	☐ Population and Housing	☐ Public Services
☒ Recreation	☒ Transportation	☒ Tribal Cultural Resources
☐ Utilities and Service Systems	☐ Wildfire	☒ Mandatory Findings of Significance

Determination (To be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Evaluation of Environmental Impacts

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an Environmental Impact Report (EIR) is required.
4. "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).
5. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
    a. Earlier Analysis Used. Identify and state where they are available for review.
    b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
    c. Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
7. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
8. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
9. The explanation of each issue should identify:
    a. The significance criteria or threshold, if any, used to evaluate each question; and
    b. The mitigation measure identified, if any, to reduce the impact to less than significance.

INTENTIONALLY LEFT BLANK

2 Project Description

2.1 Introduction

The City of Pasadena (City) Department of Water and Power (PWP) is proposing to implement the Arroyo Seco Canyon Project Areas 2 and 3 (proposed Project or Project). Pursuant to Section 15367 of the state California Environmental Quality Act (CEQA) Guidelines, the City is the Lead Agency and has the principal responsibility for carrying out the Project and has the authority for approving the Project and its accompanying environmental documentation.

The City will prepare an Environmental Impact Report (EIR) pursuant to CEQA Guidelines Section 15084 for the proposed Project. According to CEQA Guidelines 15060(d), a Lead Agency may determine that an EIR is clearly required for a project, the agency may skip further initial review of the project and begin work directly on the EIR. However, the City has prepared this Initial Study, which reflects its independent judgement, in order to focus the EIR on the Project's environmental effects determined to be potentially significant, identify the effects determined not to be significant, and explain the reasons for determining that potentially significant effects would not be significant. Pursuant to CEQA Guidelines Section 15063(d), an Initial Study must contain the following:

(1) A description of the project including the location of the project;

(2) An identification of the environmental setting;

(3) An identification of environmental effects by use of a checklist, matrix, or other method, provided that entries on a checklist or other form are briefly explained to indicate that there is some evidence to support the entries. The brief explanation may be either through a narrative or a reference to another information source such as an attached map, photographs, or an earlier EIR or negative declaration. A reference to another document should include, where appropriate, a citation to the page or pages where the information is found.

(4) A discussion of the ways to mitigate the significant effects identified, if any;

(5) An examination of whether the project would be consistent with existing zoning, plans, and other applicable land use controls; and,

(6) The name of the person or persons who prepared or participated in the Initial Study.

2.2 Project Location

The Project site is located in the City of Pasadena within the Arroyo Seco Canyon at 3420 and 3500 Arroyo Seco Road, City of Pasadena. The Project site includes portions of Assessor Parcel Numbers 5830-001-906 and 5823-015-902, located in Township 1 North, Range 12 West on the Pasadena, California 7.5′ USGS quadrangle map. The Project site can be accessed via Interstate (I) 210 by exiting Windsor Avenue and traveling northward for approximately 0.8-mile to the intersection of Windsor Avenue and Ventura Street. From this intersection, the City's open area (i.e., former Jet Propulsion Laboratory [JPL] East Parking Lot) is located approximately 0.3-mile north along Explorer Road, which constitutes the southern boundary of Area 3.

The proposed Project consists of two primary areas, as shown on Figure 1, Local Vicinity and Regional Location, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements. These areas are connected by the North Arroyo Boulevard (i.e. Gabrielino Trail/Access Road), which serves as a recreational trail and the access road for City of Pasadena and U.S. Forest Service (USFS) vehicles heading into the Arroyo Seco

Canyon. As shown on Figure 1, the proposed Project would involve construction activity and facility improvements in both areas, as well as construction truck traffic along portions of the Gabrielino Trail/Access Road. The former Travelling Screen and Chlorine Building (Screen Building) adjacent to Area 2 and the Behner Water Treatment Plant adjacent to Area 3 would be used for temporary construction materials and equipment staging.

Within the City of Pasadena, the Arroyo Seco passes through three distinct recreational areas: (1) Upper Arroyo Seco, containing the Hahamongna Watershed Park (HWP) and Devil's Gate Reservoir and Dam; (2) Central Arroyo Seco, extending south of the Devil's Gate Dam to the Colorado Street Bridge; and (3) Lower Arroyo Seco, from the Colorado Street Bridge to the southern boundary of the City. The Project proposes new facilities and improvements only in the Upper Arroyo Seco, as shown on Figure 1.

2.3 Project Background

Settlement Agreement

On October 9, 2014, the City circulated the Arroyo Seco Canyon Project (ASCP) Initial Study/Mitigated Negative Declaration (IS/MND), State Clearinghouse (SCH) Number 2014101022, for a 30-day public review period from October 9, 2014, to November 8, 2014. The City was seeking approval of a Conditional Use Permit (CUP) No. 6222 for the ASCP, which involved improvements to three areas: Area 1, Arroyo Seco Headworks; Area 2, Arroyo Seco Intake; and Area 3, JPL East Parking Lot. The Final 2015 ASCP IS/MND is available for viewing online at https://ww5.cityofpasadena.net/planning/category/environmental-notices/ and/or PWPweb.com/Arroyo and a hardcopy of the Final 2015 ASCP IS/MND can be viewed during normal business hours at:

City of Pasadena Department of Water and Power
150 South Los Robles Avenue, Suite 200
Pasadena, California 91101

In accordance with CEQA Guidelines Section 15150, the 2015 ASCP IS/MND (ASCP IS/MND), and associated conditions of approval are incorporated by reference into this Initial Study. Incorporation by reference is a necessary device for reducing the size of an environmental document. Specifically, the mitigation measures set forth in the 2015 ASCP IS/MND and as set forth in the Mitigation Monitoring and Reporting Program (MMRP) are incorporated by reference and are available for viewing online at the website and address listed above.

On January 7, 2015, the City's Hearing Officer held a public hearing regarding the requested CUP and made the findings to approve the ASCP IS/MND for CUP No. 6222. On January 20, 2015, Spirit of the Sage Council, Project Soliton, and Hugh Bowles submitted an appeal of the Hearing Officer's decision to the Board of Zoning Appeals. The Board of Zoning Appeals hearing took place on March 4, 2015, and upheld the Hearing Officer's decision by a unanimous vote. The approval was again appealed to the City Council, and on June 1, 2015, the City Council voted to uphold the Board of Zoning Appeals decision by unanimous vote.

The City of Pasadena filed a Notice of Determination (NOD) for the ASCP IS/MND on January 13, 2015, after the Hearing Officer approval, and filed an additional NOD on March 6, 2015, after the Board of Zoning Appeals approval. On July 2, 2015, a lawsuit (Court Case No. BS156207) was filed against the City by petitioners Spirit of the Sage Council and Project Soliton challenging the approval. On March 20, 2017, the Los Angeles Superior Court issued its decision and on June 26, 2017, entered a Judgment that partially favored the petitioners. The Court found that the elements of the ASCP that related to increased diversions of surface water (i.e., greater taking of stream water

from the Arroyo Seco beyond its current withdrawal) required evaluation through the preparation of an EIR. The Court also ruled that the elements of the ASCP that did not relate to increased diversions were severable from the remainder of the ASCP and complied with CEQA. As such, the Court determined that CUP No. 6222 and its related findings and conditions of approval, and the ASCP IS/MND shall remain intact for these components, and would be allowed to move forward without any additional environmental review pursuant to CEQA (Spirit of the Sage Council v. City of Pasadena 2017). These approved components include:

- Area 1, Arroyo Seco Headworks: All ASCP elements.
- Area 2, Arroyo Seco Intake: Access road improvements and related slope reconstruction and protective riprap elements.
- Area 3, JPL East Parking Lot: All ASCP elements, except the expansion of 4 existing spreading basins and the construction of 2 new spreading basins. Specifically, the components of the ASCP IS/MND allowed to proceed include the parking lot, access road, sedimentation basin, demolition of existing structures and pipelines, new pipelines, new public restroom, new security booth and associated utility services (water, sewer, power, and communication lines), and topics related to the existing groundwater contamination associated with the Jet Propulsion Laboratory (JPL) site listing on hazardous materials sites compiled pursuant to Government Code Section 65962.5.

In addition, after the Courts ruling, the petitioners and the City came to an agreement to resolve remaining issues and obtain certain assurances as to future actions of the parties. Through this Settlement Agreement, it was agreed that the City shall have the right to perform maintenance activities, including tilling and grading of the existing spreading basins to re-establish historical percolation rates and maintenance activities that involve negligible or no expansion of use as described in CEQA Guidelines Section 15301 for a Class 1 Categorical Exemption. The Settlement Agreement further clarified that the City may perform excavation and grading necessary for the temporary bridges as described in the ASCP IS/MND.

In accordance with the terms and provisions of the Judgment and Peremptory Writ of Mandate, the City's Declaration in Support of the Judgment, the Statement of Decision on Petition for Writ of Mandate, and the Settlement Agreement (see Appendix A to this Initial Study), the City is preparing an EIR for the proposed Project in accordance with CEQA and the state CEQA Guidelines. Because several components of the ASCP were allowed to proceed without any additional environmental review pursuant to CEQA, the proposed Project boundaries of Area 2 and Area 3 have been refined from those shown in the 2015 ASCP IS/MND to reflect the activities subject to review under this EIR, as described below.

Project Purpose

The City owns the right to divert up to 25 cubic feet per second (cfs) of surface water from the Arroyo Seco for direct use or for spreading into its basins for water pumping credits in the Raymond Basin. The City receives between 60 to 80% groundwater pumping credit for the amount of water recharged into the groundwater basin. In the two storm seasons following the 2009 Station Fire, excessive amounts of sediment washed down from the watershed. The debris flows damaged City structures, greatly reducing the City's capacity to divert water for spreading. As a result, PWP proposes to repair and replace damaged facilities in the Upper Arroyo Seco Canyon as a part of the proposed Project. The improvements would allow for increased utilization of the City's surface water rights from the Arroyo Seco and maximize the beneficial use of this important local water resource. The proposed Project would implement a multi-benefit approach to the repair and replacement of damaged infrastructure in the Arroyo Seco, with the overall Project objectives to increase the beneficial use of the surface water rights held by the City and to improve

biological functions within the Arroyo Seco. For any future fish populations that may establish in the Arroyo Seco, the new intake would include a fish screening feature to prevent fish populations from passing into the intake and conveyance system, and a roughened channel would be constructed directly downstream of the new weir to allow for future fish passage upstream during moderate flow periods.

The City's General Plan Open Space and Conservation Element sets forth objectives related to the use of water resources in the City (City of Pasadena 2012). The proposed Project supports these objectives, as follows:

- Increase the efficiency of water use among Pasadena residents, and commercial and industrial organizations.

  The proposed Project would facilitate the efficient use of water in the Arroyo Seco by allowing for the full utilization of the City's surface water rights and reducing reliance upon imported water supplies from the Metropolitan Water District of Southern California (MWD). PWP has a longstanding right to divert up to 25 cubic feet per second (cfs) from this source. MWD imports water from the Sacramento-San Joaquin Delta via the State Water Project, and from the Colorado River. In recent years, MWD has imposed allocation limits on its water supply deliveries to its member agencies, and the future reliability of imported water will continue to face uncertainties from climate change, environmental regulations, and droughts. Another important issue associated with imported water is cost, which has increased substantially in the past few years (City of Pasadena 2012). Achieving water supply reliability will depend on a number of key water policy and management decisions on a regional and local level, including implementation of projects such as the proposed Arroyo Seco Canyon Project Areas 2 and 3.

- Protect local water supply sources and plant trees and vegetation that are consistent with habitat and water conservation policies.

  The proposed Project would facilitate the protection of local water supply sources by improving the ability of the diversion weir and intake structure to capture water during high-flow storm events. It has been PWP's practice in the past (more so after floods following the Station Fire damaged the upstream settling basins) to bypass water from high-flow storm events when the water is sediment-laden and turbid in order to protect the function of the existing infrastructure. Improvements in the facilities to better accommodate turbid waters in high-flow events, as well as improvements to the capacity of the spreading basins, would facilitate the beneficial use of available local water supply sources.

- Improve surface permeability and recharge aquifers/enhance storm water quality to prevent pollution/trash from entering Los Angeles and San Gabriel Rivers and ocean.

  The proposed Project would improve the functionality and efficiency of the facilities responsible for the diversion and infiltration of water into the Raymond Basin. PWP has in the past forfeited available water due to the lack of spreading capacity within the spreading basins (Carollo Engineers 2013). The increased capacity and efficiency of the spreading basin improvements in Area 3 (which includes a new sedimentation basin for sediment to settle out before water is directed to the spreading basins) would maximize capacity and infiltration rates, thereby improving the recharge of groundwater supplies.

Additionally, the proposed Project would support the implementation of improvements set forth in the Hahamongna Watershed Park (HWP) Master Plan. The study area for the HWP Master Plan includes the area below the JPL Bridge, which includes Area 3 of the proposed Project (City of Pasadena 2003). Table 1, Hahamongna Watershed Park

Area 5A Water Resource and Associated Improvements, identifies the proposed Project's consistency with the HWP Master Plan Improvements identified for the proposed Project Area 3.

Table 1. Hahamongna Watershed Park Area 5A: Water Resource and Associated Improvements

HWP Master Plan Improvements for Area 5A	Arroyo Seco Canyon Project Areas 2 and 3 (Proposed Project)
Remove the southern ¾ of the east JPL parking lot.	Completed/Not a Part. The parking lot was removed in 2016.
Relocate and improve water conservation distribution system (diverted and pumped-back storm water).	Not a Part. However, implementation of the ASCP does not conflict with or hinder this improvement.
Construct the Eastside Spreading Basins Project including expanded spreading basins 1 through 4, two new basins, and relocated sludge ponds 1 and 2.	Consistent. The proposed Project would implement this proposed improvement.
Complete the pump-back system from the dam area to the spreading basins.	Not a Part. However, implementation of the ASCP does not conflict with or hinder this improvement.
Construct the overall storm drain modification improvements, including the Altacrest Drain improvements and drainage improvements in the Interpretive Area.	Not a Part. However, implementation of the ASCP does not conflict with or hinder this improvement.
Implement the Habitat Establishment Project at the eastside spreading basins from the remaining northern parking lot south to Johnson Field.	Not a Part. However, implementation of the ASCP does not conflict or hinder this improvement.
Convert the northern ¼ of the east JPL parking lot to public parking and restore and establish habitat in this area.	Would be accomplished through implementation of the ASCP assessed under the 2015 IS/MND.
Construct a sewer lift station and force main across the JPL bridge to JPL's sewer system and underground the power to the site for the new public restroom.	Would be accomplished through implementation of the ASCP assessed under the 2015 IS/MND.
Construct a new public restroom at the north end of the east lot; install eastside picnic amenities on the west side of the Stream Corridor Alignment Habitat Project and at the new public restroom. These improvements will be made when specific need and locations are identified.	The restroom would be accomplished through implementation of the ASCP assessed under the 2015 IS/MND. The remainder is Not a Part. However, implementation of the ASCP does not conflict with or hinder this improvement.

2.4 Project Summary

The Project site consists of two primary areas as shown on Figure 1, Local Vicinity and Regional Location, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements, which are connected by the Gabrielino Trail/Access Road. The proposed Project would involve construction activity and facility improvements in both areas, as well as construction vehicle traffic along portions of the Gabrielino Trail/Access Road.

Area 2: Diversion and Intake Replacement

Figure 2a, Area 2 Existing Conditions, identifies the primary existing structures in Area 2, including the concrete diversion weir and intake structure, a fenced area with a screening building and access to sections of the

conveyance system, the Gabrielino Trail/Access Road, and a historic bridge (Bridge No. 3) over the Arroyo Seco. The diversion weir directs water into the intake structure by obstructing the stream flow and creating a small pool of water that flows into the intake. The intake would be operated to divert the City's 25 cfs of water rights, while additional flows beyond 25 cfs would continue downstream. Due to sediment buildup trapped on the upstream side of the weir, the pooling capacity is reduced and the ability to collect water for spreading is limited. When water enters the intake, it is conveyed downstream through the conveyance system to the PWP's spreading basins. The existing intake/diversion system consists of an approximate 9-foot-high reinforced concrete training wall and intake structure with a trash rack on the east bank of the stream, and a reinforced concrete weir with stop logs in slots. Under current conditions, the weir crest is approximately 2 feet above the streambed on the downstream side.

Improvements in Area 2 include the demolition and removal of the existing concrete weir and portions of the intake structure and the construction of a new diversion structure that would be operated to divert up to 25 cfs of creek flows into the existing conveyance system. The intake structure would be remodeled with new concrete walls and top deck to accommodate a new screen configuration. An existing concrete slab that previously supported an equipment building located adjacent to the Gabrielino Trail/Access Road would be demolished. A new 106 square foot (11 feet 4 inches by 9 feet 4 inches) intake service building would be constructed to house the electrical and hydraulic controls for the diversion structure. Electric power for the operation of the diversion structure and control equipment enclosure would be supplied by an existing power line at the screen building (southeast of the intake structure). The locations of the proposed facilities and improvements are shown on Figure 2b, Area 2 Conceptual Design Overview.

The proposed new diversion/intake structure would capture flows up to PWP's surface water rights. This would include all flows during small storm events and dry weather flows in the Arroyo Seco, and a portion of flows during large storm events. During larger storms when the water is too turbid with suspended sediments (e.g., flows generally above 100 cfs), the stream with its associated sediment load would bypass the diversion/intake structure and continue downstream to Devil's Gate Reservoir. Operation of the weir during high flows would be facilitated by the adjustable height weir or crest gate. At low flows, the gate would start in the 'up' position and as flows increase, the gate would be lowered to maintain a constant water surface level in the diversion pool (a pool created behind the weir to allow for an appropriate water elevation to flow into the diversion intake). When the gate is fully lowered, flows would entirely bypass the diversion structure and carry all flows and sediment downstream.

The new diversion/intake structure would improve biological functions in the Arroyo Seco by allowing for fish passage if future fish populations are established, as well as other aquatic wildlife. The existing weir/diversion structure is a barrier to upstream fish passage due to the elevation drop downstream of the structure. The new diversion structure would be designed for the possibility that some future fish may pass downstream when the diversion is not operating (i.e., the gate is lowered to allow flows to continue downstream without diversion) or when the diversion is operating and flows are high enough to spill over the crest gate. A roughened channel would be constructed downstream of the new diversion structure and operable weir such that upstream passage for future fish populations may occur during periods when the diversion is not operating and flows are adequate to allow for passage. In the current condition, water passes through a trash rack to prevent debris from entering the conveyance system to the spreading basins. In addition to filtering such debris, the proposed new intake structure would include a fish screening feature to prevent future fish populations from passing into the intake and conveyance system.

Area 3: Spreading Basin Improvements

Area 3 is located approximately 0.3-mile downstream from Area 2 and includes two existing spreading basins that are known as Pasadena Ponds 1 and 2 (formerly used as sludge ponds for the Behner Treatment Plant) and Spreading Basins No. 1 through 4, the former JPL Parking Lot and adjacent Explorer Road, and the North Arroyo Boulevard (i.e. Gabrielino Trail/Access Road), which would provide construction vehicle access to Area 2 of the Project site. Figure 3a, Area 3 Existing Conditions, identifies the primary structures and facilities in Area 3.

Improvements in Area 3 include the reconfiguration and expansion of the spreading basins in order to accommodate the increased diversion of creek flows for infiltration into the Raymond Basin. Various facilities would be demolished, including inlet/outlet structures, dry vaults, woodsheds, utility light pole, pipes and valves, chain-link fencing, corrugated metal pipes, and other small appurtenant structures, to allow for the reconstructed basins.

Figure 3b, Conceptual Site Plan, depicts the proposed spreading basin improvements. Creek flows from the existing conveyance system would outlet to the new sedimentation basin or to new spreading Basin E located over the existing Pasadena Pond 1. Basin F would be adjacent to mature trees to be preserved and would be located at the site of the existing Pasadena Pond 2. Basins G, H, and I would be located at the site of the existing Basins 1 and 2 and a portion of the City's open area (i.e., former JPL East Parking Lot). Each new basin would have an access ramp for maintenance. Rock boulders would be placed along the western edge of Explorer Road to separate the roadway from the adjacent basins. With the area's sloping terrain, depths of the basins would range from 3 feet to 7 feet. When spreading water, the water depth in the basins would be approximately 1 foot. All basins would include inlets/outlets with 24-inch interconnection piping. Spillways, pipelines, culverts, and valves would be provided to connect the basins to each other. Basin J would be the last newly constructed basin located entirely within the former JPL East Parking Lot, which would include interconnection piping into the existing Basin 3. Other basins downstream of Basin 3 are not a part of the proposed Project, although Basin 4 may be temporarily impacted during construction.

Gabrielino Trail and Bridge Crossings

The Gabrielino Trail (i.e., North Arroyo Boulevard) runs generally parallel to the Arroyo Seco and along the eastern side of the former JPL East Parking Lot and serves as a recreation trail for hikers, bikers, and equestrian uses. It also serves as a maintenance access road that leads to the Behner Water Treatment Plant and into the Arroyo Seco Canyon area to provide access for PWP and the USFS. During construction activities, the Gabrielino Trail/Access Road would provide for vehicular access to and from Area 2, and sometimes Area 3 (Explorer Road will be its primary access road).

Along the Gabrielino Trail/Access Road, three bridges cross portions of the Arroyo Seco. Bridge Nos. 1, 2, and 3 are located between Areas 2 and 3, respectively . Bridge No. 1 is a culvert-style bridge with concrete slab deck over Millard Creek, approximately 0.13-mile north of the JPL Bridge. A July 2015 Bridge Condition Assessment found that the bridge abutments were being undermined due to scouring and that the Gabrielino Trail/Access Road had sloughed off in sections. A structural overlay bridge spanning the length of this bridge was constructed in 2017 to provide additional support for large/heavy vehicle travel and to protect the structure from further damage.

Bridge No. 2 is located approximately 130 feet north of Bridge No. 1 and is a reinforced concrete arch bridge with decorative cast-concrete railing. Bridge No. 2 was likely constructed to provide a formal entrance to the Upper Arroyo Seco and the ANF, and it appears to meet the required criteria to be listed as a historical resource in the California Register of Historic Resources (CRHR) and in the City of Pasadena as a landmark (BonTerra Psomas 2015).

Bridge No. 3 is located approximately 0.34-mile north of the JPL Bridge within Area 2 and was constructed with truss-bridge forms using wood timbers. It was constructed by the Civilian Conservation Corps (CCC) in 1939 and is associated with events that made a significant contribution to the history of the United States and California. Bridge No. 3 appears to meet the required criteria to be listed as a historical resource in the National Register of Historic Place (NRHP) and in the CRHR. The bridge was heavily damaged by the 2010 storms. A structural overlay bridge spanning the length of Bridge 3 was constructed in 2017 to provide additional support for large/heavy vehicle travel and to protect the structure from further damage. A structural evaluation of Bridge 3 subsequent to the structural overlay, however, shows the condition of Bridge 3 continues to deteriorate (TJC 2018).

Additionally, stone masonry walls line the east side of the Arroyo Seco at Bridge No. 2 and continue upstream to Bridge No. 3. The stone masonry walls would not be altered by Project activities. The structural overlay bridge crossings on Bridge Nos. 1 and 3 would remain in place throughout the duration of construction. Upon completion of the proposed Project, the City intends to keep the bridge structures as-is, complete with additional support structures, into the foreseeable future. No construction activities on the bridges are anticipated. As set forth in the Settlement Agreement, the impact of retaining these bridge structures will be studied in the EIR.

Construction Activities

Construction of the Project improvements is anticipated to take approximately 16 months, starting in August 2021 with Project completion expected by January 2023. In the interest of minimizing the export of excavated materials from the Project site, the City may implement a mechanical shaker to sort and sift through excavated soils to separate finer soils from larger rocks, thereby allowing for the beneficial reuse of the materials as engineered fill materials during the construction of the spreading basins. Rock materials may be used on site for decorative/landscaping purposes throughout the Project study area, added to an existing stockpile that has been created by the City in an area along the west bank of the Arroyo for future uses, or may be exported off site.

Construction trucks hauling soils and debris to and from Scholl Canyon Landfill are expected to come to the site from I-210 at the Windsor Avenue off-ramp and head north on Windsor Avenue to the intersection with Ventura Street. At this intersection is a fork in the road, one leading to Explorer Road into Area 3 and the other leading to the gated North Arroyo Boulevard, which passes adjacent to residential properties and the Behner Treatment Plant. Near the JPL Bridge over the Arroyo Seco near the northern boundary of Area 3, North Arroyo Boulevard splits and provides access to the Gabrielino Trail/Access Road and to the JPL Bridge/Explorer Road. Construction trucks would use North Arroyo Boulevard to access Area 2 and Explorer Road would be used to access Area 3. From I-210, trucks would head west on SR-134; exit at the Figueroa Street/Scholl Canyon Road off-ramp; head north-northeast toward the landfill. Trucks would come back from the landfill entering the eastbound on-ramp on the SR-134 at Figueroa Street and head east; trucks would then go west on I-210 to Windsor Avenue to Explorer Road and, ultimately, to the site.

Occasional partial closures for the Gabrielino Trail/Access Road would be required for construction truck and equipment access. The Screen Building adjacent to Area 2 and the Behner Water Treatment Plant adjacent to Area 3 would be used for temporary construction materials and equipment staging.

Operational Activities

City personnel would continue to provide maintenance of the diversion and intake structures in Area 2 as occurs under existing conditions. When necessary, cleaning of the spreading basins in Area 3 would continue to be accomplished by mechanically scraping the top layer of soil using front-end loaders, graders, or scrapers. Following

removal, the surface would be disked or harrowed to loosen any soil compaction caused by cleaning. An estimated 100 truckloads of soil from the existing and proposed spreading basins would have to be disposed of off site every 5 years, which is reflective of current maintenance activities. As such, no substantive changes to ongoing operations and/or maintenance activities are anticipated.

2.5 Project Setting

Physical Setting Overview

The Arroyo Seco is a major tributary of the Los Angeles River, flowing from the San Gabriel Mountains in the Angeles National Forest (ANF). The Canyon has a north-south alignment with steep east- and west-facing slopes. The Hahamongna Watershed Park Master Plan describes the rocky streambed as containing an ephemeral stream, which is the source of its given Spanish name "arroyo seco" meaning "dry wash" (City of Pasadena 2003). However, the Arroyo Seco north (upstream) of the JPL Bridge has been classified by the U.S. Fish and Wildlife Service as having a seasonally flooded water regime, which means surface water is typically present for extended periods, especially in the winter and early spring, but is absent by the end of the spring or early summer in most years (USFWS 2019).

The Arroyo Seco originates in the San Gabriel Mountains, with waters flowing south through the cities of Pasadena, South Pasadena and Los Angeles, before joining the Los Angeles River just east of Elysian Park and west of the Interstate (I) 5/I-110 Interchange. Within the City of Pasadena, the Arroyo Seco passes through three distinct recreational areas: (1) Upper Arroyo Seco, containing HWP and Devil's Gate Dam; (2) Central Arroyo Seco, containing the Brookside Golf Course and Rose Bowl; and (3) Lower Arroyo Seco, containing an archery range, casting pond, and Memorial Grove. The Project proposes improvements in the Upper Arroyo Seco (in the City of Pasadena on land owned by the City). HWP is bound on the south by the Devil's Gate Dam and Oak Grove Drive. Oak Grove Drive and the JPL of the California Institute of Technology bound the HWP to the west in the City of La Cañada-Flintridge. To the east, HWP is bound by the residential neighborhoods of Pasadena and Altadena. The HWP extends northward into the San Gabriel Mountains and includes approximately 1,300 acres of open spaces and recreational amenities, including the Gabrielino Trail that is heavily used for hiking/bicycling and equestrian activities.

Upstream of the JPL Bridge, the Arroyo Seco is largely vegetated with coast live oak with patches of white alder and occasional California sycamores. Immediately downstream of the diversion weir, vegetation is dominated by a mix of California sycamores and white alders with occasional Goodding's black willows and arroyo willows. Special status bird species that may occur in the Project area include the state and federally listed Endangered southwestern willow flycatcher and least Bell's vireo, as well as the California Species of Special Concern listed yellow-breasted chat and the yellow warbler (BonTerra Psomas 2014).

Downstream of the JPL Bridge, the Arroyo Seco fans out into the alluvial system of the Devil's Gate Reservoir. In November 2018, the Los Angeles County Flood Control District (LACFCD) began the removal of 1.7 million cubic yards of accumulated sediment located within 42 acres of the Devil's Gate Reservoir. Sediment removal activities would occur adjacent to existing Spreading Basin No. 14. Approximately 70 acres of habitat restoration would occur in the remaining portions of the Reservoir, including along the sloped areas between the Arroyo Seco and the spreading basins as well as within the southernmost Spreading Basin No. 17. Sediment removal activities are anticipated to continue through 2022 with habitat restoration activities occurring through 2023 (County of Los Angeles 2018). More information about the LACFCD's Devils Gate Sediment Removal Project can be found online at: https://dpw.lacounty.gov/swe/devilsgate/about.shtml.

Planning Context

The HWP is almost entirely designated and zoned as Open Space in the City of Pasadena's General Plan Land Use Plan and Zoning Map, including Areas 2 and 3 (City of Pasadena 2016, 2018). The Open Space designation and zone applies to City-owned land with active and passive public recreational facilities and natural open space. A Modification to the Conditional Use Permit (CUP) No. 6222 is required for any parkland and recreational improvements within the OS Zoning District.

The Arroyo Seco Master Plan is a park/facility planning document that consists of four elements: (1) Hahamongna Watershed Park Master Plan, (2) Central Arroyo Seco Master Plan, (3) Lower Arroyo Seco Master Plan, and (4) Design Guidelines for the Arroyo Seco. The Hahamongna Watershed Park Master Plan (HWMP) and the Arroyo Seco Design Guidelines are applicable documents that address select components of the proposed Project.

The HWMP sets forth objectives for the future use and development of HWP, which includes approximately 1,300 acres of open space that extends up the Arroyo Seco Canyon from the Devil's Gate Dam. The lower watershed, the 330 acres roughly defined as the floodplain and basin behind the Dam, is the focus of the HWMP. The HWMP establishes a framework for flood management, water conservation, habitat restoration, recreation, and cultural resources protection in this area. The HWMP was adopted in 2003 and an amendment approved in 2010.

The projects specified in the HWMP that are within the Project's boundaries include the expansion of the existing spreading grounds through the creation of new spreading basins on the central and southern portions of the former JPL East Parking Lot. The HWMP also calls for habitat restoration around the spreading basins. Other improvements are planned in the HWMP that were covered and approved under the ASCP IS/MND, including parking lot improvements and a new restroom.

2.6 Discretionary Actions

Table 2 lists all the agencies that are known or expected to have permit or approval authority over the proposed Project. This Initial Study covers all federal, state, local government, and quasi-government approvals that may be needed to construct, implement, or operate the Project, whether or not they are specifically identified in Table 2 or elsewhere in this Initial Study.

Table 2. Agency Approvals and Requirements

Agency	Approved/Permit Required	Purpose	Notes
City of Pasadena	Project approval	Approve the proposed Project and allocate City funds.	–
	Conditional Use Permit Modification	Allow for utility improvements in the Open Space zone	In compliance with the City's Zoning Code
	Tree removal authorization	Allow removal of trees in areas to be disturbed.	In compliance with City Trees and Tree Protection Ordinance
U.S. Army Corps of Engineers (USACE)	Section 404 Nationwide Permit	Allow the discharge of dredge and fill material into "waters of the United States."	Nationwide Permit (NWP) required for temporary and permanent disturbance of Arroyo Seco in Area 2

Table 2. Agency Approvals and Requirements

Agency	Approved/Permit Required	Purpose	Notes
Los Angeles Regional Water Quality Control Board (RWQCB)	Section 401 Water Quality Certification	Protect water quality within "waters of the United States."	Water Quality Certification required for temporary and permanent disturbance of Arroyo Seco in Area 2 and for temporary impacts due to spreading basin expansion in Area 3
California Department of Fish and Wildlife (CDFW)	Section 1600 Streambed Alteration Agreement	Authorize changes to the natural flow or the bed, channel, or bank of any river, stream, or lake and associated impacts to biological resources.	Streambed Alteration Agreement required for temporary and permanent disturbance of Arroyo Seco in Area 2 and for temporary impacts due to spreading basin expansion in Area 3
Los Angeles County Flood Control District	Encroachment Permit	Authorize construction activities within the Altadena Storm Drain Easement	–

INTENTIONALLY LEFT BLANK

3 Initial Study Checklist

3.1 Aesthetics

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Except as provided in Public Resources Code Section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☒	☐
b) Substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☒	☐
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☐	☒

a) Would the project have a substantial adverse effect on a scenic vista?

The City's General Plan Open Space and Conservation Element describes the Arroyo Seco as being an important primary green space for the City that includes iconic elements of the City's regional identity. Although there are no specifically designated and protected scenic vistas enumerated in the City's General Plan, the Green Space, Recreation and Parks Element states:

> Citywide Parks can be expected to draw users on a regional basis. Typically, a Citywide Park would include large natural open space areas. These areas may contain amenities such as trails and vista points. In addition to recreational opportunities, natural open space areas typically contain important visual features that contribute to the recreational experience. Pasadena's Citywide parks are Brookside Park, Hahamongna Watershed Park, and Lower Arroyo Park (City of Pasadena 2007).

Area 2 is located within a small portion of the Arroyo Seco and includes the adjacent Gabrielino Trail/Access Road. Views in this area are limited to the adjacent surrounding vegetation and canyon slopes. Recreational users along the Gabrielino Trail/Access Road have views of Area 2; however, this site is not visible from other areas within the Arroyo Seco Canyon due to intervening topography and vegetation.

The Project site is located within the HWP. The HWP Master Plan includes the area below the JPL Bridge, which includes Area 3 of the proposed Project (City of Pasadena 2003). The HWP Master Plan states:

> From the narrow canyon, just below Devil's Gate Dam, to the broad flood plain with its wooded and chaparral-covered slopes and up to the prominent points with their grand vistas, this cultural resource called Hahamongna Watershed Park should be enhanced and preserved.

The existing ponds 1 and 2 within Area 3 are fenced and are not publicly accessible facilities. However, a trail located between existing Basin 1 and Basin 2 provides connectivity among the hiking/riding trails in the HWP and provides for views of the San Gabriel Mountains, Devil's Gate Reservoir, and Arroyo Seco Canyon.

The existing water infrastructure facilities included in Areas 2 and 3 are located within important scenic areas of the City that are highly valued for their vegetated open space character; however, they would not be considered scenic resources in and of themselves. Views of the Arroyo Seco, Devil's Gate Reservoir, and surrounding natural areas from the Gabrielino Trail/Access Road would be considered scenic vistas. The visual character of the area can generally be described as including a relatively undisturbed natural stream and associated vegetation in a wooded canyon setting. The beauty of the area provides an important amenity for many recreational users.

The HWP Master Plan includes a proposal to construct the Sunset Overlook, which would be located just north of the Windsor/Ventura entrance to the HWP. A small picnic and interpretive area would be developed to take advantage of the broad views of the basin. The site overlooks the spreading basins and would provide opportunities for education on water resources and habitat restoration. Implementation of the proposed Project would not interfere with any plans to construct the small picnic and interpretive area at the Sunset Overlook, nor would it have a substantial adverse effect on the existing or future scenic views of the area. The Project site is too far from the Sunrise Overlook located near Berkshire Creek, to be visible from that location.

Within Areas 2 and 3, construction activities would temporarily detract from the natural setting, as construction equipment, staging areas, demolition/excavation, grading activities, and construction work would be visible to persons near the disturbed areas during the construction phase. Construction activities would temporarily diminish the visual quality of the areas being disturbed, and possibly the scenic vistas from portions of the Gabrielino Trail/Access Road. However, this impact would be a short-term visual nuisance. Also, security fencing that may be provided around construction work areas would shield views of construction activities. The security fencing would be located around equipment staging areas, which includes parking for vehicles/equipment when not in use and stockpiled materials.

The long-term views of scenic resources from Areas 2 and 3 would not be substantively altered from the current existing conditions. In Area 2 and as shown in Figures 2a and 2b, the new diversion and intake structure would be in largely the same location as currently located and would maintain a similar height and would span the creek, as in the current condition. Engineered streambed material, similar to riprap, which is made of natural stones, would be installed along the upstream and downstream sides of the new diversion structure to reduce erosion and would allow for natural vegetation to grow. A roughened channel would be constructed directly downstream of the new weir to allow for future fish passage upstream during moderate flow periods. The engineered streambed material would be constructed to visually mimic the rocky and undulating natural streambed and would be constructed with natural stones of varying sizes. Replacement and new chain-link fencing would be extended along the current alignment of the K-rail barriers, which would be removed as a part of the Project.

Views of the diversion/intake structure along the Gabrielino Trail/Access Road are limited because the facility is located to the east of the hiking trail, below the grade of the trail behind chain-link fencing, and is obscured by existing mature vegetation. Views of the existing facilities in Area 2 are included in Figure 4a, Area 2 Existing Conditions Photographs. The new structure would be similarly obscured from the viewshed of recreational users of the Gabrielino Trail/Access Road. No new vertical structures (e.g., buildings, towers) would be constructed at the site that could obstruct views of the stream or surrounding canyons and vegetation from the Gabrielino Trail/Access Road.

It is anticipated that approximately eight mature trees would be removed in Area 2 and approximately one mature tree would be removed in Area 3 as part of Project construction (BonTerra Psomas 2014). Replacement of these trees would be required under the City's Tree Ordinance (Chapter 8.52 of the Pasadena Municipal Code), which depending on the size of the tree to be removed and the size of the replacement tree container size, could require a replacement ratio between 2:1 or up to 12:1. Therefore, there would be an increase in the number of post-Project trees in the Arroyo Seco. With the replacement of these trees within the Arroyo Seco Canyon in compliance with City requirements, the removal of approximately eight trees in Area 2 and approximately one tree in Area 3, would not substantially adversely affect a scenic vista.

The new 106 square foot (11 feet 4 inches by 9 feet 4 inches) intake service building would be constructed to house the electrical and hydraulic controls for the diversion structure (see Figure 2b). The structure would be located on the east side of the Gabrielino Trail/Access Road at the site of a former 10-foot by 15-foot concrete slab and cement/mortar retaining wall. The building would be 10 feet tall and be constructed with an exterior stone masonry façade stem wall and lath/plaster stucco finish, with a roll-up door for access to the interior mechanical equipment. The building would reflect the natural colors and materials of the surrounding area and would not obscure views of the Arroyo Seco Canyon or otherwise substantially adversely affect a scenic vista.

In Area 3 and as shown in Figures 3a and 3b, the existing chain-link fencing around the Ponds 1 and 2 would be replaced to surround the new sedimentation basin; otherwise, no new permanent fencing would be constructed. The new sedimentation basin and spreading Basin E would be located at the site of the existing Pasadena Pond 1. Basin F would be adjacent to mature trees to be preserved and would be located at the site of the existing Pasadena Pond 2. Basins G, H, and I would be located at the site of the existing Basins 1 and 2 and a portion of the City's graded open area (i.e., former JPL East Parking Lot). Each new basin would have an access ramp for maintenance. Rock boulders would be placed along the western edge of Explorer Road to separate the roadway from the adjacent basins. Basin J would be the last newly constructed basin located entirely within the former JPL East Parking Lot, which would include interconnection piping into the existing Basin 3. Other basins downstream of Basin 3 are not a part of the proposed Project, although Basin 4 may be temporarily impacted during construction and is included in the Study Area. Views of the existing facilities in Area 3 are included in Figure 4b, Area 3 Existing Conditions Photographs.

In summary, the expanded and reconfigured basins would be located over the existing basins and the former JPL East Parking Lot. The basins would continue to be earthen structures that occasionally contain open water, which would be consistent with the current condition and may be considered a visual improvement over the former JPL East Parking Lot. Impacts to scenic vistas would be less than significant, and no mitigation is required. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic. Therefore, this topic will not be further evaluated in the EIR.

b) Would the project substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Several freeways and highways have been included in the California Scenic Highway System as "Officially Designated Scenic Highways" or "Eligible State Scenic Highways." The nearest Officially Designated Scenic Highway is State Route (SR)-2, Angeles Crest Highway, which travels through the San Gabriel Mountains from I-210 in La Cañada Flintridge to the SR-138 past Wrightwood (Caltrans 2013). As part of the SR-110, the Arroyo Seco Parkway is a designated National Scenic Byway (FHWA 2013). The closest roadways identified in Caltrans Scenic Highway Program are:

- SR-2, which is an Officially Designated Scenic Highway, is located approximately 1.5 miles northwest of Area 2 at its nearest point, and there are no views of the Arroyo Seco Canyon or HWP due to distance, structures, topography, and intervening vegetation.
- I-210, which is an Eligible Scenic Highway from the I-5 in Sylmar to the SR-134 in Pasadena, is located near the southern edge of Devil's Gate Dam. Travelers on the I-210 can catch fleeting views of some of the vegetation within the Devil's Gate Reservoir and the distant mountains, but the spreading basins in Area 3 and the more distant Arroyo Seco Canyon are not visible from the I-210.
- SR-110, which is a National Scenic Byway, terminates in Old Pasadena near East Holly Street, which is approximately 3.6 miles south of Area 3. There are no views of the Arroyo Seco Canyon or HWP due to distance, structures, topography, and intervening vegetation.

The proposed improvements in Areas 2 and 3 would not be visible from the SR-2, the I-210, or the SR-110; therefore, no impacts on scenic resources along these scenic highways would occur and this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point).

The visual character of the Area 2 is predominantly characterized by the Arroyo Seco and associated vegetation and trees, and by the graded Gabrielino Trail/Access Road and chain-link fencing running north-south along the length of the area. As shown in Figure 4a, the aesthetic aspects of the current views of Area 2 from the Gabrielino Trail/Access Road are of the vegetated canyon slopes and creek bed. Distant views are limited due to the curve in the creek and Gabrielino Trail/Access Road, as well as mature trees and vegetation. As shown in Figure 4b, the aesthetic aspects of the current views of Area 3 are predominantly characterized by the open views of the vegetated canyon slopes adjacent to the Gabrielino Trail/Access Road, existing spreading basins, and City's graded open area (i.e., former JPL East Parking Lot) and Explorer Road.

Construction activities would temporarily detract from the natural setting, as construction equipment, staging areas, excavation, grading activities, demolition, and construction work would be visible to persons near the disturbed areas during the construction phase. As discussed under Threshold 3.1(a), construction equipment and activities are a temporary visual nuisance that are commonplace; however, this impact is more noticeable in the context of the natural setting in Area 2, which is visited by people wishing to experience a natural setting. Construction activities would temporarily diminish the visual quality of the areas being disturbed; however, this impact would be a short-term inconvenience, and temporary impacts would be less than significant.

In Area 2, the proposed new diversion structure would span the width of the stream, engineered streambed material would be constructed on both sides of the diversion structure, and the intake service building would be located on the east side of the Gabrielino Trail/Access Road. The existing man-made Gabrielino Trail/Access Road, intake structure, diversion structure, chain-link fence, and K-rails in Area 2 have been in place for a long time and the proposed facilities are replacements of existing structures and are not new structures in an otherwise pristine setting. As described under Threshold 3.1(a), the new diversion and intake structure would be in the same location as currently located (see Figures 2a and 2b), and would maintain a similar height and would span the creek, as in the current condition. Views of the diversion/intake structure along the Gabrielino Trail/Access Road are limited because the facility is located to the east of the hiking trail, below the grade of the trail behind chain-link fencing, and is obscured by existing mature vegetation.

It is anticipated that approximately eight mature trees would be removed in Area 2. However, replacement of these trees would be required under the City's Tree Ordinance, which depending on the size of the tree to be removed and the size of the replacement tree container size, could require a replacement ratio between 2:1 or up to 12:1. Therefore, there would be an increase in the number of post-Project trees in the Arroyo Seco, and the removal eight trees and replacement in accordance with the City's Tree Ordinance would not substantively degrade public views of the site or surroundings. Therefore, the proposed infrastructure improvements in Area 2 would result in a similar visual character as the current conditions and the proposed Project would not result in an impact that could adversely affect a scenic vista or substantially degrade the visual character or quality of the area.

In Area 3, the expansion of the existing spreading basins into the City's graded open space (i.e., former JPL East Parking Lot) would increase the amount of periodic open water in the area, which could be interpreted by some to be a beneficial visual impact, as there may be the potential for increased use of the open water by waterfowl. As such, aesthetic impacts related to long-term operations within Area 3 would be less than significant. Impact associated with substantially degrading the existing visual character or quality of public views of the site and its surroundings would be less than significant, and no mitigation is required. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic. Therefore, this topic will not be further evaluated in the EIR.

d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

No new lighting or reflective surfaces that could cause glare are proposed in Areas 2 and 3. No construction activities would occur during nighttime hours. The proposed Project in Area 3 would be in compliance with the Arroyo Seco Master Plan Design Guidelines, which require that no lighting shall occur in natural areas. As such, there would be no impacts related to light and glare and this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.2 Agriculture and Forestry Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

a) Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

The California Department of Conservation administers the Farmland Mapping and Monitoring Program (FMMP) pursuant to Section 65570 of the California Government Code. Due to the predominance of urban development in the southern and central sections of Los Angeles County (which includes the City of Pasadena), this area was not included in the mapping effort by the FMMP (FMMP 2011). As such, there are no designated farmlands in or near the Arroyo Seco Canyon. Also, there are no existing or ongoing agricultural activities in or near the Arroyo Seco Canyon.

The Upper Arroyo Seco is designated and zoned as Open in the City of Pasadena's General Plan Land Use Plan and Zoning Map (City of Pasadena 2015). The Arroyo Seco originates in the ANF; however, Areas 2 and 3 are located south and outside of the ANF. There are no designated Farmland or Farmland Soils within or near the Project site. Thus, no impacts on Farmland or Farmland Soils would occur. Therefore, no impacts on Prime Farmland, Unique Farmland, or Farmland of Statewide Importance would occur. Therefore, this topic will not be further evaluated in the EIR.

b) Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

The Project site and the surrounding area are not zoned for agricultural use, and there are no Williamson Act contracts in the City. Therefore, the Project would not conflict with an agricultural zone or Williamson Act contract. No impact would occur. Therefore, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

There are no timberland or timberland production zones in the City. The Open Space designation and zone for the Project site applies to active and passive public recreational facilities and natural open spaces that are environmentally and ecologically significant (City of Pasadena 2016). The proposed improvements would occur along the Arroyo Seco, where no forest or timberland resources have been identified in the City's General Plan. As such, no impact would occur. Therefore, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?

No loss of forest resources or conversion of forest land to non-forest use would occur with the proposed Project. Proposed Project facilities would be constructed in the same location as existing facilities and there would be no conversion of land uses. It is anticipated that approximately eight mature trees would be removed in Area 2, which is near the Angeles National Forest. Replacement of these trees would be required under the City's Tree Ordinance (Chapter 8.52 of the Pasadena Municipal Code), which depending on the size of the tree to be removed and the size of the replacement tree container size, could require a replacement ratio between 2:1 or up to 12:1. Therefore, there would be an increase in the number of post-Project trees in the Arroyo Seco. With the replacement of these trees within the Arroyo Seco Canyon in compliance with City requirements, the removal of approximately eight trees in Area 2 would not constitute conversion of forest land to non-forest use. Long-term recreational activities in the Arroyo Seco Canyon and operation and maintenance activities on the PWP facilities would not adversely affect nearby forest resources. No impact on forest resources would occur with the Project. Therefore, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

There are no agricultural activities in or near the Upper Arroyo Seco, and no farmland conversion or impacts to agricultural uses would result from Project implementation. The Project would not conflict with the adjacent Low Density Residential (LD) or the Open Space-National Forest (O-NF) designation of

unincorporated County land to the north and east of Area 2 (LACDRP 2015, LACDRP 1986). No impacts related to the conversion of agricultural resources would occur, and no mitigation is required. Therefore, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.3 Air Quality

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☒	☐	☐	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

The Project site is located in the Los Angeles County portion of the South Coast Air Basin (SCAB) and, for air quality regulation and permitting, is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). Both the State of California and the U.S. Environmental Protection Agency (USEPA) have established health-based Ambient Air Quality Standards (AAQS) for air pollutants, which are known as "criteria pollutants." The AAQS are designed to protect the health and welfare of the populace within a reasonable margin of safety. The SCAQMD develops an Air Quality Management Plan (AQMP) that establishes a program of rules and regulations directed at attaining the National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS). Criteria air pollutants include ozone (O_3), nitrogen dioxide (NO_2), CO, sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and lead. Pollutants that are evaluated herein include volatile organic compounds (VOCs) and oxides of nitrogen (NO_x), which are important because they are precursors to O_3, as well as CO, sulfur oxides (SO_x), PM_{10}, and $PM_{2.5}$.

Regarding NAAQS and CAAQS attainment status, the SCAB is designated as a nonattainment area for national and California O_3 and $PM_{2.5}$ standards (CARB 2017). The SCAB is designated as a nonattainment area for California PM_{10} standards; however, it is designated as an attainment area for national PM_{10}

standards. The SCAB nonattainment status of O_3, PM_{10}, and $PM_{2.5}$ standards is the result of cumulative emissions from various sources of air pollutants and their precursors within the SCAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. The SCAB is designated as an attainment area for national and California NO_2, CO, and SO_2 standards. Although the SCAB has been designated as partial nonattainment (Los Angeles County) for the federal rolling 3-month average lead standard, it is designated attainment for the state lead standard.

SCAQMD's 2016 AQMP is a regional and multi-agency effort (SCAQMD, CARB, Southern California Association of Governments [SCAG], and USEPA) that incorporates the latest scientific and technical information and planning assumptions, including the 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS); updated emission inventory methodologies for various source categories; and SCAG's latest growth forecasts. The main purpose of an AQMP is to bring an area into compliance with the requirements of federal and state air quality standards.

For a project to be consistent with the AQMP, the pollutants emitted from the project should not (1) conflict with or exceed the assumptions in the AQMP or (2) exceed the SCAQMD CEQA air quality significance thresholds. The SCAQMD has adopted significance thresholds to assess the regional impact of air pollutant emissions in the SCAB. A project with emissions rates below the SCAQMD Criteria Pollutant Mass Emissions Significance Thresholds is considered to have a less than significant effect on air quality.

The proposed Project is consistent with the Zoning and General Plan Land Use designations for the site and is therefore consistent with the growth expectations for the region. Further, the proposed Project would not result in development or new land uses that have not been anticipated in the AQMP. However, it is not known whether the proposed Project would result in an exceedance of SCAQMD CEQA air quality significance thresholds for short-term construction related activities. Air quality impacts will be evaluated in the EIR using state-recommended models, such as the California Emissions Estimator Model (CalEEMod), CARB's Mobile Source Emissions Inventory Model (EMFAC), and CARB's Offroad Equipment Inventory Model (OFFROAD). Mitigation measures will be provided, if required, to address short-term construction-related activities. Long-term operational impacts are not anticipated due to the negligible increase in operations and maintenance associated with the proposed Project's implementation.

The proposed Project could result in impacts related to implementation of the applicable air quality plan. As such, this topic will be further evaluated in the EIR. The findings from the ASCP IS/MND did not require or include mitigation measures for this topic. However, the proposed Project construction activities will be re-evaluated and assessed in the EIR using the latest assumptions and modeling methods, and mitigation will be included, if applicable.

b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

The SCAQMD's approach for assessing cumulative impacts is based on the AQMP forecasts of attainment of ambient air quality standards in accordance with the requirements of the federal and state Clean Air Acts. The proposed Project could result in impacts related to the cumulatively considerable net increase of a criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard. This topic will be further addressed in the EIR. The findings from the ASCP IS/MND did not require or include mitigation measures for this topic. However, the proposed Project construction activities will be re-evaluated and assessed in the EIR using the latest assumptions and modeling methods, and mitigation will be included, if applicable.

c) Would the project expose sensitive receptors to substantial pollutant concentrations?

The nearest sensitive receptors are residential homes near Area 2 located along Canyon Dell Drive and Aralia Road approximately 780 feet (0.15-mile) to the east in the community of Altadena. The nearest sensitive receptors to Area 3 include single-family residences located along Ridgeview Drive in Altadena, approximately 225 feet from the eastern edge of the former JPL parking lot, and approximately 100 feet higher in elevation than the parking lot. The potential for exposure to substantial pollutant concentrations could potentially result from the operation of construction equipment, including equipment needed for earthmoving at the spreading basins. Additionally, the City may implement a mechanical shaker to sort/sift through excavated soils to separate larger rocks for later beneficial reuse as construction fill for the spreading basins as well as other beneficial uses within the HWP, which could result in fugitive dust. The proposed Project's potential to cause or contribute to exceedances of ambient air quality standards at sensitive receptors near the proposed activities will be assessed using the SCAQMD's localized significance thresholds (LSTs). The proposed Project could result in impacts related to the exposure of sensitive receptors to substantial pollutant concentrations. This topic will be further evaluated in the EIR. The findings from the ASCP IS/MND did not require or include mitigation measures for this topic. However, the proposed Project construction activities will be re-evaluated and assessed in the EIR using the latest assumptions and modeling methods, and mitigation measures will be included, if applicable.

d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

According to the SCAQMD's CEQA Air Quality Handbook, land uses associated with odor complaints typically include certain agricultural/livestock uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding (SCAQMD 1993). The proposed Project does not propose any of these land uses and would not otherwise produce objectionable long-term operational odors.

Short-term construction equipment and activities would generate odors associated with diesel exhaust emissions from construction equipment and paints associated with the intake service building. There may be situations where construction activity odors would be noticeable by persons on the Gabrielino Trail, but these odors would not be unfamiliar or necessarily objectionable. The odors would be temporary and would dissipate rapidly from the source with an increase in distance. Therefore, the impacts would be short-term; would not be objectionable to a substantial number of people; and would be less than significant. All Project-related odors are construction related and short term in nature; no long-term operational odors would be generated. As such, the proposed Project would have a less than significant impact regarding objectionable odors. Impacts related to odors adversely affecting substantial numbers of people would be less than significant, and no mitigation is required. Therefore, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.4 Biological Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☒	☐	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☒	☐	☐	☐
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☒	☐	☐	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☒	☐	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☒	☐	☐	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒

a) Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

The Project area provides potentially suitable habitat for the following seven federally and/or state Threatened and Endangered species: Braunton's milkvetch (*Astragalus brauntonii*), Nevin's barberry (*Mahonia nevinii*), San Fernando Valley spineflower (*Chorizanthe parryi* var. *Fernandina*), arroyo toad (*Anaxyrus californicus*), California red-legged frog (*Rana draytonii*), southwestern willow flycatcher (*Empidonax traillii extimus*), and least Bell's vireo (*Vireo bellii pusillus*) (BonTerra Psomas 2015). The southwestern willow flycatcher and least Bell's vireo are migratory bird species, however, that have the potential to occur in each spring/summer breeding season.

Three additional non-listed special status wildlife species have been observed on the Project site: coast range newt (*Taricha torosa torosa*), two-striped garter snake, (*Thamnophis hammondii*), and yellow warbler (*Setophaga petechia*). Other special status species, such as the silvery legless lizard, may also occur in the Project area. Special status bat species, including silver-haired bat (*Lasionycteris noctivagans*), western red bat (*Lasiurus blossevillii*), and hoary bat (*Lasiurus cinereus*), potentially occur in the study area and may roost on the Project site (BonTerra Psomas 2015).

The Project site contains the potential for providing habitat for candidate, sensitive, or special status species. Additionally, the proposed Project would divert flows from the Arroyo Seco at the proposed new diversion/intake structure in Area 2. Plant and wildlife resources at the site of construction activities within Area 2 and downstream of the diversion point have the potential to be impacted due to construction activities and the potential reduction in downstream flows. As such, impacts would be considered potentially significant and this issue will be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic. The proposed Project's impacts to special status species will be re-evaluated in the EIR using updated survey data and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

The proposed Project is anticipated to result in permanent and temporary impacts to riparian habitat. Sensitive vegetation communities that may be impacted by proposed Project activities include: California sagebrush scrub/California buckwheat scrub; California buckwheat scrub; California sycamore woodland; white alder grove/California sycamore woodland; mulefat thickets; riparian herb; and coast live oak woodland (BonTerra Psomas 2015). Acquisition of permits from resource agencies would be required, as well as compensatory mitigation. As such impacts would be considered potentially significant. This issue will be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic. The proposed Project's impacts to riparian habitats and other sensitive communities will be re-evaluated in the EIR using updated survey data and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

c) Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

The proposed Project is anticipated to impact areas of non-wetland "waters of the state" and "isolated waters" under the Regional Water Quality Control Board (RWQCB) jurisdiction and California Department of Fish and Wildlife (CDFW) jurisdiction. Additionally, Project components in Area 2 would impact non-wetland "waters of the United States" under the jurisdiction of the U.S. Army Corps of Engineers (USACE). Acquiring the necessary permits for impacts to jurisdictional resources and compensatory mitigation would be required. As such impacts would be considered potentially significant. This issue will be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic. The proposed Project's impacts to wetlands will be re-evaluated in the EIR using updated survey data and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

The proposed Project site is located south of the Angeles National Forest. The Gabrielino Trail/Access Road and the Arroyo Seco allows for the movement of people and wildlife into and out of the Forest. Migratory nesting birds and raptors have the potential to occur in vegetation throughout the Project area. The Devil's Gate Dam and the I-210 are barriers to movement and constitute the separation between the Upper Arroyo Seco and the Central Arroyo Seco. The removal of the headworks in Area 1 that was analyzed and approved in the ASCP IS/MND would eliminate an impediment to fish movement within the Arroyo Seco and facilitate the feasibility of fish passage through this area. Additionally, in order to allow for improved biological functions in the Arroyo Seco, the new intake would include a fish screening feature to prevent future fish populations from passing into the intake and conveyance system. A roughened channel would be constructed directly downstream of the new weir to allow for future fish passage upstream during moderate flow periods. Nevertheless, the proposed Project may result in potentially significant impacts to the movement of migratory wildlife. This issue will be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic. The proposed Project's impacts to native resident or migratory fish or wildlife species will be re-evaluated in the EIR using updated survey data and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

It is anticipated that approximately eight mature trees would be removed in Area 2 and approximately one mature tree would be removed in Area 3 as part of Project construction (BonTerra Psomas 2014). Replacement of these trees would be required under the City's Tree Ordinance (Chapter 8.52 of the Pasadena Municipal Code), which depending on the size of the tree to be removed and the size of the replacement tree container size, could require a replacement ratio between 2:1 or up to 12:1. Impacts would be potentially significant and this topic would be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic. The proposed Project's impacts to local policies will be re-evaluated in the EIR using updated survey data and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

There is no adopted Habitat Conservation Plan (HCP); Natural Community Conservation Plan (NCCP); or other approved local, regional, or state habitat conservation plan in the City of Pasadena. There are two NCCPs in Los Angeles County: (1) the Rancho Palos Verdes NCCP covers 8,616 acres and provides a Preserve of 1,402 acres at the southwestern end of the County (nearly 30 miles southwest of Area 3) (Ranch Palos Verdes 2018); and (2) the West Mojave Plan covers 9.3 million acres of the western portion of the Mojave Desert, which includes the Antelope Valley area of Los Angeles County (northeastern section of Los Angeles County and nearly 20 miles northeast of Area 1) (BLM 2005). There are several HCPs in Los Angeles County but the HCP that is located nearest the HWP is the Newhall HCP along the Santa Clara River, west of I-5 (San Marino Environmental Associates 2004). Area 1 is located over 30 miles southeast

of the Newhall HCP area. The Project would not affect these conservation plans. Therefore, the Project would not conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or state habitat conservation plan. No impact would occur, and no mitigation is required; therefore, this topic will not be further analyzed in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.5 Cultural Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	☒	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☒	☐	☐	☐
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☐	☒	☐

a) Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

According to the Phase I Cultural Resources Assessment prepared for the ACSP IS/MND, there are resources on the Project site that are potentially eligible for the National Register of Historic Places (NRHP) or the California Register of Historic Resources (CRHR). Bridge No. 1 is a culvert-style bridge with concrete slab deck over Millard Creek, approximately 0.13-mile north of the JPL Bridge, and was determined not to be a historic resource. A structural overlay bridge spanning the length of this bridge was constructed in 2017 to provide additional support for large/heavy vehicle travel and to protect the structure from further damage. Bridge No. 2 is located approximately 130 feet past Bridge No. 1 and is a reinforced concrete arch bridge with decorative cast-concrete railing. Bridge No. 2 was likely constructed to provide a formal entrance to the Upper Arroyo Seco and the ANF, and it appears to meet the required criteria to be listed as a historical resource in the CRHR and in the City of Pasadena as a landmark (BonTerra Psomas 2015).

Bridge No. 3 is located approximately 0.34-mile north of the JPL Bridge and was constructed with truss-bridge forms using wood timbers. Bridge No. 3 appears to meet the required criteria to be listed as a historical resource in the NRHP and in the CRHR. The bridge was heavily damaged by the 2010 storms. A structural overlay bridge spanning the length of Bridge 3 was constructed in 2017 to provide additional support for large/heavy vehicle travel and to protect the structure from further damage. A structural evaluation of Bridge 3 subsequent to the structural overlay, however, shows the condition of Bridge 3 continues to deteriorate (TJC 2018).

Additionally, stone masonry walls line the east side of the Arroyo Seco at Bridge No. 2 and continue upstream to Bridge No. 3. The stone masonry walls would not be altered by Project activities. The structural overlay bridge crossings on Bridge Nos. 1 and 3 would remain in place throughout the duration of the proposed Project. Upon completion of the proposed Project, the City intends to keep the bridge structures as-is, complete with additional support structures, into the foreseeable future. No construction activities on the bridges are anticipated. Project implementation would require construction truck traffic over the bridges and the associated structural overlays would remain in place. The proposed Project could result in impacts due to a substantial adverse change in the significance of a historical resource pursuant to §15064.5. The findings from the ASCP IS/MND also required mitigation for this topic. The proposed Project's impacts to historic resources will be evaluated in the EIR and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

A California Historical Resources Information System (CHRIS) records search was conducted for the proposed Project site and surrounding 0.5-mile records search area at the South Central Coastal Information Center (SCCIC), located on the campus of California State University, Fullerton on October 3rd, 2019. The SCCIC records indicate that one previously recorded cultural resource exists within the Project site, and one previously recorded cultural resource exists immediately adjacent to the Project site. One resource (P-19-189942), the Hahamongna Watershed Park, is an open space informally used since the 1880s, and formally developed into a park in the 1930s. One resource (P-19-186535,) a Historic dedication plaque placed by the USFS, is located adjacent to the Project site, but would not be impacted by the Project. Additional resources have been previously recorded within the surrounding 0.5-mile records search area. Of these, five consist of prehistoric archaeological resource discoveries and 9 consist of historic buildings and structures.

Previous disturbance during construction activities of existing facilities (e.g., diversion and intake structures, Gabrielino Trail/Access Road, bridges, and spreading basins) makes it unlikely that significant cultural resources are present in these areas. However, buried resources could exist in the Project site and be damaged by excavation and grading activities for Project construction. The proposed Project could result in impacts due to a substantial adverse change in the significance of an archaeological resource. The findings from the ASCP IS/MND required mitigation for this topic. The proposed Project's impacts to archaeological resources will be re-evaluated in the EIR and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

c) Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

A literature review of documents on file at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton was completed by Patrick O. Maxon, MA, RPA on March 18, 2013 (BonTerra Psomas 2015). The review consisted of an examination of the U.S. Geological Survey's (USGS') Pasadena, California 7.5-minute quadrangle to evaluate the project area for any sites recorded or cultural resources studies within a 1-mile radius of the Project site. Data sources consulted at the SCCIC included archaeological records, Archaeological Determinations of Eligibility, historic maps, and the Historic Property Data File (HPDF) maintained by the California Office of Historic Preservation (OHP). The records search and field survey indicate no evidence of human remains on or near the Arroyo Seco (BonTerra Psomas 2015).

In the unlikely event of an unanticipated encounter with human remains, the California Health and Safety Code and the California Public Resources Code require that any activity in the area of a potential find be halted and the Los Angeles County Coroner be notified. There would be less than significant adverse impacts to human remains with compliance with California Public Resources Code (PRC) Section 5097.98, which requires all work be halted in the immediate vicinity of the discovery if human remains are encountered during excavation activities. PRC Section 5097.98 also requires the County Coroner be notified who is required to determine whether the remains are of forensic interest. If the Coroner, with the aid of an Archaeologist, determines that the remains are prehistoric, s/he is required to contact the Native American Heritage Commission (NAHC). The NAHC is responsible for designating the most likely descendant (MLD), who is responsible for the ultimate disposition of the remains, as required by Section 7050.5 of the California Health and Safety Code. The MLD is required to make his/her recommendation within 48 hours of being granted access to the site. The MLD's recommendation is required to be followed if feasible, and may include scientific removal and non-destructive analysis of the human remains and any items associated with Native American burials (California Health and Safety Code §7050.5). Therefore, through compliance with state and local regulations, impacts to human remains would be less than significant, and no mitigation is required. Therefore, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.6 Energy

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☐	☒

a) Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Energy use during construction activities in Area 2 and 3 would include the use of fossil fuels for construction equipment, material deliveries, demolition waste disposal, and construction crew travel, and the use of electricity for the ongoing operation of the diversion structure. No natural gas is required.

Temporary electric power for as-necessary lighting and electronic equipment would be provided by PWP. The amount of electricity used during construction would be minimal, because typical demand would stem from electrically powered hand tools. The electricity used for construction activities would be temporary and minimal; therefore, proposed Project construction would not result in wasteful, inefficient, or unnecessary consumption of electricity. As such, impacts associated with short-term construction use of electricity would be less than significant.

Petroleum consumed by construction equipment, transport of construction materials, and worker trips would be the primary energy resource expended over the course of construction activities. Heavy-duty construction equipment, vendor trucks, and haul trucks would use diesel fuel. Construction workers would likely travel to and from the Project area in gasoline- or diesel-powered vehicles. Construction is expected to take approximately one year. Once construction activities cease, petroleum use from off-road equipment and transportation vehicles would end. Because of the short-term nature of construction and relatively small scale of the construction activities required for the Project, the petroleum consumption would be negligible when compared to California's daily total use of approximately 1.8 million barrels of petroleum. As such, impacts associated with short-term construction use of petroleum would be less than significant.

Operational electrical energy would be needed in Area 2 for the proposed intake service building to operate the diversion weir and intake structures. There are no long-term operational electrical demands for the spreading basins in Area 3 beyond what would be required to power a water meter. The proposed Project would not create a high enough demand for energy to require development of new energy sources. Long-term maintenance activities would not be substantively different from current existing conditions in which the diversion structure and the spreading basins currently require ongoing maintenance. With the relatively small sizes of the proposed facilities, energy needs would also be limited and would not be considered wasteful or inefficient. The Project would utilize surface water resources in the Arroyo Seco to increase groundwater recharge and, in turn, would have beneficial impacts on the PWP's water supply, including decreased demand for State Water Project (SWP) water deliveries. Energy requirements to transport water through the SWP system are high, and local sources of water are more energy efficient. The increase in groundwater recharge due to the Project could require an incremental increase in energy use for groundwater well pumping. However, decreased reliance upon imported water sources would be a benefit for energy efficiency. Impacts would be less than significant, and no mitigation is required. Therefore, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

No demand for natural gas would be created by the Project. The reductions in demand for imported SWP water deliveries due to increased groundwater recharge would help off-set, if not fully account for, increased Project-related electrical demand. The proposed project would follow applicable energy standards and regulations during the construction phase(s). In addition, the proposed project would be built and operated in accordance with all existing, applicable regulations at the time of construction. All electrical components would be constructed in accordance with the City's Building Code (Title 14 of the Pasadena Municipal Code, which incorporates the 2016 California Building Code [CBC]). Through implementation of federal, state, and local regulations, the proposed Project would not conflict with an adopted energy conservation plan; therefore, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.7 Geology and Soils

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
ii) Strong seismic ground shaking?	☐	☐	☒	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv) Landslides?	☐	☐	☒	☐
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☒	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?[1]	☒	☐	☐	☐
[1] Because the topic of paleontological resources is the only topic in Geology/Soils to be addressed in the EIR, it will be included within the chapter called "Cultural Resources."				

A Geotechnical Feasibility Study Report was prepared for the ASCP IS/MND in August 2013 by Converse Consultants. Applicable findings from this report are summarized below (see Appendix B to this Initial Study).

a) Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

The Project site is not located within a currently designated State of California Earthquake Fault Zone (formerly Alquist-Priolo Special Studies Zones) for surface fault rupture. A segment of the Sierra Madre Fault crosses the Arroyo Seco, just north of the JPL Bridge. However, there is no designated Alquist-Priolo Special Studies Zone for the fault in the Upper Arroyo Seco. Area 2 is not located within a designated Earthquake Fault Zone, but traces of the Sierra Madre Fault are located approximately 1,000 feet north and southeast of Area 2. Area 3 is not located within a designated Earthquake Fault Zone, but a trace of the Sierra Madre Fault crosses through the northern portion of Area 3. Therefore, the Project site could be potentially exposed to fault rupture. While structures sitting directly on top of a ruptured fault could be damaged in an earthquake event along the fault, the proposed Project does not include any habitable structures or structures that are critical for public safety (BonTerra Psomas 2015). As such, impacts related to rupture of a known earthquake fault would be less than significant and this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

ii) Strong seismic ground shaking?

Seismic shaking could be significant during an earthquake along other earthquake faults in the region. The new diversion and weir structures in Area 2 could sustain damage during an earthquake event; however, there are no critical or habitable structures in proximity to Area 2 that could be affected by a failure at the diversion structure. Ground shaking would not pose major safety hazards to the spreading basins in Area 3 because the basins would be designed to contain water at depths that would not pose a hazard to the public if water were to lap over the edge during a seismic event. There are no critical or habitable structures in the proximity of the spreading basins that could be affected by any overtopping water in a strong seismic event. The spreading basins, diversion structure, intake, and service building have been designed and would be constructed in compliance with all applicable building code requirements and code regulations, such as the City's Building Code (Title 14 of the Pasadena Municipal Code, which incorporates the 2016 CBC). The California Building Code requires the preparation of engineering geologic reports, supplemental ground-response reports, and/or geotechnical reports for all new construction; new structures on existing sites; and alterations to existing buildings. It also includes seismic design criteria and requirements for use in the structural design of buildings and specifies building components that require special seismic certification. Construction of the proposed Project would also be in accordance with the recommendations of the Geotechnical Feasibility Report, which includes seismic design parameters, and would ensure that the structural integrity of the proposed structures and improvements can withstand seismic shaking (BonTerra Psomas 2015). Therefore, through compliance with applicable federal, state, and local regulations, the proposed Project would result in less than significant impacts related to seismic ground shaking. As such, impacts related to strong seismic ground shaking will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

iii) Seismic-related ground failure, including liquefaction?

The Arroyo Seco is located within a Seismic Hazard Zone for liquefaction, with adjacent steep slopes susceptible to landslides. The Geotechnical Feasibility Study Report included results from a boring (BH-3) taken within the Gabrielino Trail/Access Road in Area 2. The results showed that the area is underlain by a 3-foot thick sandy soil layer over granitic bedrock, which was found to be "massive and very hard." Area 2 has exposed older alluvium consisting of brown silty sand with cobbles and boulders. Groundwater in Area 2 was not encountered during borings at a depth of 3.5 feet, but is expected to be seasonably shallow due to the Arroyo Seco.

The Geotechnical Feasibility Study states that the presence of shallow granitic bedrock in Area 2 along the Gabrielino Trail/Access Road indicates that it is not susceptible to liquefaction hazards and seismically induced settlement would be negligible. While the slope just east of the Gabrielino Trail/Access Road is stable, small rock fall hazards are expected.

Area 3 is located within a Seismic Hazard Zone for liquefaction. Area 3 is underlain by stream deposits and terrace deposits, both consisting of primarily light brown silty sand, underlain by numerous cobbles and boulders. The stream deposits and terrace deposits are both moderately dense to very dense. Groundwater was not encountered in exploratory borings to a depth of 21 feet.

The potential for liquefaction of bedrock is low, but liquefaction in the stream channel is expected to be high. The diversion structure in Area 2 would be located within the stream and may be exposed to liquefaction hazards. Slopes in Area 2 have a potential for small rock fall hazards, and slopes that would be created could be unstable. Pipelines in Area 3 could also be exposed to liquefaction hazards that may lead to ground settlement (BonTerra Psomas 2015). Design and construction of the proposed improvements would have to address liquefaction and slope stability in accordance with the recommendations of the Geotechnical Feasibility Report and in accordance with applicable Building Code and City requirements. As such, the Project would not cause or exacerbate any seismic-related ground failure including liquefaction condition. Impacts would be less than significant and will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

iv) Landslides?

According to the Geotechnical Feasibility Study, Area 2 has adjacent steep slopes but due to the observed bedrock, it was determined that the slopes are stable, although small rock fall hazards may exist due to the steepness of adjacent slopes. No mapped landslides were identified in the Geotechnical Feasibility Study. Design and construction of the proposed improvements would have to address slope stability and landslide potential in accordance with the recommendations of the Geotechnical Feasibility Report and the Building Code and City requirements. No critical or habitable structures would be constructed that could result in the risk of loss, injury, or death involving landslides due to the proposed Project. As such, impacts would be less than significant related to landslides and will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

b) Would the project result in substantial soil erosion or the loss of topsoil?

During construction, erosion-control measures would be implemented as part of the Stormwater Pollution Prevention Plan (SWPPP) for the Project. Prior to the start of construction activities, the Contractor is required to file a Permit Registration Document (PRD) with the State Water Resources Control Board (SWRCB) in order to obtain coverage under the National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges Associated with the Construction and Land Disturbance Activities (Order No 2009-009-DWQ, NPDES No. CAS000002) or the latest approved general permit. This permit is required for earthwork that results in the disturbance of 1 acre or more of total land area. The required SWPPP will mandate the implementation of best management practices (BMPs) to reduce or eliminate construction-related pollutants in the runoff, including sediment. Implementation of the erosion control BMPs in the SWPPP would reduce construction-related erosion, and impacts would be less than significant.

Area 2 is located within a 5-year floodplain and the slopes and Gabrielino Trail/Access Road are subject to potential flooding following periods of heavy rainfall. Structures, including engineered streambed material, have been designed to consider the inundation and scour by flood events. The upstream and downstream engineered streambed material would be specifically designed to reduce scour and maintain the integrity of the diversion/intake structure and adjacent Gabrielino Trail/Access Road. There would be no loss of topsoil associated with activities in Area 2, and the engineered streambed material would reduce erosion and allow for vegetation to grow, if naturally occurring.

Area 3 would involve the reconfiguration and expansion of the existing spreading basins, which would require the export of soils excavated from the former JPL East Parking Lot. These soils were located beneath a parking lot and did not support natural biological communities or agriculture, which are land uses that depend on topsoil. Additionally, in order to minimize export from the Project site, the City may implement a mechanical shaker to sort/sift through excavated soils to separate larger rocks for beneficial reuse on the Project as well as other beneficial uses within the HWP. As such, impacts would be less than significant related to substantial soil erosion or loss of topsoil and will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

In Area 2, the area is located on granitic bedrock and is not considered to be unstable or subject to landslide, lateral spreading, subsidence, liquefaction or collapse. In Area 3, the Geotechnical Feasibility Study determined that the slope stability near the existing stream channel has a factor of safety greater than 1.496, which would be reduced to 1.292 upon construction of the proposed sediment basin. Because both factors of safety remain above 1.0, the slope does not pose a risk of instability. The slopes nearer the former JPL East Parking Lot as well as the slopes adjacent to the Arroyo Seco have adequate factors of safety to meet minimum requirements. Slopes would be periodically eroded by flows within the Arroyo Seco and slope stability would be changed by the designed slope profile. However, groundwater saturation of subsurface soils would not impact slope stability.

Groundwater extraction wells in the general vicinity of Area 3 may also make this area susceptible to subsidence, although no significant regional subsidence has occurred in the City. The proposed spreading basins in Area 3 would increase recharge of the Monk Hill Subbasin of the Raymond Groundwater Basin. With between 60%–

80% of the recharge water pumped out, the Project would decrease the potential for subsidence (BonTerra Psomas 2015). The Geotechnical Feasibility Study includes seismic design parameters and recommendations for all constructed features. Compliance with the Geotechnical Feasibility Study and applicable Building Code and City requirements would avoid hazards associated with landslide, lateral spreading, subsidence, liquefaction or collapse due to Project implementation. Impacts would be less than significant, and no mitigation is required; therefore, this topic will not be further analyzed in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

The soil borings taken near surface soils in Area 3 have a "Very Low" expansion potential (no soil expansion analysis was made for near surface soils in Area 2). The Project site may contain collapsible soils due to its location within and near the Arroyo Seco stream channel. However, no critical or habitable structures would be constructed that could result in substantial direct or indirect risks to life or property related to expansive soils due to the proposed Project. Design and construction of the proposed improvements would have to address slope stability and landslide potential in accordance with the recommendations of the Geotechnical Feasibility Report and the CA Building Code. Therefore, compliance with applicable federal, state, and local regulations would address the geologic hazards that are present on the site. Impacts would be less than significant, and no mitigation is required; therefore, this topic will not be further analyzed in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

The proposed Project would not involve the construction of any restrooms or otherwise require the use of septic tanks or alternative wastewater disposal systems. The construction crew would be served by portable toilets that would be brought to the site at the start of Project construction. These portable toilets would be regularly cleaned out and removed at the end of construction. There would be no impacts related to the use of septic tanks or alternative wastewater disposal systems. As there would be no impacts, no mitigation is required; therefore, this topic will not be further analyzed in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

According to record search conducted for the ASCP IS/MND, the Project area is underlain by several geological rock units with varying paleontological sensitivity. Quartz Diorite (qd), located between Areas 2 and 3, has no potential to yield paleontological resources. Leucocratic Granitic Rocks (gr) that are present west and east of Area 2 have no potential to yield paleontological resources. Quaternary Older Alluvium Fan Deposits (Qoa) located south of Area 2 have moderate potential to yield paleontological resources. Quaternary Older Alluvial Fan Sediments (Qof) east of Area 3 have low potential to yield paleontological resources. Quaternary Stream Deposits (Qg) in the stream course of the Arroyo Seco in Areas 2 and 3 have low potential to yield paleontological resources (BonTerra Psomas 2015).

Ground disturbance would occur at the stream bottom in Area 2, which is overlain by recent alluvial material deposited by stream flows and generally does not contain fossil resources. The areas underlain by granitic

bedrock also have no paleontological sensitivity. At the edges of the stream is older alluvium that may have limited potential for paleontological resources (BonTerra Psomas 2015).

While no paleontological resources were observed on the surface of the Project site, underlying older Quaternary fluvial deposits may contain significant vertebrate fossils. Therefore, deeper excavations associated with the spreading basins could expose paleontological resources that have the potential to be damaged by heavy equipment, which would be a significant impact. This issue will be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic. The proposed Project's impacts to paleontological resources will be re-evaluated in the EIR using updated records search data and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

3.8 Greenhouse Gas Emissions

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Given that the proposed Project's emissions would almost entirely be associated with short-term construction activities, it is not anticipated that the proposed Project would result in any significant impacts related to greenhouse gas (GHG) emissions. However, because the quantification of air quality impacts will be calculated, the EIR will estimate the GHG emissions associated with construction of the Project using CalEEMod based on the same construction scenario utilized in the air quality analysis. Project-generated operational GHG emissions that will be estimated include those associated with mobile sources, electrical use, and solid waste disposal. The emissions estimates will be based on information provided by the City staff or CalEEMod default values. This topic will be further evaluated in the EIR. The findings from the ASCP IS/MND did not require or include mitigation measures for this topic. However, the proposed Project construction activities will be re-evaluated and assessed in the EIR using the latest assumptions and modeling methods.

b) Would the project generate conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Given that the proposed Project's emissions would almost entirely be associated with short-term construction activities, it is not anticipated that the proposed Project would conflict with any applicable plans for the purpose of reducing GHGs, including the City of Pasadena's Climate Action Plan (CAP). The CAP was adopted in 2018 and includes a strategy to reduce Pasadena's GHG emissions in a manner consistent with state law and statewide GHG emissions reduction targets. However, the EIR will discuss how the proposed Project complies with state regulations (Assembly Bill 32) and General Plan goals, objectives, CAP measures, and policies that help the City contribute to regional GHG reduction efforts. The EIR will also provide a qualitative post-2020 analysis that will evaluate whether or not the Project-generated GHG emissions would impede the attainment of the 2030 and 2050 reduction goals identified in Senate Bill 32 and Executive Order S-3-05, respectively. The EIR analysis will be prepared consistent with the SCAQMD's guidance and thresholds. The findings from the ASCP IS/MND did not require or include mitigation measures for this topic. However, the proposed Project construction activities will be re-evaluated and assessed in the EIR using the latest assumptions and modeling methods.

3.9 Hazards and Hazardous Materials

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☒	☐
d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☒	☐

a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

The proposed Project would not result in the long-term operational routine transport, use, or disposal of hazardous materials beyond the current conditions within Areas 2 and 3. Both the current diversion structure/intake and the proposed diversion structure/intake would require periodic maintenance activities that could involve chemicals required for the operation of the weir gate and mechanical controls. There would be no operational changes or need for additional chemicals or hazardous materials for the operation of the spreading basins.

Construction activities would utilize hazardous materials on a short-term basis, and compliance with existing federal, state, and local regulations regarding hazardous material use, storage, disposal, and transport would prevent risks to public health and safety. Construction wastes that meet hazardous waste criteria would be stored, manifested, transported, and disposed of in accordance with the California Code of Regulations (Title 22) and to the satisfaction of the Los Angeles County Fire Department, which serves as the local Certified Unified Program Agency (CUPA). Therefore, with compliance with applicable state and local regulations, the proposed Project would not create significant hazards to the public or the environment. Impacts would be less than significant, and no mitigation is required; therefore, this topic will not be further analyzed in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

The Cortese List, mandated under Section 65962.5 of the Government Code, is a list of databases that compile information regarding hazardous waste sites. The California Environmental Protection Agency (CalEPA) provides a list of hazardous waste site databases, which consists of the Department of Toxic Substances Control (DTSC) EnviroStor database; the State Water Resources Control Board (SWRCB) GeoTracker database; SWRCB's list of hazardous solid waste disposal sites; SWRCB's list of active Cease and Desist Orders (CDOs) and Cleanup and Abatement Orders (CAOs); and DTSC's list of sites subject to corrective action pursuant to the California Health and Safety Code, Section 25187.5 (CalEPA 2019). The nearest listed site to the Project site is JPL (EPA ID No. CA9800013030; Federal Facility Agreement Docket Number 1998-27):

- The JPL site at 4800 Oak Grove Drive in the City of La Canada-Flintridge (ID No. 19970008- Federal Superfund Site) is listed as an active site on the DTSC EnviroStor Database. No other sites are listed within the Pasadena or the adjacent community of Altadena.

- The JPL site at 4800 Oak Grove Drive in the City of La Canada-Flintridge (ID No. T0603703875- LUST Cleanup Site) is listed as an open cleanup status on the SWRCB GeoTracker database. No other sites are listed within the Pasadena or the adjacent community of Altadena.
- There are no listings near or at the Project site in the SWRCB's list of hazardous solid waste disposal sites; SWRCB's list of active Cease and Desist Orders (CDOs) and Cleanup and Abatement Orders (CAOs); and DTSC's list of sites subject to corrective action pursuant to the California Health and Safety Code, Section 25187.5

The 2015 ASCP IS/MND was determined to have adequately analyzed and mitigated for the potential impacts associated with the groundwater contamination associated with JPL (see Appendix B to this Initial Study). The findings from the ASCP IS/MND required mitigation for this topic and no new impacts would result from the proposed Project, and no new mitigation is required. Therefore, this topic will not be further analyzed in the EIR.

c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

The nearest school to the Project site is the Linda Vista Elementary School/Odyssey Charter School located approximately 1,230 feet (0.23-mile) from construction traffic along the Gabrielino Trail/Access Road, and approximately 0.26-mile from the limits of grading within Area 3. Construction activities would utilize hazardous materials commonly associated with construction activities (e.g., fuels, cleaners, solvents) in the short-term, but these would be handled in accordance with existing federal, state, and local regulations regarding hazardous material use, storage, disposal, and transport to prevent risks to public health and safety. Construction wastes that meet hazardous waste criteria must be stored, manifested, transported, and disposed of in accordance with the California Code of Regulations (Title 22) and to the satisfaction of the Los Angeles County Fire Department, which serves as the local CUPA. The proposed Project would not include any facilities that could result in hazardous emissions or handle hazardous materials, substances, or waste within 0.25-mile of an existing school. Impacts would be less than significant, and no mitigation is required; therefore, this topic will not be further analyzed in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

d) Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

As discussed in Threshold 3.9(b) above, the JPL campus has been placed on the NPL of sites subject to regulation under the CERCLA, with cleanup efforts financed under the federal Superfund program. As part of the cleanup effort, subsurface groundwater contamination located beneath Area 3 of the Project site is subject to ongoing remediation through wellhead treatment efforts. The findings from the ASCP IS/MND required mitigation for this topic. The 2015 ASCP IS/MND, was determined to have adequately analyzed and mitigated for the potential impacts associated with the groundwater contamination associated with JPL (see Appendix B to this Initial Study). The findings from the ASCP IS/MND required mitigation for this topic and no new impacts would result from the proposed Project, and no new mitigation is required. Therefore, this topic will not be further analyzed in the EIR.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

There are no airports or airstrips within 2 miles of the Arroyo Seco Canyon. The nearest airports are the Burbank Bob Hope Airport and the El Monte Airport, which are both approximately 11 miles from the Project site. There is a heliport and a helipad near the Arroyo Seco. The Project would not involve the construction of high-rise structures or involve activities that could pose a safety hazard to helicopter or aircraft operations or airport activities, nor would it conflict with an airport land use plan. There would be no impact to airports or airstrips from the Project. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

f) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Any closures to the Gabrielino Trail/Access Road, including those that would affect access to the USFS Ranger Station in the ANF, will be short-term and/or partial. During work days, traffic in the Project area would be facilitated by the use of a flagperson or other traffic control measures. At the end of each workday, the Gabrielino Trail/Access Road would be made passable. Residents and businesses affected by the road work, utility agencies with facilities in the area, the Pasadena Fire and Police Departments, and other emergency service providers would all be notified in advance of construction activities in accordance with provisions in the City's Supplements and Modifications to the Greenbook. The 2015 ASCP IS/MND included mitigation for this topic to address potential short-term closures of the Gabrielino Trail/Access Road and bridges. No new or different impacts would result from the proposed Project and the MMRP would be implemented during construction activities on the Gabrielino Trail/Access Road. Impacts would be less than significant and no additional mitigation is required. Therefore, this topic will not be further analyzed in the EIR.

g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?

The Arroyo Seco Canyon is located in an area designated as a Very High Fire Hazard Severity Zone (CAL FIRE 2011). In August 2009, the Station Fire burned nearly 252 square miles in the Angeles National Forest, and the threat of future wildfires is an ever-present danger throughout Southern California. Although wildfires are a potential hazard at the Project site, the proposed Project would not involve construction or operation of habitable structures that may expose people to wildfire hazards in the area. The construction and operation of new water infrastructure facilities would have no effect on the number of people or structures exposed, either directly or indirectly, to wildfires because the facilities would not increase the number of visitors or workers in the area and would not exacerbate an existing wildfire hazard. Potential sources of hazards from fire include sparks from construction equipment and vehicles and from malfunctioning electrical systems during construction. However, the City's Fire Prevention Code includes fire safety measures that need to be followed during construction and demolition. The ASCP IS/MND required mitigation for this topic to address potential hazards associated with construction activities; however, unlike the ASCP IS/MND, the proposed Project does not involve construction in the exposed vegetation within Area 1. Area 2 construction would be within and around the Arroyo Seco creek, and Area 3 construction would be within largely unvegetated spreading basins and the former JPL East Parking Lot. Impacts associated with exposing people or structures to a significant risk of loss, injury, or death from wildland fires would be less than significant, and no mitigation is required. Therefore, this topic will not be further analyzed in the EIR.

3.10 Hydrology and Water Quality

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
result in substantial erosion or siltation on or off site;	☒	☐	☐	☐
substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;	☒	☐	☐	☐
create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☒	☐	☐	☐
impede or redirect flood flows?	☒	☐	☐	☐
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☒
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☒	☐

a) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

The Upper Arroyo Seco is not listed as an impaired water body under Section 303(d) of the Clean Water Act (SWRCB 2012). The proposed Project would allow for the settlement of silts and fine sediments in the newly designed sedimentation basin prior to spreading water in basins within Area 3, which would have beneficial impacts on water quality in the Arroyo Seco. During construction, there is the potential for small amounts of oil, grease, and other vehicle fluids to leak from vehicles.

The City's Stormwater Management and Discharge Control Ordinance (Chapter 8.7 of the Pasadena Municipal Code) has the explicit purpose of reducing pollutants in stormwater and urban runoff to the maximum extent practicable. The intent of the Ordinance is to protect and enhance water quality of our

watercourses, water bodies, and wetlands in a manner pursuant to and consistent with the federal Clean Water Act, and pursuant to National Pollutant Discharge Elimination System (NPDES) Permit No. CA0061654, as amended, and any successor legislation and permits. Restrictions in this Ordinance are applicable to both construction activities and operations. The following BMPs apply to all construction sites:

- Sediment and construction waste from construction sites and parking areas shall not leave the site.
- Between October 15 and April 15, any sediments or other materials which are tracked off the site shall be removed the same day as they are tracked off the site. A sediment barrier shall be installed on land exceeding 15% slope in accordance with Chapter 14.05 of the Municipal Code, and where determined necessary by the building official.
- Excavated soil shall be located on the site in a manner that eliminates the possibility of sediments running into the street or adjoining properties. Between October 15 and April 15, soil piles shall be covered until the soil is either used or removed.
- No washing of construction or other industrial vehicles shall be allowed adjacent to a construction site. No runoff from washing vehicles on a construction site is allowed to leave the site.

For operations, the Municipal Code includes restrictions related to the protection of natural water courses (Chapter 8.70.100) and containment and notification of spills (Chapter 8.70.110).

For projects that disturb 1 acre or more of soil, or whose projects disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 acre or more, are required to obtain coverage under the General Permit for Discharges of Stormwater Associated with Construction Activity Construction General Permit Order 2009-0009-DWQ (Construction General Permit). Construction activity subject to this permit includes clearing, grading and disturbances to the ground such as stockpiling or excavation. The Construction General Permit requires the development of a Stormwater Pollution Prevention Plan (SWPPP) by a certified Qualified SWPPP Developer (QSD). Compliance with General Permit issued by the SWRCB and the City's Stormwater Management Ordinance would require implementation of BMPs during construction to address the potential for pollutants from entering the Arroyo Seco. The Project's potential to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality would be less than significant, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

The Raymond Basin is a groundwater basin that underlies the northwestern portion of the San Gabriel Valley and is divided into the Santa Anita Subarea, Pasadena Subarea, and Monk Hill Subarea. The City has both groundwater rights and surface water rights in the Monk Hill and Pasadena Sub-basins. The City's surface water rights in the Arroyo Seco overlay the Monk Hill Sub-basin.

About 1/3 of the surface runoff from the Raymond Basin is conveyed by the Arroyo Seco, which flows across the Monk Hill Subarea and the Pasadena Subarea, and joins the Los Angeles River by cutting through the San Rafael Hills. Artificial recharge of the Monk Hill subarea via off-stream spreading basins historically has occurred as a result of infiltration of stormwater runoff and, to a lesser degree, injection of treated imported water. Artificial recharge has ranged from 450 acre-feet per year to 9,700 acre-feet per year during the period of 1994-95 through 2011-12 (RBMB 2016).

Groundwater levels in the Monk Hill Subarea have fluctuated but remained relatively stable since 2000. Recharge of the Monk Hill Subarea from precipitation occurs on the mountain watershed and on the valley floor. Recharge from precipitation in the mountain watershed has ranged from 760 acre-feet to 9,280 acre-feet during the period of 1994-95 through 2011-12, with a long-term average annual recharge of 3,500 acre-feet from the mountains. Recharge of the Monk Hill subarea from precipitation on the valley flow has ranged from 17 acre-feet to 3,220 acre-feet per year during the period 1994-95 through 2011-12, with a long-term average annual recharge of 790 acre-feet from the valley floor. Water production in the Monk Hill Subarea includes groundwater pumping, purchases of treated imported water and a minor amount of treated water from local surface water diversions. Groundwater production has ranged from 3,870 acre-feet to 12,970 acre-feet during the period 1994-95 to 2011-12 and has averaged 6,990 acre-feet per year (RBMB 2016).

The City's surface water rights from the Arroyo Seco and tributaries pre-dates 1914 and includes taking surface water from the stream up to and including 25 cfs. Historically, PWP has either taken the stream water by diverting it at the intake structure directly for potable use with the addition of disinfectant (prior to 1972), and treatment at the Behner Water Treatment Plant (1972 to 1994), or by recharging the aquifer through spreading (1974 to present). The City uses the spreading grounds in order to protect its water rights; however, PWP is not currently able to fully utilize these surface water rights due to the limited capacity of its facilities.

The proposed Project does not involve extraction of groundwater and, therefore, would not decrease groundwater supplies. The Project also does not interfere substantially with groundwater recharge, but in fact would allow for the recharge of an additional 1,100 acre-feet of water annually, which would supplement the PWP's local water supplies. Importantly, PWP is able to pump between 60 to 80 of the water that is infiltrated through the spreading basins, which would result in a net augmentation of groundwater in storage. This is a beneficial impact on PWP's water resources. The Raymond Basin Management Board adjudicates water resources in this groundwater basin by setting the pumping rights and managing the groundwater storage accounts of public and private water agencies, including the PWP. Continued management of the Raymond groundwater basin would prevent adverse impacts to underlying groundwater resources, and impacts would be less than significant.

Construction activities would require water for dust control, equipment cleaning, and incidental uses, but this water demand would be provided by water trucks and would not directly impact underlying groundwater supplies. While recharge at existing spreading basins may be temporarily disrupted during the construction phases of the diversion and weir structures, the intake structure, and the spreading basins, the long-term increase in recharge due to the proposed Project would have a beneficial impact on groundwater supplies. The proposed Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) result in substantial erosion or siltation on or off site;

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;

iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

iv) impede or redirect flood flows?

The proposed improvements in Area 2 would increase the amount of water capable of being diverted into the intake structure and downstream spreading basins and could therefore result in alterations to an existing drainage pattern. As required by the Settlement Agreement, as discussed in Section 2.3 of this Initial Study, the Court found that the elements of the ASCP that related to increased diversions of surface water (i.e., greater taking of stream water from the Arroyo Seco beyond its historical withdrawal) required the preparation of an EIR. The findings from the ASCP IS/MND did not require or include mitigation measures for this topic; however, this topic will be further evaluated in the EIR using updated analyses and mitigation will be included, if applicable.

d) In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

The proposed Project is not within a designated tsunami zone or a seiche zone. A seiche is a standing wave oscillating in a body of water, such as a lake or bay. Seiches are generally caused by strong winds or atmospheric conditions and may be caused by earthquakes in smaller bodies of water. The proposed Project site is located upstream of Devil's Gate Dam. The top of this Dam is at an elevation of 1,075 feet above msl. The lowest ground elevation is at Area 3 and is 1,100 feet above msl and the basins are approximately 0.6-mile from the southernmost spreading basin (Basin J) to the general area of potential standing water behind the Devil's Gate Dam. Thus, waters behind the Dam would be below the elevation of and a great distance from the spreading basins and seiche waves would not affect the spreading basin structures. The basins would have freeboard from water surface to upper edge of the basin; pipes and outlets for water to flow into interconnected basins; and overflow pipes to direct water back into the Arroyo Seco. Thus, no seiche hazards would be created by the Project.

There are no opportunities for seiche at Area 2. Also, the potential for flood hazards associated with the failure of the Dam would release waters downstream into the Central and Lower Arroyo Seco and would not affect the proposed improvements in Areas 2 or 3. Additionally, the Project site is approximately 23 miles northeast of the Pacific Ocean and not subject to impacts from tsunamis.

The Flood Insurance Rate Maps of the Federal Emergency Management Agency (FEMA) show that Area 2 is located in Zone D (areas in which flood hazards are undetermined, but possible) and Area 3 is located in Zone X (areas determined to be outside the 0.2% annual chance floodplain) (FEMA 2019). The slopes in Area 2 and Gabrielino Trail/Access Road are subject to potential flooding following periods of heavy rainfall. However, there would be no opportunities for the Project to risk release of pollutants because the

infrastructure improvements in Areas 2 and 3 would not involve the storage, use, or transport of any hazardous materials or sources of potential pollutants. The Project would not result in adverse impacts related to the risk of release of pollutants due to inundation from flood, tsunami, or seiche zones. As such, no mitigation is required and this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

The Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties is the Water Quality Control Plan (WQMP) for the Los Angeles Region, which includes the City of Pasadena. The Basin Plan: (i) identifies beneficial uses for surface and groundwaters, (ii) includes the narrative and numerical water quality objectives that must be attained or maintained to protect the designated beneficial uses and conform to the state's anti-degradation policy, and (iii) describes implementation programs and other actions that are necessary to achieve the water quality objectives established in the Basin Plan (LARWQCB 2019). Reach 3 of the Arroyo Seco, designated to be above Devil's Gate Dam, has the following beneficial uses: domestic water supply (MUN); industrial activities (IND); industrial process dependent upon water quality (PROC); groundwater recharge (GWR); warm water ecosystems (WARM); cold water ecosystems (COLD); terrestrial ecosystems (WILD); and wetland ecosystems (WET). The Raymond Basin has the following beneficial uses: MUN, IND, PROC, and for agricultural supply (AGR) (LARWQCB 2019).

The proposed Project does not include any facilities or land uses that could generate pollutants that could result in water quality impacts. As discussed in Threshold 3.10(a), compliance with the City's Stormwater Management Ordinance would protect and enhance water quality of watercourses, water bodies, and wetlands in a manner pursuant to and consistent with the federal Clean Water Act, and pursuant to NPDES Permit No. CA0061654. Restrictions in this Ordinance are applicable to both construction activities and operations. Additionally, compliance with the General Permit issued by the SWRCB would require implementation of BMPs during construction to address the potential for pollutants from entering the Arroyo Seco. The Project's potential to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality would be less than significant, and no mitigation is required.

California Department of Water Resources (DWR) is required to prioritize and update California's groundwater basin prioritization in accordance with the requirements of Sustainable Groundwater Management Act (SGMA) and related laws. SGMA requires that groundwater resources be managed sustainably for long-term reliability and multiple benefits for current and future beneficial uses. SGMA applies to all California groundwater basins and requires that high- and medium-priority groundwater basins form Groundwater Sustainability Agencies (GSAs) (DWR 2019). DWR is required to prioritize California's 517 groundwater basins and subbasins as either high, medium, low, or very low. Raymond Basin's adjudication in 1944 established a management that utilizes a fixed safe-yield operation. As a result, the Raymond Basin was determined by DWR to be "Very Low" priority, and is therefore not subject to the requirements to form a Groundwater Sustainability Agency to develop a Groundwater Sustainability Plan.

PWP's 2015 Urban Water Management Plan demonstrates PWP's long-term water supply and resource planning, including an evaluation of its water supply sources. Current water and groundwater supply quality is analyzed and various projects aimed to improve water and groundwater quality and to increase local water supply sources are identified. The document identifies the ASCP as an anticipated future component of the City's water supply.

> By restoring and improving the intake structure, installing a new sediment removal mechanism, and expanding recharge operations with the creation of additional spreading basins, it is projected that PWP will benefit from an average 600 AFY of groundwater pumping credits (PWP 2015).

Additionally, the PWP is currently in the draft phases of preparing a 2019 Water System and Resource Plan (WSRP), which will act as an update to both the 2002 Water System Master Plan and the 2011 Water Integrated Resource Plan and is intended to establish policies and develop strategies for meeting PWP's current and future water needs (City of Pasadena 2019). The WSRP will also take into consideration the ASCP contributions to groundwater supply.

The Project's potential to substantially degrade surface or groundwater quality would be less than significant, and no mitigation is required. Additionally, the proposed Project would have beneficial impacts on groundwater supplies in the Raymond Basin and would not conflict with or obstruct implementation of a sustainable groundwater management plan. Impacts would be less than significant, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.11 Land Use and Planning

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Physically divide an established community?	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

a) Would the project physically divide an established community?

The proposed Project does not involve the displacement of existing residences or the construction of barriers through the developed residential areas located east the Arroyo Seco. Therefore, the Project would not divide an established community and no impacts would occur. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

b) Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

The proposed Project includes a portion of Assessor Parcel Number (APN) 5830-001-906 and a portion of APN 5823-015-902. The Project boundaries are located within the Open Space land use designation in the General Plan and the Open Space zone, as defined in Article 2, Zoning Districts, Allowable Land Uses, and Zone-Specific Standards in the City's Municipal Code. The City has requested a modification to CUP No. 6222 to increase utilization of the City's surface water rights through replacement of the existing diversion/intake facilities in Area 2 and construction of new and expanded spreading basins in Area 3 of the ASCP. A Conditional Use Permit or modification to a CUP are required for any recreational improvements within the Open Space zone and the proposed Project would not conflict with the City's Zoning Code.

Chapter 3.32 of the City's Municipal Code is the Arroyo Seco Public Lands Ordinance, which outlines the City's regulations for publicly owned lands within the Arroyo Seco. This ordinance only applies to the Central and Lower Arroyo Seco and does not pertain to the Project site, which is located north of the Devil's Gate Dam.

There are no adopted habitat conservation plans or natural community conservation plans in the City of Pasadena. According to the USFWS, the Project site is not located within designated critical habitat for the California Red-Legged Frog, least Bell's vireo or southwestern willow flycatcher (BonTerra Psomas 2015). The proposed Project components are consistent with the HWP Master Plan, as previously summarized in Table 1, Area 5A Water Resource and Associated Improvements, which identifies the proposed Project's consistency with the HWP Master Plan Improvements identified for Area 3. The proposed Project site does not have any overlay districts or other applicable land use regulations. Therefore, the Project would not conflict with any land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.12 Mineral Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☒	☐
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☒	☐

a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

The California Geological Survey (CGS) has identified deposits of regionally significant aggregate resources in the state in accordance with the Surface Mining and Reclamation Act (SMARA). Clusters or belts of mineral deposits are designated as Mineral Resources Zone 2 (MRZ-2), which include areas that require special management due to the presence of mineral resources important to the state. The Devil's Gate Reservoir is designated as an MRZ-2 zone and contains sand and gravel deposits. This zone encompasses Area 3. However, there is no active mining operation in this MRZ-2 zone (DOC 2017). Review of maps prepared by the California Department of Conservation shows that there are no oil, gas or geothermal fields in or near the Upper Arroyo Seco. Additionally, there are no active or idle oil wells in or near the canyon. The nearest well is a plugged and inactive well located approximately 6 miles southwest of Area 3 (DOC 2018).

The proposed improvements in Areas 2 and 3, would not affect the availability of sand and gravel resources in the Project area. Any large cobbles and/or boulders that would be disturbed by the Project construction activities would be harvested for beneficial reuse within the Arroyo Seco Canyon, as feasible. Improvements in Area 2 may use boulders depending on integrity, shapes, and sizes for the rock wall and engineered streambed material protection. Improvements in Area 3 may also utilize cobbles and boulders (e.g., structure facades, walkway/trail edges, signs). Large cobbles and boulders in Area 2 would be moved away from active construction areas and stockpiled, as feasible, for future decorative uses, to conserve these resources.

The improvements in Area 3 would require export of soil materials excavated through the creation of the spreading basins for disposal at an off-site landfill or gravel pit, although some of the excavated material may be used as fill material for the basin walls and other Area 3 improvements, if appropriate. The HWP Master Plan and Arroyo Seco Design Guidelines call for the use of local arroyo stone in structures, walls, fences, signs, entries, and along trails to reflect the culture and style that is present along the Arroyo Seco. In compliance with the HWP Master Plan and Arroyo Seco Design Guidelines, excavation activities in Area 3 would be required to include the collection of arroyo stones for use in structures, signs, walls, and other improvements in the Canyon, subject to design review and approval by the City's Planning Division. This would reduce the off-site disposal of excavated soils and materials. Additionally, the improvements in Area 3 would not create large immovable structures that would impede any future use of the area for mineral resource recovery.

Thus, the Project would maintain the availability of these mineral resources and would not preclude future mining operations in this area. Impacts pertaining to the potential loss of known mineral resources that would be of value to the region or residents of the state would be less than significant, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

b) Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

There are no identified oil, gas, or geothermal resources or ongoing mining/extraction activities in the Upper Arroyo Seco. The City of Pasadena Comprehensive General Plan does not identify any mineral resources in the City (City of Pasadena 2015). The HWP Master Plan talks about the removal of sand and gravel from the Devil's Gate Reservoir in the past but does not identify aggregate or other mineral resources in and around the reservoir that should be protected or preserved (City of Pasadena 2003).

The Project would not require mineral resources, nor would it change the availability of resources within Devil's Gate Reservoir. The construction of water infrastructure facilities and diversion of water into the

spreading basins would not affect sand and gravel resources in the Reservoir. Additionally, no new structures or facilities would be constructed as part of the Project that could potentially restrict or obstruct future mineral resource recovery activities within Devil's Gate Reservoir. Impacts related to the potential loss of locally important mineral resources would be less than significant, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.13 Noise

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☒	☐	☐	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Noise-sensitive receptors include land uses where an excessive amount of noise would interfere with normal operations or activities and where a high degree of noise control may be necessary. Examples include schools, hospitals, and residential areas. Recreational areas may be considered noise-sensitive where quiet and solitude may be an important aspect of the specific recreational experience.

The closest homes to Area 2 are approximately 780 feet (0.15-mile) to the east on Canyon Dell Drive in Altadena. Residential neighborhoods to the west in La Cañada Flintridge are more than 0.25-mile from Area 2. There are single-family residential neighborhoods to the east of Area 3. Some homes are in the City of Pasadena and others are in Altadena. The closest homes to Area 3 are on Ridgeview Drive in Altadena, approximately 225 feet from the eastern edge of the former JPL parking lot and are approximately 100 feet higher in elevation than the parking lot. North Windsor Avenue, between I-210 and Explorer Drive, would be used by traffic generated by the proposed Project. There are homes adjacent to North Windsor Avenue in the City of Pasadena and in the community of Altadena. While the Project would be located in the City of Pasadena, there are nearby noise-sensitive receptors in the unincorporated community of Altadena.

No long-term operational noise impacts are anticipated because the proposed facilities would not be substantively different from the existing operations. No new employees would be required and no new maintenance activities to/from the Project site would occur. Noise impacts associated with the proposed Project would be limited to the construction phase. The primary noise sources during construction would be the diesel engines from construction equipment, truck traffic, any required jackhammering of rocks and earthmoving, and the shaker machine to sort cobbles/rocks. As such, the Project has the potential to result in impacts associated with a substantial temporary increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. This issue will be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic. The proposed Project's impacts related to noise will be re-evaluated in the EIR using updated survey data and mitigation will be included, if applicable, and may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Short-term construction activities in Areas 2 and 3 will require earthmoving and heavy equipment to facilitate removal of large cobbles and boulders, if present. Heavy equipment and movement of boulders could result in excessive groundborne vibration. As such, the proposed Project has the potential to result in excessive vibration or groundborne noise levels in the vicinity of the Project. The findings from the ASCP IS/MND did not require mitigation for this topic; however, this issue will be further evaluated in the EIR using updated survey data and mitigation will be included, if applicable.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

There are no airports or airstrips within 2 miles of the Arroyo Seco Canyon. The nearest airports are the Burbank Bob Hope Airport and the El Monte Airport, which are both approximately 11 miles from the site. The Project would not subject persons in the area to noise from public or private airports, nor would the Project generate aircraft noise. There is a heliport and a helipad near the Arroyo Seco but no change in helicopter noise would occur with the Project. There would be no impact. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.14 Population and Housing

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☒
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

a) Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

The Project does not propose the construction of new homes or businesses that may induce direct population growth in the area. Also, no extension of infrastructure to unserved areas is proposed. The presence of the construction crew would be temporary and would not generate a measurable demand for housing, goods, or services in the area. No change in the PWP's operational or maintenance activities would occur that would lead to new employees that could indirectly induce growth or development in the area. The Project would improve the PWP's surface water diversion facilities and increase groundwater recharge. This would, in turn, reduce the PWP's reliance on imported water resources and would reduce its operating costs, but would not promote development in the City or the surrounding area. There would be no impact related to the inducement of substantial unplanned population growth, either directly or indirectly, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

b) Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

The proposed Project would have no impact on any existing housing and would not displace people. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.15 Public Services

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
Fire protection?	☐	☐	☐	☒
Police protection?	☐	☐	☐	☒
Schools?	☐	☐	☐	☒
Parks?	☐	☐	☐	☒
Other public facilities?	☐	☐	☐	☒

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

Fire protection?

The Pasadena Fire Department provides fire protection services to the City and operates eight fire stations. Pasadena Fire Station 38 at 1150 Linda Vista is located 2.4 miles south of Area 3. However, the Los Angeles County Fire Station No. 12 at 2760 North Lincoln Avenue in Altadena is located only 0.6 miles east of Area 3. County Fire Camp No. 2 is located southwest of the JPL campus and serves as a helicopter standby location during the fire season, with a crew of ten firefighters. County Fire Station No. 82 is located 1 mile southwest of Area 3 on the west side of the Arroyo Seco. The Los Angeles County Fire Department has automatic aid agreements with 33 cities in the County, including the City of Pasadena, to provide fire protection services during a fire or medical emergency regardless of territory. Thus, City and County firefighters would provide emergency response to the Upper Arroyo Seco in the event of a fire incident.

The Project does not involve the development of habitable structures, public buildings, or involve any operational activities that could increase demands for fire protection services. Proposed improvements related to the water infrastructure and appurtenant facilities are required to be designed and constructed in accordance with the Pasadena Fire Prevention Code (Chapter 14.28 of the City's Municipal Code), which adopts the California Fire Code with changes and additions to the adopted code. Temporary construction activities would not result in additional demands for fire protection such that new government facilities would be required. The proposed Project would not result in an increased residential population, increased commercial development, or any other intensification of land uses that could potentially require increased services of the Fire Department. Because there would be no increase in demand for Fire Department services, there would be no impact associated with the new or altered government facilities, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

Police protection?

The Pasadena Police Department provides police protection and law enforcement services in the City. The Police Department has a Park Safety Specialist Team that is assigned to patrol City parks, including Hahamongna Watershed Park. In addition, the Police Department has a Volunteer Mounted Unit that consists of volunteers on horses who provide patrol services in the remote park areas of the City, such as Hahamongna Watershed Park (Pasadena 2013). The Pasadena Police Department also participates in the California Law Enforcement Mutual Aid Plan and the California Disaster and Civil Defense Master Mutual Aid Agreement, which allow the City to request mutual aid from and to provide mutual aid to adjacent police protection and law enforcement agencies.

The Project does not involve the development of habitable structures, public buildings, or operational activities that could increase demands for police protection services. After each workday, construction equipment would be secured in a fenced area to minimize the risk of theft or vandalism. Temporary construction activities would not result in additional demands for police protection such that new government facilities would be required. The proposed Project would not result in an increased residential population, increased commercial development, or any other intensification of land uses that could potentially require increased services of the Police Department. Because there would be no increase in demand for Police Department services, there would be no impact associated with the new or altered government facilities, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

Schools, Parks, Other Public Facilities?

The proposed Project would not generate a demand for school, parks, libraries, or other public facilities services because no residential land uses are proposed, and there would be no increase in permanent employment that would have an indirect impact or result in additional demands on these resources. There would be no impact associated with the new or altered government facilities, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.16 Recreation

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☒	☐	☐	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

The Upper Arroyo Seco provides recreational opportunities for area residents and visitors. The Project site is located within HWP, which is developed with the Gabrielino Trail/Access Road that provides opportunities for hiking, biking, and equestrian activity up the Arroyo Seco Canyon and into the ANF. This park is maintained by the Pasadena Parks and Natural Resources Division. The HWP has numerous other active and passive recreational opportunities, including sports fields, hiking trails, picnic areas, equestrian center, a disc golf course, and other amenities. This park is maintained by the Pasadena Parks and Natural Resources Division.

The Arroyo Seco Trail runs along both sides of the Arroyo Seco and is part of the Rim of the Valley Trail Corridor that connects the Santa Monica Mountains and the San Gabriel Mountains through trails in the San Fernando and La Crescenta Valleys. This trail also continues south along the Central and Lower Arroyo Seco to connect with the Los Angeles River Trail. North of Devil's Gate Dam, there are several local trails on both sides of the Arroyo Seco, including the East Rim Trail, the West Rim Trail, the Mountain View Trail, the Flint Wash Trail, the Gould Canyon Trail, the Altadena Crest Trail, and the Gabrielino Trail.

The Project would not induce population growth directly or indirectly that could generate a need for or increase the use of parks and recreational facilities. No additional recreational amenities are associated with the proposed improvements in Areas 2 and 3. However, during construction within Areas 2 and 3, there may be times when portions of the Arroyo Seco Trail, Altacrest Trail, and Gabrielino Trail/Access Road would be closed to the public. While the trails would be kept open during construction to the extent possible, there would be days when equipment and construction activities would be on and/or near the trails, making recreational trail use hazardous for the general public.

Impacts associated with temporary construction activity could increase the use of other adjacent park amenities and other recreational facilities. The sediment removal activities associated with the ongoing Devil's Gate Reservoir project being conducted by the LACFCD would also result in the temporary closure of some local trails. It is unlikely that any direct impacts from temporary additional use would result in substantial physical deterioration of the facility, but reduced access to recreational trails during construction, which might be exacerbated by other construction projects in the HWP area, will be discussed in the EIR. The findings from the ASCP IS/MND required mitigation for this topic, and this EIR may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

The proposed Project would not involve the construction of any recreational facilities. The Project would not generate a demand for parks that could result in the construction or expansion of recreational facilities because no residential land uses are proposed, and there would be no increase in permanent employment that would have an indirect impact or result in additional demands on these resources. There would be no impact associated with the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.17 Transportation

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	☒	☐	☐	☐
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	☐	☐	☒	☐
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d) Result in inadequate emergency access?	☐	☐	☒	☐

a) Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

The Foothill Freeway (I-210) I-210 has eight travel lanes as it passes along the southern edge of Devil's Gate Dam. Access to the Arroyo Seco Canyon is provided via the I-210's Arroyo Boulevard/Windsor Avenue off-ramp. Windsor Avenue is a two-lane road that runs north and ends at its intersection with Ventura Street and Explorer Road. Explorer Road continues northerly toward the former JPL East Parking Lot adjacent to the spreading basins and turns west across the Arroyo Seco (over the JPL Bridge) and southwesterly onto the JPL campus.

Construction trucks hauling soils and construction debris to and from Scholl Canyon Landfill are expected to come to the site from I-210 at the Windsor Avenue off-ramp and head north on Windsor Avenue to the intersection with Ventura Street. At this intersection is a fork in the road, one leading to Explorer Road into Area 3 and the other leading to the gated North Arroyo Boulevard, which passes adjacent to residential properties and the Behner Treatment Plant. Near the JPL Bridge over the Arroyo Seco near the northern boundary of Area 3, North Arroyo Boulevard splits and provides access to the Gabrielino Trail/Access Road and to the JPL Bridge/Explorer Road. Construction trucks would use North Arroyo Boulevard to access Area 2 and Explorer Road to access Area 3.

During construction of Area 2, however, there will be periods where sections of the trail will need to be partially or fully closed, mainly during excavations, construction of the new intake, and hauling in materials/equipment. The portion of trail along the construction zone may also need to be reduced in width for the duration of the construction period during work hours to allow for parked construction vehicles (e.g., pickup trucks). Access to Area 2 (and the USFS Ranger Station in the ANF) would be made available during construction activities, but short-term partial closures may occur. The Gabrielino Trail/Access Road would be made passable at the end of each workday. The City will follow the Supplements and Modifications to the Greenbook regarding notifications of residents and businesses affected by the temporary closures of the Gabrielino Trail/Access Road; notification of utility agencies with facilities in the area; the Pasadena Fire and Police Departments; and other emergency service providers.

From I-210, trucks would head west on SR-134; exit at the Figueroa Street/Scholl Canyon Road off-ramp; head north-northeast toward the landfill. Trucks would come back from the landfill entering the eastbound on-ramp on the SR-134 at Figueroa Street and head east; trucks would then go west on I-210 to Windsor Avenue to Explorer Road and, ultimately, to the site.

Project-related construction activities would generate new vehicle trips from construction equipment and construction crews coming to the site; trucks bringing in building materials; trucks taking out excavated soils and other debris for off-site disposal; and construction equipment leaving the site after each construction phase. Additionally, it is anticipated that the proposed Project activities may overlap with the sediment removal activities associated with the ongoing Devil's Gate Reservoir project being conducted by the LACFCD. As such, the proposed Project has the potential to result in cumulative short-term impacts that could conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. As such, this topic will be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic, and this EIR may include modifications to mitigation measures or deletion of measures that are no longer best practices from the ASCP IS/MND.

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

CEQA Guidelines Section 15064.3(a) sets forth the purpose of the entire new Section 15064.3. First, the subdivision clarifies that the primary consideration, in an environmental analysis, regarding transportation is the amount and distance that a project might cause people to drive. Subdivision (b) focuses on specific criteria for determining the significance of transportation impacts related to land use projects, transportation projects, qualitative analysis, and methodology. The proposed Project is a water utility infrastructure project and not a "land use" project in that it is not developing any land uses or habitable structures that would generate long-term operational traffic. As such, the proposed Project would not result in an increase in vehicle miles traveled (VMT). Short-term construction related traffic would be addressed through Threshold 3.17(a). As such, this topic will not be further evaluated in the EIR. This is a new threshold of significance and the ASCP IS/MND did not include an assessment for this topic.

c) Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

The proposed Project would not result in any new roadway features or alignments or otherwise alter the geometric design of an existing roadway. No changes to the existing two temporary structures on the existing bridges would occur with the proposed Project. As such, there would be no impacts associated with a substantial increase in hazards due to a geometric design feature or incompatible uses, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic; however, the proposed Project does not involve construction of temporary bridges or alterations to the Gabrielino Trail/Access Road.

d) Would the project result in inadequate emergency access?

During the construction phase, the Gabrielino Trail/Access Road would be used for temporary construction vehicle access but construction equipment would not block access to or from the ANF and nearby U.S. Forest Ranger Station. The proposed Project would not result in any new roadway features or alignments or otherwise hinder emergency access vehicles. The Project would be conducted in compliance with the City's Supplements and Modifications to the Greenbook regarding notification of residents and businesses

affected by the road work; utility agencies with facilities in the area; the Pasadena Fire and Police Departments; and other emergency service providers. Although the Gabrielino Trail/Access Road is not a public road, it would be made passable at the end of each workday. Thus, access to Area 2 (and the USFS Ranger Station in the ANF) would be made available during construction activities, but short-term partial closures may occur. Potential impacts related to inadequate emergency access would be less than significant. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND required mitigation for this topic; however, the components of the ASCP being considered herein do not involve any construction activities within the ANF or adjacent to the Ranger Station.

3.18 Tribal Cultural Resources

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☒	☐	☐	☐
b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	☒	☐	☐	☐

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

The proposed Project involves earthwork within and adjacent to the Arroyo Seco and has the potential to result in substantial adverse changes in the significance of a tribal cultural resource, cultural value to a California Native American tribe that is potential eligible in the CRHR. As such, this topic will be further evaluated in the EIR. This is a new threshold of significance that was not

required to be analyzed at the time of the circulation of the Notice of Intent to Adopt (NOI) an MND (i.e., July 1, 2015), and the ASCP IS/MND did not include an assessment for this topic.

ii) ***A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?***

The proposed Project is subject to compliance with Section 20180.3.2 of the PRC, Assembly Bill (AB) 52, which requires lead agencies to consult with California Native American tribes that request such consultation, and also requires that the tribes ask the Lead Agency to be contacted for consultation. Lead agencies must notify California Native American Tribes that are traditionally and culturally affiliated with the geographic area of the project and that have requested such notification. As such, this topic will be further evaluated in the EIR. This is a new threshold of significance that was not required to be analyzed at the time of the circulation of the Notice of Intent to Adopt (NOI) an MND (i.e., July 1, 2015), and the ASCP IS/MND did not include an assessment for this topic.

3.19 Utilities and Service Systems

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?	☐	☐	☒	☐
c) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☐	☒
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

a) Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

The new diversion/weir and intake structures in Area 2 and the expanded spreading basins in Area 3 would increase the PWP groundwater recharge by approximately 1,100 acre-feet per year (afy). With the PWP allowed to extract between 60 and 80 percent of this volume, imported water supplies could be offset with local supplies by over 580,000 gpd. Potable water use by the Project is limited to short-term construction activities only for dust suppression. A water truck would come to the construction sites, with water obtained from off-site sources, as needed. This water demand would be short-term and minimal. No new or expanded potable water infrastructure is proposed. The Project would not affect water wells located near Area 3, but it would be necessary to relocate a portion of the JPL water line that crosses Area 3 (the JPL service was partially relocated in 2016). The new relocated line would be installed prior to removing the existing line to avoid disruption in water service to the JPL campus. Once the new water line is ready for use, the existing line would be either abandoned in place, or interfering sections would be removed. The hume line as part of the conveyance system that connects the intake in Area 2 to the spreading basins in Area 3 would be truncated and a new section added to tie into the sedimentation basin; water conveyance would be disrupted during construction of the new line and the spreading basins. This impact would be temporary and would not cut off water services to existing PWP customers.

No restroom or other wastewater generating facilities are proposed. During construction, portable toilets would be provided at the site for the construction crew, and these portable toilets would be regularly cleaned and their contents disposed of off site by an outside company. No new stormwater drainage infrastructure would be required because no new impervious surfaces would be constructed that could increase stormwater runoff or otherwise affect stormwater drainage. Impacts associated with the Project's water infrastructure facilities to increase diversions of Arroyo Seco flows would be analyzed in the EIR, as previously described in this Initial Study.

Construction equipment would be powered by petroleum via portable generators. Long-term energy consumption associated with the Project includes electricity consumption in Area 2 for the proposed intake service building to operate the diversion/weir structure, and the basin metering in Area 3. Electricity would be provided to Area 2 from an existing electrical connection at an existing equipment building, and an extension of this service via underground conduit to the new service building. Electricity would be provided to Area 3 via the existing electrical infrastructure formerly used to power the parking lot lighting. A new service-rated panelboard, pad-mounted electrical cabinets, underground conduit, and a light pole will be constructed. Construction activities would not require the use of natural gas, and no natural gas would be required for the proposed improvements and amenities. Similarly, the proposed Project would not require the use of telecommunication infrastructure because no habitable structures would be constructed. The Project proposes new local communications wiring that will allow for transmission of Supervisory Control and Data Acquisition (SCADA) telemetry data transmitted via radio. Potential impacts related to the relocation or construction of new or expanded water, wastewater treatment, or stormwater drainage, electric power, natural gas, or telecommunications facilities, would be less than significant. This topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

b) Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?

Potable water use by the Project is limited to short-term construction activities only for dust suppression. A water truck would come to the construction sites, with water obtained from off-site sources or fill on site from a temporary metered connection provided by PWP, as needed. This water demand would be short-term and minimal. The spreading basins in Area 3 would be decommissioned while the new basins are being excavated and existing basins are expanded. During these times, the intake structure in Area 2 would be closed and PWP would temporarily not be recharging surface waters. However, PWP maintains a groundwater storage reserve and access to MWD imported water deliveries if needed. Therefore, PWP is capable of accommodating the temporary interruption in spreading without disrupting water supplies and/or affecting reasonably foreseeable future development during normal, dry, and multiple dry years. Impacts would be less than significant, and no mitigation is required. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

c) Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

No restroom or other wastewater generating facilities are proposed. During construction, portable toilets would be provided at the site for the construction crew, and these portable toilets would be regularly cleaned and their contents disposed of off site by an outside company. There would be no impacts. As such, this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

d) Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Construction activities in Areas 2 and 3 would generate construction debris and soil export that requires disposal at Scholl Canyon Landfill. It is anticipated that some cut soils would include larger rocks that may be recovered through the use of an on-site shaker. It is the City's intention to utilize this recovered material on site rather than disposing of the materials to the extent feasible. The construction activities must be conducted in compliance the City's Construction and Demolition Waste Management Ordinance (Chapter 8.62 of the Pasadena Municipal Code), which reduces landfill waste by requiring applicable projects to divert a minimum of 75% of generated construction and demolition debris in compliance with state and local statutory goals and policies. The Ordinance creates a mechanism to secure compliance with the stated waste diversion requirements. There would be no new long-term operational waste generated by the proposed Project. Through compliance with existing regulations, impacts-related solid waste regulations and reduction goals would be less than significant, and thus this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

As discussed in Threshold 3.19(d), the Project's construction activities must be conducted in compliance with the City's Construction and Demolition Waste Management Ordinance, which requires applicable projects to divert a minimum of 75% of generated construction and demolition debris in compliance with state and local statutory goals and policies. The Ordinance creates a mechanism to secure compliance with the stated waste diversion requirements. There would be no new long-term operational waste generated by the proposed Project.

Through compliance with existing regulations, impacts-related solid waste regulations and reduction goals would be less than significant, and thus this topic will not be further evaluated in the EIR. The findings from the ASCP IS/MND also did not require or include mitigation measures for this topic.

3.20 Wildfire

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☒	☐
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☒	☐

a) Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

The Arroyo Seco Canyon and adjacent areas are designated as a Very High Fire Hazard Severity Zone by the California Department of Forestry and Fire Protection (CAL FIRE 2011). During construction of Area 2, however, there will be periods where sections of the trail will need to be partially or fully closed, mainly during excavations, construction of the new intake, and hauling in materials/equipment. The portion of trail along the construction zone may also need to be reduced in width for the duration of the construction period during work hours to allow for parked construction vehicles (e.g., pickup trucks). Access to Area 2 (and the USFS Ranger Station in the ANF) would be made available during construction activities, but short-term partial closures may occur. The Gabrielino Trail/Access Road would be made passable at the end of each workday. The City will follow the Supplements and Modifications to the Greenbook regarding notifications of residents and businesses affected by the temporary closures of the Gabrielino Trail/Access Road; notification of utility agencies with facilities in the area; the Pasadena Fire and Police Departments; and other emergency service providers. The ASCP IS/MND required mitigation for this topic to address potential short-term closures of the Gabrielino Trail/Access Road and bridges. No new or different impacts would result from the proposed Project and the MMRP would be implemented during construction activities on the Gabrielino Trail/Access Road. Impacts would be less than significant and no additional mitigation is required. Therefore, this topic will not be further analyzed in the EIR.

b) Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

The Project does not involve the development of habitable structures, public buildings, or involve any operational activities that could increase impact related to the exacerbation of wildfire risks because the Project would not generate a new resident population or increase visitation. Proposed improvements related to the water infrastructure and appurtenant facilities are required to be designed and constructed in accordance with the Pasadena Fire Prevention Code (Chapter 14.28 of the City's Municipal Code), which adopts the California Fire Code with changes and additions to the adopted code. Area 2 construction would be within and around the Arroyo Seco creek, and Area 3 construction would be within largely unvegetated spreading basins and the former JPL East Parking Lot. Water trucks would be available for dust control and would be required to keep areas of earthmoving periodically sprayed with water to minimize fugitive dust, which would further minimize wildfire hazards in the construction area. The proposed Project would not result in an increased residential population, increased commercial development, or any other intensification of land uses that could potentially result in an exacerbation of wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. As such, this topic will not be further evaluated in the EIR. This is a new threshold of significance that was not required to be analyzed in the ASCP IS/MND, which did not include an assessment for this topic.

c) Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

As described in Threshold 3.20(b), the proposed Project would not result in an increased residential population, increased commercial development, or any other intensification of land uses that could potentially result in an exacerbation of wildfire risks; therefore, there would be no requirement to install or maintain associated wildfire infrastructure. As such, this topic will not be further evaluated in the EIR. This is a new threshold of significance that was not required to be analyzed in the ASCP IS/MND, which did not include an assessment for this topic.

d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

As discussed under Threshold 3.20(b), the Project would not involve construction or operation of habitable structures that may expose people to wildfire or post-wildfire hazards in the area. The improvements in Area 2 are specifically designed to withstand floodwaters, are equipped with upstream and downstream engineered streambed material to reduce erosion and scour and would not expose downstream land uses to significant risks related to flooding or slope stability. All project components would be required to comply with the City's Floodplain Management Regulations Ordinance (Chapter 14.27 of the Pasadena Municipal Code), which requires facilities to be adequately anchored to prevent flotation, collapse, or lateral movement; to be constructed with materials and equipment resistant to flood damage; to have utility and service facilities designed and located to prevent water from entering; and to provide adequate drainage to reduce exposure to flood hazards. Proposed structures would also be required to be designed and constructed in accordance with the City's Building Code and the recommendations of the geotechnical investigation which would ensure construction would avoid activities associated with landslide and soil instability. As such, this topic will not be further evaluated in the EIR. This is a new threshold of significance that was not required to be analyzed in the ASCP IS/MND, which did not include an assessment for this topic.

3.21 Mandatory Findings of Significance

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☒	☐	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

As discussed above in Section 3.4, Biological Resources, Section 3.5, Cultural Resources, and 3.10, Hydrology and Water Quality, the proposed Project would lead to the disturbance of existing plant, aquatic, and animal habitats on and near the Arroyo Seco, as well as have potential impacts to hydrology and cultural resources in the Project area. Implementation of the mitigation measures may be required to ensure that the Project does not degrade the quality of the environment; does not substantially reduce the habitat of fish or wildlife species; does not reduce the number or restrict the range of Rare or Endangered plant or animal; and does not eliminate important examples of the major periods of California history or prehistory. As such, impacts would be potentially significant and would be assessed in the EIR.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Other projects are anticipated to be ongoing in or near the HWP. These cumulative projects include, but are not limited to the Los Angeles County Flood Control District's sediment removal at Devil's Gate Reservoir as well as the components of the ASCP that were approved through the 2015 ASCP IS/MND. The proposed Project could have impacts that are individually limited, but cumulatively considerable, such that the incremental effects are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. These impacts will be analyzed in the EIR.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

The proposed Project would have environmental effects that could cause adverse effects on human beings, either directly or indirectly, as they relate to Air Quality, Noise, Recreation, and Transportation, as previously discussed under these environmental issues. As such, these topics will be evaluated in the EIR.

NOTICE OF ENTRY OF JUDGMENT AND PEREMPTORY WRIT OF MANDATE

SPIRIT OF THE SAGE COUNCIL, PROJECT SOLITON v. CITY OF PASADENA, CITY OF PASADENA WATER AND POWER, Case No. BS 156207

The court issued its Statement of Decision on Petition for Writ of Mandate on March 20, 2017. The court thereafter received drafts for a Judgment and Peremptory Writ of Mandate from each side. The court held a hearing on April 24, 2017 to discuss and resolve the parties' differences as to the proposed draft Judgment and Peremptory Writ of Mandate.

The parties have since lodged revised drafts for the Judgment and Peremptory Writ of Mandate, and also objections to the drafts proposed by the other side. The principal issue dividing the parties has been the definition of those parts of the Project that are to be severed from the Peremptory Writ. The court's Statement of Decision, p. 16 provides:

The Project has separate components and petitioners have not challenged the City's approvals as to certain parts of the Project. The parties may consider whether a severance is appropriate under Public Resources Code section 21168.9(b) and submit a Writ providing for an appropriate severance. Any severance, however, must not prejudice full compliance with CEQA.

The City lodged a proposed Judgment and a proposed Peremptory Writ of Mandate on May 3, 2017. Petitioners lodged their objections and also submitted their proposed Judgment and Peremptory Writ of Mandate on June 1. The City filed its Further Memorandum and the Declaration of Gary Takara and lodged revised drafts for a Judgment and Peremptory Writ of Mandate on June 20. Petitioners filed their objections on June 22, and requested therein that the court hold another hearing to settle the form of the Judgment and Peremptory Writ of Mandate. The court declines to hold a further hearing. The City has proposed a Writ that defines a severance in a manner that "will not," the City promises, "prejudice complete and full compliance with CEQA." The definition of the parts of the project that may proceed are defined in detail in the Takara declaration and are sufficiently described in the proposed Peremptory Writ of Mandate. The court accordingly adopts the forms lodged by the City.

The court has signed, entered and herewith serves its Judgment and Peremptory Writ of Mandate.

FILING WINDOW

SUPERIOR COURT FOR THE STATE OF CALIFORNIA

COUNTY OF LOS ANGELES - CENTRAL DISTRICT

SPIRIT OF THE SAGE COUNCIL, a California Public Benefit Corporation; PROJECT SOLITON, a California Public Benefit Corporation

Petitioners,

v.

CITY OF PASADENA, a public entity; CITY OF PASADENA WATER AND POWER; and DOES 1 through 25, inclusive;

Respondents.

Case No. BS 156207

Assigned for All Purposes to the Honorable Judge Richard Fruin Department 15

~~[PROPOSED]~~ JUDGMENT GRANTING PEREMPTORY WRIT OF MANDATE

This matter came on regularly for hearing on December 15, 2016, with additional hearings on January 13 and 18, 2017, in Department 15 of this Court, located at 111 N. Hill Ave., Los Angeles CA. Todd T. Cardiff and Bryan W. Pease appeared on behalf of petitioners Spirit of the Sage Council and Project Soliton, and Theresa E. Fuentes, Assistant City Attorney, appeared on behalf of respondent City of Pasadena and its Water and Power Department.

The Court, having reviewed the record of respondent's proceedings in this matter, the briefs submitted by all parties, and the oral argument of all counsel; the matter having been submitted for decision and the Court having ruled on the entirety of the matter as set forth in its Statement of Decision attached hereto; the Court having invited the parties to propose severance of the project pursuant to Public Resources Code Section 21168.9 and consistent with its Statement of Decision; and the Court having directed that judgment and a peremptory writ of mandate issue in this proceeding,

IT IS ORDERED THAT:

1. Judgment is entered in favor of petitioners in part.

2. A peremptory writ of mandate directed to respondent shall issue under seal of this Court, invalidating respondent's approval of Conditional Use Permit No. 6222 and certification of a Mitigated Negative Declaration with the exception of those specific project elements the Court found severable under Public Resources Code Section 21168.9(b), as set forth in the Writ.

3. Petitioners are entitled to costs of suit. This Court reserves jurisdiction over this matter to determine entitlement to attorneys' fees after proper notice and motion.

4. This Court also reserves jurisdiction over any return on the writ of mandate by respondent.

DATED: June 26, 2017 By: Richard Fruin
Honorable Judge Richard Fruin

PROOF OF SERVICE

STATE OF CALIFORNIA, COUNTY OF LOS ANGELES

I, CLAIRE A. VORHIS, hereby declare and state:

I am employed in the County of Los Angeles; I am over the age of eighteen years and not a party to the within entitled action. My business address is 100 North Garfield Avenue, Suite N210, Pasadena, California. My mailing address is PO Box 7115, Pasadena, CA 91109-7215.

On June 20, 2017, I served the foregoing document described as:

[PROPOSED] JUDGMENT GRANTING PEREMPTORY WRIT OF MANDATE

on the interested parties by placing a true copy thereof enclosed in a sealed envelope addressed as follows:

SEE ATTACHED SERVICE LIST

[ ] **BY FACSIMILE:** Based on an agreement of the parties to accept service by fax transmission, I faxed the documents to the persons at the fax number. No error was reported by the fax machine that I used. A copy of the record of the fax transmission, which I printed out is attached..

[ ] **BY MAIL:**

[ ] As follows: I am "readily familiar" with the City's practice of collection and processing correspondence for mailing. Under that practice it would be deposited with U.S. postal service on that same day with postage thereon fully prepaid at Pasadena, California, in the ordinary course of business. I am aware that on motion of the party served, service is presumed invalid if postal cancellation date or postage meter date is more than one day after date of deposit for mailing in affidavit.

[ ] I deposited such envelope in the mail at Pasadena, California. The envelope was mailed with postage fully prepaid.

[ ] **BY PERSONAL SERVICE:**

[ ] I delivered such envelope by hand to the offices of the addressee pursuant to CCP § 1011.

[X] BY EMAIL OR ELECTRONIC TRANSMISSION:

[X] Based on an agreement of the parties to accept service by e-mail or electronic transmission (with a courtesy hard copy should any document exceed 30 pages), I caused the documents to be sent to the persons at the e-mail addresses listed above. I did not receive, within a reasonable time after the transmission, any electronic message or other indication that the transmission was unsuccessful.

I declare under penalty of perjury under the laws of the State of California that the above is true and correct.

EXECUTED on June 20, 2017, at Pasadena, California.

CLAIRE A. VORHIS

Assigned for All Purposes to the Honorable Judge Richard Fruin Department 15

DECLARATION OF GARY TAKARA IN SUPPORT OF CITY OF PASADENA'S [PROPOSED] JUDGMENT

///

///

///

///

///

///

///

I, Gary Takara, declare:

1. I am an Engineering Manager in the City of Pasadena's ("City") Water and Power Department ("PWP"), and have held this position since June 2015. I started with the City in March 1994 as an Associate Engineer. I have over 27 years in water resource management and related engineering experience. In 1990, I received my Bachelor of Science from California Polytechnic, Pomona in Civil Engineering.
2. In my current capacity as Engineering Manager, my job duties include managing the PWP Water Supply and Water Quality groups. I supervise the project team for the Arroyo Seco Canyon Project ("Project") at issue in this case. I have been intimately involved in the planning, engineering, grant administration, and implementation of the Project. All of the physical work done to date on the Project has received my review and approval prior to implementation.
3. As a result of the Station Fire in 2009 and subsequent heavy rains in 2010, the Arroyo Seco experienced substantial debris flows and flooding that damaged existing PWP water diversion facilities in the Arroyo. In general, the Project involves removal of facilities in Area 1 (Arroyo Seco Headworks), repair and replacement of damaged and worn facilities in Area 2 (Arroyo Seco Intake), and repair, maintenance, construction of new facilities, and recreational improvements in Area 3 (JPL East Parking Lot).
4. I am aware of the court's Statement of Decision in this matter, and in particular of the court's "Comments for Hearing on April 24, 2017 at 10:00 A.M" wherein the court stated: "The court's Statement of Decision is not limited to increased water appropriations over the City's historical usage. It refers to any additional capacity to take stream water at Area 2 or any other location within the Project boundaries."
5. The purpose of my declaration is to provide expert opinion to distinguish between the specific Project elements that would facilitate to the City's capacity to take additional stream water so that those may be severed from the Project as appears to be the desire of the court, and the remainder of the Project related to either recreational/JPL

accommodating improvements, or repair, maintain, and operate of PWP facilities necessary to fully return back to normal operations.

6. None of the work in Area 1 is related to increasing PWP's capacity to take additional stream water. That work is related to removing facilities from the Arroyo Seco and conducting streambed repair necessary as a result of such removal.

7. In Area 2, all Project elements are directly related to PWP's ability to take additional stream water, with the exception of the access road improvement and related slope reconstruction and protective riprap. The road improvements are necessary to reach Area 1 with the construction equipment required to conduct the removal described above.

8. The work in Area 3 is of overlapping utility, and is best explained by reference to Table 3.1-1 of the Initial Study/Mitigated Negative Declaration at issue in this case, a copy of which is attached hereto as Exhibit A for the court's reference. None of the Project elements in the following rows have anything to do with increasing PWP's capacity to take additional stream water: JPL East Parking Lot; New public restroom; Bridge Crossing; Trails; Trailhead; Habitat restoration (none proposed as part of the Project); Pipeline Relocation and Demolition (further explanation provided below); Storm Drain Improvements (none proposed as part of the Project); Overlook (none proposed as part of the Project); Park Entrance (none proposed as part of the Project); Access Road; Pump-back system (none proposed as part of the Project); Water line; Overhead power and communications lines; Septic Tanks and Sewer lines; Security Gates; Lighting; and Public telephones (not proposed as part of the Project).

    a. The only Project elements in Area 3 related to increasing PWP's capacity to take additional stream water are found in the "Spreading Basins" row, and consist of "expand 4 existing basins" and "construct 2 [new] spreading basins." Those items are highlighted in yellow on Exhibit A for sake of clarity.

    b. In that same row, the Project element of "replace 2 sludge ponds with 2 new spreading basins" would <u>not</u> enable to take additional stream water. PWP currently operates the sludge ponds as spreading basins, so this work is necessary

to improve existing facilities to better serve the use for which they are currently operated.

c. Also in that same row, the Project element of "construct 2 sedimentation basins" is necessary as a result of the ruined state of the headworks in Area 1, as debris currently freely flows downstream and will eventually clog up PWP's existing facilities without proper management.

d. None of the Project elements in the row titled "Pipeline Relocation and Demolition" are related to an increased capacity to take stream water.

i. The Project element "replace and realign Hume line from the north end of parking lot to the spreading basins" is related to an existing pipeline that currently directs water to the spreading basins and is not intended to be increased in size but simply realigned to accommodate the proposed layout for improvements at Area 3.

ii. The Project element "relocate the JPL water line to the new access road" moves an existing line to be located out of the way to construct the 2 sedimentation basins. (See notation regarding "Relocate the 12-inch diameter Arroyo Booster pipeline to the new access road" in paragraph 10 below.) But even if the sedimentation basins were not constructed, PWP would want the water lines under the new road so as to minimize disruption from any future digging in the area.

iii. The Project element "demolish a portion of the influent and effluent line from the Behner Water Treatment Plant" is related to removal of portions of existing pipelines no longer in use.

iv. The Project element "Remove sludge lines" is simply removal of unnecessary piping and general cleaning up of the area.

9. For sake of clarity, the Project does not propose any new or increased piping capacity between Areas 2 and 3 that would eventually be of utility should PWP receive all

necessary regulatory and court approvals to increase its capacity to take water from the Arroyo Seco.

10. PWP did undertake some physical work in Area 3 during the pendency of this litigation as there was no court order to the contrary. Specifically, PWP constructed pipelines within the alignment of the proposed new road, including: a new 12-inch pipeline to serve a future groundwater well beside Basin F; a 16-inch utility line to serve existing offsite wells in the Arroyo and the existing Monk Hill Treatment Plant, a 12-inch discharge main for the existing Arroyo Booster located south of the site (this work was undertaken in place of "Relocate the 12-inch diameter Arroyo Booster pipeline to the new access road"), and relocation of the 12-inch potable water service to the NASA/JPL property. None of this work would enable an increase in the capacity to take stream water.

11. Finally, it is important to note that certain construction activity assumptions were included in the Project, and are set forth in Exhibit A in Table 3.2-1. The assumptions would remain the same in general, but scaled back in any particular Project Area consistent with any judgment issued by this court.

12. The City is facing delay costs associated with its inability to move forward with elements of the Project unrelated to additional capacity to take water out of the stream. Temporary bridges along the trail to Areas 1 and 2 must be installed to support the movement of construction equipment. The City began that work during the pendency of this litigation, but stopped once the court issued its Statement of Decision. Because the City does not yet know whether it can proceed with any part of the Project, it must extend the contract for the temporary bridges, at an additional cost of $30,000 over the original contract amount. On Monday, June 19, 2017, the City Council approved that additional expense. Attached hereto as Exhibit B is the staff report upon which Council acted, and which explains the delay costs.

13. I am personally familiar with the facts stated herein and if called upon to testify, I could and would competently testify thereto.

I declare under penalty of perjury that the foregoing is true and correct.

Gary Takara

EXHIBIT A

TABLE 3.1-1
AREA 3 IMPROVEMENTS

Area 3 Improvements	Description of Improvements		
	Hahamongna Watershed Park Master Plan	Final Master EIR for Arroyo Seco Master Plan* (Master EIR section)	Arroyo Seco Canyon Project
JPL East Parking Lot	Relocate JPL parking, remove southern ¾ of parking lot and convert northern ¼ into public parking.	6-story, 1,200-space parking structure on JPL west parking lot (2.3.1.11.1 and 3.1.4.1.1).	*(Note: This parking structure is under construction by JPL and is not part of the Project.)*
		Convert JPL parking to 200-space public parking (2.3.1.15.1).	Up to 100-space decomposed granite recreational parking lot. *(Note: This is 100 parking spaces fewer than the parking lot analyzed in the Master EIR.)*
New public restroom	New restroom (with 1 urinal and 1 stall for men and 2 stalls for women) at northern end of parking lot, with storage area, public telephone, underground power connection, and sewage lift station and force main leading to the JPL line across the JPL bridge.	New restroom (with 1 urinal and 1 stall for men and 2 stalls for women) at northern end of parking lot, with storage area, trash enclosure, emergency phone, sewage lift station, and force main leading to the sewer line at the JPL campus through JPL bridge (2.3.1.15.2).	New restroom at northern end of parking lot with 2 gender-neutral stalls and sewage lift station and sewer connection leading to the JPL sewer line across JPL bridge. *(Note: This is 1 urinal and 1 stall fewer than the restroom analyzed in the Master EIR.)*
Bridge Crossing	New bridge crossing for the North Perimeter Trail, vehicles, and utilities.	Northern Bridge Crossing across Arroyo Seco that is 12 feet wide and 150 feet long (2.3.1.16.3).	Not proposed, but the existing pedestrian access path across the JPL bridge will be maintained and will connect to the new parking lot.
Spreading Basins	Expand 4 existing basins.	Expand 4 existing basins into the JPL parking lot (2.3.1.4.5).	Expand 4 existing basins.
	Relocate 2 sludge ponds.	Relocate and expand 2 sludge basins (2.3.1.4.5).	Replace 2 sludge ponds with 2 new spreading basins.
	Build 2 new basins.	Build 2 new basins (2.3.1.4.5).	Construct 2 sedimentation basins and 2 spreading basins. *(Note: This is 2 basins more than analyzed in the Master EIR. While the basins would be located in the same area, the area would have a different basin configuration.)*
		Convert 2 basins into a lake (2.3.1.4.5 and 2.3.1.13).	Not proposed.

TABLE 3.1-1
AREA 3 IMPROVEMENTS

Area 3 Improvements	Description of Improvements		
	Hahamongna Watershed Park Master Plan	Final Master EIR for Arroyo Seco Master Plan* (Master EIR section)	Arroyo Seco Canyon Project
Trails	New trail that runs from the north end of the JPL parking lot to the Gabrielino Trail.	4 trail connections from East Rim Trail to Perimeter Trail, including a new trail at the north end of the parking lot (2.3.1.16.5).	Potential future pedestrian pathway from the north end of the parking lot through the slope area to Gabrielino Trail
	Extend East Rim Trail from Arroyo Well to VOC Water Treatment Plant and from Arroyo Well to both the Altadena Crest Trail and the Gabrielino Trail (along back of JPL parking lot).	East Rim Trail is approximately 2,600 linear feet of new trail that runs from the VOC Water Treatment Plant through Johnson Field to the Arroyo Well before ending at the Altacrest Trail on backside of the existing parking lot (2.3.1.16.4).	Pedestrian pathway/trail along the eastern edge of the parking lot, with a potential future extension north to join the Gabrielino Trail north of Area 3.
	Relocate existing trail to the maintenance road.	Relocate the existing trail to the maintenance road (2.3.1.18.2).	Proposed maintenance roads around new spreading basins will be open for public use.
Trailhead	Gabrielino Trailhead area with a new restroom, picnic tables, public parking, and interpretive signage.	Interpretive and picnic area at the intersection of the Arroyo Well and Johnson Field Road, with parking spaces (2.3.1.12.7).	Restroom, pet waste station, and signage proposed at the Gabrielino Trailhead area.
Habitat restoration	Realign stream corridor and restore habitat on banks west of the parking lot and basins.	Move, expand, and restore the stream corridor by the Altadena drain (2.3.1.18.1.1).	No improvements are proposed on the banks west of the parking lot.
	Establish habitat at spreading basins.	Habitat establishment at spreading basins (2.3.1.18.1.3).	Not proposed.
	Establish habitat at the East Entrance.	Habitat establishment at the East Entrance and at Sunset Overlook (2.3.1.18.1.5).	Not proposed.
Pipeline Relocation and Demolition	None specified.	None specified.	Replace and realign Hume line from the north end of parking lot to the spreading basins.
			Relocate the JPL water line to the new access road.
			Demolish a portion of the influent and effluent line from the Behner Water Treatment Plant
			Relocate the 12-inch diameter Arroyo Booster pipeline to the new access road.
			Remove sludge lines.

TABLE 3.1-1
AREA 3 IMPROVEMENTS

Area 3 Improvements	Description of Improvements		
	Hahamongna Watershed Park Master Plan	Final Master EIR for Arroyo Seco Master Plan (Master EIR section)	Arroyo Seco Canyon Project
Storm Drain Improvements	Shorten the Altadena storm drain and armor embankment to reduce erosion and restore habitat.	Shorten the Altadena drain and restore the stream corridor (2.3.1.4.6).	Not proposed.
	Extend the Altacrest storm drain as an underground pipe into the stream with inlets from the access road and the parking lot.	Extend the Altacrest drain as an underground drain between basins and that empties into the stream, with inlets to receive runoff from the parking lot (2.3.1.4.7).	Altacrest drain extension is not proposed
			County Storm Drain remains in place.
Overlook	Construct Sunset Overlook with interpretive signage and park amenities north of the East entrance.	Construct Sunset Overlook with picnic tables, seating, signage, and parking near east park entrance (2.3.1.14).	Not proposed.
Park Entrance	Relocate and improve the park entrance at Windsor/Explorer/Ventura intersection to Windsor/Mountain View.	Relocate the park entrance to Windsor/Mountain View, add a retaining wall, and restore habitat (2.3.1.3.1).	Not proposed.
	Relocate the parking area south of the entrance to the JPL parking lot	Relocate the parking area to the northern end of the JPL parking lot (2.3.1.3.1).	Not proposed.
		Reconstruct Windsor/Ventura intersection; add an interpretive area and a parking area (2.3.1.3.3)	Not proposed.
Access Road	Realign to the east side of the basins.	Realign along eastern edge of the parking lot (2.3.1.3.2).	Realign along eastern side of the basins and south and west of the new parking lot.
	Widen the road to Johnson Field.	Widen the Johnson Field Road to 2 lanes (2.3.1.3.3).	Not proposed.
Pump-Back system	Inlet at dam; pipe at the bottom eastern slope; and outlet at the highest east side basin and across the new bridge to the west side basins	Inlet, pump, and pipes to basins and lakes (2.3.1.4.2).	Not proposed.
Water line	Water line connections to new restrooms, campsite sinks, drinking fountains, and buildings.	None specified.	Connect the restroom and parking lot irrigation system to a metered service from the relocated JPL water main.

TABLE 3.1-1
AREA 3 IMPROVEMENTS

Area 3 Improvements	Description of Improvements		
	Hahamongna Watershed Park Master Plan	Final Master EIR for Arroyo Seco Master Plan* (Master EIR section)	Arroyo Seco Canyon Project
Overhead power and communication lines	Relocate to the North Bridge crossing or within the utility easement.	Relocate power and communication lines.	Not proposed.
	Power connections to new restrooms and pump-back system.	None specified.	Connect the restroom, irrigation controls, and basin metering structure to a new service drop using an existing overhead line in Area 3 (where the biggest load will come from the lift station).
	Underground PWP overhead distribution lines from the VOC Water Treatment Plant to Arroyo Well and from the VOC Water Treatment Plant to Johnson Field.	Underground 3,000 feet of power and communication lines from the VOC Water Treatment Plant to Arroyo Well and from the VOC Water Treatment Plant to Johnson Field (2.3.1.19.1).	Not proposed.
	Relocate SCE lines running from the JPL substation to the Windsor/Ventura intersection.	Realign the SCE power line across the basins to the North Bridge, Gabrielino Trail, Ventura Street, and ultimately to the existing line on Altadena Drive (2.3.1.19.2).	Not proposed.
Septic Tanks and Sewer lines	Abandon all septic tanks and construct a sewer collection system.	Connect a new restroom near Johnson Field to the sewer line on Lehigh Street (2.3.1.12.3) and connect a new restroom at the JPL parking lot to the sewer line in JPL campus (2.3.1.15.2).	Connect a restroom to sewer line in JPL campus.
Security gates	Add security gates at all vehicular entries and at the tunnel from the dam parking lot.	Add gates and fencing at the East Entrance and along west side of Windsor Avenue (2.3.1.20).	Not proposed.
		Add fencing at end of Altadena Drive (2.3.1.20).	Not proposed.
			Add security gates at the north end of the parking lot, with a roundabout and a guard house

TABLE 3.1-1
AREA 3 IMPROVEMENTS

Area 3 Improvements	Description of Improvements		
	Hahamongna Watershed Park Master Plan	Final Master EIR for Arroyo Seco Master Plan* (Master EIR section)	Arroyo Seco Canyon Project
Lighting	Add lighting on built structures and at major park entrances only.	Add safety lights at the new parking lots and at the new restrooms (3.1.4.1.1).	Add restroom interior and exterior lighting.
Public telephones	Add near improved restrooms and recreation amenities.	Add at the new restroom at north end of the public parking lot (2.3.1.15.2).	Not proposed.

JPL: Jet Propulsion Laboratory; VOC: volatile organic compounds; PWP: City of Pasadena Water and Power; SCE: Southern California Edison.

* Based on the Final Master EIR that includes Draft Master EIR and Clarifications and Revisions to Draft Master EIR (Section 12.0 of the Final Master EIR).

136

As shown, the Project would implement some of the improvements proposed by the HWMP and analyzed in the Final Master EIR for the Arroyo Seco Master Plan. However, the Project proposes a recreational parking lot and a restroom that are smaller than those analyzed in the Final Master EIR. There is also a variation to the spreading basin configuration within the same location and area. Other proposed improvements in Area 3 (e.g., proposed trails, walkway, hume line relocation, JPL water line relocation, utility line demolition in the proposed basin area, water line connection, security gates, roundabout, and guard station at north end of parking lot) are not discussed in the HWMP or the Final Master EIR. At the same time, the Project does not preclude the future implementation of other improvements in Area 3 (e.g., storm drain improvements, trail relocation, pumpback system, and utility line relocations) as contained in the HWMP or analyzed by the Final Master EIR but not proposed by the Project. Accordingly, this IS/MND is a stand-alone document and does not tier off of the Master EIR.

3.2 PROJECT DEMOLITION AND CONSTRUCTION

Construction of the permanent Project improvements is anticipated to take approximately 16 months, starting in Summer 2015 with construction of the temporary bridges beginning one month before the start of construction activities in Areas 1 and 2. Designated staging areas will be fenced to prevent safety hazards, as well as deter to vandalism and theft. Project completion is expected by Fall 2016, with temporary bridge demolition occurring at the end of construction activities in Areas 1 and 2. Planned construction activities are broken out by Area below.

During grading activities in Area 3, a total of approximately 23,000 cy of cut materials is anticipated. In the interest of minimizing export from the Project site, the City may implement a mechanical shaker to sort and sift through excavated soils. The shaker would separate finer soils from larger rocks, thereby allowing for the beneficial reuse of the excavated soils as engineered fill materials during the construction of the spreading basins. The shaker would be in operation for 8-hour days over the last 2 months of grading activities. If the City utilizes the shaker option, approximately 23,000 cy of cut materials would be processed through the shaker, resulting in approximately 21,000 cy of material for fill (to be used on-site) and approximately 2,000 cy of larger rock materials. These 2,000 cy of rock materials may be used on-site for decorative/landscaping purposes throughout the Project study area, or may be exported off-site. For the sake of providing a conservative analysis, both the Air Quality, Noise and Traffic sections of the IS/MND assume export of these materials.

Table 3.2-1, Construction Activity Assumptions, summarizes the anticipated construction activities for each area.

TABLE 3.2-1

sf: square feet; ac: acres; cy: cubic yards; N/A: not applicable.

[a] Assumes 2 temporary bridges will be built, with a temporary bridge over Bridge No. 1 and another temporary bridge over Bridge No. 3.

[b] In addition to the listed equipment, the following equipment would be shared among any 1 of the 3 work areas: medium-duty trucks (<10), all-terrain forklift (1), front-end loader (1), water truck, portable generator, and hand tools (e.g., grinders, drills, compressors).

[c] In order to provide a conservative assessment to account for the unknown variation in the amount of soil that could be re-used onsite for engineered fill versus exported off-site, the number of truck trips was increased by assuming the use of 10 cy trucks instead of the standard 16 cy trucks.

Source: Carollo 2013.

Trucks hauling soils and debris to Scholl Canyon Landfill are expected to come to the site from I-210 at the Windsor Avenue off-ramp and head north on Windsor Avenue to Explorer Road into Area 3. From Area 3, trucks would turn southeast and north to the access road (North Arroyo Boulevard) to reach Areas 1 and 2. From these areas, the trucks would head south and pass through Area 3, Explorer Road, Windsor Avenue, and onto the westbound on-ramp on I-210. From I-210, trucks would head west on SR-134; exit at the Figueroa Street/Scholl Canyon Road off-ramp; head north-northeast toward the landfill. Trucks would come back from the landfill entering the eastbound on-ramp on the SR-134 at Figueroa Street and head east; trucks would then go west on I-210 to Windsor Avenue to Explorer Road and, ultimately, to the site.

EXHIBIT B

Agenda Report

June 19, 2017

TO: Honorable Mayor and City Council

FROM: Water and Power Department

SUBJECT: **AUTHORIZE THE CITY MANAGER TO AMEND CONTRACT NO. 30723 WITH TOBY B. HAYWARD, INC. TO FURNISH LABOR AND MATERIALS FOR CONSTRUCTION OF TEMPORARY BRIDGES AT ARROYO SECO CANYON**

RECOMMENDATION:

It is recommended that the City Council:

1. Acknowledge that a lawsuit was filed against the City seeking to invalidate the City's approval of the Initial Study Mitigated Negative Declaration ("IS/MND") for the underlying Arroyo Seco Canyon Project, the court issued a decision in March 2017 partially against the City, the City is currently awaiting the terms of a final judgment which may allow the work proposed herein to move forward, and such work will only move forward if in compliance with the judgment; and

2. Authorize the City Manager to amend Contract No. 30,723 with Toby B. Hayward, Inc. to extend the contract duration by an additional one year with an option for three additional one-year terms subject to the approval of the City Manager, and increase the contract not-to-exceed amount from $440,000 to $470,000 to provide labor and materials for the construction of the temporary bridges at Arroyo Seco Canyon.

3. To the extent this could be considered a separate procurement subject to the Competitive Selection process, grant the contract an exemption pursuant to Pasadena Municipal Code (PMC) Section 4.08.049(B), contracts for which the City's best interests are served.

BACKGROUND:

The Water and Power Department ("PWP") is proposing to repair and replace facilities within the Arroyo Seco Canyon area that were damaged by events related to the 2009 Station Fire. Through enhancements located in three areas of the Arroyo Seco, the project will also allow for the increased utilization of existing surface water rights held by the City, improve water quality in the canyon, improve biological habitats, restore hydrological

function, and improve ecosystem health. The proposed improvements are collectively referred to as the Arroyo Seco Canyon Project ("ASCP") and are scheduled for construction in 2017.

Two existing bridges in the Arroyo Seco Canyon do not have the capacity to support loads from construction equipment that will be needed for the ASCP. Specification WD-16-01 includes the construction of temporary structures that will allow transport of heavy equipment and materials over two existing bridges and provide protection to the railing of a third bridge in advance of the planned ASCP construction.

On September 12, 2016, City Council authorized the contract with Toby B. Hayward, Inc. to furnish labor and materials for construction of temporary bridges at Arroyo Seco Canyon based on competitive bid results. The contract was signed on November 21, 2016 for an amount not to exceed $440,000. Since the date of contract execution, Toby B. Hayward Inc. completed the construction of the first temporary bridge, and began procuring materials and fabrication for the construction of the second temporary bridge.

On July 2, 2015, two petitioners jointly filed a lawsuit against the City seeking to invalidate the City's approval of the California Environmental Quality Act ("CEQA") IS/MND. On March 23, 2017, the court issued a ruling that was unfavorable to the City; PWP instructed Toby B. Hayward Inc. to put the remaining construction of the second temporary bridge on hold, which otherwise would have been completed in approximately 45 days. On May 2, 2017, the City issued a proposed writ of mandate. However, as of May 30, 2017 the court had not issued the terms of the judgment, which would state which components of the ASCP, including the temporary bridges, will be allowed for construction.

Contract 30,723 with Toby B. Hayward Inc. expires on June 30, 2017. Staff recommends that the City Council approve an initial one-year extension to June 30, 2018 with an option for three additional one-year terms, and increase the contract amount from $440,000 to $470,000. The increased amount will cover remobilization costs resulting from the hold placed on the project and the extension of its duration. The additional costs include lease of equipment and materials, storage of materials that have been fabricated or partially fabricated, but not yet installed, and labor expenses representing the short period when the work was placed on hold, but believed to resume before contract expiration.

Staff's recommendation to extend the contract by at least one year will allow for a thorough evaluation of the City's options, which include permanent repair and strengthening of the bridge or to proceed with the temporary bridge as the preferred alternative. If the final ruling allows the work to move forward, and the evaluation of options leads to the conclusion that a continuation of the current contract remains in the best interest of the City, then the extension will also provide sufficient time to complete the second temporary bridge. Depending on the outcome of the final judgment, PWP may opt not proceed with the work, in which case staff will negotiate contract termination terms with the contractor. The optional one-year extensions may be needed depending on the timing of the final judgment and resulting additional delays to the work.

The contract amount includes a 15% contingency of $57,400 to accommodate any necessary change orders as a result of unforeseen conditions, including environmental mitigation and logistical challenges due to the location of the work in the Arroyo Seco. To date, $5,295 of this contingency has been committed. Not including contingency, the balance remaining on the contract for authorized work and retainage is $227,609.

COUNCIL POLICY CONSIDERATION:

The contract is consistent with the Public Facilities Element of the General Plan and supports the City Council's goal to improve, maintain and enhance public facilities infrastructure, and to implement capital improvements that will maintain and rehabilitate infrastructure.

ENVIRONMENTAL ANALYSIS:

In compliance with CEQA, an Initial Study ("IS") was prepared as documentation to support a Mitigated Negative Declaration ("MND") for the ASCP. The IS/MND was approved by the City's Hearing Officer at a public hearing on January 7, 2015. Subsequent appeals were filed challenging this decision, but ultimately City Council adopted the IS/MND after a public hearing on June 1, 2015. During the 30-day period set by filing the Notice of Determination, a lawsuit was filed against the City seeking to invalidate the City's approval of the IS/MND. The court issued a decision in March 2017, and the City is currently awaiting the terms of the judgment. The work provided for in this contract will only move forward in compliance with the terms of the judgment.

FISCAL IMPACT:

The cost of this action will be $309,720, which includes the balance of the contract amount of $227,609, plus remaining contingency of $52,105, plus additional costs of $30,000. Funding for this action will be addressed by the utilization of existing appropriations in the Water System Capital Improvement Program Budget Number 1040 – Arroyo Spreading Basins & Intake Structures. It is anticipated that 100% of the cost will be spent during fiscal year 2018. In addition, it is anticipated there will be $50,000 in additional costs for contract administration, and inspection as a result of this action. The total fiscal impact will be $359,720.

The following table presents the fiscal impact summary:

Remaining Authorized Work	$227,609
Proposed Increase	$30,000
Remaining Contingency	$52,105
Total FY18 Contract Amount	**$309,720**
Contract Administration	$ 30,000
Inspection	$ 20,000
Total Fiscal Impact	**$359,720**

The ASCP, including the temporary bridge work, is partially funded by a Proposition 84 grant from the California Department of Water Resources. It is not known at this time what effect the outcome of the lawsuit will have on reimbursement of temporary bridge costs. There is no anticipated impact to other operational programs or capital projects as a result of this action.

Respectfully submitted,

Gurcharan S. Bawa
General Manager
Water and Power Department

Prepared by:

Michael Tse
Associate Engineer

Approved by:

STEVE MERMELL
City Manager

PROOF OF SERVICE

STATE OF CALIFORNIA, COUNTY OF LOS ANGELES

I, CLAIRE A. VORHIS, hereby declare and state:

I am employed in the County of Los Angeles; I am over the age of eighteen years and not a party to the within entitled action. My business address is 100 North Garfield Avenue, Suite N210, Pasadena, California. My mailing address is PO Box 7115, Pasadena, CA 91109-7215.

On June 20, 2017, I served the foregoing document described as:

DECLARATION OF GARY TAKARA IN SUPPORT OF CITY OF PASADENA'S [PROPOSED] JUDGMENT

on the interested parties by placing a true copy thereof enclosed in a sealed envelope addressed as follows:

SEE ATTACHED SERVICE LIST

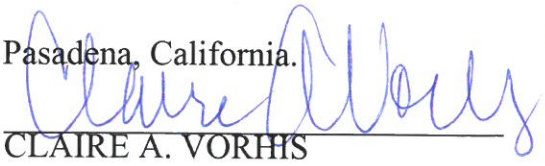
[ ] BY FACSIMILE: Based on an agreement of the parties to accept service by fax transmission, I faxed the documents to the persons at the fax number. No error was reported by the fax machine that I used. A copy of the record of the fax transmission, which I printed out is attached..

[ ] BY MAIL:

[ ] As follows: I am "readily familiar" with the City's practice of collection and processing correspondence for mailing. Under that practice it would be deposited with U.S. postal service on that same day with postage thereon fully prepaid at Pasadena, California, in the ordinary course of business. I am aware that on motion of the party served, service is presumed invalid if postal cancellation date or postage meter date is more than one day after date of deposit for mailing in affidavit.

[ ] I deposited such envelope in the mail at Pasadena, California. The envelope was mailed with postage fully prepaid.

[ ] BY PERSONAL SERVICE:



[ ] I delivered such envelope by hand to the offices of the addressee pursuant to CCP § 1011.

[X] BY EMAIL OR ELECTRONIC TRANSMISSION:

[X] Based on an agreement of the parties to accept service by e-mail or electronic transmission (with a courtesy hard copy should any document exceed 30 pages), I caused the documents to be sent to the persons at the e-mail addresses listed above. I did not receive, within a reasonable time after the transmission, any electronic message or other indication that the transmission was unsuccessful.

I declare under penalty of perjury under the laws of the State of California that the above is true and correct.

EXECUTED on June 20, 2017, at Pasadena, California.

CLAIRE A. VORHIS

STATEMENT OF DECISION ON PETITION FOR WRIT OF MANDATE

SPIRIT OF THE SAGE COUNCIL, PROJECT SOLITON v. CITY OF PASADENA, CITY OF PASADENA WATER AND POWER, Case No. BS 156207

Petitioners Spirit of Sage Council and Project Soliton ("petitioners") seek a writ of mandate to compel respondents City of Pasadena and the City of Pasadena Water and Power ("City") to set aside the June 1, 2015 approval of the Arroyo Seco Canyon Project (the "Project"). Petitioners allege the City approved the Project in violation of the California Environmental Quality Act ("CEQA"), Public Resources Code section 21000 et seq. because, petitioners argue, the City was required to prepare an environmental impact report ("EIR") for the Project. The City approved the Project with a mitigated negative declaration ("MND"), finding that the environmental impacts caused by the Project would be mitigated to a less than significant level by mitigation measures.

THE PROJECT IN AREA 2 WILL DIVERT WATER FROM THE ARROYO SECO:

Arroyo Seco Canyon channels a stream known as the Arroyo Seco. The Arroyo Seco carries rainwater runoff from the San Gabriel Mountains, north of Pasadena, to a reservoir created by Devil's Gate Dam, above the Rose Bowl. The City has legally adjudicated water rights permitting it to take water from the Arroyo Seco for City use.[1] The City diverts the water it takes from the Arroyo Seco through a pipeline to spreading basins that are located about 3,000 feet to the southeast, next to the JPL east parking lot. Water in the spreading ponds percolates into an aquifer (the Raymond Basin Aquifer) from which Pasadena draws well water. The recharging of the aquifer increases the safe yield that can be obtained from the aquifer, allowing Pasadena's municipally owned water system to obtain a greater share of its potable water from the local wells rather than by purchasing more expensive water from the Metropolitan Water District.

The City maintains a low dam (3 ft., 6 inches in height) across the Arroyo Seco to divert water into the pipeline for carriage to the spreading grounds. The proposed Project will install a weir that can be operated to raise the dam height

---

[1] The City is authorized to take 18,096 acre feet of water per year from the Arroyo Seco, but the City's historical average diversion has been 2,532 acre feet per year.

and will upgrade the diversion intake so as to allow the City to take more water. The proposed Project will also expand the capacity of the spreading basins. These improvements are expected to increase the diversion from a current average of 2,532 acre feet/year by an additional 1,100 acre feet/year. (AR184.)

A major purpose of the Project is to repair and improve the City's water diversion facilities to "allow [for] the increased utilization of the surface water rights held by the City." (Quoted from the public hearing Notices, AR 8113, 8046, and 7966.)

The Arroyo Seco exits from the Canyon about a half mile below the diversion site, crosses alluvial soils for about another half mile and then is captured in the reservoir behind the Devil's Gate Dam. (AR 172.)

The Project proposes improvements in three geographical areas: in Area 1, at the Arroyo Seco headwaters; in Area 2, at the Arroyo Seco diversion intake; and in Area 3, at the spreading basins, as well as a temporary staging site. (AR 103.) The Project will also construct park amenities along the banks of the Arroyo Seco. The Project is not challenged as to the park amenities nor as to the improvements in Area 1.

Petitioners' principal challenge to the Project relates to Area 2. Petitioners challenge the Project because the improvements proposed at the dam site are intended to and will result in a greater water diversion from the Arroyo Seco. The diversion will reduce water availability downstream from Area 2 and will, as the City concedes, have significant impacts on the downstream biological communities.

SUMMARY OF COURT'S CONCLUSIONS:

CEQA requires the City to prepare an Initial Study to identify "potentially significant effects on the environment." Based on the Initial Study "[i]f there is substantial evidence, in light of the whole record ..., that the project may have a significant effect on the environment, an environmental impact report shall be prepared." However, a negative declaration is to be prepared if either: (1) there is no substantial evidence that the project will have a significant impact on the environment, or (2) the potentially significant environmental effects can be avoided or mitigated to a point "where clearly no significant effect on the environment would occur through mitigation measures agreed to by the applicant." Public Resources Code section 21080, subds. (c), (d) and (e).

Petitioners preliminarily argue that the notices for the public hearings did not "substantially comply" with Public Resources Code section 21092, subd. (b)(1) in requiring that the public notice shall contain "a brief description of the

proposed project and its location, the significant effects on the environment, if any, ..." The Court decides this issue in the City's favor.

Petitioners' main contention is that CEQA requires that the City prepare an EIR to evaluate the water diversion impacts caused by the improved dam/weir and enhanced ponding capacity. The court agrees that a "fair argument" is made that the reduced water flow caused by the improved diversion facility may have a significant and unmitigated effect on the environment. The Project, because it significantly reduces the water available to biological resources in the Arroyo Seco, requires the preparation of an EIR. Public Resources section 21151(a); Guidelines 15064(a)(1).

Petitioners argue that the mitigation measures required for the MND impermissibly defer the setting of mitigation standards to future actions and, therefore, are inadequate. The Court decides this issue in petitioners' favor.

ISSUE 1: CITY'S NOTICES OF PUBLIC HEARINGS SUBSTANTIALLY COMPLY:

Petitioners argue that the City's public notices for the Project hearings violated CEQA because they "omitted the construction of the Diversion Dam." Pet. Br. 7: 12-13. They further argue that the City's notices did not substantially comply "when it failed to inform the public the project would raise the height of the dam and increase diversions, potentially resulting in the downstream impacts to habitat and wildlife." Reply 2: 14-15. The Court rejects these contentions because the City's public notices substantially complied with the notice content required by CEQA.

A. The Substantial Compliance Standard.

CEQA specifies the content required for notices of public hearings for projects requiring CEQA compliance. Public Resources section 21092 provides:

> "(a) A lead agency that is preparing an environmental impact report or a negative declaration ... shall provide public notice of that fact ... prior to the certification of the... adoption of the negative declaration ....
>
> "(b) (1) The notice ... include the date, time, and place of any public meetings or hearings on the proposed project, **a brief description of the proposed project and its location, the significant effects on the environment, if any, anticipated as a result of the project** ....
>
> "(2) This section shall not be construed in any manner that results in the invalidation of an action because of the alleged inadequacy of the notice content **if there has been substantial compliance with the notice content requirements of this section**." [bolding added.]

The City's Notices challenged by the petitioners are the Notice of Public Hearing (before a hearing officer) on November 19, 2014 (AR 8113); the Notice of Public Hearing before the Board of Zoning Appeals on March 4, 2015 (AR 8046); and the Notice of Public Hearing before the City Council on June 1, 2015 (AR 7966). These three Notices use the same language to describe the physical Project, saying:

> "The applicant ... submitted a Conditional Use Permit application to allow the repair and replacement of facilities within the Arroyo Seco Canyon Area that were damaged or destroyed by Station Fire-related events of 2009. The improvements will also allow the increased utilization of surface water rights held by the City, and will improve water quality in the canyon; improve biological habitats ... through the following enhancements: [ ] 1) Naturalize the Arroyo Seco streambed; 2) Remove exposed portions of existing infrastructure designed for sediment removal; 3) Restore and improve intake facilities; 4) Expand recharge operations by creating additional spreading basins...."

The three Notices also refer readers who want more information to the City's website to view the Project documents. The City mailed the Notices to more than 90 organizations and to about 450 individuals and also posted the Notices in and around the Project sites. (SAR 22, 30-50.)

The Notices provided a sufficient description that the project would include water diversion from the Arroyo Seco and would repair existing structures in the stream bed for that purpose. The Project, the Notices said, would "Restore and improve the intake facilities" and "Expand recharge operations by creating additional spreading basins" so as to increase the City "utilization of surface water rights."

The Notices that were mailed to Pasadena organizations and residents, moreover, state: "The improvements will also allow the increased utilization of surface water rights held by the City" and to do that the Project would "restore and improve intake facilities." Pasadena readers can be assumed to have been aware of structures in the Arroyo Seco stream bed that were used in conjunction with the City's water system. It was not necessary that the Notices advise that the Project would include what petitioners refer to as "the construction of a Diversion Dam" because the diversion dam already existed. The Project will add a weir to the dam and, thus, heighten the barrier.

Petitioners correctly state that the repaired dam plus the new weir when raised will increase the height of the diversion structure by three feet, to approximately 5 feet, 10 inches above the stream bed. (SAR 147.) Petitioners appear to argue that this fact should have been included in the information

provided in the Notices. See, Reply 4:14. There is no evidence that the diversion structure will be significantly more visible, however. The record indicates that the dam and proposed weir are at the bottom of a narrow, steep-sided canyon and will be attached to an existing 9 foot high retaining wall. (AR 105, 80 and 8666.) The Initial study finds: "The Project will not lead to major permanent changes in the visual quality of the Arroyo Seco Canyon." AR (293.) The height of the weir at the bottom of the Canyon is a detail that was not required to mentioned specifically in the public Notices.

The Court concludes that petitioners do not establish that the public Notices violate Public Resources Code section 21092 (b)(1).

B. Exhaustion of Administrative Remedies Defense.

The City also raised the exhaustion of administrative remedies defense. Ans.,1st Aff. Defense; Opp. p. 9. "No action or proceeding may be brought ... unless the alleged grounds for noncompliance with this division were presented to the public agency orally or in writing during the public comment period ... or prior to the close of the public hearing on the project before the issuance of the notice of determination." Pub. Resources Code section 21177(a). The exhaustion of administrative remedies is jurisdictional. *Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 535.

The issue raised by petitioners—the asserted inadequacy of the public notices to state the height and purposes of the weir that was to be added to the existing dam—was not preserved for trial. No objection on this basis was made before the Project was approved. The California Department of Fish and Wildlife in a letter suggested that the description be clarified (SAR 128), but its recommendation does not establish that the Notices lacked the "substantial compliance" required by statute. Petitioner Spirit of the Sage Council complained about the project description but that concerned a different issue, namely the removal of native sage at the spreading basins. (AR 4132.) The issue of the height or the purposes of the dam and weir structure not having been raised, the issue was not preserved for this proceeding. "The petitioner bears the burden of demonstrating that the issues raised in the judicial proceeding were first raised at the administrative level." *Ibid.* at 536.

ISSUE 2: THE PROJECT DESCRIPTION IN THE MND IS NOT INADEQUATE:

Petitioners similarly argue that the MND violates CEQA because it fails to the highlight the height of the dam plus the weir (when raised) will be three feet higher than the existing dam. See, Reply 4:14, citing AR 124. This argument is not persuasive. The entire thrust of petitioners' argument is that because the weir will add to the height of the dam more water can be captured and diverted

by the Project. That the Project will capture more water because of the added weir is thoroughly discussed under other headings by the MND.

The Court also agrees with the City's argument that the issue has not been administratively adjudicated because it was not raised in the administrative record. Opp. p. 9. Petitioners in their reply refer to various statements that they argue could have alerted the City to revise its description in the MND/IS. Reply p. 4. The purpose of raising the issue during the review period is to notify the City of something that an objector thinks is important. *Sierra Club v. City of Orange*, 163 Cal.App.4th, *supra*, at 535 ("The exact issue must have been presented to the administrative agency ....") Petitioners failed to do this, and thus waived the argument.

BIOLOGCIAL RESOURCES WILL BE IMPACTED BY REDUCED STREAM WATER:

The City in its Initial Study made findings that the Project would have "potentially significant effects on the environment" in the stream bed below Area 2.

> "Project objectives include restoring the diversion capacity to its pre storm-drainage level, as well as increasing diversions to capture an additional 1,100 acre-feet annually. As a result, Project flows downstream from the diversion point in Area 2 will be reduced to some degree relative to both current and historic conditions." (AR 183.)

The Initial Study indicates the effect of the reduced water flow below Area 2 will continue until the Arroyo reaches "the riparian woodland of the [Devil Gate] reservoir [where] the species richness and population size is expected to increase substantially." (AR 183.) The Initial Study states that the stream bed leaves the Canyon near the JPL site, thereafter flowing "across alluvial deposits with limited vegetation until reaching a large (0.25 mile by 0.40 mile) riparian woodland that occupies the occasionally flooded alluvial deposits behind Devil's Gate Dam." Id. The court concludes from this description that the section of the stream bed where vegetation and species are potentially affected by the reduced flows after the diversion point is limited to a linear distance of about one-half mile, e.g. the distance between Area 2, where the diversion occurs, to location where the stream bed exits the Canyon and enters a "sandy wash" with sparser vegetation is about 0.40 of a mile.

The biological resources downstream of Area 2 in the Canyon are described as "abundant" and "rich." The Arroyo Seco supports a variety of plants and many wildlife species. (AR 109-110.) The Initial Study states:

> "Plant and wildlife resources between the diversion point and the canyon mouth are expected to be very similar to those described for Areas 1 and

2. Due to the abundance of native vegetation, undeveloped lands, and riparian resources, the area is generally rich in native wildlife species diversity and abundance. A large portion of these species is likely to be dependent specifically on the stream and riparian habitat as a core resource. Exiting the canyon and crossing approximately 0.75 mile of mostly unvegetated sandy wash, plant and wildlife diversity is expected to drop off substantially as the area is suitable for fewer species and lower numbers of individuals." (AR 183.)

(About one quarter mile downstream from the diversion site, another, smaller stream known as Millard Creek joins the Arroyo Seco and contributes new water to the Arroyo Seco stream. (AR 105.) The Court did not find data in the administrative record as to the significance of the quantity of water that Millard Creek adds to the Arroyo Seco downstream from the diversion site.)

THE ARROYO SECO STREAM IS SUBJECT TO VARIABLE WATER FLOWS:

The quantity of water flowing through the Arroyo Seco depends solely on rainfall runoff from its catchment area. The rainfall, as typical in Southern California, is seasonal (concentrated in the winter months) and cyclical (highly variable year by year). The City for its Initial Study hired the preparation of a hydrology study (AR 6359 et seq.) and, earlier, a conceptual design report.

The record at AR 8613 provides a hydrology chart showing, for a 22 year period (1990-2011), the historic water volumes and diversion volumes for the Arroyo Seco. The City then, from this 22 years of data, prepared a bar chart titled "Average Year Stream Volume and Diversion Volume" that reports the average volume of water by month that is (a) received in the Arroyo Seco and (b) diverted for City use. (AR 763.)

As the bar chart demonstrates, the Arroyo Seco receives most of its rain runoff from winter storms in December, January, February and March. The City, in those months, diverts only about a quarter of the water flow. That is because the rain runoff from storm events in the winter months often carries heavy sediment, and the City deems such water as unsuitable for deposit in the spreading basins. (See, AR 8613, bottom.)

The Arroyo Seco receives little runoff water in the months of July, August, September, October and November. The City diverts little or no water in those months, according to the bar chart.

The greatest diversion from existing water flow caused by the Project improvement will occur in the months of April, May and June. According to the averages shown on the bar chart (again, AR 763), when the diversion facility is

completed and operating, it will permit the City to take for City use most of the Arroyo water flow in April and May and all of the water flow in June.

The data permits these conclusions based on 22-year averaging. At present the Arroyo Seco downstream from Area 2 receives no stream water flow because the City diverts the available water in the months of July, August, September, October and November. And, when the Project is complete and put into its planned operation to allow greater diversion, the Arroyo Seco below Area 2 will, additionally, receive no stream water in June and substantially less stream water in April and May. The City will then impound and divert all stream water reaching Area 2 during the months of June, July, August, September, October and November, depriving the downstream of any replenishment water in those months. (AR 7630.)

These conclusions, it should be cautioned, are based on rainfall runoff and diversion quantities that have been averaged from 22 years of data. There is significant variability in the underlying data. (See, AR 8613.) The average will not predict what will occur in any given year, and it is what occurs in particular years that will impose actual impacts on the downstream habitats. Species, and, to a lesser degree, plants, rely upon the moisture that is available when needed rather than on average moisture calculations that may be derived from multi-year data.

The plants and species in the Arroyo have experienced dry years in which water flow below the diversion site has been limited to the winter months with most of that flow occurring in the single month of February. And, with the increased diversion allowed by proposed Project, there will be no water flow past the diversion site except for February in those dry years. See bar chart titled "Average Dry Year Volume and Diversion Volume" showing water flow and diversion by month for the water years 1990, 2002, 2004 and 2007. (AR 759.)

ISSUE 3: BASELINE WATER AVAILABILITY IS PROPERLY BASED ON AVERAGE RAINFALL DATA:

The determination of the baseline water flow in the Arroyo Seco is critical to evaluating the degree to which an increase in the water diversion at the intake facility will produce impacts downstream from Area 2. The parties dispute the manner in which the baseline should be determined.

The City's MND used water data over a 22 year period to determine average water flows in the Arroyo Seco, as well as to determine water flow averages in "dry," "average" and "wet" years. Petitioners argue that the City improperly utilized historical water data to obtain water flow averages rather than using the actual flow from a single year (which petitioners claim will establish "existing conditions"). Pet. Br., Part D, pp. 12-13.

The Court finds that there is substantial evidence supporting the City's averaging methodology because the environmental impacts being measured are influenced by factors such as rainfall that vary significantly year to year. The environmental impacts downstream from Area 2 on biological resources will be determined initially from the rainfall in the catchment areas. The City describes the diversion amounts taken from the water flow as "highly variable through the years" and states that such variability is affected by "available stream flows, season of availability, recharge basin saturation, flow volume, water rights thresholds, and other [factors]." (AR 183-184.) As a result:

> "The effect of these reduced flows on biological communities downstream is difficult to measure. Reduced flows in general can cause shorter distances of available surface water; short duration of pooling; reduced extent of moist soils moving away from the stream bed and reduced stream velocities resulting in reduced sediment transport. These and other effects may impact species and vegetation communities depending on such resources and processes." (AR 184.)

As the downstream habitats of the biological resources are greatly affected by water availability, and that availability varies significantly year to year (AR 6369 et seq.), the best evidence of water availability is derived from multi-year records.

The California Department of Fish and Wildlife Services ("CDFW") recognizes the variability of water flow in the Arroyo Seco over time and for that reason recommended that the City obtain data over a multi-year period. The Service, in its letter to the City dated November 14, 2014, cautioned against relying on single site visits and recommended:

> "The Department recommends that Post-project riparian impact monitoring be conducted over a period of time that includes a wide range of expected precipitation cycles (drought, average and above average) during which the riparian vegetation response can be evaluated to represent a more accurate response to reduced flows from the Project." (SAR 121.)

This CDFW recommendation refers to the monitoring that is to occur after the Project is completed, but the CDFW letter nonetheless recognizes that Southern California rainfall is highly variable, and, therefore, requires consideration of physical conditions that are affected by the water available from such rainfall over a period of time.

The Guidelines recognize this issue through the insertion of the word "normally" when referring to obtaining data for baseline purposes. Guidelines section15125 provides that in the preparation of an EIR a description of the

physical environmental conditions must be prepared "as they exist at the time the notice of preparation is published." This direction, however, is qualified by the assumption that that baseline "will normally constitute the baseline physical conditions [to] determine whether an impact is significant." Here, because the water flows in Arroyo Seco are determined by rainfall, and annual rainfall varies significantly, the Guidelines allow that the baseline may be established over a suitable period of time to reflect the variable rainfall conditions. The Court concludes that the City has appropriately used a multi-year period to determine the water flow in the Arroyo Seco.

ISSUE 4: THE INCREASED WATER DIVERSION CAUSED BY THE PROJECT REQUIRES THE PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT:

A. The Non-Deferential "Fair Argument" Standard Applies:

The preparation of an EIR is required when a project "may have a significant effect on the environment." Public Resources sections 21080(d) and 21151(a); Guidelines 15064(a)(1). Conversely, an agency may adopt a negative declaration only if there is no substantial evidence that the project "may have a significant effect on the environment." Public Resources section 21080(c)(1) and (2); Guidelines 15070(a).

The City concedes that the project will have a significant environmental impact because the proposed dam/intake facility will divert significantly more water than at present and, thus, will decrease the water availability downstream, particularly during the summer and fall months, causing impacts to biological resources. (AR 183-184.) The City argues that the preparation of an EIR is not required because with the implementation of specified mitigation measures the adverse environmental impact will be reduced to a level that is not significant. Opp., p. 17, citing AR 6365-6366, relying on Public Resources section 21080(c); Guidelines 15070(b).

This Court is to review the agency's decision to adopt a negative declaration using the "fair argument" test, under which the agency is to prepare an environmental impact report if substantial evidence supports a fair argument that the proposed project "may have a significant effect on the environment." If such evidence is found, it cannot be rebutted or overcome by substantial evidence to the contrary. *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359, 1399-1400.

Whether the agency's record contains substantial evidence that would support a fair argument that the project may have a significant effect on the environment is a question of law. See, *Consolidated Irrig. Dist. v. City of Selma* (2012) 204 Cal. App.4th 187, 207. Where there is a genuine dispute as to the sufficiency of mitigation measures approved in an MND, an EIR is required

because it is the function of an EIR, and not a negative declaration, to resolve conflicting claims as to the environmental effects of a project. *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 935; see also, *Friends of "B" Street v. City of Hayward* (1980) 106 Cal.App.3d 998, 1002.

An agency that approves a project with a negative declaration or a mitigated negative declaration in the face of substantial evidence supporting a fair argument that the project may have a significant environmental effect abuses its discretion under the law, requiring the court to void the approval of the MND. *Gentry v. City of Murrieta*, 36 Cal.App.4th *supra* at 1412.

B. **There Are "Fair Arguments" that Reduced Water Flow Will Adversely Impact the Downstream Biological Communities:**

The City's Project will reduce water flows in the Arroyo Seco below Area 2. While it is agreed that diminished water flows will have impacts on the biological communities downstream of Area 2, the extent of those impacts and their significance to the biological communities are not explained in the administrative record. The significance of those impacts to the biological communities, therefore, is open to "fair arguments" that, if supported by substantial evidence, require the preparation of an EIR.

Petitioners argue that the effects on the downstream habitats from the Project will be significant. Pet. Br., pp.17-18. This argument is supported by substantial evidence. Arroyo Seco's habitat downstream from Area 2, like the upstream habitat, is abundant in native plants and wildlife. (AR 183.) "A large portion of these species is likely to be dependent specifically on the stream and riparian habitat as a core resource." (AR 183.) "The effect of these reduced flows on biological communities downstream is difficult to measure. ... These and other effects may impact species and vegetation communities dependent on such resources and effects." (AR 184.) The MND does not provide a baseline from which any adverse impacts on the biological communities caused by the reduction in water flows can be measured. Given the uncertainty of the Project's effect, the impact on biological resources including vegetation and wildlife species that may occur, must be considered potentially significant. (AR 184.)

The preservation of fish and wildlife, in all of its variety, is a CEQA goal. Public Resources section 21001(c). Petitioners argue that the Project may have significant impacts on special status species. Pet. Br., pp. 18-19. This argument is supported by substantial evidence. Adverse impacts are predictable due to reduced water flows for particular wildlife species that may be present in the Arroyo Seco. The MND states that habitat currently exists for southwestern pond turtle. (S120, S483.) Live trapping surveys are needed to confirm or deny the presence of pond turtles in the Arroyo Seco. (S120.) Loss of individual

southwestern pond turtles would be considered significant because of a recent decline in their range and populations. (S120.) Reduced stream flow can impact the habitat for southwestern pond turtles and other special species of concern. (S120.)

The MND identifies habitat and potential presence of two special status bird species: the Least Bell's Vireo and the Southwestern Willow Flycatcher. (AR 178, 182.) According to the federal and state resource agencies, the Least Bell Vireo has been observed nesting behind the dam and depends on riverine system for their habitat. (S96, S119.) Southwestern Willow Flycatcher is dependent on surface water to support insect life. (S96.) Water diversion can reduce both vegetation and aquatic habitat. (S96.)

Petitioners argue that the diversion of greater water flows will cause a further fragmentation of wildlife habitat. Pet. Br., pp. 20-21. The current dam is low and passable by wildlife. (AR 1934.) The proposed structure will be 5 ft., 10 inches on the upstream with a 12 foot drop on the downstream when the weir is up. (AR 124.) There may be a significant impact to fish and wildlife movement. The opinion of the U.S. Fish and Wildlife Service is that realistic pathways for fish and wildlife movement should be designed and included in the project. (S140.) The Project may create a physical divide of the Arroyo Seco at Area 2, with the upper reaches retaining their historic environmental habitat fostered by a natural water flow and the lower areas having an impacted habitat because of the greater diversion caused by the Project.

C. There Is No Substantial Evidence that the Mitigation Measures Will Reduce the Adverse Impacts to a Level Less than Significant:

The City proposed seven biological mitigation measures to mitigate the downstream impacts from the additional water diversions from the Project. These mitigation measures are found at AR 197-210. The City finding required for the MND states:

> "Given the uncertainty in the Project's level of effect, the impact on biological resources, including vegetation types and special status species potentially occurring, is considered potentially significant. Implementation of MM BIO-6, which requires monitoring the Arroyo Seco stream and associated riparian habitat from the intake structure (i.e. diversion point) downstream to Devil's Gate Dam and subsequent compensatory mitigation or corrective action to avoid or reduce any identified downstream impacts of the Project, would reduce this impact to a level considered less than significant." (AR 184)

MM-BIO-1, 2 and 3 apply to protect the special status bird species during the construction phases. MM BIO-4 requires a restoration project for any special

status vegetation that is affected. MM-BIO-5 provides that the restoration plan for jurisdictional resources "shall be prepared in accordance with the requirements specified in permits/agreements issued by the USACE, the RWQCB, and the CDFW." MM BIO-5 provides that any mitigation for loss of "jurisdictional resources" shall be negotiated with the resources agencies and shall "ensure that mitigation to compensate for permanent impacts on jurisdictional resources is equivalent or superior to biological functions and values impacted by the Project." The compensating mitigation options may include relocation of special status species; payment into a mitigation bank; and/or restoration of a riparian habitat on site or at a different site.

The major mitigation measure is MM BIO-6, and it reads in part as follows:

> "A team of qualified specialists in hydrology and plant and wildlife biology will monitor the Arroyo Seco stream and associated riparian habitat from the intake structure (i.e. the diversion point) downstream to Devil's Gate Dam....Monitoring will begin with an initial baseline assessment to be conducted within six months prior to the start of increased diversions. Thereafter, monitoring will continue quarterly for a duration of five years....Data will include surface flow measurements; surface water extent mapping; vegetation mapping; a vegetation health assessment; active channel location mapping; and a plant and wildlife habitat suitability assessment. Data will be compiled into an annual report...."

The annual report shall be submitted to the City. The annual report "will provide recommendations for corrective actions, if deemed necessary to avoid or reduce downstream impacts attributable to the Project. Reports will be submitted to the City of Pasadena for review and approval of recommended corrective actions, if any." The City is not required to take the recommended corrective actions, but, if the City does not, it must "mitigate any loss of vegetation at a minimum 1:1 replacement ratio."

MM-BIO-6 improperly defers the formulation of a mitigation plan until after the Project is approved. No specific standards are imposed to be achieved for mitigation. The baseline itself against which the Project's environmental impacts are to be measured are to be established by an "assessment to be conducted within six months prior to the start of increased diversions." This proposal does not provide a specific plan for mitigation and, therefore, defers commitment to any mitigation plan.

The City, moreover, proposes to mitigate only to the extent that diversions it attributes to its Project have adversely affected the biological

communities. BIO-6 provides that: "The City shall only be required to mitigate for those impacts attributable to the City's increased diversions." The City does not indicate how impacts "attributable to the City's increased diversions" are to be determined. The City concedes "the effect of these reduced flows on biological communities is difficult to measure." (AR 184.) The mitigation plan cannot be evaluated until the City specifies the manner in which it will calculate under a variety of rainfall conditions the downstream water reduction attributable to the Project.

For instance, the City in the MND estimated the Project will "result in an average increase of 17 percent under average year hydrologic conditions." (AR 184.) If the City, in its mitigation plan, is proposing that the water reduction "attributable to the City's increased diversions" will be a set percentage, maybe the 17 percent figure, that metric would not reflect the variability of the rain water flow into the Arroyo Seco. In the drier years, the increased diversion permitted by the Project will divert 100% of the water flow received by the downstream habitats for ten out of 12 months of the calendar year. (AR 144, 184.)

More than that, MM BIO-6 does not commit the City to take effective responsive action. BIO-6 requires only that the City decision-makers shall be made aware of the annual reports. "Reports will be submitted to the City of Pasadena for review and approval of recommended corrective measures, if any." (AR 201.) The City assumes no commitment other than to replace lost vegetation on a 1:1 basis at another location. There is no provision for trapping and relocating species that are harmed. The California Department of Fish and Wildlife recommend trapping and relocating. (S120.)

Finally, there is no public process to hold the City accountable for performance of the proposed mitigation measures.

This mitigation measure--MM-BIO-6 is the core of the City's promised mitigation—improperly defers the formulation of any mitigation plan and prescribes no standards to measure whether there will be any mitigation accomplished (apart from relocation of vegetation). The City abused its discretion in adopting the mitigated negative declaration in reliance on that condition. The City's abuse of discretion would be prejudicial but for the Court's independent finding that the MND is void due to the existence of "fair arguments" supported by substantial evidence that the Project will have significant environmental effects that require under CEQA the preparation of an environmental impact report.

ISSUE 5: THERE IS NO SUBSTANTIAL EVIDENCE THAT CONTAIMINATION IN AREA 3 REQUIRES THE CITY TO PREPARE AN EIR:

The Initial Study noted that JPL from 1941 to 1960 had disposed of solid and liquid chemical waste in pits on JPL property "and off property in Arroyo Seco Wash." (AR 487.) These locations are designated a Superfund site but the concern is the remediation of groundwater contamination in a zone 300 feet or more below the surface. JPL reported to the City that JPL's past practices did not result in ground contamination even where the chemicals had been buried. (AR 942.) JPL campus is located on the west side of the Arroyo Seco, while Area 3 is on the east side of the Arroyo Seco. (AR 103.) There is no evidence of ground contamination in Area 3, where the City as part of the Project will use construction equipment to enlarge the spreading basins. The City, nonetheless, has approved a hazard mitigation measure to caution its construction workers to watch for discolored soil. See, MM HAZ-2 at AR 234.

Petitioners make an argument that the fact that locations on the JPL property are being remediated for below ground contamination requires that the City prepare an EIR before commencing construction work in Area 3. Petitioners' argument does not satisfy the fair argument standard because they point to no substantial evidence that Area 3 has ground contamination or even that hazardous chemicals were deposited there. That the City approved a mitigation measure in the event the construction workers find discolored soil—a measure that petitioners characterize as a "scratch and sniff test"--is not evidence that dangerous contamination likely exists where the City's construction crews will be enlarging the spreading basins. Petitioner rests its argument on the fact that not all of the locations of the JPL waste chemical pits were adequately documented (Reply, p. 14 citing AR 472), but, even so, an argument that contamination likely exists in Area 3 is a supposition. No evidence for it is cited in the record. Petitioners' argument is unavailing because it is not supported by substantial evidence in the record.

PREPARATION OF JUDGMENT AND WRIT OF MANDATE:

The Court concludes the City abused its discretion in adopting a mitigated negative declaration for the Project in the face of substantial evidence supporting a fair argument that the Project, even as mitigated, may have significant adverse environmental effects on biological resources in the Arroyo Seco that are downstream from the proposed water diversion facility.

The Court shall grant Judgment for the petitioners on their First Amended Petition and issue a Peremptory Writ of Mandate to reverse the approval of the Arroyo Seco Canyon Project, the adoption of the Mitigated Negative Declaration, Conditional Use Permit # 6222 and other approvals granted for the Project. The

Project has separate components and petitioners have not challenged the City's approvals as to certain parts of the Project. The parties may consider whether a severance is appropriate under Public Resources Code section 21168.9(b) and submit a Writ providing for an appropriate severance. Any severance, however, must not prejudice full compliance with CEQA.

The Court requests that the petitioners' counsel prepare, serve, and lodge a form of Judgment and Peremptory Writ of Mandate that is consistent with the Court's Statement of Decision within five court days. The City shall have ten days to serve and file objections to the proposed Writ and Judgment. The City, if it wishes, may prepare an alternate form of Judgment and Writ.

Promptly after a Judgment is signed and the Writ issued, the parties are to retrieve (and retain in their offices for any post-judgment proceeding) the administrative record and any binders that have been provided to the Court.

The Clerk is directed to serve this STATEMENT OF DECISION ON PETITION FOR WRIT OF MANDATE on the parties by U.S. Mail this date.

DATED: March 20, 2017

Richard L. Fruin Jr.

RICHARD L. FRUIN, JR.

CITY ATTORNEY
CIVIL DIVISION

SETTLEMENT AGREEMENT AND RELEASE
SPIRIT OF THE SAGE COUNCIL ET. AL V. CITY OF PASADENA ET. AL.
LA SUPERIOR COURT CASE NO. BS156207

Whereas, on July 2, 2015, Spirit of the Sage Council and Project Soliton (together, Petitioners) filed a CEQA action against the City of Pasadena and Pasadena Department of Water and Power ("City" or Respondents) challenging the approval of what is commonly known as the Arroyo Seco Canyon Project;

Whereas, on March 20, 2017, after extensive briefing and oral argument, the Court issued a Statement of Decision granting the writ of mandamus and ordering the preparation of an EIR for the project, but proposing severance of certain portions of the project;

Whereas, on June 26, 2017, after further briefing, objections, oral argument, and additional evidence, the Court granted severance under Public Resources Code section 21168.9(c), in the manner proposed by the City of Pasadena;

Whereas, Petitioners object to the order severing certain portions of the project and the Court's consideration of additional evidence without the opportunity for Petitioners to formally respond; and

Whereas, all parties wish to resolve the remaining issues, and obtain certain assurances as to future actions of the parties, and have agreed to the following:

1. IMPLEMENTATION OF THE WRIT

The Writ (along with the Judgment, attached hereto as Exhibit A) shall be implemented as ordered by the Court with the following modifications:

a. **No new ponds or basins in Area 3**: The City will not perform any of the tasks described in Table 3.1-1 of the IS/MND ("MND") under the heading "spreading basins", until fully analyzed, and mitigated to the extent feasible, in an EIR

b. **Maintenance activities permitted**: The City shall have the right to perform maintenance activities, including tilling and grading of existing spreading basins and sludge ponds to re-establish historical percolation rates.

i. Petitioners waive the right to challenge maintenance activities that involve "negligible or no expansion of use" as described in the Class 1 exemption from CEQA. (Cal. Code of Regs. Title 14, § 15301.) Petitioners expressly do not waive the right to challenge activities that do not fall within this limitation.

ii. Prior to performance of maintenance activities, the City shall describe the work in a written document in a manner that allows Petitioners or the public to determine whether the activity falls within the CEQA Class 1 exemption, including an estimate of the quantity of any soil to be removed. Nothing in this section requires additional public notice, except as required by law.

iii. The City shall not perform work that enlarges any of the ponds or increases its ability to take surface water above and beyond its historical withdrawal, unless an EIR is prepared consistent with the Judgment/Writ.

c. The City shall remove the temporary bridges within six months of completion of the Arroyo Seco Canyon Project, unless the City decides to make such bridges permanent structures. If the City determines to make the bridges permanent structures, it must describe the bridge construction in the future EIR for the Arroyo Seco Canyon Project and analyze, and mitigate to the extent feasible, the environmental impacts of such construction.

2. NO WIDENING OF TRAILS FOR HEAVY EQUIPMENT ACCESS TO AREA 1

The City shall not widen the trail, raise the trail above ground level, pave trails (but may replace/repair any existing or damaged pavement), or allow habitat loss for the movement of heavy equipment to Area 1 (including no grading or cutting of slope). The City may perform the road work, including the slope improvements described in Area 2 and excavation and grading necessary for the temporary bridges as described in Table 3.2-1 of the MND. Trails, roads and bridges shall not be used to redirect natural surface water flows (hydrology). Nothing in this section prohibits the trail work in Area 1.

3. WAIVER OF FUTURE LEGAL CHALLENGES

In exchange for the consideration described in Paragraph 4 below, Petitioners agree to the following:

a. Petitioners waive the right to file an appeal or otherwise challenge the Judgment and Writ in *Spirit of the Sage Council et al v. City of Pasadena* (BS156207).

b. Petitioners waive the right to file any legal challenges to the EIR that will be prepared for the Arroyo Seco Canyon Project.

c. Petitioners waive the right to legally challenge the Streambed Alteration Agreement or any future permits that are granted in favor of the City for the Arroyo Seco Canyon Project.

d. Petitioners reserve the right to fully participate in the CEQA process, including submitting scoping comments and commenting on any draft or final EIR and submitting objections to the Arroyo Seco Canyon Project , including submitting objections to the draft or final Streambed Alteration Agreement.

e. Spirit of the Sage Council and Project Soliton, including their respective board members, shall be prohibited from providing any monetary or nonmonetary support to any legal actions challenging the EIR or future permits for the Arroyo Seco Canyon Project. The board members of Spirit of the Sage Council and Project Soliton are specifically prohibited from forming new organizations to mount challenges to the EIR, Streambed Alteration Agreement or future permits for the Arroyo Seco Canyon Project.

4. CONSIDERATION

a. The City shall pay $25,000 to Spirit of the Sage Council within 30 days of execution of this agreement.

b. The City shall pay $25,000 to Project Soliton within 30 days of execution of this agreement.

c. The City shall not speak or communicate any negative commentary about Petitioners, the Judgment/Writ, or this agreement. Likewise, Petitioners and their board members shall not speak or communicate any negative commentary about the City, the Judgment/Writ, or this agreement.

These payments shall be issued in the name of each petitioner and mailed to the Law Office of Todd Cardiff. These payments are non-refundable if the City decides to not move forward on the Arroyo Seco Canyon Project.

5. PAYMENT OF ATTORNEYS FEES AND COSTS

Nothing in this agreement is intended to waive or impact Petitioners' Attorneys right to move for attorneys' fees and costs, unless otherwise agreed to in a separate agreement.

6. NO WAIVER OF THE RIGHT TO ENFORCE 2004 SETTLEMENT AGREEMENT

This agreement is not intended to waive or impact, in any manner, the right to enforce the 2004 settlement agreement between Spirit of the Sage Council and the City of Pasadena.

7. NO WAIVER OF RIGHT TO OBJECT TO RETURN TO WRIT

Petitioners reserve the right to object to the return of the writ and discharge if the City fails to comply or has not fully complied with the writ.

8. PERSONS BOUND

This agreement shall be binding on all parties, their principles, agents, successors, assigns, board members, officers and employees. This agreement is specifically enforceable against Petitioners' board members who are: Leeona Klippstein, Sharee Hemphill, Ilse Asplund, Doug Doepke and Doug Lewis.

9. GENERAL PROVISIONS

a. **Integration and Interpretation**: This agreement shall constitute the entire agreement between the parties and shall supersede any prior promises or agreements whether oral or in writing. This agreement may only be amended in a writing signed by the party against whom enforcement is sought. This agreement was jointly negotiated and drafted by the parties. Any judicial interpretation of this agreement shall be in favor of the mutual intent of the parties and not in favor of or against any particular party. The parties warrant that they have had a chance to discuss the language of the agreement with their attorneys.

b. **Severance**: This agreement shall be interpreted in manner that renders it enforceable to the extent allowed by law. If any portion of this agreement is ruled to be unenforceable, the remainder of the agreement shall remain in effect.

c. **Authority**: The signatories to this agreement warrant that they have obtained the necessary authority to bind their respective organizations.

d. **Counterparts**: This agreement may be signed in counterparts, which may be faxed or delivered electronically. A copy of this agreement, with all signatures, whether original or electronic, shall be considered enforceable as if it was an original.

Subject: **GEOTECHNICAL FEASIBILITY STUDY REPORT**
Proposed Public Restroom, Roadway Improvement, and Stormwater Sediment Basins Project
Arroyo Seco Canyon
Pasadena, California
Converse Project No. 13-31-199-01

Dear Ms. Wiersema:

Converse Consultants (Converse) is pleased to present this Geotechnical Feasibility Study Report for the proposed Public Restroom, Roadway Improvement, and Stormwater Sediment Basins Project located at Arroyo Seco Canyon in Pasadena, California. Our services were performed in accordance with our proposal dated June 10, 2013.

The purpose of this study is to perform preliminary engineering geologic and geotechnical explorations to characterize the project sites, evaluate the feasibility of on-site wastewater treatment system at the planned public restroom sites, and provide geotechnical recommendations for restroom foundations and roadway improvement. Please be advised that our geotechnical recommendations for foundations and roadway improvement can be used for structural design. However, the preliminary percolation study for OWTS will not be sufficient for actual design and submission for the LA County review because the design-level information is not available to us at this time.

We appreciate the opportunity to be of service to the Carollo Engineers, Inc. If you should have any questions, please do not hesitate to contact us at (626) 930-1200.

PROFESSIONAL CERTIFICATION

This feasibility report for the proposed Improvement, and Stormwater Sediment Basins Project located at Arroyo Seco Canyon in Pasadena, California has been prepared by the staff of Converse under the professional supervision of the individuals whose seals and signatures appear hereon. This feasibility report may require additional geotechnical studies and may not contain sufficient information for design and construction.

The findings, recommendations, specifications or professional opinions contained in this report were prepared in accordance with generally accepted professional engineering and engineering geologic principles and practice in this area of Southern California. There is no warranty, either expressed or implied.

In the event that changes to the property occur, or additional, relevant information about the property is brought to our attention, the conclusions contained in this report may not be valid unless these changes and additional relevant information are reviewed and the recommendations of this report are modified or verified in writing.

EXECUTIVE SUMMARY

The following is the summary of our geotechnical study, findings, conclusions, and recommendations, as presented in the body of this report. Please refer to the appropriate sections of the report for complete conclusions and recommendations. In the event of a conflict between this summary and the report, or an omission in the summary, the report shall prevail.

- The project consists of three separate areas within a 2-mile stretch along the Arroyo Seco Canyon in the City of Pasadena, California. The elements that require geotechnical analyses consist of a public restroom with onsite wastewater treatment system (OWTS), roadway improvement and associated retaining wall, and stormwater sediment basins.

- Site No. 1 and Site No. 2C are the potential candidate sites for the planned public restroom and OWTS. The planned roadway improvement is located at Site No. 2A. The planned stormwater sediment basins are located at Site No. 3.

- Fourteen (14) exploratory borings (BH-1 through BH-14) were drilled within the project sites from July 8 to July 12, 2013. The borings were advanced using a limited access rig with 12-inch and 24-inch diameter bucket augers, and truck mounted 8-inch diameter hollow stem auger drill rig to depths ranging from 2.5 to 21 feet below the existing ground surface (bgs).

- Borings BH-2, BH-5 and BH-9 through BH-14 were utilized for percolation tests prior to backfill. Percolation test results are presented in Appendix C, *Percolation Testing Data*.

- Site No. 1 is acceptable to construct the leach lines as onsite wastewater treatment system in accordance with the Los Angeles County requirements based on our preliminary percolation testing.

- Site No. 1 is located in close proximity of a 50-year floodplain. The Arroyo Seco Canyon is subject to periodic flooding following periods of heavy rainfall. Drilled caissons with grade beam system should be used as the restroom foundation. Flood protection measures are recommended for new structures.

- Roadway improvement at Site No. 2A should be supported by a retaining wall with cast-in-drill-hole pile foundations. The original roadway section was washed away by flooding in the Arroyo Seco Canyon. Flood protection measures are recommended for new structures.

- Site No. 2C is not feasible to construct the onsite wastewater treatment system based on our preliminary percolation testing. The site is underlain by shallow hard bedrock.

- The upper 5 feet of soils within Site No. 3 have high to very high percolation rates. It is our opinion that the percolation rates presented on our table demonstrate the good percolation capacity of the onsite soils without considering fine sediment clogging. For planning or design purposes, it is recommended to consider the lowest percolation rates among the tests because the percolation test holes are located at only a few scattered points over a fairly large area. Fine sediment clogging should be also considered into the design and maintenance plan.

- Based on the slope stability analyses, the proposed new Sediment Basin A is located in the area having 1.5 factor of safety or greater for slope stability, and the slope near the creek has factor of safety greater than 1.25, which exceed the minimum required factor of safety in common geotechnical practice.

- At all of the project sites studied in this report, the onsite materials will contain large amounts of gravels, cobbles and boulders. Based on our field exploration, the earth materials at the site may be excavated with conventional heavy-duty earth moving and trenching equipment in general. Difficult drilling and excavation conditions will be encountered during construction and should be anticipated and other suitable equipment and methods should be used.

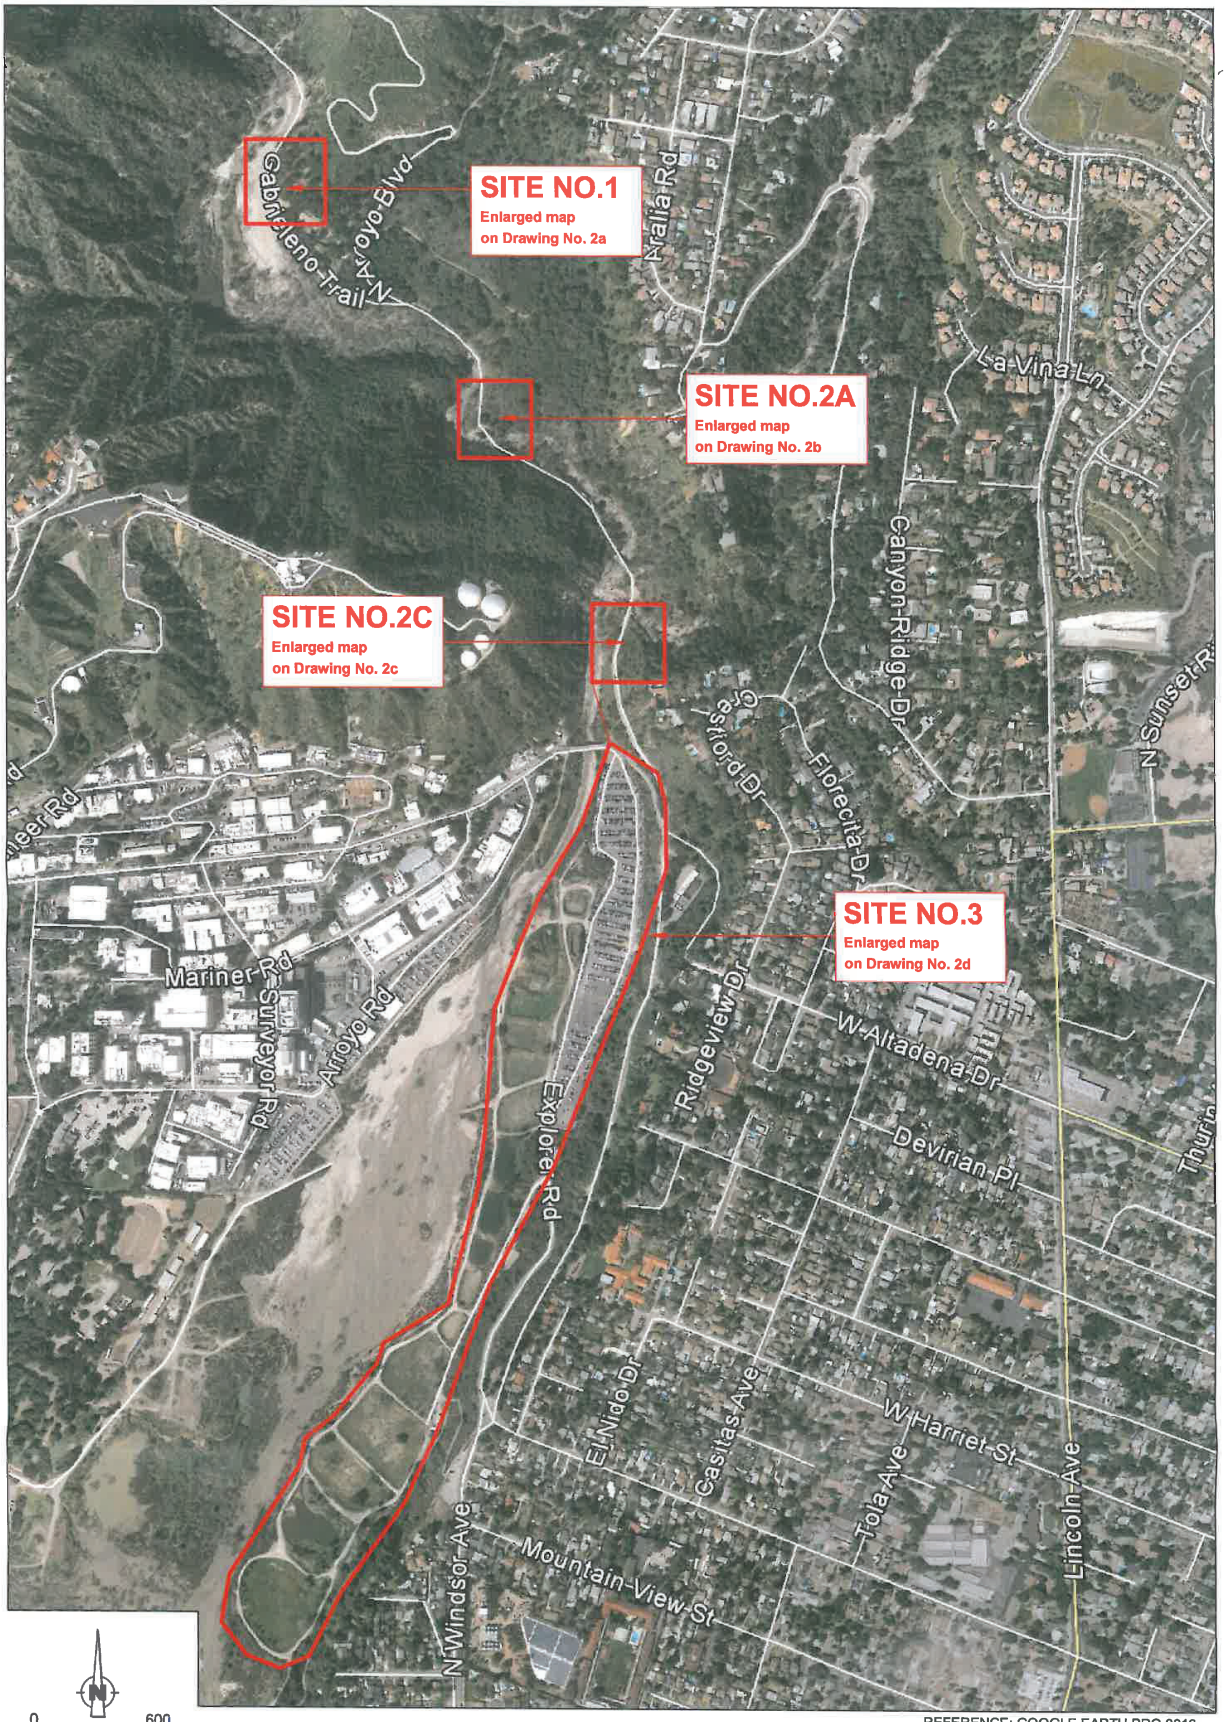
1.0 INTRODUCTION

The project consists of four separate areas within a 2-mile stretch along the Arroyo Seco Canyon in the City of Pasadena, California. The elements that require geotechnical analyses consist of a public restroom with onsite wastewater treatment system (OWTS), roadway improvement and associated retaining wall, and stormwater sediment basins. An aerial view of the site is illustrated on Drawing No. 1, *Overall Project Site Plan.*

Based on the information provided to us, the Site No. 1 and Site No. 2C are the potential candidate sites for the planned public restroom and OWTS. The planned roadway improvement is located at Site No. 2A. The planned stormwater sediment basins are located at Site No. 3. The enlarged maps for these four sites are shown on Drawing Nos. 2a thru 2d.



The purpose of this study is to perform preliminary engineering geologic and geotechnical explorations to characterize the project sites, evaluate the feasibility of on-site wastewater treatment system at the planned public restroom sites, and provide geotechnical recommendations for restroom foundations and roadway improvement. Please be advised that our geotechnical recommendations for foundations and roadway improvement can be used for structural design. However, the preliminary percolation study for OWTS will not be sufficient for actual design and submission for the LA County review because the design-level information is not available to us at this time.

This report for geologic and geotechnical design parameters for the project described herein and is intended for use solely by the Carollo Engineers, Inc. This report should not be used as a bidding document but may be made available to the potential contractors for information on faculty data only. For bidding purposes, the contractors should be responsible for making their own interpretation of the data contained in this report.

2.0 SITE NO. 1 – 1ST CANDIDATE SITE FOR PUBLIC RESTROOM

2.1 Site Description

Site No. 1 is located at the northernmost part of the project, near the National Forest Ranger's Station. The planned restroom building site is located at a flat ground on the east side of the Gabrieleno Trail near an existing trail monument at the toe of an approximate 20 feet high ascending 2H:1V slope to a terrace pad .

The planned restroom building site is located on the edge of the Arroyo Seco Canyon floodplain and is subject to potential flooding following periods of heavy rainfall.

The planned onsite wastewater treatment system (seepage pit or leach field) area is located on the upper terrace pad east of the planned restroom and north of the Ranger's Station. The surface conditions consist of unpaved trail, grass and some mature trees.

The restroom site elevation is about 1233 feet above Mean Sea Level (MSL). The onsite wastewater treatment system site elevation is about 1262 feet MSL. The coordinates for the project site are: North latitude: 34.2102 degrees and West longitude: 118.1713 degrees. The project site is depicted on Drawing No. 2a, *Site No. 1, Boring Location Map*.

2.2 Scope of Work

The scope of our present study includes site reconnaissance, subsurface exploration, soil sampling, laboratory testing, engineering analysis, and preparation of this report. Details of the tasks are addressed in the following sections:

2.2.1 Project Setup and Site Reconnaissance

A Converse geologist conducted a site reconnaissance on June 20, 2013. The purpose of the reconnaissance was to evaluate site conditions with respect to the location of the borings and drill rig accessibility. The Underground Services Alert (USA) was notified on June 28, 2013 within 14 calendar days prior to field exploration

2.2.2 Subsurface Exploration and Percolation Testing

Three (3) borings, including one boring (BH-1) within the planned restroom area and two borings (BH-2 and BH-2A) within the planned wastewater treatment system area, were drilled to a maximum depth of 7 feet below existing ground surface on July 8 and 9, 2013. The borings were drilled with a limited access drill rig equipped with 12-inch and 24-inch diameter bucket augers for soil sampling. Each boring was visually logged and sampled at regular depth intervals and at changes in subsurface soils. The borings were backfilled with soil cuttings . All three borings encountered refusals at shallow depths due to numerous cobbles, and boulders larger than 12 inches in diameter. The boring BH-2A was an additional attempt after refusal at BH-2. The locations of borings are shown on the attached *Drawing No. 2a, Site No. 1, Boring Location Map.*

California Modified Sampler (Ring samples), and bulk soil samples were obtained for laboratory testing. The bore holes were backfilled and compacted with soil cuttings after the completion of field testing.

Boring BH-2 was utilized for percolation tests prior to backfill. Percolation test procedures and test results are further discussed in Section 2.6.1, Preliminary OWTS Feasibility Evaluation. The raw data of percolation testing is presented in Appendix C, *Percolation Testing Data*.

2.2.3 Laboratory Testing

Representative samples of the site soils were tested in the laboratory to aid in the classification and to evaluate relevant engineering properties. The tests performed included:

- *In situ* moisture contents and dry densities (ASTM Standard D2216)
- Grain-Size Analysis (ASTM D422)
- Maximum dry density and optimum-moisture content relationship (ASTM Standard D1557)
- Direct shear (ASTM Standard D3080)
- Consolidation (ASTM Standard D2435)
- Soil corrosivity tests (Caltrans 643, 422, 417 and 532)

The detailed description of the laboratory test methods and test results are presented in Appendix B, *Laboratory Testing Program*.

2.2.4 Analyses and Report

Data obtained from the exploratory fieldwork and laboratory-testing program were analyzed and evaluated with respect to the proposed development. Recommendations for foundations, earthwork, and feasibility evaluation of OWTS are provided.

2.3 Subsurface Conditions

2.3.1 Subsurface Soil Profile of Project Site

Based on our exploratory soil boring (BH-1) at the restroom site, stream deposits (Map symbol: Qg) consisting of primarily light brown silty sand with some cobbles and boulders were encountered to a maximum explored depth of 7 feet below existing ground surface (bgs). The stream deposits are generally moderately dense to very dense.

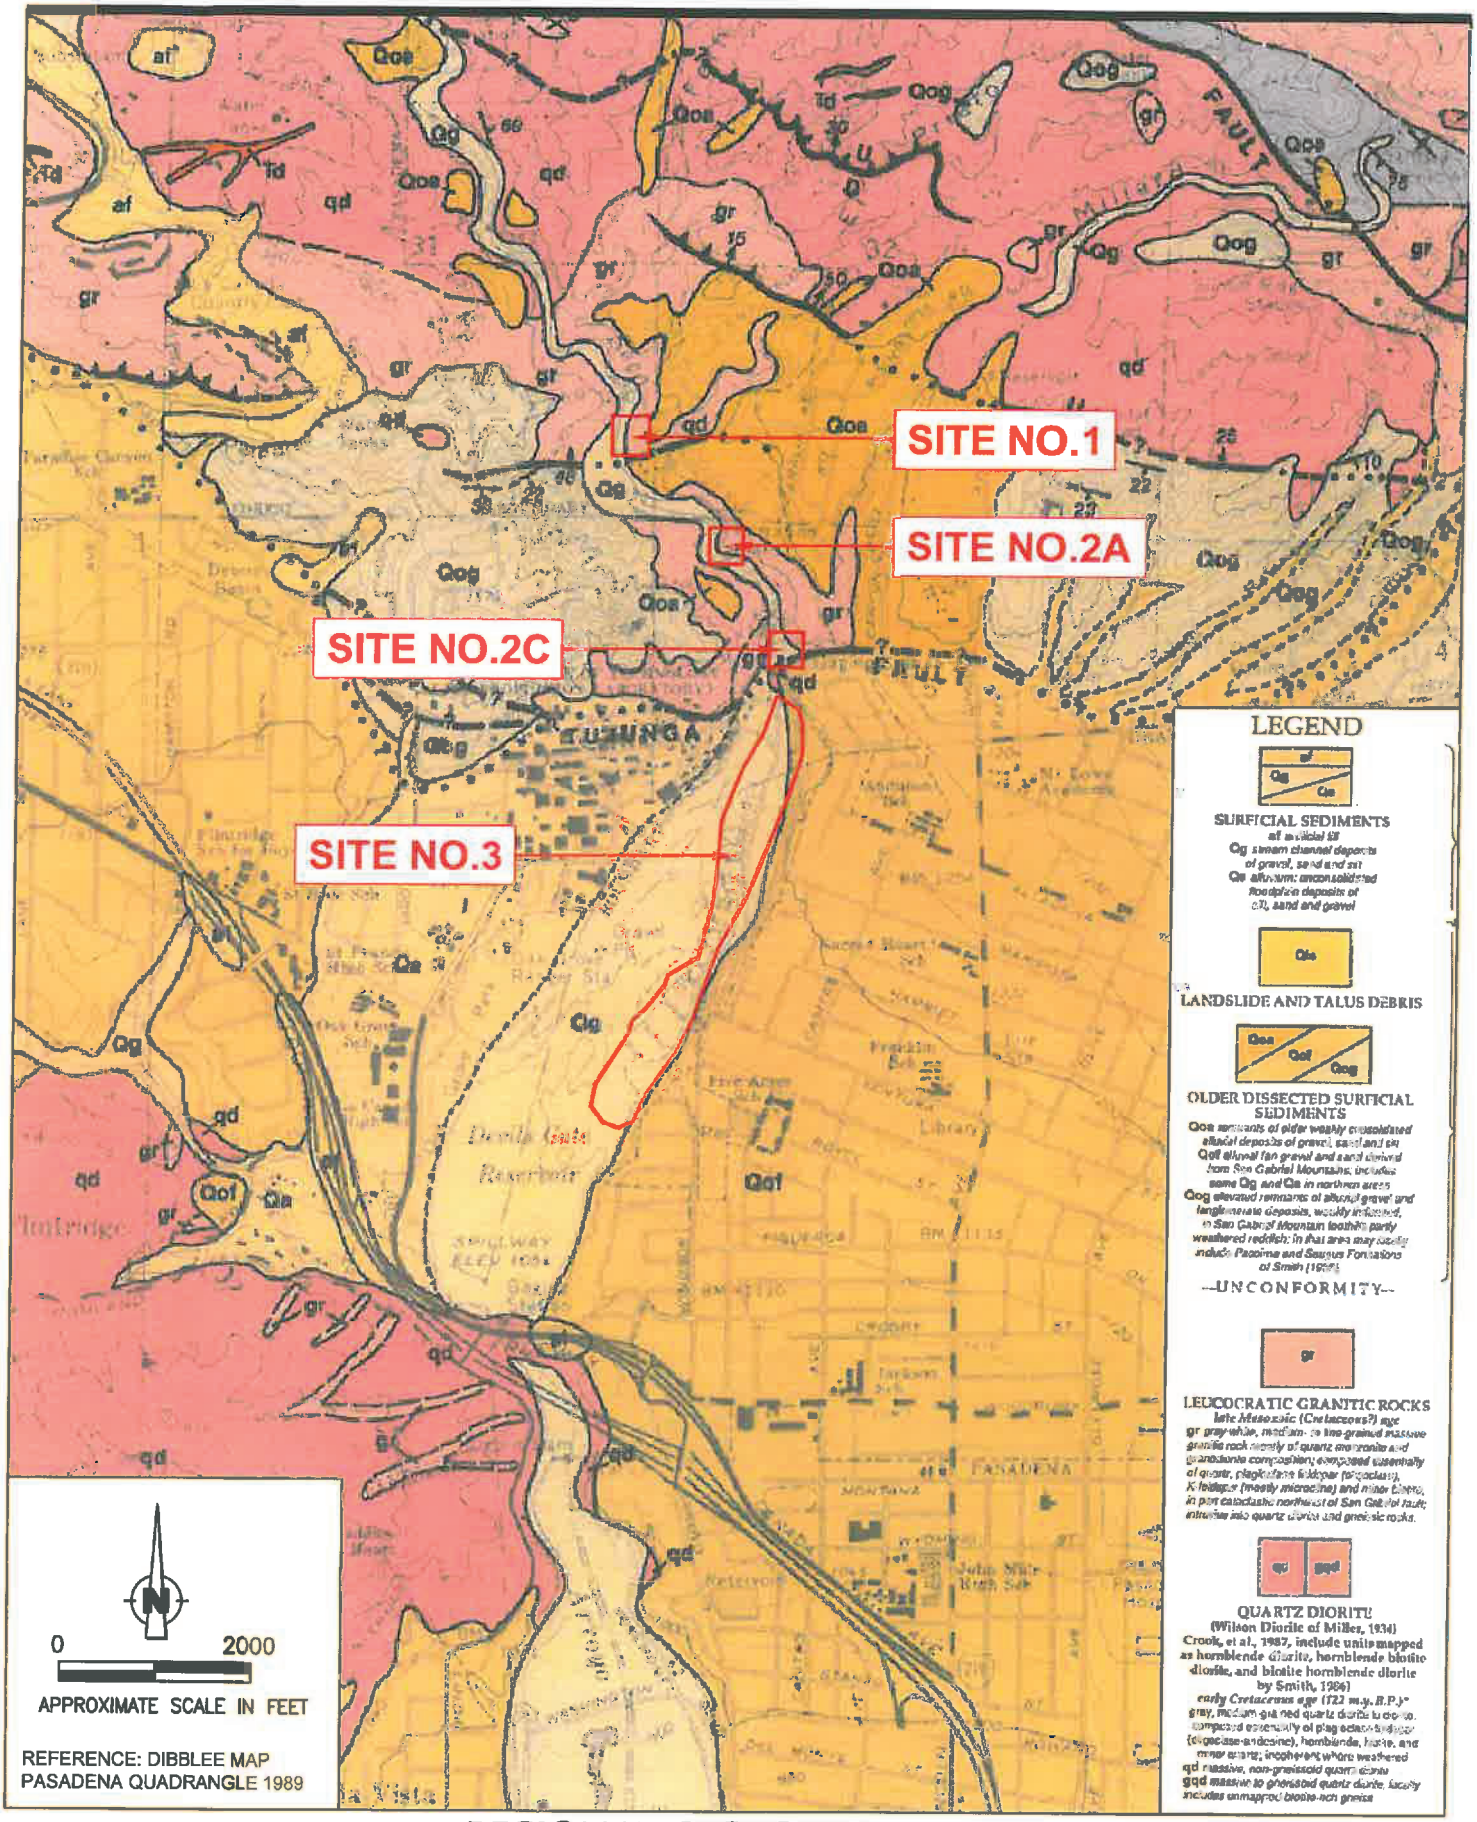
Based on our exploratory soil borings (BH-2 and BH-2A) at the wastewater treatment system site, older alluvium (Map symbol: Qoa) consisting of primarily brown silty sand with some cobbles and boulders was encountered to a maximum explored depth of 5 feet below existing ground surface (bgs). The older alluvium is generally moderately dense to dense. The detailed descriptions of the borings are presented in Appendix A, Field Exploration.

Based on large amount of cobbles and boulders encountered during our exploratory borings, difficult drilling conditions are expected during construction. Therefore it is our opinion that leach lines are more feasible than seepage pits for the onsite wastewater treatment system.

2.3.2 Groundwater

Groundwater was not encountered in our exploratory borings to a maximum depth of 7 feet. In accordance with the Seismic Hazard Zone Report for the Pasadena Quadrangle (CDMG, 1998), the historic highest groundwater level contours are not defined at this location. However, the restroom site is adjacent to existing creek. Seasonal high groundwater is anticipated to be shallow.

2.3.3 Subsurface Variations



Based on results of the subsurface exploration and our experience, some variations in the continuity and nature of subsurface conditions within the project site should be anticipated. Because of the uncertainties involved in the nature and geologic characteristics of the earth material at the site, care should be exercised in interpolating or extrapolating subsurface conditions between or beyond the boring locations. If during construction, subsurface conditions differ significantly from those presented in this report, this office should be notified immediately so that recommendations can be modified, if necessary.

2.4 Faulting and Geologic Hazards

Geologic hazards are defined as geologically related conditions that may present a potential danger to life and property. Typical geologic hazards in Southern California include earthquake ground shaking, fault surface rupture, landslides, and liquefaction.

2.4.1 Fault Surface Rupture and Active Faults

The project site is not located within a currently designated State of California Earthquake Fault Zone (formerly Alquist-Priolo Special Studies Zones) for surface fault rupture. Based on Drawing No. 3, *Regional Geologic Map (Dibblee, 1989)*, a splay of Tujunga Fault is

PASADENA, CALIFORNIA

Project No.	Drawing No.
13-31-199-01	3

located at approximate 100 feet south of the project site.

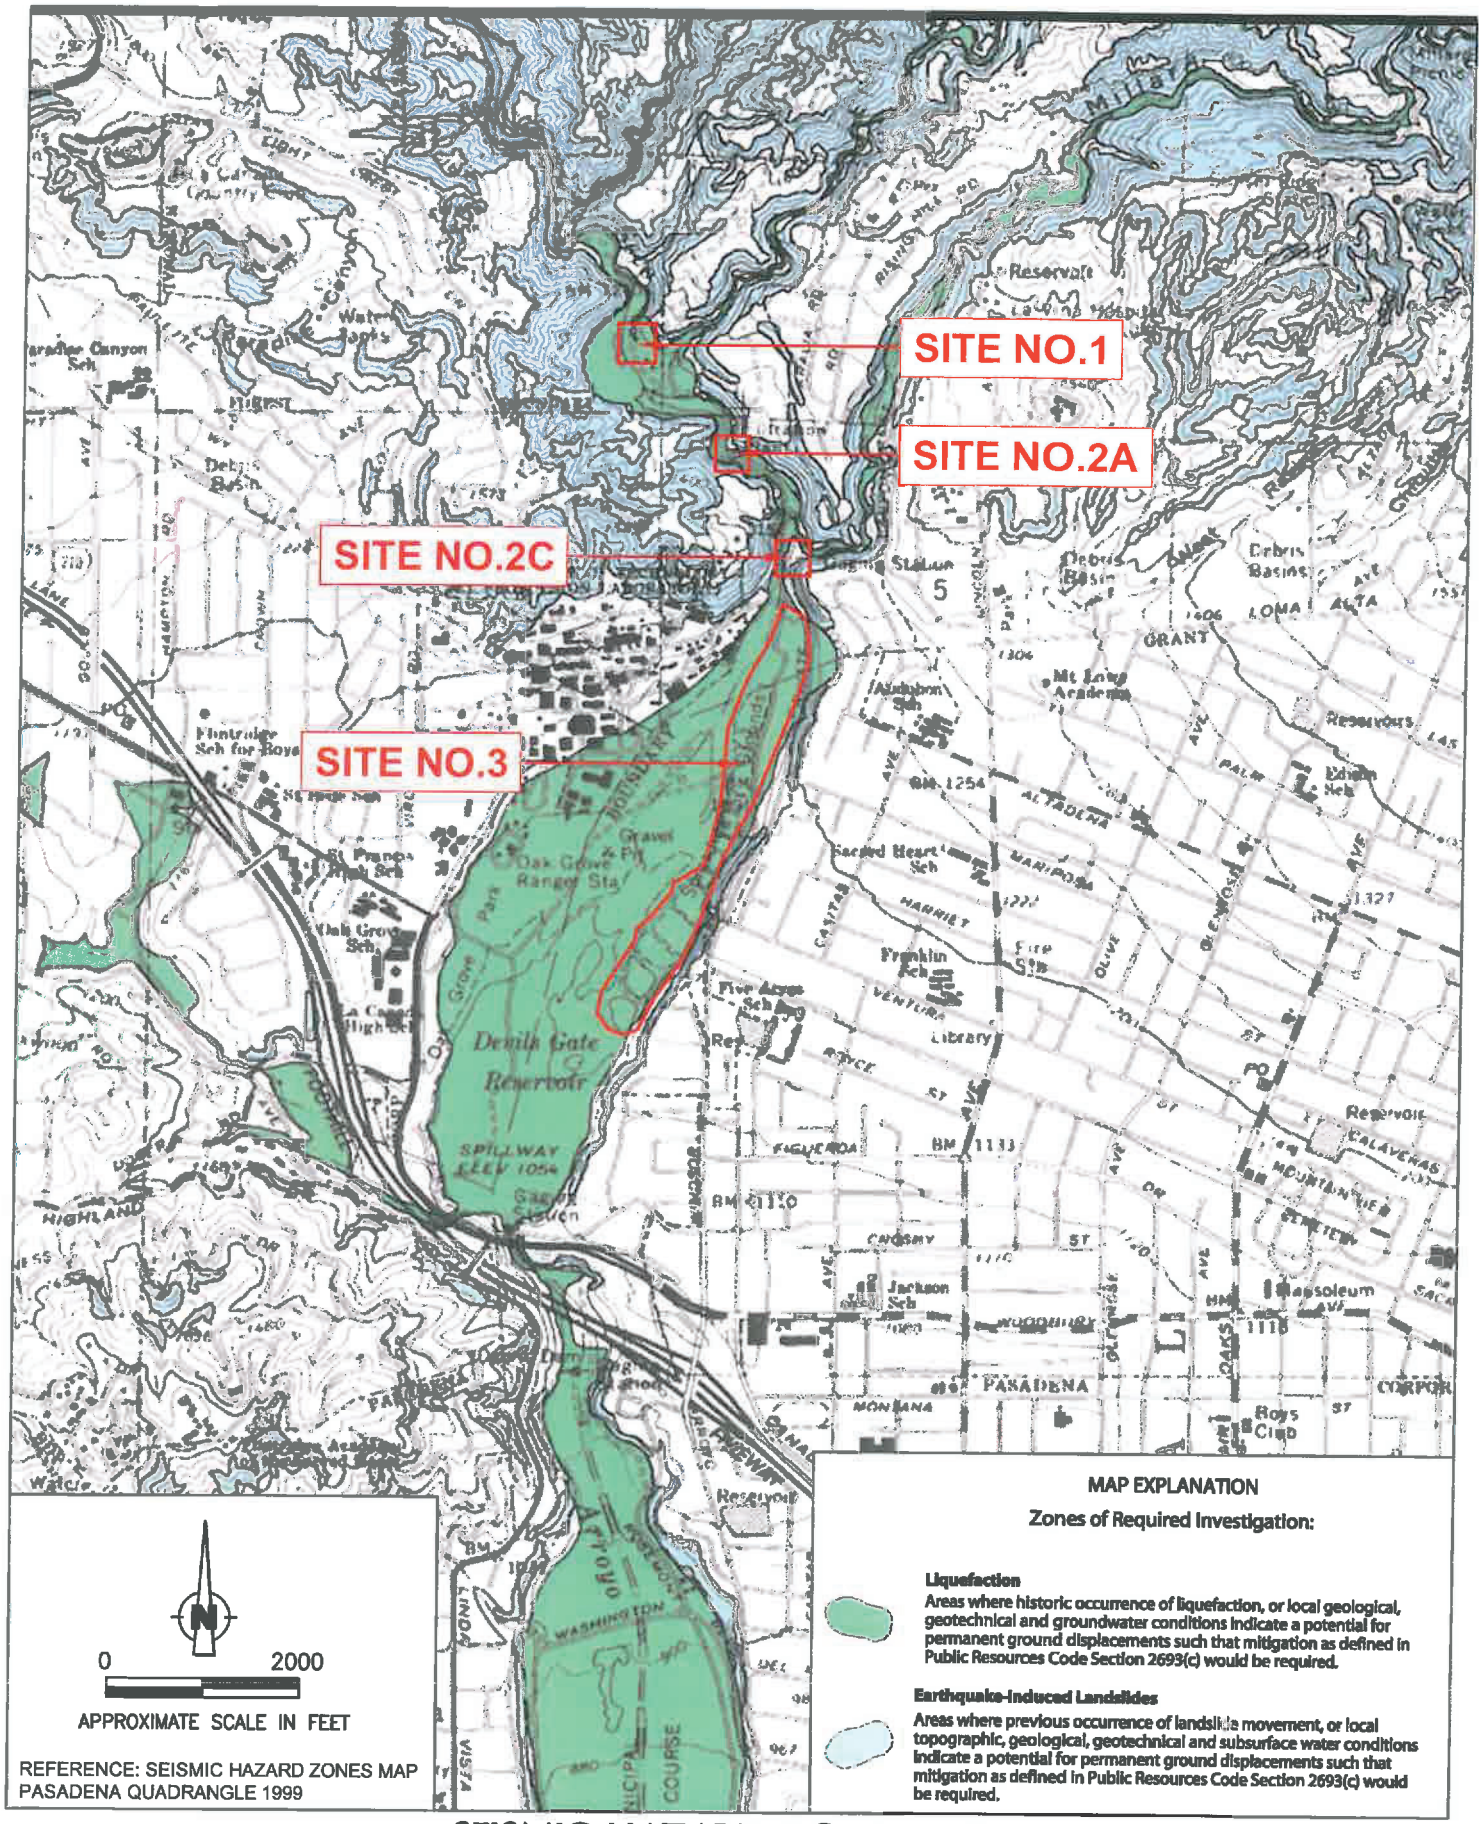
2.4.2 Liquefaction

Liquefaction is the sudden decrease in the strength of cohesionless soils due to dynamic or cyclic shaking. Saturated soils behave temporarily as a viscous fluid (liquefaction) and, consequently, lose their capacity to support the structures founded on them. The potential for liquefaction decreases with increasing clay and gravel content, but increases as the ground acceleration and duration of shaking increase. Liquefaction potential has been found to be the greatest where the groundwater level and loose sands occur within 50 feet of the ground surface. The site is located within a mapped Seismic Hazard Zone for liquefaction (CDMG, 1998) as shown in Drawing No. 4, *Seismic Hazard Zones Map*.

Based on the results of our subsurface exploration, very dense gravelly sand with cobbles and boulders was encountered underneath the proposed restroom site, it is our professional opinion that the site is not susceptible to liquefaction and seismically-induced settlement to be negligible.

2.4.3 Landslides

The site is not located within a Seismic Hazard Zone for required investigation for earthquake-induced landsliding (CDMG, 1999). The restroom site is relatively flat and the ascending 2H:1V, 20-foot-high slope at the east is covered by well developed vegetation. Based on our field explorations and gradient of slope, it is our opinion that this ascending slope is considered stable statically and seismically. The proposed restroom building should be set back at least 10 feet away from the toe of slope in accordance with CBC 2010.



2.4.4 Flood Zone

Based on the information provided by Carollo Engineers, the restroom site is located near a 50-year floodplain. The effects of flood should be considered in the design of restroom building. Flood protection measures are recommended for new structures.

2.5 Seismic Analysis

2.5.1 CBC Seismic Design Parameters

Seismic parameters based on the 2010 California Building Code are calculated using the United States Geological Survey computer program *Seismic Hazards Curves,*

SEISMIC HAZARD ZONE MAP

Converse Consultants

ARROYO SECO CANYON PROJECT
PASADENA, CALIFORNIA

Project No.	Drawing No.
13-31-199-01	4

Response Parameters and Design Parameters, Version 5.1.0a. The seismic parameters are presented below.

Table No. 1, 2010 CBC Seismic Parameters For Site No. 1

Seismic Parameters	
Site Class	D
Mapped Short period (0.2-sec) Spectral Response Acceleration, S_S	2.660g
Mapped 1-second Spectral Response Acceleration, S_1	0.976g
Site Coefficient (from Table 1613.5.3(1)), F_a	1.0
Site Coefficient (from Table 1613.5.3(2)), F_v	1.5
MCE 0.2-sec period Spectral Response Acceleration, S_{MS}	2.660g
MCE 1-second period Spectral Response Acceleration, S_{M1}	1.464g
Design Spectral Response Acceleration for short period, S_{DS}	1.773g
Design Spectral Response Acceleration for 1-second period, S_{D1}	0.976g
Seismic Design Category	D

2.5.2 Deaggregated Seismic Source Parameters

Based on our analyses utilizing the USGS 2008 NSHM PSHA Interactive Deaggregation web site, the mean and modal earthquake magnitudes for a return time of 2475 years are calculated to be 6.68 and 7.02, respectively. The earthquake magnitude of 7.02 should be considered for seismic analyses at the project site.

2.6 Conclusions and Recommendations

2.6.1 Preliminary OWTS Feasibility Evaluation

Based on large amounts of cobbles and boulders encountered during our exploratory borings, difficult drilling conditions are expected during construction. Therefore it is our opinion that leach lines are more feasible than seepage pits for the onsite wastewater treatment system.

Boring BH-2 at Site No. 1 was utilized to perform percolation testing on July 8 and 9 to evaluate the feasibility of onsite wastewater treatment system (OWTS). The bored hole was cased using a four-inch diameter perforated PVC casing surrounded with filter gravel pack. Water was added to the borehole until the water level was at the ground surface and allowed to pre-soak for one day. After pre-soak, the hole was filled with water again to 12 inches above the bottom, and allowed adequate time for the water level to drop. As the water level drops, each one inch of drop was recorded. The percolation data was presented in Appendix C, Percolation Testing Data.

In accordance with the LA County guidelines, the size of the dis persal field shall be determined by the Ryon Formula utilizing the slowest elapsed time required for the water to drop form th e 5th to the 6th inch. We have performed a preliminary capacity estimation based on our percolation test results as presented below:

Assume:
A 50' x 50' leach field is planned for 100% design capacity
Leach line consists of 3-foot wide trench wit h 1 foot of filter material below the perforated pipe
Five 50-foot long leach lines are installed within leach field

Ryon Formula: A = (T+6.24)*C/58
where A = square feet of leach lines = 3'*50'*5 = 750 ft^2
T = time for the 6th inch of water to drain =11 minutes

Therefore, the calculated maximum septic tank capacity, C = 2523 gal

Site No. 1 is acceptable to construct t he leach lines near Borings 2 for onsite wastewater treatment system in accordance with the LA County requirements. It should be advised that percolation testing was perfo rmed at only one location for the current feasibility study, which is not fully in compliance with the minimum three testing locations required by the LA County. A comprehensive percolation testing program should be conducted once the site is selected for the planned public restroom.

2.6.2 Foundation Recommendations for Public Restroom

Based on the results of our liter ature review, subsurface explor ation, laboratory testing, geotechnical analyses, and understandi ng of the planned site im provements, it is our opinion that the proposed public restroom is feasible fr om a geotechnical standpoint, provided the following conclus ions and reco mmendations are incorporated into the project plans, specifications, and are followed during site construction.

The restroom site is located in close proximity of a 50-year floodplain. The effects of base flood elevation should be c onsidered in the des ign of restroom building. W e recommended the restroom build ing be supported by drilled caissons with grade beam system. Caissons should be at least founded at least 4 feet below lowest adjacent final grade into dense soils and at least 24 inches in diameter. Bearing capacity of caisson can be calculated by an allowable skin friction of 350 psf. The allowable value indicated above is obtained by apply ing a factor of safety of 2.0 to the ultimate value. The actual reinforcement of caisson should be determined by the structural engineer.

As an alternative, conventional spread footings can be used. Isolated footing should be at least 24 inches square, and continuous footings should be 12 inches wide. Footings should be embedded at least 4 feet below the lowest adjacent grade into dense native soil. Conventional footings with the minimum sizes can be designed for a net allowable bearing pressure of 3,500 psf for dead-plus-live loads.

Resistance to lateral loads can be provided by friction acting at the base of the foundation and by passive earth pressure. A coefficient of friction of 0.35 may be assumed with normal dead load forces. An allowable passive earth pressure of 350 psf per foot of depth up to a maximum of 3,500 psf may be used. The values of coefficient of friction and allowable passive earth pressure include a factor of safety of 1.5.

The static settlement is anticipated to be less than 0.5 inch. Differential settlement is expected to be up to one-half of the total settlement over a 30-foot span.

The above vertical bearing may be increased by 33% for short durations of loading which will include the effect of wind or seismic forces. The allowable passive pressure may be increased by 33% for lateral loading due to wind or seismic forces.

2.6.3 Slab-on-grade

Slabs-on-grade should be supported on compacted fill and have a minimum thickness of four (4) inches nominal for support of normal ground-floor live loads. Minimum reinforcement for slabs-on-grade should be No. 3 reinforcing bars, spaced at 18 inches on-center each way. The thickness and reinforcement of more heavily-loaded slabs will be dependent upon the anticipated loads and should be designed by a structural engineer. A static modulus of subgrade reaction equal to 150 pounds per square inch per inch may be used in structural design of concrete slabs-on-grade.

It is critical that the exposed subgrade soils should not be allowed to desiccate prior to the slab pour. Care should be taken during concrete placement to avoid slab curling. Slabs should be designed and constructed as promulgated by the ACI and Portland Cement Association (PCA). Prior to the slab pour, all utility trenches should be properly backfilled and compacted.

In areas where a moisture-sensitive floor covering (such as vinyl tile or carpet) is used, a 10-mil-thick moisture retarder/barrier between the bottom of slab and subgrade that meets the performance criteria of ASTM E 1745 Class A material. Retarder/barrier sheets should be overlapped a minimum of six inches, and should be taped or otherwise sealed per the product specifications.

2.6.4 Earth Pressures for Retaining Walls

The following design values can be used for the proposed retaining walls, if any. The earth pressure behind any buried wall depends primarily on the allowable wall movement, type of soil behind the wall, backfill slopes, wall inclination, surcharges, and any hydrostatic pressure. The following earth pressures are recommended for vertical walls with no hydrostatic pressure.

Table No. 2, Lateral Earth Pressures for Retaining Wall Design

Backfill Slope (H:V)	**Cantilever Wall** (triangular pressure distribution) **Equivalent Fluid Pressure (pcf)**	**Restrained Wall** (uniform pressure distribution) **(psf)**
Level	32	23H
2:1	45	30H

The recommended lateral pressures assume that the walls are fully back-drained to prevent build-up of hydrostatic pressure. Adequate drainage could be provided by means of permeable drainage materials wrapped in filter fabric installed behind the walls. The drainage system should consist of perforated pipe surrounded by a minimum one (1) square feet per lineal feet of free draining, uniformly graded, ¾-inch washed, crushed aggregate, and wrapped in filter fabric such as Mirafi 140N or equivalent. The filter fabric should overlap approximately 12 inches or more at the joints. The subdrain pipe should consist of perforated, four-inch diameter, rigid ABS (SDR-35) or PVC A-2000, or equivalent, with perforations placed down. Alternatively, a prefabricated drainage composite system such as the Miradrain G100N or equivalent can be used. The subdrain should be connected to solid pipe outlets, with a maximum outlet spacing of 100 feet.

Walls subjected to surcharge loads located within a distance equal to the height of the wall should be designed for an additional uniform lateral pressure equal to one-third or one-half the anticipated surcharge load for unrestrained or restrained walls, respectively. These values are applicable for backfill placed between the wall stem and an imaginary plane rising 45 degrees from below the edge (heel) of the wall footings.

Although not anticipated, retaining walls greater than 12 feet should be designed to resist additional earth pressure caused by seismic ground shaking. A seismic earth pressure of 15H (psf), based on an inverted triangular distribution, can be used for design of wall.

2.6.5 Soil Corrosivity Evaluation

Based on our review of soil corrosivity test results (see Appendix B), the pH, chloride content and saturated resistivity are not in the corrosive range to ferrous metal. The soluble sulfate concentration is not in the corrosive range to concrete. Mitigation measures to protect concrete in contact with the soils are not anticipated.

A corrosion engineer may be consulted for appropriate mitigation procedures and construction design, if needed. General considerations for corrosion mitigation measures may include the following:

- Steel and wire concrete reinforcement should have at least three inches of concrete cover where cast against soil, unformed.
- Below-grade ferrous metals should be given a high-quality protective coating, such as 18-mil plastic tape, extruded polyethylene, coal-tar enamel, or Portland cement mortar.
- Below-grade metals should be electrically insulated (isolated) from above-grade metals by means of dielectric fittings in ferrous utilities and/or exposed metal structures breaking grade.

2.6.6 Site Drainage

Adequate positive drainage should be provided away from the structure foundations to prevent ponding and to reduce percolation of water into the foundation soils. We recommend that any landscape areas immediately adjacent to the foundation shall be designed sloped away from the foundation with a minimum 2 percent slope gradient for at least 10 feet measured perpendicular to the face of the foundation. Impervious surfaces within 10 feet of the structure foundation shall be sloped a minimum of 1 percent away from the structure.

2.6.7 Earthwork and Site Grading

The earthwork anticipated for the restroom building includes foundation excavations and subgrade preparation. To prepare the subgrade underneath the slab, we recommend scarify the subgrade at least 6 inches, moisture conditioned as needed to near optimum moisture content, and compacted to 90 percent relative compaction for slab support. Deeper removal will be needed if soft soil conditions expose at the excavation bottom.

All engineered fill should be placed on competent, scarified and compacted bottom as evaluated by the geotechnical engineer and in accordance with the recommendations presented in this section. Excavated site soils, free of deleterious materials and rock

particles larger than three (3) inches in the l argest dimension, should be sui table for placement as compacted fill. Any proposed import fill should be evaluated and approved by Converse prior to import to the site. Import fill material should have an expansion index less than 20.

The onsite materials will contain large amount of gravels, cobbles and boulders. Based on our field exploration, t he earth materials at the site may be excavated wit h conventional heavy-duty earth moving and tr enching equipment in general. Difficult drilling and excav ation conditions should be also anticipated and other suitable equipment and methods should be used.

Prior to compaction, fill materials should be thoroughly mixed and moisture conditio ned within two (2) percent above the optimum moisture content. Fill soils sha ll be evenly spread in maximum 8-inch lifts, watered or dried as necessary, mixed and compacted to at least the density specified b elow. Th e fill sha ll be placed a nd compacted on a horizontal plane, unless otherwise approved by the Geotechnical Engineer. All fill, if not specified otherwise elsewhere in this report, should be compacted to at least 90 percent of the laboratory dry density in accordance with the ASTM Standard D1557 test method. The upper 12 inches of subgrade below pavem ent areas should be compacted to 95 percent relative compaction.

2.6.8 Expansive Soil

The near surface soils have a “Very Low” expans ive potential. Mitigation for expansiv e soil is not considered necessary.

2.6.9 Pipeline Backfill

Any soft and/or unsuitable material encount ered at the pipe invert should be removed and replaced with an adequate bedding material. Th e pipe s ubgrade should be leve l, firm, uniform, free of loose materials and properly graded to provide unifor m bearing and support to the entire se ction of the pi pe placed on beddi ng material. Protruding oversize particles larger than tw o (2) inches in the largest dimension, if any, should be removed from the trench bottom and replac ed with compacted materials. During the digging of depressions for proper sealing of the pipe joints, the pipe should rest on a prepared bottom for as near its fu ll length as is practicable. The bedding zone is defined as that portion of the pipe tr ench from four inches below the pipe invert to one foot above the top of pipe, in acco rdance with Section 306-1.2.1 of the Latest Edition of the *Standard Specifications for Public Works Construction* (SSPWC).

The following specifications are recommended to provide a basis for quality control during the placement of trench backfill.

Trench excavations to receive backfill shall be free of trash, debris or other unsatisfactory materials at the time of backfill placement. Excavated on-site soils free of oversize particles, defined as larger than one (1) inch in maximum dimension in the upper 12 inches of subgrade soils and larger than three (3) inches in the largest dimension in the trench backfill below, and deleterious matter after proper processing may be used to backfill the trench zone. Imported trench backfill, if used, should be approved by the project soils consultant prior to delivery at the site. No more than 30 percent of the backfill volume should be larger than ¾ inch in the largest dimension.

Trench backfill shall be compacted to 90 percent of the laboratory maximum dry density as per ASTM Standard D1557 test method. At least the upper twelve (12) inches of trench underlying pavements should be compacted to at least 95 percent of the laboratory maximum dry density.

Trench backfill shall be compacted by mechanical methods, such as sheepsfoot, vibrating or pneumatic rollers, or mechanical tampers, to achieve the density specified herein. The backfill materials shall be brought to within two (2) percent of optimum moisture content and then placed in horizontal layers. The thickness of uncompacted layers should not exceed eight (8) inches. Each layer shall be evenly spread, moistened or dried as necessary, and then tamped or rolled until the specified density has been achieved.

The contractor shall select the equipment and processes to be used to achieve the specified density without damage to adjacent ground and completed work. The field density of the compacted soils shall be measured by the ASTM Standard D1556 or ASTM Standard D2922 test methods or equivalent. Observation and field tests should be performed by Converse during construction to confirm that the required degree of compaction has been obtained. Where compaction is less than that specified, additional compactive effort shall be made with adjustment of the moisture content as necessary, until the specified compaction is obtained. It should be the responsibility of the contractor to maintain safe conditions during cut and/or fill operations. Trench backfill shall not be placed, spread or rolled during unfavorable weather conditions. When the work is interrupted by heavy rain, fill operations shall not be resumed until field tests by the project's geotechnical consultant indicate that the moisture content and density of the fill are as previously specified.

Imported soils, if any, used as compacted trench backfill should be predominantly granular and meet the following criteria:

- Expansion Index less than 20
- Free of all deleterious materials
- Contain no particles larger than 3 inches in the largest dimension
- Contain less than 30 percent by weight retained on ¾-inch sieve
- Contain at least 15 percent fines (passing #200 sieve)
- Have a Plasticity Index of 10 or less

Any import fill should be tested and approved by the geotechnical representative prior to delivery to the site.

2.6.10 Temporary Excavations

Based on the materials encountered in the exploratory borings, sloped temporary excavations may be constructed according to the slope ratios presented in the following table:

Table No. 3, Slope Ratios for Temporary Excavation

Maximum Depth of Cut (feet)	Maximum Slope Ratio* (horizontal: vertical)
0 – 4	vertical
4 – 8	1:1
>8	1.5:1

*Slope ratio assumed to be uniform from top to toe of slope.

Any loose utility trench backfill or other fill encountered in excavations will be less stable than the native soils. Temporary cuts encountering loose fill or loose dry sand should be constructed at a flatter gradient than presented in the table above. Surfaces exposed in slope excavations should be kept moist but not saturated to minimize raveling and sloughing during construction. Adequate provisions should be made to protect the slopes from erosion during periods of rainfall. Surcharge loads, including construction, should not be placed within five (5) feet of the unsupported excavation edge.

All applicable requirements of the California Construction and General Industry Safety Orders, the Occupational Safety and Health Act of 1987 and current amendments, and the Construction Safety Act should be met. The soils exposed in cuts should be

observed during exc avation by the project's geotechnical consultant. If potentially unstable soil conditions are enc ountered, modifications of slope ratios for temporary cuts may be required.

3.0 SITE NO. 2A – ROADWAY REPAIR SITE

3.1 Site Description

Site No. 2A is located at about 1,000 feet s outheast of Site No. 1, just south of the Behner Intake. It is our understanding that the existing asphalt paved roadway (Arroyo Seco Canyon Road/Gabrieleno Trail) was er oded for approxim ate 145 feet in length along the westerly shoulder during 2009-2010 storms and subsequent canyon floods. K-rails are currently in place along the western edge of the roadway. The northern segment of road erosion scarp is about 4 to 5 feet in vertical height and about 90 feet in length along roadway. The scarp exposed older alluvial soil consisting of brown silty sand with cobbles and boulders. The southern segment of road erosion scarp is about 1 foot in height and about 55 feet in length. The southern scarp exposed soil layer about 6 inches in height underlain by very hard, massive grantic rock.

The site is situated at about 1192 feet MSL. The site coor dinates are: North latitude: 34.2075 degrees and West longi tude: 118.1681 degrees. The project site is depicted on Drawing No. 2b, *Site No. 2A, Boring Location Map*.

3.2 Scope of Work

The scope of our pres ent study includes site reconnaissance, subsurface exploration, soil sampling, laboratory testing, engineering anal ysis, and preparat ion of this report. Details of the tasks are addressed in the following sections:

3.2.1 Project Setup and Site Reconnaissance

A Converse geologist conducted a site reconnaissance on June 20, 2013. The purpose of the reconnaissance was to evalua te site conditions with respect to the lo cation of th e borings and drill rig accessibility. The Underground Services Alert (USA) was notified on June 28, 2013 within 14 calendar days prior to field exploration.

3.2.2 Subsurface Exploration

One boring (BH-3) was drilled to 5 feet below existing r oadway ground surface on July 9, 2013. The borings were drilled with a limited access drill rig equip ped with 12-inc h diameter bucket augers for soil sampling. The boring was visually logg ed

and sampled at regular depth intervals and at changes in subsurface soils. The boring was backfilled and compacted with soil cuttings and patched with asphalt after completion of drilling. The boring encountered refusal at shallow depths due to very hard grantic bedrock. The locations of borings are shown on the attached *Drawing No. 2b, Site No. 2A, Boring Location Map*.

California Modified Sampler (Ring samples), and bulk soil samples were obtained for laboratory testing. The bore holes were backfilled and compacted with soil cuttings after the completion of field testing.

3.2.3 Laboratory Testing

Representative samples of the site soils were tested in the laboratory to aid in the classification and to evaluate relevant engineering properties. The tests performed included:

- *In situ* moisture contents and dry densities (ASTM Standard D2216)
- Grain-Size Analysis (ASTM D422)
- Soil corrosivity tests (Caltrans 643, 422, 417 and 532)

The detailed description of the laboratory test methods and test results are presented in Appendix B, *Laboratory Testing Program*.

3.2.4 Analyses and Report

Data obtained from the exploratory fieldwork and laboratory-testing program were analyzed and evaluated with respect to the proposed development. Recommendations for retaining walls, foundations, earthwork, and pavement structural section are provided.

3.3 Subsurface Conditions

3.3.1 Subsurface Soil Profile of Project Site

Based on our field observations, older alluvial soil (Map symbol: Qoa) and grantic bedrock (Map symbol: gr) were exposed on the erosion scarps underneath the roadway. Based on our exploratory soil boring (BH-3), the explored location is underlain by about 3-foot thick sandy soils over by grantic bedrock. The upper 1 foot of bedrock was highly weathered. The bedrock below the weather zone is massive and very hard. The detailed descriptions of the borings are presented in Appendix A, Field Exploration.

3.3.2 Groundwater

Groundwater was not encountered in our exploratory borings to a maximum depth of 3.5 feet. In accordance with the Seismic Hazard Zone Report for the Pasadena Quadrangle (CDMG, 1998), the historic highest groundwater level contours are not defined at this location. However, the roadway is adjacent to existing stream channel, seasonal high groundwater is anticipated to be shallow.

3.3.3 Subsurface Variations

Based on results of the subsurface exploration and our experience, some variations in the continuity and nature of subsurface conditions within the project site should be anticipated. Because of the uncertainties involved in the nature and geologic characteristics of the earth material at the site, care should be exercised in interpolating or extrapolating subsurface conditions between or beyond the boring locations. If during construction, subsurface conditions differ significantly from those presented in this report, this office should be notified immediately so that recommendations can be modified, if necessary.

3.4 Faulting and Geologic Hazards

Geologic hazards are defined as geologically related conditions that may present a potential danger to life and property. Typical geologic hazards in Southern California include earthquake ground shaking, fault surface rupture, landslides, and liquefaction.

3.4.1 Fault Surface Rupture and Active Faults

The project site is not located within a currently designated State of California Earthquake Fault Zone (formerly Alquist-Priolo Special Studies Zones) for surface fault rupture. Based on Drawing No. 3, Regional Geologic Map (Dibblee, 1989), the trace of Tujunga Fault is located at approximate 1,000 feet south of the project site.

3.4.2 Liquefaction

Liquefaction is the sudden decrease in the strength of cohesionless soils due to dynamic or cyclic shaking. Saturated soils behave temporarily as a viscous fluid (liquefaction) and, consequently, lose their capacity to support the structures founded on them. The potential for liquefaction decreases with increasing clay and gravel content, but increases as the ground acceleration and duration of shaking increase. Liquefaction potential has been found to be the greatest where the groundwater level and loose sands occur within 50 feet of the ground surface. The site is not located

within a mapped Seismic Hazard Zone for liquefaction (CDMG, 1998) as shown in Drawing No. 4, *Seismic Hazard Zones Map*.

Based on the results of our subsurface exploration, the site has shallow grantic bedrock, it is our professional opinion that the site is not susceptible to liquefaction and seismically-induced settlement to be negligible.

3.4.3 Landslides

The Grantic bedrock slope east of the site is located within a Seismic Hazard Zone for required investigation for earthquake-induced landsliding (CDMG, 1999). Based on our field observations of bedrock slope, it is our opinion the slope is stable at its current condition. However, small rock fall hazard should be expected due to steepness of the slope.

3.4.4 Flood Zone

Based on the information provided by Carollo Engineers, the roadway repair site is located within a 5-year floodplain. The roadway is located along the Arroyo Seco Canyon floodplain and is subject to potential flooding following periods of heavy rainfall. The retaining wall should be designed considering the inundation and scour by flood events. Flood protection measures are recommended for new structures. Channel armor may be necessary to protect the retaining wall. Maintenance of roadway will be required after flood events.

3.5 Seismic Analysis

3.5.1 CBC Seismic Design Parameters

Seismic parameters based on the 2010 California Building Code are calculated using the United States Geological Survey computer program *Seismic Hazards Curves, Response Parameters and Design Parameters, Version 5.1.0a.* The seismic parameters are presented below.

Table No. 4, 2010 CBC Seismic Parameters For Site No. 2A

Seismic Parameters	
Site Class	C
Mapped Short period (0.2-sec) Spectral Response Acceleration, S_S	2.636g
Mapped 1-second Spectral Response Acceleration, S_1	0.973g
Site Coefficient (from Table 1613.5.3(1)), F_a	1.0
Site Coefficient (from Table 1613.5.3(2)), F_v	1.3
MCE 0.2-sec period Spectral Response Acceleration, S_{MS}	2.636g
MCE 1-second period Spectral Response Acceleration, S_{M1}	1.265g
Design Spectral Response Acceleration for short period, S_{DS}	1.757g
Design Spectral Response Acceleration for 1-second period, S_{D1}	0.843g
Seismic Design Category	D

3.5.2 Deaggregated Seismic Source Parameters

Based on our analyses utilizing the USGS 2008 NSHM P PSHA Interactive Deaggregation website, the mean and modal ear thquake magnitudes for a return ti me of 2475 years are calculated to be 6.89 and 7.02, respectively. The earthquake magnitude of 7.02 should be considered for seismic analyses at the project site.

3.6 Conclusions and Recommendations

3.6.1 Retaining Wall Recommendations

We recommend a training wall along the west shoulder of the roadway be constructed to support and restore the existing roadway. T he training wail is expected to be from 3 to 6 feet in height and should be designed for an active pressure in terms of equivalen t fluid pressure of 90 pcf, considering both earth and hydrostatic pr essure behind the wall.

Walls subjected to surcharge loads located wit hin a dis tance equal to the height of the wall should be designed for an additional unifo rm lateral pressure equal to one-third or one-half the anticipated surcharge load fo r unrestrained or restrained walls, respectively. These values are applic able for backfill placed between the wall stem and an imaginary plane rising 45 degrees from below the edge (heel) of the wall footings.

Retaining wall should be supp orted by ca st-in-drilled-hole (CIDH) piles embedded at least 8 feet into older alluvial soils (nort hern segment) or at least 3 feet into grantic bedrock (southern segment). CIDH piles s hould be at least 18 inches in diameter with 8 feet center-to-center spacing. Pile bearing capacities c an be calculated using allowable

skin friction of 400 psf and 800 psf for older alluvium and competent grantic bedrock, respectively. Uplift capacity can be taken as one-half of the downward pile capacity.

A coefficient of friction of 0.4 can be assumed for concrete in contact with firm older alluvium and bedrock. An allowable passive earth pressure in terms of equivalent fluid pressure of 300 pcf and 500 pcf up to a maximum of 4,000 psf can be used for firm older alluvial soils and bedrock, respectively. If pile spacing is greater than 3 times pile diameter, the passive pressure can be doubled.

For any backfills, excavated site soils, free of deleterious materials and rock particles larger than three (3) inches in the largest dimension, are suitable for placement as compacted fill. Any proposed import fill should be evaluated and approved by Converse prior to import to the site. Import fill material should have an expansion index less than 20. Prior to compaction, fill materials should be thoroughly mixed and moisture conditioned within two (2) percent above the optimum moisture content. Fill soils shall be evenly spread in maximum 8-inch lifts, watered or dried as necessary, mixed and compacted to at least the density specified below. The fill shall be placed and compacted on a horizontal plane, unless otherwise approved by the Geotechnical Engineer. All fill, if not specified otherwise elsewhere, should be compacted to at least 90 percent of the laboratory dry density in accordance with the ASTM Standard D1557 test method.

3.6.2 Flexible Pavement Recommendations

The flexible pavement structural section design recommendations were performed in accordance with the method contained in the *CALTRANS Highway Design Manual*, Chapter 630 without the factor of safety. No specific traffic study was performed to determine the Traffic Index (TI) for the proposed project. The recommended flexible pavement structural sections for various TI conditions are presented in the following table:

Table No. 5, Flexible Pavement Structural Sections

Design Subgrade R-value	Design TI	PAVEMENT STRUCTURAL SECTIONS		FULL AC STRUCTURAL SECTION
		AC (inches)	AB (inches)	AC (inches)
50*	4	2	2	3
	5	3	2	4
	6	3	4	5

* maximum allowable R-value for design

Actual traffic index and traffic load should be determined by either Civil Engineer or Traffic Engineer. The above pavement sections are recommended as a guideline for basic usage of the indicated TI values, and may not be sufficient for actual traffic loading.

Base material shall conform to requirements for a Class 2 Crushed Aggregate Base (CAB) or equivalent (such as crushed miscellaneous base - CMB) and should be placed in accordance with the requirements of the Standard Specifications for Public Works Construction (SSPWC, Latest Edition). Asphaltic materials should conform to Section 203-1, "*Paving Asphalt*," and should be placed in accordance with Section 302-5, "*Asphalt Concrete Pavement*," of the SSPWC.

3.6.3 Earthwork

The earthwork anticipated for the roadway improvement includes CIDH pile excavations and subgrade preparation. To prepare the subgrade underneath the pavement, we recommend scarify the subgrade at least 6 inches, moisture conditioned as needed to near optimum moisture content, and compacted to 90 percent relative compaction for slab support. Deeper removal will be needed if soft soil conditions expose at the excavation bottom.

All engineered fill should be placed on competent, scarified and compacted bottom as evaluated by the geotechnical engineer and in accordance with the recommendations presented in this section. Excavated site soils, free of deleterious materials and rock particles larger than three (3) inches in the largest dimension, should be suitable for placement as compacted fill. Any proposed import fill should be evaluated and approved by Converse prior to import to the site. Import fill material should have an expansion index less than 20.

The onsite materials will contain large amount of gravels, cobbles, boulders and very hard grantic bedrock. Based on our field exploration, the earth materials at the site may be excavated with conventional heavy-duty earth moving and trenching equipment in general. Difficult drilling and excavation conditions shall be also anticipated and other suitable equipment and methods should be used.

Prior to compaction, fill materials should be thoroughly mixed and moisture conditioned within two (2) percent above the optimum moisture content. Fill soils shall be evenly spread in maximum 8-inch lifts, watered or dried as necessary, mixed and compacted to at least the density specified below. The fill shall be placed and compacted on a horizontal plane, unless otherwise approved by the Geotechnical Engineer. All fill, if not specified otherwise elsewhere in this report, should be compacted to at least 90 percent of the laboratory dry density in accordance with the ASTM Standard D1557 test method.

4.0 SITE NO. 2C – 2nd CANDIDATE SITE FOR PUBLIC RESTROOM

4.1 Site Description

Site No. 2C is located at a relative flat area on the east side of Gabrieleno Trail just north of the JPL parking area south of a junction of two stream channels. The preliminarily planned restroom building is located on the northern portion of the site, and the onsite wastewater treatment system (OWTS) is located on the southern portion. The site is about 3 feet higher than the existing road and the surface conditions consist of bushes and some mature trees. An approximate 120 feet high ascending grantic bedrock slope to a building pad is located about 60 feet east of boring BH-5. The slope is steeper than 1H:1V.

The site is situated at about 1162 feet MSL. The site coordinates are: North latitude: 34.2102 degrees and West longitude: 118.1713 degrees. The project site is depicted on Drawing No. 2c, *Site No. 2C, Boring Location Map*.

4.2 Scope of Work

The scope of our present study includes site reconnaissance, subsurface exploration, soil sampling, laboratory testing, engineering analysis, and preparation of this report. Details of the tasks are addressed in the following sections:

4.2.1 Project Setup and Site Reconnaissance

A Converse geologist conducted a site reconnaissance on June 20, 2013. The purpose of the reconnaissance was to evaluate site conditions with respect to the location of the borings and drill rig accessibility. The Underground Services Alert (USA) was notified on June 28, 2013 within 14 calendar days prior to field exploration.

4.2.2 Subsurface Exploration and Percolation Testing

Three (3) borings, including two borings (BH-4 and BH-4A) within the planned restroom area and one boring (BH-5) within the planned wastewater treatment system (leach lines) area, were drilled a maximum 3.5 feet below existing ground surface on July 10, 2013. The borings were drilled with a limited access drill rig equipped with 12-inch and 24-inch diameter bucket augers for soil sampling. Each boring was visually logged and sampled at changes in subsurface soils. The borings were backfilled with soil cuttings after completion of testing. All three borings encountered refusals at shallow depths due to very hard grantic bedrock. The boring BH-4A was an additional attempt after

refusal at BH-4. The locations of borings are shown on the attached Drawing No. 2c, Site No. 2C, Boring Location Map.

California Modified Sampler (Ring samples), and bulk soil samples were obtained for laboratory testing. The bore holes were backfilled and compacted with soil cuttings after the completion of field testing.

Boring BH-5 was utilized for percolation tests prior to backfill. Percolation test procedures and test results are further discussed in Section 4.6.1, Preliminary OWTS Feasibility Evaluation. The raw data of percolation testing is presented in Appendix C, *Percolation Testing Data*.

4.2.3 Laboratory Testing

Representative samples of the site soils were tested in the laboratory to aid in the classification and to evaluate relevant engineering properties. The tests performed included:

- *In situ* moisture contents and dry densities (ASTM Standard D2216)
- Grain-Size Analysis (ASTM D422)
- Soil corrosivity tests (Caltrans 643, 422, 417 and 532)
- R-value

The detailed description of the laboratory test methods and test results are presented in Appendix B, *Laboratory Testing Program*.

4.2.4 Analyses and Report

Data obtained from the exploratory fieldwork and laboratory-testing program were analyzed and evaluated with respect to the proposed development. Feasibility evaluation of OWTS are provided.

4.3 Subsurface Conditions

4.3.1 Subsurface Soil Profile of Project Site

Based on our exploratory soil borings (BH-4, BH-4A and BH-5) at the site, the site is underlain by thin sandy soils over very hard grantic bedrock (Map symbol: gr). The bedrock was encountered at about 6 inches to 2.5 feet below the ground surface. The detailed descriptions of the borings are presented in Appendix A, Field Exploration.

Although the bedrock is considered as an excellent material to support the building foundation, however, it is impermeable and not suitable for the planned leach field.

4.3.2 Groundwater

Groundwater was not encountered in our exploratory borings to a maximum depth of 2.5 feet. In accordance with the Seismic Hazard Zone Report for the Pasadena Quadrangle (CDMG, 1998), the historic highest groundwater level is reportedly at depth of approximately 20 feet at the site.

4.3.3 Subsurface Variations

Based on results of the subsurface exploration and our experience, some variations in the continuity and nature of subsurface conditions within the project site should be anticipated. Because of the uncertainties involved in the nature and geologic characteristics of the earth material at the site, care should be exercised in interpolating or extrapolating subsurface conditions between or beyond the boring locations. If during construction, subsurface conditions differ significantly from those presented in this report, this office should be notified immediately so that recommendations can be modified, if necessary.

4.4 Faulting and Geologic Hazards

Geologic hazards are defined as geologically related conditions that may present a potential danger to life and property. Typical geologic hazards in Southern California include earthquake ground shaking, fault surface rupture, landslides, and liquefaction.

4.4.1 Fault Surface Rupture and Active Faults

The project site is not located within a currently designated State of California Earthquake Fault Zone (formerly Alquist-Priolo Special Studies Zones) for surface fault rupture. Based on Drawing No. 3, Regional Geologic Map (Dibblee, 1989), the trace of Tujunga Fault is located at approximate 80 feet south of the project site.

4.4.2 Liquefaction

Liquefaction is the sudden decrease in the strength of cohesionless soils due to dynamic or cyclic shaking. Saturated soils behave temporarily as a viscous fluid (liquefaction) and, consequently, lose their capacity to support the structures founded on them. The potential for liquefaction decreases with increasing clay and gravel content, but increases as the ground acceleration and duration of shaking increase. Liquefaction potential has been found to be the greatest where the groundwater level

and loose sands occur within 50 feet of the ground surface. The site is not located within a mapped Seismic Hazard Zone for liquefaction (CDMG, 1998) as shown in Drawing No. 4, *Seismic Hazard Zones Map*.

Based on the results of our subsurface exploration, the site has shallow Grantic bedrock, it is our professional opinion that the site is not susceptible to liquefaction and seismically-induced settlement to be negligible.

4.4.3 Landslides

The grantic bedrock slope east of the site is located within a Seismic Hazard Zone for required investigation for earthquake-induced landsliding (CDMG, 1999). Based on our field observations of bedrock slope, it is our opinion the slope is stable at its current condition. However, small rock fall hazard should be expected due to steepness of the slope.

4.4.4 Flood Zone

The proposed restroom site is located in the Arroyo Seco Canyon near the confluence to two tributary drainage canyons. The site is subject to potential flooding following major storm events and/or wildfires.

4.5 Seismic Analysis

4.5.1 CBC Seismic Design Parameters

Seismic parameters based on the 2010 California Building Code are calculated using the United States Geological Survey computer program *Seismic Hazards Curves, Response Parameters and Design Parameters, Version 5.1.0a.* The seismic parameters are presented below.

Table No. 6, 2010 CBC Seismic Parameters For Site No. 2C

Seismic Parameters	
Site Class	B
Mapped Short period (0.2-sec) Spectral Response Acceleration, S_S	2.656g
Mapped 1-second Spectral Response Acceleration, S_1	0.979g
Site Coefficient (from Table 1613.5.3(1)), F_a	1.0
Site Coefficient (from Table 1613.5.3(2)), F_v	1.0
MCE 0.2-sec period Spectral Response Acceleration, S_{MS}	2.656g
MCE 1-second period Spectral Response Acceleration, S_{M1}	0.979g

Design Spectral Response Acceleration for short period, S_{DS}	1.771g
Design Spectral Response Acceleration for 1-second period, S_{D1}	0.953g
Seismic Design Category	D

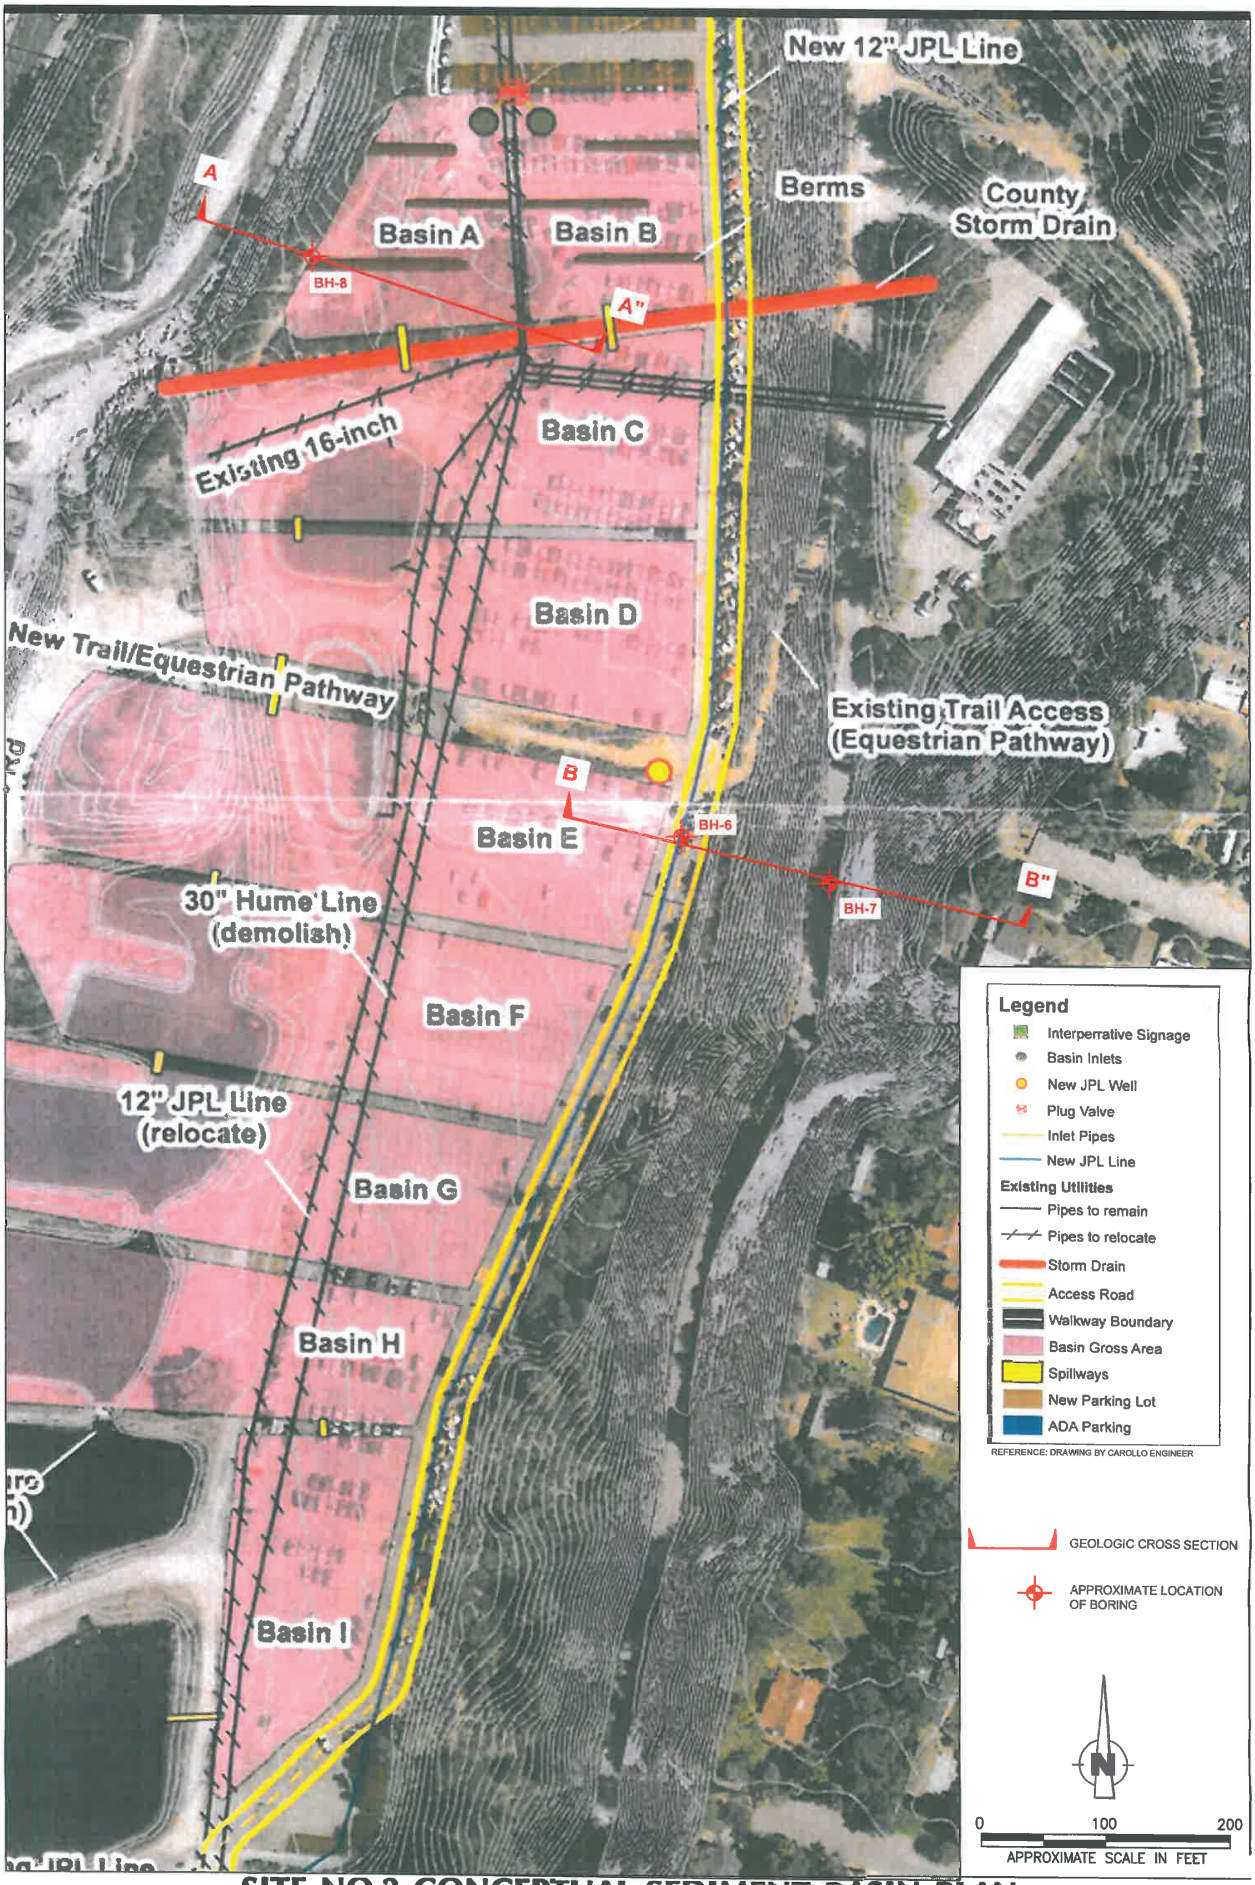
4.5.2 Deaggregated Seismic Source Parameters

Based on our analyses utilizing the USGS 2008 NSHM P PSHA Interactive Deaggregation website, the mean and modal ear thquake magnitudes for a return ti me of 2475 years are calculated to be 6.89 and 7.02, respectively. The earthquake magnitude of 7.02 should be considered for seismic analyses at the project site.

4.6 Conclusions and Recommendations

4.6.1 Preliminary OWTS Feasibility Evaluation

The boring BH-5 was utilized to perform percolation t ests on July 10 and 1 1, 2013 to evaluate the feasibility of onsite wastewater treatment system. Water was a dded to the bore hole until the water level was at the ground surface on July 10, 2013 and allowed to pre-soak for one day. Based on our obs ervations on July 11, 2013, water still remained in the borehole after the one-day pre-soak. In accordance with the LA County guidelines, **Site No. 2C is not feasible for the construction of onsite wastewater treatment system.** The site is underlain by shallow, hard bedrock with littl e permeability.



Since this site is not suitable for the public restroom, further geotechnical recommendation is not provided.

5.0 SITE NO. 3 – STORMWATER SEDIMENT BASIN SITE

5.1 Site Description

Site No. 3 is located at the southernmost part of the proj ect, including the existing JPL parking area and existing sediment basins. The surface conditions consis t of asphalt concrete pavement and unpaved ground.

It is understood that the southern portion of the existing JPL parking area will be demolished for the future sediment basin ex pansion. The construction of basins will consist of excav ating approximate 1 foot below the existing grade and constructing about 2-foot-high berms around th e basins. Although not fina lized, the conceptual plan provided by Carollo is illustrated on Drawing No. 5, *Site No. 3, Conceptual Sediment Basin Plan* for reference.

Drawing No.
5

5.2 Scope of Work

The scope of our present study includes site reconnaissance, subsurface exploration, soil sampling, laboratory testing, engineering analysis, and preparation of this report. Details of the tasks are addressed in the following sections:

5.2.1 Project Setup and Site Reconnaissance

A Converse geologist conducted a site reconnaissance on June 20, 2013. The purpose of the reconnaissance was to evaluate site conditions with respect to the location of the borings and drill rig accessibility. The Underground Services Alert (USA) was notified on June 28, 2013 within 14 calendar days prior to field exploration.

5.2.2 Subsurface Exploration and Percolation Testing

A total of nine (9) borings were drilled, including 3 borings (BH-6 through BH-8) to a maximum depth of 21 feet near the slopes, 3 borings (BH-9 through BH-11) to about 5 feet within the existing paved parking lot, and 3 borings (BH-12 though BH-14) to about 5 feet within the existing sediment basins. The locations of borings are shown on the attached Drawing No. 2d, *Site No. 3, Boring Location Map.*

The borings were drilled with a truck-mounted drill rig equipped with 8-inch diameter hollow-stem auger and a 4-inch diameter hand auger for soil sampling and/or percolation testing. Each boring will be visually logged and sampled at regular depth intervals and at changes in subsurface soils. The borings will be backfilled with soil cuttings and patched with asphalt where needed.

During our drilling at Boring BH-7 location, the driller hit a 16-inch water main pipe on July 12, 2013. Prior to using drill rig, the driller attempted to hand auger the upper 5 feet below ground surface (bgs). However, the hand augering encountered refusal due to big cobbles at about 3 feet bgs. The driller started to use drill rig to drill the boring, and then hit the water main at about 4 to 5 feet bgs.

This incident created a cavity on the existing roadway and erosion scarps on both sides of roadway. Based on our visual observations, the cavity was about maximum 15 feet in width and 10 feet in depth. The erosion scarp on the east side of roadway created a near vertical ascending slope up to approximate 20 feet in height. This slope exposed terrance deposits consisting of silty sand with cobbles and boulders. Some cobbles and boulders were exposed on the slope that may cause potential rock fall hazard.

Converse revisited the site on July 23, 2013. Based on our observations, the cavity on the road had been backfilled with slurry to about 80% of road width and the road was accessible to the recreational traffic.

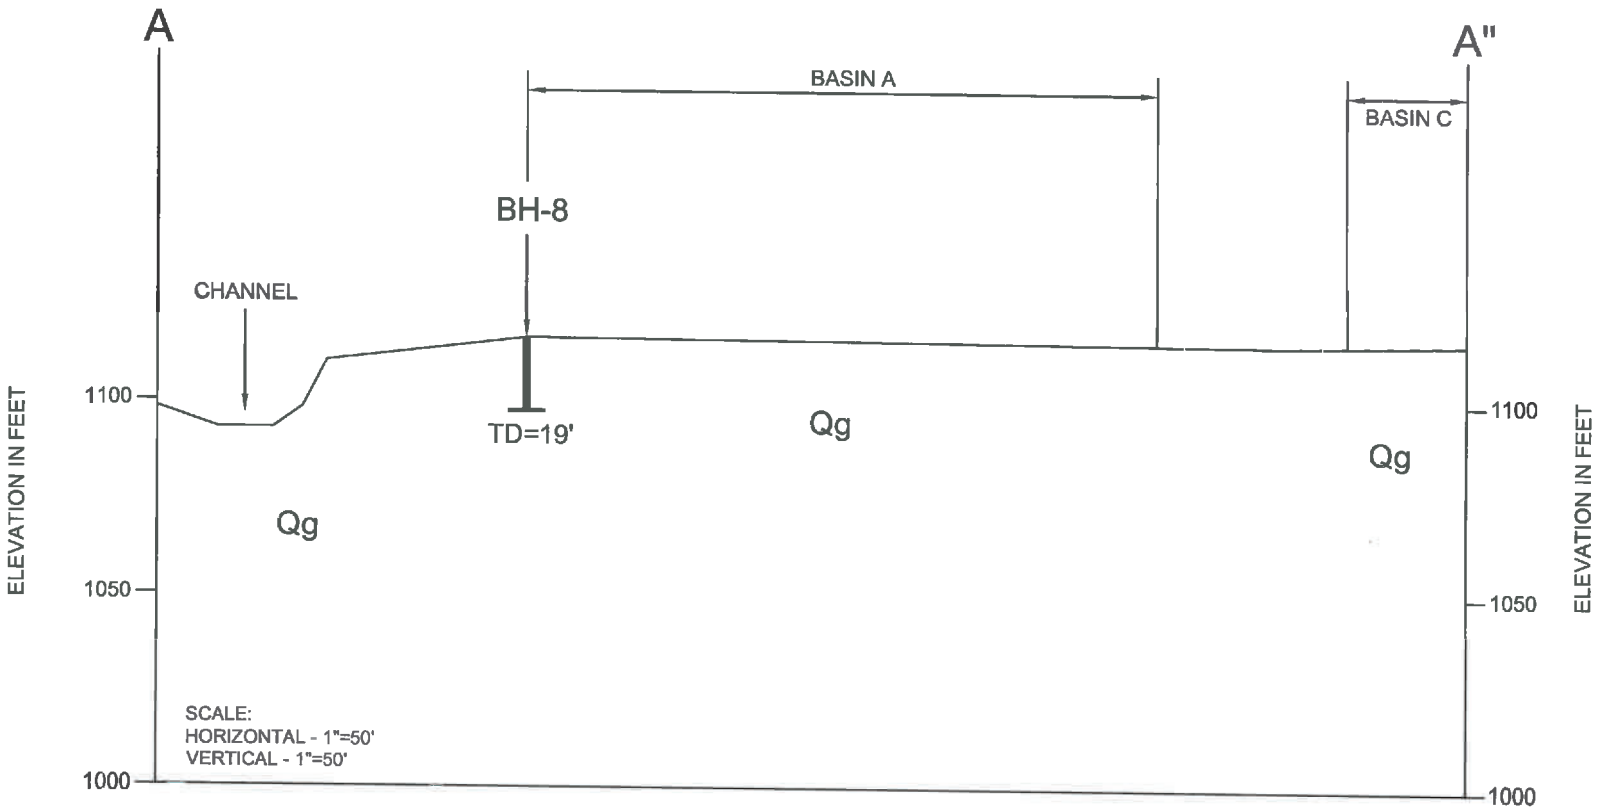
5.2.3 Laboratory Testing

Representative samples of the site soils were tested in the laboratory to aid in the classification and to evaluate relevant engineering properties. The tests performed included:

- *In situ* moisture contents and dry densities (ASTM Standard D2216)
- Grain-Size Analysis (ASTM D422)
- Maximum dry density and optimum-moisture content relationship (ASTM Standard D1557)
- Direct shear (ASTM Standard D3080)
- Consolidation (ASTM Standard D2435)
- Soil corrosivity tests (Caltrans 643, 422, 417 and 532)

The detailed description of the laboratory test methods and test results are presented in Appendix B, *Laboratory Testing Program*.

5.2.4 Analyses and Report



Percolation test results and slope stability were analyzed and evaluated with respect to the proposed development. Preliminary earthwork recommendations are presented.

5.3 Subsurface Conditions

5.3.1 Subsurface Soil Profile of Project Site

Based on our exploratory soil borings, stream deposits (Map symbol: Qg) and terrace deposits (Map symbol: Qof) both consisting of primarily light brown silty sand with numerous cobbles and boulders were encountered to a maximum explored depth of 21 feet below existing ground surface (bgs). The stream deposits and terrace deposits are both moderately dense to very dense. The detailed descriptions of the borings are presented in Appendix A, Field Exploration.

Drawing No. 6a and 6b are prepared to illustrate the geologic cross sections of A-A' and B-B' for slope stability analyses.

5.3.2 Groundwater

Groundwater was not encountered in our exploratory borings to a maximum depth of 21 feet. In accordance with the Seismic Hazard Zone Report for the Pasadena Quadrangle (CDMG, 1998), the historic highest groundwater level is reportedly at depths of approximately 20 feet.

5.3.3 Subsurface Variations

Based on results of the subsurface exploration and our experience, some variations in the continuity and nature of subsurface conditions within the project site should be anticipated. Because of the uncertainties involved in the nature and geologic characteristics of the earth material at the site, care should be exercised in interpolating or extrapolating subsurface conditions between or beyond the boring locations. If during construction, subsurface conditions differ significantly from those presented in this report, this office should be notified immediately so that recommendations can be modified, if necessary.

5.4 Percolation Testing Results

The borings BH-9 through BH-14 were utilized to perform percolation tests on July 11 and 12 to evaluate the percolation rates for the design of future sediment basins. Tests were performed using the falling head test method in accordance with Los Angeles County "Low Impact Development Best Management Practice Guideline for Design, Investigation, and Reporting"

The bored hole was cased using a two-inch diameter perforated PVC casing surrounded with filter gravel pack. Water was added to the bore hole until the water level was at the ground surface and allowed to pre-soak for at least 2 hours. After pre-soak, water was added to the bore hole until the water level was at the ground surface. The water level was measured to the nearest 1/100-foot and recorded every 10-minute interval. The results of the percolation tests are tabulated below and in Appendix C, Percolation Testing Data.

Table No. 7, Percolation Test Results at Site No. 3

Boring No.	Location	Depth of Test Hole* (feet)	Lowest Percolation Rate (inches/hour)	Average Percolation Rate (inches/hour)
BH-9	JPL Parking	5.0	6.58	7.87
BH-10	JPL Parking	5.0	11.52	15.90

BH-11	JPL Parking	5.0	4.50	6.65
BH-12	Sludge Basin 2	5.0	4.70	24.09
BH-13	Basin 8	3.0	27.51	58.65
BH-14	Basin 13	5.0	16.96	28.07

*approximate

The upper 5 feet of soils within Site No. 3 have high to very high percolation rates. Converse has reviewed a literature entitled "Seepage, Drainage and Flow Nets" by Cedregren (1989) to verify the percolation results and provide our opinions to the high percolation rates. The followings are some reasons to explain the high percolation rates.

- Young stream deposits from the river channel naturally have higher permeability than other alluvial soils. These sediments are generally loose and unconsolidated.
- Percolation test holes did not have fine sediments.
- Clean water was used for percolation tests.
- The soils surrounding the test holes (especially near surface soil) may be disturbed or loosened during drilling.
- The higher percolation rates near surface increased the average rates.

The soils encountered in the JPL parking lot and existing sediment basins are "Stream Deposits" from the Arroyo Seco Canyon, consisting of primarily gravelly sands with cobbles and boulders, which are excellent permeable materials. The typical permeability rates of gravelly sands range from 2.8 to 280 ft/day, however, the percent of fine sediments accumulated in soil will reduce the permeability down to 0.2 to 3 ft/day according to Cedergren (1989). Our test results are within the typical percolation rate range.

It is our opinion that the percolation rates presented on our table demonstrate the good percolation capacity of the onsite soils without considering fine sediment clogging. For planning or design purposes, it is recommended consider the lowest percolation rates among the tests because the percolation test holes are located at only a few scattered points over a fairly large area. Fine sediment clogging should be also considered into the design and maintenance plan for the stormwater spreading and recharge of the basins.

5.5 Slope Stability Analysis

Geologic cross sections A-A' and B-B' were analyzed for gross static slope stability by using a computer program SLOPE/W which utilizes various limiting equilibrium methods, including the ordinary slice, Bishop's, Jabu's, and Spencer's method.

To evaluate the influence of the future sediment basin expansion, groundwater level is assumed to be (1) at 20 feet below the ground surface, and (2) groundwater at ground surface, to simulate dry and saturated soil conditions underneath the sediment basins, respectively. The detailed analyses results are presented in Appendix D, Slope Stability Analyses. The summary of slope stability results are presented in the following table:

Table No. 8, Summary of Slope Factor of Safety

Cross Section	Groundwater Depth (feet)	Minimum Factor of Safety (Static)	Plate No.
A – A'	20	1.496	S-A1
	0	1.292	S-A2
B – B'	20	1.487	S-B1
	0	1.487	S-B2

As shown in the table above, the slope stability near the existing stream channel (Cross Section A-A') has a factor of safety greater than 1.496 at current condition. When the proposed new sediment basin with groundwater at surface is assumed, the factor of safety reduces to 1.292. The factors of safety in both cases remain above 1.0, which indicates this slope does not expose immediate instability. In general practices, most structures constructed on slopes require a minimum factor of safety of 1.5, and temporary grading requires a minimum factor of safety of 1.25. The proposed new Sediment Basin A is located in the area having 1.5 factor of safety, and the slope near the stream channel has factor of safety greater than 1.25 which meet the minimum requirements. It should be advised that this slope will be eroded by the stream from time to time, and the slope stability will be also changed by the slope profile.

The slope stability of the easterly slope (Cross Section B-B') has a factor of safety of 1.487 at current condition. When the proposed new sediment basin with groundwater at surface is assumed, the factor of safety remains the same, which suggests the saturation of subsurface soil will not impact the current slope stability.

5.6 Earthwork Recommendations

5.6.1 Earthwork and Site Grading

To construct the planned sediment basins, the anticipated earthwork and site grading includes excavations of basins and constructing berms. All berms should be constructed with a slope gradient less than 2H:1V.

All engineered fill should be placed on competent, scarified and compacted bottom as evaluated by the geotechnical engineer and in accordance with the recommendations presented in this section. Excavated site soils, free of deleterious materials and rock particles larger than three (3") inches in the largest dimension, should be suitable for placement as compacted fill. Any proposed import fill should be evaluated and approved by Converse prior to import to the site. Import fill material should have an expansion index less than 20.

The onsite materials will contain large amount of gravels, cobbles and boulders. Based on our field exploration, the earth materials at the site may be excavated with conventional heavy-duty earth moving and trenching equipment in general. Difficult drilling and excavation conditions should be also anticipated and other suitable equipment and methods should be used.

Prior to compaction, fill materials should be thoroughly mixed and moisture conditioned within two (2) percent above the optimum moisture content. Fill soils shall be evenly spread in maximum 8-inch lifts, watered or dried as necessary, mixed and compacted to at least the density specified below. The fill shall be placed and compacted on a horizontal plane, unless otherwise approved by the Geotechnical Engineer. All fill, if not specified otherwise elsewhere in this report, should be compacted to at least 90 percent of the laboratory dry density in accordance with the ASTM Standard D1557 test method. The upper 12 inches of subgrade below pavement areas should be compacted to 95 percent relative compaction.

5.6.2 Expansive Soil

The near surface soils have a "Very Low" expansive potential. Mitigation for expansive soil is not considered necessary.

5.6.3 Pipeline Backfill

Any soft and/or unsuitable material encountered at the pipe invert should be removed and replaced with an adequate bedding material. The pipe subgrade should be level, firm, uniform, free of loose materials and properly graded to provide uniform bearing

and support to the entire section of the pipe placed on bedding material. Protruding oversize particles larger than two (2) inches in the largest dimension, if any, should be removed from the trench bottom and replaced with compacted materials. During the digging of depressions for proper sealing of the pipe joints, the pipe should rest on a prepared bottom for as near its full length as is practicable. The bedding zone is defined as that portion of the pipe trench from four inches below the pipe invert to one foot above the top of pipe, in accordance with Section 306-1.2.1 of the Latest Edition of the *Standard Specifications for Public Works Construction* (SSPWC).

The following specifications are recommended to provide a basis for quality control during the placement of trench backfill.

Trench excavations to receive backfill shall be free of trash, debris or other unsatisfactory materials at the time of backfill placement. Excavated on-site soils free of oversize particles, defined as larger than one (1) inch in maximum dimension in the upper 12 inches of subgrade soils and larger than three (3) inches in the largest dimension in the trench backfill below, and deleterious matter after proper processing may be used to backfill the trench zone. Imported trench backfill, if used, should be approved by the project soils consultant prior to delivery at the site. No more than 30 percent of the backfill volume should be larger than ¾ inch in the largest dimension.

Trench backfill shall be compacted to 90 percent of the laboratory maximum dry density as per ASTM Standard D1557 test method. At least the upper twelve (12) inches of trench underlying pavements should be compacted to at least 95 percent of the laboratory maximum dry density.

Trench backfill shall be compacted by mechanical methods, such as sheepsfoot, vibrating or pneumatic rollers, or mechanical tampers, to achieve the density specified herein. The backfill materials shall be brought to within two (2) percent of optimum moisture content and then placed in horizontal layers if the expansion index is less than or equal to 30. Should the expansion index be greater than 30, backfill materials shall be brought to approximately 2 percent above optimum moisture content. The thickness of uncompacted layers should not exceed eight (8) inches. Each layer shall be evenly spread, moistened or dried as necessary, and then tamped or rolled until the specified density has been achieved.

The contractor shall select the equipment and processes to be used to achieve the specified density without damage to adjacent ground and completed work. The field density of the compacted soils shall be measured by the ASTM Standard D1556 or ASTM Standard D2922 test methods or equivalent. Observation and field tests should be performed by Converse during construction to confirm that the required degree of

compaction has been obtained. Where compaction is less than that specified, additional compactive effort shall be made with adjustment of the moisture content as necessary, until the specified compaction is obtained. It should be the responsibility of the contractor to maintain safe conditions during cut and/or fill operations. Trench backfill shall not be placed, spread or rolled during unfavorable weather conditions. When the work is interrupted by heavy rain, fill operations shall not be resumed until field tests by the project's geotechnical consultant indicate that the moisture content and density of the fill are as previously specified.

Imported soils, if any, used as compacted trench backfill should be predominantly granular and meet the following criteria:

- Expansion Index less than 20
- Free of all deleterious materials
- Contain no particles larger than 3 inches in the largest dimension
- Contain less than 30 percent by weight retained on ¾-inch sieve
- Contain at least 15 percent fines (passing #200 sieve)
- Have a Plasticity Index of 10 or less

Any import fill should be tested and approved by the geotechnical representative prior to delivery to the site.

5.6.4 Temporary Excavations

Based on the materials encountered in the exploratory borings, sloped temporary excavations may be constructed according to the slope ratios presented in the following table:

Table No. 9, Slope Ratios for Temporary Excavation at Site No. 3

Maximum Depth of Cut (feet)	Maximum Slope Ratio* (horizontal: vertical)
0 – 4	vertical
4 – 8	1:1
>8	1.5:1

*Slope ratio assumed to be uniform from top to toe of slope.

Any loose utility trench backfill or other fill encountered in excavations will be less stable than the native soils. Temporary cuts encountering loose fill or loose dry sand should be constructed at a flatter gradient than presented in the table above. Surfaces exposed in slope excavations should be kept moist but not saturated to minimize raveling and sloughing during construction. Adequate provisions should be made to protect the slopes from erosion during periods of rainfall. Surcharge loads, including construction, should not be placed within five (5) feet of the unsupported excavation edge.

All applicable requirements of the California Construction and General Industry Safety Orders, the Occupational Safety and Health Act of 1987 and current amendments, and the Construction Safety Act should be met. The soils exposed in cuts should be observed during excavation by the project's geotechnical consultant. If potentially unstable soil conditions are encountered, modifications of slope ratios for temporary cuts may be required.

6.0 SLOPE REPAIR RECOMMENDATIONS

The erosion scarps caused by the broken water pipe incident on both sides of the existing roadway (Arroyo Seco Canyon Road) will require repairs to support the roadway.

For the erosion scarp below the roadway, we recommend soldier piles with wood lagging be used as the retaining system to support the roadway. The soldier piles should be embedded at least 8 feet below the lowest adjacent grade. The actual embedment depth should be determined by the design engineer. The pile capacity can be calculated using allowable skin friction of 350 psf. An allowable passive resistance in the terms of equivalent fluid pressure of 300 pcf can be used for lateral design. Passive resistance can be doubled if pile spacing is greater than 3 time diameter. The retaining wall should have proper subdrain or weepholes. Loose soils and debris washed down to the parking lot fence should be removed and cleared. Portions of the fence may have to be repaired and/or replaced.

For the erosion scarp on the ascending slope east of the roadway, we recommend a buttress system be constructed to increase the slope stability and reduce rock fall hazard. Gabions constructed to a 1H:1V slope ratio to a minimum height of 8 feet can be used as the buttress system, any oversized rocks with potential rock fall hazard should be removed from the slope face.

7.0 GEOTECHNICAL SERVICES DURING CONSTRUCTION

This report has been partially prepared to aid in the foundation plans and specifications, and to assist the architect, civil and structural engineers in the design of the proposed structures. It is recommended that this office be provided an opportunity to review final design drawings and specifications to verify that the recommendations of this report have been properly implemented.

Recommendations presented herein are based upon the assumption that adequate earthwork monitoring will be provided by the geotechnical engineer. Footing excavations should be observed by the geotechnical engineer prior to placement of steel and concrete so that footings are founded on satisfactory materials and excavations are free of loose and disturbed materials. Trench backfill should be placed and compacted with observation and field density testing provided by this office.

During construction, the geotechnical engineer and/or their authorized representatives should be present at the site to provide a source of advice to the client regarding the geotechnical aspects of the project and to observe and test the earthwork performed. Their presence should not be construed as an acceptance of responsibility for the performance of the completed work, since it is the sole responsibility of the contractor performing the work to ensure that it complies with all applicable plans, specifications, ordinances, etc.

This firm does not practice or consult in the field of safety engineering. We do not direct the contractor's operations, and cannot be responsible for other than our own personnel on the site; therefore, the safety of others is the responsibility of the contractor. The contractor should notify the owner if he considers any recommended actions presented herein to be unsafe.

8.0 CLOSURE

The findings and recommendations of this report were prepared in accordance with generally accepted professional engineering and engineering geologic principles and practice. We make no other warranty, either expressed or implied. Our conclusions and recommendations are based on the results of the field and laboratory studies, combined with an interpolation and extrapolation of soil conditions between and beyond boring locations. If conditions encountered during construction appear to be different from those shown by the borings, this office should be notified.

Design recommendations given in this report are based on the assumption that the earthwork and site grading recommendations contained in this report are implemented.

Additional consultation may be prudent to interpret Converse's findings for contractors, or to possibly refine these recommendations based upon the review of the final site grading and actual site conditions encountered during construction. If the scope of the project changes, if project completion is to be delayed, or if the report is to be used for another purpose, this office should be consulted.

APPENDIX A

FIELD EXPLORATION

APPENDIX A

FIELD EXPLORATION

Field exploration included a site reconnaissance and subsurface exploration program. During the site reconnaissance, the surface conditions were noted, and the approximate locations of the boring were determined. The exploratory borings were approximately located using existing boundary and other features as a guide and should be considered accurate only to the degree implied by the method used. The various field study methods performed are discussed below.

Exploratory Borings

Fourteen (14) exploratory borings (BH-1 through BH-14) were drilled within the project sites from July 8 to July 12, 2013. The borings were advanced using a limited access rig with 12-inch and 24-inch diameter bucket augers, and truck mounted 8-inch diameter hollow stem auger drill rig to depths ranging from 2.5 to 21 feet below the existing ground surface (bgs). Every boring was visually logged by a Converse engineer and sampled at regular intervals and at changes in subsurface soils.

California Modified Sampler (Ring samples), Standard Penetration Test samples, and bulk soil samples were obtained for laboratory testing. Standard Penetration Tests (SPTs) were performed in selected borings at selected intervals using a standard (1.4 inches inside diameter and 2.0 inches outside diameter) split-barrel sampler. The bore holes were backfilled and compacted with soil cuttings by reverse spinning of the auger following the completion of drilling and patched with asphalt.

Borings BH-2, BH-5, and BH-9 through BH-14 were utilized for percolation tests prior to backfill. Percolation test results are presented in Appendix C, *Percolation Testing Data*.

It should be noted that the exact depths at which material changes occur cannot always be established accurately. Changes in material conditions that occur between driven samples are indicated in the logs at the top of the next drive sample. A key to soil symbols and terms is presented as Drawing No. A-1, *Soil Classification Chart*. The log of the exploratory boring is presented in Drawing Nos. A-2 through A-15, *Log of Borings*.

SOIL CLASSIFICATION CHART

MAJOR DIVISIONS			SYMBOLS GRAPH	SYMBOLS LETTER	TYPICAL DESCRIPTIONS
COARSE GRAINED SOILS — MORE THAN 50% OF MATERIAL IS LARGER THAN NO. 200 SIEVE SIZE	GRAVEL AND GRAVELLY SOILS — MORE THAN 50% OF COARSE FRACTION RETAINED ON NO. 4 SIEVE	CLEAN GRAVELS (LITTLE OR NO FINES)		GW	WELL-GRADED GRAVELS, GRAVEL - SAND MIXTURES, LITTLE OR NO FINES
				GP	POORLY-GRADED GRAVELS, GRAVEL - SAND MIXTURES, LITTLE OR NO FINEC
		GRAVELS WITH FINES (APPRECIABLE AMOUNT OF FINES)		GM	SILTY GRAVELS, GRAVEL - SAND - SILT MIXTURES
				GC	CLAYEY GRAVELS, GRAVEL - SAND - CLAY MIXTURES
	SAND AND SANDY SOILS — MORE THAN 50% OF COARSE FRACTION PASSING ON NO. 4 SIEVE	CLEAN SANDS (LITTLE OR NO FINES)		SW	WELL-GRADED SANDS, GRAVELLY SANDS, LITTLE OR NO FINES
				SP	POORLY-GRADED SANDS, GRAVELLY SAND, LITTLE OR NO FINES
		SANDS WITH FINES (APPRECIABLE AMOUNT OF FINES)		SM	SILTY SANDS, SAND - SILT MIXTURES
				SC	CLAYEY SANDS, SAND - CLAY MIXTURES
FINE GRAINED SOILS — MORE THAN 50% OF MATERIAL IS SMALLER THAN NO. 200 SIEVE SIZE	SILTS AND CLAYS	LIQUID LIMIT LESS THAN 50		ML	INORGANIC SILTS AND VERY FINE SANDS, ROCK FLOUR, SILTY OR CLAYEY FINE SANDS OR CLAYEY SILTS WITH SLIGHT PLASTICITY
				CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
				OL	ORGANIC SILTS AND ORGANIC SILTY CLAYS OF LOW PLASTICITY
	SILTS AND CLAYS	LIQUID LIMIT GREATER THAN 50		MH	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SAND OR SILTY SOILS
				CH	INORGANIC CLAYS OF HIGH PLASTICITY
				OH	ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS
HIGHLY ORGANIC SOILS				PT	PEAT, HUMUS, SWAMP SOILS WITH HIGH ORGANIC CONTENTS

NOTE: DUAL SYMBOLS ARE USED TO INDICATE BORDERLINE SOIL CLASSIFICATIONS

APPENDIX B

LABORATORY TESTING PROGRAM

APPENDIX B

LABORATORY TESTING PROGRAM

Tests were conducted in our laboratory on representative soil samples for the purpose of classification and evaluation of their relevant physical characteristics and engineering properties. The amount and selection of tests were based on the geotechnical requirements of the project. Test results are presented herein and on the Logs of Borings in Appendix A, *Field Exploration*. The following is a summary of the laboratory tests conducted for this project.

Moisture Content and Dry Density

Results of moisture content and dry density tests, performed on relatively undisturbed ring samples were used to aid in the classification of the soils and to provide quantitative measure of the *in situ* dry density. Data obtained from this test provides qualitative information on strength and compressibility characteristics of site soils. For test results, see the Logs of Borings in Appendix A, *Field Exploration*.

Grain-Size Analysis

To assist in classification of soils, mechanical grain-size analyses were performed on nine (9) selected samples. Testing was performed in general accordance with the ASTM Standard C136 test method. Grain-size curve is shown in Drawing No. B-1a and B-1b, *Grain Size Distribution Results*.

Maximum Density Test

One (1) representative bulk sample was tested in the laboratory to determine the maximum dry density and optimum moisture content. The tests were conducted in accordance with the ASTM Standard D1557 laboratory procedure. The test results are presented in Drawing No. B-2, *Moisture-Density Relationship Results*.

Direct Shear

Direct shear tests were performed on four (4) relatively undisturbed in-situ samples. For each test, three brass sampler rings were placed, one at a time, directly into the test apparatus and subjected to a range of normal loads appropriate for the anticipated conditions. The sample was then sheared at a constant strain rate of 0.01 inch/minute. Shear deformation was recorded until a maximum of about 0.25-inch shear displacement was achieved. Ultimate strength was selected from the shear-stress deformation data and plotted to determine the shear strength parameters. For test data,

including sample density and moisture c ontent, see Drawing No. B-3a through B-3d, *Direct Shear Test Results.*

Table No. B-1, Direct Shear Test Results

Boring No.	Depth (feet)	Soil Classification	Ultimate Strength Parameters	
			Friction Angle (degrees)	Cohesion (psf)
BH-1	3	Gravelly Sand with Silt (SP-SM)	33	200
BH-3	3	Weathered Grantic Bedrock (gr)	34	400
BH-6	7	Silty Sand (SM)	33	250
BH-8	10	Sand with Silt (SP-SM)	33	200

Consolidation

Consolidation tests were perfo rmed on one (1) relatively undisturbed in-situ sample. Data obtained from this test procedure was used to evaluate the settlement characteristics of the foundation soils under load. Preparation for this test involved trimming the sample and placing the one-i nch high brass ring into the test apparatus, which contained porous stones, both top and bottom, to accommodate drainage during testing. Normal axial loads were applied to one end of t he sample through the porous stones, and the resul ting deflections were recorded at various time periods. T he load was increa sed after the sample reached a reasona ble state equilibrium. Normal l oads were applied at a constant load-increment ratio, successive loads being ge nerally twice the precedi ng load. The sample was tested at field and submerged conditions. The test results, including sample density and moisture content, are presented in Drawing No. B- 4, *Consolidation Test Results*.

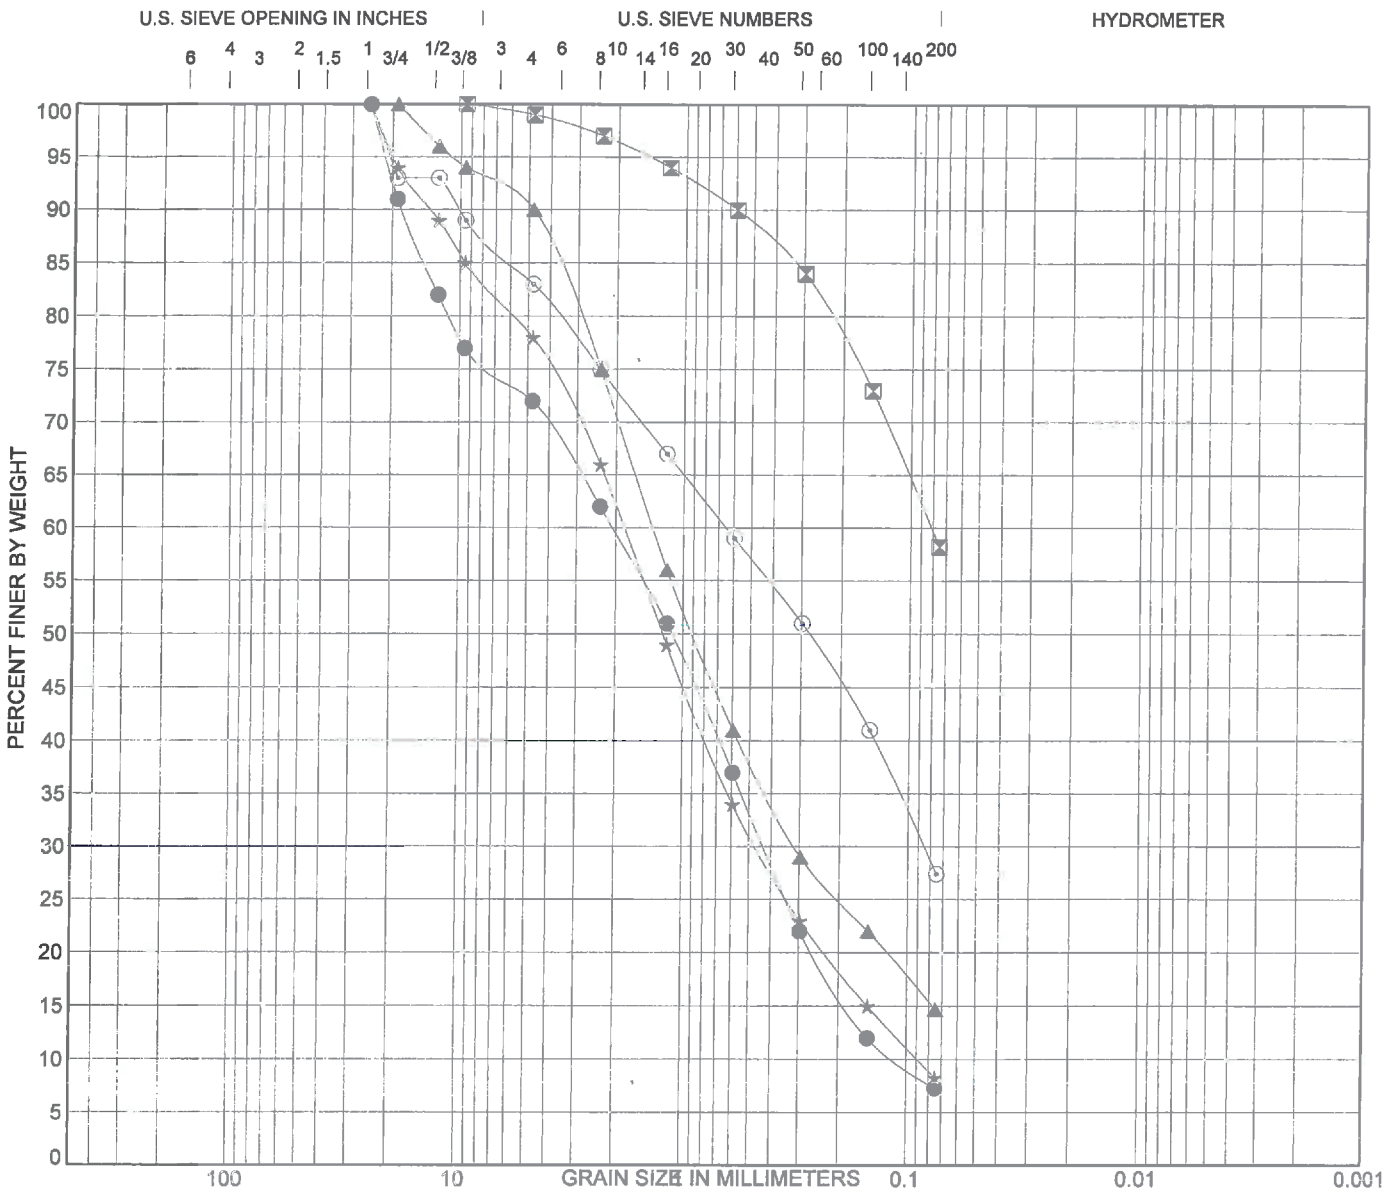
Soil Corrosivity

Three (3) representative soil samples wer e tested to evaluate minimum electrical resistivity, pH, and chemical conten t, including soluble sulfate and chloride concentrations. The purpose of these tests is to determine the corrosion potential of site soils when placed in contact with comm on construction materials. These tests were performed by Environmental Geotechnology Laborat ory, Inc. (EGL), located in Arcadia, California. The test results received from EGL are included in the following table:

Table No. B-2, Corrosivity Test Results

Boring No.	Sample Depth (feet)	pH (Caltrans 643)	Soluble Chlorides (Caltrans 422) ppm	Soluble Sulfate (Caltrans 417) (%)	Saturated Resistivity (Caltrans 643) Ohm-cm
BH-1	0 – 3	7.15	85	0.01	22,000
BH-3	0 – 3	8.15	75	0.002	23,000
BH-5	0 – 2.5	6.01	75	0.001	23,000

R-value



One (1) representative bulk soil sample was tested for resistance value (R-value) in accordance with ASTM D2844 Standard. This test is designed to provide a relative measure of soil strength for use in pavement design. The test results are shown in the following table:

Table No. B-3, R-value Test Result

Boring No.	Depth, (feet)	Soil Classification	Measured R-value
BH-3	0 – 3	Weathered Grantic Bedrock (gr)	74

Sample Storage

Soil samples presently stored in our laboratory will be discarded 30 days after the date of this report, unless this office receives a specific request to retain the samples for a longer period.

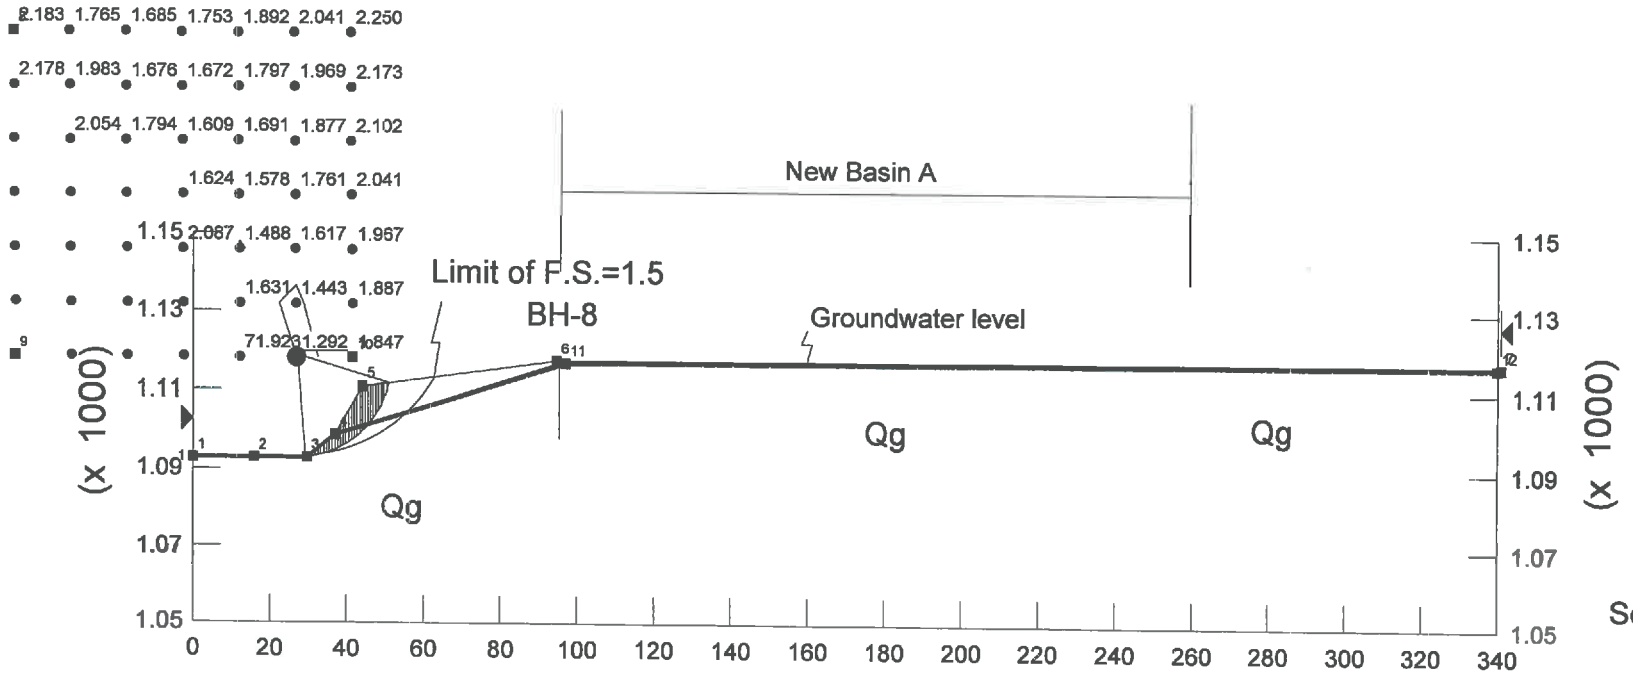
APPENDIX D

SLOPE STABILITY ANALYSES

Description: Gross Slope Stability Analysis - Geologic Cross Section A-A'
Comments: 13-31-199-01 - Arroyo Seco Canyon Project
File Name: 13-31-199-01_a1.slp
Last Saved Date: 8/20/2013
Analysis Method: Spencer
Direction of Slip Movement: Right to Left
Slip Surface Option: Grid and Radius

Case 1: Groundwater level at 20' below grade
Soil Shear Strength
Qg
unit weight = 125 pcf
cohession= 200 psf
friction= 33 degrees



Scale: 1"=50'

Plate S-A1

Description: Gross Slope Stability Analysis - Geologic Cross Section A-A
Comments: 13-31-199-01 - Arroyo Seco Canyon Project
File Name: 13-31-199-01_a2.slp
Last Saved Date: 8/20/2013
Analysis Method: Spencer
Direction of Slip Movement: Right to Left
Slip Surface Option: Grid and Radius

Case 2: Groundwater level at 0' below parking lot grade
Soil Shear Strength
Qg
unit weight = 125 pcf
cohession= 200 psf
friction= 33 degrees

Scale: 1"=50'

Subject: Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Arroyo Seco Canyon Project Areas 2 and 3, Los Angeles County

Dear Ms. Elisa Ventura:

The California Department of Fish and Wildlife (CDFW) has reviewed the above-referenced Notice of Preparation (NOP) for the Arroyo Seco Project Areas 2 and 3 (Project) Draft Environmental Impact Report (DEIR).

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW's Role

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & Game Code, §§ 711.7, subdivision (a) & 1802; Public Resources Code, § 21070; California Environmental Quality Act (CEQA) Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect state fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA (Public Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & Game Code, § 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in "take" (see Fish & Game Code, § 2050) of any species protected under the California Endangered Species Act (CESA; Fish & Game Code, § 2050 et seq.) or the Native Plant Protection Act (NPPA; Fish & Game Code, §1900 et seq.), CDFW recommends the project proponent obtain appropriate authorization under the Fish and Game Code.

Project Location: The Project site is located within the Arroyo Seco Canyon adjacent to North Arroyo Boulevard (i.e., Gabriellino Trail/Access Road), located in Township 1 North, Range 12

West. The proposed Project consists of two primary areas, including Area 2, Diversion and Intake Replacement and Area 3, Spreading Basin Improvements.

Project Description/Objectives: The Project involves a requested modification to Conditional Use Permit #6222 in order to construct and operate proposed water infrastructure improvements in Areas 2 and 3. Improvements in Area 2 include the removal of the existing diversion/weir structure and the intake structure. This would be replaced with a new diversion/weir structure that could be operated to divert up to 25 cubic feet per second (cfs) of creek flows through the new intake structure and into the existing conveyance system (a combination of tunnels and pipelines). Improvements in Area 3 include the reconfiguration and expansion of the spreading basins in order to accommodate the increased flows for infiltration into the Raymond Basin. Various facilities would be demolished, including inlet/outlet structures, pipes and valves, fencing, and other small appurtenant structures, to allow for the reconstructed basins.

The Project objective is to increase the beneficial use of the City's surface water rights and to improve biological functions within the Arroyo Seco.

COMMENTS AND RECOMMENDATIONS

CDFW offers the following comments and recommendations to assist the City of Pasadena Department of Water and Power (DWP) in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources.

Specific Comments

1) Regional Setting. CEQA Guidelines section 15125(c) require the Lead Agency to include information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis placed on resources that are rare or unique to the region. The DEIR should include measures to fully avoid and otherwise protect Sensitive Natural Communities from Project-related impacts. The Initial Study addresses three Threatened or Endangered plant species as well as impacts to riparian habitat that includes "sensitive vegetation communities". CDFW considers these communities as threatened habitats having both regional and local significance. Plant communities, alliances, and associations with a state-wide ranking of S1, S2, S3, and S4 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by visiting https://www.wildlife.ca.gov/Data/VegCAMP/Natural-Communities#sensitive%20natural%20communities.

2) LSA: The Project would directly impact the Arroyo Seco. As a Responsible Agency under CEQA, CDFW has authority over activities in streams and/or lakes that will divert or obstruct the natural flow; or change the bed, channel, or bank (including vegetation associated with the stream or lake) of a river or stream; or use material from a streambed. For any such activities, the project applicant (or "entity") must provide written notification to CDFW pursuant to section 1600 et seq. of the Fish and Game Code. Based on this notification and other information, CDFW determines whether an LSA Agreement (Agreement) with the applicant is required prior to conducting the proposed activities. CDFW's issuance of an Agreement for a project that is subject to CEQA will require related environmental compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW

may consider the CEQA document prepared by the local jurisdiction (Lead Agency) for the Project. To minimize additional requirements by CDFW pursuant to section 1600 *et seq.* and/or under CEQA, the DEIR should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring and reporting commitments for issuance of the LSA (available at www.wildlife.ca.gov/habcon/1600).

a) The Project area supports aquatic, riparian, and wetland habitats; therefore, a preliminary jurisdictional delineation of the streams and their associated riparian habitats should be included in the DEIR. The delineation should be conducted pursuant to the U. S. Fish and Wildlife Service (USFWS) wetland definition adopted by the CDFW (Cowardin et al. 1970). Some wetland and riparian habitats subject to CDFW's authority may extend beyond the jurisdictional limits of the U.S. Army Corps of Engineers' section 404 permit and Regional Water Quality Control Board section 401 Certification.

b) In areas of the Project site which may support ephemeral streams, herbaceous vegetation, woody vegetation, and woodlands also serve to protect the integrity of ephemeral channels and help maintain natural sedimentation processes; therefore, CDFW recommends effective setbacks be established to maintain appropriately-sized vegetated buffer areas adjoining ephemeral drainages.

c) Project-related changes in upstream and downstream drainage patterns, runoff, and sedimentation should be included and evaluated in the DEIR.

d) As part of the LSA Notification process, CDFW requests the 100, 50, 25, 10, 5, and 2-year frequency storm event for existing and proposed conditions. CDFW recommends the DEIR evaluate the results and address avoidance, minimization, and/or mitigation measures that may be necessary to reduce potential significant impacts.

3) Fish Habitat. Project implementation may result in substantial adverse effect to biological function for fish species during flow periods. Fish and Game Code section 5901 makes it unlawful to construct or maintain in any streams any device that prevents, impedes, or tends to prevent or impede the passing of fish up and downstream. CDFW recommends the DEIR include a thorough and complete survey by a qualified biologist during the spawning season (spring/summer) to determine that Project activities do not prevent or impede fish passage during low flow conditions.

Fish and Game Code section 5937 requires the owner of any dam to allow sufficient water at all times to pass through a fishway or in the absence of a fishway, allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or exist below the dam. CDFW also recommends the DEIR provide a thorough discussion of direct, indirect, and cumulative impacts expected to adversely affect biological resources, especially fish species, with specific measures to offset such impacts, the following should be addressed in the DEIR.

a) A discussion of potential adverse impacts from human activity, exotic species, and drainage should also be included. The latter subject should address: project-related changes on drainage and sedimentation patterns on and downstream of the project site; the volume, velocity, and frequency of existing and post-project

surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-project fate of runoff from the project site. Impact analysis should also address any interruption of sediment transport caused by the dam structure. Impeding sediment transport within the stream can have impacts to fish habitat both upstream and downstream of the dam structure.

b) The discussions should also address the proximity of the extraction activities to the water table, whether dewatering would be necessary, and the potential resulting impacts on the habitat, if any, supported by the groundwater. Mitigation measures proposed to alleviate such impacts should be included.

c) Impacts on, and maintenance of, fishway/movement areas, should be fully evaluated in the DEIR.

General Comments

1) Project Description and Alternatives. To enable CDFW to adequately review and comment on the proposed Project from the standpoint of the protection of plants, fish, and wildlife, we recommend the following information be included in the DEIR:

   a) A complete discussion of the purpose and need for, and description of, the proposed Project, including all staging areas and access routes to the construction and staging areas; and,

   b) A range of feasible alternatives to Project component location and design features to ensure that alternatives to the proposed Project are fully considered and evaluated. The alternatives should avoid or otherwise minimize direct and indirect impacts to sensitive biological resources and wildlife movement areas.

2) Wetlands Resources. CDFW, as described in Fish and Game Code section 703(a), is guided by the Fish and Game Commission's policies. The Wetlands Resources policy (http://www.fgc.ca.gov/policy/) of the Fish and Game Commission "...seek[s] to provide for the protection, preservation, restoration, enhancement and expansion of wetland habitat in California. Further, it is the policy of the Fish and Game Commission to strongly discourage development in or conversion of wetlands. It opposes, consistent with its legal authority, any development or conversion that would result in a reduction of wetland acreage or wetland habitat values. To that end, the Commission opposes wetland development proposals unless, at a minimum, project mitigation assures there will be 'no net loss' of either wetland habitat values or acreage. The Commission strongly prefers mitigation which would achieve expansion of wetland acreage and enhancement of wetland habitat values."

   a) The Wetlands Resources policy provides a framework for maintaining wetland resources and establishes mitigation guidance. CDFW encourages avoidance of wetland resources as a primary mitigation measure and discourages the development or type conversion of wetlands to uplands. CDFW encourages activities that would avoid the reduction of wetland acreage, function, or habitat values. Once avoidance and minimization measures have been exhausted, the Project must include mitigation measures to assure a "no net loss" of either wetland habitat values, or acreage, for unavoidable impacts to wetland resources. Conversions include, but are not limited to, conversion to subsurface drains, placement of fill or

building of structures within the wetland, and channelization or removal of materials from the streambed. All wetlands and watercourses, whether ephemeral, intermittent, or perennial, should be retained and provided with substantial setbacks, which preserve the riparian and aquatic values and functions for the benefit to on-site and off-site wildlife populations. CDFW recommends mitigation measures to compensate for unavoidable impacts be included in the DEIR and these measures should compensate for the loss of function and value.

b) The Fish and Game Commission's Water policy guides CDFW on the quantity and quality of the waters of this state that should be apportioned and maintained respectively so as to produce and sustain maximum numbers of fish and wildlife; to provide maximum protection and enhancement of fish and wildlife and their habitat; encourage and support programs to maintain or restore a high quality of the waters of this state; prevent the degradation thereof caused by pollution and contamination; and, endeavor to keep as much water as possible open and accessible to the public for the use and enjoyment of fish and wildlife. CDFW recommends avoidance of water practices and structures that use excessive amounts of water, and minimization of impacts that negatively affect water quality, to the extent feasible (Fish & Game Code, § 5650).

3) CESA. CDFW considers adverse impacts to a species protected by CESA to be significant without mitigation under CEQA. As to CESA, take of any endangered, threatened, candidate species, or State-listed rare plant species that results from the Project is prohibited, except as authorized by state law (Fish and Game Code, §§ 2080, 2085; Cal. Code Regs., tit. 14, §786.9). Consequently, if the Project, Project construction, or any Project-related activity during the life of the Project will result in take of a species designated as endangered or threatened, or a candidate for listing under CESA, CDFW recommends that the Project proponent seek appropriate take authorization under CESA prior to implementing the Project. Appropriate authorization from CDFW may include an Incidental Take Permit (ITP) or a consistency determination in certain circumstances, among other options [Fish & Game Code, §§ 2080.1, 2081, subds. (b) and (c)]. Early consultation is encouraged, as significant modification to a Project and mitigation measures may be required in order to obtain a CESA Permit. Revisions to the Fish and Game Code, effective January 1998, may require that CDFW issue a separate CEQA document for the issuance of an ITP unless the Project CEQA document addresses all Project impacts to CESA-listed species and specifies a mitigation monitoring and reporting program that will meet the requirements of an ITP. For these reasons, biological mitigation monitoring and reporting proposals should be of sufficient detail and resolution to satisfy the requirements for a CESA ITP.

4) Biological Baseline Assessment. To provide a complete assessment of the flora and fauna within and adjacent to the project area, with particular emphasis upon identifying endangered, threatened, sensitive, regionally and locally unique species, and sensitive habitats, the DEIR should include the following information:

a) Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region [CEQA Guidelines, § 15125(c)];

b) A thorough, recent, floristic-based assessment of special status plants and natural communities, following CDFW's *Protocols for Surveying and Evaluating Impacts to*

Special Status Native Plant Populations and Natural Communities (see https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18959&inline);

c) Floristic, alliance- and/or association-based mapping and vegetation impact assessments conducted at the Project site and within the neighboring vicinity. *The Manual of California Vegetation*, second edition, should also be used to inform this mapping and assessment (Sawyer, 2008). Adjoining habitat areas should be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions;

d) A complete, recent, assessment of the biological resources associated with each habitat type on site and within adjacent areas that could also be affected by the project. CDFW's California Natural Diversity Data Base (CNDDB) in Sacramento should be contacted to obtain current information on any previously reported sensitive species and habitat. CDFW recommends that CNDDB Field Survey Forms be completed and submitted to CNDDB to document survey results. Online forms can be obtained and submitted at http://www.dfg.ca.gov/biogeodata/cnddb/submitting_data_to_cnddb.asp;

e) A complete, recent, assessment of rare, threatened, and endangered, and other sensitive species on site and within the area of potential effect, including California SSC and California Fully Protected Species (Fish & Game Code, §§ 3511, 4700, 5050 and 5515). Species to be addressed should include all those which meet the CEQA definition of endangered, rare or threatened species (CEQA Guidelines, § 15380). Seasonal variations in use of the project area should also be addressed. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, are required. Acceptable species-specific survey procedures should be developed in consultation with CDFW and the USFWS; and,

f) A recent, wildlife and rare plant survey. CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the proposed project may warrant periodic updated surveys for certain sensitive taxa, particularly if build out could occur over a protracted time frame, or in phases.

5) Biological Direct, Indirect, and Cumulative Impacts. To provide a thorough discussion of direct, indirect, and cumulative impacts expected to adversely affect biological resources, with specific measures to offset such impacts, the following should be addressed in the DEIR:

a) A discussion of potential adverse impacts from lighting, noise, human activity, exotic species, and drainage. The latter subject should address Project-related changes on drainage patterns and downstream of the project site; the volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and, post-Project fate of runoff from the project site. The discussion should also address the proximity of the extraction activities to the water table, whether dewatering would be necessary and

the potential resulting impacts on the habitat (if any) supported by the groundwater. Mitigation measures proposed to alleviate such Project impacts should be included;

b) A discussion regarding indirect Project impacts on biological resources, including resources in nearby public lands, open space, adjacent natural habitats, riparian ecosystems, and any designated and/or proposed or existing reserve lands (e.g., preserve lands associated with a Natural Community Conservation Plan (NCCP, Fish & Game Code, § 2800 et. seq.). Impacts on, and maintenance of, wildlife corridor/movement areas, including access to undisturbed habitats in adjacent areas, should be fully evaluated in the DEIR;

c) An analysis of impacts from land use designations and zoning located nearby or adjacent to natural areas that may inadvertently contribute to wildlife-human interactions. A discussion of possible conflicts and mitigation measures to reduce these conflicts should be included in the DEIR; and,

d) A cumulative effects analysis, as described under CEQA Guidelines section 15130. General and specific plans, as well as past, present, and anticipated future projects, should be analyzed relative to their impacts on similar plant communities and wildlife habitats.

6) Compensatory Mitigation. The DEIR should include mitigation measures for adverse Project-related impacts to sensitive plants, animals, and habitats. Mitigation measures should emphasize avoidance and reduction of Project impacts. For unavoidable impacts, on-site habitat restoration or enhancement should be discussed in detail. If on-site mitigation is not feasible or would not be biologically viable and therefore not adequately mitigate the loss of biological functions and values, off-site mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed. Areas proposed as mitigation lands should be protected in perpetuity with a conservation easement, financial assurance and dedicated to a qualified entity for long-term management and monitoring. Under Government Code section 65967, the lead agency must exercise due diligence in reviewing the qualifications of a governmental entity, special district, or nonprofit organization to effectively manage and steward land, water, or natural resources on mitigation lands it approves.

7) Long-term Management of Mitigation Lands. For proposed preservation and/or restoration, the DEIR should include measures to protect the targeted habitat values from direct and indirect negative impacts in perpetuity. The objective should be to offset the Project-induced qualitative and quantitative losses of wildlife habitat values. Issues that should be addressed include (but are not limited to) restrictions on access, proposed land dedications, monitoring and management programs, control of illegal dumping, water pollution, and increased human intrusion. An appropriate non-wasting endowment should be set aside to provide for long-term management of mitigation lands.

8) Nesting Birds. CDFW recommends that measures be taken to avoid Project impacts to nesting birds. Migratory nongame native bird species are protected by international treaty under the Federal Migratory Bird Treaty Act (MBTA) of 1918 (Title 50, § 10.13, Code of Federal Regulations). Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests including raptors and other migratory nongame birds (as listed under the Federal MBTA). Proposed Project activities including

(but not limited to) staging and disturbances to native and nonnative vegetation, structures, and substrates should occur outside of the avian breeding season which generally runs from February 1 through September 1 (as early as January 1 for some raptors) to avoid take of birds or their eggs. If avoidance of the avian breeding season is not feasible, CDFW recommends surveys by a qualified biologist with experience in conducting breeding bird surveys to detect protected native birds occurring in suitable nesting habitat that is to be disturbed and (as access to adjacent areas allows) any other such habitat within 300-feet of the disturbance area (within 500-feet for raptors). Project personnel, including all contractors working on site, should be instructed on the sensitivity of the area. Reductions in the nest buffer distance may be appropriate depending on the avian species involved, ambient levels of human activity, screening vegetation, or possibly other factors.

9) Translocation/Salvage of Plants and Animal Species. Translocation and transplantation is the process of moving an individual from the Project site and permanently moving it to a new location. CDFW generally does not support the use of, translocation or transplantation as the primary mitigation strategy for unavoidable impacts to rare, threatened, or endangered plant or animal species. Studies have shown that these efforts are experimental and the outcome unreliable. CDFW has found that permanent preservation and management of habitat capable of supporting these species is often a more effective long-term strategy for conserving sensitive plants and animals and their habitats.

10) Moving out of Harm's Way. The proposed Project is anticipated to result in clearing of natural habitats that support many species of indigenous wildlife. To avoid direct mortality, we recommend that a qualified biological monitor approved by CDFW be on-site prior to and during ground and habitat disturbing activities to move out of harm's way special status species or other wildlife of low mobility that would be injured or killed by grubbing or Project-related construction activities. It should be noted that the temporary relocation of on-site wildlife does not constitute effective mitigation for the purposes of offsetting project impacts associated with habitat loss. If the project requires species to be removed, disturbed, or otherwise handled, we recommend that the DEIR clearly identify that the designated entity shall obtain all appropriate state and federal permits.

11) Tree Replacement: To compensate for any loss of trees, CDFW recommends replacing all non-native trees removed as a result of the proposed work activities at a 1:1 ratio with native trees. CDFW recommends replacing native trees at a 3:1 ratio with a combination of native trees and/or appropriate understory and lower canopy plantings. CDFW recommends that any loss of oaks shall be replanted at a minimum 10:1 ratio. Replacement oaks shall come from nursery stock grown from locally sourced acorns, or from acorns gathered locally, preferably from the same watershed in which they were planted.

12) Revegetation/Restoration Plan: Plans for restoration and re-vegetation should be prepared by persons with expertise in southern California ecosystems and native plant restoration techniques. Plans should identify the assumptions used to develop the proposed restoration strategy. Each plan should include, at a minimum: (a) the location of restoration sites and assessment of appropriate reference sites; (b) the plant species to be used, sources of local propagules, container sizes, and seeding rates; (c) a schematic depicting the mitigation area; (d) a local seed and cuttings and planting schedule; (e) a description of the irrigation methodology; (f) measures to control exotic vegetation on site; (g) specific success criteria; (h) a detailed monitoring program; (i) contingency measures should the success criteria not

be met; and (j) identification of the party responsible for meeting the success criteria and providing for conservation of the mitigation site in perpetuity. Monitoring of restoration areas should extend across a sufficient time frame to ensure that the new habitat is established, self-sustaining, and capable of surviving drought.

a) CDFW recommends that local on-site propagules from the Project area and nearby vicinity be collected and used for restoration purposes. On-site seed collection should be initiated in the near future to accumulate sufficient propagule material for subsequent use in future years. On-site vegetation mapping at the alliance and/or association level should be used to develop appropriate restoration goals and local plant palettes. Reference areas should be identified to help guide restoration efforts. Specific restoration plans should be developed for various Project components as appropriate.

b) Restoration objectives should include providing special habitat elements where feasible to benefit key wildlife species. These physical and biological features can include (for example) retention of woody material, logs, snags, rocks and brush piles.

13) Fuel Modification. The DEIR should include information as to how the Project or adjacent land may be affected by fuel modification requirements. A discussion of any fuel modification requirements for this Project should be included in the DEIR to allow CDFW to assess potential impacts to biological resources. CDFW recommends all fuel modification requirements be met on the Project, and not in mitigation lands or habitat adjacent to the Project. Habitat being subjected to fuel modification (e.g., thinning, trimming, removal of mulch layer) should be considered an impact to these vegetation communities and mitigated accordingly. CDFW also recommends any irrigation proposed in fuel modification zones drain back into the development and not onto natural habitat land as perennial sources of water allow for the introduction of invasive Argentine ants.

14) Rodenticide Use. Impacts to biological resources can occur from wildlife directly consuming poison. Impacts can also occur through secondary poisoning where an animal consumes another organism that has consumed poison. CDFW confirmed anticoagulant rodenticide in 14 of 14 mountain lions necropsied in 2013 (McMillin, 2013). Lima et al. (2010), tested 96 birds (11 raptor species) in California and found 86 out of 96 raptors tested positive for second generation anticoagulant rodenticides. CDFW recommends the DEIR contain language disallowing the use of rodenticides that could result in direct or secondary poisoning to native mammals, birds, and raptors.

15) Landscaping. CDFW recommends using native, locally appropriate plant species for landscaping on the Project site. CDFW recommends invasive/exotic plants, including pepper trees (*Schinus* genus) and fountain grasses (*Pennisetum* genus), be restricted from use in landscape plans for this Project. A list of invasive/exotic plants that should be avoided as well as suggestions for better landscape plants can be found at https://www.cal-ipc.org/solutions/prevention/landscaping/.

CONCLUSION

CDFW appreciates the opportunity to comment on the NOP to assist the City of Pasadena DWP in identifying and mitigating Project impacts on biological resources. If you have any questions or comments regarding this letter, please contact Felicia Silva, Environmental Scientist, at (562) 430-0098 or by email at Felicia.Silva@wildlife.ca.gov.

Sincerely,

Erinn Wilson
Environmental Program Manager I

RE: Arroyo Seco Canyon Project Area 2 and 3 – Notice of Preparation (NOP)
SCH # 2014101022
GTS # 07-LA-2019-02909
Vic. LA-210/PM: R21.325

Dear Ms. Elisa Ventura:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced NOP. The proposed project involves water infrastructure improvements in the Arroyo Seco Canyon to allow for the diversion and spreading of up to 25 cubic feet per second (cfs) of surface water. Improvements in Area 2 involve the demolition and replacement of an existing diversion facility and intake structure in the same general location. Improvements in Area 3 involve the reconfiguration and expansion of existing spreading basins. The project objective is to increase the beneficial use of the City's surface water rights and to improve biological functions within the Arroyo Seco. The City of Pasadena is considered the Lead Agency under the California Environmental Quality Act (CEQA).

The proposed project is located approximately 1.25 miles away from Interstate 210 (I-210) and 3.5 miles away from State Route 134 (SR-134).

After reviewing the NOP, Caltrans agrees that project-related construction truck activities, in combination with the ongoing sediment removal activities associated with the Devil's Gate Reservoir project, have the potential to result in cumulative short-term impacts and that this topic should be further evaluated in the forthcoming Draft Environmental Impact Report (DEIR). The transportation impact analysis that will be part of the upcoming DEIR may need to include the following locations, due to their proximity to the project site and the size of the project. Also, some of the below locations were identified in the NOP as facilities that construction trucks will use for this project:

- SR-134 & Figueroa Street/School Canyon Road off-ramp and on-ramp
- I-210 & Windsor Avenue off-ramp and on-ramp
- I-210 & Foothill Boulevard off-ramp and on-ramp
- I-210 & Berkshire Place off-ramp and on-ramp

Also, queueing analyses should be provided for the above off-ramps, since excessive queuing at off-ramps increases the potential for traffic conflicts.

Since the City of Pasadena adopted a Vehicles Miles Traveled (VMT) metric for transportation analysis in 2014, Caltrans looks forward to reviewing the potential VMT analyses for the above locations, and to provide further comments, if warranted.

If it is found that any of the above locations will be significantly impacted by the project, Caltrans looks forward to reviewing the proposed mitigation measures for those locations.

The following information is included for your consideration.

Caltrans applauds the City of Pasadena for its early adoption of the VMT metric, which assists the State in meeting greenhouse gas emissions reductions targets and reducing VMT. Please continue to make every attempt to reduce VMT, and in particular the potential VMT generated from construction trips for this project. For TDM options that can reduce VMT, please refer to:

- The 2010 *Quantifying Greenhouse Gas Mitigation Measures* report by the California Air Pollution Control Officers Association (CAPCOA), available at http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf, or
- *Integrating Demand Management into the Transportation Planning Process: A Desk Reference* (Chapter 8) by the Federal Highway Administration (FHWA), available at https://ops.fhwa.dot.gov/publications/fhwahop12035/index.htm

As a reminder, any transportation of heavy construction equipment and/or materials which requires use of oversized-transport vehicles on State highways will need a Caltrans transportation permit. We recommend large size truck trips be limited to off-peak commute periods. Since construction traffic is expected to cause delays on State facilities such as I-210, please submit a construction traffic management plan detailing these delays for Caltrans' review.

If you have any questions about these comments, please contact Emily Gibson, the project coordinator, at Emily.Gibson@dot.ca.gov, and refer to GTS# 07-LA-2019-02909.

Sincerely,

MIYA EDMONSON
IGR/CEQA Branch Chief

Notice of Preparation

November 1, 2019

To: Reviewing Agencies

Re: Arroyo Seco Canyon Project
SCH# 2014101022

Attached for your review and comment is the Notice of Preparation (NOP) for the Arroyo Seco Canyon Project draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Elisa Ventura
Pasadena, City of
150 S. Los Robles Ave., Suite 200
Pasadena, CA 91101

with a copy to the State Clearinghouse in the Office of Planning and Research at state.clearinghouse@opr.ca.gov . Please refer to the SCH number noted above in all correspondence concerning this project on our website: https://ceqanet.opr.ca.gov/2014101022/4.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Description: *(please use a separate page if necessary)*

The City owns the right to divert up to 25 cubic feet per second (cfs) of surface water from the Arroyo Seco for direct use or for spreading into their basins for groundwater pumping credits in the Raymond Basin. The City receives between 60 to 80% pumping credit for the amount of water recharged into the Basin. The Project involves water infrastructure improvements in the Arroyo Seco Canyon to allow for the diversion and spreading of up to 25 cfs of surface water. Improvements in Area 2 involve the demolition and replacement of an existing diversion/weir and intake structure in the same general location. Improvements in Area 3 involve the reconfiguration and expansion of existing spreading basins. The Project objective is to increase the beneficial use of the City's surface water rights and to improve biological functions within the Arroyo Seco.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

Notice of Preparation of an Environmental Impact Report for the Proposed Arroyo Seco Canyon Project Areas 2 and 3

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. South Coast AQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Environmental Impact Report (EIR). Please send South Coast AQMD a copy of the EIR upon its completion. Note that copies of the EIR that are submitted to the State Clearinghouse are not forwarded to South Coast AQMD. Please forward a copy of the EIR directly to South Coast AQMD at the address shown in the letterhead. **In addition, please send with the EIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files[1]. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, South Coast AQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

South Coast AQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. South Coast AQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from South Coast AQMD's Subscription Services Department by calling (909) 396-3720. More guidance developed since this Handbook is also available on South Coast AQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). South Coast AQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

South Coast AQMD has also developed both regional and localized significance thresholds. South Coast AQMD staff requests that the Lead Agency quantify criteria pollutant emissions and compare the results to South Coast AQMD's CEQA regional pollutant emissions significance thresholds to determine air

[1] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

quality impacts. South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found here at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. In addition to analyzing regional air quality impacts, South Coast AQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the Proposed Project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by South Coast AQMD staff or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis.

In the event that the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Guidance[2] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

Mitigation Measures

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project, including:

[2] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

- Chapter 11 "Mitigating the Impact of a Project" of South Coast AQMD'S *CEQA Air Quality Handbook* South Coast AQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- South Coast AQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- South Coast AQMD's Mitigation Monitoring and Reporting Plan (MMRP) for the 2016 Air Quality Management Plan (2016 AQMP) available here (starting on page 86): http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Alternatives

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a "no project" alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project.

Permits

If implementation of the Proposed Project requires a permit from South Coast AQMD, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the EIR. For more information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

Data Sources

South Coast AQMD rules and relevant air quality reports and data are available by calling South Coast AQMD's Public Information Center at (909) 396-2001. Much of the information available through the Public Information Center is also available at South Coast AQMD's webpage at: http://www.aqmd.gov.

South Coast AQMD staff is available to work with the Lead Agency to ensure that project's air quality and health risk impacts are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

Lijin Sun

RE: Comments on Arroyo Seco Canyon Project Environmental Impact Report Initial Study and Scoping Document

Dear Ms. Ventura:

Thank you for the opportunity to comment on scoping issues for the EIR for the Arroyo Seco Canyon Project.

The Arroyo Seco Foundation (ASF) has long been interested in this project which is important to enhance local water supplies and to do so in an integrated way that also protects and promotes habitat, wildlife, conservation and long-term sustainability.

ASF regrets that many of the environmental and recreational benefits previously proposed have dropped from the revised version of the project.

We believe the scope of the project is deficient regarding biology, hydrology and other important concerns.

The project needs to:

1) carefully evaluate stream flow requirements to assure the continued viability of stream-related fish, aquatic and wildlife resources;
2) establish an environmental flow or instream flow for the Arroyo Seco stream, which identifies a low-flow threshold to protect and ensure the long-term persistence of fish and aquatic species. The establishment of a seasonally appropriate low-flow threshold helps protect fish and aquatic species during critically low-flow time periods by supporting stream channel forms and riparian communities that directly affect aquatic life. Conditions such as barriers, sedimentation and invasive species both above and below PWP's water diversion structure need to be carefully considered and addressed.

We urge PWP to evaluate a project alternative that would rely primarily on the sandy alluvial conditions in the Hahamongna basin and the natural stream hydrology rather than the expansion of spreading basins, which are not the most efficient and environmentally appropriate method of capturing and conserving streamflow. Natural stream hydrology over the centuries is what has filled up and

replenished the Raymond Basin. Engineered efforts have proven to be less effective and rather destructive of the natural values of the Hahamongna basin.

In addition to being inefficient methods of local water retention, spreading basins occupy and substantially destroy large patches of alluvial scrub habitat that is increasingly rare in Southern California. Important endangered and threatened bird and plant species rely on this habitat, When the JPL parking lot was permitted by Pasadena for the area at the mouth of the canyon thirty years ago, it was promised that it would only be a temporary use. Now that the parking lot has been removed, the environmental richness of that area should be restored. The expansion of the PWP spreading basins would guarantee permanent destruction of the vital habitat that nature would provide at the key interface between the mountain watershed and the urban stretch of the Arroyo Seco.

PWP needs to document the need for expanded spreading basins in the light of the long recent drought and the probability of more erratic rainfall patterns caused by the impacts of climate change. Most climate experts are predicting somewhat similar overall precipitation amounts that would be contained in longer drier periods and more intense but less frequent storms. The percolation basins have rarely been full in recent decades, only about once every ten years, so the most likely prospect is that expanded spreading basins would rarely be used for water retention and could not be justified on a cost or environmental basis.

If PWP determines to go ahead with an expansion of the spreading basins, it needs to explore methods to make them less destructive and more environmentally sustainable. Altering their configuration and size, reducing compaction and sedimentation in the basins, and the use of appropriate native habitat should all be utilized,

The maintenance of a seasonal pool at the bottom of the Hahamongna basin above Devil's Gate Dam could be used in conjunction with a pump-back pipeline that would send excess streamflow back to the top of the natural stream percolation zone. Such a system would also benefit capture and retention of local water if PWP choses to rely on spreading basins and an expansion of spreading basins. It is disappointing that the pump-back program previously included in Hahamongna planning has been left out of the current ASCP program since it is so clearly and directly related to the goals of ASCP and of improved water management.

We hope you will consider these concerns carefully and positively. The Arroyo Seco Foundation looks forward to working collaboratively with Pasadena Water & Power Department to enhance local water supply while protecting the Arroyo Seco's rich natural resources.

Sincerely yours,

Tim Brick
Managing Director
Arroyo Seco Foundation

RE: Scoping Comments: Environmental Impact Report for the Arroyo Seco Canyon Project

Introduction:

The Friends of Hahamongna (FOH) is an advocacy group of Pasadena, La Canada Flintridge and Altadena residents working together for the protection of Hahamongna Watershed Park, one of Pasadena's last great open spaces. Our members are united in our support of this environmental treasure. We have attended hundreds of meetings over the past 20 years monitoring Pasadena's Hahamongna master planning. We have been working cooperatively with the Spirit of the Sage Council, the Hahamongna Watch Group and other park advocacy groups as the City of Pasadena moves forward to implement the Hahamongna Watershed Park Master Plan, a component of the Arroyo Seco Master Plan. We plan to be active participants with the Arroyo Seco Canyon Project (ASCP) scoping effort as well as project review and implementation. Our request for general considerations for project development as well as required environmental review categories are outlined below:

General Considerations:

- FOH maintains the position that the adequacy of the various project Environmental Impact Reports may be challenged if there isn't accurate evaluation of the cumulative impacts from all the current and near-future projects in the area. The Los Angeles County Department of Public Works their significant sediment removal initiative and Pasadena Department of Public Works has started their Oak Grove Area Improvements (OGAI) Berkshire Creek restoration, both of which will contribute to cumulative impacts in the Arroyo. It is important that implementation of any project fully evaluate and minimize through mitigation all cumulative impacts.

- Hahamongna Watershed Park once provided significant habitat for many species including Egrets, Blue Heron, Mallard Ducks, and numerous reptile species. Since the habitat destruction from the sediment removal project and the temporary reduction of habitat resulting from the Berkshire Creek restoration, the need for habitat has become more significant, if not critical. FOH asks that the preservation of the habitat be given consideration while developing project scope and environmental impact statements.

- The Initial Study for the ASCP appears to be sufficient for the public and the decision makers to understand and to comment effectively toward scope of and consideration points for the environmental impacts of the project within Hahamongna. However, it is important to make sure that impact scope includes the Central and Lower Arroyos which could be impact by changes in quality and volume of available water necessary to support habitat and natural stream restoration areas.

Required Environmental Review Categories:

- Air quality
    - Impacts, including airborne dust from grading, and dirt hauling and gaseous emissions from heavy equipment, delivery and dirt hauling trucks, and employee vehicles.
    - Impacts from pollutant concentrations, primarily carbon monoxide, resulting from traffic increases in the immediate vicinity of a project

    - Impact of the degraded air quality on schools, athletic fields and residences in the immediate area.
- Biological Resources
    - The potential adverse effect from habitat modifications impacting any of the species currently found in the basin. The EIR must address how various species that thrive in the existing habitat would return to and survive in the "restore" habitat after construction.
    - The potential adverse effect on any riparian habitat or other sensitive natural community, including the natural stream areas below the dam in the Central and Lower Arroyo areas that may result from water diversion.
    - The potential adverse effect on migratory wildlife species or with established migratory wildlife corridors, including those in the Central and Lower Arroyo that may result from water diversion.
- Cultural resources
    - Impact to cultural resources in the project vicinity due to the potential disruption to human remains during excavation.
- Hydrology and Water Quality
    - Potential impacts from alteration of existing drainage patterns in the site area, including the alteration of the course of the stream.
    - Potential impacts from construction activity to stream flows and water quality
    - Potential impacts to water quality and/or volume to the natural stream areas in the Central and lower Arroyo
- Noise
    - The potential increase in ambient noise levels in the project vicinity resulting from construction and construction related vehicles.
    - The impacts to park users and wildlife resulting from temporary or permanent increase to ground-borne vibration.
- Recreation
    - The temporary disruption of existing recreation uses during construction.
    - The impacts caused by a any temporary or permanent relocation or removal of the hiking / equestrian trails in the basin and in the canyon. The primary concern for equestrians is to have safe access through the north crossing trail leading to the Gabrielino Trail during non-construction hours. The north crossing runs between ponds 1 and 2, roughly following the SCE Easement through the old JPL parking lot and across Explorer Road.
    - The safety and feasibility of trail use, especially for equestrians, immediately adjacent to construction areas during non-construction hours.
- Transportation/traffic
    - Impacts from the number of truck trips in and out of the basin using the same freeway routes as the sediment removal project.
    - Impacts to normal traffic flows to area schools, JPL and the Rose Bowl during weekday events.
    - Cumulative impact of construction vehicles in conjunction with the sediment removal project.

FOH members have extensive historical knowledge on Hahamongna Watershed Park, the projects planned for the area and the controversies that have arisen over the past 20 years. Please feel free to use us as a knowledge source and please feel free to contact us with any questions regarding our scoping comments.

Sincerely,
Betsy Bour

Re: Scoping comments on the initial Study (IS) for the Environmental Impact Report of the Arroyo Seco Canyon Project (ASCP) Areas 2 and 3

Dear Ms. Ventura:

I am a Linda Vista, Pasadena resident who frequently walks in and enjoys the area subject to the City's Arroyo Seco Canyon Project proposal. I am also a (retired) California lawyer who long practiced and taught environmental law. I work for the Nature Conservancy, although these comments are my own, and not those of my employer.

My comments focus on three related subjects. First, the need to fully address viable alternatives to the proposed course of action. Second, the requirement that the EIR include a thorough cumulative effects analysis. Third, the requirement that the EIR use the best available information.

Alternatives

The stated purpose of this phase of the ASCP is to divert more water (up to 25 cubic feet per second) from the Arroyo Seco stream for diversion to existing and new spreading basins. The basis for the city's proposed action is the apparent contention that increased diversions and a significant expansion of spreading areas will increase percolation into the subsurface aquifer(s) allowing Pasadena to claim additional water.

However, the city states that the proposed restructured/rebuilt diversion will be used to take all of the water in the Arroyo Seco stream, apart from flow during major storm events. The Arroyo Seco stream rarely reaches 25 CFS, even during rains. While the city's pursuit of more local water supplies is creditable, the removal of all of the water from the Arroyo Seco stream would be ecologically highly destructive.

An alternative exists. Leaving water in the natural stream bed, which is ordinarily significantly more permeable than the spreading basin sediments, would both increase percolation and support water dependent ecosystems.

Other alternatives to satisfy the city's primary goal—to use surface water to increase legally extractable groundwater—also exist. If the pool behind Devil's Gate dam were allowed to fill—as it has been in the past—that water, once the sediment settles, could be pumped back up to either the natural stream or to existing spreading basins, or both. The water that could be stored in a pool behind the dam is a valuable resource, the use of which the city should examine fully in the EIR for this project.

Too, the need to greatly expand spreading basin area must be examined against the need to enhance natural areas in the Arroyo Seco. The County's removal of significant habitat behind Devil's Gate Dam without providing for adequate in-basin mitigation points out the need to replace ecologically important habitat in the arroyo. An alternative that is less environmentally destructive would return all or most of the area proposed for new spreading basins to habitat.

Cumulative Impacts

The LA County Flood Control District's Devil's Gate Dam multi-year sediment removal project when combined with the city's proposed plan wipes out much of the habitat value of the upper Arroyo Seco. The city's diversion of all of the water from the stream would exacerbate the impacts of the county's project. The city's claim that the diversion would enhance potential fish habitat is not a credible or worthy response to the overall impacts of the complete desiccation of the arroyo stream. The EIR should analyze in detail how these two projects would operate together to limit habitat, and look for less destructive alternatives that would avert their ecological consequences. CEQA requires that significant impacts be mitigated, and, contrary to the initial study, the impacts on species and both surface and groundwater of this proposed project are significant. Mitigation in the form of decreased stream take in the dry season and increases in habitat area would seem necessary and appropriate.

Use of the Best Available Information

The city's contention about percolation rates in spreading basins is unproven: in fact, the best science-based studies[1] seem to disprove the City's assumptions about spreading basin recharge rates. Because of sediment plugging and mechanical compaction, the existing spreading basin rates seem to be only a tiny fraction of the assumed rates. There is no information presented that proposes to evaluate these studies, nor that new spreading basins would no fall prey to the same phenomena.

The EIR needs to examine the city's proposed plan in detail in light of what is known—the existing studies-- about recharge rates and examine alternatives against the likelihood that

[1] 1995, Converse Consultants West and 2000, Williams

other options, such as allowing stream flow to conduct a large share of the recharge, may well be superior for the city's as well as the environment's purpose. It would seem incumbent on the city to understand scientifically, and to inform the public, on the best options to recover groundwater and protect the natural values of the Arroyo Seco.

Respectfully submitted,

Bill Christian

Public Comment on Initial Study for Arroyo Seco Canyon Project

Prepared by:
Hugh Bowles
626 482 9116
hsbowles@yahoo.com
12/4/2019

These comments relate to the Initial Study (IS) for the Arroyo Seco Canyon Project (ASCP) Environmental Impact Report (EIR).

Pasadena Water and Power (PWP) are preparing an EIR as a result of a legal challenge to the the original Mitigated Negative Declaration (MND) in 2015. Public comment in 2015 urged the need to complete an EIR for the proposed project. The court decision in 2017 confirmed that need. The lawsuit brought by the Spirit of the Sage Council provides this opportunity to re-iterate much of the comment made in 2015 but ignored by the project.

Under an EIR a Lead Agent is required to consider alternatives that may achieve the same project objectives with less impact on the environment. Under the original MND there was no requirement to consider alternatives.

The following comments focus on the need to consider the restoration of natural streamflows to the Arroyo Seco; this is an alternative to the project's planned increase of stream diversion into expanded spreading basins. Restoring natural flows to the Arroyo Seco can still meet PWP's surface water rights under the law; this approach will have a positive impact on the environment.

In particular, the comments relate to Initial Study (IS) question number 3.10 (b):

> "Would the project substantially decrease ground water supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?"

The IS selection is "Less than significant impact" with the claim of an additional 1100 acre feet of aquifer re-charge annually. To achieve this the project will increase diversion of the natural stream into expanded spreading ponds in Hahamongna.

The current capacity is to divert flows up to 18 cubic feet per second (cfs); under the project proposal this will increase to 25 cfs. The IS states "all flows" up to 25 cfs will be diverted. Mean flows in the Arroyo are less than 5 cfs even during the rain season. Under the proposal the Arroyo Seco stream channel will be dry outside of storm events. This will have a potentially significant impact on the riparian habitats within Hahamongna.

Increased diversion allows PWP to maximize its "surface water rights". Under these "rights" PWP claims credit to pump water from the aquifer. The Raymond Basin Management Board (RBMB) adjudicates pumping rights to local water agencies based on the Raymond Basin Judgment (The Judgment). The Judgment was established in 1944.

The proposed increase in diversion assumes water piped into the spreading basins actually percolates into the aquifer. Science paid for by Pasadena Water and Power (PWP) suggests this does not happen.

In 1995 PWP funded a study by Converse Consultants West: “Hydrogeologic Investigation Devil’s Gate Water Collection Tunnel”.

As part of the study, Converse mapped the hydraulic conductivity (percolation rate) of the different alluviums in the Hahamongna basin. The study identifies 4 types of alluvium with different levels of porosity. The spreading basins sit on the most porous group consisting of “unconsolidated coarse sand, gravel and boulders” — classed in the study as “Unit 1”. Converse measured percolation rates in the Unit 1 alluviums to be up to 3,467 gallons per day per square foot (gpd sqft). (Converse Study Table 4.1)

Yet, test pits dug in the spreading basins themselves found hydraulic conductivity to be “orders of magnitude lower” than adjacent Unit 1 areas. The spreading basins percolate less than 40 gallons per day per square foot.

Converse concluded that the low percolation rate in the spreading basins was due to:

> “…siltation… combined with artificial compaction of surficial soils due to equipment, etc.”. (Page 11 & 12 Converse Study).

Due to the extremely low percolation rate, Converse excluded the spreading basins from their study. Converse found the next lowest percolation rates in other areas of the basin to be over 800 gpd sqft.

In 2000 the City of Pasadena hired Takata and Associates to help prepare the Hahamongna Watershed Park (HWP) Plan. Takata engaged Phillip Williams and Associates (PWA) a firm of hydrology consultants to make recommendations for the the HWP Plan. PWA produced a study titled: “Flood Hazard, Sediment Management, and Water Feature Analyses”. The goal was to come up with a plan for the Park that would:

> “...promote a self-sustaining natural riparian habitat while addressing issues related to flood hazards, erosion control, sedimentation, stream stabilization, and water resource management within the park”. (Williams Study page 1).

The Williams Study references the earlier findings by Converse: the spreading basins are “by orders of magnitude” less porous than the surrounding alluviums. PWA also noticed that the spreading basins, when full, leak water back into the stream channel where it is absorbed.

PWA concluded the spreading basins: “may not be the most efficient or cost-effective way to recharge groundwater in the Hahamongna Watershed Park area”. The Williams Study proposes :

> “...increased groundwater recharge might be achieved if natural flows are restored to the Arroyo Seco channel and if ponding were allowed to occur regularly adjacent to the dam... Furthermore, natural flows in the Arroyo Seco channel could percolate most, if not all, of the low-flows currently diverted to the spreading grounds.” (Williams Study page 5).

In effect, flows of 25 cfs left in the natural stream could be absorbed within the Arroyo Seco channel before water hits the dam. 25 cfs is the maximum flow PWP can claim pumping credit

for; these flows are for “beneficial use”. Remaining flows above 25 cfs that percolate into the underground are considered to be for “the general good” for which PWP can claim no pumping credit.

The Converse and Williams findings suggest more water diverted into expanded spreading basins will not replenish the local water supply. Our Mediterranean climate provides few natural surface lakes; water held on the surface quickly evaporates and stagnates. The natural alluvial structures are designed to conduct water into underground aquifers as quickly as possible.

Under the 2015 Mitigated Negative Declaration, public comment challenged the PWP claim that the project would improve aquifer re-charge. PWP were asked to support their position. The written response was:

> “In regard to the spreading basins we have to use them regardless of their efficiency.”

There was no attempt to disprove the findings from either the Converse or Williams studies.

This response led to the challenge of the MND to the Board of Zoning Appeals and the City Council in 2015.

At the Board of Zoning Appeals Special Meeting on March 4, 2015, Chair Greg Jones asked: “The spreading basins are not efficient and are agreed upon that they are not efficient... Does the Judgment require spreading basins?”

Mr. Gary Takara from PWP replied:

> “The Judgment is the law... The question of efficiency is not necessarily which mechanism allows water to re-charge at the quickest rate.”

The Board of Zoning Appeals concluded the request in front of them related to a Conditional Use Permit (CUP) not to PWP’s method of water conservation and its impact on the environment or our water supply. The Board approved the (CUP).

With the questions on aquifer impacts evaded, the appeal went to a full hearing at Pasadena City Council on June 1, 2015. Similar presentations were made. Mayor Tornek asked: “Are spreading basins, in fact, effective re-charge technology?” Mr. Takara from PWP responded:

> “Spreading basins used for re-charge is a common practice in Southern California.”

Throughout the MND public comment and appeal process PWP failed to support the claim the project would improve aquifer re-charge. These same unproven claims have re-appeared in the new IS for the ASCP.

During the 2015 appeal hearings, support for the ASCP came from associates of the Arroyo Seco Foundation (ASF). Mr. Tim Brick, ASF Managing Director, declared that the ASCP was a “cutting edge” project with “best practices” and that it would be heard about “across the region”. Mr. Tom Seiffert informed City Council that the project was “too important” not to implement. These statements, made during “public comment” failed to acknowledge that ASF received a $250,000 no bid contract to “partner” with PWP on the project. The contract included a “gag order” that prevented associates of ASF from speaking about the project without PWP permission; this was not independent subjective comment.

The comments made by Mr. Brick and other ASF associates are in contrast with an e-mail from Mr. Brick to Mr. Tony Zampiello, Executive Officer, of RBMB dated June 20, 2013 titled “Arroyo Seco Canyon Project and Groundwater Percolation”. Mr Brick wrote:

> “This maybe a good opportunity to obtain funding to explore the issue raised by the Phillip Williams study and several community members about the best way to percolate water into the Raymond Basin and how to measure and monitor it. As an Integrated Regional Water Management project, the goal of the Arroyo Seco Canyon Project should be to maximize both water percolation and habitat values, so if we can determine the best way to percolate water and measure it, this would be a valuable tool for other groundwater and conservation programs throughout Southern California.”

The “cutting edge” project Mr. Brick mentioned in public comment on the ASCP is really that described in his e-mail: maximizing groundwater re-charge and habitat values. This is not what PWP propose. PWP have been clear they are not trying to create efficient re-charge of the aquifer.

Of note, too: Mr. Brick submitted the grant application on PWP’s behalf to obtain funding under the IRWM program Prop 84 funds. PWP have the money thanks to Mr. Brick. As Mr. Brick lays out in his e-mail to Tony Zampiello, as this is an IRWM project it should focus on maximizing re-charge and improving habitats. This is not public money obtained for PWP to do as they please; PWP has a responsibility to implement a project that is in line with IRWM goals.

In a slip, perhaps, Mr. Brick, stepping outside the constraint of the gag order, did admit to Council, that the presentation on restoring natural flows to the Arroyo represents “a better way”.

This comment along with Mr. Brick’s e-mail also reflects off the record comments about changing the approach to water conservation in Hahamongna; it shows that restoring natural flows to the Arroyo can gain mainstream support if open discussion were allowed.

On May 12, 2015 LA County Board of Supervisors adopted the resolution for Proposition 84 implementation. The stated purpose of the grants issued under this proposition include:

> “...the implementation of projects that protect communities from drought, conserve and improve water quality, restore habitat, and reduce dependency on imported water.”

Expanding diversion of a stream into spreading basins “regardless of their efficiency” undermines these objectives and is a misuse of public funds. As proposed, the ASCP could have a significant impact on our local aquifer as well as destroy key riparian habitats.

Under an EIR a Lead Agent must consider alternatives to the project that could achieve the same objectives with less impact on the environment. Using the natural stream channel to improve aquifer re-charge is a key alternative and must be considered under the law and IRWM goals.

PWP argue that the Raymond Basin Judgment affords no alternative. If the City is to maximize its “surface water rights” the stream must be diverted into the spreading basins.

PWP claim the diversion is mandated by the The Judgment quoting Section II (1) in their defense, which states:

> “The water shall be spread for percolation into the underground in the existing water conservation facilities of the Los Angeles County Flood Control District (now run by

> PWP), or in such additional spreading grounds as the parties may acquire or construct, or in any natural stream channels leading to such existing or future spreading grounds..." (Parentheses added).

PWP interprets this as a mandate to divert the Arroyo Seco a mile upstream into the existing spreading ponds with no alternative allowed under "the law". Mr Takara (Board of Zoning Appeals 3/4/2015):

> "If water is spread anywhere else the City of Pasadena will not gain any additional pumping credit."

However, Section II (1) is not prescriptive. The Judgment allows PWP to "spread" water **"in any natural stream channels leading to existing or future spreading grounds"**.

For example, under this section PWP could have claimed pumping credit for water in the 2012/13 season that spilled from the stream channel into the spreading pond just above Johnson field. There is an overflow pipe/culvert from the stream zone into that pond. Debris flows from the Station Fire raised the grade in the riparian corridor up to the level of this pipe. During higher flows water siphoned from the stream into the pond. Once full, surplus flows went into the basin below and Johnson Field. This was water in the "natural stream channel leading to a spreading ground".

Also, during this period, both the spreading basin above Johnson Field and Johnson Field itself became seasonal "wetlands". Formalized, this would be a natural implementation of LA County Flood Control District's (LACFD) objective to turn Johnson Field into a "wetland"; this plan is wholly unrealistic without the restoration of natural flows into the Arroyo.

The movement of debris downstream has since covered the pipe, but for two seasons the process provided a window into the flexibility inherent within the legal language: showing how natural processes could enhance water conservation in the Hahamongna basin.

Under current conditions, flows around 10 cfs, if not diverted, are absorbed in the stream channel by the time the stream reaches Johnson Field. Mean flows in the Arroyo measure less than 5 cfs even during months of rainfall — less during the dry season. If left in the "natural stream", for 90% of the year, flows could be absorbed entirely by the stream before reaching Johnson Field and well before reaching the dam.

Diversion of low flows occurs at a critical time for the environment – riparian habitats depend on these flows to provide crucial shaded nursery sites for wildlife – particularly quail and wildfowl – rich in insect life and protected from avian predators.

Around 30 white alder trees re-established themselves below the JPL bridge after the high flows in the 2009/10 season after the Station Fire. These trees perished in the drought years around 2013/14 — not because of the drought, but because flows that would have been in the stream were diverted so no water passed below the JPL bridge. These flows were piped into the existing settlement basin where they stagnated, evaporated, and leaked back into the stream 50 yards downstream.

During low summer flows of around 3 cfs PWP extract clean water from the stream and leave it to stagnate in a settlement basin. The flow is insufficient to pass into a spreading basin.

There needs to be clear scientific reason why low flows cannot be left in the natural stream, and why PWP cannot claim pumping credit for these flows from RBMB. These are flows of

less than 3-5 cfs that occur from the end of April through to the first rains in October/ November. If left in the stream these flows would be absorbed half a mile before the dam.

PWP make no claim that water in the settlement basin percolates into the aquifer. The new settlement basins proposed by the project will be lined with concrete.

Under The Judgment, water flowing in the stream can contribute to the City's local water allocation if it flows to "new or existing spreading grounds". The current spreading basins are just one form of "spreading ground"; they are not the only way to "spread" water. PWP are not precluded from adopting other forms of water conservation that maximize the percolation capacity of the natural stream channel.

As long ago as 1967 USDA outlined preferred mechanisms for "water spreading" of which "a series of small impound basins" was just one. USDA considered other ways of slowing water as it passes through the "intake area". (USDA Soil Conservation Service Engineering Division Technical Release #36 Geology June 1967, Victor Ponce).

In public comment on the 2015 MND California Fish and Wildlife suggested moving the diversion further downstream to allow more percolation in the stream. This might not be practical for the permanent structure; but under the USDA definition of "spreading ground" a low berm in the stream zone would "spread" and slow water to allow percolation. A seasonal berm at the lower end of Johnson Field, or anywhere before the dam, could be classed as a new "spreading ground". PWP could claim credit for all natural flows up to that berm; in reality, during low flow periods the stream would never reach that far.

Insistence that critical summer flows are diverted and the steam left dry is willful destruction of the natural environment. The "no alternative" argument is inadequate.

Diversion into spreading basins should be for excess flows up to the 25 cfs limit that cannot be absorbed by the stream. Most of the year the stream should flow as close to the dam as possible and the spreading basins remain dry, not vice versa.

PWPs adherence to "the law" has flaws. With the spreading basins absorbing just 40 gpd sqft, much of the water stagnates and evaporates (see appendix photos). Water quality quickly deteriorates in the spreading basins. The question is whether the diversion is for "percolation into the underground" as the law requires or just a measure that PWP can use to claim pumping credit. The Judgment has no requirement to measure how much of the diverted water reaches "the underground" where it becomes available for "re-capture". PWP assumes the diverted water percolates, but the Converse study findings show this is not the case.

Using the natural stream within the context of "the law" could yield a substantial improvement in aquifer re-charge; this would leverage the stream's ability to absorb up to 3,467 gpd sqft versus less than 40 gpd sqft in the spreading basins.

The Philip Williams Study in 2000 states "RBMB is currently in the process of re-evaluating their accounting procedure for percolation in the basin" and desires "to make this accounting procedure more scientifically rigorous."

RBMB were asked in public comment at their meeting on April 20, 2016 (at 2 p.m. in Azuza) what progress had been made on this objective. RBMB did not respond at that time. Follow up e-mails to Mr. Tony Zampiello put the questions in writing; Ms. Kelly Gardner responded that Mr. Zampiello could not respond to the questions in the meeting as he "did not have an opportunity to familiarize himself with the inquiry."

A final response to the questions came from Ms. Gardner who wrote “the reports (Williams and Converse studies) were prepared several years before the current team was involved in Basin Management.” There was never a direct response to the questions asked or any interest expressed in exploring the subject further.

Section XII of the RBMB Charter states the RBMB Powers and Responsibilities:

> “... shall be exercised with a view toward protecting the long term quantity and quality of the groundwater supply; utilizing the groundwater storage capacity of the basin for the maximum advantage of the parties... to reduce costs, improve reliability of supply, and to protect against drought”.

Continuing to support the diversion of natural streamflows into spreading ponds “regardless of their efficiency” that are by “orders of magnitude” less porous than the surrounding alluviums breaks the RBMB charter: it does not “protect the quantity and quality of the groundwater supply” nor “protect against drought”.

The planned expansion of the spreading ponds does not “reduce costs”... over $3MM of taxpayer funds are required plus annual maintenance.

In addition, PWP insistence that there is no option but to use the existing spreading basins is outside the requirements of the law it cites: PWP provide no evidence that the diverted water “percolates into the underground” as required.

The Converse Study details how the aquifer reacts in rainfall years when the dam is in use compared to when it is not. In years when the dam was not functioning, wells responded in line with rainfall. However, when the dam is used to hold water for short periods well logs improve. The Converse Study states:

> “This suggests that groundwater levels in the Arroyo and below the Altadena Fan decline at a much lower rate and remain at a relatively high elevation for the entire year when a lake is present.” (Converse study submission letter addressed to Ms. Rebecca Fisher of PWP dated August 29, 1995).

The Williams Study concludes that in a normal rainfall year, if water is left in the natural stream and held for short periods behind the dam, aquifer re-charge could improve by 160%.

Although prepared in 2000 the Williams Study, with its recommendation to restore natural flows to the arroyo and improve water conservation, was ignored in the 2003 HWP Plan. When questioned the City responded “it does not meet our needs.”

The Williams Study is often seen as utopian and impractical. Yet, the study provides for the clean out of accumulated debris. The study defines clean out areas of some size behind the dam and in the middle of the basin. The key is by allowing the natural stream to percolate water there is less need for the spreading basins; the study recommends the basins can be allowed to revert back to natural habitat. At a minimum, expansion of the spreading basins into the area once occupied by the JPL parking lot is unnecessary — nature can continue its work of re-claiming this area with the appropriate plant palette it chooses: buckwheat, sumac, sage... no need for human intervention.

While the Williams Study recommends retiring the spreading basins completely, this may not be practical. The porosity of the stream appears to have declined since the influx of debris from the rain season after the Station Fire. A phased approach based on measuring the percolation capacity of the stream makes sense; as one person working on the ASCP in 2013

stated: “It’s not like we cannot measure it...” — the amount of water the stream can absorb. If, for example, the stream can absorb 10 cfs before getting close to the dam, remaining flows up to 25 cfs could still be diverted with no need to expand the spreading basins — only 15 cfs would be diverted.

Much public concern about the LACFD Clean-out is that mitigation is being done off site; this is an admission the basin will be irreparably damaged. Adopting a science based approach to water conservation restores the damaged riparian corridor and frees up other areas for on site restoration. This is preferable to the off site restoration underway for the LACFD Devil’s Gate Clean-out project.

The 1967 USDA report states spreading ponds should be vegetated to avoid the problem Converse found in their study — silt and compaction reducing percolation rates. Attention to this also opens up the prospect of the remaining spreading ponds being useful for wildlife.

PWP remain wholly resistant to any consideration of percolating water in the stream and use of the dam. Mr. Takara (Board of Zoning Appeals Meeting March 4, 2015):

> “Co-mingling natural re-charge with the City’s water initiates a conflict between what water is actually percolating and what water is being released by the County.”

LACFD are not a party to The Judgment. If LACFD release flows from the dam Mr. Takara asks:

> “... so what water was released? The City’s water, the natural re-charge water, the water from a storm drain?”

This has been a common PWP refrain against restoring natural flows to the Arroyo.

The Converse and Williams studies provide a window to answers. LACFD allow water to pond behind the dam at flows around 50 cfs. The Williams study estimates the natural stream could absorb 25 cfs before water hits the dam.

If LACFD close the dam gates at 50 cfs, PWP’s maximum allocation of 25 cfs has already been absorbed by the stream. Water ponding behind the dam is water spread “for the general good” and has no impact on PWP pumping credit — the stream absorbs PWP’s maximum allocation.

To Mr. Takara’s question “What water was released if LACFD open the dam gates?” the answer is: “Not the City’s water” — the stream has already percolated PWP’s allocation “into the underground”.

In its adherence to “the law” PWP omit mention of Section II (3) of The Judgment:

> “... water diverted for spreading in such facilities cannot be percolated into the Basin and escapes therefrom, such quantity of water shall be subtracted from the amount diverted for spreading to determine the amount available for re-capture.”

The Williams Study noted that, when full, the spreading basins leak flows back into the stream where they are absorbed. In addition, low summer flows leak out of the settlement basin. If PWP were to adhere to “the law” this leakage should be measured and deducted from their pumping credit. Section II (1) is clear that the diversion is for percolation of water “into the underground”; the substantial evaporation that occurs from holding water in surface ponds in our hot climate should also be deducted.

The picture of the finished Devil's Gate Clean-out project in LACFD documentation shows a blue ribbon of streamflow winding through an alpine like meadow down to the dam. The image is designed to woo the public but under current conditions is fiction. At the level of flow depicted, the stream is diverted by PWP and never gets close to the dam. However, conserving water using natural processes in the basin could make this enticing image achievable.

A similar "artist impression" for the ASCP IS document shows clear water flowing over the new diversion dam a mile upstream. Again, this is a false image. The new dam is to divert water. Only high storm flows will spill over the new diversion dam.

LACFD's objectives with the Devil's Gate Clean-out are to restore capacity behind the dam. There should also be a commitment to restore hydraulic conductivity to the stream zone.

<u>In summation:</u>

Benefits from restoring natural flows to the Arroyo Seco include:

1. **Cost savings** — using the current spreading basins as overflow eliminates the need to expand the existing basins; this, in turn, reduces the cost of construction and annual maintenance.

2. **Increased pumping credit with no extra cost**: measuring the percolation capacity of the stream and claiming credit for water "spread in the natural stream" allows for credit during all flows. Currently, PWP cannot claim credit during high flow events as no diversion occurs. PWP has to wait for flows to slow so water is less turbid — this means that during and after prolonged periods of high flows PWP claim no pumping credit. If PWP claims credit for all flows up to the percolation capacity of the stream these credits can be issued even during high flow storm events. This will enhance PWP's pumping credit claims above the existing project goals.

3. **Water "underground" not evaporating in surface ponds**: using the natural stream to spread water ensures water percolates "into the underground" as the law requires and is not left stagnating and evaporating in ponds.

4. **Restored riparian habitats:** natural flows restored to the Arroyo Seco will lead to enhanced riparian habitats. This will compensate for the loss of riparian habitat close to the dam from the LACFD Devil's Gate clean-out. Potential environmental impacts of diverting all flows into spreading basins goes away. The type of riparian habitat that would emerge — shady areas with white alder and willow, will provide for safe wildlife nursery sites that currently do not exist.

5. **On-site mitigation for LACFD Devil's Gate clean-out** — with restored natural flows LACFD can focus on "on site" restoration of habitats. If the spreading basins are used for overflow purposes — flows that cannot be absorbed by the stream up to 25 cfs — this leaves room for the LACFD Devil's Gate restoration to occur on site; in particular, in the area left by the removal of the old JPL parking lot.

6. **Fish Passage:** much of the public comment around the MND in 2015 lauded the idea of creating "fish passage" — this is unrealistic with all flows being diverted into a pipe. The new IS is wise to point out there are no fish currently within the project area. However, restoration of natural flows could make that a possibility. There is no reason a restored natural stream channel could not support a resident fish population above the dam.

Approach options for a phased restoration of natural flows to the Arroyo Seco:

1. Measure percolation capacity of the stream from the USGS gauging station down to the dam. RBMB then allows PWP to claim credit for the full percolation of water in the "natural stream channel" before it hits the dam. Flows not absorbed by the stream up to PWP's surface water right (25 cfs) are diverted into the existing spreading basins. E.g. if the stream can absorb 15 cfs before water hits the dam, PWP diverts the remaining 10 cfs into the existing spreading basins.

2. If there is an issue with "natural stream channels" not leading to "existing or new spreading grounds", calculate the percolation rate for the natural stream up to the last of the spreading ponds, Johnson Field. All flows in the natural stream channel up to Johnson Field provide for PWP pumping credit. Most of the year flows, if left in the stream, will not reach Johnson Field.

3. Use the Prop 84 funds to construct new "spreading grounds" that allow for maximization of the high percolation provided by the stream. This includes engaging LACFD to ensure they maximize the percolation capacity of the stream under their clean-out project.

4. If "the law" proves inflexible, challenge the ongoing use of a 75 year old document that dictates an out-dated mechanism of water conservation — science and public attitudes have moved on. The environment and our fragile water supply require better. It is unreasonable to believe that the stakeholders in our local aquifer are not interested in replenishing the same as efficiently as possible.

Currently there are two lead agents implementing projects in the Arroyo — LACFD and PWP — each fails to look at the Hahamongna watershed as an integrated whole. The cumulative impacts of the ASCP and the Devil's Gate Clean-out on the Hahamongna basin must be considered.

At all stages of the project there needs to be full consultation with US Fish & Wildlife Services as well as California Department of Fish and Wildlife.

There is an imperative, with the increasing fragility of our climate, to work with, not against, the natural processes in the basin.

If the ASCP and Devil's Gate Clean-out projects continue under their current plans, the concept of Hahamongna - flowing water, fruitful valley — will die.

Please add these comments to the Administrative Record for the project.

APPENDIX
Photographs taken in the spring of 2019

Diverted water flows into Spreading Basin 1 (left).

Water outside of the main flow starts to stagnate and grow algae (below). Water quality quickly deteriorates when held in surface ponds.

Flows stop at Spreading Basin #5 (below). At this point, because the spreading basins do not absorb water efficiently there is significant stagnation and deterioration in water quality.

Note: PWP claims credit for this stagnant water — this is our “local water supply”.

Photographs taken on April 3 2019 after storm flows receded and water was being diverted.

Above: Similar flows left in the stream 50 yards below the JPL bridge.

Flows are completely absorbed adjacent to Spreading Basin #3 (left). Water quality for flows in the stream remains high.

PWP considers this “lost” water. Under the project these flows in the natural stream will be diverted into the spreading basins.

Photo taken in June 2018.

PWP diverts nearly all summer flows. Flows sit and stagnate in the sediment basin. Flows also leak back into the stream.

If these flows were left in the stream they would be absorbed well before reaching the dam.

Leaving flows in the stream would allow the recovery of riparian habitat, provide nursery sites for wildlife, and help mitigate the loss of habitat from the LACFD Devil's Gate Clean-out.

Re: Arroyo Seco Canyon Project EIR Initial Study and Scoping Document

Dear Ms Ventura,
Thank you for the opportunity to comment on this project.
My name is Laura Solomon and I am a concerned stakeholder. As a bird watcher, water conserver, and believer in the value of wildlife corridors, I am very interested in this project.
I'm concerned that it uses out-of-date strategies and needs to work more closely with natural processes. I urge PWP to work with nature to restore habitat, not destroy it. Use the conditions already present in the Hahamongna basin to replenish the aquifer. The basin is already sandy, and therefore is primed for water sinking through the sandy soil into the ground.
If PWP is determined to use spreading basins, then I urge them to use the spreading basins to create habitat. Plants are much better at collecting and storing water than basins.
Again, I urge PWP to work with natural processes in this project.
Thank you for your time.
Sincerely,
Laura Solomon

SUBJECT: Filing of Notice of Determination in compliance with Section 21108 or 21152 of the Public Resources Code.

State Clearinghouse Number (if submitted to State Clearinghouse): 2014101022

Project Title: Arroyo Seco Canyon Project

Project Applicant: City of Pasadena Department of Water and Power

Project Location (include county): 3420, 3500, 4401, 4500 Arroyo Seco Road, Pasadena, Los Angeles County; Arroyo Seco Canyon near Explorer Road; Hahamonga Watershed

Project Description:

The Project involves three areas of improvements along the upper Arroyo Seco. Area 1 includes demolition of the damaged existing headworks structure and creation of habitat restoration and a rest area/picnic area; Area 2 includes removal of the damaged existing intake structure and construction of a new diversion and wier structure and improvements to the Gabrielino Trail/access road; Area 3 includes creation of a parking lot for recreational users, reconfiguration and expansion of existing spreading basins, restrooms, and a guard house. The new intake would divert additional water during high-flows into the spreading basins for groundwater replenishment.

This is to advise that the City of Pasadena has approved the above

(■ Lead Agency or ☐ Responsible Agency)

described project on January 7, 2015 (date) and has made the following determinations regarding the above described project.

1. The project [☐ will ■ will not] have a significant effect on the environment.
2. ☐ An Environmental Impact Report was prepared for this project pursuant to the provisions of CEQA.
   ■ A Negative Declaration was prepared for this project pursuant to the provisions of CEQA.
3. Mitigation measures [■ were ☐ were not] made a condition of the approval of the project.
4. A mitigation reporting or monitoring plan [■ was ☐ was not] adopted for this project.
5. A statement of Overriding Considerations [☐ was ■ was not] adopted for this project.
6. Findings [■ were ☐ were not] made pursuant to the provisions of CEQA.

This is to certify that the final EIR with comments and responses and record of project approval, or the negative Declaration, is available to the General Public at:

City of Pasadena, Planning Department, 175 N. Garfield Avenue, Pasadena, CA, 91101

Present Land Use/Zoning/General Plan Designation:

Parking lot, trail, drainage channel/Open Space/Open Space

Project Description: *(please use a separate page if necessary)*

The project would involve restoration of a portion of the Arroyo Seco, reconstruction of surface water diversion facilities; expansion of spreading basins; and construction of recreational and educational amenities.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g., Notice of Preparation or previous draft document) please fill in.

Reviewing Agencies Checklist

Lead Agencies may recommend State Clearinghouse distribution by marking agencies below with an "X".
If you have already sent your document to the agency please denote that with an "S".

Authority cited: Sections 21083 and 21087, Public Resources Code, Reference: Section 21161, Public Resources Code.

SECTION 1.0 INTRODUCTION

1.1 PURPOSE OF INITIAL STUDY/MITIGATED NEGATIVE DECLARATION

The California Environmental Quality Act (CEQA) (*California Public Resources Code* §21000 et seq.) and the State CEQA Guidelines (*California Code of Regulations,* Title 14, §15000 et seq.) require that local government agencies, prior to taking action on projects requiring discretionary approval, consider the environmental consequences of such projects. In accordance with CEQA, this Initial Study (IS) has been prepared as documentation to support a Mitigated Negative Declaration (MND) for the Arroyo Seco Canyon Project (Project) proposed by the City of Pasadena. This IS/MND includes a description of the proposed Project; the location of the Project site; an evaluation of the potential environmental impacts of Project implementation; and recommended mitigation measures to lessen or avoid impacts on the environment.

Pursuant to Section 15367 of the State CEQA Guidelines, the City of Pasadena is the Lead Agency for the Project. This Project is being implemented under a partnership between the City of Pasadena Department of Water and Power (PWP) and the Arroyo Seco Foundation (ASF).[1] However, the City of Pasadena is serving as the Lead Agency, as it has the principal responsibility for carrying out the Project and has the authority for approving the Project and its accompanying environmental documentation.

In addition to addressing the potential environmental impacts that would result from the proposed Project, this IS/MND serves as the primary environmental document for future activities associated with the Project, including discretionary approvals requested or required for Project implementation. The Project proposes improvements to three areas within the Arroyo Seco Canyon. Project components include improvements to Area 1, Arroyo Seco Headworks; Area 2, Arroyo Seco Intake; and Area 3, Jet Propulsion Laboratory (JPL) East Parking Lot that would allow for the recharge of greater amounts of surface water into the groundwater basin, and would provide additional recreational and educational amenities.

This IS/MND evaluates the potential environmental impacts associated with implementation of the Project; includes significance determinations from the environmental analyses; identifies project design features (PDF) and regulatory requirements (RR) to be incorporated into the Project; and sets forth mitigation measures (MM) that would lessen or avoid potentially significant Project impacts on the environment. The IS/MND indicates that, while implementation of the Project would have environmental impacts, MMs have been incorporated to reduce potentially adverse impacts to levels considered less than significant (State CEQA Guidelines §15070). The reader is referred to the full text of this IS/MND and the technical appendices for a complete discussion and analysis of the Project's potential environmental effects.

As the Lead Agency, the City has reviewed and revised, as necessary, all submitted drafts and technical studies and has commissioned the preparation of this IS/MND to reflect its independent judgment, including reliance on City staff for the review of all technical subconsultant reports. Data for this IS/MND was obtained from on-site field observations; discussions with affected agencies; review of available technical studies, reports, guidelines, and data; and review of specialized environmental assessments prepared for the Project.

[1] The ASF is a community-based 501(c)(3) nonprofit organization that advocates an integrated, harmonious approach to watershed and flood management, water conservation, habitat enhancement, and the expansion of recreational opportunities in the Arroyo Seco.

1.2 SUMMARY OF ENVIRONMENTAL IMPACTS

The Arroyo Seco Canyon Project proposes improvements in three areas along the Upper Arroyo Seco, north of Devil's Gate Dam.

Area 1: Improvements proposed in Area 1 include habitat restoration along the stream channel, a new nature trail, and a rest area/picnic area, along with demolition of the existing Headworks structure on the Arroyo Seco.

Area 2: The existing diversion and intake structures are located on the Arroyo Seco in Area 2. New diversion and weir structures, a control equipment enclosure, and improvements to the damaged portion of the Gabrielino Trail/access road are proposed in this area.

Area 3: A recreational parking lot, sedimentation basins, expanded spreading basins, a restroom, and a guard station are proposed in Area 3 where the JPL East Parking Lot and four existing spreading basins are located.

Section 1.0 of this IS/MND provides the purpose of the IS/MND and a summary of the Project's environmental impacts; Section 2.0 discusses the existing environmental setting, and Section 3.0 provides a discussion of the improvements proposed as part of the Arroyo Seco Canyon Project. Section 4.0 of this IS/MND evaluates the impacts that would occur with Project implementation.

As analyzed, no impacts on Agriculture and Forest Resources and Population and Housing would accompany the Project. A number of PDFs would serve to minimize or avoid environmental impacts. Compliance with existing regulations would also reduce environmental impacts. With implementation of PDFs and compliance with RRs, the Project would have less than significant impacts on Aesthetics, Air Quality, Geology and Soils, Greenhouse Gas Emissions, Hydrology and Water Quality, Land Use and Planning, Mineral Resources, Noise, Public Services, and Utilities and Service Systems.

To avoid and reduce other potentially significant Project impacts, MMs have been developed for Biological Resources, Cultural Resources, Hazards/Hazardous Materials, Recreation, and Transportation/Traffic. With the implementation of these MMs, impacts would be reduced to less than significant levels.

The City will include these PDFs, RRs and MMs in the Contractor Specifications, as appropriate, and verify their implementation as part of the Mitigation Monitoring and Reporting Program (MMRP) for the Project. These PDFs, RRs and MMs are listed below.

Aesthetics

PDF AES-1 Public improvements in Areas 1 and 2 will be designed to comply with the Arroyo Seco Design Guidelines that address habitat restoration and landscaping using high value native plant species that would contribute to the genetic material of the Arroyo Seco, walls, signs, and site furnishings that are consistent with those found in the Hahamongna Watershed Park (HWP), subject to design review and approval by the City's Planning Division.

RR AES-1 The proposed improvements in Area 3 are required to be designed to comply with applicable criteria in the Arroyo Seco Design Guidelines, subject to design review and approval by the City's Planning Division.

Air Quality

RR AQ-1 During construction, the Contractor is required to comply with the South Coast Air Quality Management District's (SCAQMD's) Rule 403, Fugitive Dust, which requires the implementation of best available control measures (BACM) for any activity or man-made condition capable of generating fugitive dust including, but not limited to, earth-moving activities, construction/demolition activities, disturbed surface area, or heavy- and light-duty vehicular movement. The BACMs include stabilizing soil; watering surface soils and crushed materials; covering hauls or providing freeboard; preventing track-out; and limiting vehicle speeds and wind barriers, among others.

RR AQ-2 In accordance with Section 2449(d)(3) of California Air Resources Board's (CARB's) Regulation for In-Use Off-Road Diesel-Fueled Fleets, construction equipment and vehicles are required to limit idling times to no more than five consecutive minutes.

Biological Resources

PDF BIO-1 Habitat restoration in Area 1 will utilize native plant species, in accordance with the Plant Palettes set forth in Appendix A of the Arroyo Seco Design Guidelines, which allow for substitutions with the concurrence of the Project's biologist/restoration specialist.

RR BIO-1 The City of Pasadena Department of Water and Power is required to obtain all necessary permits for impacts to "waters of the United States" and "waters of the State" from applicable resource agencies, including the United States Army Corps of Engineers (USACE), the Los Angeles Regional Water Quality Control Board (RWQCB), and the California Department of Fish and Wildlife (CDFW).

RR BIO-2 Tree pruning, removal, relocation, and replacement is required to be made in compliance with the City of Pasadena "City Trees and Tree Protection Ordinance" (Section 8.52 of the Pasadena Municipal Code), which requires that mature, public, landmark, landmark-eligible, native and specimen trees be protected and preserved. Work on protected trees must be approved by the City Manager or his/her designated personnel.

MM BIO-1 A Biological Monitor shall be on site during vegetation clearing activities in Project work areas (i.e., areas of disturbance). Prior to the start of activities, the Biological Monitor shall confirm that the limits of Project work areas are clearly marked. In addition, the Biological Monitor shall conduct a pre-clearing sweep of the Project work area and shall flush and/or move common and unlisted special status wildlife to nearby suitable habitat outside the Project work area to the extent practicable. The Biological Monitor shall also be familiar with least Bell's vireo and shall conduct pre-clearing non-protocol surveys for this species while onsite. If a least Bell's vireo or other State of federally listed species is detected, work activity within 200 feet of the occupied habitat detected will be temporarily halted and the City will consult with the USFWS and CDFW. With authorization from these agencies, which may include a 'take' permit, the project will proceed in accordance with conditions developed in the consultation. Conditions will include avoidance and minimization measures to prevent or minimize impacts on the listed species(s) occurring on or adjacent to the site.

MM BIO-2 Project construction shall be conducted in compliance with the conditions set forth in the Migratory Bird Treaty Act (MBTA) and *California Fish and Game Code* with methods approved by the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW) to protect active bird/raptor nests. To the maximum extent feasible, vegetation removal shall occur during the non-breeding season for nesting birds (generally late September to early March) and nesting raptors (generally early July to late January) to avoid impacts to nesting birds and raptors. If the Project requires that work be initiated during the breeding season for nesting birds (March 1–September 30) and nesting raptors (February 1–June 30), in order to avoid direct impacts on active nests, a pre-construction survey shall be conducted by a qualified Biologist for nesting birds and/or raptors within 3 days prior to clearing of any vegetation and/or any work near existing structures (i.e., within 300 feet for nesting birds and within 500 feet for nesting raptors). If the Biologist does not find any active nests within or immediately adjacent to the impact areas, the vegetation clearing/construction work shall be allowed to proceed.

If the Biologist finds an active nest within or immediately adjacent to the construction area and determines that the nest may be impacted or breeding activities substantially disrupted, the Biologist shall delineate an appropriate buffer zone around the nest depending on the sensitivity of the species and the nature of the construction activity. Any nest found during survey efforts shall be mapped on the construction plans. The active nest shall be protected until nesting activity has ended. To protect any nest site, the following restrictions to construction activities shall be required until nests are no longer active, as determined by a qualified Biologist: (1) clearing limits shall be established within a buffer around any occupied nest (the buffer shall be 100–300 feet for nesting birds and 300–500 feet for nesting raptors), unless otherwise determined by a qualified Biologist and (2) access and surveying shall be restricted within the buffer of any occupied nest, unless otherwise determined by a qualified Biologist. Encroachment into the buffer area around a known nest shall only be allowed if the Biologist determines that the proposed activity would not disturb the nest occupants. Construction can proceed when the qualified Biologist has determined that fledglings have left the nest or the nest has failed.

MM BIO-3 A Biological Monitor shall conduct a pre-construction bat habitat assessment of buildings and~~the~~ trees marked for potential removal. Potential for roosting shall be categorized by 1) potential for solitary roost sites 2) potential for colonial roost sites (10 bats or more). If the potential for colonial roosting is determined, those trees shall not be removed during the bat maternity roost season (March 1 – July 31). Trees potentially supporting colonial roosts outside of maternity roost season, and trees potentially supporting solitary roosts may be removed via a two-step removal process, whereby some level of disturbance (such as trimming of lower branches) (at the direction of the Biological Monitor) is applied to the tree on day one to allow bats to escape during the darker hours, and the roost tree shall be removed two days later~~the following day~~ (i.e., there shall be no less or more than two~~one~~ nights between initial disturbance and the grading or tree removal). When feasible, trees will be dropped slowly and a Biological Monitor will monitor the activity. If buildings are determined to be occupied, one-way exclusionary devices will be placed over bat access points and left in place for two nights prior to building removal.

MM BIO-4 Prior to habitat disturbing activities of any Project component, a detailed restoration program shall be developed and implemented for any special status vegetation

type identified within the Project disturbance limits that is removed. These special status vegetation types shall be restored within the project disturbance limits at a ratio of not less than 1:1, or as agreed to by the City of Pasadena in consultation with the CDFW. If the 1:1 ratio cannot be achieved within the project disturbance limits, then the balance shall be achieved by identifying additional areas for restoration or conservation within the Arroyo Seco or adjacent watersheds. Restoration shall consist of seeding and container plantings of appropriate species. A Restoration Program shall be submitted to the City of Pasadena for review by a qualified Biologist and approval by the resource agencies (USACE, RWQCB, CDFW) prior to issuance of grading permits. The Restoration Program shall include, at a minimum, the following elements:

a. **Responsibilities and qualifications of the personnel to implement and supervise the plan.** The responsibilities of the landowner, specialists, and maintenance personnel that will supervise and implement the plan shall be specified.

b. **Site selection.** The site(s) for mitigation shall be determined in coordination with the City of Pasadena and the resource agencies. Restoration required outside the Project disturbance limits shall be located in dedicated open space areas (i.e. preserved in perpetuity as open space) and shall be contiguous with other natural open space areas.

c. **Site preparation and planting implementation.** The site preparation shall include (1) protection of existing native species; (2) trash and invasive non-natives removal; (3) native species salvage and reuse (i.e., duff); (4) soil treatments (i.e., imprinting, decompacting); (5) erosion-control measures (i.e., rice or willow wattles); and (6) native seed mix application and plantings.

d. **Schedule.** Establishment of restoration/revegetation sites shall be conducted between October 1 and January 30. Seeding and planting of container plants shall take place immediately after preparation of the restoration sites.

e. **Maintenance plan/guidelines.** The maintenance plan shall include (1) invasive non-natives control, (2) herbivory control, (3) trash removal, (4) irrigation system maintenance, (5) maintenance training, and (6) replacement seeding and/or planting.

f. **Monitoring Plan.** The monitoring plan shall include (1) site preparation and implementation activities; (2) performance criteria as approved by the City of Pasadena and resource agencies; (3) long-term monitoring requirements and methods to determine compliance with performance criteria; (4) goals and methods of site maintenance (e.g., weed removal, erosion control); (5) preparation of regular progress reports to document site progress; and (6) preparation of annual reports which shall be submitted to the City of Pasadena and resources agencies for three to five years. The monitoring shall be conducted for three to five years, depending upon the performance standard requirements for the vegetation type at the mitigation site.

g. **Long-term preservation.** Long-term preservation of the restoration site shall be outlined in the conceptual mitigation plan to ensure the mitigation site is not impacted by future development.

h. Performance standards will be identified and will apply for each special status vegetation type. Revegetation shall be considered successful at three years if the percent cover and species diversity of the restored and/or created habitat areas are similar to percent cover and species diversity of adjacent existing habitats, as determined by quantitative testing of existing, restored, and created habitat areas.

In addition, earth-moving equipment shall avoid maneuvering in areas outside the construction limits in order to avoid disturbing adjacent habitats. Prior to grading, the construction limits shall be identified on the grading plan and established at the Project site with appropriate staking and flagging materials. The Contractor shall submit a letter to the City of Pasadena verifying that the construction limits have been staked and flagged at the Project site.

MM BIO-5 Mitigation for the loss of jurisdictional resources shall be negotiated with the resource agencies during the regulatory permitting process (see RR BIO-1) and shall ensure that mitigation to compensate for permanent impacts on jurisdictional resources is equivalent or superior to biological functions and values impacted by the Project. Potential mitigation options may include: (1) removal of exotic species from the Arroyo Seco Canyon or Hahamongna Watershed Park or elsewhere within the Arroyo Seco or adjacent watersheds; (2) payment to a mitigation bank or regional riparian enhancement program (e.g., invasive plant or wildlife species removal); and/or (3) restoration of riparian habitat, including qualifying vegetation and trees, either on site or off site at a ratio of no less than 1:1, determined through consultation with the USACE, the RWQCB, and the CDFW. The restoration plan shall detail the methodology and performance standards, which shall be prepared in accordance with requirements specified in permits/agreements issued by the USACE, the RWQCB, and the CDFW.

MM BIO-6 A team of qualified specialists in hydrology and plant and wildlife biology will monitor the Arroyo Seco stream and associated riparian habitat from the intake structure (i.e. diversion point) downstream to Devil's Gate Dam. The extent of the riparian habitat, including aquatic habitat, will be defined based on field observations during the initial site visit. Monitoring will begin with an initial baseline assessment to be conducted within six months prior to start of increased diversions. Thereafter, monitoring shall continue quarterly for a duration of five years. Data will be gathered at fixed points along the stream, and general descriptive notes and photos will be taken of the entire stretch. Data will include surface flow measurements; subsurface hydrology; surface water extent mapping; vegetation mapping; a vegetation health assessment; active channel location mapping; and a plant and wildlife habitat suitability assessment (including protocol surveys if warranted and necessary to determine presence or absence of species). Data from four quarterly visits will be compiled in an annual report. The initial report will include a summary of available biological and hydrological historic data for the site. Annual reports will also include U.S. Geological Survey (USGS) stream gauge data from the Arroyo Seco (upstream of the Project site) and City of Pasadena data on diversion amounts within the year. These reports will consider all potential contributing factors, including precipitation and hydrologic conditions, flows from other managed tributaries, as well as potential maintenance and sediment removal activities behind the Devil's Gate Dam, and focus the reports on that which is attributable to the project to the maximum extent feasible. Annual reports will conclude with an assessment on the effects of increased diversion and will provide recommendations for corrective actions, if deemed necessary to avoid or reduce

downstream impacts attributable to the Project. Reports will be submitted to the City of Pasadena for review and approval of recommended corrective measures, if any.

Alternatively, if the City chooses not to take corrective measures, the City may mitigate for any loss of vegetation at a minimum 1:1 replacement ratio. The City shall only be required to mitigate for those impacts attributable to the City's increased diversions. Replacement vegetation shall be in kind; shall be equal to or greater than biological value prior to diversion; and shall be located within the Arroyo Seco watershed. Vegetation replacement shall mitigate for plant and wildlife impacts of the impacted community. Re-vegetated riparian communities within Area 1 established as part of the Project may potentially qualify towards credit for reduced flow impacts, if credit is available.

MM BIO-7 Prior to commencement of construction activities, trees not expected to be impacted by construction shall be enclosed by barriers such as chain-link fencing or orange snow fencing. At a minimum, the barriers will be placed at the outer canopy of each tree to be protected in place, and no grade changes will be made within the barriers without prior approval by the City. During Project construction, a biological monitor will be periodically present to record the number of trees actually impacted. If project construction can avoid impacting oak trees, the number of replacement trees will be reduced accordingly.

Cultural Resources

PDF CUL-1 A temporary bridge will be constructed over Bridge No. 3 prior to the start of construction activities in Areas 1 and 2. The temporary bridge will be used for all construction vehicles and equipment and will be removed after construction activities are completed.

RR CUL-1 If human remains are encountered during excavation activities, all work is required to halt in the immediate vicinity of the discovery and the County Coroner must be notified (*California Public Resources Code* §5097.98). The Coroner is required to determine whether the remains are of forensic interest. If the Coroner, with the aid of an Archaeologist, determines that the remains are prehistoric, s/he is required to contact the Native American Heritage Commission (NAHC). The NAHC is responsible for designating the most likely descendant (MLD), who is responsible for the ultimate disposition of the remains, as required by Section 7050.5 of the *California Health and Safety Code.* The MLD is required to make his/her recommendation within 48 hours of being granted access to the site. The MLD's recommendation is required to be followed if feasible, and may include scientific removal and non-destructive analysis of the human remains and any items associated with Native American burials (*California Health and Safety Code* §7050.5). If the landowner rejects the MLD's recommendations, the landowner is required to rebury the remains with appropriate dignity on the property in a location that will not be subject to further subsurface disturbance (*California Public Resources Code* §5097.98).

MM CUL-1 Prior to the start of construction activities in Areas 1 and 2, the cast concrete baluster railing of Bridge No. 2 shall be protected from construction activities that include the movement of heavy and large motor vehicles and machinery over it to gain access to Areas 1 and 2. Each baluster railing, from the bridge deck to the top of the railing, shall be clad with solid plywood panels, with a minimum thickness

of ¾ inches (or equally effective measures shall be installed) to protect against unintentional impacts from passing over the bridge. The plywood barriers shall be secured without damaging the balusters or railing.

The design and construction (and eventual removal) of the protective barriers at Bridge No. 2 shall be prepared in accordance with the Secretary of the Interior's Standards for the Treatment of Historic Properties. The plans for the temporary barriers shall be reviewed by an architectural historian, historic architect, and structural or civil engineer who has experience with the physical components of historic bridges. A qualified architectural historian (who meets the Secretary of Interior's Professional Qualification Standards) shall be retained to monitor the proposed installation and removal of the protective barriers on Bridge No. 2, prior to construction. An installation/construction/repair methodology to protect the historic resources shall be developed prior to construction activities to ensure that the protective measures adequately safeguard Bridge No. 2.

A pre-construction and a post-construction survey shall be prepared to ensure that adverse effects or significant impacts have not occurred to the bridge. The installation/construction methodology and post-construction survey shall be submitted to the City of Pasadena Department of Planning – Historic Preservation.

MM CUL-2 Prior to commencement of construction activities within Areas 1 and 2, the design and construction (and eventual removal) of the temporary bridge over Bridge No. 3 shall be prepared in accordance with the Secretary of the Interior's Standards for the Treatment of Historic Properties. The plans for temporary bridge shall be reviewed by an architectural historian, historic architect, and structural or civil engineer who has experience with the physical components of historic bridges and stone walls. A qualified architectural historian (who meets the Secretary of Interior's Professional Qualification Standards) shall be retained to monitor the proposed installation/construction and removal plan documents for the temporary bridge on Bridge No. 3, prior to the start of construction activities.

A pre-construction and a post-construction survey shall be prepared to ensure that adverse effects or significant impacts have not occurred to the bridge. The installation/construction methodology and post-construction survey shall be submitted to the City of Pasadena Department of Planning and Community Development, Design and Historic Preservation.

MM CUL-3 Prior to commencement of earthmoving activities, the City shall retain a qualified Archaeologist to observe grading activities. The Archaeologist shall be present at the pre-grade conference; shall establish procedures for archaeological resource surveillance; and shall establish, in cooperation with the Contractor, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts, as appropriate. Should archaeological resources be found during ground-disturbing activities for the Project, the Archaeologist shall first determine whether it is a "unique archaeological resource" pursuant to the California Environmental Quality Act (CEQA, i.e., Section 21083.2[g] of the *California Public Resources Code*) or a "historical resource" pursuant to Section 15064.5(a) of the State CEQA Guidelines. If the archaeological resource is determined to be a "unique archaeological resource" or a "historical resource", the Archaeologist shall formulate a mitigation plan in consultation with the City of Pasadena that satisfies the requirements of the above-referenced sections. The Archaeologist shall prepare a report of the results of any study prepared as part of

a testing or mitigation plan, following guidelines of the California Office of Historic Preservation, and s/he shall record the site and submit the recordation form to the City of Pasadena and the California Historic Resources Information System (CHRIS) at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. Work may proceed in other areas of the site, subject to the direction of the Archaeologist.

MM CUL-4 Prior to commencement of earthmoving activities, a qualified Paleontologist shall be retained to observe grading activities in native soils that are 5 feet below the ground surface or deeper, in paleontologically sensitive sediments, and to conduct salvage excavation of paleontological resources, as necessary. The Paleontologist shall be present at the pre-grading conference; shall establish procedures for paleontological resources surveillance; and shall establish, in cooperation with the Contractor, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of any fossils discovered, as appropriate. If paleontological resources are discovered, the Paleontologist shall report such findings to the City of Pasadena. If paleontological resources are found to be significant, the Paleontologist shall determine appropriate actions, in cooperation with the City, for exploration and/or salvage. These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the City. All recovered fossils shall be deposited in an accredited institution or museum, such as the Natural History Museum of Los Angeles County.

Geology and Soils

RR GEO-1 Grading, excavation, and construction is required to comply with the City's Building Code (Title 14 of the Pasadena Municipal Code, which incorporates the 2010 California Building Code), as they relate to site preparation and construction; alteration; moving; demolition; repair; use and occupancy of buildings; and structures and building service equipment within the City. The California Building Code requires the preparation of engineering geologic reports, supplemental ground-response reports, and/or geotechnical reports for all new construction; new structures on existing sites; and alterations to existing buildings. It also includes seismic design criteria and requirements for use in the structural design of buildings (i.e., based on seismic hazard maps and the seismic design category) and specifies building components that require special seismic certification.

RR GEO-2 Proposed improvements must be designed and constructed in accordance with the recommendations of the Geotechnical Feasibility Report that has been prepared for the Project, as required by the City's Building Code.

Hazards/Hazardous Materials

RR HAZ-1 Construction activities are required to comply with existing federal, State, and local regulations regarding hazardous material use, storage, disposal, and transport to prevent risks to public health and safety. Construction wastes that meet hazardous waste criteria must be stored, manifested, transported, and disposed of in accordance with the *California Code of Regulations* (Title 22) and to the satisfaction of the Los Angeles County Fire Department, which serves as the local Certified Unified Program Agency (CUPA).

RR HAZ-2 The City shall continue to implement its Emergency Operations Plan, which outlines the City's responses to emergencies associated with natural disasters, technological incidents, and national security emergencies.

MM HAZ-1 The City shall require Construction Contractors to implement the following measures:

- Trucks and equipment entering the site shall be inspected to be free from oil, gasoline, or other vehicle fluid leaks.
- Equipment fueling areas shall be located outside jurisdictional waters as identified by the USACE and CDFW.
- Hazardous materials shall not be stored within the 50-year floodplain for the Arroyo Seco. Instead, hazardous materials shall be stored within staging areas located away from the Arroyo Seco and shall be removed prior to the start of the storm season.
- All hazardous material spills and contaminated soils shall be excavated immediately upon discovery to minimize soil and water contamination and the potential of wildlife being poisoned or otherwise harmed.
- The Contractor shall maintain hazardous materials spill control, containment, and cleanup kits of adequate size and materials for potential accidental instream spills and releases.

MM HAZ-2 Should discolored or odorous soils be encountered during grading and excavation activities in Area 3, the Contractor shall have a sample of the soils analyzed for the presence of contamination. If the results of the testing show that chemical levels are present below regulatory levels, grading and excavation activities may proceed accordingly. Otherwise, remediation and/or removal of the contaminated soils shall be completed prior to continued ground disturbance if chemical levels are above regulatory standards. Remediation and/or disposal shall be conducted with the oversight of applicable regulatory agencies such as the Los Angeles County Fire Department, the South Coast Air Quality Management District (SCAQMD), the California Department of Toxic Substances Control (DTSC), and/or the U.S. Environmental Protection Agency in compliance with established maximum contaminant levels (MCLs).

MM HAZ-3 The Contractor shall schedule the temporary bridge construction and the access road reconstruction in Area 2 so as to shorten the necessary closures of the bridges and access road to the extent feasible. The Contractor shall also inform the Pasadena Department of Water and Power (PWP), the Pasadena Fire Department, the Pasadena Police Department, the Los Angeles County Fire Department, and the United States Forest Service (USFS) at least one week in advance of the start of construction of the times when work on Bridge No. 1/temporary bridge; Bridge No. 3/temporary bridge; and the Gabrielino Trail/access road are planned. Any major changes to the schedule shall be forwarded to these agencies at least one week prior to the bridge or trail closures.

MM HAZ-4 The Contractor shall not use, operate, or cause to be operated any internal combustion engine that uses hydrocarbon fuel, unless the engine is equipped with a spark arrestor and is maintained in effective working order, or the engine is constructed, equipped and maintained for the prevention of fire.

Hydrology and Water Quality

PDF HYD-1 Habitat restoration proposed in Area 1 will create a more natural riparian corridor for the Arroyo Seco and will include recontouring the stream channel; stabilizing the bank; revegetating with native plants; creating planting islands; and placing woody debris clusters at scattered locations.

PDF HYD-2 Replacement of the diversion and weir structures in Area 2 and additional spreading basins and expansion of the spreading basins in Area 3 will increase groundwater recharge using the City's surface water rights from the Arroyo Seco.

PDF HYD-3 The proposed restroom in Area 3 will be located outside the 50-year floodplain and would be connected to the public sewer system. In addition, trash cans and pet waste stations will be provided in Areas 1 and 3 to reduce pollutants that may enter the Arroyo Seco.

RR HYD-1 Prior to the start of construction activities, the Contractor is required to file a Permit Registration Document (PRD) with the State Water Resources Control Board (SWRCB) in order to obtain coverage under the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with the Construction and Land Disturbance Activities (Order No 2009-009-DWQ, NPDES No. CAS000002) or the latest approved general permit. This permit is required for construction activities (including demolition, clearing, grading, and excavation) and other land disturbance activities that result in the disturbance of one acre or more of total land area. The PRD consists of a Notice of Intent (NOI); a Risk Assessment; a Site Map; a Storm Water Pollution Prevention Program (SWPPP); an annual fee; and a signed certification statement. Pursuant to permit requirements, the Contractor must implement Best Management Practices (BMPs) in the SWPPP into the Project to reduce or eliminate construction-related pollutants in the runoff.

RR HYD -2 The Contractor is required to comply with SWRCB Order No. 2003-0017-DWQ, "General Waste Discharge Requirements for Dredge and Fill Discharges That Have Received State Water Quality Certification", which requires compliance with all conditions of the Water Quality Certification issued by the Regional Water Quality Control Board (RWQCB). Compliance with the Water Quality Certification issued by the RWQCB would ensure that any discharge does not conflict with the applicable provisions of Sections 301 (Effluent Limitations), 302 (Water Quality Related Effluent Limitations), 303 (Water Quality Standards and Implementation Plans), 306 (National Standards of Performance), or 307 (Toxic and Pretreatment Effluent Standards) of the Clean Water Act, or any other applicable requirements of State law.

RR HYD-3 Construction activities that will result in discharges of groundwater and dewatering that could result in discharges to surface waters are required to comply with the effluent limitations, discharge prohibitions, receiving water limitations, and other provisions outlined in the Los Angeles RWQCB Order No. R4-2013-0095. This Order requires that an NOI be filed with the Los Angeles RWQCB prior to dewatering activities and discharge into surface waters; water sampling and analysis; implementation of BMPs to prevent water quality degradation; and/or treatment of groundwater prior to discharge. The Los Angeles RWQCB reviews the NOI and the proposed discharge; authorizes the discharge subject to the

requirements in the Order; and prescribes an appropriate monitoring and reporting program.

RR HYD-4 The Contractor is required to comply with the City's Stormwater Management and Discharge Control Ordinance (Chapter 8.7 of the Pasadena Municipal Code), which prohibits illicit discharges and connections to the municipal storm water system; requires that storm water pollutants be reduced through litter control, natural water course protection, and containment of spills; and calls for the implementation of BMPs during construction through storm water pollution prevention plans (SWPPPs) and standard urban storm water mitigation plans (SUSMPs) for new development and major redevelopment.

RR HYD-5 All new construction and improvements in flood-prone areas are required by the City's Floodplain Management Regulations Ordinance (Chapter 14.27 of the Pasadena Municipal Code) to be adequately anchored to prevent flotation, collapse, or lateral movement; to be constructed with materials and equipment resistant to flood damage; to have utility and service facilities designed and located to prevent water from entering; and to provide adequate drainage to reduce exposure to flood hazards.

Land Use and Planning

RR LU-1 The proposed improvements in Area 3 must be designed and constructed in compliance with the *Hahamongna Watershed Park Master Plan* (HWMP) and the proposed restroom building will require Design Review Approval.

RR LU-2 The proposed Project will require a Conditional Use Permit (CUP) for developing/improving recreational facilities in the Open Space zone.

Mineral Resources

PDF MIN-1 Large cobbles and boulders exposed in Area 2 will be collected and stockpiled at a designated area for future use as trail markers, signs, and other decorative purposes.

RR MIN-1 Excavation activities in Area 3 is required to include the collection of arroyo stone for use in structures, signs, walls, and other improvements in accordance with the Arroyo Seco Design Guidelines, subject to the review and approval of the City's Planning Division.

Noise

RR NOI-1 In accordance with Section 9.36.070 of the City of Pasadena Municipal Code, the Contractor is required to limit noise-generating construction activities to between the hours of 7:00 AM and 7:00 PM Monday through Friday and between the hours of 8:00 AM and 5:00 PM Saturday in or within 500 feet of a residential district. No noise-generating construction activities shall be conducted on Sundays and federal holidays.

MM NOI-1 The Contractor shall implement the following noise-reduction measures during all construction activities:

- Equip all construction equipment (fixed or mobile) with properly operating and maintained mufflers, consistent with or exceeding manufacturers' standards.
- Ensure that construction equipment engine enclosures and covers, as provided by manufacturers, shall be in place during operation.
- Place all stationary construction equipment so that the equipment is as far as feasible from noise-sensitive receptors and so that the emitted noise is directed away from the noise-sensitive receptors.
- Locate equipment and materials staging in areas that will create the greatest distance between staging area noise sources and noise-sensitive receptors during Project construction.
- Ensure that construction equipment is shut down when not in use.
- Limit haul truck deliveries to the same hours specified for the operation of construction equipment.

Public Services

RR PS-1 Proposed improvements are required to be designed and constructed in accordance with the Pasadena Fire Prevention Code (Chapter 14.28 of the City's Municipal Code), which adopts the California Fire Code with changes and additions to the adopted code.

Recreation

MM REC-1 Prior to the closure of recreational trails for public use, the Construction Contractor shall post signs at the parking lots and trail entrances providing at least one week of advanced notice of the dates and times of planned trail closures. The trails shall be closed no more than 5 consecutive days in non-emergency circumstances. In addition to the closure notice, the Contractor shall provide directions to the nearest trails in the surrounding areas that would be open for public use at the times when the trails are closed.

Transportation/Traffic

PDF TRA-1 During the construction phase, a temporary access road will be maintained in Area 3 prior to the availability of the permanent access road, to provide continued vehicle access to the Jet Propulsion Laboratory (JPL) campus via the JPL Bridge. During construction activities in Area 3, the temporary access road will be available for use by JPL employees and visitors during the working weekdays, but the access road will be restricted at other times.

RR TRA-1 Construction activities are required to be conducted in accordance with the Standard Specifications for Public Works Construction (Greenbook) and the City's Supplements and Modifications to the Greenbook to maintain access to all parcels in and near the construction sites. This includes notification of residents and businesses affected by the road work; utility agencies with facilities in the area; the Pasadena Fire and Police Departments; and other emergency service providers.

The Greenbook also requires that access be made available at the end of each workday.

RR TRA-2 Temporary traffic control devices and methods used during construction are required to conform to the requirements of the latest edition of the Manual on Uniform Traffic Control Devices (MUTCD) and the California Supplement to the MUTCD. The Contractor shall provide traffic tapers, traffic control devices, barricading, and signs necessary to ensure driver awareness and safety in construction areas and to assist fire and law enforcement personnel.

MM TRA-1 During construction activities in Areas 1, 2 and 3, all Contractors shall schedule the arrival and departure of the construction equipment, and construction trucks outside the AM peak hours of 7:30 AM to 8:30 AM and the PM peak hours of 4:30 PM to 5:30 PM. In addition, trucks transporting sediment and debris from the site shall travel to and from the site outside the AM and PM peak hours.

MM TRA-2 During construction activities in Areas 1 and 2, use of Bridge No. 1, Bridge No. 3, and the Gabrielino Trail/access road by hikers, bicyclists and equestrians shall be limited or prohibited when work on the temporary bridges and Gabrielino Trail/access road is ongoing. Flagpersons and/or other safety procedures shall be used as necessary to ensure the safety of recreational users.

MM TRA-3 Prior to the start of construction, the Construction Contractor shall provide written notice to the USFS and residences at the Ranger Station of the anticipated construction schedule, stating that access may be temporarily obstructed on an intermittent basis and providing a schedule of anticipated closures. In order to ensure that emergency vehicles would not be obstructed at any time, any temporary obstructions to the Gabrielino Trail/access road that could hinder emergency vehicular access shall be mobile and able to be removed from the roadway immediately upon notice from emergency responders.

Utilities and Service Systems

RR UTIL-1 The Contractor shall comply with the City's Construction and Demolition Waste Management Ordinance (Chapter 8.62 of the Pasadena Municipal Code), which requires preparation and implementation of a Waste Management Plan that shows how at least 50 percent of construction and demolition debris would be diverted away from landfills. The Waste Management Plan shall be subject to City approval prior to the start of construction activities, and the Contractor shall provide monthly reports to demonstrate compliance during the construction phase.

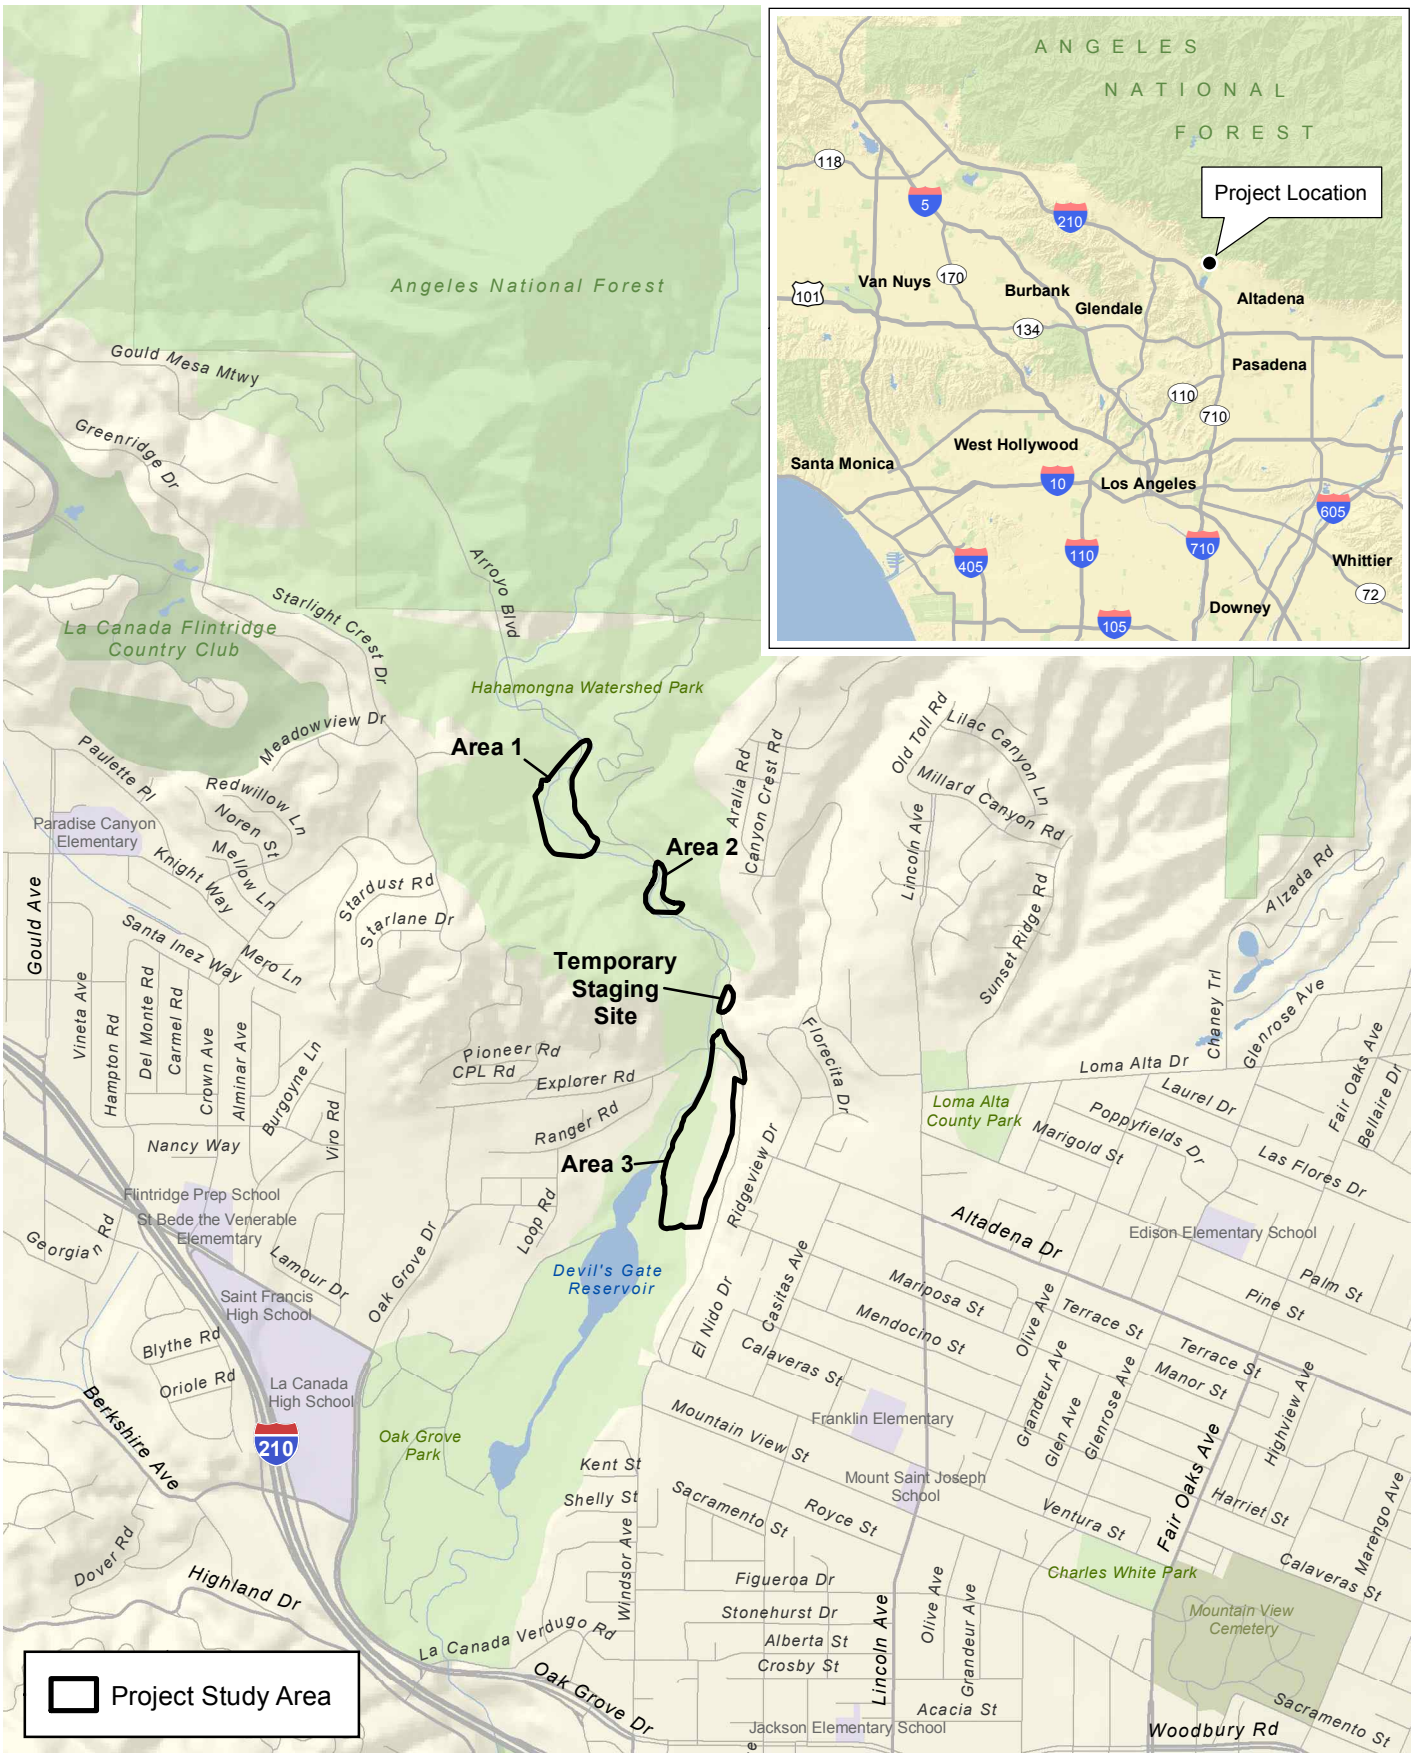
Cumulative Traffic

MM CUM-1 The Contractor for the Arroyo Seco Canyon Project shall coordinate with the Los Angeles County Department of Public Works and their contractor for the sediment removal activities at Devil's Gate Reservoir on the schedule of trucks coming to and from Scholl Canyon Landfill, such that the Project's truck traffic avoids the AM and PM peak hours to reduce conflict with local traffic and so that truck arrival times are staggered between the two projects to avoid queuing on Figueroa Street and on the State Route 134 on- and off-ramps.

SECTION 2.0 ENVIRONMENTAL SETTING

2.1 PROJECT LOCATION

The Project site is located within the Arroyo Seco Watershed, which is a subwatershed of the larger Los Angeles River Watershed. The Arroyo Seco is a perennial creek, which means there is generally flowing water year-round, but the flow is below the surface (underground) in some locations. Creek flows that originate in the San Gabriel Mountains continue to flow south through the cities of Pasadena, South Pasadena and Los Angeles, before joining the Los Angeles River just east of Elysian Park and west of the Interstate (I) 5/I-110 Interchange. Within the City of Pasadena, the Arroyo Seco passes through three distinct recreational areas: (1) Upper Arroyo Seco, containing Hahamongna Watershed Park and Devil's Gate Dam; (2) Central Arroyo Seco, containing the Brookside Golf Course and Rose Bowl; and (3) Lower Arroyo Seco, containing an archery range, casting pond, and Memorial Grove. The Project proposes new facilities and improvements in the Upper Arroyo Seco (in the City of Pasadena on land owned by the City) and sewer line connection to the JPL campus in the City of La Cañada Flintridge through the JPL Bridge. Exhibit 2-1, Regional Location and Local Vicinity Map, shows the location of the Arroyo Seco in the City of Pasadena.



The Project site can be accessed via I-210 by exiting Windsor Avenue and traveling northward for approximately 0.8 mile to its intersection with Ventura Street. From this intersection, the JPL East Parking Lot is located approximately 0.27 mile north along Explorer Road, which can be accessed by walking, bicycling, driving, or by horse.

The Project site consists of three primary areas: Area 1, Arroyo Seco Headworks; Area 2, Arroyo Seco Intake; and Area 3, JPL East Parking Lot. These 3 areas are connected together by the Gabrielino Trail, which serves as a recreational trail and the access road for City of Pasadena and United States Forest Service (USFS) vehicles heading into the Arroyo Seco Canyon. The locations of the three areas where improvements are proposed are described below and shown on Exhibit 2-2, Project Location Areas 1, 2, and 3.

2.2 EXISTING CONDITIONS

The Arroyo Seco is an important source of water supply for the City of Pasadena. The City owns the right to divert up to 25 cubic feet per second (cfs) of surface water from the Arroyo Seco and its tributaries into the City's spreading basins located along the east side of the Devil's Gate Reservoir, upstream of Devil's Gate Dam. An additional 7 cfs of surface water rights from Millard Creek (which is a tributary to the Arroyo Seco) are held by the Lincoln Avenue Water Company (LAWC). PWP and LAWC use the surface water to recharge the underlying Monk Hill Subbasin (a sub-aquifer of the Raymond Basin) for groundwater well extraction.

PWP currently operates several structures in the Arroyo Seco Canyon that capture and convey stream water to a series of groundwater recharge basins that are located adjacent to the National Aeronautics and Space Administration's (NASA's) JPL. These facilities include the Arroyo Seco Headworks structure and adjacent sedimentation basins, the Arroyo Seco Intake Dam, and the associated pipelines that convey water to the existing spreading basins. A large number of these facilities were entirely or severely damaged due to debris flows in 2010 subsequent to the 2009 Station Fire.

2.2.1 HYDROLOGY AND DRAINAGE

Natural Drainage

The Arroyo Seco Watershed includes approximately 47 square miles of land and is generally divided by the Devil's Gate Dam into the upper and lower watersheds. The drainage area north of the Dam is approximately 32 square miles. Numerous tributary streams within the San Gabriel Mountains contribute flows to the Arroyo Seco, including Colby Canyon, Little Bear Canyon, Bear Canyon, Long Canyon, Dark Canyon, Brown Canyon, Pine Canyon, Falls Canyon, Fern Canyon, El Prieto Canyon, and Millard Canyon.

Water flow within the Arroyo Seco is perennial, but can be highly variable due to seasonal rains, with the majority of rain events occurring between November and April. During drought and/or dry summer months, the stream flows can drop below the surface in areas with deeper alluvial deposits, such as in Hahamongna Watershed Park (HWP). Between 1990 and 2011, flows in the Arroyo Seco varied significantly and ranged from 471 acre-feet in 2002 to 37,888 acre-feet in 2005. Based on the results of a hydrologic study of the entire Arroyo Seco Watershed conducted by the Los Angeles County Flood Control District (LACFCD), the 2-year, 5-year, 10-year, and 50-year peak storm flows at the existing diversion structure in Area 2 were estimated to be 2,200, 4,100, 5,500 and 8,400 cfs, respectively. The 100-year storm event is estimated to generate 10,010 cfs (Carollo 2013).

In addition to highly variable stream flows, the San Gabriel Mountains are very erodible and regularly deposit alluvium, including large boulders, eroded rocks, cobbles, gravels, and coarse to fine sandy soils, into the stream course. Large amounts of sediment are deposited into the Arroyo Seco following large storm events and particularly after wildfires. During large storm events, flows could have four times more sediment load than during average years. Large storm events with sediment-laden flows are historically allowed to bypass the City's flood control facilities and continue downstream into the Devil's Gate Reservoir. However, due to the 2009 Station Fire and destruction of vegetation in upstream watershed areas, a large number of these facilities were entirely or significantly damaged due to the subsequent sediment flows. Additionally, the streambed was altered and filled with debris (e.g., sediment, vegetative/woody materials, and rocks/cobbles) in many places.

Existing Drainage Facilities

The Project site can be divided into three primary areas: Area 1 - Arroyo Seco Headworks; Area 2 - Arroyo Seco Intake; and Area 3 - JPL East Parking Lot.

Area 1 – Arroyo Seco Headworks

Area 1 is the northernmost and farthest upstream area, and is located approximately 0.7 mile north and upstream of the JPL East Parking Lot. This area is primarily located in the low- to mid-level floodplain of the Arroyo Seco and features a bend in the stream course. It includes the existing Headworks structure across the stream; an approximate 1,000-foot portion of the Arroyo Seco streambed and associated sedimentation basins; naturally vegetated areas; and the Gabrielino Trail. A chain-link fence runs along the western edge of the trail from Area 1 to Area 2.

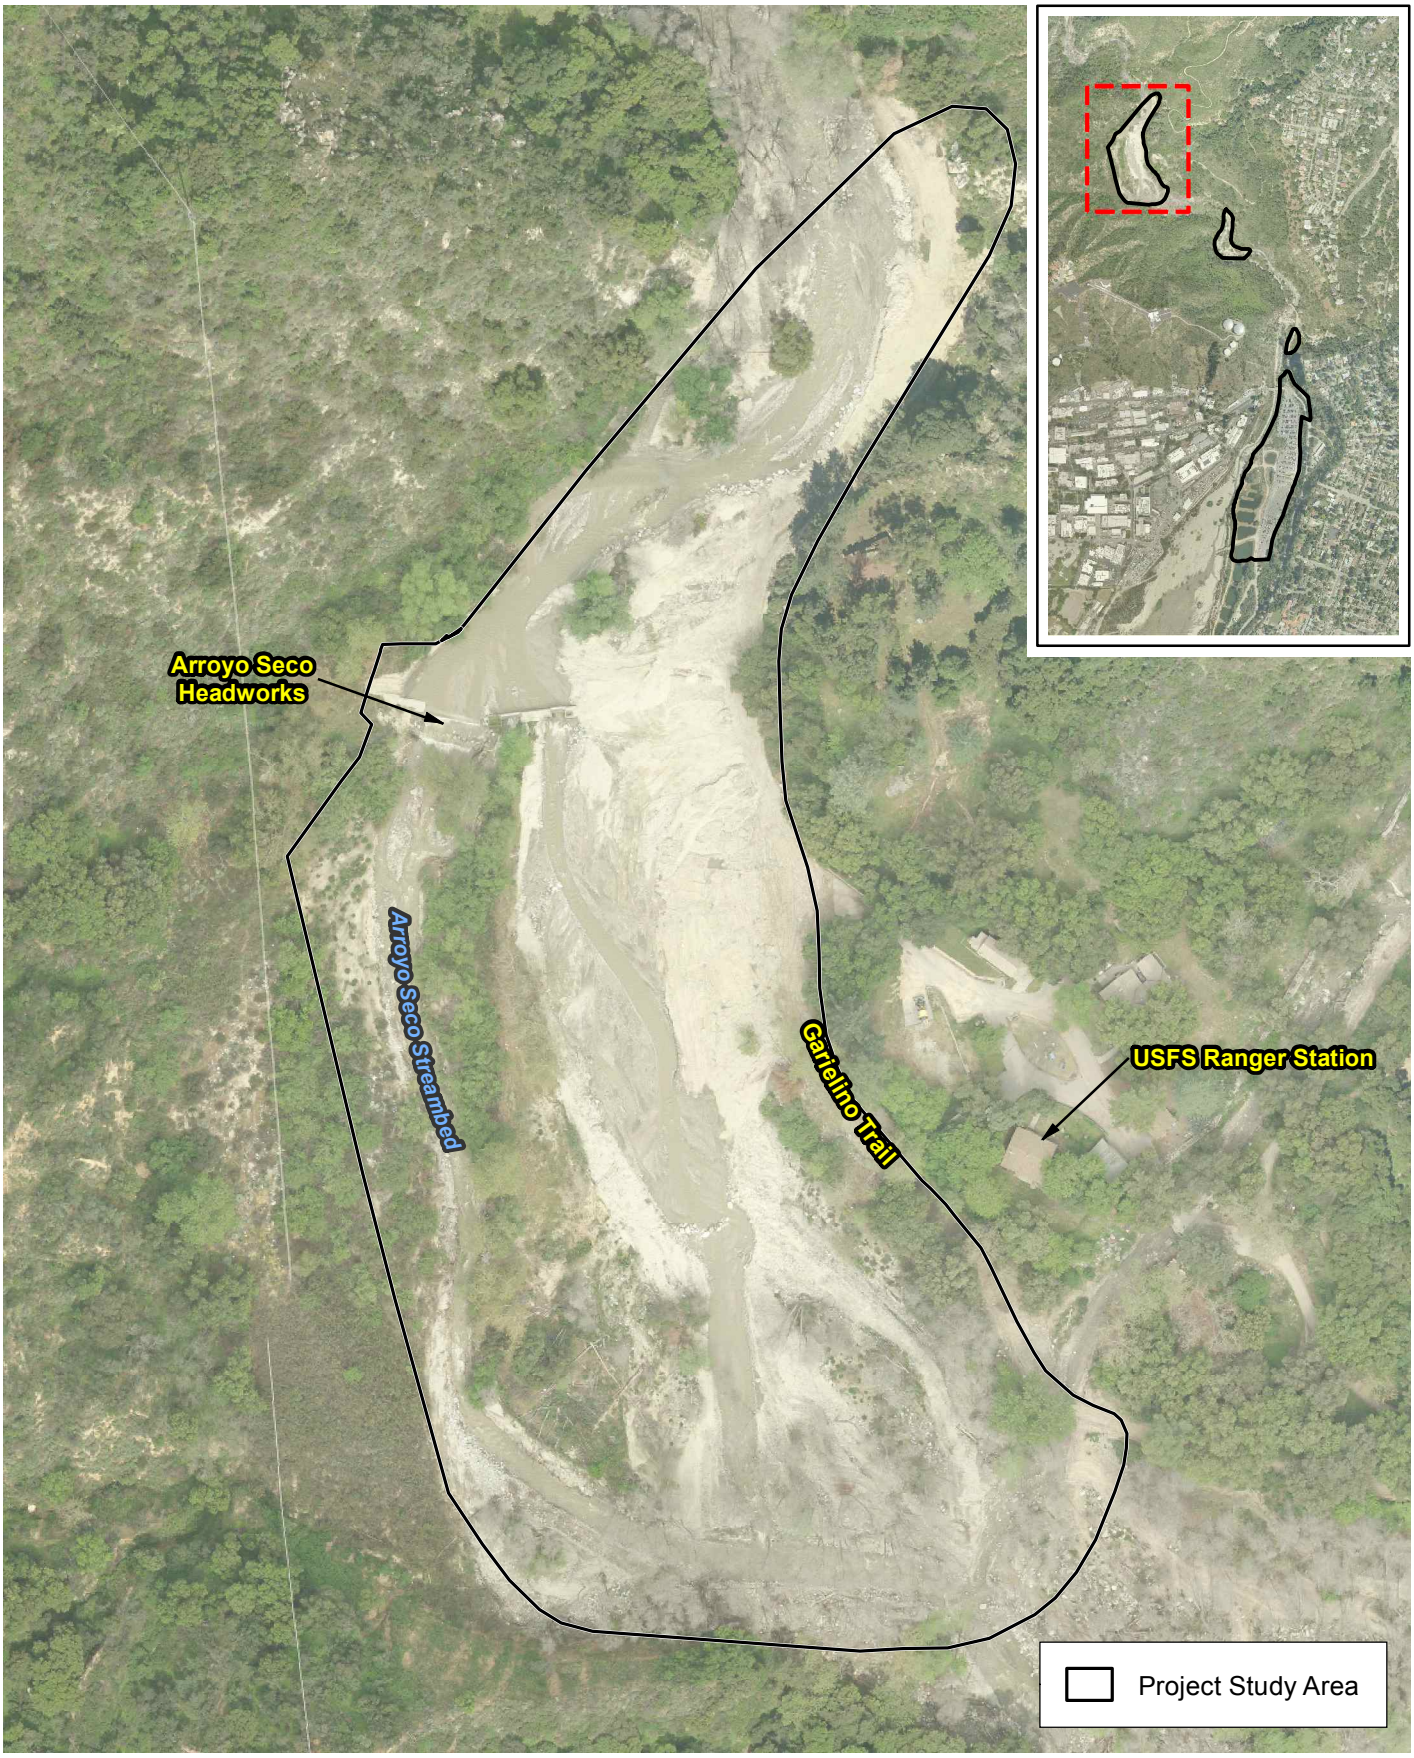
The Arroyo Seco Headworks structure was designed to divert flows into adjacent sedimentation basins to reduce the amount of suspended solids in the stream flow. The natural stream channel around the Headworks and sedimentation basins were substantially altered due to the debris flows following the 2009 Station Fire, thus rendering the facilities inoperable. The USFS Ranger Station, which includes three dwelling units providing housing for USFS Rangers, is located just

east of the Gabrielino Trail. An aerial photograph of Area 1 is depicted in Exhibit 2-3a, Area 1 – Arroyo Seco Headworks.

Area 2 – Arroyo Seco Intake

Area 2 is located approximately 0.3 mile downstream from the Arroyo Seco Headworks and 0.4 mile upstream from the JPL East Parking Lot. The primary structures in Area 2 include the diversion structure and intake structure, an equipment building, the Gabrielino Trail, and a historic bridge (Bridge No. 3) over the Arroyo Seco.

The diversion structure has historically diverted streamflows into the intake structure, which was designed to accommodate up to approximately 25 cfs of water. Upon entering the intake, the water is piped downstream approximately 3,000 feet to the PWP's spreading basins. The diversion structure consists of an approximate nine-foot high reinforced concrete retaining wall on the east bank of the stream. Near the downstream end of the retaining wall is a reinforced concrete weir that extends above the streambed roughly two feet, and generally does not support diversion of water at higher flows.[2] The diversion structure and intake structure were slightly damaged due to the debris flows following the 2009 Station Fire. Since then, the structures were repaired and placed back into service.



There is a small building pad north of the intake structure that previously supported an equipment building on the east side of the Gabrielino Trail/access road. There is another equipment building south of the intake structure and east of the Gabrielino Trail/access road. Approximately 150 feet of the Gabrielino Trail's protective embankment between the diversion structure and Bridge No. 3 has eroded, causing the edge of the paved road to break and fall apart. Currently, K-rails are used as a temporary means to prevent vehicle or foot traffic from approaching the drop-off adjacent to the trail. An aerial photograph of Area 2 is depicted in Exhibit 2-3b, Area 2 – Arroyo Seco Intake.

Millard Creek joins the Arroyo Seco approximately 0.25 mile south of the Arroyo Seco Intake and 0.15 mile north of the JPL East Parking Lot. There was an intake structure at this location that was completely damaged by floods after the 2009 Station Fire, but no new intake structure is proposed in this area. Bridge No. 1 spans Millard Creek and Bridge No. 2 crosses the Arroyo Seco just north of the Millard Creek confluence. South of this confluence and approximately 600 feet north of the JPL East Parking Lot is an area that may be used as a temporary staging site for construction activities. Construction materials, equipment, and vehicles may be temporarily located in this area during construction activities in Areas 1 and 2. An aerial photograph of this area is depicted in Exhibit 2-3c, Temporary Staging Area. All areas contained within the boundaries of the Study Area, as discussed in Section 4.4, Biological Resources, may also be used for construction staging activities.

Area 3 – JPL East Parking Lot

Area 3 includes the JPL East Parking Lot, adjacent City-owned spreading basins, and the access bridge that connects the Parking Lot to the NASA JPL Campus to the west. The Parking Lot is approximately 9.6 acres and contains 1,132 parking spaces that NASA JPL has leased from the City since 1960; these are restricted for use by NASA JPL employees and visitors. The Parking Lot is accessed from Explorer Road, which begins near the intersection of Windsor Avenue and Ventura Street, and travels through the Parking Lot northward to the access bridge. The Gabrielino Trail runs parallel to and east of the Parking Lot and also serves as a maintenance

[2] As stream flows increase during runoff events or seasonally higher water, the bed load is trapped on the upstream side of the weir, directing sediment into the intake. These sediments clog the intake and require maintenance that stops water diversion and groundwater recharge.

access road (North Arroyo Boulevard) that leads into the Arroyo Seco Canyon area. Area 3 is located within the HWP boundaries.

A series of 15 spreading basins are located northeast of the Devil's Gate Reservoir; west of the JPL East Parking Lot; approximately 650 feet south of the JPL Bridge; and approximately 2,200 feet north of Devil's Gate Dam. Area 3 includes only the four upper spreading basins that are located west of the JPL East Parking Lot. A 12-inch diameter water line serves NASA JPL, a series of 30-inch-diameter hume line and a 16-inch-diameter ductile iron pipeline connect the Intake to the spreading basins, and two 24-inch-diameter pipelines and an 8-inch-diameter sludge line from the Behner Water Treatment Plant cross the parking lot to the spreading basins. Additionally, the Altadena Drain, a storm drain line from the Altadena area, crosses Area 3 to the Arroyo Seco within a Los Angeles County storm drain easement. An aerial photograph of Area 3 is depicted in Exhibit 2-3d, Area 3 – JPL East Parking Lot.

2.2.2 BIOLOGICAL RESOURCES

The Arroyo Seco Canyon has a north-south alignment with steep east- and west-facing slopes. Chaparral and coastal sage scrub/sumac scrub are the dominant vegetation types on these steep slopes, although there are pockets of coast-live oak woodlands on the east-facing slopes. A perennial stream with a pool and riffles meanders through the canyon bottom and supports a dense riparian woodland before exiting the canyon and crossing alluvial flats towards the Devil's Gate Dam.

Vegetation types within the Project site disturbance limits include California buckwheat scrub, California buckwheat scrub/annual brome grasslands, California buckwheat scrub/laurel sumac scrub, coast-live oak woodland, California sagebrush scrub/laurel sumac scrub, California sagebrush scrub/California buckwheat scrub, disturbed, disturbed/annual brome grasslands, mule fat thickets, annual brome grasslands, coast live oak/California sycamore woodland, poison oak scrub, riparian herb, riparian herb/unvegetated wash, scrub oak chaparral, arroyo willow thickets, laurel sumac scrub, California sycamore woodland, white alder grove/California sycamore woodland, and arroyo willow thickets/mule fat thickets.

Area 1 is dominated by arroyo willow thicket and white alder grove/California sycamore woodlands; Area 2 is dominated by white alder grove/California sycamore woodland; Area 3 is dominated by developed and disturbed/annual brome grasslands; and the temporary staging site is dominated by California sagebrush scrub/California buckwheat scrub. The vegetation primarily consists of native trees and plants, although minimal amounts of non-native vegetation such as giant reed (*Arundo donax*) and tree tobacco (*Nicotiana glauca*) were observed in the disturbed portions of Area 1.

The native vegetation and the presence of naturally occurring pooled and running water gives the site potential to support many wildlife species. Amphibians observed or expected to occur on the Project site include the coast range newt (*Taricha torosa torosa*), California chorus frog (*Pseudacris cadaverina*), Pacific chorus frog (*Pseudacris regilla*), and western toad (*Anaxyrus boreas*). Reptiles observed or expected to occur on the Project site include western fence lizard (*Sceloporus occidentalis*), western whiptail (*Cnemidophorus tigris*), side-blotched lizard (*Uta stansburiana*), gopher snake (*Pituophis catenifer*), and western rattlesnake (*Crotalus oreganus*). The Project site is also expected to draw a multitude of bird species (residents and migrants). Bird species that were observed or expected to occur on the site include residents such as the California quail (*Callipepla californica*), western screech-owl (*Megascops kennicottii*), great horned owl (*Bubo virginianus*), Anna's hummingbird (*Calypte anna*), acorn woodpecker (*Melanerpes formicivorus*), western scrub-jay (*Aphelocoma californica*), oak titmouse (*Baeolophus inornatus*), bushtit (*Psaltriparus minimus*), house wren (*Troglodytes aedon*),

California towhee (*Melozone crissalis*), lesser goldfinch (*Spinus psaltria*), and migrants such as black-chinned hummingbird (*Archilochus alexandri*), western wood-pewee (*Contopus sordidulus*), Pacific-slope flycatcher (*Empidonax difficilis*), cliff swallow (*Petrochelidon pyrrhonota*), black-throated gray warbler (*Setophaga nigrescens*), Wilson's warbler (*Cardellina pusilla*), white-crowned sparrow (*Zonotrichia leucophyrys*), and Bullock's oriole (*Icterus bullockii*).

In addition, the Project site is expected to have a high abundance of small and large mammals. Mammals observed or expected to occur on the Project site include large mammals such as the mule deer (*Odocoileus hemionus*), coyote (*Canis latrans*), mountain lion (*Puma concolor*), American black bear (*Ursus americanus*), bobcat (*Lynx rufus*), and small mesopredators such as striped skunk (*Mephitis mephitis*), raccoon (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), and small herbivores like the desert cottontail (*Sylvilagus audubonii*), California ground squirrel (*Otospermophilus beecheyi*), and Botta's pocket gopher (*Thomomys bottae*). A variety of bats are also expected to occur, including the California bat (*Myotix californicus*), hoary bat (*Lasiurus cinereus*), big brown bat (*Eptesicus fuscus*), and Brazilian free-tailed bat (*Tadarida brasiliensis*). A comprehensive list of observed plant and animal species is provided in Attachment B of Appendix B.

2.2.3 LAND USE

On-Site and Surrounding Land Uses

Areas 1 and 2 are located within an open space area that is accessible to the general public, including hikers, bicyclists, and equestrians, via the Gabrielino Trail. There are no occupied land uses in these areas. Areas 1 and 2 are surrounded by open space associated with the Angeles National Forest (ANF). There are no residences or other permanent land uses in the vicinity, other than the residences associated with the USFS Ranger Station adjacent to Area 1.

Area 3 contains the existing spreading basins and the JPL East Parking Lot. The City owns the JPL East Parking Lot, but leases the lot to NASA JPL. The parking lot is currently restricted for use by NASA JPL employees and visitors, with a shuttle carrying employees and visitors across the access bridge to the NASA JPL campus and back. Area 3 is surrounded by single-family residential neighborhoods to the east, including several schools located primarily within the unincorporated Altadena area, although some residential areas are located within City of Pasadena boundaries. All residential properties to the west of the Project site are located within the City of La Cañada Flintridge, including the NASA JPL. Property to the southwest includes portions of Hahamongna Watershed Park (formerly Oak Grove Park), which spans both sides of the Hahamongna Basin within the City of Pasadena, followed by residential land uses within the City of La Cañada Flintridge on the opposite (west) site of the Hahamongna Basin.

Applicable Land Use Plans

City of Pasadena General Plan and Zoning Code

As previously discussed, all Project components are located entirely within the City of Pasadena. The Upper Arroyo Seco is designated and zoned as Open Space and a portion of Area 3 is zoned Planned Development – 16 in the City of Pasadena's Land Use Plan and Zoning Map (Pasadena 2009, 2012b). Although the Arroyo Seco originates in the ANF and although Area 1 is located within the mapped boundary of the ANF, the portions of the Project site within the ANF boundary are designated in the USFS Land Management Plan as Non-Forest System Land and are not subject to the jurisdiction of the USFS (USFS 2005a).

Hahamongna Watershed Park Master Plan

The Arroyo Seco Master Plan is a master planning document that consists of four elements: (1) Hahamongna Watershed Park Master Plan, (2) Central Arroyo Seco Master Plan, (3) Lower Arroyo Seco Master Plan, and (4) Design Guidelines for the Arroyo Seco. The *Hahamongna Watershed Park Master Plan* (HWMP) and the *Arroyo Seco Design Guidelines* are applicable documents that address certain components of the proposed Project.

The HWMP sets forth objectives for the future use and development of HWP, which includes approximately 1,300 acres of open space that extends up the Arroyo Seco Canyon from the Devil's Gate Dam. The lower watershed, the 330 acres roughly defined as the floodplain and basin behind the Dam, is the focus of the HWMP. The HWMP establishes a framework for flood management, water conservation, habitat restoration, recreation, and cultural resources protection in this area. A conceptual approval of the HWMP was given by the City in 1999, with the HWMP adopted in 2003 and an amendment approved in 2010.

Only Area 3 of the Project site is within the HWMP's HWP study area. The projects specified in the HWMP include the conversion of the JPL East Parking Lot to a small public parking area at the north end and the expansion of the existing spreading grounds through the creation of new spreading basins on the central and southern portions of the parking lot. The HWMP also calls for a new restroom at the northern end of Area 3; a sunset overlook south of Area 3; a bridge crossing for the North Perimeter Trail from an existing trail across Area 3; storm drain improvements; and habitat restoration around the spreading basins. A number of other improvements are planned in the HWMP for areas outside Area 3 and on the west side of the Arroyo Seco.

Arroyo Seco Design Guidelines

The Arroyo Seco Design Guidelines document comprises one of the four elements of the Arroyo Seco Master Plan and includes design criteria and guidelines for improvements in the Arroyo Seco. The guidelines address the following components:

- Habitat Restoration and Land Improvements
- Architecture
- Cultural Resource Preservation
- Recreation
- Signage
- Walls, Fences, and Gates
- Walkways, Paths, and Trails
- Parking and Traffic Control
- Public Art
- Site Furnishings

The proposed improvements in Area 3 would be subject to these design guidelines. For consistency, improvements subject to public use (e.g., rock walls, benches, signs, picnic tables) in Areas 1 and 2 will be designed according to these guidelines.

2.3 PROJECT BACKGROUND AND PURPOSE

The purpose of the proposed Project is to take a multi-benefit approach to repair/replace facilities that were damaged or destroyed by Station Fire-related events; to increase the existing utilization of surface water rights held by the City; improve water quality in the canyon; improve biological habitats; restore hydrological function and fish passage; and improve ecosystem health through the following enhancements:

- Remove exposed portions of existing infrastructure designed for sediment removal (Area 1)
- Naturalize the Arroyo Seco streambed (Area 1)
- Restore and improve the intake facilities (Area 2)
- Expand recharge operations by creating additional spreading basins (Area 3)
- Reduced barriers to fish passage
- Enhance recreational facilities
- Improve water quality through the proposed restroom
- Improve stormwater quality through a smaller decomposed granite parking lot

2.3.1 2009 STATION FIRE

The Station Fire burned a total of 161,189 acres (or nearly 252 square miles) of the Angeles National Forest in 2009. The fire burned vegetation and soils on steep side slopes within the Los Angeles River, San Gabriel River, Mojave River, and Santa Clara River Watersheds. This led to substantial erosion, debris flows, and flooding during subsequent winter storm seasons and summer storm events. PWP facilities in and near the Arroyo Seco have been significantly damaged, and the streambed has been altered by accumulated sediment due to the major debris flows following the Station Fire. It is estimated that over 1 million cubic yards of sediment accumulated behind the Devil's Gate Dam during the storms, which passed through the PWP's Headworks and diversion structures.

As a result of the damage generated by the sediment-laden flows following the Station Fire, the Project involves enhancing the existing diversion and intake structures in Area 2 to improve sediment removal and eliminate the need for the Headworks facility in Area 1 and naturalize the Arroyo Seco streambed through restoration activities in Area 1.

2.3.2 SURFACE WATER DIVERSION AND INFILTRATION

The spreading basins in Area 3 cover approximately 13 acres and can hold approximately 39 acre-feet of water, which is nearly equal to the existing average annual daily recharge volume of 35.75 acre-feet (af) per day. The average percolation rate of the basins is estimated to be 18 cfs after the basins have filled with water and allowed time for the ground to become saturated. Historically, approximately 2,300 af of water were recharged annually prior to the 2009 Station Fire. The City receives groundwater pumping credit equal to approximately 60 percent of the amount of water recharged into the groundwater basin.

An analysis conducted by Carollo Engineers in 2013 examined 23 years' worth of rainfall and recharge data and determined that, on average, PWP is regularly forfeiting a portion of its surface water rights due to a combination of high concentration of sediment deposits following initial storm events and spreading capacity constraints. Based on the analysis of flows during the 3 wettest

years between 1990 to 2012 (which were 1998, 2005, and 2011), it was determined that approximately 25 af of additional spreading basin capacity would be needed to capture all forfeited flows and that the additional basin capacity would have been utilized about 40 days per year during these 3 wettest years (Carollo 2013). Activities proposed within Area 3, including the reconfiguration and expansion of the existing spreading basins, would reduce the forfeiture of surface water.

2.4 CEQA REVIEW PROCESS

This IS/MND has been prepared to analyze the impacts associated with (1) the proposed habitat restoration, (2) reconstruction, and expansion of facilities for water conservation and (3) the recreational amenities at three separate areas along the Upper Arroyo Seco. Review of previous related environmental documentation was made to determine whether the proposed improvements have been addressed in previous documents and if there is a need or ability to tier off these documents.

The review indicated that the Master Environmental Impact Report (Master EIR) for the Arroyo Seco Master Plan analyzed the impacts of proposed improvements in Area 3, but the impacts of improvements proposed in Areas 1 and 2 have not been analyzed in any environmental document. As such, this IS/MND analyzes the impacts of the Project in all three areas, and compares the impacts in Area 3 with those in the Master EIR. Applicable mitigation measures from the Master EIR are then incorporated into this IS/MND. As necessary, such measures are updated and/or supplemented with additional mitigation to specifically address Project-related impacts.

The City of Pasadena is serving as the Lead Agency for the CEQA environmental review process and has submitted this IS/MND to responsible and trustee agencies and other potentially affected agencies and adjacent property owners. A Notice of Intent to Adopt an MND was also sent to the State Clearinghouse and the Los Angeles County Registrar-Recorder/County Clerk. The IS/MND and associated technical reports can be viewed online at the City's website at http://www.cityofpasadena.net/Planning/Environmental_Notices/ and the Arroyo Seco Foundation website at http://www.arroyoseco.org/ascp/ismnd/htm. Notices were also posted at the site and in the surrounding neighborhood.

In accordance with Section 15073 of the State CEQA Guidelines, a Negative Declaration or Mitigated Negative Declaration must be subject to a 30-day public review period when submitted to the State Clearinghouse for review by State agencies. The public review period for this IS/MND has been set from October 9, 2014 to November 8, 2014.

In reviewing the IS/MND, the reviewer should focus on the sufficiency of the document in identifying and analyzing the potential impacts on the environment and ways in which the Project's potentially significant effects are avoided or mitigated. Comments should be sent in writing and postmarked by November 8, 2014, by mail, email or fax to Mr. Jose Jimenez of the City of Pasadena at the address below.

Jose Daniel Jimenez
City of Pasadena
Planning and Community Development
175 North Garfield Avenue
Pasadena California 91101-1704
phone: (626) 744-7137
fax: (626) 396-8998
email: josejimenez@cityofpasadena.net

In accordance with Section 15074 of the State CEQA Guidelines, prior to approving the Project, the Hearing Officer will consider the IS/MND together with any comments received during the public review process. The City will adopt the IS/MND only if it finds that that there is no substantial evidence in the record that the Project will have a significant adverse effect on the environment and that the IS/MND reflects the independent judgment and analysis of the City. A Notice of Determination will be filed with the County Clerk and the State Clearinghouse after adoption of the MND.

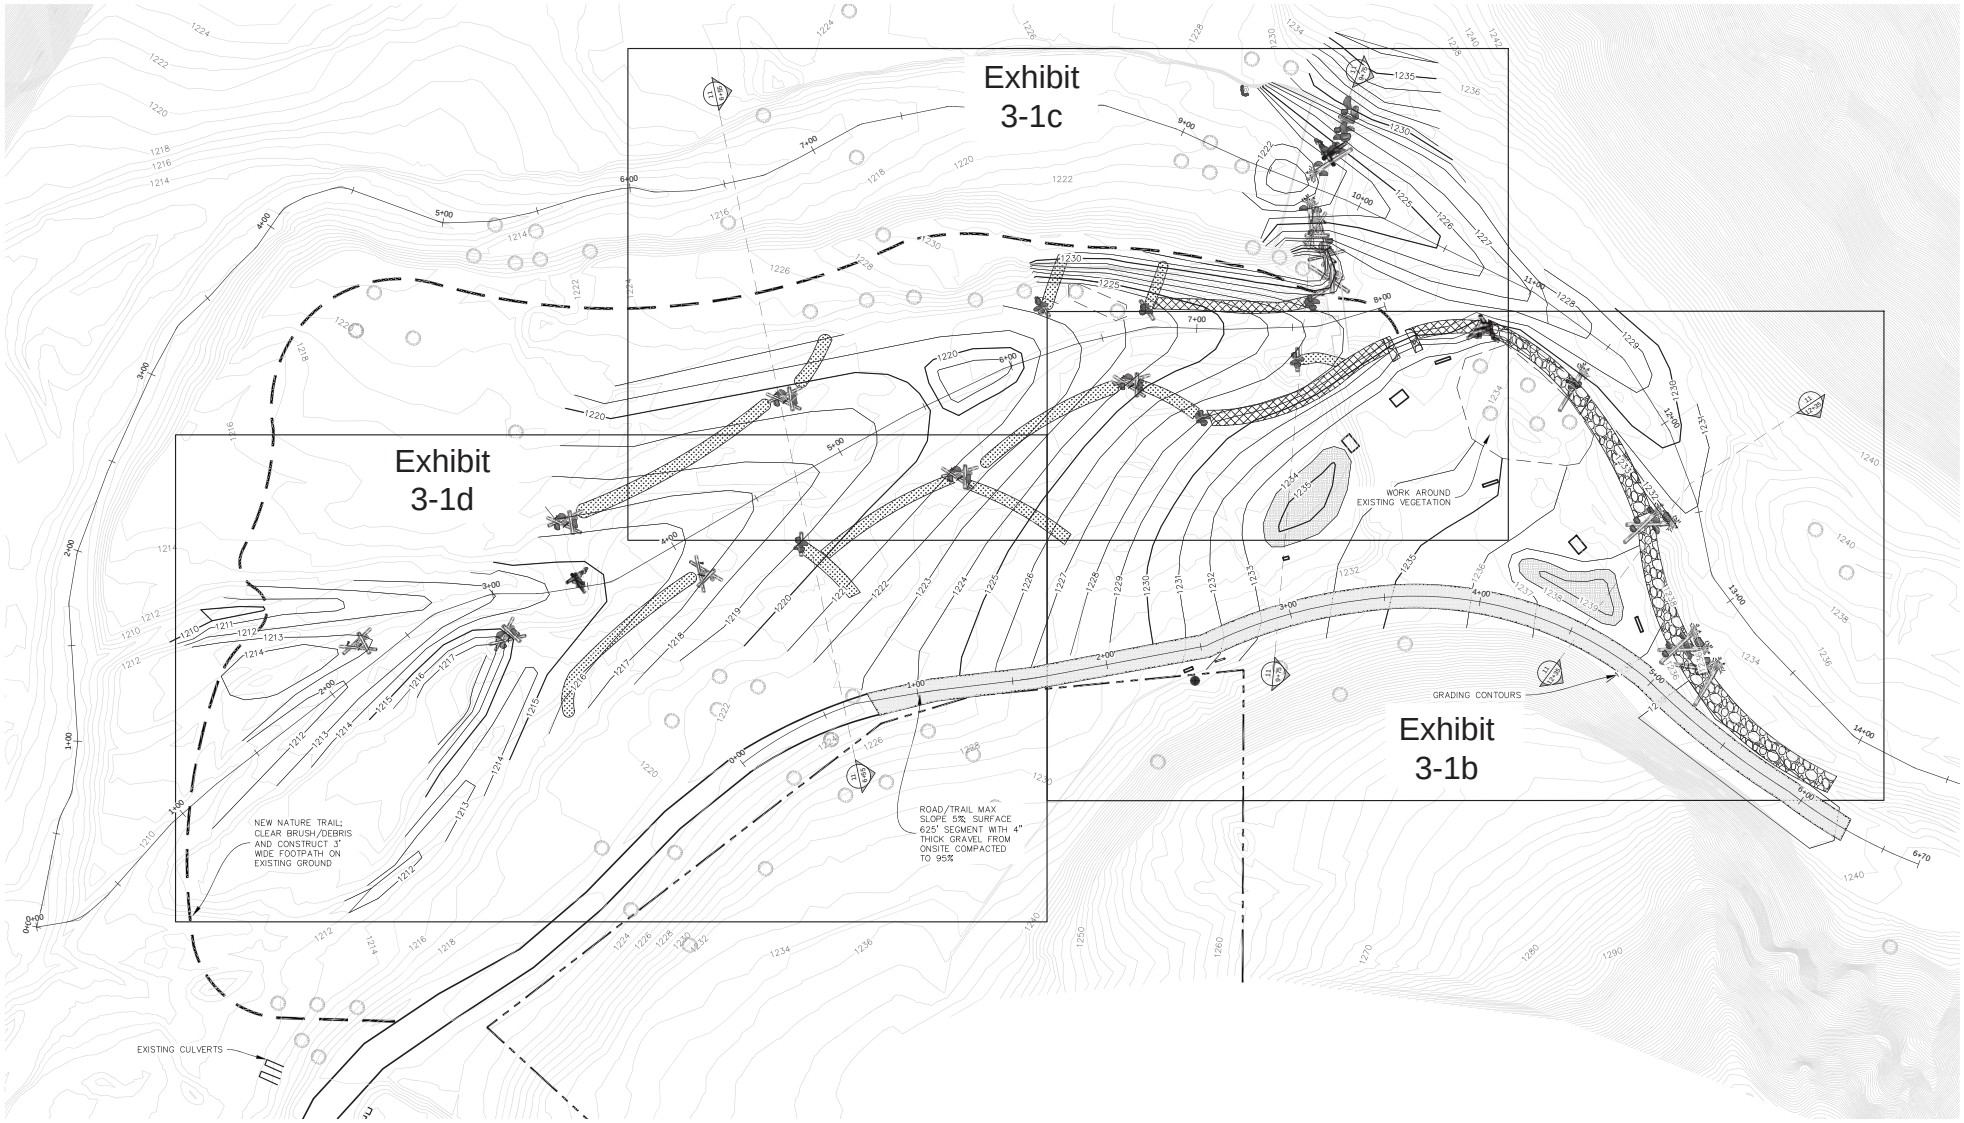
SECTION 3.0 PROJECT DESCRIPTION

The proposed Project involves minimizing the overall area for surface water diversion, spreading, and sedimentation management and locating it closer to the base of the Arroyo Seco Canyon. This would simplify sediment management and maintenance activities that are currently constrained by difficult access into the canyon. Instead of reconstructing the damaged Headworks structure in the Arroyo Seco stream, the Project would replace the diversion and intake structures in the Arroyo Seco Canyon to allow for capture of up to 25 cfs into the spreading basins and the bypass of debris and sediment during high flows. The facilities and improvements that would be constructed as part of the Arroyo Seco Canyon Project would be located at three areas along the Arroyo Seco: Area 1 – Arroyo Seco Headworks; Area 2 – Arroyo Seco Intake; and Area 3 – JPL East Parking Lot (refer to Exhibit 2-2).

3.1 PROJECT COMPONENTS



3.1.1 AREA 1 – ARROYO SECO HEADWORKS

The exposed portions of the Headworks structure will be removed, and improvements in Area 1 will focus on rehabilitating an approximate 6-acre area of the Arroyo Seco floodplain that was significantly impacted by flooding in 2010. The conceptual design for Area 1 is provided in Exhibit 3-1a, Area 1 Conceptual Design, which depicts the entire Area 1 plan, and provides a legend for the more detailed views of the plans that follow, depicted as Exhibits 3-1b, 3-1c, and 3-1d. Stream restoration would involve native plant revegetation and invasive species removal on approximately 1,000 feet of the stream. In addition, the Project includes construction of a rock bank revetment; bank stabilization; creation of planting islands; and installation of woody debris clusters.

Exhibit 3-1b, Area 1 Conceptual Design, depicts the proposed improvements to the most upstream portion of Area 1, including the planted boulder revetment, which would assist in directing creek flows around the proposed picnic area (located outside the five-year floodplain), large wood structures, and boulders. These improvements would facilitate natural sedimentation and would provide opportunities for natural revegetation. In addition, benches, picnic tables, and steps that descend over the bio-block revetment (to allow access from the nature trail to the picnic area), willow baffles, and an equestrian water trough and post are proposed in this area.

The large wood structures would be made of raw logs available from nearby lumber mills or down trees that are not rotten. The logs would be anchored and bolted together into woody debris clusters. These clusters would be positioned to collect debris at the edge of the stream below the two-year water surface elevation. At points of high velocities and shear forces, these clusters would be kept in place with boulders. The proposed picnic tables and benches would be made of heavy duty wood with weatherproofing and would be bolted to buried concrete blocks. Trash cans would have bear-proof lids. Signage would be made of wood or boulders, or other materials including metal and plastic. A signage plate would be placed near the picnic area that describes the dynamic conditions of the Upper Arroyo and river restoration components. Signage would also be located along the nature trail, which would meander and cross the streambed, to describe the native animals, aquatic life, and plants.

Exhibit 3-1c, Area 1 Conceptual Design, depicts the portion of Area 1 that contains the main creek channel, including the locations of the large wood structures and boulders, the bio-block revetment, and the nature trail alignment. This new trail is proposed across the Arroyo Seco from the lower portion of Area 1 and would meander between the Arroyo Seco main channel and the re-created riparian zone and would cross the stream at the northern section, with steps leading

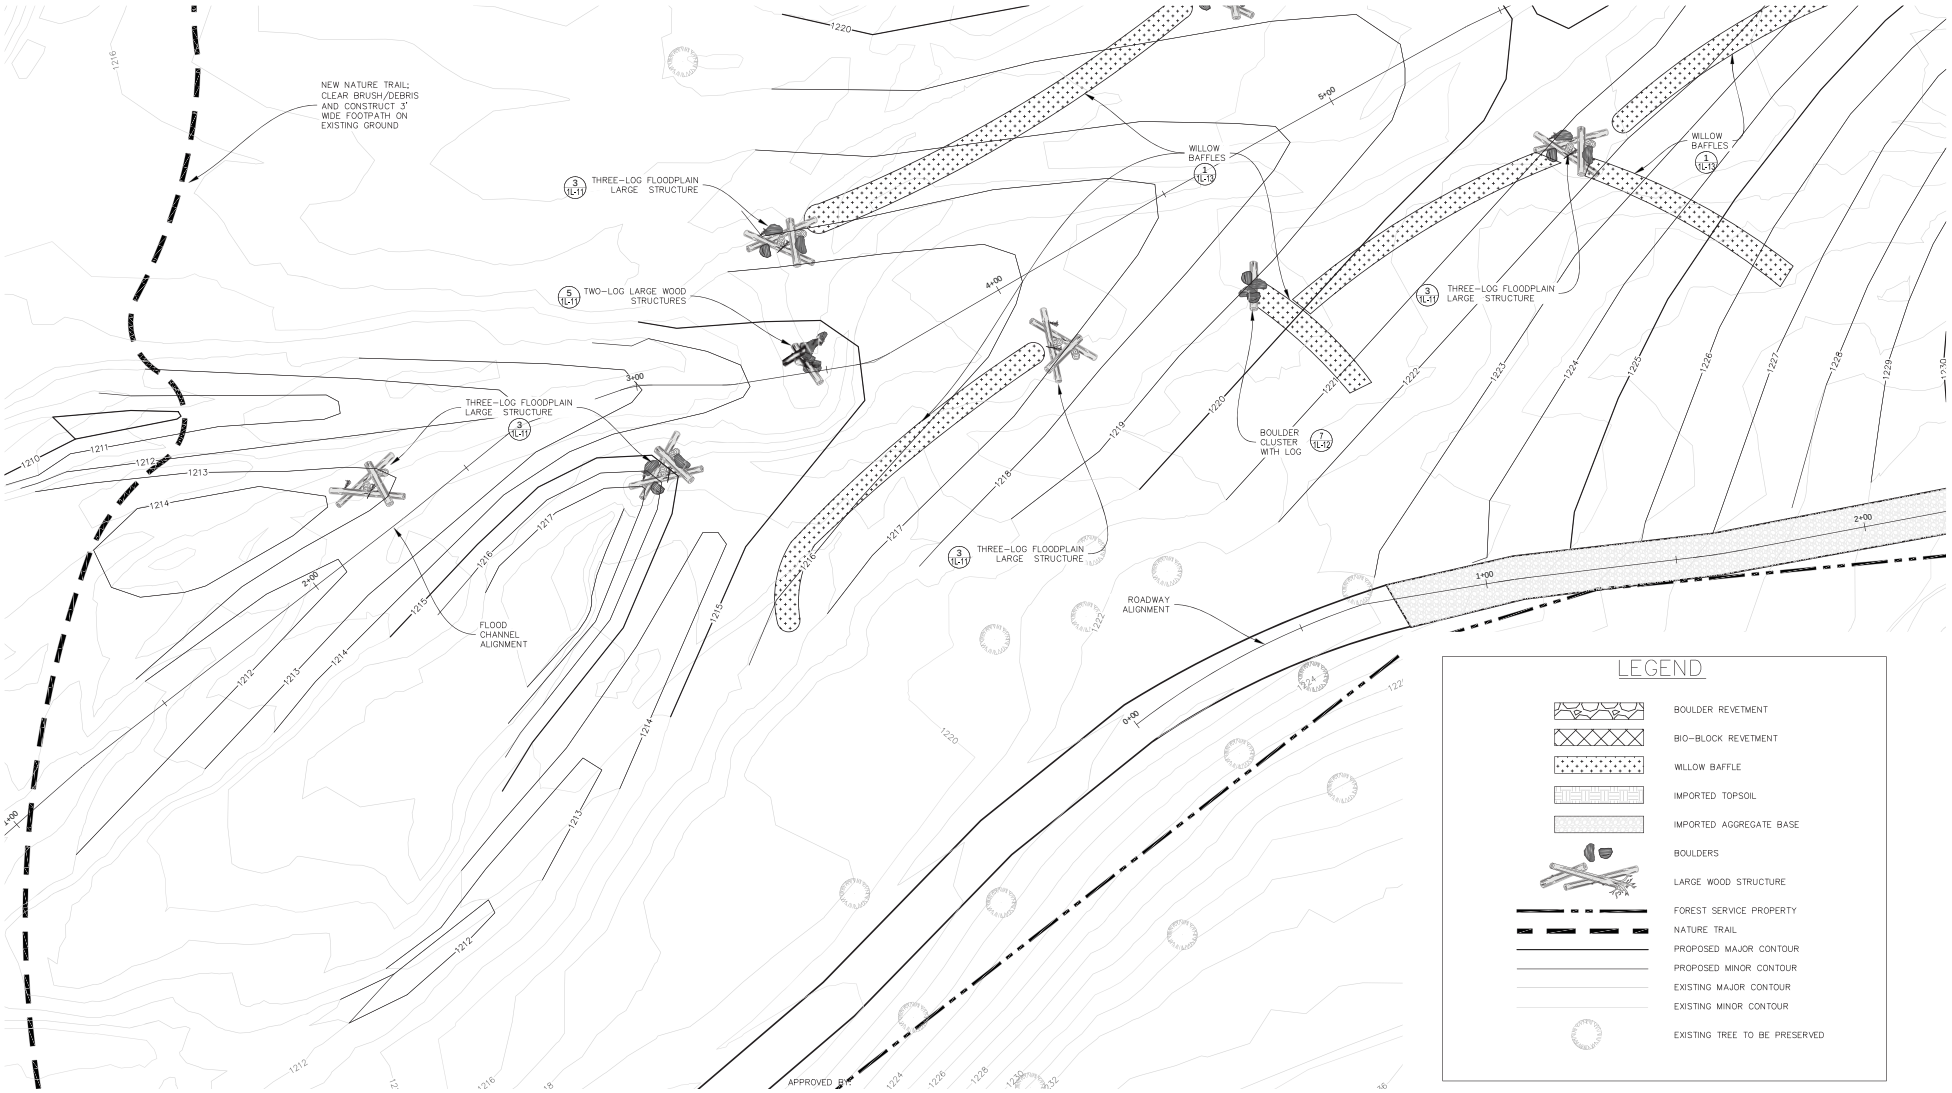
to the rest area/picnic area. It would be approximately three feet wide and would consist of the existing ground cleared of brush and debris. Exhibit 3-1d, Area 1 Conceptual Design, depicts the downstream portion of Area 1, including the locations of the willow baffles and wood structures and boulders. Additionally, a number of interpretive signage on the local watershed and native species would be installed, and a portion of the existing chain-link fence on the west side of the Gabrielino Trail/access road of Area 1 would be removed, and the trail/road would be leveled.

The preliminary planting palette includes four main restoration areas, including Riparian Floodplain, Natural Uplands, Irrigated Picnic Area, and Willow Baffles. The restoration planting palette would involve a mix of seeds and container species. The proposed planting layout for Area 1 shows that riparian tree species would be distributed along a moisture gradient. Trees such as willow and white alder would be planted near or at the water's edge. Other tree species, like California sycamore or coast live oak, would be planted where the soil is drier and the water table is at greater depths. Other common native riparian tree species that are native to the upper Arroyo Seco area would be planted in the understory of Area 1. A meandering nature trail would be developed in this restoration area and would cross the streambed.



Trees to be planted in Area 1 would include coast live oak, California sycamore, Fremont cottonwood, California bay laurel, or other suitable native trees, with an associated irrigation system to support the tree establishment. Riparian planting in the rest area/picnic area would be temporarily irrigated. Water line connections would be made from the adjacent USFS Ranger Station to the proposed rest area/picnic area for the existing water fountain, restoration vegetation establishment, and the horse water trough.

3.1.2 AREA 2 – ARROYO SECO INTAKE

Exhibit 3-2a, Area 2 – Preliminary Site Plan, depicts the proposed improvements in Area 2, which include the replacement of the diversion weir and intake structures and reconstruction of the access road. The access road south of the intake structure in Area 2 would be stabilized through the reconstruction of the slope and the provision of protective riprap. The road would be repaved with asphalt and the existing river rock wall would be extended north towards the diversion structure. The use of arroyo stone for the rock wall along the access road is consistent with the style found throughout the Arroyo Seco and is an essential characteristic of Arroyo culture. A cross-section of the proposed road reconstruction is included in Exhibit 3-2a.

The existing diversion structure would be replaced with either a pneumatically operated spillway gate, as depicted in Exhibit 3-2b, or a motorized crest gate, as depicted in Exhibit 3-2c. Either option would allow an increase in the amount of water that could be diverted to the spreading basins in Area 3 and to better manage sediment buildup behind the diversion structure. The gate/weir would have a sluice or slide gate (with an electric or a hydraulic actuator); a 35-foot-wide and 10-foot-long diversion sill, a trash rack, and a fine screen. The new gate/weir could be effectively removed from the flow path during large storm events to minimize the amount of sediment that builds up at the diversion structure. At other times, the weir/gate would be raised to allow stream flow to be diverted through the intake structure into the spreading basins. A small educational signage plate would be located adjacent to the intake structure describing the storm water diversion operation, the fish screen, and its beneficial impact on aquatic life.

An equipment building located north of the intake structure was damaged by the 2010 winter storms and will be replaced. The proposed control equipment enclosure would be approximately 6 feet by 10 feet and would house the controls for the diversion structure. Electric power for the diversion structure and control equipment enclosure would be supplied by an existing power line at the travelling screen building (southeast of the intake structure).

3.1.3 AREA 3 – JPL EAST PARKING LOT

Improvements proposed in Area 3 include a public recreational parking lot with up to 100 parking stalls paved with decomposed granite or other pervious materials; enlarging existing spreading basins; new sedimentation basins; an access road; a potential future pedestrian pathway; an existing trail/equestrian pathway; interpretative signage; a pet waste disposal station; a guard station near the JPL Bridge access point; and a public restroom that is compliant with the Americans with Disabilities Act (ADA). The restroom would include a trash receptacle and a recycling bin.

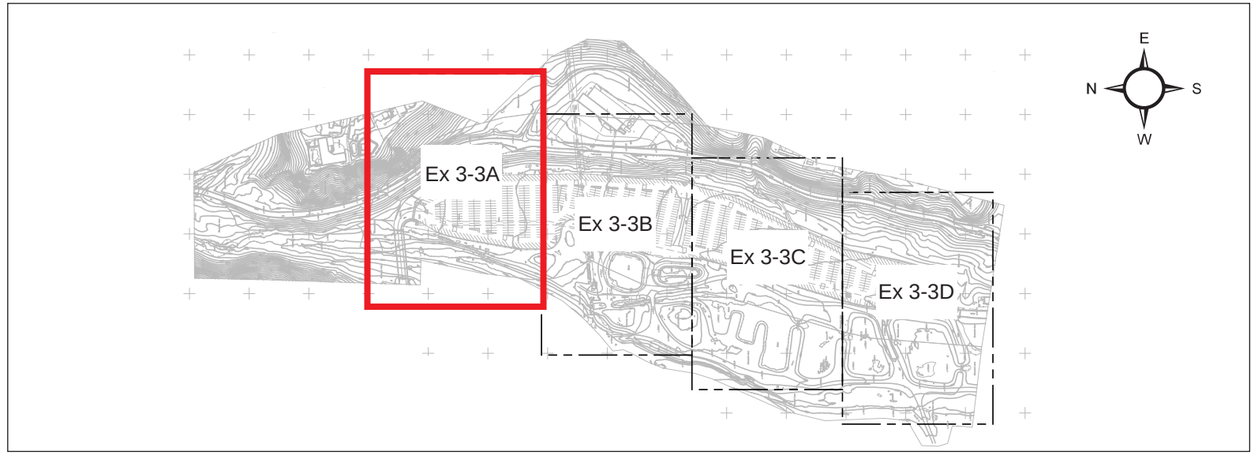

Exhibit 3-3a, Parking Lot, Restroom and Piping Plan, depicts the proposed parking in Area 3, which would be consolidated at the north end (1.25 acres) of the existing parking lot area and a 2-lane, 24-foot wide paved access road along the eastern edge of Area 3. The road would include a two-foot curb and gutter along the eastern edge, and a five-foot "pull over" area along the western edge of the road. At the northernmost end of this road is the proposed guard station that would monitor access to the NASA-JPL property to the west, including a proposed roundabout that would allow vehicles to turn around without needing to cross the existing JPL Bridge. The piping plan depicts the 30-inch-diameter inlet line that transports creek flows into the spreading basins, as well as to the downstream basin inlets.

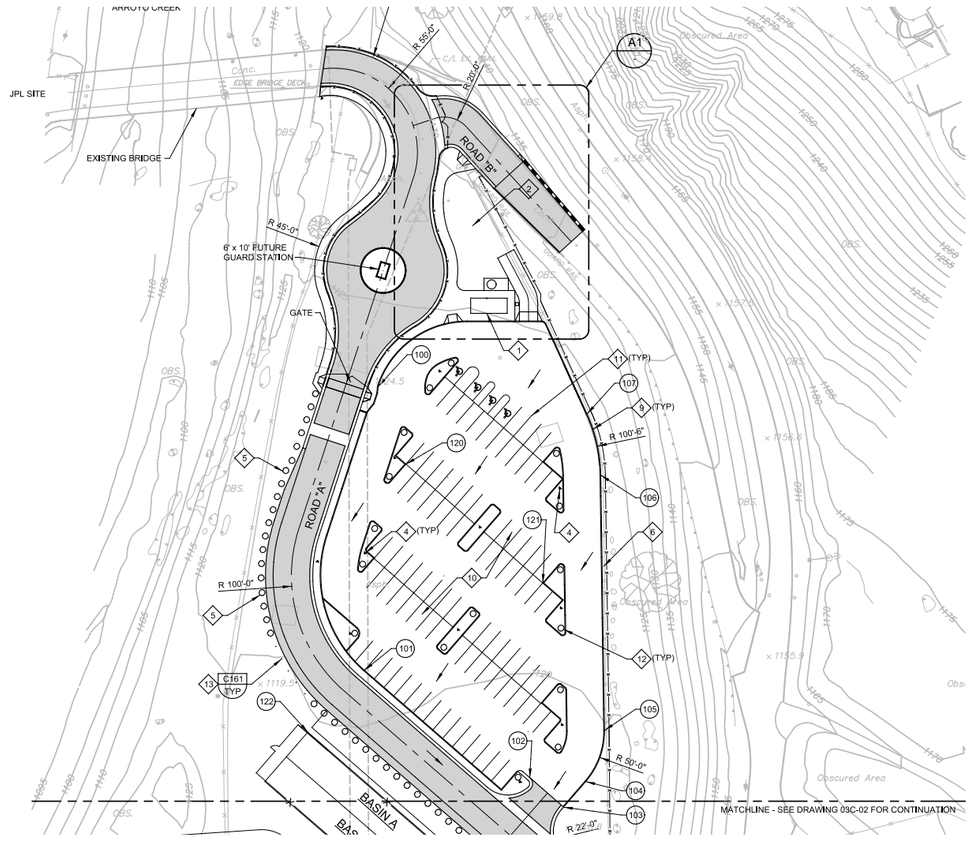
Native shade trees (e.g., California sycamore or similar species) would be provided along with native shrubs and grasses in parking islands of the parking lot and an irrigation system would be installed. The public restroom and a pet waste disposal station would be constructed at the north end of the new parking lot. The restroom would have two gender-neutral stalls, fire-retardant shingles, door locks, dead bolts, and a storage room. A sewer lift station on a concrete pad would be located directly adjacent to the restroom building. A potential future pedestrian pathway/trail could be constructed from the north end of the parking lot to connect to the existing Gabrielino Trail/access road to the northeast. In addition, a signage kiosk would be located at the top of the existing Gabrielino Trail/access road overlooking the spreading basins and would describe the spreading basin operations and inform visitors of the benefits of local water supplies and groundwater recharge. A security fence would be installed on both sides of the bridge and the proposed roundabout.



Two sedimentation basins would be constructed to serve both the existing and enlarged spreading basins. The proposed sedimentation basins in Area 3 would each be rectangular, basins that are approximately 160 feet long by 20 feet wide by 10 feet deep. The proposed spreading basins would generally have an operating water depth of 1 foot and freeboard of 2 feet with basin wall slopes of 3:1, which will provide an additional 25 af capacity of spreading volume. A 15-foot-wide dirt access road would be provided around each basin that is expanded or built. With the area's sloping terrain, maximum depths of the basins would range from 5.5 feet to 6.5 feet. To maximize the effective recharge area for the spreading basins, three existing basins would be combined with the new basins, which are proposed immediately to the east of the existing basins, except for the proposed Basin J. Spillways, pipelines, culverts, and valves would be provided to connect the basins to each other.

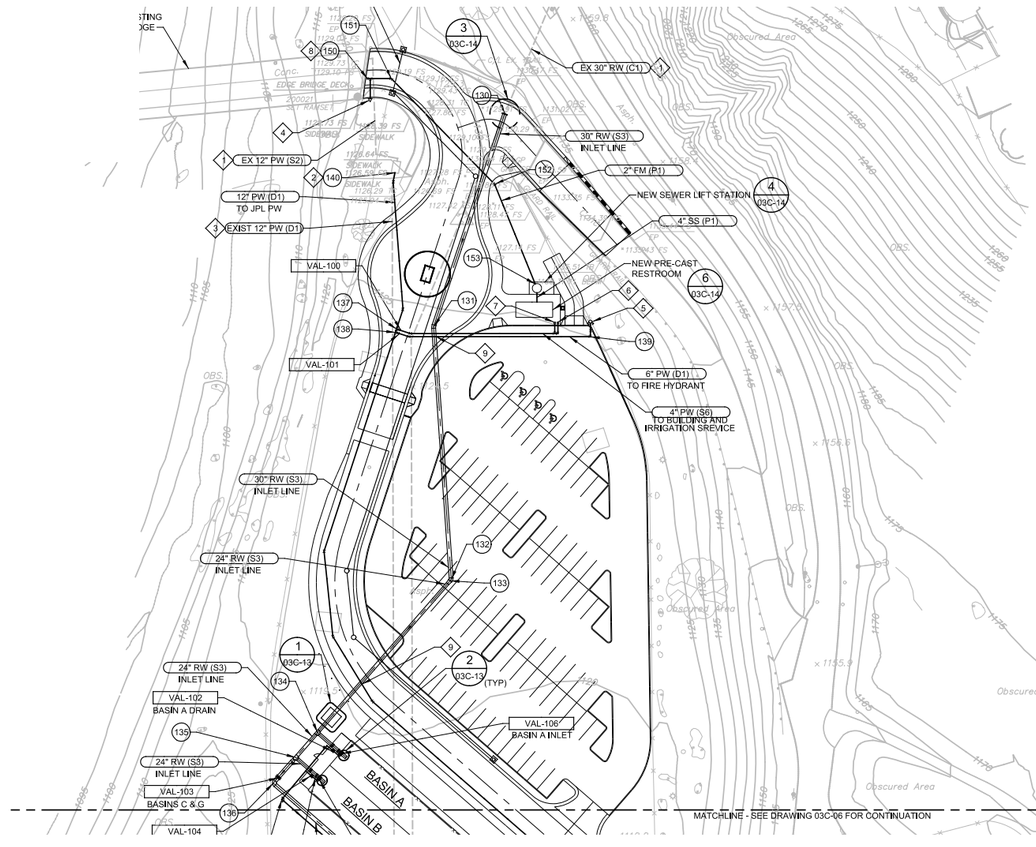


Exhibit 3-3b, Area 3 – Basins A–F and Piping Plan, depicts the locations and sizes of the two proposed pre-sedimentation basins (Basins A and B), four of the proposed spreading basins, and the access road alignment. The Piping Plan depicts the 30-inch-diameter inlet line, overflow lines, drain lines, and inlet/outlet connections between spreading basins.

Exhibit 3-3c, Area 3 – Basins F–I and Piping Plan, depicts the locations and sizes of three of the expanded spreading basins and the access road alignment. The Piping Plan depicts the 30-inch-diameter inlet line, inlet/outlet connections between spreading basins, and relocation of
